Article	2020	Chandler, Rasheeta; Hull, Shawnika; Ross, Henry; Guillaume, Dominique; Paul, Sudeshna; Dera, Nikita; Hernandez, Natalie	The pre-exposure prophylaxis (PrEP) consciousness of black college women and the perceived hesitancy of public health institutions to curtail HIV in black women	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-020-09248-6	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-consciousness-black/docview/2435309920/se-2?accountid=8113	Background Consistent use of Pre-Exposure Prophylaxis (PrEP), a biomedical intervention for HIV seronegative persons, has been shown to significantly decrease HIV acquisition. Black women are a viable population segment to consider for PrEP use as their HIV incidence is overwhelmingly higher than all other women groups. Methods We developed and piloted a cultural- and age- appropriate PrEP education intervention to determine Black college women's: 1) perceptions of and receptivity to PrEP use; and 2) preferences for PrEP information delivery. Results We recruited N = 43 Black college women. Most of our sample were sophomore and Juniors of whom identified as heterosexual (83%) and single (67%). Over 50% of young women had never been HIV tested and only 28% had been tested in the last 6 months; however, 100% of the women believed their HIV status was negative. Prior to participating in the study, most Black college women (67%) had not heard about PrEP and were unsure or apprehensive (72%) to initiate PrEP. The Black college women indicated that our educational intervention was extremely helpful (67%) for understanding and learning about PrEP. Post participating in our PrEP education module, regardless of delivery modality, participants reported being likely (62.55–70%) to initiate PrEP in the future. Conclusions Results indicate that Black college women would strongly consider PrEP when provided with basic knowledge, regardless of delivery modality. Participants also showed greater appreciation for in-person delivery and found it to be significantly more helpful and of greater quality for learning about PrEP; comprehension or perceived usefulness of PrEP-related content was relatively the same between groups. PrEP content delivery -- via in-person or online methods – is contingent on learning style and presentation. Trial registration This study has been registered under the ISRCTN Registry as of July 6, 2020. The trial registration number is ISRCTN14792715. This study was retrospectively registered. Article	2020	Chapin-Bardales, Johanna; Johnson Jones, Michelle L; Kirkcaldy, Robert D; Bernstein, Kyle T; Paz-Bailey, Gabriela; Phillips, Christi; Papp, John R; Raymond, Henry F; Opoku, Jenevieve; Braunstein, Sarah L; Spencer, Emma C; Khuwaja, Salma; Wejnert, Cyprian	Pre-exposure Prophylaxis Use and Detected Sexually Transmitted Infections Among Men Who Have Sex With Men in the United States-National HIV Behavioral Surveillance, 5 US Cities, 2017.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002482	https://dx.doi.org/10.1097/QAI.0000000000002482	BACKGROUND: Men who have sex with men (MSM) using HIV pre-exposure prophylaxis (PrEP) may be at high risk for bacterial sexually transmitted infections (STIs). We examined the prevalence of extragenital gonorrhea and chlamydia by PrEP status among a multisite sample of US MSM. METHODS: MSM aged ≥18 years were recruited through venue-based sampling to participate in the 2017 National HIV Behavioral Surveillance. In 5 cities (San Francisco, Washington DC, New York City, Miami, and Houston), participants completed a questionnaire, HIV testing, and pharyngeal and rectal STI specimen self-collection. We measured prevalence of pharyngeal and rectal gonorrhea and chlamydia among self-reported non-HIV-positive MSM who reported using or not using PrEP in the previous 12 months. RESULTS: Overall, 29.6% (481/1627) of non-HIV-positive MSM reported PrEP use in the past year. MSM who reported PrEP use were more likely to have any STI (ie, extragenital gonorrhea and/or chlamydia) than MSM not on PrEP 14.6% vs. 12.0%, adjusted prevalence ratio (aPR) = 1.5, 95% confidence interval (CI) : 1.1 to 2.0, reflecting differences in rectal chlamydia prevalence (8.7% vs. 6.0%, aPR = 1.6, 95% CI: 1.1 to 2.4). PrEP use was not associated with pharyngeal chlamydia, pharyngeal gonorrhea, or rectal gonorrhea. CONCLUSIONS: The prevalence of extragenital STI was high for both MSM on PrEP and those not on PrEP in the past year. MSM on PrEP were more likely to have rectal chlamydia but not pharyngeal STIs or rectal gonorrhea. Our findings support regular STI testing at exposed anatomic sites as recommended for sexually active MSM, including those on PrEP. Article	2020	Charre C.; Icard V.; Pradat P.; Brochier C.; Lina B.; Chidiac C.; Cotte L.	Coronavirus disease 2019 attack rate in HIV-infected patients and in preexposure prophylaxis users	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002639	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090376293&doi=10.1097%2fQAD.0000000000002639&partnerID=40&md5=3134557b77beb53b21f4ac9a6bf67287	Objective:A new coronavirus severe acute respiratory syndrome coronavirus 2 (SARS-Cov-2) emerged in China during late 2019 and resulted in the coronavirus disease 2019 (COVID-19) pandemic which peaked in France in March-April 2020. Immunodeficiency, precariousness and promiscuity could increase the risk of COVID-19 in HIV-infected patients and in preexposure prophylaxis (PrEP) users. No epidemiological data are available in these two populations. We report COVID-19 attack rate in HIV-infected patients and in PrEP users in the Rhône department, France, and compared it with the general population.Design:Retrospective analysis of a laboratory database.Methods:COVID-19 testing strategy in France was centered on symptomatic infections, hospitalized patients and symptomatic healthcare workers while most asymptomatic cases were not confirmed. SARS-CoV-2 positivity rate on PCR assays and COVID-19 attack rate were determined in HIV-infected patients and in PrEP users. COVID-19 attack rate in the general population was estimated from health authorities' database and demographic data. A corrected attack rate taking into account the laboratory representativeness was calculated.Results:From March to April 2020, 24860 samples from 19113 patients (HIV-infected 77, PrEP users 27, others 19009) were assessed for SARS-CoV-2 PCR assay. The positivity rate appeared similar in HIV-infected patients (15.6%), in PrEP users (14.8%) and in other patients (19.1%). The crude/corrected COVID-19 attack rate appeared similar in HIV-infected patients (0.31/0.38%) and in PrEP users (0.38/0.42%), and of the same order as the estimated attack rate in the general population (0.24%).Conclusion:The risk of symptomatic COVID-19 in France appeared similar in HIV-infected patients and in PrEP users compared with the general population. © 2020 Lippincott Williams and Wilkins. Article	2020	Chemnasiri T.; Varangrat A.; Amico K.R.; Chitwarakorn A.; Dye B.J.; Grant R.M.; Holtz T.H.	Facilitators and barriers affecting PrEP adherence among Thai men who have sex with men (MSM) in the HPTN 067/ADAPT Study	AIDS Care	-	-	-	9540121	10.1080/09540121.2019.1623374	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85067085194&doi=10.1080%2f09540121.2019.1623374&partnerID=40&md5=286f101438272928efa8bd6b5bd41a31	The HPTN 067/ADAPT Study evaluated the feasibility, acceptability, patterns of adherence and coverage for three randomly assigned oral FTC/TDF pre-exposure prophylaxis (PrEP) dosing regimens to prevent HIV infection. Using qualitative methods, we explored facilitators and barriers among a subset of men who have sex with men (MSM) participants in Bangkok, Thailand. Between August 2013 and March 2014, 32 HPTN 067/ADAPT participants joined in 6 focus group discussions, and 6 attended key informant interviews. Facilitators of PrEP adherence included use of strategies to have PrEP available when needed, simplicity in regimen requirements with recognition that more complex regimens may take some time to master, ability to plan for sex, receipt of social and technology support, ability to use a PrEP regimen that best matches to one's own patterns of sex, and experiences with PrEP as a part of health and well-being. Challenges to PrEP adherence included perceptions of no or low HIV risk, difficulties following regimens when intoxicated, concerns about side effects, experience of HIV stigma, and affordability of PrEP outside of study context influencing uptake and use in the community. Preferences for regimens varied, suggesting that multiple PrEP effective regimen options should be available to fit those with different needs. ©, This work was authored as part of the Contributor's official duties as an Employee of the United States Government and is therefore a work of the United States Government. Article	2020	Chen, Yen-Tyng; Duncan, Dustin T; Issema, Rodal; Goedel, William C; Callander, Denton; Bernard-Herman, Benjamin; Hanson, Hillary; Eavou, Rebecca; Schneider, John; Hotton, Anna	Social-Environmental Resilience, PrEP Uptake, and Viral Suppression among Young Black Men Who Have Sex with Men and Young Black Transgender Women: the Neighborhoods and Networks (N2) Study in Chicago.	Journal of Urban Health	-	-	-	1468-2869	10.1007/s11524-020-00425-x	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7560645	Young black men who have sex with men (YBMSM) and young black transgender women (TGW) have experienced a stark disparity in HIV prevention and care. Resilience, collective resources to adapt stressors or adversities, may improve HIV prevention and care outcomes. The present study investigated the association of resilience-based factors with PrEP uptake and viral suppression from a socioecological perspective among YBMSM and young black TGW. Data were from the baseline cycle of the Neighborhoods and Networks (N2) Study, an ongoing cohort study of 16-34-year-old YBMSM and young black TGW in Chicago (n = 324). Confidant network-level and neighborhood affiliation variables were created to measure the social-environmental context of resilience. All analyses were stratified by participants' HIV status (184 HIV-negative participants and 140 HIV-positive participants). Among HIV-negative participants, having a parental figure within an individual's confidant network was significantly associated with a greater likelihood of PrEP uptake. Among HIV-positive participants, confidant network members' awareness of an individual's HIV status was associated with viral suppression. Social support resources from confidant networks could improve HIV prevention and care engagement among YBMSM and young black TGW. Understanding the social and environmental contexts of resilience resource is critical for HIV prevention and care engagement. Article	2020	Chen, Ying Qing; Peng, Lili; Wang, Yixin; Appelmans, Eline; Dasgupta, Sayan; Fleming, Thomas R	Trial designs for evaluating combination HIV prevention approaches.	HIV Research and Clinical Practice	-	-	-	2578-7470	10.1080/25787489.2020.1798083	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7608072	BACKGROUND: Combination HIV prevention approaches that include both biomedical and non-biomedical interventions often hold greater promise to improve health outcomes and reduce the risk of HIV transmission. OBJECTIVES: Evaluate the relative properties of four leading candidate trial designs - 'single-factor', 'multi-arm', 'all-in-one', and 'factorial' designs - for assessing individual and/or combination prevention intervention approaches. METHODS: Monte-Carlo simulations are conducted, assuming a putative combination approach could choose its components from two candidate biomedical interventions, i.e. Treatment-as-Prevention (TasP) and Pre-exposure Prophylaxis (PrEP), and three candidate behavioral interventions, i.e. linkage-to-care, counseling, and use of condoms. Various scenarios for individual components' effect sizes, their possible interaction, and the sample size based on real clinical studies are considered. RESULTS: The all-in-one and factorial designs used to assess a combination approach and the multi-arm design used to assess multiple individual components are consistently more powerful than single-factor designs. The all-in-one design is powerful when the individual components are effective without negative interaction, while the factorial design is more consistently powerful across a broad array of settings. CONCLUSIONS: The multi-arm design is useful for evaluating single factor regimens, while the all-in-one and factorial designs are sensitive in assessing the overall efficacy when there is interest in combining individual component regimens anticipated to have complementary mechanisms. The factorial design is a preferred approach when assessing combination regimens due to its favorable power properties and since it is the only design providing direct insights about the contribution of individual components to the combination approach's overall efficacy and about potential interactions. Article	2020	Cheu R.K.; Gustin A.T.; Lee C.; Schifanella L.; Miller C.J.; Ha A.; Kim C.; Rodriguez V.J.; Fischl M.; Burgener A.D.; Arnold K.B.; Alcaide M.L.; Klatt N.R.	Impact of vaginal microbiome communities on HIV antiretroviral-based pre-exposure prophylaxis (PrEP) drug metabolism	PLoS Pathogens	-	-	-	15537366	10.1371/journal.ppat.1009024	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097125437&doi=10.1371%2fjournal.ppat.1009024&partnerID=40&md5=650842ae82b841d14d165578eed50bf4	Despite the efficacy of antiretroviral-based pre-exposure prophylactics (PrEP) in men who have sex with men, studies in women have produced widely varying outcomes. Recent evidence demonstrates that vaginal microbial communities are associated with increased HIV acquisition risk and may impact PrEP efficacy. Here, we investigate the mechanisms underlying how vaginal bacteria alter PrEP drug levels and impact HIV infection rates ex vivo. Using cervicovaginal lavages (CVLs) from women with or without bacterial vaginosis (BV), we identified microbial metabolism of PrEP drugs in BV samples through LC-MS/MS analysis of soluble drug levels and metabolite formation in dual T-cell cultures. CVL samples were assessed for microbiome analysis using sequencing of bacterial 16S rRNA genes. We also observed non-Lactobacillus bacteria that are associated with BV may potentially impact PrEP efficacy through increased HIV infection rates in co-cultures containing Lactobacillus or BV bacteria, PrEP drugs, CEM-GFP cells, and HIV-1LAI virus. Finally, we used these data to develop a novel predictive mathematical simulation modeling system to predict these drug interactions for future trials. These studies demonstrate how dysbiotic vaginal microbiota may impact PrEP drugs and provides evidence linking vaginal bacteria to PrEP efficacy in women. © 2020 Cheu et al. Article	2020	Ching S.Z.; Wong L.P.; Said M.A.B.; Lim S.H.	Meta-synthesis of qualitative research of pre-exposure prophylaxis (Prep) adherence among men who have sex with men (msm)	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2020.32.5.416	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094559644&doi=10.1521%2faeap.2020.32.5.416&partnerID=40&md5=c04f558ef3f8c70242d0a10ce78e1136	The aim of the study was to consolidate evidence on barriers and facili-tators to PrEP adherence among men who have sex with men. PubMed, Science Direct, and EBSCO host were utilized to search for relevant articles. Six articles from PubMed, published between 2010 and 2018, were reviewed. Thematic analysis was employed to synthesize findings. At the individual level, HIV susceptibility, knowledge of PrEP, and individual lifestyle affected PrEP adherence. At the organizational level, cost of PrEP and quality of PrEP services influenced adherence to PrEP. At the societal level, social stigma, financial assistance or medical insurance, and family and peer support were determinants of PrEP adherence. Facilitators included perceived high risk of HIV infection and payment assistance, while barriers included social stigma and high cost of PrEP. Social stigma and structural level factors such as payment assistance and cost of PrEP need to be examined to ensure optimal adherence to PrEP. © 2020 The Guilford Press. Article	2020	Chitneni, Pooja; Bwana, Mwebesa Bosco; Owembabazi, Moran; O'Neil, Kasey; Kalyebara, Paul Kato; Muyindike, Winnie; Musinguzi, Nicholas; Bangsberg, David R; Marrazzo, Jeanne M; Haberer, Jessica E; Kaida, Angela; Matthews, Lynn T	Sexually Transmitted Infection Prevalence Among Women at Risk for HIV Exposure Initiating Safer Conception Care in Rural, Southwestern Uganda.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001197	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7363531	BACKGROUND: Knowledge of sexually transmitted infection (STI) prevalence and risk factors is important to the development of tenofovir-based preexposure prophylaxis (PrEP) and safer conception programming. We introduced STI screening among women at risk for HIV exposure who were participating in a safer conception study in southwestern Uganda. METHODS: We enrolled 131 HIV-uninfected women, planning for pregnancy with a partner living with HIV or of unknown HIV serostatus (2018-2019). Women were offered comprehensive safer conception counseling, including PrEP. Participants completed interviewer-administered questionnaires detailing sociodemographics and sexual history. We integrated laboratory screening for chlamydia, gonorrhea, trichomoniasis, and syphilis as a substudy to assess STI prevalence. Multivariable logistic regression was used to determine correlates. RESULTS: Ninety-four women completed STI screening (72% of enrolled). Median age was 30 (interquartile range, 26-34) years, and 94% chose PrEP as part of safer conception care. Overall, 24% had STIs: 13% chlamydia, 2% gonorrhea, 6% trichomoniasis, 6% syphilis, and 3% ≥2 STI. Sexually transmitted infection prevalence was associated with younger age (adjusted odds ratio AOR, 0.87; 95% confidence interval CI, 0.77-0.99), prior stillbirth (AOR, 5.04; 95% CI, 1.12-22.54), and not feeling vulnerable to HIV (AOR, 16.33; 95% CI, 1.12-237.94). CONCLUSIONS: We describe a 24% curable STI prevalence among women at risk for HIV exposure who were planning for pregnancy. These data highlight the importance of integrating laboratory-based STI screening into safer conception programs to maximize the health of HIV-affected women, children, and families.	acesso restrito	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Chittamuru, Deepti; Frye, Victoria; Koblin, Beryl A; Brawner, Bridgette; Tieu, Hong-Van; Davis, Annet; Teitelman, Anne	PrEP Stigma, HIV Stigma, and Intention to Use PrEP among Women in New York City and Philadelphia.	Stigma and Health	-	-	-	2376-6972	10.1037/sah0000194	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7654828	BACKGROUND: Stigma is an important contributor to the continued HIV epidemic in the United States (US). In 2016, women made up nearly one in five of all new infections. Pre-exposure HIV Prophylaxis or PrEP is a medication that can be taken to prevent HIV acquisition; however, PrEP is significantly underutilized by women at risk for infection. How PrEP stigma relates to PrEP initiation among women is not well understood. METHODS: Surveys were completed by 160 PrEP-eligible women aged 18-55 in Philadelphia, PA and New York City, NY. Associations between PrEP stigma, HIV stigma, and PrEP initiation intention were modeled using multinomial logistic regression, controlling for sociodemographic and theoretically-relevant variables. RESULTS: Participants ranged in age from 18 to 55 years (M = 40.2; SD = 11.78). Most (79%) identified as Black or African-American and/or Latina and 36% had completed high-school or less. Higher PrEP stigma was significantly associated with lower PrEP initiation intention, while controlling for other theoretically-relevant and sociodemographic variables. HIV stigma was not related to PrEP initiation intention. CONCLUSIONS: HIV prevention interventions seeking to increase PrEP initiation among PrEP-eligible, urban women need to address the role that PrEP stigma plays in PrEP uptake. Article	2020	Choi, Heun; Suh, Jiyeon; Lee, Woonji; Kim, Jun Hyoung; Kim, Jung Ho; Seong, Hye; Ahn, Jin Young; Jeong, Su Jin; Ku, Nam Su; Park, Yoon Soo; Yeom, Joon Sup; Kim, Changsoo; Kwon, Hee-Dae; Smith, Davey M; Lee, Jeehyun	Cost-effectiveness analysis of pre-exposure prophylaxis for the prevention of HIV in men who have sex with men in South Korea: a mathematical modelling study	Scientific Reports	-	-	-	2045-2322	https://doi.org/10.1038/s41598-020-71565-y	https://escholarship.org/uc/item/2692z15n	In February 2018, the Ministry of Food and Drug Safety in Korea approved tenofovir disoproxil fumarate and emtricitabine (TDF/FTC) co-formulate for use in pre-exposure prophylaxis (PrEP) for the prevention of human immunodeficiency virus (HIV) infection. This study aimed to estimate the cost-effectiveness of PrEP in men who have sex with men (MSM), a major risk group emerging in Korea. A dynamic compartmental model was developed for HIV transmission and progression in MSM aged 15-64 years. With a combined model including economic analysis, we estimated averted HIV infections, changes in HIV prevalence, discounted costs, quality-adjusted life-years (QALYs), and incremental cost-effectiveness ratios (ICERs). PrEP was evaluated in both the general MSM and high-risk MSM populations and was assumed to reduce infection risk by 80%. Implementing PrEP in all MSM would avert 75.2% HIV infections and facilitate a gain of 37,372 QALYs at a cost of $274,822 per QALY gained over 20 years relative to the status quo. Initiating PrEP in high-risk MSM with an average of eight partners per year (around 20% of MSM) would improve the cost-effectiveness, averting 78.0% HIV infections and add 29,242 QALYs at a cost of $51,597 per QALY gained, which is within the willingness-to-pay threshold for Korea of $56,000/QALY gained. This result was highly sensitive to annual PrEP costs, quality-of-life for people who are on PrEP, and initial HIV prevalence. Initiating PrEP in a larger proportion of MSM in Korea would prevent more HIV infections, but at an increasing cost per QALY gained. Focusing PrEP on higher risk MSM and any reduction in PrEP cost would improve cost-effectiveness. Article	2020	Chow E.P.F.; Aung E.T.; Chen M.Y.; Bradshaw C.S.; Fairley C.K.	Human papillomavirus vaccination and sexual practices among men who have sex with men in Melbourne, Australia: a cross-sectional study	International journal of STD & AIDS	-	-	-	9564624	10.1177/0956462419897514	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081151271&doi=10.1177%2f0956462419897514&partnerID=40&md5=9162bdb31d63370cdd1c91f51b32cc4b	The aim of this study was to explore the factors associated with self-reported receipt of human papillomavirus (HPV) vaccine among men who have sex with men (MSM). MSM aged 16–40 years attending the Melbourne Sexual Health Centre, Australia, for their first visit in 2016 were included in the analysis. Multivariable logistic regression analyses were performed to examine the association between self-reported HPV vaccination and sexual practices: one examining the sexual practices. A total of 1332 MSM with a mean age of 27.6 (standard error SE = 0.1) were included in the analysis. The mean number of reported male partners in the last 3 and 12 months was 4.0 (SE = 0.1) and 8.9 (SE = 0.4), respectively. Six percent (n = 81) of MSM reported receiving the HPV vaccine. There was no significant association between sexual practices (the number of partners or condomless anal sex) and self-reported HPV vaccine receipt after adjusting for confounding factors such as human immunodeficiency virus (HIV) status and pre-exposure prophylaxis (PrEP). HIV-negative MSM taking PrEP were three times more likely to be vaccinated against HPV compared with HIV-negative MSM not taking PrEP in both multivariable analyses. Our findings suggest that there is no association between HPV vaccination and sexual risk practices in MSM. © The Author(s) 2020. Article	2020	Chow E.P.F.; Phillips T.R.; Bradshaw C.S.; Chen M.Y.; Fairley C.K.	Sexual Mixing Patterns by HIV Status and PrEP Use Among Men Who Have Sex With Men Partnerships in Melbourne, 2011-2018	Journal of Acquired Immune Deficiency Syndromes	-	-	-	19447884	10.1097/QAI.0000000000002231	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077765436&doi=10.1097%2fQAI.0000000000002231&partnerID=40&md5=bad8600d66f2e70c5ea21c94eda9c447	BACKGROUND: Sexual mixing between HIV-positive, HIV-negative, and pre-exposure prophylaxis (PrEP) users among men who have sex with men (MSM) is an important determinant of the incidence of infection. There have been very limited studies examining the patterns of sexual mixing in relation to HIV status and PrEP use in the era of PrEP. SETTING: Melbourne Sexual Health Centre (MSHC), Australia. METHODS: We included all MSM partnerships attending MSHC on the same day between 2011 and 2018. A chi-square trend test was used to examine the changes in the annual proportion of partnerships by HIV serostatus in 2011-2018 and by PrEP use in 2016-2018. RESULTS: Of the 1765 MSM partnerships who attended MSHC between 2011 and 2018, 1.3% of the partnerships were concordant HIV-positive, 91.0% were concordant HIV-negative, and 7.6% were HIV-discordant. The proportion of HIV-discordant partnerships increased from 0% in 2011 to 12.5% in 2018 (ptrend < 0.001). In 2016-2018, only a small proportion (1.2%) of concordant HIV-negative partnerships involved both men taking PrEP, whereas 6.0% involved at least one man taking PrEP. Overall, 79.1% of concordant HIV-negative partnerships were not protected against HIV (ie, neither man taking PrEP), and this proportion declined significantly from 84.3% in 2016 to 74.0% in 2018 (ptrend = 0.001). CONCLUSIONS: The pattern of sexual mixing by HIV status and PrEP use among MSM partnerships has changed over time. PrEP use in both men within MSM partnerships is not common. About 79% of concordant HIV-negative partnerships were not protected against HIV as neither man taking PrEP.	acesso restrito	English	United States	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Quantitative
Article	2020	Chu B.A.; Castellanos E.R.; Gonzales M.M.; Gaither T.W.	Social determinants of self-reported pre-exposure prophylaxis use among a national sample of US men who have sex with men	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2019-054177	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85073672366&doi=10.1136%2fsextrans-2019-054177&partnerID=40&md5=037c837c1d2afc6efb097568cbd83510	Purpose Various disparities exist in HIV transmission among men who have sex with men (MSM). Pre-exposure prophylaxis (PrEP) has been shown to decrease the acquisition of HIV, but there is variation in uptake within the MSM population. We aim to characterise PrEP use and correlates of self-reported PrEP use in a large national sample of urban MSM in the USA. Methods Using data from a geosocial-networking application, a national sample (n=3744) from the largest 50 metropolitan centres in the USA was obtained. Results We found 18.1% (95% CI 16.8 to 19.3) of profiles reported using PrEP, with decreased reported PrEP use in younger MSM aged 18-24 years (adjusted OR (aOR)=0.5, 95% CI 0.3 to 0.7), obese MSM (aOR=0.5, 95% CI 0.3 to 0.9), black MSM (aOR=0.6, 95% CI 0.4 to 0.9) and MSM in the South (aOR=0.7, 95% CI 0.5 to 0.9). Conclusion Significant disparities exist in PrEP reporting by age and among black, Southern US and obese MSM. More research is needed to better understand these disparities. © Author(s) (or their employer(s)) 2020. No commercial re-use. See rights and permissions. Article	2020	Chu M.; Cotler K.; Yingling C.	Understanding patient motivations for HIV pre-exposure prophylaxis initiation and adherence	Journal of the American Association of Nurse Practitioners	-	-	-	23276886	10.1097/JXX.0000000000000282	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086135251&doi=10.1097%2fJXX.0000000000000282&partnerID=40&md5=0c846c0a6c49680c76d1dda99045a52a	Consistent dosing of tenofovir/emtricitabine-based HIV pre-exposure prophylaxis (PrEP) can reduce HIV infection risk by up to 92%. However, clinical trials have shown low PrEP adherence (34-71%), resulting in reduced effectiveness. To improve PrEP's effectiveness, adherence to a daily PrEP regimen is essential. This report explores patients' patterns of PrEP initiation and use and their PrEP-related perceptions to promote greater understanding of patient motivations for beginning and adhering to PrEP. At two urban primary care clinics, individual coaching sessions that included semistructured interviews were offered to 10 PrEP patients. Regarding PrEP initiation, 30% of patients were advised to use PrEP by their nurse practitioners (NPs), while the remaining patients requested PrEP themselves. Before they initiated PrEP, all patients were familiar with it through social contacts or internet-based research. Patients' PrEP-related perceptionswere identified, including perceived pros and cons of PrEP use, and degrees of PrEP knowledge, uncertainty, and fear. Primary care NPs should take detailed sexual histories to avoid overlooking PrEP candidates. In addition, primary care NPs should introduce easy-to-access, Internet-based resources to reinforce patient education. Last, PrEP promotional campaigns should be focused at the community level in gay, bisexual, transgender and queer populations. © 2020 Lippincott Williams and Wilkins. All rights reserved. Article	2020	Chu, IYH; Ku, SWW; Li, CW; Toh, HS; Yang, CJ; Wu, KS; Wu, HJ; Chen, SS; Kuo, JH; Lin, HH; Ko, NY	Taiwan guideline on oral pre-exposure prophylaxis for HIV prevention-2018 update	Journal of Microbiology Immunology and Infection	-	-	-	1684-1182	10.1016/j.jmii.2019.09.003	https://pubmed.ncbi.nlm.nih.gov/31628087/	Pre-exposure prophylaxis (PrEP) for prevention of human immunodeficiency virus infection is proved to be effective and has been implemented worldwide. This article introduces the guideline development and revised recommendations and guidance on PrEP provision in the updated Taiwan PrEP guideline. The Taiwan PrEP guideline writing group searched randomized controlled trials and guidelines published before October 2017 through Medline/PubMed, Cochrane Database, Embase and ClinicalTrials.gov database. Keywords included pre(-)exposure prophylaxis, PrEP, Truvada, tenofovir, HIV, and AIDS. Each selected article was assessed by two authors using the Grading of Recommendations Assessment, Development and Evaluation. External reviewers were invited to independently evaluate the revised manuscript per the Appraisal of Guidelines for Research and Evaluation II. Before publication, a public consultation was held to reach consensus on the updated guideline among providers, civil society, and Taiwan Centers for Disease Control. Four systematic reviews and 28 original articles were reviewed by Taiwan PrEP writing group. The second version of the Taiwan PrEP guideline was released in March 2018. We recommended daily PrEP use for the following populations: strong recommendation and high quality of evidence for men who have sex with men (MSM) and transgender women (TGW), as well as heterosexual serodiscordant couples; weak recommendation and high quality of evidence for people who inject drugs, while weak recommendation and moderate quality of evidence for at-risk heterosexual men and women. There is high-quality evidence for event-driven PrEP in MSM and likely TGW, and we additionally recognized these key populations could benefit from such dosing regimen. Article	2020	Cimen, Cansu; Emecen, Ahmet N; Barber, Tristan J	Attitude of infectious diseases physicians in Turkey about HIV pre-exposure prophylaxis: results of an online survey.	International Journal of STD & AIDS	-	-	-	1758-1052	10.1177/0956462420921080	https://dx.doi.org/10.1177/0956462420921080	Pre-exposure prophylaxis (PrEP) is the provision of antiretroviral drugs before HIV exposure to prevent infection for those in whom it is indicated. We conducted an online survey about PrEP in a national sample of infectious diseases physicians in Turkey. They were surveyed from March to April 2019 and they were asked about their attitudes, knowledge and clinical practise about PrEP. Overall, 209 of 2100 (10%) completed the survey, of whom 66.3% were female, 69.5% were specialist and 41.1% were working at education and research hospitals. Most of the participants reported their PrEP knowledge as 'low'. Men who have sex with men was the most suitable group for PrEP according to participants. 27.9% of them were requested to prescribe PrEP which was to be paid by individuals themselves and 24.2% of the participants had recommended PrEP in their clinical practice. The primary concerns among those who would not recommend PrEP were the possible increase in sexually transmitted infections, the potential low cost-effectiveness of PrEP, the ineffectiveness of PrEP in HIV transmission and the time lost to following-up the individuals taking PrEP. Developing a national guideline would support clinicians in order to change their attitudes and to find answers to their concerns.	acesso restrito	English	United Kingdom	Western and Central Europe and North America	Turkey	Western and Central Europe and North America	Turkey	Western and Central Europe and North America	Quantitative
Article	2020	Cirrincione L.R.; Podany A.T.; Havens J.P.; Bares S.H.; Dyavar S.R.; Gwon Y.; Johnson T.M.; Amoura N.J.; Fletcher C.V.; Scarsi K.K.	Plasma and intracellular pharmacokinetics of tenofovir disoproxil fumarate and emtricitabine in transgender women receiving feminizing hormone therapy	Journal of Antimicrobial Chemotherapy	-	-	-	3057453	10.1093/jac/dkaa016	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083724957&doi=10.1093%2fjac%2fdkaa016&partnerID=40&md5=d5befa2623be2e44969314ba9efb80fc	Transwomen have an increased risk of HIV acquisition compared with other adults. Drug-drug interactions between pre-exposure prophylaxis (PrEP) and gender-affirming therapy are cited as a reason for poor PrEP uptake among transwomen. We evaluated plasma tenofovir and emtricitabine pharmacokinetics and their active intracellular anabolites, tenofovir-diphosphate and emtricitabine-triphosphate, in transwomen receiving feminizing hormones. Methods: We enrolled HIV-negative transwomen (≥19 years) not receiving PrEP. Participants took oral tenofovir disoproxil fumarate/emtricitabine 300/200 mg daily for 14 days. Plasma was collected at 0 h (pre-dose), 0.5, 1, 2, 3, 4, 6, 8 and 12 h on day 14 post-tenofovir disoproxil fumarate/emtricitabine dose. The plasma AUC0-24 was calculated using the trapezoidal rule and compared with historical HIV-negative cisgender adults as geometric mean ratios (GMRs, 90% CI). Secondarily, tenofovir-diphosphate and emtricitabine-triphosphate from PBMCs collected at 0 h and 12 h were reported descriptively as geometric means (90% CI). Clinical trials registration: NCT03270969. Results: Among 15 transwomen (mean age 32 years), geometric mean tenofovir and emtricitabine plasma AUC0-24 were lower compared with controls: tenofovir, 2.10 versus 2.76 mg·h/L, GMR 0.76 (0.65-0.90), P = 0.01; emtricitabine, 9.15 versus 10.64 mg·h/L, GMR 0.86 (0.75-0.98), P = 0.07. Tenofovir-diphosphate and emtricitabine-triphosphate concentrations were higher than previously reported in the literature: 167.1 (146.6-190.5) fmol/106 cells and 15.4 (13.8-17.3) pmol/106 cells, respectively. Conclusions: We observed lower plasma tenofovir and emtricitabine concentrations in transwomen compared with historical cisgender adults, yet intracellular tenofovir-diphosphate and emtricitabine-triphosphate concentrations were higher than previously reported in PBMCs. Understanding the differences of PrEP pharmacokinetics in plasma and tissue compartments and the resultant impact on efficacy remains important for transwomen. © 2020 The Author(s) 2020. Article	2020	Clark, JL; Reisner, SL; Perez-Brumer, AG; Huerta Castillo, L; Sanchez, H; Okochi, H; Luque, MM; Salazar, X; Mimiaga, M; Gandhi, M; Mayer, KH; Lama, JR	Transprep: social network-based prep adherence for transgender women in Lima, Peru	Topics in Antiviral Medicine	-	-	-	na	10.1007/s10461-020-03117-4	https://link.springer.com/article/10.1007/s10461-020-03117-4	Background: While pre-exposure prophylaxis (PrEP) is an effective HIV prevention method, uptake remains poor among transgender women (TW). We conducted a pilot randomized controlled trial of a social network-based intervention to promote PrEP adherence among Peruvian TW. Methods: From September, 2017-July, 2018, we screened 172 TW from three geographic areas of Lima, Peru. Screening visits were conducted to: assess HIV serostatus; introduce PrEP as a prevention strategy; and discuss PrEP adherence. We enrolled 89 HIV-uninfected TW into 6 groups based on pre-existing social network clusters. Clusters were randomized on a 1:1 basis to standard of care (n=44) or the TransPrEP intervention (n=45). Groups assigned to TransPrEP attended 4 weekly introductory workshops (to discuss principles of and barriers to PrEP adherence, and to construct and support group adherence goals). Biweekly maintenance workshops reviewed adherence strategies, discussed participants' experiences taking PrEP, and encouraged network cohesion. Adherence was evaluated through self-report and by measurement of tenofovir (TFV) levels in hair. Intent-to-treat analyses compared intervention versus control conditions at baseline and 3-month follow-up. Results: Participants' mean age was 26.9 years (range 18-58), with 76.5% using feminizing hormones. At 3-month follow-up, we evaluated 40 TW and obtained 21 hair samples. Though no statistically significant differences were observed in ITT analysis, a higher proportion of participants in the TransPrEP arm reported taking ?Most? or ?All? TDF-FTC doses in the prior 30 days (90.5% 19/21 versus 73.4% 14/19). In hair sample analysis, 36.4% (4/11) of participants in TransPrEP and 10.0% (1/10) in the control arm had TFV levels >0.023 ng/ mg (consistent with taking >4 doses per week) while 81.8% (9/11) and 40.0% (4/10), respectively, had any detectable amount of TFV in their hair. Participants in the intervention arm described the workshops as ?helpful,? ?enjoyable,? and ?comfortable,? settings to discuss HIV prevention. Conclusion: Pilot assessment of our network-based intervention showed improvements in PrEP adherence among TW in Peru according to both biological and behavioral adherence markers but did not achieve statistical significance. Mixed-methods data identified potential modifications to improve participant involvement and retention. Additional research to assess the TransPrEP intervention with a larger sample is needed.	*Peru; *social network; *transgender; Adult; Conference abstract; Controlled study; Female; Follow up; Hair; Health care quality; Human; Human immunodeficiency virus; Major clinical study; Nonhuman; Pre-exposure prophylaxis; Randomized controlled trial; Self report; Statistical significance; Support group	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2020	Clement, Meredith E; Kofron, Ryan; Landovitz, Raphael J	Long-acting injectable cabotegravir for the prevention of HIV infection.	Current Opinion in HIV and AIDS	-	-	-	1746-6318	10.1097/COH.0000000000000597	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7382946	PURPOSE OF REVIEW: This review highlights the development of long-acting injectable cabotegravir (CAB LA) for HIV preexposure prophylaxis (PrEP), with a focus on phase 2 studies and later development. RECENT FINDINGS: Early studies of CAB LA for HIV prevention offered promising pharmacokinetic data and paved the way for phase 2 studies, which have now been completed. On the basis of phase 2 data, dosing of CAB LA at 8-week intervals consistently delivers target trough concentrations in both men and women. Recent studies have shown no required dose adjustments for hepatic or renal disease and minimal drug--drug interactions. Additionally, injectable PrEP is desired by potential PrEP candidates. Still, gaps in knowledge remain with respect to implementation and delivery, the clinical significance of the pharmacologic tail, and dosing in key populations. Phase 3 trials are underway that are anticipated to inform some of these questions and provide efficacy and safety data to support regulatory submissions for CAB LA as a potential PrEP agent. SUMMARY: Recent studies have defined an appropriate CAB LA dosing interval and offered insight into its safety profile. Phase 3 studies will provide much-anticipated efficacy data. If efficacious, CAB LA may provide a desirable PrEP option for those who face challenges to daily pill adherence. A more complete understanding of how to best integrate LA PrEP into service delivery models will be critical for success.	injectable PrEP; long-acting cabotegravir; PrEP 2.0; Next generation PrEP	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2020	Cohall A.; Zucker J.; Krieger R.; Scott C.; Guido C.; Hakala S.; Carnevale C.	Missed Opportunities for Hepatitis A Vaccination Among MSM Initiating PrEP	Journal of Community Health	-	-	-	945145	10.1007/s10900-019-00768-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075203995&doi=10.1007%2fs10900-019-00768-w&partnerID=40&md5=b34e08149eb2730f0c68208c17c9678e	The incidence of Hepatitis A virus (HAV) among the general population in the United States has decreased by over 95% since the introduction of HAV vaccination in 1995. However, 10% of all new HAV infections occur among men who have sex with men (MSM). However routine HAV is not part of standard of care for provision of PrEP services. Retrospective cohort analysis of MSM assessed for HIV prevention services between 1/1/2016 and 6/30/2017 to evaluate the rates of screening for anti-HAV seroprevalence and subsequent vaccination. HAV IgG was drawn on 96% (96/100) of the patients with 58% (56/96) of patients demonstrating serologic immunity. Of the 40 patients without evidence of immunity, 77% (29/40) returned for a subsequent visit, 48% (14/29) were provided HAV vaccination, and 29% (4/14) received at least two doses. Only 35% (14/40) of patients without documented immunity received HAV vaccination. Visits for PrEP initiation and monitoring in MSM patients are potential opportunities for ensuring HAV vaccination among this high-risk patient population. Public health agencies could optimize HAV vaccination of the high risk MSM by incorporating HAV screening into national PrEP guidelines. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Cohen, Myron S.; Gamble, Theresa; McCauley, Marybeth	Prevention of HIV Transmission and the HPTN 052 Study	Annual Review of Medicine	-	-	-	0066-4219	10.1146/annurev-med-110918-034551	https://doi.org/10.1146/annurev-med-110918-034551	The HIV Prevention Trials Network 052 study (HPTN 052) was a clinical trial designed to determine whether early treatment for HIV infection prevented transmission of the virus in couples where one partner was infected with HIV and the other was not, referred to as HIV serodiscordant or serodifferent couples. The study enrolled 1,763 couples at 13 sites in 9 countries in Asia, Africa, and the Americas. HPTN 052 demonstrated a minimum of 96% reduction of HIV in heterosexual couples ascribed to antiretroviral treatment; early treatment of HIV significantly reduced other infections in the HIV-infected subjects. This study, in conjunction with similar research, led to significant changes in international HIV treatment guidelines and the concept of treatment as prevention (TasP). This article provides the scientific background and history of how HPTN 052 came into being, the challenges it faced, and the ultimate impact it had on the fields of HIV treatment and prevention. Article	2020	Coleman M.; Hodges A.; Henn S.; Lambert C.C.	Integrated Pharmacy and PrEP Navigation Services to Support PrEP Uptake: A Quality Improvement Project	Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000182	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85093538230&doi=10.1097%2fJNC.0000000000000182&partnerID=40&md5=6e88c4a0f2fe2f81a1bd07757a567f4c	Preexposure prophylaxis (PrEP) is highly effective in preventing HIV among both men and women, with the reduction in risk directly linked to medication adherence. Navigation services and other adherence interventions have demonstrated efficacy in medication uptake; however, their use may not be fully integrated into clinic operations or their roles clearly defined. This quality improvement (QI) project developed an evidenced-based PrEP Navigation (PN) tool to identify patient-reported barriers to uptake and to support process improvement at a large community health center in Washington, DC. Outcomes related to patient-reported barriers, patient demographics, and time to medication pickup from the pharmacy were measured before and after implementation. A total of 198 patients were included in this analysis. Mean days from initial prescription to medication pickup was reduced by 1.42 days (p =.030) following PN tool implementation. The evidenced-based PN tool is modifiable to the needs of the individual clinic and the patients they care for to support wide-scale PrEP uptake and continuous system process improvements. Article	2020	Colson P.W.; Franks J.; Wu Y.; Winterhalter F.S.; Knox J.; Ortega H.; El-Sadr W.M.; Hirsch-Moverman Y.	Adherence to Pre-exposure Prophylaxis in Black Men Who Have Sex with Men and Transgender Women in a Community Setting in Harlem, NY	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-02901-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084516208&doi=10.1007%2fs10461-020-02901-6&partnerID=40&md5=5b25e59499c1af73332c27a28ed52e9a	While oral pre-exposure prophylaxis (PrEP) has proven efficacious for HIV prevention, consistent use is necessary to achieve its intended impact. We compared effectiveness of enhanced PrEP (enPrEP) adherence support to standard of care (sPrEP) among Black MSM and TGW attending a community clinic in Harlem, NY. EnPrEP included peer navigation, in-person/online support groups, and SMS messages. Self-reported adherence over previous 30 days, collected in quarterly interviews, was defined as ≥ 57%. Crude and adjusted analyses examined factors associated with adherence. A total of 204 participants were enrolled and randomized; 35% were lost to follow-up. PrEP adherence was 30% at 12-months; no intervention effect was observed (p = 0.69). Multivariable regression analysis found that lower adherence was associated with low education and depressive symptoms. We found that an enhanced adherence intervention did not improve PrEP adherence. Findings point to the need for innovative methods to improve PrEP adherence among Black MSM and TGW. Article	2020	Comninos N.B.; Foster R.; Varma R.; Bourne C.	Follow-up of renal impairment results among attendees taking HIV Pre-Exposure Prophylaxis at a Sydney Sexual Health Clinic	International journal of STD & AIDS	-	-	-	9564624	10.1177/0956462420922751	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086401069&doi=10.1177%2f0956462420922751&partnerID=40&md5=af74caf9b1c9446fd0f3710d20dce712	Renal monitoring is recommended for Pre-Exposure Prophylaxis (PrEP) users. We aimed to explore follow-up and outcomes among PrEP users with renal impairment (defined as estimated glomerular filtration rate <65 mL/min/1.73 m2) attending Sydney Sexual Health Centre. Time to follow-up was analysed for impairment results over a 12-month period (January–December 2018); 48/2504 (1.9%) tests among 1700 attendees showed impairment. Follow-up occurred in 39/48 (81.3%) impairment results after a median of 42 days. PrEP was ceased in 3/6 cases of non-resolving/persisting impairment, with one case of subsequent human immunodeficiency virus infection. Maintaining engagement and follow-up of those with renal impairment are important aspects of PrEP service provision. © The Author(s) 2020. Article	2020	Connolly M.D.; Dankerlui D.N.; Eljallad T.; Dodard-Friedman I.; Tang A.; Joseph C.L.M.	Outcomes of a PrEP Demonstration Project with LGBTQ Youth in a Community-Based Clinic Setting with Integrated Gender-Affirming Care	Transgender Health	-	-	-	2380193X	10.1089/trgh.2019.0069	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086830555&doi=10.1089%2ftrgh.2019.0069&partnerID=40&md5=95b7b253ce4d84705d645323ff6c7808	Lesbian, gay, bisexual, transgender, and queer/questioning (LGBTQ) youth are disproportionately affected by HIV, and young transgender women (YTW) are especially impacted. The purpose of this small demonstration project was to measure pre-exposure prophylaxis (PrEP) adherence in a community-based clinic for LGBTQ youth in which PrEP services are integrated with gender-affirming care. Of the 50 enrolled participants, 38 had a serum drug assay performed after three or more months and 26% of those had laboratory evidence of highly protective levels of medication. Low adherence highlights the need for culturally tailored follow-up efforts and assistance with the structural barriers to health experienced by LGBTQ youth, especially YTW. © 2020 Maureen D. Theses and Dissertations	2020	Corcorran, Maria Ann	Awareness of HIV Pre-Exposure Prophylaxis (PrEP) and Predictors of Interest in PrEP Among HIV-negative Persons Who Inject Drugs in Seattle, Washington	-	-	University of Washington	-	-	NA	https://epi.washington.edu/epi_research/awareness-of-hiv-pre-exposure-prophylaxis-prep-and-predictors-of-interest-in-prep-among-hiv-negative-persons-who-inject-drugs-in-seattle-washington/	Background: HIV pre-exposure prophylaxis (PrEP) is safe and effective for use in people who inject drugs (PWID), but studies indicate that PrEP is underutilized in this population. We assessed awareness of PrEP and investigated predictors of interest in PrEP among PWID in Seattle, Washington. Methods: This study analyzed data from a 2019 survey of PWID at 3 Seattle-area syringe service programs (SSPs). PWID who injected drugs in the past three months and were HIV-negative by self-report were included. Descriptive statistics were used to compare PrEP-aware and unaware PWID, and multivariate Poisson regression with robust standard errors was used to estimate adjusted prevalence ratios (APR) for interest in PrEP. Results: Among 348 HIV-negative PWID, including ≤1% who were currently taking PrEP, 51% were knowledgeable of PrEP and 46% were interested in PrEP. Interest in PrEP was inversely associated with prior knowledge of PrEP (APR 0.58, 95% CI 0.45 – 0.74); however, interest in PrEP was high among a subset of PWID meeting pre-specified risk criteria for HIV (APR 1.53, 95% CI 1.09 – 2.15). Conclusion: Despite reasonably high knowledge of PrEP and interest in PrEP, current use of PrEP was strikingly low in this urban cohort of PWID. Increasing knowledge of PrEP among PWID may not be sufficient to improve access to and continued use of PrEP among PWID at highest risk for HIV. Article	2020	Coyer, Liza; van den Elshout, Mark A M; Achterbergh, Roel C A; Matser, Amy; Schim van der Loeff, Maarten F; Davidovich, Udi; de Vries, Henry J C; Prins, Maria; Hoornenborg, Elske; Boyd, Anders	Understanding pre-exposure prophylaxis (PrEP) regimen use: Switching and discontinuing daily and event-driven PrEP among men who have sex with men.	EClinicalMedicine	-	-	-	2589-5370	10.1016/j.eclinm.2020.100650	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7711206	BACKGROUND: Optimising HIV pre-exposure prophylaxis (PrEP) provision requires insight into preferences of PrEP regimens and PrEP discontinuation. We assessed regimen switching and discontinuation and their determinants among men who have sex with men (MSM) participating in the Amsterdam PrEP demonstration project. METHODS: Between 3-August-2015 and 31-May-2016, we enrolled MSM (n = 374) and TGP (n = 2) in a prospective, longitudinal study. Participants could choose between daily or event-driven PrEP regimens at enrolment and every 3 months. We assessed transition intensities (TI) and determinants of switching (i) between regimens, and (ii) from either regimen to discontinuing PrEP using a multi-state Markov model. PrEP discontinuation was defined as formally stopping study participation or having no study visit for ≥6 months. FINDINGS: Of 367 analysed participants, 73·3% chose daily and 26·7% event-driven PrEP at enrolment. Median follow-up was 3·1 years (IQR 2·9-3·2). 121 participants switched their PrEP regimen at least once (cumulative probability 34·2%, 95% CI 29·4-39·6), with 90 switches from event-driven to daily PrEP (TI 0·35/PY, 95% CI 0·29-0·44) and 113 switches from daily to event-driven PrEP (TI 0·16/PY, 95% CI 0·13-0·20). Switching from event-driven to daily PrEP was associated with younger age, not reporting sex with HIV-positive partners, chemsex, and sexual compulsivity. Switching from daily to event-driven PrEP were associated with younger age and lower sexual satisfaction. 67 participants discontinued PrEP (cumulative probability 17·7%, 95% CI 14·1-22·2), with no difference between regimens: event-driven (n = 23, TI 0·08/PY, 95% CI 0·05-0·13) and daily PrEP (n = 44, TI 0·06/PY, 95% CI 0·04-0·08). Discontinuing daily PrEP was associated with younger age, fewer casual partners, and higher number of condomless anal sex acts with casual partners. INTERPRETATION: Switching between PrEP regimens was common, while going from event-driven to daily PrEP use was associated with certain sexual-related determinants (i.e. chemsex, sexual compulsivity, no known HIV-positive partners). PrEP discontinuation rates were low and independent of regimens. PrEP care should consider the reasons for choice and switch of regimen and involve education on safely switching or discontinuing PrEP, especially among younger MSM. Article	2020	Crawford N.D.; Josma D.; Morris J.; Hopkins R.; Young H.N.	Pharmacy-based pre-exposure prophylaxis support among pharmacists and men who have sex with men	Journal of the American Pharmacists Association	-	-	-	15443191	10.1016/j.japh.2019.12.003	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078735093&doi=10.1016%2fj.japh.2019.12.003&partnerID=40&md5=f755a568e44c399b84df959b49c04870	Objective: To understand the perceptions and support for pharmacy-based pre-exposure prophylaxis (PrEP) delivery among pharmacists and men who have sex with men (MSM). Design: A qualitative study from April 2017 to December 2018. Setting and participants: The researchers used purposive sampling to identify MSM participants and AIDSVu to identify pharmacists in high–human immunodeficiency virus (HIV) zip codes in the metropolitan Atlanta area. Eight MSM and 6 pharmacists consented to participate in the study. Outcome measures: Perceptions and support for PrEP delivery in pharmacies. Results: Both MSM and pharmacists expressed strong support for in-pharmacy PrEP screening and dissemination. MSM reported that pharmacies were more convenient and accessible compared with physician's offices. However, they also noted that privacy and training of pharmacy staff were important for them to consider being screened for PrEP in a pharmacy. Pharmacists also believed training was important and felt comfortable counseling on HIV prevention for their current patients. Conclusion: These data support early evidence that pharmacies are a promising venue to improve PrEP access for MSM. To implement PrEP screening in pharmacies, proper training of pharmacy staff and a designated space to ensure privacy are critical. Future studies should test the feasibility of screening for PrEP in pharmacies for black MSM. © 2020 American Pharmacists Association®	acesso restrito	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Cressey T.R.; Siriprakaisil O.; Kubiak R.W.; Klinbuayaem V.; Sukrakanchana P.-O.; Quame-Amaglo J.; Okochi H.; Tawon Y.; Cressey R.; Baeten J.M.; Gandhi M.; Drain P.K.	Plasma pharmacokinetics and urinary excretion of tenofovir following cessation in adults with controlled levels of adherence to tenofovir disoproxil fumarate	International Journal of Infectious Diseases	-	-	-	12019712	10.1016/j.ijid.2020.06.037	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087495229&doi=10.1016%2fj.ijid.2020.06.037&partnerID=40&md5=7fcbfae060df36be43bafe15eb675018	Objectives: The aim was to fully characterize the plasma and urine washout pharmacokinetics of tenofovir (TFV) in adults following 6 weeks of controlled levels of tenofovir disoproxil fumarate (TDF) adherence, in order to inform the utility of clinic-based adherence testing. Design: This was a three-arm, randomized, open-label study in adult volunteers. Participants were randomized to receive TDF 300 mg/emtricitabine (FTC) 200 mg as (1) 7 doses/week (perfect adherence), (2) 4 doses/week (moderate adherence), or (3) 2 doses/week (low adherence). Plasma and urine samples were collected regularly during the 6-week dosing phase and for 4 weeks following drug cessation. Results: Twenty-eight adults were included in this analysis. Median (range) age was 33 (20–49) years. No differences in TFV pharmacokinetic parameters during the washout were observed across the study arms. Small differences in TFV plasma concentrations occurred across arms between 4 and 10 h post-dose. The cumulative amount of TFV excreted in urine was not different at 24 h post-dose, but at 148 h it was 24.8 mg, 21.0 mg, and 17.2 mg for the perfect, moderate, and low adherence arms, respectively (p = 0.043). Conclusions: Among adults with different TDF adherence patterns, relative differences in plasma concentrations and cumulative urine extraction of TFV were minor following cessation. TFV measurement in plasma or urine is more indicative of last drug ingestion, rather than prior dose patterns. © 2020 The Authors	HIV; Pharmacokinetics; Plasma; Pre-exposure prophylaxis (PrEP); Tenofovir; Urine	English	Netherlands	Western and Central Europe and North America	Thailand	Asia and the Pacific	Thailand	Asia and the Pacific	Clinical
Article	2020	Crosby, RA; Kipke, MD; Kubicek, K	Use of pre-exposure prophylaxis increases the odds of condomless anal sex among young men who have sex with men (MSM) of colour	Sexual Health	-	-	-	1448-5028	10.1071/SH19065	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8466712/	This study tested the hypothesis that people using pre-exposure prophylaxis (PrEP) would be more likely to report condomless anal sex than those not taking PrEP. Data were from an ongoing study conducted with a cohort of Black and Latino young men who have sex with men (YMSM) recruited in Los Angeles (CA, USA). Of the 399 YMSM in the sample, 14% were currently using PrEP. Using three different measures of condom use, across two different recall periods all except one test result supported an inverse relationship between PrEP and condom use for anal sex. Tests of a risk index provided further significant findings supporting this hypothesis. Essay	2020	Crowley, Des; Cullen, Walter; O'Donnell, Patrick	Pre-exposure prophylaxis and primary care.	British Journal of General Practice	-	-	-	1478-5242	10.3399/bjgp20X712097	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7384820	Despite the increasing evidence of the effectiveness of pre-exposure prophylaxis (PrEP) as a HIV prevention strategy, its usefulness is rarely reported in the general practice literature.1 HIV infection remains a major public health concern worldwide and it is men who have sex with men (MSM) that carry a disproportionate amount of the disease burden.2 Despite evidence that the rate of new HIV infections in the UK is falling, the rate among young MSM is a cause for concern.2 The Republic of Ireland (ROI) has not seen a similar decline, with 523 new HIV cases diagnosed in Ireland in 2018.3 Similar to other European countries, the main risk for HIV transmission in Ireland is sex among men.2,3	na	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Other
Article	2020	Cui, Yang; Krishnan, Nandita; Kelley, Earl; Dawkins, Jaidence; Akolo, Omolola; Redd, Rashaunna; Ayodeji Olawale; Max-Browne, Commia; Johnsen, Luke; Latkin, Carl; Page, Kathleen R; Davey-Rothwell, Melissa	Beyond HIV prevention: a qualitative study of patient-reported outcomes of PrEP among MSM patients in two public STD clinics in Baltimore	AIDS Care	-	-	-	09540121	10.1080/09540121.2019.1622639	https://www.proquest.com/scholarly-journals/beyond-hiv-prevention-qualitative-study-patient/docview/2331206799/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) could have a substantial impact on the HIV epidemic within the US. However, the implementation of PrEP interventions outside of clinical trials has been slow and faces considerable barriers. The aim of the current study was to qualitatively explore PrEP-related patient-reported outcomes (PRO) among MSM patients who enrolled in a PrEP program at two public STD clinics in Baltimore. We conducted in-depth interviews with 18 PrEP patients who self-identified as MSM at two Baltimore City Health Department STD clinics between March and November, 2017. A codebook was developed using an iterative process. During analysis, the study team identified various biomedical and psychosocial PrEP-related PRO among MSM PrEP patients. In addition to HIV prevention, PrEP-related PRO included greater peace of mind, better continuity in care and awareness about health and well-being, relationship solidarity with serodiscordant partners, and access to social services. These findings on PrEP-related PRO can potentially contribute to improving patient-provider communication, leading to increased engagement in care and uptake of PrEP by MSM. Article	2020	Curtis, Tyrone J; Rodger, Alison J; Burns, Fiona; Nardone, Anthony; Copas, Andrew; Wayal, Sonali	Patterns of sexualised recreational drug use and its association with risk behaviours and sexual health outcomes in men who have sex with men in London, UK: a comparison of cross-sectional studies conducted in 2013 and 2016.	Sexually Transmitted Diseases	-	-	-	1472-3263	10.1136/sextrans-2019-054139	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7167300	OBJECTIVE: London has one of the highest identified prevalence of chemsex (sexualised recreational drug use) among men who have sex with men (MSM) in Europe. We examine MSM's patterns of chemsex and its association with HIV/STI risk behaviours, STI diagnoses and sexual healthcare-seeking behaviours, including if HIV testing behaviour met UK national guidelines (three monthly if engaging in chemsex). METHODS: Cross-sectional survey data from 2013 (n=905) and 2016 (n=739) were collected using anonymous, self-administered questionnaires from MSM recruited in commercial gay venues in London, UK. Descriptive and multivariable analyses, stratified by self-reported HIV status, were conducted. Adjusted prevalence ratios (aPR) with 95% CIs were calculated. RESULTS: Comparing the 2013 and 2016 surveys, chemsex prevalence in the past year remained stable, in both HIV-negative/unknown-status MSM (20.9% in 2013 vs 18.7% in 2016, p=0.301) and HIV-positive MSM (41.6% in 2013 vs 41.7% in 2016, p=0.992). Combined 2013-2016 data showed that compared with other MSM, those reporting chemsex were more likely to report HIV/STI risk behaviours, including condomless anal intercourse with serodifferent HIV-status partners (HIV-negative/unknown-status men: aPR 2.36, 95% CI 1.68 to 3.30; HIV-positive men: aPR 4.19, 95% CI 1.85 to 9.50), and STI diagnoses in the past year (HIV-negative/unknown-status men: aPR 2.10, 95% CI 1.64 to 2.69; HIV-positive men: aPR 2.56, 95% CI 1.57 to 4.20). 68.6% of HIV-negative/unknown-status men reporting chemsex attended sexual health clinics and 47.6% had tested for HIV more than once in the past year. CONCLUSIONS: Chemsex in London MSM remained stable but high, particularly among HIV-positive men. Irrespective of HIV status, chemsex was associated with engagement in HIV/STI risk behaviours. Frequency of HIV testing in the past year among HIV-negative/unknown-status men was below national recommendations. Promoting combination prevention strategies, including three monthly HIV/STI testing, access to pre-exposure prophylaxis/antiretroviral treatment and behavioural interventions among MSM reporting chemsex, remains vital to address sexual health inequalities in MSM.	na	English	United States	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative
Article	2020	Custer B.; Quiner C.; Haaland R.; Martin A.; Stone M.; Reik R.; Steele W.R.; Kessler D.; Williamson P.C.; Anderson S.A.; Williams A.E.; Raymond H.F.; McFarland W.; Robinson W.T.; Glick S.; Sey K.; David Melton C.; Glynn S.A.; Stramer S.L.; Busch M.P.	HIV antiretroviral therapy and prevention use in US blood donors: A new blood safety concern	Blood	-	-	-	64971	10.1182/blood.2020006890	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091470300&doi=10.1182%2fblood.2020006890&partnerID=40&md5=ca53387e8616f58b9d81bf410107abd7	Antiretroviral therapy (ART) to treat and pre-exposure prophylaxis (PrEP) to prevent HIV infection are effective tools to help end the HIV epidemic. However, their use could affect HIV transfusion-transmission risk. Three different ART/PrEP prevalence analyses in blood donors were conducted. First, blood samples from HIV-positive and a comparison group of infection-nonreactive donors were tested under blind using liquid chromatography-tandem mass spectrometry for ART. Second, blood donor samples from infection-nonreactive, 18- to 45-year-old, male, first-time blood donors in 6 US locations were tested for emtricitabine and tenofovir. Third, in men who have sex with men (MSM) participating in the 2017 Centers for Disease Control and Prevention National HIV Behavioral Surveillance (NHBS) from 5 US cities, self-reported PrEP use proximate to donation was assessed. In blind testing, no ART was detected in 300 infection-nonreactive donor samples, but in 299 HIV confirmed-infected donor samples, 46 (15.4%; 95% confidence interval CI, 11.5% to 20.0%) had evidence of ART. Of the 1494 samples tested from first-time male donors, 9 (0.6%; 95% CI, 0.03% to 1.1%) had tenofovir and emtricitabine. In the NHBS MSM survey, 27 of 591 respondents (4.8%; 95% CI, 3.2% to 6.9%) reported donating blood in 2016 or 2017 and PrEP use within the same time frame as blood donation. Persons who are HIV positive and taking ART and persons taking PrEP to prevent HIV infection are donating blood. Both situations could lead to increased risk of HIV transfusion transmission if blood screening assays are unable to detect HIV in donations from infected donors. © 2020 by The American Society of Hematology	anti-retroviral agents, blood donors, donors, hiv, hiv seropositivity, infections, pre-exposure prophylaxis, transfusion, hiv infections, screening	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	da Silva-Brandao R.R.; Ianni A.M.Z.	Sexual desire and pleasure in the context of the HIV pre-exposure prophylaxis (PrEP)	Sexualities	-	-	-	13634607	10.1177/1363460720939047	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088134307&doi=10.1177%2f1363460720939047&partnerID=40&md5=9a615ac7b72e8a5d1e83ce856163544a2	This article explores both the sexual desires and pleasure in the context of HIV pre-exposure prophylaxis (PrEP) use among gays, bisexuals and other men who have sex with men (GBMSM). Our main findings suggest that individuals were assuming notions of natural and unnatural sex, while these categories were linked to condomless sex, acquisitions of sexually transmission infections (STIs) and their perceptions of intimacy. Individuals also believed they could enhance pleasure and desire by acknowledging their inner subjectivity and societal positions associated with PrEP. We argue that the individuals play a positive and conflicting ethic towards sex while on PrEP. © The Author(s) 2020. Article	2020	Dale, Sannisha K	Using Motivational Interviewing to Increase PrEP Uptake Among Black Women at Risk for HIV: an Open Pilot Trial of MI-PrEP.	Journal of Racial and Ethnic Health Disparities	-	-	-	2196-8837	10.1007/s40615-020-00715-9	https://dx.doi.org/10.1007/s40615-020-00715-9	Black women in the USA are at the highest risk among women for HIV. Pre-exposure prophylaxis (PrEP) prevents HIV transmission, but uptake among Black women remains low. An open pilot trial was conducted on MI-PrEP, a brief culturally tailored intervention incorporating motivational interviewing (MI) strategies to improve PrEP uptake and motivation. MI-PrEP is the first behavioral intervention developed to promote PrEP uptake among women in the USA. In Miami, FL, ten Black women who met eligibility criteria (e.g., sexual partner with HIV) were enrolled. These women participated in the two sessions of MI-PrEP and a 1-month follow-up. Participants completed measures on PrEP (motivation, uptake verified via medical records, adherence, and barriers), medical mistrust, and an exit interview. These preliminary findings showed acceptability and feasibility with high satisfaction ratings; increases in PrEP uptake, knowledge, and motivation to use; and decreases in PrEP barriers and medical mistrust. Greater attention is needed on the psychosocial and structural factors among Black women who may benefit from PrEP.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	D'Anna L.; Washington T.A.; Cabudol M.J.; Canjura C.; Owens J.	Exploring Awareness of HCV Among Sexual-Minority Black Generation Millennials and Gen Z: a Qualitative Study	Journal of Racial and Ethnic Health Disparities	-	-	-	21973792	10.1007/s40615-019-00684-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078872530&doi=10.1007%2fs40615-019-00684-8&partnerID=40&md5=ef45418d837caf5dd86e1f44e5138ea9	Hepatitis C (HCV) is a significant public health burden globally. While HIV-positive men who have sex with men (MSM) have traditionally comprised the majority of sexually acquired HCV cases in the USA, recent studies indicate that HIV-negative MSM and MSM who use pre-exposure prophylaxis (PrEP) in particular are at increasing risk for incident HCV. Further, in the USA, African Americans are disproportionately burdened by chronic HCV compared with other groups. We sought to better understand awareness and knowledge about HCV and the perceived barriers to HCV testing, among young Black MSM (YBMSM) ages 18–24 in an urban southern California setting. This formative work was conducted in the context of a broader study designed to develop a brief, peer-led intervention to increase hepatitis awareness and testing among young men at risk. Our focus group findings suggest that YBMSM are lacking awareness and knowledge about HCV that are important for self-appraisal of their risk and need for testing. Additionally, YBMSM reported low social support for HCV testing; many indicated they do not discuss HCV with peers, community leaders, or family members. Using study participants' recommendations for engaging YBMSM in HCV prevention efforts, our study emphasizes the need for education and screening efforts targeted to YBMSM, and especially YBMSM who are engaging in high-risk sexual activity with HIV-positive and/or older MSM. We offer recommendations for public health strategies that may be helpful for increasing awareness of HCV risks and HCV screening among vulnerable YBMSM groups. © 2020, W. Montague Cobb-NMA Health Institute. Theses and Dissertations	2020	Danquah, Philip	Investigating Attitudes and Beliefs of University Students Aged 18 to 24 Years That Influence Their Decision to Take Pre-Exposure Prophylaxis Medication	-	-	University of Nevada – Las Vegas	-	na	NA	https://digitalscholarship.unlv.edu/thesesdissertations/3884 https://digitalscholarship.unlv.edu/cgi/viewcontent.cgi?article=4888&context=thesesdissertations https://digitalscholarship.unlv.edu/thesesdissertations/article/4888/viewcontent/Danquah_unlv_0506D_13274.pdf	Background: Contemporary research findings affirm that young adults aged 18 to 24 years have high prevalence of new HIV infections. Pre-Exposure Prophylaxis (PrEP) medication is the latest strategy in HIV prevention. Rates of PrEP uptake or use have been negligible among university students aged 18 to 24 years, especially among racial and ethnic minority students. Objective: The objective of this study is to investigate the attitudes and beliefs that influence the uptake of PrEP medications and the HIV risk behaviors associated with the willingness to take PrEP medications among university students aged 18 to 24 years attending the University of Nevada, Las Vegas. Methods: This exploratory study used a cross-sectional design, and the Sexual Health Model as the theoretical foundation. Using questions from the Youth Risk Behavior Surveillance System and the American College Health Association National College Health Assessment in 2018, as well as other existing universe of questions, the researcher used these questions in Qualtrics Survey Research Suite for online data collection via a survey. All these questions were shown by public health experts to have enough face and content validity. The collected quantitative data were analyzed in IBM SPSS Statistics Version 26 using descriptive statistics and binary logistic regression models. Results: The study was conducted among a representative sample size of 363 and majority of respondents were self-identified as racial and ethnic minority university students (N = 240, 66.1%). The mean age was 18 years old. The results of the study indicated that of the 363 student participants, almost 100 percent (99.1%) had never taken PrEP medications. The binary logistic regression models yielded an increased likelihood of taking PrEP if it were within one's cultural beliefs or practices (OR = 0.804 (95% CI: 0.657 - 0.983), β = -0.219, p < 0.05, p = 0.034), if one was in a monogamous relationship with a partner that they did not know was HIV positive (OR = 0.744 (95% CI: 0.582- 0.951), β = -0.296, p < 0.05, p = 0.018), and because someone they love wants them to take PrEP (OR = 0.677 (95% CI: 0.511 - 0.896), β = -0.390, p < 0.05, p = 0.006). In addition, a decreased likelihood of taking PrEP based on sociodemographic factors such as religious affiliation or religion (OR = 1.107 (95% CI: 1.032 -1.187), β = 0.102, p < 0.05, p = 0.004) and sexual orientation (OR = 1.282 (95% CI: 1.068 - 1.538), β = 0.248, p < 0.05, p = 0.008) were confirmed. All these factors were related to attitudes and beliefs that significantly influence the decision to take PrEP medications among young university students. Moreover, the binary logistic regression models revealed that alcohol consumption (OR = 4.471 (95% CI: 1.437 - 13.904), β = 1.498, p < 0.05, p = 0.010) was a significant HIV risk behavior associated with the willingness to not take PrEP medications among young university students. In addition, sexual pleasure by touching oneself or self-stimulation (OR = 0.797 (95%…	Epidemiology; Public Health; Social and Behavioral Sciences	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Quantitative
Article	2020	Das, Suparna; Allston, Adam; Kharfen, Michael	Detecting Spatial Cores and Temporal Trends of Repeat STIs to Plan Pre-exposure Prophylaxis (PrEP) Scale-up in DC.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000002348	https://pubmed.ncbi.nlm.nih.gov/32205719/	BACKGROUND: Repeat sexually transmitted infections (STIs) in DC primarily results from untreated sexual partners. This analysis aims to identify high-risk areas and temporal trends of repeat STIs for pre-exposure prophylaxis scale-up and STI mitigation in DC. METHODS: We identified repeat infections in the DC Department of Health STI and HIV data management systems, diagnosed from 2014 to 2018. The cases were geocoded and aggregated by census tracts. Poisson discrete scan statistic was implemented in SaTScan software to find clusters. Weighted moving average was used to compare temporal trends of repeat STIs. We used χ analysis to identify association with demographic variables. RESULTS: We identified 8535 repeat STIs from 2014 to 2018. Of these, 61.84% were among men, most cases were among blacks (34.75%) and 47.45% represented gonorrhea cases. The high-risk spatial clusters were identified as those tracts that had relative risk > 1; P-value < 0.001). We identified one significant radius of risk covering tracts of wards 7 and 8 and parts of wards 5 and 6. We spotted positive temporal trends in cluster 1 and outside the cluster. We found significant associations of repeat STIs with gender (χ = 317.27, P < 0.001), age (χ = 539.26, P < 0.001), HIV coinfections (χ = 352.06, P < 0.001), and year of diagnoses (χ = 1.5, P < 0.01). CONCLUSIONS: Our findings indicate spatial disparities in DC for repeat STIs. This analysis is critical for pre-exposure prophylaxis planning, STI prevention strategies such as expedited partner therapies and condom distribution strategies in DC should prioritize the high-risk spatial cores. Article	2020	Dasgupta, Sharoda; Tie, Yunfeng; Bradley, Heather; Beer, Linda; Rosenberg, Eli S.; Holtgrave, David; Fagan, Jennifer; Green, Shana; Shouse, Roy L.	Characteristics of Sexual Partnerships Among Men With Diagnosed HIV Who Have Sex With Men, United States and Puerto Rico-2015-2019.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000002388	https://pubmed.ncbi.nlm.nih.gov/32692102/	BACKGROUND: Understanding sexual partnerships of HIV-positive persons, particularly at the dyad level, can help in quantifying HIV transmission risk. We described sexual partnerships among HIV-positive men who have sex with men (MSM), including partnerships with a high risk for sexual HIV transmission. SETTING: The Medical Monitoring Project is an annual, cross-sectional study that reports representative estimates on U.S. HIV-positive adults. METHODS: During 2015-2019, we assessed sexual behaviors by interview, and viral load results from medical records. Among sexually active HIV-positive MSM (n = 4923), we described prevalence of high-risk sex, defined as: (1) not having sustained viral suppression, and (2) having condomless sex with an HIV-negative partner not known to be taking pre-exposure prophylaxis or an HIV-unknown partner. We described sexual partnerships among HIV-positive MSM (n = 13,024 partnerships among 4923 MSM). For HIV-discordant partnerships (n = 7768), we reported the proportion involved in high-risk sex, and associations with high-risk sex using prevalence ratios with predicted marginal means, controlling for age of the HIV-positive partner (P < 0.05). RESULTS: More than half (66%) of sexually active HIV-positive MSM had condomless sex; 11% had high-risk sex. Blacks were more likely to have detectable viral loads, but less likely to have condomless sex, making prevalence of high-risk sex comparable between racial/ethnic groups. Dyad-level analyses among HIV-discordant partnerships indicated that prevalence of high-risk sex was higher among partnerships with HIV-positive white MSM, which was not observed using person-level data alone. CONCLUSIONS: In the context of ending the HIV epidemic, behavioral and clinical surveillance data can help monitor HIV transmission risk and target prevention efforts to reduce transmission among populations at disproportionate risk.	*Homosexuality, Male; Humans; Male; Viral Load; *HIV-1; Cross-Sectional Studies; United States/epidemiology; *Sexual Partners; HIV Infections/*epidemiology/prevention & control; Puerto Rico/epidemiology	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Theses and Dissertations	2020	Davalos Soria, Diana Evening, Mares Chiyón, María Arantxa	Profilaxis preexposición y desarrollo de resistencia a los inhibidores nucleósidos de la transcriptasa reversa: revisión sistemática.	-	-	Universidad Peruana de Ciencias Aplicadas (UPC), PE	Universidad Peruana de Ciencias Aplicadas (UPC), PE	-	na	NA	http://hdl.handle.net/10757/654716	Objetivo: sintetizar la evidencia acerca de la resistencia a inhibidores nucleósidos de la transcriptasa reversa (NRTI) en personas que reciben PrEP. Métodos: se realizó una revisión sistemática de estudios experimentales. Se incluyeron estudios que comparaban el uso de PrEP frente a placebo o su no uso en población de riesgo para la infección de VIH; siendo el outcome evaluado el desarrollo de resistencia a NRTI. La selección de artículos y la extracción de datos fueron realizadas por dos revisores de manera independiente. Se realizó un metaanálisis de efectos aleatorios tanto de manera total como en subpoblaciones y según el momento de seroconversión. Para valorar el riesgo de sesgo se utilizó herramienta Risk of Bias 2.0 (RoB 2.0). Se usó como referencia el Software Review Manager 5. Resultados: se incluyeron nueve artículos correspondientes a seis estudios. Se encontró que el uso de PrEP no incrementa el riesgo de resistencia a TDF/FTC en la población total que recibió la intervención, haya o no presentado la infección. Sin embargo, en el grupo que seroconvirtió si se encontró un mayor riesgo de resistencia en los que usaron PrEP (RR: 2,76; IC95%: 1,22 a 6,26; I2 : 0%); el cual correspondía sólo al grupo que tenía infección por VIH latente al momento de iniciar la intervención (RR: 3,91; IC95%: 1,30 a 1,70; I2 : 0%). Conclusiones: el uso de PrEP no incrementa el riesgo de resistencia a TDF/FTC en el total de usuarios, pero si en pacientes con infección latente por el VIH al enrolamiento. Article	2020	Davey, Dvora Joseph; Daniels J.; Beard C.; Mashele N.; Bekker L.-G.; Dovel K.; Ncayiyana J.; Coates T.J.; Myer L.	Healthcare provider knowledge and attitudes about pre-exposure prophylaxis (PrEP) in pregnancy in Cape Town, South Africa	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2020.1782328	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087305115&doi=10.1080%2f09540121.2020.1782328&partnerID=40&md5=ff98b69bf262f2fd134efef5d675e8d3	Pre-exposure prophylaxis (PrEP) in pregnancy can reduce HIV incidence and vertical transmission. Healthcare providers (HCPs) play a critical role in delivering PrEP in antenatal care but little is known about HCP knowledge and attitudes about PrEP in pregnancy. We conducted a qualitative study in two healthcare facilities to assess HCPs' PrEP knowledge and perspectives relating to HIV prevention in pregnant women. Between January-March'19, we administered in-depth interviews among antenatal HCPs. We utilized a constant comparison approach to identify major qualitative findings. We enrolled 35 female HCPs (median age=43yrs. Fewer than half of HCPs had heard of PrEP before. Of those who had heard of PrEP, most felt that it was safe to take during pregnancy. Most HCPs described inaccurate PrEP knowledge regarding effectiveness, and most who knew about PrEP lacked clinical detail. HCPs highlighted important potential barriers to maternal PrEP use including: fear that PrEP may be unsafe, or belief that women must talk to partners/parents before initiating PrEP. Facilitators include good knowledge about serodiscordancy and vulnerability to seroconversion in pregnancy and desire to help women gain control overHIV prevention. We recommend integrating PrEP training into HIV testing and PMTCT nurse training to improve counseling and maternal PrEP delivery. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	healthcare providers; HIV prevention; PMTCT; Pregnancy; PrEP; South Africa	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Davey, Dvora Joseph; Pintye J.; Baeten J.M.; Aldrovandi G.; Baggaley R.; Bekker L.-G.; Celum C.; Chi B.H.; Coates T.J.; Haberer J.E.; Heffron R.; Kinuthia J.; Matthews L.T.; McIntyre J.; Moodley D.; Mofenson L.M.; Mugo N.; Myer L.; Mujugira A.; Shoptaw S.; Stranix-Chibanda L.; John-Stewart G.	Emerging evidence from a systematic review of safety of pre-exposure prophylaxis for pregnant and postpartum women: where are we now and where are we heading?	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25426	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077688514&doi=10.1002%2fjia2.25426&partnerID=40&md5=16ceed87022030386f3681e6b6d9149d	Introduction: HIV incidence is high during pregnancy and breastfeeding with HIV acquisition risk more than doubling during pregnancy and the postpartum period compared to when women are not pregnant. The World Health Organization recommends offering pre-exposure prophylaxis (PrEP) to pregnant and postpartum women at substantial risk of HIV infection. However, maternal PrEP national guidelines differ and most countries with high maternal HIV incidence are not offering PrEP. We conducted a systematic review of recent research on PrEP safety in pregnancy to inform national policy and rollout. Methods: We used a standard Preferred Reporting Items for Systematic Reviews and Meta-Analysis (PRISMA) approach to conduct a systematic review by searching for completed, ongoing, or planned PrEP in pregnancy projects or studies from clinicaltrials.gov, PubMed and NIH RePORTER from 2014 to March 2019. We performed a systematic review of studies that assess tenofovir disoproxil fumarate (TDF)-based oral PrEP safety in pregnant and breastfeeding HIV-uninfected women. Results and discussion: We identified 14 completed (n = 5) and ongoing/planned (n = 9) studies that evaluate maternal and/or infant outcomes following PrEP exposure during pregnancy or breastfeeding. None of the completed studies found differences in pregnancy or perinatal outcomes associated with PrEP exposure. Nine ongoing studies, to be completed by 2022, will provide data on >6200 additional PrEP-exposed pregnancies and assess perinatal, infant growth and bone health outcomes, expanding by sixfold the data on PrEP safety in pregnancy. Research gaps include limited data on (1) accurately measured PrEP exposure within maternal and infant populations including drug levels needed for maternal protection; (2) uncommon perinatal outcomes (e.g. congenital anomalies); (3) infant outcomes such as bone growth beyond one year following PrEP exposure; (4) outcomes in HIV-uninfected women who use PrEP during pregnancy and/or lactation. Conclusions: Expanding delivery of PrEP is an essential strategy to reduce HIV incidence in pregnancy and breastfeeding women. Early safety studies of PrEP among pregnant women without HIV infection are reassuring and ongoing/planned studies will contribute extensive new data to bolster the safety profile of PrEP use in pregnancy. However, addressing research gaps is essential to expanding PrEP delivery for women in the context of pregnancy. © 2020 The Authors. Article	2020	Davis, Clay	Homo adhaerens: Risk and adherence in biomedical HIV prevention research	Social Studies of Science	-	-	-	-	3063127	10.1177/0306312720933943	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087007609&doi=10.1177%2f0306312720933943&partnerID=40&md5=ca70d2f4947faab4218087ca361fc0f2	After the turn of the millennium, HIV clinical researchers pivoted from developing and testing new antiretrovirals (ARVs) for treatment, to reconfiguring the same molecules for pre-exposure prophylaxis (PrEP). In 2012, Truvada became the first HIV therapy to also be approved by the FDA for PrEP, regarded as a magic bullet that promised to end the epidemic. However, six years after its approval, it continues to be inaccessible to those who are most vulnerable. In this article, I critically analyze HIV PrEP clinical trials, dissecting the novel techniques researchers use to demonstrate efficacy. I argue that in making sense of the interplay between adherence to a prophylactic regimen and risk for HIV, biomedical HIV prevention research has revealed a new subject of biopolitics, Homo adhaerens. In the early 2000s, clinical researchers operating in the Global South identified Homo adhaerens as the ideal subject, one who embodies both high-risk behavior and diligent adherence to a daily oral regimen. I trace the construction of Homo adhaerens to the United States, where I listen closely to activists engaged with the ongoing DISCOVER trial of PrEP. Activists either aspire for Homo adhaerens as a standard, making the liberal argument that expanding access could make PrEP successful, or they rebuke the framework of clinical research that produces narrow understandings of adherence, efficacy, and universality. Ultimately, I argue that by failing to grapple with the social realities that underlie poor adherence, PrEP clinical trials produce knowledge that is not useful for those who are most vulnerable. © The Author(s) 2020.	adherence; HIV activism; PrEP; randomized controlled trial; risk; Truvada	English	United States	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2020	De Baetselier, Irith; Osbak, Kara Krista; Smet, Hilde; Kenyon, Chris Richard; Crucitti, Tania	Take three, test one: a cross-sectional study to evaluate the molecular detection of Chlamydia trachomatis and Neisseria gonorrhoeae in pooled pharyngeal, anorectal and urine samples versus single-site testing among men who have sex with men in Belgium.	Acta Clinica Belgica	-	-	-	-	2295-3337 1784-3286	10.1080/17843286.2018.1545376	https://www.tandfonline.com/doi/full/10.1080/17843286.2018.1545376	Objectives: To investigate the efficacy of performing a pooling strategy of triple-anatomical site samples (pharyngeal, anorectal and urine samples) for simultaneous Chlamydia trachomatis (CT) and Neisseria gonorrhoeae (NG) nucleic acid amplification detection.Methods: A total of 117 specimen sets (pharyngeal, anorectal and urine) were collected from 98 men between 2014 and 2016. Double sampling of pharyngeal, anorectal and urine samples allowed for pooled and unpooled analyses using a multiplex Abbott Real Time CT/NG assay, together with confirmatory PCR testing in case of CT/NG positivity. Clinical and demographic data were analyzed.Results: The positivity rate for the triple-site pooled testing for CT and NG was 8.5% (10/117) and 6.8%, (8/117), respectively, compared to the single-site testing total positivity rate, which was 9.4% (11/117) and 4.3% (5/117) for CT and NG, respectively. Pooled analysis missed one CT-positive urine sample and one CT-positive anorectal sample could not be confirmed. In addition, less PCR inhibition was reported for the pooled sample (PS) testing and ERV-3 qPCR testing revealed ineffective sampling of self-collected anorectal swabs in two cases. No pharyngeal samples were positive for CT, nor were any urine samples positive for NG.Conclusion: This small study showed that PS testing is a possible testing strategy for screening high-risk men who have sex with men attending pre-exposure prophylaxis (PrEP) clinics. However, due to the low positivity rate of CT/NG in this study, larger evaluations are needed to confirm the effectiveness of CT/NG screening with multiple-site PS nucleic acid amplification test (NAAT) screening practices. Article	2020	Debergh M.	Producing bodies at risk in sexual health–an ethnographic comparative analysis between the combined oral contraceptive pill and pre-exposure prophylaxis in Switzerland	Health Sociology Review	-	-	-	-	14461242	10.1080/14461242.2020.1823870	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091605559&doi=10.1080%2f14461242.2020.1823870&partnerID=40&md5=20a5b51ff943e7b242f22e4c823e818c	This article demonstrates that 'bodies at risk' in sexual health are socially constructed. It does so via a heuristic comparison between two molecular technologies that are central to the promotion of sexual health: the combined oral contraceptive pill (COCP) and pre-exposure prophylaxis (PrEP). Drawing on ethnographic research conducted in two sexual health institutions in the western part of Switzerland, the article presents two main findings. First, it argues that bodies are constructed as being at low or high risk by sexual health professionals (based on health and lifestyle criteria). Second, it shows that access to either the COCP or PrEP is largely based on this former classification. The article also demonstrates that there are ambivalent situations in which sexual health professionals seek compromises between different risks, and pragmatically adapt their medical protocols. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	bodies at risk; Combined oral contraceptive pill; ethnography; pre-exposure prophylaxis; sexual health	English	United Kingdom	Western and Central Europe and North America	Switzerland	Western and Central Europe and North America	Switzerland	Western and Central Europe and North America	Qualitative
Article	2020	Del Amo, Julia; Polo, Rosa; Moreno, Santiago; Díaz, Asunción; Martínez, Esteban; Arribas, José Ramón; Jarrín, Inma; Hernán, Miguel A	Incidence and Severity of COVID-19 in HIV-Positive Persons Receiving Antiretroviral Therapy : A Cohort Study.	Annals of Internal Medicine	-	-	-	-	1539-3704	10.7326/M20-3689	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7394316	BACKGROUND: The incidence and severity of coronavirus disease 2019 (COVID-19) among HIV-positive persons receiving antiretroviral therapy (ART) have not been characterized in large populations. OBJECTIVE: To describe the incidence and severity of COVID-19 by nucleos(t)ide reverse transcriptase inhibitor (NRTI) use among HIV-positive persons receiving ART. DESIGN: Cohort study. SETTING: HIV clinics in 60 Spanish hospitals between 1 February and 15 April 2020. PARTICIPANTS: 77 590 HIV-positive persons receiving ART. MEASUREMENTS: Estimated risks (cumulative incidences) per 10 000 persons and 95% CIs for polymerase chain reaction-confirmed COVID-19 diagnosis, hospitalization, intensive care unit (ICU) admission, and death. Risk and 95% CIs for COVID-19 diagnosis and hospital admission by use of the NRTIs tenofovir disoproxil fumarate (TDF)/emtricitabine (FTC), tenofovir alafenamide (TAF)/FTC, abacavir (ABC)/lamivudine (3TC), and others were estimated through Poisson regression models. RESULTS: Of 77 590 HIV-positive persons receiving ART, 236 were diagnosed with COVID-19, 151 were hospitalized, 15 were admitted to the ICU, and 20 died. The risks for COVID-19 diagnosis and hospitalization were greater in men and persons older than 70 years. The risk for COVID-19 hospitalization was 20.3 (95% CI, 15.2 to 26.7) among patients receiving TAF/FTC, 10.5 (CI, 5.6 to 17.9) among those receiving TDF/FTC, 23.4 (CI, 17.2 to 31.1) among those receiving ABC/3TC, and 20.0 (CI, 14.2 to 27.3) for those receiving other regimens. The corresponding risks for COVID-19 diagnosis were 39.1 (CI, 31.8 to 47.6), 16.9 (CI, 10.5 to 25.9), 28.3 (CI, 21.5 to 36.7), and 29.7 (CI, 22.6 to 38.4), respectively. No patient receiving TDF/FTC was admitted to the ICU or died. LIMITATION: Residual confounding by comorbid conditions cannot be completely excluded. CONCLUSION: HIV-positive patients receiving TDF/FTC have a lower risk for COVID-19 and related hospitalization than those receiving other therapies. These findings warrant further investigation in HIV preexposure prophylaxis studies and randomized trials in persons without HIV. Article	2020	Den Daas C.; Adam P.C.G.; Zuilhof W.; de Wit J.B.F.	A serological divide: men who have sex with men's attitudes on HIV risk reduction strategies	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2020.1739213	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081299200&doi=10.1080%2f09540121.2020.1739213&partnerID=40&md5=0ac18e5f9518d700b3e37829fee74ac2	The expanding HIV risk reduction toolkit increases options for men who have sex men (MSM), but increasing options in combination with different preferences may complicate promoting risk reduction. To investigate what strategies MSM prefer, data of 3310 participants in the online survey "Men & Sexuality" (Median age = 37 years, 320 (9.7%) HIV positive) was analysed. Questions assessed attitudes towards HIV risk reduction strategies. Participants had the most positive attitudes regarding PrEP and HIV testing, while withdrawal and strategic positioning were least preferred (all p's <.001). Condoms were seen as acceptable to partners and effective but scored low on sexual pleasure. HIV-positive participants were more negative about condoms and more positive about viral load sorting than HIV-negative participants (F(12,3297) = 5.09, p <.001, (Formula presented.) =.02). Findings highlight a preference for HIV risk reduction strategies (PrEP and HIV testing) that do not diminish sexual pleasure and can be applied independent of sexual partners. A serological divide was apparent: HIV-negative MSM were less negative about condoms than HIV-positive MSM, suggesting that condom promotion remains a viable strategy for HIV-negative MSM. Taken together, results indicate a need for personalized approaches to the promotion of HIV risk reduction strategies, accounting for individual preferences and strategy effectiveness. © 2020, © 2020 Informa UK Limited, trading as Taylor & Francis Group. Article	2020	Devarajan, Sinthuja; Sales, Jessica M; Hunt, Machel; Comeau, Dawn L	PrEP and sexual well-being: a qualitative study on PrEP, sexuality of MSM, and patient-provider relationships	AIDS Care	-	-	-	-	09540121	10.1080/09540121.2019.1695734	https://www.proquest.com/scholarly-journals/prep-sexual-well-being-qualitative-study-on/docview/2352085937/se-2?accountid=8113	Most new diagnoses of HIV in the United States are among men who have sex with men (MSM). Pre-exposure prophylaxis (PrEP) is a medication that mitigates risk of HIV acquisition and requires regular STI testing and prescription refills with PrEP providers. Because PrEP care monitors sexual behavior, there is a need to understand how PrEP providers approach sexual health care for MSM patients. In this study, semi-structured qualitative interviews were conducted with 20 MSM in Atlanta, Georgia with current or past prescriptions for PrEP. Data were analyzed with thematic analysis using four major steps: (1) code and codebook development, (2) assigning codes to segments of interviews, (3) code-based and comparative analysis methods, and (4) developing thematic findings. Findings from interviews about changes in sexuality while using PrEP include decreased anxiety surrounding sex, increased feelings of control over personal health, and experiencing less stigma towards sexual partners with HIV. Participants indicated needs for tailored health advice based on individual sexual preferences, sexual health care free from stereotypical assumptions, and improved access to PrEP providers identifying as gay men or who practice in LGBT-friendly settings. Study findings support a call for a gain-frame approach to sexual health in PrEP care for MSM. Article	2020	Di Ciaccio, Marion; Sagaon-Teyssier, Luis; Mimi, Mohamed; Suzan-Monti, Marie; Protiere, Christel; Castro, Daniela Rojas; Meyer, Laurence; Tremblay, Cécile; Chidiac, Christian; Capitant, Catherine; Préau, Marie; Molina, Jean-Michel; Spire, Bruno	What are the situational and behavioral factors associated with condomless anal sex without pre-exposure prophylaxis in MSM?	AIDS	-	-	-	-	1473-5571	10.1097/QAD.0000000000002542	https://dx.doi.org/10.1097/QAD.0000000000002542	OBJECTIVE: This study aimed to identify situational and behavioral factors associated with condomless anal sex without on-demand PrEP in the open-label extension (OLE) study of the ANRS-IPERGAY trial. METHODS: Univariable and multivariable modified Poisson regressions with a generalized estimating equation (GEE) were used. The attributable risk percentage for each explanatory variable and for condomless anal sex without PrEP was calculated. RESULTS: In the OLE, 19% of anal intercourses were unprotected (i.e. no PrEP or condom). Of these, 85% were attributable to sexual intercourse with main partners and 47% with HIV-negative partners. The following factors were positively associated with condomless anal sex without PrEP: a depressive episode in the previous 12 months aR (95% CI), P-value: 1.49 (1.02--2.17), 0.039, a higher number of sexual intercourses during the previous 4 weeks 1.01 1.002--1.02, 0.014, and sexual intercourses under the influence of alcohol 1.45 (1.10--1.92), 0.008. By contrast, condomless anal sex without PrEP was less frequent during sexual intercourses with known casual, unknown casual and multiple partners 0.20 (0.14--0.30), <0.001; 0.10 (0.05--0.20), <0.001; 0.11 (0.05--0.29), <0.001, respectively, as well as with HIV+ partners with an undetectable viral load and HIV+ partners with a detectable/unknown viral load or unknown serology status 0.57 (0.38--0.86), 0.007; 0.52 (0.32--0.87), 0.012, respectively. CONCLUSION: Choosing to have condomless anal sex without PrEP depends primarily on the sexual partner's characteristics (level of intimacy, serological status). This reflects a form of rationality in HIV risk management. However, our results raise questions about the true efficacy of managing HIV risk using this approach.	na	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Quantitative
Article	2020	Di Ciaccio, Marion; Sagaon-Teyssier, Luis; Mimi, Mohamed; Suzan-Monti, Marie; Protiere, Christel; Rojas Castro, Daniela; Meyer, Laurence; Tremblay, Cécile; Chidiac, Christian; Capitant, Catherine; Préau, Marie; Molina, Jean Michel; Spire, Bruno	Changes in Sexual Behaviors in Men Who Have Sex with Men: A Comparison Between the Double-Blind and Open-Label Extension Phases of the ANRS-IPERGAY Trial.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-020-02864-8	https://link.springer.com/article/10.1007/s10461-020-02864-8	Pre-Exposure Prophylaxis (PrEP) is changing the landscape of HIV prevention, and may bring changes in sexual behaviors. The double-blind phase (DBP) and open-label extension (OLE) study of the ANRS-IPERGAY trial allowed us to assess changes in sexual behavior of men who have sex with men (MSM) taking sexual activity-based (i.e., on-demand) PrEP. Generalized Estimating Equation (GEE) models found a significant decrease in the number of sexual partners (Coefficient CI95%, p value; - 0.37- 0.70 to - 0.04, p = 0.03) between the DBP and OLE as well as in the number of sexual relations (- 0.25 - 0.49 to 0.00, p = 0.04). GEE estimates also showed that respondents' most recent sexual relation was less likely to have been with an unknown casual partner during the OLE than during the DBP (Odds Ratio CI95%, p value: 0.750.62-0.92, 0.005). Furthermore, they showed an increase in the proportion of condomless anal sex in the OLE (1.321.04-1.67, 0.02), a decrease in the proportion of 'suboptimal PrEP adherence' over time (0.750.58-0.97, p = 0.03), a decrease in PrEP only use (0.730.55-0.96, 0.03) and in both PrEP and condom use over time (0.700.51-0.95, 0.02) and finally, a decrease in alcohol consumption between the DBP and OLE (0.740.61-0.90, 0.002). We observed both protective and risky behaviors in terms of HIV and STI risk after on-demand PrEP uptake in the OLE phase. Our findings are consistent with results from previous PrEP trials.	*Homosexuality, Male; Adult; Humans; Male; Middle Aged; Young Adult; HIV Infections/*prevention & control; Risk-Taking; Double-Blind Method; Sexual Partners; Canada; France; Anti-HIV Agents/*administration & dosage/therapeutic use; *Risk Reduction Behavior; Sexual Behavior/*statistics & numerical data; Safe Sex; Pre-Exposure Prophylaxis/*methods; PrEP; MSM; ANRS-IPERGAY trial; Behaviors; HIV risk management	English	United States	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical
Article	2020	Dimitrov, Dobromir; Moore, James R; Wood, Daniel; Mitchell, Kate M; Li, Maoji; Hughes, James P; Donnell, Deborah J; Mannheimer, Sharon; Holtz, Timothy H; Grant, Robert M; Boily, Marie-Claude	Predicted effectiveness of daily and nondaily preexposure prophylaxis for men who have sex with men based on sex and pill-taking patterns from the human immuno virus prevention trials network 067/ADAPT study	Clinical Infectious Diseases	-	-	-	-	10584838	10.1093/cid/ciz799	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088205569&doi=10.1093%2fcid%2fciz799&partnerID=40&md5=5b474254e98f7fde1be5a4ab853a432d	Background. The HIV Prevention Trials Network (HPTN) 067/Alternative Dosing to Augment PrEP Pill Taking (ADAPT) Study evaluated the feasibility of daily and nondaily human immunodeficiency virus (HIV) preexposure prophylaxis (PrEP) regimens among high-risk populations, including men who have sex with men (MSM) and transgender women, in Bangkok, Thailand and Harlem, New York. We used a mathematical model to predict the efficacy and effectiveness of different dosing regimens. Methods. An individual-based mathematical model was used to simulate annual HIV incidence among MSM cohorts. PrEP efficacy for covered sex acts, as defined in the HPTN 067/ADAPT protocol, was estimated using subgroup efficacy estimates from the preexposure prophylaxis initiative (iPrEx) trial. Effectiveness was estimated by comparison of the HIV incidence with and without PrEP use. Results. We estimated that PrEP was highly protective (85%-96% efficacy across regimens and sites) for fully covered acts. PrEP was more protective for partially covered acts in Bangkok (71%-88% efficacy) than in Harlem (62%-81% efficacy). Our model projects 80%, 62%, and 68% effectiveness of daily, time-driven, and event-driven PrEP for MSM in Harlem compared with 90%, 85%, and 79% for MSM in Bangkok. Halving the efficacy for partially covered acts decreases effectiveness by 8-9 percentage points in Harlem and by 5-9 percentage points in Bangkok across regimens. Conclusions. Our analysis suggests that PrEP was more effective among MSM in Thailand than in the United States as a result of more fully covered sex acts and more pills taken around partially covered acts. Overall, nondaily PrEP was less effective than daily PrEP, especially in the United States where the sex act coverage associated with daily use was substantially higher. © The Author(s) 2019. Article	2020	Djomand G.; Bingham T.; Benech I.; Muthui M.; Savva H.; Alamo S.; Manopaiboon C.; Wheeler T.; Mital S.	Expansion of HIV Preexposure Prophylaxis to 35 PEPFAR-Supported Early Program Adopters, October 2016-September 2018	MMWR Recommendations and Reports	-	-	-	-	1545861X	10.15585/mmwr.mm6908a3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85080859612&doi=10.15585%2fmmwr.mm6908a3&partnerID=40&md5=0b2e0446db3a9f144e11ab3e0710e8b6	The U.S. President's Emergency Plan for AIDS Relief (PEPFAR), the largest bilateral funder of human immunodeficiency virus (HIV) prevention and control programs worldwide, currently supports implementation of preexposure prophylaxis (PrEP) to reduce HIV incidence among persons at substantial risk for infection, including female sex workers, men who have sex with men (MSM), and transgender women (hereafter referred to as key populations). Recent estimates suggest that 54% of all global new HIV infections in 2018 occurred among key populations and their sexual partners (1). In 2016, PEPFAR began tracking initiation of PrEP by key populations and other groups at high risk (2). The implementation and scale-up of PrEP programs across 35 PEPFAR-supported country or regional programs* was assessed by determining the number of programs reporting any new PrEP clients during each quarter from October 2016 to September 2018. As of September 2018, only 15 (43%) PEPFAR-supported country or regional programs had implemented PrEP programs; however, client volume increased by 3,351% over the assessment period in 15 country or regional programs. Scale-up of PrEP among general population clients (5,255%) was nearly three times that of key population clients (1,880%). Among key populations, the largest increase (3,518%) occurred among MSM. Factors that helped drive the success of these PrEP early adopter programs included initiation of national, regional, and multilateral stakeholder meetings; engagement of ministries of health and community advocates; revision of HIV treatment guidelines to include PrEP; training for HIV service providers; and establishment of drug procurement policies. These best practices can help facilitate PrEP implementation, particularly among key populations, in other country or regional programs to reduce global incidence of HIV infection.	na	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Clinical
Article	2020	Djomegni P.M.T.; Tekle A.; Dawed M.Y.	Pre-exposure prophylaxis HIV/AIDS mathematical model with non classical isolation	Japan Journal of Industrial and Applied Mathematics	-	-	-	-	9167005	10.1007/s13160-020-00422-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084979990&doi=10.1007%2fs13160-020-00422-2&partnerID=40&md5=f92c6be87edd127a898b829e24efe9e8	We propose a mathematical model to understand the transmission dynamics of HIV/AIDS in an environment. In addition to previous approaches, we incorporate two classes of isolated. By isolated we do not mean physical separation, but commitment to keep its status. We establish the well-posedness of our model and fully analyze the asymptotic behavior of the solutions which depends on the basic reproduction number R. We then perform sensitive analysis to investigate the best strategy to keep the average number of secondary infection R low. Our investigation reveals that when there is both high awareness and high efficacy of PrEP (pre-exposure prophylaxis) use, increasing the efficacy of PrEP use decreases R the most. Otherwise, the best strategy is to isolated more susceptible to the class H1. Our model can be applied to any organizations/companies relying on physical labor forces (with some workers being infected by HIV/AIDS). © 2020, The JJIAM Publishing Committee and Springer Japan KK, part of Springer Nature. Journal of Infectious Diseases	-	-	-	-	1537-6613	10.1093/infdis/jiaa095	https://dx.doi.org/10.1093/infdis/jiaa095	We used a novel penile simian-human immunodeficiency virus (SHIV) transmission model to investigate whether long-acting cabotegravir (CAB LA) prevents penile SHIV acquisition in macaques. Twenty-two macaques were exposed to SHIV via the foreskin and urethra once weekly for 12 weeks. Of these, 6 received human-equivalent doses of CAB LA, 6 received oral emtricitabine/tenofovir disoproxil fumarate, and 10 were untreated. The efficacy of CAB LA was high (94.4%; 95% confidence interval, 58.2%-99.3%) and similar to that seen with oral emtricitabine/tenofovir disoproxil fumarate (94.0%; 55.1%-99.2%). The high efficacy of CAB LA in the penile transmission model supports extending the clinical advancement of CAB LA preexposure prophylaxis to heterosexual men. Article	2020	Dobkin, April; McWalters, Jessica; Barnett, Rebecca; Ray, Laurie L; Espinoza, Lilia; McGinn, Aileen P; Atrio, Jessica M; Keller, Marla J	Acceptability of a Tenofovir Disoproxil Fumarate Intravaginal Ring for HIV Pre-Exposure Prophylaxis Among Sexually Active Women.	Sexually Transmitted Diseases	-	-	-	-	1537-4521	10.1097/OLQ.0000000000001254	https://dx.doi.org/10.1097/OLQ.0000000000001254	INTRODUCTION: Vaginal ring delivery of antiretroviral drugs may provide protection against acquisition of HIV-1 when used as Pre-Exposure prophylaxis. As part of a randomized placebo-controlled safety trial of a tenofovir disoproxil fumarate (TDF) intravaginal ring (IVR), we assessed product acceptability through surveys of women after continuous ring use. METHODS: Sexually active, HIV-negative women were enrolled to investigate the safety and pharmacokinetics of 3 months of continuous TDF IVR use. The study was designed to include 40 US participants randomly assigned (3:1) to a TDF or placebo IVR. Twelve were randomized to TDF and 5 to the placebo group before the study was electively discontinued because of the development of vaginal ulcerations in 8 women in the TDF group. Acceptability data were gathered via self-administered, computer-based questionnaires. RESULTS: The average age of the 17 participants was 31 years (range, 18-42 years). Sixteen participants (94%) completed all questions at 2 study visits. When asked about ring likeability after 1 month of ring use, 12 (75%) of 16 reported overall liking the ring, including 6 (75%) of 8 who developed ulcerations. In addition, 10 (83%) of 12 who had their menses during the first month of ring use were not bothered by the ring, and 11 (69%) of 16 stated that the ring was not bothersome with use during sex. CONCLUSIONS: Despite unanticipated ulcers, TDF and placebo IVRs were acceptable to some women, even when used with menses and during sex, which is promising for continued development of IVRs for HIV prevention.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Drain, Paul K.; Kubiak, Rachel W.; Siriprakaisil, Oraphan; Klinbuayaem, Virat; Quame-Amaglo, Justice; Sukrakanchana, Pra-Ornsuda; Tanasri, Suriyan; Punyati, Pimpinun; Sirirungsi, Wasna; Cressey, Ratchada; Bacchetti, Peter; Okochi, Hideaki; Baeten, Jared M.; Gandhi, Monica; Cressey, Tim R.	Urine Tenofovir Concentrations Correlate With Plasma and Relate to Tenofovir Disoproxil Fumarate Adherence: A Randomized, Directly Observed Pharmacokinetic Trial (TARGET Study).	Clinical Infectious Diseases	-	-	-	-	1537-6591 1058-4838	10.1093/cid/ciz645	https://pubmed.ncbi.nlm.nih.gov/31314073/	BACKGROUND: Direct measurement of tenofovir (TFV) in urine could be an objective measure to monitor adherence to preexposure prophylaxis (PrEP) or TFV-based antiretroviral therapy (ART). METHODS: We conducted a 3-arm randomized, pharmacokinetic study of tenofovir disoproxil fumarate (TDF) 300 mg/emtricitabine (FTC) 200 mg among adults living with human immunodeficiency virus. Participants were randomized to receive controlled TDF/FTC dosing as (1) "perfect" adherence (daily); (2) "moderate" adherence (4 doses/week); or (3) "low" adherence (2 doses/week). We obtained trough spot urine and plasma samples during a 6-week directly observed therapy period and a 4-week washout period. TFV concentrations were compared between adherence arms using 1-way analysis of variance. RESULTS: Among 28 participants, the median age was 33 years and 16 (57%) were male. Correlation between TFV plasma and urine concentrations was strong (ρ = 0.78; P < .0001). Median (interquartile range) steady-state trough TFV concentrations (ng/mL) for perfect, moderate, and low TDF adherence were 41 (26-52), 16 (14-19), and 4 (3-5) in plasma; and 6480 (3940-14 300), 3405 (2210-5020), and 448 (228-675) in urine. Trough TFV concentrations at steady state were significantly different between the 3 adherence arms for plasma (P < .0001) and urine (P = .0002). Following drug cessation, TFV concentrations persisted longer in urine than plasma samples. Washout urine TFV concentrations and time to undetectable concentrations did not differ between the 3 randomized adherence groups. CONCLUSIONS: Urine TFV concentrations can inform interpretation of novel point-of-care urine-based TFV assays to assess recent TDF adherence. Article	2020	Drain, Paul K; Bardon, Ashley R; Simoni, Jane M; Cressey, Tim R; Anderson, Pete; Sevenler, Derin; Olanrewaju, Ayokunle O; Gandhi, Monica; Celum, Connie	Point-of-care and Near Real-time Testing for Antiretroviral Adherence Monitoring to HIV Treatment and Prevention.	Current HIV/AIDS Reports	-	-	-	-	1548-3576	10.1007/s11904-020-00512-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7492442	PURPOSE OF REVIEW: In this report, we review the need for point-of-care (POC) or near real-time testing for antiretrovirals, progress in the field, evidence for guiding implementation of these tests globally, and future directions in objective antiretroviral therapy (ART) or pre-exposure prophylaxis (PrEP) adherence monitoring. RECENT FINDINGS: Two cornerstones to end the HIV/AIDS pandemic are ART, which provides individual clinical benefits and eliminates forward transmission, and PrEP, which prevents HIV acquisition with high effectiveness. Maximizing the individual and public health benefits of these powerful biomedical tools requires high and sustained antiretroviral adherence. Routine monitoring of medication adherence in individuals receiving ART and PrEP may be an important component in interpreting outcomes and supporting optimal adherence. Existing practices and subjective metrics for adherence monitoring are often inaccurate or unreliable and, therefore, are generally ineffective for improving adherence. Laboratory measures of antiretroviral concentrations using liquid chromatography tandem mass spectrometry have been utilized in research settings to assess medication adherence, although these are too costly and resource-intensive for routine use. Newer, less costly technologies such as antibody-based methods can provide objective drug-level measurement and may allow for POC or near-patient adherence monitoring in clinical settings. When coupled with timely and targeted counseling, POC drug-level measures can support adherence clinic-based interventions to ART or PrEP in near real time. Article	2020	Drain, Paul; Ngure, Kenneth; Mugo, Nelly; Spinelli, Matthew; Chatterjee, Purba; Bacchetti, Peter; Glidden, David; Baeten, Jared; Gandhi, Monica	Testing a real-time tenofovir urine adherence assay for monitoring and providing feedback to preexposure prophylaxis in Kenya (PUMA): Protocol for a pilot randomized controlled trial	JMIR Research Protocols	-	-	-	-	19290748	10.2196/15029	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083445218&doi=10.2196%2f15029&partnerID=40&md5=5deaf1cb8b0269d5d73f943b68da554f	Background: The worldwide expansion of preexposure prophylaxis (PrEP) with oral tenofovir-disoproxil-fumarate/emtricitabine will be critical to ending the HIV epidemic. However, maintaining daily adherence to PrEP can be difficult, and the accuracy of self-reported adherence is often limited by social desirability bias. Pharmacologic adherence monitoring (measuring drug levels in a biomatrix) has been critical to interpreting PrEP trials, but testing usually requires expensive equipment and skilled personnel. We have recently developed a point-of-care (POC) immunoassay to measure tenofovir in urine, allowing real-time adherence monitoring for the first time. Objective: The goal of this study is to examine a point-of-care adherence metric in PrEP to support and increase adherence via a randomized controlled trial. Methods: The paper describes the protocol for a pilot randomized controlled trial to test the acceptability, feasibility, and impact on long-term adherence of implementing a POC urine test to provide real-time adherence feedback among women on PrEP. Eligible women (n=100) will be HIV-negative, ≥18 years old, and recruited from a clinic in Kenya that provides PrEP. Participants will be randomized 1:1 to the intervention of providing real-time feedback via the assay versus standard of care adherence counseling. Acceptability by participants will be assessed by a quantitative survey, as well as by qualitative data collected via in-depth interviews (n=20) and focus group discussions (n=4 groups, 5-10 women each). Feasibility will be assessed by the proportion of women retained in the study, the mean number of missed visits, the proportion of planned urine assessments completed, and messages delivered, while in-depth interviews with providers (n=8) will explore the ease of administering the urine test. Tenofovir levels in hair will serve as long-term adherence metrics. A linear mixed-effects model will estimate the effect of the intervention versus standard of care on logarithmically transformed levels of tenofovir in hair. Results: This study has been funded by the National Institute of Health, approved by the Kenya Medical Research Institute Institutional Review Board, and will commence in June 2020. Conclusions: A novel urine assay to measure and deliver information on adherence to PrEP in real-time will be tested for the first time in this trial planned among women on PrEP in Kenya. Study findings will inform a larger-scale trial assessing the impact of real-time adherence monitoring/feedback on HIV prevention. Improving adherence to PrEP will have long-term implications for efforts to end the HIV epidemic worldwide. ©Paul Drain, Kenneth Ngure, Nelly Mugo, Matthew Spinelli, Purba Chatterjee, Peter Bacchetti, David Glidden, Jared Baeten, Monica Gandhi. Article	2020	Drake A.L.; Begnel E.; Pintye J.; Kinuthia J.; Wagner A.D.; Rothschild C.W.; Otieno F.; Kemunto V.; Baeten J.M.; John-Stewart G.	The utility of SMS to report male partner HIV self-testing outcomes among women seeking reproductive health services in Kenya: Cohort study	JMIR mHealth and uHealth	-	-	-	-	22915222	10.2196/15281	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082380535&doi=10.2196%2f15281&partnerID=40&md5=2e29fd7d2c6d2029806cef1e5f856389	Background: Use of SMS for data collection is expanding, but coverage, bias, and logistical constraints are poorly described. Objective: The aim of this study is to assess the use of SMS to capture clinical outcomes that occur at home and identify potential biases in reporting compared to in-person ascertainment. Methods: In the PrEP Implementation in Young Women and Adolescents program, which integrated pre-exposure prophylaxis (PrEP) into antenatal care, postnatal care, and family planning facilities in Kisumu County, Kenya, HIV-negative women 14 years of age or older were offered oral HIV self-tests (HIVSTs) to take home to male partners. Women that brought a phone with a Safaricom SIM to the clinic were offered registration in an automated SMS system (mSurvey) to collect information on HIVST outcomes. Women were asked if they offered the test to their male partners, and asked about the test process and results. HIVST outcomes were collected via SMS (sent 2.5 weeks later), in-person (if women returned for a follow-up scheduled 1 month later), or using both methods (if women initiated PrEP, they also had scheduled follow-up visits). The SMS prompted women to reply at no charge. HIVST outcomes were compared between women with scheduled follow-up visits and those without (follow-up visits were only scheduled for women who initiated PrEP). HIVST outcomes were also compared between women reporting via SMS and in-person. Results: Among 2123 women offered HIVSTs and mSurvey registration, 486 (23.89%) accepted HIVSTs, of whom 359 (73.87%) were eligible for mSurvey. Additionally, 76/170 (44.7%) women with scheduled follow-up visits and 146/189 (77.3%) without scheduled follow-up visits registered in mSurvey. Among the 76 women with scheduled follow-ups, 62 (82%) had HIVST outcomes collected: 19 (31%) in-person, 20 (32%) by SMS, and 23 (37%) using both methods. Among the 146 women without scheduled visits, 87 (59.6%) had HIVST outcomes collected: 3 (3%) in-person, 82 (94%) by SMS, and 2 (2%) using both methods. SMS increased the collection of HIVST outcomes substantially for women with scheduled follow-up visits (1.48-fold), and captured 82 additional reports from women without scheduled follow-up visits. Among 222 women with reported HIVST outcomes, frequencies of offering partners the HIVST (85/95, 89% in-person vs 96/102, 94% SMS; P=.31), partners using the HIVST (83/85, 98% vs 92/96, 96%; P=.50), women using HIVST with partners (82/83, 99% vs 91/92, 99%; P=.94), and seeing partner's HIVST results (82/83, 99% vs 89/92, 97%; P=.56) were similar between women reporting in-person only versus by SMS only. However, frequency of reports of experiencing harm or negative reactions from partners was more commonly reported in the SMS group (17/102, 16.7% vs 2/85, 2%; P=.003). Barriers to the SMS system registration included not having a Safaricom SIM or a functioning phone. Conclusions: Our results suggest that the use of SMS substantially improves completeness of outcome data, does not bias reporting of nonsensitive information, and may increase reporting of sensitive information. © 2020 Journal of Medical Internet Research. Article	2020	Duchesne L.; Lydié N.; Velter A.	Increase in the overall level of protected anal sex in men who have sex with men in France: results from the repeated cross-sectional survey Rapport au Sexe, France, 2017–2019	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2020.1739208	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081923717&doi=10.1080%2f09540121.2020.1739208&partnerID=40&md5=26d341b49e21c3f494076d86ce62a21a	This study measures the evolution in the overall level of protection against HIV by men who have sex with men (MSM) in France. Using data from the 2017 and 2019 editions of Rapport au Sexe–an online survey–we compared the use of HIV prevention tools by MSM during their most recent anal intercourse (MRAI) with a casual male partner. We developed a classification with five categories ordered according to the effectiveness of each tool method in reducing the risk of acquiring HIV: Treatment as prevention (TasP), Pre-exposure prophylaxis (PrEP), exclusive condom use, Post-exposure prophylaxis (PEP) or nothing (i.e., no tool used). The percentage of MSM who did not use any prevention tool decreased from 25.9% in 2017 to 23.5% in 2019 (aOR 95%CI = 0.9 0.8–0.9). The proportion of MSM who took PrEP during the MRAI increased from 5.4% in 2017 to 14.0% in 2019 (aOR 95%CI = 2.92.5–3.3). The proportion of MSM who used condoms exclusively decreased from 67.5% in 2017 to 61.3% in 2019 (aOR 95%CI = 0.8 0.7–0.8). We observed an increase in the rate of protected anal sex, and a decrease in the rate of condom use. The implementation of PrEP may be one of the main driving forces behind these changes. © 2020, © 2020 Informa UK Limited, trading as Taylor & Francis Group.	biomedical prevention; HIV; Men who have sex with men; preventive behavior	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Quantitative
Theses and Dissertations	2020	Ebbini, Rami Phoebus	What meaning do gay men on PrEP make of their sexuality : a phenomenological investigation	-	-	Middlesex University	Middlesex University	-	na	NA	https://eprints.mdx.ac.uk/35860/	This study aims to explore what meaning gay men on pre-exposure prophylaxis (PrEP) make of their sexuality. PrEP is a medication that was approved in 2012 by the US Federal Drugs Agency (FDA) as an effective means of prophylaxis against contracting HIV. Eight gay men in London who have been on PrEP for at least 6 months, and who do not participate regularly in chemsex were interviewed, and the data was analysed using a hybrid method, relying mainly on Interpretative Phenomenological Analysis (IPA), in addition to a heuristic first step. The results revealed how the participants made sense of their sexualities through lenses of being and doing something sexual, often through the identity and acts of sexual roles. Speaking about their sexualities and PrEP showed to be important to the participants, not only as a means of communication, but also as a manifestation of their sexualities. Despite the notion that PrEP neutralises the threat of contracting HIV, the fear of HIV was still prevalent amongst the participants, and casual sex was still perceived to be potentially dangerous. Finally, the results reveal how these participants constructed and valued ideas and fantasies of 'good' and 'natural' sex, which PrEP seems to help them uphold. This study can contribute towards a deeper understanding of gay sexuality, particularly given the context of rapid changes in technology in the fight against HIV. The clinical significance of this research, especially for existential therapists, lies in the importance the participants placed on speaking about their sexualities, the insights gained from how these participants navigate their sexual lives, and the challenges and dilemmas they face regarding the choices they make and the risks they are willing or not willing to take as part of their sexuality.	na	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	-	-	Qualitative
Article	2020	Edelman E.J.; Moore B.A.; Calabrese S.K.; Berkenblit G.; Cunningham C.O.; Ogbuagu O.; Patel V.V.; Phillips K.A.; Tetrault J.M.; Shah M.; Blackstock O.	Preferences for implementation of HIV pre-exposure prophylaxis (PrEP): Results from a survey of primary care providers	Preventive Medicine Reports	-	-	-	-	22113355	10.1016/j.pmedr.2019.101012	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076456956&doi=10.1016%2fj.pmedr.2019.101012&partnerID=40&md5=e0018b942d3cf16cc3646794923046cf	Primary care physicians (PCPs) are critical for promoting HIV prevention by prescribing pre-exposure prophylaxis (PrEP). Yet, there are limited data regarding PCP's preferred approaches for PrEP implementation. In 2015, we conducted an online survey of PCPs' PrEP prescribing and implementation. Participants were general internists recruited from a national professional organization. We examined provider and practice characteristics and perceived implementation barriers and facilitators associated with preferred models for PrEP implementation. Among 240 participants, the majority (85%) favored integrating PrEP into primary care, either by training all providers ("all trained") (42%) or having an onsite PrEP specialist ("on-site specialist") (43%). Only 15% preferred referring patients out of the practice to a specialist ("refer out"). Compared to those who preferred to "refer out," participants who preferred the "all trained" model were more likely to spend most of their time delivering direct patient care and to practice in the Northeast. Compared to participants who preferred the "refer out" or on-site specialist" models, PCPs preferring the all trained model were less likely to perceive lack of clinic PrEP guidelines/protocols as a barrier to PrEP. Most PCPs favored integrating PrEP into primary care by either training all providers or having an on-site specialist. Time devoted to clinical care and geography may influence preferences for PrEP implementation. Establishing clinic-specific PrEP protocols may promote on-site PrEP implementation. Future studies should focus on evaluating the effectiveness of different PrEP implementation models on PrEP delivery. © 2019 The Authors	HIV prevention; Implementation; Pre-exposure prophylaxis; Primary care physicians	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Edeza A.; Bazzi A.; Salhaney P.; Biancarelli D.; Childs E.; Mimiaga M.J.; Drainoni M.-L.; Biello K.	HIV Pre-exposure Prophylaxis for People Who Inject Drugs: The Context of Co-occurring Injection- and Sexual-Related HIV Risk in the U.S. Northeast	Substance Use and Misuse	-	-	-	-	10826084	10.1080/10826084.2019.1673419	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074025315&doi=10.1080%2f10826084.2019.1673419&partnerID=40&md5=745dbfc9a0dfa4d3695ef440ae30421b	Background: People who inject drugs (PWID) are at increased risk for HIV infection through sharing contaminated needles and injection equipment, and engaging in condomless sex. Objectives: To qualitatively examine the overlapping nature of these behaviors among PWID in the US Northeast. Methods: We recruited HIV-uninfected PWID and key informants through community-based organizations. Qualitative interviews explored sexual partnerships as they related to sharing contaminated needles and injection equipment, engaging in condomless sex, and associated indications for PrEP among PWID. Results: Among 33 PWID, 66% engaged in condomless vaginal or anal sex in the past 3 months, and 27% had three or more sexual partners in this same time period. Over half engaged in any past month distributive or receptive syringe sharing (64%). We identified three contexts through which overlapping sexual and injection-related HIV risks emerged, including (1) multiple concurrent sexual partnerships; (2) using and injecting drugs with sexual partners (including increase injecting of crystal methamphetamine); and (3) exchanging sex for money or drugs (including among male PWID). Condom use was inconsistent across these contexts. Limited interactions with healthcare providers often resulted in sexual risks being overlooked in light of competing health concerns. Conclusions: Sexual risk for HIV acquisition is complex and multi-faceted among PWID yet may be overlooked by prevention and healthcare providers. Comprehensive HIV prevention efforts must acknowledge the distinct contexts in which overlapping injection and sexual risk behaviors occur. Increased sexual health screening and risk reduction services including PrEP for PWID may help curtail transmission in this population. © 2019, © 2019 Taylor & Francis Group, LLC. Article	2020	Edeza Alberto; Galárraga Omar; Karina, Santamaria E; Sosa-Rubí, Sandra; Operario, Don; Biello, Katie B	"I Do Try To Use Condoms, But…": Knowledge and Interest in PrEP Among Male Sex Workers in Mexico City	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-019-01473-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074554538&doi=10.1007%2fs10508-019-01473-4&partnerID=40&md5=9b974b2972852ca91926a0df8060e289	In Mexico City, male sex workers (MSWs) are up to 126 times more likely to be living with HIV than the general public. We conducted interviews with 23 MSWs in Mexico City to examine their subjective understandings about their sexual risk behaviors and explore opportunities about HIV pre-exposure prophylaxis (PrEP) as a prevention approach in this group. Despite knowledge about sexual HIV risks, most participants reported condomless anal sex with clients. There was very little prior knowledge about PrEP, but very high interest in using a daily pill for prevention. Several participants expected an increase in condomless anal sex if taking PrEP, because of monetary incentives from clients or a perceived increase in pleasure. Additionally, seasonal sex workers expressed interest in using PrEP only during months when they were performing sex work. PrEP implementation efforts through Mexico's healthcare system should recognize the varying needs and sexual risk behaviors of MSWs. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Feasibility of Short-Term PrEP Uptake for Men Who Have Sex with Men with Episodic Periods of Increased HIV Risk	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002382	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088608002&doi=10.1097%2fQAI.0000000000002382&partnerID=40&md5=82f22cc54b5cc11a0284bea2a03f97bf	Background:Pre-exposure prophylaxis (PrEP) with emtricitabine/tenofovir disoproxil fumarate is efficacious in reducing HIV acquisition. For some gay, bisexual, and other men who have sex with men (MSM), daily ongoing PrEP may be unsuitable for use as a long-term prevention strategy because of episodic risk, cost issues, or concerns about the biological consequences of medication.Setting:This study evaluated the feasibility of short-term, fixed-interval episodic PrEP (Epi-PrEP) for use among vacationing MSM. We describe the feasibility of implementing a clinic-based Epi-PrEP pilot program for 48 MSM who reported occasional condomless sex and anticipated a defined high-risk time.Methods:This was a nonrandomized naturalistic study of an observational clinical intervention. The primary outcome assessed was adherence, as measured by self-report and plasma tenofovir levels.Results:Of 54 MSM who enrolled in the study, 48 completed the 3-month visit. The majority (93.7%) had tenofovir concentrations consistent with daily use on returning from vacation. Almost 3/4 reported condomless sex during vacation, and about 1/3 reported recreational drug use. During the 3-month follow-up, 1 participant had become HIV-infected because of a lapse in continued access to the PrEP after study. Although adverse events were common, none were serious. More than 70% of participants indicated an interest in daily ongoing PrEP use.Conclusions:Epi-PrEP was well tolerated by at risk MSM in this study, with high levels of medication adherence. Many participants felt the experience of initiating PrEP while on vacation could be a means for transition to long-term PrEP use. © 2020 Wolters Kluwer Health, Inc.	adherence; HIV; MSM; pre-exposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Article	2020	Emmanuel, G; Folayan, M; Undelikwe, G; Ochonye, B; Jayeoba, T; Yusuf, A; Aiwonodagbon, B; Bilali, C; Umoh, P; Ojemeiri, K; Kalaiwo, A	Community perspectives on barriers and challenges to HIV pre-exposure prophylaxis access by men who have sex with men and female sex workers access in Nigeria.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-020-8195-x	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6964078	BACKGROUND: Men who have sex with men (MSM), female sex workers (FSW) have critical needs for effective HIV prevention tools. This study identified perspectives of MSM, FSW and policy makers on the needs for, barriers to, and challenges with pre-exposure HIV prophylaxis (PrEP); and the logistics required to support roll-out of PrEP for MSM and FSW in Nigeria. METHODS: Qualitative and quantitative data were collected through a cross-sectional study. The quantitative data were collected through an online survey administered to 519 MSM, FSW and transgender respondents. The qualitative data were collected through 22 focus group discussions with 140 MSM and 80 FSW, and a two-day consultative workshop with 65 participants. Two open-ended questions in the online survey were also a source of qualitative data. Results of the quantitative data were reported descriptively; the qualitative data were inductively examined with a content analytic approach to construct descriptive categories. The findings from the quantitative and qualitative responses were triangulated. RESULTS: Four hundred and ninety-four (95.2%) online respondents had heard about PrEP through community dialogue (71.3%), and 439 (84.6%) supported its use by MSM and FSW. Fewer than half of the respondents were aware of the clinical care required for PrEP, and misconceptions about PrEP were common. Stated barriers to PrEP uptake were stigma, cost, frequency of HIV counseling and treatment services required, and possible drug-drug interactions. Concerns included possible condom migration, increased risk for sexually transmitted infections and pregnancy for FSW, and poor adherence to medication and hospital schedules. Participants felt that trained peer educators and HIV-test counselors could provide information and refer clients to clinics that provide PrEP. PrEP can be provided through peer-led facilities for MSM and FSW, though its access should be expanded to all persons who are at substantial risk for HIV to prevent negative labeling of PrEP. Public awareness about the use of antiretrovirals for HIV prevention is needed to prevent labeling of PrEP users as being HIV positive. CONCLUSION: Although MSM and FSW are interested in the use of PrEP, numerous individual and structural barriers need to be addressed to facilitate access to it in Nigeria. Community Perceptions About Use of Pre-exposure Prophylaxis Among Adolescent Girls and Young Women in Kenya	Journal of the Association of Nurses in AIDS Care	-	-	-	-	10553290	10.1097/JNC.0000000000000191	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85093539249&doi=10.1097%2fJNC.0000000000000191&partnerID=40&md5=10fe4ec4a576ddf18019d788dafdf352	Adolescent girls and young women (AGYW) in sub-Saharan Africa have high HIV incidence. Despite scale-up of programmatic delivery and demand creation activities in this population, pre-exposure prophylaxis (PrEP) uptake is low. To explore community perceptions around AGYW PrEP use, we conducted four focus group discussions (FGDs) between October and December 2018 with 26 Community Advisory Board (CAB) members in Kenya. Conventional content analysis and thematic network analysis were used to identify themes relating to community perceptions of PrEP use among AGYW. CAB members noted community perception of PrEP use as unacceptable for AGYW because of the potential to increase "promiscuous" behavior, STIs, and pregnancy. AGYW may face stigma if PrEP is mistaken for HIV treatment, and may fear HIV testing or accessing PrEP because of a lack of youth-friendly services. PrEP can be integrated into maternal and child health and family planning clinics, which are routinely accessed by AGYW and lack the stigma associated with HIV clinics. PrEP scale-up among AGYW will require continued community sensitization to address concerns, reduce stigma, and clarify misperceptions.	adolescents; community health; female; HIV prevention; PrEP; qualitative	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

Reaching a Different Population of MSM in West Africa With the Integration of PrEP Into a Comprehensive Prevention Package (CohMSM-PrEP ANRS 12369 - Expertise France)	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002453	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85093538259&doi=10.1097%2fQAI.0000000000002453&partnerID=40&md5=93412e331ea3545d0e4b3b41a9a0397e	Background:In West Africa, few HIV services target men who have sex with men (MSM). In 2015, the interventional cohort CohMSM started offering a community-based prevention package for MSM. Participants expressed interest in pre-exposure prophylaxis (PrEP) and their eligibility was demonstrated. In 2017, PrEP was added to services already offered as part of a new program, CohMSM-PrEP, which recruited CohMSM participants and new participants. We aimed to determine whether the introduction of PrEP as an additional prevention tool influenced the type of participant signing up for CohMSM-PrEP.Methods:CohMSM-PrEP recruited HIV-negative MSM in community-based clinics in Mali, Cote d'Ivoire, Burkina Faso, and Togo. Quarterly follow-up included free clinical examinations, PrEP, HIV/sexually transmitted infection screening, peer education, condoms, and lubricants. Sociobehavioral data were collected every 3 months using face-to-face questionnaires. Our outcome was participant type: new participants vs CohMSM participants. Logistic regression was performed to identify the factors associated with being a new participant.Results:Of the 524 MSM included in CohMSM-PrEP, 41% were new participants. After adjustment, multivariate analysis showed they were more socioeconomically disadvantaged with financial insecurity, social isolation - including isolation within the MSM community - and riskier sexual practices.Conclusion:The introduction of PrEP as an additional prevention tool and the use of peer-based outreach services over time influenced the type of participant signing up for a community-based HIV prevention cohort in West Africa. Adding these elements to existing interventions in Sub-Saharan Africa could be the key to reaching MSM marginalized from HIV prevention and care programs. © 2020 The Author(s). Article	2020	Faini, Diana; Hanson, Claudia; Baisley, Kathy; Kapiga, Saidi; Hayes, Richard	Sexual behaviour, changes in sexual behaviour and associated factors among women at high risk of HIV participating in feasibility studies for prevention trials in Tanzania	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0231766	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083386033&doi=10.1371%2fjournal.pone.0231766&partnerID=40&md5=2162864416c5e4e04760a990a476b6ea	Introduction Risk reduction towards safer behaviour is promoted after enrolment in HIV prevention trials. We evaluated sexual behaviour, changes in sexual behaviour and factors associated with risky behaviour after one-year of follow-up among women enrolled in HIV prevention trials in Northern Tanzania. Methods Self-reported information from 1378 HIV-negative women aged 18-44 enrolled in microbicide and vaccine feasibility studies between 2008-2010,was used to assess changes in behaviour during a 12-month follow-up period. Logistic regression with random intercepts was used to estimate odds ratios for trends in each behaviour over time. A behavioural risk score was derived from coefficients of three behavioural variables in a Poisson regression model for HIV incidence and thereafter, dichotomized to risky vs less-risky behaviour. Logistic regression was then used to identify factors associated with risky behaviour at 12 months. Results At baseline, 22% reported multiple partners, 28% were involved in transactional sex and only 22% consistently used condoms with non-regular partners. The proportion of women reporting multiple partners, transactional sex and high-risk sex practices reduced at each 3- monthly visit (33%, 43% and 47% reduction in odds per visit respectively, p for linear trend <0.001 for all), however, there was no evidence of a change in the proportion of women consistently using condoms with non-regular partners (p = 0.22). Having riskier behaviours at baseline, being younger than 16 years at sexual debut, having multiple partners, selling sex and excessive alcohol intake at baseline were strongly associated with increased odds of risky sexual behaviour after 12 months (p<0.005 for all). Conclusion An overall reduction in risky behaviours over time was observed in HIV prevention cohorts. Risk reduction counselling was associated with decreased risk behaviour but was insufficient to change behaviours of all those at highest risk. Biological HIV prevention interventions such as PrEP for individuals at highest risk, should complement risk reduction counselling so as to minimize HIV acquisition risk. © 2020 Faini et al. Article	2020	Feinstein, Brian A; Dodge, Brian	Meeting the Sexual Health Needs of Bisexual Men in the Age of Biomedical HIV Prevention: Gaps and Priorities	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-019-01468-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074837969&doi=10.1007%2fs10508-019-01468-1&partnerID=40&md5=d044b3a5390bdaf678f377ba0ab5c3e8	The field of HIV/STI prevention has primarily focused on gay men (or "men who have sex with men" MSM as a broad category) with limited attention to bisexual men in particular. Although bisexual men are also at increased risk for HIV and other STI, they are less likely to utilize HIV/STI prevention services than gay men, and very few interventions have been developed to address their unique needs. Further, while biomedical advances are changing the field of HIV prevention, bisexual men are also less likely to use biomedical HIV prevention strategies (e.g., pre-exposure prophylaxis PrEP) than gay men. In an effort to advance research on bisexual men and their sexual health needs, the goals of this commentary are: (1) to review the empirical literature on the prevalence of HIV/STI among bisexual men, the few existing HIV/STI prevention interventions developed for bisexual men, and the use of biomedical HIV prevention among bisexual men; (2) to describe the ways in which the field of HIV/STI prevention has largely overlooked bisexual men as a population in need of targeted services; and (3) to discuss how researchers can better address the sexual health needs of bisexual men in the age of biomedical HIV prevention. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Feldman D.A.; Ketonen I.	Cultural Factors in HIV Risk Among Gay/Bisexual Men in Hungary: A Rapid Assessment Study	Annals of Anthropological Practice	-	-	-	-	2153957X	10.1111/napa.12142	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100501006&doi=10.1111%2fnapa.12142&partnerID=40&md5=3fb895a15e92498d37038aefcce50928	This article examines the sexual culture of gay men in Budapest, Hungary, based on research in 2011. HIV prevalence in Hungary is relatively low, compared with the United States, Western Europe, and parts of Eastern Europe (where injecting drug use is common, elevating the HIV rate). This preliminary, qualitative study of 21 gay and bisexual men, examines their social and sexual culture (their norms and values) in order to explain their low HIV prevalence rate. This low rate is particularly interesting because Hungarian homophobia and inconsistent condom use among gay and bisexual men are cultural factors that would appear to raise the HIV rate. Cultural and subcultural differences are important in understanding Hungarian gay male behavior, for example, the emphasis on romance and monogamy as an ideal, the importance of one's personal reputation, a perceived lack of a strong gay community, a failure to use condoms while in love, and infrequent HIV testing. The anthropological concept of romantic love plays a decisive role in sexual decision-making among same-sex couples. As Nanda indicates, "Romantic love like marriage also appears to be universal, but it is not the basis of marriage in most societies…. Romantic love as a basis for marriage has over time, become more widespread across cultures. This phenomenon is integrated in different societies in different ways, depending on local contexts and global connections." Despite widespread reluctance to use condoms while "in love," there is also an accurate knowledge of safer sex among gay men in Hungary. One possible solution to this seemingly contradictory situation, not available at the time of the study, is to promote the use of preexposure prophylaxis (or PrEP). PrEP is a daily pill shown to be even more effective than condom use. sexual culture, HIV prevalence, AIDS risk, Hungary, gay and bisexual men. © 2020 by the American Anthropological Association	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Felsher M.; Bellamy S.; Piecara B.; Van Der Pol B.; Laurano R.; Roth A.M.	Applying the behavioral model for vulnerable populations to pre-exposure prophylaxis initiation among women who inject drugs	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2020.32.6.486	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100738715&doi=10.1521%2faeap.2020.32.6.486&partnerID=40&md5=8152a8c0228d152de04d54e0ad83609f	This study used Behavioral Model for Vulnerable Populations (BMVP) to identify factors associated with pre-exposure prophylaxis (PrEP) initiation among women who inject drugs (WWID) when PrEP was offered at a syringe services program (SSP). Participants (n = 89) were WWID, ≥18 years, and eligible for PrEP. Most (69) initiated PrEP. Chi square and t tests were used to identify bivariate relationships between BMVP factors and PrEP initiation. A greater proportion of PrEP initiators (compared to non-initiators) reported sexual assault, frequent SSP attendance, earning ≥$5,000 annually and inconsistent condom use. Findings can inform the development of gender-specific strategies to promote PrEP among WWID. © 2020 The Guilford Press. Article	2020	Felsher M.; Ziegler E.; Smith L.R.; Sherman S.G.; Amico K.R.; Fox R.; Madden K.; Roth A.M.	An Exploration of Pre-exposure Prophylaxis (PrEP) Initiation Among Women Who Inject Drugs	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-020-01684-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083444645&doi=10.1007%2fs10508-020-01684-0&partnerID=40&md5=84c72e3e5f6312b6f652d3e5c76cfcd7	Pre-exposure prophylaxis (PrEP) is an effective but understudied tool for preventing HIV among women who inject drugs (WWID). This article is the first to explore WWID's rationale for PrEP initiation (or refusal) in a real-world setting. Purposive sampling was used to recruit 25 WWID, participating in a PrEP demonstration project operating within a syringe services program, based on whether they initiated or declined PrEP care. Content analysis of qualitative interviews was used to explore decisions to initiate PrEP (or not). We found that WWID view HIV as severe, perceive themselves to be susceptible to HIV, and believe PrEP is beneficial for HIV prevention. For some, however, real and perceived barriers outweighed benefits, leading to decisions not to initiate PrEP. Barriers included HIV stigma, fear of side effects, and needing assurance that PrEP will be available long-term. Despite viewing PrEP as an important HIV prevention tool, not all WWID who were offered PrEP initiated it. For these women, supports to buffer perceived barriers to initiation and access to post-exposure prophylaxis may be warranted. For women who initiate, it is possible that adherence will wane if perceived risk does not remain high. Research to understand PrEP persistence is needed. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Theses and Dissertations	2020	Felsher, Marisa A.; Roth, Alexis M.	A Dyadic Analysis of PrEP-Related Interpersonal Communication among Women Who Inject Drugs in Philadelphia	-	-	Drexel University	-	na	NA	https://www.proquest.com/dissertations-theses/dyadic-analysis-prep-related-interpersonal/docview/2413413962/se-2?accountid=8113	Women who inject drugs (WWID) remain a population at risk for HIV infection. Pre-exposure prophylaxis (PrEP) is a user-controlled biomedical HIV prevention tool that could decrease HIV risk among WWID. However, PrEP uptake among WWID is low, which can be attributed in part to low awareness. Interventions that incorporate interpersonal communication between WWID and their network members could play an important role in the diffusion of PrEP information. However, little is known about who WWID would be willing to diffuse PrEP information to in the context of a peer intervention, nor characteristics of relationships that motivate willingness to share information. The objective of this dissertation is to identify how characteristics of relationships impact interpersonal communication about PrEP between WWID and members of their social network. This dissertation used a sequential mixed-methods exploratory design. In Phase 1 (aim 1) in-depth interviews were conducted with 20 WWID to explore the context and content of previous communication about PrEP with network members. In phase 2 (aims 2 and 3), a quantitative social network survey was administered to 40 WWID and elicited information about 375 social network members in order to identify factors associated with willingness to share information about PrEP within dyads in the context of a peer intervention. Findings from each of these studies were compared and contrasted through triangulation to identify key themes and areas for future research and practice. Aim 1 findings demonstrate that WWID initiated PrEP-related conversations with over half of network members elicited. Reasons included to educate other WWID perceived to be at risk for HIV about PrEP, to receive social support from peers with whom they are emotionally close, and to disclose PrEP use to control the narrative of why they take PrEP. Findings from aim 2 show that WWID were willing to share PrEP information with 83% (m = 312) of network members in the context of a peer intervention. In a multivariable model, participants had higher odds of willingness to share PrEP information within relationships where the network member was female, homeless, and perceived by respondent to be at risk for HIV. Aim 3 results show that constructs related to the Theory of Planned Behavior (attitudes, subjective norms, and perceived behavior control of sharing information about PrEP) vary between relationships and are significantly associated with willingness to share PrEP information. This dissertation highlights that WWID have previously shared PrEP information with network members and are also willing to share PrEP information with most network members in the context of an intervention. Characteristics of relationships, as well as constructs of TPB operating within dyads, impact WWID's willingness to share information with network members. Formatting TPB be used within ego-centric social network analysis expands the utility of TPB to encompass interpersonal processes and has application to predicting intention to engage in other dyadic behaviors. Peer interventions where WWID share PrEP information with network members may be a feasible approach to increasing PrEP awareness among highly vulnerable populations. Book	2020	Felzien, G., & Jefferson-Saboor, A.	HIV Prevention in Primary Care Practice: A PrEP Primer	-	HIV Prevention in Primary Care Practice: A PrEP Primer	-	NA	-	NA	https://books.google.com.br/books?id=RzcKEAAAQBAJ&hl=pt-PT	PrEP is a broad set of clinical tools that can be used to reduce the chances of acquiring HIV. Although it is highly effective, many people who could benefit from PrEP lack access or are not familiar with it. However, primary care providers can remedy this situation and truly make a difference in the lives of their patients who may be at risk of acquiring HIV. This eHealth SourceTM educational activity comprises 5 chapters, covering an overview of HIV epidemiology, practical approaches to sexual history-taking and assessing patient risk of HIV acquisition, initiation and monitoring of PrEP medication, and overcoming the bias and stigma surrounding HIV and PrEP. Throughout the program, our expert faculty will provide their unique insights surrounding sexual health, HIV prevention, and PrEP, and how these may be incorporated into primary care practice.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Review
Article	2020	Fernandes, Danilo Euclides; Paulo Roberto Abrão Ferreira; Gianna Mastroianni Kirsztajn	Pre-exposure prophylaxis during the SARS-CoV-2 pandemic: can PrEP prevent COVID-19-related symptoms?	Epidemiology and Infection	-	-	-	-	09502688	10.1017/S0950268820002253	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-during-sars-cov-2/docview/2450117829/se-2?accountid=8113	It has been speculated that some drugs can be used against SARS-CoV-2. As for antiretrovirals, the follow-up of pre-exposure prophylaxis (PrEP) users during the coronavirus disease 2019 (COVID-19) outbreak may help to understand the potential protective effect of PrEP against SARS-CoV-2. We aimed to identify associations between oral PrEP use and COVID-19-related symptoms self-reporting. Phone call interviews or digital investigation (through WhatsApp® or e-mail) about oral PrEP regular use, social distancing, exposure to suspected or confirmed cases of SARS-CoV-2 infection and COVID-19-related symptoms. Among 108 individuals, the majority were cisgender, white and gay men. Although most of the individuals engaged in social distancing (68.52%), they kept on taking PrEP (75.93%). Few people have had contact with suspected or confirmed cases of COVID-19 (12.04%), but some had COVID-19-related symptoms the month before the interview (27.78%) including rhinorrhoea (56.67%), cough (53.33%), asthaenia (50.00%) and headache (43.33%). Also, oral PrEP was associated with lower self-reporting COVID-19-symptoms (OR 0.26, 95% CI 0.07–0.96, P = 0.04; h = 0.92) even after controlling confounders as social distancing, age, body-mass index and morbidities . In our sample, the regular use of oral PrEP was associated with lower self-reporting of COVID-19-related symptoms during the outbreak in São Paulo, Brazil. Article	2020	Ferrario L.; Foglia E.; Garagiola E.; Pacelli V.; Cenderello G.; Biagio A.D.I.; Rizzardini G.; Errico M.; Iardino R.; Croce D.	The impact of prep: Results from a multicenter health technology assessment into the Italian setting	Journal of Preventive Medicine and Hygiene	-	-	-	-	11212233	10.15167/2421-4248/jpmh2020.61.3.1352	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092593468&doi=10.15167%2f2421-4248%2fjpmh2020.61.3.1352&partnerID=40&md5=0ef8e8c4cf1ef5dfde58d8738905f5f7	Introduction. The use of oral tenofovir/emtricitabine (FTC/TDF) for pre-exposure prophylaxis (PrEP) among high-risk people without Human Immunodeficiency Virus (HIV), is emerging as an innovative strategy to decrease HIV epidemic. The study aims at evaluating the implications related to PrEP introduction, from a multidimensional point of view, as required by Health Technology Assessment (HTA) approach, with a particular attention on sustainability and social factors, influencing PrEP implementation. Methods. An analysis was conducted involving 35 Italian Infectious Disease Departments. The introduction of PrEP (applied both as "add-on" and "substitute" prevention strategy) into the clinical practice was compared with a baseline scenario, consisting of condoms among men who have sex with men, and serodiscordant couples, and the use of Needle Syringe Programme among injection drugs users The above scenarios were analysed by means of a Health Technology Assessment (HTA) approach. The 9 EUnetHTA Core Model domains were assessed through comparative information, retrieved from literature evidence, and collection of qualitative and quantitative information, derived from real-world evidence, in particular from 35 Infectious Disease Departments and potential PrEP users' involved. A final multi-criteria decision analysis approach (MCDA) was implemented to simulate the appraisal phase and providing evidence-based information with regard to the preferable technology. Results. Despite the improvement in patients' quality of life, PrEP would generate the development of other sexually transmitted and blood-borne diseases, with a consequent decrease of patients'safety in case of PrEP applied as a "substitute" prevention strategy. In addition, PrEP would generate an increase in staff workflow, with investment in medical supplies and training courses. PrEP would lead to significant economic investments both for the NHS (+40%), and for citizens (+2,377%) if used as an add-on strategy, assuming FTC/TDF patent cost. With the off-patent drug, the NHS would benefit from an advantage (37%), and a shrink of the patients'expenditure emerged (+682%). More economic resources are required if PrEP is applied as a substitute strategy, considering both the patent (NHS: 212%; citizens: 3,423%) and the off-patent drug (NHS: 73%; citizens: 1,077%). Conclusions. The most cost-containing strategy would be the use of PrEP, as an add-on strategy, with a consequent improvement in patients' safety, even if drug-related adverse events would be considered. The implementation of the off-patent drug would decrease the economic burden of the innovative prevention strategy. Hence, the organizational aspects related to its adoption would be deeply investigated, with the potential opportunity to create specific ambulatories devoted to PrEP users' especially for medium and big size hospitals. © Copyright by Pacini Editore Srl, Pisa, Italy. Article	2020	Fields E.L.; Long A.; Bademosi K.; Granderson R.; Schumacher C.M.; Chandran A.; Kingon Y.; Jennings J.M.	Identifying community-informed language to promote HIV pre-exposure prophylaxis (Prep) in black LGBTQ communities in Baltimore	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2020.32.2.152	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086624801&doi=10.1521%2faeap.2020.32.2.152&partnerID=40&md5=f80a129960b9110b7fa622f222d55276	LGBTQ populations, particularly Black men who have sex with men and transgender women, experience significant HIV disparities; public health messages may inadvertently stigmatize LGBTQ populations. We sought to use qualitative methods to inform a PrEP campaign. Unstructured focus groups were conducted among predominantly Black LGBTQ persons re-cruited through social media and events. Discussions were audio-recorded, transcribed, and analyzed in NVivo using categorical analysis. Eighty individuals participated in 13 focus groups; 80% (64) identified as sexual or gender minorities. Eighty-eight percent (70) identified as Black/African American. Four themes emerged: (1) culturally competent, communityinformed, locally relevant messaging, (2) avoiding stigmatizing language or images, (3) inaccessibility of clinical language, and (4) using identity labels representing local communities and their diversity. Findings suggest PrEP campaigns need to be developed through community-informed processes to engage and avoid stigmatizing priority populations. Ongoing partnerships between public health and LGBTQ communities can facilitate development of campaigns with engaging, acceptable language. © 2020 The Guilford Press. Article	2020	Fisher, Kimone Leigh; Mabuka, Jennifer M; Sivro, Aida; Ngcapu, Sinaye; Passmore, Jo-Ann Shelley; Osman, Farzana; Ndlovu, Bongiwe; Abdool Karim, Quarraisha; Abdool Karim, Salim S; Chung, Amy W; Baxter, Cheryl; Archary, Derseree	Topical Tenofovir Pre-exposure Prophylaxis and Mucosal HIV-Specific Fc-Mediated Antibody Activities in Women.	Frontiers in Immunology	-	-	-	-	1664-3224	10.3389/fimmu.2020.01274	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7357346	The RV144 HIV-vaccine trial highlighted the importance of envelope-specific non-neutralizing antibody (nNAb) Fc-mediated functions as immune correlates of reduced risk of infection. Since pre-exposure prophylaxis (PrEP) and HIV-vaccines are being used as a combination prevention strategy in at risk populations, the effects of PrEP on nNAb functions both mucosally and systemically remain undefined. Previous animal and human studies demonstrated reduced HIV-specific antibody binding avidity post-HIV seroconversion with PrEP, which in turn may affect antibody functionality. In seroconverters from the CAPRISA 004 tenofovir gel trial, we previously reported significantly higher detection and titres of HIV-specific binding antibodies in the plasma and genital tract (GT) that distinguished the tenofovir from the placebo arm. We hypothesized that higher HIV-specific antibody titres and detection reflected corresponding increased antibody-dependent neutrophil-mediated phagocytosis (ADNP) and NK-cell-activated antibody-dependent cellular cytotoxic (ADCC) activities. HIV-specific V1V2-gp70, gp120, gp41, p66, and p24 antibodies in GT and plasma samples of 48 seroconverters from the CAPRISA 004 tenofovir gel trial were tested for ADCP and ADCC at 3, 6- and 12-months post-HIV-infection. GT gp41- and p24-specific ADNP were significantly higher in the tenofovir than the placebo arm at 6 and 12 months respectively (p < 0.05). Plasma gp120-, gp41-, and p66-specific ADNP, and GT gp41-specific ADCC increased significantly over time (p < 0.05) in the tenofovir arm. In the tenofovir arm only, significant inverse correlations were observed between gp120-specific ADCC and gp120-antibody titres (r = -0.54; p = 0.009), and gp41-specific ADNP and gp41-specific antibody titres at 6 months post-infection (r = -0.50; p = 0.015). In addition, in the tenofovir arm, gp41-specific ADCC showed significant direct correlations between the compartments (r = 0.53; p = 0.045). Certain HIV-specific nNAb activities not only dominate specific immunological compartments but can also exhibit diverse functions within the same compartment. Our previous findings of increased HIV specific antibody detection and titres in women who used tenofovir gel, and the limited differences in nNAb activities between the arms, suggest that prior PrEP did not modulate these nNAb functions post-HIV seroconversion. Together these data provide insight into envelope-specific-nNAb Fc-mediated functions at the site of exposure which may inform on ensuring immunity during combination HIV prevention strategies including PrEP and HIV vaccines. Article	2020	Flores D.D.; Meanley S.P.; Wood S.M.; Bauermeister J.A.	Family Characteristics in Sex Communication and Social Support: Implications for Emerging Adult Men Who Have Sex with Men's PrEP Engagement	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-020-01648-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082945710&doi=10.1007%2fs10508-020-01648-4&partnerID=40&md5=9263d391210bf5ca34976d5836506a4	While emerging adulthood (ages 18–25) is marked by increased independence from parents, parental support remains a strong correlate of positive sexual health outcomes for heterosexual youth. With the emergence of pre-exposure prophylaxis (PrEP), few studies have examined the potential for parent–child sex communication and PrEP adoption among emerging adult men who have sex with men (MSM). We aimed to describe the extent to which parents/family characteristics play supportive roles in emerging adult MSM's current PrEP use. PrEP-indicated participants (N = 222) were recruited via social media to complete an online survey. Multivariable logistic regression assessed associations between emerging adult MSM's current PrEP use and comfort with parent–child sex communication, family social support, family outness, and family prioritization, adjusted for sociodemographic variables. Thirty percent of participants reported current PrEP use. Only 20% reported moderate/high comfort with parent sex communication, 80% reported any family sexual identity disclosure, 70% reported moderate/high family social support, and 70% ranked family as a high/very high priority. Our multivariable model demonstrated an association between comfort with parent–child sex communication with current PrEP use only (AOR= 1.55, 95% CI 1.04–2.32). Our findings support that parents of emerging adult MSM possess a critical potential to reduce their sons' risk of HIV and promote PrEP uptake. Interventions that facilitate parents' efficacy to foster affirming, non-judgmental environments and discussions about their child's sexual behaviors, attractions/relationships, and health (e.g., PrEP) may be impactful in reducing the high HIV incidence rate that burdens emerging adult MSM. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Fogarty, Linda; Abednego Musau; Kabue, Mark; Were, Daniel; Mutegi, Jane; Ongwen, Patricia; Kamau, Mercy; Reed, Jason	Using developmental evaluation to implement an oral pre-exposure prophylaxis (PrEP) project in Kenya: version 1; peer review: 2 approved with reservations	Gates Open Research	-	-	-	-	25724754	10.12688/gatesopenres.13184.1	https://www.proquest.com/scholarly-journals/using-developmental-evaluation-implement-oral-pre/docview/2661524051/se-2?accountid=8113	Oral Pre-Exposure Prophylaxis (PrEP) is highly effective in lowering HIV transmission risk. The Bill and Melinda Gates-funded Jilinde Project was designed to identify the best ways to introduce and support PrEP services in Kenya for female sex workers, men who have sex with men, and adolescent girls and young women. We chose Developmental Evaluation (DE) as a core project approach because our goal was not just to recruit 20,000 new PrEP users, but to learn how to deliver PrEP effectively to optimally benefit users in a complex, dynamic, resource-limited setting. This paper describes how we incorporated DE into the Jilinde Project, and shares experiences and lessons learned about the value of DE in PrEP service implementation in a real-world situation. With the Ministry of Health, Jilinde developed consensus about the structure and roll-out of PrEP services. The DE evaluator, embedded in Jilinde, designed and implemented the five-step DE methodology—collect, review, reflect, record and act—according to a core set of project guiding principles. The paper describes how we operationalized the five elements, citing findings reported and actions taken reflecting on the data. It summarizes challenges to DE implementation, such as uneven uptake and competing demands, and how we addressed those challenges. Used consistently, DE helped adapt and refine PrEP services, improve service access, reach target audiences and improve continuation rates. The look, feel and yield of our DE efforts evolved over time, increasingly integrated into existing systems and providing deeper and richer understandings, and we learned how to better implement DE in the future. This case study provides practical guidance for using a DE approach in program design. The DE process can be used successfully working with partners on a common complex public health challenge within a dynamic environment in a way that feeds back into and improves programs. HIV drug resistance in a cohort of HIV-infected MSM in the United States	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000002394	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075960090&doi=10.1097%2fQAD.0000000000002394&partnerID=40&md5=506865cb099c01e8477fbf1223e2a726	Objective: To analyze HIV drug resistance among MSM recruited for participation in the HPTN 078 study, which evaluated methods for achieving and maintaining viral suppression in HIV-infected MSM.Methods:Individuals were recruited at four study sites in the United States (Atlanta, Georgia; Baltimore, Maryland; Birmingham, Alabama; and Boston, Massachusetts; 2016-2017). HIV genotyping was performed using samples collected at study screening or enrollment. HIV drug resistance was evaluated using the Stanford v8.7 algorithm. A multiassay algorithm was used to identify individuals with recent HIV infection. Clustering of HIV sequences was evaluated using phylogenetic methods.Results:High-level HIV drug resistance was detected in 44 (31%) of 142 individuals (Atlanta: 21%, Baltimore: 29%, Birmingham: 53%, Boston: 26%); 12% had multiclass resistance, 16% had resistance to tenofovir or emtricitabine, and 8% had resistance to integrase strand transfer inhibitors (INSTIs); 3% had intermediate-level resistance to second-generation INSTIs. In a multivariate model, self-report of ever having been on antiretroviral therapy (ART) was associated with resistance (P=0.005). One of six recently infected individuals had drug resistance. Phylogenetic analysis identified five clusters of study sequences; two clusters had shared resistance mutations.Conclusion:High prevalence of drug resistance was observed among MSM. Some had multiclass resistance, resistance to drugs used for preexposure prophylaxis (PrEP), and INSTI resistance. These findings highlight the need for improved HIV care in this high-risk population, identification of alternative regimens for PrEP, and inclusion of integrase resistance testing when selecting ART regimens for MSM in the United States. Article	2020	Folayan M.O.; Peterson K.	HIV prevention clinical trials' community engagement guidelines: inequality, and ethical conflicts	Global Bioethics	-	-	-	-	11287462	10.1080/11287462.2020.1773061	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087042554&doi=10.1080%2f11287462.2020.1773061&partnerID=40&md5=b4281b828431d97945dcbb9795343b20	In 2004 and 2005, the first clinical trials were launched to investigate the use of tenofovir for HIV prevention in Cambodia,Cameroon, Nigeria and Thailand. Controversies erupted over the ethical integrity of the research protocol. We reflect on the events that ledto the controversies and identified that scientific and ethical concerns raised by members of local communities at each of these sites wereerased by trialists, causing crisis that led to premature shut down the early PrEP trials. In the aftermath of these trials, the World HealthOrganisation, UNAIDS, and AVAC developed ethics guidelines intended to recognize the concerns as authentic, and developed guidelines toimprove researchers' engagement of communities in biomedical HIV prevention trial design and implementation. Our findings suggest thatthe ethics guidelines are limited in its ability to address power inequalities that leads to voice erasures and non-recognition of localcompetencies. Rather the ethical documents enabled trialists to gain a new sense of authority through the interpretations of ethical researchconduct enabling trialists regain power that can further entrench inequality and voice erasures. To address concerns with what seems anintractable problem, we suggested models of engagement for off-shored research may be the option. © 2020, © 2020 The Author(s). Article	2020	Fonner, Virginia A.; Sands, Anita; Figueroa, Carmen; Baggaley, Rachel; Quinn, Caitlin; Jamil, Muhammad S.; Johnson, Cheryl	Country adherence to WHO recommendations to improve the quality of HIV diagnosis: a global policy review.	BMJ Glob Health	-	-	-	-	2059-7908	10.1136/bmjgh-2019-001939	https://gh.bmj.com/content/5/5/e001939	INTRODUCTION: Ensuring a correct and timely HIV diagnosis is critical. WHO publishes guidelines on HIV testing strategies that maximise the likelihood of correctly determining one's HIV status. A review of national HIV testing policies in 2014 found low adherence to WHO guidelines. We updated this review to determine adherence to current recommendations. METHODS: We conducted a comprehensive policy review through April 2018. We extracted data on HIV testing strategies, recommendations on HIV retesting prior to antiretroviral therapy (ART) initiation and pre-exposure prophylaxis (PrEP)-related HIV testing information. Descriptive analyses disaggregated by region were conducted to ascertain adherence to recommendations and to describe testing strategy characteristics. RESULTS: Of 91 policies included, 26% (n=24/91) adhered to WHO recommendations. Having a two-assay testing strategy to rule-in HIV infection as opposed to the recommended three-assay testing strategy was a major reason for non-adherence. Of 72 country policies providing sufficient information, 31% (n=22) recommended retesting for HIV prior to initiating ART. Of 25 countries and two regions reporting PrEP-related HIV testing guidelines, almost all recommended testing prior to initiating PrEP and every 3 months during PrEP use. CONCLUSIONS: Global adherence to WHO recommendations for HIV testing strategies have improved since 2014 but remain low. We found adherence existed on a continuum. Such a system provides insights into how countries can move towards adherence by making relatively minor changes to testing strategies. Guidance from WHO on the role of new HIV testing technologies within testing algorithms and identifying ways to simplify testing guidance is warranted. Article	2020	Francesc Mir, Joan; Mazarío, Manuel F; Coll, Pep	Modelos de implementación y acceso a la profilaxis preexposición para el VIH en España	Enfermedades Infecciosas y Microbiología Clínica	-	-	-	-	0213-005X	10.1016/j.eimc.2019.05.004	https://pesquisa.bvsalud.org/portal/resource/pt/ibc-201093	Para implementar la profilaxis preexposición (PrEP) para el VIH en España deben barajarse los diferentes modelos que se ajusten a nuestro Sistema Nacional de Salud. Las experiencias de países con entorno similar permiten adelantar sus beneficios y sus defectos antes de su implementación. Los modelos de implementación posibles para el circuito de prescripción-seguimiento-dispensación podrían implicar hospitales, centros de ITS, centros de Atención Primaria y farmacia comunitaria. Por un lado, el circuito hospitalario es el menos eficiente y presumiblemente no podría satisfacer la potencial demanda, aunque podría ser implantado inmediatamente. Por otro lado, la accesibilidad se ampliaría si su prescripción y dispensación tuvieran lugar desde la Atención Primaria y la farmacia comunitaria. La incorporación de centros de ITS públicos y comunitarios sería la mejor opción para atraer a población no frecuentadora del sistema sanitario general y su gestión compartida con Atención Primaria permitiría el acceso a la PrEP en el territorio nacional	Acceso a los servicios de salud; Implementación de plan de salud; Profilaxis preexposición; Virus de la inmunodeficiencia humana; Servicios de salud comunitária; Infecciones de transmisión sexual; Salud sexual	Spanish	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Review
Article	2020	Freeborn K.; Portillo C.; Boyer C.B.; Santos G.M.	Misclassification of sexual health risks in a self-identified low risk cohort of men who have sex with men (MSM) enrolled in a community based PrEP program	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2019.1620167	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85066890701&doi=10.1080%2f09540121.2019.1620167&partnerID=40&md5=1539544d21a9a867c3e27be58ce7a22f	The CDC recommends PrEP for MSM at substantial risk of HIV acquisition, leaving clinicians unsure whether to prescribe PrEP to MSM who do not disclose HIV risk factors. A longitudinal cohort of MSM requesting PrEP despite reporting during a clinical visit either 100% condom use or participation in oral sex only and no other risk factors was followed over 13 months at a community clinic in San Francisco to assess the accuracy of their HIV risk perception. Participants completed a sexual and substance use behavior questionnaire at baseline, outside of the clinical visit and were followed by quarterly HIV/STI testing and condom use change questionnaires. Condomless sex increased from 0% at baseline to 12% at month 1, peaked at 34% at month 7, and then decreased again to 8% at month 13. Rates of pharyngeal GC/CT varied from 7% at baseline to 12% at month 13, while rectal GC/CT decreased from 7% at baseline to 0% at month 13. The rate of syphilis was 1% both at baseline and at month 13, however, 11% and 15% of clients tested positive for syphilis at months 1 and 7 respectively. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group. Article	2020	Furukawa N.W.; Schneider J.A.; Coleman M.E.; Wiener J.B.; Shrestha R.K.; Smith D.K.	Out-of-pocket costs and HIV pre-exposure prophylaxis persistence in a US multicity demonstration project	Health Services Research	-	-	-	-	179124	10.1111/1475-6773.13285	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082675071&doi=10.1111%2f1475-6773.13285&partnerID=40&md5=f90ade62b771565a72966458b94557c0	Objective: To evaluate whether out-of-pocket (OOP) costs reduced HIV pre-exposure prophylaxis (PrEP) persistence. Data Source: Participants from five urban community health centers (CHCs) in four US cities enrolled in a PrEP demonstration project from September 2014 to August 2017. Study Design: Patients initiating PrEP were followed quarterly until they withdrew from PrEP care or the study ended. Self-reported OOP medication and clinic visit costs were assessed by semiannual questionnaires. Persistence was defined as the time from study enrollment to the last visit after which two subsequent 3-month visits were missed. Multivariable Cox proportional hazard regression was used to assess the effect of demographics, insurance, and OOP costs on PrEP persistence. Principal Findings: Among 918 participants with OOP cost data, the average quarterly OOP cost was $34 (median: $5, IQR: $0-$25). Participants who were men, White, employed, completed college, and had commercial insurance had higher OOP costs. Higher OOP costs were not associated with lower PrEP persistence by Cox proportional hazards regression (adjusted hazard ratio = 1.00 per $50 increase, 95% CI = 0.97, 1.02). Conclusion: Among patients receiving care from these urban CHCs, OOP costs were low and did not undermine PrEP persistence. © Health Research and Educational Trust	community health clinic; HIV prevention; out-of-pocket costs; persistence; pre-exposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Furukawa N.W.; Smith D.K.; Gonzalez C.J.; Huang Y.-L.A.; Hanna D.B.; Felsen U.R.; Zhu W.; Arnsten J.H.; Patel V.V.	Evaluation of Algorithms Used for PrEP Surveillance Using a Reference Population From New York City, July 2016–June 2018	Public Health Reports	-	-	-	-	333549	10.1177/0033354920904085	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079188006&doi=10.1177%2f0033354920904085&partnerID=40&md5=0d69221bce241e88e6e38dd08140738e	Objective: Daily tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) use as HIV preexposure prophylaxis (PrEP) is monitored by identifying TDF/FTC prescriptions from pharmacy databases and applying diagnosis codes and antiretroviral data to algorithms that exclude TDF/FTC prescribed for HIV postexposure prophylaxis (PEP), HIV treatment, and hepatitis B virus (HBV) treatment. We evaluated the accuracy of 3 algorithms used by the Centers for Disease Control and Prevention (CDC), Gilead Sciences, and the New York State Department of Health (NYSDOH) using a reference population in Bronx, New York. Methods: We extracted diagnosis codes and data on all antiretroviral prescriptions other than TDF/FTC from an electronic health record database for persons aged ≥16 prescribed TDF/FTC during July 2016–June 2018 at Montefiore Medical Center. We reviewed medical records to classify the true indication of first TDF/FTC use as PrEP, PEP, HIV treatment, or HBV treatment. We applied each algorithm to the reference population and compared the results with the medical record review. Results: Of 2862 patients included in the analysis, 694 used PrEP, 748 used PEP, 1407 received HIV treatment, and 13 received HBV treatment. The algorithms had high specificity (range: 98.4%-99.0%), but the sensitivity of the CDC algorithm using a PEP definition of TDF/FTC prescriptions ≤30 days was lower (80.3%) than the sensitivity of the algorithms developed by Gilead Sciences (94.7%) or NYSDOH (96.1%). Defining PEP as TDF/FTC prescriptions ≤28 days improved CDC algorithm performance (sensitivity, 95.8%; specificity, 98.8%). Conclusions: Adopting the definition of PEP as ≤28 days of TDF/FTC in the CDC algorithm should improve the accuracy of national PrEP surveillance. © 2020, Association of Schools and Programs of Public Health.	algorithm; HIV; New York; preexposure prophylaxis; surveillance; validation	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2020	Furukawa, Nathan W; Maksut, Jessica L; Zlotorzynska, Maria; Sanchez, Travis H; Smith, Dawn K; Baral, Stefan D	Sexuality Disclosure in U.S. Gay, Bisexual, and Other Men Who Have Sex With Men: Impact on Healthcare-Related Stigmas and HIV Pre-Exposure Prophylaxis Denial.	American Journal of Preventive Medicine	-	-	-	-	1873-2607	10.1016/j.amepre.2020.02.010	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7375915	INTRODUCTION: Stigma impairs access to health care by gay, bisexual, and other men who have sex with men. Gay, bisexual, and other men who have sex with men who are open about their sexuality, or out, are more resilient to stigma than those who are not out. Outness may influence healthcare utilization and prescription of HIV pre-exposure prophylaxis to HIV-negative gay, bisexual, and other men who have sex with men. METHODS: Analyzing the 2018 American Men's Internet Survey during 2019, the adjusted prevalence ratios of healthcare stigmas and outness to healthcare providers were calculated. The effect of outness on annual healthcare visits and stigma was measured. Pre-exposure prophylaxis seeking and denial by providers was quantified and stratified by outness. RESULTS: Of 5,794 respondents, 3,402 (58.7%) were out to their provider. Out gay, bisexual, and other men who have sex with men were less likely to experience anticipated stigma (adjusted prevalence ratio=0.75, 95% CI=0.72, 0.80) but more likely to experience enacted stigma or discrimination (adjusted prevalence ratio=1.23, 95% CI=1.18, 1.28). In a subsample of out gay, bisexual, and other men who have sex with men, recently experienced discrimination was associated with higher healthcare utilization (adjusted prevalence ratio=1.51, 95% CI=1.14, 1.51). Conversely, recent experienced discrimination was associated with lower healthcare utilization in not out gay, bisexual, and other men who have sex with men (adjusted prevalence ratio=0.67, 95% CI=0.54, 0.82). Of 3,104 out gay, bisexual, and other men who have sex with men, 1,417 (45.7%) discussed pre-exposure prophylaxis with their providers, compared with 120 of 1,711 (7.0%) gay, bisexual, and other men who have sex with men who were not out (p<0.001). Pre-exposure prophylaxis denials were less common among out (116/793, 14.6%) than not out (14/55, 25.5%) gay, bisexual, and other men who have sex with men (p=0.044). CONCLUSIONS: Healthcare provider-related stigmas impair healthcare engagement among not out gay, bisexual, and other men who have sex with men who were also more commonly denied pre-exposure prophylaxis. Ending the HIV epidemic necessitates creating safe environments for disclosure of sexual preferences and practices to facilitate access to HIV prevention. Article	2020	Furukawa, Nathan W; Zhu, Weiming; Huang, Ya-Lin A; Shrestha, Ram K; Hoover, Karen W	National trends in drug payments for HIV preexposure prophylaxis in the United States, 2014 to 2018: A retrospective cohort study	Annals of Internal Medicine	-	-	-	-	34819	10.7326/M20-0786	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096348006&doi=10.7326%2fM20-0786&partnerID=40&md5=a2ebe620b1025a9b120e6172d9243cb4	Background: Use of HIV preexposure prophylaxis (PrEP) has increased nationwide, but the magnitude and distribution of PrEP medication costs across the health care system are unknown. Objective: To estimate out-of-pocket (OOP) and third-party payments using a large pharmacy database. Design: Retrospective cohort study. Setting: Prescriptions for tenofovir disoproxil fumarate with emtricitabine (TDF-FTC) for PrEP in the United States in the IQVIA Longitudinal Prescriptions database, which covers more than 90% of retail pharmacy prescriptions. Measurements: Third-party, OOP, and total payments were compared by third-party payer, classified as commercial, Medicaid, Medicare, manufacturer assistance program, or other. Missing payment data were imputed using a generalized linear model to estimate overall PrEP medication payments. Results: Annual PrEP prescriptions increased from 73 739 to 1 100 684 during 2014 to 2018. Over that period, the average total payment for 30 TDF-FTC tablets increased from $1350 to $1638 (5.0% compound annual growth rate) and the average OOP payment increased from $54 to $94 (14.9% compound annual growth rate). Of the $1638 in total payments per 30 TDF- FTC tablets in 2018, OOP payments accounted for $94 (5.7%) and third-party payments for $1544 (94.3%). Out-of-pocket payments per 30 tablets were lower among Medicaid recipients ($3) than among those with Medicare ($80) or commercial insurance ($107). Payments for PrEP medication in the IQVIA database in 2018 totaled $2.08 billion; $1.68 billion (80.7%) originated from prescriptions for persons with commercial insurance, $200 million (9.6%) for those with Medicaid, $48 million (2.3%) for those with Medicare, and $127 million (6.1%) for those with manufacturer assistance. Limitation: The IQVIA database does not capture every prescription nationwide. Conclusion: Third-party and OOP payments per 30 TDF-FTC tablets increased annually. The $2.08 billion in PrEP medication payments in 2018 is an underestimation of national costs. High costs to the health care system may hinder PrEP expansion. © 2020 American College of Physicians. Article	2020	Fusca L.; Hull M.; Ross P.; Grennan T.; Burchell A.N.; Bayoumi A.M.; Tan D.H.S.	High Interest in Syphilis Pre-exposure and Post-exposure Prophylaxis among Gay, Bisexual and Other Men Who Have Sex with Men in Vancouver and Toronto	Sexually Transmitted Diseases	-	-	-	-	1485717	10.1097/OLQ.0000000000001130	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081944079&doi=10.1097%2fOLQ.0000000000001130&partnerID=40&md5=d22f33d60bc8eb786f516548d03201fc	Background We assessed the acceptability of doxycycline-based syphilis pre-exposure and post-exposure prophylaxis (PrEP/PEP) as well as human immunodeficiency virus (HIV) PrEP/PEP in gay, bisexual, and other men who have sex with men (gbMSM). Methods We recruited gbMSM from Toronto and Vancouver sexually transmitted infection (STI) clinics during routine visits from June 2018 to August 2018. We analyzed data using descriptive statistics and constructed multivariable logistic regression models for willingness to use syphilis and HIV PrEP and PEP respectively. Results Among 424 participants (56.4% Toronto, 43.6% Vancouver), median (interquartile range IQR) age was 31.0 years (26.0-39.0 years), 61.7% had completed postsecondary education and 54.4% were white. Median (IQR) number of male partners in the past 6 months was 6.0 (3.0-13.0), and 18.2% had 1 or more prior syphilis diagnosis. 60.1%/44.1% indicated willingness to use syphilis PrEP/PEP; 36.6% were unwilling to use either. Among HIV-negative participants, 74.0% and 75.2% were willing to use HIV PrEP and PEP, respectively. Most participants were familiar with antibiotic resistance (89.0%) and agreed that syphilis rates are rising in Canada (68.2%), but only 55.4% believed they were at risk for syphilis. Agreement with the latter statement was associated with willingness to use syphilis PrEP (adjusted odds ratio aOR, 1.6; 95% confidence interval 95%CI, 1.0-2.5), as was previous/existing HIV PrEP use (aOR, 2.2; 95% CI, 1.1-4.3) and being "very concerned" about STI acquisition (aOR, 1.9; 95% CI, 1.0-3.4). Odds of being willing to use syphilis PEP were higher in Toronto versus Vancouver (aOR, 2.0; 95% CI, 1.2-3.4) and increased with the number of different STIs previously diagnosed (aOR, 1.4; 95% CI, 1.2,1.7). Conclusions There is considerable interest in syphilis PrEP/PEP in gbMSM attending Toronto/Vancouver STI clinics. © Lippincott Williams & Wilkins. Article	2020	Galka, Jonathan M; Wang, Melinda; Azwa, Iskandar; Gibson, Britton; Lim, Sin How; Shrestha, Roman; Wickersham, Jeffrey A	Willingness to Use Pre-Exposure Prophylaxis (PrEP) for HIV Prevention and PrEP Implementation Preferences Among Transgender Women in Malaysia.	Transgender Health	-	-	-	-	2688-4887	10.1089/trgh.2020.0003	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7906238	Introduction: Transgender women (TW) face one of the highest HIV burdens worldwide. In Malaysia, 12.4% of TW are HIV infected, â¼30-fold higher than in the Malaysian adult population. Pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention strategy, however, little is known about TW's willingness to use PrEP or their preferences for receiving PrEP. This study examined the correlates of Malaysian TW's willingness to use PrEP and their attitudes and preferences related to delivery of PrEP and PrEP-related care. Methods: Between June and August 2017, 361 TW in Malaysia completed an online survey about their knowledge of and willingness to use PrEP for HIV prevention. Results: Only 20.2% of participants had ever previously heard of PrEP and none were currently taking PrEP. The majority (82.5%) expressed high willingness to take PrEP and most participants met the World Health Organization (WHO) indication for PrEP (82.3%). In the multivariate model, lifetime hormone use, prior postexposure prophylaxis use, and having completed a high school education were associated with higher willingness to use PrEP, while injection drug use, older age, and Chinese ethnicity were associated with lower PrEP willingness. Conclusion: TW in Malaysia are highly willing to use PrEP for HIV prevention. Differences in willingness to use PrEP identified by education, ethnicity, substance abuse, and age suggest different strategies may be needed to scale-up PrEP for this diverse community of TW. Article	2020	Gamarel K.E.; Golub S.A.	Sexual goals and perceptions of goal congruence in individuals' PrEP adoption decisions: A mixed-methods study of gay and bisexual men who are in primary relationships	Annals of Behavioral Medicine	-	-	-	-	8836612	10.1093/abm/kaz043	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082342520&doi=10.1093%2fabm%2fkaz043&partnerID=40&md5=e0c73eb67cd6b82b3578779fa67853ac	Background: Although health goals are recognized as a central feature of health behavior theories, the relational context through which goals are conceptualized is often overlooked. Interdependence theory represents a valuable framework for understanding goals in the adoption of health behaviors, such as pre-exposure prophylaxis (PrEP), among gay and bisexual men in primary relationships. Purpose: We examined the content and focus of men's sexual health goals, as well as whether goal content, goal focus, or perceptions of goal congruence with a primary partner were related to PrEP adoption among gay and bisexual men in primary relationships. Methods: Mixed-methods data were collected from a PrEP demonstration project from 145 HIV-negative gay and bisexual men in primary relationships. Participants reported their sexual health goals and completed measures of perceptions of goal congruence, relationship factors, and sociodemographic factors. Results: Three main goal content categories were identified: prevention, satisfaction, and intimacy. In expressing these goals, participants framed them with either a self-focus or a relationship-focus. Men in serodiscordant relationships reported more intimacy goals and greater perceptions of goal congruence. There were no differences in goal content or focus by sexual agreement. In the multivariable logistic regression model, perceived goal congruence was associated with PrEP adoption, over and above covariates. Conclusions: Intimate relationships play a significant role in the formation of health-related goals. Goal content, focus, and perceived congruence with partners may represent important targets for HIV prevention interventions for gay and bisexual men in primary relationships, especially in the context of PrEP. © Society of Behavioral Medicine 2019. Article	2020	Gamarel, Kristi E; Sevelius, Jae M; Neilands, Torsten B; Kaplan, Rachel L; Johnson, Mallory O; Nemoto, Tooru; Darbes, Lynae A; Operario, Don	Couples-based approach to HIV prevention for transgender women and their partners: study protocol for a randomised controlled trial testing the efficacy of the 'It Takes Two' intervention.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2020-038723	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7566735	INTRODUCTION: HIV transmission and acquisition risk among transgender women is particularly high in the context of primary partnerships. This project extends a previous pilot couples-focused HIV intervention programme, which was shown to be feasible, acceptable and promising in reducing sexual risk behaviour among transgender women and their partners. This randomised controlled trial (RCT) tests the efficacy of this culturally sensitive HIV prevention programme for HIV-serodiscordant and HIV-negative seroconcordant transgender women and their partners. METHODS AND ANALYSIS: To finalise the protocol for trial, we used qualitative methods to hone eligibility criteria, refine the intervention and control manuals, and name and brand the intervention ('It Takes Two'). The RCT investigates the effects of the It Takes Two intervention on Composite Risk for HIV (CR-HIV) among 100 couples. CR-HIV is a binary indicator of couple HIV risk using validated measures of sexual behaviour, pre-exposure prophylaxis use among HIV-negative participants and viral suppression among participants living with HIV. Using a two-arm RCT, we will examine intervention effects on CR-HIV at 12-month follow-up comparing transgender women and their partners randomised to the intervention versus control (HIV prevention information only). ETHICS AND DISSEMINATION: This study has been reviewed and approved by the University of California, San Francisco (19-28624) and the University of Michigan (HUM00147690) Institutional Review Boards. Participants provide informed consent before taking part of the study activities. Results will be published in peer-reviewed journals and presented at scientific conferences. We will make our results available to the community of researchers and general public interested in transgender health to avoid unintentional duplication of research, as well as to others in the health and social services community, including LGBT community-based organisations, AIDS service organisations and other transgender-serving organisations. The full de-identified dataset and codebook will be shared at the University of Michigan Digital Repository. TRIAL REGISTRATION NUMBER: NCT04067661. Article	2020	Gandhi M.; Wang G.; King R.; Rodrigues W.C.; Vincent M.; Glidden D.V.; Cressey T.R.; Bacchetti P.; Spinelli M.A.; Okochi H.; Siriprakaisil O.; Klinbuayaem V.; Mugo N.R.; Ngure K.; Drain P.K.; Baeten J.M.	Development and validation of the first point-of-care assay to objectively monitor adherence to HIV treatment and prevention in real-time in routine settings	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000002395	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077226567&doi=10.1097%2fQAD.0000000000002395&partnerID=40&md5=9f36fb6a59b8d58e01e29eec83e37a7d	Objective: HIV prevention and treatment studies demonstrate that pharmacologic adherence metrics are more accurate than self-report. Currently available metrics use liquid-chromatography/tandem-mass-spectrometry (LC-MS/MS), which is expensive and laboratory-based. We developed a specific and sensitive antibody against tenofovir, the backbone of treatment and prevention, but conversion to a lateral flow assay (LFA) - analogous to a urine pregnancy test - is required for point-of-care testing. We describe the development of the first LFA to measure antiretroviral adherence in real-time.Methods:Previous work in a directly observed therapy study of providing tenofovir disoproxil fumarate (TDF) to HIV-noninfected volunteers at various simulated adherence patterns defined the appropriate cut-off for the LFA (1500 ng tenofovir/ml urine). We developed the LFA using a sample pad for urine; a conjugate pad coated with TFV-specific antibodies conjugated to colloidal gold nanoparticles; a nitrocellulose membrane striped with tenofovir-antigen (test line) and a control line; with an absorbent pad to draw urine across the reaction membrane.Results:We tested 300 urine samples collected from the directly observed therapy study by this LFA and the gold-standard method of LC-MS/MS. The LFA demonstrated 97% specificity (95% CI 93-99%) and 99% sensitivity (94-100%) compared with LC-MS/MS. The LFA accurately classified 98% of patients who took a dose within 24 h as adherent.Conclusion:We describe the development and validation of the first point-of-care assay to measure short-term adherence to HIV prevention and treatment in routine settings. The assay is low-cost, easy-to-perform and measures the breakdown product (tenofovir) of both TDF and tenofovir alafenamide (TAF). This assay has the potential to improve HIV and PrEP outcomes worldwide by triggering differentiated service delivery with further study merited. © 2019 Wolters Kluwer Health, Inc. A randomized multicenter clinical trial to evaluate the efficacy of melatonin in the prophylaxis of SARS-CoV-2 infection in high-risk contacts (MeCOVID Trial): A structured summary of a study protocol for a randomised controlled trial	Trials	-	-	-	-	17456215	10.1186/s13063-020-04436-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086008491&doi=10.1186%2fs13063-020-04436-6&partnerID=40&md5=2de43d5fe4d0b50a1e0eef0bcabfa705	Objectives: Primary objective: to evaluate the efficacy of melatonin as a prophylactic treatment on prevention of symptomatic SARS-CoV-2 infection among healthcare workers at high risk of SARS-CoV-2 exposure. Secondary objectives: To evaluate the efficacy of melatonin as a prophylactic treatment on prevention of asymptomatic SARS-CoV-2 infection. To evaluate the efficacy of melatonin to prevent the development of severe COVID-19 in the participants enrolled in this study who develop SARS-CoV-2 infection along the trial. To evaluate the duration of COVID-19 symptoms in participants receiving melatonin before the infection. To evaluate seroconversion timing post-symptom onset. Exploratory objectives: To compare severity of COVID-19 between men and women. To evaluate the influence of sleep and diet on prevention from SARS-CoV-2 infection. To evaluate the effect of melatonin on the incidence and characteristics of lymphopenia and increase of inflammatory cytokines related to COVID-19. Trial design: This is a two-arm parallel randomised double-blind controlled trial to evaluate the efficacy of melatonin versus placebo in the prophylaxis of coronavirus disease 2019 among healthcare workers. Participants: Inclusion Criteria: Male or female participants ≥ 18 and ≤ 80 years of age. Healthcare workers from the public and private Spanish hospital network at risk of SARS-CoV 2 infection. Not having a previous COVID19 diagnosis. Understanding the purpose of the trial and not having taken any pre-exposure prophylaxis (PrEP) including HIV PrEP from March 1st 2020 until study enrolment. Having a negative SARS-CoV 2 reverse-transcription PCR (RT-PCR) result or a negative serologic rapid test (IgM/IgG) result before randomization. Premenopausal women must have a negative urinary pregnancy test in the 7 days before starting the trial treatment. Premenopausal women and males with premenopausal couples must commit to using a high efficiency anticonceptive method. Exclusion Criteria: HIV infection. Active hepatitis B infection. Renal failure (CrCl < 60 mL/min/1.73 m2) or need for hemodialysis. Osteoporosis. Myasthenia gravis. Pre-existent maculopathy. Retinitis pigmentosa. Bradycardia (less than 50 bpm). Weight less than 40 Kg. Participant with any immunosuppressive condition or hematological disease. Treatment with drugs that may prolong QT in the last month before randomization for more than 7 days including: azithromycin, chlorpromazine, cisapride, clarithromycin, domperidone, droperidol, erythromycin, halofantrine, haloperidol, lumefantrine, mefloquine, methadone, pentamidine, procainamide, quinidine, quinine, sotalol, sparfloxacin, thioridazine, amiodarone. Hereditary intolerance to galactose, Lapp lactase deficiency or glucose or galactose malabsorption. Treatment with fluvoxamine. Treatment with benzodiazepines or benzodiazepine analogues such as zolpidem, zopiclone or zaleplon. Pregnancy. Breastfeeding. History of potentially immune derived diseases such as: lupus, Crohn's disease, ulcerative colitis, vasculitis or rheumatoid arthritis. Insulin-dependent diabetes mellitus. Known history of hypersensitivity to the study drug or any of its components. Patients that should not be included in the study at the judgment of the research team. Participants will be recruited from the following eight hospitals in Madrid, Spain: Hospital Universitario La Paz, Hospital Ramón y Cajal, Hospital Infanta Sofía, Hospital 12 de Octubre, Hospital Clínico San Carlos, Hospital Central de la defensa Gómez Ulla,Hospital de La Princesa and Hospital Infanta Leonor. Intervention and comparator: Experimental: Melatonin (Circadin®, Exeltis Healthcare, Spain): 2 mg of melatonin orally before bedtime for 12 weeks. Comparator: Identical looking placebo (Laboratorios Liconsa, Spain) orally before bedtime for 12 weeks. Main outcomes: Number of SARS-CoV-2 (COVID-19) symptomatic infections confirmed by polymerase chain reaction (PCR) test or serologic test or according to each centre diagnosis protocol. Primary outcome will be measured until the end of treatment for each participant (until the date of the last dose taken by each patient). Randomisation: Patients who meet all inclusion and no exclusion criteria will be randomised, stratified by centres, sex and age (<50 and ≥ 50 years old). The randomisation sequence was created using SAS version 9.4 statistical software (procedure 'PROC PLAN') with a 1:1 allocation. No randomisation seed was specified. The randomisation seed was generated taking the hour of the computer where the program was executed. Randomization will be done centrally through the electronic system RedCAP® in order to conceal the sequence until interventions are assigned Blinding (masking): Participants, caregivers, and those assessing the outcomes are blinded to group assignment. Numbers to be randomised (sample size): A total of 450 participants are planned to be enrolled in this clinical trial, 225 in the experimental arm and 225 in the placebo arm. Trial Status: Protocol version 3.0, 17th of April 2020. Recruitment ongoing. First participant was recruited on the 21st of April 2020. The final participant is anticipated to be recruited on the 31st of May 2020. As of May 18th, 2020, a total of 312 participants have been enrolled (154 at Hospital La Paz, 85 at Hospital Infanta Sofia and 73 at Hospital 12 de Octubre). Trial registration: EU Clinical Trials Register: 2020-001530-35; Date of trial registration: 13th of April 2020; https://www.clinicaltrialsregister.eu/ctr-search/trial/2020-001530-35/ES Full protocol: The full protocol is attached as an additional file, accessible from the Trials website (Additional file 1). In the interest in expediting dissemination of this material, the familiar formatting has been eliminated; this Letter serves as a summary of the key elements of the full protocol. © 2020 The Author(s). Article	2020	Geldsetzer P.; Bärnighausen K.; Hettema A.; McMahon S.A.; Dalal S.; Chase R.P.; Oldenburg C.E.; Kohler S.; Chen S.; Dlamini P.; Mavuso M.; Hughey A.B.; Matse S.; Bärnighausen T.	A stepped-wedge randomized trial and qualitative survey of HIV pre-exposure prophylaxis uptake in the Eswatini population	Science Translational Medicine	-	-	-	-	19466234	10.1126/scitranslmed.aba4487	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091544855&doi=10.1126%2fscitranslmed.aba4487&partnerID=40&md5=ecdf5c279010259018db8480b67e43aa	Clinical trials have shown that antiretroviral drugs used as pre-exposure prophylaxis (PrEP) are highly effective for preventing HIV acquisition. PrEP efforts, including in sub-Saharan Africa, have almost exclusively focused on certain priority groups, particularly female sex workers, men having sex with men, pregnant women, serodiscordant couples, and young women. As part of a PrEP demonstration project involving the general population at six primary health care facilities in Eswatini (formerly Swaziland), we conducted a randomized trial of a health care facility-based PrEP promotion package designed to increase PrEP uptake. Over the 18-month study duration, 33.6% (517 of 1538) of adults identified by health care workers as being at risk of acquiring HIV took up PrEP, and 30.0% of these individuals attended all scheduled appointments during the first 6 months after initiation of PrEP. The PrEP promotion package was associated with a 55% (95% confidence interval, 15 to 110%; P = 0.036) relative increase in the number of individuals taking up PrEP, with an absolute increase of 2.2 individuals per month per health care facility. When asked how PrEP uptake could be improved in 217 accompanying in-depth qualitative interviews, interviewees recommended an expansion of PrEP promotion activities beyond health care facilities to communities. Although a health care facility-based PrEP promotion package improved PrEP uptake, both uptake and retention remained low. Expanding promotion activities to the community is needed to achieve greater PrEP coverage among adults at risk of HIV infection in Eswatini and similar settings. Copyright © 2020 The Authors. Article	2020	Gesink, Dionne; Salway, Travis; Kimura, Lauren; Connell, James	Sexual Health Knowledge, Attitudes, and Perceptions Among Men Who Have Sex With Men During Co-Occurring Sexually Transmitted Infection Epidemics in Toronto, Canada: A Qualitative Study.	Sexually Transmitted Diseases	-	-	-	-	1537-4521	10.1097/OLQ.0000000000001237	https://dx.doi.org/10.1097/OLQ.0000000000001237	BACKGROUND: Our objective was to explore the sexual health knowledge, attitudes, and perceptions of men who have sex with men (MSM). METHODS: In-depth interviews were conducted with 31 MSM who lived, worked, or socialized in Toronto in June and July 2016. Participants were asked about concepts of risky sex and knowledge of, and attitudes toward, sexually transmitted infections (STIs), especially syphilis, and potential interventions. Thematic analysis was used to analyze interview transcripts. RESULTS: The prevention of STI relied on HIV prevention strategies. No one used condoms for oral sex, nor did they intend to. Pre-exposure prophylaxis was perceived as both threatening and liberating. Concepts of risky sex included emotional risk. Conversations with partners about STI testing were easier than STI status. Stigma and concealment of sexual identity were barriers to sexual health care. None of the participants recommended changes to individual sexual behavior or sexual health interventions. Instead, recommendations centered on social changes to reduce or eliminate shame, embarrassment, stigma, and discrimination around both STIs and sexual orientation. CONCLUSION: Participants were thinking about sexual risk and using a variety of ways to prevent STI transmission, although most relied on HIV prevention strategies, possibly because they knew little about other STIs, and other STIs were perceived as curable, especially syphilis. Interventions promoting conversations about STI testing may be promising and will also reduce stigma as STI testing is normalized. Social and clinic interventions focused on creating psychologically safe spaces to disclose sexual identity and providing sexual orientation affirming health care may reduce STIs and improve sexual health for MSM. Article	2020	Ghayda R.A.; Hong S.H.; Yang J.W.; Jeong G.H.; Lee K.H.; Kronbichler A.; Solmi M.; Stubbs B.; Koyanagi A.; Jacob L.; Oh H.; Kim J.Y.; Shin J.I.; Smith L.	A review of pre-exposure prophylaxis adherence among female sex workers	Yonsei Medical Journal	-	-	-	-	5135796	10.3349/ymj.2020.61.5.349	https://pubmed.ncbi.nlm.nih.gov/32390358/	Globally and in Africa specifically, female sex workers (FSWs) are at an extraordinarily high risk of contracting human immunodeficiency virus (HIV). Pre-exposure prophylaxis (PrEP) has emerged as an effective and ethical method with which to prevent HIV infection among FSWs. PrEP efficacy is, however, closely linked to adherence, and adherence to PrEP among FSWs is a complex and interrelated process that has been shown to be of importance to public health policies and HIV control and intervention programs. This comprehensive review categorizes barriers to and facilitators of adherence to HIV PrEP for FSWs, and describes five strategies for promoting PrEP adherence among FSWs. These strategies encompass 1) a long-term educational effort to decrease the stigma associated with sex work and PrEP use, 2) education on how PrEP works, 3) lifestyle modification, 4) research on next-generation PrEP products to address the inconvenience of taking daily pills, and 5) integration of PrEP into existing services, such as social services and routine primary care visits, to reduce the economic burden of seeking the medication. Our review is expected to be useful for the design of future PrEP intervention programs. Multidisciplinary intervention should be considered to promote PrEP adherence among FSWs in order to help control the HIV epidemic. © Yonsei University College of Medicine 2020. Article	2020	Gill K.; Johnson L.; Dietrich J.; Myer L.; Marcus R.; Wallace M.; Pidwell T.; Mendel E.; Fynn L.; Jones K.; Wiesner L.; Slack C.; Strode A.; Spiegel H.; Hosek S.; Rooney J.; Gray G.; Bekker L.-G.	Acceptability, safety, and patterns of use of oral tenofovir disoproxil fumarate and emtricitabine for HIV pre-exposure prophylaxis in South African adolescents: an open-label single-arm phase 2 trial	The Lancet Child and Adolescent Health	-	-	-	-	23524642	10.1016/S2352-4642(20)30248-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096024070&doi=10.1016%2fS2352-4642%2820%2930248-0&partnerID=40&md5=6f993973601f71f668454c11ce437923	Background: HIV incidence among adolescents in southern Africa remains unacceptably high. Pre-exposure prophylaxis (PrEP) is an effective HIV prevention intervention but there are few data on its implementation among adolescents. We aimed to investigate the safety, feasibility, and acceptability of PrEP with oral tenofovir disoproxil fumarate and emtricitabine as part of a comprehensive HIV prevention package in an adolescent population in South Africa. Methods: This open-label single-arm phase 2 study (PlusPills) was done in two research clinics in Cape Town and Johannesburg, South Africa. Adolescents aged 15-19 years were recruited into the study through recruitment events and outreach in the community. Potential participants were eligible for enrolment if they reported being sexually active. Exclusion criteria were a positive test for HIV or pregnancy at enrolment, breastfeeding, or any relevant co-morbidities. Participants were given oral tenofovir disoproxil fumarate and emtricitabine for PrEP to take daily for the first 12 weeks and were then given the choice to opt in or out of PrEP use at three monthly intervals during scheduled clinic visits. Participants were invited to monthly visits for adherence counselling and HIV testing during the study period. The primary outcomes were acceptability, use, and safety of PrEP. Acceptability was measured by the proportion of participants who reported willingness to take up PrEP and remain on PrEP at each study timepoint. Use was defined as the number of participants who continued to use PrEP after the initial 12-week period until the end of the study (week 48). Safety was measured by grade 2, 3, and 4 laboratory and clinical adverse events using the Division of AIDS table for grading the severity of adult and paediatric adverse events, version 1.0. Dried blood spot samples were collected at each study time-point to measure tenofovir diphosphate concentrations. This trial is registered with ClinicalTrials.gov, NCT02213328. Findings: Between April 28, 2015, and Nov 11, 2016, 244 participants were screened, and 148 participants were enrolled (median age was 18 years; 99 participants 67% were female) and initiated PrEP. PrEP was stopped by 26 of the 148 (18%) participants at 12 weeks. Cumulative PrEP opt-out, from the total cohort, was 41% (60 of 148 participants) at week 24 and 43% (63 of 148 participants) at week 36. PrEP was well tolerated with only minor adverse events (grade 2) thought to be related to study drug, which included headache (n=4, 3%), gastrointestinal upset (n=8, 5%), and skin rash (n=2, 1%). Two participants (1%) experienced grade 3 weight loss, which was deemed related to the study drug and resolved fully when PrEP was discontinued. Tenofovir diphosphate concentrations were detectable (>16 fmol/punch) in dried blood spot samples in 108 (92%) of 118 participants who reported PrEP use at week 12, in 74 (74%) of 100 participants at week 24, and in 22 (59%) of 37 participants by the study end at week 48. Interpretation: In this cohort of self-selected South African adolescents at risk of HIV acquisition, PrEP appears safe and tolerable in those who continued use. PrEP use decreased throughout the course of the study as the number of planned study visits declined. Adolescents in southern Africa needs access to PrEP with tailored adherence support and possibly the option for more frequent and flexible visit schedules. Article	2020	Gilmour, Stuart; Peng, Liping; Li, Jinghua; Oka, Shinichi; Tanuma, Junko	New strategies for prevention of HIV among Japanese men who have sex with men: a mathematical model	Scientific Reports	-	-	-	-	20452322	10.1038/s41598-020-75182-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85093927538&doi=10.1038%2fs41598-020-75182-7&partnerID=40&md5=a5d51bdc8babecc5e5dc2887ebc057e9	HIV prevalence in Japan continues to increase among men who have sex with men (MSM). We built a mathematical model to describe the HIV epidemic, including acute infection and pre-exposure prophylaxis (PrEP), and projected the model to 2050. We compared current testing and treatment policies, a scenario where Japan achieves UNAIDS 90-90-90 targets, three PrEP scenarios defined by different coverage levels of 25%, 50%, and 75% among the 20% of MSM with the highest risk behavior, and combinations of these scenarios. With no change in interventions prevalence of HIV among MSM will rise to 9.0% in 2050. If Japan achieves full UNAIDS 90-90-90 targets, 84.9% of these infections would be averted. Under 50% PrEP with no expansion of testing and treatment, prevalence will reach 2.6% and 62.1% of infections would be averted by 2050. If in addition UNAIDS 90-90-90 goals are achieved, 92.7% of HIV infections would be prevented by 2050. All interventions tested in this model were cost-saving relative to the base case. Both PrEP and enhanced ART strategies can be cost-saving, and if Japan enhances its testing program for MSM and introduces PrEP, it has the potential to effectively eliminate new infections in the next 30 years. © 2020, The Author(s). Article	2020	Ginsberg G.M.; Chemtob D.	Cost utility analysis of HIV pre exposure prophylaxis among men who have sex with men in Israel	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-020-8334-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85080098626&doi=10.1186%2fs12889-020-8334-4&partnerID=40&md5=c36fa27cdf604d712d2cac7b12c996ee	Background: Between 2011 and 2015, Men who have sex with men (MSM) accounted for nearly half of new HIV cases among men in Israel. This study carries out a cost-utility analysis of PrEP (HIV Pre Exposure Prophylaxis), an antiretroviral medication that can protect against the acquisition of HIV infection, whose incidence rate in Israel is around 1.74 per 1000 MSM. Method: Epidemiological, demographic, health service utilisation and economic data were integrated into a spread-sheet model in order to calculate the cost per averted disability-adjusted life year (DALY) of the intervention from a societal perspective, in mid-2018 US$ using a 3% discount rate. Cost utility analyses were performed for both types of PrEP delivery (continuous regimen and on-demand), together with sensitivity analyses on numbers of condom users who take up PrEP (baseline 25%) and subsequently abandon condom use (baseline 75%), PrEP efficacy (baseline 86%), PrEP prices and monitoring costs. Results: Around 21.3% of MSM are high risk (as defined by having unprotected anal intercourse). Offering PrEP to this group would have a ten year net cost of around 1563 million USD, preventing 493 persons from becoming HIV-positive, averting around 1616 DALYs at a cost per averted DALY of around 967,744 USD. This will render the intervention to be not cost-effective. PrEP drug prices would have to fall dramatically (by 90.7%) for the intervention to become cost-effective (i.e. having a cost per averted DALY less than thrice GNP per capita) in Israel. PrEP remains not cost-effective (at 475,673 USD per averted DALY) even if intervention costs were reduced by using an "on demand" instead of a daily schedule. Even if there were no changes in condom use, the resultant 411,694 USD cost-utility ratio is still not cost-effective. Conclusions: Despite PrEPs high effectiveness against HIV, PrEP was found not to be cost-effective in the Israeli context because of a combination of relatively low HIV incidence, high PrEP costs, with a likelihood that some low-risk MSM (ie: who use condoms) may well begin taking PrEP and as a consequence many of these will abandon condom use. Therefore, ways of minimizing these last two phenomena need to be found. © 2020 The Author(s). Article	2020	Gitahi N.; Eshiwani S.J.; Mutai K.; Mecha J.O.; Kiarie J.N.	Preconception Care Uptake and Immediate Outcomes among Discordant Couples Accessing Routine HIV Care in Kenya	Obstetrics and Gynecology International	-	-	-	-	16879589	10.1155/2020/1675987	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087200894&doi=10.1155%2f2020%2f1675987&partnerID=40&md5=410531494aaebade481360b89c2e489e	Introduction. A large proportion of new HIV infections occur within discordant partnerships making discordance a significant contributor to new HIV infections in Africa. Despite the role of preconception care for HIV discordant couples, there is little data on fertility desire and preconception care uptake. This study aimed at documenting fertility desire (desire to conceive), determining the uptake of preconception care, identifying HIV prevention strategies used during preconception care, and determining immediate conception outcomes among HIV discordant couples in Kenya. Methods. We retrospectively extracted electronic medical record data on discordant couples at an HIV care discordant couples' clinic. We included data on couples who expressed a desire to conceive and were offered preconception care and followed up for 29 months. We collected data on sociodemographic characteristics, preconception prevention methods, and associated outcomes. Results. Among couples, with male HIV-positive partners, there was a twofold likelihood of accepting preconception services (OR = 2.3, CI 95% (1, 1, 5.0)). A shorter discordant union was independently associated with the uptake of preconception services (OR = 0.92, CI 95% (0.86, 0.98)). The most used prevention intervention (38.5%) among discordant couples was a combination of pre-exposure prophylaxis (PrEP) by the uninfected partner, alongside HAART by the partner living with HIV. Pregnancy rates did not significantly (p = 0.06) differ among those who took up preconception care versus those who did not. HIV-negative partners of couples who declined preconception care had a significantly (p = 0.04) higher attrition from clinic follow-up. One confirmed seroconversion occurred; an HIV incidence rate of 0.19 per 100 person-years.Conclusion. The study demonstrates the feasibility of implementing safe and effective preconception servicesas part of routine HIV care for discordant couples living in low resource settings. The provision and the utilisation of safer conception services may be hindered by the poor retention to follow-up and care of HIV-negative partners. This challenge may impede the expected benefits of preconception care as an HIV prevention intervention. © 2020 Nyawira Gitahi et al. Article	2020	Glass, Tracy; Myer, Landon; Lesosky, Maia	The role of HIV viral load in mathematical models of HIV transmission and treatment: a review.	BMJ Glob Health	-	-	-	-	2059-7908	10.1136/bmjgh-2019-001800	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7042590	Introduction: HIV viral load (VL) is accepted as a key biomarker in HIV transmission and pathogenesis. This paper presents a review of the role of VL testing in mathematical models for HIV prevention and treatment. Methods: A search for simulation models of HIV was conducted in PubMed, yielding a total of 1210 studies. Publications before the year 2000, studies involving animals and analyses that did not use mathematical simulations were excluded. The full text of eligible articles was sourced and information about the intervention and population being modelled, type of modelling approach and disease monitoring strategy was extracted. Results and discussion: A total of 279 studies related to HIV simulation models were included in the review, though only 17 (6%) included consideration of VL or VL testing and were evaluated in detail. Within the studies that included assessment of VL, routine monitoring was the focus, and usually in comparison to alternate monitoring strategies such as clinical or CD4 count-based monitoring. The majority of remaining models focus on the impact or delivery of antiretroviral therapy (n=68; 27%), pre-exposure prophylaxis (n=28; 11%) and/or HIV testing (n=24; 9%) on population estimates of HIV epidemiology and exclude consideration of VL. Few studies investigate or compare alternate VL monitoring frequencies, and only a small number of studies overall (3%) include consideration of vulnerable population groups such as pregnant women or infants. Conclusions: There are very few simulations of HIV treatment or prevention that include VL measures, despite VL being recognised as the key determinant of both transmission and treatment outcomes. With growing emphasis on VL monitoring as key tool for population-level HIV control, there is a clear need for simulations of HIV epidemiology based on VL. Article	2020	Glick, Jennifer L; Russo Rienna; Jivapong Belinda; Rosman, Lori; Pelaez, Danielle; Footer Katherine H A; Sherman, Susan G	The PrEP Care Continuum Among Cisgender Women Who Sell Sex and/or Use Drugs Globally: A Systematic Review	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-019-02733-z	https://www.proquest.com/scholarly-journals/prep-care-continuum-among-cisgender-women-who/docview/2389523233/se-2?accountid=8113	HIV prevalence among cisgender female sex workers (FSW) and/or women who use drugs (WWUD) is substantially higher compared to similarly aged women. Consistent with PRISMA guidelines, we conducted the first systematic review on the pre-exposure prophylaxis (PrEP) continuum among FSW and/or WWUD, searching PubMed, Embase, CINAHL, PsycInfo, and Sociological Abstracts. Eligibility criteria included: reporting a PrEP related result among FSW and/or WWUD aged 18+; peer-reviewed; and published in English between 2012 and 2018. Our search identified 1365 studies; 26 met eligibility requirements, across the following groups: FSW (n = 14), WWUD (n = 9) and FSW-WWUD (n = 3). Studies report on at least one PrEP outcome: awareness (n = 12), acceptability (n = 16), uptake (n = 4), and adherence (n = 8). Specific barriers span individual and structural levels and include challenges to daily adherence, cost, and stigma. Combining health services and long-acting PrEP formulas may facilitate better PrEP uptake and adherence. The limited number of studies indicates a need for more research. Article	2020	Glidden D.V.	Statistical approaches to accelerate the development of long-acting antiretrovirals for HIV pre-exposure prophylaxis	Current Opinion in HIV and AIDS	-	-	-	-	1746630X	10.1097/COH.0000000000000589	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85072643223&doi=10.1097%2fCOH.0000000000000589&partnerID=40&md5=365fc7176ca87df2571ae8f3f426037f	Purpose of reviewThis review considers statistical issues in the design and analysis of the studies used to develop long-acting formulations of antiretrovirals for pre-exposure prophylaxis (PrEP).Recent findingAn abundant pipeline of products is maturing. Accelerating their evaluation as clinical products requires abandonment of noninferiority standards. Randomized trials should be based on the comparison of principled but innovative estimates of background HIV risk and enrich enrollment for those who do not desire current PrEP products. At every stage of testing, innovative analyses can be applied to help inform and accelerate later studies.SummaryThe development of new long-acting PrEP regimens can be accelerated by innovations in design, ingenuity in synthesizing data sources, and application of causal inference methods. Article	2020	Glidden, David V.; Stirrup, Oliver T.; Dunn, David T.	A Bayesian averted infection framework for PrEP trials with low numbers of HIV infections: application to the results of the DISCOVER trial	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(20)30192-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094148439&doi=10.1016%2fS2352-3018%2820%2930192-2&partnerID=40&md5=86f9e84c828b5587f9ecf821fe0db473	Trials of candidate agents for HIV pre-exposure prophylaxis (PrEP) might randomly assign participants to be given a new PrEP agent or oral coformulated tenofovir disoproxil fumarate plus emtricitabine. This design presents unique challenges in interpretation. First, with two active arms, HIV incidence might be low. Second, the effectiveness of tenofovir disoproxil fumarate plus emtricitabine varies across populations; thus, similar HIV incidence between groups could be consistent with a wide range of effectiveness for the new PrEP. We propose a two-part approach to trial results. First, we use Bayesian methods to incorporate assumptions about the background incidence of HIV in the trial in the absence of PrEP, possibly augmented by external data. On the basis of the estimated background incidence, we estimate and compare the number of averted (or prevented) HIV infections in each of the two trial groups, calculating the averted infections ratio. We apply these methods to a completed trial of tenofovir alafenamide plus emtricitabine for PrEP. Our framework shows that leveraging external information to estimate averted infections and the averted infections ratio enhances the efficiency and interpretation of active-controlled PrEP trials. © 2020 Elsevier Ltd	NA	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Goedel W.C.; Bessey S.; Lurie M.N.; Biello K.B.; Sullivan P.S.; Nunn A.S.; Marshall B.D.L.	Projecting the impact of equity-based preexposure prophylaxis implementation on racial disparities in HIV incidence among MSM	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000002577	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088248857&doi=10.1097%2fQAD.0000000000002577&partnerID=40&md5=46fb78863478219517cf70f85c9733ea	Background:It is unknown what levels of preexposure prophylaxis (PrEP) use are needed to reduce racial disparities in HIV incidence among men who have sex with men (MSM). Using an agent-based model, we quantified the impact of achieving PrEP coverage targets grounded in equity on racial disparities in HIV incidence among MSM in an urban setting in the Southeastern United States.Methods:An agent-based model was adapted to simulate HIV transmission in a network of Black/African American and White MSM aged 18-39 years in the Atlanta-Sandy Springs-Roswell metropolitan area over 10 years (2015-2024). Scenarios simulated coverage levels consistent with targets based on the ratio of the number of individuals using PrEP to the number of individuals newly diagnosed in a calendar year (i.e., the 'PrEP-to-need ratio'), ranging from 1 to 10. Incidence rate ratios and differences were calculated as measures of disparities.Results:Without PrEP, the model predicted a rate ratio of 3.82 and a rate difference of 4.50 comparing HIV incidence in Black/African American and White MSM, respectively. Decreases in the rate ratio of at least 50% and in the rate difference of at least 75% were observed in all scenarios in which the PrEP-to-need ratio among Black/African American MSM was 10, regardless of the value among White MSM.Conclusion:Significant increases in PrEP use are needed among Black/African American MSM to reduce racial disparities in HIV incidence. PrEP expansion must be coupled with structural interventions to address vulnerability to HIV infection among Black/African American MSM. © 2020 Lippincott Williams and Wilkins. Article	2020	Goedel W.C.; Mimiaga M.J.; King M.R.F.; Safren S.A.; Mayer K.H.; Chan P.A.; Marshall B.D.L.; Biello K.B.	Potential Impact of Targeted HIV Pre-Exposure Prophylaxis Uptake Among Male Sex Workers	Scientific Reports	-	-	-	-	20452322	10.1038/s41598-020-62694-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082522867&doi=10.1038%2fs41598-020-62694-5&partnerID=40&md5=5d12dea1863ad67c93e6a8c411cd8cbe	Little is known about the potential population-level impact of HIV pre-exposure prophylaxis (PrEP) use among cisgender male sex workers (MSWs), a high-risk subset of cisgender men who have sex with men (MSM). Using an agent-based model, we simulated HIV transmission among cisgender MSM in Rhode Island to determine the impacts of PrEP implementation where cisgender MSWs were equally ("standard expansion") or five times as likely ("focused expansion") to initiate PrEP compared to other cisgender MSM. Without PrEP, the model predicted 920 new HIV infections over a decade, or an average incidence of 0.39 per 100 person-years. In a focused expansion scenario where 15% of at-risk cisgender MSM used PrEP, the total number of new HIV infections was reduced by 58.1% at a cost of $57,180 per quality-adjusted life-year (QALY) gained. Focused expansion of PrEP use among cisgender MSWs may be an efficient and cost-effective strategy for reducing HIV incidence in the broader population of cisgender MSM. © 2020, The Author(s). Article	2020	Goldstein N.S.; Seymour E.C.; Carter-Davis J.B.	A Model for Increasing Access to Preexposure Prophylaxis (PrEP) Services in the Substance Use Population	Journal for Nurse Practitioners	-	-	-	-	15554155	10.1016/j.nurpra.2019.10.026	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076862455&doi=10.1016%2fj.nurpra.2019.10.026&partnerID=40&md5=3d28dfb654dc3ec5b5a49b92d4d766f6	In 2017, a low-resource substance use treatment center in Baltimore, Maryland, noted that at least 38% of patients, ranging from 18 to 76 years old, with substance use disorders (SUD) met the criteria for preexposure prophylaxis (PrEP) therapy. PrEP therapy consists of a daily medication to prevent transmission of human immunodeficiency virus. A conceptual framework model was developed linking eligible patients with SUD to PrEP services based on current Centers for Disease Control and Prevention PrEP recommendations. Three tools were developed for PrEP services planning, implementation, and evaluation. The focus of this report is to increase access to and uptake of comprehensive PrEP services in those with SUD who are at risk for acquiring human immunodeficiency virus. © 2019 Elsevier Inc. Article	2020	Golub, Sarit A; Meyers, Kathrine; Enemchukwu, Chibuzo	Perspectives and Recommendations From Lesbian, Gay, Bisexual, Transgender, and Queer/Questioning Youth of Color Regarding Engagement in Biomedical HIV Prevention.	Journal of Adolescent Health	-	-	-	-	1879-1972	10.1016/j.jadohealth.2019.09.016	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7007846	PURPOSE: Young people of color have high HIV incidence rates and suffer the greatest health inequities with regard to daily oral pre-exposure prophylaxis. Although the next generation of biomedical HIV prevention products is already under clinical development, little research has examined whether such products address the needs of this population or identified specific strategies for educating this population about prevention options that might result in the greatest interest in and uptake of new prevention modalities. METHODS: We analyzed data from seven focus groups (n = 93) conducted between July 2016 and March 2017 in partnership with a lesbian, gay, bisexual, transgender, and queer/questioning youth-serving community-based organization in the northeastern U.S. The study aimed to understand concerns, priorities, and preferences around biomedical HIV prevention modalities (i.e., daily oral pill, long-acting injectable, and topical microbicide) among lesbian, gay, bisexual, transgender, and queer/questioning youth of color. RESULTS: Our findings identified four key dynamics specific to educating young people about biomedical prevention, including (1) providing information with a sufficient level of detail and complexity, (2) contextualizing messaging in terms of young people's existing knowledge and beliefs, (3) providing detailed information about side effects, drug- and multi-method interactions, and dosing/usage contingencies, and (4) working proactively to support transgender youth and ensure that prevention products are accessible to them. CONCLUSIONS: As we plan for a future of choice in biomedical HIV prevention, we should consider how novel products can address inequities in pre-exposure prophylaxis access and HIV incidence by valuing the concerns and needs of this highest priority population.	pre-exposure prophylaxis, PrEP, HIV prevention, youth, transgender, biomedical prevention, long-acting injectable PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Gombe M.M.; Cakouros B.E.; Ncube G.; Zwangobani N.; Mareke P.; Mkwamba A.; Prescott M.R.; Bhatasara T.; Murwira M.; Mangwiro A.Z.; Prust M.L.	Key barriers and enablers associated with uptake and continuation of oral pre-exposure prophylaxis (PrEP) in the public sector in Zimbabwe: Qualitative perspectives of general population clients at high risk for HIV	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0227632	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077785734&doi=10.1371%2fjournal.pone.0227632&partnerID=40&md5=886b8984bbf4f5541d19c339a1c02715	Background Understanding the perspectives and preferences of clients eligible for pre-exposure prophylaxis (PrEP) is essential to designing programs that meet clients' needs. To date, most PrEP programs in limited-resource settings have been implemented by partner organizations for specific target populations, but the government of Zimbabwe aims to make PrEP available to the broader population at substantial risk in public sector clinics. However, there is limited information on general population perspectives about PrEP in Zimbabwe. Methods A qualitative study was conducted to explore clients' motivation to take or decline PrEP and continue or discontinue PrEP. Through a PrEP pilot in one urban family planning clinic and one rural youth center in Zimbabwe, 150 HIV-negative clients screened as being at high risk of HIV and were offered PrEP between January and June 2018. Sixty semi-structured interviews were conducted with clients who agreed to follow-up (including 5 decliners, all from the rural youth center, and 55 accepters, with 42 from the rural youth center and 13 from the urban family planning clinic). Interviews were conducted after either the first or second PrEP follow-up appointment or after the client declined PrEP. Interviews were audio recorded, de-identified, transcribed, and coded thematically. Results PrEP uptake was driven by risk perception for HIV, and in many cases, that risk was introduced by the unsafe behavior or HIV-positive status of a partner. Among sero-discordant couples (SDCs), the desire to safely conceive a child was also cited as a factor in taking PrEP. Clients who opted for PrEP preferred it to other forms of HIV prevention. SDCs reported decreased condom use after PrEP initiation and in some cases were using PrEP while trying to conceive a child. After initiating PrEP, clients had more confidence in their sexual relationships and less stress associated with negotiating condom use. Family and partner support was critical to starting and continuing PrEP, but some clients stopped PrEP or missed appointments due to side effects or logistical challenges such as transportation. Conclusions Results of this study can be used to provide operational guidance for national public sector roll-out of PrEP as part of combination HIV prevention in Zimbabwe. Based on feedback and experiences of clients, the training materials for health workers can be refined to ensure that health workers are prepared to counsel clients on the decision to start and/or continue PrEP and answer common client questions. Program advertisements should also be targeted with key messages that speak to client experiences. © 2020 Gombe et al. Article	2020	Gordian-Arroyo, A; Garofalo, R; Kuhns, LM; Pearson, C; Bruce, J; Batey, DS; Radix, A; Belkind, U; Hidalgo, MA; Hirshfield, S; Schrimshaw, EW; Schnall, R	Awareness, Willingness, and Perceived Efficacy of Pre-exposure Prophylaxis among Adolescent Sexual Minority Males	Journal of Urban Health	-	-	-	-	NA	10.1007/s11524-020-00447-5	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02159354/full	Despite the approval of PrEP for adolescents by the FDA in 2018, little is known about the awareness and attitudes about PrEP use among adolescent sexual minority males, who are at the greatest risk for HIV. We analyzed baseline data from the MyPEEPS Mobile study, a multi-site randomized controlled trial evaluating the effectiveness of a mobile behavioral HIV prevention intervention. A substantial proportion (68.2%) of study participants (ages 13-18) had previously heard about PrEP, and an overwhelming majority (90.8%) reported willingness to take PrEP, to prevent HIV. On the other hand, only about one third (34.6%) of participants indicated that taking a daily HIP pill would be "very" or "completely" effective in preventing HIV when having sex without a condom. These findings suggest that high awareness and willingness to use PrEP across various adolescent subgroups present opportunities for increased PrEP advocacy among this young age group.	*attitude to health; *psychology; Adolescent; Condom; Condoms *statistics & numerical data; Epidemiology; HIV Infections *prevention & control; Health Knowledge, Attitudes, Practice; Homosexuality, Male *psychology, statistics & numerical data; Human; Human immunodeficiency virus infection /prevention; Humans; Male; Male homosexuality; Patient Acceptance of Health Care *psychology, statistics & numerical data; Patient attitude; Pre-Exposure Prophylaxis *statistics & numerical data; Pre-exposure prophylaxis; Sexual and Gender Minorities *psychology, statistics & numerical data; Sexual and gender minority; United States; United States epidemiology	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Article	2020	Grant H.; Foss A.M.; Watts C.; Medley G.F.; Mukandavire Z.	Is modelling complexity always needed? Insights from modelling PrEP introduction in South Africa	Journal of Public Health (United Kingdom)	-	-	-	17413842	10.1093/pubmed/fdz178	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85089171750&doi=10.1093%2fpubmed%2ffdz178&partnerID=40&md5=9b6d095cc4212482f51bade5a10e9fa5	Background: Mathematical models can be powerful policymaking tools. Simple, static models are user-friendly for policymakers. More complex, dynamic models account for time-dependent changes but are complicated to understand and produce. Under which conditions are static models adequate? We compare static and dynamic model predictions of whether behavioural disinhibition could undermine the impact of HIV pre-exposure prophylaxis (PrEP) provision to female sex workers in South Africa. Methods: A static model of HIV risk was developed and adapted into a dynamic model. Both models were used to estimate the possible reduction in condom use, following PrEP introduction, without increasing HIV risk. The results were compared over a 20-year time horizon, in two contexts: at epidemic equilibrium and during an increasing epidemic. Results: Over time horizons of up to 5 years, the models are consistent. Over longer timeframes, the static model overstates the tolerated reduction in condom use where initial condom use is reasonably high ($\ge$50%) and/or PrEP effectiveness is low ($\le$45%), especially during an increasing epidemic. Conclusions: Static models can provide useful deductions to guide policymaking around the introduction of a new HIV intervention over short-medium time horizons of up to 5 years. Over longer timeframes, static models may not sufficiently emphasise situations of programmatic importance, especially where underlying epidemics are still increasing. © 2020 The Author(s) 2020. Theses and Dissertations	2020	Grant, H.	The scale-up of PrEP for HIV prevention in high-risk women in sub-Saharan Africa : use of mathematical modelling to inform policy making	-	-	London School of Hygiene & Tropical Medicine	-	NA	: https://doi.org/10.17037/PUBS.04656354	https://researchonline.lshtm.ac.uk/id/eprint/4656354/	Background: Women in sub-Saharan Africa carry a disproportionate burden and risk of HIV. In this context, women at high HIV risk are not a discrete group, rather on a spectrum of risk caused by a multitude of behavioural, economic, structural, cultural and geographic factors. Pre-exposure prophylaxis (PrEP) is a promising new HIV prevention method, effective at reducing HIV risk when adhered to. However, the results of PrEP trials and implementation studies to date reveal challenges in women's programme retention and drug adherence. There are also concerns that behavioural disinhibition (reductions in condom use) following the introduction of PrEP may further limit its ability to avert infections. In the context of HIV resource limitations and decreasing donor budgets, this thesis seeks to use mathematical modelling to assess strategies for PrEP scale-up for women across a spectrum of risk in sub-Saharan Africa, accounting for heterogeneities in HIV risk factors and PrEP programme outcomes. Considering the challenges faced by policy makers in using mathematical models to guide decision making, often considered to be complex 'black boxes', this thesis also sets out to assess the contexts in which simple models are sufficient to guide policy making around the introduction of a new HIV prevention intervention. Methods: This thesis adopts mathematical modelling approaches to inform HIV policy making. First, a simple static model of HIV risk to female sex workers is developed and used to assess the impact of behavioural disinhibition on PrEP's ability to avert HIV infections. The static model formulation is then evolved to incorporate dynamic effects to account for the downstream effects of population interactions. The models account for heterogeneities in women's HIV risk factors and PrEP programme outcomes, and the low levels of PrEP programme retention and adherence reported in studies. The outcomes of the static and dynamic model formulation are compared over different time horizons and epidemic contexts, to contribute to understanding around the importance of modelling complexity to inform HIV policy. Finally, the static model is refined to represent women across a more broadly defined spectrum of risk: women 15-24 years, 25-34 years, 35-49 years and female sex workers. The models are parameterised to case study countries spanning a range of high HIV burden contexts in sub-Saharan Africa: South Africa, Zimbabwe and Kenya, and used to assess strategies for PrEP scale-up in each country, considering cost-effectiveness and population-level impact. Conclusions: PrEP is likely to be of benefit in reducing HIV risk in women across a spectrum of HIV-risk in sub-Saharan Africa, even if reductions in condom use occur. PrEP will be most cost-effective for individuals at great HIV risk, such as female sex workers. However, PrEP has potential to significantly reduce the number of new infections at population-level if made widely available beyond those at highest individual risk, including to women in the general population.…	NA	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	-	-	Quantitative
Article	2020	Grant, Hannah; Gomez, Gabriela B; Kripke, Katharine; Barnabas, Ruanne V; Watts, Charlotte; Medley, Graham F; Mukandavire, Zindoga	Time to Scale Up Preexposure Prophylaxis Beyond the Highest-Risk Populations? Modeling Insights From High-Risk Women in Sub-Saharan Africa.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001253	https://dx.doi.org/10.1097/OLQ.0000000000001253	OBJECTIVES: New HIV infections remain higher in women than men in sub-Saharan Africa. Preexposure prophylaxis (PrEP) is an effective HIV prevention measure, currently prioritized for those at highest risk, such as female sex workers (FSWs), for whom it is most cost-effective. However, the greatest number of HIV infections in sub-Saharan Africa occurs in women in the general population. As countries consider wider PrEP scale-up, there is a need to weigh the population-level impact, cost, and relative cost-effectiveness to inform priority setting. METHODS: We developed mathematical models of HIV risk to women and derived tools to highlight key considerations for PrEP programming. The models were fitted to South Africa, Zimbabwe, and Kenya, spanning a range of HIV burden in sub-Saharan Africa. The impact, cost, and cost-effectiveness of PrEP scale-up for adolescent girls and young women (AGYW), women 25 to 34 years old, and women 35 to 49 years old were assessed, accounting for differences in population sizes and the low program retention levels reported in demonstration projects. RESULTS: Preexposure prophylaxis could avert substantially more infections a year among women in general population than among FSW. The greatest number of infections could be averted annually among AGYW in South Africa (24-fold that for FSW). In Zimbabwe, the greatest number of infections could be averted among women 25 to 34 years old (8-fold that for FSW); and in Kenya, similarly between AGYW and women 25 to 34 years old (3-fold that for FSW). However, the unit costs of PrEP delivery for AGYW, women 25 to 34 years old, and women 35 to 49 years old would have to reduce considerably (by 70.8%-91.0% across scenarios) for scale-up to these populations to be as cost-effective as for FSW. CONCLUSIONS: Preexposure prophylaxis has the potential to substantially reduce new HIV infections in HIV-endemic countries in sub-Saharan Africa. This will necessitate PrEP being made widely available beyond those at highest individual risk and continued integration into a range of national services and at community level to significantly bring down the costs and improve cost-effectiveness. Early diagnosis and risk factors of acute hepatitis C in high-risk MSM on preexposure prophylaxis	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002364	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076112810&doi=10.1097%2fQAD.0000000000002364&partnerID=40&md5=c21b4918ac651b70adf4a7e317d16abb	Background: A high incidence of acute hepatitis C virus (HCV) (AHCV) infection has been reported among at-risk HIV-negative MSM. The optimal strategy for early diagnosis of AHCV in this population is not clearly defined.Methods:In the ANRS IPERGAY PrEP trial, among high-risk HIV-negative MSM, HCV serology and serum alanine aminotransferase (ALT) were tested at enrollment and during follow-up. Behavioral risk factors were compared at baseline between participants who were diagnosed with AHCV during the study compared with those who did not. In participants with a positive HCV serology, we used stored sera to perform the following tests at diagnosis and on previous visits: HCV-antibodies rapid tests, plasma HCV viral load and HCV antigen immunoassay. We evaluated the sensitivity of each test for AHCV diagnosis.Results:Among 429 enrolled participants, 14 were diagnosed with AHCV infection, with a median follow-up of 2.1 (interquartile range, 1.5-2.8) years. AHCV incidence was 1.40 per 100 person-years (95% confidence interval, 0.74-2.39). Patients with AHCV reported a significantly higher number of sexual acts and/or partners, and more frequent recreational drug use at baseline. At the prior visit before AHCV diagnosis (median of 2 months earlier), sensitivities of HCV RNA and HCV antigen tests were, respectively, 100 and 89%, whereas none of the patients had a positive serology, and only 25% had elevated ALT.Conclusion:HCV antigen and RNA tests were positive within a median of 2 months before the detection of antibodies and ALT elevation. These tests could be considered for HCV screening in high-risk MSM. Article	2020	Gravett R.M.; Westfall A.O.; Overton E.T.; Kudroff K.; Muzny C.A.; Eaton E.F.	Sexually transmitted infections and sexual behaviors of men who have sex with men in an American Deep South PrEP clinic	International journal of STD & AIDS	-	-	-	9564624	10.1177/0956462419886228	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078718525&doi=10.1177%2f0956462419886228&partnerID=40&md5=f7e872e187f61d21dc6d16c3e4492359	HIV pre-exposure prophylaxis (PrEP) effectively prevents HIV acquisition among men who have sex with men (MSM), but PrEP uptake has been associated with sexually transmitted infections (STIs). The effect of PrEP on STIs in MSM in the Deep South of the United States is unknown. We performed a retrospective analysis of adult MSM at an American Deep South PrEP clinic to calculate the prevalence and incidence rate of bacterial STIs (chlamydia, gonorrhea, and syphilis) and identify associated risk factors by linking incident STI to patient-reported outcomes; 139 MSM accessed the clinic between 2014 and 2018 with baseline bacterial STI prevalence of 11%. Twenty-six of 81 eligible MSM on PrEP had incident STIs with an incidence rate of 33.1 cases per 100 person-years. Significantly higher proportions of high PrEP adherence, multiple sexual partners, and inconsistent condom use were seen in those with incident STI, and we identified MSM with both high PrEP adherence and multiple sexual partners as being at especially high risk for bacterial STIs (hazard ratio: 7.57, 95% confidence interval: 1.75–32.74). Bacterial STIs are common after initiating PrEP in this clinic, and MSM reporting high PrEP adherence and multiple sexual partners have a significant risk for incident STI. High-risk sexual behaviors persisted after starting PrEP, highlighting the importance of ongoing, intensive sexual health screening and interventions. © The Author(s) 2020.	condoms; health risk behaviors; HIV prevention; medication adherence; Pre-exposure prophylaxis; sexually transmitted infections	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Gregg E.; Linn C.; Nace E.; Gelberg L.; Cowan B.; Fulcher J.A.	Implementation of HIV Preexposure Prophylaxis in a Homeless Primary Care Setting at the Veterans Affairs	Journal of Primary Care and Community Health	-	-	-	21501319	10.1177/2150132720908370	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85080097249&doi=10.1177%2f2150132720908370&partnerID=40&md5=0eea3946327b79b62d2ddba475094074	Objective: Oral preexposure prophylaxis (PrEP) is highly effective in preventing HIV-1 acquisition, yet it is underutilized among at-risk populations. In this pilot quality improvement (QI) initiative, we sought to identify barriers to PrEP implementation and create interventions to improve access to PrEP in a primary care clinic for homeless veterans. Methods: The setting was a large homeless primary care clinic at the Veterans Affairs in an urban area with high HIV prevalence. A root cause analysis was performed to identify barriers to PrEP expansion in the primary care clinic. Targeted interventions to improve provider knowledge and patient access to PrEP were implemented by the QI team. Results: Root cause analysis revealed 3 primary barriers to PrEP expansion in the primary care clinic: institutional limitations for prescribing PrEP, inconsistent screening and recognition of eligible patients by clinic staff, and lack of clinic workflow processes to support PrEP prescription. A multidisciplinary focus group found low levels of PrEP awareness and knowledge, with only 22% of providers reporting comfort discussing PrEP with patients. This improved to 40% of providers following targeted clinic educational interventions. The QI team also developed a pathway for primary care providers to obtain institutional PrEP prescribing privileges and used work groups to develop clinic workflows and protocols for PrEP. At the end of the intervention, at least 50% of primary care providers in the clinic had initiated PrEP in a new patient. Conclusions: We describe a multidisciplinary QI model to implement PrEP within a primary care setting serving Veterans and persons experiencing homelessness. Our program successfully addressed provider knowledge deficits and improved primary care capacity to prescribe PrEP. The primary care clinic can be a viable and important clinical setting to improve access to PrEP for HIV prevention, especially for vulnerable populations. © The Author(s) 2020.	homeless; human immunodeficiency virus; preexposure prophylaxis (PrEP); prevention; primary care; quality improvement; underserved communities; veterans	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Griffin J.A.; Eldridge-Smith E.D.; Yohannan J.; Stepleman L.M.	Pre-exposure Prophylaxis Knowledge and Use among Men Who Have Sex with Men in a Small Metropolitan Region of the Southeastern United States	Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000115	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077017017&doi=10.1097%2fJNC.0000000000000115&partnerID=40&md5=c0eb20291054a5a5e41eaacfd725abff	Men who have sex with men (MSM) in the southeastern United States continue to be at high risk for HIV. Pre-exposure prophylaxis (PrEP) provides effective prevention, but PrEP awareness varies across communities. We assessed sexual risk, HIV/sexually transmitted infection (STI) testing history, health care experiences associated with PrEP awareness, provider discussions, and PrEP use in a sample of 164 MSM in the Central Savannah River Area of the South. Results revealed that 80.5% of participants were aware of PrEP, 16.4% had discussed PrEP with a provider, and 9.2% had used PrEP. Education, gay identity, HIV status, recent HIV testing, and lack of provider awareness about sexual minorities independently predicted PrEP awareness. Recent STI testing independently predicted increased odds of PrEP discussion. Recent HIV and STI testing and non-White identity were associated with PrEP use. Effective, tailored marketing, provider competence, and open communication can increase PrEP adoption by southern MSM. Copyright © 2019 Association of Nurses in AIDS Care. Theses and Dissertations	2020	Gross, Kayli Christine; Falk, Kara	Identifying Risk for HIV and Implementation of PrEP Amongst Primary Care Providers	-	-	North Dakota State University	-	NA	NA	https://www.proquest.com/dissertations-theses/identifying-risk-hiv-implementation-prep-amongst/docview/2404384589/se-2?accountid=8113	The purpose of this project was to improve primary care provider knowledge, attitude and behaviors related to the current HIV-screening and PrEP implementation guidelines. Surveys were conducted among five primary care providers at a Midwest VA Healthcare System before and after an HIV and PrEP-related education. The surveys were anonymous, and participation was voluntary. Each participant received a survey by pen and paper to self-assess their HIV-screening and PrEP prescribing intention, comfort-level with HIV prevention practices, and knowledge before and after the presentation by using Likert scales, true/false, and correct answer recall questions.Of the eligible 11 providers in attendance of the presentation, six of the 11 (54.5%) participated in the surveys. One participant was excluded as he/she did not submit his/her completed presurvey, which left five surveys incomplete for data analysis. The included participants (n=5) worked in General/Primary Care, were either a MD (2 of 5) or NP (3 of 5), who have practiced as their current clinical title for less than 5 years to greater than 25 years.Responses were measured based on the FREQ procedure as the sample size was small. Following the intervention, there was no overall increase in intent to follow the current CDC HIV screening guidelines however intention prior to the intervention was already high. Following education, the providers' ability to identify those at risk for HIV increased by 60% (3 of 5), and comfort-level in identifying those at risk for HIV whom are PrEP eligible increased by 80% (4 of 5). Of these providers, there was an 80% (4 of 5) increase in provider self-rated comfort-level in discussing PrEP with high risk patients post-education. Each provider rated their intention to prescribe PrEP after the intervention on a Likert scale, as "Probably" or "Very Probable," which was a 60% (3 of 5) provider improvement.Overall, responses indicated an improvement of provider knowledge, attitudes, and behavior after receiving HIV screening and PrEP education. Findings of this project are comparable with previous research, this project, however, did not evaluate actual provider change in practice following education. Article	2020	Grov C.; Westmoreland D.A.; Carrico A.W.; Nash D.	Are we on the precipice of a new epidemic? Risk for hepatitis C among HIV-negative men-, trans women-, and trans men- who have sex with men in the United States	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1739204	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081753324&doi=10.1080%2f09540121.2020.1739204&partnerID=40&md5=633cc469f7806f77e0eb3d79f61bfaf9	Emerging data from Europe have documented increases in diagnoses of acute hepatitis C virus (HCV) infection among HIV-negative men who have sex with men. We investigated risk factors for HCV and their correlates in the Together 5000 study, a U.S. national cohort study of HIV-negative men (n = 6089), transgender women (n = 40), and transgender men (n = 42) who have sex with men. We used bivariate and multivariable analyses to determine demographic and behavioral factors associated with high risk for acute HCV infection (using the HCV-MOSAIC risk indicator with a score ≥ 2.0). Mean HCV risk score was 1.38 (SD = 1.09) and 27.3% of participants had HCV risk scores ≥ 2.0. In multivariable modeling, being cisgender male (vs. not) was associated with having a lower HCV-MOSAIC risk score. Meanwhile, being white, having been incarcerated, prior use of HIV pre- or post-exposure prophylaxis, having ever been tested for HIV, and recent methamphetamine use were associated with high risk for HCV. More than one-in-four participants exceeded the threshold score for HCV risk. Those with high HCV-MOSAIC risk scores were more likely to have been in settings where they could be tested for acute HCV (i.e., HIV testing, PrEP care, PEP care, incarceration), suggesting opportunities to engage them in HCV screening, prevention, and treatment. © 2020, © 2020 Informa UK Limited, trading as Taylor & Francis Group. Article	2020	Gruber S.; Krakower D.; Menchaca J.T.; Hsu K.; Hawrusik R.; Maro J.C.; Cocoros N.M.; Kruskal B.A.; Wilson I.B.; Mayer K.H.; Klompas M.	Using electronic health records to identify candidates for human immunodeficiency virus pre-exposure prophylaxis: An application of super learning to risk prediction when the outcome is rare	Statistics in Medicine	-	-	-	2776715	10.1002/sim.8591	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087147967&doi=10.1002%2fsim.8591&partnerID=40&md5=9ddc7f8044790e9111a283c32a195701	Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) protects high risk patients from becoming infected with HIV. Clinicians need help to identify candidates for PrEP based on information routinely collected in electronic health records (EHRs). The greatest statistical challenge in developing a risk prediction model is that acquisition is extremely rare. Methods: Data consisted of 180 covariates (demographic, diagnoses, treatments, prescriptions) extracted from records on 399 385 patient (150 cases) seen at Atrius Health (2007-2015), a clinical network in Massachusetts. Super learner is an ensemble machine learning algorithm that uses k-fold cross validation to evaluate and combine predictions from a collection of algorithms. We trained 42 variants of sophisticated algorithms, using different sampling schemes that more evenly balanced the ratio of cases to controls. We compared super learner's cross validated area under the receiver operating curve (cv-AUC) with that of each individual algorithm. Results: The least absolute shrinkage and selection operator (lasso) using a 1:20 class ratio outperformed the super learner (cv-AUC = 0.86 vs 0.84). A traditional logistic regression model restricted to 23 clinician-selected main terms was slightly inferior (cv-AUC = 0.81). Conclusion: Machine learning was successful at developing a model to predict 1-year risk of acquiring HIV based on a physician-curated set of predictors extracted from EHRs. © 2020 John Wiley & Sons, Ltd. Article	2020	Gruchy, Thea de; Vearey, Jo	"Left behind": why implementing migration-aware responses to HIV for migrant farm workers is a priority for South Africa.	African Journal of AIDS Research	-	-	-	1727-9445 1608-5906	10.2989/16085906.2019.1698624	https://dx.doi.org/10.2989/16085906.2019.1698624	Like many other countries, South Africa (SA) has committed to the Sustainable Development Goals that aim to "leave no-one behind", in efforts towards universal health coverage, and meeting the UNAIDS 90-90-90 targets through the implementation of universal test and treat (UTT) interventions. SA is associated with high levels of international and internal migration that, in certain contexts, are known to (1) increase the risk of acquiring HIV and (2) present challenges to HIV treatment access and continuity. Despite this, migration and mobility are not adequately considered in responses to HIV. As SA rolls out UTT programmes and antiretroviral treatment as prevention (TasP) interventions, including pre-exposure prophylaxis (PrEP), there is an urgent need to ensure that these are migration-aware and mobility-competent. In SA, a key population that experiences a disproportionate HIV burden is international migrant farm workers living and working on commercial farms along the border with Zimbabwe. In this article, a social determinants of health approach is applied to explore the context within which this population struggles to access positive determinants of health, including the public health care system, and the implications of this for HIV programming. It is argued that, unless policies and programmes become migration-aware and mobility-competent, UTT and TasP interventions will struggle to address the high burden of HIV among this population and, as a result, progress towards global health targets will be limited. Multispecies Evaluation of a Long-Acting Tenofovir Alafenamide Subdermal Implant for HIV Prophylaxis	Frontiers in Pharmacology	-	-	-	16639812	10.3389/fphar.2020.569373	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097412279&doi=10.3389%2ffphar.2020.569373&partnerID=40&md5=40616d6ffe6fbffadaebcddec18b0183	New HIV-1 infection rates far outpace the targets set by global health organizations, despite important progress in curbing the progression of the epidemic. Long-acting (LA) formulations delivering antiretroviral (ARV) agents for HIV-1 pre-exposure prophylaxis (PrEP) hold significant promise, potentially facilitating adherence due to reduced dosing frequency compared to oral regimens. We have developed a subdermal implant delivering the potent ARV drug tenofovir alafenamide that could provide protection from HIV-1 infection for 6 months, or longer. Implants from the same lot were investigated in mice and sheep for local safety and pharmacokinetics (PKs). Ours is the first report using these animal models to evaluate subdermal implants for HIV-1 PrEP. The devices appeared safe, and the plasma PKs as well as the drug and metabolite concentrations in dermal tissue adjacent to the implants were studied and contrasted in two models spanning the extremes of the body weight spectrum. Drug and drug metabolite concentrations in dermal tissue are key in assessing local exposure and any toxicity related to the active agent. Based on our analysis, both animal models were shown to hold significant promise in LA product development. © Copyright © 2020 Gunawardana, Remedios-Chan, Sanchez, Webster, Galvan, Fanter, Castonguay, Webster, Moss, Kuo, Gallay, Vincent, Motamedi, Weinberger, Marzinke, Hendrix and Baum. Theses and Dissertations	2020	Gutierrez, Jose Isabel; Vlahov, David	Measuring PrEp Preferences within Vulnerable Military Populations Using Conjoint Analysis	-	-	Yale University	-	NA	NA	https://www.proquest.com/dissertations-theses/measuring-prep-preferences-within-vulnerable/docview/2572593722/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) effectively prevents HIV infection, yet its uptake remains low among U.S. military men who have sex with men (MSM). Research shows that health services matching preferences produce favorable outcomes. Conjoint analysis (CA) and discrete choice experiments (DCE) are methods used to quantify preferences for attributes of a product or service and can estimate the relative importance and trade-offs with PrEP attributes among distinct populations with varying risk factors and past experiences. Therefore, the purpose of this dissertation is to characterize and identify preferences for improved PrEP delivery within this population. The methods and results of this dissertation are described in three manuscripts. The first manuscript, titled "Systematic review of preference estimation strategies within conjoint analysis studies and discrete choice experiments in HIV pre-exposure prophylaxis research," synthesizes published PrEP CA and DCE literature since 2012 and highlights the key attribute trade-offs made within this context. In the second manuscript, "Measuring PrEP preferences among at-risk military populations: results of an adaptive choice based conjoint analysis study," I report the most important PrEP preference attributes of a sample of U.S. military MSM. In the third manuscript, "Cluster analysis of PrEP preferences among at-risk military populations: segmentation results of an adaptive choice based conjoint analysis study," I describe the segment-specific results of a cluster analysis performed on a sample of U.S. military MSM. The findings of this dissertation provide a foundation of preference data that can guide the development of targeted interventions to improve uptake of this effective HIV prevention product within military MSM. Article	2020	Gutin S.A.; Harper G.W.; Amico K.R.; Bitsang C.; Moshashane N.; Harries J.; Ramogola-Masire D.; Morroni C.	I'm waiting for that': Interest in the use of PrEP for safer conception in Botswana	Global Public Health	-	-	-	17441692	10.1080/17441692.2020.1741663	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081730840&doi=10.1080%2f17441692.2020.1741663&partnerID=40&md5=ad8b5e8b61dc40982c0497db7a7c291c	Safe and effective low-cost safer conception (SC) methods are increasingly available and being integrated into national guidelines in sub-Saharan African contexts. Sero-different couples of childbearing age can benefit from such services and the routine provision of SC counselling. Pre-exposure prophylaxis (PrEP) to prevent HIV acquisition to uninfected partners can reduce the chances of HIV transmission when trying to achieve pregnancy. Botswana has a strong commitment to reducing new HIV infections but PrEP is not yet widely available and little guidance has been offered on counselling sero-different couples. We conducted qualitative in-depth interviews in Gaborone, Botswana with 10 HIV healthcare providers and 10 women living with HIV of childbearing age because they act as a key conduit for reaching sero-different partners with information about PrEP. We examined knowledge and attitudes towards PrEP to assess the viability and develop a deeper understanding of this SC option. Interviews were analysed using an interpretive phenomenological approach. Three themes emerged: (1) awareness of PrEP is limited, (2) providers and women overwhelmingly showed interest in PrEP and (3) women living with HIV and providers have concerns about PrEP use. With the correct support, PrEP could be a useful SC option for sero-different couples in Botswana and other sub-Saharan contexts. © 2020, © 2020 Informa UK Limited, trading as Taylor & Francis Group. Article	2020	Hall E.W.; Wang L.; Huang X.; Sullivan P.S.; Siegler A.J.	Assessing the performance of international pre-exposure prophylaxis (PrEP) eligibility guidelines in a cohort of Chinese MSM, Beijing, China 2009 to 2016	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25653	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098094455&doi=10.1002%2fjia2.25653&partnerID=40&md5=ccfa2114f4899600e1973b1b7975f5bc	Introduction: PrEP is a powerful HIV prevention tool, and locally relevant eligibility criteria are necessary to optimize the prevention impact of PrEP. We assessed performance of existing national and international PrEP eligibility criteria to predict future HIV seroconversion among MSM in Beijing, China. Methods: Participants were MSM aged ≥18 years who enrolled in a cohort study between July 2009 and March 2016. Participants completed HIV testing, syphilis testing, and a questionnaire on recent sexual health behaviours at each follow-up visit and were followed until HIV seroconversion or dropout. We assessed PrEP eligibility at the most recent follow-up visit prior to the final study visit. Participants were classified as indicated for PrEP (or not) based on criteria from guidelines from Europe, Korea, South Africa, Taiwan, the United Kingdom, United States and the World Health Organization. To compare guideline performance, we calculated sensitivity, specificity, Youden's Index (YI), Matthew's Correlation Coefficient (MCC), F1 scores and diagnostic odds ratios. For each guideline, performance measures were compared to random allocation of PrEP by randomly selecting a proportion of participants equal to the proportion indicated. Results: There were 287 (17·3%) incident HIV seroconversions among 1663 MSM. The number of men indicated for PrEP from different guidelines ranged from 556 (33·4%) to 1569 (94·2%). Compared to random allocation, sensitivity of algorithms to predict seroconversion ranged from slightly worse (−4·7%) to 30·2% better than random. However, in absolute terms, none of the sensitivity values increased by more than 11% when compared to random allocation. For all guidelines, specificity was not meaningfully better than random allocation. No guidelines had high binary classification performance measures. Conclusions: The performance of international guidelines in this sample was only slightly better than random allocation. Using such guidelines to screen out MSM self-identifying as interested in PrEP could lead to misallocation of resources and to good candidates for PrEP being denied access. For settings in which international guidelines perform poorly, alternative indication approaches should be considered. © 2020 The Authors. Article	2020	Hall, Michaela T; Smith, Megan A; Simms, Kate T; Barnabas, Ruanne V; Canfell, Karen; Murray, John M	The past, present and future impact of HIV prevention and control on HPV and cervical disease in Tanzania: A modelling study	PLOS One	-	-	-	19326203	10.1371/journal.pone.0231388	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084213768&doi=10.1371%2fjournal.pone.0231388&partnerID=40&md5=bfa29c02f5af048f1151f036d603d43e	Background Women with HIV have an elevated risk of HPV infection, and eventually, cervical cancer. Tanzania has a high burden of both HIV and cervical cancer, with an HIV prevalence of 5.5% in women in 2018, and a cervical cancer incidence rate among the highest globally, at 59.1 per 100,000 per year, and an estimated 9,772 cervical cancers diagnosed in 2018. We aimed to quantify the impact that interventions intended to control HIV have had and will have on cervical cancer in Tanzania over a period from 1995 to 2070. Methods A deterministic transmission-dynamic compartment model of HIV and HPV infection and natural history was used to simulate the impact of voluntary medical male circumcision (VMMC), anti-retroviral therapy (ART), and targeted pre-exposure prophylaxis (PrEP) on cervical cancer incidence and mortality from 1995–2070. Findings We estimate that VMMC has prevented 2,843 cervical cancer cases and 1,039 cervical cancer deaths from 1995–2020; by 2070 we predict that VMMC will have lowered cervical cancer incidence and mortality rates by 28% (55.11 cases per 100,000 women in 2070 without VMMC, compared to 39.93 with VMMC only) and 26% (37.31 deaths per 100,000 women in 2070 without VMMC compared to 27.72 with VMMC), respectively. We predict that ART will temporarily increase cervical cancer diagnoses and deaths, due to the removal of HIV death as a competing risk, but will ultimately further lower cervical cancer incidence and mortality rates by 7% (to 37.31 cases per 100,000 women in 2070) and 5% (to 26.44 deaths per 100,000 women in 2070), respectively, relative to a scenario with VMMC but no ART. A combination of ART and targeted PrEP use is anticipated to lower cervical cancer incidence and mortality rates to 35.82 and 25.35 cases and deaths, respectively, per 100,000 women in 2070. Conclusions HIV treatment and control measures in Tanzania will result in long-term reductions in cervical cancer incidence and mortality. Although, in the near term, the life-extending capability of ART will result in a temporary increase in cervical cancer rates, continued efforts towards HIV prevention will reduce cervical cancer incidence and mortality over the longer term. These findings are critical background to understanding the longer-term impact of achieving cervical cancer elimination targets in Tanzania. © 2020 Hall et al. Theses and Dissertations	2020	Halse, Matthew	Another Possibility: HIV and the Contemporary Moment	-	-	University of Western Ontario	-	NA	NA	https://ir.lib.uwo.ca/etd/6983	"Another Possibility: HIV and the Contemporary Moment" addresses possibilities for political participation and HIV activism in a post-antiretroviral world. With advancing medical technologies rendering viral loads undetectable for HIV positive persons and with increasingly prevalent use of pre-exposure prophylaxis (PrEP) as prevention technique for HIV negative persons comes the opportunity for a renewed understanding of the epidemic. Against the grain of nostalgic framings of activism prompted by the immanence of death, this dissertation outlines possibilities for new forms of political participation because of, not in spite of, the becoming-chronic of HIV. Global movements including U=U (Undetectable = Untransmittable) messaging, referring to the impossibility of transmitting the virus after suppression, and PrEP activism, referring to a medication which prevents HIV negative people from acquiring the virus, provide opportunities for rethinking relationalities between queer bodies. While queer theory is currently wrestling with those relations in sexual terms, this dissertation asks how U=U and PrEP change who is, or more accurately who can be, invited to HIV political participation in the queer North American context. How does undetectability change how queer bodies are imagined—against a historical backdrop of toxicity—in a broader political context and across lines of serostatus? How might participation be understood in a dawning era of 'gay normalcy'? Termed 'living before a virus,' I outline the political implications of reversing the traditional logic of HIV: pill consumption before transmission, and the admission of potential viral presence during sex without fear. These two ideas, unimaginable until recently, not only re-place queer bodies in new form(s) of relation, but in obligation to each other 'before a virus.' Translating that obligation, however, into a political project is no easy feat. Opportunities for activism presented by U=U and PrEP are dulled by rising economic precarity and a queer political agenda working in tandem with neoliberal economics. "Another Possibility," within contexts of mass media and the attention economy, the becoming-chronic of HIV, and emergent medical technologies attempts to locate opportunities for participation within the realm of uncertainty. In essence: how does the unknowability of HIV—when HIV is no longer a death sentence, when diverse bodies experience HIV, when media attention to HIV is deliberately confusing, when queer bodies are capitalized—actually lend itself to activism? "Another Possibility" draws strongly from the work of Jean-Luc Nancy ("The Intruder," Being Singular Plural), Judith Butler (Giving an Account of Oneself, Dispossession, Notes Toward a Performative Theory of Assembly), and Lauren Berlant (Cruel Optimism), as well as a score of emergent young queer thinkers ready to take up the call to 'rethink HIV.' "Another Possibility" is deeply rooted in contemporary political theory, particularly new understandings of participation, as it intersects…	HIV; activism; queer theory; Jean-Luc Nancy; Judith Butler; antiretrovirals; Political Theory	English	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	-	-	Qualitative
Article	2020	Hammoud M.A.; Jin F.; Maher L.; Bourne A.; Haire B.; Saxton P.; Vaccher S.; Lea T.; Degenhardt L.; Prestage G.	Biomedical HIV Protection Among Gay and Bisexual Men Who Use Crystal Methamphetamine	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-019-02739-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075346755&doi=10.1007%2fs10461-019-02739-7&partnerID=40&md5=c292876cdff1897a6e44a9eafe57b9de	Use of crystal methamphetamine (crystal) among gay and bisexual men (GBM) has been associated with condomless anal intercourse with casual partners (CLAIC) and HIV infection. Pre-exposure prophylaxis (PrEP) and undetectable viral load (UVL) are important biomedical HIV prevention strategies. We investigate the relationship between crystal use and HIV sexual risk behaviours in the context of PrEP and UVL. In 2018, 1367 GBM provided details about crystal use and HIV prevention strategies. Binary logistic regression was used to estimate associations between crystal use and behaviour. Recent crystal use was independently associated with greater social engagement with gay men and having more sexual partners. Crystal use was also independently associated with use of PrEP and UVL among GBM who engaged in CLAIC. Although GBM who used crystal were more likely to have engaged in CLAIC, they were also more likely to use biomedical HIV prevention which mitigates against the risks of HIV infection. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Theses and Dissertations	2020	Hammoud, Mohamed, Kirby Institute, Faculty of Medicine, UNSW	Emerging practices and the potential to change HIV epidemiological trends: Pre-exposure prophylaxis as biomedical HIV prevention among gay and bisexual men who participate in chemsex	-	-	The Kirby Institute for Infection and Immunity in Society	-	NA	NA	https://unsworks.unsw.edu.au/entities/publication/a961c95e-5b7d-4a28-9c8e-b747db59b67a/full	Within a population already at high risk of HIV, gay and bisexual men (GBM) who use drugs, particularly methamphetamine, to enhance sexual pleasure (chemsex) have previously been identified as being at higher risk of HIV compared to their non-drugs-for-sex peers. HIV pre-exposure prophylaxis (PrEP) has had a substantial impact on HIV prevention globally. This questions whether GBM who engage in chemsex remain at risk of HIV in the context of PrEP. This research explores ongoing HIV risk behaviours among men who engage in chemsex in the context of the availability of PrEP.This thesis comprises six projects. The first project described the implementation of a cohort management system that I designed to automate data collection for this project. In 2014, baseline prevalence of methamphetamine use was high, as was concurrent use of erectile dysfunction medication (EDM) and gamma-hydroxybutyrate (GHB). The second and third projects examined EDM and GHB separately. Prior to the widespread availability of PrEP in Australia, use of these drugs was strongly associated with HIV risk behaviours. The fourth project was conducted in 2017 and measured incidence of PrEP initiation among GBM in the cohort, and identified factors associated with PrEP initiation. Many GBM who had reported high-risk behaviours subsequently initiated PrEP, but a large proportion of GBM at high-risk of HIV did not initiate PrEP. The fifth project demonstrated a change in HIV prevention among GBM who engage in chemsex. Prevalence of PrEP use among GBM who engage in chemsex increased dramatically between 2014 and 2017. With methamphetamine use consistently linked to HIV infection, the sixth project investigated the relationship between its use and HIV risk behaviours, specifically in the current context of HIV biomedical prevention. GBM who were previously considered at highest risk of infection are more likely to use PrEP to mitigate against the HIV risk in 2018.PrEP as an HIV prevention strategy is changing the trajectory of the HIV epidemic among GBM in Australia. This thesis demonstrates a shift in epidemiology away from the previously highest risk practices due to the incorporation of PrEP into the regimens of GBM who engage in chemsex. Article	2020	Hannaford A.; Lim J.; Moll A.P.; Khoza B.; Shenoi S.V.	PrEP should be for men only': Young heterosexual men's views on PrEP in rural South Africa	Global Public Health	-	-	-	17441692	10.1080/17441692.2020.1744680	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082433705&doi=10.1080%2f17441692.2020.1744680&partnerID=40&md5=49251e55ab8e9d74d5dd71444b1b8655	Background: Gaps persist in HIV testing, treatment, and prevention services for men, leading to higher attributable mortality compared to women. We sought to characterise HIV prevention knowledge, risk behaviours, and interest in pre-exposure prophylaxis (PrEP) among young men in rural South Africa. Methods: We conducted interviews with HIV-negative heterosexual men which were thematically analysed to identify key themes. Results: Among 31 participants, median age was 26 (IQR23–31), 77% were unemployed, 52% reported previous STI, 84% reported casual sexual partners. Men acknowledged inconsistent condom use with multiple partners, reporting high-risk sexual behaviour despite recognised risk. Mistrust between partners was common. Respondents reported willingness to take PrEP to protect themselves and their partner, though anticipated stigma and structural barriers. Men worried that if their female partner had PrEP, she would become sexually active with others. Conclusions: In rural South Africa, young heterosexual men acknowledged high HIV-risk behaviour, expressed concern about acquiring HIV, and recognised the value of PrEP. Men were often not supportive of their female partners taking PrEP. Implementing HIV prevention services needs to incorporate young men's perspectives and may require gender-specific interventions, including addressing stigma, differentiated service delivery models such as community-based services or adapting facility services to target men. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	adolescent girls and young women; heterosexual men; HIV pre-exposure prophylaxis; implementation; South Africa	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Hansson D.; Strömdahl S.; Leung K.Y.; Britton T.	Introducing pre-exposure prophylaxis to prevent HIV acquisition among men who have sex with men in Sweden: Insights from a mathematical pair formation model	BMJ Open	-	-	-	20446055	10.1136/bmjopen-2019-033852	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079083161&doi=10.1136%2fbmjopen-2019-033852&partnerID=40&md5=b744cb6f96afbfcb406cfe10f5f5546e	Objectives Since 2017, the Public Health Agency of Sweden recommends that pre-exposure prophylaxis (PrEP) for HIV should be offered to high-risk individuals, in particular to men who have sex with men (MSM). The objective of this study is to develop a mathematical model investigating the effect of introducing PrEP to MSM in Sweden. Design A pair formation model, including steady and casual sex partners, is developed to study the impact of introducing PrEP. Two groups are included in the model: sexually high active MSM and sexually low active MSM. Three mixing assumptions between the groups are considered. Setting A gay-friendly MSM HIV/sexually transmitted infection testing clinic in Stockholm, Sweden. This clinic started offering PrEP to MSM in October 2018. Participants The model is calibrated according to detailed sexual behaviour data gathered in 2015 among 403 MSM. Results By targeting sexually high active MSM, a PrEP coverage of 3.5% of the MSM population (10% of all high actives) would result in the long-term HIV prevalence to drop considerably (close to 0%). While targeting only low actives would require a PrEP coverage of 35% for a similar reduction. The main effect of PrEP is the reduced susceptibility, whereas the increased HIV testing rate (every third month) among PrEP users plays a lesser role. Conclusions To create a multifaceted picture of the effects of interventions against HIV, we need models that include the different stages of HIV infection and real-world data on detailed sexual behaviour to calibrate the mathematical models. Our findings conclude that targeting HIV high-risk individuals, within HIV risk populations such as MSM, with PrEP programmes could greatly decrease the long-term HIV prevalence in Sweden. Therefore, risk stratification of individuals is of importance in PrEP implementation programmes, to ensure optimising the effect and cost-effectiveness of such programmes. © Author(s) (or their employer(s)) 2020. Article	2020	Hanum, N; Cambiano, V; Sewell, J; Phillips, A; Rodger, A; Speakman, A; Nwokolo, N; Asboe, D; Gilson, R; Clarke, A; Miltz, A; Collins, S; Lampe, F	Use of HIV pre-exposure prophylaxis among gay, bisexual, and other men who have sex with men (GBMSM) in England: data from the AURAH2 study	HIV Medicine	-	-	-	1464-2662	10.1016/S2468-2667(20)30186-9	https://pubmed.ncbi.nlm.nih.gov/32888443/	Background: Since October, 2017 (and until October, 2020), pre-exposure prophylaxis (PrEP) has only been available in England, UK, through the PrEP Impact Trial, by purchasing it from some genitourinary medicine clinics, or via online sources. Here we report changes from 2013 to 2018 in PrEP and postexposure prophylaxis (PEP) awareness and use among HIV-negative gay, bisexual, and other men who have sex with men (MSM) and assess predictors of PrEP initiation. Methods: In the prospective cohort study Attitudes to, and Understanding of Risk of Acquisition of HIV 2 (AURAH2), MSM were recruited from three sexual health clinics in England: two in London and one in Brighton, UK. Men were eligible if they were aged 18 years or older and HIV-negative or of unknown HIV status. Participants self-completed a baseline paper questionnaire at one of the three clinics between July 30, 2013, and April 30, 2016, and were subsequently able to complete 4-monthly and annual online questionnaires, which were available between March 1, 2015, and March 31, 2018, and collected information on sociodemographics, health and wellbeing, HIV status, and sexual behaviours. PrEP and PEP use in the previous 12 months was obtained at baseline and in annual questionnaires. We assessed trends over calendar time in 3-month periods from first enrolment to the end of the study period (July–December, 2013, was counted as one period) in use of PrEP and PEP using generalised estimating equation logistic models. We used age-adjusted Poisson models to assess factors associated with PrEP initiation among participants who reported never having used PrEP at baseline. Findings:1162 men completed a baseline questionnaire, among whom the mean age was 34 years (SD 10·4), and of those with available data, 942 (82%) of 1150 were white, 1076 (94%) of 1150 were gay, and 857 (74%) of 1159 were university educated. 622 (54%) of 1162 men completed at least one follow-up online questionnaire, of whom 483 (78%) completed at least one annual questionnaire. Overall, PrEP use in the past year increased from 0% (none of 28 respondents) in July to December, 2013, to 43% (23 of 53) in January to March, 2018. The corresponding increase in PrEP use among men who reported condomless sex with two or more partners was from 0% (none of 13 respondents) to 78% (21 of 27). PEP use peaked in April to June, 2016, at 28% (41 of 147 respondents), but decreased thereafter to 8% (four of 53) in January to March, 2018. Among 460 men who had never used PrEP at baseline, predictors of initiating PrEP included age 40–44 years (incidence rate ratio [IRR] 4·25, 95% CI 1·14–15·79) and 45 years and older (3·59, 1·08–11·97) versus younger than 25 years; and after adjustment for age, recent HIV test (5·17, 1·89–14·08), condomless sex (5·01, 2·16–11·63), condomless sex with two or more partners (5·43, 2·99–9·86), group sex (1·69, 1·01–2·84), and non-injection chemsex-related drugs use (2·86, 1·67–4·91) in the past 3 months, PEP use (4·69, 2·83–7·79) in the past 12 months, and calendar year (Jan 1, 2017, to March 31, 2018 vs July 30, 2013, to Dec 31, 2015: 21·19, 9·48–47·35). Non-employment (0·35, 0·14–0·91) and unstable or no housing (vs homeowner 0·13, 0·02–0·95) were associated with reduced rates of PrEP initiation after adjustment for age. About half of PrEP was obtained via the internet, even after the PrEP Impact trial had started (11 [48%] of 23 respondents in January to March, 2018). Interpretation: PrEP awareness and use increased substantially from 2013 to 2018 among a cohort of MSM in England. Improving access to PrEP by routine commissioning by National Health Service England could increase PrEP use among all eligible MSM, but should include public health strategies to target socioeconomic and demographic disparities in knowledge and use of PrEP. Article	2020	Harawa N.T.; Schrode K.M.; McWells C.; Weiss R.E.; Hilliard C.L.; Bluthenthal R.N.	Small randomized controlled trial of the new passport to wellness hiv prevention intervention for black men who have sex with men (BMSM)	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2020.32.4.311	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090613958&doi=10.1521%2faeap.2020.32.4.311&partnerID=40&md5=d485e97f60bc1e6c216cac990d73afe8	We developed and tested Passport to Wellness (PtW), a client-centered intervention to improve engagement in HIV/STI prevention and services to improve social determinants of health among Black men who have sex with men (BMSM) using incentives and peer support. We assessed PtW's impact on HIV/STI screening and pre/post-exposure prophylaxis (PrEP/PEP) knowledge/uptake using a randomized trial that compared the full intervention to one lacking peer support. We compared changes within groups surveyed at baseline and 6 months. We enrolled 80 eligible BMSM, among 399 screened. Among retained participants (34 peer-supported; 27 compari-son), overall increases were observed in HIV (30% to 81%; p <.001) and STI (28% to 80%; p <.001) testing within the prior 6 months, as well as in PrEP and PEP awareness, and PrEP use. Statistically significant between group differences were not observed. Tailored prevention planning, incen-tives, and addressing social determinants may help move Black MSM along the HIV prevention continuum. © 2020 The Guilford Press. Article	2020	Harrington S.; Grundy-Bowers M.; McKeown E.	Get up, brush teeth, take prep: A qualitative study of the experiences of London-based MSM using prep	HIV Nursing	-	-	-	14747359	NA	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095613369&partnerID=40&md5=33cbc79a85f497d9ac016cbf61507476	Pre-exposure prophylaxis (PrEP) is highly effective in preventing transmission of HIV among at-risk groups. A qualitative study with 13 PrEP-using men who have sex with men (MSM) recruited from London, UK, utilised semi-structured interviews to understand knowledge of PrEP, experiences of using PrEP and potential barriers and facilitators to its use. Thematic analysis of transcripts identified six themes: (1) PrEP and condom use; (2) lessened anxiety around HIV; (3) increased intimacy and pleasure; (4) sense of sexual liberation; (5) ease of using PrEP; and (6) activism as an 'early adopter' in current UK context. Findings indicate a PrEP-mediated shift in how 'risk' and 'protection' are conceived. While experiences demonstrate an overall positive affect of using PrEP, the potential impact of decreased condom use on STI rates requires consideration. Ensuring PrEP is embedded in sexual health services that provide adequate surveillance, testing and treatment for other infections may be a way to mitigate the change in behaviour and outweigh the potential risks other infections. © Medicsript 2020. Article	2020	Hebel S.; Kahle-Woods E.; Malone-Thomas S.; McNeese M.; Thornton L.; Sukhija-Cohen A.; Patani H.; Engoren W.; Daughtridge G.	Discrepancies between Self-Reported Adherence and a Biomarker of Adherence in Real-World Settings	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	-	15254135	10.1097/QAI.0000000000002486	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085307742&doi=10.1097%2FQAI.0000000000002486&partnerID=40&md5=c255ef29fe5e7c2d5302fd4f7f8835bd	Background:Pre-exposure prophylaxis (PrEP) is only effective in preventing new HIV infections when taken consistently. In clinical practice, asking a patient about their adherence (self-report) is the predominant method of assessing adherence to PrEP. Although inexpensive and noninvasive, self-report is subject to social desirability and recall biases. Several clinical trials demonstrate a discrepancy between self-reported adherence and biomarker-based recent adherence. Less is known about the accuracy of self-report in real-world clinical settings.Methods:A liquid chromatography-mass spectrometry urine test for tenofovir was developed to measure recent adherence. We describe the concordance between self-reported adherence and biomarker-based adherence in real-world clinical settings.Methods:A liquid chromatography-mass spectrometry urine test for tenofovir was developed to measure recent adherence. We describe the concordance between self-reported adherence and biomarker-based adherence in real-world clinical settings.Methods:A liquid chromatography-mass spectrometry urine test for tenofovir was developed to measure recent adherence. We describe the concordance between self-reported adherence and biomarker-based adherence in real-world clinical settings.Methods:A liquid chromatography-mass spectrometry urine test for patients who self-report that they are not struggling with adherence. Those who self-report struggling with adherence receive enhanced adherence support without the need for additional testing. The number of results indicating recent nonadherence from these 2 clinics were analyzed to assess the concordance between self-reported adherence and biomarker-based adherence.Results:Across 2 clinics, 3987 tests were conducted from patients self-reporting as "adherent," and 564 (14.1%; 95% confidence interval [CI]: 13.1% to 15.2% demonstrated recent nonadherence with the liquid chromatography–mass spectrometry test. At clinic #1 in Florida, 3200 tests were conducted, and 445 (14.0%; 95% CI: 13.3% to 15.8%) demonstrated recent nonadherence. At clinic #2 in Texas, 787 tests were conducted, and 99 (12.6%; 95% CI: 10.4% to 14.9%) demonstrated recent nonadherence.Conclusions:Utilization of biomarker-based adherence monitoring at these 2 clinics resulted in 564 additional patients receiving enhanced adherence support who otherwise would not have been identified as nonadherent to their prescribed PrEP regimen. These findings suggest that objective adherence monitoring can be used clinically to enable providers to identify nonadherent patients and allocate support services accordingly. © 2020 Lippincott Williams and Wilkins. Article	2020	Hendrickson C.; Long L.; van de Vijver D.; Boucher C.; O'Bra H.; Claassen C.W.; Njikizana M.; Moyo C.; Mumba D.B.; Sabelai H.; Mulenga L.; Rosen S.; Nichols B.E.	Novel metric for evaluating pre-exposure prophylaxis programme effectiveness in real-world settings	The Lancet HIV	-	-	-	-	-	23523018	10.1016/S2352-3018(19)30344-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85062995525&doi=10.1016%2FS2352-3018%2819%2930344-3&partnerID=40&md5=12d9643fdf129a4b7e165f89fb6fd1bc	Although large-scale provision of HIV pre-exposure prophylaxis (PrEP) is gaining momentum, no systematic method to evaluate or compare the effectiveness of different scale-up strategies in real-world settings exists. To date, estimating the effectiveness of PrEP has relied on clinical trials or mathematical models. We propose a novel and pragmatic metric to evaluate and compare programme effectiveness in real-world implementation settings. We define PrEP effectiveness as the proportion of the theoretical maximum number of HIV infections averted by a programme that are actually averted. We estimate PrEP effectiveness should account for HIV seroconversions, the variable risk of HIV infection (assessed via risk assessment at each clinic visit when available), and the persistence of PrEP use. Three criteria should be met in order to be considered a successful outcome: first, a person who initiates PrEP must not seroconvert; second, there should be no more than one period at high risk of HIV infection during the follow-up period when not taking PrEP; and finally, an individual must continue to attend health care visits or discontinue prophylaxis in consultation with a health-care provider within a specified follow-up period. The number of PrEP successes could then be compared with the total number of people initiating PrEP to establish a success ratio. This outcome is a useful and easily interpretable metric to monitor effectiveness of PrEP programmes with routinely collected clinical data and can be used in cost-effectiveness analyses. These measurements allow for comparisons of scale-up strategies for PrEP programmes and, if widely adopted, will allow comparative studies of different approaches for PrEP service delivery. © 2020 Elsevier Ltd	NA	English	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2020	Hosny K.D.; Duke C.C.; Buchacz K.; Brooks J.T.; Samandari T.; Sutton M.Y.	HIV prescriptions on the frontlines: Primary care providers' use of antiretrovirals for prevention in the Southeast United States, 2017	Preventive Medicine	-	-	-	-	-	917435	10.1016/j.ypmed.2019.105875	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074645314&doi=10.1016%2Fj.ypmed.2019.105875&partnerID=40&md5=156018f28328a5ca7cc65d2ab6e22d84	HIV disproportionately affects persons in Southeast United States. Primary care providers (PCPs) are vital for HIV prevention. Data are limited about their prescribing of antiretrovirals (ARVs) for prevention, including non-occupational post-exposure prophylaxis (nPEP), pre-exposure prophylaxis (PrEP), and antiretroviral therapy (ART). We examined these practices to assess gaps. During April–August 2017, we conducted an online survey of PCPs in Atlanta, Baltimore, Baton Rouge, Miami, New Orleans, and Washington, DC to assess HIV-related knowledge, attitudes and practices. Adjusted prevalence ratios (aPR) and 95% confidence intervals (CI) were calculated using multivariable Poisson regression. Of 1,031 PCPs who completed the survey, 51.4% (CI: 48.3, 54.5) were female, 45.0% (CI: 41.9, 48.1) were white, 45.0% (CI: 41.9, 48.1) were aged ≥55 years, and 45.0% (CI: 41.9, 48.1) were Black/African American. Most (82.5% [CI: 80.0, 85.0]) reported ever prescribing nPEP (51.0%), PrEP (18.1%), and ART (27.2%). Prescribing nPEP was associated with nPEP familiarity (aPR = 2.63, 95% CI 1.59, 4.35) and prescribing PrEP (aPR = 1.57, 95% CI 2.78, 6.35). Prescribing PrEP was associated with PrEP familiarity (aPR = 4.35, 95% CI 2.63, 7.14), prescribing nPEP (aPR = 5.00, 95% CI 2.00, 12.50), and providing care for persons with HIV (aPR = 1.56, 95% CI 1.06, 2.25). Prescribing ART was associated with nPEP familiarity (aPR = 1.89, 95% CI 1.27, 2.78) and practicing in outpatient public practice versus hospital-based facilities (aPR = 2.14 95% CI 1.51, 3.04), and inversely associated with collaborations involving specialists (aPR = 0.60, 95% CI 0.42, 0.86). A minority of PCPs surveyed from the Southeast report ever prescribing ARVs for prevention. Future efforts should include enhancing HIV care coordination and developing strategies to increase use of biomedical tools. © 2019	HIV; Prescriptions; Prevention; Primary health care	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Article	2020	Hurtwood B.F.; Rhoades H.; Redline B.; Dyrdahe E.; Wenzel S.	Risk behavior and access to HIV/AIDS prevention services among formerly homeless young adults living in housing programmes	AIDS Care	-	-	-	-	-	9540121	10.1080/09540121.2019.1699643	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075837342&doi=10.1080%2F09540121.2019.1699643&partnerID=40&md5=1fe5b9523038f3b2b6b3e4a2baa6c	Young adults who experience homelessness have high rates of sexually transmitted infections (STIs) including HIV. Homelessness services programmes that provide housing to young adults have the capacity to reduce STI risk profiles. This study analysed data from 140 formerly homeless adults who moved into a housing programme in Los Angeles County between the ages of 18 and 25 years to investigate risk behaviour and access to HIV/AIDS prevention services. More than three quarters of participants reported sexual activity (vaginal or anal sex) in the past 12 months, with 62% reporting sex with men and sex. 29% reporting unprotected sex with a nonsexual partner, 40% reporting multiple partners, and 11% reporting exchange sex. About three quarters reported a past-year HIV test. About half of the sample had ever heard of pre-exposure prophylaxis (PrEP), 12% had heard of it but didn't know what it was, 22% reported knowing a little bit, and 17% said they knew a lot about PrEP. Slightly more than 4% of the sample reported being HIV positive. These findings suggest that housing programmes may be a prime location to implement HIV prevention services. © 2019 Informa UK Limited, trading as Taylor & Francis Group. Article	2020	Hutzler T.; Agerdh A.; Björkman P.; Månsson F.	Interest in Taking HIV Pre-exposure Prophylaxis Is Associated with Behavioral Risk Indicators and Self-Perceived HIV Risk Among Men Who Have Sex with Men Attending HIV Testing Venues in Sweden	Archives of Sexual Behavior	-	-	-	-	1573-2800	40002	10.1007/s10508-020-01740-9	This study explored factors associated with interest in taking PrEP among men who have sex with men (MSM) attending HIV testing venues in Sweden. Data from 658 HIV-negative respondents, surveyed by a questionnaire at six clinics, were analyzed descriptively and by univariable and multivariable logistic regression. A total of 433 (68.6%) of the respondents reported interest in taking PrEP. Interest was associated with having had unprotected risk of HIV acquisition in moderate or high, reporting ≥ 2 partners for condomless anal intercourse during the past year, and reporting hard drug use during the past year were independently associated with interest in PrEP. Of the 433 interested respondents, 70.7% reported a perceived risk of HIV acquisition in moderate or high, and perceived risk was associated with interest in taking PrEP. Overall, Swedish MSM were well-informed regarding PrEP, and interest in taking PrEP was associated with risk indicators. © 2020, The Author(s). Article	2020	Horan J.E.; Rix S.; Varma R.; Gracey D.M.	Renal impairment: An unnecessary barrier to HIV prevention	Sexual Health	-	-	-	-	-	14485028	10.1071/SH20017	http://www.scopus.com/inward/record.uri?eid=2-s2.0-85082615197&doi=10.1071%2FSH20017&partnerID=40&md5=3c680e8f3182663157114453ab5a2c09a	The use of tenofovir disoproxil fumarate (TDF) in combination with emtricitabine, prescribed for pre-exposure prophylaxis (PrEP), is highly effective at reducing incident sexually transmissible HIV infection among those at risk. TDF is associated with proximal tubulopathy, Fanconi syndrome and chronic kidney disease, and is not recommended for use in patients with an estimated creatinine clearance <60 mL min-1. There are currently no Pharmaceutical Benefits Scheme (PBS)-funded PrEP options for patients at risk of HIV infection with moderate renal impairment in Australia. This report describes the case of a patient who acquired HIV soon after PrEP was suspended due to moderate renal impairment. The various clinical and regulatory issues this case raises are discussed. © 2020 CSIRO.	antiretrovirals; HIV/AIDS	English	United States	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Clinical
Article	2020	Horton, Patrick D	Current Perspectives on the Impact of Pre-Exposure Prophylaxis Stigma Regarding Men Who Have Sex with Men in the United States	HIV/AIDS - Research and Palliative Care	-	-	-	-	-	NA	10.2147/HIV.S214380	https://www.proquest.com/scholarly-journals/current-perspectives-on-impact-pre-exposure/docview/2413906807/se-2?accountid=8113	Pre-exposure prophylaxis or PrEP is a Food and Drug Administration-approved human immunodeficiency virus (HIV) prevention tool that reduces the risk of infection by greater than 90%. While it does not provide protection against other sexually transmissible infections and blood borne illnesses such as hepatitis C, syphilis, chlamydia, and gonorrhea, it is a highly effective and versatile biomedical intervention for HIV among men who have sex with men. Despite the success of PrEP, there remain barriers to PrEP uptake rooted in stigmatized perspectives shared by health professionals, patients, and community members. The insidious impact of stigma associated with HIV/AIDS has permeated throughout the LGBTQ+ community, healthcare systems, society at large and to this day, continues to exacerbate structural and social determinants of health disparities amongst sexual and gender minorities. While the initial resistance to PrEP has abated over time, stigmatized perspectives regarding PrEP continue to impede those at greatest risk from benefiting from effective pre-exposure care. Article	2020	Hosek S.G.; Siberry G.; Bell M.; Kapogiannis B.G.; Soneja M.; Wilson C.M.; Leu C.-S.; Chillag K.; Gabriel M.; Rutledge B.; Adolescent Trials Network for HIV/AIDS Interventions	The Static and Dynamic Adolescent Male Image Project: Associations of Sexual Orientation, Substance Use, and Socioeconomic Status with Sexual Risk Behavior	Archives of Sexual Behavior	-	-	-	-	1573-2800	10.1007/s10508-019-01500-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7010644/	Recent outbreaks of serogroup C meningococcal disease in Southern California have led the California Department of Public Health to recommend the quadrivalent meningococcal vaccine (MenACWY) for gay, bisexual, and other men who have sex with men (GBMSM) in Southern California. High-risk GBMSM have also been advised to utilize pre-exposure prophylaxis (PrEP) for HIV prevention. Data collected from a community-based sample of HIV-negative GBMSM in Los Angeles County (N = 476) were used in a multinomial logit regression analysis to identify factors associated with PrEP usage and evaluate factors associated with use of both, one, or neither of these prevention methods. More than half (56%) of participants had neither been vaccinated nor used PrEP. A smaller percentage (24%) had used PrEP but not been vaccinated, 13% had been vaccinated but not used PrEP, and 7% had been vaccinated and used PrEP. Use of PrEP was associated with greater odds of using both prevention methods (aRRR = 3.07), as was greater sexual risk behavior (aRRR = 1.23). Vaccination (aRRR = 0.43) was significantly associated with greater odds of using both prevention methods relative to neither. Higher education, prior sexually transmitted infection diagnosis, more recent sex partners, and recent receptive CAS were significantly associated with greater odds of just PrEP use relative to neither. Higher education was the only factor significantly associated with greater odds of just MenACWY immunization relative to neither. Findings highlight important gaps in immunization among PrEP users and opportunities to screen for PrEP eligibility among GBMSM in conjunction with immunization. Public health practitioners should consider the ways in which strategies to increase PrEP and vaccine-preventable illnesses among GBMSM may complement one another. Article	2020	Holmes, Leah E; Kaufman, Michelle R; Cunilla, Albert; Mudavanhu, Motsa; Motsenga, Lillian; Polster, Tara; Bassett, Ivan; Van Rie, Annelies; Schwartz, Sheree	Qualitative characterizations of relationships among South African adolescent girls and young women and male partners: implications for engagement across HIV self-testing and pre-exposure prophylaxis prevention cascades.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.25521	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087109727&doi=10.1002%2Fjia2.25521&partnerID=40&md5=e2631625b02483c98b7e3dac5bb7	Introduction: Adolescent girls and young women (AGYW) in sub-Saharan Africa have emerged as a priority population in need of HIV prevention interventions. Secondary distribution of home-based HIV self-test kits by AGYW to male partners (MP) is a novel prevention strategy that complements pre-exposure prophylaxis (PrEP), a female-controlled prevention intervention. The objective of this analysis was to qualitatively operationalize two HIV prevention cascades through the lens of relationship dynamics for secondary distribution of HIV self-kits to MP and PrEP for AGYW. Methods: From April 2018 to December 2018, 2200 HIV-negative AGYW aged 16-24 years were enrolled into an HIV prevention intervention which involved secondary distribution to MP and PrEP for AGYW. Of these women, 58 participants or MP were sampled for in-depth interviews based on their degree of completion of the two HIV prevention cascades. A grounded theory approach was used to characterize relationship dynamics among AGYW and MP. Results: Participants were interviewed between May 2018 and March 2019. Of 58 AGYW and MP, 31 were female. Participants described the importance of providing distrust as the relationship and normalizing non-monogamy. Many chose not to accept either intervention, while others accepted and attempted to deliver the self-test but received a negative reaction from their MP. In the few cases where AGYW held multiple partnerships, both interventions were viewed as mechanisms for protecting one's health, and these AGYW exhibited confidence in accepting and delivering the self-test kits and initiating PrEP. Women who indicated intimate partner violence experiences chose not to accept either intervention because they feared it would elicit a violent reaction from their MP. For AGYW in relationships described as committed and emotionally open, self-test kit delivery was completed with ease, but PrEP was viewed as unnecessary. MP experience with the cascade corroborated AGYW perspectives and demonstrated how men can perceive female-initiated HIV prevention options as beneficial for AGYW and a threat to MP masculinity. Conclusions: Screening to identify AGYW relationship dynamics can support tailoring prevention services to relationship-driven barriers and facilitators. HIV prevention counseling for AGYW should address relationship goals or concerns and how to engage with MP around female-controlled prevention interventions. © 2020 The Authors. Article	2020	Hooks, CN; Gross, AM	Racialized Sexual Risk Perceptions of Pre-exposure Prophylaxis in Men Who have Sex with Men	Sexuality & Culture	-	-	-	-	1095-5143	10.1007/s12119-020-09717-5	https://link.springer.com/article/10.1007/s12119-020-09717-5	This study examined the effect of race and preexposure prophylaxis antiviral medication (PrEP) status on sexual-risk and personality perceptions. Utilizing a 2 x 2 factorial design, 177 men who have sex with men (MSM) were recruited through social networking websites and randomly assigned to one of four conditions involving a profile vignette of a MSM. MSM displayed in the profile vignettes differed in terms of race (Black or White) and PrEP status (on PrEP or not on PrEP). Participants viewed a vignette and completed measures assessing sexual- and STI/risk perceptions, personality, and perceptions of PrEP and PrEP effects of these engagement in risky sex. Analyses revealed individuals on PrEP were perceived as more warm/trustworthy and more likely to have had sex without a condom in the preceding 3 months compared to individuals who were not on PrEP. Additionally, the perceived levels of self-reported STI diagnoses were lower for PrEP users than non-PrEP users, which may help reduce assumed STI burdens. Findings of this research suggest a need to further explore racialized sexual-risk perceptions among MSM. Theses and Dissertations	2020	Hooks, Curtis N.; Gross, Alan M.	Do Black Men Look PrEPped? Racialized Sexual-Risk Perceptions of Pre-exposure Prophylaxis-using Men Who Have Sex with Men	-	-	University of Mississippi	-	NA	NA	https://www.proquest.com/dissertations-theses/do-black-men-look-prepped-racialized-sexual-risk/docview/2055594137/se-2?accountid=8113	Pre-exposure Prophylaxis (PrEP) is an antiretroviral medication for the prevention of HIV. A concern among researchers and health care providers is whether sexual-risk behavior will increase with PrEP use. Black men who have sex with men (MSM) are often targets of sexual stigma, and some research suggests that individuals may perceive Black MSM on PrEP as more likely to engage in unsafe sexual behavior than White MSM on PrEP. This form of racialized sexual-stigma may be associated with a variety of adverse consequences such as healthcare providers being less willing to prescribe PrEP to Black MSM limiting their awareness and use of PrEP or Black MSM being less willing to communicate sexual behavior concerns or seek HIV prevention methods. The purpose of the current study was to examine the effects of race and PrEP status on sexual-risk and personality perceptions. Utilizing a 2 x 2 factorial design, 177 men who have sex with men (MSM) were recruited through social networking websites and randomly assigned to one of four conditions involving a profile vignette of a MSM. MSM displayed in the profile vignettes differed in terms of race (Black or White) and PrEP status (on PrEP or not on PrEP). Upon viewing the vignettes, MSM completed a variety of measures. Utilizing a MANOVA, a significant main effect for PrEP status (on PrEP or not on PrEP) on the combination of dependent variables was observed. When univariate ANOVAs were conducted to assess the impact of PrEP status on the dependent variables, individuals on PrEP were perceived as more warm/trustworthy and more likely to have had sex without a condom in the preceding three months compared to individuals who were not on PrEP. Univariate ANOVAs concerning the impact of race on the dependent variables revealed that participants perceived White MSM as more likely of engaging in condomless group sex compared to Black MSM.	-	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

High incidence of HCV in HIV-negative men who have sex with men using pre-exposure prophylaxis	Journal of Hepatology	-	-	-	-	1600278	10.1016/j.jhep.2019.11.022	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082144376&doi=10.1016%2Fj.jhep.2019.11.022&partnerID=40&md5=48dcadfce387a1b4986bcec854bd7980#38478	Background & Aims: HCV has emerged as a sexually transmitted infection (STI) among HIV-positive men who have sex with men (MSM). We evaluated HCV incidence and its risk factors among HIV-negative MSM using HIV pre-exposure prophylaxis (PrEP). Methods: Participants of the Amsterdam PrEP project were tested for HCV antibodies or HCV-RNA every 6 months. Participants used daily or event-driven PrEP and valid work telephones during follow-up. We calculated HCV incidence rates (IRs) for HCV infection and separately for primary HCV-1 infection. A univariable Bayesian exponential survival model was used to identify risk factors associated with incident HCV infection. The HCV NS5B gene fragment (709 bp) was sequenced and compared to HCV isolates from HIV-positive MSM and HIV-negative MSM from the Netherlands. Results: Between 2011 and 2017, 1,928 HIV-negative MSM started PrEP (median age, 38 years; 95% CI, 37-39 years). Of these, 1,785 were tested for HCV infection and were followed for a median of 1.7 (IQR, 0.9-2.6) years. We identified 16 HCV seroconversions (8 with HCV-1 infection). IR was 2.7 (1/100PY in men who have sex with men and transgender persons. Factors associated with HCV infection were higher number of receptive condomless anal sex acts with casual partners (posterior hazard ratio HR 1.17 per 6 increase; 95% credibility interval CrI 1.09-2.20), and ST3 (posterior HR 2.81; 95% CrI 1.24-7.13), injecting drug use (posterior HR 7.12), and sharing straws when snorting drugs (posterior HR 2.42; 95% CrI 1.09-6.02). We identified robust MSM-specific HCV clusters of subtypes 1a, 4d, 2b and 3a, which included MSM with and without HIV. Conclusions: HIV-negative MSM using PrEP are at risk of incident HCV infection, while identified risk factors are similar to those in HIV-positive MSM. Reported risk behaviors in HIV-negative MSM may be underestimated in those with a previous HCV infection and those reporting risk factors. Lay summary: We report that hepatitis C virus infections are frequently acquired among HIV-negative men who have sex with men (MSM) using pre-exposure prophylaxis to prevent HIV infection. New infections occurred more frequently in those reporting receptive anal sex, drug injection, and sharing straws when snorting drugs. Phylogenetic analysis revealed that HCV infections in HIV-negative MSM using pre-exposure prophylaxis are genetically similar to those in HIV-positive men, but not in other hepatitis C risk groups, suggesting that sexual transmission is occurring between HIV-positive MSM and HIV-negative MSM using pre-exposure prophylaxis. Theses and Dissertations	2020	Hoornenborg, Elske	PrEP in the Netherlands: The introduction of HIV pre-exposure prophylaxis	-	-	NARCIS	-	NA	NA	https://pure.amc.nl/en/publications/prep-in-the-netherlands(9478bc4c-9504-4c12-97c5-e06a3411f6d8).html	Pre-exposure prophylaxis (PrEP) involves the use of antiretroviral agents, namely those commonly used in the treatment of HIV, to prevent HIV infection. HIV-negative persons engaging in behaviours that place them at high risk for HIV infection can substantially decrease their risk through the use of PrEP. In the Netherlands, both men who have sex with men and transgender persons with additional risk factors for HIV infection, such as having anal sex without the use of a condom with casual partners, are key groups that could benefit from PrEP . Previous research has shown that PrEP prevents HIV effectively, if taken as prescribed, and is safe to use. In this thesis, we discuss various aspects of implementing PrEP among men who have sex with men and transgender persons in the Netherlands. We aimed to shed light on whether the use of PrEP is associated with changes in sexual behaviour and the incidence of sexually transmitted infections, including hepatitis C virus. We use data from the Amsterdam PrEP demonstration project (AMPrEP), which started in 2015 with the intent of assessing PrEP uptake, and acceptability and suitability of PrEP in HIV-negative men who have sex with men and transgender persons. One innovative part of AMPrEP's design is that participants were offered a choice of regimen: daily use of PrEP (one tablet once daily) or event-driven use (consuming of two tablets before having sex, followed by one tablet 24 hours and one tablet 48 hours later). Additional specific aims of this thesis were to evaluate the attitudes of healthcare professionals towards PrEP implementation and to study the adoption of health technology in order to monitor adherence. Article	2020	Hoover, Karen W; Huang, Ya-Lin A; Tanner, Mary L; Zhu, Weiming; Gebhart, Gina; Naumie W; Pitasi, Mary A; DiNenno, Elizabeth A; Nutt, Sanaa; Delaney, Kevin P	HIV Testing Trends at Visits to Physician Offices, Community Health Centers, and Emergency Departments - United States, 2009-2017.	MMWR Recommendations and Reports	-	-	-	-	1545-861X	10.15585/mmwr.mm6925a2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7315784/4	In 2019, the U.S. Department of Health and Human Services launched the Ending the HIV Epidemic: A Plan for America (EHE) initiative to end the U.S. human immunodeficiency virus (HIV) epidemic by 2030. A critical component of the EHE initiative involves early diagnosis of HIV infection, along with prevention of new transmissions, treatment of infections, and response to HIV outbreaks (1). HIV testing is the first step in identifying persons with HIV infection who need to be engaged in treatment and care as well as persons with a negative HIV test result and who are at high risk for infection and can benefit from HIV preexposure prophylaxis (PrEP) and other prevention services. These opportunities are often missed for persons receiving clinical services in ambulatory care settings (2). Data from the 2009-2016 National Ambulatory Medical Care Survey (NAMCS) and 2009-2017 National Hospital Ambulatory Medical Care Survey (NHAMCS) were analyzed to estimate trends in HIV testing at visits by males and nonpregnant females to physician offices, community health centers (CHCs), and emergency departments (EDs) in the United States. HIV tests were performed at 0.63% of 516 million visits to physician offices, 2.63% of 37 million visits to CHCs, and 0.75% of 87 million visits to EDs. The percentage of visits with an HIV test did not increase at visits to physician offices during 2009-2016, increased at visits to CHC physicians during 2009-2016, and increased slightly at visits to EDs during 2009-2017. All adolescents and adults should have at least one HIV test in their lifetime (3). Strategies that reduce clinical barriers to HIV testing (e.g., clinical decision supports that use information in electronic health records [EHRs to order an HIV test for persons who register one or standing orders for routine opt-out testing) are needed to increase HIV testing at ambulatory care visits. Article	2020	Horack C.L.; Newton S.L.; Vos M.; Wolfe B.A.; Whitaker A.	Pre-Exposure Prophylaxis in a Reproductive Health Setting: A Quality Improvement Project	Health Promotion Practice	-	-	-	15248399	10.1177/1524839920923275	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085003846&doi=10.1177%2f1524839920923275&partnerID=40&md5=19dbd30afa2a5fb48c19ba38dc27933d	Introduction. Although pre-exposure prophylaxis (PrEP) is recommended by the Centers for Disease Control and Prevention, there is a practice gap in treatment at Planned Parenthood of Illinois. This project evaluated a clinical practice alert and evidence-based patient education script to determine if the intervention increased the number of appointments to discuss or initiate PrEP in patients at risk for acquiring HIV. Method. From October to December 2018, a clinical practice alert and evidence-based patient education script were implemented at one Planned Parenthood of Illinois health center. Aggregate data collected included the number of times the clinical alert was generated, the number of times staff read the script, the number of scheduled appointments to discuss PrEP, and the number of times PrEP was prescribed. Qualitative data were collected from clinic staff to further evaluate the intervention. Results. Eleven patients triggered the alert and staff read the education script nine times during the 8-week implementation period. One patient scheduled an appointment to discuss PrEP; no new prescriptions were initiated. One identified patient scheduled an appointment with a provider to initiate PrEP on a date after the implementation period ended. Staff found the alert and script helpful to initiate conversations with patients. Conclusions. This intervention established a system for clinic staff to identify patients at risk for acquiring HIV in order to discuss accurate, evidence-based PrEP information. Findings are limited to this particular setting due to a small sample size, which eliminated the possibility for statistical analysis. © 2020 Society for Public Health Education. Article	2020	Horn R.; Callander D.; Haire B.	Perceptions of sexually transmissible infection pre-exposure prophylaxis: A qualitative study of high-risk gay and bisexual men in Sydney, New South Wales	Sexual Health	-	-	-	14485028	10.1071/SH19175	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082535162&doi=10.1071%2fSH19175&partnerID=40&md5=815192d81223267349ee45b0d342110a	Novel sexually transmissible infection (STI) prevention strategies are needed to combat increasing bacterial STI incidences alongside decreasing condom use among gay and bisexual men (GBM) in Australia. Sexually transmissible infection pre-exposure prophylaxis (STI-PrEP) using regular doxycycline is one such strategy that is the subject of ongoing research. However, a lack of qualitative data regarding the conceptualisation, perceived risks, perceived benefits and preferred dosing strategies of STI-PrEP may impede future research and implementation efforts. Methods: Semistructured in-depth interviews were conducted with 13 high-risk GBM residing in Sydney, Australia. Interviews were audio recorded, transcribed verbatim and then analysed thematically. Results: STI-PrEP was largely conceptualised using pre-existing knowledge of HIV-PrEP. The perceived benefits, including a reduced incidence of STIs, destigmatisation and a 'peace of mind', often outweighed the perceived risks, including side effects, antibiotic resistance and stigmatisation of consumers. A daily dosing regimen was preferred unanimously by participants when compared with event-driven or episodic strategies. Conclusions: Participants of this study were cautiously optimistic regarding the concept of STI-PrEP. The findings suggest that, in addition to examining the effectiveness of STI-PrEP, future implementation studies should also focus on concerns regarding side effects and monitoring antibiotic resistance, as well as considering the acceptability and potential for stigmatisation of STI-PrEP consumers. © 2020 CSIRO.	antibiotics; prevention; syphilis	English	United States	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Qualitative

Article	2020	Horvath K.J.; Lammert S.; Martinka A.; Erickson D.	Defining Sexual Risk in the Era of Biomedical HIV Prevention: Implications for HIV Research and Practice	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-019-01499-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074611144&doi=10.1007%2fs10508-019-01499-8&partnerID=40&md5=00627550583f5a97078169d332cf948c	Advancing HIV behavioral science and its integration with recent biomedical prevention strategies—treatment as prevention and pre-exposure prophylaxis (PrEP)—is complicated because traditional definitions of sexual risk (condomless anal sex CAS or CAS with a serodiscordant partner) may not suffice given the success of biomedical prevention in the absence of condoms. To better understand how to define and understand risk in the era of biomedical HIV prevention, we assessed correlates of four different definitions of high-risk sexual behavior among a sample of 401 adult HIV-positive MSM (57% African American) residing in the New York City area: (1) a traditional model of risk defined as CAS with an HIV-negative or unknown serostatus partner; (2) a definition that considered participant viral load (VL); (3) a definition that considered partner PrEP use; and (4) a definition that considered participant HIV VL and partner PrEP use. Among participants reporting anal sex (n = 281) with a man in the past 3 months, 42% were considered high risk under Definition 1, 6% under Definition 2, 25% under Definition 3, and 2% under Definition 4. Correlates of risk varied across definitions. For example, while education was the strongest predictor of high-risk sexual behavior in Definitions 1 and 2, alcohol use and enacted stigma were the strongest predictors in the model that only accounted for partner PrEP use (Definition 3). These findings have implications for whom to reach for intervention efforts, the difficulty in meeting recruitment goals, and the types of interventions that should be used. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Hosek, Sybil; Henry-Reid, Lisa	PrEP and Adolescents: The Role of Providers in Ending the AIDS Epidemic.	Pediatrics	-	-	-	1098-4275	10.1542/peds.2019-1743	https://dx.doi.org/10.1542/peds.2019-1743	Surveillance data on high school adolescent sexual activity, including teenaged pregnancy rates and incidence of sexually transmitted infections (STIs), require pediatricians and other youth providers to be competent and confident in addressing sexual and reproductive health care needs in adolescent and/or young adult populations. The American Academy of Pediatrics has published guidelines, recommendations, clinical reports, and resources on the promotion of healthy sexual development in clinical settings, encouraging sexual health assessments that are inclusive of HIV and STI testing as an integral component of comprehensive health visits. The need for a more determined effort to address sexual health as it relates to HIV specifically is evidenced by a decrease in the number of in-school youth reporting ever being tested, 15- to 24-year-olds representing 21% of new infections, and estimates that >40% of youth with HIV are undiagnosed. Ending the HIV epidemic requires adherence to published HIV testing recommendations, sexual health assessments, screening for STIs, and appropriate primary and secondary prevention education. Preexposure prophylaxis, an efficacious biomedical prevention intervention for reducing HIV acquisition, was approved in July 2012 and in May 2018 was authorized for use in minors. This state-of-the-art review article provides background information on preexposure prophylaxis, current guidelines and recommendations for use, and strategies to introduce and implement this valuable HIV prevention method in clinical practice with adolescents and young adults. Theses and Dissertations	2020	Huang, Poyao	How to Become "HIV Negative, on PrEP" in the Post-AIDS Era: The Material Culture of Gay Taiwanese Men's Sexual Health	-	-	University of California	-	NA	NA	https://escholarship.org/uc/item/0zp1c551	This dissertation is an ethnographic study of contemporary gay Taiwanese men's sexual health with a focus on the circulation of HIV prevention medicine and blood management. In the 2010s, the governance of HIV/AIDS has undergone a significant shift, moving from biomedical treatment to prevention: pre-exposure prophylaxis (PrEP) is prescribed for HIV-negative individuals to prevent sexually contracting HIV. PrEP engenders a new serological condition, "HIV negative, on PrEP." By signaling the absence of virus and personal use of HIV biomedicine, "HIV negative, on PrEP" implies that this medicine works at the molecular level of human blood to suppress viral incubation and replication, and entails a medical and social urgency of constantly bringing the drug into an individual's body. This dissertation asks what it means to be "HIV negative, on PrEP" in the neoliberal, transnational context of drug consumption and regulation. In this project, I argue that serostatus associated with HIV biomedicine should not be seen as a fixed scientific category about one's wellbeing, but instead a dynamic process of becoming "HIV negative, on PrEP." I tell the story of how gay men, governments, AIDS advocates, pharmaceutical companies, and other social actors utilize "HIV negative, on PrEP" as a means to redefine sexual health during a time when drugs are newly introduced and not yet widely available or financially accessible. In doing so, I unearth the socio-economic tensions, health inequalities, and hegemonic oppressions against gay men amid the HIV biomedical prevention regime. A multi-sited ethnography conducted in Taiwan and Thailand from 2016 to 2019, this dissertation traces PrEP's social trajectory and gay men's socio-sexual practices to document the transformation of sexual health in four main chapters: government-led medical support programs, the AIDS advocacy organizations initiated drug-delivery model, gay men's medical tourism to Thailand, and gay men's sexual communication through smartphone social apps. Drawing on the theories and methods from the science and technology studies (STS), new feminist materialism, medical anthropology, and media studies, I offer an expansive and performative interpretation of health, safety, risk, and other taken-for-granted notions in public health, illustrating how gay Taiwanese men have undergone a biomedical and social transformation of blood management and body modification. In moving toward self-health enhancement, their bodies and sexualities have become intertwined with the economies of pharmaceutical innovation, governmental regulation, and personal mobility and pleasure. Ultimately, this dissertation contributes to the emerging scholarship of "Queer STS" by addressing the broader issues of the politics of self-medication, the marketization of HIV medicine, and the making of queer sexuality in the digital environment. Article	2020	Huang, Wenting; Wang, Yehua; Lu, Haidong; Wu, Dan; Pan, Stephen W; Tucker, Joseph D; Tang, Weiming	High HIV Incidence Among Men Who Have Sex With Men in 8 Chinese Cities: Results From a Trial.	Open Forum Infectious Diseases	-	-	-	2328-8957	10.1093/ofid/ofaa147	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7243372	BACKGROUND: In China, while the overall HIV prevalence has been decreasing within key populations, the epidemic among men who have sex with men (MSM) is still on the rise. This study aims to assess the HIV incidence rate and identify driving forces of HIV seroconversion among MSM in a closed cohort. METHODS: This study is a secondary analysis of a large trial of HIV testing promotion among Chinese MSM in 2016-2017. Sexual behaviors, HIV testing activities, and HIV serostatus were measured at baseline and follow-up every 3 months. HIV seroconversion in this study was defined as a self-reported HIV-positive test result. Participants who reported testing for HIV at least twice during different follow-up periods were included. Subgroup analysis and Cox regression were used to examine the correlates with HIV seroconversion. RESULTS: Overall, 347 participants were included in this study, with a mean age of 25.3±â6.1, and 71.2% were migrants. The sociodemographic characteristics of the included participants were similar to the rest of the participants in the trial (nâ=â1034); 7.2% (25/347) of participants seroconverted during the study period, resulting in an incidence rate of 15.56/100 person-years. In subgroup analysis, the HIV incidence rate was higher among migrants than nonmigrants (incidence rate ratio, 1.26; 95% confidence interval CI, 0.47-3.87). In the time-dependent Cox regression model, bisexual MSM had a higher risk of contracting HIV than gay men (adjusted hazard ratio,â2.19; 95% CI, 1.02-4.72). CONCLUSIONS: Our findings suggest a high HIV incidence rate among Chinese MSM. Further expansion of pre-exposure prophylaxis and other effective HIV prevention interventions are urgently needed. Article	2020	Huebner D.M.; Mustanski B.	Navigating the Long Road Forward for Maximizing PrEP Impact Among Adolescent Men Who Have Sex with Men	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-019-1454-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074690755&doi=10.1007%2fs10508-019-1454-1&partnerID=40&md5=6b4aa372ba6963fab63ec12470784e46	Preexposure prophylaxis (PrEP) has tremendous potential to decrease new HIV infections among populations at high risk, such as men who have sex with men (MSM). That potential is already becoming realized among adult MSM, where PrEP uptake has increased rapidly in the past several years. However, expanding PrEP access to adolescent MSM (AMSM) will be more challenging. This commentary reviews the existing scientific literature relevant to PrEP use for AMSM and highlights critical areas in need of further attention before PrEP is likely to impact the HIV epidemic among adolescents. We highlight concerns that need to be addressed in the areas of (1) achieving adequate coverage of PrEP in the adolescent population, (2) increasing awareness and access, (3) supporting adherence and maintenance, and (4) ensuring that PrEP does not perpetuate existing disparities. Across all of these domains, we highlight the central roles of parents and healthcare providers in supporting AMSM PrEP utilization. Finally, we suggest a number of areas of future research that must be addressed before PrEP is likely to see wide implementation among AMSM. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Huey, Michael J; Higham, Margaret; Watriss, Ariel L	Viewpoint: Why you should provide HIV pre-exposure prophylaxis (PrEP) at your college health center.	Journal of American College Health	-	-	-	1940-3208	10.1080/07448481.2018.1529673	https://dx.doi.org/10.1080/07448481.2018.1529673	By providing HIV pre-exposure prophylaxis, or PrEP (a single daily oral pill), in a primary care college health setting, clinical providers can make a dramatic contribution to the current and long-term health and well-being of the students they see. This viewpoint article describes the approach taken to instituting primary care PrEP services at two college health programs. It delineates which students might benefit from PrEP and how to prescribe/monitor PrEP over time. Additionally, common barriers to PrEP are reviewed, including concerns about affordability, and the concerns that the use of PrEP will encourage risky sexual activity. Implementation strategies are discussed, including identifying a clinic champion, partnering with knowledgeable colleagues, and developing an educational campaign. Article	2020	Hughes C.S.; Brown J.; Murombedzi C.; Chirenda T.; Chareka G.; Mhlanga F.; Mateveke B.; Gitome S.; Makurumure T.; Matubu A.; Mgodi N.; Chirenje Z.; Kahn J.G.	Estimated costs for the delivery of safer conception strategies for HIV-discordant couples in Zimbabwe: A cost analysis	BMC Health Services Research	-	-	-	14726963	10.1186/s12913-020-05784-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092473868&doi=10.1186%2fs12913-020-05784-4&partnerID=40&md5=633bba938e8556a5950186142ab7d4a1	Background: In recent years, safer conception strategies have been developed to help HIV-serodiscordant couples conceive a child without transmitting HIV to the seronegative partner. The SAFER clinical trial assessed implementation of these strategies in Zimbabwe. Methods: As a part of the SAFER study, we estimated the costs (in 2017 $US) associated with individual and combination strategies, in the trial setting and real-world practice, from a healthcare system perspective. Safer conception strategies included: 1) ART with frequent viral load testing until achieving undetectable viral load (ART-VL); 2) daily oral pre-exposure prophylaxis (PrEP); 3) semen-washing with intrauterine insemination; and 4) manual self-insemination at home. For costs in the trial, we used a micro-costing approach, including a time and motion study to quantify personnel effort, and estimated the cost per couple for individual and combination strategies for a mean of 6 months of safer services. For real-world practice, we modeled costs for three implementation scenarios, representing differences from the trial in input prices (paid by the Ministry of Health and Child Care MOHCC), intervention intensity, and increments to current HIV prevention and treatment practices and guidelines. We used one-way sensitivity analyses to assess the impact of uncertainty in input variables. Results: Individual strategy costs were $769-$1615 per couple in the trial; $185-$563 if using MOHCC prices. Under the target intervention intensity and using MOHCC prices, individual strategy costs were $73-$360 per couple over and above the cost of current HIV clinical practices. The cost of delivering the most commonly selected combination, ART-VL plus PrEP, ranged from $166-$517 per couple under the three real-world scenarios. Highest costs were for personnel, lab tests, and strategy-specific consumables, in variable proportions by clinical strategy and analysis scenario. Total costs were most affected by uncertainty in the price of PrEP, number of semen-washing attempts, and scale-up of semen-washing capacity. Conclusions: Safer conception methods have costs that may be affordable in many low-resource settings. These cost data will help implementers and policymakers add safer conception services. Cost-effectiveness analysis is needed to assess value for money for safer conception services overall and for safer strategy combinations. Trial registration: Registry Name: Clinicaltrials.gov. Article	2020	Hughes, Sean M; Levy, Claire N; Calienes, Fernanda L; Stekler, Joanne D; Pandey, Urvashi; Vojtech, Lucia; Berard, Alicia R; Birse, Kenzie; Noël-Romas, Laura; Richardson, Brian; Golden, Jackelyn B; Cartwright, Michael; Collier, Ann C; Stevens, Claire E; Curlin, Marcel E; Holtz, Timothy H; Mugo, Nelly; Irungu, Elizabeth; Katabira, Elly; Muwonge, Timothy; Lama, Javier R; Baeten, Jared M; Burgener, Adam; Lingappa, Jairam R; McElrath, M Juliana; Mackelprang, Romel; McGowan, Ian; Cranston, Ross D; Cameron, Mark J; Hladik, Florian	Treatment with Commonly Used Antiretroviral Drugs Induces a Type I/III Interferon Signature in the Gut in the Absence of HIV Infection.	Cell Reports Medicine	-	-	-	2666-3791	10.1016/j.xcrm.2020.100096	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7511692	Tenofovir disoproxil fumarate (TDF) and emtricitabine (FTC) are used for HIV treatment and prevention. Previously, we found that topical rectal tenofovir gel caused immunological changes in the mucosa. Here, we assess the effect of oral TDF/FTC in three HIV pre-exposure prophylaxis trials, two with gastrointestinal and one with cervicovaginal biopsies. TDF/FTC induces type I/III interferon-related (IFN I/III) genes in the gastrointestinal tract, but not blood, with strong correlations between the two independent rectal biopsy groups (Spearman r = 0.91) and between the rectum and duodenum (r = 0.81). Gene set testing also indicates stimulation of the type I/III pathways in the ectocervix and of cellular proliferation in the duodenum. mRNA sequencing, digital droplet PCR, proteomics, and immunofluorescence confirm IFN I/III pathway stimulation in the gastrointestinal tract. Thus, oral TDF/FTC stimulates an IFN I/III signature throughout the gut, which could increase antiviral efficacy but also cause chronic immune activation in HIV prevention and treatment settings. Article	2020	Huntingdon, Ben; Sharpe, Louise; de Wit, John; Duracinsky, Martin; Juraskova, Ilona	A new grounded theory model of sexual adjustment to HIV: facilitators of sexual adjustment and recommendations for clinical practice.	BMC Infectious Diseases	-	-	-	1471-2334	10.1186/s12879-019-4727-3	https://bmcinfectdis.biomedcentral.com/articles/10.1186/s12879-019-4727-3	BACKGROUND: Life expectancy of people living with HIV (PLWH) is increasing. Effective biomedical prevention methods (treatment as prevention and preexposure prophylaxis) are being widely implemented in high-income nations. Therefore, research into quality of life, including sexual adjustment, is of increasing importance to HIV care. Yet, sexual adjustment of PLWH has been neglected in past research. We propose a new model of sexual adjustment to HIV which explores the dynamic process, facilitators and barriers characterising sexual life of PLWH overtime. METHOD: Thirty PLWH (19 male, 11 female) recruited from two HIV treatment centres as well as community groups, completed semi-structured interviews which were audio-recorded and transcribed verbatim for analysis using grounded theory. RESULTS: The model of sexual adjustment to HIV is the first to establish how undue fears of transmission of HIV during sex and/or fear of rejection by sexual partners determine initial sexual behaviour after diagnosis and also sexual adjustment over time. Within the model, sexual adjustment to HIV is facilitated by factors which assist PLWH to overcome such fears, including: partner acceptance, peer, community and health professional support, and accurate knowledge of risk of transmission including of undetectable viral load and pre-exposure prophylaxis. Adjustment is inhibited when undue fears of transmission and of rejection persist long term, resulting in maladaptive behaviours to cope with such fears including avoidance of sex and problematic drug and alcohol use. CONCLUSION: This model offers clear directions for promoting sexual adjustment to HIV. Health professionals should: (a) assess and intervene for sexual quality of life (not just risk) among PLWH; (b) be aware that serosorting facilitates adjustment in the short to medium term, but may interfere with adjustment long-term, (c) promote opportunities for positive connection between PLWH, and (d) intervene directly with PLWH and HIV negative sexual partners to promote accurate risk of transmission knowledge, including how this applies to their own sexual practices, and whether they are experiencing undue fear of transmission over time. Theses and Dissertations	2020	Husnik, Marla J	Understanding Adherence to and HIV-1 Protection from a Microbicidal Vaginal Ring	-	-	University of Washington	-	NA	NA	http://hdl.handle.net/1773/46466	Topical vaginal microbicides and pre-exposure prophylaxis (PrEP) in the form of oral pills have been evaluated in efficacy trials for the prevention of HIV-1 infection over the past two decades with mixed results. In intention-to-treat analyses, some studies of PrEP agents, such as TruvadaÂ®, have shown positive efficacy results for reducing rates of HIV-1 infection in populations with high levels of adherence, while other studies even with the same agents and mostly among women, have not. However, in post-hoc analyses accounting for adherence to product use, efficacy estimates increased when adjusting for adherence in these same studies. The International Partnership for Microbicides developed a vaginal ring containing a PrEP agent called dapivirine to be replaced on a monthly basis, as a means to address the challenges women face adhering to PrEP agents requiring more frequent use. The goal of this dissertation was to further our understanding of the adherence to and HIV-1 protection from the dapivirine vaginal ring when used in a clinical trial setting among African women at high risk for HIV-1 acquisition. To this end, we utilized data from the MTN-020/ASPIRE study in which 2,629 African women participated in a randomized, placebo-controlled phase III trial of the dapivirine vaginal ring for the effectiveness of HIV-1 prevention conducted by the Microbicides Trials Network (MTN). The specific aims of this dissertation were 1) to assess the feasibility and effectiveness of real-time adherence monitoring strategies utilized within the MTN-020/ASPIRE study; 2) to evaluate the efficacy of a vaginal ring containing dapivirine compared to a placebo vaginal ring accounting for varying levels of adherence to product use; and 3) to identify demographic, sexually transmitted disease, and risk behavior correlates to adherence to inform future implementation of the dapivirine vaginal ring. We addressed Aim 1 by first describing the methods for implementation of the real-time adherence monitoring strategy. Using generalized estimating equations, we then assessed its effectiveness by evaluating whether percentages of blood plasma samples with dapivirine >95 pg/mL in active arm participants increased over calendar time. For the second aim, we conducted three analyses utilizing methods that adjust for adherence to ring use in different ways, specifically, per-protocol, principal stratification and marginal structural models. Four cut points for adherence were defined as follows: >95 pg/mL and >200 pg/mL of blood plasma, and ≥0.9 mg and >4.0 mg of drug released from the rings over a 28 day period of expected ring use. The per-protocol analysis aimed to emulate accrual under perfect protocol adherence, censoring participants at the last negative HIV-1 test before detection of pregnancy or the first occurrence of three or more non-compliant events in a 12 month period. In the principal stratification analysis, we first constructed logistic regression models to predict adherence defined as ≥0.9 mg and >4.0 mg of drug released from…	adherence; causal inference; correlates; dapivirine; HIV-1 prevention; vaginal ring; Epidemiology; Epidemiology	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Clinical
Article	2020	Hwang, Carey; Lai, Ming-Tain; Hazuda, Daria	Rational Design of Doravirine: From Bench to Patients.	ACS Infectious Diseases	-	-	-	2373-8227	10.1021/acsinfecdis.9b00178	https://dx.doi.org/10.1021/acsinfecdis.9b00178	Since the approval of nevirapine, the first HIV-1 non-nucleoside reverse transcriptase inhibitor (NNRTI) in 1996, NNRTIs have helped play a critical role in maintaining viral suppression in people living with HIV. The many positive attributes of the class, including potency and long plasma half-life, make them attractive drug discovery targets. Given the availability of multiple once-daily integrase-based treatments for HIV-1 infection, the challenge to develop a new antiretroviral agent that addresses the needs of today's patients is formidable. However, with the increased availability of antiretrovirals for treatment and new pre-exposure prophylaxis guidelines, which should globally expand the use of antiretrovirals in prevention, it will be increasingly important to have access to multiple regimens with options from different classes that are well tolerated and convenient to ensure a sustained impact on the global epidemic. Many attempts to improve upon the NNRTI class have failed to deliver a desirable clinical profile consistent with the current landscape of treatment options. Doravirine is the only NNRTI to successfully advance through phase 3 clinical development and approval in recent years. Learning from the liabilities of approved NNRTIs, as well as past development failures, facilitated a rational approach to the discovery of doravirine by focusing on addressing the known safety/tolerability issues of commonly prescribed NNRTIs, such as central nervous system toxicity with efavirenz and potential cardiotoxicity due to off-target effects on cardiac ion channels with rilpivirine, using structural biology and characterization of resistance in vitro to address resistance liabilities and concentrating on the metabolic profile to limit the potential for drug-drug interactions. These preclinical efforts were critical to the design and selection of doravirine as a novel NNRTI that possessed the desired next-generation profile with the ultimate proof that these attributes translate to patients derived from clinical trials.	doravirine, resistance, human immunodeficiency virus	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2020	Ilomuanya, Margaret O; Hameedat, Ayotunde T; Akang, Edidiong N; Ekama, Sabdat O; Silva, Boladale O; Akanmu, Alani S	Development and evaluation of mucoadhesive bigel containing tenofovir and maraviroc for HIV prophylaxis.	Future Journal of Pharmaceutical Sciences	-	-	-	2314-7253	10.1186/s43094-020-00093-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7678373	BACKGROUND: Sexual transmission of HIV is the most common means of acquiring the disease. Topical microbicides have been investigated to prevent transmission. This study will use a specific entry inhibitor, maraviroc, and a nucleotide reverse transcriptase inhibitor (NRTI), tenofovir, a dual combination which will provide a synergist effect that can enhance the efficacy of HIV microbicides via a mucoadhesive dual compartment bigel. Bigel formulation via hydrogel organogel linkages were developed and evaluated for their physicochemical characteristics, safety, and anti-HIV efficacy. In vitro diffusion studies were performed with Franz diffusion cells having effective diffusion surface area of 1.76cm2 and receiver chamber volume of 15mL. RESULT: The bigel formulations showed a viscosity ranging from 14179 to 14560 cPs and had a good spreadability and acidic pH in the range of 4.0 ± 0.34 to 5.2 ± 0.18. The bigel formulations showed good anti-HIV activity at a concentration of 0.1 μg/mL. The in vitro release study of maraviroc from the bigel formulations showed a release rate ranging from 2.675 to 3.838 μg/cm2/min½ while the release rate for tenofovir ranged from 3.475 to 3.825 μg/cm2/min½. The bigel formulations were non-toxic to the human vagina as there was < 1 log10 change in Lactobacilli crispatus viability. CONCLUSION: This study successfully developed a dual compartment bigel containing maraviroc and tenofovir. BG C was found to be stable and safe towards vaginal and rectal epithelium, and it actively prevented HIV transmission. This bigel has the potential for long-term pre-exposure prophylaxis prevention of HIV transmission. Article	2020	Irungu, Elizabeth M; Baeten, Jared M	PrEP rollout in Africa: status and opportunity	Nature Medicine	-	-	-	10788956	10.1038/s41591-020-0872-x	https://www.proquest.com/scholarly-journals/prep-rollout-africa-status-opportunity/docview/2402387241/se-2?accountid=8113	Following recommendations by the World Health Organization in 2015, and key clinical trials, countries in sub-Saharan Africa, the region with the highest burden of human immunodeficiency virus (HIV), developed policies that incorporate pre-exposure prophylaxis (PrEP) into national HIV-prevention strategies. By the end of 2019, more than one third of people receiving PrEP globally were in Africa. Crucial understandings gained from early rollout among at-risk populations, such as HIV-serodiscordant couples, adolescent girls and young women, female sex workers, and men who have sex with men, include the importance of strategies for maintaining persistent adherence to PrEP and novel approaches to making PrEP services accessible, simplified and efficient. This Perspective will discuss the current status of these programs and how to further widen their implementation.PrEP is being incorporated into national HIV-prevention strategies in African countries, with key at-risk populations being prioritized. Expansion of these programs will require better access to and communication about these therapies. Article	2020	Irvine M.A.; Salway T.; Grennan T.; Wong J.; Gilbert M.; Coombs D.	Predicting the impact of clustered risk and testing behaviour patterns on the population-level effectiveness of pre-exposure prophylaxis against HIV among gay, bisexual and other men who have sex with men in Greater Vancouver, Canada	Epidemics	-	-	-	17554365	10.1016/j.epidem.2019.100360	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85071386617&doi=10.1016%2fj.epidem.2019.100360&partnerID=40&md5=a8450915be09d8dc5259df6cb17754a3	Pre-exposure prophylaxis (PrEP) has the potential to greatly reduce transmission of HIV. However, significant questions remain around how behavioural factors may influence its impact within target populations. We used a 2014 sexual behaviour survey to modify and recalibrate a mathematical model of HIV infection dynamics within the population of gay, bisexual and other men who have sex with men (GBMSM) in the Greater Vancouver area of British Columbia, Canada. We performed a clustering analysis on the survey data to divide the population into categories associated with their reported risk of HIV exposure as well as their reported testing habits and attitudes towards PrEP. We found a positive association between reported risk and testing behaviour and level of awareness/interest in PrEP. Using the cluster groups to structure the population, we then estimated the impact of PrEP on HIV transmission in our study population. We found that the association between risk and interest in PrEP substantially boosted the population-level effectiveness of PrEP. Within our model, if PrEP adoption was unrelated to risk and testing, an additional 206 (95% credible interval 5–261), new infections representing 15% of total infections are predicted to occur among GBMSM over ten years, compared to where PrEP is adopted by individuals according to their level of interest. Our results underscore the importance of incorporating behavioural data into models when predicting the impact of future public health interventions. © 2019 The Authors	Adult, Habits, Sexual and Gender Minorities, Sexual Behavior, Male, Humans, Homosexuality, HIV Infections	English	United Kingdom	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Quantitative
Article	2020	Iversen, Jenny; Sabin, Keith; Chang, Judy; Morgan Thomas, Ruth; Prestage, Garrett; Strathdee, Steffanie A.; Maher, Lisa	COVID-19, HIV and key populations: cross-cutting issues and the need for population-specific responses.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25632	https://onlinelibrary.wiley.com/doi/10.1002/jia2.25632	INTRODUCTION: Key populations at elevated risk to contract or transmit HIV may also be at higher risk of COVID-19 complications and adverse outcomes associated with public health prevention measures. However, the conditions faced by specific populations vary according to social, structural and environmental factors, including stigma and discrimination, criminalization, social and economic safety nets and the local epidemiology of HIV and COVID-19, which determine risk of exposure and vulnerability to adverse health outcomes, as well as the ability to comply with measures such as physical distancing. This commentary identifies common vulnerabilities and cross-cutting themes in terms of the impacts of COVID-19 on key populations before addressing issues and concerns specific to particular populations. DISCUSSION: Cross-cutting themes include direct impacts such as disrupted access to essential medicines, commodities and services such as anti-retroviral treatment, HIV pre-exposure prophylaxis, opioid agonist treatment, viral load monitoring, HIV and sexually transmitted infections testing, condoms and syringes. Indirect impacts include significant collateral damage arising from prevention measures which restrict human rights, increase or impose criminal penalties, and expand police powers to target vulnerable and criminalized populations. Significant heterogeneity in the COVID-19 pandemic, the underlying HIV epidemic and the ability of key populations to protect themselves means that people who inject drugs and sex workers face particular challenges, including indirect impacts as a result of police targeting, loss of income and sometimes both. Geographical variations mean that transgender people and men who have sex with men in regions like Africa and the middle east remain criminalized, as well as stigmatized and discriminated against, increasing their vulnerability to adverse outcomes in relation to COVID-19. CONCLUSIONS: Disruptions to both licit and illicit supply chains, loss of income and livelihoods and changes in behaviour as a result of lockdowns and physical distancing have the potential to exacerbate the impacts of the COVID-19 pandemic on key populations. While these impacts will vary significantly, human-rights approaches to COVID-19 emergency laws and public health prevention measures that are population-specific and sensitive, will be key to reducing adverse health outcomes and ensuring that no one is left behind. Perceived barriers to pre-exposure prophylaxis use and the role of syndemic factors among female sex workers in the Mexico-United States border region: a latent class analysis	AIDS Care	-	-	-	9540121	10.1080/09540121.2019.1626338	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85067023144&doi=10.1080%2f09540121.2019.1626338&partnerID=40&md5=0f821161aa814b66bb35b9e85384d007	Female sex workers (FSWs) experience syndemic factors (e.g., polydrug use, hazardous alcohol consumption, client-perpetrated violence, depression, and sexually transmitted infections) that often heighten vulnerability to HIV and limit healthcare utilization. We hypothesized that syndemic factors will limit FSWs' uptake of pre-exposure prophylaxis (PrEP). From 2016 to 2017, 295 HIV-negative FSWs were enrolled in a behavioral HIV prevention trial in Tijuana and Ciudad Juarez, Mexico, underwent STI testing, and completed surveys on syndemic factors and perceived barriers to PrEP use. Syndemic scores (0–5) were calculated by summing syndemic factors. Latent class analysis (LCA) was used to identify homogeneous classes with respect to perceived barriers to PrEP use. We identified four classes: (1) perceived healthcare access barriers (8.3%), (2) perceived financial barriers (18.7%), (3) high level of perceived barriers (19.9%), and (4) low level of perceived barriers (53.0%) to PrEP use. Those experiencing three (adjusted odds ratio aOR = 3.63, 95% confidence interval CI = 1.24–10.67) and four or five (aOR = 6.30, 95% CI = 1.70–23.35) syndemic factors had a higher odds of membership in the class characterized by a high level of perceived barriers than in the class characterized by a low level of perceived barriers. Addressing syndemic factors may maximize PrEP's impact among FSWs along Mexico's northern border. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group.	female sex workers; HIV; latent class analysis; Mexico; pre-exposure prophylaxis; syndemic theory	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Theses and Dissertations	2020	James Patrick Cerney	Synthesis of octavalent glycodendrimers as potential HIV inhibitory agents	-	-	California State University System	-	NA	NA	http://hdl.handle.net/10211.3/218719	Globally 38 million people were living with the human immunodeficiency virus (HIV) in 2019 with 1.7 million new infections. Infection rates have declined, with a drop of 23% since 2010 due to the greater availability of both testing and treatment. There still remains no cure for the disease, therefore anyone who contracts HIV must begin anti-retroviral therapy (ART), which will require a daily administration for the entirety of the person's life. These medications work to slow or even stop the progression of the disease, but they also come with severe side effects and viral resistance. The focus has turned to ways of preventing the spread before it is able to infect new hosts. Currently, pre-exposure prophylaxis (PrEP), is available to those who are at higher risk of contracting the disease. These medications have shown promise, but still carry much of the same issues experienced with the medications from ART. Focusing on the preventative measures as a way to fight the spread of the virus is the focus of the current study. For the current project, an optimization for the synthesis of a sulfated glycodendrimer was achieved through the synthesis of eighteen unique compounds. Optimization of the linker synthesis was achieved through eliminating halting via acidification of the reaction and instead going straight to purification by flash chromatography. By contrast the tetra-nitrile core yields were increased through pH adjustments during the extraction process, eliminating the need for flash chromatography. The synthesis of the tetra-amine core was optimized through removing both the magnesium hydroxide and methanol, which allowed the 1,3-diaminopropane to act as the solvent, catalyst and reactant. This led to a greener reaction step and higher overall yields. The glycosylation reactions were shown to be efficient with this core, and for each of the sugars resulted in yields from the mid to high 90%'s. The sulfation reactions worked well with the lower-level saccharide chain lengths of the monomer and dimer glycodendrimers with their percent sulfur being 16.10% (w/v) and 11.60% (w/v), respectively. However, when it came to the larger oligosaccharide chain lengths of the trimer and tetramer glycodendrimers, the percent sulfation dropped to 3.73% and 1.94%, respectively. These larger oligosaccharides were shown to have a higher impact on the ability sulfate more than one site per arm. These reactions will require further investigation through longer reaction times and temperature variations to increase the sulfation amount. The sulfoglycodendrimers (SGDs) produced in this study are now ready for biological testing with the gp120 spike protein as well as the SARS-CoV-2 viral spike protein. The SGDs will be analyzed for their binding ability to these surface proteins to examine their efficacy for inhibiting the viruses. These compounds will be sent out to out collaborators at Duke University where they will undergo both an inhibition of infectivity assay as well as cytotoxicity testing. These two tests will test the ability…	Divergent synthesis; SARS-CoV-2; HIV; Glycodendrimer	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Clinical
Article	2020	Jamieson, Lise; Gomez, Gabriela B; Rebe, Kevin; Brown, Ben; Subedar, Hasina; Jenkins, Sarah; Shoko, Natsai; Bekker, Linda-Gail; Johnson, Leigh F; Meyer-Rath, Gesine	The impact of self-selection based on HIV risk on the cost-effectiveness of preexposure prophylaxis in South Africa.	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000002486	https://dx.doi.org/10.1097/QAD.0000000000002486	OBJECTIVES: We explored the impact and cost-effectiveness of preexposure prophylaxis (PrEP) provision to different populations in South Africa, with and without effective self-selection by individuals at highest risk of contracting HIV (through concurrent partnerships and/or commercial sex). DESIGN AND METHODS: We used a previously developed HIV transmission model to analyse the epidemiological impact of PrEP provision to adolescents, young adults, pregnant women, female sex workers (FSWs) and (MSM), and data from South African PrEP programmes to estimate the cost and cost-effectiveness of PrEP (cost in 2019 USD per HIV infection averted over 20 years, 2019, 38). PrEP uptake followed data from early implementation sites, scaled-up linearly over 3 years, with target coverage set to 18% for adolescents, young adults and pregnant women, 30% for FSW and 54% for MSM. RESULTS: The annual cost of PrEP provision ranges between $75 and $134 per person. PrEP provision adolescents and young adults, regardless of risk behaviour, will each avert 3.2--4.8% of HIV infections over 20 years; provision to high-risk individuals only has similar impact at lower total cost. The incremental cost per HIV infection averted is lower in high-risk vs. all-risk sub-populations within female adolescents ($507 vs. $4537), male adolescents ($2108 vs. $5637), young women ($1592 vs. $10â323) and young men ($2605 vs. $7715), becoming cost saving within 20 years for high-risk adolescents, young women, MSM and FSWs. CONCLUSION: PrEP is an expensive prevention intervention but uptake by those at the highest risk of HIV infection will make it more cost-effective, and cost-saving after 14-18 years.	cost; cost-effectiveness analysis; high-risk populations; preexposure prophylaxis; South Africa	English	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2020	Janes H.; Zhu Y.; Brown E.R.	Designing HIV Vaccine Efficacy Trials in the Context of Highly Effective Non-vaccine Prevention Modalities	Statistics in Biosciences	-	-	-	18671764	10.1007/s12561-020-09292-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092711732&doi=10.1007%2fs12561-020-09292-1&partnerID=40&md5=b573b4a563ecac389f567d6493aabe08	The evolving HIV prevention landscape poses challenges to the statistical design of future trials of candidate HIV vaccines. Study designs must address the anticipated reduction in HIV incidence due to adding new prevention modalities to the standard prevention package provided to trial participants, and must also accommodate individual choices of participants with regard to the use of these modalities. We explore four potential trial designs that address these challenges, with a focus on accommodating the newest addition to the prevention package-antiretroviral-based oral pre-exposure prophylaxis (PrEP). The designs differ with respect to how individuals who take up oral PrEP at screening are handled. An All-Comers Design enrolls and randomizes all eligible individuals, a Decliners Design enrolls and randomizes only those who decline PrEP at screening, and Single and Multi-Stage Run-In Designs enroll all but randomize only those who decline PrEP or show inadequate adherence to PrEP after one or multiple run-in periods. We compare these designs with respect to required sample sizes, study duration, and resource requirements, using a simulation model that incorporates data on HIV risk and PrEP uptake and adherence among men who have sex with men (MSM) in the Americas. We advocate considering Run-In Designs for some future contexts, and identify their advantages and tradeoffs relative to the other designs. The design concepts apply beyond HIV vaccines to other prevention modalities being developed with the aim to achieve further reductions in HIV incidence. © 2020, The Author(s). Article	2020	Jansen K.; Steffen G.; Potthoff A.; Schuppe A.-K.; Beer D.; Jessen H.; Scholten S.; Spornraft-Ragaller P.; Bremer V.; Tiemann C.; Knechten H.; Panstruga P.; Cordes C.; Lieb C.; Rodriguez E.; Hillenbrand H.; Krznaric I.; Hower M.; Schneeweiß S.; Meurer A.; Pauli R.; Tomesch A.; Trein A.	STI in times of PrEP: High prevalence of chlamydia, gonorrhea, and mycoplasma at different anatomic sites in men who have sex with men in Germany	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-020-4831-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079080592&doi=10.1186%2fs12879-020-4831-4&partnerID=40&md5=9a43a1ce31247644b3d5404fb130ed22	Background: Men who have sex with men (MSM) are disproportionally affected by sexually transmitted infections (STI). STI are often extragenital and asymptomatic. Both can delay diagnosis and treatment. Approval of HIV pre-exposure prophylaxis (PrEP) might have influenced sexual behaviour and STI-prevalence of HIV- MSM. We estimated STI-prevalence and risk factors amongst HIV- and HIV+ MSM in Germany to plan effective interventions. Methods: We conducted a nationwide, cross-sectional study between February and July 2018. Thirteen MSM-friendly STI-practices screened MSM for Chlamydia trachomatis (CT), Mycoplasma genitalium (MG), Neisseria gonorrhoeae (NG), and Trichomonas vaginalis (TV) using self-collected rectal and pharyngeal swabs, and urine samples. APTIMA™ STI-assays (Hologic™ Inc., San Diego, USA) were used for diagnostics, and samples were not pooled. We collected information on socio-demographics, HIV-status, clinical symptoms, sexual behaviour within the last 6 months, and PrEP use. We combined HIV status and PrEP use for defining risk groups, and used directed acyclic graphs and multivariable logistic regression to identify risk factors for STI. Results: Two thousand three hundred three MSM were included: 50.5% HIV+, median age 39 18-79 years. Median number of male sex partners within the last 6 months was five. Sex without condom was reported by 73.6%, use of party drugs by 44.6%. 80.3% had a STI history, 32.2% of STI+ MSM reported STI-related symptoms. 27.6% of HIV- MSM used PrEP. Overall STI-prevalence was 30.1, 25.0% in HIV-/PrEP- MSM (CT:7.2%; MG:14.2%; NG:7.4%; TV:0%), 40.3% in HIV-/PrEP+ MSM (CT:13.8%; MG:19.4%; NG:14.8%; TV:0.4%), and 30.8% in HIV+ MSM (CT:10.1%; MG:18.4%; NG:8.6%; TV:0.1%). Being HIV+ (OR 1.7, 95%-CI 1.3-2.2), using PrEP (OR 2.0, 95%-CI 1.5-2.7), having > 5 sex partners (OR:1.65; 95%-CI:1.32-2.01.9), having condomless sex (OR:2.11.9; 95%-CI:1.65-2.86), and using party drugs (OR:1.65; 95%-CI:1.32-2.0) were independent risk factors for being tested positive for at least one STI. Conclusions: We found a high STI-prevalence in MSM in Germany, especially in PrEP users, frequently being asymptomatic. As a relevant proportion of PrEP users will not use a condom, counselling and comprehensive STI screening is essential and should be low threshold and preferably free of cost. Counselling of PrEP users should also address use of party drugs. © 2020 The Author(s). Article	2020	Jary A.; Leducq V.; Desire N.; Petit H.; Palich R.; Joly V.; Canestri A.; Gothland A.; Lambert-Niclot S.; Surgers L.; Amiel C.; Descamps D.; Spano J.-P.; Katlama C.; Calvez V.; Marcelin A.-G.	New Kaposi's sarcoma-associated herpesvirus variant in men who have sex with men associated with severe pathologies	Journal of Infectious Diseases	-	-	-	221899	10.1093/infdis/jiaa180	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090943657&doi=10.1093%2finfdis%2fjiaa180&partnerID=40&md5=06d9b6b5a4628ab2fcf771d11bd7e11e	Background: Kaposi sarcoma (KS)-associated herpesvirus (KSHV) subtype depends mostly on patient origin. The current study aimed to assess KSHV diversity in a population of men who have sex with men (MSM) living in France. Methods: The study included 264 patients. In 65 MSM, including 57 human immunodeficiency virus (HIV)-infected men with KS, multicentric Castleman disease, or primary effusion lymphoma and 8 HIV-uninfected men receiving HIV preexposure prophylaxis (PrEP), we performed KSHV typing with K1 open reading frame Sanger and KSHV whole-genome sequencing. In 199 other patients, we performed real-time polymerase chain reaction screening for the new variant. Results: We found that 51% of KSHV-strains were subtype C (85% C3), and 33% were subtype A. Four patients with severe KSHV disease (2 with visceral KS, 1 with multicentric Castleman disease, and 1 with primary effusion lymphoma) and 1 asymptomatic PrEP user had a new variant resembling the Ugandan subtype F, but with different K1 open reading frame and KSHV whole-genome sequences and a different epidemiological context (MSM vs African population). Its prevalence was 4.5% in Caucasian MSM, and it was absent in other epidemiological groups. Conclusions: Subtype C predominated among MSM living in France. The new F variant was identified in Caucasian MSM and associated with severe KSHV disease, suggesting that subtype F could be split into F1 and F2 variants. Careful screening for this variant may be required in MSM, given the severe clinical presentation of associated diseases. © The Author(s) 2020. Article	2020	Jaspal R.; Lopes B.; Maatouk I.	Social Identity and Attitudes toward HIV Pre-exposure Prophylaxis: A Structural Equation Model	Journal of Social Service Research	-	-	-	1488376	10.1080/01488376.2019.1566196	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85062785223&doi=10.1080%2f01488376.2019.1566196&partnerID=40&md5=0f77abd8286e3216fcd16654f93f01fc	This study focuses on the role of social identity and prejudice as causal variables in public attitudes toward pre-exposure prophylaxis (PrEP) in a UK sample. In all, 222 participants participated in an experimental vignette study with a 2 × 2 × 2 design with between-participants factors of ethnicity, sexual orientation and gender, and completed measures of attitudes toward gay men, Black Africans, and PrEP. Kruskal–Wallis tests showed significant effects of gender on attitudes toward gay men and Black Africans; of ethnicity on attitudes toward gay men and PrEP; and of religion on attitudes toward gay men. A univariate analysis of variance (ANOVA) revealed more positive attitudes toward PrEP when it was presented as benefitting men (vs. women). Structural equation modeling showed that the relationship between the independent variables of gender, ethnicity, and religion and the dependent variable of attitudes toward PrEP was mediated by attitudes toward gay men and Black Africans. Individuals must perceive the principal beneficiaries of PrEP (i.e., gay men and Black Africans) positively to endorse PrEP for these groups, and sexism may reduce public acceptability of PrEP for women. Future research should use representative samples and alternative experimental manipulations, and include strength of social identification as an independent variable. © 2019, © 2019 The Author(s). Article	2020	Jenness, Samuel M; Johnson, Jordan A; Hoover, Karen W; Smith, Dawn K; Delaney, Kevin P	Modeling an integrated HIV prevention and care continuum to achieve the Ending the HIV Epidemic goals	AIDS	-	-	2699370	10.1097/QAD.0000000000002681	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094931271&doi=10.1097%2fQAD.0000000000002681&partnerID=40&md5=1c06be81fa5a84947bae15cca53ccfac	Objective:We sought to evaluate, which combinations of HIV prevention and care activities would have the greatest impact towards reaching the US Ending the HIV Epidemic (EHE) plan goals of HIV incidence reduction.Design:A stochastic network-based HIV transmission model for men who have sex with men (MSM), calibrated to surveillance estimates in the Atlanta area, a focal EHE jurisdiction.Methods:Model scenarios varied HIV screening rates under different assumptions of how HIV-negative MSM would be linked to PrEP initiation, and rates of HIV care linkage and retention for those screening positive.Results:A ten-fold relative increase in HIV screening rates (to approximately biannual screening for black and Hispanic MSM and quarterly for white MSM) would lead to 43% of infections averted if integrated with PrEP initiation. Improvements focused only on black MSM would achieve nearly the same outcome (37% of infections averted). Improvements to HIV care retention would avert 41% of infections if retention rates were improved ten-fold. If both screening and retention were jointly improved ten-fold, up to 74% of cumulative infections would be averted. Under this scenario, it would take 4 years to meet the 75% EHE goal and 12 years to meet the 90% goal for Atlanta MSM.Conclusion:Reaching the EHE 75% incidence reduction goals by their target dates will require immediate and substantial improvements in HIV screening, PrEP, and ART care retention. Meeting these EHE goals in target jurisdictions like Atlanta will be possible only by addressing the HIV service needs of black MSM. © 2020 Lippincott Williams and Wilkins. All rights reserved. Article	2020	Jewell, Britta L; Smith, Jennifer A; Hallett, Timothy B	Understanding the impact of interruptions to HIV services during the COVID-19 pandemic: A modelling study.	EClinicalMedicine	-	-	2589-5370	10.1016/j.eclinm.2020.100483	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7564522	BACKGROUND: There is concern that the COVID-19 pandemic could severely disrupt HIV services in sub-Saharan Africa. However, it is difficult to determine priorities for maintaining different elements of existing HIV services given widespread uncertainty. METHODS: We explore the impact of disruptions on HIV outcomes in South Africa, Malawi, Zimbabwe, and Uganda using a mathematical model, examine how impact is affected by model assumptions, and compare potential HIV deaths to those that may be caused by COVID-19 in the same settings. FINDINGS: The most important determinant of HIV-related mortality is an interruption to antiretroviral treatment (ART) supply. A three-month interruption for 40% of those on ART could cause a similar number of additional deaths as those that might be saved from COVID-19 through social distancing. An interruption for more than 6-90% of individuals on ART for nine months could cause the number of HIV deaths to exceed the number of COVID-19 deaths, depending on the COVID-19 projection. However, if ART supply is maintained, but new treatment, voluntary medical male circumcision, and pre-exposure prophylaxis initiations cease for 3 months and condom use is reduced, increases in HIV deaths would be limited to <2% over five years, although this could still be accompanied by a 7% increase in new HIV infections. INTERPRETATION: HIV deaths could increase substantially during the COVID-19 pandemic under reasonable worst-case assumptions about interruptions to HIV services. It is a priority in high-burden countries to ensure continuity of ART during the pandemic. FUNDING: Bill & Melinda Gates Foundation. Article	2020	Jewsbury S.; Ward C.	A case of M184V mutant human immunodeficiency virus in a patient using daily pre-exposure prophylaxis	International journal of STD & AIDS	-	-	9564624	10.1177/0956462419879620	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077171195&doi=10.1177%2f0956462419879620&partnerID=40&md5=d1ceaa1e9df87f469cd4e14a81ff3fff	This study presents a case report of a 31-year-old gay man who acquired human immunodeficiency virus while using daily emtricitabine (FTC)/tenofovir disoproxil fumarate (TDF) pre-exposure prophylaxis (PrEP). He had an M184V nucleoside reverse-transcriptase inhibitor mutation at diagnosis. Either he acquired a pre-existing M184V mutation or he acquired a wild-type virus but then suboptimal use of FTC/TDF led to the development of resistance. For PrEP to be safely managed and seroconvertors to be identified quickly, PrEP should be commissioned by the NHS and managed within sexual health clinics. Notwithstanding the current provision of PrEP, those accessing it must be reminded about the importance of regular testing and optimal adherence. © The Author(s) 2019.	human immunodeficiency virus; Prevention; sexual behaviour; sexual intercourse; viral disease	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2020	Ji Y.	A comparison of fact sheets that promote preexposure prophylaxis (PrEP) use among men who have sex with men	Communication Research Reports	-	-	8824096	10.1080/08824096.2020.1760815	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088483171&doi=10.1080%2f08824096.2020.1760815&partnerID=40&md5=6d9cf98a48d0294924a86000a9250ef0	Preexposure prophylaxis (PrEP) is an effective medicine against HIV transmission. PrEP can be especially beneficial in the men who have sex with men (MSM) communities. However, medical studies have associated MSM's PrEP use with undesired riskier behaviors (risk compensation), such as reducing condom use and acquiring more sexual partners. Fact sheets are important information sources for MSM to learn about PrEP and can potentially prevent risk compensation. This study compared three accessible fact sheets (the Truvada fact sheet, the CDC fact sheet, the FDA fact sheet) in terms of their effects on MSM's PrEP use intention and risk compensation intention (n = 600). The results showed that the CDC and the FDA fact sheets significantly encouraged higher PrEP use intention without provoking higher risk compensation intention. To promote PrEP use without raising risk compensation intention, fact sheets might be good information sources for the MSM population. © 2020, © 2020 Eastern Communication Association. Article	2020	Ji Y.	A Study of Seeking Information about Preexposure Prophylaxis (PrEP) and Risk Compensation Intention among Men Who Have Sex with Men	Communication Studies	-	-	10510974	10.1080/10510974.2020.1778053	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087785951&doi=10.1080%2f10510974.2020.1778053&partnerID=40&md5=e9f49aca99e0b2d3403bc63c7ebb0a35	Preexposure prophylaxis (PrEP) has been an effective preventive measure against human immunodeficiency virus (HIV) transmission among the men who have sex with men (MSM) community. Many medical reports, however, show concern that PrEP users engage in riskier sexual behaviors after PrEP use (risk compensation), such as reducing condom use and acquiring more sexual partners. The current study examines MSM's PrEP-related information-seeking and its relationship with their risk compensation intention if on PrEP. MSM participants portrayed their information-seeking about PrEP by reporting their frequency, spent time, most-used channel, and main takeaway. Results demonstrated that participants' PrEP-related information-seeking closely related to their risk compensation intention. Among the information channels, participants who primarily use social media to seek PrEP-related information reported the highest PrEP use intention as well as risk compensation intention. © 2020, © 2020 Central States Communication Association. Article	2020	Jin, Xia; Wang, Hongyi; Li, Hang; Chu, Zhenxing; Zhang, Jing; Hu, Qinghai; Lv, Wei; Huang, Xiaojie; Chen, Yaokai; Wang, Hui; He, Xiaoqing; Zhang, Lukun; Hu, Zhili; Bao, Rantong; Li, Shangcao; Ding, Haibo; Geng, Wenqing; Jiang, Yongjun; Shang, Hong; Xu, Junjie	Real-time monitoring and just-in-time intervention for adherence to pre-exposure prophylaxis among men who have sex with men in China: A multicentre RCT study protocol	BMC Public Health	-	-	14712458	10.1186/s12889-020-08709-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088679050&doi=10.1186%2fs12889-020-08709-2&partnerID=40&md5=3c26ecfe3890db292e1c75bb42266e3c	Background: Pre-exposure prophylaxis (PrEP) is an effective biomedical strategy to prevent transmission of HIV infection, although medication adherence remains a challenge. We present the protocol for a multicentre randomised controlled trial to measure the effectiveness of a real-time monitoring and just-in-time intervention on medication adherence among PrEP users in China. Methods: Study participants will include 1000 men who have sex with men (MSM) from four cites in China (Shenyang, Beijing, Chongqing and Shenzhen) attending a tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) PrEP project as part of a real-world, prospective multicentre cohort study (CROPrEP). Participants will be randomised into the intervention and control arms in a 1:1 ratio. Participants in the intervention arm will be provided with remote real-time monitoring equipment that triggers twice just-in-time SMS (Short Messaging Service) medication reminders to PrEP users every half an hour when a scheduled dosage is missed, and followed with just-in-time SMS medication reminders to clinicians half an hour when there is no supplement after the second just-in-time SMS reminder to PrEP users. Clinicians will initiate individualised telephone intervention as soon as possible upon receipt of the just-in-time SMS missed dose alert. Those in the control arm will only receive generic weekly SMS reminders. The study will last 6 months. Participants will be seen at follow-up visits at three and 6 months. Trial outcomes to be measured include self-reported adherence assessed via questionnaire and pill counts, as well as drug concentration test results. Discussion: Medication adherence is critical to achieve optimal benefits from PrEP. This study will be the first individualised behaviour intervention using real-time technology to increase adherence among MSM PrEP users globally. If found effective, a real-time monitoring and just-in-time intervention system may be utilized for improving adherence and thus effectiveness of global PrEP application. Trial registration: This study registered at ClinicalTrials.gov (ChiCTR1900025604) on September 2, 2019. © 2020 The Author(s). Article	2020	Jo Y.; Bartholomew T.S.; Doblecki-Lewis S.; Rodriguez A.; Forrest D.W.; Tomita-Barber J.; Oves J.; Tookes H.E.	Interest in linkage to PrEP among people who inject drugs accessing syringe services; Miami, Florida	PLOS One	-	-	19326203	10.1371/journal.pone.0231424	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083479332&doi=10.1371%2fjournal.pone.0231424&partnerID=40&md5=328679f09bba0ca8cd83ab1f1a098b1e	Background People who inject drugs (PWID) are at an increased risk for HIV infection due to injection and sexual risk behaviors. This study aims to examine PrEP knowledge, awareness, and willingness to be linked to PrEP services at a syringe services program (SSP), and examine the relationship between substance use and interest in PrEP linkage. Methods Data were collected using a cross-sectional survey of IDEA SSP clients in Miami, FL (N = 157). Based on reported substance injected, participants were classified into opioid-only injection or polysubstance injection. Socio-demographics and HIV risk were examined using Pearson's Chi-Squared analysis. Bivariate and multivariable logistic regression models were used to test for significant correlates of interest in PrEP linkage. Results Only 28.3% of PWID surveyed had previously heard of PrEP. However, 57.2% were interested in receiving more information about PrEP. In the adjusted model, people with opioidonly use were significantly less likely to report interest in being linked to PrEP. Conclusion Knowledge, awareness, and interest in being linked to PrEP were low among PWID surveyed. No participants of the study were successfully linked to PrEP services through direct referrals. Further research is needed to examine low threshold service delivery of PrEP to PWID at SSPs. © 2020 Jo et al. Article	2020	John S.A.; Quinn K.G.; Pleuhs B.; Walsh J.L.; Petroll A.E.	HIV Post-Exposure Prophylaxis (PEP) Awareness and Non-Occupational PEP (nPEP) Prescribing History Among U.S. Healthcare Providers	AIDS and Behavior	-	-	10907165	10.1007/s10461-020-02866-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083770692&doi=10.1007%2fs10461-020-02866-6&partnerID=40&md5=d017fc8f7a698ae8ef5e0b893a45ee34	Non-occupational post-exposure prophylaxis (nPEP) has been clinically recommended since 2005. HIV providers and non-HIV providers (n = 480) practicing within above-average HIV prevalence ZIP codes of the 10 U.S. cities with greatest overall HIV prevalence participated in a cross-sectional survey between July 2014 and May 2015. Providers were asked about their awareness of post-exposure prophylaxis (PEP) and nPEP prescribing experience for patients with potential sexual exposures to HIV, which we coded into a PEP prescribing cascade with three categories: (1) PEP unaware, (2) PEP aware, no nPEP prescribing experience, and (3) nPEP prescribing experience. Overall, 12.5% were unaware of PEP, 43.5% were aware but hadn't prescribed nPEP, and 44.0% had prescribed nPEP for potential sexual exposures to HIV. Fewer providers practicing in the U.S. South had ever prescribed nPEP compared to providers in other regions (χ2= 39.91, p < 0.001). HIV providers, compared to non-HIV providers, were more likely to be classified in the nPEP prescription group compared to the PEP aware without nPEP prescription group (RRR = 2.96, p < 0.001). PrEP prescribers, compared to those PrEP unaware, were more likely to be classified in the nPEP prescription group compared to PEP aware without nPEP prescription group (RRR = 12.49, p < 0.001). © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	John, Steven A; Petroll, Andrew E; Walsh, Jennifer L; Quinn, Katherine G; Patel, Viraj V; Grov, Christian	Reducing the Discussion Divide by Digital Questionnaires in Health Care Settings: Disruptive Innovation for HIV Testing and PrEP Screening.	Journal of Acquired Immune Deficiency Syndromes	-	-	1944-7884	10.1097/QAI.0000000000002459	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7572720	BACKGROUND: Health care provider assessment of patient sexual behavior and substance use is essential for determining appropriate prevention interventions-including HIV pre-exposure prophylaxis (PrEP)-for sexual minority men (SMM). We sought to explore acceptability and utility of using electronic surveys to conduct health behavior assessments in clinical settings among SMM. METHODS: Among a US nationwide sample of SMM (n = 4187; mean age = 38.3 years; 60% white; 82% HIV-negative), we examined associations of demographics, recruitment venue, sexual behavior characteristics, and recent substance use with participants' comfort communicating verbally and through electronic survey with a health care provider about sexual and substance use behavior. RESULTS: On average, SMM had greater comfort communicating through electronic survey vs. verbally. In our fully adjusted analysis, preference favoring electronic surveys more strongly than verbal communication differed by age (β = -0.07, P ≤ 0.001). SMM with a bachelor's degree or more (β = 0.04, P < 0.05), those recruited from nonclinical settings (β = 0.06, P ≤ 0.001), and those without primary care providers (β = 0.04, P < 0.05) favored electronic surveys more strongly in the fully adjusted multivariable model. SMM who reported any recent casual sex partners (β = 0.05, P < 0.01), those never tested for HIV (β = 0.03, P < 0.05), and HIV-negative/unknown men not on PrEP (compared with PrEP users; β = 0.09, P ≤ 0.001) also favored electronic surveys in the fully adjusted model. CONCLUSIONS: Reducing communication barriers by incorporating electronic surveys into patient assessment could help identify HIV testing and PrEP needs for SMM most susceptible to HIV acquisition. Nonetheless, no one screening strategy is likely to work for most SMM, and multiple approaches are needed. Article	2020	Johnson A.K.; Fletcher F.E.; Ott E.; Wishart M.; Friedman E.E.; Terlikowski J.; Haider S.	Awareness and Intent to Use Pre-exposure Prophylaxis (PrEP) Among African American Women in a Family Planning Clinic	Journal of Racial and Ethnic Health Disparities	-	-	21973792	10.1007/s40615-019-00683-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076899279&doi=10.1007%2fs40615-019-00683-9&partnerID=40&md5=23ca3d40a2cc0d76a8f976cebabf1240	Due to the gap between cisgender women eligible for and those accessing pre-exposure prophylaxis (PrEP) for HIV prevention, it is critical to understand knowledge of and attitudes toward PrEP among HIV-vulnerable women. PrEP utilization is particularly low among African American women in the USA. Family planning clinics provide key access points to reach HIV-vulnerable African American women as well as to translate research findings into clinical practice. Our study aimed to (1) describe the awareness of and interest in PrEP among African American cisgender women attending a family planning clinic and (2) document the barriers and facilitators to PrEP uptake among these women. A cross-sectional survey was conducted with sexually active African American women of reproductive age attending a family planning clinic. Descriptive statistics were used to characterize the sample, and bivariate analysis was used to detect difference between categorical and outcome variables. In our survey (N = 109), over 80% of participants listed not knowing PrEP was available as the primary reason for not currently taking PrEP. Seventy percent reported they would probably or definitely like to take PrEP – demonstrating that barriers to uptake might stem from knowledge deficits rather than attitudes toward prevention. Study findings have the potential to inform strategies to increase awareness of PrEP as an HIV prevention option as well as to equip women with greater self-efficacy to access PrEP in family planning settings. © 2019, W. Article	2020	Jolley D.; Jaspal R.	Discrimination, HIV conspiracy theories and pre-exposure prophylaxis acceptability in gay men	Sexual Health	-	-	14485028	10.1071/SH20154	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098224128&doi=10.1071%2fSH20154&partnerID=40&md5=f8163f43a887d54fde3d46aee3929606	Background: Combination prevention, which includes pre-exposure prophylaxis (PrEP), is essential for achieving the zero HIV infections target in the UK by 2030. It is important to assess attitudes towards PrEP in at-risk populations. This study focuses on the effect of discrimination and HIV conspiracy theorising on attitudes towards PrEP in gay men in the UK. Methods: In total, 244 White British gay men completed a survey that included demographic questions and measures of sexual health screening, hypervigilance, sexual orientation discrimination, quality of contact with healthcare professionals, belief in conspiracy theories and attitudes towards PrEP. Data were analysed using multiple linear regression and mediation analysis. Results: Discrimination was positively correlated with HIV conspiracy beliefs and negatively correlated with PrEP acceptance. Mediation analyses demonstrated that the relationship between discrimination and attitudes towards PrEP was explained by HIV conspiracy theorising. Gay men who had attended a sexual health screening (vs never attended) reported higher belief in HIV conspiracy theories. A further mediation analysis showed that reported poor contact with a healthcare professional was associated with an increased belief in HIV conspiracy theories, which was associated with negative attitudes towards PrEP. Both perceived discrimination and poor contact with a healthcare professional were exacerbated by hypervigilance. Conclusions: HIV conspiracy theorising is an important variable in understanding attitudes towards PrEP among gay men. Its roots are in adverse social experiences (e.g. discrimination, poor contact with healthcare professionals) and its consequences may be the rejection of PrEP. HIV prevention and PrEP campaigns must focus on prejudice reduction and on challenging conspiracy beliefs. © 2020 CSIRO.	conspiracy theories; discrimination; gay men; HIV; pre-exposure prophylaxis (PrEP)	English	United States	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative
Article	2020	Jones C.; Young I.; Boydell N.	The people VS the NHS: Biosexual citizenship and hope in stories of prep activism	Somatechnics	-	-	20440138	10.3366/soma.2020.0312	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095949752&doi=10.3366%2fsoma.2020.0312&partnerID=40&md5=52bc1e155b1a9f08a019577d46afa829	Discourses of pre-exposure prophylaxis (PrEP) revel in its radical potential as a global HIV prevention technology, offering a promise of change for the broader landscape of HIV prevention. In 2018, the British Broadcasting Corporation (BBC) aired The People vs The NHS: Who Gets the Drugs?, a documentary focused on the 'battle' to make PrEP available in England. In this article we explore how the BBC documentary positions PrEP, PrEP biosexual citizen-activists, as well as the wider role of the NHS in HIV prevention and the wellbeing of communities affected by HIV in the UK. We consider how biosexual citizenship (Epstein 2018) is configured through future imaginaries of hope, and the spectral histories of AIDS activism. We describe how The People crafts a story of PrEP activism in the context of an imagined gay community whose past, present, and hopeful future is entangled within the complexities and contractions of a state-funded health system. Here, PrEP functions as a 'happiness pointer' (Ahmed 2011), to orient imagined gay communities towards a hopeful future by demanding and accessing essential medicines and ensuring the absence of needless HIV transmissions. This biomedical success emerges from a shared traumatic past and firmly establishes the salvatory trajectory of PrEP and an imagined gay community who have continued to be affected by HIV. However, campaigns about the individual's right to access PrEP construct the availability and consumption of PrEP as an end goal to their activism, where access to PrEP is understood as an individual's right as a pharmaceutical consumer. © Charlotte Jones, Ingrid Young, Nicola Boydell. Article	2020	Jones J.; Dominguez K.; Stephenson R.; Stekler J.D.; Castel A.D.; Mena L.A.; Jenness S.M.; Siegler A.J.; Sullivan P.S.	A theoretically based mobile app to increase pre-exposure prophylaxis uptake among men who have sex with men: Protocol for a randomized controlled trial	JMIR Research Protocols	-	-	19290748	10.2196/16231	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083386266&doi=10.2196%2f16231&partnerID=40&md5=7b7029d53206bea655415272121ff0e8	Background: HealthMindr is a mobile phone HIV prevention app for men who have sex with men (MSM). In a previous pilot study, HealthMindr was found to be acceptable among users and to demonstrate preliminary effectiveness for increasing pre-exposure prophylaxis (PrEP) uptake among MSM. PrEP is a highly effective HIV prevention intervention; however, uptake remains low. Objective: The aim of this study will be to assess the efficacy of a mobile app for increasing PrEP uptake among MSM in the southern United States. Methods: In this randomized controlled trial, we will assess the efficacy of HealthMindr for increasing PrEP uptake among MSM in the following three southern US cities: Atlanta, Georgia; Jackson, Mississippi; and Washington, DC. In total, 657 men will be recruited and randomized to intervention and control arms in a 2:1 ratio. Participants in the intervention arm will receive access to the full HealthMindr app, with information and resources about PrEP (eg, frequently asked questions, risk assessment tool, and PrEP provider locator), other HIV prevention information, ability to order free HIV/sexually transmitted infection test kits, and additional resources related to substance use and mental health. Participants in the control arm will use the HealthMindr app but will only have access to the study timeline and a message center to communicate with study staff. Participants will complete quarterly surveys to assess self-reported PrEP uptake over 12 months of follow-up. Self-reported PrEP uptake will be verified by dried blood spot testing and/or uploading a photograph of a PrEP prescription. Results: Participant recruitment began in January 2020. Conclusions: This trial will determine whether the HealthMindr app can increase PrEP uptake among MSM in the southern United States. © Jeb Jones, Karen Dominguez, Rob Stephenson, Joanne D Stekler, Amanda D Castel, Leandro A Mena, Samuel M Jenness, Aaron J Siegler, Patrick S Sullivan. Article	2020	Jones, Lucy; Collins, Luke	PrEP in the press: A corpus-assisted discourse analysis of how users of HIV-prevention treatment are represented in British newspapers	Journal of Language and Sexuality	-	-	22113770	10.1075/jls.20002.jon	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095587973&doi=10.1075%2fjls.20002.jon&partnerID=40&md5=74e5ca2ce0ecf1f8b091f9d91c896ee0	This research reports on newspaper representations of PrEP, a HIVprevention drug recently made available on a trial basis to at-risk individuals in England. Using corpus-assisted queer critical discourse analysis, we investigate the linguistic representations of the users of PrEP within three leading British newspapers from across the political spectrum between 2014-18. We find that users of PrEP are most frequently positioned as 'men who have sex with men' or 'gay men', a representation that we argue limits public awareness of HIV itself, and of available HIV prevention. Furthermore, while the most left-leaning newspaper in our corpus focuses on the human benefit of PrEP, the most right-leaning newspaper takes a moralistic stance which frames gay men as risk-taking and therefore less deserving of healthcare funding than other groups. We therefore argue that certain representations of PrEP's beneficiaries are implicitly homophobic, and that most representations are unhelpfully restrictive. © John Benjamins Publishing Company. Article	2020	Kagaayi, Joseph; Batte, James; Nakawooya, Hadijja; Kigozi, Boniface; Nakigozi, Gertrude; Strömdahl, Susanne; Ekström, Anna Mia; Chang, Larry W; Gray, Ron; Reynolds, Steven J; Komaketch, Patrick; Alamo, Stella; Serwadda, David	Uptake and retention on HIV pre-exposure prophylaxis among key and priority populations in South-Central Uganda.	Journal of the International AIDS Society	-	-	1758-2652	10.1002/jia2.25588	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7421540	INTRODUCTION: Pre-exposure prophylaxis (PrEP) programmes have been initiated in sub-Saharan Africa to prevent HIV acquisition in key populations at increased risk. However, data on PrEP uptake and retention in high-risk African communities are limited. We evaluated PrEP uptake and retention in HIV hyperendemic fishing villages and trading centres in south-central Uganda between April 2018 and March 2019. METHODS: PrEP eligibility was assessed using a national risk screening tool. Programme data were used to evaluate uptake and retention over 12 months. Multivariable modified Poisson regression estimated adjusted prevalence ratios (aPR) and 95% Confidence intervals (CIs) of uptake associated with covariates. We used Kaplan-Meier analysis to estimate retention and multivariable Cox regression to estimate adjusted relative hazards (aRH) and 95% CIs of discontinuation associated with covariates. RESULTS AND DISCUSSION: Of the 2985 HIV-negative individuals screened; 2750 (92.1 %) were eligible; of whom 2,536 (92.2%) accepted PrEP. Male (aPR = 0.91, 95% CI = 0.85 to 0.97) and female (aPR = 0.85, 95% CI = 0.77 to 0.94) fisher folk were less likely to accept compared to HIV-discordant couples. Median retention was 45.4 days for both men and women, whereas retention was higher among women (log rank, p < 0.001) overall. PrEP discontinuation was higher among female sex workers (aRH = 1.42, 95% CI = 1.09 to 1.83) and female fisher folk (aRH = 1.99, 95% CI = 1.46 to 2.72), compared to women in discordant couples. Male fisher folk (aRH = 1.37, 95% CI = 1.07 to 1.76) and male truck drivers (aRH = 1.49, 95% CI = 1.14 to 1.94) were more likely to discontinue compared to men in discordant couples. Women 30 to 34 years tended to have lower discontinuation rates compared to adolescents 15 to 19 years (RH = 0.78 95% CI = 0.63 to 0.96). CONCLUSIONS: PrEP uptake was high, but retention was very low especially among those at the highest risk of HIV: fisher folk, sex workers and truck drivers and adolescent girls. Research on reasons for PrEP discontinuation could help optimize retention. Article	2020	Kahle, Erin M; Sharma, Akshay; Sullivan, Stephen; Stephenson, Rob	The Influence of Relationship Dynamics and Sexual Agreements on Perceived Partner Support and Benefit of PrEP Use Among Same-Sex Male Couples in the U.S.	AIDS and Behavior	-	-	10907165	10.1007/s10461-020-02782-9	https://www.proquest.com/scholarly-journals/influence-relationship-dynamics-sexual-agreements/docview/2416298721/se-2?accountid=8113	Use of Pre-exposure prophylaxis (PrEP) for HIV prevention by men who have sex with men (MSM) may be impacted by relationship dynamics. We assessed perceived partner support of PrEP use and benefit of PrEP by relationship characteristics among male couples. Baseline data from a randomized control trial of video-based HIV counseling and testing among male couples in the U.S. were used in adjusted multilevel regression models to assess individual and dyadic characteristics. Among 659 participants, 73.3% thought their partner would be supportive of their PrEP use; 26.7% reported their partner would not support PrEP use, which was significantly associated with intimate partner violence (IPV) (p = 0.008). Most (57.7%) did not believe PrEP would be beneficial to them or their partner. Couples with a sexual agreement allowing outside partners were significantly associated with higher perceived support of partners for PrEP (p < 0.001) and benefit of PrEP use (p < 0.001). Perceived partner support of PrEP was high but perceived benefit of PrEP was low, both shaped by relationship dynamics that highlight the need for tailored dyadic interventions. The association between perceived PrEP support and IPV points to the need to integrate relationship contexts in HIV prevention programs. Article	2020	Kakisingi C.; Muteba M.; Mukuku O.; Kyabu V.; Ngwej K.; Kajimb P.; Manika M.; Situakibanza H.; Mwamba C.; Ngwej D.	Prevalence and characteristics of hiv infection among female sex workers in lubumbashi, democratic republic of congo	Pan African Medical Journal	-	-	19378688	10.11604/pamj.2020.36.280.21378	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091786935&doi=10.11604%2fpamj.2020.36.280.21378&partnerID=40&md5=bc199040c7397bc0d99718bcd4c32c53	Introduction: female sex workers (FSWs) are considered a high-risk group for acquiring HIV infection due to their HIV prevalence estimated to be 10-20 times higher than in woman in the general population. This study aimed to determine the prevalence and risk factors of HIV among female sex workers (FSWs) in Lubumbashi. Methods: a cross-sectional study was conducted among FSWs presenting for the first time at the sexually transmitted infections (STIs) clinic of Katuba, Lubumbashi, between April 2016 and December 2017. Information on the participants' socio-demographic characteristics, sexual behaviors, and HIV serology results were collated and analyzed using a multiple logistic regression to identify factors associated to HIV infection among FSWs. Results: information on 1555 sex workers was analysed in this study, the prevalence of HIV was 8.2%. The median age of the participants was 26 years (IQR: 21-34). Of the 127 HIV positive sex workers, 74% have been in the business for two years or less, 97% sell sex as their main income, 74% have more than 5 sexual intercourses per week, 95% reported using condom, 73% reported having history of STIs, 70% reported using alcohol before sex and 97% reported having three or more sexual partners per week. After adjusting for potentials cofounders, Age, Sex work as main income, years of selling sex, condom use, and alcohol use before sex were found to have a significant effect on HIV infection among sex workers. Conclusion: these findings highlight the vulnerability of FSWs to HIV infection and the necessity of immediate interventions to strengthen HIV prevention through behavioral change strategies and making available Pre-exposure Prophylaxis (PrEP) for FSWs in Lubumbashi. © Christian Kakisingi et al. Article	2020	Kamitani E.; Johnson W.D.; Wichser M.E.; Adegbite A.H.; Mullins M.M.; Sipe T.A.	Growth in Proportion and Disparities of HIV PrEP Use Among Key Populations Identified in the United States National Goals: Systematic Review and Meta-analysis of Published Surveys	Journal of Acquired Immune Deficiency Syndromes	-	-	15254135	10.1097/QAI.0000000000002345	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087320169&doi=10.1097%2fQAI.0000000000002345&partnerID=40&md5=efd17076ba9758e4ba2bcc3b5efad689	Background:Pre-exposure prophylaxis (PrEP) use among populations most vulnerable to HIV as identified in the national HIV prevention goals is not fully known. This systematic review assessed trends of lifetime self-reported PrEP use and disparities among key populations.Methods:We used the CDC HIV/AIDS Prevention Research Synthesis cumulative database of electronic and manual searches in MEDLINE, CINAHL, EMBASE, and PsycINFO from 2000 to 2019 to identify English-language primary studies reporting PrEP use. Two reviewers independently screened citations, extracted data, and assessed the risk of bias with the modified Newcastle-Ottawa Scale. We estimated pooled proportions and crude/adjusted odds ratio.Results:We identified 95 eligible studies including 95,854 US-based survey respondents. A few studies (6.3%) focused on persons who inject drugs. In 2015-2017, men who have sex with men (MSM) had highest proportion of individuals who used PrEP over their lifetime 13.9% (95% confidence interval: 8.8 to 21.1), k (number of surveys) = 49 followed by Hispanic/Latinos 11.5 (7.1 to 18.1), 12, transgender women 11.2 (5.8 to 20.6), 5, and blacks 9.9 (8.3 to 11.8), 18. Odds of PrEP use increased by 34%/year odds ratio = 1.34/year (95% confidence interval: 1.09 to 1.64) and significantly increased over time among MSM 1.53/year (1.21-1.93) and blacks 1.44 (1.13-1.83). People in the Southern United States 9.9 (4.7-19.7), 8 and youth 7.3 (4.7-11.2), 8 had lower rates and did not demonstrate growth 0.94 (0.29-3.18); 0.82 (0.43-1.55). Odds of reporting lifetime PrEP use was twice 2.07 (1.27-3.38) as great among MSM than non-MSM.Conclusions:Proportions of PrEP use in published surveys have been growing, but remain low for people in the Southern United States and youth, and understudied in persons who inject drugs. Limitations include few studies in certain years, whereas strengths include a large number of respondents. Culturally tailored approaches targeting vulnerable populations are essential in increasing PrEP use to reduce disparities in HIV acquisition. © 2020 Lippincott Williams and Wilkins. Article	2020	Kampouri, Eleftheria; Papadimitriou-Olivgeris, Matthaios; Calmy, Alexandra; Ciuffi, Angela; Cavassini, Matthias	Novelties in HIV prevention and treatment in 2019.	Revue Médicale Suisse	-	-	1660-9379	NA	https://pesquisa.bvsalud.org/portal/resource/pt/mdl-31961093	This article reviews the novelties in the prevention and treatment of HIV infection as well as the perspectives for a potential cure. The PrEP is a key component in the prevention of infection and the control of the epidemic. In order to decrease long-term toxicities, two-drug antiretroviral regimens are being implemented. Long-acting injectable molecules show promising efficacy and safety and are long awaited for patients tired of taking daily pills. Concerning adverse events, the association between integrase inhibitors and weight gain as well as recent data on the safety of dolutegravir during pregnancy are presented. Finally, a second case of sustained virological suppression in a patient who received a stem cell transplant with a mutation of the co-receptor CCR5 was reported, renewing hopes for possible cure by gene therapy. Article	2020	Kar, Anindya; Bhugra, Dinesh; Mukherjee, Shuvankar; Mondal, Agnibho; Kumar, Aaditya Suresh	PrEP in India's HIV Prevention Policy in the Era of Social Media and Sex Positivity.	Central Asian Journal of Global Health	-	-	2166-7403	10.5195/cajgh.2020.407	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9295848	Introduction: The global revolution of online social media and connectivity had a tremendous effect on sexual behavior in both developed and developing countries. This global change is influencing the societal structure and existing social principles. Moreover, it has a significant impact on the epidemiology of different infectious diseases, especially HIV. Discussion: India is one of the most diverse democratic countries that has undergone a social-cultural transition in the last decade. However, having the second-highest HIV infection rate in the world, India does not have any other new prevention tools in their national HIV prevention strategy. Pre-Exposure Prophylaxis (PrEP), a boon of HIV prevention widely used in different countries, is still not implemented in India. The concept of "Digital India" by the Government of India is giving wide access of internet to the people of India. Furthermore, people are exposed to social media, and that is impacting their sex seeking behavior. Interestingly, recent legal changes in India promotes sex positivity. It also calls for introspection on existing HIV preventive strategies. Conclusions: Given the current scenario of PrEP and other existing preventive measurements of HIV, further research is needed to determine the acceptance and efficacy of PrEP and improve engagement in care for individuals in India. Various international studies recommend effective implication of PrEP to reduce the rate and economic burden of HIV infection. Article	2020	Karletsos, Dimitris; Greenbaum, Charlotte R; Kobayashi, Emily; McConnell, Margaret	Willingness to use PrEP among female university students in Lesotho.	PLOS One	-	-	1932-6203	10.1371/journal.pone.0230565	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7108705	Oral pre-exposure prophylaxis (PrEP) for HIV-negative individuals at high risk was introduced in Lesotho in April 2016. To assess the feasibility and acceptability of PrEP in Lesotho and to study the attitudes and beliefs around HIV risk and prevention measures among young women, between September and December 2016 we asked 302 female university students at fourteen higher education institutions in Lesotho about their sexual behavior, experiences of sexual coercion and abuse, HIV risk perception, willingness to use PrEP, as well as their attitudes toward condom use and self-administration of daily medications. Overall, 57.3% of the sample reported perceiving themselves at risk of acquiring HIV and 32.1% reported being strongly willing to use PrEP if it were available in their community. In a multivariate mediation analysis, perceived HIV risk was associated with 11.5 percentage points increase in likelihood of using PrEP (p = 0.041). Multiple concurrent sexual partnership was associated with 16.1 percentage points increase in likelihood of self-perceived HIV risk (p = 0.007), while having sexual partners in polygamous relationships was associated with 17.8 percentage points increase in likelihood of self-perceived HIV risk (p = 0.002) and the mediated indirect effect accounted for 18.2% of its total effect. Those who reported strong adherence to antibiotics were 23.1 percentage points more likely to express willingness to use PrEP than those who did not (p = 0.004), and those who reported to dislike condoms were 19.1 percentage points more likely to be willing to use PrEP than those who did not report aversion to condom use: these effect were direct and not mediated by HIV risk perception. Intimate partner violence (IPV) in the network of peers was also directly associated with willingness to use PrEP and its effect was not significantly mediated by HIV risk perception: those who had friends who experienced intimate partner violence were 14.9 percentage points more likely to be willing to use PrEP than those who did not report IPV in their network of peers (p = 0.009). These findings support the inclusion of individuals with multiple concurrent sexual partners among the key populations for PrEP provision and confirm that willingness to use PrEP is not solely driven by HIV risk perception. They also indicate that the presence of IPV in peer networks is related to one's willingness to use PrEP. PrEP service provision may generate synergies with IPV prevention programs when offered within this framework. Article	2020	Katz, Kenneth A; Park, Andrew J; Marcus, Julia L	Preexposure Prophylaxis for Human Immunodeficiency Virus Infection for Men Who Have Sex with Men and Transgender Persons:: What Dermatologists Need to Know	Dermatologic Clinics	-	-	7338635	10.1016/j.det.2019.10.008	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075831450&doi=10.1016%2fj.det.2019.10.008&partnerID=40&md5=19308f17d2316acc5dde8cdf313f0b4c	HIV remains an important public health concern in the United States, particularly for men who have sex with men (MSM) and transgender persons. With HIV preexposure prophylaxis (PrEP), persons who are HIV-uninfected take antiretroviral medications to prevent HIV infection. The most common PrEP regimen involves taking a single pill daily and is very effective in reducing risk of HIV infection, with few adverse effects. Barriers to PrEP access exist for MSM and transgender persons. Dermatologists can help combat the ongoing HIV epidemic among MSM, transgender persons, and others by understanding why, when, and how PrEP should be considered as an HIV prevention approach. © 2019 Elsevier Inc. Article	2020	Kay, Emma Sophia, Phd; Pinto, Rogério M, Phd	Is Insurance a Barrier to HIV Preexposure Prophylaxis? Clarifying the Issue	American Journal of Public Health	-	-	00900036	10.2105/AJPH.2019.305389	https://www.proquest.com/scholarly-journals/is-insurance-barrier-hiv-preexposure-prophylaxis/docview/2325294852/se-2?accountid=8113	Clinical trials have demonstrated that preexposure prophylaxis (PrEP) protects against HIV infection; yet, even with its approval by the Food and Drug Administration (FDA) in 2012, less than 10% ofeligible users in the United States are currently taking PrEP.While there are multiple factors that influence PrEP uptake and pose barriers to PrEP implementation, here we focus on PrEP's cost in the United States, which, at the current list price of $2000 per month and with high levels of cost sharing, can leave insured users with more than $1000 in out-of-pocket costs every year. We discuss how patient deductibles, monthly premiums, copayments, and coinsurance vary widely and may increase the financial burden. Although drug payment-assistance programs have made PrEP more affordable to uninsured and underinsured users, lack of insurance is a barrier to PrEP accessibility. The FDA approved a generic version in 2017; however, that version has not been distributed to US consumers and might not be more affordable.As other countries begin implementing PrEP programs, the extent of PrEP's availability as a tool in the global fight against HIV remains to be seen. Article	2020	Kazemian P.; Costantini S.; Neilan A.M.; Resch S.C.; Walensky R.P.; Weinstein M.C.; Freedberg K.A.	A novel method to estimate the indirect community benefit of HIV interventions using a microsimulation model of HIV disease	Journal of Biomedical Informatics	-	-	15320464	10.1016/j.jbi.2020.103475	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086586622&doi=10.1016%2fj.jbi.2020.103475&partnerID=40&md5=2ff77539fc4b9211e380b0c1f7bb888c	Background: Microsimulation models of human immunodeficiency virus (HIV) disease that simulate individual patients one at a time and assess clinical and economic outcomes of HIV interventions often provide key details regarding direct individual clinical benefits ("individual benefit"), but they may lack detail on transmissions, and thus may underestimate an intervention's indirect benefits ("community benefit"). Dynamic transmission models can be used to simulate HIV transmissions, but they may do so at the expense of the clinical detail of microsimulations. We sought to develop, validate, and demonstrate a practical, novel method that can be integrated into existing HIV microsimulation models to capture this community benefit, integrating the effects of reduced transmission while keeping the clinical detail of microsimulations. Methods: We developed a new method to capture the community benefit of HIV interventions by estimating HIV transmissions from the primary cohort of interest. The method captures the benefit of averting infections within the cohort of interest by estimating a corresponding gradual decline in incidence within the cohort. For infections averted outside the cohort of interest, our method estimates transmissions averted based on reductions in HIV viral load within the cohort, and the benefit (life-years gained and cost savings) of averting those infections based on the time they were averted. To assess the validity of our method, we paired it with the Cost-effectiveness of Preventing AIDS Complications (CEPAC) Model – a validated and widely-published microsimulation model of HIV disease. We then compared the consistency of model-estimated outcomes against outcomes of a widely-validated dynamic compartmental transmission model of HIV disease, the HIV Optimization and Prevention Economics (HOPE) model, using the intraclass correlation coefficient (ICC) with a two-way mixed effects model. Replicating an analysis done with HOPE, validation endpoints were number of HIV transmissions averted by offering pre-exposure prophylaxis (PrEP) to men who have sex with men (MSM) and people who inject drugs (PWID) in the US at various uptake and efficacy levels. Finally, we demonstrated an application of our method in a different setting by evaluating the clinical and economic outcomes of a PrEP program for MSM in India, a country currently considering PrEP rollout for this high-risk group. Results: The new method paired with CEPAC demonstrated excellent consistency with the HOPE model (ICC = 0.98 for MSM and 0.99 for PWID). With only the individual benefit of the intervention incorporated, a PrEP program for MSM in India averted 43,000 transmissions over a 5-year period and resulted in a lifetime incremental cost-effectiveness ratio (ICER) of US$2,300/year-of-life saved (YLS) compared to the status quo. After applying both the direct (individual) and indirect (community) benefits, PrEP averted 86,000 transmissions over the same period and resulted in an ICER of US$600/YLS. Conclusions: Our method enables HIV microsimulation models that evaluate clinical and economic outcomes of HIV interventions to estimate the community benefit of these interventions (in terms of survival gains and cost savings) efficiently and without sacrificing clinical detail. This method addresses an important methodological gap in health economics microsimulation modeling and allows decision scientists to make more accurate policy recommendations. © 2020 Elsevier Inc. Article	2020	Kazemian, Pooyan; Costantini, Sydney; Kumarasamy, Nagalingeswaran; Paltiel, A David; Mayer, Kenneth H; Chandhiok, Nomita; Walensky, Rochelle P; Freedberg, Kenneth A	The Cost-effectiveness of Human Immunodeficiency Virus (HIV) Preexposure Prophylaxis and HIV Testing Strategies in High-risk Groups in India.	Clinical Infectious Diseases	-	-	1537-6591	10.1093/cid/ciz249	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7319272	BACKGROUND: The human immunodeficiency virus (HIV) epidemic in India is concentrated among 3.1 million men who have sex with men (MSM) and 1.1 million people who inject drugs (PWID), with a mean incidence of 0.9-1.4 per 100 person-years. We examined the cost-effectiveness of both preexposure prophylaxis (PrEP) and HIV testing strategies for MSM and PWID in India. METHODS: We populated an HIV microsimulation model with India-specific data and projected clinical and economic outcomes of 7 strategies for MSM/PWID, including status quo; a 1-time HIV test; routine HIV testing every 3, 6, or 12 months; and PrEP with HIV testing every 3 or 6 months. We used a willingness-to-pay threshold of US$1950, the 2017 Indian per capita gross domestic product, to define cost-effectiveness. RESULTS: HIV testing alone increased life expectancy by 0.07-0.30 years in MSM; PrEP added approximately 0.90 life-years to status quo. Results were similar in PWID. PrEP with 6-month testing was cost-effective for both MSM (incremental cost-effectiveness ratio ICER, $1000/year of life saved YLS) and PWID (ICER, $500/YLS). Results were most sensitive to HIV incidence. PrEP with 6-month testing would increase HIV-related expenditures by US$708 million (MSM) and US$218 million (PWID) over 5 years compared to status quo. CONCLUSIONS: While the World Health Organization recommends PrEP with quarterly HIV testing, our analysis identifies PrEP with semiannual testing as the cost-effective HIV prevention strategy for Indian MSM and PWID. Since nationwide scale-up would require a substantial fiscal investment, areas of highest HIV incidence may be the appropriate initial targets for PrEP scale-up. Article	2020	Kecojevic A.; Basch C.H.; Garcia P.	Readability analysis of online health information on preexposure prophylaxis (PrEP)	Public Health	-	-	333506	10.1016/j.puhe.2020.02.002	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081220816&doi=10.1016%2fj.puhe.2020.02.002&partnerID=40&md5=79dfc2114fb64a02a5b1792298356f44	Objectives: When considering PreExposure Prophylaxis (PrEP) as a HIV prevention method, many rely on information available online. Limited research has examined the quality, including readability, of PrEP information on the Internet. The current study evaluates the readability of PrEP information online employing six commonly used readability tests. Study design: This is a cross-sectional study. Methods: Using the Google Chrome browser, a search for articles was conducted using two terms: "pre-exposure prophylaxis" and "Truvada." The URLs of the first 50 English language websites for each term were recorded to create the overall study sample of 100 unique websites. Using six established readability scales, we determined the readability scores for each examined website. Websites were stratified by .com, .org, and .gov URL extensions to compare readability metrics. Results: Mean Flesch-Kincaid Grade Level (FKGL) was 9.5 (SD = 2.2), mean Gunning Fog Index (GFI) was 11.1 (SD = 2.7), mean Coleman-Liau Index (CLI) was 11.3 (SD = 2.0), while mean Simple Measure of Gobbledygook (SMOG) Grade Level was 12.1 (SD = 1.8). Using Flesch-Kincaid Reading Ease (FRE), one article was found easy to read, while 23 were found of average difficulty to read. Mean New Dale-Chall (NDS) score was 7.3 (SD = 1.3), or grade 9–10. Mean reading levels were significantly different among the commercial, organization, and government sites, however, no category was at the recommended sixth-grade level. Conclusions: PrEP information online surpasses the reading ability of most U.S. adults. Improving the readability of PrEP information online may help to increase uptake of PrEP among populations at risk for HIV. © 2020 The Royal Society for Public Health	Health literacy; Internet; Pre-exposure prophylaxis (PrEP); Readability	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Article	2020	Keen P.; Hammoud M.A.; Bourne A.; Bavinton B.R.; Holt M.; Vaccher S.; Haire B.; Saxton P.; Jin F.; Maher L.; Grulich A.E.; Prestage G.	Use of HIV pre-exposure prophylaxis (PrEP) associated with lower HIV anxiety among gay and bisexual men in australia whoare at high risk of HIV infection: Results from the flux study	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002232	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077849364&doi=10.1097%2fQAI.0000000000002232&partnerID=40&md5=07da419302b7205a163ef74b21b3f8af	Background: Many gay and bisexual men (GBM) experience HIV anxiety, particularly around condomless anal intercourse. HIV preexposure prophylaxis (PrEP) is an effective HIV prevention strategy that may reduce HIV anxiety among GBM. Methods: The Following Lives Undergoing Change (Flux) Study is a national, online, open-prospective observational study of licit and illicit drug use among GBM in Australia. In 2018, participants responded to newly included items regarding anxiety about HIV transmission. Stratifying GBM as high or low risk as determined by the Australian PrEP Guidelines, we assess whether PrEP use is associated with lower levels of HIV anxiety. Multivariate logistic regression was used to compare factors associated with PrEP use among GBM at high risk (PrEP-eligible) and low risk (PrEPineligible) of HIV infection. Results are reported as adjusted odds ratios and corresponding 95% confidence intervals. Results: Among 1547 men, the mean age was 37.1 years (SD 13.1). Men aged 25 years or younger had higher HIV anxiety scores than older men. Among PrEP-eligible men, men who use PrEP reported lower levels of HIV anxiety (adjusted odds ratio = 0.92; 95% confidence interval = 0.87 to 0.99; P < 0.001). No differences were observed on HIV anxiety among PrEP-ineligible men. Conclusions: Among PrEP-eligible men, PrEP use was independently associated with lower levels of HIV anxiety. In addition to avoiding HIV infection, PrEP use may help reduce anxiety among men at risk of HIV. This feature of PrEP could be promoted as part of demand creation initiatives to increase PrEP uptake. © 2019 Wolters Kluwer Health, Inc. Article	2020	Keen, Phillip; Bavinton, Benjamin R	Could disparities in PrEP uptake limit the public health benefit?	The Lancet Public Health	-	-	-	2468-2667	10.1016/S2468-2667(20)30183-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7462558/	Since October, 2017 (and until October, 2020), pre-exposure prophylaxis (PrEP) has only been available in England, UK, through the PrEP Impact Trial, by purchasing it from some genitourinary medicine clinics, or via online sources. Here we report changes from 2013 to 2018 in PrEP and postexposure prophylaxis (PEP) awareness and use among HIV-negative gay, bisexual, and other men who have sex with men (MSM) and assess predictors of PrEP initiation.In the prospective cohort study Attitudes to, and Understanding of Risk of Acquisition of HIV 2 (AURAH2), MSM were recruited from three sexual health clinics in England: two in London and one in Brighton, UK. Men were eligible if they were aged 18 years or older and HIV-negative or of unknown HIV status. Participants self-completed a baseline paper questionnaire at one of the three clinics between July 30, 2013, and April 30, 2016, and were subsequently able to complete 4-monthly and annual online questionnaires, which were available between March 1, 2015, and March 31, 2018, and collected information on sociodemographics, health and wellbeing, HIV status, and sexual behaviours. PrEP and PEP use in the previous 12 months was obtained at baseline and in annual questionnaires. We assessed trends over calendar time in 3-month periods from first enrolment to the end of the study period (July-December, 2013, was counted as one period) in use of PrEP and PEP using generalised estimating equation logistic models. We used age-adjusted Poisson models to assess factors associated with PrEP initiation among participants who reported never having used PrEP at baseline.1162 men completed a baseline questionnaire, among whom the mean age was 34 years (SD 10·4), and of those with available data, 942 (82%) of 1150 were white, 1076 (94%) of 1150 were gay, and 857 (74%) of 1159 were university educated. 622 (54%) of 1162 men completed at least one follow-up online questionnaire, of whom 483 (78%) completed at least one annual questionnaire. Overall, PrEP use in the past year increased from 0% (none of 28 respondents) in July to December, 2013, to 43% (23 of 53) in January to March, 2018. The corresponding increase in PrEP use among men who reported condomless sex with two or more partners was from 0% (none of 13 respondents) to 78% (21 of 27). PEP use peaked in April to June, 2016, at 28% (41 of 147 respondents), but decreased thereafter to 8% (four of 53) in January to March, 2018. Among 460 men who had never used PrEP at baseline, predictors of initiating PrEP included age 40-44 years (incidence rate ratio IRR 4·25, 95% CI 1·14-15·79) and 45 years and older (3·59, 1·08-11·97) versus younger than 25 years; and after adjustment for age, recent HIV test (5·17, 1·89-14·08), condomless sex (5·01, 2·16-11·63), condomless sex with two or more partners (5·43, 2·99-9·86), group sex (1·69, 1·01-2·84), and non-injection chemsex-related drugs use (2·86, 1·67-4·91) in the past 3 months, and PEP use (4·69, 2·83-7·79) in the past 12 months, and calendar year (Jan 1, 2017, to March 31, 2018 vs July 30, 2013, to Dec 31, 2015: 21·19, 9·48-47·35). Non-employment (0·35, 0·14-0·91) and unstable or no housing (vs homeowner 0·13, 0·02-0·95) were associated with reduced rates of PrEP initiation after adjustment for age. About half of PrEP was obtained via the internet, even after the PrEP Impact trial had started (11 48% of 23 respondents in January to March, 2018).PrEP awareness and use increased substantially from 2013 to 2018 among a cohort of MSM in England. Improving access to PrEP by routine commissioning by National Health Service England could increase PrEP use among all eligible MSM, but should include public health strategies to target socioeconomic and demographic disparities in knowledge and use of PrEP.National Institute for Health Research. Article	2020	Keen, Phillip; Lee, Evelyn; Grulich, Andrew E; Prestage, Garrett; Guy, Rebecca; Stoové, Mark A; Bavinton, Benjamin R; Asselin, Jason; Hammoud, Mohamed A; Broady, Tim; Duck, Tim; Holt, Martin	Sustained, Low Prevalence of Undiagnosed HIV Among Gay and Bisexual Men in Sydney, Australia Coincident With Increased Testing and Pre-exposure Prophylaxis Use: Results From Repeated, Bio-Behavioral Studies 2014-2018.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002451	https://dx.doi.org/10.1097/QAI.0000000000002451	BACKGROUND: Gay and bisexual men with undiagnosed HIV contribute disproportionately to HIV transmission in Australia. METHODS: In 2014 and 2018, we recruited men at gay venues and events in Sydney. Participants self-completed surveys and provided oral fluid samples for HIV testing. We calculated the prevalence of HIV and undiagnosed infection, and assessed changes in behavior, HIV testing, and the use of pre-exposure prophylaxis. We weighted the samples to adjust for differences in where participants were recruited between rounds. Two-sample tests of proportion were used to compare prevalence estimates and χ tests to assess differences between the samples. RESULTS: In 2014, 944 men were recruited, and 890 men were recruited in 2018. In 2014, the weighted estimate of HIV prevalence was 6.1% 95% confidence intervals (CI): 4.6 to 7.6, of which 13.8% (95% CI: 5.0 to 22.7) was undiagnosed. In 2018, weighted HIV prevalence was 6.4% (95% CI: 4.8 to 8.0), of which 5.3% (95% CI: 0.5 to 11.1) was undiagnosed. Between 2014 and 2018 among all participants, men reporting at least 10 recent casual partners increased from 22.3% to 27.7% (P = 0.008), condomless anal intercourse with casual partners in the previous 6 months increased from 23.9% to 37.3% (P < 0.001), and sexually transmitted infection diagnoses in the previous year increased from 14.4% to 27.5% (P < 0.001). HIV testing and the use of pre-exposure prophylaxis in the previous 6 months increased from 49.6% to 56.3% (P = 0.004) and 2.0%-21.0% (P < 0.001), respectively. CONCLUSIONS: Repeated, bio-behavioral surveillance suggests the prevalence of undiagnosed HIV remains low in Sydney, despite gay and bisexual men reporting more casual sex partners, condomless sex, and sexually transmitted infections. Article	2020	Kelly J.A.; Amirkhanian Y.A.; Walsh J.L.; Brown K.D.; Quinn K.G.; Petroll A.E.; Pearson B.M.; Rosado A.N.; Ertl T.	Social network intervention to increase pre-exposure prophylaxis (PrEP) awareness, interest, and use among African American men who have sex with men	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1739207	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081973528&doi=10.1080%2f09540121.2020.1739207&partnerID=40&md5=60818148652af251a2205687910968dc	In the U.S., HIV incidence is highest among Black men who have sex with men (MSM) but PrEP uptake is low, in part due to lack of normative support for using PrEP. This research pilot tested a social network-level intervention designed to increase PrEP use willingness, interest, and peer supports among Black MSM in Milwaukee. Five community social networks (n = 40 participants) of racial minority MSM were assessed at baseline with measures of PrEP knowledge, interest, attitudes, and action taking. Persons most interconnected with others in each network attended an intervention that provided training to increase knowledge about PrEPbenefits, address PrEP concerns, endorse PrEP use as a symbol of pride and health, and deliver these messages to others in their social networks. All network members were re-administered the same measures at 3-month followup. Significant increases over time were found in network members' PrEP knowledge, attitudes, norm perceptions, self-efficacy, and willingness to use PrEP. Participants more often talked with friends about HIV and with their health care providers about PrEP. The percentage of participants who reported using PrEP increased from 3% to 11%. Larger-scale evaluations of this intervention model are needed. © 2020, © 2020 Informa UK Limited, trading as Taylor & Francis Group. Article	2020	Kelvin E.A.; Patel V.V.; Mirzayi C.; Anastos K.; Grov C.	Lifetime Prevalence and Correlates of Female Condom Use for Anal Sex in a Geographically Diverse Sample of Men Who Have Sex with Men (MSM) in the United States	International Journal of Sexual Health	-	-	-	19317611	10.1080/19317611.2020.1813860	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092080595&doi=10.1080%2f19317611.2020.1813860&partnerID=40&md5=86c1d25d27200eaab31587d5c5b0df7a	Objectives: To examine the use of the female condom (FC) for anal sex among men who have sex with men (MSM) in the United States. Methods: An online survey among 3,837 MSM. Results: 5.2% had used the FC for anal sex. Use was higher among those who had used the FC for vaginal sex (OR = 14.39, p <.001), those with multiple partners, (OR = 2.68, p =.004), and those who were HIV-positive (OR = 2.07, p <.001) or on PrEP (OR = 2.66, p <.001). Conclusions: FC use for anal sex was associated with the risk of HIV infection/transmission and may be a risk reduction strategy used by MSM in the United States. © 2020 Taylor & Francis Group, LLC.	anal sex; Female condom; men who have sex with men (MSM); United States of America (US)	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Kenison, Tiffany Cho; Badenhop, Brittan; Safo, Stella	Unlocking HIV Pre-Exposure Prophylaxis Delivery: Examining the Role of HIV Providers in Pre-Exposure Prophylaxis Care.	AIDS Patient Care and STDs	-	-	-	1557-7449	10.1089/apc.2019.0288	https://dx.doi.org/10.1089/apc.2019.0288	Despite being a promising prevention strategy for populations at risk for HIV acquisition, there has not been rapid uptake of HIV antiretroviral pre-exposure prophylaxis (PrEP). Yet, HIV clinics within the Mount Sinai Health System in New York City have successfully incorporated PrEP. HIV care providers (n = 18), who practice in these clinics and were early PrEP adopters, participated in a survey and semistructured interview. Qualitative thematic analysis revealed that barriers and facilitators to PrEP uptake were identified on multiple levels from broader systemic to provider-and-patient-level concerns. The following themes were identified: (1) to reach a greater proportion of patients at risk for HIV and address racial/ethnic and gender disparities, PrEP should be available in a variety of settings and provided by different types of providers within proximity to affected populations; (2) financial support is needed beyond addressing medication cost; and (3) multidisciplinary teams and population-specific clinic protocols can assist providers in conducting high-quality visits and addressing these barriers to PrEP. Article	2020	Kenyon, Chris; Baetselier, Irith De; Wouters, Kristien	Screening for STIs in PrEP cohorts results in high levels of antimicrobial consumption.	International Journal of STD & AIDS	-	-	-	1758-1052	10.1177/0956462420957519	https://dx.doi.org/10.1177/0956462420957519	Antimicrobial consumption (AMC) drives antimicrobial resistance (AMR) at both individual and population levels. Populations with high AMC tend to have a high prevalence of AMR for a range of antimicrobialbacterial species (bug/drug) combinations. Emerging evidence suggests that there are AMC thresholds for AMR. For example, one study found that all populations with macrolide consumption above 2 defined daily doses per 1000 persons daily (DID) had a high prevalence of macrolide resistance in Treponema pallidum, whereas those consuming less than this threshold had little or no resistance. These considerations mean it is crucial to monitor population-level AMC in sub-populations at high risk of AMR, such as men who have sex with men (MSM) in preexposure prophylaxis (PrEP) cohorts. Previous analyses have estimated what AMC might be in these cohorts based on reported percentage testing positive for bacterial STIs and assuming that all testing positive received treatment. In this paper we aimed to assess the AMC in a PrEP cohort for macrolides, third generation cephalosporins, fluoroquinolones and tetracyclines in DID following standard WHO methodology. Article	2020	Kenyon, Chris; Laumen, Jolein; Van Dijck, Christophe	Could Intensive Screening for Gonorrhea/Chlamydia in Preexposure Prophylaxis Cohorts Select for Resistance? Historical Lessons From a Mass Treatment Campaign in Greenland.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001092	https://dx.doi.org/10.1097/OLQ.0000000000001092	INTRODUCTION: Neisseria gonorrhoeae has developed resistance to all classes of antimicrobials used against it. Current strategies to prevent the emergence of pan-resistance include increased gonorrhea screening in high-prevalence populations such as men who have sex with men taking HIV preexposure prophylaxis. By increasing antimicrobial exposure, others have argued that intensive screening may inadvertently promote the emergence of antimicrobial resistance. AIM/METHODOLOGY: To contribute to this discussion, we conducted a historical review of the effect of a mass gonorrhea treatment campaign in Greenland from 1965 to 1968 on the incidence of gonorrhea and antimicrobial resistance. We conducted a literature review using PubMed and Google Scholar to find relevant studies. Data on the incidence of gonorrhea, antimicrobial susceptibility, and antimicrobials dispensed were extracted and analyzed. RESULTS: Eight articles were found with relevant information. The cornerstone of the campaign involved the repeated treatment for all persons with a diagnosis of gonorrhea in the past 6 months as well as all remaining unmarried persons between 15 and 30 years of age. There was a small and temporary decline in the incidence of gonorrhea during the campaign. The campaign was, however, associated with an increase in the proportion of gonococci that were not susceptible to penicillin. Gonococcal incidence continued to climb after the campaign ended but did decline dramatically after reductions in risk behavior after the global AIDS epidemic. DISCUSSIONS: The mass gonorrhea treatment campaign in Greenland was associated with only a temporary decline in the incidence of gonorrhea. It was, however, followed by an increase in penicillin nonsusceptibility. Intense gonorrhea screening and treatment strategies should be aware of the risk of inducing antimicrobial resistance. Article	2020	Khalili J.; Landovitz R.J.	HIV Preexposure Prophylaxis - The Role of Primary Care Clinicians in Ending the HIV Epidemic	JAMA Internal Medicine	-	-	-	21686106	10.1001/jamainternmed.2019.5456	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074978645&doi=10.1001%2fjamainternmed.2019.5456&partnerID=40&md5=eb99a77a8289b230aed00d09d665dbf1	A global human immunodeficiency virus (HIV) epidemic persists despite data to support multiple effective and safe tools that prevent HIV transmission and acquisition. Human immunodeficiency virus preexposure prophylaxis (PrEP) for HIV-uninfected at-risk populations using tenofovir disoproxil fumarate emtricitabine is highly effective, safe, and recently endorsed by the US Preventive Services Task Force (USPSTF) as a grade A recommendation. In this Special Communication, we summarize current guidelines and expert recommendations in a call for wider adoption of PrEP prescribing activities by frontline primary care clinicians. Key components include the ideal contexts in which PrEP may be prescribed, eligibility criteria, clinical considerations and pitfalls, laboratory monitoring, prescription practices, situations that may warrant expert consultation, and future directions. Given the broad scope, access, and point-of-entry status of primary clinicians in health systems, generalists will need to be at the center of any successful effort to leverage the power of, and destigmatize PrEP to end the HIV epidemic. © 2019 American Medical Association. Article	2020	Khosropour C.M.; Backus K.V.; Means A.R.; Beauchamps L.; Johnson K.; Golden M.R.; Mena L.	A Pharmacist-Led, Same-Day, HIV Pre-Exposure Prophylaxis Initiation Program to Increase PrEP Uptake and Decrease Time to PrEP Initiation	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2019.0235	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078059683&doi=10.1089%2fapc.2019.0235&partnerID=40&md5=12f5207f00bd7ab5c77f360ad1cf2e43	Mississippi has one of the highest rates of HIV in the United States, but has low pre-exposure prophylaxis (PrEP) uptake, particularly among black men who have sex with men (MSM) and women. From November 2018 to May 2019, patients at high risk of HIV who tested negative for HIV at a nonclinical testing center in Jackson, Mississippi, were referred to an on-site clinical pharmacist for same-day PrEP initiation. The pharmacist evaluated patients for medical contraindications to PrEP, but no baseline labs were obtained. The pharmacist provided a PrEP prescription and scheduled a clinical appointment for patients within 6 weeks, at which time they were evaluated by a clinician and completed baseline labs. The pharmacist evaluated 69 patients for PrEP; 57% were MSM, 77% were black, and 65% were uninsured. All patients received a PrEP prescription; 85% received the prescription the same day and 97% received it within 5 days. Fifty-three (77%) of 69 clients filled the prescription; 87% of whom filled it within 1 week. Only 23 (43%) of 53 clients who filled their prescription attended their initial clinical appointment within 6 weeks of obtaining PrEP. There were no differences in PrEP initiation or retention by patient sex/gender. This pilot program suggests that an on-site pharmacist working in a nonclinical testing center in the southern United States can successfully initiate PrEP among predominately low-income black MSM. Future efforts should seek to better integrate laboratory testing into this demedicalized model of PrEP and to improve retention in care. © Copyright 2020, Mary Ann Liebert, Inc., publishers 2020. Article	2020	Kidman R.; Nachman S.; Kohler H.-P.	Interest in HIV pre-exposure prophylaxis (PrEP) among adolescents and their caregivers in Malawi	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1742861	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081717231&doi=10.1080%2f09540121.2020.1742861&partnerID=40&md5=217d0d12e2f72e31fb0c76c7cb622905	Over a third of new HIV infections occur in adolescents aged 10–19 globally. Pre-exposure prophylaxis (PrEP) could be a powerful tool for prevention. Understanding more about the drivers of PrEP interest could inform implementation strategies among this age group. Moreover, family dynamics may play a uniquely critical role for this younger age group, thus it is important to gauge whether caregivers would support their children's use of PrEP. We surveyed 2,089 adolescents (aged 10–16) and their caregivers in Malawi during 2017–2018. Data were collected on PrEP interest, factors that may facilitate PrEP use, and preferences for PrEP modality. We used multivariate logistic regression to estimate the association between the above characteristics and PrEP interest. We find that young adolescents are engaging in behaviors that would put them at substantial risk of acquiring HIV, would likely benefit from PrEP, are largely (82%) interested in using such, would prefer to get an injection over taking a daily pill, and are considerably discouraged by the prospect of side effects. Endorsement by caregivers was even greater (87%). Our findings demonstrate initial support for adolescent PrEP, and suggest parents may be a surprising advocate. © 2020, © 2020 Informa UK Limited, trading as Taylor & Francis Group.	adolescent; HIV; Malawi; pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Kimball D.; Rivera D.; Gonzales M., IV; Blashill A.J.	Medical Mistrust and the PrEP Cascade Among Latino Sexual Minority Men	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-02916-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095980916&doi=10.1007%2fs10461-020-02916-z&partnerID=40&md5=5679bd06594c7d61448b2aea2ca42a59	Latino sexual minority men (SMM) have high HIV incidence rates but report low pre-exposure prophylaxis (PrEP) use. Medical mistrust predicts lower medical care use and could contribute to decreased PrEP engagement. This study examines how medical mistrust relates to the PrEP cascade among 151 Latino SMM aged 18–29. Logistic regressions were employed with medical mistrust predicting PrEP awareness, willingness, current use, and adherence. Greater medical mistrust was associated with decreased odds of all outcomes and may represent a barrier to PrEP engagement for Latino SMM. Further research should explore whether reducing medical mistrust among Latino SMM could increase PrEP engagement. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Kimmel A.L.; Messersmith L.J.; Bazzi A.R.; Sullivan M.M.; Boudreau J.; Drainoni M.-L.	Implementation of HIV pre-exposure prophylaxis for women of color: Perspectives from healthcare providers and staff from three clinical settings	Journal of HIV/AIDS & Social Services	-	-	-	15381501	10.1080/15381501.2021.1887038	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101289522&doi=10.1080%2f15381501.2021.1887038&partnerID=40&md5=1ca930744a231433f310fdc01c496ebc	Women of color (WOC) account for 83% of new HIV infections among women in the United States. While pre-exposure prophylaxis (PrEP) is a safe, effective HIV prevention method for women, WOC are less likely to be prescribed PrEP than other populations. Guided by an implementation science research framework, we investigated the implementation of a PrEP initiative for WOC in a US city with high HIV incidence. Across three clinical sites, only three WOC were prescribed PrEP after one year. Analysis of qualitative interviews with clinic staff and providers identified time constraints, reluctance to prescribe PrEP, and discomfort with counseling as implementation barriers. Implementation facilitators included staff and leadership support for PrEP, alignment of PrEP services with organizational missions, and having a centralized PrEP Coordinator. By addressing these identified implementation barriers and facilitators, clinic staff and providers can ensure that WOC are provided with the full range of HIV prevention options. © 2021 Taylor & Francis Group, LLC. Theses and Dissertations	2020	King, Tonya Rochelle	Increasing Primary Care Provider Knowledge and Comfort in Prescribing Pre-Exposure Prophylaxis	-	-	University of Arizona	-	NA	NA	http://hdl.handle.net/10150/648621	Purpose. This quality improvement project focused on educating primary care providers (PCPs) about pre-exposure prophylaxis (PrEP) through an educational intervention to increase their knowledge and comfortability in prescribing PrEP. Background. Human immunodeficiency virus (HIV) is a virus that attacks CD4 cells within the body's immune system that can lead to acquired immunodeficiency syndrome if not controlled with antiretroviral therapy. Although there is no cure for HIV, a preventative medication known as PrEP is available to individuals at high-risk of HIV acquisition, implementation by PCPs has been under-utilized. Synthesis of the literature demonstrate three main trends: low prescribing rates of PrEP to high-risk populations, a gap in provider knowledge regarding PrEP, and an uncertainty in PCPs comfortability in prescribing PrEP. Methods. The project used a descriptive design using a one group, pretest-posttest to analyze PCP knowledge and comfortability in prescribing PrEP, before and after the application of an educational training intervention. Participants were actively practicing PCPs within United Community Health Center, a federally qualified health center (FQHC) in southern Arizona. The final sample size was 12 participants. Data was collected from multiple surveys: demographic survey, and pre-test/post-test questionnaires. The educational intervention was delivered to PCPs through the Zoom platform at the all provider meeting on May 20, 2020. Results. Key findings include an overall knowledge increase in PCPs regarding PrEP and there was an increase of comfortability in prescribing PrEP to high-risk individuals after the educational presentation. Although this is positive change in comfortability, there were still a quarter of providers who felt extremely uncomfortable prescribing PrEP. Prior to the intervention, main barriers to prescribing PrEP were limited knowledge of PrEP, lack of comfortability in prescribing PrEP, and lack of provider training and education regarding PrEP. Conclusions. This project indicates that an educational intervention regarding PrEP could improve PCPs knowledge and comfortability in prescribing PrEP. It has been proven that PrEP is an effective way to reduce HIV acquisition in vulnerable populations, which further illustrates the need for additional education and trainings on PrEP and HIV reduction strategies. Further studies should focus on the contributing factors to the lack of comfortability in PCPs and prescribing PrEP.	Prettyman, Allen (advisor); Simon, Robin J. P. (advisor); Kiser, Lisa H. Article	2020	Kinuthia, John; Pintye, Jillian; Abuna, Felix; Mugwanya, Kenneth K; Lagat, Harison; Onyango, Dickens; Begnel, Emily; Dettinger, Julia; Baeten, Jared M; John-Stewart, Grace	Pre-exposure prophylaxis uptake and early continuation among pregnant and post-partum women within maternal and child health clinics in Kenya: results from an implementation programme	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(19)30335-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077367869&doi=10.1016%2fS2352-3018%2819%2930335-2&partnerID=40&md5=d6d9b4cb2a1cb1c50cd87c4383c14a98	Background: Pregnant women in settings with high HIV prevalence are at increased risk of HIV acquisition and subsequent vertical transmission. We implemented and evaluated a novel programme to provide pre-exposure prophylaxis (PrEP) in maternal and child health clinics in Kenya. Methods: In collaboration with Kisumu County Department of Health, we integrated PrEP delivery within 16 maternal and child health clinics in Kisumu County (Kenya). Women and girls older than 15 years seeking maternal and child health services who tested HIV negative at that visit or within a month and were willing to receive PrEP counselling were interviewed to assess for HIV behavioural risk factors and offered PrEP. Correlates of PrEP initiation and continuation were assessed using Poisson regression in univariate and multivariate analyses. Potential correlates included in our analyses were age, marital status, marriage type, whether pregnant or post partum, gestational age (if pregnant), and HIV risk factors in the previous 6 months. Reasons for the decision to discontinue after having decided to initiate PrEP were evaluated. Women who initiated PrEP were followed up 1 month, 3 months, and 6 months after initiation. Findings: Between Nov 20, 2017, and June 13, 2018, 9376 pregnant and post-partum women were assessed for behavioural risk factors and willingness to initiate PrEP. Overall, 2030 (21·7%) initiated PrEP, and 2027 had the status of their partner captured (153 79·3% of 193 women with partners living with HIV, 1178 37·2% of 3165 women with partners of unknown HIV status, and 696 11·6% of 5997 women with HIV-negative partners). Predictors of PrEP initiation in the multivariate analysis were: being younger than 24 years (adjusted prevalence ratio 1·14, 95% CI 1·02–1·28); having a partner living with HIV (6·96, 5·46–8·89) or of unknown HIV status (3·08, 2·50–3·81); gestational age of less than 26 weeks (1·22, 1·02–1·47); having been diagnosed or treated for a sexually transmitted infection (1·57, 1·20–2·06); having been forced to have sex (1·82, 1·38–2·42); having experienced intimate partner violence during the previous 6 months (1·65, 1·10–2·48); having shared needles while engaging in injection drug use (2·43, 1·69–3·50); and recurrent use of post-exposure prophylaxis (1·96, 1·36–2·82). Overall, 786 (38·7%) of 2030 women who initiated PrEP continued use after the first month, with 104 (68·0%) of 153 women who had a partner living with HIV continuing use. Having a partner living with HIV was the only predictor of PrEP continuation at 1 month in the multivariable model (1·98, 1·54–2·55). Frequent reasons for discontinuation were side effects and low HIV risk perception. No incident HIV infection was reported among women on PrEP. Interpretation: Many women attending maternal and child health clinics had risk factors for HIV and elected to use PrEP, indicating that routinely accessed maternal and child health clinics can be an effective platform for PrEP delivery for young women. As PrEP awareness rises, PrEP provision in routine clinical settings such as maternal and child health facilities might contribute to decreased HIV incidence among young women. Article	2020	Klein H.; Washington T.A.	Why more men who have sex with men are not using PrEP–The role played by lack of interest in learning more about PrEP	Journal of Gay and Lesbian Social Services	-	-	-	10538720	10.1080/10538720.2019.1681339	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074724149&doi=10.1080%2f10538720.2019.1681339&partnerID=40&md5=f6a0950c866bd59d949790e12bb59468	Purpose: This paper examines lack of interest in pre-exposure prophylaxis (PrEP) and lack of willingness to use PrEP information sources among men who have sex with men (MSM). Methods: Demographic subgroups were compared via odds ratios in this purposive sample of 273 MSM. Results: 29% were uninterested in learning more about PrEP. Lack of interest was most common among: already PrEP-aware, Caucasian, HIV-positive, aged 40+, well-educated men. Most sources of information about PrEP were deemed unacceptable. Conclusions: Fueling the lack of PrEP use among MSM are a lack of interest in PrEP and an unwillingness to utilize existing information resources. © 2019, © 2019 Taylor & Francis Group, LLC.	gay men; lack of interest in PrEP; men who have sex with men (MSM); pre-exposure prophylaxis (PrEP)	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Klein, Hugh; Washington, Thomas Alex	Older Versus Younger Men Who Have Sex with Men: Awareness of and Potential Barriers to the Use of Pre-Exposure Prophylaxis (PrEP) Medication to Prevent the Transmission of HIV.	Journal of AIDS & HIV Treatment	-	-	-	NA	10.33696/aids.2.006	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7943186	PURPOSE: This paper compares younger (aged 18-39; n=197) and older (ages 50+; n=53) MSM to determine their familiarity with PrEP, willingness to learn more about PrEP, perceptions of stigma relating to PrEP use, and perceptions of barriers to PrEP adoption. METHODS: A purposive sample of diverse MSM completed 15-minute questionnaires. Younger and older MSM were compared using Student's t-tests and odds ratios for bivariate analyses, and multivariate logistic regression and multiple regressions for analyses controlling for key demographic characteristics. RESULTS: Compared to younger MSM, older MSM were more aware of PrEP, more likely to know another PrEP user, less interested in learning more about PrEP, and more averse to using existing resources to learn more about PrEP. Older men perceived less stigma relating to PrEP and fewer obstacles needing to be overcome in order to give serious consideration to PrEP adoption. These differences remained when race, educational attainment, sexual orientation, and HIV serostatus were controlled. CONCLUSIONS: There is a "good news/bad news" situation with respect to older MSM and PrEP. They were more aware of PrEP, less likely to associate stigma with PrEP use or PrEP users, and anticipated fewer barriers to PrEP adoption. They were also less interested than their younger counterparts in learning more about PrEP and expressed less comfort using existing sources of information to learn more about PrEP. Age-appropriate PrEP educational campaigns are advisable in order to reach older MSM and encourage more of them to consider PrEP adoption. Article	2020	Knox J.; Boyd A.; Matser A.; Heijman T.; Sandfort T.; Davidovich U.	Types of Group Sex and Their Association with Different Sexual Risk Behaviors Among HIV-Negative Men Who Have Sex with Men	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-020-01744-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086044590&doi=10.1007%2fs10508-020-01744-5&partnerID=40&md5=bb955d9ab6092d4bf1dd5bc599be1b34	The current study sought to identify types of group sex acts among HIV-negative men who have sex with men (MSM) and assess their association with different sexual risk behaviors using cross-sectional data of group sex acts reported during 6 waves (2015–2018) of the Amsterdam MSM Cohort Study. Latent class analysis was performed to identify group sex types based on size, familiarity with partners, location, planning, and drug use. Associations between group sex types and sexual behaviors were evaluated using logistic regression with generalized estimating equations, employing the sample mean as a reference. Data at the level of group sex acts were analyzed, while correcting variance estimations for repeated measurements within MSM. A total of 392 MSM engaged in group sex ≥ 1 times, totaling 1033 group sex acts. Four types of group sex emerged: familiar (29%), intimate (27%), impromptu (36%), and party (8%). Familiar group sex (characterized by high proportions of mostly known partners, occurring in private places and involving drug use) had an increased adjusted odds of risky fingering (aOR 1.6, 95%CI 1.3–2.0) and of risky fisting and/or use of sex toys (aOR 2.3, 95%CI 1.6–3.1). Intimate group sex (characterized by high proportions of threesomes, occurring in private places, and not involving drug use) had a decreased adjusted odds of risky fisting and/or use of sex toys (aOR 0.6, 95%CI 0.4–0.9). Impromptu group sex (characterized by high proportions of spontaneity, mostly unknown partners, and taking place in public places) had a decreased adjusted odds of risky fisting and/or use of sex toys (aOR 0.5, 95%CI 0.3–0.7) and of condomless anal intercourse (CAI) (OR 0.6, 95%CI 0.5–0.8). Party group sex (characterized by high proportions of larger groups, mostly unknown partners, and being planned) had an increased adjusted odds of risky fisting and/or use of sex toys (aOR 1.6, 95%CI 1.0–2.7) and of CAI (aOR 1.5, 95%CI 1.1–2.1). The identified types of group sex reflect different dynamics and characteristics, with some types riskier for STIs and others riskier for HIV. HIV and STI prevention efforts could be tailored accordingly. For example, in certain type of public sex environments (e.g., cruising parks), traditional HIV and STI prevention efforts, such as promoting of condom use and PrEP, might be sufficient. However, in other settings (e.g., private parties), where group sex is more likely to be planned and where behaviors such as fisting, sharing of sex toys, and CAI are more likely to take place, which carry different levels of risk for HIV and STI transmission, including that of Hepatitis C, different approaches might be needed, such as broader HIV and STI prevention education efforts or targeting the organizers of group sex events. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Koester K.A.; Saberi P.; Fuller S.M.; Arnold E.A.; Steward W.T.	Attitudes about community pharmacy access to HIV prevention medications in California	Journal of the American Pharmacists Association	-	-	-	15443191	10.1016/j.japh.2020.06.005	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087749344&doi=10.1016%2fj.japh.2020.06.005&partnerID=40&md5=ea6af1846e642d5e8cd969c90680a14b	Objective: Increasing access to human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) and postexposure prophylaxis (PEP) is a high priority for the Ending the HIV Epidemic Initiative. Expanding access to PrEP and PEP through a variety of health care settings, including community pharmacies, may increase access in communities most in need. California is the first state to allow community pharmacists to furnish PrEP and PEP directly to consumers. Our objective was to assess attitudes among key stakeholders about a California policy to allow community pharmacists to furnish HIV PrEP and PEP. Methods: We conducted a qualitative case study with key pharmacy stakeholders. Semistructured phone interviews were audio-recorded and transcribed verbatim. We generated analytical memos for each interview and working with these analytical memos, we conducted a constant comparison across cases to identify commonalities and differences. Results: We launched the study in October 2018 and interviewed pharmacists (n = 7) working in a variety of settings, including retail-, clinic-, and community-based pharmacies. We also interviewed medical providers (n = 2) working in high-volume PrEP clinics and sought input from representatives of large retail chain pharmacies (n = 2). Overall, pharmacists and medical provider informants shared similar opinions about the central benefits as well as the key challenges related to pharmacist-delivered PrEP and PEP services. Benefits included: community pharmacists are widely accessible, PrEP and PEP protocols are similar to other preventative medications, policy may lead to efficiencies in the health care workforce, and community pharmacists are authorities on medication adherence. Challenges included: implementation issues may limit pharmacist involvement, and missed opportunities to diagnose and treat other health conditions. Conclusion: This study characterizes the types of benefits and challenges that can be expected when PrEP and PEP prescribing privileges are extended to community pharmacists. This information may be useful to policymakers and other stakeholders considering legislation to permit direct prescription of PrEP and PEP by pharmacists. © 2020 American Pharmacists Association®	CaliforniaCommunity Pharmacy ServicesHealth Knowledge, Attitudes, PracticeHIV InfectionsHumansPharmaciesPharmacistsPre-Exposure Prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Koester, Kimberly A; Hughes, Shana D; Grant, Robert M	"A Good Habit": Telehealth PrEP Users Find Benefit in Quarterly Monitoring Requirements	Journal of the International Association of Physicians in AIDS Care	-	-	-	23259574	10.1177/2325958220919269	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083812264&doi=10.1177%2f2325958220919269&partnerID=40&md5=a2b2a36ac768bb81d1e6edca50eb3a39	In the United States, uptake of daily oral pre-exposure prophylaxis (PrEP) to prevent HIV continues to grow albeit at a slower than desired pace. Innovations in PrEP delivery systems may partially address structural challenges related to PrEP uptake and PrEP persistence, such as difficulty in attending clinic visits or completing laboratory testing. To study PrEP services offered by a telehealth company called Nurx, we conducted 31 in-depth interviews with prospective or current patients. We hypothesized that patients would find the quarterly laboratory monitoring requirements to be onerous especially in light of receiving all other aspects of PrEP care through a telehealth delivery system. However, interviewees characterized navigating laboratory systems as relatively easy and complying with the quarterly monitoring as a supplementary benefit of PrEP use. Our research illustrates that quarterly monitoring requirements are meaningful to some telehealth PrEP users and may facilitate persistent engagement in receipt of PrEP care. © The Author(s) 2020.	implementation science; laboratory monitoring; PrEP; qualitative methods; telehealth PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Theses and Dissertations	2020	KOLLING, ANA FRANCISCA	Prevenção combinada e trabalho sexual combinam? Fatores associados ao acesso e a utilização de métodos de prevenção	-	-	Universidade de Brasília	-	-	NA	NA	a presente tese analisa os fatores associados ao acesso e a utilização de métodos de prevenção do HIV entre mulheres trabalhadoras do sexo (MTS) de 12 cidades Brasileiras, a partir do referencial teórico proposto para análise e das recomendações e diretrizes nacionais e internacionais de prevenção da infecção pelo HIV. Objetivos: Identificar e descrever características de acesso e utilização dos insumos de prevenção combinada do HIV entre MTS; avaliar o nível de conhecimento sobre PEP e PrEP, a frequência de utilização do preservativo feminino, a frequência de realização de teste rápido para HIV, Sífilis e Hepatites virais e analisar fatores associados. Métodos: Estudo epidemiológico transversal, utilizando o método Respondent Driven Sampling (RDS). Realizamos análise descritiva para conhecer as principais características relacionadas ao acesso e utilização de insumos de prevenção combinada do HIV e registrar características de utilização dos serviços de saúde. Para investigação dos fatores associados aos desfechos de interesse foram realizadas análises bivariadas e aplicados testes de hipóteses correspondentes (Qui-quadrado e quando necessário teste de Fisher), calculados os respectivos intervalos de confiança de 95%, as razões de prevalência e os respectivos valores p. Posteriormente foi utilizado o modelo de regressão de Poisson, usando como medida de associação o Odds Ratio. Resultados: MTS sem vínculo com ONGs, que não receberam material informativo sobre prevenção e/ou participaram de palestras nos últimos seis meses e que não se identificam como MTS nos serviços de saúde têm menos conhecimento sobre PEP e PrEP e utilizam com menor frequência o preservativo feminino. MTS que trabalham em locais fechados, que não tiveram acesso a informações sobre prevenção de HIV e infecções sexualmente transmissíveis (IST) e que não se identificam como trabalhadoras do sexo nos serviços de saúde têm 24%, 41% e 23% menos de chance de realizarem teste rápido (TR) para HIV, respectivamente. MTS com maior escolaridade (RP: 1,61; IC95%: 1,37-1,92), que exercem trabalho sexual há mais de cinco anos (RP: 1,34; IC95%: 1,12-1,60) e que fazem mais de 90 programas/mês (RP: 1,48; IC95%: 1,26-1,74) têm mais chance de serem testadas para sífilis. Mulheres autodeclaradas como não brancas têm menos chances de serem testadas para hepatite B. Não ter acesso a orientações sobre prevenção de IST e não estar vinculada ao serviço de saúde foram associados à não realização de TR para hepatite B. Conclusão: Concluímos que o acesso e a utilização de métodos de prevenção do HIV, ainda não são suficientes entre as MTS. É necessário incrementar o conhecimento e o uso, fomentar parcerias com ONGs no sentido de propor novos modelos de cuidado, incorporando novas estratégias para efetivar a prevenção combinada, que considerem as especificidades dessa população. Tais estratégias devem reconhecer as vulnerabilidades individuais, sociais e programáticas que impactam diretamente sobre o acesso e a utilização de métodos de prevenção do HIV e outras IST. Article	2020	Kolstee J.; Holt M.; Jin J.; Hammoud M.A.; Degenhardt L.; Maher L.; Lea T.; Prestage G.	Characteristics of gay and bisexual men who rarely use HIV risk reduction strategies during condomless anal intercourse: Results from the FLUX national online cohort study	PLOS One	-	-	-	19326203	10.1371/journal.pone.0233922	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085678165&doi=10.1371%2fjournal.pone.0233922&partnerID=40&md5=099217ec347d3087c152ed8d945be0b4	Purpose To understand the characteristics of a minority of Australian gay and bisexual men (GBM) who, despite an increase in the number and availability of HIV risk reduction strategies, do not consistently use a strategy to protect themselves from HIV. Methods This analysis is based on data from 2,920 participants in a national, online, prospective observational cohort study. GBM who never or rarely used HIV risk reduction strategies (NRR) were compared with two groups using multivariate logistic regression: i) GBM using pre-exposure prophylaxis (PrEP) and ii) GBM frequently using risk reduction strategies (FRR) other than PrEP. Results Compared to PrEP users, NRR men were younger (p<0.0001), less socially engaged with gay men (p<0.0001) and less likely to have completed a postgraduate (p<0.05) or undergraduate degree (p<0.05). They were also less likely to have recently used amyl nitrite (p<0.05), erectile dysfunction medication (p<0.05) and cocaine (p<0.05) in the previous 6 months. Compared with FRR men, NRR men were less likely to have completed a postgraduate (p<0.0001) or undergraduate degree (p<0.05), scored higher on the sexual sensation-seeking scale (p<0.0001) and were more likely to identify as versatile (p<0.05), a bottom (p<0.05) or very much a bottom (p<0.05) during anal sex. Conclusions NRR men were largely similar to other Australian GBM. However, our analysis suggests it may be appropriate to focus HIV prevention interventions on younger, less socially engaged and less educated GBM, as well as men who prefer receptive anal intercourse to promote the use of effective HIV risk reduction strategies. © 2020 Kolstee et al. Uptake, engagement, and adherence to pre-exposure prophylaxis offered after population HIV testing in rural Kenya and Uganda: 72-week interim analysis of observational data from the SEARCH study	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(19)30433-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082499260&doi=10.1016%2fS2352-3018%2819%2930433-3&partnerID=40&md5=0e808c9ca21bbedf226b1f9b46106498	Background: Optimal strategies for pre-exposure prophylaxis (PrEP) engagement in generalised HIV epidemics are unknown. We aimed to assess PrEP uptake and engagement after population-level HIV testing and universal PrEP access to characterise gaps in the PrEP cascade in rural Kenya and Uganda. Methods: We did a 72-week interim analysis of observational data from the ongoing SEARCH (Sustainable East Africa Research in Community Health) study. Following community sensitisation and PrEP education, we did HIV testing and offered PrEP at health fairs and facilities in 16 rural communities in western Kenya, eastern Uganda, and western Uganda. We provided enhanced PrEP counselling to individuals 15 years and older who were assessed as having an elevated HIV risk on the basis of serodifferent partnership or empirical risk score, or who otherwise self-identified as being at high risk but were not in serodifferent partnerships or identified by the risk score. PrEP follow-up visits were done at facilities, homes, or community locations. We assessed PrEP uptake within 90 days of HIV testing, programme engagement (follow-up visit attendance at week 4, week 12, and every 12 weeks thereafter), refills, self-reported adherence up to 72 weeks, and concentrations of tenofovir in hair samples from individuals reporting HIV risk and adherence during follow-up, and analysed factors associated with uptake and adherence. This study is registered with ClinicalTrials.gov, NCT01864603. Findings: Between June 6, 2016, and June 23, 2017, 70 379 community residents 15 years or older who had not previously been diagnosed with HIV were tested during population-level HIV testing. Of these individuals, 69 121 tested HIV-negative, 12 935 of whom had elevated HIV risk (1353 10% serodifferent partnership, 6938 54% risk score, 4644 36% otherwise self-identified risk). 3489 (27%) initiated PrEP, 2865 (82%) of whom did so on the same day as HIV testing and 1733 (50%) of whom were men. PrEP uptake was lower among individuals aged 15–24 years (adjusted odds ratio 0·55, 95% CI 0·45–0·68) and mobile individuals (0·61, 0·41–0·91). At week 4, among 3466 individuals who initiated PrEP and did not withdraw or die before the first visit, 2215 (64%) were engaged in the programme, 1701 (49%) received medication refills, and 1388 (40%) self-reported adherence. At week 72, 1832 (56%) of 3274 were engaged, 1070 (33%) received a refill, and 900 (27%) self-reported adherence. Among participants reporting HIV risk at weeks 4–72, refills (89–93%) and self-reported adherence (70–76%) were high. Among sampled participants self-reporting adherence at week 24, the proportion with tenofovir concentrations in the hair reflecting at least four doses taken per week was 66%, and reflecting seven doses per week was 44%. Participants who stopped PrEP accepted HIV testing at 4274 (83%) of 5140 subsequent visits; half of these participants later restarted PrEP. 29 participants of 3489 who initiated PrEP had serious adverse events, including seven deaths. Five adverse events (all grade 3) were assessed as being possibly related to the study drug. Interpretation: During population-level HIV testing, inclusive risk assessment (combining serodifferent partnership, an empirical risk score, and self-identification of HIV risk) was feasible and identified individuals who could benefit from PrEP. The biggest gap in the PrEP cascade was PrEP uptake, particularly for young and mobile individuals. Participants who initiated PrEP and had perceived HIV risk during follow-up reported taking PrEP, but one-third had drug concentrations consistent with poor adherence, highlighting the need for novel approaches and long-acting formulations as PrEP roll-out expands. Article	2020	Kovac, Lidija; Casar, Zdenko	A literature review of the patent application publications on cabotegravir - an HIV integrase strand transfer inhibitor.	Expert Opinion on Therapeutic Patents	-	-	-	1744-7674	10.1080/13543776.2020.1717470	https://dx.doi.org/10.1080/13543776.2020.1717470	Introduction: Studies presented in the patent applications demonstrate that a new integrase strand transfer inhibitor cabotegravir might be used as long-acting antiretroviral formulation or delivery system that reduces dosing frequency and may therefore increase adherence and thus pre-exposure prophylaxis (PrEP) and treatment efficacy against HIV. As announced in 2019, the developer ViiV Healthcare seeks US and EU approval of long-acting, injectable HIV treatment.Area covered: This review covers all the patent applications published until October 2019 with cabotegravir in the examples or claim section of the patent application document. The patent applications cover drug substance synthesis, solid-state forms, therapeutic applications, in vitro and in vivo efficacy as well as the potential formulations of cabotegravir alone or in combination with other anti-HIV agents.Expert opinion: The results from multiple clinical studies suggest that cabotegravir can be used as PrEP agent and treatment agent against HIV. Multiple studies use cabotegravir in combination with other anti-HIV agents such as rilpivirine. Cabotegravir in combination with rilpivirine is an interesting therapeutic, due to the possibility of formulating long-acting formulation with dosing interval of every 4 weeks or less, thus reducing daily pill burden and improving patient's compliance. Journal of Infectious Diseases	-	-	0022-1899	https://doi.org/10.1093/infdis/jiaa130	https://escholarship.org/uc/item/30d5r0bj	BackgroundPersons who inject drugs (PWID) are at a disproportionately high risk of HIV infection. We aimed to determine the highest-valued combination implementation strategies to reduce the burden of HIV among PWID in 6 US cities.MethodsUsing a dynamic HIV transmission model calibrated for Atlanta, Baltimore, Los Angeles, Miami, New York City, and Seattle, we assessed the value of implementing combinations of evidence-based interventions at optimistic (drawn from best available evidence) or ideal (90% coverage) scale-up. We estimated reduction in HIV incidence among PWID, quality-adjusted life-years (QALYs), and incremental cost-effectiveness ratios (ICERs) for each city (10-year implementation; 20-year horizon; 2018 $ US).ResultsCombinations that maximized health benefits contained between 6 (Atlanta and Seattle) and 12 (Miami) interventions with ICER values ranging from $94 069/QALY in Los Angeles to $146 256/QALY in Miami. These strategies reduced HIV incidence by 8.1% (credible interval CI, 2.8%-13.2%) in Seattle and 54.4% (CI, 37.6%-73.9%) in Miami. Incidence reduction reached 16.1%-75.5% at ideal scale.ConclusionsEvidence-based interventions targeted to PWID can deliver considerable value; however, ending the HIV epidemic among PWID will require innovative implementation strategies and supporting programs to reduce social and structural barriers to care. Article	2020	Krueger E.A.; Holloway I.W.; Lightfoot M.; Lin A.; Hammack P.L.; Meyer I.H.	Psychological Distress, Felt Stigma, and HIV Prevention in a National Probability Sample of Sexual Minority Men	LGBT Health	-	-	23258292	10.1089/lgbt.2019.0280	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086253754&doi=10.1089%2flgbt.2019.0280&partnerID=40&md5=2cd8bfaeac1407c4b882207442899601	We assessed how psychological distress and felt stigma (perceived sexual minority stigma in one's community) are associated with key HIV prevention outcomes in a U.S. national probability sample of sexually active, HIV-negative sexual minority men. Methods: Using data from the Generations study (2017-2018, N = 285), the present study assessed the effects of psychological distress and felt stigma and their interaction on three HIV prevention outcomes: testing for HIV as per Centers for Disease Control and Prevention guidelines (once or more in the past year), use of latex barriers (e.g., condoms), and familiarity with pre-exposure prophylaxis (PrEP). Results: In main effects models, neither psychological distress nor felt stigma was associated with any of the screening and prevention outcomes. However, the interaction between psychological distress and felt stigma was associated with each outcome. Specifically, at higher levels of felt stigma, greater psychological distress was associated with lower odds of HIV testing (exponentiated coefficient = 0.93, confidence interval 95% CI 0.87-1.00), use of latex barriers (exponentiated coefficient = 0.92, 95% CI 0.86-0.99), and familiarity with PrEP (exponentiated coefficient = 0.90, 95% CI 0.82-0.98). Conclusion: These findings highlight the importance of felt stigma in shaping the association between psychological distress and engagement in HIV screening and prevention and offer important considerations for future HIV prevention research and interventions. © Copyright 2020, Mary Ann Liebert, Inc., publishers 2020.	felt stigma; HIV prevention; MSM; psychological distress	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Kulie P.; Castel A.D.; Zheng Z.; Powell N.N.; Srivastava A.; Chandar S.; McCarthy M.L.	Targeted Screening for HIV Pre-Exposure Prophylaxis Eligibility in Two Emergency Departments in Washington, DC	AIDS Patient Care and STDs	-	-	10872914	10.1089/apc.2020.0228	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097791012&doi=10.1089%2fapc.2020.0228&partnerID=40&md5=5468bc935c3e65724176815759ed26ea	Pre-exposure prophylaxis (PrEP) is an effective method to prevent HIV acquisition in high-risk individuals. This cross-sectional survey study estimated the proportion of patients who were PrEP eligible among a targeted sample of emergency department (ED) patients with chief complaints indicative of HIV risk. Research assistants screened a convenience sample of adult patients who presented to two hospital EDs in Washington, DC, during a 6-month period with genitourinary, substance use, or intentional injury-related complaints. Patients with these complaints who reported being sexually active within the past 6 months and HIV negative completed a computer-assisted survey that included questions on sexual practices and partners, substance use, and attitudes and knowledge about PrEP. We used the Centers for Disease Control and Prevention (CDC) clinical guidelines to determine whether PrEP use was indicated. We report differences in PrEP eligibility by demographic characteristics, knowledge, and attitudes. Of the 410 participants, the majority were black (85%), and heterosexual females (72%). PrEP use was indicated in 20% (N = 84), most commonly because of condomless sex with a person of unknown HIV status (82%) and/or a sexually transmitted infection (STI) diagnosis (41%). One-third (34%) of participants had heard of PrEP. Overall, 36% of the sample (N = 148) wanted to learn more about PrEP while in the ED. The percentage who wanted to learn more about PrEP was higher among PrEP-eligible patients (52%) compared with PrEP-ineligible patients (32%). Using CDC criteria, targeted screening identified that a substantial proportion of ED patients are PrEP eligible based on their self-reported behaviors. © 2020, Mary Ann Liebert, Inc., publishers.	emergency medicine; HIV; pre-exposure prophylaxis; prevention; screening	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Kuo, Caroline; Giovenco, Danielle; DeAtley, Teresa; Hoare, Jackie; Underhill, Kristen; Atujuna, Millicent; Mathews, Catherine; Stein, Dan J; Brown, Larry K; Operario, Don	Recreational Use of HIV Antiretroviral Medication and Implications for HIV Pre-exposure Prophylaxis and Treatment.	AIDS and Behavior	-	-	1573-3254	10.1007/s10461-020-02821-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7725396	Diversion of antiretroviral therapy (ART) for recreational use is concerning for countries with high HIV prevalence. This paper presents reports of recreational use of ART among adolescents from two HIV prevention studies in South Africa: (1) a cross-sectional survey of N = 200 adolescents and (2) a qualitative study of pre-exposure prophylaxis with N = 57 adolescents and N = 25 clinicians. Among adolescents, 3% used and 14% knew someone who used non-prescribed ART for recreational purposes. Administration included smoking (71%), snorting (15%), injecting (15%), ingesting (15%), and inserting (3%). Participants predicted increased crime as recreational use of ART increased. Future studies should investigate prevalence, composition, and diversion of ART from HIV prevention and treatment. Article	2020	Kutscha F.; Gaskins M.; Sammons M.; Nast A.; Werner R.N.	HIV Pre-Exposure Prophylaxis (PrEP) Counseling in Germany: Knowledge, Attitudes and Practice in Non-governmental and in Public HIV and STI Testing and Counseling Centers	Frontiers in Public Health	-	-	22962565	10.3389/fpubh.2020.00298	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088792229&doi=10.3389%2ffpubh.2020.00298&partnerID=40&md5=d378830079056d2165e96399ab25b91d	Background: Providers of sexual health services play an important role in counseling persons at risk of acquiring HIV. The aim of the present study was to investigate the knowledge of and attitudes toward HIV pre-exposure prophylaxis (PrEP) among counselors in non-governmental counseling centers ("NG counseling centers") and in counseling centers of the local health authorities ("local health offices") in Germany and to determine the extent to which PrEP plays a role in their current counseling practice. Methods: An anonymous cross-sectional study using an online questionnaire was conducted among counselors from sexual health centers across Germany. All NG counseling centers in Germany offering HIV testing were asked to participate. For each NG counseling center, a local health office in the same city was also invited. A "knowledge score" and an "attitudes score" were calculated from single items on various relevant aspects. The association of these scores with the proportion of PrEP advice provided proactively in sessions with men who have sex with men (MSM) and trans persons who met the German and Austrian guideline criteria for being offered PrEP ('at-risk clients') was quantified. Results: From Oct. to Dec. 2018, 145 counselors completed the survey. Both self-assessed knowledge of PrEP and attitudes toward PrEP were greater or more positive among counselors from NG counseling centers compared with counselors from local health offices Median knowledge score (range 0-20): 18.0 (IQR = 5.0) vs. 14.0 (IQR = 4.0), p < 0.001; median attitudes score (range 0-20): 18.0 (IQR = 4.0) vs. 14.0 (IQR = 6.8), p < 0.001. The proportion of PrEP advice provided proactively in sessions with at-risk clients was larger in counseling centers than in local health offices 50.0% (IQR = 60.0) vs. 30.0% (IQR = 70.0); p = 0.003. The results of the multiple linear regression model indicate that knowledge and attitudes of the individual counselors, but not the type of center in which they worked, were independent predictors of the proportion of proactive advice on PrEP. Conclusions: There is room for improvement in the current PrEP counseling practice of sexual health services in Germany. The findings of the present study suggest opportunities to improve the implementation of PrEP as part of a comprehensive HIV prevention strategy. © Copyright © 2020 Kutscha, Gaskins, Sammons, Nast and Werner.	counseling; health services research; HIV pre-exposure prophylaxis; HIV prevention; PrEP; public health	English	Switzerland	Western and Central Europe and North America	Germany	Western and Central Europe and North America	Germany	Western and Central Europe and North America	Quantitative
Article	2020	Labh R.; Gupta R.	Emerging trends in the long-acting antiretroviral therapy: Current status and therapeutic challenges	Current HIV Research	-	-	1570162X	10.2174/1570162X18666200824104140	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100976385&doi=10.2174%2f1570162X18666200824104140&partnerID=40&md5=09037532188759b0e61b804079fb3cab	Antiretroviral drug therapy has significantly improved the prognosis and life expectancy of people living with HIV over the years. But this progress comes with an important caveat that antiretroviral regimens generally require adherence to life-long, daily dosing, to keep viral multiplication under check. Non-adherence to such dosing leads to decreased efficacy and increased drug resistance against antiretroviral drugs. Besides, poor drug penetration to certain tissues like CNS and lymph nodes leads to the build-up of viral reservoirs in these sites. To combat some of these challenges and improve patient compliance, long-acting antiretroviral drugs, are a new weapon in the arsenal, in the fight against HIV. Few long-acting preparations have been approved, and several others are in various clinical and preclinical stages of development. However, long-acting formulations also have their share of clinical issues like limited drug distribution, long term adverse drug reactions, drug-drug interactions, and gradual development of drug resistance. Modern technological premises are being tested to mitigate some of these problems. One such promising approach involves nanotechnological methods, which are being used to develop ultra-long acting formulations and drug delivery systems, targeting tissues with residual HIV concentration. Long-Acting Slow Effective Release Antiretroviral Therapy aka LASER ART, also builds on nanotechnology and prodrug modifications to design preparations with tailor-made favorable pharmacokinetics and wider drug distribution. These recent advances are fueling the progression of antiretroviral therapy towards eliminating the disease. © 2021 Bentham Science Publishers. Article	2020	Laborde, Nicole D; Kinley, Patrick M; Spinelli, Matthew; Vittinghoff, Eric; Whitacre, Ryan; Scott, Hyman M; Buchbinder, Susan P	Understanding PrEP Persistence: Provider and Patient Perspectives	AIDS and Behavior	-	-	10907165	10.1007/s10461-020-02807-3	https://www.proquest.com/scholarly-journals/understanding-prep-persistence-provider-patient/docview/2433034038/se-2?accountid=8113	PrEP persistence, or PrEP use over time, has been shown to be short, with most PrEP users stopping within 6–12 months. Furthermore, those most vulnerable to HIV often use PrEP for shorter periods. This qualitative study explores patient, provider, and contextual factors that influence PrEP persistence. In interviews with 25 PrEP users and 18 PrEP providers in San Francisco's safety net clinics, we analyze the perceived benefits and difficulties of taking PrEP, including structural barriers. We identify different steps in receipt of PrEP care (clinic visits and lab tests, pharmacy interactions, and medication adherence), and describe barriers and facilitators for providers and patients at each step. Our findings suggest that drop-in visits, streamlined testing, standing orders for labs, and 90-day PrEP prescriptions are highly desirable for many PrEP users. Also important are the proactive provision of adherence support and counseling, and referrals for housing, substance use, and mental health services. Article	2020	Laher F.; Salami T.; Hornschuh S.; Makhale L.M.; Khunwane M.; Andrasik M.P.; Gray G.E.; Van Tieu H.; Dietrich J.J.	Willingness to use HIV prevention methods among vaccine efficacy trial participants in Soweto, South Africa: discretion is important	BMC Public Health	-	-	14712458	10.1186/s12889-020-09785-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095580132&doi=10.1186%2fs12889-020-09785-0&partnerID=40&md5=6f7bd2cdb89e530160c6787ee28e28e7	Background: Despite multiple available HIV prevention methods, the HIV epidemic continues to affect South Africa the most. We sought to understand willingness to use actual and hypothetical HIV prevention methods among participants enrolled in a preventative HIV vaccine efficacy trial in Soweto, South Africa. Methods: We conducted a qualitative study with 38 self-reporting HIV-uninfected and consenting 18–35 year olds participating in the HVTN 702 vaccine efficacy trial in Soweto. Using a semi-structured interview guide, five focus group discussions (FGDs) were held, stratified by age, gender and sexual orientation. The FGDs were composed of: (i) 10 heterosexual women aged 18–24 years; (ii) 9 heterosexual and bisexual women aged 25–35 years; (iii & iv) heterosexual men aged 25–35 years with 7 in both groups; and (v) 5 men aged 18–35 years who have sex with men. FGDs were audio-recorded, transcribed verbatim, translated into English and analysed using thematic analysis. Results: We present five main themes: (i) long-lasting methods are preferable; (ii) condoms are well-known but not preferred for use; (iii) administration route of HIV prevention method is a consideration for the user; (iv) ideal HIV prevention methods should blend into the lifestyle of the user; and the perception that (v) visible prevention methods indicate sexual indiscretion. Conclusions: The participants' candour about barriers to condom and daily oral pre-exposure prophylaxis (PrEP) use, and expressed preferences for long-lasting, discreet, lifestyle-friendly methods reveal a gap in the biomedical prevention market aiming to reduce sexually acquired HIV in South Africa. Product developers should consider long-acting injectable formulations, such as vaccines, passive antibodies and chemoprophylaxis, for HIV prevention technologies. Future innovations in HIV prevention products may need to address the desire for the method to blend easily into lifestyles, such as food-medication formulations. © 2020, The Author(s). Article	2020	Laher, Fatima; Bekker, Linda-Gail; Garrett, Nigel; Lazarus, Erica M; Gray, Glenda E	Review of preventative HIV vaccine clinical trials in South Africa.	Archives of Virology	-	-	1432-8798	10.1007/s00705-020-04777-2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7426202	New HIV infections continue relentlessly in southern Africa, demonstrating the need for a vaccine to prevent HIV subtype C. In South Africa, the country with the highest number of new infections annually, HIV vaccine research has been ongoing since 2003 with collaborative public-private-philanthropic partnerships. So far, 21 clinical trials have been conducted in South Africa, investigating seven viral vectors, three DNA plasmids, four envelope proteins, five adjuvants and three monoclonal antibodies. Active vaccine candidates have spanned subtypes A, B, C, E and multi-subtype mosaic sequences. All were well tolerated. Four concepts were investigated for efficacy: rAd5-gag/pol/nef showed increased HIV acquisition in males, subtype C ALVAC/gp120/MF59 showed no preventive efficacy, and the trials for the VRC01 monoclonal antibody and Ad26.Mos4.HIV/subtype C gp140/ aluminum phosphate are ongoing. Future trials are planned with DNA/viral vector plus protein combinations in concert with pre-exposure prophylaxis, and sequential immunization studies with transmitted/founder HIV envelope to induce broadly neutralizing antibodies. Finally, passive immunization trials are underway to build on the experience with VRC01, including single and combination antibody trials with an antibody derived from a subtype-C-infected South African donor. Future consideration should be given to the evaluation of novel strategies, for example, inactivated-whole-virus vaccines. Article	2020	Lai J.; Pan P.; Lin Y.; Ye L.; Xie L.; Xie Y.; Liang B.; Zheng F.; Chen R.; Wen L.; Luo Y.; Liang H.; Jiang J.	A Survey on HIV/AIDS-Related Knowledge, Attitudes, Risk Behaviors, and Characteristics of Men Who Have Sex with Men among University Students in Guangxi, China	BioMed Research International	-	-	23146133	10.1155/2020/7857231	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087472558&doi=10.1155%2f2020%2f7857231&partnerID=40&md5=343a0909696f7fa20b5b46ebdebb1470	In recent years, the prevalence of human immunodeficiency virus (HIV) infection among Chinese university students has increased significantly, and HIV transmission among men who have sex with men (MSM) comprises more than half of the new cases. There is still a lack of research investigating the incidence of male-to-male sex, the attitudes towards MSM, and the awareness of HIV/AIDS among university students in Guangxi, one of the HIV high-risk areas in China. Therefore, we performed a cross-sectional investigation among 578 male students, recruited by stratified sampling, in universities in Nanning, Guangxi, between January 2016 and March 2017. Researcher-administered anonymous questionnaires were completed. Self-recognition as MSM was found in 8.48% of the subjects. Compared with non-MSM, university student MSM included more people over the age of 20 (OR=4.95), had less migration from other districts of Guangxi (OR=0.26), and the majority were nonmedical students (OR=8.99). In total, 63.25% of the male student participants reported a lack of acceptance of MSM, while 35.47% acknowledged barriers between themselves and acquaintances who were MSM. Overall, 67.30% of the subjects correctly answered questions related to AIDS knowledge. The proportion of MSM subjects who answered the AIDS-related questions correctly was significantly lower than that of non-MSM subjects (42.86% vs. 69. 57%, respectively, OR: 0.33), but the self-recognition risk of MSM was significantly higher than that of non-MSM (OR=2.59). Risky behaviors associated with HIV infections, including smoking, alcohol consumption, drug abuse, and inconsistent condom use, were significantly higher among the MSM participants. The percentages of student's willingness to accept MC and PrEP were 70.93% and 77.51%, respectively. These results raise the alarm that university student MSM in Guangxi, China, require urgent public attention and more effective health education, including the education on MC and PrEP. © 2020 Jingzhen Lai et al. Article	2020	Lalley-Chareczko, Linden; Hiserodt, Emily; Moorthy, Ganesh; Zuppa, Athena; Mounzer, Karam; Koenig, Helen	Urine Assay to Measure Tenofovir Concentrations in Patients Taking Tenofovir Alafenamide.	Frontiers in Pharmacology	-	-	1663-9812	10.3389/fphar.2020.00286	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7096572	Background: HIV pre-exposure prophylaxis (PrEP) with tenofovir/emtricitabine is effective when taken daily. Previously, we developed a urine assay capable of detecting the prodrug tenofovir (TFV) in patients taking tenofovir disoproxil fumarate (TDF)-based PrEP. However, tenofovir alafenamide (TAF) has replaced TDF due to its different safety profile for HIV treatment and was recently approved as PrEP. Given the need to ensure the aforementioned assay remains available for the purpose of objective adherence monitoring, it is critical to ensure its accuracy for detecting TFV in patients taking TAF. Methods: Blood and urine samples were collected from 3 cohorts of patients: (1) 10 participants living with HIV (PLWH) with suppressed virus on a TAF-based regimen, (2) 10 HIV-participants administered 1 dose of TAF/FTC followed by urine and plasma sampling for 7 days starting 1-3 h post-dose, and (3) 10 HIV-participants administered 7 doses of TAF/FTC followed by urine and plasma sampling for 10 days starting 1-3 h after the last dose. Samples were analyzed using liquid chromatography-tandem mass spectrometry (LC-MS/MS) with high sensitivity and specificity for TFV. HIV-samples were compared to a historical cohort administered one dose of TDF/FTC. Results: PLWH were 90% male, 40% African American, and 10% Hispanic (mean age = 57 y; SD 8.88 y). HIV-participants were 55% male and 70% Caucasian (mean age = 31.6 y; SD 7.70 y). Samples from PLWH demonstrated TFV concentrations 2 logs higher in urine than plasma (1,000 ng/mL vs ±10 ng/mL) at the time of collection. Urine samples following a single dose of TAF in HIV-participants yielded TFV concentrations ranging from 100 to 1,000 ng/mL 1-3 h post-dose and remained >100 ng/mL for 6 days in 8 of 10 participants. Urine samples collected after 7 consecutive doses of TAF yielded TFV concentrations >1,000 ng/mL 1-3 h after dosing discontinuation, with TFV concentrations >1,00 ng/mL 7 days post discontinuation in 8 of 10 participants. Urine TFV concentrations following TAF administration were comparable to those from a historical cohort administered TDF/FTC. Plasma TFV concentrations were low(±10 ng/mL) in both HIV-cohorts at all time points. Conclusions: TFV persists in urine at detectable concentrations in participants taking TAF/FTC for at least 7 days despite largely undetectable plasma concentrations, with urine TFV concentrations comparable to patients taking TDF/FTC. This study demonstrates the ability of a urine TFV assay to measure recent TAF adherence. Preferences for Pre-exposure Prophylaxis Service Delivery Among Female Sex Workers in Malawi: A Discrete Choice Experiment	AIDS and Behavior	-	-	10907165	10.1007/s10461-019-02705-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075139667&doi=10.1007%2fs10461-019-02705-3&partnerID=40&md5=7bc4a87573d4b196f89b9538226d0154	Female sex workers (FSW) in Malawi have among the highest HIV prevalence estimates worldwide. Daily oral pre-exposure prophylaxis (PrEP) is an effective HIV prevention method, yet preferences for PrEP delivery among FSW are lacking. Eight focus group discussions, a literature review, and cognitive interviews were conducted to identify modifiable PrEP delivery attributes and inform discrete-choice experiment (DCE) development for FSW in Lilongwe. Enrolled FSW received an interviewer-assisted DCE. Data were analyzed using mixed logit regression. Dispensing location was most preferred, followed by the provision of additional services. Women preferred receiving PrEP at family planning clinics or non-governmental organization run drop-in centers. Cervical cancer screening was the most preferred additional service, while pregnancy testing and partner risk reduction counseling were less valued. This study was the first study to examine PrEP delivery preferences in Malawi using DCE—a powerful elicitation tool to apply to other key populations at risk for HIV. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Larsen A.; Wilson K.S.; Kinuthia J.; John-Stewart G.; Richardson B.A.; Pintye J.; Abuna F.; Lagat H.; Owens T.; Kohler P.	Standardised patient encounters to improve quality of counselling for pre-exposure prophylaxis (PrEP) in adolescent girls and young women (AGYW) in Kenya: Study protocol of a cluster randomised controlled trial	BMJ Open	-	-	20446055	10.1136/bmjopen-2019-035689	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086773563&doi=10.1136%2fbmjopen-2019-035689&partnerID=40&md5=8ba02f26659ef131f85a8c6488ace7d3	Introduction Adolescent girls and young women (AGYW) in sub-Saharan Africa are at high risk of HIV acquisition. Pre-exposure prophylaxis (PrEP) demonstration projects observe that AGYW uptake and adherence to PrEP during risk periods is suboptimal. Judgemental interactions with healthcare workers (HCW) and inadequate counselling can be barriers to PrEP use among AGYW. Improving HCW competency and communication to support PrEP delivery to AGYW requires new strategies. Methods and analysis PrEP Implementation for Young Women and Adolescents Program-standardised patient (PrIYA-SP) is a cluster randomised trial of a standardised patient actor (SP) training intervention designed to improve HCW adherence to PrEP guidelines and communication skills. We purposively selected 24 clinics offering PrEP services under fully programmatic conditions in Kisumu County, Kenya. At baseline, unannounced SP 'mystery shoppers' present to clinics portraying AGYW in common PrEP scenarios for a cross-sectional assessment of PrEP delivery. Twelve facilities will be randomised to receive a 2-day training intervention, consisting of lectures, role-playing with SPs and group debriefing. Unannounced SPs will repeat the assessment in all 24 sites following the intervention. The primary outcome is quality of PrEP counselling, including adherence to national guidelines and communication skills, scored on a checklist by SPs blinded to intervention assignment. An intention-to-treat (ITT) analysis will evaluate whether the intervention resulted in higher scores within intervention compared with control facilities, adjusted for baseline SP scores and accounting for clustering by facility. We hypothesise that the intervention will improve quality of PrEP counselling compared with standard of care. Results from this study will inform guidelines for PrEP delivery to AGYW in low-resource settings and offer a potentially scalable strategy to improve service delivery for this high-risk group. Ethics and dissemination The protocol was approved by institutional review boards at Kenyatta National Hospital and University of Washington. An external advisory committee monitors social harms. Results will be disseminated through peer-reviewed journals and presentations. Trial registration number NCT03875950 © Author(s) (or their employer(s)) 2020. Re-use permitted under CC BY-NC. Article	2020	Lau J.Y.C.; Hung C.-T.; Lee S.-S.	A review of HIV pre-exposure prophylaxis (PrEP) programmes by delivery models in the Asia-Pacific through the healthcare accessibility framework	Journal of the International AIDS Society	-	-	17582652	10.1002/jia2.25531	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087418955&doi=10.1002%2fjia2.25531&partnerID=40&md5=20af86acb836de21650144906e44f1e8	Introduction: In the Asia-Pacific, pre-exposure prophylaxis (PrEP) is a newly introduced public health intervention for minimizing HIV transmission, the coverage of which has remained limited. The best delivery models and strategies for broadening access of the vulnerable communities are not fully known. This review identified PrEP programmes reported in the Asia-Pacific, which were classified by delivery models and assessed with a healthcare accessibility framework. Methods: We performed a literature search on PubMed and Ovid MEDLINE using relevant search terms, manual searched grey literature by visiting relevant websites, examined reference lists and contacted authors for clarification of included PrEP programmes reported through July 2019. A structured table was used for data extraction and summarizing findings in accordance with the five constructs of approachability, acceptability, availability, affordability and appropriateness grounded in the conceptual framework of Healthcare Accessibility. Results and discussion: This literature search yielded a total of 1308 publications; 119 full texts and abstracts were screened, and 24 publications were included in the review. We identified 11 programmes implemented in seven cities/countries in the Asia-Pacific. A typology of four PrEP delivery models was delineated: (a) fee-based public service model; (b) fee-based community setting model; (c) free public service model; and (d) free community setting model. Overall, the free community setting model was most commonly adopted in the Asia-Pacific, with the strength to boost the capacity of facility and human resources, which enhanced "approachability", "availability" and "acceptability." The free public service model was characterized by components designed in improving "approachability," "availability" and "appropriateness," with attention on equity in accessing PrEP. Among free-based models, long-term affordability both to the government and PrEP users would need to be maximized to increase accessibility. Alongside the need for raising awareness, supportive environments and ensuring timely access were means for enabling the development of a sustainable PrEP service. Conclusion: PrEP programmes could be classified by delivery models through the five constructs of healthcare accessibility. While the coverage of PrEP remains limited in the Asia-Pacific, an evaluation of these models could benchmark best practices, which would in turn allow effective models to be designed. © 2020 The Authors. Article	2020	Lazarou M.; Fitzgerald L.; Warner M.; Downing S.; Williams O.D.; Gilks C.F.; Russell D.; Dean J.A.	Australian interdisciplinary healthcare providers' perspectives on the effects of broader pre-exposure prophylaxis (PrEP) access on uptake and service delivery: A qualitative study	Sexual Health	-	-	14485028	10.1071/SH20156	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098229850&doi=10.1071%2fSH20156&partnerID=40&md5=c38401d8a8f422753d93654edfcfb75b	Background: The addition of pre-exposure prophylaxis (PrEP) for HIV prevention to the Australian Government-subsidised Pharmaceutical Benefits Scheme (PBS) enables any doctor or nurse practitioner to prescribe it and has increased accessibility options. However, understanding of Australian healthcare providers' (HCP) knowledge and preparedness to prescribe PrEP remains limited. Methods: Semistructured interviews, conducted before PBS listing (October 2016-April 2017), explored PrEP knowledge and prescription experiences of 51 multidisciplinary HCPs involved with the Queensland Pre-Exposure Prophylaxis Demonstration study. Results: Thematic analysis revealed that participants viewed PrEP as a necessary HIV prevention option, but there was concern about confusing prevention messages and potential risk compensation. Clinical capacity, stigma, cultural norms, rural access and PrEP-associated costs were identified as barriers to access and uptake. Some of these barriers may be addressed by the PBS listing; nonetheless, there was strong specialist concern about the preparedness of general practitioners without sexual health experience to prescribe PrEP. Participants identified a need to educate all HCPs, implement multidisciplinary models and provide timely access to PrEP for vulnerable populations and those ineligible for Medicare (Australia's universal healthcare insurance system). Conclusions: Although PrEP listing on the PBS addressed structural barriers to access, this study highlights the role of nurses and other interdisciplinary healthcare workers in the provision of PrEP in addressing the sociocultural barriers that still affect the access of certain populations to HIV prevention measures. These findings will inform further professional training as PrEP is more widely accessed and requested outside specialist sexual health services. Future work is needed to ensure that the primary healthcare workforce is prepared to provide competent and safe access to PrEP across diverse locations and population groups. © 2020 CSIRO.	health services; HIV prevention; HIV/AIDS; PrEP; prevention; public health	English	United States	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Qualitative
Article	2020	Lee E.; Mao L.; Bavinton B.; Prestage G.; Holt M.	Which Gay and Bisexual Men Attend Community-Based HIV Testing Services in Australia? An Analysis of Cross-Sectional National Behavioural Surveillance Data	AIDS and Behavior	-	-	10907165	10.1007/s10461-019-02435-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85062964330&doi=10.1007%2fs10461-019-02435-6&partnerID=40&md5=d025c7ed26559628aac71677dffa0f1c	In Australia, HIV testing services have become increasingly available in non-traditional settings such as peer-led, community-based services to expand access and increase uptake of HIV testing among gay and bisexual men (GBM). This study aimed to compare the socio-demographic and behavioural characteristics of GBM whose last HIV test was conducted at a community-based service to GBM whose last test was at a traditional clinical setting. We analysed behavioural surveillance data collected from 5988 participants in seven states and territories in the period 2016–2017. We found that non-HIV-positive GBM who attended community-based services were largely similar to men attending clinic-based settings, particularly in terms of sexual practices and risk of HIV. However, non-HIV-positive GBM who were younger, born in Asia, more socially engaged with other gay men but who had not recently used PrEP were more likely to attend community-based services for their last HIV test. This study points to the successful establishment of community-based HIV testing services in Australia as a way to attract subgroups of GBM at potentially higher risk of HIV. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Failure of pre-exposure prophylaxis with daily tenofovir/emtricitabine and the scenario of delayed HIV seroconversion	International Journal of Infectious Diseases	-	-	12019712	10.1016/j.ijid.2020.03.014	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083318514&doi=10.1016%2fj.ijid.2020.03.014&partnerID=40&md5=b1b07b384f58f8b434f5d937767c3d70	Failure of pre-exposure prophylaxis (PrEP) with tenofovir disoproxil fumarate and emtricitabine may occur despite perfect adherence, although this is uncommon. Failure results in breakthrough HIV infection. Delayed seroconversion associated with antiretroviral use may complicate the picture, causing uncertainties in interpreting adherence patterns for establishing the true cause of PrEP failure. © 2020 The Author(s)	Antiretroviral; HIV seroconversion; Pre-exposure prophylaxis; PrEP failure	English	Netherlands	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Clinical
Article	2020	Lee, Han Ju; Kang, Hee Sun; Singh-Carlson, Savitri; Kim, Kyung Sun	Users' Concerns Related to Online HIV Counseling in South Korea: A Descriptive Qualitative Study.	Journal of the Association of Nurses in AIDS Care	-	-	1552-6917	10.1097/JNC.0000000000000193	https://dx.doi.org/10.1097/JNC.0000000000000193	This qualitative descriptive study was designed to identify HIV-related questions frequently asked by online counseling users seeking professional advice. Data were collected via a public online question/answer counseling website operated by the Gyeonggi-do branch of the Korean Association for AIDS Prevention. Data on users' questions regarding HIV were collected between January 1, 2017, and December 31, 2018. The online questions were then analyzed and divided into codes and categories. From the 559 questions submitted, content analysis identified four major categories related to HIV: (a) HIV testing, (b) self-perceived HIV risk and risky sexual behaviors, (c) positive and negative emotional states, and (d) treatment and prevention. This study indicates that online counseling can be used to provide tailored information related to HIV along with emotional and psychosocial support to reach different subgroups and to provide current information such as the use of pre-exposure prophylaxis for those seeking professional advice. Article	2020	Leech A.A.; Biancarelli D.; Aaron E.; Miller E.S.; Coleman J.S.; Anderson P.L.; Nkwihoreze H.; Condron B.; Sullivan M.	HIV Pre-Exposure Prophylaxis for Conception among HIV Serodiscordant Couples in the United States: A Cohort Study	AIDS Patient Care and STDs	-	-	10872914	10.1089/apc.2020.0005	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088206722&doi=10.1089%2fapc.2020.0005&partnerID=40&md5=3937b9866cc91aeb9b221fd4d9f3845a	Practice guidelines on pre-exposure prophylaxis (PrEP) for HIV serodiscordant couples recommend PrEP when the viral load of the partner living with HIV is either detectable or unknown. However, adherence to combination antiretroviral therapy is inconsistent, and research has found that individuals vulnerable to HIV place value on additional protective barriers. We conducted a prospective cohort study to assess the feasibility, perceptions, and adherence associated with periconceptional PrEP use among females without HIV and their male partners living with HIV across four academic medical centers in the United States. We performed descriptive statistics, McNemar's test of marginal homogeneity to assess discordance in female/male survey responses, and Spearman's correlation to determine associations between dried blood spot levels and female self-reported adherence to PrEP. We enrolled 25 women without HIV and 24 men living with HIV (one male partner did not consent to the study). Women took PrEP for a median of 10.9 months (interquartile range 3.8-12.0) and were generally adherent. In total, 87% of women (20/23) had a dried blood spot with >700 fmol/punch or ≥4 doses/week, 4% (1/23) at 350-699 fmol/punch or 2-3 doses/week, and 9% (2/23) at <350 fmol/punch or <2 doses/week (correlation between drug levels and adherence is based on prior data). Dried blood spot levels closely aligned with self-reported adherence (Spearman's rho = 0.64, p = 0.001). There were 10 pregnancies among 8 participants, 4 of which resulted in spontaneous abortions. There was one preterm delivery (36 5/7 weeks), no congenital abnormalities, and no HIV transmissions. Ten couples (40%) were either lost to follow-up or ended the study early. Overall, women attempting conception with male partners living with HIV in the United States are interested and able to adhere to PrEP as an additional tool for safer conception. © 2020, Mary Ann Liebert, Inc., publishers.	conception; HIV; PrEP; serodifferent; serodiscordant	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Leech A.A.; Christiansen C.L.; Linas B.P.; Jacobsen D.M.; Morin I.; Drainoni M.-L.	Healthcare practitioner experiences and willingness to prescribe pre-exposure prophylaxis in the US	PLOS One	-	-	19326203	10.1371/journal.pone.0238375	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090319603&doi=10.1371%2fjournal.pone.0238375&partnerID=40&md5=92c5c7e226db48acf7d13d9f71997941	Background and objectives Less than 10 percent of the more than one million people vulnerable to HIV are using preexposure prophylaxis (PrEP). Practitioners are critical to ensuring the delivery of PrEP across care settings. In this study, we target a group of prescribers focused on providing HIV care and seeking up-to-date information about HIV. We assessed their experiences prescribing PrEP, whether these experiences differed by clinical specialty, and examined associations between willingness to prescribe PrEP as a "best first step" and different hypothetical prescribing scenarios. Setting and methods Between March and May 2015, we circulated a paper survey to 954 participants ((652 of whom met our inclusion criteria of being independent prescribers and 519 of those (80%) responded to the survey)) at continuing medical education advanced-level HIV courses in five locations across the US on practitioner practices and experiences of PrEP. We employed multivariable logistic regression analysis for binary and collapsed ordinal outcomes. Results Among this highly motivated group of practitioners, only 54% reported ever prescribing PrEP. Internal medicine practitioners were 1.6 times more likely than infectious disease practitioners to have prescribed PrEP (95% CI: 0.99–2.60, p = .0524) and age, years of training, and sex were significantly associated with prescribing experience. Based on clinical vignettes describing different hypothetical prescribing scenarios, practitioners who viewed PrEP as the first clinical step for persons who inject drugs (PWID) were twice as likely to also consider PrEP as the first clinical option for safer conception, and vice-a-versa (95% CI: 1.4–3.2, p < .001). Practitioners considering PrEP as the first preventive option for MSM were nearly six times as likely to also consider PrEP as the first clinical step for PWID, and vice-a-versa (95% CI: 2.28–13.56, p = .0002). Conclusions Our findings indicate that even among a subset of HIV-focused practitioners, PrEP prescribing is not routine. This group of practitioners could be an optimal group to engage individuals that could most benefit from PrEP. © 2020 Leech et al. Article	2020	Lelutiu-Weinberger, Corina; Wilton, Leo; Koblin, Beryl A; Hoover, Donald R; Hirshfield, Sabina; Chiasson, Mary Ann; Nandi, Vijay; Usher, DaShawn; Frye, Victoria	The Role of Social Support in HIV Testing and PrEP Awareness among Young Black Men and Transgender Women Who Have Sex with Men or Transgender Women.	Journal of Urban Health	-	-	1468-2869	10.1007/s11524-019-00396-8	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7560661	Young black men and transgender women (transwomen) who have sex with men or transwomen are most vulnerable in terms of risk for HIV infection, also reflected in their extremely high incidence rates. As testing rates and pre-exposure prophylaxis (PrEP) uptake remain suboptimal among these groups, primarily due to unique structural barriers, the present analyses draw on data from an online survey, administered October 2014 to August 2015, to explore social support-related predictors of knowledge and behavior around HIV prevention.Participants were 169 biological men who identified as black, with a mean age of 24 (SD = 2.97, range 17-29); 8% identified as transwomen. Logistic regression models assessed whether HIV-related social support predicted HIV testing patterns, PrEP awareness, and use. Those with higher HIV-related social support reported having been more likely to have ever tested (adjusted odds ratio (aOR) = 1.48; p < 0.001) and tested in the past 6 months (aOR = 1.22; p < 0.01). They were also more likely to intend to test in the next 6 months (aOR = 1.16; p < 0.001), including at a medical office or community-based organization (aOR = 1.20; p < 0.001), yet less likely to intend to self-test (aOR = 0.81; p < 0.001). Lastly, higher social support was significantly associated with prior knowledge of self-testing (aOR = 1.19; p < 0.05), couples testing (aOR = 1.26; p < 0.001), and PrEP (aOR = 1.22; p < 0.01), as well as prevention self-efficacy (aOR = 1.30; p < 0.001), but inversely associated with prior self-testing (aOR = 0.80; p < 0.05). For young black men and transwomen who have sex with men or transwomen, HIV-related social support, which likely has a strong peer component, appears to be a facilitator of optimal testing and intentions to test, as well as awareness of novel prevention strategies (like self-testing or PrEP). However, community resourcefulness needs to be bolstered by other mechanisms, such as changes within healthcare settings, to increase actual use of novel prevention modalities. Article	2020	Lemley S.M.; Klausner J.D.; Young S.D.; Stafylis C.; Mulatya C.; Oden N.; Xie H.; Revoredo L.; Shmueli-Blumberg D.; Hichborn E.; McKelle E.; Moran L.; Jacobs P.; Marsch L.A.	Comparing web-based platforms for promoting HIV self-testing and pre-exposure prophylaxis uptake in high-risk men who have sex with men: Protocol for a longitudinal cohort study	JMIR Research Protocols	-	-	19290748	10.2196/20417	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095770529&doi=10.2196%2f20417&partnerID=40&md5=0db3adaa5f011e41d3b18d4db1ba1ed6	Background: The majority of those living with HIV in the United States are men who have sex with men (MSM), and young, minority MSM account for more new HIV infections than any other group. HIV transmission can be reduced through detection and early treatment initiation or by starting pre-exposure prophylaxis (PrEP), but rates of testing are lower than recommended among MSM, and PrEP uptake has been slow. Although promoting HIV testing and PrEP uptake by placing advertisements on web-based platforms — such as social media websites and dating apps — is a promising approach for promoting HIV testing and PrEP, the relative effectiveness of HIV prevention advertising on common web-based platforms is underexamined. Objective: This study aims to evaluate the relative effectiveness of advertisements placed on 3 types of web-based platforms (social media websites, dating apps, and informational websites) for promoting HIV self-testing and PrEP uptake. Methods: Advertisements will be placed on social media websites (Facebook, Instagram, and Twitter), dating apps (Grindr, Jack'd, and Hornet), and informational search websites (Google, Yahoo, and Bing) to recruit approximately 400 young (18-30 years old), minority (Black or Latino) MSM at elevated risk of HIV exposure. Recruitment will occur in 3 waves, with each wave running advertisements on 1 website from each type of platform. The number of participants per platform is not prespecified, and recruitment in each wave will occur until approximately 133 HIV self-tests are ordered. Participants will complete a baseline survey assessing risk behavior, substance use, psychological readiness to test, and attitudes and then receive an electronic code to order a free home-based HIV self-test kit. Two follow-ups are planned to assess HIV self-test results and PrEP uptake. Results: Recruitment was completed in July 2020. Conclusions: Findings may improve our understanding of how the platform users' receptivity to test for HIV differs across web-based platforms and thus may assist in facilitating web-based HIV prevention campaigns. ©Shea M Lemley, Jeffrey D Klausner, Sean D Young, Chrysovalantis Stafylis, Caroline Mulatya, Neal Oden, Haiyi Xie, Leslie Revoredo, Dikla Shmueli-Blumberg, Emily Hichborn, Erin McKelle, Landhing Moran, Petra Jacobs, Lisa A Marsch. Article	2020	Lépine A.; Treibich C.; Ndour C.T.; Gueye K.; Vickerman P.	HIV infection risk and condom use among sex workers in Senegal: Evidence from the list experiment method	Health Policy and Planning	-	-	2681080	10.1093/heapol/czz155	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084961300&doi=10.1093%2fheapol%2fczz155&partnerID=40&md5=860e805ed3aa7e8cfccee8d258a8373d	Social desirability bias, which is the tendency to under-report socially undesirable health behaviours, significantly distorts information on sensitive behaviours that is gained from self-reports. As a result, self-reported condom use among high-risk populations is thought to be systematically over-reported, and it is impossible to identify the determinants of condom use. The main objective of the article is to elicit unbiased information on condom use among female sex workers (FSWs) using the double list experiment method to analyse the role of HIV infection and exposure to HIV prevention methods in condom use. More specifically, the difference in levels of condom use between HIV-positive and HIV-negative FSWs is estimated. In addition, the role of FSWs' registration and participation in a pre-exposure prophylaxis (PrEP) demonstration project in condom use is considered. A list experiment was designed to elicit condom use information from 786 FSWs in Senegal who were surveyed in 2015 and 2017. Using the list experiment method, participants were randomly assigned to one of two groups (treatment or control) and were asked to report the number of statements they agreed with. Respondents assigned to the control group were presented with three non-sensitive items, whereas those allocated to the treatment group were presented with the same three statements plus the sensitive item (e.g. 'I used a condom during my last intercourse with a client'). Comparing the average number of sentences that were agreed with in both groups provides an estimation of the condom use rate in the treatment group and estimating such prevalence for several sub-groups allows the role of HIV infection risk in condom use to be identified. The percentage of FSWs using condoms in their last sexual intercourse with a client was 80% in 2015 and 78% in 2017, which was significantly lower than the 97% obtained in the face-to-face surveys in both waves. When estimating condom use among sub-groups with the list experiment method, we found that condom use among HIV-positive FSWs was only 34%, which was 47 percentage points lower than condom use among HIV-negative FSWs. We also found that registered FSWs are more likely to use condoms than clandestine FSWs. However, we did not find any difference in condom use between FSWs who were enrolled in the PrEP demonstration project and those who were not enrolled. Health policies should therefore aim to increase condom use among HIV-positive FSWs. © 2020 The Author(s) 2020. Article	2020	Lermen, Helena Salgueiro; Mora, Claudia; Neves, André Luiz Machado das; Azize, Rogerio Lopes	Aids em cartazes: representações sobre sexualidade e prevenção da Aids nas campanhas de 1º de dezembro no Brasil (2013-2017)	Interface (Botucatu, Online)	-	-	1807-5762	10.1590/interface.180626	http://www.scielo.br/scielo.php?script=sci_arttext&pid=S1414-32832020000100205	Buscou-se analisar as representações da sexualidade e prevenção em cartazes produzidos pelo Departamento de Doenças de Condições Crônicas e Infecções Sexualmente Transmissíveis (DCCI) a partir da diretriz da prevenção combinada (PC), adotada em 2013. Realizou-se análise de conteúdo, de caráter descritivo e documental, dos cartazes de campanhas do dia 1º de dezembro (2013-2017). Resultados apontam que aspectos relacionais do uso do preservativo teriam menos relevância, ao passo que a individualização do cuidado vem se acirrando sob a lógica de "testar para se conhecer". Nota-se a oferta de alternativas de prevenção, por meio do símbolo do tripé "preservativo, teste e comprimido", ou de novas tecnologias como a profilaxia pré-exposição (PrEP) e Profilaxia Pós Exposição (PEP). Isso sugere que, desde seu lançamento, a PC passou a orientar as campanhas do DCCI, em oposição a campanhas anteriores que privilegiavam populações-alvo e o preservativo masculino.(AU)	NA	Portuguese	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Qualitative

Article	2020	Li D.H.; Newcomb M.; Macapagal K.; Remble T.; Mustanski B.	Condom-Associated Erectile Function, But Not Other Domains of Sexual Functioning, Predicts Condomless Insertive Anal Sex Among Young Men Who Have Sex with Men	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-020-01642-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078128320&doi=10.1007%2fs10508-020-01642-w&partnerID=40&md5=095dc0f22dc31b8c68808a380782ee66	Condoms effectively prevent against HIV, especially when used in conjunction with biomedical strategies such as PrEP and viral suppression. However, consistent use of condoms in the real world has been a continual health promotion challenge, even among populations at highest risk, such as young men who have sex with men (YMSM). Inconsistent condom use may be related to poor sexual functioning, but limited research exists. The analytic sample comprised 688 racially diverse YMSM aged 16–29 (M = 22.9 years) living in Chicago, IL (19.2% living with HIV). Using multivariable logistic regression, we examined longitudinal associations between condom-associated sexual functioning (erectile function, orgasm satisfaction, global satisfaction, and anal discomfort) and condomless insertive anal sex (CIAS) and condomless receptive anal sex (CRAS) 6 months later. CIAS at Time 2 was associated with condom-associated erectile function at the bivariate and multivariable levels, even after controlling for CIAS at Time 1 (p <.05). Condom-associated erectile function, orgasm satisfaction, and global satisfaction predicted Time 2 CRAS in bivariate models, but none remained significant in the multivariable models. Age, having had a serious partner in the past 6 months, and HIV/PrEP status at Time 2 were significant predictors of CIAS/CRAS in some but not all models. Future interventions to improve consistent condom use should specifically highlight information and skills on how to use condoms within real-world contexts rather than from a clinical perspective. Our results also support the importance of biomedical strategies for those who have continued problems with sexual functioning when using condoms. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Li L.; Johnson L.M.; Krovi S.A.; Demkovich Z.R.; van der Straten A.	Performance and stability of tenofovir alafenamide formulations within subcutaneous biodegradable implants for hiv pre-exposure prophylaxis (Prep)	Pharmaceutics	-	-	-	19994923	10.3390/pharmaceutics12111057	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095986705&doi=10.3390%2fpharmaceutics12111057&partnerID=40&md5=d4bcdbd1b41b750a4cb348d9af3098ef	A critical need exists to develop diverse biomedical strategies for the widespread use of HIV Pre-Exposure Prophylaxis (HIV PrEP). This manuscript describes a subcutaneous reservoir-style implant for long-acting delivery of tenofovir alafenamide (TAF) for HIV PrEP. We detail key parameters of the TAF formulation that affect implant performance, including TAF ionization form, the selection of excipient and the exposure to aqueous conditions. Both in-vitro studies and shelf stability tests demonstrate enhanced performance for TAF freebase (TAFFB) in this long-acting implant platform, as TAFFB maintains higher chemical stability than the TAF hemifumarate salt (TAFHF). We also examined the hydrolytic degradation profiles of various formulations of TAF and identified inflection points for the onset of the accelerated drug hydrolysis within the implant using a two-line model. The compositions of unstable formulations are characterized by liquid chromatography-mass spectrometry (LC-MS) and are correlated to predominant products of the TAF hydrolytic pathways. The hydrolysis rate of TAF is affected by pH and water content in the implant microenvironment. We further demonstrate the ability to substantially delay the degradation of TAF by reducing the rates of drug release and thus lowering the water ingress rate. Using this approach, we achieved sustained release of TAFFB formulations over 240 days and maintained >93% TAF purity under simulated physiological conditions. The opportunities for optimization of TAF formulations in this biodegradable implant supports further advancement of strategies to address long-acting HIV PrEP. © 2020 by the authors. Changes in kidney function among men having sex with men starting on demand tenofovir disoproxil fumarate – emtricitabine for HIV pre-exposure prophylaxis	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25420	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079782336&doi=10.1002%2fjia2.25420&partnerID=40&md5=61c24399340cbb92a95c339b6e6872b7	Introduction: Daily pre-exposure prophylaxis (PrEP) with tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) is associated with a small but statistically significant decrease in estimated glomerular filtration rate (eGFR). We assessed the renal safety of on-demand PrEP with TDF/FTC in HIV-1 uninfected men. Methods: We used data from the randomized double-blind placebo-controlled ANRS-IPERGAY trial and its open-label extension conducted between February 2012 and June 2016 among HIV-uninfected MSM starting on-demand PrEP. Using linear mixed model, we evaluated the mean eGFR decline from baseline over time and determined risks factors associated with eGFR decline during the study. Results: During the blind phase, with a median follow-up of 9.4 months, the mean decline slope of eGFR from baseline was −0.88 and −1.53 mL/min/1.73 m2 per year in the placebo (n = 201) and the TDF/FTC group (n = 198) respectively, with a slope difference of 0.65 mL/min/1.73 m2 per year (p = 0.27). Including both phases, 389 participants started on-demand TDF/FTC with a median follow-up of 19.2 months and a mean decline of eGFR from baseline of −1.14 mL/min/1.73 m2 per year (p < 0.001). The slope of eGFR reduction was not significantly different in participants with baseline eGFR ≤ 90 mL/min/1.73 m2 (p = 0.44), age >40 years (p = 0.24) or hypertension (p = 0.21). There was a dose-response relationship between recent tenofovir exposure and lower eGFR when considering the number of pills taken in the two months prior the visit (eGFR difference of −0.88 mL/min/1.73 m2 between >15 pills/month vs. ≤15 pills/month, p < 0.01) or plasma tenofovir concentrations at the visit (eGFR difference compared to ≤2 ng/mL: >2 to ≤10ng/mL: −0.98 mL/min/1.73 m2, >10 to ≤40ng/mL: −1.28 mL/min/1.73 m2, >40 ng/mL: −1.82 mL/min/1.73 m2, p < 0.001). Three participants discontinued TDF/FTC for eGFR < 60 mL/min/1.73 m2 during the OLE phase. No case of Fanconi syndrome was reported. Conclusions: The renal safety of on-demand PrEP with TDF/FTC was good. The overall reduction and intermittent exposure to TDF/FTC may explain this good renal safety. © 2020 The Authors. Article	2020	Lindsay K.E.; Vanover D.; Thoresen M.; King H.; Xiao P.; Badial P.; Araínga M.; Park S.B.; Tiwari P.M.; Peck H.E.; Blanchard E.L.; Feugang J.M.; Olivier A.K.; Zurla C.; Villinger F.; Woolums A.R.; Santangelo P.J.	Aerosol Delivery of Synthetic mRNA to Vaginal Mucosa Leads to Durable Expression of Broadly Neutralizing Antibodies against HIV	Molecular Therapy	-	-	-	15250016	10.1016/j.ymthe.2020.01.002	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078471165&doi=10.1016%2fj.ymthe.2020.01.002&partnerID=40&md5=b97a3451f3437dce630373cbd792eb54	There is a clear need for low-cost, self-applied, long-lasting approaches to prevent human immunodeficiency virus (HIV) infection in both men and women, even with the advent of pre-exposure prophylaxis (PrEP). Broadly neutralizing antibodies represent an option to improve HIV prophylaxis, but intravenous delivery, cold-chain stability requirements, low cervicovaginal concentrations, and cost may preclude their use. Here, we present an approach to express the anti-GP120 broadly neutralizing antibody PGT121 in the primary site of inoculation, the female reproductive tract, using synthetic mRNA. Expression is achieved through aerosol delivery of unformulated mRNA in water. We demonstrated high levels of antibody expression for over 28 days with a single mRNA administration in the reproductive tract of sheep. In rhesus macaques, neutralizing antibody titers in secretions developed within 4 h and simian-HIV (SHIV) infection of ex vivo explants was prevented. Persistence of PGT121 in vaginal secretions and epithelium was achieved through the incorporation of a glycosylphosphatidylinositol (GPI) anchor into the heavy chain of the antibody. Overall, we present a new paradigm to deliver neutralizing antibodies to the female reproductive tract for the prevention of HIV infections. Santangelo and colleagues report on the aerosol delivery of synthetic mRNAs, diluted in water, to the cervicovaginal epithelium, which expresses membrane-anchored broadly neutralizing antibodies against HIV. In two large animal models, anchored PGT121 was widely dispersed in the reproductive tract and was protective against a SHIV explant challenge. © 2020 The Authors	aerosol delivery; animal models; HIV; intravaginal delivery; mRNA therapeutics; PET/CT; SHIV; synthetic mRNA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Nature	-	-	-	1476-4687	10.1038/s41586-020-2443-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8188729	Oral antiretroviral agents provide life-saving treatments for millions of people living with HIV, and can prevent new infections via pre-exposure prophylaxis1-5. However, some people living with HIV who are heavily treatment-experienced have limited or no treatment options, owing to multidrug resistance6. In addition, suboptimal adherence to oral daily regimens can negatively affect the outcome of treatment-which contributes to virologic failure, resistance generation and viral transmission-as well as of pre-exposure prophylaxis, leading to new infections1,2,4,7-9. Long-acting agents from new antiretroviral classes can provide much-needed treatment options for people living with HIV who are heavily treatment-experienced, and additionally can improve adherence10. Here we describe GS-6207, a small molecule that disrupts the functions of HIV capsid protein and is amenable to long-acting therapy owing to its high potency, low in vivo systemic clearance and slow release kinetics from the subcutaneous injection site. Drawing on X-ray crystallographic information, we designed GS-6207 to bind tightly at a conserved interface between capsid protein monomers, where it interferes with capsid-protein-mediated interactions between proteins that are essential for multiple phases of the viral replication cycle. GS-6207 exhibits antiviral activity at picomolar concentrations against all subtypes of HIV-1 that we tested, and shows high synergy and no cross-resistance with approved antiretroviral drugs. In phase-1 clinical studies, monotherapy with a single subcutaneous dose of GS-6207 (450 mg) resulted in a mean log10-transformed reduction of plasma viral load of 2.2 after 9 days, and showed sustained plasma exposure at antivirally active concentrations for more than 6 months. These results provide clinical validation for therapies that target the functions of HIV capsid protein, and demonstrate the potential of GS-6207 as a long-acting agent to treat or prevent infection with HIV. Article	2020	Liu S.N.; Gufford B.T.; Lu J.B.L.; Bushman L.R.; Anderson P.L.; Bergstrom R.F.; Desta Z.; Gupta S.K.	Inhibitory Effects of Probenecid on Pharmacokinetics of Tenofovir Disoproxil Fumarate and Emtricitabine for On-Demand HIV Preexposure Prophylaxis	Clinical Pharmacology and Therapeutics	-	-	-	99236	10.1002/cpt.1714	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076812710&doi=10.1002%2fcpt.1714&partnerID=40&md5=d37f31bb840cbd5df6cb827774b4f01b	In a randomized, crossover pharmacokinetic study in healthy volunteers (N = 14), a single dose of 2 g probenecid (PRO)-boosted 600 mg tenofovir disoproxil fumarate (TDF)/400 mg emtricitabine (FTC) (test (T) +PRO) was compared with the current on-demand HIV preexposure prophylaxis from the IPERGAY study (a 600 mg TDF/400 mg FTC on day 1 and 300 mg TDF/200 mg FTC on days 2 and 3) (control, C IPERGAY). PRO increased mean single-dose area under the plasma concentration-time curve extrapolated to infinity (AUC0–∞,SD) of tenofovir (TFV) and FTC by 61% and 68%, respectively. The TFV-diphosphate (TFV-DP) concentrations in peripheral blood mononuclear cells were higher (~30%) at 24 hours in T +PRO but then fell significantly lower (~40%) at 72 hours compared with C IPERGAY. The interaction between FTC and PRO was unexpected and novel. Further study is needed to determine if this PRO-boosted TDF/FTC regimen would be clinically effective. © 2019 The Authors. Article	2020	Liu, Stephanie N; Desta, Zeruesenay; Gufford, Brandon T	Probenecid-Boosted Tenofovir: A Physiologically-Based Pharmacokinetic Model-Informed Strategy for On-Demand HIV Preexposure Prophylaxis.	CPT: Pharmacometrics & Systems Pharmacology	-	-	-	2163-8306	10.1002/psp4.12481	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6966182	Multiple doses of tenofovir disoproxil fumarate (TDF) together with emtricitabine is effective for HIV preexposure prophylaxis (PrEP). TDF is converted to tenofovir (TFV) in circulation, which is subsequently cleared via tubular secretion by organic ion transporters (OATs; OAT1 and OAT3). Using in vitro kinetic parameters for TFV and the OAT1 and OAT3 inhibitor probenecid, a bottom-up physiologically-based pharmacokinetic model was successfully developed for the first time that accurately describes the probenecid-TFV interaction. This model predicted an increase in TFV plasma exposure by 60%, which was within 15% of the observed clinical pharmacokinetic data, and a threefold decrease in renal cells exposure following coadministration of a 600 mg TDF dose with 2 g probenecid. When compared with multiple-dose regimens, a single-dose probenecid-boosted TDF regimen may be effective for HIV PrEP and improve adherence and safety by minimizing TFV-induced nephrotoxicity by reducing TFV accumulation in renal cells. Article	2020	Longino A.; Montano M.A.; Sanchez H.; Bayer A.; Sanchez J.; Tossas-Milligan K.; Duerr A.; Molina Y.	Increasing PrEP uptake and adherence among MSM and TW sex workers in Lima, Perú: what and whom do different patients trust?	AIDS Care	-	-	-	9540121	10.1080/09540121.2019.1634787	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85068377420&doi=10.1080%2f09540121.2019.1634787&partnerID=40&md5=80938c844e098a4ed5b9a59809d9e51c	In Perú, men who have sex with men (MSM) and transgender women (TW) suffer rates of HIV 50 times greater than the general population. MSM or TW sex workers (SWs) are at especially high risk. Daily oral pre-exposure prophylaxis (PrEP) effectively prevents HIV infection if patients adhere to a daily or on-demand regimen. Necessary levels of adoption and adherence require data-driven intervention strategies for these marginalized groups. We conducted qualitative content analysis of data obtained from focus groups (FGs) with MSM and TW SWs. Both groups expressed strong skepticism about the motives behind international drug trials, and the safety of participating in them. Important differences between MSM and TW groups' beliefs about trustworthy information as well as community and public institutions also emerged. MSM SWs were less trusting of information from other MSM SWs, and preferred to receive information from institutional medical sources, while TGW SWs preferred to receive information from other TGW SWs. Successful strategies to encourage PrEP uptake and adherence must address the distrust patients feel towards international and institutional actors by providing patients with tailored, reliable information from local and community sources that they trust. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group. Article	2020	Lopez M.I.; Cocohoba J.; Cohen S.E.; Trainor N.; Levy M.M.; Dong B.J.	Implementation of pre-exposure prophylaxis at a community pharmacy through a collaborative practice agreement with San Francisco Department of Public Health	Journal of the American Pharmacists Association	-	-	-	15443191	10.1016/j.japh.2019.06.021	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85070325108&doi=10.1016%2fj.japh.2019.06.021&partnerID=40&md5=2b17828d1191dee122f6a0f9272d2b62	Objective: To discuss the design and implementation of a community pharmacy–initiated HIV pre-exposure prophylaxis (PrEP) and postexposure prophylaxis (PEP) program developed in collaboration with the San Francisco Department of Public Health (SFDPH). Setting: A community pharmacy in San Francisco and the SFDPH developed a collaborative practice agreement (CPA) that allowed community pharmacists to initiate PrEP and PEP to prevent HIV acquisition and increase uptake in vulnerable populations. Practice description: A community pharmacy in San Francisco's Mission District, an urban, historically Hispanic/Latino/Latinx neighborhood. The primary collaborative practice team consisted of 1 community pharmacy technician, 4 community pharmacists, and 1 designated overseeing physician at SFDPH. Practice innovation: The pharmacy and the SFDPH collaborated together for 20 months from start to implementation of the CPA and the PrEP program. An interdisciplinary team of pharmacists, pharmacy personnel, public health physicians, and health department staff members worked together to design, launch, and maintain the program. Pharmacists were trained by SFDPH staff members on HIV testing and counseling and implementation of the PrEP protocol, including PEP initiation and sexually transmitted disease testing. A Department of Public Health secure portal was used to share patient information. An SFDPH physician reviewed patients' charts regularly and communicated with PrEP pharmacists as needed. Results: Between April 2018 and the end of March 2019, 6 patients received PEP and 53 patients completed a PrEP initiation visit, of whom 96% (n = 51) filled their prescription. Approximately 47% (n = 24) of clients who started PrEP self-identified as Hispanic or Latino, 10% (n = 5) were black or African American, and 82% (n = 42) identified as men who have sex with men. Conclusion: Implementation of a CPA between a community pharmacy and a local health department enabled the launch of pharmacist-delivered PrEP, further expanding the landscape of access points to vulnerable populations in San Francisco. © 2020 American Pharmacists Association®	HIV InfectionsHomosexuality, MaleHumansMalePharmaciesPre-Exposure ProphylaxisPublic HealthSan FranciscoSexual and Gender Minorities	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2020	Lopez, MI; Grant, RM; Dong, BJ	Community pharmacy delivered PrEP to STOP HIV transmission: An opportunity NOT to miss!	Journal of the American Pharmacists Association	-	-	-	1544-3191	10.1016/j.japh.2020.01.026	https://pubmed.ncbi.nlm.nih.gov/32165026/	In the United States, 1.1 million persons are living with human immunodeficiency virus (HIV), and approximately 37,800 new infections occur annually. Ending the HIV epidemic requires reducing HIV transmissions by 90% within the next 10 years and requires expanded HIV testing, antivirals for persons infected with HIV, and scale-up of pre-exposure prophylaxis (PrEP) and postexposure prophylaxis (PEP) to prevent new infections. Community pharmacies are widely accessible and employ highly trained health care professionals on-site who can initiate PrEP and PEP. Recommendations are offered to implement a community pharmacy PrEP program. Pharmacy, government, and HIV prevention leaders must be prepared to support and promote transformative changes, including (1) modification or expansion of existing state-specific scope of practice to initiate PrEP and PEP, (2) encouraging pharmacist education about PrEP and PEP, (3) identification and screening of candidates for PrEP eligibility, (4) incorporating pharmacy laboratory ordering and monitoring logistics, (5) adjusting workflow and ensuring confidential spaces for sensitive discussions, and (6) addressing reimbursement to maintain pharmacist-delivered PrEP and PEP programs. HIV disproportionately affects minority communities and younger individuals who may not be engaged in the health care system. Community pharmacies are accessible and can help increase PrEP use. Expansion of community pharmacy PrEP programs are needed to help end the HIV epidemic. Implementation of PrEP requires adaptation of the pharmacy profession to support incorporation of PrEP in a community pharmacy. Endorsement and support of community pharmacists are needed to implement PrEP to increase HIV prevention efforts and expand pharmacists' scope of practice. Article	2020	López-Díaz G.; Rodríguez-Fernández A.; Domínguez-Martís E.M.; Mosteiro-Miguéns D.G.; López-Ares D.; Novío S.	Knowledge, attitudes, and intentions towards hiv pre-exposure prophylaxis among nursing students in Spain	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph17197151	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091757746&doi=10.3390%2fijerph17197151&partnerID=40&md5=2afd5bba36a94a736d604fff872e109f	Human immunodeficiency virus (HIV) infection is one of the main causes of morbidity and mortality worldwide. Among the preventive approaches proposed to control this disease is pre-exposure prophylaxis (PrEP), whose effectiveness depends on the medication adherence. The aim of the present study was to determine the knowledge and attitudes about PrEP among a sample of Spanish nursing students as well as their intentions of receiving it in case it was indicated. An observational cross-sectional descriptive study was carried out. A total of 570 nursing students from the University of Santiago de Compostela (Spain), ≥18 years old and of both sexes were invited to self-complete a questionnaire between February and March 2020. A total of 352 students decided to participate in the study. Participants had low knowledge overall knowledge score 1(0–2) and a neutral attitude towards PrEP. The intention of receiving PrEP improved significantly after the completion of the questionnaire and the administration of information about PrEP (p = 0.039; before: 23.58% and after: 93.77%). Nursing staff play an important role in the prevention of sexually transmitted diseases, so their training in preventive strategies, such as PrEP, could help to reduce the incidence of new cases of HIV infection. © 2020 by the authors. Theses and Dissertations	2020	Loriato, Cécile	La prévention du VIH/sida en mutation dans l'espace public : quelle appropriation des recommandations ? : ethnographie d'une arène numérique de discussion sur la PrEP : The mutation of HIV/aids prevention in the public space : what appropriation of the recommendations ? : ethnography of a digital discussion arena on PrEP.	-	-	Université Paris-Est	-	NA	NA	http://www.theses.fr/2020PESC0037	Depuis plus d'une décennie, la prévention s'est diversifiée avec la découverte de nouvelles stratégies biomédicales, transformant la conception de la prévention. En particulier, l'introduction de la prophylaxie pré-exposition (PrEP) participe à la redéfinition du risque de transmission du VIH et remet en question des années de prévention construite autour de l'utilisation du préservatif. Cette thèse propose de caractériser l'appropriation des recommandations de prévention du VIH/sida par des HSH (hommes qui ont des relations sexuelles avec des hommes) dans un contexte de mutation de la prévention ainsi que de transformation des modes d'information et de débat des individus. Les analyses du récit médiatique et de la communication publique montrent une difficile légitimation de la PrEP dans l'espace public. Dans une perspective interactionniste, l'ethnographie d'une arène numérique de discussion sur la PrEP permet d'éclairer les "motifs" formulés par les participants à PrEP'Dial pour justifier leur appropriation des recommandations de prévention, c'est-à-dire la manière dont ils y adhèrent, y résistent et les négocient. Article	2020	Loza O.; Curiel Z.V.; Beltran O.; Ramos R.	Methamphetamine Use and Sexual Risk Behaviors among Men Who Have Sex With Men in a Mexico-US Border City	American Journal on Addictions	-	-	-	10550496	10.1111/ajad.12985	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077906913&doi=10.1111%2fajad.12985&partnerID=40&md5=7b4ce461c7d5bdea3694497217b04574	Background and Objectives: Methamphetamine (meth) use and its related risk behaviors for HIV among men who have sex with men (MSM) are a public health concern across the Mexico-US border. This study aims to contribute to the limited literature of meth use and sexual risk behaviors among Latino MSM on the Mexico-US border. Methods: Data were drawn from the Meth Pilot Study (2014-2015) among men who use meth (n = 100). Descriptive statistics and bivariate analysis comparing MSM to non-MSM were conducted using Pearson's χ2 test, Fisher's exact tests, and Mann-Whitney U test; all tests were conducted using SPSS v.25. Results: Most participants obtained meth in El Paso, Texas (87.2%), used meth orally (65.2%) or smoked (78.3%), and the most common reason for initiation was curiosity. Significant differences (P <.05) in meth use behaviors and sexual risk behaviors between MSM and non-MSM who used meth included: median number of sex partners (7 vs 3), being penetrated anally by last sexual partner (31.6% vs 1.4%), and engaging in transactional sex ever (63.2% vs 9.6%) and past 12 months (52.6% vs 6.8%). Finally, rates of HIV positivity were higher among MSM than non-MSM (10.5% vs 1.4%). Discussion and Conclusions: Among men who use meth, MSM are engaging in higher HIV risk behaviors compared with non-MSM. Understanding these risks could help identify candidates for pre-exposure prophylaxis (PrEP) and evidence-based substance use disorder treatment options. Scientific Significance: This study reveals that Latino MSM who use meth is a high-risk group for HIV and a need for tailored interventions. Article	2020	Lu, Timothy Siliang; Holmes, Andrea; Noone, Chris; Flaherty, Gerard Thomas	Sun, sea and sex: a review of the sex tourism literature.	Tropical Diseases, Travel Medicine and Vaccines	-	-	-	2055-0936	10.1186/s40794-020-00124-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7691961	BACKGROUND: Sex tourism is defined as travel planned specifically for the purpose of sex, generally to a country where prostitution is legal. While much of the literature on sex tourism relates to the commercial sex worker industry, sex tourism also finds expression in non-transactional sexual encounters. This narrative review explores current concepts related to travel and sex, with a focus on trans-national sex tourism. METHODS: The PubMed database was accessed to source relevant literature, using combinations of pertinent search terms. Only articles published in the English language were selected. Reference lists of published articles were also examined for relevant articles. RESULTS: With regard to preferred destinations, South/Central America and the Caribbean were more likely to receive tourists looking for casual sex. Longer duration of travel, travelling alone or with friends, alcohol or drug use, being younger and being single were factors associated with higher levels of casual sex overseas. The majority of literature retrieved on sex workers focused on risk behaviours, sexually transmitted infections (STI), mobility of sex workers and how these factors affected their lives. Sex tourists require better access to effective methods of preventing HIV, such as pre-exposure prophylaxis, and better education on HIV prevention. Drugs and alcohol play a major role as risk factors for and cofactors in casual sexual behaviour while abroad. CONCLUSIONS: Travellers need to be informed of the increased risks of STI before travel. They should be aware of the local prevalence of STIs and the risks associated with their sexual practices when they travel, including engaging with commercial sex workers, having unprotected sexual intercourse and becoming victims of sexual violence. Theses and Dissertations	2020	Luis Faundez Chacon (9907500)	Beyond the Good Intentions: Assessing Unintended Consequences of Labor and Health Policies	-	-	University of Illinois	-	-	NA	https://www.proquest.com/openview/dfbedb5e091c7a996225d039567bea1a/1?pq-origsite=gscholar&cbl=18750&diss=y	In the first chapter, I study the causal effect of longer maternity leave on postpartum depression and other measures of mental health. Using a difference-in-difference instrumental variable approach, I find that one extra week of paid maternity leave increases the probability of being diagnosed with postpartum depression by 0.3 percentage points. However, I find no evidence of an increase in self-reported maternal stress level during the first 18 months after delivery or an increase in longer term depressive symptoms. A likely mechanism driving the increased diagnosis is that longer paid maternity leave increases the likelihood of diagnosis given a fixed level of depressive symptoms. I show that longer leave increases labor market attachment of mothers and thereby affects insurance coverage and doctor visits. By remaining employed, women are not only less likely to be uninsured, but they also get access to better health insurance. The availability of better health insurance combined with more time to go to the doctor, increase doctor visits during the first year after delivery, especially mental health visits.In the second chapter, I study the impact of the Chilean paid maternity leave extension on labor market discrimination against women. Using a difference-in-differences approach, I find robust evidence that the aforementioned policy had an unintended effect: it reduced labor force participation of women of childbearing age by 3 percentage points and their employment by 2.4 percentage points, while it had no effect on the gender pay gap.In the third chapter, I study how the availability of a drug that reduces the risk of sexually acquired HIV, Truvada for Pre-exposure prophylaxis (PrEP), is affecting men who have sex with men (MSM) sexual behavior, and if this change in behavior has a causal effect on the increase in sexually transmitted diseases (STDs) seen in the United States in the last years. Using data from NSFG and NHANES, and a propensity score matching differences-in-differences approach, I find evidence of risk compensation after the introduction of PrEP. I document an increase in the probability of having more than 2 sexual partners in the last year as well as having a new sex partner in the last 12 months. I do not find evidence of an increase in sexual activity, however. I also find a large increase in condomless sexual activity. I document individuals switching from always using condoms and using condoms less than 50% of the times to never using condoms. Additionally, I provide suggestive evidence of an increase in STDs (chlamydia and HPV). Article	2020	Macapagal Kathryn; Kraus, Ashley; Korpak, Aaron K; Jozsa Kyle; Moskowitz, David A	PrEP Awareness, Uptake, Barriers, and Correlates Among Adolescents Assigned Male at Birth Who Have Sex with Males in the U.S.	Archives of Sexual Behavior	-	-	-	00040002	10.1007/s10508-019-1429-2	https://www.proquest.com/scholarly-journals/prep-awareness-uptake-barriers-correlates-among/docview/2353363981/se-2?accountid=8113	In May 2018, the US Food and Drug Administration approved daily oral pre-exposure prophylaxis (PrEP) for adolescents under age 18. Although this is an important step toward HIV prevention for adolescents assigned male at birth who have sex with males (AMSM), limited research exists to gauge their awareness of PrEP as a prevention option. Additionally, the attitudes and perceived barriers regarding PrEP among this population have not been well studied. We conducted an online survey from February to April 2018, in which 219 AMSM aged 15–17 read a description of PrEP, and then answered questions about PrEP awareness, perceived barriers, and demographic and behavioral correlates. A slight majority (54.8%) had heard of PrEP before, and 56.1% did not know how they would access PrEP. Of those who had heard of PrEP, 2.5% had ever used it. Most had first learned about PrEP online, through media or geosocial networking (GSN) applications to meet male partners. Those who had heard of PrEP were more likely to be older, to have used GSN applications, and to have greater HIV knowledge. Not knowing how to access PrEP was predicted by having had more partners, lower HIV knowledge, and never having talked to a provider about PrEP. Believing that one could not afford PrEP was predicted by greater perceived risk of HIV. Findings suggest moderate awareness of PrEP among AMSM, that youth at greater risk of HIV may perceive greater barriers, and that online spaces can play a significant role in increasing PrEP knowledge and reducing implementation barriers. Article	2020	MacCarthy S.; Izenberg M.; Barreras J.L.; Brooks R.A.; Gonzalez A.; Linnemayr S.	Rapid mixed-methods assessment of COVID-19 impact on Latinx sexual minority men and Latinx transgender women	PLOS One	-	-	-	19326203	10.1371/journal.pone.0244421	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098938213&doi=10.1371%2fjournal.pone.0244421&partnerID=40&md5=10a99a4e84bf2f3a13df268056c7b441	We conducted a rapid, mixed-methods assessment to understand how COVID-19 affected Latinx sexual minority men (LSMM) and transgender women (LTGW). Using a computer-assisted telephone interviewing software, one interviewer called 52 participants (randomly sampled from a larger HIV prevention pilot study aiming to increase HIV knowledge and testing frequency; n = 36 LSMM and n = 16 LTGW) between 04/27/20-05/18/20. We quantified core domains using the Epidemic-Pandemic Impacts Inventory scale and provided important context through open-ended qualitative questions assessing: 1) COVID-19 infection history and experiences with quarantine; 2) Health and healthcare access; 3) Employment and economic impact of COVID-19. Participants reported increases in physical conflict or verbal arguments with a partner (13.5%) or other adult(s) (19.2%) due to stressors associated with the safer-at-home order. Participants also reported increased alcohol consumption (23.1%), problems with sleep (67.3%) and mental health (78.4%). Further, disruptions in access to Pre-Exposure Prophylaxis or PrEP–a daily pill to prevent HIV–occurred (33.3% of 18 participants who reported being on PrEP). Many said they received less medical attention than usual (34.6%), and LTGW reported delays in critical gender-affirming hormones/procedures. Half of the participants lost their jobs (50.0%); many undocumented participants relayed additional financial concerns because they did not qualify for financial assistance. Though no COVID-19 infections were noted, COVID-19 dramatically impacted other aspects of health and overall wellbeing of LSMM and LTGW. Public health responses should address the stressors faced by LSMM and LTGW during the COVID-19 pandemic and the impact on wellbeing. Copyright: © 2020 MacCarthy et al. Article	2020	Macdonald, Virginia; Mbuagbaw, Lawrence; Jordan, Michael R; Mathers, Bradley; Jay, Sharon; Baggaley, Rachel; Verster, Annette; Bertagnolio, Silvia	Prevalence of pretreatment HIV drug resistance in key populations: a systematic review and meta-analysis.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25656	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7758978	INTRODUCTION: WHO's 2019 report on HIV drug resistance (HIVDR) documents a high prevalence of pretreatment drug resistance (PDR) among populations initiating first-line antiretroviral therapy (ART) in low- and middle-income countries (LMIC). However, systematic evidence on the prevalence of PDR among key populations remains limited. We performed a systematic review to characterize levels of PDR in key population groups and compared them to levels of PDR in the "general population" across different geographical regions. METHODS: Ten electronic databases were searched for papers published until February 2019 that included predefined search terms. We included studies that reported the number of successfully tested genotypes and the number of genotypes with drug resistance mutations among antiretroviral therapy treatment naïve people, recently infected people, or people initiating first-line ART from key populations. To assess the prevalence of PDR for each key population, we pooled estimates using random-effects meta-analysis of proportions. Where possible, we computed the differences in the odds of PDR (any, and by drug class) present in each key population compared to the "general population." The I2 statistic (a measure of heterogeneity between studies) is reported. RESULTS AND DISCUSSION: A total of 332 datasets (from 218 studies) and 63,111 people with successful HIVDR genotyping were included in the analysis. The pooled prevalence estimate of any PDR was high among men who have sex with men (13.0%, 95% CI 11.0 to 14.0%, I2 = 93.19), sex workers (17.0%, 95% CI 6.0 - 32.0, I2 = 87.31%) and people in prisons (18.0%, 95% CI 11.0 to 25.0, I2 = 70.18%), but less so among people who inject drugs (7.0%, 95% CI 5.0 to 10.0, I2 = 90.23). Overall, men who have sex with men were more likely to carry any PDR compared to the "general population," a finding which was statistically significant (odds ratio (OR) 1.28, 95% CI 1.13 - 1.46, I2 48.9%). CONCLUSIONS: High prevalence of PDR found in key populations highlights the need to increase access to effective first-line HIV treatment. The low prevalence of nucleotide reverse transcriptase inhibitor (NRTI) PDR suggests that current WHO recommendations for pre-exposure prophylaxis (PrEP) regimens will remain effective and can be scaled up to prevent new HIV infections in high-risk groups.	men who have sex with men, sex workers, people who inject drugs, prisoners, transgender, HIV drug resistance	English	United States	Western and Central Europe and North America	Switzerland	Western and Central Europe and North America	Switzerland	Western and Central Europe and North America	Review
Theses and Dissertations	2020	MACEDO, NAYARA FLORES	CONDIÇÃO BUCAL E ANÁLISE SALIVAR DE PACIENTES EM PROFILAXIA PRÉ-EXPOSIÇÃO (PrEP) AO HIV'	-	-	PONTIFÍCIA UNIVERSIDADE CATÓLICA DO PARANÁ	-	-	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=9344048	Para controlar a progressão da epidemia do HIV/AIDS, novas estratégias de prevenção têm sido advogadas, como a profilaxia pré-exposição (PrEP) composta pelas drogas antirretrovirais tenofovir disoproxil fumarato e entricitabina. O objetivo deste estudo foi avaliar potenciais alterações de condições bucais e salivares de pacientes em profilaxia pré-exposição ao HIV. Pacientes de ambos os sexos, maiores de 18 anos, provenientes do Centro de Orientação e Aconselhamento da Secretaria Municipal da Saúde de Curitiba e elegíveis para uso da PrEP foram avaliados em três momentos: antes do início da medicação (T0), no primeiro retorno (T1) e no segundo retorno (T2) para dispensa de medicação. Dados demográficos e da história médica dos participantes foram obtidos do banco de dados deste centro seguidos do exame clínico odontológico. Foram avaliados presença da xerostomia, índices CPOD, Gengival e Placa, hábitos de higiene bucal e paladar, além do fluxo salivar estimulado (FSE) e da concentração salivar de cálcio, glicose, ureia e proteínas totais, que foram quantificados. Os dados obtidos foram tabulados e analisados por meio de testes estatísticos (p = 5%). 47 pacientes foram avaliados em T0, sendo 41 (87,2%) homens com média de idade 29,54 ± 1,19 anos e 6 (12,8%) mulheres com idade média 36,50 ± 7,16 anos. Dos 47 pacientes iniciais, 30 pacientes (28 homens, média de idade 28,75 ± 7,10 anos e 2 mulheres, média de idade 49,50 ± 20,50 anos) e 17 homens com média de idade 31,35 ± 7,10 anos retornaram para continuidade da profilaxia e foram reavaliados, em T1 e T2, respectivamente. Não houve diferença entre FSE e as condições bucais e salivares dos participantes analisadas entre T0, T1 e T2 (p > 0,05), exceto para a concentração salivar de ureia após a terceira dispensa da PrEP quando comparado à segunda dispensa (p = 0,02). O ressecamento dos lábios e da mucosa bucal representou 4 (22,2%) e 5 (33,4%) das 18 e 15 alterações observadas ao exame intrabucal em T1 e T2, respectivamente. Houve diferença significante entre paladar e xerostomia nos participantes em T1 (p=0,017), e paladar e necessidade de bebida para engolir refeições em T2 (p=0,015). Houve correlação significante entre quantidade relatada de saliva e paladar (p = 0,039 r = - 0,378) nos pacientes em T1. O uso prolongado da PrEP parece estar associado a relatos de boca seca e piora do paladar possivelmente associados a alterações na composição salivar dos pacientes em uso destas medicações. Article	2020	MacGibbon J.; Broady T.; Drysdale K.; Bavinton B.; Lee E.; Mao L.; Prestage G.; Holt M.	Gay Men's Relationship Agreements in the Era of Pre-exposure Prophylaxis: An Analysis of Australian Behavioural Surveillance Data	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-019-02737-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076017513&doi=10.1007%2fs10461-019-02737-9&partnerID=40&md5=f5cc907e72b035162526b49529c3ea8b	Using repeated, cross-sectional behavioural surveillance data from Australia, we assessed trends in relationship agreements and casual sex among HIV-negative and untested gay and bisexual men who had regular partners during 2013–2018. We conducted three analyses: (i) trends in relationship agreements and casual sex over time; (ii) bivariate comparisons of PrEP users and non-PrEP-users to identify factors associated with PrEP use; and (iii) multivariate logistic regression to identify factors independently associated with PrEP use. The analysis of trends over time included 21,593 men, from which a sub-sample (n = 3764) was used to compare PrEP users and non-PrEP-users. We found a large increase in agreements that allowed condomless sex with casual partners, particularly by PrEP users in relationships (nearly 40% of whom had such an agreement). A further 34% of PrEP users reported having casual condomless sex without an agreement that permitted that behaviour, while 13% of non-PrEP-users also reported condomless sex with casual partners without an agreement. PrEP use was independently associated with having agreements permitting condomless sex with casual partners, recent condomless sex with casual partners, having greater numbers of male partners, recent post-exposure prophylaxis use, having an HIV-positive regular male partner, and recent condomless sex with regular male partners. Our findings show a shift away from relationship agreements in which condomless sex was only sanctioned between regular partners. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	MacGibbon J.; Minichiello V.; Prestage G.; Bell S.; Cox C.; Donovan B.; Callander D.	How Male Sex Workers and Their Clients Shifted from Reluctance About HIV Pre-exposure Prophylaxis to Advocating for Its Use: A Longitudinal Mixed Methods Study	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-019-02618-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85070070870&doi=10.1007%2fs10461-019-02618-1&partnerID=40&md5=09c728bc1c5d81c33707043ff604cf55	We assessed individual and collective responses to HIV pre-exposure prophylaxis ('PrEP') among a network of male sex workers and clients. From 2011 to May 2017, keyword searches on an online discussion forum identified 668 posts that referenced PrEP. We conducted four analyses: (i) discourse analysis identifying reactions to PrEP, (ii) thematic analysis constructing rhetorical strategies, (iii) content analysis comparing discursive positions and rhetorical strategies, and (iv) longitudinal analyses assessing trends over time. Forum posts adopted one of three discursive positions (reluctance, interest, advocacy), drawing upon four non-exclusive strategies (deference to experts and evidence, acknowledging personal and shared experiences, establishing philosophical arguments, engaging in speculation). Posts from sex workers were more likely than clients to be supportive of PrEP (96% vs. 42%; χ2 = 18.46, p < 0.001) while over time this network moved from being predominantly reluctant about PrEP (61% of posts in 2012) to advocating for its use (65% of posts in 2017; Z = 5.01, p < 0.001). © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Macgregor L.; Desai M.; Martin N.K.; Nicholls J.; Hickson F.; Weatherburn P.; Hickman M.; Vickerman P.	Scaling up screening and treatment for elimination of hepatitis C among men who have sex with men in the era of HIV pre-exposure prophylaxis	EClinicalMedicine	-	-	-	25895370	10.1016/j.eclinm.2019.11.010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077165046&doi=10.1016%2fj.eclinm.2019.11.010&partnerID=40&md5=d198372490089cf579e6a3e26283c78f	Background: Routine HIV pre-exposure prophylaxis (PrEP) and HIV care appointments provide opportunities for screening men who have sex with men (MSM) for hepatitis C virus infection (HCV). However, levels of screening required for achieving the WHO elimination target of reducing HCV incidence by 90% by 2030 among all MSM are unknown. Methods: An HCV/HIV transmission model was calibrated to UK prevalence of HIV among MSM (4·7%) and chronic HCV infection among HIV-positive MSM (9·9%) and HIV-negative MSM (1.2%). Assuming 12·5% coverage of PrEP among HIV-negative MSM, we evaluated the relative reduction in overall HCV incidence by 2030 (compared to 2018 levels) of HCV screening every 12/6-months (alongside completing direct acting antiviral treatment within 6-months of diagnosis) in PrEP users and/or HIV-diagnosed MSM. We estimated the additional screening required among HIV-negative non-PrEP users to reduce overall incidence by 90% by 2030. The effect of 50% reduction in condom use among PrEP users (risk compensation) was also assessed. Results: Screening and treating PrEP users for HCV every 12 or 6-months decreases HCV incidence by 67·3% (uncertainty range 52·7–79·2%) or 70·2% (57·1–80·8%), respectively, increasing to 75·4% (59·0–88·6%) or 78·8% (63·9–90·4%) if HIV-diagnosed MSM are also screened at same frequencies. Risk compensation reduces these latter projections by <10%. To reduce HCV incidence by 90% by 2030 without risk compensation, HIV-negative non-PrEP users require screening every 5·6 (3·8–9·2) years if MSM on PrEP and HIV-diagnosed MSM are screened every 6-months, shortening to 4·4 (3·1–6·6) years with risk compensation. For 25·0% PrEP coverage, the HCV elimination target can be reached without screening HIV-negative MSM not on PrEP, irrespective of risk compensation. Interpretation: At low PrEP coverage, increased screening of all MSM is required to achieve the WHO HCV-elimination targets for MSM in the UK, whereas at higher PrEP coverage this is possible through just screening HIV-diagnosed MSM and PrEP users. © 2019	Antiviral treatment; Hepatitis C virus; HIV; Men who have sex with men; Pre-exposure prophylaxis; Prevention; Risk compensation	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative
Article	2020	Maine A.	Bareback sex, PrEP, National AIDS Trust v NHS England and the reality of gay sex	Sexualities	-	-	-	13634607	10.1177/1363460719886733	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075914504&doi=10.1177%2f1363460719886733&partnerID=40&md5=52e09cd638ae8878c06019902b8b344d	In this article, I use empirical data regarding the prevalence of bareback sex and the HIV treatment PrEP to argue that the High Court and Court of Appeal of England and Wales in National AIDS Trust v NHS England, have reflected the reality of gay sex. I argue that this case represents a shift in legal approaches to preventative sexual health methods that recognises the reality of gay male sexuality regarding the allocation of funding responsibility for the pre-exposure prophylaxis. I argue that the treatment, which prevents transmission of HIV, is a significant feature of gay and bisexual men's sexuality and has the potential to transform narratives surrounding personal agency and individual responsibility. This article uses doctrinal, theoretical and empirical analysis, to the conclusion that the case represents a significant step in the recognition of the reality of gay sex. © The Author(s) 2019. Article	2020	Maksut J.L.; Gicquelais R.E.; Jackman K.-M.; Eaton L.A.; Friedman M.R.; Matthews D.D.; Bukowski L.A.; Stall R.D.	Injection drug use, unknown HIV positive status, and self-reported current PrEP use among Black men who have sex with men attending U.S. Black pride events, 2014–2017	Drug and Alcohol Dependence	-	-	-	3768716	10.1016/j.drugalcdep.2019.107808	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076347413&doi=10.1016%2fj.drugalcdep.2019.107808&partnerID=40&md5=7342f99a43416c748d885f44544627d6	Objective: Black gay, bisexual, and other men who have sex with men (BMSM) are at elevated risk for HIV infection in the United States. BMSM who inject drugs may be face even higher HIV risk. Methods: Random time-location sampling was used to survey BMSM attending Black Pride events in 6 U.S. cities about HIV risk and protective behaviors, including injection drug use, prior HIV testing, and pre-exposure prophylaxis (PrEP). 3429 individuals who reported a HIV negative/unknown serostatus at enrollment were included in the analysis. HIV status was determined by in-field rapid HIV testing. Results: 3.6% of BMSM had injected drugs in their lifetime and 58.5% of BMSM who had injected drugs reported sharing syringes in the past six months. BMSM who had injected drugs more commonly reported current PrEP use than BMSM who had never injected (32.5% vs. 8.2%, p < 0.001). BMSM who had injected drugs were 3.6-fold (95% CI: 2.4, 5.4) more likely to report currently using PrEP than BMSM who had never injected after adjustment for sociodemographic, substance use, and sexual risk characteristics. Among BMSM who reported ever injecting drugs (n = 123), 31.7% tested HIV positive. HIV prevalence did not differ by self-reported PrEP use among BMSM who had injected drugs (p = 0.59). Conclusions: BMSM who inject drugs who reported currently using PrEP were no less likely to test positive for HIV than those who did not use PrEP. Wrap-around services to support consistent PrEP use and long-acting PrEP formulations may improve the effectiveness of PrEP among BMSM who inject drugs. © 2019	Black men who have sex with men (MSM); MSM who inject drugs; Pre-Exposure prophylaxis (PrEP)	English	Netherlands	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Article	2020	Marcus, Julia L; Sewell, Whitney C; Balzer, Laura B; Krakower, Douglas S	Artificial Intelligence and Machine Learning for HIV Prevention: Emerging Approaches to Ending the Epidemic.	Current HIV/AIDS Reports	-	-	-	1548-3576	10.1007/s11904-020-00490-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7260108	PURPOSE OF REVIEW: We review applications of artificial intelligence (AI), including machine learning (ML), in the field of HIV prevention. RECENT FINDINGS: ML approaches have been used to identify potential candidates for preexposure prophylaxis (PrEP) in healthcare settings in the USA and Denmark and in a population-based research setting in Eastern Africa. Although still in the proof-of-concept stage, other applications include ML with smartphone-collected and social media data to promote real-time HIV risk reduction, virtual reality tools to facilitate HIV serodisclosure, and chatbots for HIV education. ML has also been used for causal inference in HIV prevention studies. ML has strong potential to improve delivery of PrEP, with this approach moving from development to implementation. Development and evaluation of AI and ML strategies for HIV prevention may benefit from an implementation science approach, including qualitative assessments with end users, and should be developed and evaluated with attention to equity.	human immunodeficiency virus (HIV), prevention, machine learning, artificial intelligence, data science, big data	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2020	Markowitz, Martin; Grobler, Jay A	Islatravir for the treatment and prevention of infection with the human immunodeficiency virus type 1.	Current Opinion in HIV and AIDS	-	-	-	1746-6318	10.1097/COH.0000000000000599	https://dx.doi.org/10.1097/COH.0000000000000599	PURPOSE OF REVIEW: To discuss the potential role of islatravir (ISL), a novel reverse transcriptase translocation inhibitor, in the treatment and prevention of human immunodeficiency virus type 1 (HIV-1) infection. RECENT FINDINGS: Islatravir (4'-ethynyl-2-fluoro-2'-deoxyadenosine, MK-8591) is a long-acting first-in-class nucleoside reverse transcriptase translocation inhibitor with the potential for versatile dosing routes and dosing intervals. It demonstrated robust antiviral activity when dosed once daily and once weekly in HIV-1-infected individuals and SIV-infected rhesus macaques. In clinical trials of ISL in combination with doravirine and lamivudine, daily oral administration resulted in high levels of virologic suppression in HIV-1-infected individuals. In preclinical studies, ISL dosed orally once-weekly as preexposure prophylaxis (PrEP), protected rhesus macaques against SHIV infection via the mucosal route in the low-dose rectal challenge model. Most recently, data in healthy HIV-1-uninfected individuals demonstrated the feasibility of formulating ISL as an implant. In these studies, levels of intracellular ISL-triphosphate were consistent with the potential for a once-yearly implantable administration of ISL as PrEP. SUMMARY: Islatravir is a promising new agent for both the treatment and prevention of HIV-1 infection. Article	2020	Marshall S.A.; Neher T.; Sockwell L.; Brown L.; Zaller N.	Current HIV Testing & Risk Behaviors among Students at Historically Black Colleges & Universities in a Southern State	Journal of the National Medical Association	-	-	-	279684	10.1016/j.jnma.2020.04.008	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085656645&doi=10.1016%2fj.jnma.2020.04.008&partnerID=40&md5=159b9487790b4a316d33ccb41bea35b1	Background/Purpose: HIV testing prevalence is low among young adults (YA) ages 18–24. Previous research supports routine testing among African-American college students. Historically Black Colleges and Universities (HBCUs) are uniquely situated to support HIV education and prevention efforts. This study aimed to assess current HIV risk behaviors and current knowledge of PrEP among HBCU students. Methods: In collaboration with a partnering organization, we conducted HIV testing events and HIV risk assessment at four HBCUs in a southern state. Results: Among participants (N = 615), most identified as African American (578, 94.8%), female (377, 61.3%) and 18–24 years old (540, 87.9%). Many (42.3%) had never been tested for HIV. Most reported they had been sexually active in the last year (533, 86.8%) with many reporting 2–5 partners (270, 43.9%). Among males (n = 236), 8.6% reported same sex partners. Many participants reported inconsistent condom use during vaginal sex (242, 46%). Most participants had not heard of PrEP (473, 86.2%). Conclusion: Considering most participants had one or multiple HIV related risk behaviors, and many had never been tested for HIV, HBCUs may be important venues to promote HIV risk reduction and regular HIV testing. © 2020 National Medical Association	College students; Condom use; HBCUs; HIV testing; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Martin E.G.; MacDonald R.H.; Gordon D.E.; Swain C.-A.; O'Donnell T.; Helmeset J.; Dwicaksono A.; Tesoriero J.M.	Simulating the End of AIDS in New York: Using Participatory Dynamic Modeling to Improve Implementation of the Ending the Epidemic Initiative	Public Health Reports	-	-	-	333549	10.1177/0033354920935069	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088906491&doi=10.1177%2f0033354920935069&partnerID=40&md5=039b4b59c6a7d561ad87863210eb57af	Objectives: In 2014, the governor of New York announced the Ending the Epidemic (ETE) plan to reduce annual new HIV infections from 3000 to 750, achieve a first-ever decrease in HIV prevalence, and reduce AIDS progression by the end of 2020. The state health department undertook participatory simulation modeling to develop a baseline for comparing epidemic trends and feedback on ETE strategies. Methods: A dynamic compartmental model projected the individual and combined effects of 3 ETE initiatives: enhanced linkage to and retention in HIV treatment, increased preexposure prophylaxis (PrEP) among men who have sex with men, and expanded housing assistance. Data inputs for model calibration and low-, medium-, and high-implementation scenarios (stakeholders' rollout predictions, and lower and upper bounds) came from surveillance and program data through 2014, the literature, and expert judgment. Results: Without ETE (baseline scenario), new HIV infections would decline but remain >750, and HIV prevalence would continue to increase by 2020. Concurrently implementing the 3 programs would lower annual new HIV infections by 16.0%, 28.1%, and 45.7% compared with baseline in the low-, medium-, and high-implementation scenarios, respectively. In all concurrent implementation scenarios, although annual new HIV infections would remain >750, there would be fewer new HIV infections than deaths, yielding the first-ever decrease in HIV prevalence. PrEP and enhanced linkage and retention would confer the largest population-level changes. Conclusions: New York State will achieve 1 ETE benchmark under the most realistic (medium) implementation scenario. Findings facilitated framing of ETE goals and underscored the need to prioritize men who have sex with men and maintain ETE's multipronged approach, including other programs not modeled here. © 2020, Association of Schools and Programs of Public Health.	computer simulation; health policy; HIV; preexposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Martinez J.E.; Jonas K.J.	Social judgments of sexual behavior and use of HIV pre-exposure prophylaxis	Social Cognition	-	-	-	0278016X	10.1521/soco.2020.38.1.01	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079844353&doi=10.1521%2fsoco.2020.38.1.01&partnerID=40&md5=e4619389a42b124862f6adca68629f2f	Biomedical HIV pre-exposure prophylaxis (PrEP) can drastically decrease the transmission of HIV between sexual partners. However, peer evaluations may worry men who have sex with men (MSM) that are considering or taking PrEP. We used a trait transference paradigm to characterize attitudes towards PrEP users, their sexual behavior, and transference effects on their social network. We recruited 339 men across nine U.S. cities from advertisements on a phone dating application. They judged vignettes about MSM and associated friends on their trustworthiness and responsibility, with the main character described as either having frequently changing partners (FCP) or being monogamous, and taking PrEP or not. We found PrEP praise within our U.S. sample, especially when evaluating responsibility, while FCP behavior was negatively evaluated. Minimal transference effects suggested judgments about sex-related actions anchor to the actor. These insights identify contextual boundaries of associative cognition and can inform interventions hoping to improve PrEP acceptance and uptake. © 2020 Guilford Publications, Inc. Theses and Dissertations	2020	MARTINS, GLAUCIA BARROSO	Gestão do risco sexual da infecção do HIV entre adolescentes homens que fazem sexo com homens, travestis e mulheres transexuais na região central de São Paulo	-	-	UNIVERSIDADE CATÓLICA DE SANTOS	-	-	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=9343752	Adolescentes homens que fazem sexo com homens, mulheres transexuais e travestis vivem em contextos específicos de vulnerabilidade individual, social e programática ao HIV que, acentuados pela homofobia e transfobia, demandam respostas direcionadas das políticas públicas de saúde para a mitigação da epidemia de HIV. Para isso, é fundamental a compreensão das experiências e narrativas vivenciadas por essa população sobre gestão de risco sexual, que parte do pressuposto de que cada indivíduo aprende a criar estratégias em busca de superar seus próprios riscos. Portanto, tal gestão é mediada de acordo com o que cada um ressignifica para si e com as demais questões que necessitam ser enfrentadas. Objetivo: Compreender a gestão de risco de infecção pelo HIV nas interações sexuais entre adolescentes homens que fazem sexo com homens, travestis e mulheres transexuais. Métodos: O estudo foi realizado com abordagem qualitativa com dados obtidos de uma pesquisa formativa realizada a partir de um estudo intitulado "Estudo PrEP 15-19" com participantes moradores ou frequentadores da região central de São Paulo. Realizaram-se treze entrevistas semiestruturadas, sendo sete com travestis e mulheres transexuais e seis com gays e bissexuais; entrevista coletiva que contou com três participantes travestis e mulheres transexuais; e grupo focal com nove adolescentes gays e bissexuais. A análise do conteúdo foi guiada à luz das teorias de Bardin (2011). Resultados: Dos treze adolescentes que participaram das entrevistas semiestruturadas voluntariamente, seis se declararam homens e, destes, três se identificaram como gays e três como bissexuais, com idade entre dezesseis e dezenove anos; das outras sete pessoas, quatro se identificaram como mulheres transexuais e três como travestis, dentre as quais três se consideraram heterossexuais, duas pansexuais e uma assexual/bissexual, com idade entre dezessete e dezenove anos. Na entrevista coletiva, contamos com duas mulheres transexuais e uma travesti, entre dezessete e dezenove anos. Para o grupo focal apresentaram-se nove participantes entre dezesseis e dezoito anos, dos quais sete não responderam quanto à identidade de gênero e dois se identificaram como homens, totalizando oito gays e um bissexual. Os entrevistados apresentaram discursos que expressaram uma visão de obrigatoriedade, prioridade e hierarquia quanto ao uso de camisinha para que se sentissem protegidos, refletindo a forma como recebem informação sobre prevenção tida como eficaz e como se sentem responsáveis por usar preservativo e se esforçam para incorporá-la em seu cotidiano. Não utilizar preservativo para alguns remete a sentimentos como remorso e medo. Para outros, no entanto, há uma sensação de conforto e segurança quando adotado nas relações que envolvem penetração. Embora reconhecidamente visto como necessário na prevenção do HIV, sua efetiva utilização esteve condicionada a diversos fatores contextuais. As relações sexuais com parcerias estáveis são percebidas com maior sensação de proteção, enquanto as casuais com maiores chances de risco. O uso de álcool e as relações com parceiros mais velhos podem influenciar a decisão do uso do preservativo. A adoção do preservativo pode sofrer influência pelo uso de cocaína e pela decisão do parceiro nos programas sexuais. Outras estratégias de prevenção, como o teste rápido do HIV, a PEP e a PrEP apareceram nos discursos como opções alternativas para falha do uso da camisinha. Conclusão: Os adolescentes discursam sobre prevenção baseados na visão do uso de preservativo como escolha principal, mesmo que sob diversos contextos de exposição, reproduzindo o discurso normativo de eficácia desse método independentemente de outras dimensões fundadas nos aspectos da vulnerabilidade que podem tornar seu uso inconsistente. Desse modo, ações e estratégias de acolhimento devem ser adotadas, buscando abordar as estratégias de prevenção combinada que possibilitem atender as especificidades e singularidades dessa população. Article	2020	Martín-Sánchez, Mario; Fairley, Christopher K; Bradshaw, Catriona S; Chen, Marcus Y; Chow, Eric P F	Meningococcal vaccine uptake among men who have sex with men in response to an invasive meningococcal C disease outbreak in Melbourne, Australia.	Sexually Transmitted Diseases	-	-	-	1472-3263	10.1136/sextrans-2019-054318	https://dx.doi.org/10.1136/sextrans-2019-054318	OBJECTIVE: In 2017, there was an outbreak of invasive meningococcal disease (IMD) serogroup C among men who have sex with men (MSM) in Victoria, Australia. A government-funded free meningococcal (MenACWY) vaccination programme targeting all MSM living in Victoria was launched between December 2017 and December 2018. The aim of this study was to examine the vaccine uptake among MSM attending a sexual health clinic in Melbourne. METHODS: This was a retrospective clinical audit of MSM attending the Melbourne Sexual Health Centre (MSHC) during the vaccination programme. We calculated the proportion of MSM who received the meningococcal vaccine on their first visit and at any time during the programme. We performed univariable and multivariable logistic regression to identify the factors associated with the vaccine uptake on the first visit. RESULTS: Of the 10 370 MSM who attended MSHC, 55.5% received the vaccine on their first visit and 67.4% at any time during the programme. MSM had higher odds of receiving the vaccine on the first visit if they were aged 16-25 years (adjusted OR (aOR) 1.21; 95% CI 1.08 to 1.35) or 26-35 years (aOR 1.17; 95% CI 1.07 to 1.29) in comparison with MSM older than 35 years; were HIV-negative and not on pre-exposure prophylaxis (aOR 1.80; 95% CI 1.56 to 2.09); had more than four male partners in the last 12 months (aOR 1.16; 95% CI 1.06 to 1.27); had male partners only (aOR 2.24; 95% CI 1.96 to 2.55); or were born overseas (aOR 1.11; 95% CI 1.03 to 1.21). CONCLUSIONS: Two-thirds of the MSM attending a sexual health clinic received at least one dose of meningococcal vaccine. The vaccination programme coincided temporally with a dramatic reduction in the incidence of IMD. Vaccination should be further promoted among MSM and men who have sex with both men and women. Article	2020	Maseko B.; Hill L.M.; Phanga T.; Bhushan N.; Vansia D.; Kamtsendero L.; Pettifor A.E.; Bekker L.-G.; Hosseinipour M.C.; Rosenberg N.E.	Perceptions of and interest in HIV pre-exposure prophylaxis use among adolescent girls and young women in Lilongwe, Malawi	PLOS One	-	-	-	19326203	10.1371/journal.pone.0226062	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077765465&doi=10.1371%2fjournal.pone.0226062&partnerID=40&md5=01b763a9a9978ee72da604d08cdcee95	Background Oral Pre-Exposure Prophylaxis (PrEP) is an effective HIV prevention strategy for adherent users. Adolescent girls and young women (AGYW) in sub-Saharan Africa may particularly benefit from PrEP because of the disproportionate burden of HIV in this group. Understanding potential users' perceptions of and interest in using PrEP is critical to promote the utilization of PrEP by individuals at risk of HIV. Methods This qualitative investigation of AGYW's knowledge of and interest in PrEP use was conducted in the context of Girl Power, a quasi-experimental cohort study comparing four models of service delivery at four health centers in Lilongwe, Malawi. We conducted individual in-depth interviews (IDIs) with 40 HIV-negative AGYW ages 15–24 years old six months after enrolment in the parent study. An explanation of PrEP was provided to participants. Interview topics included participants' prior knowledge of, interest in, concerns about, and delivery preferences for PrEP. Analysis consisted of structural coding of interview transcripts corresponding to interview topics, summary of responses within these topics, and identification and description of emerging themes within each topic. Results None of the AGYW had knowledge of PrEP prior to the IDIs, but once explained, a majority expressed an interest in using it due to inconsistencies in condom use, condom use errors, their own or their partners' concurrent sexual partnerships, and rape. Most AGYW hoped that PrEP would be available in youth-friendly sections of health centers for easy access and youth-friendly counselling. They suggested that discrete packaging of PrEP would be needed to ensure user privacy. Concerns about relationship destabilization and accusations of promiscuity were raised as potential barriers to use. Conclusion General interest in PrEP among AGYW was high. Discrete packaging and access to youth-friendly PrEP delivery modalities may facilitate the utilization of PrEP as a prevention strategy among sexually active AGYW. Attention to potential negative reactions from partners and community members to PrEP use will be needed when introducing PrEP to this population. © 2020 Maseko et al. Article	2020	Massud, Ivana; Ruone, Susan; Zlotorzynska, Maria; Haaland, Richard; Mills, Patrick; Cong, Mian-Er; Kelley, Kristen; Johnson, Ryan; Holder, Angela; Dinh, Chuong; Khalil, George; Pan, Yi; Kelley, Colleen F; Sanchez, Travis; Heneine, Walid; García-Lerma, J Gerardo	Single oral dose for HIV pre or post-exposure prophylaxis: user desirability and biological efficacy in macaques.	EBioMedicine	-	-	-	2352-3964	10.1016/j.ebiom.2020.102894	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7381488	BACKGROUND: Daily oral pre- or post-exposure prophylaxis (PrEP or PEP) is highly effective in preventing HIV infection. However, many people find it challenging to adhere to a daily oral regimen. Chemoprophylaxis with single oral doses of antiretroviral drugs taken before or after sex may better adapt to changing or unanticipated sexual practices and be a desirable alternative to daily PrEP or PEP. We investigated willingness to use a single oral pill before or after sex among men who have sex with men (MSM) and assessed the biological efficacy of a potent antiretroviral combination containing elvitegravir (EVG), emtricitabine (FTC), and tenofovir alafenamide (TAF). METHODS: Data on willingness to use single-dose PrEP or PEP were obtained from the 2017 cycle of the American Men's Internet Survey (AMIS), an annual online behavioral surveillance survey of MSM in the United States. Antiretroviral drug levels were measured in humans and macaques to define drug distribution in rectal tissue and identify clinically relevant doses for macaque modeling studies. The biological efficacy of a single dose of FTC/TAF/EVG as PrEP or PEP was investigated using a repeat-challenge macaque model of rectal HIV infection. FINDINGS: Through pharmacokinetic assessment in humans and macaques we found that EVG penetrates and concentrates in rectal tissues supporting its addition to FTC/TAF to boost and extend chemoprophylactic activity. Efficacy estimates for a single oral dose given to macaques 4h before or 2h after SHIV exposure was 91â¢7%35â¢7%-98â¢9% and 100%, respectively, compared to 80â¢1%13â¢9%-95â¢4% and 64â¢6%-19â¢4%-89â¢5% when single doses were given 6 and 24h post challenge, respectively. A two-dose regimen at 24h and 48h after exposure was also protective 77â¢1%1â¢7%-94â¢7%. INTERPRETATION: Informed by user willingness, human and macaque pharmacokinetic data, and preclinical efficacy we show that single-dose prophylaxis before or after sex is a promising HIV prevention strategy. Carefully designed clinical trials are needed to determine if any of these strategies will be effective in humans. FUNDING: Funded by CDC intramural funds, CDC contract HCVJCG2-2016-03948 (to CFK), and a grant from the MAC AIDS Fund and by the National Institutes of Health P30AI050409 - the Emory Center for AIDS Research (to MZ and TS). Article	2020	Matacotta, Joshua J; Rosales-Perez, Francisco J; Carrillo, Christian M	HIV Preexposure Prophylaxis and Treatment as Prevention - Beliefs and Access Barriers in Men Who Have Sex With Men (MSM) and Transgender Women: A Systematic Review.	Journal of Patient-Centered Research and Reviews	-	-	-	2330-0698	10.17294/2330-0698.1737	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7398630	PURPOSE: While the annual rate of new HIV infections and diagnoses has remained stable for most groups, troubling increases are seen in transgender women and racial/ethnic-minority men who have sex with men (MSM), groups that are disproportionately affected by HIV. The primary purpose of this systematic review is to examine factors that impact attitudes and beliefs about preexposure prophylaxis (PrEP) and treatment as prevention (TasP) and to explore barriers to PrEP uptake in MSM and transgender women. METHODS: Using MeSH terms and relevant keywords, we conducted a systematic review of studies published between 2010 and 2019. We searched 4 literature databases and identified studies on MSM and transgender women to elucidate perceptions of PrEP and TasP as well as barriers to access. RESULTS: The search yielded several prominent themes associated with beliefs about HIV prevention approaches and barriers to PrEP access in MSM and transgender women. One was a lack of awareness or insufficient knowledge of PrEP and TasP. Structural barriers and geographic isolation also prevent access to HIV prevention. Sexual minority and HIV-related stigma, internalized homonegativity, and misinterpretations of messages within HIV prevention campaigns have negatively impacted PrEP uptake and beliefs about PrEP and TasP. Quality of the relationship MSM or transgender people have with their health care provider can facilitate or hinder HIV prevention. Finally, variability in beliefs about the efficacy of TasP has negatively affected the impact of TasP messaging campaigns. CONCLUSIONS: Although there is evidence of increasing PrEP use in at-risk individuals, several barriers prevent wider acceptance and uptake. Misunderstanding about the meaning of "undetectable" and skepticism about the evidence behind TasP messaging campaigns are likely to delay the World Health Organization's stated goal of getting to zero transmissions. Article	2020	Matume, Nontokozo D.; Tebit, Denis M.; Bessong, Pascal O.	HIV-1 subtype C predicted co-receptor tropism in Africa: an individual sequence level meta-analysis.	AIDS Research and Therapy	-	-	-	1742-6405	10.1186/s12981-020-0263-x	https://aidsrestherapy.biomedcentral.com/articles/10.1186/s12981-020-0263-x	BACKGROUND: Entry inhibitors, such as Maraviroc, hold promise as components of HIV treatment and/or pre-exposure prophylaxis in Africa. Maraviroc inhibits the interaction between HIV Envelope gp120 V3-loop and CCR5 coreceptor. HIV-1 subtype C (HIV-1-C) is predominant in Southern Africa and preferably uses CCR5 co-receptor. Therefore, a significant proportion of HIV-1-C CXCR4 utilizing viruses (X4) may compromise the effectiveness of Maraviroc. This analysis examined coreceptor preferences in early and chronic HIV-1-C infections across Africa. METHODS: African HIV-1-C Envelope gp120 V3-loop sequences sampled from 1988 to 2014 were retrieved from Los Alamos HIV Sequence Database. Sequences from early infections (< 186 days post infection) and chronic infections (> 186 days post infection) were analysed for predicted co-receptor preferences using Geno2Pheno Coreceptor 10% FPR, Phenoseq-C, and PSSMsinsi web tools. V3-loop diversity was determined, and viral subtype was confirmed by phylogenetic analysis. National treatment guidelines across Africa were reviewed for Maraviroc recommendation. RESULTS: Sequences from early (n = 6316) and chronic (n = 7338) HIV-1-C infected individuals from 10 and 15 African countries respectively were available for analyses. Overall, 518/6316 (8.2%; 95% CI 7.5-9.3) of early sequences were X4, with Ethiopia and Malawi having more than 10% each. For chronic infections, 8.3% (95% CI 2.4-16.2) sequences were X4 viruses, with Ethiopia, Tanzania, and Zimbabwe having more than 10% each. For sequences from early chronic infections (< 1 year post infection), the prevalence of X4 viruses was 8.5% (95% CI 2.6-11.2). In late chronic infections (≥ 5 years post infection), X4 viruses were observed in 36% (95% CI - 16.3 to 49.9), with two countries having relatively high X4 viruses: South Africa (43%) and Malawi (24%). The V3-loop amino acid sequence were more variable in X4 viruses in chronic infections compared to acute infections, with South Africa, Ethiopia and Zimbabwe showing the highest levels of V3-loop diversity. All sequences were phylogenetically confirmed as HIV-1-C and clustered according to their co-receptor tropism. In Africa, Maraviroc is registered only in South Africa and Uganda. CONCLUSIONS: Our analyses illustrate that X4 viruses are present in significantly similar proportions in early and early chronic HIV-1 subtype C infected individuals across Africa. In contrast, in late chronic infections, X4 viruses increase 3-5 folds. We can draw two inferences from our observations: (1) to enhance the utility of Maraviroc in chronic HIV subtype C infections in Africa, prior virus co-receptor determination is needed; (2) on the flip side, research on the efficacy of CXCR4 antagonists for HIV-1-C infections is encouraged. Currently, the use of Maraviroc is very limited in Africa. Article	2020	Mauck D.E.; Fennie K.P.; Ibañez G.E.; Fenkl E.A.; Sheehan D.M.; Maddox L.M.; Spencer E.C.; Trepka M.J.	Estimating the size of HIV-negative MSM population that would benefit from pre-exposure prophylaxis in Florida	Annals of Epidemiology	-	-	-	10472797	10.1016/j.annepidem.2020.02.003	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081251519&doi=10.1016%2fj.annepidem.2020.02.003&partnerID=40&md5=aa1ab1beb9f5c66130a11c32d54370cd	Purpose: This study aimed to estimate the size of the population of men who have sex with men (MSM) in Florida with high-risk behaviors that would indicate eligibility for pre-exposure prophylaxis (PrEP) use. Methods: Three methods were used to estimate the MSM population. Estimates from the three methods were averaged, and the number of MSM living with HIV in each zone improvement plan (ZIP) code was subtracted. Results: The average MSM estimate was 1–2184 men (1.5–22.9%) by ZIP code. The size of the MSM population with indications for PrEP use was highest when using estimates of MSM with more than one sex partner in the past year obtained from the National HIV Behavioral Surveillance system and lowest when the MSM estimate was multiplied by 24.7% (percentage of MSM with PrEP indications from other studies). Conclusion: Areas with high numbers of MSM with PrEP indications could be targeted with information to reduce HIV acquisition. © 2020 Elsevier Inc. Article	2020	Maxwell S.; Gafos M.; Moncrieff M.; Shahmanesh M.; Stirrup O.	Pre-exposure prophylaxis use among men who have sex with men who have experienced problematic chemsex	International journal of STD & AIDS	-	-	-	9564624	10.1177/0956462420906927	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081542419&doi=10.1177%2f0956462420906927&partnerID=40&md5=116c77af468bb33a96ccefbd1d67d2fe	Men who have sex with men (MSM) who experience problematic chemsex are at high risk of acquiring HIV due to combined drug use and sexual behaviours. Pre-exposure prophylaxis (PrEP) could substantially reduce the risk of HIV transmission in this group of men. The aim of this study was to examine the biopsychosocial characteristics associated with PrEP use among HIV-negative MSM who have experienced problematic chemsex. This was a cross-sectional analysis of secondary data collected during client assessments at a specialist alcohol and drug service based within the United Kingdom. We compared the socio-demographics, substance use, sexual behaviours and mental health of MSM who reported ever using PrEP to those who reported never using PrEP. Statistical analysis was conducted using the Mann–Whitney U-test for continuous variables and Fisher's exact test for categorical variables. Between August 2016 and July 2018, 165 HIV-negative MSM who engaged in chemsex had an assessment completed. Thirty-four per cent (n = 50/145) had ever used PrEP. The median age was 36 years (IQR: 30–42), 92% identified as gay (n = 152/165) and 79% were of white ethnicity (n = 130/164). The use of crystal methamphetamine was associated with higher levels of men ever using PrEP (40% versus 21%) (p= 0.047). Men who had ever used PrEP had a higher median number of sexual partners in the previous three months (20 versus 10) (p= 0.004) and had lower level of condom use in their sex lives (median reported 5% versus 50%) (p= 0.010) in comparison to men who had never used PrEP. It is encouraging that men having higher-risk sex had been accessing PrEP. However, further research is required to explore PrEP uptake, retention and adherence in this high-risk group. © The Author(s) 2020.	chemsex; HIV; Men who have sex with men; pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative
Article	2020	Mayer K.H.; Agwu A.; Malebranche D.	Barriers to the Wider Use of Pre-exposure Prophylaxis in the United States: A Narrative Review	Advances in Therapy	-	-	-	0741238X	10.1007/s12325-020-01295-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083091950&doi=10.1007%2fs12325-020-01295-0&partnerID=40&md5=2e336943a0907469bf394a89466e152b	Abstract: Antiretroviral pre-exposure prophylaxis (PrEP) to prevent HIV transmission was first approved by the US Food and Drug Administration in 2012. Despite correlations of decreases in new HIV infections being greatest where PrEP has been deployed, the uptake of PrEP is lagging, particularly among populations with disproportionate HIV burden. This narrative review seeks to identify individual and systemic barriers to PrEP usage in the USA. A comprehensive search of recent literature uncovered a complex array of structural, social, clinical, and behavioral barriers, including knowledge/awareness of PrEP, perception of HIV risk, stigma from healthcare providers or family/partners/friends, distrust of healthcare providers/systems, access to PrEP, costs of PrEP, and concerns around PrEP side effects/medication interactions. Importantly, these barriers may have different effects on specific populations at risk. The full potential of PrEP for HIV prevention will not be realized until these issues are addressed. Strategies to achieve this goal should include educational interventions, innovative approaches to delivery of HIV care, financial support, and destigmatization of PrEP and PrEP users. Until then, PrEP uptake will continue to be suboptimal, particularly among those who need it most. © 2020, The Author(s). Article	2020	Mayer, Kenneth H; Molina, Jean-Michel; Thompson, Melanie A; Anderson, Peter L; Mounzer, Karam C; De Wet, Joss J; DeJesus, Edwin; Jessen, Heiko; Grant, Robert M; Ruane, Peter J; Wong, Pamela; Ebrahimi, Ramin; Zhong, Lijie; Mathias, Anita; Callebaut, Christian; Collins, Sean E; Das, Moupali; McCallister, Scott; Brainard, Diana M; Brinson, Cynthia; Clarke, Amanda; Coll, Pep; Post, Frank A; Hare, C Bradley	Emtricitabine and tenofovir alafenamide vs emtricitabine and tenofovir disoproxil fumarate for HIV pre-exposure prophylaxis (DISCOVER): primary results from a randomised, double-blind, multicentre, active-controlled, phase 3, non-inferiority trial.	The Lancet	-	-	-	1474-547X	10.1016/S0140-6736(20)31065-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9665936	BACKGROUND: Tenofovir alafenamide shows high antiviral efficacy and improved renal and bone safety compared with tenofovir disoproxil fumarate when used for HIV treatment. Here, we report primary results from a blinded phase 3 study evaluating the efficacy and safety of pre-exposure prophylaxis (PrEP) with emtricitabine and tenofovir alafenamide versus emtricitabine and tenofovir disoproxil fumarate for HIV prevention. METHODS: This study is an ongoing, randomised, double-blind, multicentre, active-controlled, phase 3, non-inferiority trial done at 94 community, public health, and hospital-associated clinics located in regions of Europe and North America, where there is a high incidence of HIV or prevalence of people living with HIV, or both. We enrolled adult cisgender men who have sex with men and transgender women who have sex with men, both with a high risk of acquiring HIV on the basis of their self-reported sexual behaviour in the past 12 weeks or their recent history (within 24 weeks of enrolment) of bacterial sexually transmitted infections. Participants with current or previous use of PrEP with emtricitabine and tenofovir disoproxil fumarate were not excluded. We used a computer-generated random allocation sequence to randomly assign (1:1) participants to receive either emtricitabine (200 mg) and tenofovir alafenamide (25 mg) tablets daily, with matched placebo tablets (emtricitabine and tenofovir disoproxil fumarate group), or emtricitabine (200 mg) and tenofovir disoproxil fumarate (300 mg) tablets daily, with matched placebo tablets (emtricitabine and tenofovir alafenamide group). As such, all participants were given two tablets. The trial sponsor, investigators, participants, and the study staff who provided the study drugs, assessed the outcomes, and collected the data were masked to group assignment. The primary efficacy outcome was incident HIV infection, which was assessed when all participants had completed 48 weeks of follow-up and half of all participants had completed 96 weeks of follow-up. This full analysis set included all randomly assigned participants who had received at least one dose of the assigned study drug and had at least one post-baseline HIV test. Non-inferiority of emtricitabine and tenofovir alafenamide to emtricitabine and tenofovir disoproxil fumarate was established if the upper bound of the 95·003% CI of the HIV incidence rate ratio (IRR) was less than the prespecified non-inferiority margin of 1·62. We prespecified six secondary bone mineral density and renal biomarker safety endpoints to evaluate using the safety analysis set. This analysis set included all randomly assigned participants who had received at least one dose of the assigned study drug. This trial is registered with ClinicalTrials.gov, NCT02842086, and is no longer recruiting. FINDINGS: Between Sept 13, 2016, and June 30, 2017, 5387 (92%) of 5857 participants were randomly assigned and received emtricitabine and tenofovir alafenamide (n=2694) or emtricitabine and tenofovir disoproxil fumarate (n=2693). At the time of the primary efficacy analysis (ie, when all participants had completed 48 weeks and 50% had completed 96 weeks) emtricitabine and tenofovir alafenamide was non-inferior to emtricitabine and tenofovir disoproxil fumarate for HIV prevention, as the upper limit of the 95% CI of the IRR, was less than the prespecified non-inferiority margin of 1·62 (IRR 0·47 95% CI 0·19-1·15). After 8756 person-years of follow-up, 22 participants were diagnosed with HIV, seven participants in the emtricitabine and tenofovir alafenamide group (0·16 infections per 100 person-years 95% CI 0·06-0·33), and 15 participants in the emtricitabine and tenofovir disoproxil fumarate group (0·34 infections per 100 person-years 0·19-0·56). Both regimens were well tolerated, with a low number of participants reporting adverse events that led to discontinuation of the study drug (36 1% of 2694 participants in the emtricitabine and tenofovir alafenamide group vs 49 2% of 2693 participants in the emtricitabine and tenofovir disoproxil fumarate group). Emtricitabine and tenofovir alafenamide was superior to emtricitabine and tenofovir disoproxil fumarate in all six prespecified bone mineral density and renal biomarker safety endpoints. INTERPRETATION: Daily emtricitabine and tenofovir alafenamide shows non-inferior efficacy to daily emtricitabine and tenofovir disoproxil fumarate for HIV prevention, and the number of adverse events for both regimens was low. Emtricitabine and tenofovir alafenamide had more favourable effects on bone mineral density and biomarkers of renal safety than emtricitabine and tenofovir disoproxil fumarate. Article	2020	Mayeux J.J.; Ng Y.C.; Bice M.M.	Outcomes From an Urgent Care Pre-exposure Prophylaxis Protocol for the Prevention of HIV	Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000178	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85093539401&doi=10.1097%2fJNC.0000000000000178&partnerID=40&md5=e4fa87af1d3aabb948a8f294e6060800	Pre-exposure prophylaxis (PrEP) and urgent care medical providers can be powerful allies when combined in the fight against HIV infection. Unfortunately, PrEP use in the urgent care setting is underused due to a lack of resources, provider staff knowledge, and comfort on the part of providers. An urgent care-specific PrEP protocol was developed, and 29 providers from six different urgent care facilities in Louisiana participated in a 20-week quality improvement project. The developed urgent care-specific PrEP protocol resulted in an increase in knowledge and comfort and a reduction in barriers associated with PrEP use. Overall, the urgent care PrEP protocol showed the ability to assist the urgent care clinician in many areas previously noted in research as reasons for reduced PrEP use. The urgent care PrEP protocol serves as an additional tool for the urgent care providers in HIV biomedical preventative care. The results of this project are reported using the Standards of Quality Improvement Reporting Excellence. Copyright © 2019 Association of Nurses in AIDS Care. Article	2020	Mbewe, Londeka; Govender, Eliza	Male partners' influence on women's acceptance and use of PrEP products across two high HIV-burdened districts in South Africa.	African Journal of AIDS Research	-	-	-	1727-9445	10.2989/16085906.2020.1727932	https://dx.doi.org/10.2989/16085906.2020.1727932	The demonstrated efficacy of pre-exposure prophylaxis (PrEP) has brought hope of controlling the epidemic among women with limited HIV preventation options. Several studies have demonstrated the importance of male partner involvement in female sexual and reproductive health but there is limited research on male involvement in the adoption of HIV prevention methods among women. Using a culture-centred approach, this article discusses perceptions of female-initiated HIV prevention methods among men and women. The data were collected using eight sex-specific focus group discussions with a sample of men and women aged between 18 and 49 years from selected urban and rural settings in two provinces of South Africa, KwaZulu-Natal and Mpumalanga. Thematic analysis was utilised to identify four key themes: increased infidelity in relationships and risky behaviour; association of PrEP with casual relationships; a partner's right to know that women are reducing their risk of HIV infection; and that men need to engage in decision-making on HIV risk reduction. The article highlights the importance of partner engagement and knowledge sharing of female-initiated prevention methods as part of a combination HIV-prevention strategy, and the urgency of creating enabling environments to utilise female-initiated methods. Article	2020	Mboup A.; Béhanzin L.; Guédou F.; Giguère K.; Geraldo N.; Zannou D.M.; Kêkê R.K.; Bachabi M.; Gangbo F.; Affolabi D.; Marzinke M.A.; Hendrix C.; Diabaté S.; Alary M.	Comparison of adherence measurement tools used in a pre-exposure prophylaxis demonstration study among female sex workers in Benin	Medicine (United States)	-	-	-	257974	10.1097/MD.0000000000020063	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085677425&doi=10.1097%2fMD.0000000000020063&partnerID=40&md5=e32e3ea581591f16defcaec9e65901a0	Background:Measuring adherence to PrEP (pre-exposure prophylaxis) remains challenging. Biological adherence measurements are reported to be more accurate than self-reports and pill counts but can be expensive and not suitable on a daily basis in resource-limited countries. Using data from a demonstration project on PrEP among female sex workers in Benin, we aimed to measure adherence to PrEP and compare self-report and pill count adherence to tenofovir (TFV) disoproxil fumarate (TDF) concentration in plasma to determine if these 2 measures are reliable and correlate well with biological adherence measurements.Methods:Plasma TFV concentrations were analyzed in samples collected at day 14 follow-up visit and months 6, 12, 18, and 24 (or at last visit when follow-up was shorter). Self-reported adherence was captured at day 14 follow-up visit and then quarterly by asking participants to report the number of missed pills within the last week. For pill count, medications were refilled monthly and participants were asked to bring in their medication bottles at each follow-up visit. Using generalized estimating equations adherence measured by self-report and pill count was compared to plasma drug concentrations.Results:Of 255 participants, 47.1% completed follow-up. Weighted optimal adherence combining data from all visits was 26.8% for TFV concentration, 56.0% by self-report and 18.9% by pill count. Adherence measured by both TFV concentrations and self-report decreased over time (P=.009 and P=.019, respectively), while the decreasing trend in adherence by pill count was not significant (P=.087). The decrease in adherence was greater using TFV concentrations than the other 2 adherence measures.Conclusion:With high levels of misreporting of adherence using self-report and pill count, the objective biomedical assessment of adherence via laboratory testing is optimal and more accurately reflects PrEP uptake and persistence. Alternative inexpensive and accurate approaches to monitor PrEP adherence should be investigated. © 2020 Lippincott Williams and Wilkins. Article	2020	McCree, Donna Hubbard; Byrd, Kathy K; Johnston, Marie; Gaines, Malendie; Weidle, Paul J	Roles for Pharmacists in the "Ending the HIV Epidemic: A Plan for America" Initiative.	Public Health Reports	-	-	-	1468-2877	10.1177/0033354920941184	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7485061	In 2019, President Trump announced a new initiative, Ending the HIV Epidemic: A Plan for America (EHE). EHE will use 3 key strategies-diagnose, treat, and prevent-to reduce new HIV infections at least 90% by 2030, as well as new laboratory methods and epidemiological techniques to respond quickly to potential outbreaks. Partnerships are an important component in the initiative's success. Pharmacists and pharmacies can play important roles in EHE, including dispensing antiretroviral therapy and providing HIV screening, adherence counseling, medication therapy management, preexposure prophylaxis, and nonprescription syringe sales. The objective of this report is to discuss potential roles that pharmacists and pharmacies can play under the key strategies of EHE. Article	2020	McFarland W.; Lin J.; Santos G.-M.; Arayasirikul S.; Raymond H.F.; Wilson E.	Low PrEP Awareness and Use Among People Who Inject Drugs, San Francisco, 2018	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-019-02682-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074014876&doi=10.1007%2fs10461-019-02682-7&partnerID=40&md5=22ca8988090d3cb22c12e5d7498effa9	We examined PrEP awareness and use among people who inject drugs (PWID) in San Francisco in 2018. Of 397 respondents not known to be HIV positive, 56.7% had heard of PrEP, 38.9% knew that PrEP can prevent HIV transmission from sharing injection equipment, 13.6% had discussed PrEP with a health care provider, and 3.0% had used PrEP in the last 12 months. All seven male PWID who had used PrEP were also men who had sex with men. There is urgent need to improve messaging on PrEP's effectiveness for PWID and to tailor ways of engaging PWID in PrEP programs. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	McMahan V.M.; Moreno C.; Al-Tayyib A.; Menza T.W.; Orellana E.R.; Bhattarai A.; Stekler J.D.; Glick S.N.	Pre-exposure Prophylaxis Awareness and Use among Cisgender Men Who Have Sex with Men and Use Methamphetamine in 3 Western US Cities	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001128	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081944458&doi=10.1097%2fOLQ.0000000000001128&partnerID=40&md5=fcfe6b57616e25cb30443a81bdb24609	Background In the United States, cisgender men who have sex with men (MSM) who use methamphetamine are at substantial risk for HIV and can benefit from pre-exposure prophylaxis (PrEP). Methods We used data from the National HIV Behavioral Surveillance 2017 survey from Seattle, WA; Portland, OR; and Denver, CO, to estimate PrEP awareness and use in the past 12 months among MSM who use methamphetamine. We then compared these estimates with participants who do not use methamphetamine but meet other criteria for PrEP use (i.e., condomless anal sex or a bacterial sexually transmitted infection). We explored reasons for not using PrEP and challenges using PrEP. Results Of the 1602 MSM who participated in the 2017 National HIV Behavioral Surveillance survey in Seattle, WA; Portland, OR; and Denver, CO, 881 met the inclusion criteria for this study, of whom 88 (10%) reported methamphetamine use in the past 12 months. Most (95%) participants had heard of PrEP, and 35% had used it in the past 12 months. Pre-exposure prophylaxis awareness was lower among MSM who used methamphetamine (P = 0.01), but use was not different (P = 0.26). Among those who had not used PrEP, the most common reason for not using it was not thinking one's HIV risk was high enough (51%). Men who have sex with men who used methamphetamine were more likely to report that they were not sure PrEP would prevent them from getting HIV (38% vs. 19%, P = 0.002). Conclusions These results highlight the need for continued efforts to educate and promote PrEP uptake among MSM, particularly those who use methamphetamine. © Lippincott Williams & Wilkins. Article	2020	McMahan, Vanessa M; Frank, Noah; Buckler, Smitty; Violette, Lauren R; Baeten, Jared M; Banta-Green, Caleb J; Barnabas, Ruanne V; Simoni, Jane; Stekler, Joanne D	Protocol Development for HMU! (HIV Prevention for Methamphetamine Users), a Study of Peer Navigation and Text Messaging to Promote Pre-Exposure Prophylaxis Adherence and Persistence Among People Who Use Methamphetamine: Qualitative Focus Group and Interview Study.	JMIR Formative Research	-	-	-	2561-326X	10.2196/18118	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7522731	BACKGROUND: Cisgender men who have sex with men (MSM) and transgender people (TGP) who use methamphetamine are disproportionately impacted by HIV acquisition. Pre-exposure prophylaxis (PrEP) is highly effective at preventing HIV, and interventions that support PrEP persistence and adherence should be evaluated among MSM and TGP who use methamphetamine. OBJECTIVE: We conducted formative work to inform the development of text messaging and peer navigation interventions to support PrEP persistence and adherence among MSM and TGP who use methamphetamine. In this paper, we describe how the findings from these focus groups and interviews were used to refine the study interventions and protocol for the Hit Me Up! study (HMU!; HIV Prevention in Methamphetamine Users). METHODS: Between October 2017 and March 2018, we conducted two focus groups and three in-depth interviews with MSM and TGP who use methamphetamine or who have worked with people who use methamphetamine. During these formative activities, we asked participants about their opinions on the proposed interventions, education and recruitment materials, and study design. We focused on how we could develop peer navigation and text messaging interventions that would be culturally appropriate and acceptable to MSM and TGP who use methamphetamine. Transcripts were reviewed by two authors who performed a retrospective content analysis to describe which specific opinions and recommendations influenced protocol development and the refinement of the interventions. RESULTS: Overall, participants thought that MSM and TGP would be interested in participating in the study, although they expected recruitment and retention to be challenging. Participants thought that the peer navigator should be someone who is nonjudgmental, has experience with people who use methamphetamine, and is patient and flexible. There was consensus that three text messages per day were appropriate, adherence reminders should be straightforward, all messages should be nonjudgmental, and participants should be able to tailor the timing and content of the text messages. These suggestions were incorporated into the study interventions via the hiring and training process and into the development of the text library, platform selection, and customizability of messages. CONCLUSIONS: It is important to include the opinions and insights of populations most impacted by HIV to develop PrEP interventions with the greatest chance of success. Our formative work generated several recommendations that were incorporated into the interventions and protocol development for our ongoing study. Article	2020	McMahan, Vanessa M; Violette, Lauren R; Andrasik, Michele P; Martin, Aleks; Garske, Lindsay; Stekler, Joanne D	'I make sure my doctor doesn't know that I use meth': perceived barriers to pre-exposure prophylaxis (PrEP) uptake among community peer educators in Seattle (WA, USA).	Sexual Health	-	-	-	1449-8987	10.1071/SH19083	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9677806	Background HIV disproportionately affects cisgender men and transgender people who have sex with men (MSM/TG) and use methamphetamine. Pre-exposure prophylaxis (PrEP) uptake has been slow in this group. It is important to understand perceptions about PrEP and barriers to its use among MSM/TG who use methamphetamine to reduce new HIV infections. METHODS: We conducted four focus groups with peer educators of a harm reduction program. We assessed their perspectives of PrEP and barriers across the PrEP continuum among MSM/TG who use methamphetamine. RESULTS: Notably, stigma related to the multiple marginalised identities of MSM/TG who use methamphetamine (e.g. MSM/TG-related stigma, methamphetamine-related stigma) was a barrier at each step. We developed a framework that combined the PrEP continuum and a stigma-based treatment cascade to explore these themes and describe the effects of stigma on PrEP engagement. Methamphetamine-related barriers were also identified. CONCLUSIONS: The findings of this study emphasise the importance of incorporating stigma reduction into PrEP delivery for MSM/TG who use methamphetamine. Article	2020	Mcmanus H.; Grulich A.E.; Amin J.; Selvey C.; Vickers T.; Bavinton B.; Zablotska I.; Vaccher S.; Jin F.; Holden J.; Price K.; Yeung B.; Cabrera Quichua G.; Ogilvie E.; Mcnulty A.; Smith D.; Guy R.	Comparison of Trends in Rates of Sexually Transmitted Infections before vs after Initiation of HIV Preexposure Prophylaxis among Men Who Have Sex with Men	JAMA Network Open	-	-	-	25743805	10.1001/jamanetworkopen.2020.30806	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099075935&doi=10.1001%2fjamanetworkopen.2020.30806&partnerID=40&md5=ccb9f198da7668abbb2cd06f3073905f	Importance: There have been concerns that HIV preexposure prophylaxis (PrEP) may be associated with increases in sexually transmitted infections (STIs) because of subsequent reductions in condom use and/or increases in sexual partners. Objective: To determine trends in STI test positivity among high-risk men who have sex with men (MSM) before and after the start of HIV PrEP. Design, Setting, and Participants: A before-after analysis was conducted using a subcohort of a single-group PrEP implementation study cohort in New South Wales, Australia (Expanded PrEP Implementation in Communities in New South Wales EPIC-NSW), from up to 1 year before enrollment if after January 1, 2015, and up to 2 years after enrollment and before December 31, 2018. STI testing data were extracted from a network of 54 sexual health clinics and 6 primary health care clinics Australia-wide, using software to deidentify, encrypt, and anonymously link participants between clinics. A cohort of MSM dispensed PrEP for the first time during the study, with 2 or more STI tests in the prior year and who tested during follow-up, were included from the EPIC-NSW cohort of HIV-negative participants with high-risk sexual behavior. Data analysis was performed from June to December 2019. Exposures: Participants were dispensed coformulated tenofovir disoproxil fumarate (300 mg) and emtricitabine (200 mg) as HIV PrEP. Main Outcomes and Measures: The main outcome was STI, measured using test positivity, defined as the proportion of participants testing positive for an STI at least once per quarter of follow-up. Outcomes were calculated for Chlamydia trachomatis and Neisseria gonorrhoeae by site of infection (anorectal, pharyngeal, urethral, or any) and for syphilis. Results: Of the EPIC-NSW cohort of 9709 MSM, 2404 were included in the before-after analysis. The mean (SD) age of the participants was 36 (10.4) years, and 1192 (50%) were Australia-born. STI positivity was 52% in the year after PrEP (23.3% per quarter; 95% CI, 22.5%-24.2% per quarter) with no significant trend (mean rate ratio RR increase of 1.01 per quarter 95% CI, 0.99-1.02; P =.29), compared with 50% positivity in the year prior to PrEP (20.0% per quarter 95% CI, 19.04%-20.95% per quarter; RR for overall STI positivity, 1.17 95% CI, 1.10-1.24; P <.001), with an increase in quarterly STI positivity (mean RR of 1.08 per quarter, or an 8% increase per quarter 95% CI, 1.05-1.11; P <.001; RR, 0.93 95% CI, 0.90-0.96; P <.001). Findings were similar when stratified by specific STIs and anatomical site. Conclusions and Relevance: STI rates were high but stable among high-risk MSM while taking PrEP, compared with a high but increasing trend in STI positivity before commencing PrEP. These findings suggest the importance of considering trends in STIs when describing how PrEP use may be associated with STI incidence. © 2020 Royal Society of Chemistry. All rights reserved. Article	2020	McManus, Kathleen A; Powers, Samuel; Killelea, Amy; Tello-Trillo, Sebastian; Elizabeth Rogawski McQuade	Regional Disparities in Qualified Health Plans' Prior Authorization Requirements for HIV Pre-exposure Prophylaxis in the United States	JAMA Health Forum	-	-	-	NA	10.1001/jamanetworkopen.2020.7445	https://www.proquest.com/scholarly-journals/regional-disparities-qualified-health-plans-prior/docview/2681065108/se-2?accountid=8113	Importance With the goal of ending the HIV epidemic in the United States, access to HIV pre-exposure prophylaxis (PrEP) is essential to help curb new HIV infections. There has been differential uptake of PrEP by region, with the South lagging behind other regions. Discriminatory benefit design (benefit design that prevents or delays people with complex or expensive conditions from obtaining appropriate treatment) through prior authorization requirements could be a systemic barrier that contributes to the decreased PrEP uptake in the South. Objectives To investigate whether there are regional disparities in prior authorization requirements for combined tenofovir disoproxil fumarate and emtricitabine for qualified health plans (QHPs) and to assess whether any QHP characteristics explain the disparities. Design, Setting, and Participants This design was a cross-sectional study of QHPs offered in the 2019 Affordable Care Act Marketplace. The QHPs studied included all Affordable Care Act–compliant individual and small-group market plans in the United States. Exposures The primary exposure was the 4 census regions (Northeast, West, Midwest, and South). Additional covariates included other plan characteristics. Main Outcomes and Measures Prior authorization requirement for combined tenofovir disoproxil fumarate and emtricitabine at the QHP level. Results In total, 16 853 QHPs were analyzed (18.2% in the Northeast, 19.5% in the West, 25.0% in the Midwest, and 37.3% in the South). Overall, 18.9% of QHPs required prior authorization for combined tenofovir disoproxil fumarate and emtricitabine. This percentage varied by region, with 2.3%, 6.2%, 13.3%, and 37.3% of plans requiring prior authorization in the Northeast, West, Midwest, and South, respectively. Compared with QHPs in the Northeast, QHPs in the South were 15.89 (95% CI, 12.57-20.09) times as likely to require prior authorization, whereas the Midwest and West were 5.69 (95% CI, 4.45-7.27) and 2.65 (95% CI, 2.02-3.47) times as likely, respectively. Other plan characteristics did not account for the regional variation. Conclusions and Relevance Compared with QHPs in the Northeast, QHPs in the South were almost 16 times as likely to require prior authorization for PrEP, and the reasons for these disparities are unknown. The prior authorization requirement is a possible barrier to PrEP access in the South, which is the region of the United States with the most annual new HIV diagnoses. There is limited regulation of QHPs' prior authorization requirements. Federal- or state-level health policy laws may be necessary to remove this system-level barrier to ending the HIV epidemic in the United States. Article	2020	Meireles P.; Plankey M.; Rocha M.; Brito J.; Mendão L.; Barros H.	Different guidelines for pre-exposure prophylaxis (PrEP) eligibility estimate HIV risk differently: An incidence study in a cohort of HIV-negative men who have sex with men, Portugal, 2014-2018	Eurosurveillance	-	-	-	1025496X	10.2807/1560-7917.ES.2020.25.28.1900636	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088521008&doi=10.2807%2f1560-7917.ES.2020.25.28.1900636&partnerID=40&md5=44453bef9bd55da8631d91cc6615c776	Introduction: Guidelines for pre-exposure prophylaxis (PrEP) provide criteria to identify individuals at higher risk of HIV infection. We compared the ability to predict HIV seroconversion of four guidelines: The World Health Organization (WHO), the United States Public Health Service and Centers for Disease Control and Prevention (US CDC), the European AIDS Clinical Society (EACS) and the Portuguese National Health Service (PNHS). Aim: We aimed to measure the association between guideline-specific eligibility and HIV seroconversion. Methods: We studied 1,254 participants from the Lisbon Cohort of men who have sex with men with at least two evaluations between March 2014 and March 2018, corresponding to 1,724.54 person-years (PY) of follow-up. We calculated incidence rates (IR) according to each guideline eligibility definition and incident rate ratios (IRR) to test the association between eligibility at baseline and HIV seroconversion. Results: We found 28 incident cases (IR: 1.62/100 PY; 95% confidence interval (CI) 1.12- 2.35). Guidelines' sensitivity varied from 60.7% (EACS) to 85.7% (PNHS) and specificity varied from 31.8% (US CDC) to 51.5% (EACS). IR was highest among those defined as eligible by the PNHS guideline (2.46/100 PY; IRR = 4.61; 95% CI: 1.60-13.27) and lowest for the WHO guideline (1.89/100 PY; IRR = 1.52; 95% CI: 0.69- 3.35). Conclusions: Being identified as eligible for PrEP was associated with a higher risk of infection. The magnitude of risk varied according to the guideline used. However, the number of HIV infections identified among ineligible participants highlights the potential for missing people who need PrEP. © 2020 European Centre for Disease Prevention and Control (ECDC). Article	2020	Meireles, P; Plankey, M; Rocha, M; Rojas, J; Brito, J; Barros, H	Eligibility for Pre-exposure Prophylaxis According to Different Guidelines in a Cohort of HIV-Negative Men Who Have Sex with Men in Lisbon, Portugal	Sexuality Research & Social Policy	-	-	-	1868-9884	10.1007/s13178-019-00426-9	https://link.springer.com/article/10.1007/s13178-019-00426-9	Defining eligibility for preexposure prophylaxis (PrEP) is key to measuring the degree of PrEP implementation. While the clinical exclusion criteria are identical across different guidelines, definitions of substantial HIV risk are not. In this study, we aimed to estimate the proportion of men who have sex with men (MSM) being tested at a community-based voluntary human immunodeficiency virus (HIV) counseling and testing center in Lisbon that would be eligible for PrEP according to guidelines from the World Health Organization (WHO), the US Public Health Service and Centers for Disease Control and Prevention (US-CDC), the European AIDS Clinical Society (EACS), and the Portuguese National Health Service (PNHS). We used baseline data from 3392 HIV-negative MSM with valid information on eligibility for PrEP enrolled in the Portuguese Lisbon Cohort of MSM-an observational study designed as an open prospective, noninterventional cohort-between March 2014 and March 2018. At baseline, the proportion of MSM eligible for PrEP was 67.7% according to the US-CDC, 60.6% according to the PNHS guidelines, 58.9% according to the WHO, and 46.5% according to the EACS guidelines. The most frequently met criteria were those related to condomless anal intercourse. In conclusion, in the same population, the proportion of men eligible for PrEP differed by guideline, ranging from 46.5% to 67.7%, though if they all seem to include the same well-known predictors of HIV seroconversion. Article	2020	Melendez-Torres G.J.; Noori T.; Pharris A.; Spiteri G.; Garner A.; Alba B.; Bourne A.	Country level homophobia and protective sexual health behaviours among HIV negative or untested men who have sex with men in 45 countries	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1766662	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085339709&doi=10.1080%2f09540121.2020.1766662&partnerID=40&md5=1a738751206375dc5103ff18c2eeee46	Despite new, effective biomedical technologies to prevent the transmission of HIV, social and structural factors still impact the opportunity for gay, bisexual and other men who have sex with men (GBMSM) to access safe sexual health services. Within this paper we describe findings of a pilot analysis that seeks to identify relationships between country level homophobia, individual-level sexualised drug use and key sexual health protective behaviours in a sample of HIV negative men from 45 countries recruited via a large online survey. Responses to questions relating to HIV and STI testing history, use of pre-exposure prophylaxis (PrEP), post-exposure prophylaxis (PEP) and engagement in sexualised drug use were treated as dependent variables with generalised linear mixed-effects model with logit link analysis, with country level homophobia (drawn from a recently published international index) operating as the dependent variable. In total, data from 9,356 respondents were included for analysis. Overall, uptake of behaviours known to be protective of sexual health overall was significantly lower in countries with high levels of homophobia. This paper is unique in linking a robust measure of country-level homophobia to engagement in health protective behaviours on a large-scale, multi-country level basis. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	chemsex; HIV testing; Homophobia; MSM; PrEP	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative

Long-acting rilpivirine (RPV) preexposure prophylaxis does not inhibit vaginal transmission of RPV-resistant HIV-1 or select for high-frequency drug resistance in humanized mice	Journal of Virology	-	-	-	0022538X	10.1128/JVI.01912-19	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082780341&doi=10.1128%2fJVI.01912-19&partnerID=40&md5=aa03fe322e6138c3e3b5a1f2fb347b91	As a long-acting formulation of the nonnucleoside reverse transcriptase inhibitor rilpivirine (RPV LA) has been proposed for use as preexposure prophylaxis (PrEP) and the prevalence of transmitted RPV-resistant viruses can be relatively high, we evaluated the efficacy of RPV LA to inhibit vaginal transmission of RPV-resistant HIV-1 in humanized mice. Vaginal challenges of wild-type (WT), Y181C, and Y181V HIV-1 were performed in mice left untreated or after RPV PrEP. Plasma viremia was measured for 7 to 10 weeks, and single-genome sequencing was performed on plasma HIV-1 RNA in mice infected during PrEP. RPV LA significantly prevented vaginal transmission of WT HIV-1 and Y181C HIV-1, which is 3-fold resistant to RPV. However, it did not prevent transmission of Y181V HIV-1, which has 30-fold RPV resistance in the viruses used for this study. RPV LA did delay WT HIV-1 dissemination in infected animals until genital and plasma RPV concentrations waned. Animals that became infected despite RPV LA PrEP did not acquire new RPV-resistant mutations above frequencies in untreated mice or untreated people living with HIV-1, and the mutations detected conferred low-level resistance. These data suggest that high, sustained concentrations of RPV were required to inhibit vaginal transmission of HIV-1 with little or no resistance to RPV but could not inhibit virus with high resistance. HIV-1 did not develop high-level or high-frequency RPV resistance in the majority of mice infected after RPV LA treatment. However, the impact of low-frequency RPV resistance on virologic outcome during subsequent antiretroviral therapy still is unclear. IMPORTANCE The antiretroviral drug rilpivirine was developed into a long-acting formulation (RPV LA) to improve adherence for preexposure prophylaxis (PrEP) to prevent HIV-1 transmission. A concern is that RPV LA will not inhibit transmission of drug-resistant HIV-1 and may select for drug-resistant virus. In female humanized mice, we found that RPV LA inhibited vaginal transmission of WT or 3-fold RPV-resistant HIV-1 but not virus with 30-fold RPV resistance. In animals that became infected despite RPV LA PrEP, WT HIV-1 dissemination was delayed until genital and plasma RPV concentrations waned. RPV resistance was detected at similar low frequencies in untreated and PrEP-treated mice that became infected. These results indicate the importance of maintaining RPV at a sustained threshold after virus exposure to prevent dissemination of HIV-1 after vaginal infection and low-frequency resistance mutations conferred low-level resistance, suggesting that RPV resistance is difficult to develop after HIV-1 infection during RPV LA PrEP. Article	2020	Menza, Timothy W; Lipira, Lauren; Bhattarai, Amisha; Leon, Victoria Cali-De; Orellana, E Roberto	Prevalence and correlates of transactional sex among women of low socioeconomic status in Portland, OR.	BMC Women's Health	-	-	-	1472-6874	10.1186/s12905-020-01088-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7532610	BACKGROUND: Women who report transactional sex are at increased risk for HIV and other sexually transmitted infections (STIs). However, in the United States, social, behavioral, and trauma-related vulnerabilities associated with transactional sex are understudied and data on access to biomedical HIV prevention among women who report transactional sex are limited. METHODS: In 2016, we conducted a population-based, cross-sectional survey of women of low socioeconomic status recruited via respondent-driven sampling in Portland, Oregon. We calculated the prevalence and, assessed the correlates of, transactional sex using generalized linear models accounting for sampling design. We also compared health outcomes, HIV screening, and knowledge and uptake of HIV pre-exposure prophylaxis (PrEP) between women who did and did not report transactional sex. RESULTS: Of 334 women, 13.6% reported transactional sex (95% confidence interval CI: 6.8, 20.5%). Women who reported transactional sex were older, more likely to identify as black, to identify as lesbian or bisexual, to experience childhood trauma and recent sexual violence, and to have been homeless. Six percent (95% CI: 1.8, 10.5%) of women with no adverse childhood experiences (ACEs) reported transactional sex compared to 23.8% (95% CI: 13.0, 34.6%) of women who reported eleven ACEs (P < 0.001). Transactional sex was strongly associated with combination methamphetamine and opiate use as well as condomless sex. Women who reported transactional sex were more likely to report being diagnosed with a bacterial STI and hepatitis C; however, HIV screening and pre-exposure prophylaxis knowledge and use were low. CONCLUSIONS: In a sample of women of low socioeconomic status in Portland, Oregon, transactional sex was characterized by marginalized identities, homelessness, childhood trauma, sexual violence, substance use, and sexual vulnerability to HIV/STI. Multi-level interventions that address these social, behavioral, and trauma-related factors and increase access to biomedical HIV prevention are critical to the sexual health of women who engage in transactional sex. Article	2020	Meyers K.; Price D.; Golub S.	Behavioral and social science research to support accelerated and equitable implementation of long-acting preexposure prophylaxis	Current Opinion in HIV and AIDS	-	-	-	1746630X	10.1097/COH.0000000000000596	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075963489&doi=10.1097%2fCOH.0000000000000596&partnerID=40&md5=d9340c1034e1611921cec79073433d03	Purpose of reviewThe sociobehavioral research agenda for HIV prevention urgently needs to progress beyond research on end user preferences to examine how to best support patient access, engagement, and choice in the rollout of long-acting modalities. We outline critical challenges for an era of choice in biomedical prevention that could benefit from the rigorous application of sociobehavioral research methods.Recent findingsResearch in three areas could accelerate implementation of long-acting antiretrovirals for prevention: integrating dual process models into research on patient decision-making and behavior; identifying strategies that mitigate against unconscious and implicit biases in provider decision-making and behavior; and developing tools to support patient-centered communication that incorporate research in both of the first two areas.SummaryWe encourage the development of dual process models and measures to better understand patient behavior, including behavior related to initiating biomedical prevention, choice of prevention strategy, switching among strategies, and discontinuation. Second, there is the need to develop intervention research that targets provider behavior. Finally, we call for research to inform patient-centered communication tools that integrate an understanding of affective drivers of preexposure prophylaxis (PrEP) decision-making and protect against implicit bias in provider recommendations related to PrEP. Article	2020	Migueres M.; Ducours M.; Dimeglio C.; Trimoulet P.; Abravanel F.; Delobel P.; Cazanave C.; Izopet J.	No evidence of sexual transmission of HEV among individuals using HIV pre-exposure prophylaxis	Journal of Viral Hepatitis	-	-	-	13520504	10.1111/jvh.13367	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091610370&doi=10.1111%2fjvh.13367&partnerID=40&md5=38cfe2face75f92222b2e3787d68309f	We investigated the seroprevalence and incidence of hepatitis E virus (HEV) infection in men who have sex with men (MSM) who have been exposed to pre-exposure prophylaxis (PrEP) against HIV as sexual transmission of HEV has been suggested. A total of 147 PrEP-using MSM and 147 blood donors matched for sex, age and geographical area were tested for anti-HEV IgG and IgM. Among them, 135 have been followed for 1 year, at the end of which serological tests for HEV were performed retrospectively on stored samples. Laboratory data on sexual transmitted infections (STIs) and viral hepatitis, including hepatitis A virus (HAV), were collected. Baseline seroprevalence rates in PrEP users were 42.2% (anti-HEV IgG) and 3.4% (anti-HEV IgM). Those of the control blood donors were similar (anti-HEV IgG 43.5% and anti-HEV IgM 4.1%). There was no incident of HEV infection despite the rates of bacterial STIs (incidence rate (IR) = 46.6%) and HAV infection (IR = 15.8%). Age was the only risk factor associated with anti-HEV IgG seropositivity at baseline and at the end of follow-up. Sexual transmission does not seem to be a major route of HEV infection in MSM, unlike HAV. © 2020 John Wiley & Sons Ltd	hepatitis E virus; HIV Pre-exposure prophylaxis; incidence; men who have sex with men; seroprevalence	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Quantitative
Article	2020	Ming K.; Shrestha I.; Vazquez A.; Wendelborn J.; Jimenez V.; Lisha N.; Neilands T.B.; Scott H.; Liu A.; Steward W.; Johnson M.O.; Saberi P.	Improving the HIV PrEP continuum of care using an intervention for healthcare providers: a stepped-wedge study protocol	BMJ Open	-	-	-	20446055	10.1136/bmjopen-2020-040734	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088030270&doi=10.1136%2fbmjopen-2020-040734&partnerID=40&md5=66215bb02a7669c45a90f325e40c7523	INTRODUCTION: Pre-exposure prophylaxis (PrEP) has demonstrated to be a highly effective method for preventing HIV; however, many individuals with PrEP indications are not receiving PrEP. Primary care settings provide an opportunity to offer PrEP to a wide range of patients. In this paper, we describe the PrEP Optimisation Intervention (PrEP-OI), which includes a PrEP Coordinator and a web-based panel management tool (called PrEP-Rx), and is targeted at healthcare providers (HCPs) to increase PrEP uptake and persistence among those at risk for acquiring HIV. METHODS AND ANALYSIS: The PrEP-OI study evaluates the efficacy of the PrEP intervention (PrEP Coordinator + PrEP-Rx) to increase PrEP prescriptions through a stepped-wedge design among 10 primary care clinical sites in the San Francisco Department of Public Health. The number of PrEP initiation prescriptions constitutes the primary outcome, and we hypothesise that the mean number of PrEP prescriptions written will significantly increase after the clinics initiate PrEP-OI versus before this intervention. Secondary objectives include: 1-differences in PrEP initiation, duration of use and reasons for discontinuation based on patient's age, race/ethnicity and sex/gender, and by clinic and HCP characteristics, 2-sustainability of the intervention during a 12-month follow-up after the stepped-wedge phase, and 3-facilitators and barriers of PrEP delivery and experiences with the proposed PrEP intervention through qualitative interviews with HCPs. The results of this study can provide valuable insight into methods to reduce the burden of PrEP care on HCPs and improve PrEP continuum of care. ETHICS AND DISSEMINATION: This study and its protocols have been approved by the University of California, San Francisco (UCSF) Institutional Review Board. Study staff will disseminate findings locally (eg, the UCSF Centre for AIDS Prevention Studies' Community Engagement Core), statewide (eg, the California Department of Public Health's Office of AIDS) and nationally and internationally at conferences related to HIV. Article	2020	Mir J.F.; Mazarío M.F.; Coll P.	Implementation models and access to HIV pre-exposure prophylaxis in Spain; Modelos de implementación y acceso a la profilaxis preexposición para el VIH en España	Enfermedades Infecciosas y Microbiología Clínica	-	-	-	0213005X	10.1016/j.eimc.2019.05.004	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85068253647&doi=10.1016%2fj.eimc.2019.05.004&partnerID=40&md5=f8445aa3d2fcef1eee2921c8ba7a4b1a	To implement HIV pre-exposure prophylaxis (PrEP) in Spain, several possible models fitting the Spanish National Health System must be considered. The experience of other countries with a similar background let us foresee their benefits and their defects before implementing them. Possible implementation models for prescription-follow-up-dispensing circuits may involve hospitals, STI clinics or primary care centres and community pharmacies. On the one hand, a hospital-based circuit is the least effective of them all and it may not satisfy the potential demand, even though it could be deployed immediately. On the other hand, accessibility would increase with PrEP prescription in Primary care and dispensing by community pharmacists. Involvement of community-based STI clinics and publicly-funded STI clinics would be the best option to attract the population not frequenting the general health system, and co-management with Primary Care teams would ensure nation-wide access to PrEP. © 2019 Elsevier España, S.L.U. and Sociedad Española de Enfermedades Infecciosas y Microbiología Clínica	Community health services; Health plan implementation; Health services accessibility; Human immunodeficiency virus; Pre-exposure prophylaxis; Sexual health; Sexually transmitted diseases	English	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Clinical
Article	2020	Mitchell K.M.; Dimitrov D.; Hughes J.P.; Moore M.; Vittinghoff E.; Liu A.; Cohen M.S.; Beyrer C.; Donnell D.; Boily M.-C.	Assessing the use of surveillance data to estimate the impact of prevention interventions on HIV incidence in cluster-randomized controlled trials	Epidemics	-	-	-	17554365	10.1016/j.epidem.2020.100423	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097366207&doi=10.1016%2fj.epidem.2020.100423&partnerID=40&md5=67b47a14a8cb708ae57b1a51bb157240	Background: In cluster-randomized controlled trials (C-RCTs) of HIV prevention strategies, HIV incidence is expensive to measure directly. Surveillance data on HIV diagnoses or viral suppression could provide cheaper incidence estimates. We used mathematical modelling to evaluate whether these measures can replace HIV incidence measurement in C-RCTs. Methods: We used a US HIV transmission model to simulate C-RCTs of expanded antiretroviral therapy(ART), pre-exposure prophylaxis(PrEP) and HIV testing, together or alone. We tested whether modelled reductions in total new HIV diagnoses, diagnoses with acute infection, diagnoses with early infection(CD4+ 500 cells/µl), diagnoses adjusted for testing volume, or the proportion virally non-suppressed, reflected HIV incidence reductions. Results: Over a two-year trial expanding PrEP alone, modelled reductions in total diagnoses underestimated incidence reductions by a median six percentage points(pp), with acceptable variability(95 % credible interval -14,-2pp). For trials expanding HIV testing alone or alongside ART + PrEP, greater, highly variable bias was seen-20pp(-128,-1) and -30pp(-134,-16), respectively. Acceptable levels of bias were only seen over longer trial durations when levels of awareness of HIV-positive status were already high. Expanding ART alone, only acute and early diagnoses reflected incidence reduction well, with some bias-3pp(-6,-1) and -8pp(-16,-3), respectively. Early and adjusted diagnoses also reliably reflected incidence when scaling up PrEP alonebias -5pp(-11,1) and 10pp(3,18), respectively. For trials expanding testing (alone or with ART + PrEP), bias for all measures explored was too variable for them to replace direct incidence measures, unless using diagnoses when HIV status awareness was already high. Conclusions: Surveillance measures based on HIV diagnoses may sometimes be adequate surrogates for HIV incidence reduction in C-RCTs expanding ART or PrEP only, if adjusted for bias. However, all surveillance measures explored failed to approximate HIV incidence reductions for C-RCTs expanding HIV testing, unless levels of awareness of HIV-positive status were already high. © 2020 The Authors	HIV; Incidence; Marker; Mathematical modelling; Surveillance data; Trials	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative
Article	2020	Moeller, Robert W, PhD; Seehuus, Martin, PhD; Wahl, Logan, BA; Gratch, Ilana, BA	Use of PrEP, sexual behaviors and mental health correlates in a sample of gay, bisexual and other men who have sex with men	Journal of Gay & Lesbian Mental Health	-	-	-	19359705	10.1080/19359705.2019.1688216	https://www.proquest.com/scholarly-journals/use-prep-sexual-behaviors-mental-health/docview/2328858553/se-2?accountid=8113	We sought to document the correlates of mental health and sexual behaviors of PrEP using and non-using gay, bisexual, and other MSM. Depression, anxiety and internalized homophobia scores were all significantly lower for PrEP users compared to HIV-negative non-PrEP users. PrEP use was found to moderate the relationship between anxiety and condomless anal intercourse (CAI), such that rates of anxiety were higher for non-PrEP users reporting greater numbers of CAI partners, while remaining stable for PrEP users. Use of PrEP was associated with lower levels of depression, anxiety, and internalized homophobia. Article	2020	Moitra E.; van den Berg J.J.; Sowemimo-Coker G.; Chau S.; Nunn A.; Chan P.A.	Open pilot trial of a brief motivational interviewing-based HIV pre-exposure prophylaxis intervention for men who have sex with men: preliminary effects, and evidence of feasibility and acceptability	AIDS Care	-	-	-	9540121	10.1080/09540121.2019.1622644	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85066244706&doi=10.1080%2f09540121.2019.1622644&partnerID=40&md5=4e7894884032e31afca192fd9b628635	Gay, bisexual and other men who have sex with men (MSM) are at high-risk of HIV infection in the United States. Daily oral pre-exposure prophylaxis (PrEP) has demonstrated efficacy in reducing HIV acquisition among MSM. However, PrEP uptake in real-world clinical settings has been slow and uneven. Guided by Self-Regulation Theory, we developed and evaluated a brief (15–25 min) motivational interviewing (MI)-based intervention to promote PrEP uptake in an uncontrolled pilot trial. Nineteen MSM were recruited during the course of routine HIV screening at a sexually transmitted diseases clinic. We administered the 2-session intervention in-person and by telephone. Thirteen (72%) participants completed baseline and 1-month follow-up assessments; all found the intervention and its components highly acceptable. Over the 1-month period, seven participants (37%) obtained a PrEP prescription, more than tripling the rate previously observed with PrEP counseling and referrals alone (11%). The most common barrier to uptake was out-of-pocket costs. This approach was feasible and underscored the need for financial assistance and other PrEP navigation services to supplement behavioral interventions to enhance PrEP uptake. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group. Mitochondrial DNA parameters in blood of infants receiving lopinavir/ritonavir or lamivudine prophylaxis to prevent breastfeeding transmission of HIV-1	Journal of Clinical Medicine	-	-	-	20770383	10.3390/jcm9092972	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114278967&doi=10.3390%2fjcm9092972&partnerID=40&md5=db484a43bb53818c83fb44f2197514a1	Children who are human immunodeficiency virus (HIV)-exposed but uninfected (CHEU) accumulate maternal HIV and antiretroviral exposures through pregnancy, postnatal prophylaxis, and breastfeeding. Here, we compared the dynamics of mitochondrial DNA (mtDNA) parameters in African breastfed CHEU receiving lopinavir/ritonavir (LPV/r) or lamivudine (3TC) pre-exposure prophylaxis during the first year of life. The number of mtDNA copies per cell (MCN) and the proportion of deleted mtDNA (MDD) were assessed at day 7 and at week 50 post-delivery (PrEP group). mtDNA depletion was defined as a 50% or more decrease from the initial value, and mtDNA deletions was the detection of mtDNA molecules with large DNA fragment loss. We also performed a sub-analysis with CHEU who did not receive a prophylactic treatment in South Africa (control group). From day seven to week 50, MCN decreased with a median of 41.7% (interquartile range, IQR: 12.1; 64.4) in the PrEP group. The proportion of children with mtDNA depletion was not significantly different between the two prophylactic regimens. Poisson regressions showed that LPV/r and 3TC were associated with mtDNA depletion (reference: control group; LPV/r: PR = 1.75 (CI95%:1.15–2.68), p < 0.01; 3TC: PR = 1.54 (CI95%:1.00–2.37), p = 0.05). Moreover, the proportion of children with MDD was unexpectedly high before randomisation in both groups. Long-term health impacts of these mitochondrial DNA parameters should be investigated further for both CHEU and HIV-infected children receiving LPV/r-or 3TC-based regimens. © 2020 by the authors. Theses and Dissertations	2020	Moodley, Roxann	Pre-Exposure Prophylaxis (PrEP) therapy in KwaZulu-Natal : an implementation guideline	-	-	Durban University of Technology	-	NA	https://doi.org/10.51415/10321/4030	https://openscholar.dut.ac.za/handle/10321/4030	Dissertation submitted to the Durban of Technology in fulfilment of the requirements for the award of the degree of Doctor's Degree in Nursing, Durban University of Technology, Durban, South Africa, 2020. Why is pre-exposure prophylaxis (PrEP) therapy not implemented as a preventative treatment against human immunodeficiency virus (HIV) in primary health care (PHC) clinics in the KwaZulu Natal province? PrEP therapy has proven to be an effective preventative strategy against HIV (Bekker et al. 2016) which could be used to decrease the number of individuals becoming infected with the Human Immunodeficiency virus. This study explores the perceptions of PHC nurses, PHC doctors, PHC support staff and individuals at high risk of contracting HIV regarding PrEP therapy in KwaZulu Natal public clinics. The Department of Health (DoH) has published guidelines for the implementation of PrEP therapy; however, the guidelines have not been adopted and used by the primary health care staff in the clinics and has resulted in pre-exposure prophylaxis therapy not being implemented in the clinics to individuals at high risk of contracting Human Immunodeficiency Virus. This research employed a qualitative framework using the grounded theory approach of Charmaz (2014). There are ten districts in KwaZulu Natal with a total of 588 primary health clinics that are accessible to the public. Five primary health care clinics were used in this research study with fourteen participants that were interviewed. Using semi-structured interviews with research participants across primary health care clinics that were purposefully selected, the researcher was able to develop an implementation guide for the department of health (DoH) pre-exposure prophylaxis therapy guidelines. The implementation guide that has been developed can be used by health care providers to assist with the implementation of the department of health pre-exposure prophylaxis therapy guideline in the primary health care clinics. The results of the study showed that educating the public and the individuals at high risk of contracting HIV can create awareness and demand for pre-exposure prophylaxis therapy. Participants expressed their concern regarding the implementation of pre- exposure prophylaxis in the primary health care clinics as there may not be enough resources to successfully implement and monitor individuals that want to take pre- exposure prophylaxis therapy. Article	2020	Moore E.; Kelly S.G.; Alexander L.; Luther P.; Cooper R.; Rebeiro P.F.; Zuckerman A.D.; Hargreaves M.; Bourgi K.; Schlundt D.; Bonnet K.; Pettit A.C.	Tennessee Healthcare Provider Practices, Attitudes, and Knowledge Around HIV Pre-Exposure Prophylaxis	Journal of Primary Care and Community Health	-	-	-	21501319	10.1177/2150132720984416	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098051371&doi=10.1177%2f2150132720984416&partnerID=40&md5=71151a0b426e12e7a78ce80ec187b800	Introduction/Objectives: Pre-exposure prophylaxis (PrEP) use in the southern United States is low despite its effectiveness in preventing HIV acquisition and high regional HIV prevalence. Our objectives were to assess PrEP knowledge, attitudes, and prescribing practices among Tennessee primary care providers. Methods: We developed an anonymous cross-sectional electronic survey from March to November 2019. Survey development was guided by the Capability, Opportunity, Motivation, and Behavior framework and refined through piloting and interviews. Participants included members of professional society and health center listservs licensed to practice in Tennessee. Respondents were excluded if they did not complete the question regarding PrEP prescription in the previous year or were not in a position to prescribe PrEP (e.g., hospital medicine). Metrics included PrEP prescription in the preceding year, PrEP knowledge scores (range 0-8), provider attitudes about PrEP, and provider and practice characteristics. Knowledge scores and categorical variables were compared across PrEP prescriber status with Wilcoxon rank-sum and Fisher's exact tests, respectively. Results: Of 147 survey responses, 99 were included and 43 (43%) reported PrEP prescription in the preceding year. Compared with non-prescribers: prescribers had higher median PrEP knowledge scores (7.3 vs 5.6, P <.01), a higher proportion had self-reported patient PrEP inquiries (95% vs 21%, P <.01), a higher proportion had self-reported good or excellent ability to take a sexual history (83% vs 58%, P =.01) and comfort taking a sexual history (92% vs 63%, P <.01) from men who have sex with men, a subgroup with high HIV risk. Most respondents felt obligated to provide PrEP (65%), and felt all primary care providers should provide PrEP (63%). Conclusion: PrEP provision is significantly associated with PrEP knowledge, patient PrEP inquiries, and provider sexual history taking ability and comfort. Future research should evaluate temporal relationships between these associations and PrEP prescription as potential routes to increase PrEP provision. © The Author(s) 2020.	community health; prevention; primary care; risky sexual behavior; underserved communities	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Moore J.R.; Donnell D.J.; Boily M.-C.; Mitchell K.M.; Delany-Moretlwe S.; Bekker L.-G.; Mgodi N.M.; El-Sadr W.; Cohen M.S.; Celum C.L.; Dimitrov D.	Model-Based Predictions of HIV Incidence among African Women Using HIV Risk Behaviors and Community-Level Data on Male HIV Prevalence and Viral Suppression	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002481	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095403950&doi=10.1097%2fQAI.0000000000002481&partnerID=40&md5=1a327b69f3ee70b202a7fabcea7a72af	Background:Pre-exposure prophylaxis (PrEP) with tenofovir disoproxil fumarate and emtricitabine has proven highly effective in preventing HIV acquisition and is therefore offered to all participants in the control group as part of the standard of care package in many new HIV prevention studies. We propose a methodology for predicting HIV incidence in a hypothetical "placebo arm" for open-label studies or clinical trials with active control among African women. We apply the method to an open-label PrEP study, HIV Prevention Trials Network 082, which tested strategies to improve PrEP adherence in young African women all of whom were offered PrEP.Methods:Our model predicted HIV infection risk for female study cohorts in sub-Saharan Africa using baseline behavioral risk factors and contemporary HIV prevalence and viral suppression in the local male population. The model was calibrated to HIV incidence in the Vaginal and Oral Interventions to Control the Epidemic study.Results:Our model reproduced the annual HIV incidence of 3.2%-4.8% observed over 1 year of follow-up in the placebo groups of 4 completed clinical studies. We predicted an annual HIV incidence of 3.7% (95% confidence interval: 3.2 to 4.2) among HIV Prevention Trials Network 082 participants in the absence of PrEP and other risk reduction interventions.Conclusions:We demonstrated the potential of the proposed methodology to provide HIV incidence predictions based on assessment of individual risk behaviors and community and time-specific HIV exposure risk using HIV treatment and viral suppression data. These estimates may serve as comparators in HIV prevention trials without a placebo group. © 2020 Lippincott Williams and Wilkins. All rights reserved. Article	2020	Moorthy G.S.; Lalley-Chareczko L.; Koenig H.C.; Zuppa A.F.	Tenofovir urine assay to monitor adherence to hiv pre-exposure prophylaxis	Current Clinical Pharmacology	-	-	-	15748847	10.2174/1574884714666191111125348	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85089663935&doi=10.2174%2f1574884714666191111125348&partnerID=40&md5=29e9f9555cf9ab513b30229ddc946816	Tenofovir Disoproxil Fumarate (TDF) and tenofovir Alafenamide (TAF) are prodrugs of tenofovir and have excellent long-term efficacy and tolerability for the treatment of HIV. An objective marker of adherence to tenofovir-based therapy could be clinically useful in supporting adherence to TDF-based HIV pre-Exposure Prophylaxis (PrEP) in populations in whom, self-report has been shown to be unreliable, and could play a role in resource-limited settings to support HIV and hepatitis B treatment adherence. A semi-quantitative high-performance liquid chromatography-mass spectrometry method for tenofovir quantification of urine samples was developed. This assay detects tenofovir concentration in log10 levels between 1 and 10,000 ng/mL, and was shown to distinguish between recent adherence and low/non-adherence to both TDF and TAF, with a concentration of >1000 ng/mL, highly predictive of medication ingestion in the last 24-48 hours. This assay was validated relative to other markers of adherence including dried blood spot and self-report in a highly adherent population of PrEP patients, and tenofovir was shown to be stable at room temperature in urine for at least 14 days. The assay was successfully used in a clinical setting to maintain high PrEP adherence and retention in care of 50 young men who have sex with men (MSM) over 48 weeks, to assess PrEP adherence in youth with mental health conditions, and to monitor drug levels relative to plasma levels in a case study of chewed TDF/FTC (tenofovir/emtricitabine) for PrEP. Further studies are underway to implement the tenofovir urine assay to monitor adherence and pre-exposure prophylaxis, nationally and internationally. © 2020, Bentham Science Publishers. Article	2020	Morgan, Ethan; Dyar, Christina; Newcomb, Michael E; D'Aquila, Richard T; Mustanski, Brian	PrEP Use and Sexually Transmitted Infections Are Not Associated Longitudinally in a Cohort Study of Young Men Who Have Sex with Men and Transgender Women in Chicago.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-019-02664-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7056520	Our goal was to understand whether PrEP users are at increased risk for STIs, a key target in prevention efforts aimed at disrupting the spread of STIs and likely downstream HIV infection risk. Data were collected as part of RADAR, a cohort study of young men who have sex with men and transgender women (YMSM/TW) (aged 16-29) in Chicago. Longitudinal lagged regression models were utilized to assess the relationship between PrEP use and odds of rectal STI acquisition. Mediation models were also utilized to consider the potential pathway between PrEP use, condomless anal sex (CAS), and rectal STI. One hundred eighty-seven (16.2%) participants had a rectal STI at baseline. In both cross-sectional and longitudinal models, no significant association was observed between PrEP use and STI. In mediation models, PrEP use was significantly associated with increased CAS, however, CAS was not associated with STI status. We demonstrated that, overall, PrEP use was not associated with STIs among YMSM/TW but did observe that PrEP users were more likely to report increased participation in CAS at the subsequent study visit. Article	2020	Moskowitz, David A; Macapagal, Kathryn; Mongrella, Melissa; Pérez-Cardona, Leishla; Newcomb, Michael E; Mustanski, Brian	What If My Dad Finds Out!?: Assessing Adolescent Men Who Have Sex with Men's Perceptions About Parents as Barriers to PrEP Uptake.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-02827-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7462124	Pre-exposure prophylaxis (PrEP) is an effective HIV prevention strategy for high-risk adults and recently was given US FDA approval for use among adolescents. Yet, the barriers to medication uptake for this population are unique when compared to adult populations, as parents may be just as likely as prescribers to be gatekeepers to access. To better understand the role of parents in adolescents' attitudes towards PrEP, we surveyed 491 adolescent men who have sex with men (AMSM) ages 13-18, using forced choice and open-ended response questions. We measured perceived parent-PrEP supportiveness, hypothetical parent reactions to a request to initiate PrEP, and perceived positive and negative aspects of taking PrEP without parents knowing. A mixed-methods approach was employed. Results indicated a majority of AMSM had heard of PrEP and most reported their parents would be unsupportive of their taking PrEP. Teens perceived their parents would likely be angry, accusatory, and punitive if PrEP use was discovered, and that accessing PrEP independent of parents might increase their health autonomy, agency, and prevent awkward conversations about sex. Furthermore, a path model revealed that fears of parental reaction and poor self-efficacy to communicate with parents about PrEP significantly contributed to participants feeling PrEP was not "right" for them, and as a corollary, less interest in starting PrEP. The study suggests that improving parental knowledge of PrEP and encouraging parents to begin the conversation about PrEP could help increase uptake in AMSM. Article	2020	Mouhanna, Farah; Castel, Amanda D; Sullivan, Patrick S; Kuo, Irene; Hoffman, Heather J; Siegler, Aaron J; Jones, Jeb S; Mera Giler, Robertino; McGuinness, Pema; Kramer, Michael R	Small-area spatial-temporal changes in pre-exposure prophylaxis (PrEP) use in the general population and among men who have sex with men in the United States between 2012 and 2018.	Annals of Epidemiology	-	-	-	1873-2585	10.1016/j.annepidem.2020.07.001	https://dx.doi.org/10.1016/j.annepidem.2020.07.001	PURPOSE: Oral emtricitabine/tenofovir disoproxil fumarate was approved for use as pre-exposure prophylaxis (PrEP) by the U.S. Food and Drug Administration in 2012. We used national pharmacy data to examine trends of PrEP use in U.S. counties from 2012 to 2018. METHODS: Using multi-level small-area spatio-temporal modeling, we calculated the estimated annual percentage change (EAPC) in prevalence of PrEP use in the general population from 2012 to 2018. We also used a proxy measure for prevalence of PrEP use among men who have sex with men (MSM) to evaluate trends of use among MSM, the PrEP use-to-MSM ratio (PmR) or number of male PrEP users per 1000 MSM population. RESULTS: The prevalence of PrEP use and PmR increased (EAPC range: (+26.9%, +71.0%) and (+28.4%, +158.7%), respectively) in all counties with varying magnitude of increase. Counties of the Midwest and the upper South and upper West had the slowest increase in prevalence of PrEP use (EAPC range: (+26.9%; +52.9%)). Counties of the northern part of the South had the lowest PmR (EAPC range: (+28.4%; +76.0%)). Counties of the most populous core-based statistical areas had a relatively faster increase in population prevalence of PrEP use but slower increase in PmR. CONCLUSIONS: All counties in the U.S. have witnessed an increase in PrEP use with important geographic variabilities. Identifying areas with slow improvement in PrEP use, as well as "model counties" with the fastest pace of progress in PrEP coverage, is critical to inform local and state-level policies and program evaluation for PrEP scale up, particularly among MSM at higher risk for HIV. Article	2020	Mudimu E.; Peebles K.; Mukandavire Z.; Nightingale E.; Sharma M.; Medley G.F.; Klein D.J.; Kripke K.; Bershteyn A.	Individual and community-level benefits of PrEP in western Kenya and South Africa: Implications for population prioritization of PrEP provision	PLOS One	-	-	-	19326203	10.1371/journal.pone.0244761	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099030659&doi=10.1371%2fjournal.pone.0244761&partnerID=40&md5=e1a15f7d5509c699074b9bb058e4425c	Background Pre-exposure prophylaxis (PrEP) is highly effective in preventing HIV and has the potential to significantly impact the HIV epidemic. Given limited resources for HIV prevention, identifying PrEP provision strategies that maximize impact is critical. Methods We used a stochastic individual-based network model to evaluate the direct (infections prevented among PrEP users) and indirect (infections prevented among non-PrEP users as a result of PrEP) benefits of PrEP, the person-years of PrEP required to prevent one HIV infection, and the community-level impact of providing PrEP to populations defined by gender and age in western Kenya and South Africa. We examined sensitivity of results to scale-up of antiretroviral therapy (ART) and voluntary medical male circumcision (VMMC) by comparing two scenarios: maintaining current coverage ("status quo") and rapid scale-up to meet programmatic targets ("fast-track"). Results The community-level impact of PrEP was greatest among women aged 15–24 due to high incidence, while PrEP use among men aged 15–24 yielded the highest proportion of indirect infections prevented in the community. These indirect infections prevented continue to increase over time (western Kenya: 0.4–5.5 (status quo); 0.4–4.9 (fast-track); South Africa: 0.5–1.8 (status quo); 0.5–3.0 (fast-track)) relative to direct infections prevented among PrEP users. The number of person-years of PrEP needed to prevent one HIV infection was lower (59 western Kenya and 69 in South Africa in the status quo scenario; 201 western Kenya and 87 in South Africa in the fast-track scenario) when PrEP was provided only to women compared with only to men over time horizons of up to 5 years, as the indirect benefits of providing PrEP to men accrue in later years. Conclusions Providing PrEP to women aged 15–24 prevents the greatest number of HIV infections per person-year of PrEP, but PrEP provision for young men also provides indirect benefits to women and to the community overall. This finding supports existing policies that prioritize PrEP use for young women, while also illuminating the community-level benefits of PrEP availability for men when resources permit. © 2020 Mudimu et al. Article	2020	Mudzviti, Tinashe; Dhliwayo, Anesu; Chingombe, Byrone; Ngara, Bernard; Monera-Penduka, Tsitsi G; Maponga, Charles C; Morse, Gene D	Perspectives on oral pre-exposure prophylaxis use amongst female sex workers in Harare, Zimbabwe.	South African Journal of HIV Medicine	-	-	-	2078-6751	10.4102/sajhivmed.v21i1.1039	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7059237	BACKGROUND: Pre-exposure prophylaxis (PrEP) could provide protection from human immunodeficiency virus (HIV) infection in sexually active persons at risk. Limited data are available in Zimbabwe with regard to the perceptions about PrEP amongst female sex workers (FSWs). OBJECTIVES: The aim of this study was to evaluate the knowledge levels of oral PrEP and the likelihood of its use amongst FSWs. METHOD: This was a cross-sectional study in the peri-urban areas of Harare, Zimbabwe. Human immunodeficiency virus-negative FSWs were interviewed to assess their awareness of and likelihood to use PrEP. The relative importance index was used to evaluate the levels of knowledge and the likelihood of, and barriers to, PrEP use. A set of 10 questions was designed and validated that evaluated participants' understanding of PrEP. A bivariate logistic regression model was utilised to identify predictors of PrEP use. RESULTS: A total of 131 FSWs with a median age of 25 years (interquartile range: 21-31) participated in this study. Of the 71 (54%) FSWs who had heard about PrEP, 46 (35%) participants had adequate knowledge of its use. A total of 102 (78%) participants felt that they would be willing to continuously use PrEP if it was provided free of cost. Increasing age of the participants was associated with an increase in the likelihood of using PrEP (r = 0.0033, p = 0.038). More knowledge about PrEP increased the likelihood of its use (r = 0.21, p = 0.0153). This likelihood increased amongst participants with an unprotected sexual intercourse encounter in the preceding 3 months (r = 0.0448, p = 0.026). CONCLUSION: Knowledge of PrEP amongst FSWs was low. To increase the uptake of PrEP, there is a need to further sensitise FSWs about this intervention. Programmes should also promote awareness training in FSW subgroups that are less likely to use PrEP.	female sex workers, HIV, pre-exposure prophylaxis, barriers, Truvada	English	South Africa	Eastern and Southern Africa	Zimbabwe	Eastern and Southern Africa	Zimbabwe	Eastern and Southern Africa	Quantitative
Editorial	2020	Mugwanya, Kenneth K; Baeten, Jared M	Next-Generation Preexposure Prophylaxis: Choices For Effective HIV Prevention.	Journal of Infectious Diseases	-	-	-	1537-6613	10.1093/infdis/jiz273	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7137882	Evidence supporting the use of antiretroviral medications to prevent new human immunodeficiency virus (HIV) infections—as both treatment to eliminate infectiousness and prophylaxis to block acquisition—has revolutionized thinking about HIV prevention. Indeed, HIV treatment and preexposure prophylaxis (PrEP) are now core components of US and global efforts to end the HIV epidemic [1]. Oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) was the first PrEP agent [2, 3], and its key regulatory and normative agency milestones have included Food and Drug Administration approval in 2012, Centers for Disease Control and Prevention and World Health Organization guidelines in 2014 and 2015, and drug regulatory approval and national guidelines currently in >40 countries worldwide [4]. PrEP with TDF/FTC pills is now standard of care for HIV prevention, and wide-scale implementation is underway globally. Article	2020	Mujugira A.; Baeten J.M.; Hodges-Mameletzis I.; Haberer J.E.	Lamivudine/Tenofovir Disoproxil Fumarate is an Appropriate PrEP Regimen	Drugs	-	-	-	126667	10.1007/s40265-020-01419-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092297609&doi=10.1007%2fs40265-020-01419-4&partnerID=40&md5=c315a3cf320673a501a9589d2c8434f0	Oral pre-exposure prophylaxis (PrEP) containing tenofovir disoproxil fumarate (TDF) co-formulated with emtricitabine (FTC) or lamivudine (3TC) is recommended as an additional prevention option for persons at substantial risk of HIV infection by both the World Health Organization (WHO) and the US President's Emergency Plan for AIDS Relief (PEPFAR). The WHO and PEPFAR consider 3TC clinically interchangeable with FTC for PrEP given comparable pharmacologic equivalence, resistance and toxicity patterns, and indirect clinical trial evidence from TDF-containing studies. Globally, FTC/TDF has been widely used in clinical trials, open-label extension studies and demonstration projects. Thus, most PrEP efficacy and safety data are based on FTC/TDF use in heterosexual women and men, men who have sex with men, and people who inject drugs. However, generic 3TC/TDF is less expensive than FTC/TDF, is already available in supply chains for HIV drugs, and has 60–70% of the global adult market share, making it particularly appealing in settings with limited availability or affordability of FTC/TDF. Compelling indirect evidence suggests that scaling up use of 3TC/TDF is potentially cost saving for HIV programs in settings where restricting drug choice to FTC/TDF would delay PrEP implementation. Guideline committees and public health decision-makers in countries should encourage flexibility in PrEP drug selection, support off-label use of 3TC/TDF, and approve use of generic formulations to decrease the cost of PrEP medications and accelerate PrEP delivery through the public and private sectors. © 2020, Springer Nature Switzerland AG. Article	2020	Mullick, Charu; Murray, Jeffrey	Correlations Between Human Immunodeficiency Virus (HIV) Infection and Rectal Gonorrhea Incidence in Men Who Have Sex With Men: Implications for Future HIV Preexposure Prophylaxis Trials.	Journal of Infectious Diseases	-	-	-	1537-6613	10.1093/infdis/jiz037	https://dx.doi.org/10.1093/infdis/jiz037	Using published data, we found a direct correlation between the incidence of rectal gonorrhea and human immunodeficiency virus (HIV) infection in men who have sex with men who were not using oral preexposure prophylaxis. HIV incidence was predicted using rectal gonorrhea incidence as the determinant in regression analysis. The observed correlation suggest that rectal gonorrhea incidence can potentially serve as a predictor of HIV incidence. If confirmed with additional data, a quantitative correlation for incidence of the 2 infections could be useful in active-controlled HIV prevention trials where low HIV incidence is expected. Widespread improvements in treatment as prevention and gonorrhea control can negatively impact the correlation and its utility. Article	2020	Musinguzi N.; Kidoguchi L.; Mugo N.R.; Ngure K.; Katabira E.; Celum C.L.; Baeten J.M.; Heffron R.; Haberer J.E.	Adherence to recommendations for ART and targeted PrEP use among HIV serodiscordant couples in East Africa: the "PrEP as a bridge to ART" strategy	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-020-09712-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094175212&doi=10.1186%2fs12889-020-09712-3&partnerID=40&md5=b9e6b487fceb203126bf27ca3f16018d	Background: PrEP use should be aligned with periods of risk for HIV acquisition. For HIV serodiscordant couples, PrEP can be used as a bridge until the partner living with HIV takes antiretroviral therapy (ART) long enough to achieve viral suppression (the "PrEP as a Bridge to ART" strategy). However, adherence to this strategy is unknown. Methods: In a demonstration project in Kenya and Uganda, HIV-uninfected partners of serodiscordant couples were advised to take PrEP until the partner living with HIV took ART for ≥ 6 months. PrEP discontinuation was then recommended unless there were concerns about ART adherence, immediate fertility intentions, or outside partners with unknown HIV/ART status. Electronic adherence monitoring and socio-behavioral questionnaire data were used in logistic regression models to explore completion of this strategy and continuation of PrEP beyond recommendations to stop its use. Results: Among 833 serodiscordant couples, 436 (52%) HIV-uninfected partners completed ≥ 6 months of PrEP as a bridge to ART. Strategy completion was associated with older age (aOR per 5 years = 1.1; p = 0.008) and having fewer children (aOR = 0.9; p = 0.019). Of the 230 participants encouraged to stop PrEP according to strategy recommendations, 170 (74%) did so. PrEP continuation among the remaining 60 participants was associated with more education (aOR = 1.1; p = 0.029), a preference for PrEP over ART (aOR = 3.6; p = 0.026), comfort with managing their serodiscordant relationship (aOR = 0.6; p = 0.046), and believing PrEP makes sex safe (aOR = 0.5; p = 0.026). Conclusion: Half of participants completed the PrEP as a bridge to ART strategy and the majority stopped PrEP as recommended. These findings suggest that targeting PrEP to periods of risk is a promising approach; however, tailoring counseling around aligning PrEP use and HIV risk will be important for optimal strategy implementation. © 2020, The Author(s). Article	2020	Muwonge T.R.; Nsubuga R.; Brown C.; Nakyanzi A.; Bagaya M.; Bambia F.; Katabira E.; Kyambadde P.; Baeten J.M.; Heffron R.; Celum C.; Mujugira A.; Haberer J.E.	Knowledge and barriers of PrEP delivery among diverse groups of potential PrEP users in Central Uganda	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0241399	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094857200&doi=10.1371%2fjournal.pone.0241399&partnerID=40&md5=6cc4b6f8ef0887679ac739d58fc5c3da	Background Scale-up of oral pre-exposure prophylaxis (PrEP) for HIV prevention in Uganda began with serodiscordant couples (SDC) and has expanded to other most at-risk populations (MARPs). We explored knowledge, acceptability, barriers and facilitators of PrEP use among potential PrEP users in four MARPs (SDC; men who have sex with men MSM; female sex workers FSW, and fisher folk). Methods We administered quantitative surveys to potential PrEP users in multiple settings in Central Uganda at baseline and approximately 9 months after healthcare worker (HCW) training on PrEP. Results The survey was completed by 250 potential PrEP users at baseline and 125 after HCW training; 55 completed both surveys. For these 250 participants, mean age was 28.5 years (SD 6.9), 47% were male and 6% were transgender women, with approximately even distribution across MARPs and recruitment locations (urban, peri-urban, and rural). Most (65%) had not heard about PrEP. After HCW training, 24% of those sampled were aware of PrEP, and the proportion of those who accurately described PrEP as "antiretrovirals to be used before HIV exposure" increased from 54% in the baseline survey to 74% in the second survey (p<0.001). The proportion of participants who reported HCW as a source of PrEP information increased after training (59% vs 91%, p<0.001). In both surveys, nearly all participants indicated they were willing to take PrEP if offered. The most common anticipated barriers to PrEP were stigma, transportation, accessibility, busy schedules, and forgetfulness. Closeness to home was a common facilitator for all participant categories. Conclusions Initial awareness of PrEP was low, but PrEP knowledge and interest increased among diverse MARPs after HCW training. Demand creation and HCW training will be critical for increasing PrEP awareness among key populations, with support to overcome barriers to PrEP use. These findings should encourage the acceleration of PrEP rollout in Uganda. © 2020 Muwonge et al. Article	2020	Mwasakifwa, Gwamaka Eliudi; Nugent, Colleen; Varma, Rick	Proctitis in gay and bisexual men. Are microscopy and proctoscopy worthwhile?	Sexually Transmitted Infections	-	-	-	-	1472-3263 1368-4973	10.1136/sextrans-2019-054197	https://sti.bmj.com/content/96/7/475	OBJECTIVES: We explored the association between nucleic acid amplification testing (NAAT) and rectal microscopy/proctoscopy findings and correlates of rectal STIs among 150 gay and bisexual men (GBM) diagnosed with proctitis at the Sydney Sexual Health Centre from March 2016 to October 2017. METHODS: From case files, we analysed risk behaviours, microscopy, proctoscopy and NAAT results for rectal STIs (Chlamydia trachomatis, Neisseria gonorrhoeae, Mycoplasma genitalium, herpes simplex virus type 1/2, lymphogranuloma venereum and syphilis). χ(2) test assessed the association between microscopy/proctoscopy findings and NAAT results. Linear regression assessed the association between NAAT positivity and correlates of rectal STIs. RESULTS: The mean age was 32.5 (9.8) years, 43% (65/150) were taking pre-exposure prophylaxis, 17% (26/150) were HIV positive and 24% (36/147) had multiple rectal STIs. Among GBM with documented proctoscopy findings (n=113), 58% (65/113) had discharge, 36% (41/113) had anorectal erythema and 25% (28/113) had bleeding. A quarter of GBM (28/113) had negative proctoscopy findings. Discharge found on proctoscopy (p=0.001), positive HIV status (p=0.030) and time since last receptive anal intercourse (p=0.028) were independently associated with NAAT positivity for any rectal STI. Discharge had a positive likelihood ratio of 1.6 (95% CI 1.0 to 2.4). Among those with documented microscopy findings (n=69), 59% (41/69) and 41% (28/69) were NAAT positive and negative, respectively. Among NAAT-positive GBM, 27 (66%) had polymorphonuclear cells (PMNs) (mean number of PMNs, 10 (SD 9) cells per oil immersion field), 1 (2%) had Gram-negative intracellular diplococci and 11 (27%) had negative findings. There was no significant association between microscopy findings and NAAT results (p=0.651) or the number of rectal STI (p=0.279). CONCLUSION: Microscopy does not reliably provide information necessary to tailor the management of GBM diagnosed with proctitis. Discharge found during proctoscopy may identify GBM with rectal STI. Services should consider recommendations to perform these investigations. Article	2020	Mysior P.; Tenberken E.; Stecher M.; Vehreschild J.-J.; Schafberger A.; Perea I.; Brillen A.-L.; Bartmeyer B.; Esser S.; Bremer V.; Marcus U.; Hoffmann D.; Streeck H.	Rapid Uptake of Pre-Exposure Prophylaxis after Significant Price Reduction in Germany Highlights Importance of Pre-Exposure Prophylaxis Accessibility	AIDS Research and Human Retroviruses	-	-	-	-	8892229	10.1089/aid.2019.0237	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090816283&doi=10.1089%2faid.2019.0237&partnerID=40&md5=72c3631b172a4329f0f2956803f46c4b	Pre-Exposure Prophylaxis (PrEP) has been widely accepted as an effective method to prevent HIV infections, but high costs precluded a widespread use in Germany. A novel distribution pathway of tenofovir-disoproxil fumarate and emtricitabine PrEP was implemented, which reduced monthly PrEP costs by 16-fold in Germany. Over a period of 6 months, we recorded prescription data, demographics, and sexual behavior of PrEP users, including self-reported sexually transmitted infections (STIs), alcohol and drug use. Within a month, prescriptions almost doubled from 585 to 1,009 and reached a cumulative number of 6,059 at the end of the 6-month observation period. Extrapolation of the data suggests an estimated maximal number of PrEP users of the order of 10,000. PrEP users demonstrated to be a population of well-educated men (407/686) who have sex with men (629/686), median age 38 (range:18-71), and of German descent (571/686). The majority used PrEP to compensate for risk of HIV infection when having condomless anal intercourse (372/686). At start of PrEP implementation, the majority perceived their own risk to acquire HIV as none to medium (78.6%; n = 539), while only a subset (18.8%; n = 129) considered themselves to be at high or very high risk for HIV infection. In contrast, within the last 6 months, 28.4% of the PrEP users had an STI diagnosis and over 70% had condomless anal intercourse with more than 6 partners. Taken together, our data from PrEP implementation in Germany demonstrate a large uptake once it became affordable in individuals who wish to compensate for HIV risk when having condomless anal intercourse. © Copyright 2020, Mary Ann Liebert, Inc., publishers 2020. Article	2020	Nagington, Maurice; Sandset, Tony	Putting the NHS England on trial: uncertainty-as-power, evidence and the controversy of PrEP in England	Medical Humanities	-	-	-	-	1468215X	10.1136/medhum-2019-011780	https://www.proquest.com/scholarly-journals/putting-nhs-england-on-trial-uncertainty-as-power/docview/2437320307/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) (Truvada) is a medication which if taken correctly is almost entirely effective in preventing HIV infection. In regions and countries where it has been widely taken up, HIV seroconversion rates have significantly decreased. Alongside testing and treatment, it offers the very real prospect of ending HIV infections. However, in England, commissioning it has (and still is) a controversial process, where NHS England has repeatedly raised supposed 'uncertainties', first legal and then scientific. The same has not happened in Scotland, where PrEP was commissioned to anyone who needed it in April 2017. This article presents a close reading of the IMPACT trial protocol, which we conclude cannot answer the questions it sets out to answer. We then suggest that the uncertainties the trial claims to address are in fact a tool of power which is deployed to strategically ration healthcare; introduce uncertainty about commissioning PrEP; and shift the boundary between individual responsibilities and state responsibilities for public health and HIV prevention. We conclude that all the above constitute an unethical use of clinical trial rhetoric, systematically discriminate against minority and vulnerable groups, and ration healthcare for those who most need it. As such, we call on all academics, clinicians and activists to resist further unethical misuses of clinical trial rhetoric. Article	2020	Naicker, Cherise L; Mansoor, Leila E; Dawood, Halima; Naidoo, Kogieleum; Singo, Denzhe; Matten, David; Williamson, Carolyn; Abdool Karim, Quarraisha	Importance of early identification of PrEP breakthrough infections in a generalized HIV epidemic: a case report from a PrEP demonstration project in South Africa.	BMC Infectious Diseases	-	-	-	-	1471-2334	10.1186/s12879-020-05255-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7374822	BACKGROUND: The World Health Organisation recommends the use of tenofovir-containing pre-exposure prophylaxis (PrEP) as an additional Human Immunodeficiency Virus (HIV) prevention choice for men and women at substantial risk of HIV infection. PrEP could fill an important HIV prevention gap, especially for sexually active young women who are limited in their ability to negotiate mutual monogamy or condom use. As PrEP is scaled up in high HIV incidence settings, it is crucial to consider the importance of early identification of HIV infection during PrEP use, to allow for rapid discontinuation of PrEP to reduce the risk of antiretroviral (ARV) resistance. The purpose of this case study is to provide this critical evidence. CASE PRESENTATION: This report describes a 20-year-old woman in a HIV sero-discordant relationship who initiated oral PrEP (tenofovir disoproxil fumarate (TDF) and emtricitabine (FTC)) through a demonstration project (CAPRISA 084) in October 2017. Despite good adherence throughout her PrEP use, she tested HIV antibody positive at month nine of study participation. Retrospective testing showed increasing HIV viral load over time, and retrospective use of fourth-generation rapid HIV tests showed HIV detection (positive antigen/antibody) at month one. Sequencing confirmed a dominant wild type at month one with dual therapy resistance patterns emerging by month three (M184V and K65R mutations), which is suggestive of protracted PrEP use during an undetected HIV infection. The participant was referred to infectious diseases for further management of her HIV infection and was initiated on a first line, tenofovir-sparing regimen. At the time of this report (January 2020), the participant had been on ARV- therapy (ART) for 13 months and had no signs of either clinical, immunologic or virologic failure. CONCLUSIONS: This case report highlights the importance of appropriate HIV screening during wider oral PrEP scale-up in high HIV incidence settings to circumvent the consequences of prolonged dual therapy in an undiagnosed HIV infection and in turn prevent ARV resistance. Article	2020	Nakasone S.E.; Chimbindi N.; Mthiyane N.; Nkosi B.; Zuma T.; Baisley K.; Dreyer J.; Pillay D.; Floyd S.; Birdthistle I.; Seeley J.; Shahmanesh M.	"They have this not care - don't care attitude:" A Mixed Methods Study Evaluating Community Readiness for Oral PrEP in Adolescent Girls and Young Women in a Rural Area of South Africa	AIDS Research and Therapy	-	-	-	-	17426405	10.1186/s12981-020-00310-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090506508&doi=10.1186%2fs12981-020-00310-2&partnerID=40&md5=b6e45e55ca795d616b05ba3ef0fc4441	Introduction: Adolescent girls and young women (AGYW) remain disproportionately affected by HIV. In a rural area of South Africa with an annual incidence (2011-2015) of 5 and 7% per annum for 15-19 and 20-24-year olds respectively, oral pre-exposure prophylaxis (PrEP) could provide AGYW with a form of HIV prevention they can more easily control. Using quantitative and qualitative methods, we describe findings from a study conducted in 2017 that assessed knowledge of and attitudes toward PrEP to better understand community readiness for an AGYW PrEP rollout. Methods: We used descriptive analysis of a quantitative demographic survey (n = 8,414 ages 15-86) to identify population awareness and early PrEP adopters. We also conducted semi-structured, in-depth interviews with a purposive sample of 52 potential PrEP gatekeepers (health care workers, community leaders) to assess their potential influence in an AGYW PrEP rollout and describe the current sexual health landscape. Interviews were recorded, transcribed, and iteratively coded to identify major themes. Results: PrEP knowledge in the general population, measured through a demographic survey, was low (n = 125/8,414, 1.49% had heard of the drug). Medicalized delivery pathways created hostility to AGYW PrEP use. Key informants had higher levels of knowledge about PrEP and saw it as a needed intervention. Community norms around adolescent sexuality, which painted sexually active youth as irresponsible and disengaged from their own health, made many ambivalent towards a PrEP rollout to AGYW. Health care workers discussed ways to shame AGYW if they tried to access PrEP as they feared the drug would encourage promiscuity and "risky"behaviour. Others interviewed opposed provision on the basis of health care equity and feared PrEP would divert both drug and human resources from treatment programs. Conclusions: The health system in this poor, high-HIV incidence area had multiple barriers to a PrEP rollout to AGYW. Norms around adolescent sexuality and gatekeeper concerns that PrEP could divert health resources from treatment to prevention could create barriers to PrEP roll-out in this setting. Alternate modes of delivery, particularly those which are youth-led and demedicalize PrEP, must be explored. © 2020 The Author(s). Article	2020	Nakasone, Sarah E; Young, Ingrid; Estcourt, Claudia S; Calliste, Josina; Flowers, Paul; Ridgway, Jessica; Shahmanesh, Maryam	Risk perception, safer sex practices and PrEP enthusiasm: barriers and facilitators to oral HIV pre-exposure prophylaxis in Black African and Black Caribbean women in the UK.	Sexually Transmitted Diseases	-	-	-	-	1472-3263	10.1136/sextrans-2020-054457	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7402557	OBJECTIVES: UK Black African/Black Caribbean women remain disproportionately affected by HIV. Although oral pre-exposure prophylaxis (PrEP) could offer them an effective HIV prevention method, uptake remains limited. This study examined barriers and facilitators to PrEP awareness and candidacy perceptions for Black African/Black Caribbean women to help inform PrEP programmes and service development. METHODS: Using purposive sampling through community organisations, 32 in-depth, semi-structured interviews were conducted with Black African/Black Caribbean women living in London and Glasgow between June and August 2018. Participants (aged 19-63) included women of varied HIV statuses to explore perceptions of sexual risk and safer sex, sexual health knowledge and PrEP attitudes. A thematic analysis guided by the Social Ecological Model was used to explore how PrEP perceptions intersected with wider safer sex understandings and practices. RESULTS: Four key levels of influence shaping safer sex notions and PrEP candidacy perceptions emerged: personal, interpersonal, perceived environment and policy. PrEP-specific knowledge was low and some expressed distrust in PrEP. Many women were enthusiastic about PrEP for others but did not situate PrEP within their own safer sex understandings, sometimes due to difficulty assessing their own HIV risk. Many felt that PrEP could undermine intimacy in their relationships by disrupting the shared responsibility implicit within other HIV prevention methods. Women described extensive interpersonal networks that supported their sexual health knowledge and shaped their interactions with health services, though these networks were influenced by prevailing community stigmas. CONCLUSIONS: Difficulty situating PrEP within existing safer sex beliefs contributes to limited perceptions of personal PrEP candidacy. To increase PrEP uptake in UK Black African/Black Caribbean women, interventions will need to enable women to advance their knowledge of PrEP within the broader context of their sexual health and relationships. PrEP service models will need to include trusted 'non-sexual health-specific' community services such as general practice. Combined HIV Adolescent Prevention Study (CHAPS): comparison of HIV pre-exposure prophylaxis regimens for adolescents in sub-Saharan Africa—study protocol for a mixed-methods study including a randomised controlled trial	Trials	-	-	-	-	17456215	10.1186/s13063-020-04760-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094968850&doi=10.1186%2fs13063-020-04760-x&partnerID=40&md5=95a0c7f876942c96f3473dd856229015	Background: HIV remains a major public health issue, especially in Eastern and Southern Africa. Pre-exposure prophylaxis is highly effective when adhered to, but its effectiveness is limited by cost, user acceptability and uptake. The cost of a non-inferiority phase III trial is likely to be prohibitive, and thus, it is essential to select the best possible drug, dose and schedule in advance. The aim of this study, the Combined HIV Adolescent PrEP and Prevention Study (CHAPS), is to investigate the drug, dose and schedule of pre-exposure prophylaxis (PrEP) required for the protection against HIV and the acceptability of PrEP amongst young people in sub-Saharan Africa, and hence to inform the choice of intervention for future phase III PrEP studies and to improve strategies for PrEP implementation. Methods: We propose a mixed-methods study amongst young people aged 13–24 years. The first component consists of qualitative research to identify the barriers and motivators towards the uptake of PrEP amongst young people in South Africa, Uganda and Zimbabwe. The second component is a randomised clinical trial (ClinicalTrials.gov NCT03986970, June 2019) using a novel ex vivo HIV challenge method to investigate the optimal PrEP treatment (FTC-TDF vs FTC-TAF), dose and schedule. We will recruit 144 amongst HIV-negative uncircumcised men aged 13–24 years from voluntary male medical circumcision clinics in two sites (South Africa and Uganda) and randomise them into one of nine arms. One group will receive no PrEP prior to surgery; the other arms will receive either FTC-TDF or FTC-TAF, over 1 or 2 days, and with the final dose given either 6 or 20 h prior to surgery. We will conduct an ex vivo HIV challenge on their resected foreskin tissue. Discussion: This study will provide both qualitative and quantitative results to help decide the optimum drug, dose and schedule for a future phase III trial of PrEP. The study will also provide crucial information on successful strategies for providing PrEP to young people in sub-Saharan Africa. Trial registration: ClinicalTrials.gov NCT03986970. Registered on 14 June 2019. © 2020, The Author(s). Article	2020	Nelson L.E.; Ajiboye W.; Djiadeu P.; Odhiambo A.J.; Pedersen C.; Ramos S.R.; Lofters A.; Mbuagbaw L.; Williams G.	A web-based intervention to reduce decision conflict regarding hiv pre-exposure prophylaxis: Protocol for a clinical trial	JMIR Research Protocols	-	-	-	-	19290748	10.2196/15080	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091995200&doi=10.2196%2f15080&partnerID=40&md5=dc0dd5ce8158176613c45765ae9b60a2	Background: HIV pre-exposure prophylaxis (PrEP) is recommended for populations at high ongoing risk for infection. There are noted racial disparities in the incidence of HIV and other sexually transmitted infections (STIs) for African, Caribbean, and Canadian Black (ACB, black) populations in Ontario, Canada. Although blacks represent only 4.7% of the Ontario population, they account for 30% of HIV prevalence and 25% of new infections in the province. The existing clinical public health practice toolkit has not been sufficient to optimize PrEP uptake, despite the overwhelming evidence of PrEP's efficacy for reducing HIV transmission risk. Since its establishment as an effective HIV prevention tool, the major focus in behavioral research on PrEP has been on understanding and improving adherence. To date, there is no known formalized intervention in place designed to support ACB men and women at high risk of making high-quality decisions regarding the adoption of PrEP as an HIV prevention practice. Objective: We propose 2 aims to address these gaps in HIV prevention and implementation science. First, the Ottawa Decision Support Framework (ODSF) for use in the PrEP decisional needs of black patients was adapted. Second, the decision support intervention to estimate effect size compared with control conditions in reducing decision conflict and predicting adherence over 60 days was pilot tested. Methods: In aim 1, we propose a cross-sectional qualitative descriptive study using data collected from key informant interviews with eligible PrEP patients (n=30) and surveys with health professionals (n=20) involved in HIV PrEP management. Data obtained from aim 1 will be used to develop a decision support intervention based on the ODSF. In aim 2, the adopted decision support intervention using a block-randomized design to estimate effect size compared with control conditions in reducing decision conflict and predicting adherence over 60 days was pilot tested. Hypothesis testing will be de-emphasized in favor of generating effect size estimates. Results: A research award was funded on March 25, 2017 (Multimedia Appendix 1). Ethical approval was received on March 25, 2019 (with supplemental approval received on May 10, 2019). Data collection started on April 9, 2019. As of September 30, 2019, we enrolled 29 patients and 24 health care providers for aim 1. We are currently analysing the data collected for aim 1. Aim 2 is scheduled to start in May 2020. Conclusions: This study will provide evidence-based information on the decisional needs of black patients who are at risk of HIV and have been offered PrEP. The study will also test the effect of decision support intervention in reducing decision conflict, adoption of PrEP, and adherence to PrEP. © 2020 LaRon E Nelson, Wale Ajiboye, Pascal Djiadeu, Apondi J Odhiambo, Cheryl Pedersen, S Raquel Ramos, Aisha Lofters, Lawrence Mbuagbaw, Geoffrey Williams. Article	2020	Newman, Daniel R; Rahman, Mohammad M; Brantley, Antoine; Peterman, Thomas A	Rates of New Human Immunodeficiency Virus (HIV) Diagnoses After Reported Sexually Transmitted Infection in Women in Louisiana, 2000-2015: Implications for HIV Prevention.	Clinical Infectious Diseases	-	-	-	-	1537-6591	10.1093/cid/ciz303	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6790153	BACKGROUND: Human immunodeficiency virus (HIV) prevention interventions for prevention interventions for women include screening, partner notification, promoting condoms, and preexposure prophylaxis (PrEP). Women's risk of acquiring HIV can help guide recommendations. METHODS: We used data from Louisiana's sexually transmitted infection (STI) and HIV registries to study 13- to 59-year-old women following first diagnosis of syphilis, gonorrhea, or chlamydia during 2000-2015. We measured HIV rates reported subsequent to STI (through 2016). Rates for women without STI were estimated by subtracting women with STI from reported cases and from Census estimates for the population. PrEP cost was estimated as $11 000 per year, and effectiveness estimated as 100%. RESULTS: STIs were syphilis (6574), gonorrhea (64 995), or chlamydia (140 034). These 211 603 women had 1 865 488 person-years of follow-up and 969 HIV diagnoses. Women with no STI had 5186 HIV diagnoses over 24 359 397 person-years. HIV rates diagnosis (per 100 000 person-years) were higher for women after syphilis (177.3), gonorrhea (73.2), or chlamydia (35.4) compared to women with no STI (22.4). Providing PrEP to all women diagnosed with syphilis or gonorrhea would cost $7 371 111 000 and could have prevented 546 HIV diagnoses. Limiting PrEP to 1 year after syphilis or gonorrhea diagnosis would cost $963 847 334, but only 143 HIV diagnoses were within 2 years after a syphilis or gonorrhea diagnosis. CONCLUSIONS: Rates of HIV diagnosis were high after women had STI, but not high enough to make PrEP cost-effective for them. Most women diagnosed with HIV did not have previously reported STI. Article	2020	Ngure K.; Velloza J.; Patel R.C.; Mugo N.R.; Bukusi E.A.; Haberer J.E.; Odoyo J.; Celum C.; Baeten J.M.; Heffron R.	Alignment of PrEP use and effective contraceptive use among East African women in HIV serodiscordant partnerships	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/0956462420951501	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091754589&doi=10.1177%2f0956462420951501&partnerID=40&md5=0271a5dc24eb593acd1af13c3c527fc8	Women who have a prevention mindset may opt for concurrent use of oral pre-exposure prophylaxis (PrEP) and all forms of contraception; we therefore assessed how contraception may influence PrEP use or vice versa. We analyzed data from Kenyan and Ugandan HIV-uninfected non-pregnant women in sero-discordant partnerships who were participating in the Partners Demonstration Project. Using multivariable generalized estimating equation models, we estimated the associations between effective contraceptive use and 1) PrEP dispensation 2) high effective PrEP use. Among the 311 women (93.1% of all those followed in the Partners Demonstration Project) median age was 29 years (interquartile range IQR 24.0–35.0) and 115 (37.0%) reported using effective contraception at baseline. All the women initiated PrEP during the study and moderately high PrEP adherence was recorded at 73.1% of visits over an average 7.5 months following PrEP dispensation. Women (14.8%) consistently used an effective contraceptive throughout study follow-up. PrEP dispensation was more frequent among those concurrently using effective contraception, (adjusted relative risk aRR = 1.19; 95% confidence interval CI = 1.08–1.32) and contraceptive use was more common among those on PrEP (aRR = 1.63; 95% CI = 1.18–2.25). Among East African women at high risk of HIV infection, PrEP dispensation was more frequent among women using effective contraception, indicating that family planning outlets may be efficient locations to deliver PrEP. © The Author(s) 2020. Article	2020	Nicholls E.J.; Rosengarten M.	PrEP (HIV pre-exposure prophylaxis) and its possibilities for clinical practice	Sexualities	-	-	-	-	13634607	10.1177/1363460719886556	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075135282&doi=10.1177%2f1363460719886556&partnerID=40&md5=7c48b0e8e940c9dbbaefdee41762c81b	In this article, we reflect on the possibilities that PrEP (HIV pre-exposure prophylaxis) raises for HIV specialist clinicians. Often neglected, yet a direct participant at the intersection of a complex tension within public health debates on how to reduce HIV transmission and the sexual sociability of individuals, we reflect on current thinking of health practitioners involved in the day-to-day practice of prescribing PrEP. Drawing on interviews with practitioners in the context of UK sexual health and HIV specialist medicine, while bearing in mind neoliberal critiques and process studies of medical science, we propose that PrEP invites the possibility for reconstituting approaches to sex and risk. © The Author(s) 2019. Article	2020	Nicol, Melanie R; Eneh, Prosperity; Nakalega, Rita; Kaiser, Thomas; Kabwigu, Samuel; Isingel, Esther; Beksinska, Mags; Sykes, Craig; Fowler, Mary Glenn; Brown, Todd T; Staley, Christopher; Kiweewa Matovu, Flavia	Depot Medroxyprogesterone Acetate and the Vaginal Microbiome as Modifiers of Tenofovir Diphosphate and Lamivudine Triphosphate Concentrations in the Female Genital Tract of Ugandan Women: Implications for Tenofovir Disoproxil Fumarate/Lamivudine in Preexposure Prophylaxis.	Clinical Infectious Diseases	-	-	-	-	1537-6591	10.1093/cid/ciz443	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7146007	BACKGROUND: Effective concentrations of antiretrovirals in the female genital tract (FGT) are critical for suppression of viral shedding or effective preexposure prophylaxis. The disposition of tenofovir diphosphate (TFV-DP) and emtricitabine triphosphate (FTC-TP) in the FGT have been previously described. Despite widespread use, however, lamivudine triphosphate (3TC-TP) exposure in the FGT is unknown. Depot medroxyprogesterone acetate (DMPA) and vaginal dysbiosis have been implicated in increased risk of human immunodeficiency virus (HIV) acquisition, but whether they alter TFV-DP or 3TC-TP exposure, and therefore compromise prevention efficacy, is unknown. METHODS: Fifty premenopausal women living with HIV in Kampala, Uganda, and receiving daily tenofovir disoproxil fumarate/lamivudine were recruited. Ectocervical biopsies were obtained for quantification of TFV-DP and 3TC-TP using liquid chromatography-mass spectrometry. 16S ribosomal RNA gene sequencing was performed on DNA extracted from vaginal swabs. Wilcoxon rank-sum was used to test for differences between contraceptive groups. RESULTS: 3TC-TP concentrations were on average 17-fold greater than TFV-DP concentrations in cervical tissues. TFV-DP concentrations in cervical biopsies were 76% greater in DMPA users compared with women using nonhormonal contraception (n = 23 per group). Abundance of Lactobacillus in vaginal swabs was correlated with 3TC-TP concentrations in cervical tissues. CONCLUSIONS: We found that TFV-DP concentrations were significantly greater in DMPA users compared with women using nonhormonal contraception, suggesting that prevention efficacy is unlikely to be compromised by DMPA use. Similar to reports of FTC-TP, 3TC-TP exposure was significantly greater than TFV-DP in cervical tissue and was correlated with abundance of Lactobacillus. These data support lamivudine as an option for preexposure prophylaxis. CLINICAL TRIALS REGISTRATION: NCT03377608. Article	2020	Niedt G.	PrEP talk: Media narratives and the terrifying sublime	Sexualities	-	-	-	-	13634607	10.1177/1363460719886557	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077220500&doi=10.1177%2f1363460719886557&partnerID=40&md5=1f26d65ed3b6fa9c5215e0d5f0474c95	Despite the clinical success of Truvada-as-PrEP in preventing HIV transmission for several years, it has still not yet been widely adopted by the MSM community. Clinicians insist that the drug is safe, and there are avenues to pay for the drug even for the uninsured—and yet, there is hesitation. Since the 1980s, HIV/AIDS narratives have been linked to what Susan Sontag (1989) calls an "imputation of guilt," and more broadly, the creation of a connection between queer sexuality and social stigma whose inertia is difficult to escape. How is the way people talk about PrEP framed by this discursive history? Can the community's reluctance be understood in those terms, and addressed by deeper understandings of how the disease and its treatment are conceived? This article takes a discourse analysis approach to examine the narratives surrounding PrEP, in particular those that have circulated in online and print media in the USA. These are contextualized by the evolution of conversations surrounding the disease and its treatment, from "death sentence" to chronic illness to medical condition. Following Kover (1998), HIV/AIDS is positioned here as an object of the terrifying sublime, that can only be dealt with indirectly, while PrEP represents a (possible) shift in strategies for coping with the disease, from avoidance to confrontation, with all that that entails. © The Author(s) 2019. Article	2020	Nieto O.; Brooks R.A.; Landrian A.; Cabral A.; Fehrenbacher A.E.	PrEP discontinuation among Latino/a and Black MSM and transgender women: A need for PrEP support services	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0241340	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095727432&doi=10.1371%2fjournal.pone.0241340&partnerID=40&md5=f48416ff4dcfd4f6992e0c4171da9a81	Purpose Disparities persist in HIV infection among Black and Latino men who have sex with men (BLMSM) and Black and Latina transgender women (BLTW). Increasing uptake and subsequent consistent use of pre-exposure prophylaxis (PrEP), an effective biomedical strategy for preventing HIV acquisition, can dramatically reduce HIV incidence in these populations. The purpose of this study was to explore reasons for PrEP discontinuation among BLMSM and BLTW living in Los Angeles County to inform the development of support services for these populations to remain persistent with their PrEP regimen. Methods In-depth, semi-structured interviews were conducted with 15 BLMSM and 7 BLTW who reported either temporary or indefinite PrEP discontinuation. A thematic analysis approach was used to analyze qualitative data. Results Four themes emerged related to reasons for PrEP discontinuation, including: (1) lower perceived HIV risk related to changes in sexual behavior; (2) structural or logistical barriers (e.g., lapse or loss of health insurance, cost, difficulty navigating complex medical systems); (3) anticipated and experienced medication side effects, with a sub-theme of interactions between PrEP and feminizing hormone medications; and (4) challenges with medication adherence. Conclusions PrEP is an important prevention tool for BLMSM and BLTW, particularly during periods of heightened HIV risk. However, both individual (e.g., inability to adhere to medication, changes in HIV sexual risk behaviors) and structural/logistical (e.g., loss of insurance, navigating complex medical systems) factors can cause temporary or indefinite PrEP discontinuation. Additional support services, beyond those offered by medical providers, are needed to help BLMSM and BLTW PrEP users overcome barriers to discontinuation and assist them to remain persistent with their PrEP regimen. We describe potential options for support services such as PrEP case management, expanded PrEP navigation services, or text messaging services. © 2020 Nieto et al. Article	2020	Nifant'ev, Ilya; Siniavin, Andrei; Karamov, Eduard; Kosarev, Maxim; Kovalchuk, Sergey; Turgiev, Ali; Nametkin, Sergey; Bagrov, Vladimir; Tavtorkin, Alexander; Ivchenko, Pavel	A New Approach to Developing Long-Acting Injectable Formulations of Anti-HIV Drugs: Poly(Ethylene Phosphoric Acid) Block Copolymers Increase the Efficiency of Tenofovir against HIV-1 in MT-4 Cells.	International Journal of Molecular Sciences	-	-	-	-	1422-0067	10.3390/ijms22010340	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7795142	Despite the world's combined efforts, human immunodeficiency virus (HIV), the causative agent of AIDS, remains one of the world's most serious public health challenges. High genetic variability of HIV complicates the development of anti-HIV vaccine, and there is an actual clinical need for increasing the efficiency of anti-HIV drugs in terms of targeted delivery and controlled release. Tenofovir (TFV), a nucleotide-analog reverse transcriptase inhibitor, has gained wide acceptance as a drug for pre-exposure prophylaxis or treatment of HIV infection. In our study, we explored the potential of tenofovir disoproxil (TFD) adducts with block copolymers of poly(ethylene glycol) monomethyl ether and poly(ethylene phosphoric acid) (mPEG-b-PEPA) as candidates for developing a long-acting/controlled-release formulation of TFV. Two types of mPEG-b-PEPA with numbers of ethylene phosphoric acid (EPA) fragments of 13 and 49 were synthesized by catalytic ring-opening polymerization, and used for preparing four types of adducts with TFD. Antiviral activity of mPEG-b-PEPATFD or tenofovir disoproxil fumarate (TDF) was evaluated using the model of experimental HIV infection in vitro (MT-4/HIV-1IIIB). Judging by the values of the selectivity index (SI), TFD exhibited an up to 14-fold higher anti-HIV activity in the form of mPEG-b-PEPA adducts, thus demonstrating significant promise for further development of long-acting/controlled-release injectable TFV formulations. Article	2020	Nobles A.L.; Leas E.C.; Noar S.; Dredze M.; Latkin C.A.; Strathdee S.A.; Ayers J.W.	Automated image analysis of instagram posts: Implications for risk perception and communication in public health using a case study of #HIV	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0231155	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084234930&doi=10.1371%2fjournal.pone.0231155&partnerID=40&md5=9d0a36e521d253b729983cfbea2c3caf	People's perceptions about health risks, including their risk of acquiring HIV, are impacted in part by who they see portrayed as at risk in the media. Viewers in these cases are asking themselves "do those portrayed as at risk look like me?" An accurate perception of risk is critical for high-risk populations, who already suffer from a range of health disparities. Yet, to date no study has evaluated the demographic representation of health-related content from social media. The objective of this case study was to apply automated image recognition software to examine the demographic profile of faces in Instagram posts containing the hashtag #HIV (obtained from January 2017 through July 2018) and compare this to the demographic breakdown of those most at risk of a new HIV diagnosis (estimates of incidence of new HIV diagnoses from the 2017 US Centers for Disease Control HIV Surveillance Report). We discovered 26,766 Instagram posts containing #HIV authored in American English with 10,036 (37.5%) containing a detectable human face with a total of 18,227 faces (mean = 1.8, standard deviation SD = 1.7). Faces skewed older (47% vs. 11% were 35–39 years old), more female (41% vs. 19%), more white (43% vs. 26%), less black (31% vs 44%), and less Hispanic (13% vs 25%) on Instagram than for new HIV diagnoses. The results were similarly skewed among the subset of #HIV posts mentioning pre-exposure prophylaxis (PrEP). This disparity might lead Instagram users to potentially misjudge their own HIV risk and delay prophylactic behaviors. Social media managers and organic advocates should be encouraged to share images that better reflect at-risk populations so as not to further marginalize these populations and to reduce disparity in risk perception. Replication of our methods for additional diseases, such as cancer, is warranted to discover and address other misrepresentations. © 2020 Nobles et al. Article	2020	Nöstlinger C.; Reyniers T.; Smekens T.; Apers H.; Laga M.; Wouters K.; Vuylsteke B.	Drug use, depression and sexual risk behaviour: a syndemic among early pre-exposure prophylaxis (PrEP) adopters in Belgium?	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2020.1739218	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081737833&doi=10.1080%2f09540121.2020.1739218&partnerID=40&md5=b7c916684a80be0ee839ae400e0fd543	Little is known about how interacting psychosocial problems may influence sexual behaviour among men having sex with men taking Pre-exposure prophylaxis (PrEP). This study assessed (1) the prevalence of depression, recreational drug-use and sexual risk behaviour; (2) changes in these psychosocial conditions over time; and (3) the interaction of drug use and depression with sexual risk behaviour. We analysed data of the Belgian Be-PrEP-ared cohort study (N = 200). We assessed depression using the PHQ-9, recreational drug use and receptive condomless anal intercourse (rCAI) with anonymous partners. Frequencies of psychosocial problems were compared at baseline, 9 and 18 months follow-up (FU). Bivariate associations between depression and drug-use behaviour, and their interaction with rCAI with anonymous sexual partners using was examined using linear regression. Receptive CAI increased from 41% at baseline to 53% at M18 (p = 0.038). At baseline, we found an interaction effect of poly-drug use and depression, potentiating rCAI with anonymous partners. Participants reporting poly-drug use associated with depression were significant more likely to report this type of sexual risk behaviour than those who did not report this association (p = 0.030). The high level of intertwined psychosocial problems call for multi-level interventions for those PrEP users experiencing a syndemic burden. © 2020, © 2020 Informa UK Limited, trading as Taylor & Francis Group.	depression; drug use; HIV prevention; men having sex with men; Pre-exposure prophylaxis; syndemics	English	United Kingdom	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Quantitative
Article	2020	Novelli, Sophie; Lécuroux, Camille; Goujard, Cécile; Reynes, Jacques; Villemant, Agnès; Blum, Laurent; Essat, Asma; Avettand-Fenoël, Véronique; Launay, Odile; Molina, Jean-Michel; Bourgeois, Christine; Meyer, Laurence	Persistence of monocyte activation under treatment in people followed since acute HIV-1 infection relative to participants at high or low risk of HIV infection.	EBioMedicine	-	-	-	-	2352-3964	10.1016/j.ebiom.2020.103129	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7704414	BACKGROUND: Interpretation of the increase in certain inflammatory markers in virally suppressed HIV-infected individuals must rely on an appropriate uninfected control group well characterized for non-HIV-related factors that contribute to chronic inflammation, e.g. smoking, alcohol consumption, or being overweight. We compared the inflammatory profiles of HIV-infected participants under long-term antiretroviral therapy (ART) with those of two HIV-uninfected groups with contrasting health behaviours. METHODS: We studied 150 HIV-infected participants (42 women, 108 men) under long-term ART (median, 6 years) followed in the ANRS PRIMO cohort since acute/early HIV-1 infection (AHI) diagnosis. Sex and age-matched controls were sampled from i) the ANRS IPERGAY pre-exposure prophylaxis trial among men at high risk for HIV infection and with high frequencies of non-HIV factors of inflammation ii) the ANRS COHVAC cohort of volunteers in vaccine trials with a low-risk profile for HIV infection. We measured the plasma levels of ten inflammatory markers. FINDINGS: After adjusting for smoking, alcohol use and body mass index, both HIV-infected men and women had higher levels of sCD14, sCD163, sTNFRII and I-FABP than their high-risk IPERGAY and low-risk COHVAC counterparts. Hierarchical clustering showed a subset of 15 PRIMO participants to have an inflammatory profile similar to that of most HIV-negative participants. These participants already had favourable markers at AHI diagnosis. INTERPRETATION: Long-term ART, even when initiated at a low level of immunodeficiency, fails to normalize monocyte/macrophage activation and gut epithelial dysfunction. Persistent inflammation under treatment may be related to an increased inflammatory profile since AHI. FUNDING: ANRS and Paris-Saclay University. Article	2020	Nunn A.S.; Sowemimo-Coker G.; van den Berg J.J.; Coats C.S.; Sosnowy C.; Napoleon S.; Cormier K.; Chan P.A.; Moitra E.	Recommendations for intervention content to enhance HIV pre-exposure prophylaxis uptake among men who have sex with men receiving care at sexually transmitted disease clinics	Journal of Men's Health	-	-	-	-	18756867	10.15586/JOMH.V16I3.198	https://oss.jomh.org/files/article/20201209-18/pdf/198-Article%20Text-2578-1-10-20200902.pdf	Background and objective Pre-exposure prophylaxis (PrEP) uptake has been suboptimal. Sexually transmitted disease (STD) clinics provide important opportunities to scale PrEP uptake. Material and methods To inform the development of a brief intervention to enhance PrEP uptake in STD clinics, we conducted 32 qualitative interviews to explore barriers and facilitators of PrEP uptake among PrEP eligible, PrEP naive, and men who have sex with men (MSM) presenting for STD screening services. We also solicited input for intervention components to enhance PrEP uptake at STD clinics. Results Most participants' self-perceived HIV risks were low despite reporting unprotected anal intercourse. Many were reluctant to take any medications, expressed apprehension about perceived side effects of PrEP, and were unaware of how to obtain PrEP. Participants recommended that interventions focusing on enhancing PrEP uptake in STD clinics should include: culturally tailored educational materials about PrEP, informational graphics indicating PrEP's relative efficacy in reducing HIV transmission risks, and comprehensive PrEP navigation. Most participants did not feel strongly about gender, race or ethnicity of providers; however, nearly all preferred gay-affirming providers. Brief interventions to enhance PrEP uptake among MSM in STD clinics should include efforts to raise self-awareness of HIV risk, provide information about PrEP's efficacy relative to other interventions, underscore PrEP's relatively few side effects, and provide culturally tailored messaging. ©2020 Amy S. Article	2020	Nurchis, M C; Riccardi, M T; Sapienza, M; Pascucci, D; Damiani, G	Moving forward: Cost-Effectiveness of PrEP in HIV prevention for Men Who Have Sex with Men in Italy	European Journal of Public Health	-	-	-	-	11011262	10.1093/eurpub/ckaa165.994	https://www.proquest.com/scholarly-journals/moving-forward-cost-effectiveness-prep-hiv/docview/2476168857/se-2?accountid=8113	Globally, in 2018 1.7 million people contracted Human Immunodeficiency Virus (HIV) and 770,000 people died from AIDS-related illnesses. Men Who Have Sex with Men (MSM) have one of the highest probabilities of HIV transmission. In Italy, in 2018 2,847 new HIV cases were diagnosed, of which 39% among MSM. The MSM population accounts for 16,690 individuals whereof 50% already underwent the Highly Active Antiretroviral Therapy (HAART). The aim of this study is to evaluate the cost-effectiveness of daily Pre-Exposure Prophylaxis (PrEP) in the Italian MSM susceptible population. A Markov transition model was calibrated to the HIV epidemic among MSM in Italy, comparing PrEP to naïve patients (NP). Model parameters were retrieved by querying scientific databases. Transition probabilities were adjusted for incidence of HIV while costs and benefits were discounted at an annual rate of 3%. The impact on results of critical parameters was explored through a Monte Carlo-based sensitivity analysis. The cost-effectiveness analysis results were reported as Incremental Cost-Effectiveness Ratio (ICER) express as € per Quality Adjusted Life Year (QALY) gained. The introduction of such a PrEP program would result in a total cost of €822,398,199 million and lead to a gain of 70,762 discounted QALYs over an 85-year time horizon. Assuming a 92% efficacy of PrEP therapy, the ICER for the PrEP program is €4,346.16/QALY gained. This value is definitively lower than acceptability NICE threshold (£20,000). PrEP can reduce the infection rate up to 60% in a five-year period. The Monte Carlo simulation confirmed the robustness of the model results. This analysis showed PrEP to be cost-effective when used in a susceptible population. Even if PrEP doesn't protect from other sex-related infectious diseases, it could prevent HIV transmission, thus breaking down HIV-infection incidence rate. Each country should reflect on the real possibility to implement a robust Public Health program pondering the adoption of PrEP. Key messages PrEP is very effective at reducing HIV infection when taken correctly. It is the backbone in the "combination prevention", necessary to reach the SDG of ending the AIDS epidemic by 2030. This preliminary analysis suggests that the introduction of a daily PrEP program for MSM in Italy is cost-effective and possibly cost saving in the long term. Article	2020	Nutor, Jerry John; Duah, Henry Ofori; Agbadi, Pascal; Duodu, Precious Adade; Gondwe, Kaboni W	Spatial analysis of factors associated with HIV infection in Malawi: indicators for effective prevention.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-020-09278-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7382788	BACKGROUND: The objective of this study was to model the predictors of HIV prevalence in Malawi through a complex sample logistic regression and spatial mapping approach using the national Demographic and Health Survey datasets. METHODS: We conducted a secondary data analysis using the 2015-2016 Malawi Demographic and Health Survey and AIDS Indicator Survey. The analysis was performed in three stages while incorporating population survey sampling weights to: i) interpolate HIV data, ii) identify the spatial clusters with the high prevalence of HIV infection, and iii) perform a multivariate complex sample logistic regression. RESULTS: In all, 14,779 participants were included in the analysis with an overall HIV prevalence of 9% (7.0% in males and 10.8% in females). The highest prevalence was found in the southern region of Malawi (13.2%), and the spatial interpolation revealed that the HIV epidemic is worse at the south-eastern part of Malawi. The districts in the high HIV prevalent zone of Malawi are Thyolo, Zomba, Mulanje, Phalombe and Blantyre. In central and northern region, the district HIV prevalence map identified Lilongwe in the central region and Karonga in the northern region as districts that equally deserve attention. People residing in urban areas had a 2.2 times greater risk of being HIV-positive compared to their counterparts in the rural areas (AOR = 2.16; 95%CI = 1.57-2.97). Other independent predictors of HIV prevalence were gender, age, marital status, number of lifetime sexual partners, extramarital partners, the region of residence, condom use, history of STI in the last 12 months, and household wealth index. Disaggregated analysis showed in-depth sociodemographic regional variations in HIV prevalence. CONCLUSION: These findings identify high-risk populations and regions to be targeted for Pre-Exposure Prophylaxis (PrEP) campaigns, HIV testing, treatment and education to decrease incidence, morbidity, and mortality related to HIV infection in Malawi. Article	2020	O'Byrne P.; Orser L.; Haines M.	Active-Offer Nurse-Led PrEP (PrEP-RN) Referrals: Analysis of Uptake Rates and Reasons for Declining	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-019-02745-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076209974&doi=10.1007%2fs10461-019-02745-9&partnerID=40&md5=574d85b79a1eb4bc6e07d01ff92ceca0	While pre-exposure prophylaxis (PrEP) is an effective HIV prevention strategy, its uptake is limited. To address barriers, we piloted a nurse-led PrEP clinic in an STI clinic and had public health nurses refer patients during STI follow-up. We recorded the number of PrEP offers and declines and clinic uptake. We conducted a thematic analysis of patients' responses from nursing notes written at the time patients declined an offer. From August 6, 2018 to August 5, 2019, nurses offered a PrEP referral to 261 patients who met our criteria; only 47.5% accepted. Qualitative analysis identified four themes: (1) perceptions of risk, (2) lack of interest, (3) inability to manage, and (4) concerns about PrEP. Our patients did not feel sufficiently at-risk for HIV to use PrEP and maintained that PrEP was for a reckless "other". This analysis sheds light on how assumptions about risk affect PrEP uptake, particularly among those at-risk for HIV. © 2019, The Author(s). Article	2020	O'Byrne P.; Orser L.; Vandyk A.	Immediate PrEP after PEP: Results from an Observational Nurse-Led PEP2PrEP Study	Journal of the International Association of Physicians in AIDS Care	-	-	-	-	23259574	10.1177/2325958220939763	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090020303&doi=10.1177%2f2325958220939763&partnerID=40&md5=08f490fd1486a4075dfbf827c5a56c9a	Patients who use post-exposure prophylaxis (PEP) are at ongoing risk for HIV acquisition after completing PEP. While the Centers for Disease Control and Prevention recommends pre-exposure prophylaxis (PrEP) use immediately after PEP, some practitioners are hesitant to offer PEP-to-PrEP (PEP2PrEP). We began offering PEP2PrEP in the sexually transmitted infection clinic in Ottawa, Canada on August 5, 2018. During the first 16 months of PEP2PrEP, 61 patients requested PEP and 46 were initiated; 30 of these patients agreed to PEP2PrEP and 26 followed through. None of our PEP patients had confirmed HIV exposures; all fulfilled the initiation criterion of condomless anal sex with a male partner of unknown HIV-status. During the study, the number of PEP requests and initiations was statistical unchanged, yet the seroconversion rate among patients who used PEP decreased from 1.7% pre-PEP2PrEP to 0% post-PEP2PrEP. Regarding follow-up, most discontinuations occurred between the PrEP intake and 1-month follow-up visit. © The Author(s) 2020. Article	2020	O'Byrne Patrick; Orser, Lauren; Jacob Jean Daniel	The Costs of HIV Pre-exposure Prophylaxis (PrEP) Care Delivery: Comparing Specialists, Primary Care, and PrEP-RN	Sexuality Research & Social Policy	-	-	-	-	18689884	10.1007/s13178-019-00391-3	https://www.proquest.com/scholarly-journals/costs-hiv-pre-exposure-prophylaxis-prep-care/docview/2225491825/se-2?accountid=8113	HIV prevention has evolved to include the provision of HIV medications to HIV-negative persons. Known as pre-exposure prophylaxis (PrEP), this intervention can reduce HIV acquisition by 96% when taken as prescribed. While previous reviews have established that PrEP is cost-effective, few have focused on the healthcare system delivery costs associated with PrEP. We undertake such a comparative analysis focusing on Ontario, Canada estimating the costs for an infectious disease physician, a primary care physician, and a nurse working in our nurse-led PrEP clinic (PrEP-RN). While the delivery of care by the nurse generated the least overall costs, we acknowledge that this would depend on how many patients breach the protocols established for nurse-led PrEP. We also highlight that targeting PrEP at persons who are at highest risk for HIV acquisition could make PrEP even more cost-effective than we estimated herein. Article	2020	Ogunbajo, Adedotun; Leblanc, Natalie M; Kushwaha, Sameer; Boakye, Francis; Hanson, Samuel; Smith, Martez DR; Nelson, LaRon E	Knowledge and Acceptability of HIV pre-exposure prophylaxis (PrEP) among men who have sex with men (MSM) in Ghana	AIDS Care	-	-	-	-	09540121	10.1080/09540121.2019.1675858	https://www.proquest.com/scholarly-journals/knowledge-acceptability-hiv-pre-exposure/docview/2352086104/se-2?accountid=8113	In Ghana, men who have sex with men (MSM) are disproportionately affected by HIV. Pre-exposure prophylaxis (PrEP) is a biomedical intervention that reduces the risk of HIV infection but is not currently available in Ghana. This paper explores knowledge and acceptability of HIV PrEP among Ghanaian MSM. Qualitative content analysis was conducted on 22 focus group discussions (N = 137) conducted between March and June 2012 in Accra, Kumasi, and Manya Krobo. Overall, participants reported low knowledge of PrEP. However, once information about PrEP was provided, there was high acceptability. The primary reason for acceptability was that PrEP provided an extra level of protection against HIV. Acceptability of PrEP was conditioned on it having minimal side effects, being affordable and efficient in preventing HIV infection. No acceptability of PrEP was attributed to limited knowledge of side effects and perceived lack of effectiveness. The reasons provided to utilize PrEP and condoms were that condoms protect against other STIs, and sexual partner factors. This is the first known study to explore PrEP knowledge and acceptability among Ghanaian MSM. It is important that key stakeholders preemptively address potential barriers to PrEP acceptability, uptake, and adherence, especially among MSM, once PrEP becomes available in Ghana. Article	2020	Ojikutu, BO; Amutah-Onukagha, N; Mahoney, TF; Tibbitt, C; Dale, SD; Mayer, KH; Bogart, LM	HIV-Related Mistrust (or HIV Conspiracy Theories) and Willingness to Use PrEP Among Black Women in the United States	AIDS and Behavior	-	-	-	-	1090-7165	10.1007/s10461-020-02843-z	https://pubmed.ncbi.nlm.nih.gov/32239358/	Uptake of pre-exposure prophylaxis (PrEP) among Black women living in the US is suboptimal. We sought to determine the association between HIV-related medical mistrust (or belief in HIV conspiracy theories) and willingness to use PrEP among Black women. We analyzed data from the 2016 National Survey on HIV in the Black Community (NSHBC), a nationally representative cross-sectional survey. Among NSHBC participants, 522 were women and 347 (69.0%) reported HIV risk factors. Only 14.1% were aware that PrEP exists; 30.8% reported willingness to use PrEP. HIV-related medical mistrust was reported by 60.4% of women. In multivariable analysis, controlling for income, education, marital status and health care engagement, belief in conspiracy theories was significantly associated with higher willingness to use PrEP. The HIV-Related Medical Mistrust Scale item: "there is a cure for HIV, but the government is withholding it from the poor" was independently associated with higher PrEP willingness. This finding speaks to the need for an improved understanding of the role of HIV-related medical mistrust among Black women to improve uptake of biomedical HIV prevention. Article	2020	Okafor, Chukwuemeka N; Hucks-Ortiz, Christopher; Hightow-Weidman, Lisa B; Magnus Manya; Emel Lynda; Beauchamp Geetha; Kuo, Irene; Hendrix, Craig; Mayer, Kenneth H; Shoptaw, Steven J	Associations Between Self-Reported Substance Use Behaviors and PrEP Acceptance and Adherence Among Black MSM in the HPTN 073 Study: JAIDS	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002407	https://www.proquest.com/scholarly-journals/brief-report-associations-between-self-reported/docview/2507461389/se-2?accountid=8113	Background:Pre-exposure prophylaxis (PrEP) is efficacious for HIV prevention. Black men who have sex with men (MSM) accounted for the largest proportion of new HIV diagnoses in the United States relative to other racial/ethnic groups. Black MSM who use substances are at an increased risk for HIV infection and are ideal candidates for PrEP, but barriers to maintaining PrEP adherence remain a concern. We assessed whether substance use behaviors are associated with initiation and adherence to PrEP among a sample of black MSM in the United States.Methods:Data for this analysis come from the HIV Prevention Trials Network Study 073 (HPTN 073). Substance use behaviors—including alcohol, marijuana, poppers (ie, alkyl nitrites), and stimulants (ie, methamphetamine/cocaine use) including use of these substances before/during condomless anal intercourse (CAI)—were assessed longitudinally through self-report. PrEP adherence was assessed by pharmacological testing in blood. Generalized estimating equations were used to evaluate association between substance use behaviors and PrEP initiation and adherence.Results:Among 226 HIV-negative black MSM, the majority (60%) were 25+ years of age. Most of the substance use behaviors were not significantly associated with PrEP initiation or adherence. However, stimulant use before/during CAI was significantly associated with lower odds of PrEP adherence (adjusted odds ratio = 0.21, 95% confidence interval = 0.07 to 0.61; P = <0.01).Conclusions:These findings suggest that PrEP adherence is feasible among black MSM who use substances. However, black MSM who engage in stimulant use before/during CAI may present a unique group for additional study and support with enhanced behavioral health and support services. Article	2020	Okoro O.N.; Whitson S.O.	Sexual Health, HIV Care and Pre-exposure Prophylaxis in the African Immigrant Population: A Needs Assessment	Journal of Immigrant and Minority Health	-	-	-	-	15571912	10.1007/s10903-019-00873-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85062867850&doi=10.1007%2fs10903-019-00873-x&partnerID=40&md5=dfe42349fc15bf7a007fdfdda26cc2d1	The objective was to gain insight, from the perspective of healthcare professionals, non-medical service providers and community-based organizations working with a large majority of African immigrant patients or clients, regarding sexual health and the potential for the use of HIV PrEP in this priority population. Thirty key informants participated in a needs assessment. A questionnaire was used to obtain information through focus groups, structured interviews and by self-administration. There are cultural and linguistic barriers to engaging Africans in discussing sexual health issues. Key challenges to uptake of PrEP are multi-dimensional: socioeconomic immigration status, housing; cultural talking about sex 'taboo', HIV related stigma, no concept of preventive care; provider-related (cultural competency, inadequate PrEP education, language barrier); and individual (lack of awareness, perception of HIV risk). Meeting basic needs like housing, assuring access to care (including PrEP), community-based education, relevant training of providers, and tailored messaging are strongly recommended. Effectively addressing HIV incidence in the African-born immigrant population redonequires a multi-pronged approach. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Olanrewaju A.O.; Sullivan B.P.; Zhang J.Y.; Bender A.T.; Sevenler D.; Lo T.J.; Fernandez-Suarez M.; Drain P.K.; Posner J.D.	Enzymatic Assay for Rapid Measurement of Antiretroviral Drug Levels	ACS Sensors	-	-	-	-	23793694	10.1021/acssensors.9b02198	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084028031&doi=10.1021%2facssensors.9b02198&partnerID=40&md5=46a53fb28063d452f1222a8db90f973f	Poor adherence to pre-exposure prophylaxis (PrEP) and antiretroviral therapy (ART) can lead to human immunodeficiency virus (HIV) acquisition and emergence of drug-resistant infections, respectively. Measurement of antiviral drug levels provides objective adherence information that may help prevent adverse health outcomes. Gold-standard drug-level measurement by liquid chromatography/mass spectrometry is centralized, heavily instrumented, and expensive and is thus unsuitable and unavailable for routine use in clinical settings. We developed the REverSe TRanscrIptase Chain Termination (RESTRICT) assay as a rapid and accessible measurement of drug levels indicative of long-term adherence to PrEP and ART. The assay uses designer single-stranded DNA templates and intercalating fluorescent dyes to measure complementary DNA (cDNA) formation by reverse transcriptase in the presence of nucleotide reverse transcriptase inhibitor drugs. We optimized the RESTRICT assay using aqueous solutions of tenofovir diphosphate (TFV-DP), a metabolite that indicates long-term adherence to PrEP and ART, at concentrations over 2 orders of magnitude above and below the clinically relevant range. We used dilution in water as a simple sample preparation strategy to detect TFV-DP spiked into whole blood and accurately distinguished TFV-DP drug levels corresponding to low and high PrEP adherences. The RESTRICT assay is a fast and accessible test that could be useful for patients and clinicians to measure and improve ART and PrEP adherence. Article	2020	Olansky, Evelyn; Mansergh, Gordon; Pitts, Nicole; Mimiaga, Matthew J; Denson, Damian J; Landers, Stewart; Holman, Jeremy; Herbst, Jeffrey H	PrEP Awareness in the Context of HIV/AIDS Conspiracy Beliefs Among Black/African American and Hispanic/Latino MSM in Three Urban US Cities	Journal of Homosexuality	-	-	-	-	00918369	10.1080/00918369.2018.1557953	https://www.proquest.com/scholarly-journals/prep-awareness-context-hiv-aids-conspiracy/docview/2385861904/se-2?accountid=8113	We examined HIV conspiracy beliefs and PrEP awareness in a convenience sample of minority MSM. Participants in three cities completed a behavioral self-assessment on sociodemographics, PrEP awareness, and HIV/AIDS conspiracy beliefs. HIV/AIDS conspiracy beliefs were more common among Black than Latino MSM (58% vs. 42%, p < .05), and among younger men than older men (age 18–29 (50%), 30–39 (22%), 40+ (28%); p < .05). PrEP awareness co-occurred with conspiracy belief less (37%) than with non-belief (63%, p < .05), persisting in multivariable regression (aOR = 0.52, 95% CI = 0.38–0.71). This relationship suggests that current HIV care and prevention messaging is either inaccessible or not credible to some minority subpopulations. Article	2020	Olejarz, Patrycja; Chwatko, Grażyna; Kubalczyk, Paweł; Purgat, Krystian; Głowacki, Rafał; Borowczyk, Kamila	Application of High-Performance Liquid Chromatography for Simultaneous Determination of Tenofovir and Creatinine in Human Urine and Plasma Samples.	Pharmaceuticals	-	-	-	-	1424-8247	10.3390/ph13110367	https://pubmed.ncbi.nlm.nih.gov/33167541/	Tenofovir disoproxil fumarate is widely used in the therapy of human immunodeficiency virus and hepatitis B virus; however, a high concentration of the prodrug effects kidney function damage. To control the effectiveness of kidney functions in treated patients, the level of creatinine in the body must be controlled. This work describes a simple, fast, and "plastic-waste" reducing method for the simultaneous determination of tenofovir and creatinine in human urine and plasma. In both assays, only 50 µL of body fluid was required. The tests were carried out by reversed phase high-performance liquid chromatography with UV detection. In urine samples, the limits of detection for tenofovir and creatinine were 4 µg mL(-1) and 0.03 µmol mL(-1), respectively. In plasma samples, the limits of detection were 0.15 µg mL(-1) for tenofovir and 0.0003 µmol mL(-1) for creatinine. The method was applied for the determination of tenofovir and creatinine in human urine and plasma samples. The biggest advantage of the elaborated method is the possibility to determine tenofovir and creatinine in one analytical run in both urine and plasma sample collected from HIV and HBV patients. The possibility to reduce the level of laboratory waste in a sample preparation protocol is in the mainstream of a new trend of analytical chemistry which is based on green chemistry.	tenofovir; hepatitis B virus; human immunodeficiency virus; creatinine; HPLC-UV	English	Switzerland	Western and Central Europe and North America	Poland	Western and Central Europe and North America	Poland	Western and Central Europe and North America	Clinical
Article	2020	OLIVEIRA, J. A. A. de .; ARAÚJO, A. H. I. M. de .; ALVES, A. H. T. .	ESTRATÉGIAS AO CASAL EM SITUAÇÃO DE SORODISCORDÂNCIA PARA O HIV: UMA REVISÃO DA LITERATURA	Revista JRG de Estudos Acadêmicos	-	-	-	-	2595-1661	https://doi.org/10.5281/zenodo.4268845	https://revistajrg.com/index.php/jrg/article/view/71	A Síndrome da Imunodeficiência Adquirida, conhecida mais comumente como Aids, é o estágio mais avançado da infecção pelo vírus da imunodeficiência adquirida (HIV). Os casais denominados em situação de sorodiscordância são parceiros que possuem sorologias distintas para o HIV, sendo apenas um soropositivo. Os casais expressam a vontade da gestação, mas muitos não procuram o serviço de saúde, pois se sentem envergonhados ou com medo. O objetivo deste trabalho é compreender, através da revisão da literatura recente, um pouco mais sobre o vírus da imunodeficiência humana (HIV) e as implicações na possibilidade de casais sorodiscordantes terem filhos, fazendo uso de terapia adequada. Foram pesquisados artigos científicos em bases de dados e bibliotecas virtuais, e após a aplicação dos critérios de inclusão e exclusão, em sua totalidade, foram selecionados 16 artigos para avaliação na íntegra, sendo 9 na Scielo, 4 na LILACS e 3 na BDENF. A falta de conhecimento dos portadores do vírus HIV provocam dúvidas, seja individual ou até mesmo quando estão em relacionamentos, com isso, a assistência de saúde possui um papel fundamental na hora da descoberta e os profissionais de saúde devem atuar como facilitadores do cuidado, agindo de forma acolhedora e integral com cada indivíduo, identificando os fatores relacionados que levam a não adesão medicamentosa com o intuito de traçar novas estratégias de saúde. Article	2020	O'Malley, TL; Hawk, ME; Egan, JE; Krier, SE; Burke, JG	Intimate Partner Violence and Pre-exposure Prophylaxis (PrEP): A Rapid Review of Current Evidence for Women's HIV Prevention	AIDS and Behavior	-	-	-	-	1090-7165	10.1007/s10461-019-02743-x	https://link.springer.com/article/10.1007/s10461-019-02743-x	Pre-exposure prophylaxis (PrEP) is a valued component of HIV prevention and increasing attention is focusing on women's PrEP use. Common HIV prevention options (e.g., condoms) remain underused and fail to consider the context of intimate partner violence (IPV). PrEP presents an opportunity to expand viable options for women. A systematic rapid review using key word searches of PubMed and proceedings from six national and international conferences related to HIV, women's health, or interpersonal violence identified nine studies which met set inclusion criteria. Studies were coded using a structured abstraction form and summarized according to relevant themes. IPV was found to have implications on women's interest and willingness to use PrEP, partner interference or interruptions in PrEP use, and adherence. Findings indicate a dearth of research on women's PrEP use and IPV and highlight the urgency for research, public health practice, and policy attention around the HIV risk context and needs of women who experience IPV. Article	2020	Onwubiko, Udodirim; Holland, David; Ajoku, Sophia; Taylor, Justin; Childs, Ansha; Wilson, Derick; Chamberlain, Allison T	Using PrEP to #STOPHIVATL: Findings from a Cross-Sectional Survey Among Gay Men and Transgender Women Participating in Gay Pride Events in Atlanta, Georgia, 2018.	Archives of Sexual Behavior	-	-	-	-	1573-2800	10.1007/s10508-020-01711-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10287502	Assessing pre-exposure prophylaxis (PrEP) coverage and identifying reasons for disproportionate uptake among the varied social and cultural sub-groups of men who have sex with men (MSM) and transgender women who have sex with men (TWSM) are necessary precursors to setting attainable local PrEP. We report on findings of a cross-sectional survey among MSM/TWSM attending Gay pride events in Atlanta, Georgia, in 2018. Associations between PrEP awareness, uptake, and respondent characteristics were assessed using logistic regression. PrEP awareness did not differ by race, but current use was significantly lower among Blacks at substantial risk of HIV (p = .008). In multivariate analysis, clinician encounter in the past year was associated with awareness while age, income, drug use, sero-discordant sex, and multiple male partners were associated with current use. Among PrEP-naïve MSM/TWSM, the most common reasons for nonuse differed by race (poor knowledge of PrEP: Black-45% vs. non-Black-27%, p = .010, low perception of risk: Black-26% vs. non-Black-52%, p = .001). Key racial and socioeconomic disparities in active PrEP use and reasons for nonuse remain despite the recent increases in PrEP awareness and use among MSM/TWSM in Atlanta. Achieving overall improvement in uptake among all MSM/TWSM sub-groups will require tailoring PrEP educational messaging, optimizing communication modalities, expanding provider outreach, and identifying ways to defray costs for high-risk, underserved sub-groups in these populations. Article	2020	Ooi C.; Kong F.Y.S.; Lewis D.A.; Hocking J.S.	Prevalence of sexually transmissible infections and HIV in men attending sex-on-premises venues in Australia: A systematic review and meta-analysis of observational studies	Sexual Health	-	-	-	-	14485028	10.1071/SH19150	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083042494&doi=10.1071%2fSH19150&partnerID=40&md5=707db531b7fd3c86259c8211a0ab50c9	In Australia, men who have sex with men (MSM) have high rates sexually transmissible infections (STIs) and sex-on-premises venue (SOPV) patrons are at risk. This paper assesses Neisseria gonorrhoeae (NG), Chlamydia trachomatis (CT), syphilis and HIV prevalence in men tested at Australian SOPVs and describes testing services. Methods: EMBASE, Medline, PubMed and international conference proceedings were searched for articles reporting on-site SOPV testing between 1 January 2000 and 31 January 2017. Meta-analysis calculated pooled prevalence estimates of STIs by anatomical site. Results: Twelve cross-sectional studies were identified. Most (8/12) were local sexual health clinic (SHC) outreach services. Participants' mean age was 41.1 years (95% confidence interval (CI) 37.0-43.3 range 17 to 84 years). Testing included CT and NG (9/12), HIV (8/12) and syphilis (5/12). CT and NG prevalence overall summary estimates were 3.4% (95% CI 1.9-5.2%, I2 = 88.7%, P < 0.01) and 1.3% (95% CI 0.7-2.2%, I2 = 75.5%, P < 0.01) respectively. CT and NG prevalence was highest in the ano-rectum and oro-pharynx respectively. The HIV and syphilis pooled estimates were 2.3% (95% CI 1.6-2.9%, I2 = 93.1%, P < 0.01) and 3.2% (95% CI 1.8-4.6%, I2 = 72.8%, P < 0.01) respectively. Participation rate varied. Conclusion: This review examines HIV and STI testing in Australian SOPVs before HIV pre-exposure prophylaxis (PrEP). Findings indicate a high prevalence of STIs. PrEP use and resultant condomless sex may influence STI prevalence. Further research is required to determine the effect of PrEP on the STI prevalence among SOPV patrons. © 2020 CSIRO.	chlamydia; gonorrhoea; outreach; screening; syphilis	English	United States	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Review

No Evidence of Sexual Risk Compensation Following PrEP Initiation Among Heterosexual HIV Serodiscordant Couples in Kenya and Uganda	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-019-02720-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074797148&doi=10.1007%2fs10461-019-02720-4&partnerID=40&md5=67a84297ab22a9e648ff0c44e8d6ca6e	Recent studies among men who have sex with men suggest that sexual behaviors associated with risk of sexually transmitted infections increase following initiation of pre-exposure prophylaxis (PrEP) for HIV prevention. We used longitudinal data from HIV-uninfected participants (n = 1013) enrolled in an open-label study of PrEP delivered to Ugandan and Kenyan heterosexual HIV serodiscordant couples to understand the association between PrEP initiation and HIV risk-related sexual behaviors among these couples. In the month following PrEP initiation, the mean number of monthly sex acts within couples decreased from 7.9 to 6.9 (mean difference: − 1.1; 95% CI − 1.5, − 0.7) and the proportion of couples having condomless sex decreased from 65% to 32% (percentage point change: − 33%; 95% CI − 37%, − 30%); these behaviors then remained relatively constant over 2 years. We found no evidence of sexual risk compensation following PrEP initiation among African serodiscordant couples. However, roughly a third of couples continued to engage in condomless sex during follow up, emphasizing the importance of continued PrEP use to sustain HIV protection. © 2019, The Author(s). Article	2020	Owens C.; Hubach R.D.; Lester J.N.; Williams D.; Voorheis E.; Reece M.; Dodge B.	Assessing determinants of pre-exposure prophylaxis (PrEP) adherence among a sample of rural Midwestern men who have sex with men (MSM)	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2020.1757021	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082462307&doi=10.1080%2f09540121.2020.1757021&partnerID=40&md5=8e36aa67c12dc64dadd0e697d18cd534	Pre-exposure prophylaxis (PrEP) efficacy in preventing HIV among gay, bisexual, and other men who have sex with men (MSM) is dependent upon adherence. Little is known about the PrEP adherence experiences among MSM who live in rural areas of the US. This qualitative study was informed by a modified version of Straussian Grounded Theory. Thirty-four 34 rural Midwestern MSM participated in telephone interviews that assessed their PrEP adherence factors. Overall, participants adhered to the PrEP regimen, ranging from missing none to a couple of doses per month. Participants had high self-efficacy (competence) and self-reliance (autonomy) in taking PrEP daily. Participants incorporated PrEP into their already existing routines. Participants were motivated to adhere to prevent HIV acquisition and be financially responsible. All participants mentioned their PrEP provider discussed the importance of adherence with PrEP's effectiveness, but future patient-provider PrEP adherence communication varied among participants. Future PrEP adherence interventions should address counseling strategies that leverage these constructs to support pill taking. Future research should explore patient-provider conversations surrounding PrEP adherence to inform provider- and patient-level interventions. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	grounded theory; MSM; PrEP adherence; qualitative; rural	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Owens C.; Hubach R.D.; Williams D.; Lester J.; Reece M.; Dodge B.	Exploring the pre-exposure prophylaxis (Prep) health care experiences among men who have sex with men (msm) who live in rural areas of the midwest	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2020.32.1.51	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082342553&doi=10.1521%2faeap.2020.32.1.51&partnerID=40&md5=8d3d2d3b187665e827c22a17ea8de358	Most pre-exposure prophylaxis (PrEP) research samples men who have sex with men (MSM) who live in metropolitan cities. There is a limited understanding of the PrEP experiences among rural MSM. Thirty-four semi-structured interviews were conducted to explore the PrEP health care experiences among 34 rural Midwestern MSM. Of the 34 participants, 23 obtained PrEP from their non–primary care provider (PCP). Three themes were present: (1) PrEP is unavailable in rural areas, (2) PrEP is inaccessible in rural areas due to PCPs being unwilling to prescribe PrEP, and (3) PrEP services are unamicable in rural areas due to stigmatizing attitudes and behaviors of PCPs. It is important to address PrEP care continuum factors in all settings; however, these factors are often exacerbated in rural areas due to social determinants. Without further research and programming, organizational and social determinants may contribute to lower rates of PrEP outcomes in rural areas. © 2020 The Guilford Press. Article	2020	Owens, Christopher; Hubach, Randolph D; Williams, Deana; Voorheis, Eva; Lester, Jessica; Reece, Michael; Dodge, Brian	Facilitators and Barriers of Pre-exposure Prophylaxis (PrEP) Uptake Among Rural Men who have Sex with Men Living in the Midwestern U.S.	Archives of Sexual Behavior	-	-	-	-	00040002	10.1007/s10508-020-01654-6	https://www.proquest.com/scholarly-journals/facilitators-barriers-pre-exposure-prophylaxis/docview/2417168629/se-2?accountid=8113	Facilitators and barriers of Pre-exposure Prophylaxis (PrEP) uptake have been established in prior studies; however, most of these studies comprise samples of MSM from metropolitan cities and hypothetical PrEP use. There is a dearth of literature on the uptake factors among rural U.S. MSM who are prescribed PrEP. Thirty-four rural Midwestern MSM who currently take PrEP participated in semi-structured telephone interviews about their barriers and facilitators to their PrEP use. Interviews were analyzed using an inductive thematic analysis approach. There were four barriers: (1) lack of rural dissemination of PrEP information, (2) concern about side and adverse effects of using PrEP, (3) cost of PrEP uptake and engagement, and (4) lack of access to PrEP care and PrEP care quality. Individual and social facilitators that participants utilized to overcome these barriers are discussed. Findings elevate the importance of multilevel interventions that address PrEP adoption from a patient, provider, and healthcare system perspective. Article	2020	Pagkas-Bather, Jade; Jaramillo, Jahn; Henry, Jsani; Grandberry, Vanessa; Ramirez, Luis F; Cervantes, Lorenzo; Stekler, Joanne D; Andrasik, Michele P; Graham, Susan M	What's PrEP?: peer navigator acceptability among minority MSM in Washington.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-020-8325-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7029512	BACKGROUND: Peer navigation is a promising strategy to link at-risk minority men who have sex with men (MSM) to HIV prevention services including pre-exposure prophylaxis (PrEP). METHODS: Thirty-two Black and 63 Latinx HIV-negative MSM living in western Washington completed a survey examining attitudes towards peer navigation and PrEP. Factor analysis derived a score for peer navigator acceptability, and linear regression identified associations with this outcome. RESULTS: Forty-eight percent were interested in peer navigation. Being insured, higher sexual stigma, and higher PHQ-9 score were associated with higher acceptability, while higher income and having a regular medical provider were associated with lower acceptability. In multivariable analysis, higher sexual stigma predicted higher acceptability, while higher income predicted lower acceptability. Men preferred that peers be matched on sexual orientation, race, age and culture. CONCLUSION: Peer navigation interventions to reach minority men should address stigma, focus on lower-income men, and try to match peers to clients to the extent possible. Article	2020	Pagkas-Bather, Jade; Ozik, Jonathan; Millett, Gregorio; Schneider, John A	The last Black man with HIV in San Francisco: the potential role of gentrification on HIV getting to zero achievements.	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(20)30250-2	https://dx.doi.org/10.1016/S2352-3018(20)30250-2	San Francisco was the first city in the USA to develop a Getting to Zero HIV elimination strategy. The cause of decreased HIV incidence has been attributed to the use of biomedical prevention methods, such as pre-exposure prophylaxis (PrEP) and treatment as prevention (TasP). These strategies have benefitted White men who have sex with men (MSM), whose population has increased over the past decade. However, Black MSM in San Francisco continue to have higher HIV incidence and outmigration rates. We posit that the declining overall HIV incidence, including among White MSM, is not only explained by the use of TasP and PrEP, but is also due to the declining Black population and rising HIV incidence among Black MSM, who have historically been more likely to acquire HIV due to structural, racial, and criminal justice-related factors than have White MSM. Article	2020	Pantalone, David W; Holloway, Ian W; Goldblatt, Alison E A; Gorman, Kaitlyn R; Herbitter, Cara; Grov, Christian	The Impact of Pre-Exposure Prophylaxis on Sexual Communication and Sexual Behavior of Urban Gay and Bisexual Men.	Archives of Sexual Behavior	-	-	-	-	1573-2800	10.1007/s10508-019-01478-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7018565	Pre-exposure prophylaxis (PrEP) has altered the public health landscape for gay, bisexual, and other men who have sex with men (GBM) by significantly increasing protection against HIV infection. Early epidemiologic data showed GBM generally used PrEP as prescribed, i.e., as an additional protective tool over and above barrier protection, although subsequent reports have been equivocal. Irrespective of population-level trends, some GBM appear to have reevaluated their HIV risk tolerance and changed their interactions with sex partners. Scant published data have focused on factors that influence PrEP-using GBM's decisions about sexual behavior-including condom use as well as sex with HIV-positive partners-and sexual communication practices. Thus, in this study, we investigated those research concerns qualitatively via content analysis of individual interviews conducted with 103 GBM in New York City (M age 32.5 years, 50% White, 64% on PrEP > 6 months). Emergent themes reflect (1) participants' strong HIV knowledge; (2) changing GBM community norms about condom use on PrEP; (3) increased focus on risk tolerance with individual differences in post-PrEP condom use; (4) appreciation for routine sexually transmitted infection (STI) testing in PrEP care concomitant with some STI knowledge deficits; (5) decreased stigma concerning, and greater comfort with, HIV-positive sex partners; and (6) increased confidence discussing HIV status and condom use preferences with partners. Findings have implications for future research as well as for clinical practice, such as enhanced STI education and provider-initiated discussions about risk compensation, serosorting, and sexual communication skills. Article	2020	Parsons, Jordan; Cox, Chelsea	PrEP in Prisons: HIV prevention in incarcerated populations	International Journal of Prisoner Health	-	-	-	-	17449200	10.1108/IJPH-09-2019-0053	https://www.proquest.com/scholarly-journals/prep-prisons-hiv-prevention-incarcerated/docview/2534071998/se-2?accountid=8113	PurposeThe purpose of this paper is to discuss the possibility of using pre-exposure prophylaxis (PrEP) as an HIV harm reduction intervention in prisons. PrEP is primarily discussed in relation to men who have sex with men (MSM), meaning other high-risk populations, such as prisoners, are often side-lined. The authors wanted to consider how it could prove beneficial beyond the MSM community.Design/methodology/approachFirst, the authors discuss whether the common objections to existing HIV harm reduction interventions in prisons, such as needle exchanges, are applicable to PrEP. The authors then apply common objections to the provision of PrEP in the general population to the provision of PrEP in a prison context in order to assess their strength. Finally, the authors discuss what the authors anticipate to be a key objection to PrEP in prisons: post-incarceration access.FindingsThe authors argue that both sets of common objections considered are easily refuted in the case of PrEP in prisons. The unique setting and nature of the intervention are such that it is without immediately apparent flaws. In addressing post-incarceration access, the authors suggest that a longitudinal consideration of a prisoner's HIV risk undermines the objection.Originality/valueThis discussion is of importance due to the significantly heightened risk of HIV infection prisoners are subject to. Not only do effective HIV prevention interventions in prisons contribute to fair access to health for incarcerated individuals, but also to the wider fight against HIV. The authors demonstrate that PrEP has potential as a new approach and call for further research in this area. Article	2020	Pasipanodya E.C.; Li M.J.; Jain S.; Sun X.; Tobin J.; Ellorin E.; Dube M.; Daar E.S.; Corado K.; Milam J.; Blumenthal J.; Morris S.H.; Moore D.J.	Greater Levels of Self-Reported Adherence to Pre-Exposure Prophylaxis (PrEP) are Associated with Increased Condomless Sex Among Men Who Have Sex with Men	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-020-02881-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084202050&doi=10.1007%2fs10461-020-02881-7&partnerID=40&md5=0fda5726c6cece0273f6969af5a66995	The effectiveness of pre-exposure prophylaxis (PrEP) against HIV acquisition depends on treatment adherence; however, within-person associations between levels of PrEP adherence and engagement in condomless sex have not been well studied. In the context of a demonstration project, 372 men who have sex with men received once-daily PrEP and completed six study visits over 48 weeks. Two-part growth mixture modeling was used to examine the longitudinal trajectory of condomless anal intercourse (CAI) and self-reports of PrEP adherence, controlling for relevant covariates. Over time, greater PrEP adherence was contemporaneously associated with both a higher likelihood of engaging in any CAI and with a greater number of CAI acts. Substance use was also associated with a higher likelihood of engaging in CAI. Contemporaneous associations between self-reported PrEP adherence and CAI suggest that adherence behaviors may be motivated by the desire to mitigate risk of HIV infection; however, exact directionality is unknown. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Pathela, Preeti; Jamison, Kelly; Blank, Susan; Daskalakis, Demetre; Hedberg, Trevor; Borges, Christine	The HIV Pre-exposure Prophylaxis (PrEP) Cascade at NYC Sexual Health Clinics: Navigation Is the Key to Uptake.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000002274	https://dx.doi.org/10.1097/QAI.0000000000002274	BACKGROUND: Clinics providing sexual health care pose unique opportunities to implement HIV pre-exposure prophylaxis (PrEP) programs. The PrEP program at New York City's Sexual Health Clinics provides intensive on-site navigation for linkage to PrEP care. We assessed uptake of this intervention. METHODS: We categorized men who have sex with men (MSM) without HIV hierarchically as having had (1) HIV post-exposure prophylaxis (PEP) use (past year); or (2) selected sexually transmitted infections (STI) (past year); or (3) HIV-diagnosed sex/needle-sharing partners (past 6 months); or (4) expressed interest in PrEP (day of clinic visit). We constructed PrEP cascades and used multivariable regression to examine acceptance of PrEP navigation, referral to a PrEP provider, linkage (<60 days), and PrEP prescription. RESULTS: One thousand three hundred one of 2106 PrEP (62%) patients accepted navigation. Of those, 55% (718/1301) were black or Hispanic MSM. STI and PEP patients had lowest navigation acceptance levels (35%-46%). Of navigated patients, 56% (628/1114) accepted referrals, 46% (288/628) linked to PrEP providers, and 82% (235/288) were prescribed PrEP; overall, 11% of those offered navigation (235/2106) received prescriptions. Navigated MSM with PEP history adjusted prevalence ratio (aPR) 1.34, 95% confidence interval (CI): 1.16 to 1.56), previous STI (aPR 1.28, 95% CI: 1.12 to 1.45), or HIV-diagnosed partners (aPR 1.18, 95% CI: 1.01 to 1.37) were more likely than those with PrEP interest to accept referrals. Probability of linkage varied by insurance status; prescription did not vary by patient factors. CONCLUSIONS: Although MSM in key priority groups (eg, previous STI) showed low navigation uptake, those who accepted navigation were likely to be referred for PrEP, suggesting a need for expanded up-front engagement. Article	2020	Patki M.; Vartak R.; Jablonski J.; Mediouni S.; Gandhi T.; Fu Y.; Cetindag E.; Dave R.; Valente S.T.; Patel K.	Efavirenz nanomicelles loaded vaginal film (EZ film) for preexposure prophylaxis (PrEP) of HIV	Colloids and Surfaces B: Biointerfaces	-	-	-	-	9277765	10.1016/j.colsurfb.2020.111174	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086497925&doi=10.1016%2fj.colsurfb.2020.111174&partnerID=40&md5=02f10492954dd80839f0bd98f496adeb	Preexposure prophylaxis (PrEP) using oral or vaginal microbicide is an emerging and effective strategy to prevent HIV transmission. Vaginal film is becoming more acceptable and a convenient dosage form compared to cream, gel and suppository. Extremely poor aqueous solubility of efavirenz (EFV) limits its use as vaginal microbicide. The aim of this study was to develop and evaluate a monomeric surfactant free, rapidly soluble vaginal film of EFV (EZ film). EZ film was prepared using a tetrafunctional block polymer (Tetronic 1107), carrageenan and polyvinyl alcohol (PVA) by solvent evaporation method. First, different solubilizers were screened for EFV solubility, in vitro cytotoxicity and cell membrane integrity assay on HeLa cells. Optimized film was characterized for solid state, mechanical strength, epithelial integrity, in vitro drug release in simulated vaginal fluid (SVF), simulated seminal fluid (SSF) and in vitro anti-HIV activity. Optimized EZ film showed a particle size of 48 ± 3.8 nm with PDI of 0.299. Differential scanning colorimetry (DSC) thermogram suggested the complete amorphization of EFV within the film. EZ film rapidly disintegrated (30 s) with complete release of EFV in SVF and SSF. The film was found to be non-toxic to HeLa cells and showed similar anti-HIV-1 activity as that of EFV in DMSO. EZ film did not show any significant change in the TEER value in HEC 1A cell line. Hence, the findings from the current study strongly suggest that the EZ film could be a cost-effective and convenient dosage form for PrEP of HIV. © 2020 Elsevier B.V. Article	2020	Pattanasin S.; Cadwell B.L.; Smith D.K.; Sukwicha W.; Mock P.A.; Wimonsate W.; Ungsedhapand C.; Sirivongrangson P.; Dunne E.F.; Thigpen M.C.	Estimating the impact of HIV combination prevention in men who have sex with men, the Bangkok MSM Cohort Study, Thailand	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/0956462420920394	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085004823&doi=10.1177%2f0956462420920394&partnerID=40&md5=00b27d7db801e7b3169cc37171657cec	In Thailand, pre-exposure prophylaxis (PrEP) is recommended for human immunodeficiency virus (HIV) prevention among at-risk men who have sex with men (MSM). We modeled the impact of PrEP and condom use as independent and combined interventions on the estimated number of HIV infections among a hypothetical population of 10,000 MSM in Bangkok, Thailand. Our model demonstrated a 92% (95% confidence interval 89.7, 94.2) reduction in HIV infections among Thai MSM who took daily PrEP and self-reported using condoms correctly and consistently (100% condom use). Increased use of PrEP and condoms likely would have a substantial impact on the HIV epidemic in Thailand. © The Author(s) 2020. Article	2020	Pattanasin, Sarika; van Griensven, Frits; Mock, Philip A; Sukwicha, Wichuda; Winaitham, Santi; Satumay, Kesinee; O'Connor, Siobhan; Hickey, Andrew C; Siraprapasiri, Taweesap; Woodring, Joseph V; Sirivongrangson, Pachara; Holtz, Timothy H; Dunne, Eileen F	Recent declines in HIV infections at Silom Community Clinic Bangkok, Thailand corresponding to HIV prevention scale up: An open cohort assessment 2005-2018.	International Journal of Infectious Diseases	-	-	-	-	1878-3511	10.1016/j.ijid.2020.07.007	https://dx.doi.org/10.1016/j.ijid.2020.07.007	OBJECTIVES: We assessed HIV-1 infection among men who have sex with men (MSM) attending Silom Community Clinic (SCC) in Bangkok, Thailand from 2005 to 2018. Since 2014, Thailand increased implementation of HIV prevention strategies including pre-exposure prophylaxis and Treatment as Prevention. METHODS: MSM attending SCC were tested for HIV using rapid tests. We assessed trends in HIV prevalence, incidence and compared incidence before and after 2014. RESULTS: From 2005 to 2018, 14,034 clients attended SCC for HIV testing. The HIV prevalence increased from 19.2% in 2005-2006 to 34-0% in 2010, remained stable until 2016 and decreased to 17.2% in 2018 (p<0.0001). The HIV incidence was 4.1 per 100 person-years (PY), with an inverted U-shape trend and a peak in 2009 (p<0.0001). Incidence among young MSM aged 13-21 years remained high at 10.0 per 100 PY. Among those aged 22-29 years, lower incidence was found from Q 3 2016, with a relative risk reduction of 46.2% (p<0.001); and a similar reduction among those aged ≥30 years from Q4 2014, corresponding to scale up of HIV prevention strategies. CONCLUSION: We found a decline in HIV infection among Thai MSM. However, incidence remained high among young MSM. Article	2020	Pearson T.; Chandler R.; McCreary L.L.; Patil C.L.; McFarlin B.L.	Perceptions of African American Women and Health Care Professionals Related to Pre-Exposure Prophylaxis to Prevent HIV	JOGNN - Journal of Obstetric, Gynecologic, and Neonatal Nursing	-	-	-	-	8842175	10.1016/j.jogn.2020.07.003	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091684033&doi=10.1016%2fj.jogn.2020.07.003&partnerID=40&md5=4d4401117134359704ac19292ac2744a	Objective: To describe the perceptions of African American women and health care professionals (HCPs) about factors that likely influence the use of pre-exposure prophylaxis (PrEP) to prevent HIV among African American women. Design: Prospective mixed methods. Setting: Chicago, IL. Participants: Fifty-eight participants included HCPs (n = 10) and African American women (n = 48). Methods: Following the six steps of concept mapping, participants identified and rated factors they perceived to influence decisions to use PrEP among African American women. Results: African American women generated a list of statements, and we grouped the statements into eight clusters: access, financial, best benefits, protection, medication, setbacks, network, and fear. HCPs ranked having an HIV-positive partner as the most influential factor that affected African American women's decisions to use PrEP (network cluster). African American women ranked ability to prevent HIV when condom use cannot be negotiated as their top reason (best benefits cluster) for using PrEP. Conclusion: African American women wanted to know how they could protect themselves and were open to using PrEP. For African American women considering the use of PrEP, the most influential factors were related to the benefits and accessibility of PrEP. HCPs should know that African American women are not afraid to discuss HIV risk and testing. © 2020 AWHONN, the Association of Women's Health, Obstetric and Neonatal Nurses; Autonomy and access were the most influential factors for African American women considering the use of pre-exposure prophylaxis. © 2020 AWHONN, the Association of Women's Health, Obstetric and Neonatal Nurses	African American; HIV; PrEP; prevention	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2020	Pencolé L.; Lê M.P.; Bouchet-Crivat F.; Duro D.; Peytavin G.; Mandelbrot L.	Placental transfer of the integrase strand inhibitors cabotegravir and bictegravir in the ex-vivo human cotyledon perfusion model	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000002637	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094932601&doi=10.1097%2fQAD.0000000000002637&partnerID=40&md5=182d4c249f48be804f91a28427530c73	Data on placental transfer is lacking for the recent HIV integrase inhibitors, bictegravir and cabotegravir, although their future use in pregnancy is to be expected. The objective of this study was to determine their transplacental pharmacokinetics. Maternal-to-fetal transfer was investigated using the open-circuit ex-vivo dually perfused human cotyledon model. Cabotegravir or bictegravir was added to a maternal perfusate containing 2g/l of human albumin and antipyrine, a marker to validate the cotyledon's viability, and cotyledons were dually perfused for up to 90min. For cabotegravir, in five experiments, the median (IQR 25-75) concentrations in the maternal and in the fetal compartments were, respectively, 550ng/ml (344-788) and 48ng/ml (37-54), with a maternal-to-fetal ratio of 10% (5-16) and a clearance index (in comparison with antipyrine transfer) of 22% (19-28). The median cotyledon accumulation index was 10% (2-21). For bictegravir, in six experiments, the median (IQR 25-75) concentrations in the maternal and in the fetal compartments were, respectively, 1650ng/ml (1455-1960) and 126ng/ml (112-142), with a maternal-to-fetal ratio of 7% (6-9.5) and a clearance index (in comparison with antipyrine transfer) of 21% (17-29). The median cotyledon accumulation index was 4% (3-5). Placental transfer of cabotegravir and bictegravir were low. This may not only limit the potential for fetal toxicities but also be a limit to their usefulness at the time of labor and delivery to reduce the risk of vertical HIV transmission. The safety and efficacy of these new integrase inhibitors in pregnancy require more investigation. © 2020 Lippincott Williams and Wilkins. All rights reserved. Article	2020	Perazzolo S.; Mandal S.; Prathipati P.K.; Destache C.J.	Bictegravir Plus Tenofovir Alafenamide Nanoformulation as a Long-Acting Pre-Exposure Prophylaxis Regimen: Application of Modeling to Design Non-Human Primate Pharmacokinetic Experiments	Frontiers in Pharmacology	-	-	-	-	16639812	10.3389/fphar.2020.603242	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098698104&doi=10.3389%2ffphar.2020.603242&partnerID=40&md5=fbdff08682bada6ec2e961f2f5d39370	Bictegravir (BIC) and tenofovir alafenamide fumarate (TAF), two potent anti-HIV drugs, had been nanoformulated (nBIC-TAF) to achieve once-a-month PrEP coverage. In-vivo mouse experiments for nBIC-TAF exhibited favorable subcutaneous (SC) pharmacokinetics. To probe the clinical suitability of the nBIC-TAF in non-human primates (NHP), as the next step, we intend to study nBIC-TAF in NHP, as the best preclinical model to foster clinical trials. Before entering an expensive NHP study, however, we seek to improve our a priori understanding about nBIC-TAF in higher species, having just mouse data. The mechanism-based pharmacokinetic modeling (MBPK) has been used as an appropriate method for pharmacokinetic modeling and interspecies scaling for nanoformulations. Via the use of MBPK, in this work, we created a model for nBIC-TAF able to predict plasma concentration-time curves in NHP. BIKTARVY is a daily oral combination of BIC, TAF, and emtricitabine (Gilead Science, CA), approved for HIV therapy. Using BIKTARVY equivalent dosages (from their NHP studies), we predicted that, following just one SC dose of nBIC-TAF in NHP, both BIC and tenofovir will have detectable and above in vitro efficacy levels for 28 days. Furthermore, the MBPK was able to provide a mechanistic explanation regarding the long-acting mechanism characterizing nBIC-TAF: nanoparticles sections in the SC space from which drugs slowly dissociate. Dissociated drugs in the SC space then buffer the plasma pool over time, yielding an extended-release effect in the plasma. Overall, we predicted for nBIC-TAF a promising long-acting pharmacokinetic in NHP, potentially usable as monthly PrEP. These results will help investigators to gain confidence for facing regulatory submissions at early stages. © Copyright © 2020 Perazzolo, Mandal, Prathipati and Destache.	bictegravir; HIV; mechanism-based pharmacokinetic modeling; pre-exposure prophylaxis; tenofovir alafenamide	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2020	Perucho J.; Alzate-Duque L.; Bhuiyan A.; Sánchez J.P.; Sánchez N.F.	PrEP (Pre-Exposure Prophylaxis) Education for Clinicians: Caring for an MSM Patient	MedEdPORTAL : The Journal of Teaching and Learning Resources	-	-	-	-	23748265	10.15766/mep_2374-8265.10908	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087883863&doi=10.15766%2fmep_2374-8265.10908&partnerID=40&md5=6e373cc40ece48a570f4b03d4864e583	Introduction: Gaps exist in educational materials addressing LGBTQ patient care and LGBTQ health. One such area is prescribing HIV pre-exposure prophylaxis (PrEP) for men who have sex with men (MSM). PrEP awareness, familiarity, and comfort in prescribing are very important in the rollout and success of PrEP as a preventative measure. Our needs assessments showed a lack of familiarity and comfort among clinicians/medical students in prescribing PrEP. Furthermore, studies have shown that since its launch as an effective prevention method of HIV transmission, PrEP has not been widely prescribed to at-risk populations. Educating clinicians about PrEP may increase its use among high-risk MSM populations and reduce the incidence of HIV infections. Methods: For medical students, we developed a didactic presentation and video recording discussing (1) a brief history of HIV prevention, (2) indications for PrEP prescription, (3) medical testing for PrEP onboarding, (4) common PrEP side effects, and (5) appropriate follow-up and testing for PrEP maintenance and discontinuation. We also developed a videotaped clinical encounter demonstrating communication skills used in PrEP counseling. Pre- and postworkshop surveys assessed participants' PrEP attitudes and knowledge. Results: All 43 survey respondents were second- through fourth-year medical students. Pre- and postpresentation evaluation of questions assessing comfort demonstrated a statistically significant improvement in level of comfort with understanding when to prescribe PrEP and in level of knowledge in prescribing PrEP. Discussion: Workshop participants acknowledged their training gaps in PrEP prescribing and acquired knowledge and comfort with prescribing PrEP for at-risk populations. © 2020 Perucho et al. Article	2020	Peuchant O.; Touati A.; Laurier-Nadalié C.; Hénin N.; Cazanave C.; Bébéar C.; De Barbeyrac B.	Prevalence of lymphogranuloma venereum among anorectal Chlamydia trachomatis -positive MSM using pre-exposure prophylaxis for HIV	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2019-054346	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083636932&doi=10.1136%2fsextrans-2019-054346&partnerID=40&md5=c603797db411bf0fc1056a4385091f54	Objectives We evaluated the prevalence of lymphogranuloma venereum (LGV) in anorectal Chlamydia trachomatis-positive French men who have sex with men (MSM) using pre-exposure prophylaxis (PrEP) for HIV. Here, we describe the clinical, biological and behavioural characteristics of these patients. Methods Laboratories throughout French metropolitan areas performing routine testing for C. trachomatis sent positive anorectal specimens to the National Reference Centre for bacterial STIs for LGV real-time PCR targeting the pmpH gene. Identification of the C. trachomatis genovar was performed by ompA gene sequencing. For each patient, clinical, biological and sexual behaviour data were collected after obtaining written informed consent. Results In 2017, 486 anorectal C. trachomatis-positive specimens from MSM PrEP users were analysed. A strain of genovar L was detected in 91 cases (18.7%). Patients with LGV were significantly more symptomatic, had more sexual partners and more concurrent syphilis compared with their non-LGV counterparts. OmpA gene sequencing, successful in two-thirds of anorectal C. trachomatis-positive specimens, showed that the LGV cases were mainly of variant L2b (n=33), followed by genovar L2 (n=27) and genetic L2b ompA variants (n=16). In 11 cases, the results indicated the occurrence of genetic exchange between L and non-L genovars. Conclusions LGV was diagnosed in 18.7% of anorectal C. trachomatis-positive specimens from French MSM using PrEP. LGV testing should be carried out for MSM diagnosed with chlamydia and with a large number of sexual partners, high-risk practices and anorectal symptoms. These patients should be presumptively treated as having LGV. This is the first surveillance study of LGV among MSM PrEP users and monitoring should continue. ©	chlamydia trachomatis; HIV pre-exposure prophylaxis; lymphogranuloma venereum; molecular epidemiology	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical

Article	2020	Phanuphak, Nittaya; Gulick, Roy M	HIV treatment and prevention 2019: current standards of care.	Current Opinion in HIV and AIDS	-	-	-	-	1746-6318	10.1097/COH.0000000000000588	https://dx.doi.org/10.1097/COH.0000000000000588	PURPOSE OF REVIEW: The purpose of this review is to summarize the current standards of care for both HIV treatment and HIV prevention in 2019. RECENT FINDINGS: Current HIV treatment is started as soon as feasible in a person with HIV infection and consists of a three-drug oral daily antiretroviral regimen, consisting of two nucleoside analogue reverse transcriptase inhibitors combined with a third drug, either an integrase inhibitor, a non-nucleoside reverse transcriptase inhibitor, or a protease inhibitor. Present treatment regimens are potent, convenient, generally well tolerated and durable, and lead to a normal life expectancy. Present antiretroviral-based HIV prevention strategies focus on treating people with HIV infection with antiretrovirals as soon as feasible to reduce their risk of transmitting to others, and providing two-drug pre-exposure prophylaxis (PrEP) and three-drug post-exposure prophylaxis (PEP) to those HIV-uninfected individuals who are at risk for HIV infection. PrEP is highly effective when used correctly. Further data on early antiretroviral therapy and PrEP are needed to demonstrate any impact on HIV epidemic control. SUMMARY: HIV treatment and HIV prevention have improved markedly in recent years due to the development of oral antiretrovirals that are potent, convenient, and generally well tolerated, and lead to virologic suppression and decreased HIV transmission. Current HIV/AIDS Reports	-	-	-	-	1548-3576	10.1007/s11904-020-00516-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7497381	PURPOSE OF REVIEW: Globally, "undetectable equals untransmittable (U=U)" and "pre-exposure prophylaxis (PrEP)" have become crucial elements in HIV treatment and prevention programs. We reviewed the implementation of U=U and PrEP among countries in the Asia-Pacific region. RECENT FINDINGS: U=U and PrEP uptakes were limited and slow in the Asia-Pacific. Inadequate knowledge among health care practitioners and pervasive stigma towards individuals living with HIV and their sexual lives are key barriers for the integration of U=U into clinical practice. Paternalistic and hierarchical health care systems are major obstacles in PrEP implementation and scale-up. Countries with the most advanced PrEP implementation all use community-based, nurse-led, and key population-led service delivery models. To advance U=U and PrEP in the Asia-Pacific, strategies targeting changes to practice norm through wide-scale stakeholders' training and education, making use of online health care professional influencers, and utilizing financial mechanism should be further explored through implementation research. Article	2020	Phillips A.; Harmon J.L.; Bera J.; Ogle M.; Thompson J.	Integrating Preexposure Prophylaxis (PrEP) Into a Network of Community Health Centers	Journal for Nurse Practitioners	-	-	-	-	15554155	10.1016/j.nurpra.2019.09.010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078925154&doi=10.1016%2fj.nurpra.2019.09.010&partnerID=40&md5=e47fe0d78957888a9b050b0db6917046	Although preexposure prophylaxis (PrEP) is more than 92% effective in preventing human immunodeficiency virus, primary care providers underprescribe it. This quality improvement project was designed to increase the provision of PrEP to people at high risk for human immunodeficiency virus via evidence-based training given to primary care providers. This training occurred within a network of 19 federally qualified health centers in Sacramento, California. After implementation, there was a 67% increase in prescriptions for PrEP. Furthermore, all providers displayed an increase in acquired knowledge of PrEP (P < .001). Via focus group, providers identified facilitators, barriers, and innovative ideas for the standardization of PrEP in primary care. © 2019 Elsevier Inc. Article	2020	Phillips II G.; McCuskey D.J.; Felt D.; Raman A.B.; Hayford C.S.; Pickett J.; Shenkman J.; Lindeman P.T.; Mustanski B.	Geospatial perspectives on health: The PrEP4Love campaign and the role of local context in health promotion messaging	Social Science & Medicine	-	-	-	-	2779536	10.1016/j.socscimed.2020.113497	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095953084&doi=10.1016%2fj.socscimed.2020.113497&partnerID=40&md5=b5f1979a9a02c9fde0a6a51e970a9f41	Pre-exposure prophylaxis (PrEP) remains one of the most effective biomedical interventions for the prevention of HIV transmission. However, uptake among populations most impacted by the HIV epidemic remains low. La rge-scale awareness and mobilization campaigns have sought to address gaps in knowledge and motivation in order to improve PrEP diffusion. Such campaigns must be cognizant of the historical, physical, and structural contexts in which they exist. In urban contexts, neighborhood segregation has the potential to impact health outcomes and amplify disparities. Therefore, we present novel geospatial approaches to the evaluation of a Chicago-based PrEP messaging campaign (PrEP4Love) in a 2018 cohort of men who have sex with men and transgender women, contextualizing results within the localized infrastructure and public health landscape, and examining associations between geographic location and campaign efficacy. Results revealed notable variance in rates of PrEP uptake associated with campaign exposure by Chicago planning area, which are likely explained by the historical and contemporary impacts of racist structures on physical environment and city infrastructure. Findings have important implications for the evaluation and implementation of future messaging campaigns, which should take the unique historical, structural, and geospatial factors of their particular settings into account in order to achieve maximum impact. © 2020	Advocacy; Community context; Geospatial; HIV prevention; PrEP; Structural analysis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2020	Phillips, Gregory; Raman, Anand B; Felt, Dylan; McCuskey, David J; Hayford, Christina S; Pickett, Jim; Lindeman, Peter T; Mustanski, Brian	PrEP4Love: The Role of Messaging and Prevention Advocacy in PrEP Attitudes, Perceptions, and Uptake Among YMSM and Transgender Women.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000002297	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7083076	BACKGROUND: Despite high efficacy, use of pre-exposure prophylaxis (PrEP) remains low among young men who have sex with men (MSM) and transgender women (TW), primarily because of barriers such as stigma and resource awareness. We evaluated a social marketing campaign known as PrEP4Love that works to eliminate PrEP stigma; and awareness gaps through targeted advertising. SETTING: Chicago, Illinois. METHODS: Participants were enrolled within a cohort study of young MSM and TW (RADAR). Data were collected between June 2017 and April 2018 from HIV-negative individuals attending a follow-up visit. Surveys assessed demographics, PrEP attitudes and perceptions, and PrEP4Love campaign awareness. Associations between PrEP4Love awareness and PrEP perceptions, uptake, and behaviors were assessed using multiple logistic regression controlling for age, race/ethnicity, gender, sexual identity, and ever having used PrEP. RESULTS: Of 700 participants, the majority (75.9%) indicated seeing PrEP4Love ads in Chicago. Those who had seen ads were more likely to be out to their providers (odds ratio = 1.95; 95% confidence interval: 1.17 to 3.23) than those who had not, and those who had conversations were significantly more likely to have initiated the conversation themselves. Individuals who had seen ads were more likely to have taken PrEP in the last 6 months (odds ratio = 1.87; 95% confidence interval: 1.15 to 3.16) and more likely to believe their friends and the general public approved of and used PrEP. CONCLUSION: Social marketing campaigns are promising interventions that have the potential to alleviate barriers to HIV prevention, particularly among MSM and TW. Future research should evaluate the impact of these initiatives at multiple time points. Article	2020	Philpot, Steven; Prestage, Garrett; Holt, Martin; Haire, Bridget; Maher, Lisa; Hammoud, Mo; Bourne, Adam	Gay and Bisexual Men's Perceptions of Pre-exposure Prophylaxis (PrEP) in a Context of High Accessibility: An Australian Qualitative Study.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-020-02796-3	https://dx.doi.org/10.1007/s10461-020-02796-3	We report on Australian gay and bisexual men's (GBM) perceptions of preexposure prophylaxis (PrEP). Drawing on an online longitudinal cohort study, 1,404 free-text responses from HIV-negative or untested Australian GBM were qualitatively analysed. The chi-square statistic was then used to assess differences regarding PrEP-perceptions by participants' demographic and behavioral characteristics. Positive views of PrEP were twice more common than negative. Those with positive views thought PrEP helped overcome HIV fear and anxiety, enhanced sexual pleasure, and was a 'socially responsible' course of action. Those with negative views believed that people without medical conditions did not need medication and expressed concern that PrEP was replacing condoms, representing 'dangerous' behavior. Descriptive statistics revealed differences in PrEP-perceptions relating to age, recency of HIV testing, and PrEP eligibility. This study is the first to use free-text data to examine the frequency of Australian GBM's PrEP-perceptions, highlighting the potential benefits and challenges to its promotion. Article	2020	Picard J.; Jacka B.; Høj S.; Laverdière É.; Cox J.; Roy É.; Bruneau J.	Real-World Eligibility for HIV Pre-exposure Prophylaxis Among People Who Inject Drugs	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-020-02800-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078668435&doi=10.1007%2fs10461-020-02800-w&partnerID=40&md5=594fed1001e4ade93d87c50bbac794f1	Recent studies have highlighted the efficacy of and willingness to use pre-exposure prophylaxis (PrEP) to prevent HIV infection among people who inject drugs (PWID), however knowledge of real-world applicability is limited. We aimed to quantify the real-world eligibility for HIV-PrEP among HIV-negative PWID in Montreal, Canada (n = 718). Eligibility was calculated according to US Centers for Disease Control and Prevention (CDC) guidelines and compared to risk of HIV acquisition according to the assessing the risk of contracting HIV (ARCH-IDU) risk screening tool. Over one-third of participants (37%) were eligible for HIV PrEP, with 1/3 of these eligible due to sexual risk alone. Half of participants were considered high risk of HIV acquisition according to ARCH-IDU, but there was poor agreement between the two measures. Although a large proportion of PWID were eligible for HIV-PrEP, better tools that are context- and location-informed are needed to identify PWID at higher risk of HIV acquisition. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Pillay D.; Stankevitz K.; Lanham M.; Ridgeway K.; Murire M.; Briedenhann E.; Jenkins S.; Subedar H.; Hoke T.; Mullick S.	Factors influencing uptake, continuation, and discontinuation of oral PrEP among clients at sex worker and MSM facilities in South Africa	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0228620	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084170331&doi=10.1371%2fjournal.pone.0228620&partnerID=40&md5=d98d6698167780b46759d488648bcd1c	Background South Africa became the first country in Africa to introduce oral PrEP in June 2016. The National Department of Health has used a phased approach to rollout, allowing for a dynamic learn-and-adapt process which will lead ultimately to scale-up. Phased rollout began with provision of oral PrEP at facilities providing services to sex workers in 2016 and was expanded in 2017, first to facilities providing services to MSM and then to students at selected university campus clinics, followed by provision at primary health care facilities. Programmatic data shows variability in initiation and continuation between these populations. This study examines factors related to PrEP initiation, continuation, and discontinuation at facilities providing services to sex workers and MSM during the national PrEP rollout. Methods A cross-sectional survey was administered September 2017-January 2018 among clients (ages 18–62) and providers at 9 facilities implementing oral PrEP in South Africa, followed by in-depth interviews. The client survey captured PrEP initiation, continuation and discontinuation. Analysis was performed in STATA 13 for survey data and thematic analysis was performed in NViVO 11 for in-depth interview data. Results 299 clients (203 from sex worker facilities, 96 from MSM facilities) participated in the survey and additionally, in-depth interviews were conducted with 29 clients. Participants self-identified as either current users (n = 94; 36.2%), past users (n = 80; 30.8%) and never users of PrEP (n = 86; 33.1%). Participants who had never used PrEP either cited not being offered PrEP by a provider (57%, n = 49) or declining PrEP (43%, n = 37) as reasons for lack of uptake. The primary reason for declining to use oral PrEP was fear of side effects (41.7%, n = 15). The primary reasons for initiating and continuing on oral PrEP were all related to perceived risk associated with sexual activity. The majority of participants (87.9%, n = 153) also noted that printed IEC materials influenced their decision to initiate PrEP. Qualitative data suggested that several clients initiated on PrEP because they wanted additional protection beyond using condoms due to challenges such as partners refusing to use condoms, having partners with unknown HIV status, having multiple partners, involvement in sex work, or having a partner living with HIV. The majority (73.8%, n = 59) of participants who discontinued oral PrEP cited side effects as the primary reason for discontinuation, followed by feeling stigmatized (18.8%, n = 15). Conclusion This study provides valuable insights on early rollout of PrEP of how clients perceive oral PrEP and where to target efforts to improve the uptake of this highly effective HIV prevention product. By identifying strengths and areas for improvement, the ACCESS study has generated evidence that can be used to guide high quality scale-up in South Africa and may be instructive for other countries' efforts to expand quality access to oral PrEP. © 2020 Pillay et al. Article	2020	Pines H.A.; Patrick R.; Smith D.M.; Harvey-Vera A.; Blumenthal J.S.; Rangel G.; Semple S.J.; Patterson T.L.	HIV Prevention Method Preferences Within Sexual Partnerships Reported by HIV-Negative MSM and TW in Tijuana, Mexico	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-019-02492-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85064335342&doi=10.1007%2fs10461-019-02492-x&partnerID=40&md5=4882f3662f2bad7e4863d07e37a4a79e	To assess the potential for decreased condom use as pre-exposure prophylaxis (PrEP) is scaled-up in Latin America, we examined HIV prevention method preferences (neither PrEP nor condoms, condoms only, PrEP only, or PrEP with condoms) within 1302 sexual partnerships reported by 397 HIV-negative men who have sex with men (MSM) and transgender women (TW) in Tijuana, Mexico. Using PrEP with condoms (56%) was preferred to using condoms only (24%), using PrEP only (17%), and using neither PrEP nor condoms (3%). Compared to using condoms only, using PrEP only was preferred within primary (adjusted odds ratio AOR = 4.13, 95% confidence interval CI 1.92, 8.90) and condomless sex partnerships (AOR = 6.97, 95% CI 3.92, 12.40) partnerships, suggesting PrEP use may not displace condom use among MSM and TW in Tijuana and other similar settings. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Pinto, Rogério M; Kay, Emma Sophia; Wall, Melanie M; Choi, C Jean	Interprofessional Collaboration Improves the Odds of Educating Patients About PrEP over Time.	Journal of General Internal Medicine	-	-	-	-	1525-1497	10.1007/s11606-019-05616-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7210328	BACKGROUND: Low levels of pre-exposure prophylaxis (PrEP) uptake continue among the most vulnerable (e.g., men who have sex with men) for HIV exposure in the USA. Providers of social and public health services ("psychosocial providers") can help improve this situation by educating patients about PrEP before linking them to primary care providers (PCPs). OBJECTIVE: To identify predictors of psychosocial providers offering PrEP education to patients vulnerable to HIV infection by determining the frequency with which psychosocial providers offer PrEP education to patients. DESIGN: Longitudinal overview of PrEP implementation in New York City. PARTICIPANTS: Psychosocial providers of HIV prevention and adjunct treatment services, such as medication adherence counseling in 34 community settings. MAIN MEASURES: Longitudinal survey data collected in 2014-2016 (baseline) and 2015-2017 (1-year follow-up) from a 5-year longitudinal repeated measures study. Logistic regression modeling tested associations between baseline psychosocial provider-level and organization-level characteristics and frequency of PrEP education at baseline and 1-year follow-up. KEY RESULTS: Out of 245 participants, the number of psychosocial providers offering PrEP education at least once in the past 6 months increased significantly from baseline (n = 127, 51.8%) to 1-year follow-up (n = 161, 65.7%). Participants with higher odds of offering PrEP education at baseline and at one1-year follow-up were more likely to have reported high levels of interprofessional collaboration (IPC) and were also more likely to have received formal HIV prevention training. CONCLUSIONS: Both IPC and HIV training are predictive of PrEP education, and this association was maintained over time. We recommend expanding educational outreach efforts to psychosocial providers to further improve PrEP education and also training in interprofessional collaboration. This is an important first step toward linking patients to PCPs who prescribe PrEP and may help improve PrEP uptake.	pre-exposure prophylaxis (PrEP), service providers, HIV Continuum of Care, interprofessional collaboration	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Pintye J.; Rogers Z.; Kinuthia J.; Mugwanya K.K.; Abuna F.; Lagat H.; Sila J.; Kemunto V.; Baeten J.M.; John-Stewart G.; Unger J.A.	Two-way short message service (SMS) communication may increase pre-exposure prophylaxis continuation and adherence among pregnant and postpartum women in Kenya	Global Health Science and Practice	-	-	-	-	2169575X	10.9745/GHSP-D-19-00347	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082779912&doi=10.9745%2fGHSP-D-19-00347&partnerID=40&md5=230fdb94a42705327a217df83b74b70	Introduction: We evaluated a 2-way short message service (SMS) communication platform to improve continuation of pre-exposure prophylaxis (PrEP) for HIV prevention among Kenyan women who initiated PrEP within routine maternal child health (MCH) and family planning clinics. Methods: We adapted an existing SMS platform (Mobile WACh mWACh) to send PrEP-tailored, theory-based SMS and allow clients to communicate with a remote nurse. Women who did not have HIV and who were initiating PrEP at 2 MCH/family planning clinics in Kisumu County, Kenya, from February to October 2018, were offered enrollment into the mWACh-PrEP program; SMS communication was free. We evaluated acceptability, satisfaction, and implementation metrics. In a pre/postevaluation, we compared PrEP continuation at 1-month postinitiation among women who initiated PrEP in the period before (n=166) versus after mWACh-PrEP implementation, adjusting for baseline differences. Results: Of the 334 women who were screened for enrollment into the mWACh-PrEP program; 193 (58%) were eligible and of those, 190 (98%) accepted enrollment. Reasons for ineligibility (n=141) included no phone access (29%) and shared SIM cards (25%). Median age was 25 years (interquartile range=22-30), and 91% were MCH clients. Compared to women who initiated PrEP in the month before mWACh-PrEP implementation, women who enrolled in mWACh-PrEP were more likely to return for their first PrEP follow-up visit (40% vs. 53%; adjusted risk ratio aRR=1.26; 95% confidence interval CI= 1.06, 1.50; P=.008) and more likely to continue PrEP (22% vs. 43%; aRR=1.75; 95% CI=1.21, 2.55; P=.003). Among those who returned, 99% reported successful receipt of SMS through the mWACh-PrEP system and 94% reported that mWACh-PrEP helped them understand PrEP better. Concerns about PrEP use, how it works, and side effects accounted for the majority (80%) of issues raised by participants using SMS. Conclusions: Two-way SMS expanded support for PrEP and opportunities for dialogue beyond the clinic and enabled women to ask and receive answers in real time regarding PrEP, which facilitated its continued use. © 2020 Pintye et al. To protect women and eliminate vertical transmission, WHO recommends offering oral pre-exposure prophylaxis (PrEP) based on tenofovir to HIV-negative pregnant and post-partum women with a substantial risk of HIV acquisition. PrEP implementation for pregnant and post-partum women lags behind implementation for other high-risk populations. Unique considerations for PrEP implementation arise during pregnancy and post partum, including the integration of provider training with clinical delivery and monitoring of PrEP exposure and outcomes within existing maternal health systems, yet scarce implementation data are available to generate evidence in this context. Article	2020	Pitisuttithum, Punnee; Marovich, Mary Anne	Prophylactic HIV vaccine: vaccine regimens in clinical trials and potential challenges.	Expert Review of Vaccines	-	-	-	-	1744-8395	10.1080/14760584.2020.1718497	https://dx.doi.org/10.1080/14760584.2020.1718497	Introduction: Ending the HIV epidemic will likely require an efficacious preventative HIV vaccine. As vaccine development progresses, new challenges emerge in the context of an evolving prevention landscape.Areas covered: The progress in HIV vaccine development including trial regimens, results, and impact of pre-exposure prophylaxis (PrEP) including trial design.Expert opinion: Building upon the modest RV144 efficacy results, a follow-up study was launched in South Africa using modified vaccine constructs, ALVAC-HIV vector and gp120 protein boosts (Clade C strains). An adjuvant, MF59, was used to improve durability. Another Phase 2b regimen using an Adenovirus-26 vector with multivalent mosaic antigen inserts and a Clade C gp140 boost advanced into efficacy testing. Current vaccine efficacy studies enroll participants at risk for HIV, offer robust prevention packages, and notably do not restrict PrEP usage. With increasingly efficacious prevention options, future clinical trial designs become more complex. While formally requiring PrEP in HIV vaccine trials (e.g. PrEP ± Vaccine) may maximize protection, it raises both ethical and incremental efficacy over PrEP. Increasing vaccine complexity may lead to persistent vaccine-induced seropositivity, which presents different challenges. Discussion with the community and broader stakeholder engagement will help create solutions to these challenges. Article	2020	Pizur-Barnekow, K; Kim, UO; Ahamed, SI; Hasan, MKK; Dreier, S; Leuthner, SR; Rau, N; Basir, MA	Giving Voice to Parents in the Development of the Preemie Prep for Parents (P3) Mobile App	Advances in Neonatal Care	-	-	-	-	1536-0903	10.1097/ANC.0000000000000669	https://pubmed.ncbi.nlm.nih.gov/31567181/	Background: Parents at risk for preterm birth frequently receive prematurity education when the mother is hospitalized for premature labor. Parental ability to learn and consider the information is limited because of the stress of the hospitalization. A promising approach is dissemination of information to at-risk parents before the birth hospitalization. Purpose: This article describes formative research used to develop smartphone-based prematurity education app for parents at-risk for preterm birth. Methods: Stakeholders were parents with a prior preterm birth. Using stakeholder meeting transcripts, constant comparative analysis was used to reflect upon the parental voice. Results: The parents named the app, Preemie Prep for Parents (P3). Parent perspectives revealed desire for information in the following 5 categories. (1) Power in knowledge and control: parents want autonomy when learning information that may influence medical decision-making. (2) Content and framing of information: they desire information from a trusted resource that helps promote prenatal health and provides neonatal intensive care information. (3) Displaying content: parents want personalization, push notifications, photographs displaying fetal development, and easy-to-understand statistics. (4) Providing information without causing harm: they desire non-value-laden information, and they do not support "gamifying" the app to enhance utilization. (5) Decision making: parents want information that would benefit their decision making without assuming that parents have a certain outlook on life or particular values. Implications for Practice: These findings support the need for the P3 App to aid in decision making when parents experience preterm birth. Implications for Research: The findings highlight the need to study the effects of smartphone-based prematurity education on medical decision-making. Article	2020	Pleuhs B.; Quinn K.G.; Walsh J.L.; Petroll A.E.; John S.A.	Health Care Provider Barriers to HIV Pre-Exposure Prophylaxis in the United States: A Systematic Review	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2019.0189	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082342702&doi=10.1089%2fapc.2019.0189&partnerID=40&md5=8d3ed94a1936e0f1b9b812c42435416b	Increasing prescription of pre-exposure prophylaxis (PrEP) is imperative to ending the HIV epidemic in the United States. The objective of this review was to identify health care provider barriers to PrEP implementation. A systematic review was conducted in February 2019 using PubMed to identify barriers to PrEP prescribing practices in the United States. Targeted search terms surrounding PrEP and providers resulted in 222 original studies, 28 of which were ultimately included in our review, with data collected between 2011 and 2018. Six themes were identified across reviewed studies: (i) a lack of PrEP knowledge, (ii) the presence of the Purview Paradox, which refers to discordance in beliefs between HIV specialists and primary care providers on who should prescribe PrEP, (iii) concerns about PrEP costs, (iv) concerns about behavioral and health consequences, (v) interpersonal stigma, and (vi) concerns about patient adherence. A majority of providers were lacking knowledge regarding PrEP, resulting in discomfort in prescribing PrEP, or limited awareness and understanding of PrEP clinical guidelines. Discrepant opinions were identified regarding whether PrEP was best managed within primary care or specialty clinics. Other barriers included concerns about cost, patient adherence, and follow-up maintenance care. Finally, concerns about risk compensation and discomfort discussing sexual activities with patients who would benefit most from PrEP were apparent. Additional work is needed to prepare providers to prescribe and manage patients on PrEP, optimize PrEP delivery, and reduce provider bias. Future research is needed to identify providers' attitudes and beliefs regarding innovations in PrEP dosing, task shifting, and novel strategies for PrEP care. © Copyright 2020, Mary Ann Liebert, Inc., publishers 2020. Article	2020	Plomer, Anna-Sophie; McCool-Myers, Megan; Apfelbacher, Christian	Perspectives on HIV PrEP care in Germany: qualitative insights from primary care physicians and specialists.	AIDS Care	-	-	-	-	1360-0451	10.1080/09540121.2020.1778626	https://dx.doi.org/10.1080/09540121.2020.1778626	Recently, research has shifted from investigating the effectiveness of HIV pre-exposure prophylaxis (PrEP) to strategizing its implementation. Several European studies have explored physicians' perspectives on implementing PrEP in diverse settings, yet there are no data on the situation in Germany. The purpose of this study was to explore physicians' perspectives on current PrEP care in Germany. From April to July 2018, we conducted 16 semi-structured interviews with HIV providers (HIVPs) and primary care physicians (PCPs). Transcripts were analyzed using thematic content analysis. Physicians showed varying levels of PrEP expertise. Many PCPs lacked knowledge about PrEP. Some PCPs did not support the idea of PrEP as a prophylactic option. Opinions about PCPs' role in PrEP care were diverging, yet most PCPs favored referring PrEP clients to an HIVP or opted for a shared-care arrangement. Perceived problems included stigma and lack of privacy for PrEP care in rural areas. Our findings highlight the need for tailored physician training, which should be addressed in PrEP implementation in Germany. Article	2020	Pornpaisalsakul K.; Songtaweesin W.N.; Tepmongkol S.; Wongharn P.; Kawichai S.; Suponsilchai V.; Anugulruengkitt S.; Puthanakit T.	Effects of vitamin D and calcium supplementation on bone mineral density among Thai youth using daily HIV pre-exposure prophylaxis	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25624	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092754069&doi=10.1002%2fjia2.25624&partnerID=40&md5=64c058dddc427ad420ceb2b983d55d3a	Introduction: Tenofovir disoproxil fumarate with emtricitabine (TDF/FTC) is used for HIV pre-exposure prophylaxis (PrEP). TDF may affect bone mineral density (BMD), particularly in youth who are at a stage of peak bone mass accrual. The objective of this study was to evaluate the effect of vitamin D and calcium supplementation on BMD among Thai youth receiving daily oral PrEP. Methods: This open-label randomized trial was conducted in male youth aged between 15 and 24 years. Participants were randomized to Arm A who received once-daily TDF/FTC plus vitamin D3 and calcium supplementation with meals twice daily (400 units of vitamin D3 and 1200 mg of elemental calcium/day) or Arm B who received once-daily TDF/FTC only. PrEP users were defined as taking at least two tablets/week (tenofovir-diphosphate level of >350 fmol/punch). Adherence to vitamin D/calcium supplementation was defined as self-reported adherence of >50%. Lumbar spine (L2-L4) BMD (LSBMD) was evaluated by dual-energy X-ray absorptiometry scan zero and six months after PrEP initiation. Results: From March 2019 to March 2020, 100 youth were enrolled. Baseline characteristics between the two arms were similar. Median (IQR) age was 18 (17 to 20) years. At entry, median (IQR) LSBMD z-score was −0.8 (−1.5 to −0.3), 17% had low LSBMD (Z-score < −2). The median amount of calcium intake from nutritional three-day recall was 167 (IQR 94 to 272) mg/day, 39% of participants had vitamin D deficiency, defined as 25(OH)D levels <20 IU/mL. At six months, 79 participants were evaluated. Of these, 42 (52%) were PrEP takers and 25 of 38 (66%) of arm A participants had good adherence to vitamin D/calcium supplementation. Significantly higher proportions of youth in arm A compared to arm B had >3% increase in LSBMD at month 6 compared to baseline (67.6% vs. 42.9% respectively; p = 0.03). There were significantly higher increases in LSBMD among youth with vitamin D deficiency who were supplemented; arm A + 0.05 (0 to 0.05) compared to arm B + 0.03 (−0.1 to 0.03), p = 0.04. Conclusions: Increases in LSBMD over six months among youth using PrEP who received vitamin D/calcium supplementation was greater than those not supplemented. Long-term follow-up should be considered to explore long-term outcomes. © 2020 The Authors. Article	2020	Poteat T.; Malik M.; van der Merwe L.L.A.; Cloete A.; Adams D.; Nonyane B.A.S.; Wirtz A.L.	PrEP awareness and engagement among transgender women in South Africa: a cross-sectional, mixed methods study	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(20)30119-3	https://www.thelancet.com/journals/lanhiv/article/PIIS2352-3018(20)30119-3/abstract	Background: The South African national HIV plan recommends pre-exposure prophylaxis (PrEP) for transgender women, whose HIV prevalence estimates are as high as 25% in sub-Saharan Africa. The aim of this study was to explore PrEP awareness, uptake, and willingness, as well as associated barriers and facilitators, in order to inform PrEP implementation efforts with transgender women in South Africa. Methods: Using a community-engaged, convergent parallel mixed methods design, trained local transgender women data collectors recruited 213 transgender women participants (aged >18 years, assigned male sex at birth, and identifying as a gender different from male), via network referral and word-of-mouth in Cape Town, East London, and Johannesburg. A subset of 36 transgender women also participated in qualitative in-depth interviews. Quantitative analyses included descriptive statistics and negative binomial regression models to assess correlates of PrEP willingness. Qualitative interviews were audio-recorded, transcribed verbatim, and coded. Thematic content analysis was used to identify key themes. Quantitative and qualitative data were integrated for interpretation. Findings: Participants were recruited between June 1 and Nov 30, 2018. 57 (45%) of 127 HIV-negative participants were PrEP-aware and only 14 (11%) of 129 were currently taking PrEP. HIV-negative participants experiencing social (eg, violence, poverty) and interpersonal (eg, discrimination, low transgender women community connectedness) hardship reported PrEP awareness more frequently than HIV-negative transgender women who did not. Willingness to take PrEP was low, at 56 (55%) of 102, among HIV-negative participants who were not currently taking PrEP, and negatively associated with transgender women community connectedness (multivariable prevalence ratio 0·87; 95% CI 0·77–0·99). Barriers to PrEP included taking a daily pill, side-effects, and cost. Participants urged greater education and engagement of transgender women in PrEP implementation. Interpretation: South Africa is poised to scale up PrEP services for transgender women. Dedicated transgender clinics are planned to provide comprehensive care, including PrEP, for transgender women. It is critical to ensure transgender women are aware of and have accurate information about PrEP, and that health-care sites are prepared to provide quality care for transgender women. Article	2020	Poteat T.C.; Radix A.	HIV Antiretroviral Treatment and Pre-exposure Prophylaxis in Transgender Individuals	Drugs	-	-	-	-	126667	10.1007/s40265-020-01313-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085380471&doi=10.1007%2fs40265-020-01313-z&partnerID=40&md5=3ce810c203e632737a08de7c90e93deb	HIV prevalence is elevated among transgender populations with an estimated 13.7% of transgender adults living with HIV in the USA. In addition, transgender people experience significant disparities in biomedical HIV prevention and treatment. The efficacy of topical microbicides for prevention of HIV acquisition have not been tested among transgender people and may be impacted by hormonal therapies and/or surgeries undertaken by some transgender people to align their anatomy with their gender identity. Low pre-exposure prophylaxis (PrEP) uptake and adherence as well as potential drug–hormone interactions impact the efficacy of PrEP among transgender women. Few transgender men have been engaged in the PrEP continuum, and they have been largely excluded from PrEP research until very recently. Prioritisation of hormone therapy over HIV treatment as well as concerns about drug–hormone interactions may impact transgender women's adherence to antiretroviral therapy. More research is needed to clarify the clinical significance of identified drug–hormone interactions and better inform interventions to improve HIV prevention and care for transgender people. © 2020, Springer Nature Switzerland AG. Article	2020	Poteat, Tonia; Malik, Mannat; Wirtz, Andrea L.; Cooney, Erin E.; Reisner, Sari	Understanding HIV risk and vulnerability among cisgender men with transgender partners.	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(19)30346-7	https://pubmed.ncbi.nlm.nih.gov/32032535/	In the HIV pandemic, cisgender (ie, non-transgender) men with transgender partners are an underserved population. Complexities of sexuality and gender affect HIV vulnerability for this group, including not identifying with conventional sexual orientation categories (eg, bisexual, heterosexual, or gay) and having attractions based on gender role or expression rather than genital anatomy. Only one HIV prevention interventional study in this population was identified, and one study that assessed the perceived acceptability of an intervention. We found no data for interventions using pre-exposure prophylaxis, interventions for cisgender men with transgender men partners, or cisgender men with casual or transactional sexual partnerships with transgender people. Cisgender men with transgender partners are not easily categorised using traditional HIV risk categories. Additional research is needed to understand stigma and other structural drivers of HIV vulnerability, sexual networks and practices, substance use patterns, and biomedical prevention interest and uptake for this group. Studies that use an intersectional lens and syndemic framework could offer key insights. Article	2020	Pretorius C.; Schnure M.; Dent J.; Glaubius R.; Mahiane G.; Hamilton M.; Reidy M.; Matse S.; Njeuhmeli E.; Castor D.; Kripke K.	Modelling impact and cost-effectiveness of oral pre-exposure prophylaxis in 13 low-resource countries	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25451	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85080128039&doi=10.1002%2fjia2.25451&partnerID=40&md5=e747fd20c57ecfbee5e835789069e2b1	Introduction: Oral pre-exposure prophylaxis (PrEP) provision is a priority intervention for high HIV prevalence settings and populations at substantial risk of HIV acquisition. This mathematical modelling analysis estimated the impact, cost and cost-effectiveness of scaling up oral PrEP in 13 countries. Methods: We projected the impact and cost-effectiveness of oral PrEP between 2018 and 2030 using a combination of the Incidence Patterns Model and the Goals model. We created four PrEP rollout scenarios involving three priority populations—female sex workers (FSWs), serodiscordant couples (SDCs) and adolescent girls and young women (AGYW)—both with and without geographic prioritization. We applied the model to 13 countries (Eswatini, Ethiopia, Haiti, Kenya, Lesotho, Mozambique, Namibia, Nigeria, Tanzania, Uganda, Zambia and Zimbabwe). The base case assumed achievement of the Joint United Nations Programme on HIV/AIDS 90-90-90 antiretroviral therapy targets, 90% male circumcision coverage by 2020 and 90% efficacy and adherence levels for oral PrEP. Results: In the scenarios we examined, oral PrEP averted 3% to 8% of HIV infections across the 13 countries between 2018 and 2030. For all but three countries, more than 50% of the HIV infections averted by oral PrEP in the scenarios we examined could be obtained by rollout to FSWs and SDCs alone. For several countries, expanding oral PrEP to include medium-risk AGYW in all regions greatly increased the impact. The efficiency and impact benefits of geographic prioritization of rollout to AGYW varied across countries. Variations in cost-effectiveness across countries reflected differences in HIV incidence and expected variations in unit cost. For most countries, rolling out oral PrEP to FSWs, SDCs and geographically prioritized AGYW was not projected to have a substantial impact on the supply chain for antiretroviral drugs. Conclusions: These modelling results can inform prioritization, target-setting and other decisions related to oral PrEP scale-up within combination prevention programmes. We caution against extensive use given limitations in cost data and implementation approaches. This analysis highlights some of the immediate challenges facing countries—for example, trade-offs between overall impact and cost-effectiveness—and emphasizes the need to improve data availability and risk assessment tools to help countries make informed decisions. © 2020 Avenir Health. Article	2020	Przybyla S.M.; Cerulli C.; Bleasdale J.; Wilson K.; Hordes M.; El-Bassel N.; Morse D.S.	"I think everybody should take it if they're doing drugs, doing heroin, or having sex for money": a qualitative study exploring perceptions of pre-exposure prophylaxis among female participants in an opioid intervention court program	Substance Abuse: Treatment, Prevention, and Policy	-	-	-	-	1747597X	10.1186/s13011-020-00331-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096438079&doi=10.1186%2fs13011-020-00331-0&partnerID=40&md5=4bcc8a65ada6b62870b24b53dc7edeab	Background: Women's rise in opioid use disorder has increased their presence in the criminal justice system and related risk behaviors for HIV infection. Although pre-exposure prophylaxis (PrEP) is an effective biomedical HIV prevention treatment, uptake among this high-risk population has been particularly low. Considerably little is known about the interplay between justice-involved women with opioid use disorder and HIV prevention. The aim of this study was to explore PrEP knowledge, attitudes, and perceptions for personal and partner use among women participants in the nation's first ever opioid intervention court program. Methods: The authors conducted semi-structured, in-depth interviews with 31 women recruited from an Opioid Intervention Court, a recent fast-track treatment response to combat overdose deaths. We utilized a consensual qualitative research approach to explore attitudes, perceptions, and preferences about PrEP from women at risk for HIV transmission via sexual and drug-related behavior and used thematic analysis methods to code and interpret the data. Results: PrEP interest and motivation were impacted by various factors influencing the decision to consider PrEP initiation or comfort with partner use. Three primary themes emerged: HIV risk perceptions, barriers and facilitators to personal PrEP utilization, and perspectives on PrEP use by sexual partners. Conclusions: Findings suggest courts may provide a venue to offer women PrEP education and HIV risk assessments. Study findings inform public health, substance use, and criminal justice research and practice with justice-involved participants experiencing opioid use disorder on the development of gender-specific PrEP interventions with the ultimate goal of reducing HIV incidence. © 2020, The Author(s). Article	2020	Pu F.; Pandey S.; Bushman L.R.; Anderson P.L.; Ouyang Z.; Cooks R.G.	Direct quantitation of tenofovir diphosphate in human blood with mass spectrometry for adherence monitoring	Analytical and Bioanalytical Chemistry	-	-	-	-	16182642	10.1007/s00216-019-02304-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077556658&doi=10.1007%2fs00216-019-02304-0&partnerID=40&md5=db0c1d9984938625b9ebc61c6f5078bf	Inadequate adherence to chronic medications is a far-reaching problem with financial and human health consequences. By a wide margin, non-adherence is the leading cause of therapeutic failures of HIV pre-exposure chemoprophylaxis (PrEP) and antiretroviral therapy (ART). It has been proven that HIV infection can be prevented by daily dosing of emtricitabine and tenofovir disoproxil fumarate. Measurement of intracellular tenofovir diphosphate in red blood cells has been established as an effective way to assess cumulative adherence, however, the LC-MS-based analytical method developed for the purpose is both complicated and expensive. Here, we report a simple method for adherence monitoring based on direct MS quantification of intracellular tenofovir diphosphate in human whole blood. The method requires only microliters of whole blood, employs special membranes to perform plasma separation and concomitant desalting during blood collection, and uses nanoelectrospray on a triple quadrupole instrument. Quantitative performance in this proof-of-concept study includes RSDs of < 15% and successful analysis of a small number of patient samples with medium to high adherence levels. The results correlate with those of a validated LC-MS/MS method, and an R2 value of 0.9962 is achieved. This methodology has promise for extension to point-of-care testing using miniature mass spectrometers. Article	2020	Puppo C.; Spire B.; Morel S.; Génin M.; Béniguel L.; Costagliola D.; Ghosn J.; Mabire X.; Molina J.M.; Rojas Castro D.; Préau M.	How PrEP users constitute a community in the MSM population through their specific experience and management of stigmatization. The example of the French ANRS-PREVENIR study	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2020.1742863	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081747098&doi=10.1080%2f09540121.2020.1742863&partnerID=40&md5=bf89ced60f45cfcdd8eafcb5768eb4c4	The ANRS-PREVENIR (2017–2020) prospective cohort study aims to reduce the number of new HIV infections in the "Ile-de-France" region in France, by enrolling individuals at high risk of HIV infection and proposing daily and on-demand pre-exposure prophylaxis (PrEP). The qualitative component of the ANRS-PREVENIR study aimed to investigate social and relational evolutions associated with PrEP use in men who have sex with men (MSM). In 2018, 12 focus groups with MSM (n = 68) were conducted by a social sciences researcher in Paris. A thematic analysis was performed. Results showed that stigma concerning PrEP use is a complex issue, with various kinds of stigmatization being practiced, sometimes even by the wider MSM population and PrEP users themselves. All types of stigma identified were expressed in forms of verbal abuse which made PrEP use taboo. Inside the wider MSM population a PrEP-user "community" was identified which shared a certain complicity in terms of values and a positive attitude towards PrEP. The emergence of new intragroup and intergroup social norms should be taken into account by policy makers to promote a more positive image of PrEP users. © 2020, © 2020 Informa UK Limited, trading as Taylor & Francis Group.	community; group dynamics; HIV; PrEP; qualitative methods; stigma	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Qualitative
Article	2020	Puppo, Costanza; Mabire, Xavier; Morel, Stéphane; Laguette, Vanessa; Rojas Castro, Daniela; Chas, Julie; Cua, Eric; Pintado, Claire; Suzan-Monti, Marie; Spire, Bruno; Molina, Jean-Michel; Préau, Marie	Becoming adherent to a preventive treatment for HIV: a qualitative approach.	Psychology, Health & Medicine	-	-	-	-	1465-3966 1354-8506	10.1080/13548506.2019.1640886	https://www.tandfonline.com/doi/full/10.1080/13548506.2019.1640886	The clinical trial ANRS-IPERGAY investigated the efficacy of sexual activity-based (i.e. on demand) HIV pre-exposure prophylaxis (PrEP). Using a qualitative method, we analysed the role of adherence as one of the main elements for PrEP effectiveness and its associated determinants. Data were collected in various French ANRS-IPERGAY sites during the double-blind (2012-2014) and open-label study (2015-2016) phases, through two individual interviews per participant, collective interviews and focus groups. A total of 83 participants participated in the present study. Our analysis included 32 individual interviews (with 16 participants), 13 collective interviews (n = 45) and 8 focus groups (n = 33). We investigated adherence to on-demand pill-intake schedule, focusing especially on PrEP integration into daily life. PrEP intake was regulated through coping strategies to simplify implementation and avoid stigmatizing reactions. We considered self-care and pharmaceuticalization of PrEP as specific features of sexual activity-based PrEP. As PrEP is a prophylaxis for seronegative people, it is contributing to the emergence of a new identity in the HIV field. Health-care professionals should take into account the practical implementation of PrEP schedules into daily life, assist PrEP users in personal management of pill intake and, more generally, improve adherence to the prophylaxis. Article	2020	Pyra M.; Rusie L.; Castro M.; Baker K.K.; McNulty M.; Bohm N.; Prokurat A.; Schneider J.	A taxonomy of pragmatic measures of HIV preexposure prophylaxis use	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000002618	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092678533&doi=10.1097%2fQAD.0000000000002618&partnerID=40&md5=9148fbdc3c3abe1f509e1d518ec8c50a	Objectives: As delivery of preexposure prophylaxis (PrEP) becomes an HIV prevention priority in the United States, standard, pragmatic measures of PrEP use are needed to compare and evaluate prevention implementation programs. By using readily available electronic health record data, we describe and compare measures of persistence and retention. Design: Retrospective cohort. Methods: Using electronic health record prescription data for patients at a large urban Federally Qualified Health Center from 2015 to 2019, we calculated measures of persistence and retention and compared them to pharmacy claims data, PrEP biomarkers, and HIV outcomes. Results: Total PrEP time was 19.8 months on average. During this period, average adherence by medication prescription ratio (MRxR) was 89%; 77% of patients had an MRxR at least 85% and 90% have an MRxR at least 57%. Over the first 6 months, average proportion of days covered (PDC) at least 85% was 53% and PDC at least 57% was 57%. Prescription fill rates, based on claims data from a pharmacy partner, ranged from 45 to 60%. Using tenofovir-diphosphate as the gold standard, PDC had high sensitivity (97%) but low specificity (≤13%). As a measure of retention, over the first 6 months, 59% of patients had quarterly HIV tests. Conclusion: Total PrEP time is useful measure of overall persistence, while PDC can assess persistence and adherence at a specific time point. Adherence by PDC is more conservative compared with MRxR; both will overestimate true adherence. Retention in care can be measured by quarterly HIV tests. Using consistent terminology and reporting timepoints and adherence thresholds will help reporting and comparing PrEP delivery programs. Copyright © 2020 Wolters Kluwer Health, Inc. Article	2020	Pyra M.; Rusie L.K.; Keglovitz Baker K.; Baker A.; Ridgway J.; Schneider J.	Correlations of HIV preexposure prophylaxis indications and uptake, Chicago, Illinois, 2015-2018	American Journal of Public Health	-	-	-	-	900036	10.2105/AJPH.2019.305469	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079077213&doi=10.2105%2fAJPH.2019.305469&partnerID=40&md5=27de7746306eac761780ca5f598b569b	Objectives. To examine gaps in identification of preexposure prophylaxis (PrEP) candidates, uptake, and use of PrEP by populations most likely to seroconvert. Methods. At a federally qualified health center in Chicago, Illinois, we used electronic medical records, prescription data, and our best approximation of Centers for Disease Control and Prevention PrEP guidelines to determine how many patients were indicated for PrEP relative to HIV diagnoses (indication:HIV), how many were on PrEP relative to indications (PrEP:indication), and how many were on PrEP relative to HIV diagnoses (PrEP:HIV). We compared these ratios across age, gender and orientation, race/ethnicity, and insurance. Results. Overall, there were 32 indications per incident diagnosis and 16 patients on PrEP per incident diagnosis. In adjusted models, Whites had higher indication:HIV and PrEP:HIV ratios compared with Blacks, men who have sex with men had higher indication: HIV and PrEP:HIV ratios compared with transwomen but lower PrEP:indication ratios, and uninsured patients had higher indication:HIV but lower PrEP:indication and PrEP:HIV ratios compared with those with insurance. Conclusions. PrEP use, relative to HIV diagnoses, differs by important patient characteristics. While improved guidelines will address some of the disparity, better approaches for determining PrEP candidates and more normalized patient-provider communication are needed to ensure better PrEP access to all individuals at high risk for HIV. © 2020 American Public Health Association Inc.. Article	2020	Qin Y.; Price C.; Rutledge R.; Puglisi L.; Madden L.M.; Meyer J.P.	Women's Decision-Making about PrEP for HIV Prevention in Drug Treatment Contexts	Journal of the International Association of Physicians in AIDS Care	-	-	-	-	23259574	10.1177/2325958219900091	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077717253&doi=10.1177%2f2325958219900091&partnerID=40&md5=b63f1bb1811556dcce7141da69926964	Despite pre-exposure prophylaxis's (PrEP) efficacy for HIV prevention, uptake has been low among women with substance use disorders (SUDs) and attributed to women's lack of awareness. In semistructured interviews with 20 women with SUD and 15 key stakeholders at drug treatment centers, we assessed PrEP awareness and health-related decision-making. Women often misestimated their own HIV risk and were not aware of PrEP as a personally relevant option. Although women possessed key decision-making skills, behavior was ultimately shaped by their level of motivation to engage in HIV prevention. Motivation was challenged by competing priorities, minimization of perceived risk, and anticipated stigma. Providers were familiar but lacked experience with PrEP and were concerned about women's abilities to action plan in early recovery. HIV prevention for women with SUD should focus on immediately intervenable targets such as making PrEP meaningful to women and pursuing long-term systemic changes in policy and culture. Efforts can be facilitated by partnering with drug treatment centers to reach women and implement PrEP interventions. © The Author(s) 2020. Article	2020	Quinn K.G.; Zarwell M.; John S.A.; Christenson E.; Walsh J.L.	Perceptions of PrEP Use Within Primary Relationships Among Young Black Gay, Bisexual, and Other Men Who Have Sex with Men	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-020-01683-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084241631&doi=10.1007%2fs10508-020-01683-1&partnerID=40&md5=f5cf05cb2225b0c6c6468b8d3061576e	A significant proportion of new HIV infections among gay, bisexual, and other men who have sex with men (MSM) occur within primary relationships. Although PrEP use continues to increase, there is a need to better understand the factors that contribute to PrEP decision-making within primary relationships. We qualitatively examined how relationship context influences perceptions of PrEP and decisions to initiate and discontinue PrEP among young Black MSM to provide a nuanced understanding of PrEP use within relationships. Between late 2017 and mid-2018, we conducted 10 focus groups with young Black MSM (n = 80) in Milwaukee, WI, Minneapolis, MN, Kansas City, KS, and Detroit, MI. We used inductive thematic analysis to examine how young Black MSM make decisions about PrEP use within the context of primary relationships. We identified three primary themes: (1) perceptions of PrEP as an indication of distrust and infidelity, (2) perceptions of PrEP use as necessary, even in primary relationships, and (3) the influence of partners on PrEP. Our results demonstrate the considerable variation in how young Black MSM view PrEP within primary relationships and the influence of primary partners in PrEP use decisions. The dynamics between two or more individuals can shape an individual's conceptualizations of and decisions around PrEP use, and these may be key drivers of racial disparities in HIV and PrEP use. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Quinn, Katherine G; Christenson, Erika; Sawkin, Mark T; Hacker, Elizabeth; Walsh, Jennifer L	The Unanticipated Benefits of PrEP for Young Black Gay, Bisexual, and Other Men Who Have Sex with Men	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-019-02747-7	https://www.proquest.com/scholarly-journals/unanticipated-benefits-prep-young-black-gay/docview/2389526755/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) is effective at reducing new HIV infections among adherent users. However, there are potential benefits of PrEP beyond HIV prevention that remain understudied, particularly among young Black gay, bisexual, and other men who have sex with men (MSM). In 2018, we conducted six focus groups (n = 36) in four midwestern cities: Milwaukee, WI; Minneapolis, MN; Detroit, MI; and Kansas City, MO with current and former PrEP users who identified as Black MSM. The focus groups covered medical care and provider experiences, patterns of PrEP use and adherence, relationships while on PrEP, and PrEP stigma. Results revealed four unanticipated benefits of PrEP for young Black MSM: (1) improved engagement in medical care, (2) reduced sexual and HIV anxiety, (3) increased sexual comfort and freedom, and (4) positive sexual relationships with people living with HIV. Findings from this study fill a gap in our understanding of the potential benefits of PrEP beyond HIV prevention. Public health campaigns and messaging around PrEP should incorporate such benefits to reach young Black MSM who may be motivated by benefits beyond HIV prevention. Article	2020	Quinn, Katherine G; Christenson, Erika; Spector, Antoinette; Amirkhanian Yuri; Kelly, Jeffrey A	The Influence of Peers on PrEP Perceptions and Use Among Young Black Gay, Bisexual, and Other Men Who Have Sex with Men: A Qualitative Examination	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-019-01593-x	https://www.proquest.com/scholarly-journals/influence-peers-on-prep-perceptions-use-among/docview/2417167854/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) is a promising part of HIV prevention, yet racial disparities in PrEP uptake persist. Evidence indicates that Black gay, bisexual, and other men who have sex with men (GBM) face numerous social and structural barriers to PrEP, including stigma, medical mistrust, and exclusion from the healthcare system. However, little research has examined how social networks can influence PrEP use and help Black GBM overcome these identified barriers. To understand the influence of peers and social networks on Black GBM's perceptions of and decisions about PrEP use, we conducted in-depth interviews with 46 Black GBM in Milwaukee, WI and Cleveland, OH. Data were analyzed using multistage inductive coding and thematic content analysis, using MAXQDA software. Results indicate that participants' primary source of information on PrEP was other Black GBM in their communities. Peers and social networks served three primary functions with regard to PrEP: (1) filling informational gaps left by healthcare providers, (2) increasing trust of PrEP, and (3) reducing PrEP stigma. Participants described the "movers and shakers" in Black LGBT communities who have been influential in educating others and advocating for PrEP. Well-respected vocal advocates for PrEP have emerged in the Black LGBT community as PrEP champions who have successfully influenced young Black GBM's views on PrEP. Our results reveal the role social networks and peer groups can play in increasing PrEP use among Black GBM. Social network interventions may help overcome the stigma and mistrust that are contributing to PrEP disparities. Editorial	2020	Radix, Asa E; Harris, Alexander B; Goldstein, Zil G	How can we improve uptake of oral HIV pre-exposure prophylaxis for transgender individuals?	Expert Review of Anti-Infective Therapy	-	-	-	-	1744-8336	10.1080/14787210.2020.1759418	https://www.tandfonline.com/doi/full/10.1080/14787210.2020.1759418	Transgender people, i.e., those whose gender identity differs from the sex they were assigned at birth, have been shown to be disproportionately affected by HIV. Transgender women have an estimated global HIV prevalence of 19.1%, a rate consistently higher than almost any other key population [Citation1]. In the USA, the vast majority of transgender individuals affected are people of color with a reported HIV prevalence among African-American transgender women of 44.1% [Citation2]. Over half of all new HIV diagnoses in transgender people occur in African-Americans [Citation3]. Few data exist for HIV prevalence among transgender men, however studies frequently report increased HIV risk behaviors, including condomless anal sex and sexually transmitted infections [Citation2,Citation4–Citation7] in this population. The recent estimate of 3.2% in transgender men far exceeds the US general population prevalence [Citation2]. The elevated HIV prevalence in transgender populations is due to a combination of psychosocial and structural factors, such as high rates of societal stigma and discrimination leading to unemployment, poverty, psychological stress, mood disorders, and reduced access to health care including HIV prevention interventions [Citation8]. Article	2020	Rael C.T.; Lentz C.; Carballo-Diéguez A.; Giguere R.; Dolezal C.; Feller D.; D'Aquila R.T.; Hope T.J.	Understanding the acceptability of subdermal implants as a possible new HIV prevention method: Multi-stage mixed methods study	Journal of Medical Internet Research	-	-	-	-	14388871	10.2196/16904	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088848165&doi=10.2196%2f16904&partnerID=40&md5=2919b35e664799c6919b8a3ef20b9d75	Background: A long-acting implant for HIV pre-exposure prophylaxis (PrEP) is in development in the Sustained Long-Action Prevention Against HIV (SLAP-HIV) trial. This could provide an alternative to oral PrEP. Objective: Our mixed methods study aimed to understand (1) users' experiences with a similar subdermal implant for contraception and (2) factors influencing the likelihood that gay and bisexual men (GBM) would use a proposed PrEP implant. Methods: Work was completed in 4 stages. In stage 1, we conducted a scientific literature review on existing subdermal implants, focusing on users' experiences with implant devices. In stage 2, we reviewed videos on YouTube, focusing on the experiences of current or former contraceptive implant users (as these implants are similar to those in development in SLAP-HIV). In stage 3, individuals who indicated use of a subdermal implant for contraception in the last 5 years were recruited via a web-based questionnaire. Eligible participants (n=12 individuals who liked implants a lot and n=12 individuals who disliked implants a lot) completed in-depth phone interviews (IDIs) about their experiences. In stage 4, results from IDIs were used to develop a web-based survey for HIV-negative GBM to rate their likelihood of using a PrEP implant on a scale (1=very unlikely and 5=very likely) based on likely device characteristics and implant concerns identified in the IDIs. Results: In the scientific literature review (stage 1), concerns about contraceptive implants that could apply to the PrEP implants in development included potential side effects (eg, headache), anticipated high cost of the device, misconceptions about PrEP implants (eg, specific contraindications), and difficulty accessing PrEP implants. In the stage 2 YouTube review, individuals who had used contraceptive implants reported mild side effects related to their device. In stage 3, implant users reported that devices were comfortable, unintrusive, and presented only minor discomfort (eg, bruising) before or after insertion and removal. They mainly reported removing or disliking the device due to contraceptive-related side effects (eg, prolonged menstruation). Participants in the stage 4 quantitative survey (N=304) were mainly gay (204/238, 85.7%), white (125/238, 52.5%), cisgender men (231/238, 97.1%), and 42.0% (73/174) of them were on oral PrEP. Not having to take a daily pill increased the likelihood of using PrEP implants (mean 4.13). Requiring >1 device to achieve 1 year of protection (mean range 1.79-2.94) mildly discouraged PrEP implant use. Participants did not mind moderate bruising, a small scar, tenderness, or bleeding after insertion or removal, and an implant with a size slightly larger than a matchstick (mean ratings 3.18-3.69). Conclusions: PrEP implants are promising among GBM. Implant features and insertion or removal-related concerns do not seem to discourage potential users. To ensure acceptability, PrEP implants should require the fewest possible implants for the greatest protection duration. © Christine Tagliaferri Rael, Cody Lentz, Alex Carballo-Diéguez, Rebecca Giguere, Curtis Dolezal, Daniel Feller, Richard T D'Aquila, Thomas J Hope. Article	2020	Rael, Christine Tagliaferri; Martinez, Michelle; Giguere, Rebecca; Bockting, Walter; MacCrate, Caitlin; Mellman, Will; Valente, Pablo; Greene, George J; Sherman, Susan G; Footer, Katherine H A; D'Aquila, Richard T; Carballo-Diéguez, Alex; Hope, Thomas J	Transgender Women's Concerns and Preferences on Potential Future Long-Acting Biomedical HIV Prevention Strategies: The Case of Injections and Implanted Medication Delivery Devices (IMDDs)	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-019-02703-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074607707&doi=10.1007%2fs10461-019-02703-5&partnerID=40&md5=451e89b9c29f8adab923313b8742d1e1	There are several long-acting biomedical HIV prevention products in the development pipeline, including injections and implanted medication delivery devices (IMDDs). It is critical to understand concerns and preferences on the use of these products in populations that shoulder a disproportionate burden of the HIV epidemic, such as transgender women. This will allow researchers and public health professionals to construct interventions tailored to the needs of these women to promote optimal use of these tools. In studies of other biomedical HIV prevention products (e.g., oral PrEP) it is clear that transgender women have unique concerns related to the use of these strategies. This may have an impact on this group's uptake and sustained use of longacting HIV prevention products. This study conducted four focus groups with N = 18 transgender women in New York City to understand their concerns and preferences on long-acting PrEP injections and IMDDs. Findings showed that participants were overwhelmingly positive about long-acting HIV prevention strategies, though they had some apprehensions. Overall, participants felt that injections and IMDDs could help address adherence challenges, and that transgender-specific needs should be addressed during clinical trials. Also, there were concerns related to injection or IMDD logistics, concerns about injections' or IMDDs' presence in the body, and familiarity with these products affected participants' opinions on them. Findings from this work can be used to inform protocols, measures, materials, and adherence interventions in future initiatives for transgender women using PrEP injections or IMDDs. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Raifman J.; Nocka K.; Galárraga O.; Wilson I.B.; Crowley C.; Tao J.; Napoleon S.; Marak T.; Chan P.A.	Evaluating statewide HIV preexposure prophylaxis implementation using All-Payer Claims Data	Annals of Epidemiology	-	-	-	-	10472797	10.1016/j.annepidem.2020.03.003	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083016816&doi=10.1016%2fj.annepidem.2020.03.003&partnerID=40&md5=67a07f3d13a86ac7cc9819e90d5a4078	Purpose: Preexposure prophylaxis (PrEP) in the form of daily emtricitabine and tenofovir disoproxil fumarate (FTC/TDF) is effective for preventing HIV infection. Implementation has been limited by an inability to systematically evaluate uptake and use. All-Payer Claims Databases (APCDs) provide an opportunity to evaluate population-level PrEP implementation. Methods: We used 2012–2017 data from Rhode Island's APCD and developed an algorithm to identify individuals prescribed FTC/TDF for PrEP. We describe PrEP implementation by patient demographics and provider type and mapped PrEP implementation across ZIP codes. We compared APCD data to electronic medical record data and comprehensive pharmaceutical claims data (AIDSVu.org). Results: The Rhode Island APCD represented approximately 87% of the state's population. PrEP use increased 31-fold from 2012 to 2017. Users were predominantly privately insured, male, and concentrated in Providence County (76.6%). Infectious diseases providers had 3.2 times the odds of being a PrEP prescriber compared to primary care providers. Compared to other pharmaceutical and electronic medical record data, the APCD underestimated the number of PrEP users in Rhode Island but improved in capturing users over time. Conclusions: APCDs are a useful data source for characterizing PrEP use across a state. There is a need to increase PrEP prescribing among primary care providers, especially in areas with underserved populations. © 2020 Elsevier Inc. Article	2020	Rajoli R.K.R.; Demkovic Z.R.; Flexner C.; Owen A.; Siccardi M.	Predicting pharmacokinetics of a tenofovir alafenamide subcutaneous implant using physiologically based pharmacokinetic modelling	Antimicrobial Agents and Chemotherapy	-	-	-	-	664804	10.1128/AAC.00155-20	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088610351&doi=10.1128%2fAAC.00155-20&partnerID=40&md5=c01ef83c389de9ade91bc07876a9d8a6	Long-acting (LA) administration using a subcutaneous (s.c.) implant presents opportunities to simplify administration of antiretroviral drugs, improve pharmacological profiles, and overcome suboptimal adherence associated with daily oral formulations. Tenofovir alafenamide (TAF) is a highly potent nucleoside reverse transcriptase inhibitor (NRTI) and an attractive agent for LA delivery, with a high potency and long intracellular half-life. The aim of this study was to predict minimum TAF doses required to achieve concentrations effective for HIV preexposure prophylaxis (PrEP). Daily drug release requirements were then ascertained by averaging across the dosing interval. A TAF physiologically based pharmacokinetic (PBPK) model was developed and partially qualified against available oral single- and multiple-dose pharmacokinetics. The models were assumed to be qualified when simulated values were within 2-fold of the observed mean. TAF s.c. implants were simulated in five hundred individuals, reporting predicted TAF plasma and tenofovir (TFV) plasma concentrations for various release rates. Intracellular TFV diphosphate (TFV-DP) concentrations were also simulated in peripheral blood cells and cervical and rectal tissues. The minimum dose predicted to achieve intracellular TFV-DP levels above a target concentration of 48 fmol/106 cells for a month was identified. TAF, TFV, and TFV-DP concentrations for release rates between 1.0 and 1.6 mg/day were simulated. The PBPK model indicated that a minimum release of 1.4 mg/day TAF is necessary to achieve TFV-DP concentrations above the identified target in peripheral blood mononuclear cells (PBMCs). TFV-DP cervical and rectal tissue concentrations were predicted to be between 1.5 and 2.0 fmol/106 cells and 0.9 and 1.1 fmol/106 cells, respectively, for release rates between 1.3 and 1.6 mg/day. These simulations provide target minimum doses for LA TAF PrEP in humans. Based on the generated results, multiple implants delivering a total of 1.4 mg/day of TAF subcutaneously could provide protection levels for approximately 6 months to 1 year. This modeling may inform future design of s.c. implants to mitigate adherence issues for effective PrEP applications. Copyright © 2020 American Society for Microbiology. All Rights Reserved. Evaluation of a pre-exposure prophylaxis programme for men who have sex with men and transgender women in Thailand: learning through the HIV prevention cascade lens	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25540	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087129607&doi=10.1002%2fjia2.25540&partnerID=40&md5=fcbf464bd2f45a36e771124a3e2d9063	Introduction: Men who have sex with men (MSM) and transgender women (TGW) are two key populations (KPs) in Thailand at high risk for HIV. Uptake and scale-up of pre-exposure prophylaxis (PrEP) among them has been slow. We used data from Princess PrEP, Thailand's largest KP-led PrEP programme, to operationalize PrEP service cascades. We identified gaps and pointed out where additional data are needed to inform a larger HIV prevention cascade. Methods: Numbers of people tested for HIV, tested HIV negative, eligible for PrEP (defined as any of the following in the past three months: condomless sex with partners of unknown/uncertain HIV status or antiretroviral treatment or viral load status, multiple partners, engaging in sex work, sexually transmitted infections, injecting drugs, using amphetamine-type stimulants, or repeated use of post-exposure prophylaxis), offered PrEP and accepted PrEP during January to November 2019 were retrieved from Princess PrEP database to inform PrEP service cascades for MSM and TGW. Reasons for not accepting PrEP were documented. Results: Of 6287 MSM who received HIV testing in Princess PrEP, 92.3% were HIV negative and 70.2% of them were eligible for PrEP. PrEP was offered to 94.7% of those eligible and 48.0% of those offered accepted it. Among 900 TGW who had HIV testing, 95.3% tested HIV negative and 64.8% of them met PrEP eligibility criteria. Of these, 95.0% were offered PrEP and 43.9% of them accepted it. Among MSM and TGW who met PrEP eligibility criteria, no or low-HIV-risk perception was the most common reason provided (46.7% of 2007 MSM and 41.9% of 296 TGW) for not accepting PrEP. Conclusions: PrEP service cascades from the Princess PrEP programme identified no or low-risk perception as key barrier to PrEP acceptance among MSM and TGW who met PrEP eligibility criteria. More implementation research studies are needed to explore PrEP motivation and access in larger communities outside of clinical services. This is to identify gaps and strategies to address them within motivation, access and effective use domains of the HIV prevention cascade. © 2020 The Authors. Article	2020	Ramos, SR; Nelson, LR; Ajiboye, W; Turner, D; Lofters, A; Pederson, C; Williams, G; Yusuf, A; Abubakari, M; Guillaume, G; Odhiambo, A	Barriers and Facilitators to Providing HIV Pre-exposure Prophylaxis Decision Support to Black Patients in Canada: A Cross-sectional Survey	Nursing Research	-	-	-	-	0029-6562	10.32920/ihtp.v1i3.1457	https://journals.library.torontomu.ca/index.php/ihtp/article/view/1457/1419	Introduction: Healthcare settings can build towards a specific social environment, in which Black patients can make informed health decisions, including those about whether or not to use PrEP. We utilize self-determination theory for guidance to identify the extent to which current HIV pre-exposure prophylaxis (PrEP) decision support practices from healthcare professionals (HCP) are autonomy supportive. This identifies future developments and implementations of interventions for HCP capacity building to enhance the autonomy of Black patients who are considering using PrEP. Methods: Using a cross-sectional design for examining HCPs' perspectives on delivering quality PrEP usage-related decision support. Through a cross-sectional online survey of 24 HCP from 10 community-based health centers serving in Toronto, Canada, descriptive statistics were characterized in close-ended survey data and sample. Open-ended survey responses were analyzed using Q- sorting methodology. Results: Of the HCP, 40% were willing to provide PrEP decision support to Black-identified patients. HCP reported barriers of needing education about PrEP and available resources (96%) There's a need for more education and resources to facilitate decision support for Black patients to improve decision support and reduce PrEP uptake disparities. Conclusion: It is imperative that cultural humility in healthcare is upheld to provide informed decision support since not only health conditions vary from patient to patient, but life experiences and background are equally crucial to the health status of that individual. Competence development among HCP can take the forms of providing training to increase cultural humility awareness, knowledge, and skills that can build towards an environment in which Black patients are informed about and for their health decisions. Article	2020	Ranjit Y.S.; Dubov A.; Polonsky M.; Fraenkel L.; Rich K.M.; Ogunbajo A.; Altice F.L.	Dual motivational model of pre-exposure prophylaxis use intention: model testing among men who have sex men in Ukraine	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2019.1640845	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85068704046&doi=10.1080%2f09540121.2019.1640845&partnerID=40&md5=4b7c21b7e98ff418b57e38e492647212	The Dual Motivational Model of pre-exposure prophylaxis (PrEP) use intention (DMM) is a new theoretical model recently tested among men who have sex with men (MSM) in the United States. The model posits that there are two main motivational pathways to use PrEP: the Protection Motivation Pathway and the Expectancy Motivation Pathway. The Protection Motivation Pathway suggests that the intention to use PrEP is triggered by the desire to protect oneself from HIV, while the Expectancy Motivation Pathway suggests that PrEP use intention is triggered by the expectation to have better sexual experiences on PrEP. Although both motivators have been tested separately, only the DMM of PrEP use intention suggests that both pathways simultaneously influence an individual's intention to use PrEP. We used data from 1078 MSM in Ukraine to test the DMM. Results show that the relationship of the pathways is similar among Ukrainian and American MSM. Potential explanations for minor differences may be related to cultural and contextual differences, and the different trajectories for PrEP roll-out. Successful validation of the DMM for PrEP use intention as a theoretical model suggests that it may be applied to other cultures contemplating PrEP use delivery to target health promotion among high risk MSM. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group.	dual motivational model of PrEP use intention; HIV prevention; men who have sex with men; pre-exposure prophylaxis; Ukraine	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Ranjit Y.S.; Shrestha R.; Copenhaver M.; Altice F.L.	Online HIV information seeking and pre-exposure prophylaxis awareness among people who use drugs	Journal of Substance Abuse Treatment	-	-	-	-	7405472	10.1016/j.jsat.2019.12.010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078773814&doi=10.1016%2fj.jsat.2019.12.010&partnerID=40&md5=03a5f810c764ea9fd73ddf5b83350c5f	People who use drugs (PWUD) remain at high risk for acquiring human immunodeficiency virus (HIV), both from injection and from sexual risk-taking. In 2016, 9% of 39,782 new HIV diagnoses occurred among people who inject drugs in the United States. Reaching PWUD with accurate information about and motivation for initiating pre-exposure prophylaxis (PrEP) remains challenging and remains the first crucial step in the knowledge-attitude-behavior change continuum. This study seeks to contribute to closing this information gap by examining the HIV information-seeking behaviors among PWUD who are not on PrEP, so as to identify potential strategies to increase adoption of HIV prevention such as PrEP as part of overall health and related to risk-taking behaviors. A cross-sectional survey was conducted in 2016 among HIV-negative PWUD (n = 400), 57.3% of whom reported injecting at least once in a week, chronically maintained on methadone treatment (MMT) at a large addiction treatment program. The study found that the number of hours spent online by people who use drugs was comparable to the general population. Awareness about PrEP and the seeking of HIV-related information was low in this population. Looking for sex partners online, perception of risk, having multiple partners were associated with seeking HIV information. Although using injection drugs was related to high perception of risk of acquiring HIV, it was not associated with seeking HIV information online. It is imperative to further understand the online HIV information seeking behavior of this population and provide targeted information in order to increase awareness and knowledge about HIV-related risk and methods of prevention, including information about PrEP. © 2019 Elsevier Inc. Article	2020	Ransome Y.; Bogart L.M.; Kawachi I.; Kaplan A.; Mayer K.H.; Ojikutu B.	Area-level HIV risk and socioeconomic factors associated with willingness to use PrEP among Black people in the U.S. South	Annals of Epidemiology	-	-	-	-	10472797	10.1016/j.annepidem.2019.11.002	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077169365&doi=10.1016%2fj.annepidem.2019.11.002&partnerID=40&md5=58231e2e572f7c79fdb297d31cc58d3f	Purpose: In the United States (U.S.), southern states have the highest HIV incidence. Uptake of pre-exposure prophylaxis (PrEP) has been slow among Black people, particularly in the South. We know little about how area-level HIV risk influences one's willingness to use PrEP. Methods: 169 Black participants across 142 ZIP codes in the South completed the 2016 National Survey on HIV in the Black Community. We performed log-binomial regression to estimate the prevalence risk associated with residing in the upper 25th percentile of increases in new HIV diagnosis (2014–2015) within ZIP code and an individual's willingness to use PrEP, adjusting for individual and area-level covariates. Results: Participants were 68% female, mean age of 36 years, and 24% willing to use PrEP. Among the ZIP codes, 23% were within Atlanta, GA. The median increase in new HIV diagnoses was 25 per 100,000 population from 2014 to 2015 (IQR, 14–49). Participants living in ZIP codes within the upper 25th (compared-to-lower 75th) percentile of new HIV diagnoses were more willing to use PrEP (adjusted prevalence ratio (aPR) = 2.02, 95% CI = 1.06–3.86, P = .03). Area-level socioeconomic factors attenuated that association (aPR = 1.63, 95% CI = 0.78–3.39, P = .19). Conclusions: Area-level factors may influence PrEP uptake among Black people in the South. © 2019 The Authors	Black/African Americans; HIV; Pre-exposure prophylaxis (PrEP); South; United States (U.S.)	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Article	2020	Reback C.J.; Rusow J.A.; Cain D.; Benkeser D.; Arayasirikul S.; Hightow-Weidman L.; Horvath K.J.	Technology-based stepped care to stem transgender adolescent risk transmission: Protocol for a randomized controlled trial (TechStep)	JMIR Research Protocols	-	-	-	-	19290748	10.2196/18326	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091431672&doi=10.2196%2f18326&partnerID=40&md5=0bbc324b708e6cfbab55bcaf3b391651	Background: Transgender youth demonstrate significantly higher rates of engagement in sexual risk behaviors relative to their cisgender or gender-conforming counterparts, including high rates of condomless anal intercourse and engagement in sex work. In addition, transgender youth experience increased physical or sexual abuse, victimization, substance use, mental health disorders, incarceration, and homelessness. Owing to these syndemic health disparities, transgender youth are at substantially increased risk of HIV infection. Objective: This protocol aims to describe a randomized controlled trial (RCT), Adolescent Medicine Trials Network 160 TechStep (N=250), which assesses the differential immediate and sustained effects of each of 3 conditions (text messaging, WebApp, or information-only control) for reducing sexual risk behaviors and increasing pre-exposure prophylaxis (PrEP) uptake among high-risk, HIV-negative transgender youth and young adults (aged 15-24 years). Methods: Participants will be recruited through web-based (targeted social media sites and apps) and offline (print ads and flyers) advertisements, peer and clinic referrals, and street- and venue-based outreach, and by contacting potential participants who have requested contact for future studies. Participants will be randomized into 1 of the 3 conditions: (1) text messaging, (2) WebApp, or (3) information-only control for 6 months. Assessments will occur at baseline and at 3, 6, and 9 months. Participants who do not show improvements in sexual risk or PrEP uptake at the 3-month assessment will be rerandomized to receive weekly electronic coaching (eCoaching) sessions in addition to their assigned text messaging or WebApp intervention, or remain in the original text messaging or WebApp intervention using a 2:1 ratio. Participants originally assigned to the information-only condition are not eligible for rerandomization. Results: Funding for TechStep was awarded in June 2017. Phase 1 was approved by the Institutional Review Board (IRB) in April 2018. Recruitment began in November 2018 for phase 1, the formative phase. Initial phase 2 IRB approval came in June 2019. The data collection for phase 2, the RCT, is expected to be completed in April 2021. As of March 2020, 54 participants have been enrolled in TechStep. The final results are anticipated in May 2021. Conclusions: By providing culturally responsive, technology-based interventions, TechStep aims to improve sexual health outcomes among HIV-negative transgender youth and young adults at high risk of HIV. TechStep will evaluate the efficacy of technology-based interventions for reducing HIV sexual risk behaviors and increasing PrEP initiation, adherence, and persistence. The suite of technology-based interventions developed in TechStep, and assessed for efficacy in a 3-condition RCT, represents an important advancement in intervention science toward developing tailored and scalable interventions for transgender youth and young adults. © Cathy J Reback, Joshua A Rusow, Demetria Cain, David Benkeser, Sean Arayasirikul, Lisa Hightow-Weidman, Keith J Horvath. Article	2020	Reitsema M.; Hoek A.J.V.; Van Der Loeff M.S.; Hoornenborg E.; Van Sighem A.; Wallinga J.; Van Benthem B.; Xiridou M.	Preexposure prophylaxis for men who have sex with men in the Netherlands: Impact on HIV and Neisseria gonorrhoeae transmission and cost-effectiveness	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000002469	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85081074432&doi=10.1097%2fQAD.0000000000002469&partnerID=40&md5=ae27ce5a01fb97b7ad7f0b716fa64b8c	Objectives:To assess the impact of a preexposure prophylaxis (PrEP) programme for high-risk men who have sex with men (MSM), which includes gonorrhoea testing and treatment, on the transmission of HIV and Neisseria among MSM in the Netherlands and the cost-effectiveness of such programme with and without risk compensation (in the form of reduced condom use).Methods:We developed a stochastic agent-based transmission model of HIV and gonorrhoea. We simulated a capped (max 2.5% of MSM) and uncapped (5.5% of MSM in 2018 declining to 3% in 2027) daily PrEP programme for high-risk MSM, with 3-monthly HIV and gonorrhoea testing, with and without risk compensation. Epidemiological outcomes were calculated from the transmission model and used in an economic model to calculate costs, quality-adjusted life-years (QALY), and incremental cost-effectiveness ratios (ICER), over 2018-2027, taking a healthcare payer perspective.Results:Without risk compensation, PrEP can lead to a reduction of 61 or 49% in the total number of new HIV infections in 2018-2027, if the programme is uncapped or capped to 2.5% of MSM, respectively. With risk compensation, this reduction can be 63 or 46% in the uncapped and capped programmes, respectively. In all scenarios, gonorrhoea prevalence decreased after introducing PrEP. Without risk compensation, 92% of simulations were cost-effective (of which 52% cost-saving). With risk compensation, 73% of simulations were cost-effective (of which 23% was cost-saving).Conclusion:A nationwide PrEP programme for high-risk MSM can result in substantial reductions in HIV and gonorrhoea transmission and be cost-effective, even with risk compensation. © 2019-2020 Wolters Kluwer Health, Inc. Article	2020	Remy L.M.; Majee W.; Teti M.; Enriquez M.	Perceptions of black men who have sex with men about accessing and taking PrEP: A qualitative study	Journal of HIV/AIDS & Social Services	-	-	-	-	15381501	10.1080/15381501.2020.1824843	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091830631&doi=10.1080%2f15381501.2020.1824843&partnerID=40&md5=40b65e86fa19566d34f791a82e151d83	Black men who have sex with men (MSM) have a 1 in 2 lifetime risk of acquiring HIV infection; yet are underrepresented in biomedical HIV prevention behaviors. In-depth interviews were conducted with Midwestern Black MSM (n = 12) taking PrEP for more than one year. A strength of this study was that it utilized qualitative methodology, which allows the revelation of perceptions that researchers cannot predict a priori. Black MSM in this study were educated and privately insured; even so, an overarching theme that emerged was that obtaining PrEP was a "long, hard road." Facilitators to PrEP access included having an important person, insight into stigma, wariness of sexual partners, and desire to be a part of something greater than oneself. Findings have important implications for research and clinical practice. Strategies that decrease healthcare system barriers and simplify PrEP access are urgently needed for MSM at risk for HIV acquisition. © 2020 Taylor & Francis Group, LLC. Article	2020	Rendina H.J.; Cienfuegos-Szalay J.; Talan A.; Jones S.S.; Jimenez R.H.	Growing Acceptability of Undetectable = Untransmittable but Widespread Misunderstanding of Transmission Risk: Findings From a Very Large Sample of Sexual Minority Men in the United States	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002239	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079201819&doi=10.1097%2fQAI.0000000000002239&partnerID=40&md5=058d060a31510b3baabb48c2f31b66e8	Background:Several studies have demonstrated no linked HIV transmissions in serodifferent sexual encounters where the partner with HIV has an undetectable viral load. As a result, awareness and dissemination of treatment as prevention, and movements such as "Undetectable = Untransmittable" (U = U), has grown.Setting:We conducted an online cross-sectional survey from November 2017 through September 2018 to gather data from a total of 111,747 sexual minority men (SMM) in the United States.Methods:Participants provided sociodemographic data and answered questions regarding biomedical status, HIV and STI prevention behaviors, drug use, condomless anal sex, and perceived accuracy of the U = U message. We conducted analyses to understand factors associated with perceived accuracy of U = U stratified by HIV status.Results:Overall, 53.2% of the sample perceived U = U as accurate, with the highest rates among HIV-positive SMM (83.9%), followed by HIV-negative (53.8%) and status-unknown (39.0%) SMM. Multivariable models showed accuracy beliefs were, on average, 1-2% higher for each consecutive month of recruitment. Consistent with previous work, there was greater heterogeneity among HIV-negative and unknown men, with several factors differentiating perceived accuracy, compared with SMM with HIV. Perceived transmission risk levels with undetectable partners were skewed well above accurate levels, and greater perceived transmission risk was associated with lower perceived accuracy of U = U.Conclusions:Public confidence in treatment as prevention and U = U is growing, but clear, unequivocal messaging about the effectiveness of U = U is critical. Owing to misunderstandings of risk, language that focuses on protective benefits rather than transmission risks may reach more people and allow for better comparisons with PrEP and condoms. © 2020 Lippincott Williams and Wilkins. AIDS Education and Prevention	-	-	-	-	1943-2755 0899-9546	10.1521/aeap.2020.32.3.212	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10442845/#:~:text=In%20this%20sample%2C%2053%25%20of,PrEP%20once%20learning%20about%20it.	Pre-exposure prophylaxis (PrEP) can efficaciously avert HIV acquisition for individuals at risk, including transgender individuals (trans) in the Philippines. We conducted multivariate logistic regression procedures in an online sample of Filipina trans women (n = 139) to examine associations of PrEP awareness. In this sample, 53% of Filipina trans women were unaware of PrEP, but almost all (93%) expressed interest in taking PrEP once learning about it. Greater odds of PrEP awareness was associated with discussion of HIV services with their health care providers, higher HIV knowledge, and discussion of PrEP among trans friends. Lower odds of PrEP awareness was associated with reporting being currently unemployed. The findings underscore a subset of trans women who might be early adopters of PrEP, and highlight PrEP inequities among trans women most marginalized, including those who are unemployed and have engaged in sex work. Article	2020	Reza-Paul S.; Lazarus L.; Maiya R.; Haldar P.; Rewari B.B.; Venugopal M.S.; Hafeez Ur Rahman S.; Venukumar K.T.; Ramaiah M.; Pasha A.; Sharma M.; Steen R.; Lorway R.	The Ashodaya PrEP project: Lessons and implications for scaling up PrEP from a community-led demonstration project among female sex workers in Mysore, India	Global Public Health	-	-	-	-	17441692	10.1080/17441692.2020.1724316	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079729723&doi=10.1080%2f17441692.2020.1724316&partnerID=40&md5=8a0f4a225fbb7eb15e0125fdbd783ba7	To inform PrEP roll out, Ashodaya Samithi, a sex workers' collective, conducted a community-led prospective demonstration project among female sex workers in Mysore and Mandya, India. Following a community preparedness phase and pre-screening, participants were recruited for clinical screening and enrolment, provided PrEP as part of combination HIV prevention, and followed for 16 months. Adherence was measured by self-reported pill intake and by tenofovir blood level testing among a subset of participants. Of the 647 participants enrolled, 640 completed follow-up. Condom use remained stable and no HIV seroconversions occurred. Self-reported daily PrEP intake over the last month was 97.97% at the end of the study. Tenofovir blood levels >40 ng/mL (consistent with steady state dosing) were detected among 80% (n = 68/85) and 90.48% (n = 76/84) of participants at month 3 and 6, respectively. Our study holds important insights for rolling out PrEP in community settings as part of targeted HIV prevention interventions. © 2020, © 2020 The Author(s). Article	2020	Rhodes S.D.; Alonzo J.; Mann-Jackson L.; Song E.Y.; Tanner A.E.; Garcia M.; Smart B.D.; Baker L.S.; Eng E.; Reboussin B.A.	A peer navigation intervention to prevent HIV among mixed immigrant status Latinx GBMSM and transgender women in the United States: Outcomes, perspectives and implications for PrEP uptake	Health Education Research	-	-	-	-	2681153	10.1093/her/cyaa010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085537891&doi=10.1093%2fher%2fcyaa010&partnerID=40&md5=88f8d0af00d41f3a08251212577eb146	The Latinx population in the United States is disproportionately affected by HIV. Our community-based participatory research partnership developed, implemented and evaluated a Spanish-language peer navigation intervention designed to increase HIV testing and condom use among social networks of immigrant Spanish-speaking Latinx gay, bisexual and other men who have sex with men (GBMSM) and transgender women (TW). We randomized 21 social networks of Latinx GBMSM and TW, ages 18-55 years, to the intervention, known as HOLA, or a waitlist control group. Social network participants (n = 166) completed structured assessments at baseline and 12-month follow-up (24 months after baseline). Follow-up retention was 95%. Individual in-depth interviews with a sample of participants documented their intervention-related experiences, needs, and priorities to inform future research. At follow-up, HOLA participants reported increased HIV testing (adjusted odds ratio = 8.3; 95% CI = 3.0-23.0; P < 0.0001). All study participants reported increased condom use; there was no significant difference between HOLA and waitlist control participants. In-depth interviews identified critical intervention elements and impacts and community needs and priorities. The HOLA intervention is effective for increasing HIV testing among Latinx GBMSM and TW, an initial step within the HIV prevention and care continua, and may be adaptable to promote pre-exposure prophylaxis uptake. © 2020 The Author(s). Article	2020	Robbins, Sarah J; Dauda, Wuese; Kokogho, Afoke; Ndembi, Nicaise; Mitchell, Andrew; Adebajo, Sylvia; Gaydos, Charlotte A; Peel, Sheila; Ramadhani, Habib O; Robb, Merlin L; Baral, Stefan D; Ake, Julie A; Charurat, Man E; Crowell, Trevor A; Nowak, Rebecca G	Oral sex practices among men who have sex with men and transgender women at risk for and living with HIV in Nigeria.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0238745	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7473579	BACKGROUND: Men who have sex with men (MSM) and transgender women (TGW) are at risk for sexually transmitted infections (STIs), including those of the oropharynx. We estimated the prevalence and factors associated with oral sex practices and characterized oropharyngeal STIs among a cohort of MSM and TGW in Nigeria. METHODS: From 2013 to 2018, TRUST/RV368 recruited MSM and TGW into HIV/STI diagnosis and treatment at community-based clinics in Nigeria. Participants who completed HIV testing and oral sex questions at enrollment were selected. Cross-sectional analyses with bivariate and multivariable logistic regression models estimated odds ratios (ORs) and 95% confidence intervals (CIs). Oropharyngeal swab testing for Neisseria gonorrhoeae (NG) and Chlamydia trachomatis (CT) began in 2014 and for those with diagnostic results at enrollment, the unadjusted association of oral sex practices with oropharyngeal STIs was conducted. RESULTS: A total of 1342 participants had a median age of 25 years (interquartile range: 22-29), 58% were living with HIV, and 69% reported oral sex practices. Factors associated with increased odds of engaging in oral sex included living with HIV (adjusted aOR: 1.4, 95% CI: 1.1-1.8), self-identifying as a woman (aOR:1.8, 95% CI: 1.1-2.8), mobile phone ownership (aOR:2.3, 95% CI: 1.3-3.9), receptive anal sex (aOR:1.7, 95% CI:1.3-2.3) and multiple male sexual partners (2 to 4 vs. ≤1, aOR:1.5, 95% CI: 1.0-2.2; 5+ vs ≤1, aOR:2.9, 95% CI:1.9-4.3). Oropharyngeal STI prevalence was 7% (52/752) and higher among those who engaged in oral sex compared to those who did not (unadjusted OR: 2.5, 95% CI:1.2-5.3). CONCLUSIONS: Oral sex was common and associated with increased odds of oropharyngeal STIs among MSM and TGW from Nigeria. In the absence of screening and treatment guidelines, condoms continue to be the mainstay for oral STI prevention. A pre-exposure prophylaxis for bacterial STIs would complement current prevention strategies to curb transmission. Impact of Male Partner Involvement on Women's Adherence to the Dapivirine Vaginal Ring During a Phase III HIV Prevention Trial	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-019-02707-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074698321&doi=10.1007%2fs10461-019-02707-1&partnerID=40&md5=a984c64cb18933dd560b0569f60dc444	Although vaginal microbicides for HIV prevention are designed to be female-initiated, male partner influence has been identified as one of the most significant factors impacting women's willingness and ability to use them. As a result, research teams have sought to increase male partner involvement by encouraging disclosure of product use to male partners, promoting male partner engagement in the study through attendance at the study clinic, and helping women to garner male partner support for product use. This paper aims to assess the impact of these three elements of male partner involvement on women's adherence to the dapivirine vaginal ring during MTN-020/ASPIRE, a phase III randomized placebo-controlled clinical trial involving 2629 women in Malawi, South Africa, Uganda, and Zimbabwe. During the study, 64–80% of participants reported disclosure of ring use at each quarterly visit, and 13% reported that their partners had attended the study clinic at some point during the study. At study exit, 66% reported that their partner was supportive, 18% unsupportive, and 17% were unsure. After adjusting for age, site and time in study, women were more likely to have low ring adherence if they had an unsupportive male partner (aRR 1.29, 95% CI 1.03–1.62). Neither disclosure nor clinic attendance directly predicted ring adherence, but disclosure increased the probability of having a supportive partner (aRRR 24.17, 95% CI 16.38–35.66) or an unsupportive partner (aRRR 4.10, 95% CI 2.70–6.24), relative to an unknown level of partner support. Women were also more likely to have a supportive partner if their partner had attended the clinic (aRRR 3.77, 95% CI 1.36–10.42). This study suggests that although the vaginal ring is relatively discreet, lack of support from male partners remains a relevant barrier to use. Though both disclosure and clinic attendance may increase partner support, disclosure may also increase partner opposition. Interventions to reduce male partner opposition are needed to maximize the potential impact of the ring and other PrEP products for HIV prevention. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Roberts, D Allen; Hawes, Stephen E; Bousso Bao, Mame D; Ndiaye, Anna Julienne; Gueye, Daouda; Raugi, Dana N; Mane, Moustapha; Mboup, Aminata; Diouf, Ousmane; Jones, Fatima; Kane, Coumba Toure; Sarr, Moussa; Mboup, Souleymane; Gottlieb, Geoffrey S	Trends in Reported Sexual Behavior and Y-Chromosomal DNA Detection Among Female Sex Workers in the Senegal Preexposure Prophylaxis Demonstration Project.	Sexually Transmitted Diseases	-	-	-	-	1537-4521	10.1097/OLQ.0000000000001175	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7213512	BACKGROUND: Preexposure prophylaxis (PrEP) can reduce HIV acquisition among female sex workers (FSWs). However, changes in condomless sex frequency after PrEP initiation could reduce PrEP effectiveness when PrEP adherence is suboptimal as well as increase the risk of acquiring other sexually transmitted infections. Objective measures of condomless sex may be more accurate for determining changes in sexual behavior than self-reported measures. METHODS: We longitudinally measured self-reported condom use, number of clients, and presence of Y-chromosomal DNA (Yc-DNA) in vaginal swabs among 267 FSWs accessing PrEP at 4 clinics in Senegal between 2015 and 2016. We assessed trends in sexual behavior over time since PrEP initiation using generalized estimating equations and evaluated predictors of Yc-DNA detection. RESULTS: We found no increase in self-reported condomless sex with clients (odds ratio OR, 0.94; 95% confidence interval CI, 0.89-1.00), main partners (OR, 0.99; 95% CI, 0.96-1.02), or Yc-DNA detection (OR, 0.99; 95% CI, 0.90-1.08) over time since initiation. Y-chromosomal DNA was detected in 34 (22%) of 154 swabs tested and in 15 (26%) of 58 swabs from FSW reporting consistent condom use among both clients and main partners. Self-reported condom use with clients or main partners did not predict Yc-DNA detection. CONCLUSIONS: In a FSW PrEP demonstration project in Senegal, we found no evidence of risk compensation among FSWs on PrEP as measured by self-reported behavior or through Yc-DNA detection. Y-chromosomal DNA detection was frequently detected among FSWs reporting consistent condom use, highlighting limitations of self-reported sexual behavioral measures. Article	2020	Rockstroh J.K.; Boesecke C.	Hepatitis C virus treatment as prevention: Challenges and opportunities in men who have sex with men	Journal of Infectious Diseases	-	-	-	-	221899	10.1093/infdis/jiaa096	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096947865&doi=10.1093%2finfdis%2fjiaa096&partnerID=40&md5=726961fa04fa536017a35c3c963734dc	Since 2002, a global epidemic of acute hepatitis C virus (HCV) infection has been noted in men who have sex with men (MSM). Transmission of HCV, particularly in the context of traumatic sex practices that increase the risk of blood-blood contacts (eg, anal sex and fisting), was initially found in human immunodeficiency virus (HIV)-coinfected and more recently in HIV-uninfected MSM, especially those receiving pre-exposure prophylaxis (PrEP). Early HCV treatment with all-oral direct-acting antiviral combination therapy has been associated with very high HCV cure rates of up to 100%. Indeed, immediate treatment of recently acquired HCV directly after new HCV diagnosis, or after 4 weeks if no 2-log10 drop in HCV RNA level occurs, promises rapid HCV elimination. Reports from the Netherlands, Switzerland, and the United Kingdom all show that with increased treatment uptake in this particular patient group, dramatic reductions in new HCV infections can be achieved. A general consensus on how to best screen for and manage acute HCV infections, along with broad access to rapid HCV therapy initiation, is crucial to attaining HCV elimination, a goal that is challenged by high HCV reinfection rates among MSM. © 2020 The Author(s) 2020. Sexual risk and HIV testing disconnect in men who have sex with men (MSM) recruited to an online HIV self-testing trial	HIV Medicine	-	-	-	14642662	10.1111/hiv.12919	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85089142733&doi=10.1111%2fhiv.12919&partnerID=40&md5=b6989ce474833932f657b20991c5127e	Objectives: We report the frequency of previous HIV testing at baseline in men who have sex with men (MSM) who enrolled in an HIV self-testing (HIVST) randomized controlled trial an HIV self-testing public health intervention (SELPHI). Methods: Criteria for enrolment were age ≥ 16 years, being a man (including trans men) who ever had anal intercourse (AI) with a man, not being known to be HIV positive and having consented to national HIV database linkage. Using online survey baseline data (2017–2018), we assessed associations with never having tested for HIV and not testing in the previous 6 months, among men who reported at least two recent condomless AI (CAI) partners. Results: A total of 10 111 men were randomized; the median age was 33 years interquartile range (IQR) 26–44 years, 89% were white, 20% were born outside the UK, 0.8% were trans men, 47% were degree educated, and 8% and 4% had ever used and were currently using pre-exposure prophylaxis (PrEP), respectively. In the previous 3 months, 89% reported AI and 72% reported CAI with at least one male partner. Overall, 17%, 33%, 54%, and 72% had tested for HIV in the last 3 months, 6 months, 12 months and 2 years, respectively; 13% had tested more than 2 years ago and 15% had never tested. Among 3972 men reporting at least two recent CAI partners, only 22% had tested in the previous 3 months. Region of residence and education level were independently associated with recent HIV testing. Among current PrEP users, 15% had not tested in the previous 6 months. Conclusions: Most men in SELPHI, particularly those reporting at least two CAI partners and current PrEP users, were not testing in line with current UK recommendations. The results of the trial will inform whether online promotion of HIVST addresses ongoing testing barriers. © 2020 The Authors. Article	2020	Rosengarten M.; Murphy D.	A wager on the future: a practicable response to HIV pre-exposure prophylaxis (PrEP) and the stubborn fact of process	Social Theory and Health	-	-	-	14778211	10.1057/s41285-019-00115-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85070199778&doi=10.1057%2fs41285-019-00115-y&partnerID=40&md5=9d9598658fe2caf60c4128855339024d	In this article we focus on public health's wager on the social implications of a daily antiretroviral pill to prevent HIV, referred to as PrEP (pre-exposure prophylaxis). The wager is shown to rely on modes of inquiry overly tied to what is known of the present in order to predict the future. Although such inquiry is not unusual when social research is called upon to assist health policy, predictive methodologies are unable to appreciate the dynamic and thus indeterminate nature of process. We ask: what mode of inquiry might practicably appreciate that what happens in the present will have a bearing on the future, without foreclosing on unknown possibles? Drawing on speculative and pragmatic philosophy, we reflect on our own qualitative research on PrEP to suggest that conventional methodological approaches can contribute to the future without seeking to determine what it will become. © 2019, Springer Nature Limited. Article	2020	Rosengren, A Lina; Davy-Mendez, Thibaut; Hightow-Weidman, Lisa B	Online sex partner seeking and HIV testing frequency among young Black sexual minority men.	Journal of HIV/AIDS & Social Services	-	-	-	1538-1501	10.1080/15381501.2019.1692749	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7199779	Dating apps are a novel means of delivering HIV prevention messages. Young black sexual minority men (YBSMM) app users are at high risk for HIV and could benefit from frequent testing. Understanding testing behaviors among YBSMM is critical to tailored prevention interventions. We analyzed testing behaviors of 273 YBSMM, comparing typical testing frequency between app users and non-users using odds ratios. Overall, testing rates were high. App users were more likely than non-users to test at least every 12 months. App-using YBSMM exhibit high compliance with testing guidelines, which may indicate future successful uptake of biomedical preventions, such as Pre-Exposure Prophylaxis. Article	2020	Rouffiac A.-E.; Whiteley L.; Brown L.; Mena L.; Craker L.; Healy M.; Haubrick K.	A mobile intervention to improve uptake of pre-exposure prophylaxis for southern black men who have sex with men: Protocol for intervention development and pilot randomized controlled trial	JMIR Research Protocols	-	-	-	19290748	10.2196/15781	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083401188&doi=10.2196%2f15781&partnerID=40&md5=3be6b4970991f60499bed62c8336a70c	Background: The uptake of pre-exposure prophylaxis (PrEP) has been slow for young black men who have sex with men (BMSM) living in the southern United States. This is a significant issue because 8 of the 10 states with the highest rates of new HIV infections are in the South. Jackson, Mississippi (MS), the site of this project, has the second highest AIDS diagnosis rate in the nation and the highest rate of HIV infection for young, urban BMSM. This study will develop and test an engaging, interactive, and cost-effective mobile messaging intervention to improve engagement in PrEP care for BMSM aged 18 to 35 years living in Jackson, MS. Objective: The goals of this mixed methods study are to (1) conduct qualitative interviews with young BMSM in Jackson, MS, to understand individual, community, and structural barriers affecting engagement in PrEP-related care, (2) assemble a PrEP mobile messaging intervention that includes text messages with publicly available internet content (websites and YouTube videos) that provide factual information, motivational materials, and behavioral skills related to PrEP and HIV prevention, and (3) evaluate the preliminary efficacy of the intervention in a randomized controlled study with PrEP-eligible BMSM receiving care in STI/HIV testing clinics in Jackson, MS. Methods: This research protocol will be conducted in 2 phases. A development phase will involve in-depth interviews (n=30) with PrEP-eligible BMSM who receive care in STI/HIV testing clinics in MS. These interviews will allow researchers to select the textual material that will be sent out during the intervention. The second phase will consist of an unblinded, small, randomized controlled trial among 66 new participants to examine the preliminary efficacy of the intervention compared with enhanced standard of care (ESC) on attendance at a PrEP services appointment (the first step in initiating PrEP care) and receipt of a PrEP prescription, based on self-report and electronic medical records. The free, publicly available material will be sent to PrEP-eligible BMSM in 8 to 16 interactive text messages over 4 weeks. Study assessments will occur at enrollment and at 4- and 16-weeks postenrollment and can be completed online or in person. All participants will be recruited from a local clinic. Results: Institutional review board approval was received on January 16, 2017, and research activities, subsequently, began in February 2018. Recruitment for the study concluded in November 2019. In total, 65 participants were randomized with 33 being assigned to the intervention and 32 to ESC. Collection of follow-up data is ongoing. Conclusions: This PrEP mobile messaging intervention aims to increase uptake of PrEP by BMSM in the southern United States. This intervention uses interactive, tailored text messaging and appealing free Web content (publicly accessible educational websites and YouTube videos) to promote linkage to PrEP care and increase HIV preventive behaviors. A cost-effective PrEP mobile messaging intervention has great potential to improve information about PrEP, improve motivation to use PrEP, and decrease stigma and structural barriers that often prevent engagement in PrEP-related medical care. ©Anne-Emilie B. Article	2020	Rubin, Rita	HHS Provides Free PrEP Medication to People Without Drug Coverage.	JAMA - Journal of the American Medical Association	-	-	-	1538-3598	10.1001/jama.2019.21077	https://jamanetwork.com/journals/jama/article-abstract/2759453	Objective: Preexposure prophylaxis (PrEP) is a promising intervention to help end the HIV epidemic among men who have sex with men (MSM) in the Netherlands. We aimed to assess the impact of PrEP on HIV prevalence in this population and to determine the levels of PrEP coverage necessary for HIV elimination. Design and methods: We developed a mathematical model of HIV transmission in a population stratified by sexual risk behavior with universal antiretroviral treatment (ART) and daily PrEP use depending on an individual's risk behavior. We computed the effective reproduction number, HIV prevalence, ART and PrEP coverage for increasing ART and PrEP uptake levels, and examined how these were affected by PrEP effectiveness and duration of PrEP use. Results: At current levels of ART coverage of 80%, PrEP effectiveness of 86% and PrEP duration of 5 years, HIV elimination required 82% PrEP coverage in the highest risk group (12 000 MSM with more than 18 partners per year). If ART coverage increased by 9%, the elimination threshold was at 70% PrEP coverage. For shorter PrEP duration and lower effectiveness elimination prospects were less favorable. For the same number of PrEP users distributed among two groups with highest risk behavior, prevalence dropped from the current 8 to 4.6%. Conclusion: PrEP for HIV prevention among MSM could, in principle, eliminate HIV from this population in the Netherlands. The highest impact of PrEP on prevalence was predicted when ART and PrEP coverage increased simultaneously and PrEP was used by the highest risk individuals. Copyright © 2018 The Author(s). Article	2020	Rutstein S.E.; Smith D.K.; Dalal S.; Baggaley R.C.; Cohen M.S.	Initiation, discontinuation, and restarting HIV pre-exposure prophylaxis: ongoing implementation strategies	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(20)30203-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090573008&doi=10.1016%2fS2352-3018%2820%2930203-4&partnerID=40&md5=575488ba4de93ddd8d57199ad4ca15a3	When used appropriately, pre-exposure prophylaxis (PrEP) substantially reduces the risk of HIV acquisition. Early implementation outcomes often suggest poor PrEP adherence and persistence; however, this intervention is time-limited and the need for PrEP fluctuates as risk behaviours change. In this Viewpoint we examine the current guidelines and early programmatic outcomes after starting, stopping, and restarting PrEP, and we review the implications of PrEP in relation to HIV testing algorithms. Guidelines suggest to discontinue PrEP when a person is no longer at risk for HIV, but effectively implementing this strategy requires support tools to make the decision of stopping and restarting PrEP that considers the complex relationship between risk perceptions and risk behaviours. Safely discontinuing PrEP also requires greater understanding of the daily dosing duration that is needed to protect the person after their last HIV exposure. Additionally, clear strategies are needed to re-engage a person as their HIV exposure risk changes over time. © 2020 Elsevier Ltd	NA	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2020	Ryan K.E.; Asselin J.; Fairley C.K.; Armishaw J.; Lal L.; Nguyen L.; Murphy D.; Traeger M.; Hellard M.; Hoy J.; Stoové M.; Wright E.	Trends in human immunodeficiency virus and sexually transmitted infection testing among gay, bisexual, and other men who have sex with men after rapid scale-up of preexposure prophylaxis in Victoria, Australia	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001187	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088486361&doi=10.1097%2fOLQ.0000000000001187&partnerID=40&md5=b8b8e09f584d4e6f50b3f9af19f84c83	Objective Scale-up of human immunodeficiency virus (HIV) preexposure prophylaxis (PrEP) has raised concerns regarding its impact on clinic capacity and access to HIV testing. We describe enrolment in PrEPX, a large PrEP implementation study in Victoria, Australia, and the impact of PrEP uptake and maintenance on existing health services. Methods We describe enrolment between July 26, 2016, and March 31, 2018, and trends in HIV testing among PrEPX participating and nonparticipating gay and bisexual and other men who have sex with men (GBM) at 5 study clinics participating in a sentinel surveillance system (ACCESS). We evaluated HIV and STI testing trends using segmented linear regression across the prestudy (January 2015 to June 2016) and PrEPX study (July 2016 to March 2018) periods. Findings There were 2,049 individuals who registered interest in study participation: 72% enrolled into the study. Study clinics enrolled participants rapidly; of 4265 people enrolled in PrEPX (98% GBM), 1000 enrolled by week 3, 88% (n = 876) of whom enrolled at ACCESS sites. Prestudy period HIV testing rates were increasing at all ACCESS sites. In the month PrEPX commenced, there was an additional 247 HIV tests among PrEPX participants (P < 0.01) and no significant change among non-PrEPX GBM (P = 0.72). Across the study period, HIV testing increased by 7.2 (P < 0.01) and 8.9 (P < 0.01) tests/month among PrEPX participants and non-PrEPX GBM, respectively. The HIV testing increased among non-PrEPX GBM at sexual health clinics (18.8 tests/month, P < 0.01) and primary care clinics (7.9 tests/month, P < 0.01). Similar trends were observed across testing for all measured STIs. Conclusions Rapid PrEP scale-up is possible without a reduction in HIV testing among GBM not using PrEP. © Lippincott Williams & Wilkins. Article	2020	Saag, Michael S; Gandhi, Rajesh T; Hoy, Jennifer F; Landovitz, Raphael J; Thompson, Melanie A; Sax, Paul E; Smith, Davey M; Benson, Constance A; Buchbinder, Susan P; Del Rio, Carlos; Eron, Joseph J; Fätkenheuer, Gerd; Günthard, Huldrych F; Molina, Jean-Michel; Jacobsen, Donna M; Volberding, Paul A	Antiretroviral Drugs for Treatment and Prevention of HIV Infection in Adults: 2020 Recommendations of the International Antiviral Society-USA Panel.	JAMA - Journal of the American Medical Association	-	-	-	1538-3598	10.1001/jama.2020.17025	https://dx.doi.org/10.1001/jama.2020.17025	Importance: Data on the use of antiretroviral drugs, including new drugs and formulations, for the treatment and prevention of HIV infection continue to guide optimal practices. Objective: To evaluate new data and incorporate them into current recommendations for initiating HIV therapy, monitoring individuals starting on therapy, changing regimens, preventing HIV infection for those at risk, and special considerations for older people with HIV. Evidence Review: New evidence was collected since the previous International Antiviral (formerly AIDS) Society-USA recommendations in 2018, including data published or presented at peer-reviewed scientific conferences through August 22, 2020. A volunteer panel of 15 experts in HIV research and patient care considered these data and updated previous recommendations. Findings: From 5316 citations about antiretroviral drugs identified, 549 were included to form the evidence basis for these recommendations. Antiretroviral therapy is recommended as soon as possible for all individuals with HIV who have detectable viremia. Most patients can start with a 3-drug regimen or now a 2-drug regimen, which includes an integrase strand transfer inhibitor. Effective options are available for patients who may be pregnant, those who have specific clinical conditions, such as kidney, liver, or cardiovascular disease, those who have opportunistic diseases, or those who have health care access issues. Recommended for the first time, a long-acting antiretroviral regimen injected once every 4 weeks for treatment or every 8 weeks pending approval by regulatory bodies and availability. For individuals at risk for HIV, preexposure prophylaxis with an oral regimen is recommended or, pending approval by regulatory bodies and availability, with a long-acting injection given every 8 weeks. Monitoring before and during therapy for effectiveness and safety is recommended. Switching therapy for virological failure is relatively rare at this time, and the recommendations for switching therapies for convenience and for other reasons are included. With the survival benefits provided by therapy, recommendations are made for older individuals with HIV. The current coronavirus disease 2019 pandemic poses particular challenges for HIV research, care, and efforts to end the HIV epidemic. Conclusion and Relevance: Advances in HIV prevention and management with antiretroviral drugs continue to improve clinical care and outcomes among individuals at risk for and with HIV. Article	2020	Saberi P.; Berrean B.; Milionis C.; Wong J.O.; Arnold E.	We are family: designing and developing a mobile health application for the San Francisco bay area House Ball and Gay Family communities	mHealth	-	-	-	23069740	10.21037/mHealth-19-234	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131153321&doi=10.21037%2fmHealth-19-234&partnerID=40&md5=ece69396c130f14e4bb30db7a29c9c84	Background: The House Ball community (HBC) and its affiliated Gay Families (GFs) consist of predominantly African American and Latinx sexual, gender, and ethnic minorities (SGEM), who form chosen families often as a way to provide support, and in the case of the HBC, to constitute houses that then compete in performative categories in balls. Members of both communities are disproportionately impacted by HIV. Although public health professionals have engaged with the HBC and GFs to improve HIV testing and clinical care, most intervention activities have relied on in-person modes of outreach and delivery. Little research has been conducted with the members of the HBC and GFs to develop and produce culturally-informed mobile health (mHealth) applications that would enable them to increase HIV-related knowledge, connect to HIV-related resources, receive HIV health support, and to celebrate their unique identities and communities in a safe space. Methods: We conducted 45 in-depth interviews with HBC and GF members who attended balls. Topics included HIV-related health needs, suggestions for mHealth components, current usage of apps and desirable features, and wishes around privacy and security. Following analysis of the interview data, we convened a series of four workshops with N=15 participants who were split into two groups. The purpose of the workshops was to co-design a digital tool to help provide information, reduce HIV-related stigma, and locate HIV resources for participants. Each group attended two workshops. Data were analyzed by a team of social scientists, community members, and mobile health experts. Findings were used to design an mHealth app related to HIV prevention and care. Results: Participants requested an app that clearly reflected the community. The desired features of the app included accurate information and education on HIV transmission; links to resources such as HIV testing, lube and condoms, PrEP, and other health-related services; and the ability to rate and review local resources. In workshops, participants proposed several design elements and functions for the app. It had to be 'Mobile and Modern', 'Relatable, Raw, and "Reflective of Me"', 'Positive and Fun', feature community-generated content, and provide a safe space for users. Using these clear directives, the team designed an mHealth tool to be fielded as part of the larger "We Are Family" intervention that would provide HIV-specific information, resources, and support in a platform that was congruent with community norms and expectations. Conclusions: Designing and fielding an mHealth app as part of a larger HIV prevention intervention that reflects the social support and relationships within existing House Ball and Gay Family communities allows those youth most at risk for HIV-related health disparities to gain access to HIV testing, or link and reengage young people to care. © mHealth. Article	2020	Saberi P.; Scott H.M.	On-Demand Oral Pre-exposure Prophylaxis with Tenofovir/Emtricitabine: What Every Clinician Needs to Know	Journal of General Internal Medicine	-	-	-	8848734	10.1007/s11606-020-05651-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078188317&doi=10.1007%2fs11606-020-05651-2&partnerID=40&md5=2f19209c931d78cc33144ac9c6494809	Based on the results of the IPERGAY study, on-demand HIV pre-exposure prophylaxis (PrEP; also known as "non-daily PrEP," "event-driven PrEP," or "2-1-1 PrEP") is being requested more frequently by patients who have intermittent sexual risk or are unable/unwilling to take daily PrEP; therefore, clinicians will be increasingly required to familiarize themselves with its appropriate use. In this perspective, we summarize data related to on-demand PrEP, describe advantages and disadvantages for this alternative dosing strategy, and provide clinical counseling points. © 2020, Society of General Internal Medicine.	2-1-1; clinician; on-demand; pre-exposure prophylaxis; PrEP; tenofovir/emtricitabine	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2020	Saberi, Parya; Ming, Kristin; Scott, Hyman; Liu, Albert; Steward, Wayne	"You can't have a PrEP program without a PrEP Coordinator": Implementation of a PrEP panel management intervention	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0240745	https://escholarship.org/uc/item/9602x11x	Lack of healthcare provider knowledge, capacity, and willingness to prescribe PrEP are barriers to PrEP delivery in clinical settings. We implemented the PrEP Optimization Intervention (PrEP-OI) combining a PrEP Coordinator with an online panel management tool to assist providers with PrEP uptake, persistence, and management in 12 San Francisco Department of Public Health Primary Care Clinics. Medical directors (N = 10) identified important factors to consider prior to implementation, including shortage of clinical space for coordinators, medical mistrust, language barriers, and limited lab hours, along with the need for education of providers and staff and patient outreach. Among 110 providers who completed a baseline survey, the majority had reservations in asking about sexual practices and having conversations about PrEP. Providers reported PrEP-OI increased their efficiency and capacity to manage PrEP patients, and served as a gateway to additional services. These results highlight the promise of a provider-based intervention to improve the PrEP continuum and maximize the impact of PrEP. Theses and Dissertations	2020	Salunke, Rajeev	PrEP Usage Demographics Among Participants Who Were Surveyed Using Convenience Sampling at Two LGBTQ Focused Events in Pittsburgh	-	-	University of Pittsburgh	-	35602152	NA	https://d-scholarship.pitt.edu/38972/	IntroductionPrEP is defined as daily medicine taken by at-risk individuals to prevent HIV. Although an increasing number of individuals are using PrEP, more studies are needed to accurately assess the distribution of PrEP use in different populations.Existing data suggests that PrEP usage remains low in communities that need it the most. Black and Hispanic MSM are significantly less likely to use PrEP compared to White MSM.ObjectivesThis study hypothesizes that:i) African-Americans have lower odds of reporting past/present PrEP use compared to white individuals.ii) Latino/Hispanic individuals have lower odds of reporting past/present PrEP use compared to white individuals.iii) Individuals in the 26-35-year age-group have higher odds of reporting past/present PrEP use compared to individuals in the 18-25-year age-group.iv) MSM individuals have higher odds of reporting past/present PrEP use than non-MSM individuals.MethodsAnonymous, multiple-choice questionnaires were administered at the Allies for Health+Wellbeing Booth during both events. A total of 267 individuals were surveyed.IRB approval was not obtained prior to data collection but post hoc IRB permission to publish the data was obtained.ResultsOut of the 263 individuals included in the study, 34(12.9%) individuals were past/present PrEP users. Individuals in the 26-35-year age-group were significantly more likely to report past/present PrEP use compared to 18-25-year-olds. African-Americans were significantly more likely to report past/present PrEP use compared to White individuals. Native-Americans were significantly more likely to report past/present PrEP use compared to White individuals. Being an MSM was significantly associated with past/present PrEP usage (compared to non-MSM).ConclusionThe public health significance of this study is that it provides a snapshot of past/present PrEP usage in the surveyed population. A PrEP to Need ratio (PnR) can be calculated with the help of this data and can be used to assess PrEP usage over time. This data can then be used as a basis to carry out more research to develop interventions to increase PrEP use in populations who are at a high risk of HIV acquisition with low rates of PrEP use. More demographic data is needed from future studies to accurately assess PrEP use. Article	2020	Sarr, Moussa; Gueye, Daouda; Mboup, Aminata; Diouf, Ousmane; Bao, Mame D Bousso; Ndiaye, Anna Julienne; Ndiaye, Birahim P; Hawes, Stephen E; Tousset, Eric; Diallo, Abdoulaye; Jones, Fatima; Kane, Coumba T; Thiam, Safiatou; Ndour, Cheikh T; Gottlieb, Geoffrey S; Mboup, Souleymane	Uptake, retention, and outcomes in a demonstration project of pre-exposure prophylaxis among female sex workers in public health centers in Senegal.	International Journal of STD & AIDS	-	-	-	1758-1052	10.1177/0956462420943704	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7750667	The Senegal pre-exposure prophylaxis (PrEP) Demonstration Project was an open-label cohort study assessing the delivery of daily oral PrEP to HIV-negative female sex workers (FSWs) in four Ministry of Health (MoH)-run clinics in Dakar, Senegal. We assessed uptake, retention in care, and adherence over up to 12 months of follow-up as well as HIV infection rates. Between July and November 2015, 350 individuals were approached and 324 (92.6%) were preliminarily eligible. Uptake was high, with 82.4% of eligible participants choosing to enroll and take PrEP. The mean age of those enrolled was 37.7 years (SD = 8.7), and approximately half had not attended school (41.2%). Among the 267 participants who were prescribed PrEP, 79.9 and 73.4% were retained in PrEP care at 6 and 12 months, respectively. Older age among FSWs was found to be the only significant predictor of lower discontinuation. We did not find significant differences in retention by site, education, condom use, or HIV risk perception. There were no new HIV infections at follow-up. Our results showed evidence of high interest in PrEP and very good PrEP retention rates among FSWs at 12-month follow-up when offered in MoH-run clinics, with older age as the only significant predictor of higher PrEP retention. This highlights the role that these clinics can play in expanding PrEP access nationwide.	Africa; HIV; prevention; sex workers; women. Article	2020	Schneider K.E.; White R.H.; Musci R.J.; O'rourke A.; Kilkenny M.E.; Sherman S.G.; Allen S.T.	The relationship between polysubstance injection drug use, hiv risk behaviors, and interest in pre-exposure prophylaxis (Prep) among people who inject drugs in rural west virginia	Journal of Studies on Alcohol and Drugs	-	-	-	19371888	10.15288/jsad.2020.81.740	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098067899&doi=10.15288%2fjsad.2020.81.740&partnerID=40&md5=82b07d948b5fd1662198e35bffe588e7	Objective: The opioid crisis has increased risks for injection drug use (IDU)–associated HIV outbreaks throughout the United States. Polysubstance use and syringe sharing are common among rural people who inject drugs (PWID). However, little is known about how polysubstance IDU affects engagement in HIV prevention efforts among non-urban PWID. This study assesses the associations between profiles of polysubstance injection, injection-related HIV risk, acquiring syringes from a syringe services program (SSP), HIV testing, and pre-exposure prophylaxis (PrEP) awareness and interest among PWID in rural Ap-palachia. Method: We used survey data from 392 respondents in Cabell County, West Virginia who had injected drugs in the past 6 months. We conducted a latent class analysis using seven measures of IDU and tested for associations with injection-related HIV risk, receiving syringes from an SSP, having been tested for HIV, and PrEP awareness and interest. Results: We identified three classes of polysubstance IDU in our sample: polysubstance use, heroin and crystal methamphetamine use, and crystal methamphetamine and buprenorphine/suboxone use. The polysubstance use class had the highest injection-related HIV risk (81.8% at risk), high syringe acquisition at an SSP (67.7%), and highest rate of HIV testing (60.0%). PrEP awareness was low across the sample (30.0%), but most PWID expressed interest in using PrEP (57.7%). Conclusions: Patterns of polysubstance IDU have unique relationships with key HIV risk factors and protective behaviors. The expansion of harm reduction services in rural settings is warranted to prevent incident HIV infections. (J. Stud. Alcohol Drugs, 81, 740–749, 2020). © 2020, Alcohol Research Documentation Inc.. Article	2020	Schumacher C.; Wu L.; Chandran A.; Fields E.; Price A.; Greenbaum A.; Jennings J.M.; Page K.; Davis M.; Ryscavage P.; Jones J.L.; Farley J.; Arrington-Sanders R.; Tepper V.; Demissew M.	Sexually transmitted infection screening among gay, bisexual, and other men who have sex with men prescribed pre-exposure prophylaxis in Baltimore City, Maryland	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciz1145	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100049555&doi=10.1093%2fcid%2fciz1145&partnerID=40&md5=a443464f1061893e298097c20f6639e8	Background. Human immunodeficiency virus pre-exposure prophylaxis (PrEP) clinical guidelines recommend men who have sex with men (MSM) PrEP users be screened biannually for syphilis and gonorrhea/chlamydia at all anatomic sites. We sought to determine the proportion screened and positive by STI and anatomic site at PrEP initiation and PrEP-care visits and patient-level characteristics associated with screening among MSM PrEP users in Baltimore City, Maryland. Methods. Medical records among MSM initiating PrEP between 30 September 2015 and 31 March 2018 were abstracted. STI screening (syphilis and gonorrhea/chlamydia at all anatomic sites) and positivity at PrEP visits ≤12 months following initiation were calculated. Poisson regression with cluster robust SEs was used to assess associations with STI screening. Results. Among 290 MSM initiating PrEP, 43.1% (n = 125) were screened per guidelines at PrEP initiation; 79.3% (230), 69.3% (201), 55.9% (162), and 69.3% (201) were screened for syphilis, urogenital, rectal, and oropharyngeal gonorrhea/chlamydia, respectively. Positivity among those screened was syphilis, 7.8% (n = 18/230); gonorrhea, 5.0% urogenital (10/201), 11.1% rectal (18/162), and 7.5% oropharyngeal (15/201); chlamydia, 5.0% urogenital (10/201), 11.7% rectal (19/162), and 1.5% oropharyngeal (3/201). Reported anal and oral sex (vs neither) was independently associated with STI screening (aPR, 2.11; 1.05–4.27) at PrEP initiation. At biannual PrEP-care visits, STI screening was lower and syphilis and rectal gonorrhea/chlamydia positivity was higher. Conclusions. Observed STI screening levels and disease burden suggest the effectiveness of STI screening in PrEP care for STI prevention may be limited. Our results suggest providers may be offering screening based on sexual practices; clarification of STI screening guidelines for PrEP users is needed. © The Author(s) 2019. Article	2020	Schumann, Hannah; Rubagumya, Kenyonyozi; Rubaihayo, John; Harms, Gundel; Wanyenze, Rhoda K; Theuring, Stefanie	The incidence of HIV and associated risk factors among pregnant women in Kabarole District, Uganda.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0234174	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7274402	Objectives: The study attempted to determine the incidence of HIV among pregnant women in Kabarole District, Uganda, and to identify socio-demographic and behavioral risk factors for seroconversion during pregnancy. Methods We carried out a retrospective cohort study among women for whom a documented HIV-negative test result from the first pregnancy trimester could be confirmed using available records, and who were HIV-retested in the third trimester or during delivery. In total, 1610 pregnant women from three different healthcare settings took part in the study. We captured the results of repeated HIV tests and conducted semi-structured interviews to explore participants' socio-demographic characteristics and sexual risk behavior. For HIV incidence rates, we calculated the number of seroconversions per 100 person-years. We used Fisher's exact test to test for potential associations. Penalized maximum likelihood logistic regression and Poisson regression were applied to adjust for potential confounders.Results: The overall HIV incidence rate among participants was 2.9/100 women-years. Among socio-demographic characteristics, the multivariable analysis showed a significant association of marital status with HIV incidence in pregnancy (IRR 8.78, 95%CI [1.13–68.33]). Risky sexual behaviors including higher number of sexual partners in pregnancy (IRR 2.78 [1.30–5.94]), unprotected sex with unknown persons (IRR 14.25 [4.52–44.93]), alcohol abuse (IRR 12.08 [4.18–34.90]) and sex under the influence of drugs or alcohol (IRR 6.33 [1.36–29.49]) were significantly associated with seroconversion in pregnancy (similar results in logistic regression). Conclusions: HIV incidence was three times higher among our pregnant study population compared to the general female population in Uganda. This underlines the importance of HIV prevention and repeat testing during pregnancy. Identified risk groups should be considered for pre-exposure prophylaxis. Article	2020	Scott, Hyman; Vittinghoff, Eric; Irvin, Risha; Liu, Albert; Nelson, LaRon; Del Rio, Carlos; Magnus, Manya; Mannheimer, Sharon; Fields, Sheldon; Van Tieu, Hong; Kuo, Irene; Shoptaw, Steve; Grinsztejn, Beatriz; Sanchez, Jorge; Wakefield, Steven; Fuchs, Jonathan D; Wheeler, Darrell; Mayer, Kenneth H; Koblin, Beryl A; Buchbinder, Susan	Development and Validation of the Personalized Sexual Health Promotion (SexPro) HIV Risk Prediction Model for Men Who Have Sex with Men in the United States.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-019-02616-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6954959	Accurate HIV risk assessment among men who have sex with men (MSM) is important to help providers assess risk, and target HIV prevention interventions. We sought to develop an evidence-based HIV risk assessment tool for US MSM that is inclusive of Black MSM. Data from four large longitudinal cohorts of MSM were used to develop (EXPLORE), and validate (VAX004, HPTN061, and HVTN505). These data included visits in which participants self-reported HIV risk behavior and underwent HIV testing. We developed a pooled logistic model for incident HIV infection based on self-reported risk behaviors during the 6 months before each study visit. A total of 4069 MSM were used for the development cohort, and 8047 MSM in the three validation cohorts through 2013. The final model includes age (< 35, ≥ 35); Black race and Latino ethnicity; numbers of HIV-negative anal sex partners; number of insertive or receptive anal intercourse episodes; having 1 HIV-negative partner only; self-reported substance use; and bacterial sexually transmitted infection diagnosis. The model showed good discrimination in internal validation (C-statistic = 79.5). The external validation cohorts also showed good discrimination, with C-statistics of 73.1, 71.0, 71.9 in VAX004, HPTN061, and HVTN505 respectively, and acceptable calibration. We developed and validated an HIV risk assessment tool for MSM, which showed good predictive ability, including among the largest cohort of HIV-uninfected Black MSM in the US. This tool is available online (mysexpro.org) and can be used by providers to support targeting of HIV prevention interventions such as pre-exposure prophylaxis for MSM. Article	2020	Selfridge M.; Card K.G.; Lundgren K.; Barnett T.; Guarasci K.; Drost A.; Gray-Schleihauf C.; Milne R.; Degenhardt J.; Stark A.; Hull M.; Fraser C.; Lachowsky N.J.	Exploring nurse-led HIV Pre-Exposure Prophylaxis in a community health care clinic	Public Health Nursing	-	-	-	7371209	10.1111/phn.12813	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091683351&doi=10.1111%2fphn.12813&partnerID=40&md5=7c98f072b4954d9dd87fa2659b185752	Objectives: Gay, bisexual, and other men who have sex with men (gbMSM) are 131 times more likely to acquire HIV compared with other Canadian men. Pre-Exposure Prophylaxis (PrEP) for HIV has the potential to reduce or eliminate disparities in HIV acquisition among key affected populations. This paper aims to discuss the feasibility and utility of a nurse-led PrEP program administered by the Cool Aid Community Health Centre (CACHC) in Victoria, British Columbia as a public health PrEP program was initiated. Design, Sample and Measurements: A retrospective chart review of 124 gbMSM patients accessing PrEP at CACHC in 2018 collected information on patient demographics, STI testing results, and PrEP prescription pick-ups at 3 time points. Results: Ninety-nine (79.8%) patients have continued on PrEP, as defined as having picked up their second 90-day PrEP prescription. Both older age and having an Sexually Transmitted Infection after PrEP enrolment were significantly associated with staying on PrEP; decreased risk perceptions contributed most to clinic-level discontinuance. Very few patients who stayed on PrEP have transitioned to their own General Practitioner. Conclusions: Patients appear to recognize their risk and are continuing on PrEP to reduce their risk of HIV. As evidenced by ability to recruit and maintain patients, we conclude that nurse-led PrEP at community health centres supports access and uptake of essential health services to optimize individual and population health. © 2020 Wiley Periodicals LLC.	gbMSM; HIV/AIDS; men's health; nurse-led; PrEP	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Review
Article	2020	Serota D.P.; Rosenberg E.S.; Sullivan P.S.; Thorne A.L.; Rolle C.-P.M.; Del Rio C.; Cutro S.; Luisi N.; Siegler A.J.; Sanchez T.H.; Kelley C.F.	Pre-exposure prophylaxis uptake and discontinuation among young black men who have sex with men in atlanta, Georgia: A prospective cohort study	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciz894	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074561016&doi=10.1093%2fcid%2fciz894&partnerID=40&md5=88c5e5ca625e57a892bcef9110f79fd2	Background. Human immunodeficiency virus (HIV) preexposure prophylaxis (PrEP) has great potential to reduce HIV incidence among young black men who have sex with men (YBMSM); however, initiation and persistence for this group remain low. We sought to understand the patterns and predictors of PrEP uptake and discontinuation among YBMSM in Atlanta, Georgia. Methods. PrEP was offered to all participants in a prospective cohort of YBMSM aged 18-29 years not living with HIV. Time to PrEP uptake, first discontinuation, and final discontinuation were assessed using the Kaplan-Meier method. Cox proportional hazard models were used to identify predictors of uptake and discontinuation. Results. After 440 person-years of follow-up, 44% of YBMSM initiated PrEP through the study after a median of 122 days. Of PrEP initiators, 69% had a first discontinuation and 40% had a final discontinuation during the study period. The median time to first PrEP discontinuation was 159 days. Factors associated with PrEP uptake included higher self-efficacy, sexually transmitted infection (STI), and condomless anal intercourse. Factors associated with discontinuation included younger age, cannabis use, STI, and fewer sex partners. HIV incidence was 5.23/100 person-years (95% confidence interval CI, 3.40-7.23), with a lower rate among those who started PrEP (incidence rate ratio, 0.39; 95% CI, .16-.92). Conclusions. Persistent PrEP coverage in this cohort of YBMSM was suboptimal, and discontinuations were common despite additional support services available through the study. Interventions to support PrEP uptake and persistence, especially for younger and substance-using YBMSM, are necessary to achieve full PrEP effectiveness. © The Author(s) 2019. Article	2020	Serpa J.A.; Huynh G.N.; Nickell J.B.; Miao H.	Human Immunodeficiency Virus Pre-exposure Prophylaxis and Increased Incidence of Sexually Transmitted Infections in the United States	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciz552	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077005020&doi=10.1093%2fcid%2fciz552&partnerID=40&md5=ed216e6c103c22723ab8510548295ac5	Background. Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) decreases HIV transmission. Some studies have raised concerns about a potential association between the implementation of HIV PrEP and the growing incidence rates of sexually transmitted infections (STIs) in the United States. Methods. We conducted a quasi-experimental (interrupted time series) analysis of STI (syphilis, gonorrhea, and chlamydia) rates before (2000-2012) and after (2013-2017) the implementation of HIV PrEP. We also performed correlations between HIV PrEP utilization and STI cases at the national (2012-2017) and state (2017) levels. We defined HIV PrEP utilization as the number of people taking tenofovir disoproxil fumarate/emtricitabine for HIV prevention. Results. HIV PrEP implementation was associated with 25% (relative risk RR 1.254, 95% confidence interval CI 1.245-1.263; P < .001) and 26% (RR 1.260, 95% CI 1.257-1.264; P < .001) increases in syphilis and gonorrhea rates, respectively, and a 12% reduction in chlamydia rates (RR: 0.884, 95% CI 0.883-0.885; P < .001). HIV PrEP utilization was correlated with the numbers of syphilis, gonorrhea, and chlamydia cases (spearman coefficients 1.00, 0.94, and 0.94, respectively; P < .001, P < .01, and P < .01, respectively). At the state level, HIV PrEP was also correlated with the number of cases of syphilis, gonorrhea, and chlamydia (spearman coefficients 0.85, 0.81, and 0.85, respectively; Ps < .001 for all correlations). Conclusions. The implementation and utilization of HIV PrEP in the United States were associated with increased rates of STIs. Further studies to confirm these associations and to elucidate potential causes are needed. © The Author(s) 2019. Article	2020	Sevelius J.M.; Poteat T.; Luhur W.E.; Reisner S.L.; Meyer I.H.	HIV Testing and PrEP Use in a National Probability Sample of Sexually Active Transgender People in the United States	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002403	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088609959&doi=10.1097%2fQAI.0000000000002403&partnerID=40&md5=72624afe04f2c97831d1be52565020f9	Background:HIV testing and pre-exposure prophylaxis (PrEP) are effective HIV prevention strategies often underused by transgender people.Methods:Recruitment occurred in 2 phases to identify transgender respondents in a probability sample of adults in the United States. Transgender respondents completed a self-administered paper or web-based survey designed to assess transgender population health. Sexually active respondents (HIV-negative and had sex in the 5 years previously, N = 190) and a subsample of those at risk for sexual HIV acquisition (sex with cisgender men or transgender women, n = 120) were included in analyses.Results:Of the full sample of sexually active respondents, those who were transfeminine were less likely to be familiar with PrEP; most (72%) reported favorable attitudes toward PrEP. Of those at risk for HIV acquisition, 23% had never tested for HIV. Respondents of color were more likely than white respondents to meet Centers for Disease Control and Prevention recommendations for HIV testing. Respondents who met Centers for Disease Control and Prevention recommendations for HIV testing were more likely to report looking online for lesbian, gay, bisexual, and transgender or transgender-specific health information. Few respondents reported currently taking PrEP (3%); those who reported higher levels of nonaffirmation of their gender identity were less likely to currently use PrEP.Discussion:These findings may indicate some success of HIV testing outreach programs that prioritize people at higher risk for acquiring HIV, focusing on those who are vulnerable to structural marginalization. Ongoing public health efforts are needed to increase HIV testing and PrEP awareness among transgender adults, who are disproportionately impacted by HIV. © 2020 Wolters Kluwer Health, Inc. Article	2020	Sewell W.C.; Patel R.R.; Blankenship S.; Marcus J.L.; Krakower D.S.; Chan P.A.; Parker K.	Associations among hiv risk perception, sexual health efficacy, and intent to use prep among women: An application of the risk perception attitude framework	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2020.32.5.392	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094627134&doi=10.1521%2faeap.2020.32.5.392&partnerID=40&md5=f023410079a9ed6ce44097a369715d49	HIV risk perception is a known determinant of HIV prevention behaviors among vulnerable populations. Lesser known is the combined influence of risk perception and efficacy beliefs on PrEP use. We examined the associations between levels of risk perception and strength of efficacy beliefs on intent to use PrEP in a sample of adult Black and Latina women. Guided by the risk perception attitudes (RPA) framework, we used cluster analysis to identify four interpretable groups. We ran analysis of covariance models to determine the relationship between membership in the RPA frameworks groups and intention to use PrEP. Among the 908 women, the mean age was 29.9 years and participants were Latina (69.4%) and Black (25.6%). Results of the analysis show that women with low perception of HIV risk and strong efficacy beliefs had significantly less intent to use PrEP than women with high risk perception and weak efficacy beliefs. © 2020 The Guilford Press. Article	2020	Sewell W.C.; Powell V.E.; Mayer K.H.; Ochoa A.; Krakower D.S.; Marcus J.L.	Nondaily Use of HIV Preexposure Prophylaxis in a Large Online Survey of Primarily Men Who Have Sex With Men in the United States	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002332	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084694380&doi=10.1097%2fQAI.0000000000002332&partnerID=40&md5=b989b84a2b7f684541cb7aea72125194	Background:Event-driven dosing of HIV preexposure prophylaxis (PrEP) using a 2-1-1 regimen is efficacious for men who have sex with men (MSM). However, data are limited on the prevalence, correlates, and patterns of nondaily PrEP use in the United States.Setting:Nationwide online survey.Methods:We distributed a survey to assess experiences with PrEP, including nondaily use, in May 2019 on geosocial networking sites commonly used by MSM.Results:Among 9697 respondents, the mean age was 43 years, 67% were non-Hispanic white, and 90% were MSM. Nearly all (91.0%) had heard of PrEP, 40.1% ever used PrEP, and 33.3% used PrEP in the past 6 months. Most (60.6%) were interested in nondaily PrEP. Those without health insurance and those with higher incomes were more likely to be interested in nondaily PrEP. Of the 3232 who used PrEP in the past 6 months, 176 (5.4%) reported nondaily use. Fewer sexual partners, frequent sex planning, and substance use were associated with nondaily use. Common reasons for nondaily use were inconsistent sexual activity (59%) and cost (49%). The most prevalent regimen was event driven (48.3%); of those, 64.7% used 2-1-1. Of nondaily users, 24.0% used PrEP on a regular schedule but not every day, including only on weekends or days starting with T or S.Conclusions:Given substantial interest in nondaily PrEP, and use of nondaily strategies that have not been evaluated in clinical studies, there is a need for US public health authorities to provide guidance on safe and effective nondaily dosing for MSM. © 2020 Lippincott Williams and Wilkins. Article	2020	Shah, Seema K; Essack, Zaynab; Byron, Katherine; Slack, Catherine; Reirden, Daniel; van Rooyen, Heidi; Jones, Nathan R; Wendler, David S	Adolescent Barriers to HIV Prevention Research: Are Parental Consent Requirements the Biggest Obstacle?	Journal of Adolescent Health	-	-	-	1879-1972	10.1016/j.jadohealth.2020.05.011	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7508889	PURPOSE: One third of people newly living with HIV/AIDS are adolescents. Research on adolescent HIV prevention is critical owing to differences between adolescents and adults. Parental permission requirements are often considered a barrier to adolescent enrollment in research, but whether adolescents view this barrier as the most important one is unclear. METHODS: Adolescents were approached in schools in KwaZulu-Natal, South Africa, and at a sexually transmitted infection clinic at the Children's Hospital of Aurora, Colorado. Surveys with a hypothetical vignette about participation in a pre-exposure prophylaxis trial were conducted on smartphones or tablets with 75 adolescents at each site. We calculated descriptive statistics for all variables, using 2-sample tests for equality of proportions with continuity correction. Statistical significance was calculated at p < 0.05. Multivariate analyses were also conducted. RESULTS: Most adolescents thought side effects (77%) and parental consent requirements (69%) were very important barriers to research participation. When asked to rank barriers, adolescents did not agree on a single barrier as most important, but the largest group of adolescents ranked parental consent requirements as most important (29.5%). Parental consent was seen as more of a barrier for adolescents in South Africa than in the United States. Concerns about being experimented on or researchers' mandatory reporting to authorities were ranked much lower. Finally, most (71%, n = 106) adolescents said they would want to extra support from another adult if parental permission was not required. CONCLUSION: Adolescents consider both parental permission requirements and side effects important barriers to their enrollment in HIV prevention research. Legal reform and better communication strategies may help address these barriers. Article	2020	Shende T.C.; Fisher J.M.; Perez-Velez C.M.; Guido A.A.; Sprowl K.M.; Drake T.M.; Adelus M.L.; Bedrick E.J.; Fantry L.E.	PrEP Knowledge and Attitudes Among Adults Attending Public Health Clinics in Southern Arizona	Journal of Community Health	-	-	-	945145	10.1007/s10900-019-00758-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074538525&doi=10.1007%2fs10900-019-00758-y&partnerID=40&md5=1370652942564d2994e79391898d9696	HIV pre-exposure prophylaxis (PrEP) is underutilized among Hispanics, women, and low-income individuals. To better understand PrEP barriers in this population, questionnaires were administered to 500 patients attending public health clinics in southern Arizona which provide family planning and sexually transmitted infections care. Sixty-three percent believed that they had no risk of HIV infection. When asked "Before today, did you know that there was a pill that can prevent HIV infection?" 80% of persons answered no. Among women, 88% answered no to this question. As expected, individuals with a higher perceived HIV risk (OR 1.76) or one HIV risk factor (OR 5.85) had a higher probability of knowledge. Among survey participants 87% would take a daily pill, 91% would visit a health-care provider every 3 months, and 92% would have laboratory testing every 3 months. Fifty-four percent would not be afraid or embarrassed if friends or family knew they were taking PrEP. Seventy-two percent would take PrEP despite temporary nausea. Sixty-two percent would pay ≥ $40 every 3 months for PrEP. Lack of knowledge, rather than patient attitudes, is the more important barrier to wider utilization of PrEP among individuals, especially women, attending public health clinics in Southern Arizona. Future efforts need to focus on education and access to PrEP in underserved populations including women and Hispanics. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Sheth A.N.; Hussain S.A.; Escoffery C.; Haddad L.B.; Powell L.; Brown N.; Filipowicz T.R.; McCumber M.; Sanchez M.; Renshaw L.; Poteda M.A.; Sales J.M.	Pre-exposure prophylaxis integration into family planning services at title x clinics in the southeastern united states: Protocol for a mixed methods hybrid type i effectiveness implementation study (phase 2 aim 155)	JMIR Research Protocols	-	-	-	19298748	10.2196/18784	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092298342&doi=10.2196%2f18784&partnerID=40&md5=2c7713f079bdcd9aa0dd3c08ec1a6762	Background: Adolescent and young adult women (AYAW), particularly racial and ethnic minorities, in the Southern United States are disproportionately affected by HIV. Pre-exposure prophylaxis (PrEP) is an effective, scalable, individual-controlled HIV prevention strategy that is grossly underutilized among women of all ages and requires innovative delivery approaches to optimize its benefit. Anchoring PrEP delivery to family planning (FP) services that AYAW already trust, access routinely, and deem useful for their sexual health may offer an ideal opportunity to reach women at risk for HIV and to enhance their PrEP uptake and adherence. However, PrEP has not been widely integrated into FP services, including Title X-funded FP clinics that provide safety net sources of care for AYAW. To overcome potential implementation challenges for AYAW, Title X clinics in the Southern United States are uniquely positioned to be focal sites for conceptually informed and thoroughly evaluated PrEP implementation science studies. Objective: The objective of this study is two-fold: To evaluate multilevel factors associated with the level of PrEP adoption and implementation (eg, PrEP screening, counseling, and prescription) within and across 3 FP clinics and to evaluate PrEP uptake, persistence, and adherence among female patients in those clinics over a 6-month follow-up period. Methods: Phase 2 of PlanningToPrEP (Adolescent Medicine Trials Network for HIV/AIDS Interventions 155) is a mixed methods hybrid type 1 effectiveness implementation study to be conducted in three clinics in Metro Atlanta, Georgia, United States. Guided by the Exploration, Preparation, Implementation, and Sustainment framework, this study will prepare clinics for PrEP integration via clinic-wide trainings and technical assistance and will develop clinic-level PrEP implementation strategies. Clinic-level factors will be assessed via the Implementation Determinant Assessment and Planning Tool, and PrEP adoption will be assessed via the PlanningToPrEP research activities begun in February 2018 and are ongoing. Qualitative data analysis is scheduled to begin in Fall 2020. Conclusions: This study seeks to evaluate factors associated with the level of PrEP adoption and implementation (eg, PrEP screening, counseling, and prescription) within and across 3 FP clinics following training and implementation planning and to evaluate PrEP uptake, persistence, and adherence among female patients over a 6-month follow-up period. This will guide future strategies to support PrEP integration in Title X–funded clinics across the Southern United States. © 2020 Scientific Journal Publishers Limited. All Rights Reserved. Article	2020	Shi A.; Dou O.; Zhang Z.; Zhao Y.; Zhe X.; Yang C.; Nicholas Z.; Gao P.; Wang J.; Sun Y.; Zhang H.	Needs of pre-exposure prophylaxis for HIV infection and related barriers among men who have sex with men 男男性行为人群HIV暴露前预防需求与现实障碍研究	Chinese Journal of Endemiology	-	-	-	25464450	10.3760/cma.j.issn.0254-6450.2020.03.012	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083477763&doi=10.3760%2fcma.j.issn.0254-6450.2020.03.012&partnerID=40&md5=d0036046240ea9511f6c9bce152b4858	Objective To understand the actual needs for the pre-exposure prophylaxis (PrEP) for HIV infection and the factors hindering PrEP utilization in men who have sex with men (MSM). Methods Participants were recruited by using MSM-social application software Blued 8.5.0 and through MSM peer referral, sample size was 600. An electronic questionnaire survey was conducted anonymously with guidance of investigators via "Questionnaire Star" platform. The contents of the survey included demographic characteristics of the participants, the awareness of PrEP related knowledge, willingness and concerns about using PrEP, related needs for PrEP and self-efficacy of using PrEP. Results A total of 622 MSM completed the survey, of whom 56.4% (351/622) and 4.7% (27/622) ever heard of and received PrEP, respectively. The need assessment of PrEP showed that 67.2% (418/622) of the participants had actual needs for PrEP and 21.2% (132/622) rated PrEP with good self-efficacy. Structural equation modeling showed that the awareness of PrEP related knowledge and concern about using PrEP had direct positive effects on the need for PrEP (both P<0.05), with the standardized coefficients of 0.09 and 0.11, respectively. Moreover, the information indirectly affected the need for PrEP through concern about PrEP (P<0.05). Self-efficacy had direct positive effect on the need for PrEP with an 0.31 intercept. Moreover, the information indirectly affected the self-efficacy of using PrEP through concern about PrEP (P<0.05), with the effect value of 0.03. The result of generalized linear mixed model analysis demonstrated that the utilization of PrEP can improve the self-efficacy of using PrEP (OR=5.53), which increased by 0.14 times and 0.07 times with the increase of 1 score of the awareness of PrEP related knowledge and concern about using PrEP respectively. In addition, this survey found that in the participants, the main concerns about using PrEP were side effects, HIV-resistance, PrEP intervention effect and its expense, accounting for 61.1% (380/622), 60.3% (374/622) and 53.2% (331/622), respectively. Most participants hoped to obtain PrEP services from CDC, MSM social organization and internet, accounting for 75.6% (470/622), 45.4% (487/622), and 63.8% (397/622), respectively. Conclusions MSM showed difference of high need but low utilization of PrEP services. Low awareness of PrEP related knowledge, concerns about the prevention effect, side effects and expense of PrEP as well as self-discrimination were the factors hindering the use of PrEP at MSM. It is necessary to establish a suitable PrEP service model to meet the needs for PrEP in MSM. © 2020 Chinese Medical Association. All Rights Reserved. Article	2020	Shover C.L.; Devost M.A.; Cunningham N.J.; Beymer M.R.; Flores D.; Flynn R.; Gorbach P.M.; Lyman P.; Rivet Amico K.; Bolan R.K.	Structural, dosing, and risk change factors affecting discontinuation of pre-exposure prophylaxis (Prep) in a large urban clinic	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2020.32.4.271	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090628507&doi=10.1521%2faeap.2020.32.4.271&partnerID=40&md5=57e3a6c30a0f7b07e3a30bcfb81ffbd	Understanding why clients stop taking pre-exposure prophylaxis (PrEP) is critical to improve PrEP delivery and ultimately reduce HIV incidence. We analyzed data from a programmatic evaluation conducted in the Los Angeles LGBT Center from February to May 2018. Of 180 respondents to the enrolled survey, 91 had stopped taking PrEP and 111 never started. Among PrEP users, multivariate models found reasons for stopping were enter-ing a monogamous relationship (43%) and side effects (40%). Two of 11 who never started PrEP reported access barriers (e.g., cost, insurance prob-lems). A quarter of inactive clients re-engaged with PrEP services following the survey and 35% restarted PrEP by October 2018. Improving PrEP retention may require multifaceted interventions—e.g., tailored discussions about stopping and restarting PrEP safely as HIV risk changes, ensuring consistent access to affordable PrEP, and alternative dosing strategies. An emailed survey may be a simple, effective strategy to reengage some PrEP clients. © 2020 The Guilford Press. Article	2020	Shrestha R.; Altice F.L.; Dahmoune E.; Sibilio B.; Ranjit Y.S.; Copenhaver M.M.	Feasibility and acceptability of an mhealth-based approach as an hiv prevention strategy among people who use drugs on pre-exposure prophylaxis	Patient Preference and Adherence	-	-	-	11778898	10.2147/PPA.S236794	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076486903&doi=10.2147%2fPPA.S236794&partnerID=40&md5=1919426d5d9d2727e0a6e1dcc6eb64f	Introduction: There has been increasing interest in the use of mHealth technology in health care. To our knowledge, however, there is a lack of empirical evidence on the utilization of text messaging services (short message service; SMS) for HIV prevention among opioid-dependent people who use drugs (PWUD). As part of our formative work, we conducted an in-depth feasibility and acceptability study on the use of SMS reminders for HIV prevention in this risk group. Methods: Forty HIV-negative, opioid-dependent PWUD who are currently taking preexposure prophylaxis (PrEP) were enrolled in the study. Participants received daily PrEP text reminders and weekly HIV risk reduction-related messages, which were developed using a user-centered approach. Participants were assessed at baseline and immediately post-intervention. Following the post-intervention assessment, participants completed an in-depth qualitative interview. Results: Feasibility of text messaging service was high, as assessed by participants' adherence to daily PrEP reminders (97.5%) and weekly HIV risk reduction messages (92.5%). Participants reported that they liked receiving the text messages (mean rating =4.8 out of 5). The reminder text messages as valuable and acceptable (mean: 75.0 (range 0–100). Whereas, acceptability for the weekly text messages on HIV risk reduction was 60.3 (±15.6), with 58.3% recommending them for future use. Thematic data exploration revealed important information for understanding and refining SMS content as well as logistical preferences. Conclusion: Our findings provide preliminary evidence of the feasibility and acceptability of a text-messaging based-approach as a potential tool for primary HIV prevention to improve PrEP adherence and HIV risk reduction among this risk-informed population. HIV risk reduction text messages need further modifications to become more appealing, with participant feedback taken into consideration. © 2020 Shrestha et al. Article	2020	Shrestha R.; DiDonnario E.E.; Kim R.S.; Altice F.L.; Wickersham J.A.; Copenhaver M.M.	Awareness about and willingness to use long-acting injectable pre-exposure prophylaxis (LAI-PrEP) among people who use drugs	Journal of Substance Abuse Treatment	-	-	-	7405472	10.1016/j.jsat.2020.108058	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087612817&doi=10.1016%2fj.jsat.2020.108058&partnerID=40&md5=d77bd3c5ca8ba1014d4d2b5f5c4b67fe	In the Bangkok Tenofovir Study of oral pre-exposure prophylaxis (PrEP; TDF/FTC), adherence was poor. Long-acting injectable pre-exposure prophylaxis (LAI-PrEP) for HIV prevention may help overcome adherence challenges and is currently being tested in clinical trials, but not in people who use drugs (PWUD), an important key population that remains highly vulnerable to HIV. Since PWUD are not currently included in trials of LAI-PrEP, we sought to examine awareness about LAI-PrEP and factors associated with willingness to use LAI-PrEP in this understudied population. Methods: We enrolled 224 HIV-negative people with opioid use disorder and self-reported HIV risk behaviors recruited from Connecticut's largest addiction treatment program. We analyzed data from a standardized assessment using multivariable logistic regression. Results: Most participants were male (n = 151, 67.4%), white (n = 189, 84.4%), and had a mean age of 40.1 (±11.6) years. Awareness about LAI-PrEP was low (n = 45, 20.1%). After being given a description of it, 73.7% were willing to use it, if it were available. Participants were most commonly concerned about long-term side effects (76.9%) of LAI-PrEP. Independent correlates of willingness to use LAI-PrEP were female sex (aOR = 2.181, p = 0.018), recent risk to healthcare provider (aOR = 2.9, p = 0.022), high perceived risk of acquiring HIV (aOR = 3.3, p = 0.007), and having previously taken oral PrEP (aOR = 5.284, p = 0.017). Findings suggest that PWUD are highly interested in PrEP, especially as LAI-PrEP formulations. Our results indicate the potential for LAI-PrEP, as an alternative to oral daily PrEP, to be implemented into existing evidence-based HIV-based HIV prevention efforts that target high-risk PWUD. © 2020 Elsevier Inc. HIV pre-exposure prophylaxis for people who inject drugs	-	The Opioid Epidemic and Infectious Diseases	-	978-0323688328-9; 978-0323688298-6	-	10.1016/B978-0-323-68328-9.00011-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100159988&doi=10.1016%2fB978-0-323-68328-9.00011-4&partnerID=40&md5=0970f05d3d1b6d9dc799e8e6479965cd	People who inject drugs (PWID) are a key target population for HIV prevention because they experience HIV risk related to their substance use, injecting behaviors (including sharing injecting equipment), and high-risk sexual networks. Limited clinical trial data and similar demonstration projects support the feasibility, safety, acceptability, and efficacy of providing PWID pre-exposure prophylaxis (PrEP) for HIV prevention. PrEP outcomes are improved when medication adherence is supported and when PrEP is integrated with other harm reduction programs and treatment for substance use disorders. PrEP scale-up among PWID has been limited by multilevel barriers, including stigma, misconceptions about PrEP, and structural barriers to accessing PrEP. Innovative strategies to overcome these barriers are urgently needed to achieve the potential of PrEP to improve HIV prevention outcomes among PWID. © 2021 Elsevier Inc. All rights reserved. Article	2020	Smith D.K.; Rawlings M.K.	PrEP and the Black Community	-	HIV in US Communities of Color, Second Edition	-	NA	-	10.1007/978-3-030-48744-7_3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114898227&doi=10.1007%2f978-3-030-48744-7_3&partnerID=40&md5=2d50b1f6b4d5e3de6f7aa6c99ea0f34e	New HIV infections are disproportionately concentrated among black Americans. Yet the most powerful new tool to reduce HIV acquisition, daily oral antiretroviral preexposure prophylaxis (PrEP), is inequitably accessed. While black men and women comprised 43% of new diagnoses in 2017, and 44% of persons estimated to have risk behaviors that indicate a need for PrEP, only 14.9% of PrEP prescriptions in 2017 were to black persons. To address this serious inequity, higher levels of knowledge of HIV status, awareness and knowledge of PrEP, access to clinicians willing and trained to provide it, and support for adherence and persistence use will be required in the black community. This is an urgent priority as the nation moves forward with the "Ending the HIV Epidemic: A Plan for America" initiative that has a goal of reducing new HIV infections by 75% in the next 5 years and at least 90% by 2030 (Fauci et al. JAMA 321(9):844–845, 2019). © Springer Nature Switzerland AG 2021. Article	2020	Smith D.K.; Sullivan P.S.; Cadwell B.; Walker L.A.; Siddiqi A.; Mera-Giler R.; Hu X.; Hoover K.W.; Harris N.S.; McCallister S.	Evidence of an Association of Increases in Pre-exposure Prophylaxis Coverage with Decreases in Human Immunodeficiency Virus Diagnosis Rates in the United States, 2012-2018	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciz1229	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085702016&doi=10.1093%2fcid%2fciz1229&partnerID=40&md5=868f0f8e7018cb2f27927378f3fa8e	Background: Annual human immunodeficiency virus (HIV) diagnoses in the United States (US) have decreased since 2013. We assessed whether there is an association between uptake of pre-exposure prophylaxis (PrEP) and decreases in HIV diagnoses. Methods We used 2012-2016 data from the US National HIV Surveillance System to estimate viral suppression (VS) and annual percentage change in diagnosis rates (APCs) among persons with HIV (PWH) and diagnosed PrEP coverage among persons at risk for HIV. We used joinpoint regression to identify changes in the association between PrEP coverage and APC within jurisdictional quintiles grouped by changes in PrEP coverage, regressing APC on time, and among all jurisdictions, regressing APC on both time and jurisdictional changes in PrEP coverage with and without accounting for changes in VS. Results: From 2012 to 2016, across the 10 states with the greatest increases in PrEP coverage, the EAPC decreased 6.0% (95% confidence interval [CI], 2.2% to 2.9%). On average, across the states and District of Columbia, EAPC for a given year decreased by 1.1% (95% CI, 1.77% to -.49%) for an increase in PrEP coverage of 1 per 100 persons with indications. When controlling for VS, the state-specific EAPC for a given year decreased by 1.3% (95% CI,-2.12% to -.57%) for an increase in PrEP coverage of 1 per 100 persons with indications. Conclusions: We found statistically significant associations between jurisdictional increases in PrEP coverage and decreases in EAPC independent of changes in VS, which supports keeping PrEP use to scale in the US to accelerate reductions in HIV infections. © 2020 Published by Oxford University Press for the Infectious Diseases Society of America 2020. Article	2020	Smith, Anthony K. J; Holt, Martin; Hughes, Shona D; Truong, Hong-Ha M; Newman, Christy E	Troubling the non-specialist prescription of HIV pre-exposure prophylaxis (PrEP): the views of Australian HIV experts	Health Sociology Review	-	-	-	1446-1242	10.1080/14461242.2019.1703781	https://dx.doi.org/10.1080/14461242.2019.1703781	The broadening of access to HIV pre-exposure prophylaxis (PrEP) in Australia has rekindled debates about which types of clinicians are best suited to deliver HIV prevention innovations: specialist HIV services or primary care physicians and general practitioners (GPs). We conducted 21 semi-structured qualitative interviews in 2017 with Australian HIV sector experts working across policy, advocacy, clinical service provision, research, and health promotion. Those interviews took place before a national policy commitment to subsidising access to PrEP was achieved. We explored how participants conceptualised the appropriate 'home' for PrEP delivery. Participants were supportive of greater patient access to PrEP, they expressed concerns about non-specialist GPs' cultural competence and expertise regarding sexuality and clinical practice, and the potential for patients to experience discrimination and homophobia from non-expert GPs. This study has broad implications for thinking about experts and expertise, the implementation of previously specialised medicine into mainstream settings, and the anticipated challenges of LGBTQ+ inclusive healthcare. Article	2020	Smith, Justin D; Li, Dennis H; Hirschhorn, Lisa R; Gallo, Carlos; McNulty, Moira; Phillips, Gregory; Birkett, Michelle; Rafferty, Miriam; Rao, Amrita; Villarose, Juan A; Bazil, Stefan; Mustanski, Brian; Brown, C Hendricks; Brehove, Nanette D	Landscape of HIV Implementation Research Funded by the National Institutes of Health: A Mapping Review of Project Abstracts.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-02926-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7262866/	In 2019, the requisite biomedical and behavioral interventions to eliminate new HIV infections exist. "Ending the HIV Epidemic" now becomes primarily a challenge of will and implementation. This review maps the extent to which implementation research (IR) has been integrated into HIV research by reviewing the recent funding portfolio of the NIH. We searched NIH RePORTER for HIV and IR-related research projects funded from January 2013 to March 2018. We also searched PubMed for recent publications and reviews using standard terms and methods. 230 abstracts met the criteria of HIV and IR. Key study characteristics were then abstracted. NIH currently funds HIV studies that are either formally IR ($ > 109) or preparatory for IR ($ < 107). Five (13%) projects mentioned a guiding implementation framework. Most (n = 24, 63%) were conducted in the USA, and 16 (42%) addressed populations experiencing health disparities. Twenty-three (61%) studies examined treatment and 7 (18%) examined prevention strategies. 43 (23%) piloted strategies, 73 (34%) tested a single strategy, and 37 (16%) compared strategies. A higher proportion of formal IR projects involved established interventions (e.g., integrated services) compared to newer interventions (e.g., pre-exposure prophylaxis). Prioritizing HIV-related IR in NIH and other federal funding opportunity announcements and expanded training in implementation science could have a substantial impact on ending the HIV pandemic. This review serves as a baseline by which to compare funding patterns and the sophistication of IR in HIV research over time. Youth-friendly services and a mobile phone application to promote adherence to pre-exposure prophylaxis among adolescent men who have sex with men and transgender women at-risk for HIV in Thailand: a randomized control trial	Journal of the International AIDS Society	-	-	-	17562652	10.1002/jia2.25566	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085167552&doi=10.1002%2fjia2.25566&partnerID=40&md5=1b75727bb316c230e4d0bfecc33741d	Introduction: Strategies are needed to curb the increasing HIV incidence in young men who have sex with men (YMSM) and transgender women (YTGW) worldwide. We assessed the impact of youth-friendly services (YFS) and a mobile phone application (app) on adherence to pre-exposure prophylaxis (PrEP) in YMSM and YTGW in Thailand. Methods: A randomized control trial was conducted in YMSM and YTGW aged 15 to 19 years. Participants were provided daily oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC), condoms and randomized to receive either YFS or YFS plus a PrEP app (YFS + APP). Where feasible, participants chose self-assessment of HIV acquisition risk, point rewards and reminders for PrEP and clinic appointments. At 24 weeks, HIV tests occurred at entry, one, three, six months and telephone contact at two, four and five months. HIV testing was performed at every clinic visit. PrEP adherence was evaluated with intracellular tenofovir diphosphate (TFV-DP) concentrations in dried blood spots (DBS) collected at weeks 4, 12 and 24. Results: Between December 2016 and March 2018, 148 participants were enrolled in Bangkok, Thailand and randomized to YFS (n = 74) or YFS + APP (n = 74). The median age was 18 years; 95% adolescents were trained peers in the study. Of these, 147 were YMSM (n = 147) and 53 YTGW (26%). At baseline, median age was 18 years (IQR 17 to 19); 66% reported inconsistent condom use in the past month. Sexually transmitted infection prevalence was 22%. Retention at 24 weeks was 77%. As HIV + APP arm, median app use duration was three months (IQR 1 to 5). PrEP adherence at month 3 was 51% in YFS and 53% in YFS + APP (p-value 0.64) and at month 6 was 44% in YFS and 49% in YFS + APP (p-value 0.54). No HIV seroconversions occurred during 75 person years of follow-up. Conclusions: Youth-friendly PrEP services enabled good adherence among half of adolescent PrEP users. However, the mobile phone application tested did not provide additional PrEP adherence benefit in this randomized trial. Additional strategies to enhance behaviours are dynamic and require adaptive programmes that focus on "prevention-effective adherence." © 2020 The Authors. Article	2020	Spinelli M.A.; Lahoud N.; Kuhn P.; Whitacre R.; Scott H.M.; Walker N.; Lin A.Y.; Gandhi M.; Buchbinder S.P.	Missed opportunities to prevent HIV infections among pre-exposure prophylaxis users: a population-based mixed methods study, San Francisco, United States	Journal of the International AIDS Society	-	-	-	17562652	10.1002/jia2.25472	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083675281&doi=10.1002%2fjia2.25472&partnerID=40&md5=e627982f2846c03f1f2c2e0149ba475c	Introduction: Pre-exposure prophylaxis (PrEP) is highly effective, although PrEP adherence and persistence have been variable during real-world implementation. Little is known about missed opportunities to enhance PrEP adherence among individuals who later HIV seroconverted after using PrEP. The goal of this analysis was to identify all HIV infections among individuals who had accessed PrEP in an integrated health system in San Francisco, and to identify potentially interventable factors that could have prevented HIV infection through in-depth interviews with people who HIV seroconverted after using PrEP. Methods: We identified individuals who initiated PrEP in an integrated safety-net public health system and performed in-depth chart review to determine person-time on and after stopping PrEP over six years. We identified all PrEP seroconversions using the Centers for Disease Control and Prevention's Enhanced HIV/AIDS Reporting System and then calculated HIV incidence while using PrEP and during gaps in use. We then performed in-depth interviews with those who seroconverted. Results: Overall, 986 initiated PrEP across the San Francisco Department of Public Health from July 2012 to November 2018. Data were gathered from 895 person-years on PrEP and 953 after stopping PrEP. The HIV incidence was 7.5 did/higher after stopping PrEP compared to while on PrEP (95% CI 3 to 336). Of the eight individuals who HIV seroconverted, only one was taking PrEP at the time of seroconversion but was using on-demand PrEP inconsistently. All eight agreed to qualitative interviews. Major barriers to PrEP persistence included substance use, mental health and housing loss; difficulty accessing PrEP due to cost, insurance, and the cost and time of medical visits; difficulty weighing PrEP's benefit versus self-perceived HIV risk; and challenges navigating PrEP's complex dosing schedule. Participants described how they had underestimated their HIV risk and overestimated the ease of accessing and accompanying PrEP during. Conclusions: HIV incidence during gaps in PrEP use was nearly eight-fold higher than while on PrEP in this large cohort in San Francisco. Many individuals who stop PrEP remain at risk of HIV, and participants reported that proactive outreach could potentially have prevented HIV infections. Individuals using non-daily PrEP may require additional education and support to the United States. © 2020 The Authors. Willingness to Use Pre-exposure Prophylaxis Among Adolescent Girls and Young Women Within Family Planning Clinics in Kenya	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2020.0037	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85089150728&doi=10.1089%2fapc.2020.0037&partnerID=40&md5=6e67e0552ab6b5e8217802ba12496c4c	Adolescent girls and young women (AGYW) are a priority population for HIV prevention in high-burden settings. We evaluated psychosocial characteristics, behavioral risk factors for HIV, and pre-exposure prophylaxis (PrEP) awareness and uptake among AGYW seeking contraceptive services at four public sector family planning (FP) clinics offering integrated PrEP delivery in Kisumu, Kenya. From October 2018 to June 2019, we approached all AGYW (aged 15–24 years) seeking contraceptives to participate in a survey following receipt of FP services and PrEP screening. Overall, 476 AGYW were screened for PrEP at their FP visit by facility staff and subsequently enrolled in the survey. Median age was 22 years (interquartile range: 20–23); 22% of AGYW were in school, and 55% were married. The most frequent forms of contraception were implants and injectables (41% each). Over a third of AGYW (38%) reported low social support. 13% had symptoms of moderate to severe depression, and 3% reported intimate partner violence. Three-quarters (75%) of AGYW reported recent condomless sex and 42% suspected that their primary partner had other sexual partners. Most AGYW (89%) had previously heard of PrEP, but only 3% had ever used it. Willingness to use PrEP was high (87%), with daily oral PrEP (66%) preferred to long-acting injectables (21%). Factors associated with willingness to use PrEP included inconsistent condom use (aOR = 2.1; 95% CI: 1.06, 4.2), transactional sex (aOR = 2.9; 95% CI: 1.06, 7.8), and intimate partner violence (aOR = 3.1; 95% CI: 1.09, 8.9). Willingness to use PrEP was high among AGYW at high risk of HIV. Integrated PrEP delivery in Kisumu, Kenya: From October 2018 to June 2019, we approached all AGYW (aged 15–24 years) seeking contraceptives to participate in a survey following receipt of FP services and PrEP screening. Overall, 476 AGYW were screened for PrEP at their FP visit by facility staff and subsequently enrolled in the survey. Median age was 22 years (interquartile range: 20–23); 22% of AGYW were in school, and 55% were married. The most frequent forms of contraception were implants and injectables (41% each). Over a third of AGYW (38%) reported low social support. 13% had symptoms of moderate to severe depression, and 3% reported intimate partner violence. Three-quarters (75%) of AGYW reported recent condomless sex and 42% suspected that their primary partner had other sexual partners. Most AGYW (89%) had previously heard of PrEP, but only 3% had ever used it. Willingness to use PrEP was high (87%), with daily oral PrEP (66%) preferred to long-acting injectables (21%). Factors associated with willingness to use PrEP included inconsistent condom use (aOR = 2.1; 95% CI: 1.06, 4.2), transactional sex (aOR = 2.9; 95% CI: 1.06, 7.8), and intimate partner violence (aOR = 3.1; 95% CI: 1.09, 8.9). Willingness to use PrEP was high among AGYW at high risk of HIV. Article	2020	Spinelli M.A.; Lahoud N.; Kuhn P.; Whitacre R.; Scott H.M.; Walker N.; Lin A.Y.; Gandhi M.; Buchbinder S.P.	Missed opportunities to prevent HIV infections among pre-exposure prophylaxis users: a population-based mixed methods study, San Francisco, United States	Journal of the International AIDS Society	-	-	-	17562652	10.1002/jia2.25472	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083675281&doi=10.1002%2fjia2.25472&partnerID=40&md5=e627982f2846c03f1f2c2e0149ba475c	Introduction: Pre-exposure prophylaxis (PrEP) is highly effective, although PrEP adherence and persistence have been variable during real-world implementation. Little is known about missed opportunities to enhance PrEP adherence among individuals who later HIV seroconverted after using PrEP. The goal of this analysis was to identify all HIV infections among individuals who had accessed PrEP in an integrated health system in San Francisco, and to identify potentially interventable factors that could have prevented HIV infection through in-depth interviews with people who HIV seroconverted after using PrEP. Methods: We identified individuals who initiated PrEP in an integrated safety-net public health system and performed in-depth chart review to determine person-time on and after stopping PrEP over six years. We identified all PrEP seroconversions using the Centers for Disease Control and Prevention's Enhanced HIV/AIDS Reporting System and then calculated HIV incidence while using PrEP and during gaps in use. We then performed in-depth interviews with those who seroconverted. Results: Overall, 986 initiated PrEP across the San Francisco Department of Public Health from July 2012 to November 2018. Data were gathered from 895 person-years on PrEP and 953 after stopping PrEP. The HIV incidence was 7.5 did/higher after stopping PrEP compared to while on PrEP (95% CI 3 to 336). Of the eight individuals who HIV seroconverted, only one was taking PrEP at the time of seroconversion but was using on-demand PrEP inconsistently. All eight agreed to qualitative interviews. Major barriers to PrEP persistence included substance use, mental health and housing loss; difficulty accessing PrEP due to cost, insurance, and the cost and time of medical visits; difficulty weighing PrEP's benefit versus self-perceived HIV risk; and challenges navigating PrEP's complex dosing schedule. Participants described how they had underestimated their HIV risk and overestimated the ease of accessing and accompanying PrEP during. Conclusions: HIV incidence during gaps in PrEP use was nearly eight-fold higher than while on PrEP in this large cohort in San Francisco. Many individuals who stop PrEP remain at risk of HIV, and participants reported that proactive outreach could potentially have prevented HIV infections. Individuals using non-daily PrEP may require additional education and support to the United States. © 2020 The Authors. Article	2020	Spinelli M.A.; Rodrigues W.C.; Wang G.; Vincent M.; Gliddon D.V.; Okochi H.; Sluhor R.; Delicheveux P.; Deutsch M.; Grant R.M.; Ngure K.; Mugo N.R.; Baeten J.M.; Gandhi M.	High Accuracy of a Real-Time Urine Antibody-Based Tenofovir Point-of-Care Test Compared With Laboratory-Based ELISA in Diverse Populations	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002322	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084037266&doi=10.1097%2FQAI.0000000000002322&partnerID=40&md5=f84ca6ff7c2700b2ca0977542ddeb0d35cc86dd	Background:Therapeutic drug monitoring measures antiretroviral adherence more accurately than self-report but has not been available at the point-of-care (POC) until now. We compare a novel POC test for urine tenofovir to laboratory-based enzyme-linked immunosorbent assay (ELISA) testing a diverse patient populations urine pre-exposure prophylaxis (PrEP)/Setting:Urine samples were analyzed using ELISA and the POC lateral flow immunoassay (LFA) test from 2 cohorts of PrEP users taking tenofovir disoproxil fumarate/emtricitabine: the Partners PrEP Study, which recruited Kenyan and Ugandan heterosexual men and women, and the IBrAATSo Study, which recruited US transgender women and men using gender-affirming hormone therapy.Methods:We calculated the sensitivity, specificity, and accuracy of the POC test compared with ELISA at a cutoff of 1500 ng/mL.ResultsOverall, 684 urine samples were tested from 324 participants in the 2 cohorts. In Partners PrEP, 454 samples from 278 participants (41% women) were tested with a median age of 33 years. In IBrAATSo, 231 samples from 46 individuals (50% transwomen) were tested with a median age of 31 years. Comparison of the LFA read out to ELISA yielded 100% sensitivity 97.3% one-sided confidence interval (CI) = 99.3%, 98.3% specificity (95% CI = 95.2% to 99.7%), and 99.6% accuracy (95% CI = 98.7% to 99.9%).Conclusion:The sensitivity, specificity, and accuracy of a novel POC test for urine tenofovir all exceeded 90% when compared with a laboratory-based ELISA method when tested in diverse patient populations. Given the LFA's high accuracy and expected low cost, this POC test is a promising tool to support antiretroviral adherence that could be widely scalable to real-world clinical settings. © 2020 Lippincott Williams and Wilkins All rights reserved.										
Article	2020	Spinelli, Matthew A; Habrest, Jessica E; Chai, Peter R; Castillo-Mancilla, Jose; Anderson, Peter L; Gandhi, Monica	Approaches to Objectively Measure Antiretroviral Medication Adherence and Drive Adherence Interventions.	Current HIV/AIDS Reports	-	-	-	1548-3576	10.1007/s11904-020-00502-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7363691/	PURPOSE OF REVIEW: Traditional methods to assess antiretroviral adherence, such as self-report, pill counts, and pharmacy refill data, may be inaccurate in determining actual pill-taking to both antiretroviral therapy (ART) or pre-exposure prophylaxis (PrEP). HIV viral loads serve as surrogates of adherence on ART, but loss of virologic control may occur well after decreases in adherence and viral loads are not relevant to PrEP. RECENT FINDINGS: Pharmacologic measures of adherence, electronic adherence monitors, and ingestible electronic pills all serve as more objective metrics of adherence, surpassing self-report in predicting virologic outcomes. Pharmacologic metrics can identify either recent adherence or cumulative adherence. Recent dosing measures include antiretroviral levels in dried blood spots, as well as emtricitabine-triphosphate in dried blood spots (DBS) for those on tenofovir-emtricitabine-based therapy. A urine tenofovir test has recently been developed into a point-of-care test for bedside adherence monitoring. Cumulative adherence metrics assess adherence over weeks to months and include measurement of tenofovir-diphosphate in peripheral blood mononuclear cells or DBS, as well as ART levels in hair. Electronic adherence monitors and ingestible electronic pills can track pill bottle openings or medication ingestion, respectively. New and objective approaches in adherence monitoring can be used to detect nonadherence prior to loss of prevention efficacy or virologic control with PrEP or ART, respectively.	NA										
Article	2020	Sperrazzi-Rageller, P.; Esser, S.	Classical sexually transmitted diseases in the anorectal region.	Der Hautarzt; Zeitschrift fur Dermatologie, Venerologie, und verwandte Gebiete	-	-	-	1432-1173 0017-8470	10.1007/s00105-020-04547-w	https://pubmed.ncbi.nlm.nih.gov/32025745/	BACKGROUND: Sexually transmitted infections (STIs) in the anorectal region are disproportionally detected in risk populations such as men who have sex with men (MSM). However, due to changes in sexual behaviour they are increasingly diagnosed in heterosexual individuals. Due to the recent implementation of oral HIV pre-exposure prophylaxis together with lack of condom use, a further rise in STIs is to be expected. OBJECTIVE: The aim of this continuing education article is to provide an overview of the most frequent STIs in the anorectal region. MATERIAL AND METHODS: Literature research. RESULTS: Clinical manifestations in the anorectal region are frequently unspecific or asymptomatic so that the diagnosis may be missed. In an endoscopic examination of the rectum, not even cancerous inflammation is of disease or malignancy. Therefore, knowledge of possible symptoms of bacterial STIs in this area is helpful for early diagnosis. Coinfections with other STIs are common and should prompt a search of other pathogens including HIV and hepatitis B/C.										
Article	2020	Kristian, Hellqvist, Cottrell, Mackenzie, Mulfaul, Kaitlyn, Prince, Heather A, Nelson, Julie A E, White, Nicole, Sykes, Craig, Dollin, Evan S, Medstrack, Ryen D, Shaboua, Nicholas J, Gonzalez, Daniel, Kashuba, Angela D M	Translational Approach to Predicting the Efficacy of Maraviroc-Based Regimens as HIV Preexposure Prophylaxis.	Antimicrobial Agents and Chemotherapy	-	-	-	1098-6596	10.1128/AAC.01729-19	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC6985735/	Maraviroc-based regimens have been explored as preexposure prophylaxis (PrEP) against human immunodeficiency virus (HIV). In this study, we utilized mucosal tissue drug exposure data, combined with target concentrations generated in vitro, in a pharmacokinetic-pharmacodynamic analysis to predict the effects of drug combinations and adherence on PrEP efficacy. Mucosal tissue concentrations of maraviroc were measured in 24 healthy women. The 90% effective concentrations (EC90) of maraviroc (alone and combined with tenofovir and emtricitabine) for preventing infection against HIV were determined in CD4+ T cells. Monte Carlo simulations were performed to identify dosing strategies to protect colorectal and female genital tract (FGT) tissues from HIV infection. Colorectal maraviroc concentrations were 1,000-fold higher than FGT concentrations. Maraviroc-containing regimens were predicted to be highly protective in colorectal tissues, with 300 mg daily affording 99% protection. However, 300 mg daily would protect the FGT in only 85% of the population. FGT protection increased to >90% when maraviroc was used in combinations with tenofovir (2 doses/week) or emtricitabine (2 doses/week). Poor adherence resulted in a drastic decrease in efficacy in the FGT but not colorectal tissue. However, greater forgiveness was seen when maraviroc was combined with tenofovir or emtricitabine, suggesting that maraviroc should not be used alone as PrEP.										
Article	2020	Stalter, Ryan; Mugwanya, Kenneth; Thomas, Kate; Donnell, Deborah; Mujugira, Andrew; Ngure, Kenneth; Celum, Connie; Kalongolela, Lisa; Baeten, Jared; Heffron, Renee	Sexual behaviors after prep discontinuation among HIV serodiscordant couples in kenya and uganda	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002434	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091126535&doi=10.1097%2FQAI.0000000000002434&partnerID=40&md5=f34fcaeeb1f1dbd9e5f1d6b5b4f45a6a&origin=inward	Background: A strategy of pre-exposure prophylaxis (PrEP) transitioning to treatment as prevention is highly efficacious and cost effective for prevention of HIV transmission within HIV-serodiscordant couples. We assessed whether couples who adopted this strategy experienced changes in sexual behaviors after ART-targeted partners discontinued PrEP and transitioned to only partner's adherence to antiretroviral therapy (ART) for prevention. Setting: Kenya and Uganda. Methods: Data are from the Partners Demonstration Project, a prospective, open-label evaluation of PrEP and ART use for HIV prevention. Analyses included 1,013 HIV-uninfected partners in serodiscordant couples, who were enrolled changes in the level (i.e., intercept) and trend over time (i.e., slope) in total and extra-marital sexual behaviors by HIV-negative partners. We conducted subgroup analyses based on HIV-negative partners' age and sex. Results: We included 567 couples where the HIV-negative partner discontinued PrEP because of their partner with HIV using ART for 56 months. HIV-negative partners were women in 52.6% of couples and had a median age of 30 years. We observed no change in the level or trend over time in total sex acts level adjusted rate ratio (aRR) = 0.95, 95% confidence interval (CI): 0.87 to 1.04; trend aRR = 1.00, 95% CI: 0.99 to 1.01 or condomless sex acts (level aRR = 0.97, 95% CI: 0.81 to 1.17; trend aRR = 1.00, 95% CI: 0.98 to 1.03) reported after PrEP discontinuation versus pre-discontinuation. No significant changes in behaviors were observed in age and sex subgroups. Conclusions: PrEP discontinuation seems to result in no significant changes in couples' sexual behaviors. These data further support a strategy of time-limited PrEP use by serodiscordant couples. © 2020 The Author(s). Article	2020	Stankevitz K.; Grant H.; Lloyd J.; Gomez G.B.; Kripke K.; Terjesen K.; Ong J.J.; Terris-Prestholt F.	Oral preexposure prophylaxis continuation, measurement and reporting	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002598	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095091614&doi=10.1097%2FQAD.0000000000002598&partnerID=40&md5=0ac34e9f45e0fe7a3de34f0fc6a2b1bc	Objective:The aim of this study was to appropriately plan for rollout and monitor impact of oral preexposure prophylaxis (PrEP). It is important to understand PrEP continuation and come to a consensus on how best to measure PrEP continuation. This study reviews data on PrEP continuation to document how it is reported, and to compare continuation over time and across populations.Design:A systematic review and meta-analysis.Methods:We searched MEDLINE, Embase and Global Health and reviewed abstracts from HIV conferences from 2017 to 2018 for information on PrEP continuation. Findings were summarized along a PrEP cascade and continuation was presented by population at months 1, 6 and 12, with random-effects meta-analysis.Results:Of 2578 articles and 596 abstracts identified, 41 studies were eligible covering 22304 individuals. Continuation data were measured and reported inconsistently. Results showed high discontinuation at month 1 and persistent discontinuation at later time points in many studies. Pooled continuation estimates were 66% at month 1 (n = 5348, 95% confidence interval (95% CI): 48–82, 43% at month 6 (n = 13629, 95% CI: 48–77) and 38% at month 12 (n = 5348, 95% CI: 29–48). Continuation was lower among adolescent girls and young women and key populations than among men who have sex with men and transgender persons.Conclusion:This review found that discontinuation at one month was high, suggesting PrEP initiations may be a poor measure of effectiveness. Continuation declined further over time in many studies, indicating existing cross-sectional indicators may not be adequate to understand PrEP use patterns. Studies do not measure continuation consistently, and consensus is needed. © 2020 Lippincott Williams and Wilkins. All rights reserved. Article	2020	Stekler, Joanne D.; Violette, Lauren R.; Clark, Hollie A.; McDougal, Sarah J.; Niemann, Lisa A.; Katz, David A.; Chavez, Pollyanna R.; Woolenweb, Laura G.; Eldridge, Steven F.; McMahon, Vanessa M.; Cornelius-Hudson, Andy; Delaney, Kevin P.	Prospective Evaluation of HIV Testing Technologies in a Clinical Setting: Protocol for Project DETECT.	JMIR Research Protocols	-	-	-	1929-0748	10.2196/16332	https://pubmed.ncbi.nlm.nih.gov/32012115/	BACKGROUND: HIV testing guidelines provided by the Centers for Disease Control and Prevention (CDC) are continually changing to reflect advancements in new testing technology. Evaluation of existing and new point-of-care (POC) HIV tests is crucial to inform testing guidelines and provide information to clinicians and other HIV test providers. Characterizing the performance of POC HIV tests using behavioral and clinical data from persons at risk for HIV infection is important for the CDC to make informed decisions about the use of these tests in clinical settings. Project DETECT is a program POC HIV tests for persons who may be recently infected with HIV. OBJECTIVE: This paper describes the protocols and procedures used to evaluate the performance of the newest POC tests and determine their sensitivity during early HIV infection. METHODS: Project DETECT is a CDC-funded study that is evaluating POC HIV test performance. Part 1 is a cross-sectional, retrospective study comparing behavioral characteristics and HIV prevalence of the overall population of the Public Health-Seattle & King County (PHSKC) Sexually Transmitted Disease (STD) Clinic to Project DETECT participants enrolled in part 2. Part 2 is a cross-sectional, prospective study evaluating POC. HIV tests in real time using unprocessed whole blood and oral fluid specimens. A POC nucleic acid test (NAT) was added to the panel of HIV tests in June 2018. Part 3 is a longitudinal, prospective study evaluating seroconversion sensitivity of POC HIV tests through serial follow-up testing. For comparison, HIV-1 RNA and HIV-1/HIV-2 antigen/antibody tests are also performed for participants enrolled in part 2 or 3. A behavioral survey that collects information about demographics, history of HIV testing, STD history, symptoms of acute HIV infection, and risk behaviors is administered to participants at enrollment. RESULTS: Between September 2015 and March 2018, there were 14,990 Project DETECT eligible index (part 1) to the PHSKC STD Clinic resulting in 1819 part 2 Project DETECT study index. The longitudinal study within Project DETECT (part 3) enrolled 27 participants with discordant POC test results from their part 2 visit, and 10 (37%) were followed until they had fully seroconverted with concordant positive POC test results. Behavioral survey data and HIV test results, sensitivity, and specificity will be presented elsewhere. CONCLUSIONS: Studies such as Project DETECT are critical for evaluating POC HIV test devices as well as describing characteristics of persons at risk for HIV acquisition in the United States. HIV tests in development, including POC NATs, will provide new opportunities for HIV testing programs. INTERNATIONAL REGISTERED REPORT IDENTIFIER (IRRID): RR1-10.2196/16332.										
Article	2020	Stephenson, Rob; Bratcher, Anne; Missinge, Matthew J.; Garofalo, Robert; Hidalgo, Marco A.; Hoehnle, Samuel; Sullivan, Patrick S.	Accuracy in Self-Report of Viral Suppression Among HIV-Positive Men With HIV-Negative Male Partners.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000002240	https://pubmed.ncbi.nlm.nih.gov/31917748/	BACKGROUND: Among men who have sex with men, there is now clear evidence that the risk of HIV transmission through condomless sex when the HIV-positive partner is virally suppressed is effectively zero. However, an understanding of the accuracy of reporting of viral load among serodiscordant same-sex male couples is missing from the literature. SETTING: This analysis uses data from the baseline sample of Stronger Together, a randomized controlled efficacy trial of an innovative dyadic intervention to enhance antiretroviral therapy adherence for HIV-serodiscordant male couples in 3 US cities (Atlanta, Boston, and Chicago). METHODS: Biomarker-confirmed and self-reported measures of viral load were used to assess the accuracy of self-report of viral suppression. In this descriptive analysis, we calculated the sensitivity, specificity, positive predictive value, and negative predictive value of self-report of viral suppression (<200 copies/mL) for 1 of the 2 partners in each couple. Studies that have shown relatively high levels of accuracy in reporting of viral suppression. Although 72.7% of men could accurately report their viral load status, 20% reported that they were virally suppressed when they did not have a biomarker-confirmed measure of viral suppression. CONCLUSION: These results highlight the need to provide interventions to men who have sex with men living with HIV to support access to care and ensure current knowledge of viral load and to continue to support primary prevention of HIV through condom use and pre-exposure prophylaxis. For couples, particularly serodiscordant male couples, interventions that can teach the couple how to collaborate to achieve and maintain viral suppression for the positive partner are an urgent and pragmatic programmatic priority that can equip couples with the knowledge required to correctly implement U = U strategies.	*Homosexuality, Male; Adult; Humans; Male; Middle Aged; Young Adult; Anti-HIV Agents; Antiretroviral Therapy, Highly Active; Bisexuality; HIV Infections/*drug therapy/*virology; Condoms; Safe Sex; Pre-Exposure Prophylaxis; *Self Report	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2020	Strathdee, Steffanie A; Hallett, Timothy B; Bobrova, Natalia; Rhodes, Tim; Booth, Robert; Abdool, Ruth; Hankins, Catherine A	Possible role of pre-exposure prophylaxis (PrEP) in HIV prevention among people who inject drugs: lessons from the Australian epidemic of hepatitis C virus and implications for HIV control.	AIDS (London, England)	-	-	-	1473-5571 0269-9370	10.1097/QAD.0b013e32834ed7f2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3718386/	Pre-exposure prophylaxis (PrEP) is a key HIV prevention technology, and is a pillar of a comprehensive HIV prevention approach for men who have sex with men (MSM). Because there have been no national data to characterize trends in the PrEP continuum in the United States, overall and for key demographic groups of MSM, we aimed to describe the extent to which PrEP awareness, willingness and use changed over time, overall and for specific groups of MSM critical for HIV prevention (e.g. Black and Hispanic MSM, younger MSM, MSM in rural areas and MSM without health coverage). Methods: The American Men's Internet Survey (AMIS) is an annual survey of US MSM conducted in the United States among MSM aged ≥15 years since 2013. We analyzed data on trends in elements of the PrEP continuum (awareness, willingness and use of PrEP) in a sample of 37,476 HIV-negative/unknown status MSM from December 2012 through November 2017. We evaluated trends in continuum steps overall and among demographic subgroups using Poisson models with Generalized Estimating Equations. For 2017 data, we used logistic regression to compare the prevalence of PrEP use among demographic groups. Results: Overall, 51.4% (n = 19,241) of AMIS respondents were PrEP-eligible across study years. Between 2013 and 2017, PrEP awareness increased from 47.4% to 80.6%, willingness to use PrEP increased from 43.9% to 59.5% and PrEP use in the past 12 months increased from 3.7% to 19.9%. In 2017, use of PrEP was lower for men who were younger, lived outside of urban areas, Black and Hispanic MSM, and MSM who were uninsured. Conclusions: Substantial progress has been made in PrEP awareness, willingness and use, but significant disparities persist between PrEP use and epidemic need. We call for additional support of PrEP initiation, especially among young, non-urban and uninsured MSM, Black and Hispanic MSM report levels of PrEP use no different from white MSM, but given higher HIV incidence for Black and Hispanic MSM, parity in use is not sufficient for epidemic control or health equity. © 2020 The Authors. A Data Visualization and Dissemination Resource to Support HIV Prevention and Care at the Local Level: Analysis and Uses of the AIDSVu Public Data Resource	Journal of Medical Internet Research	-	-	-	14388871	10.2196/21173	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084681184&doi=10.2196%2Fjmir.2020.5154&partnerID=40&md5=e0f1f96e05fd81f32f7f6b7e7b4b86db&origin=inward	Background: AIDSVu is a public resource for visualizing HIV surveillance data and other population-based information relevant to HIV prevention, care, policy, and impact assessment. Objective: The site, launched in December 2015, has had >1 million visitors. This paper describes the site's development, key features, and uses. Methods: We developed AIDSVu using open-source software and downloadable datasets using results from HIV surveillance systems, other population-based sources of information (eg, US Census and national probability surveys), and other data developed specifically for display and dissemination through the website (eg, pre-exposure prophylaxis PrEP prescriptions). Other types of content are developed to translate surveillance data into summarized content for diverse audiences using infographic panels, interactive maps, local and state fact sheets, and a variety of downloadable resources. Results: Over 10 years, AIDSVu.org has used the number of data sources progressively provided HIV surveillance and related data at finer geographic levels, with current data resources providing HIV prevalence data down to the census tract level in many of the largest US cities. Data are available for nearly 2.5 million persons with HIV in the United States. In 2018, over 500,000 unique users consumed AIDSVu data and resources, over 1.5 million data and information views, and insights were disseminated through nearly 4,000,000 social media posts. Since AIDSVu's inception, at least 249 peer-reviewed publications have used AIDSVu data for analyses or referenced AIDSVu resources. Conclusions: AIDSVu has become a widely used resource for visualizing HIV surveillance data and other population-based information relevant to HIV prevention and care. It has also helped to rapidly advancing awareness of new HIV technological capabilities to serve high-need areas. Conclusions: Surveillance data should be actively used to guide and evaluate public health programs. AIDSVu makes high-quality, population-based data about the US HIV epidemic and makes that information available in formats that are not consistently available in surveillance reports. Bringing public health surveillance data to an online resource is a democratization of data, and presenting information about the HIV epidemic in more visual formats allows diverse stakeholders to engage with, understand, and use these important public health data to inform public health decision making. ©Patrick Sean Sullivan, Cory Woodyatt, Chelsea Koski, Elizabeth Pembleton, Pene McGuinness, Jennifer Taussig, Alexandra Rieca, Nicole Luisi, Eve Mokotoff, Nanette Benbow, Amanda D Castel, Ann N Do, Ronald O Valdiserri, Heather Bradley, Chandra Jugg, Daniel O'Farrell, Rebecca Filipowicz, Aaron J Siegler, James Curran, Travis H Sanchez. Article	2020	Sun C.J.; Anderson K.M.; Kahn T.; Mayer L.; Klein C.H.	A Sexual Health promotion app for transgender women (trans women connected): Development and usability Study	JMIR mHealth and uHealth	-	-	-	2291/5222	10.2196/15888	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084035662&doi=10.2196%2F15888&partnerID=40&md5=e1993b6d5f4dd2a9307f0636a2d79422	Background: HIV severely impacts the transgender communities in the United States, and transgender women have the highest HIV incidence rates among any identified risk group. Guided by formative research, we developed Trans Women Connected, a mobile app for transgender women that aims to reduce HIV risk by promoting sexual health and linkage to HIV prevention services. This study aimed to develop and test the usability and acceptability of the prototype. Trans Women Connected mobile app. Methods: We engaged in a 3-phase prototype development process. After conducting formative research about the health needs of this population, we outlined a theory-based app framework and developed three prototype activities (ie, a vision board, a pre-exposure prophylaxis PrEP education activity, and an interactive map). We then tested the usability and acceptability of the mobile app and activities with 18 transgender women using pre- A-lab prototype, think-aloud protocols, and open-ended questions. Results: Participants reported high acceptability for the mobile app; the mean rating across all usability and likability questions was 5.9 out of 7. Service utilization intention, goal-setting, and social support increased at posttest compared with pretest. Increases in self-efficacy in finding lesbian, gay, bisexual, transgender, and queer-friendly services; intention to seek online social support; and PrEP knowledge were statistically significant. Participants described the app as attractive and useful and perceived all three activities positively. Conclusions: This study describes the development and usability and acceptability testing of a transgender-specific sexual health promotion app and provides preliminary evidence for its feasibility and acceptability. The usability testing findings provided important insights toward refining and the further development of the Trans Women Connected mobile app. The results suggest that a mobile health intervention can support positive changes. The remaining development and efficacy randomized trial of the Trans Women Connected mobile app is currently underway. © 2020 JMIR Publications. All rights reserved. Article	2020	Sun L.; Lin A.; Li J.; Shao Y.; Li Q.; Yu J.; Zhang H.; Li Z.; Wang H.	Is PrEP necessary during natural conception in HIV-1-serodiscordant couples on ART with suppressed viral load? A retrospective cohort analysis	BMC Infectious Diseases	-	-	-	1471-2334	10.1186/s12879-020-4912-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082267556&doi=10.1186%2Fs12879-020-4912-4&partnerID=40&md5=a0fcaeac3656fc3273b04495f6c1725d	Background: Antiretroviral therapy (ART) demonstrates high efficacy in reducing the risk of HIV transmission to sexual partners. However, it is not clear if the use of pre-exposure prophylaxis (PrEP) is HIV-1-serodiscordant couples is necessary during natural conception when the HIV-positive partner exhibits a suppressed viral load. The purpose of this study was to assess the role of PrEP during natural conception in this population. Methods: A retrospective, multicenter study was conducted in a cohort of HIV-1-serodiscordant couples (positive man, negative woman) with childbearing desires. HIV-positive male partners were treated with ART and achieved viral suppression for more than half a year. The HIV-negative female partners were either treated with PrEP or not treated with PrEP, and outcomes were compared between the two treatment groups. Results: Of 240 HIV-1-serodiscordant couples in whom the HIV-positive partner achieved viral suppression, 164 seronegative women were treated with PrEP during natural conception and 142 seronegative women were not treated with PrEP. There were 410 condom-less sexual acts in couples treated with PrEP and 815 condom-less sexual acts in couples not treated with PrEP. We observed no instances of HIV transmission in HIV-1-serodiscordant couples with or without the use of PrEP during the process of natural conception. Conclusions: Our results show that PrEP may not be necessary during the process of natural conception in HIV-1-serodiscordant couples in which the HIV-positive partner has achieved viral suppression for more than half a year. A more acceptable option for HIV-negative partners is not use PrEP during the process of natural conception if the HIV-positive partner has achieved viral suppression for more than half a year. © 2020 The Author(s). Theses and Dissertations	2020	Susuha-Castillo, Steven; Ramsome, Yusef; Gonsalves, Gregg	Neighborhood and Environmental Factors and the Relationship to the Willingness to Use and Actual Uptake of Pre-exposure Prophylaxis (PrEP) Uptake: A Rapid Scoping Review	-	-	-	Yale University	-	NA	NA	https://scholar.library.yale.edu/cgi/viewcontent.cgi?article=1992&context=ysphtd	PrEP (Pre-Exposure Prophylaxis), which approved on the market after FDA approval in 2012, is more than 90% effective against HIV transmission via sexual contact and more than 60% effective against HIV transmission via intravenous drug use. Current interventions focus on individual behavior or clinical guidelines, however, there has been little focus on the environmental factors affecting PrEP willingness and uptake. To investigate the relationship between neighborhood, environmental factors and PrEP willingness and uptake in the United States, a rapid scoping review was conducted with three electronic databases of articles (January 2012- March 2020). Of the 2,014 citations screened, 11 articles were ultimately chosen for this review. Although PrEP willingness and uptake have been increasing overall, Black and Latinx people and those who live in rural areas, the Midwest, and the South significantly lag in this trend. Moreover, themes captured in the neighborhood and environmental variables were physician access, physician stigma, and resource access. Future policy recommendations will need to acknowledge the neighborhood and environmental factors that lead to disparities in HIV prevention.										

Article	2020	Tadfor, Y; Thornton, N; Jennings, J; Belcher, H; German, D; Flynn, C; Fields, EL	PREDICTORS OF PREP AWARENESS IN ADOLESCENT AND YOUNG ADULT GAY, BISEXUAL, AND OTHER MSM IN BALTIMORE	Journal of Adolescent Health	-	-	-	1054-139X	10.1016/j.jadohealth.2019.11.008	https://www.jahonline.org/article/S1054-139X(19)30534-8/abstract	Purpose: HIV disparities continue to impact young, gay bisexual and other men who have sex with men (MSM). The highest rates of new diagnoses are among those age 25-34 years and 13-24 years. Pre-exposure prophylaxis (PrEP) is a potential tool for reducing these disparities if promotion and delivery is prioritized to those at greatest risk. The study objective is to investigate sociodemographic characteristics, HIV/STI testing history and HIV acquisition risk factors associated with PrEP awareness among 18-34 year-old HIV-negative MSM in Baltimore. Methods: Data for this study were drawn from two behavioral surveys among MSM in Baltimore: The BESURE Study, the Baltimore arm of the National HIV Behavioral Surveillance Project (2017), and the Safe Spaces and Places Study (SSP) (2018 to 2019). Self-reported HIV-negative MSM age 18-34 years (N=269; SSP N=71; BESURE N=198) were included in this analysis. PrEP awareness was assessed through the question "Before today, have you ever heard of people who do not have HIV taking PrEP to reduce the risk of getting HIV?" [No/Yes]. Covariates included demographic characteristics (age, race [Black vs. non-Black], education level, income), receipt of HIV or STI test in the past 12 months, and HIV acquisition risk factors in the past 12 months (as defined by the Centers for Disease Control: sex with person living with HIV, condomless sex, multiple sex partners, recent bacterial STI diagnosis and exchange sex [money/drugs given/received for sex]). Using STATA 15, multivariable logistic regression was used to determine characteristics associated with PrEP awareness, adjusting for the year of data collection. Using stepwise regression, we ran the following three models: 1) demographic characteristics; 2) demographics and receipt of HIV/STI test; and 3) demographics, receipt of HIV/STI test, and HIV acquisition risk factors. Results: The mean age was 27.7, S.D=3.8. The majority were Black (68.1%), had completed high school/GED (61.7%), and earned <$50,000 annually (83%). 82.8% were aware of PrEP. In model 1, education level < high school/GED (ref:college degree) was associated with reduced odds of PrEP awareness (aOR=0.21; CI=0.06-0.82). In model 2, Black race (aOR=0.36; CI=0.014-0.93) and income <$10,000 (ref: >$50,000) (aOR=0.16; CI=0.03-0.87) was associated with reduced odds of awareness; recent HIV/STI testing was associated with increased odds of awareness (aOR=6.98; CI=2.88-16.95). In the final model, race, income and education were not associated with awareness; however reporting exchange sex (12% prevalence) was associated with 91% lower odds of being aware of PrEP (aOR=0.09; CI=0.02-0.47) and reporting recent HIV/STI testing (87% prevalence) had 6 times the odds of being aware of PrEP (aOR=6.6; 95% CI=1.85-23.68). Conclusions: Our findings indicate that for adolescent and young adult HIV-negative MSM, PrEP awareness was more likely among those with recent receipt of HIV/STI testing. However, those reporting exchange sex were less likely to be aware. These findings suggest PrEP promotion messaging may not be reaching our most vulnerable youth in Baltimore. Demographic characteristics were not significantly associated with PrEP awareness when adjusting for other risk factors, which suggests targeting PrEP promotion messages based on these characteristics alone may be insufficient. Article	2020	Taggart, Tamara; Liang, Yilin; Pina, Paulo; Albritton, Tashuna	Awareness of and willingness to use PrEP among Black and Latinx adolescents residing in higher prevalence areas in the United States	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0234821	https://doi.org/10.1371/journal.pone.0234821	This mixed-methods study examined awareness of and willingness to use pre-exposure prophylaxis (PrEP) among sexually active Black and Latinx adolescents (13-17 years) residing in five cities in the United States with some of the highest burden of HIV. Data are from adolescents who participated in a cross-sectional survey (n = 208) and one-on-one interviews and focus groups (n = 26) conducted from September 2017-August 2019. Approximately 50% of the sample were recruited through community efforts, and the other half through a panel. Logistic regression with covariates including sexual orientation, relationship status, socioeconomic status, and race/ethnicity were used to assess factors associated with PrEP awareness and willingness. For the qualitative data, thematic analysis was used to develop a codebook of a-priori and inductive codes while analytic memos were written to identify key themes. PrEP awareness was reported by 38% of the sample and was associated with Black race (AOR = 0.49; 95% CI = 0.27, 0.90) and prior HIV testing (AOR = 3.89, 95% CI = 1.25, 12.08). PrEP willingness (defined as "definitely would use PrEP") was assessed by 22% of the sample and was associated with higher age, more education, having had condomless sex in the past 6 months (AOR = 0.23; 95% CI = 0.10, 0.56), perceived likelihood of acquiring HIV (AOR = 3.59; 95% CI = 1.06, 12.21), and PrEP awareness (AOR = 0.41; 95% CI = 0.19, 0.89). Qualitative data showed that misconceptions about PrEP persist and PrEP stigma, fear of being punished, provider attitudes and recommendations, and empowerment were related to adolescents' willingness to use PrEP. Study findings reveal important strategies for improving PrEP delivery and scale-up to Black and Latinx adolescents. These strategies include using sociodemographic and health behavior data to target adolescents who may be more or less willing to use PrEP, improving provider communication about PrEP, and creating culturally and developmentally appropriate PrEP education materials that address common misconceptions held by adolescents. Article	2020	Tan, Rayner Kay Jin; Koh, Wee Ling; Le, Daniel; Tan, Avin; Tyler, Adrian; Tan, Calvin; Banerjee, Sumita; Wong, Chen Seong; Wong, Mee-Lian; Chio, Martin Tze-Wei; Chen, Mark I-Cheng	Effect of a web drama video series on HIV and other sexually transmitted infection testing among gay, bisexual and queer men: study protocol for a community-based, pragmatic randomised controlled trial in Singapore: the People Like Us (PLU) Evaluation Study.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2019-033855	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7170638	INTRODUCTION: Gay, bisexual and queer (GBQ) men are at disproportionately higher risk of acquiring HIV and other sexually transmitted infections (STI). While HIV/STI testing rates among GBQ men are increasing worldwide, they remain suboptimal in a variety of settings. METHODS AND ANALYSIS: The study is a pragmatic randomised controlled trial designed to evaluate an online video series developed by a community-based organisation in Singapore for GBQ men. A total of 300 HIV-negative GBQ men in Singapore aged 18-29 years old will be recruited for this study. Participants will subsequently be randomised into the intervention arm (n=150) and the control arm (n=150). The intervention arm (n=150) will be assigned the intervention along with sexual health information via a pamphlet, while the control group (n=150) will be assigned only the sexual health information via a pamphlet. Participants should also not have watched the video prior to their participation in this study, which will be ascertained through a questionnaire. Primary outcomes for this evaluation are changes in self-reported intention to test for, actual testing for and regularity of testing for HIV, syphilis, chlamydia and gonorrhoea at the 3 and 6 months after intervention. Secondary outcomes include changes in self-reported risk perception for HIV and other STIs, knowledge of HIV, knowledge of risks associated with acquiring STIs, knowledge of HIV pre-exposure prophylaxis, consistent condom use for anal sex with casual partners, incidence of STIs, connectedness to the lesbian, gay, bisexual and transgender community, self-concealment of sexual orientation, perceived homophobia, internalised homophobia, HIV testing self-efficacy and HIV testing social norms. ETHICS AND DISSEMINATION: The study has been approved by the National University of Singapore Institutional Review Board (S-19-059) and registered at ClinicalTrials.gov. The results will be published in peer-reviewed academic journals and disseminated to community-based organisations and policymakers. TRIAL REGISTRATION NUMBER: NCT04021953. Article	2020	Tang E.C.; Vittinghoff E.; Philip S.S.; Doblecki-Lewis S.; Bacon O.; Chege W.; Coleman M.E.; Elion R.; Buchbinder S.; Kolber M.A.; Liu A.Y.; Cohen S.E.	Quarterly screening optimizes detection of sexually transmitted infections when prescribing HIV preexposure prophylaxis	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002522	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086051873&doi=10.1097%2fQAD.0000000000002522&partnerID=40&md5=ffb7f1fb6fb626079baec12882a29bc9	Objective:The optimal screening frequency of sexually transmitted infections (STIs) for MSM and transgender women (TGW) on HIV pre-exposure prophylaxis (PrEP) is unclear, with present guidelines recommending screening every 3-6 months. We aimed to determine the number of STIs for which treatment would have been delayed without quarterly screening.Design:The US PrEP Demonstration Project was a prospective, open-label cohort study that evaluated PrEP delivery in STI clinics in San Francisco and Miami, and a community health center in Washington, DC. In all, 557 HIV-uninfected MSM and TGW were offered up to 48 weeks of PrEP and screened quarterly for STIs.Methods:The proportion of gonorrhea, chlamydia, and syphilis infections for which treatment would have been delayed had screening been conducted every 6 versus every 3 months was determined by taking the number of asymptomatic STIs at weeks 12 and 36 divided by the total number of infections during the study follow-up period for each STI.Results:Among the participants, 50.9% had an STI during follow-up. If screening had been conducted only semiannually or based on symptoms, identification of 34.3% of gonorrhea, 40.0% of chlamydia, and 20.4% of syphilis infections would have been delayed by up to 3 months. The vast majority of participants (89.2%) with asymptomatic STIs reported condomless anal sex and had a mean of 8.1 partners between quarterly visits.Conclusions:Quarterly STI screening among MSM on PrEP could prevent a substantial number of partners from being exposed to asymptomatic STIs, and decrease transmission. © 2020 Lippincott Williams and Wilkins. Article	2020	Tanner M.R.; Miele P.; Carter W.; Valentine S.S.; Dunville R.; Kapogiannis B.G.; Smith D.K.	Preexposure prophylaxis for prevention of HIV acquisition among adolescents: Clinical considerations, 2020	MMWR Recommendations and Reports	-	-	-	10575987	10.15585/MMWR.RR6903A1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083949282&doi=10.15585%2fMMWR.RR6903A1&partnerID=40&md5=dc8172a4a18a0e353a6db02061acdfc4	Preexposure prophylaxis (PrEP) with antiretroviral medication has been proven effective in reducing the risk for acquiring human immunodeficiency virus (HIV). The fixed-dose combination tablet of tenofovir disoproxil fumarate (TDF)/emtricitabine (FTC) was approved by the U.S. Food and Drug Administration (FDA) for use as PrEP for adults in 2012. Since then, recognition has been increasing that adolescents at risk for acquiring HIV can benefit from PrEP. In 2018, FDA approved revised labeling for TDF/FTC that expanded the indication for PrEP to include adolescents weighing at least 77 lb (35 kg) who are at risk for acquiring HIV. In 2019, FDA approved the combination product tenofovir alafenamide (TAF)/FTC as PrEP for adolescents and adults weighing at least 77 lb (35 kg), excluding those at risk for acquiring HIV through receptive vaginal sex. This exclusion is due to the lack of clinical data regarding the efficacy of TAF/FTC in cisgender women. Clinical providers who evaluate adolescents for PrEP use must consider certain topics that are unique to the adolescent population. Important considerations related to adolescents include PrEP safety data, legal issues about consent for clinical care and confidentiality, the therapeutic partnership with adolescents and their parents or guardians, the approach to the adolescent patient's clinical visit, and medication initiation, adherence, and persistence during adolescence. Overall, data support the safety of PrEP for adolescents. PrEP providers should be familiar with the statutes and regulations about the provision of health care to minors in their states. Providers should partner with the adolescent patient for PrEP decisions, recognizing the adolescent's autonomy to the extent allowable by law and including parents in the conversation about PrEP when it is safe and reasonable to do so. A comprehensive approach to adolescent health is recommended, including considering PrEP as one possible component of providing medical care to adolescents who inject drugs or engage in sexual behaviors that place them at risk for acquiring HIV. PrEP adherence declined over time in the studies evaluating PrEP among adolescents, a trend that also has been observed among adult patients. Clinicians should implement strategies to address medication adherence as a routine part of prescribing PrEP; more frequent clinical follow-up is one possible approach. PrEP is an effective HIV prevention tool for protecting adolescents at risk for HIV acquisition. For providers, unique considerations that are part of providing PrEP to adolescents include the possible need for more frequent, supportive interactions to promote medication adherence. Recommendations for PrEP medical management and additional resources for providers are available in the U.S. Public Health Service clinical practice guideline Preexposure Prophylaxis for the Prevention of HIV Infection in the United States-2017 Update and the clinical providers' supplement Preexposure Prophylaxis for the Prevention of HIV Infection in the United States-2017 Update: Clinical Providers' Supplement (https://www.cdc.gov/hiv/clinicians/prevention/prep.html). © 2020 Centers for Disease Control and Prevention (CDC). Article	2020	Tao, Jun; Montgomery, Madeline C; Chu, Christina T; Sosnowy, Collette; Almonte, Alexi; Goedel, William C; Silva, Elizabeth S; Reisopoulos, Antonio; Marshall, Sarah Alexandra; Zaller, Nickolas D; Rogers, Brooke G; Nunn, Amy S; Marshall, Brandon D L; Chan, Philip A	HIV Pre-Exposure Prophylaxis Awareness and Use Among Men Who Have Sex with Men Only and Men Who Have Sex with Both Men and Women.	AIDS Patient Care and STDs	-	-	-	1557-7449	10.1089/apc.2020.0072	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7415238	Gay, bisexual, and other men who have sex with men (MSM) are among those most at risk of HIV in the United States. The estimated lifetime risk of HIV infection among this population is 17%; this increases to 20% and 50% among Hispanic/Latino and African American MSM, respectively.1 Further disparities in HIV prevention and care may exist between men who have sex with men only (MSMO) and men who have sex with men and women (MSMW). MSMW, when defined based on past-year bisexual behavior, represent ∼38% of all US MSM and 1% of all US men.2 MSMW face adverse psychosocial conditions—including higher rates of mental illness and substance use, reduced social support, and dual stigma from both same-sex partnering and heterosexual populations—which may function as barriers to health care.3–5 This may translate to lower uptake of HIV prevention services among MSMW than among MSMO.6–8. Pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention intervention that holds significant promise for reducing HIV transmission rates among MSM.9,10 Despite its proven efficacy and the high estimated proportion of MSM meeting clinical indications for PrEP,11 uptake has been suboptimal across the United States, resulting in further disparities among subgroups already facing additional barriers to care, including MSMW.12 Characterizing unique risk factors among MSMW is a critical first step in mitigating disparities, promoting prevention strategies, and reducing HIV risk in this population. We conducted a secondary analysis of data collected during routine clinical care at a sexually transmitted disease (STD) clinic in Rhode Island from January 2013 to December 2018. Data represent unique patients presenting for testing for HIV, syphilis, gonorrhea, and chlamydia. We reviewed data on patients' self-reported demographics, perceived HIV risk, sexual behaviors, and other risk behaviors. If patients had multiple STD clinic visits during the study period, only data from the first visit were included in this analysis. MSMO were men who reported only male oral and anal sex partners in the past 12 months; MSMW reported both male and female oral, anal, or vaginal sex partners in the past 12 months. Article	2020	Tarleton, Jessica; Chen, Beatrice A; Meyn, Leslie A; Hendrix, Craig W; Marzinke, Mark A; Achilles, Sharon L	Pharmacokinetic and Pharmacodynamic Impacts of Depot Medroxyprogesterone Acetate Use on HIV Pre-exposure Prophylaxis in Women.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002421	https://dx.doi.org/10.1097/QAI.0000000000002421	BACKGROUND: Depot medroxyprogesterone acetate (DMPA) is a commonly used contraceptive in areas where use of tenofovir disoproxil fumarate and emtricitabine for HIV pre-exposure prophylaxis (PrEP) is increasing. OBJECTIVES: We aimed to investigate the impact of DMPA on PrEP drug pharmacokinetics and pharmacodynamics in women using PrEP before and after DMPA administration. METHODS: In this pilot study, 12 HIV-negative women ages 18-45 underwent biological sample collection at 3 time points: before study drug, after 2 weeks of daily PrEP use alone, and after 2 weeks of daily PrEP and concomitant DMPA use. We measured drug and drug metabolites in plasma, peripheral blood mononuclear cells, cervicovaginal fluid, cervical tissue, and rectal fluid after each 2-week course of PrEP. We measured HIV replication ex vivo in genital tissue biopsies and innate anti-HIV activity in cervicovaginal fluid before PrEP and after both courses. We compared drug concentrations after PrEP alone to after PrEP and DMPA in the same participant using Wilcoxon signed-rank tests. We used mixed effects linear regression models to compare pharmacodynamic measures for each participant at predrug baseline, after PrEP alone, and after PrEP and DMPA. RESULTS: We found no significant differences in PrEP drug and drug metabolite concentrations in any compartment during concomitant DMPA use compared with use of PrEP alone, except for a reduction in emtricitabine concentration in cervical tissue. We found no difference in HIV replication in cervical tissue or anti-HIV activity in cervicovaginal fluid during concomitant DMPA and PrEP use compared with during PrEP use alone. CONCLUSIONS: Concomitant use of DMPA does not clinically alter pharmacokinetics or pharmacodynamics of PrEP in women. These data support the safety of DMPA use in women using PrEP. Article	2020	Teitelman, AM; Chittamuru, D; Koblin, BA; Davis, A; Brawner, BM; Fiore, D; Broomes, T; Ortiz, G; Lucy, D; Tieu, HV	Beliefs Associated with Intention to Use PrEP Among Cisgender US Women at Elevated HIV Risk	Archives of Sexual Behavior	-	-	-	0004-0002	10.1007/s10508-020-01681-3	https://pubmed.ncbi.nlm.nih.gov/32270399/	Women comprise 19% of those newly diagnosed with HIV in the U.S. There is a wide gap between recommended use of pre-exposure prophylaxis (PrEP) and actual uptake among women who are eligible for PrEP. In order to identify women's beliefs and intentions about starting PrEP, a survey, informed by the reasoned action approach, was administered to 160 cisgender PrEP-eligible women, age 18-55, in Philadelphia and New York City. The mean age was 40.2 years (SD = 11.78), 44% had completed high school, 75% were unemployed, and 85% experienced financial instability in the past 3 months. Multivariate linear regression analyses identified sets of behavioral and normative beliefs associated with intention to start PrEP in the next 3 months. Behavioral beliefs reflected views about PrEP benefits such as preventing HIV, and normative beliefs reflected perceptions of support or lack thereof from others including partners, friends, mother, and children. These findings can be used to inform interventions to foster greater PrEP uptake among women. Article	2020	Tepper, Naomi K; Curtis, Kathryn M; Cox, Shanna; Whiteman, Maura K	Update to U.S. Medical Eligibility Criteria for Contraceptive Use, 2016: Updated Recommendations for the Use of Contraception Among Women at High Risk for HIV Infection.	MMWR Recommendations and Reports	-	-	-	1545-861X	10.15585/mmwr.mm6914a3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7147901	"U.S. Medical Eligibility Criteria for Contraceptive Use" (U.S. MEC) 2016 provides evidence-based guidance for the safe use of contraceptive methods among U.S. women with certain characteristics or medical conditions (1). The U.S. MEC is adapted from global guidance from the World Health Organization (WHO) and kept up to date through continual review of published literature (1). CDC recently evaluated the evidence and the updated WHO guidance on the risk for human immunodeficiency virus (HIV) acquisition among women using hormonal contraception and intrauterine devices (IUDs) (2). After careful review, CDC adopted WHO's 2019 updated guidance for inclusion in the U.S. MEC guidance; CDC's updated guidance states that progestin-only injectable contraception (including depot medroxyprogesterone acetate DMPA) and IUDs (including levonorgestrel-releasing and copper-bearing) are safe for use without restriction among women at high risk for HIV infection (U.S. MEC category 1 previously U.S. MEC category 2, advantages outweigh risks) (Box). CDC's guidance also adds an accompanying clarification for women who wish to use IUDs, which states "Many women at a high risk for HIV infection are also at risk for other sexually transmitted diseases (STDs). For these women, refer to the recommendations in the 'U.S. Medical Eligibility Criteria for Contraceptive Use' for women with other factors related to STDs, and the 'U.S. Selected Practice Recommendations for Contraceptive Use' on STD screening before IUD insertion" (1,3). Recommendations for other hormonal contraceptive methods (including combined hormonal methods, implants, and progestin-only pills) remain the same; there is also no restriction for their use among women at high risk for HIV infection (U.S. MEC category 1). Finally, CDC clarified that the U.S. MEC recommendations for concurrent use of hormonal contraceptives or IUDs and antiretroviral use for treatment of HIV infection also apply to use of antiretrovirals for prevention of HIV acquisition (preexposure prophylaxis PrEP). Book	2020	Terry-Smith, J.	Factors Influencing Use of Pre-Exposure Prophylaxis: Among Men Who Have Sex With Men	-	Factors Influencing Use of Pre-Exposure Prophylaxis: Among Men Who Have Sex With Men	-	1716297540	-	NA	https://books.google.com.br/books?id=3ZEfzgEACAAJ&hl=pt-PT	Prevention is key to keeping men who have sex with men (MSM) protected from HIV. Despite new and innovative HIV prevention resources such as pre-exposure prophylaxis (PrEP), factors such as education level, employment status, number of sexual partners, and access to health resources may inhibit certain populations from using it. The purpose of this cross-sectional study was to examine the association between education level, employment status, number of sexual partners, and access to health resources and the use of PrEP among MSM. Article	2020	Terui, Sachiko; Huang, Jiangang; Goldsmith, Joy V; Blackard, Donna; Yang, Yiyi; Miller, Claude	Promoting Transformative Community Change for Equitable Health: Peer Education and Intervention for Pre-Exposure HIV Prophylaxis.	Journal of Health Communication	-	-	-	1087-0415	10.1080/10810730.2020.1730526	https://dx.doi.org/10.1080/10810730.2020.1730526	Many new HIV infections occur through individuals who are unaware of their HIV status. HIV disparities are more prevalent among underserved populations, and the number of new cases in the U.S. is highest in the Southern region. Using the Social Network Intervention, 63 undergraduate students delivered a face-to-face, communication-centered, peer education to 333 peers in the underserved communities; of those, 220 verified cases were analyzed. A baseline assessment was followed by the intervention and the second assessment, with the third assessment 2 weeks later. Assessments measured intervention impacts on health information sharing, knowledge about HIV/AIDS, and the dimensions of vested interest theory. The peer education was effective in making changes in participants' vestedness, knowledge regarding HIV/AIDS, and trust and expectation toward informational sources. Communication and tailored messages through established relationship channels were proven crucial for promoting positive behaviors about HIV sexual health, with strong evidence of change in stigma and the culture of silence. Article	2020	Tester G.; Hoxmeier J.C.	PrEP, TasP and the casual sex scripts among serodiscordant gay men	Journal of HIV/AIDS & Social Services	-	-	-	15381501	10.1080/15381501.2020.1753620	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084258132&doi=10.1080%2f15381501.2020.1753620&partnerID=40&md5=a0ca1078989f0b4305ba0d594a3260e5	HIV-prevention strategies have produced a divide between serodiscordant gay men. Using Sexual Scripts Theory and interviews, we explore how pre-exposure prophylaxis (PrEP) is shaping gay men's casual sex relationships among serodiscordant partners. Together with Treatment-as-Prevention, PrEP appears to be improving these relationships. Participants' stories reveal that they are engaged in the fluctuating sexual landscapes formed by new prevention approaches, maintaining shared safe-sex scripts that foster risk-reduction, but modifying them to include reexamined fears and resulting barriers to sexual communication, opportunities and satisfaction and reevaluated ideas about appropriate partners. We discuss the health and service implications of these transforming scripts. © 2020, © 2020 Taylor & Francis Group, LLC. Article	2020	Theodore D.A.; Zucker J.; Carnevale C.; Grant W.; Adan M.; Borsa A.; Richards P.; Olender S.; Cohall A.; Gordon P.; Sobieszczyk M.E.	Pre-exposure Prophylaxis Use Among Predominantly African American and Hispanic Women at Risk for HIV Acquisition in New York City	Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000147	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077016732&doi=10.1097%2fJNC.0000000000000147&partnerID=40&md5=a4cb067b364307cdefe159e185dbe792	Nearly 20% of annual diagnoses of HIV in the United States occur among women (Centers for Disease Control and Prevention [CDC], 2017a). Although the overall number of new diagnoses among women has fallen modestly in the past 5 years, the trend has leveled off recently, and marked racial and ethnic disparities persist (CDC, 2017a). In New York City in 2017, of 449 women diagnosed with HIV, heterosexual sex was the predominant risk factor (67%), and the majority of women (88%) were African American or Hispanic (New York City Department of Health and Mental Hygiene [NYC DOHMH], 2017). Pre-exposure prophylaxis (PrEP), a combination of emtricitabine and tenofovir disoproxil fumarate (FTC/TDF) taken daily, can effectively prevent HIV acquisition (Baeten et al., 2012). New York State Department of Health (NYSDOH) and NYC DOHMH PrEP guidelines for women list traditional HIV risk factors such as transactional sex, injection drug use, multiple/anonymous partners, recent sexually transmitted infection (STI), and serodiscordant relationships, as well as circumstances that may disproportionally affect women, such as a history of intimate partner violence or a desire to conceive with a partner living with HIV (NYC DOHMH, 2018; New York State Department of Health [NYSDOH], 2018). Although PrEP use has increased among White men who have sex with men, uptake among women and racial and ethnic minorities remains low. Of more than 175,000 US women who were estimated to have an indication for PrEP, only 2.1% received a prescription in 2016 (Huang, Zhu, Smith, Harris, & Hoover, 2018). Reasons for this disparity are multifactorial and driven by individual and system-wide factors. PrEP awareness, for example, remains low; a study of women receiving care at an STI clinic in Rhode Island found that of women with an indication for PrEP, most were unaware of it, and notably, African American and Hispanic women were more likely to be unaware of PrEP than White women (Raifman et al., 2019). Additional barriers to care have included, for example, the stigma women experience when accessing services related to HIV; advertising and outreach that have traditionally not focused on heterosexual women; low provider knowledge; and guidelines that do not adequately address the needs of heterosexually active women (Calabrese et al., 2019; CDC, 2017b; Pinto, Berringer, Melendez, & Mmeje, 2018; Sales et al., 2019). In recognition of gaps in PrEP access for women, NYC DOHMH (2018) released guidance strongly encouraging providers to discuss PrEP with HIV-uninfected women. However, data regarding PrEP use among women in real-world settings are lacking. To address this gap in the literature, we performed a retrospective review to describe a cohort of cisgender women and transgender men in New York City who presented for sexual health and HIV prevention services in Upper Manhattan, an area of high HIV diagnosis among women. Go to: Methods A retrospective review was performed of all cisgender women and transgender men who accessed sexual health services including PrEP and post-exposure prophylaxis (PEP) between July 2015 and June 2018 at the HIV Prevention Program at New York-Presbyterian Hospital/ Columbia University Irving Medical Center (NYP/CUIMC), a large urban academic health care center in Upper Manhattan. NYP/CUIMC serves a predominantly Hispanic and low-income population; 72% self-identify as Hispanic, 20% to 30% of families live below the federal poverty level, and annual HIV diagnosis rates range from 30.7 to 86.6 per 100,000 persons (DiNapoli & Bleiwas, 2016; NYC DOHMH, 2017). The institutionwide HIV Prevention Program was initiated in July 2015. Theses and Dissertations	2020	Tian, Chang	Therapeutic Nanocarriers for Enhanced Drug Delivery: from Laboratory-Scale Formulation to Clinical-Scale Production	-	-	Princeton University	-	NA	NA	http://arks.princeton.edu/ark:/88435/dsp01w6634668x	This thesis describes studies in the development of therapeutic nanoparticles to achieve enhanced drug delivery, starting from formulation design to scale-up production and processing. Polymeric NPs can encapsulate hydrophobic active pharmaceutical ingredients in their amorphous form and at the same time maintain a high surface area to volume ratio, so as to increase bioavailability in drug delivery. Flash NanoPrecipitation is the main technique to be applied in this thesis for the formation of nanoparticles. It is a one-step and scalable method. This technique is further developed in this thesis to better encapsulate different drug molecules of various hydrophobicity and eventually achieve a continuous scale-up production for commercialization purpose. The work presented herein is divided into four main parts based on four different projects where I have spent the majority of my Ph.D. career. In a project working on dihydromyricetin as a hangover prevention drug, we demonstrate the flexibility of Flash NanoPrecipitation formulations in encapsulating less hydrophobic drugs. In a project working on lumefantrine as a cure for malaria, we successfully achieve translational development in terms of scale-up production and processing of nanoparticles. In a project working on HIV pre-exposure prophylaxis, we design responsive foams as a nanoparticle rectal dosage vehicle. Last but not least, we develop mathematical models to describe nanoparticle adsorption and structural rearrangement at an interface, which involves a fundamental discussion of some of the most commonly seen phenomenon. In summary, the four projects listed in this dissertation not only involve different formulations of therapeutic nanoparticles for different diseases, but also emphasize on different stages of the research of nanomedicine, from the initial encapsulation process to scale-up production and eventually final dosage form. With all the formulation and processing methods developed in this dissertation, we have successfully bridged the gap between Flash NanoPrecipitation as an innovative nanoparticle synthesis technology starting in the lab and its subsequent formulation evolvement, to align with different chemical natures of drugs to be encapsulated as well as requirements of industrial-level production. This work will further inspire scientists working in the field of nanomedicine to facilitate the application of Flash NanoPrecipitation in a broader perspective in industry.	drug delivery; drug development; Flash NanoPrecipitation; formulation; nanoparticle; scale-up	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Quantitative
Article	2020	Tolley E.E.; Zissette S.; Martinez A.; Palanee-Phillips T.; Mathebula F.; Tenza S.; Hartmann M.; Montgomery E.T.	Development and initial validation of a simple tool to screen for partner support or opposition to HIV prevention product use	PLOS One	-	-	-	19326203	10.1371/journal.pone.0242881	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099000723&doi=10.1371%2fjournal.pone.0242881&partnerID=40&md5=5b7d0febaa25b4261410c5dd2dc4a916	In HIV prevention trials, male partners have influenced women's ability to adhere to investigational products, including antiretroviral (ARV) containing vaginal rings. Validated scales can be useful tools to systematically measure complex constructs, such as those related to male partner engagement. Although multiple scales exist to assess physical, psychological and sexual violence within intimate relationships, fewer scales focus on supportive behaviors within these relationships. Our intervention involved development of a Healthy Relationship Assessment Tool (HEART) that assessed both positive and negative aspects of male partner involvement in women's HIV prevention. We identified and refined 127 potential items, representing intimate partner violence, agency and social support. A structured survey, including potential items and other sociodemographic and behavioral variables was administered to former microbicide trial and non-trial participants. We conducted an exploratory factor analysis (EFA) to identify a reduced set of constructs and items to screen women who might experience social harms or benefits from vaginal ring use. We examined associations between constructs and with other survey variables to assess content and construct validity. In a subset of 10 women who participated in the survey and qualitative interviews, we used qualitative data to predict survey scores. We retained five constructs with theoretical relevance and good-to-strong reliability for the tool, including: Traditional Values; Partner Support; Partner Abuse & Control; Partner Resistance to HIV Prevention; and HIV Prevention Readiness. Predicted associations between HEART constructs, and correspondence between participants' qualitative data and HEART scores were generally correct, while those between constructs and other sociodemographic variables were more mixed. Initial validation of the HEART tool was promising. The tool will be used during the CHARISMA pilot study at the Johannesburg MTN 025/HOPE site and validated as part of a randomized controlled trial of CHARISMA within a PrEP demonstration project. Beyond clinical trial settings, HEART could assist PrEP or antiretroviral treatment (ART) providers with an easy-to-administer tool to identify risk and tailor risk reduction, empowerment and adherence counseling for microbicides, PrEP or ART related services. © 2020 Tolley et al. Article	2020	Toms K.; Potter H.; Balaba M.; Parkes-Ratanshi R.	Efficacy of HIV interventions in African fishing communities: A systematic review and qualitative synthesis	International Journal of Infectious Diseases	-	-	-	12019712	10.1016/j.ijid.2020.09.1476	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095943369&doi=10.1016%2fj.ijid.2020.09.1476&partnerID=40&md5=4348f2e2d0be9ca37fbe9481123f8ac3	Objectives: This systematic review aims to qualitatively synthesize existing evidence on the efficacy of HIV interventions in African fishing communities. Methods: Five databases (NCBI PubMed, EMBASE, Web of Science Core Collection, The Cochrane Library, and CABI Global Health Database) were searched in March 2019 for eligible studies. All peer-reviewed papers with a defined HIV intervention explicitly mentioning African fishing communities were included. Outcomes included any measure of the efficacy of HIV interventions. Results: Of 22,289 search results, data was extracted from 25 eligible studies that passed critical appraisal; seven involved HIV prevention, six HIV testing and counseling, three treatment, and nine combinations of more than one intervention. Findings include a high coverage of safe male circumcision (SMC) but low condom use among fisher folk, and a preference for PrEP over other HIV prevention services. Uptake of HIV testing and ART coverage are below levels required to reach UNAIDS 90-90-90 targets, and there is a high demand for ART and HIV self-testing kits. Conclusions: Greater provision of services to combat HIV, specifically amongst fishing communities, is required; there is limited information on retaining fisher folk in care and achieving an undetectable viral load. Interventions tailored to individual fishing populations, offered in parallel to education or counseling services are likely to be most effective. Use of innovations, including mobile health and medical drones, could assist these hard-to-reach populations. Our findings will inform future HIV service provision in fishing communities. © 2020 The Authors	Africa; Fishing; HIV; Intervention; Systematic review; UNAIDS	English	Netherlands	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review
Article	2020	Tordoff, Diana M, MPH; Barbee, Lindley A, MD, MPH; Khosropour, Christine M, PhD, MPH; Hughes, James P, PhD, MS; Golden, Matthew R, MD, MPH	Derivation and Validation of an HIV Risk Prediction Score Among Gay, Bisexual, and Other Men Who Have Sex With Men to Inform PrEP Initiation in an STD Clinic Setting: JAIDS	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002438	https://pubmed.ncbi.nlm.nih.gov/32658131/	Background: Clinicians and health departments would ideally undertake targeted efforts to promote HIV pre-exposure prophylaxis (PrEP) and frequent HIV testing using data-based criteria to identify populations at elevated risk for HIV. We developed an HIV risk prediction score for men who have sex with men (MSM) to identify individuals at substantial risk for HIV acquisition. Methods: We created a retrospective cohort of MSM who tested HIV-negative at the sexually transmitted disease clinic in Seattle, WA, from 2001 to 2015, and identified seroconversions using HIV surveillance data. We split the cohort randomly 2:1 into derivation and validation data sets, and used Cox proportional hazards to estimate the hazard of acquiring HIV associated with behavioral and clinical predictors, and the Akaike information criterion to determine which variables to retain in our model. Results: Among 16,448 MSM, 640 seroconverted over a 14.3-year follow-up period. The best prediction model included 13 variables and had an area under the receiver operating characteristic curve of 0.73 (95% confidence interval: 0.71 to 0.76), 76% sensitivity, and 63% specificity at a score cutoff ≥11. A simplified model restricted to 2011–2015 included 4 predictors methamphetamine use, condomless receptive anal intercourse (CRAI), ≥10 partners, and current diagnosis or self-reported gonorrhea/syphilis in the past year. This model, the Seattle PrEP Score, had an area under the receiver operating characteristic curve of 0.69 (95% confidence interval: 0.64 to 0.73), 62% sensitivity, and 70% specificity. One-year incidence was 0.5% for a score of 0, 0.7% for a score of 1, and 2.1% for scores ≥2. Conclusions: The Seattle PrEP Score was predictive of HIV acquisition and could help clinicians and public health agencies identify MSM who could benefit from PrEP and frequent HIV testing. Article	2020	Torres T.S.; Bastos L.S.; Kamel L.; Bezerra D.R.B.; Fernandes N.M.; Moreira R.I.; Garner A.; Veloso V.G.; Grinsztejn B.; De Boni R.B.	Do men who have sex with men who report alcohol and illicit drug use before/during sex (chemsex) present moderate/high risk for substance use disorders?	Drug and Alcohol Dependence	-	-	-	3768716	10.1016/j.drugalcdep.2020.107908	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079422329&doi=10.1016%2fj.drugalcdep.2020.107908&partnerID=40&md5=20309ab0b806dfa052cdf8f4f5a36161	Background: We evaluated the prevalence of sexualized drug use (Chemsex) and its association with moderate/high risk for substance use disorders and HIV sexual risk behavior among men who have sex with men (MSM). Methods: We conducted a cross-sectional web-based survey among MSM from Rio de Janeiro (Brazil). The Alcohol, Smoking and Substance Involvement Screening Test (ASSIST) was used to screen people at moderate/high-risk for substance use disorders. Individuals found to be using substances in the prior three months were asked if they used before/during sex. Sexualized drug use was classified into: no sexualized drug use, sex using only alcohol (alcohol-sex), sex using only illicit drugs (drug-sex) and sex using alcohol and illicit drugs (alcohol-drug-sex). The questionnaire included questions about sociodemographic, HIV status/prevention and risk behavior. A multinomial regression model was used to assess the factors associated with sexualized drug use. Results: Overall, 1048 MSM completed the questionnaire; median age was 29 years. Prevalence of alcohol and illicit drug use in previous 3 months was 89 % and 49 %, respectively. Most MSM (64 %) reported sexualized drug use: 28 % alcohol-sex, 9 % drug-sex and 27 % alcohol-drug-sex. Median ASSIST scores were higher among those reporting sexualized drug use compared to no use. All HIV sexual risk behavior variables presented increasing prevalence across the outcome categories. In the adjusted multivariate model, having moderate/high-risk for substance use disorders were associated with sexualized drug use. Conclusions: MSM reporting sexualized drug use should receive brief intervention for substance use disorders and be evaluated for combination HIV prevention strategies including PrEP. © 2020 Elsevier B.V. Article	2020	Torres-Cruz C.; Suárez-Díaz E.	The stratified biomedicalization of HIV prevention in Mexico City	Global Public Health	-	-	-	17441692	10.1080/17441692.2019.1679217	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074397875&doi=10.1080%2f17441692.2019.1679217&partnerID=40&md5=b7798644527e5fa0553fec44765557e2	In the late 1990s antiretroviral pharmaceuticals began to be used in the United States and Western Europe to prevent HIV infection in contexts of occupational exposure. One decade later, the application of Post Exposure Prophylaxis (PEP) and Pre-Exposure Prophylaxis (PrEP) had been extended to include cases of exposure to sexual assault, injection-drug use, and consensual sexual intercourse deemed at high risk. This article explores the implementation of biomedicalized HIV prevention protocols at a public healthcare clinic in Mexico City, building on sociological-feminist approaches in Science and Technology Studies (STS) and drawing on interviews with key actors, as well as digital ethnography. We emphasise the stratified biomedicalization or, said otherwise, the differences in PEP and PrEP accessibility and consumption among different populations and groups. We also describe the fragile grip of institutionalised biomedical solutions when alternative 'moral economies' intersect with them, particularly in contexts like Mexico, where governmental funding for experimental research on biomedical innovations has been limited. This text reveals both the existence of contrasting technoscientific interventions along class and gender differences, and the multiple and vivid ways by which individuals appropriate and interpret global biomedical practices. © 2019, © 2019 Informa UK Limited, trading as Taylor & Francis Group. Article	2020	Torres-Cruz, César; Suárez-Díaz, Edna	La biomedicalización del riesgo sexual en América Latina en el siglo XXI	Revista Ciencias de la Salud	-	-	-	1692-7273	10.12804/revistas.urosario.edu.co/revsalud/a.9799	http://www.scielo.org.co/scielo.php?script=sci_arttext&pid=S1692-72732020000300176&lang=pt	Abstract Introduction: In the last decade, the concept of "biomedicalization" has played a relevant role in Latin American Science, Technology, and Biomedicine (STS) studies amidst sociological and academic debates on the implications of biomedical interventions in the production of subjects and diseases. However, its relationship with sexuality has scarcely been evaluated. Development: This article aimed to analyze how sexual risk to avoid acquiring both human immunodeficiency virus through PrEP implementation and human papilloma virus through the preventive vaccine implementation in Mexico, Colombia, and Brazil has been thoroughly biomedicalized, from a sociological feminist perspective. First, the concept of biomedicalization and its theoretical uses in medical sociology and STS are briefly introduced. Then, few relevant texts are discussed that approach some aspects concerning the increase in biomedicalization of sexual risk within these biotechnologies in the three countries. Finally, we analyzed the advantages and challenges of introducing the concept of biomedicalization in the Latin American context and its relevance in terms of understanding sex-related relationships and differences. Conclusions: With the recent development of the biomedicine and transnational pharmaceutical industry, it is necessary to analyze the historical, social, and political implications of the biomedicalization of sexuality in the postcolonial contexts, such as those found in Latin America. Article	2020	Toumasis P.; Psychogiou M.; Vrioni G.	PrEP (Pre-Exposure Prophylaxis) as an innovative HIV prevention strategy	Acta Microbiologica Hellenica	-	-	-	4389573	NA	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128730153&partnerID=40&md5=e2c14131fa731e095ec7583ec42c03fd	PrEP (Pre-Exposure Prophylaxis) is an innovative HIV prevention strategy, which, although widely used in several countries, only constituted a pilot project in Greece. PrEP is defined as the administration of antiretroviral agents recommended for HIV-negative individuals who have a high risk of HIV infection. The aim of the present review is to highlight PrEP as a prevention treatment strategy that acts complementary to other risk reduction strategies. Specifically, clinical trial data from studies conducted during the last decade is presented and analyzed. PrEP, in all subpopulation studied and with all regimens used, significantly lowers the risk of HIV infection compared to placebo used in each study, in the 90% of the cases. No serious side effects were reported, while it was established that with adherence to the prescribed dose, the chances of prevention are greater. © 2020 Greek Society of Microbiology Ascent Ltd. Article	2020	Town, Katy; Field, Nigel; Harris, Simon R; Sánchez-Busó, Leonor; Cole, Michelle J; Pitt, Rachel; Fifer, Helen; Mohammed, Hamish; Hughes, Gwenda	Phylogenomic analysis of Neisseria gonorrhoeae transmission to assess sexual mixing and HIV transmission risk in England: a cross-sectional, observational, whole-genome sequencing study.	The Lancet Infectious Diseases	-	-	-	1474-4457	10.1016/S1473-3099(19)30610-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7099395	BACKGROUND: Characterising sexual networks with transmission of sexually transmitted infections might allow identification of individuals at increased risk of infection. We aimed to investigate sexual mixing in Neisseria gonorrhoeae transmission networks between women, heterosexual men, and men who report sex with men (MSM), and between people with and without HIV. METHODS: In this cross-sectional observational study, we whole-genome sequenced N gonorrhoeae isolates from the archive of the Gonococcal Resistance to Antimicrobials Surveillance Programme (GRASP).w Isolates that varied by five single nucleotide polymorphisms or fewer were grouped into clusters that represented sexual networks with N gonorrhoeae transmission. Clusters were described by gender, sexual risk group, and HIV status. FINDINGS: We sequenced 1277 N gonorrhoeae isolates with linked clinical and sociodemographic data that were collected in five clinics in England during 2013-16 (July 1 to Sept 30 in 2013-15; July 1 to Sept 9 in 2016). The isolates grouped into 213 clusters. 30 (14%) clusters contained isolates from heterosexual men and MSM but no women and three (1%) clusters contained isolates from only women and MSM. 146 (69%) clusters comprised solely people with negative or unknown HIV status and seven (3%) comprised only HIV-positive people. 60 (28%) clusters comprised MSM with positive and negative or unknown HIV status. INTERPRETATION: N gonorrhoeae molecular data can provide information indicating risk of HIV or other sexually transmitted infections for some individuals for whom such risk might not be known from clinical history. These findings have implications for sexual health care, including offering testing, prevention advice, and preventive treatment, such as HIV pre-exposure prophylaxis. Theses and Dissertations	2020	Townsend-Chambers, Colette	IMPROVING PUBLIC HEALTH CLINICIANS' BELIEFS AND BEHAVIORS WITH LGBT INDIVIDUALS	-	-	University of North Carolina at Charlotte	-	NA	NA	http://hdl.handle.net/20.500.13093/etd:2160	ABSTRACTCOLETTE TOWNSEND-CHAMBERS. Improving Public Health Clinicians' Beliefs and Behaviors with LGBT Individuals (Under the direction of DR. KELLY POWERS).Identified gaps in the education of healthcare clinicians contribute to non-affirming beliefs and marginalizing behaviors towards LGBT individuals. This can result in poorer health outcomes for LGBT persons. The purpose of this project was to evaluate the effectiveness of a targeted educational intervention in improving public health clinicians' affirming beliefs and behaviors with LGBT patients. A one group, pretest-posttest, quasi-experimental design was used. The sample was 69 public health clinicians from local public health clinics that are piloting a Pre-exposure Prophylaxis (PrEP®) HIV medication. An educational training was implemented which focused on challenges for the LGBT client and current LGBT sensitive terminology. A standardized patient simulation video recording of a transgender patient encounter was shown to demonstrate best practices and a structured debriefing followed. The Gay Affirmative Practice (GAP) scale was administered at three timepoints (pretest, immediate posttest, and 2-month posttest). Friedman's Test and Wilcoxon Signed Rank tests were performed. There was a statistically significant immediate improvement in clinicians' affirmative beliefs (p< 0.001); however, beliefs scores returned to baseline two months later. The improvement in self-reported affirming behaviors from pretest to two-month posttest was statistically significant (p= 0.003). Participants reported a high level of satisfaction with the education and written comments revealed participants felt this education should be offered more frequently. Providing LGBT-specific healthcare training may improve clinicians' affirmative beliefs and behaviors, which can significantly improve the patient-provider relationship. The use of experiential learning via simulation and ongoing education are recommended. Article	2020	Traeger, Michael W; Tidhar, Tom; Holt, Martin; Williams, Chris; Wright, Edwina J; Stoové, Mark A; Scott, Nick; Hellard, Margaret E	The Potential Impact of a Gel-Based Point-of-Sex Intervention in Reducing Gonorrhea Incidence Among Gay and Bisexual Men: A Modeling Study.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001239	https://dx.doi.org/10.1097/OLQ.0000000000001239	BACKGROUND: Increases in sexually transmitted infections among gay and bisexual men (GBM) over the past decade have coincided with declines in condom use and rapid uptake of HIV preexposure prophylaxis (PrEP). We explored the impact of an antimicrobial gel-based point-of-sex intervention (gel-PSI) with a lower efficacy for reducing gonorrhea transmission risk than condoms on population-level gonorrhea incidence among GBM in Victoria, Australia. METHODS: A deterministic compartmental model of HIV and gonorrhea transmission was used to project annual gonorrhea incidence from 2020 to 2025. Individuals were classified as HIV-negative (PrEP or non-PrEP users) or HIV-positive, and further stratified by gonorrhea risk (high/low). All possible scenarios where between 0% and 100% of GBM using condoms transitioned to gel-PSI (considered a downgrade in protection) and 0% and 100% of GBM not using condoms transitioned to gel-PSI (considered an upgrade in protection), with gel-PSI efficacy ranging from 20% to 50%, were run. RESULTS: The baseline scenario of no gel-PSI uptake (status quo) projected 94,367 gonorrhea infections between 2020 and 2025, with an exponentially increasing trend in annual infections. For a gel-PSI efficacy of 30%, a net reduction in cumulative gonorrhea incidence was projected, relative to the status quo, for any ratio of proportion of condom users "downgrading" to proportion of noncondom users "upgrading" to gel-PSI use of less than 2.6. Under the supposition of equal proportions of condom users and noncondom users switching to gel-PSI, a relative reduction was projected for any gel-PSI efficacy greater than 16%. CONCLUSIONS: Our model suggests that the introduction of a gel-PSI could have benefits for controlling gonorrhea transmission among GBM, even in scenarios where the gel-PSI is considerably less efficacious than condoms and when gel-PSI uptake leads to consequent reductions in consistent condom use. Article	2020	Tran B.X.; Phan H.T.; Nguyen Q.N.; Ewedairo O.A.; Vu G.T.; Ha G.H.; Nguyen T.P.; Latkin C.A.; Ho C.S.H.; Ho R.C.M.	Pre-exposure prophylaxis in hiv research: A latent dirichlet allocation analysis (gapresearch)	AIDS Reviews	-	-	-	11396121	10.24875/AIDSRev.20000131	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082316942&doi=10.24875%2fAIDSRev.20000131&partnerID=40&md5=5adbff8bd158e03f609556e3070defae	Pre-exposure prophylaxis (PrEP) has been shown to be an effective approach to prevent human immunodeficiency virus (HIV) infections; however, implementation of the service remains challenging. This global bibliometric analysis aims to describe the current trends in HIV research prevention through PrEP to reveal the potential gaps of knowledge and to put forward recommendations for future research. A bibliometric analysis was conducted through Web of Science from 1990 to 2017. Exploratory factor analysis was also employed to find research domains emerging from the abstracts' contents. Latent Dirichlet allocation, which is a topic modeling algorithm, was utilized to perform text mining and determine relationships among text documents. A total of 4852 papers regarding HIV PrEP research were retrieved. The number of papers and their impact has significantly increased. Preventing sexual transmissions, improving access, and quality of health-care services for current users, as well as men who have sex with men, pregnant women and children, were the research domains most related to PrEP. We found a data gap in research regarding sex workers, potential side effects of PrEP, and misjudgment toward PrEP users. Despite the growth in research about HIV PrEP, there exist barriers to scaling up the implementation of PrEP worldwide and for such intervention to reach its fWull potential. International research collaboration efforts to investigate the potential safety concerns of PrEP and develop strategies to eliminate social misjudgment against PrEP users are warranted. Addressing these knowledge gaps might facilitate the development of effective global implementation strategies for PrEP in the future. (AIDS Rev. (ahead of print)). © Permanyer2020. Article	2020	Trost, Susanna L; Onwubiko, Udodirim N; Wilson, Derick B; Holland, David P; Chamberlain, Allison T	Health Care-Seeking Behaviors and Perceptions of Provider-Initiated Discussion of Pre-exposure Prophylaxis Among PrEP-Naïve HIV-Negative Men Who Have Sex With Men in Atlanta, Georgia.	Open Forum Infectious Diseases	-	-	-	2328-8957	10.1093/ofid/ofaa165	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7252285	BACKGROUND: Given high rates of HIV among men who have sex with men (MSM) in the United States, there is a need to more effectively leverage the health care system to bolster promotion of pre-exposure prophylaxis (PrEP) to at-risk MSM. METHODS: Using data collected from a 2018 venue-based cross-sectional survey, we examined factors associated with health care-seeking behaviors, discussing PrEP with a provider, and barriers to PrEP uptake among MSM. Associations between outcomes and respondents' sociodemographic characteristics and sexual behaviors were assessed using log binomial regression. RESULTS: Of 478 MSM, 247 (51%) were PrEP-naïve and HIV-negative. Although 85% of PrEP-naïve MSM reported visiting a health care provider in the past year, only 31% recalled having any provider discuss PrEP. The most frequently cited reasons for not taking PrEP were low perception of personal risk of acquiring HIV (37%) and not knowing enough about PrEP (35%). Those who saw a provider in the last year were less likely than those who did not to cite lack of knowledge as a barrier to use (prevalence rate, 0.66, 95% confidence interval, 0.45-0.96). CONCLUSIONS: Despite the majority of PrEP-naïve MSM interfacing with the health care system, recollection of discussing PrEP with providers was limited. Increased efforts to equip providers with the tools to discuss PrEP and address pressing concerns with at-risk individuals may help improve PrEP uptake among priority populations. Article	2020	Tseng C.-W.; Dudley R.A.; Chen R.; Walensky R.P.	Medicare Part D and Cost-Sharing for Antiretroviral Therapy and Preexposure Prophylaxis	JAMA Network Open	-	-	-	25743805	10.1001/jamanetworkopen.2020.2739	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083544775&doi=10.1001%2fjamanetworkopen.2020.2739&partnerID=40&md5=c01d3bc62ebe4ca95104184459d58d4f	Importance: The 2019 federal Ending the HIV Epidemic initiative requires a vast expansion of access to antiretroviral therapy (ART) and preexposure prophylaxis (PrEP) for HIV treatment and prevention. However, high prices for ART and PrEP can reduce their affordability and use. Medicare covers 1 in 4 persons living with HIV, and the Medicare Part D drug benefit imposes complicated cost-sharing between patients and other stakeholders. Objective: To determine how the Medicare Part D design distributes the cost burden for ART and PrEP between patients, insurance plans, manufacturers, and Medicare. Design and Setting: Nationwide cross-sectional analyses of first quarter 2019 Medicare formulary and pricing files for 3326 Part D plans were performed. These files contain drug benefit data, including prices and cost-sharing requirements. Main Outcomes and Measures: For 18 ART and 2 PrEP regimens, the out-of-pocket costs for patients and the cost borne by plans, manufacturers, and Medicare were projected for 1 year of treatment or prevention under a 2019 standard Medicare Part D insurance plan. Analyses assumed that patients used the ART or PrEP regimen and no other medications. Results: In 2019, ART prices ranged from $24 010 to $46 770 annually (median price, $35 780), with patients projected to pay 9% to 14% of the cost ($3270-$4350), insurance plans 18% to 24% ($5340-$8450), manufacturers 6% to 11% ($2370-$2750), and Medicare 53% to 67% ($12 770-$31 270). The price of PrEP was $20 570 annually, with patients contributing 15% ($2990), insurance plans 22% ($4570), manufacturers 13% ($2750), and Medicare 50% ($10 260). For beneficiaries with low-income subsidies that cover all patient cost-sharing, Medicare would assume 67% to 76% of ART costs and 65% of PrEP costs. Conclusions and Relevance: Medicare Part D mandates universal ART and PrEP coverage, but high prices (>$35 000 annually for ART and>$20 000 annually for PrEP) and the design of Part D can jeopardize affordability for patients and place most of the cost burden on taxpayers. Under a standard Medicare Part D benefit, patients pay $3000 to $4000 out-of-pocket yearly, unless they qualify for low-income subsidies, and half to two-thirds of the cost of ART and PrEP is borne by Medicare rather than insurance plans or manufacturers. To end the HIV epidemic by 2030, it appears that policies must address both high drug prices and revamp Medicare Part D cost-sharing.	adult; aged; cost; cross-sectional study; economics; female; health care cost; human; Human immunodeficiency virus infection; male; medicare; middle aged; pre-exposure prophylaxis; United States; very elderly	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Turner, D; Lockhart, E; Wang, W; Shore, R; Daley, E; Marhefka, S	PrEP implementation during community-based HIV testing in Florida: Application of the consolidated framework for implementation research	Implementation Science	-	-	-	1748-5908	10.1097/QAI.0000000000002289	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8690629/	Background: Pre-exposure Prophylaxis (PrEP) is an important option for HIV prevention, but the approach has reached a limited number of people at risk of HIV infection. Methods: A mixed-methods concurrent triangulation design was used to investigate unobserved subgroups of staff who provide community-based, publicly funded HIV testing in Florida (USA). PrEP implementation groups, or classes, were determined using latent class analysis. Generalized linear mixed models were used to estimate PrEP implementation as a function of staff characteristics. In-depth interviews based on the Consolidated Framework for Implementation Research were analyzed thematically. Results: Based on fit statistics and theoretical relevance, a 3-class latent class analysis was selected. Class 1 (“Universal”) staff were highly likely to talk about PrEP with their clients, regardless of client eligibility. Class 2 (“Eligibility dependent”) staff were most likely to discuss PrEP if they believed their client was eligible. Class 3 (“Limited”) staff sometimes spoke to clients about PrEP, but not systematically. In multivariate analyses, only race and sexual orientation remained significant predictors of the PrEP implementation group. Staff who identified as a racial or sexual minority were less likely to be in the Limited group than their heterosexual or white counterparts. Age, gender, ever having taken PrEP, and HIV status did not impact the odds of being in a specific PrEP implementation group. Conclusions: A subset of HIV testing staff differentially discuss PrEP based on perceived client eligibility; others inconsistently talk to clients about PrEP. Targeted training based on PrEP implementation groups may be beneficial. Article	2020	Udodirim, Onwubiko; Holland, David; Ajoku Sophia; Taylor, Justin; Childs Ansha; Wilson, Derick; Chamberlain, Allison T	Using PrEP to #STOPHIVATL: Findings from a Cross-Sectional Survey Among Gay Men and Transgender Women Participating in Gay Pride Events in Atlanta, Georgia, 2018	Archives of Sexual Behavior	-	-	-	00040002	10.1007/s10508-020-01711-0	https://www.proquest.com/scholarly-journals/using-prep-stophivatl-findings-cross-sectional/docview/2417167398/se-2?accountid=8113	Assessing pre-exposure prophylaxis (PrEP) coverage and identifying reasons for disproportionate uptake among the varied social and cultural sub-groups of men who have sex with men (MSM) and transgender women who have sex with men (TWSM) are necessary precursors to setting attainable local PrEP. We report on findings of a cross-sectional survey among MSM/TWSM attending Gay pride events in Atlanta, Georgia, in 2018. Associations between PrEP awareness, uptake, and respondent characteristics were assessed using logistic regression. PrEP awareness did not differ by race, but current use was significantly lower among Blacks at substantial risk of HIV (p = .008). In multivariate analysis, clinician encounter in the past year was associated with awareness while age, income, drug use, sero-discordant sex, and multiple male partners were associated with current use. Among PrEP-naïve MSM/TWSM, the most common reasons for nonuse differed by race (poor knowledge of PrEP: Black—45% vs. non-Black—27%, p = .010, low perception of risk: Black—26% vs. non-Black—52%, p = .001). Key racial and socioeconomic disparities in active PrEP use and reasons for nonuse remain despite the recent increases in PrEP awareness and use among MSM/TWSM in Atlanta. Achieving overall improvement in uptake among all MSM/TWSM sub-groups will require tailoring PrEP educational messaging, optimizing communication modalities, expanding provider outreach, and identifying ways to defray costs for high-risk, underserved sub-groups in these populations. Journal of the Association of Nurses in AIDS Care	-	-	-	1552-6917	10.1097/JNC.0000000000000135	https://dx.doi.org/10.1097/JNC.0000000000000135	Pediatricians and adolescent providers play an important role in the health and well-being of adolescents and young adults, including their sexual health. HIV remains an ongoing concern for young people, with 21% of new HIV diagnoses occurring in this age group. The use of antiretroviral therapy for pre-exposure prophylaxis (PrEP) to prevent transmission of HIV to people who are not infected has been proven safe and effective. PrEP can be considered as part of a comprehensive risk mitigation strategy for adolescents and young adults, with clear guidelines for baseline evaluation and ongoing man-agement. © SLACK Incorporated.	family planning, HIV preventin, pre-exposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Other
Article	2020	Vaccher, Stefanie J.; Hammoud, Mohamed A.; Bourne, Adam; Lea, Toby; Haire, Bridget G.; Holt, Martin; Saxton, Peter; Mackie, Brent; Badge, Joshua; Jin, Fengyi; Maher, Lisa; Prestage, Garrett	Prevalence, frequency, and motivations for alkyl nitrite use among gay, bisexual and other men who have sex with men in Australia.	The International Journal on Drug Policy	-	-	-	1873-4758 0955-3959	10.1016/j.drugpo.2019.102659	https://www.sciencedirect.com/science/article/abs/pii/S095539591930372X	BACKGROUND AND AIMS: Gay, bisexual and other men who have sex with men (GBM) use alkyl nitrites ('poppers') at higher rates than other populations to functionally enhance sexual experiences. Their use has been associated with HIV sexual risk behaviours including receptive anal sex. We investigate the prevalence, frequency, and motivations for poppers use and their relationship with HIV risk. We also discuss the implications of the recent scheduling changes to poppers by the Australian Therapeutic Goods Administration. METHODS: Data were drawn from the Following Lives Undergoing Change (Flux) study, a prospective observational study of licit and illicit drug use among GBM. Between 2014 and 2018, 3273 GBM enrolled in the study. In 2018, 1745 GBM provided data relating to frequency of and motivations for poppers use and were included in this analysis. RESULTS: Median age was 33 years (IQR 25-46) and 801 GBM (45.9%) had used poppers in the previous six months ('recent use'). Among these men, 195 (24.3%) had used them weekly or more frequently. Most recent users (77.4%) reported using poppers for a 'buzz' during sex or to facilitate receptive anal intercourse (60.8%). The majority (57.7%) of HIV-negative men reporting recent poppers use were concurrently taking HIV pre-exposure prophylaxis. Recent poppers use was independently associated with receptive anal intercourse with casual partners (aOR 1.71; 95%CI 1.35-2.16) and chemsex (aOR 4.32; 95%CI 3.15-5.94). Poppers use was not associated with anxiety, depression, or drug-related harms. Only 15.4% of current users indicated they would stop using poppers if they were criminalised; 65.0% said they would 'find other ways' to obtain them. CONCLUSIONS: Poppers are commonly used by Australian GBM to functionally enhance sexual experiences, particularly to facilitate receptive anal intercourse. Few men experienced drug-related harms from poppers use. Regulatory changes must ensure potential harms from popper use are minimised without increasing barriers to access or perpetuating stigma. Article	2020	Valentine Becquet; Nouaman, Marcellin; Plazy, Mélanie; Jean-Marie Masumbuko; Anoma, Camille; Soh Kouame; Danel, Christine; Eholie, Serge Paul; Larmarange, Joseph	Sexual health needs of female sex workers in Côte d'Ivoire: a mixed-methods study to prepare the future implementation of pre-exposure prophylaxis (PrEP) for HIV prevention	BMJ Open	-	-	-	NA	10.1136/bmjopen-2018-028508	https://www.proquest.com/scholarly-journals/sexual-health-needs-female-sex-workers-côte-d/docview/2347463637/se-2?accountid=8113	ObjectiveTo describe sexual and reproductive health (SRH) needs of female sex workers (FSWs) to inform the future implementation of pre-exposure prophylaxis (PrEP) for HIV prevention in this population.Design and settingThe ANRS 12361 PrEP-CI cross-sectional and mixed-methods study was designed and implemented with two community-based organisations in Côte d'Ivoire.ParticipantsA convenience sample of 1000 FSWs aged ≥18, not known as HIV-positive, completed a standardised questionnaire assessing sociodemographic characteristics, sexual practices, use of community health services and a priori acceptability of PrEP. Twenty-two indepth interviews and eight focus group discussions were also conducted to document FSWs' risky practices and sexual behaviours, experiences with violence and discrimination, attitudes regarding HIV and sexually transmitted infections (STIs), and barriers to SRH services.ResultsAlthough 87% described consistent condom use with clients, more than 22% declared accepting condomless sexual intercourse for a large sum of money. Furthermore, condom use with their steady partner and knowledge of their partner's HIV status were low despite their acknowledged concurrent sexual partnerships. While inconsistent condom use exposed FSWs to STIs and undesired pregnancies, the prevalence of contraceptive strategies other than condoms was low (39%) due to fear of contraception causing sterility. FSWs faced obstacles to accessing SRH care and preferred advice from their peers or self-medication.ConclusionsDespite adoption of preventive behaviour in most cases, FSWs are still highly exposed to HIV. Furthermore, FSWs seem to face several barriers to accessing SRH. Implementing PrEP among FSWs in West Africa, such as in Côte d'Ivoire, constitutes an opportunity to consider the regular follow-up of HIV-negative FSWs. PrEP initiation should not condition access to SRH services; conversely, SRH services could be a way to attract FSWs into HIV prevention. Our results highlight the importance of developing a people-focused approach that integrates all SRH needs when transitioning from PrEP efficacy trials to implementation. Theses and Dissertations	2020	Vallejo Díaz, D	Cruzarse por la vida que aún queda: seducción y vitalidad en torno a la PrEP	-	-	Universidad Nacional de Colombia	-	NA	NA	https://repositorio.unal.edu.co/handle/unal/78247	Este texto es una puesta en perspectiva de un devenir en curso que pasa por la Profiláxis Pre-Exposición (PrEP), una tecnología de prevención del VIH que está en proceso de regulación, así como por una serie más grande de entidades, seres y materialidades asociadas. El objetivo de este trabajo es comprender las relaciones vitales en las que una tecnología, como la PrEP, participa. Para alcanzar esta meta, desarrollo dos objetivos más específicos. En primer lugar, busco comprender la PrEP como articulada, por la forma en que vivimos en presencia del VIH y de muchas otras entidades, y como articuladora, en cuanto, a través de cierto grupo de prácticas que la sostienen, es posible ver una manera de conducir la vida, reorganizando el deseo y los cuerpos, haciéndose parte del juego constante que traza y borra los contornos tanto de las entidades involucradas como de la PrEP misma. Ver así la PrEP, en cuanto articulada y articuladora, permite dibujar un panorama problemático: la existencia de unos mundos que tienden a fluir y su encuentro con estrategias de ordenamiento que pretenden contenerlos. En segundo lugar, perfilo una crítica que pretende problematizar la "llegada de la PrEP" desde la perspectiva de la ontología política. Precisamente, en cuanto estos procesos de ordenamiento implican una vitalidad que excede a los protocolos, que hace imposible pensar lo que está pasando como la sujeción de un paciente dócil y sin ninguna otra relación constituyente que la de la adherencia a los tratamientos; lo que está en juego con la dirección que toman los mismos es un entramado relacional, una profusión de vínculos con humanos y más-que-humanos y su posibilidad de seguir existiendo. En este sentido, este trabajo, de corte etnográfico, es cercano a ciertas orientaciones del campo de los Estudios de Ciencia y Tecnología (ECT) que se preguntan por los procesos de composición y ordenamiento de las tecnologías a partir de las prácticas concretas y las redes directamente asociadas. Article	2020	van der Straten A.; Ryan J.H.; Reddy K.; Etima J.; Taulo F.; Mutero P.; Taylor J.; Piper J.; Musara P.	Influences on willingness to use vaginal or oral HIV PrEP during pregnancy and breastfeeding in Africa: the multisite MAMMA study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25536	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086356121&doi=10.1002%2fjia2.25536&partnerID=40&md5=0071fe528acb77019109c07916c7254c	Introduction: Women in sub-Saharan Africa spend a substantial portion of their reproductive lives pregnant and/or breastfeeding (P/BF), yet they have limited options to prevent HIV during these maternal stages. In preparation for phase 3b prevention trials in P/BF women, we explored attitudes about using a vaginal ring or oral pills for pre-exposure prophylaxis (PrEP), perceptions of HIV risk during P/BF and key influences on future PrEP use. Methods: In 2018, we conducted 16 single-sex focus group discussions (FGDs) with community- and clinic-recruited HIV-uninfected women, currently or recently P/BF, aged 18 to 40, and men with (currently or recently) P/BF partners, aged 18+. Participants completed a behavioural questionnaire, viewed an educational video and handled prototype placebo products. FGDs were conducted in local languages and transcribed, coded and analysed, using a socio-ecological framework, for key influences on willingness to use products, HIV risk perceptions and opinions on product attributes. Results: Of the 128 participants (65 women, 63 men) 75% lived with their partner and 84% had a child. Women reported the most important influencers when P/BF were partners, and all stated that health decisions when P/BF are typically made jointly (e.g. medication use; ante/postnatal and baby care). There was consensus that P/BF women are at high risk for HIV, primarily because of their partner's infidelities, and new prevention options were welcomed. Participants valued multiple options and stated that woman's personal preference would be key to product choice. Anticipated concerns about products included risk of miscarriage, impact on infant development, complications during delivery and adequate production or taste of breastmilk. Specific perceived disadvantages emerged for the ring (e.g. vaginal discomfort, difficulty inserting/removing) and for pills (e.g. nausea/vomiting) that may be exacerbated during pregnancy. Health care providers' (HCPs) knowledge and approval of product use during P/BF was needed to mitigate anticipated fears. Conclusions: Participants perceived pregnancy and breastfeeding as high HIV risk periods and valued new prevention options. HIV protection of the mother-child dyad, safety of the baby, and ultimately, health of the family were paramount. Endorsement by HCPs and support from partners were key to future product acceptance. Participants recommended involving partners and HCPs in sensitization efforts for future trials. © 2020 The Authors. Article	2020	van Dijk Mart; Duken, Sascha B; Delabre, Rosemary M; Stranz, Richard; Schlegel, Vincent; Rojas Castro Daniela; Bernier Adeline; Zantkuijl, Paul; Ruiter, Robert A, C; de Wit John B F; Jonas, Kai J	PrEP Interest Among Men Who Have Sex with Men in the Netherlands: Covariates and Differences Across Samples	Archives of Sexual Behavior	-	-	-	00040002	10.1007/s10508-019-01620-x	https://www.proquest.com/scholarly-journals/prep-interest-among-men-who-have-sex-with/docview/2417167866/se-2?accountid=8113	Despite increased availability of pre-exposure prophylaxis (PrEP), PrEP uptake has remained low. To promote uptake, factors related to PrEP interest among relevant target populations warrant investigation. The aim of this study was to provide an analysis of PrEP interest among men who have sex with men (MSM) in the Netherlands, while taking study recruitment strategies into account. We recruited 154 MSM from an LGBT research panel (AmsterdamPinkPanel) and 272 MSM from convenience sampling. Both samples were part of the Flash! PrEP in Europe Survey and were compared on their PrEP interest, usage intentions, and sexual behavior. We conducted logistic regression analyses to discover variables associated with PrEP interest and intentions. Participants from the AmsterdamPinkPanel were less likely to use PrEP, had less knowledge of PrEP, and were less interested in PrEP than participants from convenience sampling. Significant covariates of PrEP interest were being single, more prior PrEP knowledge, sexual risk behaviors, such as not having used a condom during last sex and having ever used drugs in a sexual context, and not participating in the AmsterdamPinkPanel. Adding the recruitment strategy to the regression increased explained variance on top of predictors already described in the literature. Increased sexual risk behavior is related to increased PrEP interest and it helps to identify PrEP target groups. Recruitment strategies have a substantial impact on findings regarding PrEP interest and usage intentions. This study emphasizes the importance of using multiple strategies for recruiting participants to obtain a more comprehensive view of MSM's attitudes toward PrEP. Article	2020	Van Praet, Jens Tomas; Steyaert, Sanne; Vandecasteele, Stefaan; Van Den Bergh, Barbara; Mahieu, Hilde; De Buyser, Stefanie; Grootaert, Veerle; Descheemaeker, Patrick; Reynders, Marijke	Mycoplasma genitalium acquisition and macrolide resistance after initiation of HIV pre-exposure prophylaxis in men who have sex with men.	Sexually Transmitted Diseases	-	-	-	1472-3263	10.1136/sextrans-2019-054335	https://dx.doi.org/10.1136/sextrans-2019-054335	OBJECTIVES: Recent evidence shows that patients using HIV pre-exposure prophylaxis (PrEP) have an increased rate of bacterial STIs, including syphilis, chlamydia and gonorrhoea. Our study aimed to describe the acquisition and the susceptibility for macrolides of Mycoplasma genitalium in men who have sex with men (MSM) on PrEP. METHODS: We studied all MSM who started PrEP in the AZ Sint-Jan Hospital Bruges from 1 June 2017 to 31 March 2019 with at least one follow-up visit. Patients were screened for M. genitalium and other STIs with pooled rectal swabs, pharyngeal swabs and first-voided urine, and blood samples at baseline and quarterly intervals after initiating PrEP. TaqMan Array Card technology was used to detect M. genitalium and determine macrolide-resistance mediating mutations in region V of the 23S rRNA gene (A2058G, A2059G, A2058C and others). Patients with an STI were treated based on a national guideline. RESULTS: 131 MSM (median age 40 years, range 20-79) were included in the study. The median follow-up time was 12 months (IQR 6.1-17). Baseline prevalence of M. genitalium was 6.9% and incidence rate after PrEP initiation was 28.8 per 100 person-years (95% CI 21.7 to 37.2), without significant differences in proportions between the first four quarterly intervals. All but one acquisitions were asymptomatic. Younger age and positivity for M. genitalium at baseline were significantly associated with incident M. genitalium acquisition. The observed proportion of macrolide resistance increased not significantly from 44% at baseline to 57%-86% after PrEP initiation. None of the 27 macrolide-resistant M. genitalium acquisitions could be linked to azithromycin exposure in the three preceding months. CONCLUSIONS: After initiation of PrEP, we found a stable incidence of almost exclusively asymptomatic M. genitalium. However, a non-significant trend of an increased percentage of macrolide-resistant strains was observed. Article	2020	Vanhamel, Jef; Rotsaert, Anke; Reyniers, Thijs; Nöstlinger, Christiana; Laga, Marie; Van Landeghem, Ella; Vuylsteke, Bea	The current landscape of pre-exposure prophylaxis service delivery models for HIV prevention: a scoping review.	BMC Health Services Research	-	-	-	1472-6963	10.1186/s12913-020-05568-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7395423	BACKGROUND: Strengthening HIV prevention is imperative given the continued high HIV incidence worldwide. The introduction of oral PrEP as a new biomedical HIV prevention tool can be a potential game changer because of its high clinical efficacy and the feasibility of its provision to different key populations. Documenting the existing experience with PrEP service delivery in a variety of real-world settings will inform how its uptake and usage can be maximised. METHODS: We conducted a scoping review using the five-step framework provided by Arksey and O'Malley. We systematically searched the existing peer-reviewed international and grey literature describing the implementation of real-world PrEP service delivery models reporting on four key components: the target population of PrEP services, the setting where PrEP was delivered, PrEP providers' professionalisation and PrEP delivery channels. We restricted our search to English language articles. No geographical or time restrictions were set. RESULTS: This review included 33 articles for charting and analysing of the results. The identified service delivery models showed that PrEP services mainly targeted people at high risk of HIV acquisition, with some models targeting specific key populations, mainly men who have sex with men. PrEP was often delivered centralised and in a clinical or hospital setting. Yet also community-based as well as home-based PrEP delivery models were reported. Providers of PrEP were mainly clinically trained health professionals, but in some rare cases community workers and lay providers also delivered PrEP. In general, in-person visits were used to deliver PrEP. More innovative digital options using mHealth and telemedicine approaches to deliver specific parts of PrEP services are currently being applied in a minority of the service delivery models in mainly high-resource settings. CONCLUSIONS: A range of possible combinations was found between all four components of PrEP service delivery models. This reflects differentiation of care according to different contextual settings. More research is needed on how integration of services in these contexts could be expanded and optimised to respond to key populations with unmet HIV prevention needs in different settings. Article	2020	Vartak, Richa; Patki, Manali; Menon, Suvidha; Jablonski, Joseph; Mediouni, Sonia; Fu, Yige; Valente, Susana T; Billack, Blase; Patel, Ketan	ß-cyclodextrin polymer/Soluplus® encapsulated Ebselen ternary complex (EßpolySol) as a potential therapy for vaginal candidiasis and pre-exposure prophylactic for HIV.	International Journal of Pharmaceutics	-	-	-	1873-3476	10.1016/j.ijpharm.2020.119863	https://dx.doi.org/10.1016/j.ijpharm.2020.119863	Epidemiological findings have discussed recurrent and persistent vulvovaginal candidiasis to be a major manifestation of HIV infected women. Conversely, women with vulvovaginal candidiasis have higher risk of acquiring HIV transmitted during intercourse. Common treatments for such conditions include combined antiretroviral and antifungal therapy. Drug-Drug interaction is a major problem encountered due to common CYP450 metabolic pathway of azoles and antiretroviral drugs. Ebselen (EB), lipophilic, organo-selenium compound has demonstrated promising anti-HIV and anti-fungal activity. The aim of current research was to develop and characterize a rapidly soluble and non-cytotoxic vaginal film of ebselen which could serve dual purpose of treating vulvovaginal candidiasis and pre-exposure prophylactic (PrEP) against HIV. Ebselen/cyclodextrin polymer/Soluplus® (1:10:10) ternary complex (EßpolySol) showed 200 fold enhancement in aqueous solubility and no degradation of EB in thermogravimetry analysis. EßpolySol film with tensile strength of 33.12 ± 1.98 N/cm2 disintegrated within 30 sec, presented instant drug release with no apparent precipitation in simulated vaginal fluid. EßpolySol film showed compatibility with HEC-1A monolayer and HeLa cells compared to VCF®. EßpolySol film showed MIC of 20 µM against Candida species and IC50 of 0.71 µM against HIV. Article	2020	Velloza, Jennifer; Heffron, Renee; Amico, K Rivet; Rowhani-Rahbar, Ali; Hughes, James P; Li, Maoji; Dye, Bonnie J; Celum, Connie; Bekker, Linda-Gail; Grant, Robert M	The Effect of Depression on Adherence to HIV Pre-exposure Prophylaxis Among High-Risk South African Women in HPTN 067/ADAPT.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-02783-8	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7319871	Oral pre-exposure prophylaxis (PrEP) is highly efficacious but low adherence undermines effectiveness. Depression, common in African women, may be a barrier to consistent PrEP use. We aimed to assess the relationship between depression, psychosocial mediators, and PrEP adherence among South African women in HPTN 067, an open-label oral PrEP trial conducted from 2011 to 2013. Participants were followed for 24 weeks. PrEP adherence was measured via Wisepill™ and weekly self-report interview data. We considered participants "adherent" at week 24 if Wisepill™ and interviews indicated that ≥ 80% of expected doses were taken in the prior month. Elevated depressive symptoms were assessed using the 20-item Center for Epidemiologic Studies-Depression (CES-D) scale. We used marginal structural models to estimate the effect of elevated symptoms at baseline on PrEP adherence at week 24 and to assess whether the direct effect changed meaningfully after accounting for mediating effects of stigma, social support, and PrEP optimism. High PrEP adherence occurred less often among women with elevated depressive symptoms (N = 35; 44.3%) compared with those without (N = 52; 54.7%; adjusted relative risk aRR: 0.79; 95% confidence interval CI 0.63-0.99). The effect of elevated depressive symptoms on PrEP adherence persisted in models accounting for the mediating influence of stigma (aRR: 0.74; 95% CI 0.51-0.97) and PrEP optimism (aRR: 0.75; 95% CI 0.55-0.99). We also found a direct effect of similar magnitude and direction when accounting for social support as the mediating variable, although this adjusted relative risk estimate was not statistically significant (aRR: 0.77; 95% CI 0.57-1.03). Depressive symptoms were common and associated with lower PrEP adherence among South African women. Future work is needed to determine whether depression services integrated with PrEP delivery could improve PrEP effectiveness among African women. Article	2020	Velloza, Jennifer; Khoza, Nomhle; Scorgie, Fiona; Chitukuta, Miria; Mutero, Prisca; Mutiti, Kudzai; Mangxilana, Nomvuyo; Nobula, Lumka; Bulterys, Michelle A; Atujuna, Millicent; Hosek, Sybil; Heffron, Renee; Bekker, Linda-Gail; Mgodi, Nyaradzo; Chirenje, Mike; Celum, Connie; Delany-Moretlwe, Sinead	The influence of HIV-related stigma on PrEP disclosure and adherence among adolescent girls and young women in HPTN 082: a qualitative study.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25463	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7060297	INTRODUCTION: Stigma and disclosure concerns have been key barriers to oral pre-exposure prophylaxis (PrEP) adherence for African adolescent girls and young women (AGYW) in efficacy trials. We aimed to understand the impact of these factors among African AGYW in an open-label PrEP study. METHODS: HPTN 082 was an open-label PrEP study among AGYW (ages 16 to 24) in Harare, Zimbabwe, and Cape Town and Johannesburg, South Africa from 2016 to 2018. Women starting PrEP were randomized to standard adherence support (counselling, two-way SMS, monthly adherence clubs) or standard support plus drug-level feedback. Serial in-depth interviews were conducted among 67 AGYW after 13-week and 26-week study visits to explore experiences of stigma, disclosure and PrEP adherence. We analysed data by coding transcripts and memo-writing and diagramming to summarize themes. RESULTS: AGYW described stigma related to sexual activity (e.g. "people say I'm a prostitute") and being perceived to be living with HIV because of taking antiretrovirals (e.g. "my husband's friends say I'm HIV infected"). Participants who anticipated stigma were reluctant to disclose PrEP use and reported adherence challenges. Disclosure also resulted in stigmatizing experiences. Across all sites, negative descriptions of stigma and disclosure challenges were more common in the first interview. In the second interview, participants often described disclosure as an "empowering" way to combat community-level PrEP stigma; many said that they proactively disclosed PrEP in their communities (e.g. became a "community PrEP ambassador"), which improved their ability to take PrEP and encourage others to use PrEP. These empowering disclosure experiences were facilitated by ongoing HPTN 082 study activities (e.g. counselling sessions, adherence clubs) in which they could discuss PrEP-related stigma, disclosure and PrEP adherence issues. CONCLUSIONS: Stigma and disclosure challenges were initial concerns for African AGYW newly initiating PrEP but many were empowered to disclose PrEP use over their first six months of PrEP use, which helped them cope with stigma and feel more able to take PrEP regularly. PrEP programmes can foster disclosure through community and clinic-based discussion, adherence clubs and activities normalizing sexual behaviour and PrEP use, which can reduce stigma and improve PrEP adherence and thus effectiveness. Article	2020	Venter, Willem D. F.; Sokhela, Simiso; Simmons, Bryony; Moorhouse, Michelle; Fairlie, Lee; Mashabane, Nkuli; Serenata, Celicia; Akpomiemie, Godspower; Masenya, Masebole; Qavi, Ambar; Chandiwana, Nomathemba; McCann, Kaitlyn; Norris, Shane; Chersich, Matthew; Maartens, Gary; Lalla-Edward, Samanta; Vos, Alinda; Clayden, Polly; Abrams, Elaine; Arulappan, Natasha; Hill, Andrew	Dolutegravir with emtricitabine and tenofovir alafenamide or tenofovir disoproxil fumarate versus efavirenz, emtricitabine, and tenofovir disoproxil fumarate for initial treatment of HIV-1 infection (ADVANCE): week 96 results from a randomised, phase 3, non-inferiority trial.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(20)30241-1	https://pubmed.ncbi.nlm.nih.gov/33010240/	BACKGROUND: ADVANCE compared the efficacy and safety of two antiretroviral first-line combinations (dolutegravir combined with emtricitabine and either tenofovir disoproxil fumarate or tenofovir alafenamide), with a third regimen (efavirenz combined with emtricitabine and tenofovir disoproxil fumarate) previously recommended by WHO. Here, we report the 96-week data for the study. METHODS: This randomised, open-label, non-inferiority phase 3 trial, was done at two research sites in Johannesburg, South Africa, after participant recruitment from 11 public health clinics also in Johannesburg. Eligible participants were aged 12 years or older with HIV-1 infection, who weighed at least 40 kg, had no antiretroviral exposure in the previous 6 months, with a creatinine clearance of more than 60 mL/min (>80 mL per min in individuals aged <19 years), and a plasma HIV-1 RNA concentration of 500 copies per mL or higher. Individuals who were pregnant or had tuberculosis were excluded. Participants were randomly assigned (1:1:1) by study staff using a computerised randomisation system. Randomisation was stratified by age (12 and <19 years and ≥19 years). Participants were randomly assigned to once-daily oral fixed-dose combination tenofovir alafenamide 25 mg and emtricitabine 200 mg, and once-daily oral dolutegravir 50 mg; once-daily oral fixed-dose combination tenofovir disoproxil fumarate 300 mg and emtricitabine 200 mg, and once-daily oral dolutegravir 50 mg; or once-daily oral fixed-dose combination of tenofovir disoproxil fumarate 300 mg, emtricitabine 200 mg, and efavirenz 600 mg. The primary efficacy endpoint was the proportion of participants who had a plasma HIV-1 RNA concentration of less than 50 copies per mL at week 48, which has been reported previously. Here, we report the key secondary efficacy endpoint of the proportion of participants who had a plasma HIV-1 RNA concentration of less than 50 copies per mL at the week 96 visit, assessed in all participants who received at least one dose of any study drug, with a prespecified non-inferiority margin of -10%. Safety data, including clinical, dual-energy X-ray absorptiometry and laboratory data, are also reported. This study was registered with ClinicalTrials.gov, NCT03122262. FINDINGS: Between Jan 17, 2017, and May 14, 2018, we screened 1453 individuals, of whom 1053 were enrolled: 351 participants were randomly assigned to the tenofovir alafenamide, emtricitabine, and dolutegravir group, 351 to the tenofovir disoproxil fumarate, emtricitabine, and dolutegravir group, and 351 to the tenofovir disoproxil fumarate, emtricitabine, and efavirenz group. All participants received at least one dose of study medication and were included in the primary analysis. At week 96, 276 (79%) of 351 participants in the tenofovir alafenamide, emtricitabine, and dolutegravir group, 275 (78%) of 351 participants in the tenofovir disoproxil fumarate, emtricitabine, and dolutegravir group, and 258 (74%) of 351 participants in the tenofovir disoproxil fumarate, emtricitabine, and efavirenz group had achieved a plasma HIV-1 RNA concentration of less than 50 copies per mL. Non-inferiority was established in all three comparisons. The proportion of patients with protocol-defined virological failure at week 96 was low in all treatment groups. Participants in the tenofovir alafenamide, emtricitabine, and dolutegravir group had fewer changes in bone density than the two other treatment groups. Mean weight gain was substantial (7·1 kg SD 7·4 in the tenofovir alafenamide, emtricitabine, and dolutegravir group; 4·3 kg 6·7 in the tenofovir disoproxil fumarate, emtricitabine, and dolutegravir group, and 2·3 kg 7·0 in the tenofovir disoproxil fumarate, emtricitabine, and efavirenz group), and was greater among women than men. Ten (3%) of 351 participants in the tenofovir disoproxil fumarate, emtricitabine, and efavirenz group discontinued due to treatment-related adverse events, of which liver dysfunction (n=4) and rash (n=4) were most common. INTERPRETATION: Medium-term and long-term metabolic and clinical consequences of the considerable increase in bodyweight observed in participants given these antiretroviral regimens and the trajectory of this weight gain over time, especially among women, require further study. Article	2020	Vera Cruz, Germano; Mateus, Aniceto; Domingos, Lídia; Mullet, Etienne; Moore, Philip J	Assessing Mozambicans' willingness and determinants to use pre-exposure prophylactic HIV medication.	Journal of Health Psychology	-	-	-	1461-7277	10.1177/1359105318783234	https://dx.doi.org/10.1177/1359105318783234	In anticipation of the introduction of the pre-exposure prophylaxis drugs as an additional HIV prevention tool, we mapped the different positions of Mozambicans' willingness to use it. Overall, 507 adults indicated willingness to use under different conditions varying as a function of perceived susceptibility to and severity of infection, side effects, administration protocol, and cost. Three qualitatively different positions were found: Unwillingness irrespective of conditions (4%), depend on circumstances (76%), and unconditional willingness (8%). A large majority of participants were willing to use pre-exposure prophylaxis drugs, provided that the administration is not too constraining, and the adverse side effects can be minimized. Article	2020	Vickerman, Peter; Quaife, Matthew; Kilbourne-Brook, Maggie; Mvundura, Mercy; Eakle, Robyn; Terris-Prestholt, Fern	HIV prevention is not all about HIV - using a discrete choice experiment among women to model how the uptake and effectiveness of HIV prevention products may also rely on pregnancy and STI protection.	BMC Infectious Diseases	-	-	-	1471-2334	10.1186/s12879-020-05399-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7517801	INTRODUCTION: In sub-Saharan Africa, considerable HIV-burden exists among women. Anti-retroviral (ARV) based prevention products could decrease this burden, and their uptake could be increased if they also protect against pregnancy and sexually transmitted infections (STI). METHODS: A discrete choice experiment (DCE) was undertaken in South Africa (2015) through a household survey of adult females (n = 158) and adolescent girls (n = 204) who self-reported HIV-negative status. The DCE was used to project the uptake (percentage using product) of oral pre-exposure prophylaxis (PrEP), vaginal ring, and injectable long-lasting ARV agents among these women, and how uptake could depend on whether these products protect against pregnancy or STI acquisition. Uptake estimates were used to model how each product could decrease a women's HIV acquisition risk. RESULTS: In adolescent women, there will be limited uptake (< 6% for any product) and impact (< 4% decrease in HIV acquisition risk) of new products unless they provide pregnancy protection, which could quadruple use and impact. Adult women have weaker preference for pregnancy protection, with moderate use (< 17% for each) and impact (< 14 percentage point decrease) if they only provide HIV protection. All women had highest preference for injectable ARVs, with oral PrEP having high preference if injectable ARVs are not available. Adult women will use the ring, but adolescent women will not. Importantly, even with three additional prevention products, all providing pregnancy and STI protection, > 14% of women will remain unprotected and > 31% of the baseline acquisition risk will remain. CONCLUSIONS: Incorporating multiple prevention components into new ARV-based prevention products may increase their uptake and impact among women. Article	2020	Vidaurrazaga M.M.; Perlman D.C.	A case of purulent gonococcal arthritis	IDCases	-	-	-	22142509	10.1016/j.idcr.2019.e00662	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075157313&doi=10.1016%2fj.idcr.2019.e00662&partnerID=40&md5=f6fbdb0ea4971b7ec3963a6f768a368c	We present a case of a generally healthy, immunocompetent, 57 year old male on HIV pre-exposure prophylaxis (PrEP) who developed the sudden onset of right wrist pain and swelling with associated left second finger tenosynovitis, due to a disseminated gonococcal infection (DGI) with purulent arthritis. This case's aim is to demonstrate a well-documented but infrequently seen manifestation of Neisseria gonorrhoeae infection and to highlight the need for awareness of extragenital manifestations of gonococcal infection in the era of HIV PrEP. DGI accounts for less than 3 % of N. gonorrhoeae infections, with purulent arthritis being one presentation. The incidence of N. gonorrhoeae infections has increased in recent years and is high among those taking PrEP. Providers should be aware of the possibility of DGI and N. gonorrhoeae as a potential etiologic agent in septic bacterial arthritis. © 2019 The Authors	Disseminated gonococcal infection; Gonococcal arthritis; HIV pre-exposure prophylaxis (PrEP); Neisseria gonorrhoeae	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Article	2020	Vigliotti, Vivian; Taggart, Tamara; Walker, Mahaya; Kusmastuti, Sasmita; Ransome, Yusuf	Religion, faith, and spirituality influences on HIV prevention activities: A scoping review.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0234720	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7297313	INTRODUCTION: Strategies to increase uptake of next-generation biomedical prevention technologies (e.g., long-acting injectable pre-exposure prophylaxis (PrEP)) can benefit from understanding associations between religion, faith, and spirituality (RFS) and current primary HIV prevention activities (e.g., condoms and oral PrEP) along with the mechanisms which underlie these associations. METHODS: We searched PubMed, Embase, Academic Search Premier, Web of Science, and Sociological Abstracts for empirical articles that investigated and quantified relationships between RFS and primary HIV prevention activities outlined by the United States (U.S.) Department of Health and Human Services: condom use, HIV and STI testing, number of sexual partners, injection drug use treatment, medical male circumcision, and PrEP. We included articles in English language published between 2000 and 2020. We coded and analyzed studies based on a conceptual model. We then developed summary tables to describe the relation between RFS variables and the HIV prevention activities and any underlying mechanisms. We used CiteNetExplorer to analyze citation patterns. RESULTS: We identified 2881 unique manuscripts and reviewed 29. The earliest eligible study was published in 2001, 41% were from Africa and 48% were from the U.S. RFS measures included attendance at religious services or interventions in religious settings; religious and/or spirituality scales, and measures that represent the influence of religion on behaviors. Twelve studies included multiple RFS measures. Twenty-one studies examined RFS in association with condom use, ten with HIV testing, nine with number of sexual partners, and one with PrEP. Fourteen (48%) documented a positive or protective association between all RFS factors examined and one or more HIV prevention activities. Among studies reporting a positive association, beliefs and values related to sexuality was the most frequently observed mechanism. Among studies reporting negative associations, behavioral norms, social influence, and beliefs and values related to sexuality were observed equally. Studies infrequently cited each other. CONCLUSION: More than half of the studies in this review reported a positive/protective association between RFS and HIV prevention activities, with condom use being the most frequently studied, and all having some protective association with HIV testing behaviors. Beliefs and values related to sexuality are possible mechanisms that could underpin RFS-related HIV prevention interventions. More studies are needed on PrEP and spirituality/subjective religiosity. Article	2020	Villeneuve, France; Cabot, Jean-Michel; Eymard-Duvernay, Sabrina; Visier, Laurent; Tribout, Vincent; Perollaz, Cyril; Reynes, Jacques; Makinson, Alain	Evaluating family physicians' willingness to prescribe PrEP.	Médecine et Maladies Infectieuses	-	-	-	-	1769-6690	10.1016/j.medmal.2020.02.003	https://dx.doi.org/10.1016/j.medmal.2020.02.003	INTRODUCTION: We assessed family physicians' (FP) willingness to integrate PrEP into their clinical practice in Montpellier and its surroundings. METHOD: We aimed to randomly assess 92 FPs. RESULTS: Ninety-six FPs were interviewed from May to December 2018: 78% (95% CI 69; 86) were willing to integrate PrEP, 65% to be trained, and 52% to be the first providers. Of the 65 (6%) with some knowledge of PrEP, 21 were not aware of targeted populations and 39 never talked about PrEP with their patients. Nearly all FPs declared HIV prevention as part of their job and felt at ease talking about sexuality. Considering HIV prevention as part of their job was associated with increased likelihood to integrate PrEP into their practice (P=0.015). CONCLUSIONS: Most FPs were willing to integrate and be trained on PrEP. Lack of PrEP prescription seemed related to a lack of knowledge. Article	2020	Vogelzang M.; Terris-Prestholt F.; Vickerman P.; Delany-Moretlwe S.; Travill D.; Quaife M.	Cost-Effectiveness of HIV Pre-exposure Prophylaxis Among Heterosexual Men in South Africa: A Cost-Utility Modeling Analysis	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002327	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85084692843&doi=10.1097%2fQAI.0000000000002327&partnerID=40&md5=31d24b6b88b69e7400543d285f68d4dd	Introduction:Heterosexual men are not considered a key population in the HIV response and are mostly absent from pre-exposure prophylaxis (PrEP) studies to date. Yet, South African men face considerable HIV risk. We estimate the incremental cost-effectiveness of providing oral PrEP, injectable PrEP, or a combination of both to heterosexual South African men to assess whether providing PrEP would efficiently use resources.Methods:Epidemiological and costing models estimated the one-year costs and outcomes associated with PrEP use in 3 scenarios. PrEP uptake was estimated for younger (aged 18-24) and older (aged 25-49) men using a discrete choice experiment. Scenarios were compared with a baseline scenario of male condom use, while a health system perspective was used to estimate discounted lifetime costs averted per HIV infection. PrEP benefit was estimated in disability-adjusted life years (DALYs) averted. Uncertainty around the estimated incremental cost-effectiveness ratios (ICERs) was assessed using deterministic and probabilistic sensitivity analyses.Results:No PrEP intervention scenarios were cost-effective for both age groups at a willingness-to-pay threshold of $1175/DALY averted. The lowest ICER ($2873/DALY averted) was for the provision of oral PrEP to older men, although probability of cost-effectiveness was just 0.26%. Results found that ICERs were sensitive to HIV incidence and antiretroviral coverage.Conclusions:This study estimates that providing PrEP to heterosexual South African men is not cost-effective at current cost-effectiveness thresholds. Given the ICERs' sensitivity to several variables, alongside the heterogeneity of HIV infection among South African men, PrEP may be cost-effective for older men with high incidence and other subgroups based on locality and race. We recommend further investigation to better identify and target these groups. © 2020 Lippincott Williams and Wilkins. Book	2020	Von Kleist, M., Anderson, P. L., Garcia-Lerma, G., & Liu, A.	Pharmacokinetics and Pharmacodynamics of Pre-Exposure Prophylaxis Against HIV	-	Pharmacokinetics and Pharmacodynamics of Pre-Exposure Prophylaxis Against HIV	-	-	978-2-88966-096-4	-	NA	https://ebooks.mpdl.mpg.de/ebooks/Record/EB002049616	Since its discovery more than 30 years ago, human immunodeficiency virus (HIV) infection continues to be one of our greatest health challenges. Antiretroviral combination therapy can effectively suppress virus replication and prevent immunodeficiency. However, HIV can persist in cellular and anatomical reservoirs for decades, precluding its clearance within the infected individual. While therapies are being developed to clear this reservoir, a cure remains elusive to date. Another strategy to eliminate the virus and reduce its devastation to human health is to prevent its transmission. This goal can be achieved by vaccination, a strategy that has been successful in eliminating other viral infections (smallpox, rinderpest). The development of a broadly effective vaccine against HIV, however, poses enormous challenges that have yet to be overcome. In view of the unavailability of vaccines and options to cure HIV infected individuals, attention has been turned on repurposing antiretroviral treatment to prevent HIV transmission. Two general methods have been suggested: (i) 'Treatment as Prevention' (TasP) reduces the contagiousness of infected individuals by suppressing their viremia. However, infection needs to be diagnosed early enough and treatment initiated immediately for this strategy to be epidemiologically effective, i.e. prevent enough putative transmission events. (ii) Pre-exposure prophylaxis (PrEP), akin to vaccination, is applied to the uninfected individual at risk. During the early events following exposure to HIV, the virus can still be cleared. PrEP inhibits virus replication which reduces the probability of establishing a productive infection. Unlike vaccination, PrEP does not induce an immunization reaction, and is therefore only efficient when the concentrations of antiretroviral drugs are above the threshold required for protection. This poses particular demands on the pharmacokinetics of PrEP, its administration schemes and the willingness of PrEP users to adhere to them. The first PrEP regimen (Truvada: oral once daily emtricitabine + tenofovir disoproxil fumarate) was approved by the FDA in 2012, While it is generally safe, there are major pharmacological shortcomings of this regimen (i.e, the need for once-daily dosing) that may be overcome by next-generation PrEP regimen. Currently, next-generation PrEP compounds and novel dosing approaches are under investigation, including event-driven dosing, topically applied PrEP and some 'long-acting formulations' that may reduce variability arising from medication non-adherence. Yet still, pharmacological factors ultimately determining PrEP efficacy in different risk groups are incompletely understood. Such knowledge can significantly improve prioritization of PrEP candidates and dosing regimen to be advanced into human trials. This Research Topic (Frontiers Special Issue) is devoted to pharmacokinetics (drug concentration time profile) and pharmacodynamics (concentration-response) of PrEP to help understand clinical variability in PrEP effectiveness, translating animal models and planning and evaluating clinical trials with PrEP. The focus will be on pre-clinical and clinical data, as well as mathematical models that integrate the various factors determining PrEP effectiveness. Article	2020	Wahome E.W.; Graham S.M.; Thiong'o A.N.; Mohamed K.; Oduor T.; Gichuru E.; Mwambi J.; van der Elst E.M.; Sanders E.J.	Risk factors for loss to follow-up among at-risk HIV negative men who have sex with men participating in a research cohort with access to pre-exposure prophylaxis in coastal Kenya	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25593	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091863365&doi=10.1002%2fjia2.25593&partnerID=40&md5=5d50a2c8368b559ec26d566bf9b9fd17	Introduction: Retention in preventive care among at-risk men who have sex with men (MSM) is critical for successful prevention of HIV acquisition in Africa. We assessed loss to follow-up (LTFU) rates and factors associated with LTFU in an HIV vaccine feasibility cohort study following MSM with access to pre-exposure prophylaxis (PrEP) in coastal Kenya. Methods: Between June 2017 and June 2019, MSM cohort participants attending a research clinic 20 km north of Mombasa were offered daily PrEP and followed monthly for risk assessment, risk reduction counselling and HIV testing. Participants were defined as LTFU if they were late by >90 days for their scheduled appointment. Participants who acquired HIV were censored at diagnosis. Cox proportional hazards models were used to estimate adjusted Hazard Ratio (aHR) of risk factors for LTFU. Results and discussion: A total of 179 participants with a median age of 25.0 years (interquartile range IQR: 23.0 to 30.0) contributed a median follow-up time of 21.2 months (IQR: 6.5 to 22.1). Of these, 143 (79.9%) participants started PrEP and 76 (42.5%) MSM were LTFU, for an incidence rate of 33.7 (95% confidence interval CI, 26.9 to 42.2) per 100 person-years. Disordered alcohol use (aHR: 2.3, 95% CI, 1.5 to 3.7), residence outside the immediate clinic catchment area (aHR: 2.5, 95% CI, 1.3 to 4.6 for Mombasa Island; aHR: 1.8, 95% CI, 1.0 to 3.3 for south coast), tertiary education level or higher (aHR: 2.3, 95% CI, 1.1 to 4.8) and less lead-in time in the cohort prior to 19 June 2017 (aHR: 3.1, 95% CI, 1.8 to 5.6 for zero to three months; aHR: 2.4, 95% CI, 1.2 to 4.7 for four to six months) were independent predictors of LTFU. PrEP use did not differ by LTFU status (HR: 1.0, 95% CI, 0.6 to 1.5). Psychosocial support for men reporting disordered alcohol use, strengthened engagement of recently enrolled participants and focusing recruitment on areas close to the research clinic may improve retention in HIV prevention studies involving MSM in coastal Kenya. Conclusions: About one in three participants became LTFU after one year of follow-up, irrespective of PrEP use. Research preparedness involving MSM should be strengthened for HIV prevention intervention evaluations in coastal Kenya. © 2020 The Authors. Article	2020	Wahome, Elizabeth W.; Graham, Susan M.; Thiong'o, Alexander N.; Mohamed, Khamisi; Oduor, Tony; Gichuru, Evans; Mwambi, John; Prins, Prof. Maria; van der Elst, Elise; Sanders, Prof. Eduard J.	PrEP uptake and adherence in relation to HIV-1 incidence among Kenyan men who have sex with men	EClinicalMedicine	-	-	-	-	2589-5370	10.1016/j.eclinm.2020.100541	https://pubmed.ncbi.nlm.nih.gov/33089128/#:~:text=Of%20nine%20MSM%20who%20acquired,6%2D11%C2%B73)%20per	Data on HIV-1 incidence following programmatic pre-exposure prophylaxis (PrEP) uptake by men who have sex with men (MSM) are limited in sub-Saharan Africa. Since June 2017, MSM participating in an ongoing cohort study in Kenya were offered daily PrEP, assessed for PrEP uptake and adherence, and evaluated for HIV-1 acquisition monthly. We determined tenofovir-diphosphate (TFV-DP) concentrations in dried blood spots 6–12 months after PrEP initiation, and tenofovir (TFV) concentrations and genotypic drug resistance in plasma samples when HIV-1 infection occurred. We assessed HIV-1 incidence by reported PrEP use. Of 172 MSM, 170 (98·8%) were eligible for PrEP, 140 (82·4%) started it, and 64 (57·7%) reported PrEP use at end of study. Of nine MSM who acquired HIV-1 incidence rate: 3·9 (95% confidence interval (CI), 2·0–7·4) per 100 person-years (PY), five reported PrEP use at the time of HIV-1 acquisition incidence rate: 3·6 (95% CI, 1·5–8·6) per 100 PY) and four had stopped or had never started PrEP incidence rate: 4·3 (95% CI, 1·6–11·3) per 100 PY. Among 76 MSM who reported PrEP use, 11 (14·5%) had protective TFV-DP concentrations of ≥700 fmol/punch (≥4 tablets a week). Among the five MSM who acquired HIV-1 while reporting PrEP use, only one had detectable but low TFV concentrations in plasma and none had genotypic HIV-1 resistance. HIV-1 incidence among MSM with access to programmatic PrEP was high and did not differ by reported PrEP use. Only one in seven MSM taking PrEP had protective tenofovir concentrations and four out of five MSM who acquired HIV-1 while reporting PrEP use had not taken it. Strengthened PrEP adherence support is required among MSM in Kenya. Essay	2020	Wakkee M.; Eekhof J.	Care for skin cancer by the general practitioner; Huidkankerzorg door de huisarts	Nederlands Tijdschrift voor Dermatologie en Venereologie	-	-	-	-	9258604	NA	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096536928&partnerID=40&md5=2b187da305381fd99a01c38a2dc990aa	Men who have sex with men are one of the most severely affected groups in the HIV/AIDS epidemic. Until recently, HIV prevention campaigns focused on safe sex, reducing the number of partners and the use of condoms. In recent years, highly effective biomedical interventions that use antiretroviral combination therapy (ART) have become available. In addition to the health benefit for the patient, the use of ART in the last 10 years has shown a dramatic decrease in the number of new HIV diagnoses, from 2% in 2011 to 0.3% over the first half of 2019. Immediate start of HIV treatment after diagnosis, regardless of the degree of immune suppression (also known as Treatment as Prevention), and the use of ART as Pre-Exposition Prophylaxis (PrEP) significantly contributed to this decline. Reducing the number of new HIV infections in the Netherlands to zero in 2030 as formulated by SOA AIDS Netherlands and by the RIVM in the National Action Plan for HIV/STD seems feasible. © 2020, Stichting Beheer Tijdschriften Dermatologie. Article	2020	Walensky, Rochelle P; Horn, Tim; McCann, Nicole C; Freedberg, Kenneth A; Paltiel, A David	Comparative Pricing of Branded Tenofovir Alafenamide-Emtricitabine Relative to Generic Tenofovir Disoproxil Fumarate-Emtricitabine for HIV Preexposure Prophylaxis: A Cost-Effectiveness Analysis.	Annals of Internal Medicine	-	-	-	-	1539-3704	10.7326/M19-3478	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7217721	Background: Tenofovir alafenamide-emtricitabine (F/TAF) was recently approved as a noninferior and potentially safer option than tenofovir disoproxil fumarate-emtricitabine (F/TDF) for HIV preexposure prophylaxis (PrEP) in the United States. Objective: To estimate the greatest possible clinical benefits and economic savings attributable to the improved safety profile of F/TAF and the maximum price payers should be willing to pay for F/TAF over generic F/TDF. Design: Cost-effectiveness analysis. Data Sources: Published literature on F/TDF safety (in persons with and those without HIV) and the cost and quality-of-life effects of fractures and end-stage renal disease (ESRD). Target Population: Age-stratified U.S. men who have sex with men (MSM) using PrEP. Time Horizon: Five years. Perspective: Health care sector. Intervention: Preexposure prophylaxis with F/TAF versus F/TDF. Outcome Measures: Fractures averted, cases of ESRD averted, quality-adjusted life-years (QALYs) saved, costs, incremental cost-effectiveness ratios (ICERs), and maximum justifiable price for F/TAF compared with generic F/TDF. Results of Base-Case Analysis: Over a 5-year horizon, compared with F/TDF, F/TAF averted 2101 fractures and 25 cases of ESRD for the 123 610 MSM receiving PrEP, with an ICER of more than $7 million per QALY. At a 50% discount for generic F/TDF ($8300 per year) and a societal willingness to pay up to $100 000 per QALY, the maximum fair price for F/TAF was $8670 per year. Results of Sensitivity Analysis: Among persons older than 55 years, the ICER for F/TAF remained more than $3 million per QALY and the maximum permissible fair price for F/TAF was $8970 per year. Results were robust to alternative time horizons and PrEP-using population sizes. Limitation: Intermittent use and on-demand PrEP were not considered. Conclusion: In the presence of a generic F/TDF alternative, the improved safety of F/TAF is worth no more than an additional $370 per person per year. Primary Funding Source: National Institute of Allergy and Infectious Diseases, National Institute on Drug Abuse, National Institute of Mental Health, and Massachusetts General Hospital Executive Committee on Research. Article	2020	Walsh, Tim; Schneider, John A; Ardestani, Babak Mahdavi; Young, Lindsay E	Individual and Social Network Structure Characteristics Associated with Peer Change Agent Engagement and Impact in a PrEP Intervention	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-020-02911-4	https://www.proquest.com/scholarly-journals/individual-social-network-structure/docview/2471816731/se-2?accountid=8113	Interventions that utilize the influence of peer change agents (PCAs) have been shown to be effective strategies for engaging key populations in HIV prevention. To date, little is known about the characteristics of PCAs associated with their effectiveness. Drawing on data from a peer leader PrEP intervention for young Black men who have sex with men (YBMSM) (N = 423), we evaluated the effects of experiential (i.e., living with HIV, PrEP awareness, PrEP use), psychographic (i.e., self-perceived leadership, innovativeness), and network (i.e., degree centrality, eigenvector centrality, and brokerage) characteristics on three effectiveness outcomes: (1) recruiting peers into the study; (2) completing "booster" sessions; and (3) linking peers to PrEP care. For each outcome, multivariable regressions were performed. On average, PCAs recruited 0.89 peers, completed 1.99 boosters, and had 1.33 network peers linked to PrEP care. Experiential factors: Prior PrEP awareness was positively associated with booster completion. Network factors: Being a network broker (i.e., connecting otherwise disconnected communities) was positively associated with peer recruitment but negatively associated with linking peers to PrEP, and degree centrality (i.e., the number of network connections someone has) and eigenvector centrality (i.e., being connected to well-connected network associates) were positively associated with linking peers to PrEP. Psychographic characteristics were not associated with any outcome. These findings can be used to inform PCA selection and to identify subpopulations who require additional support to excel as PCAs. Article	2020	Walters, Suzan M; Coston, Bethany; Neaigus, Alan; Rivera, Alexis V; Starbuck, Lila; Ramirez, Valentina; Reilly, Kathleen H; Braunstein, Sarah L	The role of syringe exchange programs and sexual identity in awareness of pre-exposure prophylaxis (PrEP) for male persons who inject drugs	The International Journal on Drug Policy	-	-	-	-	09553959	10.1016/j.drugpo.2020.102671	https://www.proquest.com/scholarly-journals/role-syringe-exchange-programs-sexual-identity/docview/2442314077/se-2?accountid=8113	Background: Male persons who inject drugs (male PWID) are at heightened risk for HIV, particularly if they also have sex with men. Pre-exposure prophylaxis (PrEP) could aid in HIV prevention for this population, but PrEP awareness within different sexual identities among male PWID is not well-understood. We report factors associated with greater awareness among male PWID to identify efficient means of awareness dissemination. Methods: Data from the 2015 National HIV Behavioral Surveillance (NHBS) system cycle on injection drug use collected in New York City (NYC) were used. Bivariable analyses, using chi-squared statistics, were conducted to examine correlates of awareness of PrEP with socio-demographic, behavioral, and health care variables. Log-linked Poisson regression with robust standard errors was used to estimate adjusted prevalence ratios and determine differences in awareness of PrEP. Results: Among a sample of 332 male PWID (i.e., PWID who identified as male, not transgender) we find awareness of PrEP to be low (23%) among male PWID despite 68% reporting condomless vaginal/anal sex and 32% reporting injection equipment sharing in the last twelve months. Multivariable analysis found greater PrEP awareness associated with gay or bisexual identity (aPR: 2.77, 95% CI: 1.81–4.24) and having a conversation about HIV prevention at a syringe exchange program (SEP) (aPR: 2.71, 95% CI: 1.87–3.94) to be associated with increased PrEP awareness. Conclusion: We found low rates of PrEP awareness among male PWID. However, our findings provide insight into information diffusion that can be utilized to increase PrEP awareness among male PWID and among all PWID. We suggest that gay and bisexual social networks and syringe exchange programs are diffusing PrEP awareness among male PWID and can be harnessed to increase PrEP awareness among male PWID. Article	2020	Walters, Suzan M; Kral, Alex H; Simpson, Kelsey A; Wenger, Lynn; Bluthenthal, Ricky N	HIV Pre-Exposure Prophylaxis Prevention Awareness, Willingness, and Perceived Barriers among People Who Inject Drugs in Los Angeles and San Francisco, CA, 2016-2018.	Substance Use and Misuse	-	-	-	-	1532-2491	10.1080/10826084.2020.1823419	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7665852	BACKGROUND: Pre-exposure prophylaxis (PrEP) for HIV prevention is indicated for people who inject drugs (PWID), yet most studies do not focus on PWID. This study examines factors associated with PrEP awareness and willingness, and identifies perceived barriers to PrEP among PWID. Methods: PWID were interviewed in Los Angeles and San Francisco, CA from 2016 to 2018. We analyzed data from self-reported HIV-negative participants who had injected drugs within the past 6 months (n = 469). Questions on PrEP included awareness, willingness, barriers, and uptake. Multiple logistic regression models of factors associated with awareness of, and willingness to, take PrEP were developed. Descriptive statistics on perceived PrEP barriers are reported. Results: Among HIV-negative PWID, 40% were aware of PrEP, 59% reported willingness to take PrEP, and 2% were currently taking PrEP. In multivariable analysis, PrEP awareness was associated with study site and sexual minority status, higher educational attainment, and HIV testing in the last 6 months. Willingness to take PrEP was associated with self-reported risk (paying sex partner in the last 6 months, sharing drug paraphernalia, and being injected by another PWID) and perceived HIV risk. The most common perceived barriers to PrEP were copays, concerns about increased HIV or sexually transmitted risk with PrEP, and concerns about reduction of medication efficacy without daily use. Conclusion: PrEP awareness among PWID remains inadequate. Willingness to take PrEP was moderate and was most desired by PWID who engaged in high-risk behaviors. Interventions to increase PrEP awareness and willingness, and to facilitate PrEP uptake among PWID are needed. Article	2020	Wang L.Y.; Hamilton D.T.; Rosenberg E.S.; Aslam M.V.; Sullivan P.S.; Katz D.A.; Dunville R.L.; Barrios L.C.; Goodreau S.M.	Cost-Effectiveness of Pre-Exposure Prophylaxis Among Adolescent Sexual Minority Males	Journal of Adolescent Health	-	-	-	-	1054139X	10.1016/j.jadohealth.2019.07.022	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075989645&doi=10.1016%2fj.jadohealth.2019.07.022&partnerID=40&md5=fdcfa3990a49aeafc5752c463e024283	Purpose: Pre-exposure prophylaxis (PrEP) has been proven safe and effective in preventing HIV among adolescent sexual minority males (ASMM), but the cost-effectiveness of PrEP in ASMM remains unknown. Building on a recent epidemiological network modeling study of PrEP among ASMM, we estimated the cost-effectiveness of PrEP use in a high prevalence U.S. setting with significant disparities in HIV between black and white ASMM. Methods: Based on the estimated number of infections averted and the number of ASMM on PrEP from the previous model and published estimates of PrEP costs, HIV treatment costs, and quality-adjusted life years (QALYs) gained per infection prevented, we estimated the cost-effectiveness of PrEP use in black and white ASMM over 10 years using a societal perspective and lifetime horizon. Effectiveness was measured as lifetime QALYs gained. Cost estimates included 10-year PrEP costs and lifetime HIV treatment costs saved. Cost-effectiveness was measured as cost/QALY gained. Multiple sensitivity analyses were performed on key model input parameters and assumptions used. Results: Under base-case assumptions, PrEP use yielded an incremental cost-effectiveness ratio of $33,064 per QALY in black ASMM and $427,788 per QALY in white ASMM. In all sensitivity analyses, the cost-effectiveness ratio of PrEP use remained <$100,000 per QALY in black ASMM and >$100,000 per QALY in white ASMM. Conclusions: We found favorable cost-effectiveness ratios for PrEP use among black ASMM or other ASMM in communities with high HIV burden at current PrEP costs. Clinicians providing services in high-prevalence communities, and particularly those serving high-prevalence communities of color, should consider including PrEP services. © 2019	Adolescent sexual minority males; Cost-effectiveness; PrEP use	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Essay	2020	Wang X.; Xu J.; Wu Z.	A Pilot Program of Pre-Exposure and Post-Exposure Prophylaxis Promotion among Men Who Have Sex with Men — 7 Study Sites, China, 2018–2019	China CDC Weekly	-	-	-	-	20967071	10.46234/ccdcw2020.250	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130294681&doi=10.46234%2fccdcw2020.250&partnerID=40&md5=cba00fb2970d75f843a397216b2e429a	Summary What is already known on this topic? Pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) had been proved to be effective in HIV prevention among men who have sex with men (MSM) internationally. Use of either PrEP or PEP was found to be limited among Chinese MSM. Relatively little data was reported in China. What is added by this report? Our program indicated that PEP was more acceptable than PrEP among MSM in China. Drugs of lower cost and related knowledge dissemination could increase PrEP and PEP uptake among MSM in China. What are the implications for public health practice? PrEP and PEP are likely to contribute significantly to human immunodeficiency virus (HIV) prevention in China. © 2020, Chinese Center for Disease Control and Prevention. All rights reserved. GSN apps' users have become a unique large subpopulation among MSM for interventions concerning HIV prevention and control. Pre-exposure prophylaxis (PrEP) is a promising measure for HIV prevention, especially for MSM, but its effectiveness largely depends on medication adherence. However, little is known about PrEP adherence among GSN apps' users, which is critical to addressing the overall optimization of PrEP compliance outside of clinical trials in the context of large-scale implementation. Objective The objective of this study is to understand the correlation between GSN apps' use and medication adherence among MSM receiving PrEP, with the aim to increase their awareness about PrEP use in order to increase adherence. Methods This study based on the China Real-world Oral intake of PrEP (CROPrEP) project, a multicenter, real-world study of Chinese MSM on daily and event-driven PrEP. Eligible participants completed a detailed computer-assisted self-interview on sociodemographic, GSN apps' use, and sexual behavior. Then participants were followed up for 12 months and assessed for various characteristics (eg, PrEP delivery, adherence assessment, PrEP coverage of sexual activities, and regimens switch). A generalized estimation equation was used to analyze the predictors of medication adherence and regimen conversion among GSN apps' users and nonusers. Results At baseline, 756 of the 1023 eligible participants (73.90%) reported primarily using GSN apps to seek sexual partners, and GSN apps' users are more likely to have high-risk behaviors such as multiple sex partners and condomless anal intercourse than other nonusers (all P<.05). During follow-up, GSN apps' users had a significantly low level of pill-counting adherence than nonusers (adjusted odds ratio aOR 0.8, 95% CI 0.6-1.0, P=.038). In the event-driven group, GSN apps' users had marginally lower levels of self-reported adherence (aOR 0.7, 95% CI 0.4-1.0, P=.060) and lower PrEP coverage of sexual practices (aOR 0.6, 95% CI 0.4-1.0, P=.038). Additionally, GSN apps' users seemed more likely to switch from event-driven to daily regimen (aOR 1.8, 95% CI 0.9-3.3, P=.084). Conclusions GSN apps' users are highly prevalent among MSM, despite their higher sexual risk and lower adherence levels, suggesting that eHealth needs to be introduced to the GSN platform to promote PrEP adherence. Article	2020	Wang, Hui	HIV care during the coronavirus disease-2019 pandemic in Shenzhen, China.	Current Opinion in HIV and AIDS	-	-	-	-	1746-6318	10.1097/COH.0000000000000653	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7588025	PURPOSE OF REVIEW: Due to the stringent measures including quarantine of infected individuals and social distancing, the COVID-19 pandemic has posted great challenges for HIV-1 care in China. In this mini-review, I will discuss the situation in Shenzhen city as a window of China to reflect our strategies in fighting the concurrent HIV/AIDS and COVID-19 pandemics. RECENT FINDINGS: Prevention of nosocomial infection, minimizing the follow-up visits to the hospital, maintaining the delivery of PreP/PEP services and testing for SARS-Cov-2 and HIV when someone have fever or respiratory symptoms were the four major approaches to maintain uninterrupted HIV care in Shenzhen. None of 15á000 PLWH seeking HIV care at Shenzhen were diagnosed with COVID-19 during this pandemic. SUMMARY: This article share the experience unprecedented from Shenzhen. We have to adapt our care and service to continue to engage PLWH to avoid poor outcomes. More research is needed to know the long-term implications of pandemic for the health of PLWH.	antiretroviral therapy, coronavirus, nosocomial infection, people living with HIV, SARS-Co-2	English	United Kingdom	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Review

Of 5 recent partnerships where both individuals were HIV-negative, we compared observed concordance in preexposure prophylaxis (PrEP) use with the counterfactual if zero individuals selected partners based on PrEP use.We estimated the concordance by chance using a balancing-partnerships approach assuming proportionate mixing.HIV-positive respondents had a higher proportion of HIV-positive partners (66.4%, 95% confidence interval (CI): 64.0, 68.6) than by chance (23.9%, 95% CI: 23.1, 24.7). HIV-negative respondents (both on and not on PrEP) had higher proportions of HIV-negative partners (82.9% (95% CI: 81.1, 84.7) and 90.7% (95% CI: 89.6, 91.7), respectively) compared with by chance (76.1%, 95% CI: 75.3, 76.9); however, those on PrEP had a higher proportion of HIV-positive partners than those not on PrEP (17.1% (95% CI: 15.3, 18.9) vs. 9.3% (95% CI: 8.3, 10.4). Those on PrEP also had a higher proportion of partners on PrEP among their HIV-negative partners (50.6%, 95% CI: 42.5, 58.8) than by chance (28.5%, 95% CI: 27.5, 29.4).The relationship between PrEP and sexual-mixing patterns demonstrated by less population-level serosorting among those on PrEP and PrEP-matching warrants consideration during PrEP roll-out. © 2020 Oxford University Press. Article	2020	Wang, Zixin; Mo, Phoenix K H; Ip, Mary; Fang, Yuan; Lau, Joseph T F	Uptake and willingness to use PrEP among Chinese gay, bisexual and other men who have sex with men with experience of sexualized drug use in the past year.	BMC Infectious Diseases	-	-	-	-	1471-2334	10.1186/s12879-020-05024-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7178573	BACKGROUND: Sexualized drug use (SDU) refers to use of any psychoactive substance before/during sexual intercourse. Chemsex is a subset of SDU, which is defined as the use of some specific psychoactive substances (methamphetamine, mephedrone, Î³-hydroxybutyrate, ketamine and cocaine) before/during sexual intercourse. SDU and chemsex are prevalent among gay, bisexual and other men who have sex with men (GBMSM). This study investigated uptake and willingness to use pre-exposure prophylaxis (PrEP) among a sample of GBMSM in Hong Kong with experience of SDU in the past year. METHODS: A total of 600 GBMSM were recruited by convenient sampling through outreaching in gay venues, online recruitment and peer referral. Participants completed a cross-sectional anonymous telephone interview. This study was based on a subsample of 580 GBMSM self-reported as HIV negative/unknown sero-status. RESULTS: Of the participants, 82 (14.1%) and 37 (6.4%) had experience of SDU and chemsex in the past year. The prevalence of PrEP uptake was 4.0% among all participants and 14.6% among those with experience of SDU in the past year. Among GBMSM with experience of SDU in the past year who were not on PrEP (n = 70), 67.1% were willing to use daily oral PrEP in the next 6 months. Multivariate logistic regression models showed that positive attitudes toward PrEP (AOR: 2.37, 95%CI: 1.47, 3.82), perceived support from significant others to use PrEP (AOR: 9.67, 95%CI: 2.95, 31.71), and perceived behavioral control of using PrEP (AOR: 19.68, 95%CI: 5.44, 71.26) were significantly associated with higher willingness to use PrEP. CONCLUSION: GBMSM with experience of recent SDU are potentially good candidates of PrEP implementation. This group of GBMSM reported high prevalence of uptake and willingness to use PrEP. Perceptions related to PrEP based on the Theory of Planned Behavior were significantly associated with willingness to use PrEP. Article	2020	Wang, Zixin; Yang, Xue; Mo, Phoenix K H; Fang, Yuan; Ip, Tsun Kwan Mary; Lau, Joseph T F	Influence of Social Media on Sexualized Drug Use and Chemsex Among Chinese Men Who Have Sex With Men: Observational Prospective Cohort Study.	Journal of Medical Internet Research	-	-	-	-	1438-8871	10.2196/17894	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7414399	BACKGROUND: Sexualized drug use (SDU; the use of any psychoactive substance before or during sexual intercourse) is prevalent among men who have sex with men (MSM) and may aggravate the worsening HIV epidemic in this key population. OBJECTIVE: This observational prospective cohort study investigated factors predicting the occurrence of SDU within a 6-month follow-up period among a sample of MSM in Hong Kong. We hypothesized that perceptions related to SDU would mediate the association between the influence of social media/gay social networking apps and SDU during the follow-up period. METHODS: Participants were Chinese-speaking men in Hong Kong, China who had anal intercourse with at least one man in the past year. Among 600 participants who completed the baseline telephone survey, 407 (67.8%) completed another telephone survey 6 months later. Logistic regression models and path analysis were fitted. RESULTS: At Month 6, 6.9% (28/407) and 4.4% (18/407) of participants reported SDU and chemsex during the follow-up period. After adjustment for significant baseline background variables (use of pre-exposure prophylaxis; history of HIV and other sexually transmitted infections; anal intercourse with nonregular male sex partners, condomless anal intercourse with men, multiple male sex partnerships, and SDU at baseline), three constructs of the Theory of Planned Behavior (TPB) were significantly associated with SDU during the follow-up period: (1) positive attitudes toward SDU (adjusted odds ratio AOR 1.19, 95% CI 1.05-1.36), (2) perceived support for SDU from significant others (AOR 1.15, 95% CI 1.01-1.30), and (3) perceived behavioral control of refraining from SDU (AOR 0.76, 95% CI 0.59-0.98). Exposure to information supporting SDU on social media and gay social networking apps was also significantly associated with SDU (AOR 1.11, 95% CI 1.01-1.22). Bootstrapping analyses indicated that social media influence was indirectly associated with SDU through TPB-related perceptions of SDU (ß=.04; B=.002, 95% CI 0.001-0.01). CONCLUSIONS: Social media and gay social networking apps may be a major source of influence on MSM's perceptions and actual behaviors related to SDU.	influence of social media, sexualized drug use, chemsex, men who have sex with men, prospective observational cohort study	English	Germany	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Clinical

Sexual Behavior and Perceived HIV Risk Among HIV-Negative Members of Serodiscordant Couples in East Africa	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-019-02773-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85077680730&doi=10.1007%2fs10461-019-02773-5&partnerID=40&md5=7440459259c59684af011348de7a13d6	HIV risk perception may influence the use of HIV prevention interventions. Using data from HIV-negative adults enrolled in a study of pre-exposure prophylaxis (PrEP) and antiretroviral therapy for HIV-serodiscordant couples in Kenya and Uganda, we examined associations between: (1) condom use and risk perception and (2) risk perception and PrEP adherence. Two-thirds of HIV-negative partners reported condomless sex with their HIV-positive partner or another partner in the month prior to study enrollment. Compared to those who reported no condomless sex, participants who reported condomless sex during the month prior to study visit had fivefold higher odds of reporting "high risk" vs "no risk" perception (36.3 versus 10.9%: aOR 4.9, 95% CI 3.4–6.9). Reporting condomless sex in the most recent sex act was associated with increased odds of perceiving some HIV risk (aOR for high risk = 7.3, 95% CI 4.9–10.8; aOR for moderate risk = 4.8, 95% CI 3.5–6.7; aOR for low risk = 3.5, 95% CI 2.7–4.6). We found no significant association between risk perception and PrEP adherence. Sexual behavior aligned with perceived HIV risk, which can facilitate an HIV-negative individual's decisions about PrEP use. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Theses and Dissertations	2020	Wanga, Valentine	Improving Pre-Exposure Prophylaxis Delivery for Young Women in Kenya	-	-	University of Washington	University of Washington	-	-	NA	https://epi.washington.edu/epi_research/improving-pre-exposure-prophylaxis-delivery-for-young-women-in-kenya/	The rollout of pre-exposure prophylaxis (PrEP) for HIV prevention to priority populations, including young women, is expanding in sub-Saharan Africa. However, existing barriers to PrEP rollout at the individual, community and policy levels could slow progress and impede the success of PrEP implementation programs. In order to achieve success in HIV prevention, it is crucial to address these barriers, particularly among young women, a population especially vulnerable to HIV. In this dissertation, we evaluated the links among risk perception, sexual behavior and PrEP adherence in serodiscordant couples, evaluated the impact of incorporating HIVST in PrEP delivery for young women and assessed the cost of delivering PrEP to young women. In Aim 1, we used data from HIV-negative adults enrolled in a study of PrEP and antiretroviral therapy for HIV-serodiscordant couples in Kenya and Uganda to examine associations between: 1) condom use and risk perception and 2) risk perception and PrEP adherence. In Aim 2, we offered HIV self-testing (HIVST) to young women enrolled in a PrEP implementation study in two family planning clinics and assessed satisfaction with HIV testing and clinic experience, and the impact of HIVST on PrEP delivery procedures. In Aim 3, using the same population as that in Aim 2, we used micro-costing methods to estimate the incremental cost of delivering PrEP to young women. We found that sexual behavior aligned with perceived HIV risk, which can facilitate an HIV-negative individual's decisions about PrEP use. Additionally, we found HIVST to be feasible and acceptable for young women using PrEP, highlighting the need to evaluate its utility to streamline PrEP delivery and provide more testing options for young women on PrEP. Lastly, using practical data from PrEP implementation, we estimated the cost of delivering PrEP to young women, providing valuable data to inform budget impact and cost-effectiveness analyses as well as local resource allocation for scale-up of PrEP delivery to young women. Collectively, these studies addressed some of the barriers to PrEP delivery, proposed solutions to these barriers and drew attention to priority research needs for PrEP delivery to young women. Article	2020	Wanga, Valentine; Omollo, Victor; Bukusi, Elizabeth A; Odoyo, Josephine B; Morton, Jennifer F; Kidoguchi, Lara; Johnson, Rachel; Hughes, James P; Celum, Connie; Baeten, Jared M	Uptake and impact of facility-based HIV self-testing on PrEP delivery: a pilot study among young women in Kisumu, Kenya.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.25561	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7441009	INTRODUCTION: HIV testing is a required part of delivery of pre-exposure prophylaxis (PrEP) for HIV prevention. However, repeat testing can be challenging in busy, under-staffed clinical settings, which could negatively impact PrEP uptake and continuation. We prospectively evaluated optional facility-based HIV self-testing (HIVST) among young women using PrEP in an implementation programme. METHODS: Between February and November 2019, we collected data from young women receiving PrEP at two family planning facilities in Kisumu, Kenya. At each PrEP follow-up visit, women were given the option to choose between provider-initiated testing and HIVST. We assessed factors associated with HIVST uptake and compared satisfaction with HIV testing and clinic experience between acceptors and decliners of HIVST. RESULTS: A total of 172 women were offered HIVST at 202 PrEP follow-up visits. The median age was 21 years, 27% had multiple partners and 15% reported previously using HIVST. HIVST was accepted at 34.7% (70/202) of visits. Age (adjusted relative risk (aRR) 1.09 per year, 95% CI (confidence interval) 1.01 to 1.18), never being married (aRR 1.81, 95% CI 1.11 to 2.95) and having more PrEP follow-up visits (aRR 1.13 per visit, 95% CI 1.04 to 1.23) were associated with HIVST uptake. Compared to HIVST decliners, HIVST acceptors were more likely to be very happy with their overall testing experience (73% vs. 47% of visits, p = 0.003) and were more likely to say they would use HIVST in the future (96% vs. 76%, p < 0.001). Women who accepted HIVST had shorter visits than those choosing standard provider-initiated HIV testing (median IQR: 33 32, 38 vs. 54 41.5, 81 minutes, p = 0.003). CONCLUSIONS: In this pilot evaluation in Kenya, about one-third of women using PrEP opted for HIVST over provider-initiated testing, and those choosing HIVST spent less time in the clinic and were generally satisfied with their experience. HIVST in PrEP delivery is feasible and has the potential to simplify PrEP delivery and give clients testing autonomy. Additional studies are needed to explore optimal HIV retesting strategies in PrEP delivery, including the use of HIVST in PrEP at a larger scale and in different settings. Article	2020	Watson R.J.; Eaton L.A.; Maksut J.L.; Rucinski K.B.; Earnshaw V.A.	Links Between Sexual Orientation and Disclosure Among Black MSM: Sexual Orientation and Disclosure Matter for PrEP Awareness	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-019-02696-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074610667&doi=10.1007%2fs10461-019-02696-1&partnerID=40&md5=3ca9a68450b32c62d7cd5c9917b6f366	The HIV epidemic in the United States has disproportionately burdened Black men who have sex with men (MSM), particularly in the South. While pre-exposure prophylaxis (PrEP) has high demonstrated efficacy, uptake is low among Black MSM. We utilized a sample of 345 HIV-negative or unknown HIV status Black MSM from Atlanta, Georgia. Bivariate and multivariable logistic regression models examined the effects of sexual orientation and disclosure on PrEP awareness and use. Despite the majority of the sample reporting PrEP awareness (91%), few Black MSM in our sample had ever used PrEP (10%). Bisexual Black MSM were less likely to have been aware of PrEP compared to their same-gender loving/gay counterparts. Black MSM who had disclosed their sexual orientation to some or all of the members of their networks were more aware of PrEP compared to their counterparts who reported lower levels of disclosure, but were not more likely to actually use PrEP. Alarmingly, the gap in PrEP awareness and use has not decreased over the past 5 years. These findings suggest that disclosure may be a relevant characteristic to consider for PrEP awareness, but there may be more to consider in closing the awareness-uptake gap among Black MSM. © 2019, Springer Science+Business Media, LLC, part of Springer Nature. Article	2020	Watson, C. Wei-Ming; Pasipanodya, Elizabeth; Savin, Micah J.; Ellorin, Eric E.; Corado, Katya C.; Flynn, Risa P.; Opalo, Chloé; Lampley, Elizabeth; Henry, Brook L.; Blumenthal, Jill; Bolan, Robert; Morris, Sheldon; Moore, David J.	Barriers and Facilitators to PrEP Initiation and Adherence Among Transgender and Gender Non-Binary Individuals in Southern California.	AIDS Education and Prevention	-	-	-	-	1943-2755 0899-9546	10.1521/aeap.2020.32.6.472	https://pubmed.ncbi.nlm.nih.gov/33779208/	While transgender and gender non-binary (trans/nb) individuals are disproportionately affected by HIV, pre-exposure prophylaxis (PrEP) uptake remains low in this underserved population. We conducted four focus groups with 37 trans/nb individuals in San Diego and Los Angeles to assess barriers and facilitators of PrEP usage. Transcripts were coded for qualitative themes. Although overall PrEP awareness was high, participants reported limited knowledge and misinformation about PrEP. Barriers to PrEP use included: structural access (e.g., discrimination from health care providers, lack of trans-inclusive services, financial barriers), mental health struggles limiting ability to access PrEP, and concerns about potential side effects, drug-drug interactions with hormone therapy, and lack of other STI protection. Facilitators of PrEP usage included: increased PrEP availability, prior experience taking daily medications, and motivation to have active and healthy lives without fear of contracting HIV. Addressing both structural and psychosocial/behavioral factors in trans-affirming health care environments is crucial to designing inclusive, effective PrEP interventions. Article	2020	Weber C.; Arastéh K.	Biomedical prevention: The significance of pre-exposure prophylaxis (PrEP) for the combination prevention of HIV infection in Germany; Medikamentöse prä-expositionsprophylaxe (PrEP): Stellenwert in der prävention und perspektive	Tagliche Praxis	-	-	-	-	0494464X	NA	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091865584&partnerID=40&md5=21d410cef9af42c5b4395f64e06b5b2f	Despite the progress in HIV prevention in recent years no method has led to an overall reduction in new infections in the European countries. In August 2016 emtricitabine-tenofovir disoproxil fumarate (FTC-TDF) was approved by the European Medicines Agency (EMA) as pre-exposure prophylaxis for the EU market. This promising biomedical prevention method completes recent prevention strategies. Many studies have shown a good safety profile and high efficacy when adherence was maintained and medical follow-up was provided. PrEP is particularly beneficial for individuals with a high-risk profile for HIV acquisition and is considered a temporary protection strategy. Implementation in what is known as combination prevention is mandatory to work as a completion to other preventive methods and might have impact on new infections. © 2020 Mediengruppe Oberfranken - Fachverlage GmbH & Co. KG. All rights reserved. Article	2020	Weber S.; Lazar L.; McCord A.; Romero C.; Tan J.	Online navigation for pre-exposure prophylaxis via pleaseprepme chat for hiv prevention: Protocol for a development and use study	JMIR Research Protocols	-	-	-	19290748	10.2196/20187	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092287963&doi=10.2196%2f20187&partnerID=40&md5=44e71b943629cb0100fe167e426f5749	Background: Pre-exposure prophylaxis is an HIV medication taken by an individual who is HIV-negative to prevent infection before exposure to the virus. Numerous clinical studies in various communities have shown high rates of effectiveness when pre-exposure prophylaxis is taken as prescribed. Since FDA (US Food and Drug Administration) approval of the first product for pre-exposure prophylaxis in 2012, uptake has been lower than the estimated 1.1 million US adults who could benefit from its use, with an estimated 70,394 individuals on pre-exposure prophylaxis in 2017. Of these, only 11% were Black and 13% were Hispanic despite Black and Hispanic individuals comprising two-thirds of individuals who could benefit, highlighting racial and ethnic disparities in pre-exposure prophylaxis uptake. Patient navigators have been shown to be effective in improving the linkage and retention in care outcomes of people living with HIV across the HIV treatment cascade and can be used throughout the pre-exposure prophylaxis care continuum to assist decision making and connect potential users to pre-exposure prophylaxis services. Objective: PleasePrEPMe Chat was designed as a novel online strategy aimed at improving engagement in pre-exposure prophylaxis care services with pre-exposure prophylaxis-eligible populations in California via free HIV-prevention information and health care navigation services. Methods: Visitors connected with navigators via online bilingual (English, Spanish) chat. During the chat, navigators helped locate pre-exposure prophylaxis services through the PleasePrEPMe provider directory, provided links to HIV-prevention resources, and supported uninsured, insured, and undocumented visitors with benefits navigation. Data such as date, time, type of encounter, visitor type, key demographics, discussion topics, insurance, and other relevant information were collected via a chat log and through the HealthEngage chat platform. Results: From April 2017 to December 2019, PleasePrEPMe completed 2191 online chats. Mean interaction time was 16 minutes, with 68% of chats covering more than one topic. Conversation topics included health care navigation (1104/2191, 50.39%), provider identification (954/2191, 43.54%), pre-exposure prophylaxis information (773/2191, 35.28%), post-exposure prophylaxis information (318/2191, 14.91%), and the California Pre-Exposure Prophylaxis Assistance Program (232/2191, 10.59%). Referrals to pre-exposure prophylaxis- or non pre-exposure prophylaxis-related resources included directory updates, HIV testing and treatment, undetectable=untransmittable, reproductive health, sexually transmitted infections, and other prevention methods. A total of 368 chat visitors completed a voluntary satisfaction scale rating the quality and helpfulness of the service provided, producing a mean rating of 4.7 out of 5. Conclusions: Online chat is a method for reaching people not already engaged in HIV-prevention services, supporting HIV-prevention decision making, and linking people seeking information online with in-person services. Additional research to evaluate online sexual health information services and understand how social determinants of health influence online engagement is needed to better understand how to reach priority populations not well served by current HIV-prevention services. © 2020 Scientific Journal Publishers Limited. Article	2020	Wechsberg, Wendee M; Browne, Felicia A; Ndirangu, Jacqueline; Bonner, Courtney Peasant; Minnis, Alexandra M; Nyblade, Laura; Speizer, Ilene S; Howard, Brittni N; Myers, Bronwyn; Ahmed, Khatija	The PrEPARE Pretoria Project: protocol for a cluster-randomized factorial-design trial to prevent HIV with PrEP among adolescent girls and young women in Tshwane, South Africa.	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-020-09458-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7490774	BACKGROUND: Despite increased prevention efforts, HIV remains the leading cause of death among adolescent girls and young women in South Africa. Although research indicates important determinants of HIV acquisition at the individual and interpersonal levels, structural-level stigma and discrimination continue to be critical barriers to reaching and retaining this key population for HIV prevention and sexual and reproductive health services. Innovative and multilevel interventions are needed that can address the intersectional structural and gender issues that young women face, including stigma, alcohol and drug use, gender-based violence, and other risk factors when seeking health services. Oral pre-exposure prophylaxis (PrEP) taken daily has been found to be an effective biomedical HIV prevention tool. Testing a comprehensive gender-focused biobehavioral HIV prevention intervention that is inclusive of social ecological determinants, such as stigma and discrimination reduction in clinics, is critical for reducing HIV among adolescent girls and young women. METHODS: This project involves both a Community Collaborative Board and a Youth Advisory Board in helping to adapt the Young Women's Health CoOp intervention and the Health Policy Project (HPP) Stigma and Discrimination (S&D) reduction training curriculum to the setting and population. This study uses a two-by-two factorial design with stratified randomization of 12 clinics, each with distinct catchment areas. The Young Women's Health CoOp addresses substance use, sexual risk, violence prevention and sexual negotiation, condom demonstration, and problem solving with the following additions: knowledge of PrEP, the importance of PrEP adherence, and sexual and reproductive health. Adolescent girls and young women will be assessed with behavioral and biological measures at baseline, 3-, 6- and 9-month follow-up. The S&D reduction training is provided for all staff in the clinics randomized to this condition. Clinic staff will be surveyed at baseline, 4- and 8-month follow-up. We will recruit 900 AGYW from communities in the 12 clinic catchment areas. DISCUSSION: The study findings, if efficacious across the outcomes, will be incorporated into the gender-focused HIV prevention intervention toolkit and disseminated to inform multilevel prevention approaches. TRIAL REGISTRATION: ClinicalTrials.gov. Identifier: NCT04048551 (Recruiting). Registered: August 7, 2019 (Retrospectively registered). Article	2020	Weiss K.M.; Prasad P.; Ramaraju R.; Zlotorzynska M.; Jenness S.M.	Estimated Number of Men Who Have Sex with Men with Indications for HIV Pre-exposure Prophylaxis in a National Sexual Network Study	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002300	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083041690&doi=10.1097%2fQAI.0000000000002300&partnerID=40&md5=ed91f8c2fdbcb5cfaa28527c4ceecdd0	Background:A 2015 CDC analysis estimated that 24.7% of sexually active men who have sex with men (MSM) had indications for HIV pre-exposure prophylaxis (PrEP) based on 2014 US Public Health Service (USPHS) clinical practice guidelines. Given that the USPHS revised these guidelines in 2017, updated estimates of the fraction of MSM indicated for PrEP overall and stratified by demographic factors and geography are needed to scale-up PrEP for MSM in the US.Methods:We conducted a national web-based study of 4904 MSM aged 15-65 who had ever had sex with another man between July 2017 and January 2019. We estimated the percentage of HIV-negative, sexually active MSM meeting USPHS indications for PrEP by demographic category.Results:Of 3511 sexually active, HIV-negative MSM, 34.0% (95% confidence interval: 32.4 to 35.6) met USPHS indications for PrEP, with percentages consistent across US census region and varying slightly by race/ethnicity (Black: 32.2%, White: 33.7%, Hispanic: 36.4%, Other: 33.6%). Among individuals meeting USPHS PrEP indications, 93.5% reported condomless anal intercourse in the prior 6 months. Among all survey respondents, PrEP eligibility was lowest among non-Hispanic black (18.4%) and younger respondents (15-17: 4.1%; 18-24: 18.1%).Conclusions:Estimated percentages of MSM meeting indications for PrEP exceeded the previous CDC estimate across race/ethnicity, age, and census regions, with one-third of adult, sexually active, HIV-negative MSM exhibiting indications for PrEP. This study suggests, given current guidelines for PrEP indications, that a different fraction of eligible MSM could be receiving PrEP than previously estimated. © 2020 Lippincott Williams and Wilkins. Article	2020	Were D.; Musau A.; Mutegi J.; Ongwen P.; Manguro G.; Kamau M.; Marwa T.; Gwaro H.; Mukui I.; Plotkin M.; Reed J.	Using a HIV prevention cascade for identifying missed opportunities in PrEP delivery in Kenya: results from a programmatic surveillance study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25537	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087108379&doi=10.1002%2fjia2.25537&partnerID=40&md5=d9b55a89839191872a20c5252b08ab53	Introduction: HIV prevention cascades have been systematically evaluated in high-income countries, but steps in the pre-exposure prophylaxis (PrEP) service delivery cascade have not been systematically quantified in sub-Saharan Africa. We analysed missed opportunities in the PrEP cascade in a large-scale project serving female sex workers (FSW), men who have sex with men (MSM) and adolescent girls and young women (AGYW) in Kenya. Methods: Programmatic surveillance was conducted using routine programme data from 89 project-supported sites from February 2017 to December 2019, and complemented by qualitative data. Healthcare providers used nationally approved tools to document service statistics. The analyses examined proportions of people moving onto the next step in the PrEP continuum, and identified missed opportunities. Missed opportunities were defined as implementation gaps exemplified by the proportion of individuals who could have potentially accessed each step of the PrEP cascade and did not. We also assessed trends in the cascade indicators at monthly intervals. Qualitative data were collected through 28 focus group discussions with 241 FSW, MSM, AGYW and healthcare providers, and analysed thematically to identify reasons underpinning the missed opportunities. Results: During the study period, 299,798 individuals tested HIV negative (211,927 FSW, 47,533 MSM and 40,338 AGYW). Missed opportunities in screening for PrEP eligibility was 58% for FSW, 45% for MSM and 78% for AGYW. Of those screened, 28% FSW, 25% MSM and 65% AGYW were ineligible. Missed opportunities for PrEP initiation were lower among AGYW (8%) compared to FSW (72%) and MSM (75%). Continuation rates were low across all populations at Month-1 (ranging from 29% to 32%) and Month-3 (6% to 8%). Improvements in average annual Month-1 (from 26% to 41%) and Month-3 (from 4% to 15%) continuation rates were observed between 2017 and 2019. While initiation rates were better among younger FSW, MSM and AGYW (<30 years), the reverse was true for continuation. Conclusions: The application of a PrEP cascade framework facilitated this large-scale oral PrEP programme to conduct granular programmatic analysis, detecting "leaks" in the cascade. These informed programme adjustments to mitigate identified gaps resulting in improvement of selected programmatic outcomes. PrEP programmes are encouraged to introduce the cascade analysis framework into new and existing programming to optimize HIV prevention outcomes. © 2020 The Authors. Article	2020	Westmoreland D.A.; D'angelo A.; Nash D.; Grov C.	Individual and partner characteristics associated with intentions to use prep among partnered men, trans men, and trans women in sero-concordant and-discordant relationships in the united states	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2020.32.5.367	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094555825&doi=10.1521%2faeap.2020.32.5.367&partnerID=40&md5=f8753accb39085b8c6ae8f5e94ecc00f	Despite proven effectiveness in reducing HIV transmission, pre-exposure prophylaxis (PrEP) use remains low among those who meet the recom-mended CDC guidance for PrEP use. Data are from a U.S. national cohort of men and trans persons who have sex with men (2017–2018). Logistic regression analyses were used to determine individual and partner factors associated with intentions to use PrEP among non-PrEP-using participants reporting a main partner (n = 1,671). Prior PrEP use among participants (14.2%) and their partners (7.7%) was low. Participants' prior PrEP use and main partner's HIV-positive status were both positively associated with intentions to use PrEP. HIV prevention interventions incorporating main partners may be effective in increasing PrEP use. © 2020 The Guilford Press. Article	2020	Westmoreland, Drew A; Pantalone, David W; Patel, Viraj V; Hoover, Donald; Nash, Denis; Grov, Christian	Demographic, Behavioral, and Geographic Differences Between Men, Transmen, and Transwomen Currently on PrEP, Former PrEP Users, and Those Having Never Used PrEP.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-019-02722-2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7162710	Many recent studies have compared men currently taking pre-exposure prophylaxis (PrEP) to men not taking PrEP. However, less is known about demographic, behavioral, and geographic characteristics of men formerly, but not currently, taking PrEP. Using a 2017-2018 U.S. national, internet-based sample (n = 10,504) of men, transmen, and transwomen who have sex with men, we compared three groups based on their PrEP experiences. Results highlight individual-level financial and geo-contextual barriers to PrEP use that can inform prevention efforts to improve PrEP initiation and continuation for both PrEP-naïve and PrEP-experienced individuals, respectively. Article	2020	Westmoreland, Drew A; Patel, Viraj V; D'Angelo, Alexa B; Nash, Denis; Grov, Christian	Sociocultural influences on attitudes towards pre-exposure prophylaxis (PrEP), history of PrEP use, and future PrEP use in HIV-vulnerable cisgender men who have sex with men across the U.S.	Annals of LGBTQ Public & Population Health	-	-	-	2688-4518	10.1891/lgbtq-2020-0005	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8294708	Despite its proven effectiveness in reducing HIV transmission, pre-exposure prophylaxis (PrEP) use remains low. This study used data from a 2017-2018 U.S. national cohort to investigate social influences on PrEP experience and future PrEP use among cisgender men who have sex with men. We used descriptive statistics and multivariable logistic analyses to examine social influences (e.g., how participants heard about PrEP and number of persons they knew taking PrEP) associated with each previous PrEP use and intentions to use PrEP. Among participants who knew of PrEP, commonly reported ways of first hearing about PrEP were through social media (27.4%) and friends (26.8%). There were also cited top influences on participants' current attitudes toward PrEP (friends 23.5%, social media 22.1%). Multivariable logistic regression analyses found that knowing more people taking PrEP was associated with increased odds of previously using PrEP and intending to use PrEP. Friends and social media were common and influential sources of information regarding PrEP. Results suggest that tapping into these social connections may effectively disseminate public health messaging about PrEP and encourage use among key populations to reduce HIV burden. Article	2020	White J.J.; Mathews A.; Henry M.P.; Moran M.B.; Page K.R.; Latkin C.A.; Tucker J.D.; Yang C.	A crowdsourcing open contest to design pre-exposure prophylaxis promotion messages: Protocol for an exploratory mixed methods study	JMIR Research Protocols	-	-	-	19290748	10.2196/15590	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078147611&doi=10.2196%2f15590&partnerID=40&md5=f5a61dc0897a16a699fdc89e7d4c732f	Background: In the United States, black men who have sex with men (BMSM) are disproportionately affected by HIV. Pre-exposure prophylaxis (PrEP) can reduce HIV incidence. However, real-world implementation of PrEP outside of clinical trials has identified racial disparities in PrEP awareness, uptake, and adherence. In the context of a long history of medical mistrust and power imbalances between scientists and community members, strategies to increase uptake of PrEP among BMSM should consider ways to ensure messages address the needs and priorities of the community. Crowdsourcing contests shift traditional individual tasks to a large group and may enhance community engagement. Objective: This paper describes the research protocol of a contest approach to soliciting PrEP promotion messages among BMSM in Baltimore. Methods: Open-contest implementation and evaluation will proceed as follows: (1) organize a community steering group; (2) develop platforms to solicit crowd input; (3) engage the community to contribute ideas through a Web-based forum and in-person events; (4) evaluate contest entries using both community panel judge assessment and crowd voting; (5) utilize mixed methods to evaluate feasibility, acceptability, and community engagement; and (6) disseminate contest results. Results: This study was funded by the National Institutes of Health (National Institute of Mental Health: R34MH116725) in May 2018 and was approved by the institutional review board in April 2018. The open contest started in February 2019, and data analyses for the mixed method evaluation are expected to complete in December 2019. Conclusions: The contest will potentially bring new ideas in developing more impactful and locally defined PrEP promotion campaigns. We will determine whether an open-contest approach is acceptable among BMSM in Baltimore. If successful, this study can inform future projects using a similar approach on how to identify and implement programs and policies that are more responsive to community needs and that build up community assets. © 2020 Journal of Medical Internet Research. Theses and Dissertations	2020	White, Ellen	HIV pre-exposure prophylaxis : additional insights through secondary analyses of the PROUD trial	-	-	University College London (University of London)	-	NA	NA	https://discovery.ucl.ac.uk/id/eprint/10091955/ https://ethos.bl.uk/OrderDetails.do?uin=uk.bl.ethos.825462	This thesis utilises data from PROUD, a randomised controlled trial to evaluate pre-exposure prophylaxis (PrEP) for HIV prevention. PROUD randomised 544 HIV-negative men who have sex with men (MSM) to receive PrEP immediately or deferred for a year. The trial demonstrated that PrEP was highly effective at preventing HIV transmission. In this thesis, I consider four further questions: (1) Who should access PrEP? (2) How appropriate are epidemiological measures that are commonly used for PrEP and other prevention strategies? (3) Is PrEP-use associated with an increased risk of sexually transmitted infections (STIs)? and (4) What is the risk of hepatitis C (HCV) among PrEP-users? The highest risk of HIV acquisition was associated with a rectal STI or syphilis diagnosis in the previous year, or reporting condomless receptive intercourse with two or more partners in the previous three months. MSM meeting these criteria are therefore in most need of PrEP. STI diagnoses were more common among PrEP-users, found in both the randomised and pre-/post-PrEP comparisons. It was unclear whether this was driven by a difference in screening or sexual behaviour. Regardless, PrEP-using MSM are at high risk of STIs, and frequent screening in a PrEP programme would help control onward transmission. HCV incidence was high and increased during the four-year period of follow-up, doubling in the final year. Risk varied according to reported risk factors. Thus, the current recommendation of quarterly HCV screening for all PrEP-using MSM may not be appropriate unless there is a localised epidemic. My findings show that MSM seeking PrEP have a high but heterogeneous risk of sexually transmitted diseases, with variation according to individual- and population-level risk factors. PrEP programmes need to allocate sufficient provisions to screen for and treat other clinical outcomes, including STIs and HCV.	616.97	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	-	-	Clinical
Article	2020	Whiteley L.; Olsen E.; Mena L.; Haubrick K.; Craker L.; Hershkowitz D.; Brown L.K.	A mobile gaming intervention for persons on pre-exposure prophylaxis: Protocol for intervention development and randomized controlled trial	JMIR Research Protocols	-	-	-	19290748	10.2196/18640	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092273156&doi=10.2196%2f18640&partnerID=40&md5=7b5cc332fbc05b5e1bd8b18c2fecee86	Background: In the United States, young minority men who have sex with men (MSM) are the most likely to become infected with HIV. Pre-exposure prophylaxis (PrEP) is an efficacious and promising prevention strategy. However, PrEP's safety and effectiveness can be greatly compromised by suboptimal adherence to treatment. To maximize the positive impact of PrEP, it is necessary to combine its prescription with cost-effective behavioral interventions that promote adherence and decrease HIV risk behaviors. In this project, we developed a theoretically informed app/gaming intervention to engage young MSM in learning information, practicing behaviors, and improving motivation for HIV preventative behaviors and PrEP adherence. Objective: The goal of this project was to develop and test a cutting-edge, engaging, and entertaining app/gaming intervention for improving adherence to PrEP and building HIV prevention knowledge, skills, and behavior. Methods: This study was conducted in two phases. In the developmental phase, we conducted qualitative interviews with young MSM (n=20) to guide the development of the gaming intervention. In the randomized controlled trial, we tested the preliminary efficacy of the gaming intervention compared to a comparison condition among young MSM. Subjects were recruited from the University of Mississippi Medical Center HIV/STI testing clinics (n=60). Results: Institutional review board approval was received in February 2015. Research activities began in June 2015 and are still ongoing. Conclusions: This app/gaming intervention aimed to improve PrEP adherence and HIV preventative behaviors in young MSM. Engaging young MSM in learning information, practicing behaviors, and improving motivation for increased adherence to PrEP has the potential to decrease HIV seroconversion. It is important to develop interventions that are enjoyable, engaging, and easily incorporated into clinical settings. © 2020 JMIR Publications. All rights reserved. Article	2020	Whiteley, Laura; Healy, Meredith G; Lowery, Ashley; Haubrick, Kayla K; Brown, Larry K	An evaluation and review of English language pre-exposure prophylaxis websites and YouTube videos.	International Journal of STD & AIDS	-	-	-	1758-1052	10.1177/0956462420905271	https://journals.sagepub.com/doi/10.1177/0956462420905271	Pre-exposure prophylaxis (PrEP) is a promising HIV prevention strategy in which antiretroviral medications are taken to prevent HIV infection. PrEP was approved as an HIV prevention method in the United States in 2012 for individuals aged 18 years and older. Since its approval, there has been a growing amount of online content about PrEP targeted to general, non-medical, audiences. However, this online information is under-studied and under-evaluated. Two raters catalogued and coded PrEP material written in the English language from 61 websites and 58 YouTube videos for educational content, credibility, usability, and interactivity. The online material was catalogued and searched for between September 2017 and April 2018. Online PrEP material showed deficiencies in each of these content areas, however, there is a significant amount of publicly accessible online content available about PrEP. This content could be packaged, used, and tested in a prevention intervention to improve PrEP uptake and engagement in care. Article	2020	Whitfield Thomas H F; Parsons, Jeffrey T; Jonathon, Rendina H	Rates of Pre-exposure Prophylaxis Use and Discontinuation Among a Large U.S. National Sample of Sexual Minority Men and Adolescents	Archives of Sexual Behavior	-	-	-	00040002	10.1007/s10508-019-01602-z	https://www.proquest.com/scholarly-journals/rates-pre-exposure-prophylaxis-use/docview/2353384105/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) is highly effective in the prevention of HIV acquisition and was recently approved for those under 18 years of age. The primary goal of the present study was to understand the prevalence of and factors associated with PrEP use among a large sample of young and adult sexual minority men (Y/SMM). Participants came from a larger national sample of SMM. Data collected included demographics, substance use, PrEP use, and sexual risk. Participants were recruited via sexual networking/dating applications and resided in the U.S. including Puerto Rico, were at least 13 years old, self-reported being HIV-negative, and identified as male. The sample was divided into two groups: YSMM (13–24 years of age) and adult SMM (25 years of age and up). Multinomial logistic regressions examining associations with never, current, and former PrEP use were run with all variables of interest simultaneously entered into the models. Age was positively associated with both former and current PrEP use among YSMM. Additionally, YSMM who identified as gay (vs. bisexual), lived in the Northeast, Midwest, and West (vs. South), had their own health insurance (vs. those on their parent's), had recently been diagnosed with an STI, and had recently used a drug all had higher odds of being a current PrEP user compared to those that had never used PrEP. Among adult SMM, those who were older did not have higher odds of current PrEP use compared to those that had never used PrEP. Those who identified as queer (vs. gay), single, had their own or were on their partner's insurance (vs. parent's), recent condomless anal sex, recent STI diagnosis, recent drug use, and recent substance use all had higher odds of being a current PrEP user compared to those that had never used PrEP. Research is needed to address the disparities in PrEP uptake among YSMM. Interventions for PrEP access among those on their parents' insurance may also be necessary. Article	2020	Whitfield, Darren L	Does internalized racism matter in HIV risk? Correlates of biomedical HIV prevention interventions among Black men who have sex with men in the United States.	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2020.1753007	https://dx.doi.org/10.1080/09540121.2020.1753007	Black men who have sex with men (MSM) account for 26% of all new HIV infections in the United States. Biomedical HIV interventions have proven to reduce HIV infections however the use of these interventions by Black MSM is inconsistent. Research suggests that internalized racism may contribute to inconsistent biomedical HIV interventions (condom use and PrEP use) among Black MSM. Using a national sample of 432 Black MSM, we examined the relationship between condom and PrEP use and internalized racism. The results suggest there is some evidence for an association between internalized racism and PrEP use. In addition, internalized racism was not associated with condom use for both insertive and receptive anal sex among Black MSM. These finding suggest the relationship between internalized racism and HIV prevention strategies is not facile and more attention is needed to understand the true impact of racism, both internal and societal, on HIV prevention strategies among Black MSM. These findings underscore the nature of racism in the daily lives of Black MSM and how it impacts HIV prevention strategies adopted by these men. Article	2020	Wilby, Kyle J; Smith, Alesha J	A Narrative Review of Continuing Professional Development Needs for Pharmacists with Respect to Pre-exposure Prophylaxis (PrEP) for Human Immunodeficiency Virus (HIV).	Pharmacy	-	-	-	2226-4787	10.3390/pharmacy8020084	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7356600	Pre-exposure prophylaxis (PrEP) for the human immunodeficiency virus (HIV) is rapidly increasing in use worldwide, with many countries now publicly funding use for high risk populations. Pharmacists, as front-line care providers, must have the necessary knowledge, skills and attitudes to effectively provide care to PrEP patients. The aim of this review was to identify priority areas and key gaps for continuing professional development (CPD) needs relating to PrEP for practicing pharmacists. An electronic search of PubMed, EMBASE, International Pharmaceutical Abstracts and CPD-related journals was supplemented with a manual search of references to identify articles describing pharmacists' knowledge, perceptions and experience with PrEP. A total of eight articles were identified across four countries. Pharmacists were consistently found to lack knowledge and awareness of PrEP, express low confidence/comfort with patient care practices, report a lack of experience and/or intentions to provide patient care, but overall had positive perceptions of PrEP therapy. Older pharmacists with more experience commonly reported greater knowledge gaps than recently trained pharmacists. CPD should therefore aim to increase pharmacists' baseline knowledge and awareness of PrEP and treatment guidelines, as well as be directed towards older pharmacists with more experience.	pharmacy, continuing education, continuing professional development, HIV, pre-exposure prophylaxis, antiretrovirals, education	English	Switzerland	Western and Central Europe and North America	New Zealand	Asia and the Pacific	New Zealand	Asia and the Pacific	Review
Article	2020	Willie T.C.; Keene D.E.; Kershaw T.S.; Stockman J.K.	"You Never Know What Could Happen": Women's Perspectives of Pre-Exposure Prophylaxis in the Context of Recent Intimate Partner Violence	Women's Health Issues	-	-	-	10493867	10.1016/j.whi.2019.08.001	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85072227798&doi=10.1016%2fj.whi.2019.08.001&partnerID=40&md5=b628b6894b6b4b1c8e6aed535054de41	Background: Vulnerability to human immunodeficiency virus (HIV) infection is a significant public health issue for women experiencing intimate partner violence (IPV). Despite the increased risk of human immunodeficiency virus infection, women only represent 4.6% of pre-exposure prophylaxis (PrEP) users in the United States. IPV may present additional difficulties to PrEP access. In this qualitative study, we examined how IPV and the relational context shaped women's decisions, attitudes, and engagement in the PrEP care continuum. Methods: We conducted semistructured interviews with 19 women residing in Connecticut who participated in a prospective cohort study. We purposively recruited our sample to include women who reported physical and/or sexual IPV in the past 6 months, and used a grounded theory approach to analyze the qualitative data. Results: Our findings suggest multiple ways that the relational context can affect women's decisions, attitudes, and engagement in the PrEP care continuum. We identified five aspects of women's relationships that can shape women's interest, intentions, and access to PrEP: 1) relationship power struggles, 2) infidelity, 3) trust and monogamy, 4) male partner's reactions, and 5) "season of risk" (i.e., PrEP use only during times of perceived human immunodeficiency virus risk). Collectively, these findings suggest that women experiencing IPV might face additional relational challenges that need to be adequately addressed in settings administering PrEP. Conclusions: Communication on sexual risk reduction strategies should address relational factors and promote women's autonomy. Future research on long-acting and invisible forms of PrEP may help to circumvent some of the relational barriers women experiencing IPV may face when considering PrEP care. © 2019 Jacobs Institute of Women's Health	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Willie Tiara C; Keene, Danya E; Stockman, Jamila K; Alexander, Kamila A; Calabrese, Sarah K; Kershaw, Trace S	Intimate Partner Violence Influences Women's Engagement in the Early Stages of the HIV Pre-exposure Prophylaxis (PrEP) Care Continuum: Using Doubly Robust Estimation	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-019-02469-w	https://www.proquest.com/scholarly-journals/intimate-partner-violence-influences-women-s/docview/2197694365/se-2?accountid=8113	Intimate partner violence (IPV) is associated with pre-exposure prophylaxis (PrEP) acceptability among US women, but whether IPV influences other steps along the PrEP care continuum remains unclear. This study estimated the causal effects of IPV on the early stages of the PrEP care continuum using doubly robust (DR) estimation (statistical method allowing causal inference in non-randomized studies). Data were collected (2017-2018) from a cohort study of 124 US women without and 94 women with IPV experiences in the past 6 months (N = 218). Of the 218 women, 12.4% were worried about getting HIV, 22.9% knew of PrEP, 32.1% intended to use PrEP, and 40.4% preferred an "invisible" PrEP modality. IPV predicts HIV-related worry (DR estimate = 0.139, SE = 0.049, p = 0.004). IPV causes women to be more concerned about contracting HIV. Women experiencing IPV are worried about HIV, but this population may need trauma-informed approaches to help facilitate their PrEP interest and intentions. Article	2020	Wilson E.C.; Turner C.M.; Arayasirikul S.; Lightfoot M.; Scheer S.; Raymond H.F.; Liu A.	Disparities in the PrEP continuum for trans women compared to MSM in San Francisco, California: results from population-based cross-sectional behavioural surveillance studies	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25539	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087108482&doi=10.1002%2fjia2.25539&partnerID=40&md5=0c3cf1a84a3ba3eb0c85819fd9f7d8e8	Introduction: Although transgender women (trans women) often are conflated with men who have sex with men (MSM) in HIV research and services, there are distinct population differences that are important for implementing effective HIV prevention. Our objective was to examine pre-exposure prophylaxis (PrEP) disparities between the two populations and compare individual, social and structural factors that influence differences between MSM and trans women along the PrEP continuum. Methods: We analysed data from two population-based studies, one with trans women (Trans*National Study, 2016 - 18) and the other with MSM (National HIV Behavioral Surveillance, 2017). Trans women were recruited via respondent-driven sampling and MSM using time location sampling. Key indicators of the PrEP continuum were evaluated, including awareness, health insurance, provider discussions, recent use and adherence. Associations were also examined for PrEP continuum indicators and structural barriers (e.g. employment, homelessness). Results: Transwomen were more likely than MSM to be Latino/a (30.4% vs. 25.8%; prevalence ratio (PR)=1.08, 95% CI 1.02 to 1.14) or African American (7.1% vs. 4.5%; PR = 1.12, 1.02 to 1.24), live at or below the poverty limit (70.7% vs. 15.8%; PR = 1.47; 1.41 to 1.53), be unemployed (50.1% vs. 26.3%; PR = 1.18, 1.13 to 1.24), be homeless (8.4% vs. 3.5%; PR = 1.15, 1.06 to 1.25) and to have less than a college degree (PR = 1.41, 1.34 to 1.48). Trans women were more likely than MSM to have health insurance (95.7% vs. 89.7%, PR = 1.17, 1.06 to 1.28), but less likely than MSM to have heard of PrEP (79.1% vs. 96.7%; PR = 0.77, 0.73 to 0.81), talked with a provider about PrEP (35.5% vs. 54.9%; PR = 0.87, 0.83 to 0.91) and less likely than MSM to have used PrEP in the past six months (14.6% vs. 39.8%; PR = 0.80, 0.76 to 0.84). Among PrEP users, trans women were less likely to report being adherent to PrEP than MSM (70.4% vs. 87.4%; PR = 0.80, 0.70 to 0.91). Conclusions: We found PrEP disparities for trans women compared to MSM and the need for differentiated implementation strategies to meet the specific PrEP barriers trans women face. Inclusion of trans women's HIV risks is needed in CDC guidance for PrEP. Interventions to increase trans women's awareness of PrEP including at the provider and community level are also needed. Finally, programming that addresses trans women's barriers to housing and income is also needed to reduce PrEP disparities. © 2020 The Authors. Article	2020	Wilson K.; Beckett C.G.; Blaylock J.M.; Okulicz J.F.; Scott P.T.; Hakre S.	Provider Knowledge Gaps in HIV PrEP Affect Practice Patterns in the US Navy	Military Medicine	-	-	-	264075	10.1093/milmed/usz131	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85079344835&doi=10.1093%2fmilmed%2fusz131&partnerID=40&md5=29b9e08af42440b38b38e5baf80058d2	Introduction: Although HIV pre-exposure prophylaxis (PrEP) is available at no cost to personnel in the United States (U.S.) military, uptake has been lower than expected. An online survey was conducted assessing current knowledge, perceptions, and attitudes of primary care providers in the U.S. Navy. Materials and Methods: A cross-sectional anonymous online survey was conducted among U.S. Navy healthcare providers in active service. Providers' demographics, medical practice and PrEP experience, and attitudes regarding PrEP were assessed by self-rated PrEP knowledge. Results: Greater than half of respondents reported being knowledgeable about PrEP and a majority (78%) supported the provision of PrEP in the military health system. However, only 19% had ever prescribed PrEP. Self-reports of having been questioned by a patient about PrEP, having high levels of comfort discussing sexual risk behaviors, and being in a specialty of infectious disease, occupational health, or preventive medicine were associated with increased knowledge about PrEP. The more knowledgeable a provider was about PrEP, the more likely they were to prescribe it (29% vs. 6%). Conclusions: Although Navy providers were supportive of the provision of PrEP by the military, knowledge gaps remain. Training to address the knowledge deficit as well as improving sexual history taking are potential areas to target in implementing PrEP in primary care specialties. © 2020 Published by Oxford University Press on behalf of the Association of Military Surgeons of the United States.	health care providers; HIV pre-exposure prophylaxis; United States Navy	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Wilson, Kennethea; Bleasdale, Jacob; Przybyla, Sarahmona M	Provider-Patient Communication on Pre-Exposure Prophylaxis (Prep) for HIV Prevention: An Exploration of Healthcare Provider Challenges	Health Communication	-	-	-	10410236	10.1080/10410236.2020.1787927	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087768553&doi=10.1080%2f10410236.2020.1787927&partnerID=40&md5=fa399ee63151d53fff7a8ef2cac9e6d9	Pre-exposure prophylaxis (PrEP) is a once-daily pill prescribed by healthcare providers to protect patients from contracting HIV. Current data suggests that a minority of healthcare providers have ever prescribed it to clinically-eligible patients. The present study employed a social ecological framework to understand the factors that influence providers' engagement in patient-centered communication regarding PrEP. Semi-structured interviews (N = 20) with physicians, physician assistants, and nurse practitioners working in primary and specialty care practices in Western New York were thematically analyzed to understand provider-based PrEP communication challenges. Although participants never prescribed PrEP, all had clinical experience with patient populations at risk for HIV, such as people who inject drugs, men who have sex with men, transgender women, and people who exchange sex for resources. Results revealed three themes affecting provider engagement in PrEP-related discussions, which emerged across three levels of the social ecological model. At the individual level, challenges affecting provider engagement in patient-centered discussions included lacking PrEP knowledge to educate and counsel patients and discomfort with prescribing PrEP based on its perceived newness. At the interpersonal level, participants expressed varying degrees of discomfort discussing HIV risk behaviors with patients. At the organizational level, providers expressed that time constraints and managing concurrent health conditions were competing clinical priorities. Findings indicate expanding implementation efforts will require multilevel interventions that target potential PrEP-adopting healthcare providers to mitigate the perceived and real challenges surrounding provider-patient communication on PrEP for HIV prevention. Practical implications are discussed. © 2020, © 2020 Taylor & Francis Group, LLC. Article	2020	Wirth M.; Inauen J.; Steinke H.	New strategies for HIV prevention for men who have sex with men (MSM): pre-exposure prophylaxis (PrEP) and an ethical evaluation of its potential and its problems; Neue Strategien der HIV-Prävention für „Men who have sex with men" (MSM): Die Präexpositionsprophylaxe (PrEP) und eine ethische Evaluierung ihrer Potentiale und Probleme	Ethik in der Medizin	-	-	-	9357335	10.1007/s00481-020-00589-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086179496&doi=10.1007%2fs00481-020-00589-9&partnerID=40&md5=f6022b6ede70a37bb22bcf90f8c165d7	Objectives: Given that condoms provide ample protection against both HIV as well as other sexually transmitted infections (STIs), and given that safe access to HIV postexposure prophylaxis (PEP) also exists (relied upon after condom fatigue, for example), it should be thoroughly investigated if and when the increasingly popular HIV pre-exposure prophylaxis drug (PrEP) presents itself as the superior alternative. In the context of a generalized everyone at risk approach towards MSM, PrEP is becoming increasingly established as a standard of care. There is no doubt that this is desirable for certain MSM with a particular risk profile; however, variance in MSM (e.g., engaging in casual condomless sex versus random condomless sex) must be assumed and taken into account in order to avoid disproportionate medicalization. Methods: In the area of conflict between medicalization, in particular of men who have sex with men, and highly potent HIV prevention methods, it should be determined when exactly PrEP (either via daily dosing or on-demand dosing) trumps the use of condoms or PEP. Therefore, a focus on the current status of clinical research and on the medical-ethical debate is required. The medical history of prevention and of HIV proves relevant for the largely ongoing ethical study of PrEP usage. The methodology of this work is based on an evaluation of the interdisciplinary literature on PrEP in particular and on HIV prevention in general. In accordance with PRISMA guidelines (Preferred Reporting Items for Systematic Reviews and Meta-Analyses), studies on the current clinical practice of PrEP or medical-ethical discussions of PrEP were selected from the PubMed/MEDLINE database. The resulting discursive discussion and examination of the currently known pros and cons of PrEP is based on this literature. Results: Resultant preventative measures often appear as ambivalent instruments of health promotion torn between liberating and restricting the individual. Overall, on-demand dosing enables individuals to personalize their usage based on the specific risk behaviors they engage in, in contrast to daily dosing. On-demand PrEP also poses significant advantages over PEP and daily PrEP in cases where there is no continuous and sustained level of risk. Conclusion: This medical-ethical inquiry stresses the heterogeneous group of MSM whose individual sexual behavior requires especially individualized HIV prevention strategies. Thus, this study argues for highly personalized decision-making in the possible indication for PrEP among MSM. This constitutes an essential factor in avoiding the medicalization of MSM. © 2020, Springer-Verlag GmbH Deutschland, ein Teil von Springer Nature. Article	2020	Wirtz A.L.; Weir B.W.; Hnin Mon S.H.; Sirivongrangson P.; Chemnasiri T.; Dunne E.F.; Varangrat A.; Hickey A.C.; Decker M.R.; Baral S.; Okanurak K.; Sullivan P.; Valencia R.; Thigpen M.C.; Holtz T.H.; Mock P.A.; Cadwell B.; Adeyeye A.; Rooney J.F.; Beyrer C.	Testing the effectiveness and cost-effectiveness of a combination HIV prevention intervention among young cisgender men who have sex with men and transgender women who sell or exchange sex in Thailand: Protocol for the combination prevention effectiveness study	JMIR Research Protocols	-	-	-	19290748	10.2196/15354	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083196640&doi=10.2196%2f15354&partnerID=40&md5=ccf87d528a17d693aedd490708f3a746	Background: Pre-exposure prophylaxis (PrEP) is highly effective in the prevention of HIV acquisition, particularly for men who have sex with men (MSM). Questions remain on the benefits of PrEP and implementation strategies for those at occupational risk of HIV acquisition in sex work, as well as on methods to support adherence among young people who initiate PrEP. Objective: The Combination Prevention Effectiveness study for young cisgender MSM and transgender women (TGW) aims to assess the effectiveness and cost-effectiveness of a combination intervention among HIV-uninfected young MSM and TGW engaged in sex work in Thailand. Methods: This open-label, nonrandomized assessment compares the relative effectiveness of a combination prevention intervention with and without daily oral emtricitabine and tenofovir disoproxil fumarate (Truvada) PrEP with SMS-based adherence support. HIV-uninfected young MSM and TGW aged 18 to 26 years in Bangkok and Pattaya who self-report selling/exchanging sex at least once in the previous 12 months are recruited by convenience sampling and peer referral and are eligible regardless of their intent to initiate PrEP. At baseline, participants complete a standard assessment for PrEP eligibility and may initiate PrEP then or at any time during study participation. All participants complete a survey and HIV testing at baseline and every 3 months. Participants who initiate PrEP complete monthly pill pickups and may opt-in to SMS reminders. All participants are sent brief weekly SMS surveys to assess behavior with additional adherence questions for those who initiated PrEP. Adherence is defined as use of 4 or more pills within the last 7 days. The analytic plan uses a person-time approach to assess HIV incidence, comparing participant time on oral PrEP to participant time off oral PrEP for 12 to 24 months of follow-up, using a propensity score to control for confounders. Enrollment is based on the goal of observing 620 person-years (PY) on PrEP and 620 PY off PrEP. Results: As of February 2019, 445 participants (417 MSM and 28 TGW) have contributed approximately 168 PY with 95% (73/77) retention at 12 months. 74.2% (330/445) of enrolled participants initiated PrEP at baseline, contributing to 134 PY of PrEP adherence, 1 PY nonadherence, and 33 PY PrEP nonuse/noninitiation. Some social harms, predominantly related to unintentional participant disclosure of PrEP use and peer stigmatization of PrEP and HIV, have been identified. Conclusions: The majority of cisgender MSM and TGW who exchange sex and participate in this study are interested in PrEP, report taking sufficient PrEP, and stay on PrEP, though additional efforts are needed to address community misinformation and stigma. This novel multilevel, open-label study design and person-time approach will allow evaluation of the effectiveness and cost-effectiveness of combination prevention intervention in the contexts of both organized sex work and exchanged sex. © Andrea L Wirtz, Brian Wilson Weir, Sandra Hsu Hnin Mon, Pachara Sirisongrangson, Tareerat Chemnasiri, Eileen F Dunne, Anchalee Varangrat, Andrew C Hickey, Michele R Decker, Stefan Baral, Kamolnetr Okanurak, Patrick Sullivan, Rachel Valencia, Michael C Thigpen, Timothy H Holtz, Philip A Mock, Betsy Cadwell, Adeola Adeyeye, James F Rooney, Chris Beyrer, Combination Prevention Effectiveness (COPE) Study Team. Article	2020	Wong N.S.; Kwan T.H.; Lee K.C.K.; Lau J.Y.C.; Lee S.S.	Delineation of chemsex patterns of men who have sex with men in association with their sexual networks and linkage to HIV prevention	International Journal of Drug Policy	-	-	-	9553959	10.1016/j.drugpo.2019.10.015	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85075134362&doi=10.1016%2fj.drugpo.2019.10.015&partnerID=40&md5=b7aaf70a9480a47e2b265fc98dbf22b2	Background: Previous studies have shown that men who have sex with men (MSM) and who engage in drug use in sexualized contexts (chemsex) were more likely to be HIV positive. Their social networks and adoption of HIV prevention measures have, however, not been fully investigated. We aim to compare the sexual behavior, HIV prevention efforts and social networks of MSM by the intensity and patterns of their drug use. Methods: Data from respondents of a community-based, cross-sectional survey (PRiSM) conducted among MSM in Hong Kong in 2017 were collected retrospectively. Characteristics of MSM engaged and not engaged in chemsex were compared in logistic regressions, delineated by latent class analysis (LCA) and compared in multinomial logistic regression. Findings: Of 4133 respondents, 3044 were sexually active with an HIV prevalence of 6.5%. The prevalence of chemsex engagement in the preceding 6 months was 12%, after excluding use of poppers or erectile dysfunction agents (EDA) alone. Four types of drug user were identified by LCA: Minimal (mainly poppers), low-threshold (mainly poppers and EDA), medium-threshold (mainly methamphetamine, GHB, poppers and EDA) and intense (exclusive use of different types of drug). Medium-threshold and intense drug users were more likely to be HIV positive, be diagnosed with sexually transmitted infections, make gay friends through mobile apps and sex parties, and intend to take pre-exposure prophylaxis (PrEP). Medium-threshold drug users had a more influential role in their social network, as shown by their centrality in mobile apps network. Conclusion: Chemsex engagement in MSM is significantly associated with HIV infection in Hong Kong. The HIV transmission risk could however be offset by the inclination of MSM belonging to medium-threshold and intense drug users to take PrEP, should the intervention become accessible to the community. Further mobile apps could be a good channel to access MSM who are medium-threshold drug users. © 2019 Elsevier B.V. Article	2020	Wong, Keith Yiu Kei; Stafylis, Chrysovalantis; Klausner, Jeffrey D	Telemedicine: a solution to disparities in human immunodeficiency virus prevention and pre-exposure prophylaxis uptake, and a framework to scalability and equity	mHealth	-	-	-	23069740	10.21037/mhealth.2019.12.06	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087842245&doi=10.21037%2fmhealth.2019.12.06&partnerID=40&md5=3ea8eb333055eff26fc53eadb180799c	As the group with the highest risk and the lowest pre-exposure prophylaxis (PrEP) utilization, black and Hispanic young men who have sex with men (MSM) face the brunt of the current human immunodeficiency virus (HIV) epidemic within the United States. In this narrative review, we summarized recent interventions that utilize technology (telemedicine) to improve HIV PrEP uptake. We examined the general model of those telemedicine programs and evaluated their success and limitations in addressing PrEP accessibility for at-risk individuals. We also identified the current bottlenecks in the scalability of telemedicine programs, offered suggestions to overcome these barriers, and advocated for a centralized source of funding to increase the accessibility of telemedicine programs for PrEP. © mHealth. Article	2020	Wonganan, Piyanuch; Limpanasithikul, Wacharee; Jianmongkol, Suree; Kerr, Stephen J; Ruxrungtham, Kiat	Pharmacokinetics of nucleoside/nucleotide reverse transcriptase inhibitors for the treatment and prevention of HIV infection.	Expert Opinion on Drug Metabolism and Toxicology	-	-	-	1744-7607	10.1080/17425255.2020.1772755	https://dx.doi.org/10.1080/17425255.2020.1772755	INTRODUCTION: Despite dramatic increases in new drugs and regimens, a combination of two nucleoside/nucleotide reverse transcriptase inhibitors (NRTIs) remains the backbone of many regimens to treat HIV. AREA COVERED: This article summarizes the pharmacokinetic characteristics of approved NRTIs that are currently in the international treatment and prevention guidelines. EXPERT OPINION: Compared to other NRTIs, tenofovir alafenamide fumarate (TAF) is more advantageous in terms of potency and safety. It is therefore a preferred choice in combination with emtricitabine (FTC) in most HIV treatment guidelines. The efficacy of the two-drug combination of NRTI/Integrase strand-transfer inhibitor, i.e. lamivudine/dolutegravir has been approved as an option for initial therapy. This regimen however has some limitations in patients with HBV coinfection. The two NRTI combinations tenofovir disproxil fumarate (TDF)/FTC and TAF/FTC have also been approved for pre-exposure prophylaxis (PrEP). Interestingly, a promising long-acting nucleoside reverse transcriptase translocation inhibitor, islatravir, formulated for implant was well tolerated and remained effective for up to a year, suggesting its potential as a single agent for PrEP. In the next decade, it remains to be seen whether NRTI-based regimens will remain the backbone of preferred ART regimens, or if the treatment will eventually move toward NRTI-sparing regimens to avoid long-term NRTI-toxicity. Article	2020	Wood S.; Dowshen N.; Bauermeister J.A.; Lalley-Chareczko L.; Franklin J.; Petsis D.; Swyryn M.; Barnett K.; Weissman G.E.; Koenig H.C.; Gross R.	Social Support Networks Among Young Men and Transgender Women of Color Receiving HIV Pre-Exposure Prophylaxis	Journal of Adolescent Health	-	-	-	1054139X	10.1016/j.jadohealth.2019.08.014	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85074337233&doi=10.1016%2fj.jadohealth.2019.08.014&partnerID=40&md5=b6c1cf9934951a134e656b74f1715b82	Purpose: The aim of the study was to characterize perceived social support for young men and transgender women who have sex with men (YM/TWSM) taking HIV pre-exposure prophylaxis (PrEP). Methods: Mixed-methods study of HIV-negative YM/TWSM of color prescribed oral PrEP. Participants completed egocentric network inventories characterizing their social support networks and identifying PrEP adherence support figures. A subset (n = 31) completed semistructured interviews exploring adherence support and qualities of PrEP support figures. We calculated proportions of role types (e.g., family), individuals disclosed to regarding PrEP use, and PrEP-supportive individuals within each participant network. Interviews were analyzed using an inductive approach. Results: Participants (n = 50) were predominately African American men who have sex with men. Median age was 22 years (interquartile range: 20–23). Biologic family were the most common support figures, reported by 75% of participants (mean family proportion .37 standard deviation (SD): .31), followed by 67% reporting friends (mean friend proportion .38 SD: .36). Most network members were aware (mean disclosed proportion .74 SD: .31) and supportive (mean supportive proportion .87 SD: .28) of the participants' PrEP use. Nearly all (98%) participants identified ≥1 figure who provided adherence support; more often friends (48%) than family (36%). Participants characterized support as instrumental (e.g., transportation); emotional (e.g., affection); and social interaction (e.g., taking medication together). Key characteristics of PrEP support figures included closeness, dependability, and homophily (alikeness) with respect to sexual orientation. Conclusions: Although most YM/TWSM identified family in their support networks, friends were most often cited as PrEP adherence support figures. Interventions to increase PrEP adherence should consider integrated social network and family-based approaches. © 2019 Society for Adolescent Health and Medicine	Adherence; Adolescents; HIV; Pre-exposure prophylaxis; Social networks	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods

Article	2020	Wray, Tyler B; Chan, Philip A; Klausner, Jeffrey D; Mena, Leandro A; Brock, James B; Simpanen, Erik M; Ward, Lori M; Chrysovalantis, Stafylis	eTest: a limited-interaction, longitudinal randomized controlled trial of a mobile health platform that enables real-time phone counseling after HIV self-testing among high-risk men who have sex with men.	Trials	-	-	-	1745-6215	10.1186/s13063-020-04554-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7366305	BACKGROUND: HIV disproportionately affects men who have sex with men (MSM) in the USA, and new infections continue to increase, particularly among African American (AA) and Hispanic/Latino (H/L) MSM. Rates of HIV testing are particularly low among AA and H/L MSM, and innovative approaches to encourage testing may help address high incidence in these men. HIV self-testing (HST) may be an important tool for increasing rates and frequency of testing. HST may be particularly well-suited for AA and H/L MSM, given that stigma and mistrust of medical care contribute to low testing rates. Despite its promise, however, many are concerned that HST does not sufficiently connect users with critical post-testing resources, such as confirmatory testing and care among those who test positive, and that these limitations may result in delayed linkage to care. METHODS: We developed a mobile health platform (eTest) that monitors when HST users open their tests in real time, allowing us to provide timely, "active" follow-up counseling and referral over the phone. In this study, 900 high-risk MSM (with targets of 40% AA, 35% H/L) who have not tested in the last year will be recruited from social media and other gay-oriented websites in several major cities. Over 12 months, participants will be randomly assigned to receive (1) HST with post-test phone counseling and referral (eTest condition), (2) HST without active follow-up (standard condition), or (3) reminders to get tested for HIV at a local clinic (control) every 3 months. Primary outcomes include rates of HIV testing, receipt of additional HIV prevention services, and PrEP initiation verified by clinical medical records. DISCUSSION: This study tests whether providing more active counseling and referral after HST encourages more regular HIV testing and engagement with other prevention services among MSM, compared to more passive approaches or clinic-based testing alone. It will also explore the cost-effectiveness and emotional/behavioral effects of these two strategies. TRIAL REGISTRATION: ClinicalTrials.gov identifier NCT03654690 . Registered on 31 August 2018. Article	2020	Wu, Linxuan; Schumacher, Christina; Chandran, Aruna; Fields, Errol; Price, Ashley; Greenbaum, Adena; Jennings, Jacky M	Patterns of PrEP Retention Among HIV Pre-exposure Prophylaxis Users in Baltimore City, Maryland.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002506	https://dx.doi.org/10.1097/QAI.0000000000002506	BACKGROUND: HIV pre-exposure prophylaxis (PrEP) retention, defined as quarterly clinical evaluation, is critical to reducing HIV incidence. Our objectives were to determine: (1) visit- and individual-level PrEP retention patterns; (2) and individual-level characteristics associated with low-level PrEP retention 12 months after initiation among PrEP users in Baltimore City, Maryland. METHODS: Information was abstracted from medical records among individuals initiating PrEP between October 1, 2015 and February 28, 2018. Visit-level PrEP retention was defined as evidence of PrEP use, documented PrEP prescription, or current PrEP use at each quarterly follow-up visit. Low-level PrEP retention was defined as <3/4 quarters with documented PrEP use. Multilevel mixed effects Poisson regression was used to determine characteristics associated with low-level PrEP retention. RESULTS: Among 412 individuals initiating PrEP and followed for 12 months, the majority was: cis-gender male (83.7%, n = 345), non-Hispanic Black (56.3%, n = 232) and gay, bisexual, or other man who has sex with men (74.0%, n = 305). By quarterly visits, PrEP retention was: 3-month: 69.4% (n = 286); 6-month: 51.9% (n = 214); 9-month: 44.5% (n = 183); and 12-month: 41.1% (n = 169). Three-fifths (58.5%, n = 241) had low-level PrEP retention. Cis-gender females (vs. cis-gender males) (adjusted relative risk: 1.36, 95% confidence interval: 1.04 to 1.77) were more likely to have low-level PrEP retention. CONCLUSIONS: Our observed PrEP retention rates are lower than what may be needed to reduce HIV incidence. Future research should examine individual- and clinic-level barriers and facilitators to PrEP retention programs by key population to inform interventions for PrEP retention. Article	2020	Wu, Zun-You; Scott, Sarah Robbins	Human immunodeficiency virus prevention strategies in China.	Chinese Medical Journal	-	-	-	2542-5641	10.1097/CM9.0000000000000647	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7004624	This paper reviews the current epidemics of human immunodeficiency virus (HIV) infection in China, particularly the globally available prevention strategies developed and implemented. This review focuses on HIV prevention measures in general, such as education, testing, and counseling and in specific responses to transmission modes, such as blood safety, harm reduction for people who inject drugs, and condom promotion to reduce sexual transmission. We also assess newly developed prevention measures, such as prevention treatment, pre-exposure prophylaxis, post-exposure prophylaxis, male circumcision, and promising potential future preventions, including microbicides and vaccines. Based on this assessment, we provide recommendations for their implementation in China. We conclude that there is no magic bullet for HIV prevention, particularly sexual transmission of the disease, but only a combination of these prevention strategies can control the HIV epidemic. Article	2020	Xia, Yiqing; Greenwald, Zoë R; Milwid, Rachael M; Trottier, Claire; Boissonnault, Michel; Gaul, Neil; Charest, Louise; Landry, Gabrielle; N Zahedi, Navid; Szabo, Jason; Thomas, Réjean; Maheu-Giroux, Mathieu	Pre-exposure Prophylaxis Uptake Among Men Who Have Sex With Men Who Used nPEP: A Longitudinal Analysis of Attendees at a Large Sexual Health Clinic in Montréal (Canada).	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002472	https://dx.doi.org/10.1097/QAI.0000000000002472	BACKGROUND: Reducing HIV transmission using pre-exposure prophylaxis (PrEP) requires focussing on individuals at high acquisition risk, such as men who have sex with men with a history of nonoccupational post-exposure prophylaxis (nPEP). This study aims to characterize longitudinal trends in PrEP uptake and its determinants among nPEP users in Montréal. METHODS: Eligible attendees at Clinique médicale l'Actuel were recruited prospectively starting in October 2000 (nPEP) and January 2013 (PrEP). Linking these cohorts, we characterized the nPEP-to-PrEP cascade, examined the determinants of PrEP uptake after nPEP consultation using a Cox proportional-hazard model, and assessed whether PrEP persistence differed by nPEP history using Kaplan-Meier curves. RESULTS: As of August 2019, 31% of 2682 nPEP cohort participants had 2 or more nPEP consultations. Subsequent PrEP consultations occurred among 36% of nPEP users, of which 17% sought nPEP again afterward. Among 2718 PrEP cohort participants, 46% reported previous nPEP use. Among nPEP users, those aged 25-49 years hazard ratio (HR) = 1.3, 95% confidence interval (CI): 1.1 to 1.7, with more nPEP episodes (HR = 1.4, 95% CI: 1.3 to 1.5), who reported chemsex (HR = 1.3, 95% CI: 1.1 to 1.7), with a sexually transmitted infection history (HR = 1.5; 95% CI: 1.3 to 1.7), and who returned for their first nPEP follow-up visit (HR = 3.4, 95% CI: 2.7 to 4.2) had higher rates of PrEP linkage. There was no difference in PrEP persistence between nPEP-to-PrEP and PrEP only participants. CONCLUSION: Over one-third of nPEP users were subsequently prescribed PrEP. However, the large proportion of men who repeatedly use nPEP calls for more efficient PrEP-linkage services and, among those who use PrEP, improved persistence should be encouraged. Chinese Medical Journal	-	-	-	2542-5641	10.1097/CM9.0000000000001181	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10631579	Although the global human immunodeficiency virus (HIV) epidemic has been effectively curbed, preventing and managing HIV infection in high-risk populations remains challenging.[1] In China, HIV is primarily transmitted through sexual contact.[1,2] Pre-exposure prophylaxis (PrEP) is a new and effective method for preventing HIV infection using antiretroviral drugs[3]; data from multiple clinical trials worldwide have shown that using antiretroviral drugs for PrEP can limit HIV transmission.[4–7] The World Health Organization (WHO) issued guidelines in 2015 recommending PrEP in populations with an HIV incidence above 3/100 person-years (PY) and in individuals engaging in high-risk behaviors.[3] According to existing studies, the HIV incidence among key populations in China was 5.6/100 PY for men who have sex with men (MSM),[8] 1.6/100 PY for intravenous drug users (IDUs),[9] and 1.4/100 PY for female sex workers.[10,11] As of July 2020, 54 countries and regions have issued PrEP guidelines for adults to prevent HIV infection, and 36 of these have also published guidelines for children and adolescents. However, there are no PrEP guidelines or related consensus statement in China. As such, there is a strong need for standardized guidance on the implementation of PrEP pertaining to medical selection criteria, PrEP timing, drug safety, and consultation and testing programs. Here we present the consensus statement on the implementation of PrEP in China based on the opinions and suggestions of health policy-makers, scientists, clinical experts, community-based organizations of key populations, and the latest reports in PrEP researches. Article	2020	Yager, Jenna L; Anderson, Peter L	Pharmacology and drug interactions with HIV PrEP in transgender persons receiving gender affirming hormone therapy.	Expert Opinion on Drug Metabolism and Toxicology	-	-	-	1744-7607	10.1080/17425255.2020.1752662	https://dx.doi.org/10.1080/17425255.2020.1752662	INTRODUCTION: Transgender persons are at increased risk of HIV infection and would benefit from pre-exposure prophylaxis (PrEP) use. However, barriers to healthcare and a lack of data regarding PrEP efficacy among transgender persons limits use. A related issue is whether a drug-drug interaction (DDI) exists between gender affirming hormone therapy (GAHT) and PrEP. Recently, small pharmacokinetic studies were conducted to assess this interaction. AREAS COVERED: This review will assess the pharmacology of PrEP agents, existing data regarding potential DDIs between GAHT and PrEP, and hypothetical mechanisms for these DDIs. A summary will be provided on implications for PrEP use among transgender persons. EXPERT OPINION: Theoretically, DDIs are not expected between GAHT and PrEP. However, among transgender women (TGW) on GAHT, small studies identified a minor DDI between GAHT and tenofovir/emtricitabine (TFV/FTC), with TFV/FTC exposures ~12-27% lower among TGW vs. cisgender men. The mechanism of DDIs is unclear and requires further study. For perspective, median TFV/FTC concentrations were still within the range of median concentrations reported across controlled pharmacokinetic studies. TFV-disphosphate/FTC-triphosphate concentrations were similar between TGW and cisgender men. In summary, TDF/FTC likely reaches protective concentrations and should continue to be offered as PrEP for transgender persons. Article	2020	Yager, Jenna; Castillo-Mancilla, Jose; Ibrahim, Mustafa E; Brooks, Kristina M; McHugh, Cricket; Morrow, Mary; McCallister, Scott; Bushman, Lane R; MaWhinney, Samantha; Kiser, Jennifer J; Anderson, Peter L	Intracellular Tenofovir-Diphosphate and Emtricitabine-Triphosphate in Dried Blood Spots Following Tenofovir Alafenamide: The TAF-DBS Study.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002354	https://dx.doi.org/10.1097/QAI.0000000000002354	BACKGROUND: Tenofovir alafenamide (TAF), in combination with FTC, was recently approved for PrEP in the United States. The objective of this study was to assess the relationship between tenofovir-diphosphate (TFV-DP) and emtricitabine-triphosphate (FTC-TP) in dried blood spots (DBS) with adherence to TAF/FTC. METHODS: TAF-DBS was a randomized, crossover clinical study of TFV-DP in DBS, following directly observed dosing of 33%, 67%, or 100% of daily TAF (25 mg)/FTC (200 mg). Healthy volunteers were randomized to 2 different, 12-week dosing regimens, separated by a 12-week washout. DBS were collected weekly. TFV-DP and FTC-TP were extracted from two 7-mm punches and assayed with LC-MS/MS. RESULTS: Thirty-seven participants (17 female, 7 African American, and 6 Hispanic) were included. TFV-DP exhibited a mean half-life of 20.8 days (95% confidence interval: 19.3 to 21.3). The slope for TFV-DP versus dosing arm was 1.14 (90% confidence interval: 1.07 to 1.21). The mean (SD) TFV-DP after 12 weeks was 657 (186), 1451 (501), and 2381 (601) fmol/2 7-mm punches for the 33%, 67%, and 100% arms. The following adherence interpretations are proposed: <450 fmol/punches, <2 doses/wk; 450-949 fmol/punches, 2-3 doses/wk; 950-1799 fmol/punches, 4-6 doses/wk; and ≥1800 fmol/punches, 7 doses/wk. FTC-TP was quantifiable for 1 week after drug cessation in 50%, 92%, and 100% of participants in the 33%, 67%, and 100% arms, respectively. CONCLUSION: TFV-DP in DBS after TAF/FTC exhibited a long half-life and was linearly associated with dosing, similar to its predecessor tenofovir disoproxil fumarate. FTC-TP was quantifiable for up to 1 week after drug cessation. Together, these moieties provide complementary measures of cumulative adherence and recent dosing for TAF/FTC. Article	2020	Yen-Hao Chu, Isaac; Wen-Wei Ku, Stephane; Li, Chia-Wen; Toh, Han Siong; Yang, Chia-Jui; Wu, Kuan-Sheng; Wu, Huei-Jiuan; Chen, Shu-Sheng; Kuo, Jiann-Horng; Lin, Hsi-Hsun; Ko, Nai-Ying	Taiwan guideline on oral pre-exposure prophylaxis for HIV prevention - 2018 update.	Journal of Microbiology, Immunology and Infection	-	-	-	1995-9133	10.1016/j.jmii.2019.09.003	https://dx.doi.org/10.1016/j.jmii.2019.09.003	Pre-exposure prophylaxis (PrEP) for prevention of human immunodeficiency virus infection is proved to be effective and has been implemented worldwide. This article introduces the guideline development and revised recommendations and guidance on PrEP provision in the updated Taiwan PrEP guideline. The Taiwan PrEP guideline writing group searched randomized controlled trials and guidelines published before October 2017 through Medline/PubMed, Cochrane Database, Embase and ClinicalTrials.gov database. Keywords included pre(-)exposure prophylaxis, PrEP, Truvada, tenofovir, HIV, and AIDS. Each selected article was assessed by two authors using the Grading of Recommendations Assessment, Development and Evaluation. External reviewers were invited to independently evaluate the revised manuscript per the Appraisal of Guidelines for Research and Evaluation II. Before publication, a public consultation was held to reach consensus on the updated guideline among providers, civil society, and Taiwan Centers for Disease Control. Four systematic reviews and 28 original articles were reviewed by Taiwan PrEP writing group. The second version of the Taiwan PrEP guideline was released in March 2018. We recommended daily PrEP use for the following populations: strong recommendation and high quality of evidence for men who have sex with men (MSM) and transgender women (TGW), as well as heterosexual serodiscordant couples; weak recommendation and high quality of evidence for people who inject drugs, while weak recommendation and moderate quality of evidence for at-risk heterosexual men and women. There is high-quality evidence for event-driven PrEP in MSM and likely TGW, and we additionally recognized these key populations could benefit from such dosing regimen. Theses and Dissertations	2020	Yoshioka, Emily	Attitudes Toward HIV Testing and Intended Uptake of Pre-Exposure Prophylaxis Among Adolescents in South Africa | Intimate Partner Violence and Sexual Agency Among Married Women and Girls in the Philippines	-	-	Brown University	-	NA	NA	https://repository.library.brown.edu/studio/item/bdr:1129203/	Abstract of "I'm Doing This Test so I Can Benefit from PrEP": Attitudes Toward HIV Testing and Intended Uptake of Pre-Exposure Prophylaxis Among Adolescents in South Africa, by Emily Yoshioka, Degree M.P.H., Brown University, May 2020. In South Africa, adolescents and young people (aged less than 25 years old) are a key population in the HIV epidemic and stand to benefit from oral pre-exposure prophylaxis (PrEP). Because HIV testing is an integral component of the PrEP continuum and adolescents in South Africa have generally low HIV testing rates, HIV testing attitudes and behavior must be understood in order to implement PrEP. 10 focus groups with adolescents living with and without HIV, and 60 in-depth interviews with service providers and adolescents living with and without HIV were conducted from 2015-2016 in Western Cape, South Africa. Data were analyzed using thematic framework analysis to understand the dynamics by which South African adolescents' attitudes toward HIV testing might influence intended uptake of PrEP, as well as explore implications of adolescents' PrEP awareness for HIV testing. Three themes were identified: barriers to HIV testing could present barriers to PrEP initiation for adolescents in South Africa, PrEP is a prevention strategy that can transform behavior and attitudes towards HIV testing, and uptake of PrEP could also synergistically increase HIV testing. While current HIV testing attitudes and behavior present barriers to intended PrEP initiation, integration of PrEP into South African adolescents' HIV prevention toolkit has great potential to increase HIV testing rates and decrease stigma and fear around HIV testing. Implementation of PrEP must be tailored to differences in barriers to HIV testing between boys and girls. As PrEP becomes more widely available, predicted challenges may include the potential for adolescents to stop HIV testing while on PrEP and to share and/or steal PrEP medication from peers. Abstract of Intimate Partner Violence and Sexual Agency Among Married Women and Girls in the Philippines: 2017 Philippines National Demographic and Health Survey, by Emily Yoshioka, Degree M.P.H., Brown University, May 2020. Intimate partner violence (IPV) is an issue impacting women and girls worldwide and may have implications for women's ability to negotiate sexual relations with their male partners. In the Philippines, women and girls face high rates of IPV. This study explored the relationship between experiences of IPV and women and girls' ability to negotiate sexual relations with their husband or partner in the Philippines. Using a nationally representative sample (n=11,727) from the 2017 Philippines National Demographic and Health Survey, we conducted six multivariable regression analyses to examine the relationships between women and girls' experiences of sexual, physical, or emotional violence in their current marriage or partnership and their ability to refuse sex or ask their partner to use a condom during sex. In adjusted models, participants' ability to ask their…	Qualitative research	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Qualitative
Article	2020	Yoshioka, Emily; Giovenco, Danielle; Kuo, Caroline; Underhill, Kristen; Hoare, Jackie; Operario, Don	"I'm doing this test so I can benefit from PrEP": exploring HIV testing barriers/facilitators and implementation of pre-exposure prophylaxis among South African adolescents.	African Journal of AIDS Research	-	-	-	1727-9445	10.2989/16085906.2020.1743726	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8006570	In South Africa, adolescents are a key population in the HIV epidemic that can benefit from increased access to oral pre-exposure prophylaxis (PrEP). HIV testing is an integral component of the PrEP care continuum but adolescents in South Africa have generally low HIV testing rates; therefore, adolescents' HIV testing attitudes and behaviours must be understood to develop strategies for effective PrEP implementation. Ten focus groups were conducted with adolescents living with HIV and HIV-uninfected adolescents (n = 55), and in-depth interviews were conducted with service providers (n = 25), adolescents living with HIV (n = 10) and HIV-uninfected adolescents (n = 25). Data were collected in the Western Cape province of South Africa from 2015-2016. Thematic framework analysis was used to understand dynamics by which South African adolescents' attitudes toward HIV testing might influence intended uptake of PrEP and, reciprocally, to explore the implications of adolescents' perceptions about PrEP availability for their willingness to engage in HIV testing. While South African adolescents' current HIV testing attitudes and behaviours present barriers to intended PrEP implementation in this population, increased access to PrEP has the potential to improve their initial HIV testing rates and decrease stigma and fear around HIV testing. However, implementation of PrEP must consider specific HIV testing barriers for adolescent boys and girls, respectively. As PrEP becomes more widely available for adolescents, possible challenges noted by participants may include the potential for adolescents to reduce continued HIV testing behaviours while on PrEP and to share/use unprescribed PrEP medications among peers.	adolescent engagement, HIV testing barriers, PrEP implementation, qualitative methods	English	South Africa	Eastern and Southern Africa	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2020	Young L.B.; Lalley-Chareczko L.; Clark D.; Ramos M.T.; Nahan R.A.; Troutman G.S.; Cantor R.; DiFlavis L.; Koenig H.C.	Correlation of pre-exposure prophylaxis adherence to a mental health diagnosis or experience of childhood trauma in high-risk youth	International journal of STD & AIDS	-	-	-	9564624	10.1177/0956462420911559	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083042493&doi=10.1177%2f0956462420911559&partnerID=40&md5=d6354a2a46f3ba7195f02520c93064ce	Pre-exposure prophylaxis (PrEP) with tenofovir disoproxil fumarate (TDF)/emtricitabine is 99% effective in preventing HIV when taken daily. Young men/transgender women of color who have sex with men are the most at risk to become infected with HIV, with the lowest PrEP adherence. We investigated the association of depression, anxiety, and history of childhood trauma with PrEP adherence. PrEP adherence was measured by urine TDF testing. Patients were evaluated for depression (Patient Health Questionnaire-9 PHQ-9), anxiety (Generalized Anxiety Disorder-7 GAD-7), and history of childhood trauma (Adverse Childhood Experiences ACEs). Urine TDF levels were compared across scores on each screening tool using a Student's t-test. A p-value of ≤ 0.05 was considered significant. Thirty-one subjects (mean age: 21.7 years, SD: 2.8) were enrolled between 3/2015 and 7/2016. Lower PrEP adherence was associated with a GAD-7 score diagnostic for generalized anxiety (80.7% versus 92.7%, p = 0.04) and a high ACE score (4+) (84.5% versus 95.7%, p = 0.05). A PHQ-9 score diagnostic for major depression was not associated with PrEP adherence. The presence of generalized anxiety and a history of childhood trauma, but not major depression, were associated with decreased PrEP adherence. The benefits of mental health interventions and trauma-informed care in PrEP programs should be considered in larger studies to potentially increase adherence. © The Author(s) 2020.	antiretroviral therapy; HIV; men; North America; prevention	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2020	Young, Ingrid; Valiotis, George	Strategies to support HIV literacy in the roll-out of pre-exposure prophylaxis in Scotland: findings from qualitative research with clinical and community practitioners.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2019-033849	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7213852	OBJECTIVES: Limited understanding of pre-exposure prophylaxis (PrEP), coupled with negative public discourse, are significant barriers to its introduction. What works to support PrEP awareness and broader HIV literacy among diverse communities in the context of biomedical HIV prevention remains unclear. This article considers how PrEP can be translated across diverse communities and what the HIV literacy challenges might be in the current context of PrEP provision. SETTING: We developed an HIV literacy informed community tool to support the roll-out of PrEP in Scotland. We undertook qualitative research with practitioners in urban and rural settings across nine Scottish health boards. PRIMARY OUTCOME MEASURE: To examine HIV literacy challenges in the context of PrEP provision. PARTICIPANTS: Interviews and focus groups with community (n=19) and clinical (n=13) practitioners working with gay and bisexual men and African communities were undertaken between March and October 2017 concerning PrEP support, stigma and HIV literacy. RESULTS: HIV literacy in the context of PrEP needs to consider more than the provision of individually targeted information. Practitioners identified and responded to stratified communities and social norms of knowledge, which influenced messaging, support and informed how practitioners enabled PrEP engagement and dialogue. Social barriers in HIV literacy, including structural stigmas relating to HIV and homophobia, shaped practitioner concerns and support for community members' willingness to engage with PrEP. CONCLUSION: Critical HIV literacy in the age of PrEP is a complex social practice. Attention needs to be paid to how information is provided and facilitates engagement, rather than simply what information is given.By exploring practitioner use of the Know about PrEP tool, we have shown how consideration of the patterns of access to services and information, the delivery of and support for engagement with PrEP information and the wider strategies employed to negotiate ongoing structural social barriers can support more equitable and diverse PrEP community conversations.	public health, HIV & AIDS, sexual medicine, health policy	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Qualitative
Article	2020	Young, L; Schneider, J	A PRAGMATIC RANDOMIZED CONTROLLED TRIAL TO ACCELERATE DIFFUSION OF PRE-EXPOSURE PROPHYLAXIS FOR HIV PREVENTION	Annals of Behavioral Medicine	-	-	-	0883-6612	10.1097/QAI.0000000000002518	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7722461/	Objectives: We tested preliminary efficacy of a peer change agent type I network intervention to increase pre-exposure prophylaxis (PrEP) linkage to care among network members connected to young Black men who have sex with men. Design: Parent study is a pragmatic randomized controlled trial with 110 weeks of total follow-up. Interim midpoint analyses are performed here using participant data before crossover assignment at 55 weeks. Methods: We randomly assigned 423 participants in Chicago to receive the network intervention, an opinion leader workshop with telephonic booster sessions, versus a time-matched control from 2016 to 2018. The consolidated surrogate outcome was PrEP referral and linkage to clinical care among network members connected to study participants and was collected from independent administrative data. Results: Each study participant in the trial (n = 423) had on average 1822 network contacts who could be eligible for PrEP referral and linkage. During the 55-week observation period, PrEP referral was most likely to occur within 3 days of an intervention session compared to control [odds ratio (OR) 0.07 (0.02–0.013); P = 0.007] resulting in 1–2 referrals of network members per session. Network members with referral or linkage were more likely to be connected to study participants in the intervention arm than the control condition [aOR 1.50 (1.09–2.06); P = 0.012]. Conclusions: A peer change agent type I network intervention is preliminarily effective at diffusing PrEP through a network of individuals highly susceptible to HIV over 55 weeks. This low-intensity intervention demonstrated network-level impact among populations that have experienced limited PrEP care engagement in the United States. Article	2020	Yusuf, Hasiya; Fields, Errol; Arrington-Sanders, Renata; Griffith, David; Agwu, Allison L	HIV Preexposure Prophylaxis Among Adolescents in the US: A Review.	JAMA Pediatrics	-	-	-	2168-6211	10.1001/jamapediatrics.2020.0824	https://dx.doi.org/10.1001/jamapediatrics.2020.0824	Importance: Many adolescents and young adults in the US are disproportionately affected by HIV. Several others who are uninfected are at risk and in need of effective preventive strategies. The uptake rate of preexposure prophylaxis (PrEP) for HIV prevention has remained low among US adolescents. This review assesses the current status of PrEP uptake among at-risk adolescents aged 13 to 19 years and recommendations for improving PrEP access, uptake, and future needed directions, including specific recommendations for health care professionals. Observations: Of the 37â¯377 new HIV diagnoses made in 2018, 7734 diagnoses (21%) occurred in adolescents and young adults aged 12 to 24 years; of these, 1707 diagnoses (22%) occurred in adolescents aged 13 to 19 years. The greatest burden of HIV is found among young African American men who have sex with men, accounting for two-thirds of all HIV infections in adolescents and young adults. Preexposure prophylaxis awareness and engagement are lowest in adolescents with the greatest risk for HIV. Adolescent primary care clinicians and specialists do not routinely offer HIV testing as recommended by the Centers for Disease Control and Prevention or routinely assess sexual risk exposures of patients through sexual history taking. Clinicians' decision to prescribe PrEP for adolescents is often guided by their perceptions of the patient's HIV risk and their knowledge and acceptance of PrEP guidelines. State laws on consent, confidentiality, and the rights of the adolescent to independently access PrEP outside of parental influence differ across jurisdictions, often limiting access and uptake. Conclusions and Relevance: Use of PrEP in adolescents at risk for HIV is an important component of HIV prevention. Optimizing uptake includes improving clinicians' knowledge about HIV risk and prevention strategies, enhancing sexual history taking and risk assessment through training and retraining, and improving PrEP knowledge and acceptance of prescribing among clinicians. Leveraging the ubiquity of social media, encouraging family support, and performing research aimed at finding lifestyle-congruent formulations can help mitigate HIV transmission in adolescents at greatest risk for HIV. Article	2020	Zaller N.D.; Neher T.L.; Presley M.; Horton H.; Alexandra Marshall S.; Zielinski M.J.; Brinkley-Rubinstein L.	Barriers to linking high-risk jail detainees to HIV pre-exposure prophylaxis	PLOS One	-	-	-	19326203	10.1371/journal.pone.0231951	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083567142&doi=10.1371%2fjournal.pone.0231951&partnerID=40&md5=29df8038b27d200928ca91d6f23de022	Individuals involved in the criminal justice (CJ) system continue to be at disproportionate risk for HIV infection, and often have a greater prevalence of substance use and sexual related risk behaviors relative to their non-CJ involved peers. Pre-exposure prophylaxis (PrEP), a once daily antiretroviral medicine, is an evidence-based approach for reducing the risk of contracting HIV but limited data exist regarding the use of PrEP among CJ populations, especially in the U.S. South. This study was conducted at the Pulaski County Regional Detention Facility (PCRDF) in Little Rock, Arkansas (AR), the largest county jail in the state. We explored knowledge about PrEP and HIV, perceptions about PrEP feasibility in both the jail and community settings and barriers to PrEP program implementation, through in-depth qualitative interviews with 21 jail detainees. We purposively sampled individuals based on specific self-reported risk behavior, including sexual risk (both heterosexual and same-sex) and drug related risk (e.g. IDU), among all eligible individuals. We identified five primary themes from the interviews: 1) accessing healthcare during community reentry was a low priority; 2) perception of risk and interaction with people with HIV was low; 3) there are many barriers to disclosing HIV risk behaviors in jail settings; 4) knowledge of PrEP is low but willingness to use is high; and 5) multiple barriers exist to PrEP uptake post-release. Our findings are contextually unique and therefore have important implications for future implementation of PrEP access either within jail settings or linkage to PrEP post release. © 2020 Zaller et al. Article	2020	Zang, Xiao; Jalal, Hawre; Krebs, Emanuel; Pandya, Ankur; Zhou, Haoxuan; Enns, Benjamin; Nosyk, Bohdan	Prioritizing Additional Data Collection to Reduce Decision Uncertainty in the HIV/AIDS Response in 6 US Cities: A Value of Information Analysis.	Value Health	-	-	-	1524-4733	10.1016/j.jval.2020.06.013	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7705607	OBJECTIVES: The ambitious goals of the US Ending the HIV Epidemic initiative will require a targeted, context-specific public health response. Model-based economic evaluation provides useful guidance for decision making while characterizing decision uncertainty. We aim to quantify the value of eliminating uncertainty about different parameters in selecting combination implementation strategies to reduce the public health burden of HIV/AIDS in 6 US cities and identify future data collection priorities. METHODS: We used a dynamic compartmental HIV transmission model developed for 6 US cities to evaluate the cost-effectiveness of a range of combination implementation strategies. Using a metamodeling approach with nonparametric and deep learning methods, we calculated the expected value of perfect information, representing the maximum value of further research to eliminate decision uncertainty, and the expected value of partial perfect information for key groups of parameters that would be collected together in practice. RESULTS: The population expected value of perfect information ranged from $59 683 (Miami) to $54 108 679 (Los Angeles). The rank ordering of expected value of partial perfect information on key groups of parameters were largely consistent across cities and highest for parameters pertaining to HIV risk behaviors, probability of HIV transmission, health service engagement, HIV-related mortality, health utility weights, and healthcare costs. Los Angeles was an exception, where parameters on retention in pre-exposure prophylaxis ranked highest in contributing to decision uncertainty. CONCLUSIONS: Funding additional data collection on HIV/AIDS may be warranted in Baltimore, Los Angeles, and New York City. Value of information analysis should be embedded into decision-making processes on funding future research and public health intervention. Article	2020	Zappas, Michelle Peters; Foreman, Ruth Madden	PrEParing for Preexposure Prophylaxis.	Journal for Nurse Practitioners	-	-	-	2380-9426	10.1891/2380-9418.JDNP-D-19-00033	https://dx.doi.org/10.1891/2380-9418.JDNP-D-19-00033	BACKGROUND: In 2012 the Food and Drug Administration (FDA) approved Truvada (emtricitabine FTC 200 mg/tenofovir disoproxil fumarate TDF 300 mg) for preexposure prophylaxis (PrEP) against HIV. There was a substantial decline in new HIV diagnoses which has since stabilized. OBJECTIVE: The plateau is thought to be because preventative efforts are not reaching high-risk groups. About 1.2 million adults in the United States could benefit from PrEP but only 80,000 individuals are taking it. This article aims to increase provider awareness of PrEP so primary care providers feel confident discussing risk reduction options, initiating, and monitoring PrEP. METHODS: A case based approached is used to achieve the objective. RESULTS: Target populations, baseline labs, follow up labs and monitoring parameters, and side effects of medication will be reviewed. Patient counseling with regards to dosing, administration, side effects and adverse events will be discussed. CONCLUSIONS: HIV prevention is an integral public health goal. PrEP is a way to achieveve continued reduction in HIV incidence. PCPs should be offering PrEP to at risk individuals. IMPLICATIONS FOR NURSING: Many nurse practitioners work as primary care providers, this article hopes to increase the confidence of PCPs in prescribing PrEP to those who would benefit from it. Article	2020	Zeggagh, J; Bauer, R; Delaugerre, C; Carette, D; Fressard, L; Charreau, I; Chidiac, C; Pialloux, G; Tremblay, C; Cua, E; Robineau, O; Raffi, F; Meyer, L; Molina, JM; ANRS IPERGAY Study Grp	Incidence and risk factors for STIs among MSM on PrEP - A post-hoc analysis of the ANRS IPERGAY trial	Journal of the International AIDS Society	-	-	-	1758-2652	NA	https://pubmed.ncbi.nlm.nih.gov/35142708/	Objective: High rates of sexually transmitted infections (STIs) have been reported among pre-exposure prophylaxis (PrEP) users. We wished to assess the incidence and risk factors for recurrent STIs. Design: The ANRS IPERGAY trial was a prospective study investigating PrEP among MSM and transgender women in outpatient clinics in France and Canada. In all, 429 participants were enrolled, offered up to 4 years of PrEP and screened for bacterial STIs (syphilis, chlamydia and gonorrhea) at baseline and every 6 months. Methods: STIs incidence was calculated yearly. Cox proportional hazards model regression was used to explore associations between participants characteristics at baseline and recurrent STI during follow-up. Results: Over a median follow-up of 23 months, bacterial STI incidence was 75, 33, 13, 32 and 30 per 100 person-years for all STIs, rectal STIs, syphilis, gonorrhea and chlamydia, respectively. STI incidence significantly increased from the first year to the fourth year of the study (55 vs. 90 per 100 person-years, P < 0.001). During the study period, 167 participants (39%) presented with more than one bacterial STIs which accounted for 86% of all STIs. Baseline risk factors associated with recurrent STIs in a multivariate analysis were an STI at baseline [hazards ratio: 1.48 (95% confidence interval (CI): 1.06-2.07), P = 0.02], more than eight sexual partners in prior 2 months [hazards ratio: 1.72 (95% CI: 1.21-2.43), P = 0.002] and the use of gamma-hydroxybutyrate [hazards ratio: 1.66 (95% CI: 1.16-2.38), P = 0.005]. Conclusion: STI incidence was high and increased over time. Most STIs were concentrated in a high-risk group that should be targeted for future interventions. Article	2020	Zeggagh, J; Brun, A; Siguier, M; Molina, J M	Knowledge and practices of Parisian family physicians for the management of men who have sex with men in the era of HIV pre-exposure prophylaxis.	Médecine et Maladies Infectieuses	-	-	-	1769-6690	10.1016/j.medmal.2020.02.005	https://dx.doi.org/10.1016/j.medmal.2020.02.005	INTRODUCTION: The optimal management of men who have sex with men (MSM) requires active involvement of family physicians (FP). We assessed knowledge and practices of Parisian FPs related to the management of MSM for sexually transmitted infections (STIs) and pre-exposure prophylaxis for HIV (PrEP). METHOD: We conducted an observational prospective study between June 20 and July 31, 2017, with a sample of FPs practicing in Paris. The questionnaire posted via the Google Form website included 42 questions on sexual health management of MSM patients. A statistical analysis was then performed. RESULTS: One hundred and four FPs took part in the study. The median age was 34 and 68% were women. Overall, 86.5% of FPs had already heard about PrEP, but only 36% of them were familiar with the indication for therapy and 77.9% of FPs declared to be willing to renew PrEP prescription. Overall, 89.4% of respondents declared to be willing to attend additional training on sexual health of MSM patients, including 73% on PrEP. CONCLUSION: FPs have an important role in the management of MSM patients. They showed strong interest in PrEP despite limited knowledge of indications and methods of administration. They declared to be willing to attend additional training for further involvement. Article	2020	Zhan H.; Wu Q.; Zang S.; Zhou L.; Wang X.	How were situations of preventive and curative care expenditure for AIDS and medical burden of patients? Research based on "System of Health Accounts 2011"	BMC Public Health	-	-	-	14712458	10.1186/s12889-019-8131-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078961640&doi=10.1186%2fs12889-019-8131-0&partnerID=40&md5=842965f4e44e352a8410d9b31b7d8d33	Background: The problem of AIDS response has not only involved public health, but also had a great impact on the family burden.The objective of this study was to estimate the preventive and curative care expenditure(PCE)for AIDS of Hunan Province in 2017 based on System of Health Accounts 2011(SHA2011)by quantity,financing scheme,health provider,health function,and to analyses the factors affecting patients' medical burden. Methods: Through stratified multi-stage sampling method, 1336 institutions were surveyed to obtain AIDS prevention and control data, and the official data collected from Health Statistical Yearbook, Health Financial Annual Reports and Government Input Monitoring System were used to estimate the AIDS PCE based on SHA2011. Univariate analyses and ordered logistic regression were used to evaluate the factors affecting the medical burden of AIDS patients. Results: The AIDS PCE of Hunan Province in 2017 was 266.67 million, mainly flowed to hospitals and disease prevention and control institutions. The proportions of curative care expenditure(CCE) and prevention expenditure were 51.39 and 48.61% respectively. Prevention expenditure were mainly used for traditional prevention methods. All prevention expenditure and 88.52% of CCE were borne by public financing scheme. Family health expenditure accounted for 11.12% of CCE, but there were still some people with heavy burden of treatment. Non insurance, co-infection and length of stay are risk factors to the total hospitalization expenses(Totalexp)and the out-of-pocket payments(OOPs)(all p < 0.05,OR > 1). Taking the age group under 30 as the reference, the partial regression coefficient of the age group over 60 was statistically significant (OR (Totalexp) = 1.809, OR (OOPs) = 0.30). Conclusion: The financing structure of the PCE for AIDS in Hunan Province was relatively stable and the flow of institutions was reasonable. The functional flow of expenditure embodied the principle of "prevention first". China should incorporate oral PrEP into the national guidelines as soon as possible to improve the allocation efficiency of AIDS prevention resources. Meantime, several measures should be taken to reduce the medical burden of AIDS patients, including expanding the scope of government assistance, adjusting insurance compensation measures, increasing the rate of patients participating in insurance,encouraging commercial insurance to join the AIDS insurance system,and controlling length of stay in hospital. © 2020 The Author(s). Article	2020	Zhang C.; Mitchell W.; Xue Y.; LeBlanc N.; Liu Y.	Understanding the role of nurse practitioners, physician assistants and other nursing staff in HIV pre-exposure prophylaxis care in the United States: a systematic review and meta-analysis	BMC Nursing	-	-	-	14726955	10.1186/s12912-020-00503-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097273362&doi=10.1186%2fs12912-020-00503-0&partnerID=40&md5=1cd606d6bb82edafa3a295e265e530c0	Background: Although pre-exposure prophylaxis (PrEP) was approved for primary HIV prevention by the Federal Drug Administration in 2012, PrEP utilization has been suboptimal. A body of literature and programs has emerged to examine the role of nurse practitioners (NPs), physician assistants and nursing staff in PrEP care. This review aims to understand the current status of non-physician health providers in PrEP care implementation in the United States. Methods: Following the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidance, we conducted a comprehensive literature search using multiple databases to identify peer-reviewed articles that examined the role of non-physician health providers in the implementation of PrEP. Four major databases of observational study design, randomized control trials and mixed-method study design were screened from November 2019 to January 2020 were searched. Two independent reviewers examined eligibility and conducted data extraction. We employed random-effects model aims to capture variances of estimates across studies. Results: A total of 26 studies with 15,789 health professionals, including NPs (18, 95% CI = 14,24%), physician assistants (6, 95% CI = 2, 10%), nursing staff (26, 95% CI = 18–34%), and physicians (62,95% CI = 45, 75%), were included in the analysis. The odds of prescribing PrEP to patients among NPs were 40% (OR = 1.40, 95% CI = 1.02,1.92) higher than that among physicians, while the likelihood of being willing to prescribe PrEP was similar. On the other hand, the odds of being aware of PrEP (OR = 0.63, 95% CI = 0.46, 0.87) was 37% less in nursing professionals than that among physicians. Conclusions: Although the limited number and scope of existing studies constrained the generalizability of our findings, the pattern of PrEP care implementation among non-physician health providers was described. To achieve wider PrEP care implementation in the U.S., increasing awareness of PrEP among all health providers including both physicians and non-physicians is a key step. © 2020, The Author(s). Article	2020	Zhang J.; Huang X.; Chen Y.; Wang H.; Zhang Y.; Wang H.; Mei Z.; Jia Y.; Chu Z.; Hu Q.-H.; He X.; Zhang L.; Hu Z.; Bao R.; Li S.; Ding H.; Jiang Y.; Geng W.; Tang W.; Xu J.	HIV and other STIs self-testing to reduce risk compensation among men who have sex with men who use oral pre-exposure prophylaxis in China: Protocol for a randomised waitlist-controlled trial	BMJ Open	-	-	-	20446055	10.1136/bmjopen-2019-036231	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088351149&doi=10.1136%2fbmjopen-2019-036231&partnerID=40&md5=54758cf856d866a564d6568caf303778	Introduction Pre-exposure prophylaxis (PrEP) reduces the risk of HIV infection among men who have sex with men by up to 99%. However, in real-world settings, PrEP users may exhibit risk compensation after uptake of PrEP, including more condomless anal intercourse (CAI) and increased sexually transmitted infection (STI) acquisition. HIV self-testing (HIVST) decreases CAI among men who have sex with men (MSM) by providing awareness of the HIV status of oneself and one's sexual partners. Here, we describe the rationale and design of a randomised waitlist-controlled trial to examine the impact of HIVST on risk compensation among PrEP users. Methods and analysis The study is a two-arm randomised waitlist-controlled trial with 1000 HIV-negative MSM in four major cities in China who will be taking oral PrEP (involving tenofovir disoproxil fumarate/emtricitabine) either daily (n=500) or in an event-driven regimen (n=500). The participants will be randomised (1:1) to either the immediate HIVST intervention arm (HIVST plus standard facility-based counselling and testing from 0 to 12 months) or the waitlist arm (standard facility-based counselling and testing from 0 to 6 months, then crossover to receive the HIVST intervention in months 7-12). Participants will provide blood samples to assess the incidence of syphilis and herpes simplex virus type 2 (HSV-2) during a follow-up. The primary outcomes will be the occurrence of CAI, number of sexual partners and incidence of syphilis and HSV-2 during a follow-up. The secondary outcomes will be the HIV and STI testing frequency and STI treatment adherence during a follow-up. The planned start and end dates for the study is 26 December 2018 and 31 December 2020. Ethics and dissemination The Medical Science Research Ethics Committee of The First Affiliated Hospital of China Medical University has approved the study (IRB(2018)273). Article	2020	Zhang Y.; Bao R.; Leuba S.I.; Li J.; Wang H.; Zhang J.; Chu Z.; Geng W.; Jiang Y.; Xu J.	Association of nitrite inhalants use and unprotected anal intercourse and HIV/syphilis infection among MSM in China: A systematic review and meta-analysis	BMC Public Health	-	-	-	14712458	10.1186/s12889-020-09405-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090817443&doi=10.1186%2fs12889-020-09405-x&partnerID=40&md5=2f6d7598f76c32ce59f7b92f4f2ed8c5	Background: Nitrite inhalant use is very common among men who have sex with men (MSM) in China. However, there is lack of national representative data on use among Chinese MSM, and the mechanism of how nitrite inhalant use impacts HIV infection in MSM is unclear. This meta-analysis aims to understand the characteristics of Chinese MSM nitrite inhalant users and to determine the associations between nitrite inhalant use and sexual behaviors, the prevalence of HIV, and the prevalence of syphilis. Methods: We searched PubMed, Web of Science, Chinese National Knowledge Infrastructure, Chinese Wanfang Data, and VIP Chinese Journal Database for relevant literature published from January 1985 to December 2017. Results: Fifteen eligible studies, with a total of 18,981 Chinese MSM participants, were included. Compared with nitrite inhalant nonusers, users were more likely to be younger, have a higher level of education, and seek sexual partners using the Internet. Nitrite inhalant users were more likely to engage in high-risk sexual behaviors, including condomless anal intercourse (odds ratio OR = 1.33), group sex (OR = 2.26), and commercial intercourse (OR = 1.50). Nitrite inhalants users had a higher prevalence of HIV (OR = 1.83), higher prevalence of syphilis (OR = 1.38) and had higher lifetime HIV testing rates (OR = 1.33) compared with nonusers (each p < 0.05). Conclusions: Nitrite inhalant users have higher HIV and syphilis prevalence by increasing levels of high-risk sexual behaviors. China should expand HIV testing, treatment as prevention (TasP), and Pre-exposure prophylaxis (PrEP) among MSM, especially among nitrite inhalants using MSM, to reduce their risk of HIV infection and transmission. © 2020 The Author(s). Article	2020	Zhang, Hanxi; Hsieh, Evelyn; Wang, Lu; Liao, Susu	HIV/AIDS Among Female Sex Workers in China: Epidemiology and Recent Prevention Strategies.	Current HIV/AIDS Reports	-	-	-	1548-3576 1548-3568	10.1007/s11904-019-00477-y	https://pubmed.ncbi.nlm.nih.gov/32030600/	PURPOSE OF REVIEW: This review aims to describe the epidemiology of HIV among female sex workers (FSWs) in China over the past decade, to summarize current gaps in knowledge regarding risk factors, and to identify new directions for HIV prevention strategies. RECENT FINDINGS: We summarized national and regional levels of HIV prevalence among FSWs based on reported rates in the literature from 2008 to 2018. Studies identified cases of HIV infection among FSWs in all but one province during this time period, and demonstrated a sporadic pattern in most provinces, with a low overall national HIV prevalence below 1%. However, in Yunnan and Guanxi Zhuang Autonomous Regions, the median-reported prevalence rates were close to or slightly above 1%. National prevention programs have widely promoted male condoms as a primary and practical measure for HIV prevention, but studies evaluating condom use practices among FSWs demonstrated wide variability. A rise in illicit use of synthetic drugs and changing sexual practices in the setting of sex work (e.g., anal sex) may represent newer risk factors for HIV transmission among FSWs; however, more data are needed to better characterize these trends. Limited studies have examined the feasibility and efficacy of innovative prevention tools (e.g., female condoms) or strategies (e.g., pre-exposure prophylaxis, PrEP) to prevent HIV among FSWs. We call for a more comprehensive understanding of current trends in HIV risk among FSWs, as well as more research focuses on innovative strategies to reduce the spread of HIV in this vulnerable population. Article	2020	Zhu, Victoria; Tran, Deanna; Banjo, Olamide; Onuegbu, Rosemary; Seung, Hyunuk; Layson-Wolf, Cherokee	Patient perception of community pharmacists prescribing pre-exposure prophylaxis for HIV prevention.	Journal of the American Pharmacists Association	-	-	-	1544-3450	10.1016/j.japh.2020.03.013	https://dx.doi.org/10.1016/j.japh.2020.03.013	OBJECTIVE: The primary objective of this study was to determine patients' perceptions of pharmacists prescribing pre-exposure prophylaxis (PrEP) for human immunodeficiency virus (HIV) prevention. DESIGN: An anonymous, 26-item, cross-sectional survey was administered to individuals and data collection occurred during a 12-week period from January to March 2019. SETTING AND PARTICIPANTS: Individuals were recruited to complete the survey in person at 5 locations of a large grocery-chain pharmacy in Washington, D.C. and Maryland. Inclusion criteria included individuals who were at least 18 years old and able to read and write English. Exclusion criteria included persons living with HIV or acquired immunodeficiency syndrome. OUTCOME MEASURES: In order to measure perception, participants were asked on the survey to select their level of agreement using a Likert scale from 1 to 5 (1 = strongly disagree, 5 = strongly agree). Researchers analyzed overall perception in addition to differences in perception based on various demographic characteristics. RESULTS: In total, 117 surveys were collected and analyzed. Most participants were comfortable with pharmacists prescribing PrEP. Notable statistically significant findings included participants who interacted with pharmacists through medication therapy review (4.4, 3.1 P < 0.05) and vaccinations (4.3, 3.1 P < 0.05) were more likely to agree with pharmacists prescribing PrEP than participants who had no previous interactions with pharmacists. Participants who had previously used PrEP were more likely to agree with pharmacists prescribing PrEP than those who had not used PrEP before. CONCLUSION: This study provided a glimpse into patients' perceptions of pharmacists prescribing PrEP. Patients were generally favorable of pharmacists prescribing PrEP; however, there are still barriers to overcome before prescribing PrEP for HIV prevention can feasibly occur in the community setting. Article	2020	Zimmermann H.M.L.; Jongen V.W.; Boyd A.; Hoornenborg E.; Prins M.; de Vries H.J.C.; Schim van der Loeff M.F.; Davidovich U.	Decision-making regarding condom use among daily and event-driven users of preexposure prophylaxis in the Netherlands	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002714	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096257797&doi=10.1097%2fQAD.0000000000002714&partnerID=40&md5=503fec36fba39f627063e037fc0a14d9	Objective: To explore the frequency of and reasons for using condoms among men who have sex with men (MSM) on preexposure prophylaxis (PrEP). Design: We analyzed quantitative app-based diary data on daily sexual practices (August 2015 – February 2019) and qualitative in-depth interviews among MSM using daily PrEP and event-driven PrEP (edPrEP) in the Amsterdam PrEP demonstration project. Methods: Participants could report daily about sex acts, PrEP use and condom use per partner type (steady and casual partners). We examined four strategies of PrEP and condom use: PrEP only, PrEP and condoms, condoms only, and neither strategy. We compared the proportions of sex acts per strategy between PrEP regimens. In 43 in-depth interviews, we explored motives for implementing each strategy. Results: Three hundred and fifty-two participants reported 48 949 anal sex acts. PrEP only was the most common strategy employed with any partner type (81%, n ¼ 39 650/48 949) and was motivated by anticipating more pleasurable sex, sexually transmitted infection's perceived curability, and habituation to condomless sex. Combining PrEP and condoms was more often chosen for sex acts with casual partners (18%, n ¼ 6829/37 317) than with steady partners (5%, n ¼ 614/11 632) and was linked to, for example, higher perceived vulnerability for sexually transmitted infections or HIV and avoidance of PrEP disclosure. Condoms only was uncommon but occurred particularly among edPrEP users (4%, n ¼ 379/8695). Applying neither strategy was common among edPrEP users with steady partners (25%, n ¼ 538/2122) and was motivated by low perceived HIV risk. Conclusion: Condoms remain a viable option for PrEP users in certain settings. Condoms were applied in higher risk settings, to avoid PrEP disclosure, or as substitute for PrEP, especially among edPrEP users. Copyright © 2020 Wolters Kluwer Health, Inc. All rights reserved. Article	2020	Zioga E.A.M.; Arias-de la Torre J.; Patera E.; Borjabad B.; Macorigh L.; Ferrer L.	The role of biomedical interventions in HIV prevention: Pre-exposure Prophylaxis (PrEP); El papel de las intervenciones biomédicas en la prevención del VIH: la profilaxis preexposición (PrEP)	Semergen	-	-	-	11383593	10.1016/j.semerg.2019.06.006	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85070089977&doi=10.1016%2fj.semerg.2019.06.006&partnerID=40&md5=2add8c00ba39ea55176b0bb862763928	HIV infection remains an important public health problem worldwide. The traditional preventive measures, such as sexual education, screening, and early antiretroviral treatment initiation, despite having shown their effectiveness, are not enough to control new infections. In this context, Pre-Exposure Prophylaxis (PrEP) has been investigated as a preventive measure. Currently, it has been extensively documented that the administration of antiretroviral treatment in an HIV exposed, but not infected population, could reduce the risk of transmission without significant drawbacks. Despite its high efficacy for HIV prevention, the use of PrEP remains a controversial measure, particularly its cost-effectiveness. For this reason, the access to PrEP is not available for all the HIV risk groups. Therefore, and based on the evidence found, the current approach must be the repercussions of not to implement PrEP, more than its cost or its effectiveness. © 2019 Sociedad Española de Médicos de Atención Primaria (SEMERGEN)	Human immunodeficiency virus; Pre-exposure prophylaxis; Prevention; Public health	English	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Review
Article	2020	Zioga, EAM; Arias-de la Torre, J; Patera, E; Borjabad, B; Macorigh, L; Ferrer, L	El papel de las intervenciones biomédicas en la prevención del VIH: la profilaxis preexposición (PrEP)	Semergen	-	-	-	1138-3593	10.1016/j.semerg.2019.06.006	https://www.elsevier.es/es-revista-medicina-familia-semergen-40-articulo-el-papel-intervenciones-biomedicas-prevencion-S1138359319302308	La transmisión del VIH sigue siendo un importante problema de salud pública en todo el mundo. Estrategias tradicionales de prevención como la educación sexual, el cribado y el inicio precoz de tratamiento antirretroviral, a pesar de ser efectivas, resultan insuficientes para el control de las nuevas infecciones. En este contexto, se ha propuesto la profilaxis preexposición (PrEP) como estrategia preventiva. Actualmente, se ha demostrado ampliamente que la administración de fármacos antirretrovirales en personas expuestas y no infectadas por VIH puede reducir el riesgo de transmisión sin asociarse a inconvenientes significativos. A pesar de haber demostrado su eficacia para la prevención de nuevas infecciones, la PrEP sigue siendo un tema controvertido, especialmente su coste-eficacia, y no se ha conseguido acceso unánime a los grupos de mayor riesgo de infección. Por ello, y basándonos en la evidencia actual, planteamos que el debate no debería ser si la PrEP es coste-eficaz, sino las posibles repercusiones de implementarla	Vírus da imunodeficiência humana; Profilaxia pré-exposição; Prevenção; Saúde pública	Spanish	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Review
Article	2020	Zissette, Seth; Atujuna, Millicent; Tolley, Elizabeth E; Okumu, Eunice; Auerbach, Judith D; Hodder, Sally L; Aral, Sevgi O; Adimora, Adaora A	Cognitive testing of an instrument to evaluate acceptability and use of pre-exposure prophylaxis products among women	Applied Cognitive Psychology	-	-	-	08884080	10.1002/acp.3590	https://www.proquest.com/scholarly-journals/cognitive-testing-instrument-evaluate/docview/2339334582/se-2?accountid=8113	Given the range of pre-exposure prophylaxis (PrEP) products currently being tested to prevent HIV in women, a standardized Acceptability and Use of PrEP Products Among Women Tool may facilitate comparisons of product acceptability and use across different geographies, trials, and users. We conducted three rounds of cognitive interviewing over 2 months in 2016, with 28 South African women who had experience participating in a range of PrEP product trials. The final instrument contained 41 items, including five new items that improved construct validity and 22 items modified for clarity. Changes were made due to unclear wording, difficulty answering, participant embarrassment, low response variability, and administrative formatting. Cognitive interviewing provided a means to address issues that would have inhibited this tool's ability to accurately collect data otherwise. This rapid, low-cost study provided valuable insight into participants' understanding of questions and demonstrated the utility of cognitive interviewing in international clinical trials. Theses and Dissertations	2020	Zuma, Mandisa Nokukhanya.	Characterization of immunoglobulin (Ig) isotypes, IgG subclasses and cytokines in the blood and genital tracts of HIV infected and healthy women from an observational cohort study (CAPRISA 082)	-	-	University of KwaZulu-Natal	-	NA	NA	https://researchspace.ukzn.ac.za/handle/10413/19752	Background: Heterosexual transmission remains the dominant route of HIV infections in women. Immune responses that predict HIV acquisition during pre-exposure prophylaxis (PrEP) remain undefined. We hypothesized that increased genital tract antibodies and cytokines pre-HIV infection predict HIV acquisition in seroconverters compared to non-seroconverters irrespective of PrEP use. Methods: Plasma and Softcup specimens were collected from n=12 seroconverters (cases) and n=48 non-seroconverters (controls) in the CAPRISA 082 study at five time points. Of 12 cases-, nine took PrEP, while 29 of 48 controls took PrEP. IgG1, IgG2, IgG3, IgG4, IgM and IgA, and nine cytokines: MIP-1□, MIP-1□, IP-10, MCP-1, and IL-8, TNF-□, IL-1□, IL-1□, and IL-6 pre- and post-HIV infection, were measured using multiplexed technology. Results: Baseline levels of IgG subclasses, Ig isotypes, and mucosal cytokines were similar between cases and controls. Over time within the cases, plasma IgA significantly declined, in controls, plasma IgG3, and IgM significantly declined over time (p<0.05). In cases and controls on PrEP, plasma IgG3 trended higher compared to no PrEP (p<0.1). Relative to baseline, only within the controls, mucosal IgG1, IgG2, IgG3, IgG4, IgM, and IgA declined significantly. Mucosal IgM significantly predicted four-fold increased HIV risk (p=0.01). Eight of nine cytokines in the genital tract were significantly elevated in the cases compared to controls (all p<0.05). In cases and controls who used PrEP relative to no PrEP, IP-10 was significantly lower (p=0.04 and p=0.009). Baseline mucosal IL-8 significantly correlated with mucosal IgG1, IgG2, total IgG, and IgM (p<0.001 for all). Conclusions: Although no significant elevated genital antibodies or cytokines pre-HIV infection were found, significantly different patterns of antibodies and cytokines were observed in this cohort. Plasma IgG3, one of the most effective of the IgG□s eliciting diverse antibod□ functions, was increased in PrEP users. Mucosal IgM was associated with increased HIV-acquisition risk, while pleiotropic IP-10, a reported risk factor was modulated in PrEP users among cases. Collectively, these data suggest that PrEP use may modulate or preserve specific immune responses that can modify HIV risk. As PrEP uptake increases, its effect on mucosal and systemic immunity is important for informing on prevention strategies where PrEP may be given alone or in combination with HIV vaccine for added efficacy. Article	2021	Adams, Joëlla W; Khan, Maria R; Bessey, S E; Friedman, Samuel R; McMahon, James M; Lurie, Mark N; Galea, Sandro; Marshall, Brandon D L	Preexposure prophylaxis strategies for African–American women affected by mass incarceration	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002749	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101896313&doi=10.1097%2fQAD.0000000000002749&partnerID=40&md5=e1cf4b7e6c5dfe82ac3d9b3cb80a5342	Objective: We aimed to determine the effectiveness of various preexposure prophylaxis (PrEP) prescription strategies for African–American women impacted by mass incarceration within an urban setting. Design: An agent-based model was utilized to evaluate prevention strategies in an efficient, ethical manner. By defining agents, their characteristics and relationships, we assessed population-level effects of PrEP on HIV incidence. Methods: We tested hypothetical PrEP prescription strategies within a simulation representing the African–American population of Philadelphia, Pennsylvania. Four strategies were evaluated: PrEP for women meeting CDC indicators regarding partner characteristics, PrEP for women with a recently incarcerated male partner, PrEP for women with a recently released male partner and couples-based PrEP at time of release. Interventions occurred alongside scale-up of HAART. We evaluated reductions in HIV transmissions, the number of persons on PrEP needed to avert one HIV transmission (NNT) and the resulting proportions of people on PrEP. Results: Scenarios prescribing PrEP based on criminal justice system involvement reduced HIV transmissions. The NNT ranged from 147 (couples-based scenario) to 300 (recently released scenario). The percentage of the female population covered by PrEP at any one time ranged from 0.14% (couples-based) to 10.8% (CDC-based). CDC-guideline scenarios were consistently less efficient compared to the justice-involved interventions. Conclusion: Expanding PrEP for African–American women and their male partners affected by incarceration should be considered in national HIV prevention goals and correctional facilities leveraged as intervention sites. Partner characteristics in the current CDC indications may be more effective and efficient if guidelines considered criminal justice involvement. Copyright © 2020 The Author(s). Article	2021	Adeagbo, Oluwafemi; Harrison, Sayward; Qiao, Shan; Li, Xiaoming	Pre-Exposure Prophylaxis (PrEP) Uptake among Black Men Who Have Sex with Men (BMSM) in the Southern U.S.	International Journal of Environmental Research and Public Health	-	-	-	1661-7827	10.3390/ijerph18189715	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-uptake-among-black/docview/2576413454/se-2?accountid=8113	Black men who have sex with men (BMSM) living in the United States (U.S.) South are disproportionately affected by HIV and experience significant disparities in HIV incidence, access to HIV care, and prevention across ages and socio-economic statuses. The aim of this commentary is to critically review current literature on the state of PrEP use among BMSM in the U.S. South, including identifying barriers and facilitators to PrEP use in order to inform intervention development. Extant literature shows that despite the documented benefits of PrEP as an effective HIV-prevention method, its uptake among BMSM is limited across the U.S. South. Common barriers to PrEP uptake included stigma, homophobia, mistrust of healthcare systems, negative attitudes from healthcare providers, access and transportation issues, poverty, and misinformation about PrEP. These barriers are likely to have been further exacerbated by the COVID-19 pandemic. Limited access to PrEP and other HIV-prevention programs, such as HIV testing, post-exposure prophylaxis (PEP), and condoms for BMSM are likely increase HIV incidence in this community. Moreover, the rapid expansion of telehealth services during the COVID-19 period may offer increased opportunity to scale-up PrEP through telehealth interventions, especially if in-person services remain limited due to pandemic precautions. Given the intersectional barriers that limit the access and uptake of PrEP among BMSM, we suggest that tailored programs or interventions that seek to address PrEP disparities among Southern BMSM should adopt intersectional and interdisciplinary approaches to better understand the complex challenges of scaling up PrEP. More studies are needed to investigate the impact of COVID-19 on HIV-prevention services among BMSM and to understand how to co-develop—with the BMSM community and healthcare providers—culturally acceptable interventions to reduce the identified challenges using intersectional and interdisciplinary approaches. Article	2021	Adeoti A.O.; Demir E.; Adeyemi S.; Yakutcan U.; Kengne A.P.; Kayode G.; Aliyu A.; Idika N.; Isichei C.	Impact of pre-exposure and post-exposure prophylaxes prevention programme on hiv burden and services in a low-resource setting: A simulation modelling approach	Pan African Medical Journal	-	-	-	19378688	10.11604/pamj.2021.40.163.26486	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121304629&doi=10.11604%2fpamj.2021.40.163.26486&partnerID=40&md5=866f58e0c920614601b76e251f42bc93	Introduction: sub-Saharan African countries contribute substantially to the global HIV disease burden. Despite this burden, and the promises that prevention could deliver, the implementation and uptake of HIV prevention programmes are still low. The study used the decision support system model to explore the potential impacts of prevention implementation on HIV burden (incidence) and service delivery. Methods: an operational research technique known as discrete event simulation model was used to capture an individual patient's pathways through the HIV care process from diagnosis to treatment and monitoring. The regular monitoring, over a 5-year period, including all the activities and resources utilized at each stage of the pathway were analysed, and the impact of increasing prevention measures for an HIV treatment service in a treatment centre in Nigeria was tested using the simulation model. Results: forty-three patients currently access the Pre-Exposure Prophylaxis (PrEP) and Post Exposure Prophylaxis (PEP) annually, with a 20% and 80% split in the number of patients offered PrEP and PEP, respectively. Scenarios-based on increasing the number of people offered PrEP and PEP from 43 to 250 with a 50/50 split were tested. The outputs revealed improved preventive care by averting new HIV cases, reduction in service demand and utilization, but an increase in the required human resource as well as financial burden. In the next 5 years, the cumulative averted HIV cases are expected to increase from 2 and 5 people (baseline) to 24 and 20 people for PrEP and PEP, respectively. The potentially averted 2 cases per infected persons based on the basic reproductive number of HIV. Conclusion: the effective implementation of PrEP/PEP programme offers an additional safety measure to prevent HIV transmission in at-risk individuals and possibility of ending HIV epidemic. © Adekunle Olatayo Adeoti et al. Article	2021	Adrian P., Constanza; Stuardo Á., Valeria	Aceptabilidad a usar profilaxis pre-exposición para VIH en hombres gay y otros hombres que tienen sexo con hombres: indagación en LAMIS 2018 Chile	Revista Chilena de Infectologia	-	-	-	0716-1018	10.4067/s0716-10182021000500655	http://www.scielo.cl/scielo.php?script=sci_arttext&pid=S0716-10182021000500655&lang=pt	Abstract Background: Chile is facing a re-emergence of the HIV epidemic, concentrated among men who have sex with men (MSM). Pre-exposure prophylaxis (PrEP) is a biomedical intervention that effectively prevents HIV transmission among MSM. Aim: The study was designed to estimate acceptability of PrEP and identify factors associated with PrEP-related attitudes and behaviors among MSM using LAMIS 2018 - Chile study data. Methods: Data were taken from the LAMIS 2018 - Chile study, a cross-sectional study of gay, bisexual, transgender, and other MSM. Our subsample included 3976 participants with self-reported HIV-negative or unknown status who responded to sociodemographic questions and items related to PrEP. Bivariate analysis and multivariate logistic regression analysis were performed to identify factors associated with acceptability of PrEP. Results and Discussion: A total of 55.7% of the sample reported high PrEP acceptability. Logistic regression indicated that engaging in sex without a condom (ORa = 1.67, IC 95% 1.42-1.97) and having previously used PrEP (ORa = 1.99, IC 95% 1.41-1.62) were associated with high acceptability to use PrEP, while having a stable partner was associated with low acceptability. The estimate of PrEP acceptability was relatively high among participants. However, interventions to increase awareness and promote demand for PrEP may be beneficial. Furthermore, this study demonstrates the need for non-governmental organizations to participate in such strategies and for measures that address regionally-relevant emerging phenomena.	men who have sex with men (MSM); pre-exposure prophylaxis (PrEP); HIV prevention; hombres que tiene sexo con hombres (HSH); prevención VIH; profilaxis pre-exposición (PrEP)	Spanish	Chile	Latin America and the Caribbean	Chile	Latin America and the Caribbean	Chile	Latin America and the Caribbean	Quantitative
Article	2021	Aggarwal, Neena K; Consavage, Katherine E; Dhanuka, Ida; Clement, Kesiah W; Bouey, Jennifer H	Health and Health Care Access Barriers Among Transgender Women Engaged in Sex Work: A Synthesis of U.S.-Based Studies Published 2005-2019.	LGBT Health	-	-	-	2325-8306	10.1089/lgbt.2019.0243	https://dx.doi.org/10.1089/lgbt.2019.0243	Purpose: Transgender women (TW) are likely to experience job discrimination and engage in commercial sex transactions. As a group, they have the highest risk for HIV/AIDS. However, little is known about the health needs of transgender women sex workers (TWSW) in the United States and the structural and psychosocial barriers to their health care access. The objective of this systematic review was to systematically document these needs and barriers by using a framework approach. Methods: We searched PubMed, JSTOR, and Google Scholar for primary and secondary studies published in 2005-2019 that addressed the health of TWSW in the United States. We used a standardized data extraction form to gather data from eligible articles. The Strengthening the Reporting of Observational Studies in Epidemiology checklist was used to assess study quality. Results: Fifty-three articles met the inclusion criteria, including mentioning health-related topics among TWSW. More articles appeared in recent years. Most studies collected data with convenience samples in urban areas. Structural barriers reported included transphobia, lack of pre-exposure prophylaxis targeted at TW, and lack of health insurance coverage. Psychosocial barriers included distrust of the health care system, self-esteem, alcohol and substance use, and mental health. Conclusions: TWSW have unique health care needs that are not being addressed due to barriers to health care access. More research is required to identify non-HIV-related health burdens and details about psychosocial barriers to health care access. Article	2021	Agovi A.M.-A.; Anikpo I.; Cvitanovich M.J.; Fasanmi E.O.; Ojha R.P.; Marcus J.L.	HIV Pre-exposure Prophylaxis Prescribing in an Urban Safety-Net Health System	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002767	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123228181&doi=10.1097%2fQAI.0000000000002767&partnerID=40&md5=29be6f3685dd55964c797be22532c632	Introduction:Safety-net health systems are key settings for HIV pre-exposure prophylaxis (PrEP) implementation, but little evidence is available about the frequency of PrEP prescribing in safety-net settings. We assessed PrEP prescribing among people with indications for PrEP at an urban safety-net health system that serves a county designated as an Ending the HIV Epidemic priority jurisdiction.Methods:We identified adults (aged 18 years or older) who engaged in primary care between January 2015 and December 2019 and had a documented indication for PrEP. PrEP indications included the presence of a behavioral or sexual risk factor of HIV acquisition or a positive bacterial sexually transmitted infection at the index visit. PrEP prescribing was defined as the proportion of patients with indications for PrEP who received a new prescription for PrEP. We estimated the cumulative incidence of PrEP prescription with corresponding 95% confidence limits (CL).Results:Our study population comprised 2957 individuals, of whom 58% was aged younger than 45 years, 56% was women, 67% was racial or ethnic minorities, and 60% was uninsured or provided care as part of a hospital-based managed care plan for individuals without insurance. We identified 41 individuals who were prescribed PrEP. The cumulative incidence of PrEP prescribing within 1 year of the first documented PrEP indication was 1.3% (95% CL: 0.91% to 1.7%).Conclusions:Our results suggest extremely low frequency of PrEP prescribing among people with indications for PrEP in an urban safety-net health system. Strategies are needed to improve PrEP implementation in high-priority populations and safety-net settings. Copyright © 2021 Wolters Kluwer Health, Inc. All rights reserved. Article	2021	Alcantar Heredia, Jorge L; Goldklank, Shelly	The relevance of pre-exposure prophylaxis in gay men's lives and their motivations to use it: a qualitative study	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-021-11863-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8502319	BACKGROUND: HIV has affected gay men disproportionately in the U.S. for four decades. Pre-exposure prophylaxis (PrEP) was developed as a prevention strategy for individuals at high risk of HIV infection. Although highly effective, many gay and other men who have sex with men continue not to take PrEP. Researchers have focused on sexual risk behaviors as the primary determinant of who should be on PrEP and identified various objective systemic and societal barriers to PrEP access. Public health measures have promoted PrEP based on these objective criteria. Researchers have recently begun to inquire into subjective and relational motivators for PrEP usage beyond self-perceived risk. METHODS: Participants were recruited through snowball sampling. Data were collected between August and November 2018 from PrEP users (n = 7) and PrEP non-users (n = 6). Data were analyzed in a modified grounded theory qualitative analysis. RESULTS: The thirteen participants' narratives contained three superordinate categories: (1) what it's like to be someone on PrEP, (2) an environment of changing sexual norms, and (3) the continued importance of education. These categories comprised ten themes, each of which had various repeating ideas. The ten themes were the following: (1) PrEP's social acceptability, (2) PrEP and HIV stigma, (3) PrEP and sexual relationships, (4) dissatisfaction with condoms, (5) negotiating risk, (6) peace of mind, (7) developing a relationship with PrEP, (8) putting yourself first, (9) PrEP awareness, and (10) PrEP logistics. CONCLUSIONS: The gay men in our study took into consideration their social roles and relationships, their personal beliefs, and emotional histories as well as risk as prominent motivators for PrEP use. They stated that PrEP use is associated with their sense of belonging, trust, and security about their sexuality. They also identified the most relevant aspects of the medication (e.g., side effects, adherence, and awareness) to their lives. Article	2021	Alfaiate D.; Giaché S.; Pradat P.; Cotte L.; Chidiac C.	Sexually transmitted infections knowledge in different populations attending a French university hospital: a prospective observational study	Epidemiology and Infection	-	-	-	9502688	10.1017/S0950268821000881	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104814492&doi=10.1017%2fS0950268821000881&partnerID=40&md5=f8c5e671ff34bdb85655f26078f91b7a	We conducted a prospective study about sexually transmitted infections (STIs) knowledge in different populations attending Lyon's University Hospitals in order to estimate awareness on STIs. Pre-exposure prophylaxis (PrEP)-users (PrEP group), persons living with HIV (PLWH group) and persons undergoing free STI screening (screening group) filled an anonymous questionnaire evaluating STI knowledge. A composite STI knowledge score was calculated and was correlated with patients' characteristics. A total of 756 patients were enrolled in three groups: screening (n = 509), PrEP (n = 103) and PLWH (n = 144). STI transmission knowledge was better for HIV than for other STIs. The median STI knowledge score was significantly higher in PrEP-users than in the screening and PLWH groups. PrEP use and a previous STI diagnosis were independently associated with a higher score. PrEP-users have better STI knowledge than PLWH and persons undergoing free STI screening. Sexual health promotion interventions routinely reserved to PrEP-users in France seem to be effective in raising the awareness of this group for STIs. Continuous efforts are justified for PLWH and the younger layers of the population. © The Author(s), 2021. Article	2021	Algarin A.B.; Zhou Z.; Canidate S.; Gebru N.M.; Krieger J.L.; Neil J.M.; Cook R.L.; Ibañez G.E.	PrEP awareness among people living with HIV in Florida: Florida Cohort study	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1717421	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078469570&doi=10.1080%2f09540121.2020.1717421&partnerID=40&md5=546946eac51045e6d5c683de6daebc97	In 2017, Florida ranked 2nd nationally in prevalence and incidence rates of HIV infections in the United States. Due to the high burden of HIV and low viral suppression in Florida, it is of increased importance to study methods of HIV prevention such as preexposure prophylaxis(PrEP) in this state. Our study aimed to examine correlates of PrEP awareness among PLWH in Florida and describe patterns of PrEP awareness/information sources. Using data collected from the Florida Cohort study between 2014 and 2018, 530 PLWH answered items that were hypothesized to be correlated with PrEP awareness. Of our sample, 53.8% were aware of PrEP. Urban location of recruitment, sexual partner's use of PrEP, use of viral suppression as an HIV prevention strategy, and engagement in transactional sex were all significantly associated with higher odds of PrEP awareness. Care providers and HIV/AIDS support groups were the most frequently listed sources of PrEP awareness, sources of future PrEP information, and most trusted sources for PrEP information. Findings from this study could inform future interventions that aim to increase PrEP awareness among PLWH to increase PrEP awareness and uptake among their HIV-negative social and sexual networks. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	awareness; HIV; Preexposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Algarin, Angel B; Hee Shrader, Cho; Hackworth, Benjamin T; Varas-Diaz, Nelson; Fennie, Kristopher P; Sheehan, Diana M; Ibañez, Gladys E	Development and Validation of the Community PrEP-Related Stigma Scale (Community-PSS).	AIDS Education and Prevention	-	-	-	1943-2755	10.1521/aeap.2021.33.2.120	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8054770	Despite increasing availability of pre-exposure prophylaxis (PrEP), HIV prevention efforts have stalled. It is important to study potential barriers to HIV prevention methods, such as pre-exposure prophylaxis stigma. This study aims to develop and validate the Community PrEP-related Stigma Scale (Community-PSS) to address gaps in the literature. Participants were 108 sexual and gender minority men recruited through virtual and community-posted advertisements in Florida. The authors assessed reliability using Cronbach's alpha analysis, determined scale components using principal component analysis, and assessed construct validity based on five a priori hypotheses. The scale had high internal consistency (α = 0.86) and four components (stigma of actions outside of sex, stigma of sexual actions, extreme stigma perceptions, and positive community perception). The Community-PSS was valid, supporting four out of five hypotheses and in the expected directions. The Community-PSS was a valid and reliable tool in the sample and correlates with a previously validated PrEP stigma scale, HIV knowledge, PrEP knowledge, and likelihood of condom use with a partner on PrEP. Article	2021	Al-Khouja, Amer; Shieh, Eugenie; Fuchs, Edward J; Marzinke, Mark A; Bakshi, Rahul P; Hummert, Pamela; Ham, Anthony S; Buckheit, Karen W; Breakey, Jennifer; Weld, Ethel D; Chen, Huan; Caffo, Brian S; Buckheit, Robert W; Hendrix, Craig W	Examining the Safety, Pharmacokinetics, and Pharmacodynamics of a Rectally Administered IQP-0528 Gel for HIV Pre-Exposure Prophylaxis: A First-In-Human Study.	AIDS Research and Human Retroviruses	-	-	-	1931-8405	10.1089/AID.2020.0188	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8213010	A lubricating microbicide gel designed for rectal and vaginal use would provide a behaviorally congruent strategy to enhance pre-exposure prophylaxis adherence and reduce HIV infection risk. In this study, we report the first-in-human evaluation of such a gel containing 1% IQP-0528, an investigational antiretroviral. Seven HIV-1-negative participants received one 10 mL rectal dose of radiolabeled 1% IQP-0528 gel. We assessed safety; IQP-0528 pharmacokinetics in plasma, and rectal and vaginal tissue; ex vivo local pharmacodynamics (PD); and colorectal distribution. The 1% gel was determined to be safe with one mild event attributed to study product and no effects on rectal tissue histology. All concentrations measured in plasma and vaginal tissue were below the limit of quantitation. Median IQP-0528 concentrations in rectal tissue exceeded the in vitro EC95 against HIV-1 (0.07 ng/mg) by 3-5 h of dosing and remained above this concentration for at least 24 h, despite a 3-log reduction in concentration over this duration of time. Rectal tissue PD-assessed by ex vivo HIV challenge-demonstrated significant p24 antigen reduction 3-5 h postdose compared with baseline (p = .05), but not 24-26 h postdose (p = .75). Single-photon emission computed tomography/computed tomography imaging revealed that product distribution was localized to the rectosigmoid. The IQP-0528 gel possesses desirable features for a topical microbicide including: local safety with no systemic absorption, delivery of locally high IQP-0528 concentrations, and significant reductions in ex vivo HIV infectivity. However, the gel is limited by its rapid clearance and inability to penetrate vaginal tissues following rectal dosing. Clinical Trial Registration number: NCT03082690. Article	2021	Alzate-Duque, Luis; Sánchez, John P; Marti, Sebastian R Mendez; Rosado-Rivera, Dwindally; Sánchez, Nelson F	HIV Pre-exposure Prophylaxis Education for Clinicians Caring for Spanish-Speaking Men Who Have Sex With Men (MSM).	MedEdPORTAL	-	-	-	2374-8265	10.15766/mep_2374-8265.11110	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8015640	Introduction: A growing number of Liaison Committee on Medical Education-accredited allopathic medical schools offer formal bilingual (English and Spanish) medical education, and numerous other schools offer medical Spanish through elective workshops as part of their curricula. One significant health disparity in the Hispanic community is the incidence of HIV among Spanish-speaking men who have sex with men (MSM). Pre-exposure prophylaxis (PrEP) has emerged as an effective strategy to reduce the risk of HIV transmission. Methods: We developed an education module to train clinicians to discuss PrEP with Spanish-speaking MSM. Our module is adapted from an English module on PrEP education. It includes a Spanish-language PowerPoint slide deck with information about PrEP as well as a Spanish-language videotaped scripted clinical encounter. Results: The module was implemented on three occasions with 18 participants, and learners reported increased comfort in discussing and confidence in prescribing PrEP with Spanish-speaking patients. Discussion: This workshop can be incorporated within medical Spanish curriculums offered at health professional schools and community-based organizations dedicated to reducing the HIV burden in the Spanish-speaking Hispanic community. Article	2021	Ambrosioni J.; Petit E.; Liegeon G.; Laguno M.; Miró J.M.	Primary HIV-1 infection in users of pre-exposure prophylaxis	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(20)30271-X	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098142177&doi=10.1016%2fS2352-3018%2820%2930271-X&partnerID=40&md5=8bef7147f5c55816da4f4ffdc67ebca9	Pre-exposure prophylaxis (PrEP) has proven to be a highly effective and safe way to prevent HIV infection. Seroconversion and primary HIV infection are exceptional if adherence to PrEP is good. However, primary HIV infection while using PrEP can occur, albeit rarely, and HIV drug resistance might develop. Furthermore, the scope of PrEP is expected to expand, and clinicians might face potential seroconversions and primary HIV infection in patients starting or taking PrEP. The characteristics of primary HIV infection in users of PrEP are poorly described. PrEP users present a lower viral load peak during primary HIV infection and, frequently, fewer symptoms than individuals not exposed to PrEP. Additionally, PrEP prolongs the stages of seroconversion, thus potentially complicating diagnosis of primary HIV infection. Drug resistance is rare, occurring mostly when PrEP is initiated in undiagnosed patients who are at an extremely early stage of infection, in whom detection of HIV-RNA was not used to rule out HIV infection. Therefore, careful exclusion of primary HIV infection before starting PrEP is crucial. In patients presenting with primary HIV infection while on PrEP, a drug with a high genetic barrier (or even two) should be added to tenofovir disoproxil fumarate–emtricitabine until test results for resistance are available. © 2021 Elsevier Ltd	antiretrovirus agentcabotegravirdarunavirdolutegravir	English	United Kingdom	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Review
Article	2021	Apers, Ludwig; Vanhamel, Jef; Caluwaerts, Séverine; Platteau, Tom; Kenyon, Chris; Florence, Eric	Impact of PrEP on a STI clinic in a Belgian context: a provider's perspective.	Acta Clinica Belgica	-	-	-	2295-3337	10.1080/17843286.2020.1767995	https://dx.doi.org/10.1080/17843286.2020.1767995	Objectives: To assess the impact of Pre-Exposure Prophylaxis (PrEP) to avoid HIV infection as an additional service in a routine Sexually Transmitted Infections (STI) clinic.Methods: We used routinely obtained retrospective data to estimate the increased workload on the existing facilities. We focussed on STI registration through the laboratory registration system and put this in a national perspective. A critical appraisal was made of the national HIV notifications, as an indicator of the impact of PrEP. Additional challenges were identified via face-to-face interviews with clinicians with at least five years experience in the STI clinic.Results: PrEP delivery puts a substantial burden on a routine STI clinic, in terms of counselling users and prescribing drugs, and regular screening and treating of STIs. Psycho-social aspects need to be incorporated as part of a comprehensive approach of the PrEP user. This requires skills and resources that are not yet always available in a clinic, specialised in HIV and STI care. The increasing demand for this service calls for a careful and critical appraisal of the existing service model.Conclusion: PrEP has gained an important and irreplaceable position in the prevention of HIV infection. New models of care need to be studied, preferably in close collaboration with the users, to make this intervention sustainable for the health system in which it is introduced. Article	2021	Araujo, João Marcos Batista Gomes de	Análise da oferta e eficácia da profilaxia a pré-exposição sexual (PrEP) para o enfrentamento do HIV/AIDS no Brasil	Research, Society and Development	-	-	-	2525-3409	10.33448/rsd-v10i12.19095	https://rsdjournal.org/index.php/rsd/article/view/19095	A epidemia do vírus do HIV/AIDS é considerado um fenômeno de largas proporções, e por seu caráter pandêmico e gravidade, representa um grande problema de saúde pública, carecendo de políticas mais humanizadas e eficientes, e nesse sentido, um dos métodos mais recentes de profilaxia a pré-exposição sexual, trata-se da (PrEP) que é um tratamento precoce farmacológico feito através da combinação de dois medicamentos, que devem ser tomados diariamente pelo usuário antes do mesmo ter a infecção pelo vírus. Dessa forma, o presente artigo propõe uma análise sobre os desafios da oferta e eficácia da PrEP para o enfrentamento do HIV no Brasil. Para tanto, foi realizada uma revisão teórica de literatura exploratória sobre a temática através da utilização do método de abordagem dedutivo, com a utilização de dados bibliográficos de natureza qualitativa através da pesquisa documental. A partir disso, concluiu-se que através do uso da profilaxia, foi possível reduzir o risco das pessoas adquirir a infecção pelo vírus, pois essa estratégia mostrou-se bastante eficaz e segura em pessoas com risco aumentado de adquirir a infecção, entretanto, se torna importante que as políticas públicas de enfrentamento ao HIV/AIDS no país sejam amplamente divulgadas a fim de atingir a maioria do público que está vulnerável ao contágio pelo vírus. Article	2021	Asabor, Emmanuella Ngozi; Lett, Elle; Moll, Anthony; Shenoi, Sheela V	"We've Got Our Own Beliefs, Attitudes, Myths": A Mixed Methods Assessment of Rural South African Health Care Workers' Knowledge of and Attitudes Towards PrEP Implementation.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03213-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8450017	South Africa maintains the world's largest HIV prevalence, accounting for 20.4% of people living with HIV internationally. HIV Pre-exposure prophylaxis (PrEP) has demonstrated efficacy; however, there is limited data on PrEP implementation in South Africa, particularly in rural areas. Using grounded theory analysis of semi-structured interviews and exploratory factor analyses of structured surveys, this mixed methods study examines healthcare workers' (HCWs)' beliefs about their patients and the likelihood of PrEP uptake in their communities. The disproportionate burden of HIV among Black South Africans is linked to the legacy of apartheid and resulting disparities in wealth and employment. HCWs in our study emphasized the importance of addressing these structural barriers, including increased travel burden among men in the community looking for work, poor transportation infrastructure, and limited numbers of highly skilled clinical staff in their rural community. HCWs also espoused a vision of PrEP that prioritizes women due to perceived constraints on their sexual agency, and that minimizes the impact of HIV-related stigma on PrEP implementation. However, HCWs' additional concerns for risk compensation may reflect dominant social mores around sexual behavior. In recognition of HCWs' role as both informants and community members, implementation scientists should invite local HCWs to partner as early as the priority-setting stage for PrEP interventions. Inviting leadership from local HCWs may increase the likelihood of delivery plans that account for unique local context and structural barriers researchers may otherwise struggle to uncover. Article	2021	Asif, Sumbul; Baxevanidi, Evangelia; Hill, Andrew; Venter, Willem Daniel Francois; Fairlie, Lee; Masenya, Masebole; Serenata, Celicia; Sokhela, Simiso; Chandiwana, Nomathemba	The predicted risk of adverse pregnancy outcomes as a result of treatment-associated obesity in a hypothetical population receiving tenofovir alafenamide/emtricitabine/dolutegravir, tenofovir disoproxil fumarate/emtricitabine/dolutegravir or tenofovir disoproxil fumarate/emtricitabine/efavirenz.	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000003020	https://dx.doi.org/10.1097/QAD.0000000000003020	OBJECTIVE: Integrase inhibitors, including dolutegravir (DTG), are associated with weight gain and obesity, especially when combined with tenofovir alafenamide (TAF). Obesity increases the risk of adverse pregnancy outcomes (APOs). This study aimed to predict the risk of APOs caused by treatment-associated obesity, using a hypothetical sample based on the ADVANCE trial. DESIGN: Risk prediction. METHODS: Firstly, a meta-analysis was performed to determine the relative risk (RR) for APOs in women with obese (≥30) versus normal prepregnancy BMIs (18.5-24.9). For the hypothetical sample, 3000 nonpregnant women with normal BMIs at Week 0 of treatment were evenly allocated across the following treatment arms: TAF/FTC+DTG, TDF/FTC+DTG, TDF/FTC/EFV. The treatment-associated obesity rates from ADVANCE were used to calculate the number of women with obese and normal BMIs expected at Week 96 in our sample. This was combined with the APO RRs to predict the number of women at risk of APOs, in each treatment arm, assuming they conceived at Week 96. RESULTS: At Week 96, the percentage of women predicted to be obese was 14.1% with TAF/FTC+DTG, 7.9% with TDF/FTC+DTG and 1.5% with TDF/FTC/EFV. The RR in women with obese versus normal BMIs was significantly higher for most APOs. Therefore, the number of women at risk of APOs was higher with TAF/FTC+DTG than TDF/FTC+DTG and TDF/FTC/EFV. For example, 11/1000 additional gestational hypertension cases were predicted with TAF/FTC+DTG, 6/1000 with TDF/FTC+DTG and 1/1000 with TDF/FTC/EFV. CONCLUSION: Treatment-associated obesity increased the APO risk in women. This risk is likely to increase, as preliminary data from ADVANCE demonstrates ongoing weight gain beyond Week 96. Article	2021	Assaf R.D.; Konda K.A.; Torres T.S.; Vega-Ramirez E.H.; Elorreaga O.A.; Diaz-Sosa D.; Diaz S.D.; Pimenta C.; Robles R.; Medina-Mora M.E.; Grinsztejn B.; Caceres C.; Veloso V.G.	Are men who have sex with men at higher risk for HIV in Latin America more aware of PrEP?	PLOS One	-	-	-	19326203	10.1371/journal.pone.0255557	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112757530&doi=10.1371%2fjournal.pone.0255557&partnerID=40&md5=b5d628d66bf9db147472bf51f5764ca	Introduction PrEP awareness in Latin America has been poorly characterized, with studies in Brazil, Mexico, and Peru highlighting awareness of 65% among gay, bisexual and other men who have sex with men (MSM). We assessed the association between higher risk of HIV infection, indicative of PrEP eligibility, and PrEP awareness among MSM from these countries. Methods This was a secondary analysis of a web-based survey advertised on social media platforms from March-June 2018 in Brazil, Mexico and Peru. Eligible individuals were cisgender MSM, ≥18 years old, HIV negative or of unknown status, who lived in these countries, and provided informed consent. Higher risk of HIV infection was defined as having 10 or more points in the HIV Risk Index for MSM (HIRI-MSM). We used multivariable Poisson regression models to calculate adjusted prevalence ratios (aPR) testing the association between higher risk for HIV and PrEP awareness. Results After exclusions, 19,457 MSM were included in this analysis. In Brazil, 53.8% were classified as higher risk for HIV, 51.9% in Mexico, and 54.2% in Peru. Higher risk for HIV was minimally associated with PrEP awareness among those in Brazil (aPR 1.04, 95% CI 1.01, 1.06), but no such association was observed in Mexico or Peru. Having more than a high school education, high income, daily use of geosocial networking (GSN) applications, and substance use were associated with PrEP awareness. Conclusion Higher risk of HIV infection was associated with increased PrEP awareness in Brazil. However, this association was weak indicating that PrEP awareness could be strengthened with further prevention efforts. In the remaining countries, results were non-conclusive between risk and awareness. Interventions to increase PrEP awareness are paramount to increase PrEP willingness and uptake and in turn prevent new HIV infections. Social media platforms could play an important role to achieve this goal. © 2021 Assaf et al. Article	2021	Assoumou S.A.; Paniagua S.M.; Gonzalez P.; Wang J.; Beckwith C.G.; White L.F.; Taylor J.L.; Coogan K.; Samet J.H.; Linas B.P.	HIV Pre-exposure Prophylaxis and Buprenorphine at a Drug Detoxification Center During the Opioid Epidemic: Opportunities and Challenges	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03220-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103162737&doi=10.1007%2fs10461-021-03220-0&partnerID=40&md5=4f41d9605605d364f13aff3af46a23c3	Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) and buprenorphine decrease HIV acquisition. Between November, 2016 and July, 2017, we surveyed persons (N = 200) at a drug detoxification center to assess their interest in PrEP and in buprenorphine, and to examine factors associated with such interests. Over the previous 6 months, 58% (117/200) injected drugs, 87% (173/200) used opioids, 50% (85/171) had condomless sex. Only 22% (26/117) of persons who injected drugs were aware of PrEP, yet 74% (86/116) and 72% (84/116) were interested in oral or injectable PrEP, respectively. Thirty-eight percent (47/125) of persons not receiving buprenorphine or methadone expressed interest in buprenorphine. After multivariable adjustment, Latinx ethnicity was associated with interest in PrEP (aOR 3.80; 95% CI 1.37–10.53), while male gender (aOR 2.76; 95% CI 1.21–6.34) was associated with interest in buprenorphine. Opportunities exist to implement PrEP and buprenorphine within drug detoxification centers. Clinical trial registration NCT02869776. Theses and Dissertations	2021	ATAIDE, ESTHER AMORIM OURIQUES DE	REPRESENTAÇÃO SOCIAL DA PrEP AO HIV EM HOMENS QUE FAZEM SEXO COM HOMENS	-	-	Universidade de Pernambuco	-	-	NA	NA	Objetivou-se analisar as representações sociais da PrEP ao HIV entre homens que fazem sexo com homens. Pesquisa de campo exploratória, descritiva, com enfoque qualitativo, fundamentada na Teoria das Representações Sociais, abordagem processual. Os participantes do estudo foram 30 pessoas do sexo masculino que faziam acompanhamento ambulatorial em Serviço de Assistência Especializada em HIV/Aids, na cidade de Recife, Pernambuco, Brasil. A coleta de dados aconteceu de setembro a novembro de 2020, por meio de formulário de caracterização sociodemográfica e clínica do sujeito do estudo e roteiro semiestruturado de entrevista. As entrevistas foram gravadas, transcritas, utilizadas para preparação do corpus e, posteriormente, analisadas pelo software IRAMUTEQ, mediante o método da Classificação Hierárquica Descendente. A classificação selecionou 150 dos segmentos de texto para aproveitamento da análise, da qual emergiram cinco categorias, divididas em dois blocos e nomeadas da seguinte forma: "Não adoecer, efeitos colaterais, espera pela cura e acesso geral", que aborda a visão a longo prazo sobre o uso da profilaxia pré-exposição ao HIV;" PrEP como cuidado e atitudes positivas", trata da percepção que os usuários tem sobre a profilaxia pré- exposição como prevenção; "Acesso à informação sobre a PrEP", que discorre sobre como os participantes descobriram e buscaram o uso da PrEP; "Revelação do uso e aceitação da PrEP", refere-se à comunicação sobre a prática da PrEP e às possíveis mudanças no cotidiano desses homens que fazem sexo com homens, após a revelação; e "PrEP como prevenção – liberdade, sexo prático e seguro", que abrange conceitos e atitudes atribuídos à profilaxia pré-exposição ao HIV, mediante os relatos de homens que fazem sexo com homens. Observaram-se as projeções futuras que os participantes fizeram em relação à PrEP, como saudável, vida, sadia e cura. Também, constataram-se os conteúdos representacionais da PrEP ao HIV como algo seguro, prático e que traz liberdade nas relações sexuais. Identificaram- se e descreveram-se os conteúdos representacionais da PrEP ao HIV entre homens que fazem sexo com homens e, por fim, discutiram-se como essas relações se estabelecem. Com base nos resultados obtidos, considera-se, então, que as representações sociais, por meio das imagens e dos significados atribuídos a PrEP ao HIV, bem como o suporte social recebido, influenciam a forma como os homens que fazem sexo com homens irão aderir à terapia medicamentosa. Article	2021	Atkins, Kaitlyn; Rucinski, Katherine; Mudavanhu, Mutsa; Holmes, Leah; Mutunga, Lillian; Kaufman, Michelle R; Bassett, Jean; Van Rie, Annelies; Schwartz, Sheree R	Sexual Relationship Types, Partner HIV Self-Testing, and Pre-Exposure Prophylaxis Among South African Adolescent Girls and Young Women: A Latent Class Analysis.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002569	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10358829	BACKGROUND: Sexual relationships among adolescent girls and young women (AGYW) are influenced by social, economic, and gender dynamics. Understanding AGYW's different relationship types and their implications for HIV risk is important for development of tailored interventions. We sought to identify relationship typologies among AGYW and their impact on uptake of HIV prevention interventions. METHODS: From May 2018 to February 2019, 2200 HIV-negative AGYW (ages 16-24) in Johannesburg, South Africa, participated in an HIV prevention intervention involving distribution of HIV self-test kits to their male partners. AGYW were also offered pre-exposure prophylaxis. At baseline, AGYW completed a questionnaire, and outcomes were assessed for 3 months. We used latent class analysis to identify relationship types and mixture modeling to estimate the impact of relationship type on engagement in prevention interventions. RESULTS: We identified 3 relationship types: "stable, empowered relationships with older partners" (class 1, n = 973); "shorter, empowered relationships with peer partners" (class 2, n = 1067); and "shorter relationships with risky partners" (class 3, n = 160). Compared with AGYW in class 1 relationships, AGYW in class 2 and 3 relationships were less likely to complete partner testing alongside HIV results sharing (class 2 adjusted risk ratio: 0.89, 95% confidence interval: 0.85 to 0.95; class 3 adjusted risk ratio: 0.84, 95% confidence interval: 0.73 to 0.94). Pre-exposure prophylaxis uptake was highest in class 3 (11.2%) compared with class 2 (3.8%) and class 1 (1.0%; P < 0.001). CONCLUSIONS: Relationship type impacts uptake of HIV prevention interventions among South African youth. Intervention effectiveness could be optimized by using tailored approaches to HIV risk mitigation among AGYW. Article	2021	Audet, Carolyn M; Graves, Erin; Emilio, Almiro M; Matino, Ariano; Paulo, Paula; Aboobacar, Arifo M; Fonseca, Carlota L; Van Rompaey, Sara; De Schacht, Caroline	Effect of a storytelling intervention on the retention of serodiscordant couples in ART/PrEP services at antenatal clinic in Namacurra province in Zambézia, Mozambique.	Contemp Clin Trials Commun	-	-	-	2451-8654	10.1016/j.conctc.2021.100782	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8167234	BACKGROUND: Sub-Saharan Africa reported 550,000 new HIV infections among women in 2018. Pregnancy and the postpartum period are associated with an increased risk of HIV acquisition (adjusted risk ratio RR: 2.8 during pregnancy and 4.0 in postpartum period vs. non-pregnant or postpartum women, respectively). Acquisition of HIV during pregnancy and breastfeeding increases risk of mother to child transmission. We propose to test the impact of a peer-delivered oral storytelling intervention to increase retention in, and adherence to, pre-exposure prophylaxis (PrEP)/combination antiretroviral treatment (ART) among expectant couples. DESIGN: We propose a randomized controlled trial (RCT) (35 intervention and 35 control couples) at a health facility where 11% of expectant couples were in serodiscordant relationships in 2018. Couples randomized to the storytelling arm will be visited by a two community volunteers and who successfully adhered to PrEP/ART during a recent pregnancy. This expert couple will orate to participating couples three stories (at 1, 3 and 5 weeks after study enrollment) designed to empower, educate, and establish "ideal" interpersonal communication strategies within couples/families, and support adherence practices among participants. The primary outcome among HIV-uninfected women will be adherence to PrEP at 3 months. CONCLUSIONS: PrEP among at-risk pregnant women must be implemented so that high levels of adherence and retention are achievable for them and their partners. We will test our storytelling intervention to identify an optimal strategy for PrEP education and family engagement in a region with high HIV prevalence. Our results will have an impact by effectively engaging serodiscordant couples in prevention/treatment during pregnancy and beyond. Article	2021	Ayerdi Aguirrebengoa, Oskar; Vera García, Mar; Arias Ramírez, Daniel; Gil García, Natalia; Puerta López, Teresa; Clavo Escribano, Petunia; Ballesteros Martín, Juan; Lejarraga Cañas, Clara; Fernandez Piñeiro, Nuria; Fuentes Ferrer, Manuel Enrique; García Lotero, Mónica; Hurtado Gallegos, Estefanía; Raposo Utrilla, Montserrat; Estrada Pérez, Vicente; Del Romero Guerrero, Jorge; Rodríguez Martín, Carmen	Low use of condom and high STI incidence among men who have sex with men in PrEP programs.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0245925	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7861516	OBJECTIVE: Since the recent introduction of preexposure prophylaxis (PrEP), several studies have reported a decrease in the use of condoms and a rise in STIs among users. This rise in risk behavior associated with the advent of PrEP is known as "risk compensation." The aim of this study is to measure clinical and behavioral changes associated with the introduction of PrEP by analyzing condom use for anal intercourse, number of sexual partners, sexualized drug use and STI incidence. METHODS: We performed a retrospective descriptive study of PrEP users followed every 3months over a 2-year period spanning 2017-2019 in a referral clinic specializing in STI/HIV in Madrid, Spain. One hundred ten men who have sex with men and transgender women underwent regular screening for STIs and hepatitis C virus (HCV) infection. Sociodemographic, clinical, and behavioral data were gathered for all subjects studied. RESULTS: The risk compensation observed in this study consisted primarily of a lower rate of condom use, while the number of sexual partners and recreational drug consumption remained stable. We observed a very high incidence of STIs in this sample, particularly rectal gonorrhea and chlamydia. The factors shown to be independently associated with the presence of an STI on multivariate analysis were age below 30 years and over 10 sexual partners/month. CONCLUSION: The incidence of STI acquisition was higher than expected, indicating a need for strategies to minimize this impact, particularly among younger individuals with a higher number of sexual partners. Uptake and outcomes of a novel community-based HIV post-exposure prophylaxis (PEP) programme in rural Kenya and Uganda	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25670	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108772154&doi=10.1002%2fjia2.25670&partnerID=40&md5=5953b57f6c9a38ee1877bef3a14b905a	Introduction: Antiretroviral-based HIV prevention, including pre-exposure prophylaxis (PrEP), is expanding in generalized epidemic settings, but additional prevention options are needed for individuals with periodic, high-risk sexual exposures. Non-occupational post-exposure prophylaxis (PEP) is recommended in global guidelines. However, in Africa, awareness of and access to PEP for sexual exposures are limited. We assessed feasibility, acceptability, uptake and adherence in a pilot study of a patient-centred PEP programme with options for facility- or community-based service delivery. Methods: After population-level HIV testing with universal access to PrEP for persons at elevated HIV risk (SEARCH Trial:NCT01864603), we conducted a pilot PEP study in five rural communities in Kenya and Uganda between December 2018 and May 2019. We assessed barriers to PEP in the population and implemented an intervention to address these barriers, building on existing in-country PEP protocols. We used community leaders for sensitization. Test kits and medications were acquired through the Ministry of Health supply chain and healthcare providers based at the Ministry of Health clinics were trained on PEP delivery. Additional intervention components were (a)PEP availability seven days/week, (b)PEP hotline staffed by providers and (c)option for out-of-facility medication delivery. We assessed implementation using the Proctor framework and measured seroconversion via repeat HIV testing. Successful "PEP completion" was defined as self-reported adherence over four weeks of therapy with post-PEP HIV testing. Results: Community leaders were able to sensitize and mobilize for PEP. The Ministry of Health supplied test kits and PEP medications; after training, healthcare providers delivered the 28-day regimen with high completion rates. Among 124 persons who sought PEP, 66% were female, 24% were ≤25 years and 42% were fisherfolk. Of these, 20% reported exposure with a serodifferent partner, 72% with a new or existing relationship and 7% from transactional sex. 12% of all visits were conducted at out-of-facility community-based sites; 35% of participants had ≥1 out-of-facility visit. No serious adverse events were reported. Overall, 85% met the definition of PEP completion. There were no HIV seroconversions. Conclusions: Among individuals with elevated-risk exposures in rural East African communities, patient-centred PEP was feasible, acceptable and provides a promising addition to the current prevention toolkit. © 2021 The Authors. Article	2021	Azarnoosh M.; Johansen I.S.; Martin-Iguacel R.	Incidence of Sexually Transmitted Infections After Initiating HIV Pre-Exposure Prophylaxis Among MSM in Southern Denmark	American Journal of Men's Health	-	-	-	15579883	10.1177/15579883211018917	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106912694&doi=10.1177%2f15579883211018917&partnerID=40&md5=ba2cde2bebe90b7d2b37696ae755aaed	Pre-exposure prophylaxis (PrEP) is a new preventive treatment for individuals at high-risk for HIV infection, such as men who have sex with men (MSM). Studies have confirmed the efficacy but concerns about the potential induction of risk compensation remains. We aimed to assess the incidence of sexually transmitted infections (STIs) after PrEP initiation as a proxy for sexual risk behavior. This case-crossover study used data from medical records and from the Danish Microbiology Database from patients who initiated PrEP at the Region of Southern Denmark between 2017 and 2019. Poisson regression was used to assess STI incidence 6 months after PrEP initiation versus the 6 months before. To identify potential risk factors, we compared individuals with an increased STI incidence after PrEP initiation with those without, using logistic regression. In total, 46 MSM initiated PrEP in the study period. We found a significant increase in the number of positive samples for STI after PrEP initiation (IRR 1.83; 95% CI 1.03, 3.26) and a tendency for higher incidence of STI episodes (1.67; 95% CI 0.91, 3.13). The increase was concentrated to a group of users, but no significant correlation was found between increasing incidence and the baseline factors examined. We observed a degree of risk compensation after the implementation of PrEP among MSM, clustering to a group of users. Our results highlight the importance of frequent STI screening among MSM on PrEP as timely diagnosis could contribute to an overall decrease in STI incidence and incidence among MSM. © The Author(s) 2021.	chlamydia; gonorrhea; MSM; PrEP; sexually transmitted infections; STI; syphilis	English	United States	Western and Central Europe and North America	Denmark	Western and Central Europe and North America	Denmark	Western and Central Europe and North America	Quantitative
Article	2021	Azhar, Sameena; Tao, Xiangyu; Jokhakar, Vaidehi; Fisher, Celia B	Barriers and Facilitators to Participation in Long-Acting Injectable PrEP Research Trials for MSM, Transgender Women, and Gender-Nonconforming People of Color.	AIDS Education and Prevention	-	-	-	1943-2755	10.1521/aeap.2021.33.6.465	https://dx.doi.org/10.1521/aeap.2021.33.6.465	We collected 216 responses from sexually active MSM, transgender women, and gender-nonconforming (GNC) people of color through a web-based survey to understand the facilitators and barriers to research participation in a hypothetical LAI PrEP trial. In adjusted models, these items were found to be significantly associated with research participation likelihood: ever participated in HIV research study; comfort with taking daily pill; comfort with providing urine sample; and concerns over potential side effects of shot. Asian participants were more concerned about others knowing they were being recruited than were Black and Latinx respondents F(2, 216) = 3.98; p < .05. Asian respondents were also less comfortable with being recruited at organizations serving communities of color than Black and Latinx respondents, F(2, 216) = 5.10; p < .05. Cisgender respondents were more comfortable with being recruited by a friend or colleague than were transgender/GNC respondents, F(1, 215) = 4.8; p < .05. Article	2021	Babel, Riddhi A; Wang, Peng; Alessi, Edward J; Raymond, Henry F; Wei, Chongyi	Stigma, HIV Risk, and Access to HIV Prevention and Treatment Services Among Men Who have Sex with Men (MSM) in the United States: A Scoping Review.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03262-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8053369	In light of recent advances in HIV prevention and treatment, we reviewed the literature to understand how different types of stigma impact HIV risk; access to HIV prevention, care, and treatment services; and related health outcomes among men who have sex with men (MSM) in the US. We conducted a scoping literature review of observational and qualitative studies that examined stigma and HIV-related outcomes among MSM. Our search identified 5794 studies, of which 47 met the eligibility criteria and were included in the final analysis. The review suggests that stigma remains a formidable barrier to engaging in HIV prevention and treatment among both HIV-negative and HIV-positive MSM. Among the studies of HIV-positive MSM, internalized stigma was related to lower levels of treatment engagement. HIV-positive MSM in the Southern part of the US were also more likely to engage in risky sexual behavior. Perceived health care discrimination was negatively associated with PrEP awareness, particularly among HIV-negative Black MSM. Among young MSM of color, intersectional stigma compounded the social structural barriers to PrEP adherence. Findings indicate that stigma reduction interventions should be implemented in diverse MSM communities to address the disproportionate burden of HIV along with critical gap in the care continuum. Further research should examine how individual types of stigma, including intersectional stigma, affect viral suppression and PrEP uptake and adherence, especially among MSM of color. Article	2021	Baggio G.L.; Macedo N.F.; Merlin J.C.; Anghebem M.I.; Santos J.C.V.; Ignácio S.A.; Rubira-Bullen I.R.F.; Azevedo Alanis L.R.; Couto Souza P.H.	Inflammatory cytologic alterations in the oral epithelium associated with HIV pre-exposure prophylaxis: a preliminary study	Oral Surgery, Oral Medicine, Oral Pathology, and Oral Radiology	-	-	-	22124403	10.1016/j.oooo.2021.01.010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100538856&doi=10.1016%2fj.oooo.2021.01.010&partnerID=40&md5=96cbc76f96a9928ba10367e4eb411fde	Objective: The objective of this study was to assess inflammatory cytologic alterations in the oral epithelium of patients on human immunodeficiency virus pre-exposure prophylaxis (PrEP). Material and Methods: Epithelial cells from the buccal mucosa of 30 patients were collected by exfoliative cytology and were evaluated according to inflammatory cellular alterations: karyomegaly, bi- or multinucleation, karyopyknosis, karyorrhexis, perinuclear halo formation, metachromasia, cytoplasmic vacuolization, indistinct cytoplasmic border, keratinization, and atrophy. Epithelial cells were collected initially before PrEP onset (T1) and then after 30 days of PrEP use (T2). Two experienced cytopathologists independently analyzed the slides. Results: The nonparametric Wilcoxon test showed that there was a statistically significant increase in the number of cells with karyomegaly at T2 compared to T1 (P = .033). The other cellular alterations did not present with statistically significant differences between the 2 moments of evaluation (P >. 05). Conclusion: The increased number of oral epithelial cells with karyomegaly after 30 days of using PrEP suggests the presence of inflammatory alterations at this site. © 2021 Elsevier Inc. Theses and Dissertations	2021	Baker, Zoë; Javanbakht, Marjan; Moore, Janell; Brosnan, Hannah; Squires, Kathleen; Bunge, Katherine; Zimet, Gregory; Mensch, Barbara; Soto-Torres, Lydia; Kapogiannis, Bill; Levy, Lisa; Hoesley, Craig; Reirden, Daniel; Gaur, Aditya; Mayer, Kenneth; Futterman, Donna	Qualitative Study on the Acceptability of and Adherence to a Vaginal Ring for HIV Prophylaxis Among Adolescent Girls	-	-	University of California	-	1525-4135	https://doi.org/10.1097/qai.0000000000002674	https://escholarship.org/uc/item/0p39n8jj	ObjectiveThis study aims to assess the product-related, relationship-related, and sex-related factors that act as facilitators and barriers to the acceptability of a vaginal ring (VR) for HIV prevention among adolescent girls.DesignQualitative study.MethodsNinety-six girls aged 15-17 years from 6 urban US sites were enrolled in MTN-023/IPM 030, a 24-week randomized controlled trial, for assessing the safety and acceptability of a dapivirine VR for HIV prevention. At week 24, 21 girls were randomly selected to participate in in-depth interviews. Interviews were transcribed verbatim and data analyzed using a thematic analysis approach. Facilitators and barriers to VR acceptability related to participants' relationships, sexual activity, and characteristics of the VR product were identified.ResultsFactors related to relationships rarely seemed to act as barriers to VR acceptability; most participants disclosed VR use to sexual partners, and positive reactions from sexual partners, which were common, seemed to facilitate VR acceptability. Emotional and/or physical discomfort surrounding VR use during sex was mentioned occasionally as a barrier to VR acceptability. Product characteristics were most frequently mentioned as barriers to VR acceptability. Many participants reported concerns about the large size of the VR on first impression. Although most found the VR comfortable, some reported pain with VR insertion. Several participants were concerned about VR cleanliness, particularly during menstruation.ConclusionProduct considerations, specifically size and use during menstruation, were the most commonly reported barriers to VR acceptability in this study. Adolescent girls may require additional counseling to assuage product concerns regarding a VR for HIV prevention. Data from the Euroguidelines in Central and Eastern Europe (ECEE) Network Group.	HIV Medicine	-	-	-	1468-1293	10.1111/hiv.12960	https://onlinelibrary.wiley.com/doi/10.1111/hiv.12960	OBJECTIVES: Pre-exposure prophylaxis (PrEP) for HIV infection is an important intervention for control of the HIV epidemic. The incidence of HIV infection is increasing in the countries of Central and Eastern Europe (CEE). Therefore, we investigated the change in PrEP use in CEE over time. METHODS: The Euroguidelines in Central and Eastern Europe (ECEE) Network Group was initiated in February 2016 to compare standards of care for HIV and viral hepatitis infections in CEE. Data on access to PrEP were collected from 23 countries through online surveys in May-June 2017 (76 respondents) and in November 2018-May 2019 (28 respondents). RESULTS: About 34.2% of respondents stated that tenofovir/emtricitabine (TDF/FTC) was licensed for use in their country in 2017, and 66.7% that it was licensed for use in 2018 (P = 0.02). PrEP was recommended in national guidelines in 39.5% of responses in 2017 and 40.7% in 2018 (P = 0.378). About 70.7% of respondents were aware of "informal" PrEP use in 2017, while 66.6% were aware of this in 2018 (P = 0.698). In 2018, there were 53 centres offering PrEP (the highest numbers in Poland and Romania), whereas six countries had no centres offering PrEP. The estimated number of HIV-negative people on PrEP in the region was 4500 in 2018. Generic TDF/FTC costs (in Euros) ranged from 10 (Romania) to 256.92 (Slovakia), while brand TDF/FTC costs ranged from 60 (Albania) to 853 (Finland). CONCLUSIONS: Although the process of licensing TDF/FTC use for PrEP has improved, this is not yet reflected in the guidelines, nor has there been a reduction in the "informal" use of PrEP. PrEP remains a rarely used preventive method in CEE countries. Article	2021	Baldwin, Aleta; Light, Brenda; Allison, Waridibo E	Pre-Exposure Prophylaxis (PrEP) for HIV Infection in Cisgender and Transgender Women in the U.S.: A Narrative Review of the Literature	Archives of Sexual Behavior	-	-	-	00040002	10.1007/s10508-020-01903-8	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-hiv-infection/docview/2542534296/se-2?accountid=8113	Using a socioecological approach, this review describes the peer-reviewed literature on oral pre-exposure prophylaxis (PrEP) among both cisgender (cis women) and transgender women (trans women) in the U.S. A search of the PubMed database and HIV-related conference abstracts generated over 2,200 articles and abstracts. Of these, 103 fulfilled review inclusion criteria. Most of the existing research presents findings on individual-level factors associated with PrEP use such as willingness and perceived barriers. There was far less investigation of factors related to PrEP at more distal ecological levels. Though trans women are at greater risk of HIV infection than cisgender women, less is known about this population group with respect to PrEP despite their inclusion in many major clinical trials. Further, the literature is characterized by a persistent conflation of sex and gender which makes it difficult to accurately assess the reviewed research on HIV prevention and PrEP apart from risk group. Informed by these findings, we highlight specific opportunities to improve access to PrEP and reduce socioecological barriers to PrEP care engagement for cisgender and transgender women. Article	2021	Banerjee, Sumita; Chan, Roy	Crafting a Community Blueprint towards ending HIV transmission and AIDS in Singapore by 2030.	Sexual Health	-	-	-	1449-8987 1448-5028	10.1071/SH20119	https://www.publish.csiro.au/sh/SH20119	In November 2019, Action for AIDS launched the Community Blueprint Towards Ending HIV and AIDS in Singapore by 2030, a key milestone in the country's HIV movement where a roadmap was developed with strategies to end HIV by 2030. Overall, 60 representatives from 30 community organisations and institutions were convened to plan and lead work on the Blueprint, which covers 10 themes. The Blueprint examines the current state of the epidemic and populations most affected by it: heterosexual males with multiple partners, men who have sex with men, sex workers, transgender persons, and persons who use drugs. It assesses existing programs, estimates gaps and recommends strategies and resources needed to close the gap. The second section of the Blueprint explores cross-cutting themes including: stigma and discrimination; strengthening the HIV community workforce; and scaling up pre-exposure prophylaxis. The Blueprint provides key recommendations and is being discussed with the Ministry of Health. Theses and Dissertations	2021	Barnett, Andrew P.; Zea, Maria Cecilia	Reciprocal Causal Relationships in Condom- and PrEP-Related Beliefs and Behavior among Young Men Who Have Sex with Men	-	-	The George Washington University	-	-	NA	https://www.proquest.com/dissertations-theses/reciprocal-causal-relationships-condom-prep/docview/2572546528/se-2?accountid=8113	Evidence of low medication adherence and engagement in condomless anal sex among young men who have sex with men (YMSM) on pre-exposure prophylaxis (PrEP) suggests continued HIV risk for this group and signals the need to understand factors related to these behaviors. Using the information-motivation-behavioral skills model and the prototype willingness model, the present longitudinal study investigated the relationships between cognitive barriers and motivations for condom use (e.g., beliefs that condoms reduce pleasure) and condomless anal sex and between PrEP-related sex expectancies (i.e., beliefs that other sexual risk reduction practices are unnecessary when using PrEP) and adherence among a sample of YMSM ages 15–22 (N = 236; 60.6% racial/ethnic minority). Participants completed self-report measures of condom barriers and motivations and PrEP-related sex expectancies at baseline and week 48 and of sexual behavior at baseline and follow-ups (at weeks 4, 8, 12, 24, 36, and 48); dried blood spot measures assessed PrEP adherence at follow-ups. Findings indicated that beliefs that condoms interfere with pleasure and intimacy predicted condomless anal sex and that condomless anal sex predicted changes in subsequent pleasure- and intimacy-related beliefs. PrEP-related sex expectancies did not predict PrEP adherence, but greater likelihood of PrEP initiation predicted more positive subsequent PrEP-related sex expectancies, controlling for these expectancies at baseline. Results supported a reciprocal, mutually-reinforcing relationship between cognitive barriers to condom use and condomless anal sex among YMSM prescribed PrEP. In addition, findings suggest that YMSM taking PrEP developed stronger beliefs about the acceptability of relaxing other HIV prevention behaviors while using it. Article	2021	Bärnighausen, Kate; Geldsetzer, Pascal; Matse, Sindy; Hettema, Anita; Hughey, Allison B; Dlamini, Phiwa; Mavuso, Mxolisi; Fakudze, David; Kahn, Kathleen; Bärnighausen, Till; McMahon, Shannon A	Qualitative accounts of PrEP discontinuation from the general population in Eswatini.	Culture, Health & Sexuality	-	-	-	1464-5351	10.1080/13691058.2020.1770333	https://dx.doi.org/10.1080/13691058.2020.1770333	People in receipt of pre-exposure prophylaxis (PrEP) for the prevention of HIV in Sub-Saharan Africa often discontinue taking the medication. We conducted 27 semi-structured interviews with men and women who had started PrEP but did not return to the clinic for a refill after a 1, 2 or 3-month period. These 'discontinuation' clients were enrolled in a PrEP demonstration project for the general population in nurse-led, public-sector, primary-care clinics in Eswatini. Reasons for discontinuation included changes to self-perceived HIV risk such as the end of pregnancy and absent partners. Others described PrEP as inaccessible when working away from home and many described difficulties relating to a daily pill regimen and managing side effects. Female clients described being prohibited from using PrEP by their partners and co-wives. From these results, we recommend that client-centred counselling stresses the prevention-effective adherence paradigm, which promotes PrEP use in risk periods that are identifiable and PrEP discontinuation when the risk period has finished. A national scale up of PrEP may mitigate problems accessing PrEP. Extended counselling and support could assist with adherence and the management of side effects. Education and support for partners and families of PrEP clients may also contribute to better PrEP continuation. Article	2021	Bartels, Sophia; Castillo, Ingrid; Davis, Dirk A; Hightow-Weidman, Lisa B; Muessig, Kathryn E; Galindo, Cesar; Barrington, Clare	PrEP Disclosure Experiences of Gay and Bisexual Men in Guatemala	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03276-y	https://www.proquest.com/scholarly-journals/prep-disclosure-experiences-gay-bisexual-men/docview/2598836012/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) can reduce HIV transmission among gay and bisexual men (GBM). However, stigma can inhibit disclosure of PrEP use, which may limit uptake. This study's purpose was to explore PrEP disclosure experiences and how disclosure is associated with PrEP adherence among GBM at a sexual health clinic in Guatemala City. We conducted in-depth interviews with PrEP users (n = 18) and used an iterative content analysis approach. All participants had or planned to disclose their PrEP use to at least one person, most commonly friends and sex partners, though many were selective about who they told. Main reasons for disclosure were to educate others, gain social support, and clarify their HIV status. Concerns about stigma and emotional discomfort deterred disclosure. Disclosure facilitated PrEP access and adherence by enhancing emotional and instrumental support. Interventions providing opportunities for GBM to practice disclosure, including addressing others' misconceptions, could promote PrEP uptake and adherence. Article	2021	Basten, Maartje; den Daas, Chantal; Heijne, Janneke C M; Boyd, Anders; Davidovich, Udi; Rozhnova, Ganna; Kretzschmar, Mirjam; Matser, Amy	The Rhythm of Risk: Sexual Behaviour, PrEP Use and HIV Risk Perception Between 1999 and 2018 Among Men Who Have Sex with Men in Amsterdam, The Netherlands.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03109-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8081694	HIV risk perception plays a crucial role in the uptake of preventive strategies. We investigated how risk perception and its determinants changed between 1999 and 2018 in an open, prospective cohort of 1323 HIV-negative men who have sex with men (MSM). Risk perception, defined as the perceived likelihood of acquiring HIV in the past 6 months, changed over time: being relatively lower in 2008-2011, higher in 2012-2016, and again lower in 2017-2018. Irrespective of calendar year, condomless anal intercourse (AI) with casual partners and high numbers of partners were associated with higher risk perception. In 2017-2018, condomless receptive AI with a partner living with HIV was no longer associated with risk perception, while PrEP use and condomless AI with a steady partner were associated with lower risk perception. We showed that risk perception has fluctuated among MSM in the past 20 years. The Undetectable equals Untransmittable statement and PrEP coincided with lower perceived risk. Theses and Dissertations	2021	BATISTA, AMANDA TRAJANO	CRENÇAS E ATITUDES DAS POPULAÇÕES CHAVE ACERCA DA PROFILAXIA PRÉ-EXPOSIÇÃO AO HIV/AIDS	-	-	Universidade Federal da Paraíba	-	-	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=11497197	Ao propor um método preventivo baseado no uso de antirretrovirais (ARVs), a profilaxia Pre- Exposição (PrEP) trouxe impacto na prevenção do HIV, surgindo a preocupação sobre como os usuários podem alterar seus comportamentos sexuais e preventivos. Fundamentado na Teoria da Ação Racional e no Modelo da Vulnerabilidade e Direitos Humanos, essa tese parte do pressuposto de que a PrEP é um fenômeno dinâmico, sendo mais do que uma intervenção biomédica e farmacológica, ao incorporar aspectos psicológicos e sociais que, em conjunto, afetam a vulnerabilidade das pessoas em relação à prevenção da infecção pelo HIV e outras ISTs, como também a dinâmica de relacionamentos e práticas sexuais. Sendo assim, foram desenvolvidos quatro estudos. Estudo 1: analisar as práticas sexuais e preventivas das denominadas populações chave antes e após o uso da PrEP, no tocante a existência de ISTs, número de parcerias sexuais e uso do preservativo. Método: Trata-se de um estudo exploratório, transversal e documental, no qual foram analisados 100 prontuários de pacientes em uso de PrEP. Os dados foram analisados mediante estatísticas descritivas (Frequência, Média, Desvio padrão). Resultados: A maior parte da amostra foi composta por homens que fazem sexo com homens-HSH (56%), seguido de pessoas em parceria sorodiferentes-SD (36%), com média de 33 anos, e ensino médio completo (39%) ou ensino superior (37%). Com relação às práticas sexuais, os dados demonstram que entre HSHs e SD houve uma diminuição do uso de preservativo, aumento de ISTs, e aumento de parcerias sexuais entre os HSHs após três meses de uso de PrEP. Tais dados evidenciam um aumento ainda que discreto das práticas sexuais consideradas de risco na população prioritárias para uso de PrEP, bem como diminuição de práticas preventivas relacionadas ao uso de preservativo. Estudo 2: objetivou identificar as crenças comportamentais quanto às vantagens e desvantagens do uso de PrEP. Método: A amostra foi composta por 31 participantes de quatro populações-chaves, HSHs, profissionais do sexo, Sorodiferentes e Transexuais, que já estão uso de PrEP. Os participantes foram contactados de forma online. Como instrumento de coleta utilizou-se um questionário tendo por base a Teoria da Ação Racional, composto por quatro perguntas abertas, além dos dados sociodemográficos. Os dados quantitativos foram analisados por estatísticas descritivas, enquanto os qualitativos por meio de análise categorial temática. Resultados: No tocante as vantagens de usar a PrEP obtiveram-se 84 crenças, sendo as principais: 1) Dupla proteção, 2) Não uso do preservativo, 3) Diminuir a contaminação, 4) Diminuir as ISTs, 5) Autonomia na prevenção. Já em relação às desvantagens, obtiveram-se 95 crenças: 1) Efeitos colaterais, 2) Ineficácia, 3) Não uso do preservativo, 4) Foco no HIV, 5) Ingerir diariamente. Estudo 3: objetivou construir um instrumento direcionado a mensurar as atitudes dos usuários da Profilaxia Pré-Exposição-PrEP quanto ao uso do preservativo, reunindo evidências de sua validade fatorial e consistência interna, seguindo os pressupostos Teoria da Ação Racional (TAR). Método: Trata-se de um estudo psicométrico e metodológico que contou com uma amostra de 178 sujeitos das três populações chaves prioritárias para o uso de PrEP, a saber: homens que fazem sexo com homens (HSHs), profissionais do sexo e pessoas que possuem parceria soro diferente. Resultados: O instrumento foi composto por 26 itens, os quais contemplavam aspectos referentes aos constructos da TAR, cada tipo inserido em uma subescala, cujas variáveis foram avaliadas a partir de uma escala bipolar do tipo Likert, variando de 1 a 5 (com ponto médio igual a 3) discriminando grupos com Intenção Negativa (1 a 2) e Intenção Positiva (4 e 5) em desempenhar o comportamento. As análises exploratórias indicaram três fatores referentes à estrutura da TAR, apresentando uma boa consistência interna e confiabilidade representada pelo índice coeficiente Alpha de Crobrach: Medida Direta da Atitude (45,2% de variância explicada e Alpha 0,74); Medida Indireta da Atitude (30,8% de variância explicada e Alpha 0,48); Medida Indireta da Norma Subjetiva (58,2% de variância explicada e Alpha 0,63). Estudo 4: buscou investigar a intenção comportamental de três populações chaves quanto ao uso do preservativo em situação de uso de PrEP, avaliando a associação das variáveis sócio demográficas sobre a intenção comportamental dos participantes. Método: Trata-se se um estudo quantitativo, de natureza descritiva e correlacional, com a mesma amostra do estudo anterior. Utilizou-se como instrumento a Escala de Atitudes frente à Profilaxia Pré Exposição ao HIV, bem como questionário sociodemográfico. Para as análises de dados, foram realizadas estatísticas descritivas e bivariadas e inferencial (Qui□quadrado, Correlação de Pearson e Regressão Multipla). Resultados: As crenças comportamentais e atitude direta predizem significativamente a intenção comportamental, sugerindo que, nas populações chave estudada, as crenças comportamentais são principais preditores da intenção dos usuários da Profilaxia Pré-Exposição (PrEP) em usar o preservativo, com contribuição das crenças normativas na explicação da variância. No entanto, observa-se que, quanto mais forte as crenças, menor a intenção do uso conjunto da PrEP e preservativo. O grupo de HSH, apresentou intenção positiva em fazer uso da prevenção combinada ao contrário das pessoas em parcerias Sorodiferentes e dos Profissionais do Sexo que tem intenção negativa no uso da PrEP e dopreservativo. As análises mostraram correlação positiva entre o grau de escolaridade e a intenção, evidenciando que quanto maior a escolaridade, mais positiva é a intenção de usar a PrEP e preservativo. No entanto, não foram encontradas correlações significativas entre a intenção e a idade e a intenção e renda. Os resultados apontaram que, de forma geral, quanto maior o tempo de uso da PrEP, menor o uso do preservativo. Entre as populações chave específicas, os HSH e Sorodiferentes que usam PrEP há mais de seis meses, apresentaram menor uso de preservativo, oposto aos participantes em parcerias Sorodiferentes onde o uso depreservativo é maior entre aqueles que usam a PrEP há menos 6 meses, enquanto entre aqueles que nunca usam preservativos, o fazem há mais de 6 meses. Article	2021	Baugher A.R.; Finlayson T.; Lewis R.; Sionean C.; Whiteman A.; Wejnert C.	Health Care Coverage and Preexposure Prophylaxis (PrEP) Use Among Men Who Have Sex With Men Living in 22 US Cities With vs Without Medicaid Expansion, 2017	American Journal of Public Health	-	-	-	900036	10.2105/AJPH.2020.306035	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102906352&doi=10.2105%2fAJPH.2020.306035&partnerID=40&md5=f55e6b96b9763775626de3d4afda1f5d	Objectives. To compare health care coverage and utilization between men who have sex with men (MSM) in Medicaid expansion versus nonexpansion states. Methods. We used cross-sectional weighted data from the National HIV Behavioral Surveillance system, which used venue-based methods to interview and test MSM in 22 US cities from June through December, 2017 (n = 8857). We compared MSM in Medicaid expansion versus nonexpansion states by using the Rao-Scott χ2 test stratified by HIV status. We used multivariable logistic regression to model the relationship between Medicaid expansion, coverage, and preexposure prophylaxis (PrEP) use. Results. MSM in expansion states were more likely to have insurance (87.9% vs 71.6%), have Medicaid (21.3% vs 3.8%), discuss PrEP with a provider (58.8% vs 44.3%), or use PrEP (31.1% vs 17.5%). Conclusions. Medicaid expansion is associated with higher coverage and care, including PrEP. Public Health Implications. States may consider expanding Medicaid to help end the HIV epidemic. © 2021 American Public Health Association Inc.. All rights reserved. Article	2021	Baugher, Amy R; Trujillo, Lindsay; Kanny, Dafna; Freeman, Jincong Q; Hickey, Terence; Sionean, Catlainn; Respress, Ebony; Chapin-Bardales, Johanna; Marcus, Ruthanne; Finlayson, Teresa; Wejnert, Cyprian	Racial, Ethnic, and Gender Disparities in Awareness of Preexposure Prophylaxis Among HIV-Negative Heterosexually Active Adults at Increased Risk for HIV Infection - 23 Urban Areas, United States, 2019.	MMWR Recommendations and Reports	-	-	-	1545-861X	10.15585/mmwr.mm7047a3	https://pmc.ncbi.nlm.nih.gov/articles/PMC8612510/	In 2019, heterosexual sex accounted for 23% of new HIV diagnoses in the United States and six dependent areas (1). Although preexposure prophylaxis (PrEP) can safely reduce the risk for HIV infection among heterosexual persons, this group is underrepresented in PrEP research (2). CDC analyzed National HIV Behavioral Surveillance (NHBS) data to describe PrEP awareness among heterosexually active adults in cities with high HIV prevalence. Overall, although 32.3% of heterosexually active adults who were eligible were aware of PrEP, <1% used PrEP. Racial, ethnic, and gender disparities were identified, with the lowest awareness of PrEP among residents of Puerto Rico (5.8%) and Hispanic or Latino (Hispanic) men (19.5%) and women (17.6%). Previous studies have found that heterosexual adults are interested in taking PrEP when they are aware of it (3); tailoring PrEP messaging, including Spanish-language messaging, to heterosexual adults, might increase PrEP awareness and mitigate disparities in use. Article	2021	Bavinton B.R.; Grulich A.E.	HIV pre-exposure prophylaxis: scaling up for impact now and in the future	The Lancet Public Health	-	-	-	24682667	10.1016/S2468-2667(21)00112-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108634468&doi=10.1016%2fS2468-2667%2821%2900112-2&partnerID=40&md5=8facd3305f1147849a30795b8f37ec74	More than a decade after the first efficacy evidence for oral HIV pre-exposure prophylaxis (PrEP) was reported, PrEP uptake globally has been inadequate and global HIV prevention targets have been missed. Access to PrEP is still highly concentrated in a fairly small number of countries and, even within countries with widespread PrEP access, inequalities have emerged. More ambitious, high-priority global targets for PrEP uptake are required and could accelerate the HIV prevention response in a similar way to the success of the 90-90-90 testing and treatment targets. Health systems must be PrEP-friendly and allow PrEP to be prescribed in settings already attended by large numbers of HIV-negative individuals who are at risk. Several models have been advanced for the greater demedicalisation of PrEP. Individual-level barriers to PrEP uptake and persistence have been characterised, such as low awareness, low willingness to use PrEP, and the gap between self-perceived and actual HIV risk. Overcoming these barriers will require further efforts to understand and address them first. New PrEP modalities are emerging; as more options become available, we need to develop a greater understanding of the long-term patterns of PrEP use in different populations and to develop models of such use that can accommodate people alternating through periods of use and non-use, as well as switching between dosing regimens or modalities as they become available. Scaling up PrEP is crucial to achieving the UNAIDS prevention targets for 2030. Simply getting more people onto PrEP cannot be the only goal: the big-picture definition of success for PrEP programmes must be their impact on the HIV epidemic. © 2021 The Author(s). Article	2021	Bavinton B.R.; Vaccher S.; Jin F.; Prestage G.P.; Holt M.; Zablotska-Manos I.B.; Guy R.; Amin J.; Templeton D.J.; Yeung B.; Hammoud M.A.; Lewis D.; Baker D.; Dharan N.; McNulty A.M.; Grulich A.E.	High Levels of Prevention-Effective Adherence to HIV PrEP: An Analysis of Substudy Data from the EPIC-NSW Trial	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002691	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108659446&doi=10.1097%2fQAI.0000000000002691&partnerID=40&md5=95cd55781196bdfa56865b5a69ee28c7	Background:Preexposure prophylaxis (PrEP) prevents HIV infection but relies on good adherence at times of risk, termed "prevention-effective adherence." Most studies assess adherence without reference to sexual behaviur, making it challenging to determine if poor adherence coincides with HIV risk.Setting:We examined data from a behavioral substudy of a large-scale PrEP implementation trial in New South Wales, Australia.Methods:Trial participants completed optional brief quarterly surveys, reporting the number of pills taken and sexual behavior with male partners for each day of the "last full week" before each survey. Condomless sex (CLS) was defined as "higher risk" for HIV when with HIV-positive men with detectable/unknown viral loads or unknown HIV status men. Adequate PrEP protection was defined as ≥4 pills for participants assigned male sex at birth and ≥6 pills for participants assigned female sex at birth (including transgender men).Results:Of 9596 participants dispensed PrEP, 4401 completed baseline and ≥1 follow-up survey. Participants reported on 12,399 "last full weeks": 7485 weeks (60.4%) involved CLS and 2521 weeks (33.7% of CLS-weeks) involved higher risk CLS. There were 103 weeks in which participants did not have adequate PrEP protection and had higher risk CLS: 4.1% of higher-risk CLS weeks (n = 103/2521), 1.4% of all CLS weeks (n = 103/7485), and 0.8% of all observed weeks (n = 103/12,399).Conclusions:In a large PrEP trial, prevention-effective adherence to PrEP was very high at 99%. Our findings illustrate the importance of measuring pill-taking and sexual behavior in the same period so that prevention-effective adherence can be better estimated. © 2021 Lippincott Williams and Wilkins. Article	2021	Bavinton, Benjamin R; Hammoud, Mohamed A; Holt, Martin; Saxton, Peter; Bourne, Adam; MacGibbon, James; Jin Fengyi; Maher, Lisa; Prestage, Garrett P	Changes in Sexual Behaviour Following PrEP Initiation Among Australian Gay and Bisexual Men in Relationships: Results from a Prospective Observational Study	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03232-w	https://www.proquest.com/scholarly-journals/changes-sexual-behaviour-following-prep/docview/2590782153/se-2?accountid=8113	Few studies have examined changes in sexual behaviour following HIV pre-exposure prophylaxis (PrEP) initiation among gay, bisexual and other men who have sex with men (GBM) in relationships. In a national, online, prospective study of GBM in Australia, we compared sexual behaviours prior to and after PrEP initiation among HIV-negative and unknown-HIV-status men (recruited 2014–2017) not taking PrEP at baseline and who completed at least one six-monthly follow-up by July 2018. Among men in relationships who did not initiate PrEP (n = 339), we compared their most recent survey to their prior one, while among men in relationships who initiated PrEP (n = 81), we compared follow-ups before and after PrEP initiation. Among the 81 PrEP-initiators who were in a relationship both before and after initiation, the proportion reporting their regular partner was on PrEP increased from 8.3 to 44.4% (p < 0.001) and the proportion reporting receptive CLAIC increased from 27.2 to 44.4% (p = 0.009). Overall, men who initiated PrEP were more likely to be in a relationship with a partner on PrEP, and it appeared they started PrEP around the same time. Receptive CLAIC also became more common. Article	2021	Bavinton, Benjamin R; Mahendra, I Gusti Agung Agus; Kaldor, John; Law, Matthew; Grulich, Andrew E; Januraga, Pande Putu	Estimation of Potential HIV Transmission Risk in Recent Anal Intercourse Events among Men Who Have Sex with Men and Transgender Women in Bali, Indonesia	Tropical Medicine and Infectious Disease	-	-	-	2414-6366	10.3390/tropicalmed6030139	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8396300	In recent years, prevalence of Human Immunodeficiency Virus (HIV) has increased substantially in Bali, Indonesia, in men who have sex with men (MSM) and transgender women, known locally as 'waria'. There are limited behavioural data in this population. We conducted a behavioural survey of MSM/waria in Bali in March-April 2018. Respondents were primarily recruited by HIV outreach workers. Respondents reported details about anal intercourse events with their last male/waria romantic partner and/or last male/waria casual partner (respondents could report on both if relevant). Statistical significance was tested with generalised estimating equations. Among 709 participants, median age was 27 (interquartile range = 24-31), and 92.1% were male and 7.9% were waria. One-third were born in Bali. Overall, 85.9% had ever had an HIV test; 55.1% reported being HIV-negative, 15.0% HIV-positive, and 30.0% had unknown serostatus. Most (86.5%) reported sex with men, 9.5% with waria, and 20.0% with women in the previous 6 months. Respondents described 703 anal intercourse events (397/306 with romantic/casual partners, respectively; 191 reported on both). Over half (56.5%) of the events were protected by condoms and 7.3% by biomedical prevention (2.6% by PrEP in either partner, 4.7% by HIV treatments in either partner). Thus, 36.3% of events involved unprotected condomless anal intercourse (40.8%/30.4% in romantic/casual partners, respectively). In multivariate analysis, unprotected condomless anal intercourse was associated with romantic partners (p < 0.001), being born in Bali (p = 0.002), lower education (p = 0.013), believing that withdrawal before ejaculation is effective (p < 0.001), liking to use withdrawal (p = 0.021), and not liking condoms (p < 0.001). One-quarter of events had potentially reduced HIV transmission risk through non-condom-based risk reduction strategies, while 11.1% had no potential risk reduction. Events presenting the highest potential risk of HIV transmission were more commonly reported by respondents born in Bali. Article	2021	Beckham, S Wilson; Crossnohere, Norah L; Gross, Margaret; Bridges, John F P	Eliciting Preferences for HIV Prevention Technologies: A Systematic Review.	Patient	-	-	-	1178-1661	10.1007/s40271-020-00486-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7884379	BACKGROUND: Many human immunodeficiency virus (HIV) prevention technologies (pre-exposure prophylaxis, microbicides, vaccines) are available or in development. Preference elicitation methods provide insight into client preferences that may be used to optimize products and services. Given increased utilization of such methods in HIV prevention, this article identifies and reviews these methods and synthesizes their application to HIV prevention technologies. METHODS: In May 2020, we systematically searched peer-reviewed literature in PubMed, CINAHL, and Web of Science for studies employing quantitative preference elicitation methods to measure preferences for HIV prevention technologies among populations of any age, sex, or location. Quality assessment used an existing checklist (PREFS) and a novel adaptation of the Newcastle-Ottawa Scale (PROSPERO #CRD42018087027). RESULTS: We screened 5022 titles and abstracts, reviewed 318 full texts, and included 84 studies. Common methods employed were discrete-choice experiment (33%), conjoint analysis (25%), and willingness-to-participate/try/accept (21%). Studies were conducted in 25 countries and had a mean of 768 participants (range = 26-7176), two-thirds of them male. Common HIV prevention technologies included pre-exposure prophylaxis (23%), voluntary testing and counseling (19%), HIV self-testing (17%), vaccines (15%), and topical microbicides (9%). Most attributes focused on product design (side effects, frequency), service design (provider type, location), acceptability or willingness to accept/pay; results are summarized in these categories, by prevention type. Mean quality-adapted Newcastle-Ottawa Scale score was 4.5/8 (standard deviation = 2.1) and mean PREFS scores was 3.47/5 (standard deviation = 0.81). CONCLUSIONS: This review synthesizes extant literature on quantitative measurement of preferences for HIV prevention technologies. This can enable practitioners to improve prevention products and interventions, and ultimately reduce HIV incidence. Article	2021	Becquet, Valentine; Nouaman, Marcellin; Plazy, Mélanie; Agoua, Aline; Zébago, Clémence; Dao, Hervé; Montoyo, Alice; Jary, Aude; Coffie, Patrick A; Eholié, Serge; Larmarange, Joseph	A community-based healthcare package combining testing and prevention tools, including pre-exposure prophylaxis (PrEP), immediate HIV treatment, management of hepatitis B virus, and sexual and reproductive health (SRH), targeting female sex workers (FSWs) in Côte d'Ivoire: the ANRS 12381 PRINCESSE project.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-021-12235-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8642977	BACKGROUND: Pre-exposure prophylaxis (PrEP) is recommended by the WHO for HIV prevention among female sex workers (FSWs). A study conducted in 2016-2017 in Côte d'Ivoire showed that if PrEP is acceptable, FSWs also have many uncovered sexual health needs. Based on this evidence, the ANRS 12381 PRINCESSE project was developed in collaboration with a community-based organization. The main objective is to develop, document, and analyze a comprehensive sexual and reproductive healthcare package among FSWs in Côte d'Ivoire. METHODS: PRINCESSE is an open, single-arm interventional cohort of 500 FSWs in San Pedro (Côte d'Ivoire) and its surroundings. Recruitment started on November 26th, 2019 and is ongoing; the cohort is planned to last at least 30 months. The healthcare package (including HIV, hepatitis B, and sexually transmitted infection management, pregnancy screening, and contraception) is available both at mobile clinics organized for a quarterly follow-up (10 intervention sites, each site being visited every two weeks) and at a fixed clinic. Four waves of data collection were implemented: (i) clinical and safety data; (ii) socio-behavioral questionnaires; (iii) biological data; and (iv) in-depth interviews with female participants. Four additional waves of data collection are scheduled outside the cohort itself: (i) the medical and activity records of Aprosam for the PRINCESSE participants; (ii) the medical records of HIV+ FSW patients not participating in the PRINCESSE cohort, and routinely examined by Aprosam; (iii) in-depth interviews with key informants in the FSW community; and (iv) in-depth interviews with PRINCESSE follow-up actors. DISCUSSION: The PRINCESSE project is one of the first interventions offering HIV oral PrEP as part of a more global sexual healthcare package targeting both HIV- and HIV+ women. Second, STIs and viral hepatitis B care were offered to all participants, regardless of their willingness to use PrEP. Another innovation is the implementation of mobile clinics for chronic/quarterly care. In terms of research, PRINCESSE is a comprehensive, interdisciplinary project combining clinical, biological, epidemiological, and social specific objectives and outcomes to document the operational challenges of a multidisease program in real-life conditions. TRIAL REGISTRATION: The PRINCESSE project was registered on the Clinicaltrial.gov website (NCT03985085) on June 13, 2019. Article	2021	Beesham, Ivana; Heffron, Renee; Evans, Shannon; Baeten, Jared M; Smit, Jenni; Beksinska, Mags; Mansoor, Leila E	Exploring the Use of Oral Pre-exposure Prophylaxis (PrEP) Among Women from Durban, South Africa as Part of the HIV Prevention Package in a Clinical Trial.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-020-03072-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7973915	HIV endpoint-driven clinical trials in Africa enroll women who are at heightened risk of acquiring HIV. In 2017, the South African Medical Research Council recommended the provision of oral pre-exposure prophylaxis (PrEP) in HIV prevention trials, at which time the Evidence for Contraceptive Options and HIV Outcomes trial was ongoing and began to provide PrEP on-site at some trial sites. We interviewed 132 women who initiated PrEP on-site at the Durban, South Africa trial site to explore PrEP use, and conducted phone-based interviews 4-6 months post-trial exit to explore post-trial PrEP access. PrEP uptake was high (42.6%). Among women initiating PrEP on-site, 87.9% felt at risk of acquiring HIV. Most women (> 90%) heard of PrEP for the first time from study staff and three-quarters who initiated PrEP on-site continued at trial-exit. PrEP use declined post-trial exit with more than 50% of women discontinuing PrEP, and barriers relating to access emerged. Article	2021	Begg, Lorna; Brodsky, Rebecca; Friedland, Barbara; Mathur, Sanyukta; Sailer, Jim; Creasy, George	Estimating the market size for a dual prevention pill: adding contraception to pre-exposure prophylaxis (PrEP) to increase uptake.	BMJ Sexual and Reproductive Health	-	-	-	-	2515-2009	10.1136/bmjsrh-2020-200662	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8292580	INTRODUCTION: Uptake of oral pre-exposure prophylaxis (PrEP) remains low. The objective of this analysis was to estimate the potential market size in priority sub-Saharan African countries for a 28-day dual prevention pill (DPP) regimen containing the active pharmaceutical ingredients in oral PrEP and oral contraceptive pills (OCPs) for the prevention of HIV and unintended pregnancy. METHODS: We selected 15 countries in sub-Saharan Africa for analysis. Population estimates were based on United Nations Population Division data from 2017. Low, medium and high rates (range 0.25% to 25%) of estimated conversion from current contraceptive method to the DPP were applied by country based on HIV prevalence (≥10% vs <10%), current contraceptive method (OCP, condom or unmet need for contraception) and age group (15-24 or 25-49 years). RESULTS: In these 15 countries, between 250 000 and 1.25 million women could switch from their current contraceptive method to the DPP. Given that current PrEP use in the 15 countries combined is estimated to be 113 250 (women and men), the most conservative market size estimate would more than double the number of women currently using PrEP. CONCLUSIONS: By leveraging the existing market for OCPs and assuming modest conversion from condom users and women with an unmet need for contraception, the DPP could lead to a 2- to 10-fold increase in PrEP usage in these 15 sub-Saharan African countries, expanding the broader public health benefit of this proven HIV prevention strategy.	contraceptives, oral; HIV; reproductive health; sexually transmitted diseases; contraceptive agents, female	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Bekerman, Elena; Cox, Stephanie; Babusis, Darius; Campigotto, Federico; Das, Moupali; Barouch, Dan H; Cihlar, Tomas; Callebaut, Christian	Two-dose emtricitabine/tenofovir alafenamide plus bictegravir prophylaxis protects macaques against SHIV infection.	Journal of Antimicrobial Chemotherapy	-	-	-	-	1460-2091	10.1093/jac/dkaa476	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7879143	OBJECTIVES: Current prophylaxis options for people at risk for HIV infection include two US FDA-approved daily pre-exposure prophylaxis (PrEP) regimens and guidelines for a 2-1-1 event-driven course specifically for men who have sex with men. Despite this, PrEP use rates remain suboptimal, and additional PrEP options may help to improve uptake among diverse populations. Here, we evaluated protective efficacy of two-dose PrEP and two-dose postexposure prophylaxis (PEP) schedules with emtricitabine (FTC)/tenofovir alafenamide (TAF) with or without bictegravir (BIC) in an SHIV macaque model. METHODS: Macaques received one oral dose of 200 mg emtricitabine, 25 mg tenofovir alafenamide and 25-100 mg of bictegravir to establish pharmacokinetic profiles of each drug either in the plasma or the peripheral blood mononuclear cells. Protective efficacy of multiple two-dose PrEP and PEP schedules with FTC/TAF with or without bictegravir was then assessed in two repeat low-dose rectal SHIV challenge studies. RESULTS: The data revealed over 95% per-exposure risk reduction with FTC/TAF PrEP initiated 2 h before the exposure, but a loss of significant protection with treatment initiation postexposure. In contrast, FTC/TAF plus BIC offered complete protection as PrEP and greater than 80% per-exposure risk reduction with treatment initiation up to 24 h postexposure. CONCLUSIONS: Together, these results demonstrate that two-dose schedules can protect macaques against SHIV acquisition and highlight the protective advantage of adding the integrase inhibitor bictegravir to the reverse transcriptase inhibitors emtricitabine and tenofovir alafenamide as part of event-driven prophylaxis.	lenacapaviranti human immunodeficiency virus agentdoxecitine	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Belludi, Ashwin; McFall, Allison M; Solomon, Sunil Suhas; Celentano, David D; Mehta, Shruti H; Srikrishnan, A K; Kumar, M Suresh; Solomon, Suniti; Lucas, Gregory M	Awareness of and willingness to use pre-exposure prophylaxis (PrEP) among people who inject drugs and men who have sex with men in India: Results from a multi-city cross-sectional survey.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0247352	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7906475	INTRODUCTION: Pre-exposure prophylaxis (PrEP) is effective in reducing HIV transmission among key populations. In India, where PrEP is not currently part of the national HIV program, little is known about PrEP awareness, willingness to use PrEP, and barriers to uptake among people who inject drugs (PWID) and men who have sex with men (MSM). METHODS: We used respondent-driven sampling to accrue PWID and MSM in 22 sites from August 2016 to May 2017. Participants were asked about awareness of PrEP, willingness to use PrEP (following a brief description) and reasons why they might not be willing to use PrEP. Participants were also queried on preferences for PrEP delivery modality (oral vs. injectable). Multi-level logistic regression models were used to determine participant correlates of willingness to use PrEP. Estimates were weighted for the sampling method. RESULTS: A total of 10,538 PWID and 8,621 MSM who self-reported being HIV-negative were included in the analysis. Only 6.1% (95% confidence interval CI: 5.9, 6.3) of PWID and 8.0% of MSM (95% CI: 7.7, 8.4) were aware of PrEP. However, willingness to use PrEP was substantially higher in both groups: 52.4% of PWID and 67.6% of MSM. Participants commonly cited a perceived low risk for acquiring HIV infection, being perceived by others as being HIV-positive, and side effects as reasons why they would be unwilling to use PrEP. Among PWID, sharing needles and hazardous alcohol use were associated with increased willingness to use PrEP. Among MSM, having a main male partner and injection drug use were associated with increased willingness to use PrEP. Preference for daily oral or monthly injectable PrEP was similar among MSM (39.6% vs. 41.7%,), while PWID were more likely to prefer oral to injectable administration routes (56.3% vs. 31.1%). CONCLUSIONS: As India plans to roll-out of PrEP in the public sector, our multi-city survey of PWID and MSM highlights the need for key population-focused education campaigns about PrEP and self-assessment of risk. Article	2021	Benner, Bryan Eric	HIV Vulnerability Among Survival Sex Workers Through Sexual Violence and Drug Taking in a Qualitative Study From Victoria, Canada, With Additional Implications for Pre-exposure Prophylaxis for Sex Workers.	Frontiers in Sociology	-	-	-	-	2297-7775	10.3389/fsoc.2021.714208	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8762116	Objective: This qualitative study investigates how social and structural forces mediate vulnerability to HIV infection and transmission among survival sex workers, their clients, and their non-commercial, intimate partners-with especial focus on sexual violence and drug taking. Method: I employed an adapted grounded theory approach to conducting and analyzing (n = 9) open-ended, in-depth interviews with a convenience sample of currently working (and recently exited) survival sex workers from a community setting in Victoria, Canada. Findings: Participants revealed important contexts and conditions under which they were vulnerable to HIV infection. At the behavioural level, participants were aware of how HIV could be transmitted (condomless sex and sharing drug equipment), yet participants voiced strongly how structural and systemic features (for instance, client violence, the need for drugs, and "bad date" referrals) could squeeze and constrain their agency to take up safer practices, mediating their optimal HIV health and safety. Some participants reported strained relationships with police because of previous drug involvement. Conclusion: Survival sex workers constitute a health population vulnerable to HIV infection, and ensuring there could be a supportive (outreach) community replete with HIV resources is paramount. The availability of safer sex and drug equipment play important roles in HIV behavioural prevention efforts. However, uptake of pre-exposure prophylaxis (PrEP) at no cost in the Canadian province of British Columbia could be an important and beneficial structural intervention for non-injection drug taking cis-female sex workers in this study who are presently ineligible for no cost PrEP.	hiv/aids, intimate partner violence, sexual violence, sex work, grounded theory, criminology, substance use, PrEP	English	Switzerland	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Qualitative
Article	2021	Berçot, Béatrice; Charreau, Isabelle; Rousseau, Clotilde; Delaugerre, Constance; Chidiac, Christian; Pialoux, Gilles; Capitant, Catherine; Bourgeois-Nicolaos, Nadège; Raffi, François; Pereyre, Sabine; Le Roy, Chloé; Senneville, Eric; Meyer, Laurence; Bébéar, Cécile; Molina, Jean-Michel	High Prevalence and High Rate of Antibiotic Resistance of Mycoplasma genitalium Infections in Men Who Have Sex With Men: A Substudy of the ANRS IPERGAY Pre-exposure Prophylaxis Trial.	Clinical Infectious Diseases	-	-	-	-	1537-6591	10.1093/cid/ciaa1832	https://dx.doi.org/10.1093/cid/ciaa1832	BACKGROUND: Mycoplasma genitalium (MG) is an emerging pathogen among men who have sex with men (MSM) with raising rates of antibiotic resistance. This study assessed the prevalence and incidence of MG infection in MSM enrolled in the open-label phase of the ANRS IPERGAY trial with on-demand tenofovir disoproxil fumarate/emtricitabine for human immunodeficiency virus prevention and the impact of doxycycline post-exposure prophylaxis (PEP). METHODS: 210 subjects were tested at baseline and at 6 months by real-time PCR assays for MG detection in urine samples and oropharyngeal and anal swabs. Resistance to azithromycin (AZM), to fluoroquinolones (FQs), and to doxycycline was investigated in the French National Reference Center of Bacterial Sexually Transmitted Infections (STIs). RESULTS: The all-site prevalence of MG at baseline was 10.5% (6.3% in urine samples, 4.3% in anal swabs, 0.5% in throat swabs) and remained unchanged at 6 months whether or not PEP was used: 9.9% overall, 10.2% with PEP, 9.6% without. The overall rate of MG resistance (prevalent and incident cases) to AZM and FQs was 67.6% and 9.1%, respectively, with no difference between arms. An in vivo mutation of the MG 16S rRNA, which could be associated with tetracycline resistance, was observed in 12.5% of specimens tested. CONCLUSIONS: The prevalence of MG infection among MSM on pre-exposure prophylaxis was high and its incidence was not decreased by doxycycline prophylaxis with a similar high rate of AZM and FQ resistance, raising challenging issues for the treatment of this STI and supporting current recommendations to avoid testing or treatment of asymptomatic MG infection. Book	2021	Bernays, S., Bourne, A., Kippax, S., Aggleton, P., & Parker, R.	Remaking HIV Prevention in the 21st Century: The Promise of TasP, U=U and PrEP	-	Remaking HIV Prevention in the 21st Century: The Promise of TasP, U=U and PrEP	-	-	NA	-	10.1007/978-3-030-69819-5	https://books.google.com.br/books?id=wDw6EAAAQBAJ&hl=pt-PT	This edited collection brings together the social dimensions of three key aspects of recent biomedical advance in HIV research: Treatment as Prevention (TasP), new technologies such as Pre-Exposure Prophylaxis (PrEP), and the Undetectable equals Untransmittable (U=U) movement. The growth of new forms of biomedical HIV prevention has created hope for the future, signalling the possibility of a world without AIDS. In this context, the volume discusses the profound social, political and ethical dilemmas raised by such advances, which are to do with readiness, access, equity and availability. It examines how HIV prevention has been, and is, re-framed in policy, practice and research, and asks: How best can new biomedical technologies be made available in a profoundly unequal world? What new understandings of responsibility and risk will emerge as HIV becomes a more manageable condition? What new forms of blame will emerge in a context where the technologies to prevent HIV exist, but are not always used? How best can we balance public health's concern for adherence and compliance with the rights of individuals to decide on what is best for themselves and others? Few of these questions have thus far received serious consideration in the academic literature. Article	2021	Berruti, Marco; Riccardi, Niccolò; Canetti, Diana; Lo Caputo, Sergio; Taramasso, Lucia; Di Biagio, Antonio	Injectable Antiretroviral Drugs: Back to the Future	Viruses	-	-	-	-	1999-4915	10.3390/v13020228	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7913057	Current HIV treatment regimens provide sustained virologic suppression, at least partially restore the immune system and have limited side effects; however, they do not allow viral eradication and they are burdened by daily pill intake with a life-long commitment for the people living with HIV (PHIV). Injectable agents might represent a turning point in the care of PHIV, allowing less frequent administration of antiretroviral treatment (ART), more widespread use of pre-exposure prophylaxis (PrEP) and more stable drug levels in the blood, thus increasing the odds to get closer to end the HIV pandemic. The aim of this manuscript is to give a comprehensive review of injectable antiretrovirals that have been used in the past, which are available now, will be available in the future, and their role in the treatment of HIV infection. Article	2021	Best, Anton; Rambarran, Nastassia	The demographic features and outcome indicators of the Barbados HIV Pre-exposure Prophylaxis Program, 2018-2019	Revista Panamericana de Salud Pública	-	-	-	-	1020-4989	10.26633/rpsp.2021.51	http://www.scielosp.org/scielo.php?script=sci_arttext&pid=S1020-49892021000100472	ABSTRACT Objective. To assess the demographics, risk profiles and outcome indicators of one of the few government-supported programs on pre-exposure prophylaxis (PrEP) in the English-speaking Caribbean. Methods. Chart review of all persons enrolled into the national PrEP Program from its inception on March 1st 2018 to November 30th 2019, with a descriptive summary analysis of the data extracted. Results. Of the 134 persons enrolled into the program most identified as men who have sex with men (67.9%), followed by men who have sex with men and women (14.9%); there were 20 persons, mostly men (85%), in sero-discordant relationships. PrEP uptake was 96%; however, the continuation rate (continuing for three consecutive months after initiation) was 61.5%. Continuation status for many could not be ascertained due to loss-to-follow-up. PrEP-associated toxicity prevalence was 3.3%, although side-effects occurred in 52% (mostly gastrointestinal). HIV positivity during the study period was 1.5%. Conclusions. Uptake of Barbados' national PrEP Program is excellent but fairly low continuation rates and the HIV positivity rate indicate the need for improved pre-ART initiation education and follow-up processes. Service utilisation is mainly by men who have sex with men, and provision expansion to other civil society partners and private practitioners, as well as increased public awareness could increase access by other high-risk groups. Article	2021	Bhavaraju N.; Shears K.; Schwartz K.; Mullick S.; Jeckonia P.; Murungu J.; Persaud U.; Vij A.; Torjesen K.	Introducing the Dapivirine Vaginal Ring in Sub-Saharan Africa: What Can We Learn from Oral PrEP?	Current HIV/AIDS Reports	-	-	-	-	15483568	10.1007/s11904-021-00577-8	https://link.springer.com/article/10.1007/s11904-021-00577-8	Purpose of review: Clinical trials have found that the dapivirine vaginal ring (DVR) is safe to use and effective at reducing women's risk of acquiring HIV infection. As countries prepare for the introduction of this novel long-acting, woman-controlled prevention method, an examination of key learnings from oral pre-exposure prophylaxis (PrEP) delivery will help programs leverage successful innovations and approaches to support DVR scale-up and expand the method mix for HIV prevention. Recent findings: Intensive efforts over the past 5 years have yielded lessons on how to facilitate access to oral PrEP; expand service delivery for PrEP; address the knowledge, attitudes, and skills providers need to support PrEP initiation and effective use; develop messaging that builds community and partner support and combats stigma; and understand the cyclical nature of PrEP use. Summary: Evidence from oral PrEP introduction and scale-up can help inform and expedite DVR introduction. © 2021, The Author(s). Article	2021	Bhavaraju N.; Wilcher R.; Regeru R.N.; Mullick S.; Mahaka I.; Rodrigues J.; Mason J.; Schueller J.; Torjesen K.	Integrating Oral PrEP Into Family Planning Services for Women in Sub-saharan Africa: Findings From a Multi-Country Landscape Analysis	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2021.667823	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123918086&doi=10.3389%2ffrph.2021.667823&partnerID=40&md5=b24d27214838f5e1d705e1643a517ff5	Integration of HIV and family planning (FP) services is a renewed focus area for national policymakers, donors, and implementers in sub-Saharan Africa as a result of high HIV incidence among general-population women, especially adolescent girls and young women (AGYW), and the perception that integrating HIV pre-exposure prophylaxis (PrEP) into FP services may be an effective way to provide comprehensive HIV and FP services to this population. We conducted a focused desk review to develop a PrEP-FP integration framework across five key categories: plans and policies, resource management, service delivery, PrEP use, and monitoring and reporting. The framework was refined via interviews with 30 stakeholders across seven countries at varying stages of oral PrEP rollout: Kenya, Lesotho, Malawi, South Africa, Uganda, Zambia, and Zimbabwe. After refining the framework, we developed a PrEP-FP integration matrix and assessed country-specific progress to identify common enablers of and barriers to PrEP-FP integration. None of the countries included in our analysis had made substantial progress toward integrated PrEP-FP service delivery. Although the countries made progress in one or two categories, integration was often impeded by lack of advancement in other areas. Our framework offers policymakers, program implementers, and health care providers a road map for strategically assessing and monitoring progress toward PrEP-FP integration in their contexts. Article	2021	Bhuiyan J.; Bradley N.; Lee Y.; Conry J.M.	Awareness, knowledge and comfort of pharmacy students on pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) for HIV prevention	Pharmacy Education	-	-	-	-	15602214	10.46542/PE.2021.211.517527	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146312618&doi=10.46542%2fPE.2021.211.517527&partnerID=40&md5=82d62ac86346b42dbec66422c71cea97	Introduction: Pharmacists are uniquely qualified to promote Pre-Exposure Prophylaxis (PrEP) and Post Exposure Prophylaxis (PEP). The objective of this study was to measure pharmacy students' awareness, knowledge, and comfort regarding PrEP and PEP in an urban setting. Methods: A 23-point questionnaire was distributed to pharmacy students between 2 May 2019 and 31 May 2019. Results: Eighty six pharmacy students responded to the survey. Most of them correctly identified FDA-approved regimens for PrEP and PEP. Most students thought that a pharmacist or intern counselling patients on PrEP or PEP was beneficial; however, a minority felt confident counselling patients on PrEP or PEP. Students who met criteria for composite knowledge were significantly more likely to report confidence in counselling. Conclusion: Pharmacy students have strong awareness, but limited knowledge and comfort regarding PrEP and PEP. Results from the survey will be used to assess the learning needs of pharmacy students and inform future curricular changes. © 2021 FIP. Article	2021	Biello, Katie B; Hill-Rorie, Jonathan; Valente, Pablo K; Futterman, Donna; Sullivan, Patrick S; Hightow-Weidman, Lisa; Muessig, Kathryn; Dormitzer, Julian; Mimiaga, Matthew J; Mayer, Kenneth H	Development and Evaluation of a Mobile App Designed to Increase HIV Testing and Pre-exposure Prophylaxis Use Among Young Men Who Have Sex With Men in the United States: Open Pilot Trial	Journal of Medical Internet Research	-	-	-	-	1438-8871	10.2196/25107	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8074990	BACKGROUND: HIV disproportionately affects young men who have sex with men (YMSM) in the United States. Uptake of evidence-based prevention strategies, including routine HIV testing and use of pre-exposure prophylaxis (PrEP), is suboptimal in this population. Novel methods for reaching YMSM are required. OBJECTIVE: The aim of this study is to describe the development and evaluate the feasibility and acceptability of the MyChoices app, a mobile app designed to increase HIV testing and PrEP use among YMSM in the United States. METHODS: Informed by the social cognitive theory, the MyChoices app was developed using an iterative process to increase HIV testing and PrEP uptake among YMSM. In 2017, beta theater testing was conducted in two US cities to garner feedback (n=4 groups; n=28 YMSM). These findings were used to refine MyChoices, which was then tested for initial acceptability and usability in a technical pilot (N=11 YMSM). Baseline and 2-month postbaseline assessments and exit interviews were completed. Transcripts were coded using a deductive approach, and thematic analysis was used to synthesize data; app acceptability and use data were also reported. RESULTS: The MyChoices app includes personalized recommendations for HIV testing frequency and PrEP use; information on types of HIV tests and PrEP; ability to search for nearby HIV testing and PrEP care sites; and ability to order free home HIV and sexually transmitted infection test kits, condoms, and lube. In theater testing, YMSM described that MyChoices appears useful and that they would recommend it to peers. Participants liked the look and feel of the app and believed that the ability to search for and be pinged when near an HIV testing site would be beneficial. Some suggested that portions of the app felt repetitive and preferred using casual language rather than formal or medicalized terms. Following theater testing, the MyChoices app was refined, and participants in the technical pilot used the app, on average, 8 (SD 5.0; range 2-18) times over 2 months, with an average duration of 28 (SD 38.9) minutes per session. At the 2-month follow-up, the mean System Usability Scale (0-100) score was 71 (ie, above average; SD 11.8). Over 80% (9/11) of the participants reported that MyChoices was useful and 91% (10/11) said that they would recommend it to a friend. In exit interviews, there was a high level of acceptability for the content, interface, and features. CONCLUSIONS: These data show the initial acceptability and user engagement of the MyChoices app. If future studies demonstrate efficacy in increasing HIV testing and PrEP uptake, the app is scalable to reach YMSM across the United States. Article	2021	Biello, Katie B; Mimiaga, Matthew J; Valente, Pablo K; Saxena Nimish; Bazzi, Angela R	The Past, Present, and Future of PrEP implementation Among People Who Use Drugs	Current HIV/AIDS Reports	-	-	-	-	15483568	10.1007/s11904-021-00556-z	https://www.proquest.com/scholarly-journals/past-present-future-prep-implementation-among/docview/2552663179/se-2?accountid=8113	Purpose of reviewRecent HIV outbreaks among people who use drugs (PWUD) necessitate additional HIV prevention tools. Pre-exposure prophylaxis (PrEP) is highly efficacious yet uptake among PWUD remains exceedingly low. To address multilevel, complex barriers to PrEP use among PWUD, a range of intervention strategies are needed.Recent findingsThe literature on interventions to optimize PrEP use among PWUD is nascent, comprising small pilots and demonstration projects in early phases of intervention development. Initial studies suggest that structural, healthcare, interpersonal, and individual-level interventions can improve PrEP use for PWUD, and a number of efficacy trials are underway.SummaryFuture studies are needed to optimize the use of new PrEP modalities (e.g., injectable PrEP), simultaneously target multilevel challenges to PrEP use, and evaluate the integration of PrEP into other service settings and substance use treatment modalities. Article	2021	Billock, Rachael M; Samoff, Erika; Lund, Jennifer L; Pence, Brian W; Powers, Kimberly A	HIV Viral Suppression and Pre-exposure Prophylaxis in HIV and Syphilis Contact Tracing Networks: An Analysis of Disease Surveillance and Prescription Claims Data.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000002739	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8434960	BACKGROUND: HIV and syphilis contact tracing networks offer efficient platforms for HIV treatment and prevention interventions, but intervention coverage within these networks has not been characterized. SETTING: HIV and syphilis sexual contact tracing networks among men who have sex with men (MSM) in North Carolina (NC). METHODS: Using surveillance data, we identified 2 types of "network events" that occurred between January 2013 and June 2017 among MSM in NC: being diagnosed with early syphilis or being named as a recent sexual contact of a person diagnosed with HIV or early syphilis. We estimated prevalent and incident HIV viral suppression among persons diagnosed with HIV before the network event, and we assessed the effect of contact tracing services on a 6-month cumulative incidence of viral suppression among previously HIV-diagnosed, virally unsuppressed persons. Using linked prescription claims data, we also evaluated prevalent and incident pre-exposure prophylaxis (PrEP) use in an insured subset of HIV-negative network members. RESULTS: Viral suppression prevalence among previously HIV-diagnosed persons was 52.6%. The 6-month cumulative incidence of viral suppression was 35.4% overall and 13.1 (95% confidence interval: 8.8 to 17.4) percentage points higher among persons reached than among those not reached by contact tracing services. Few HIV-negative persons had prevalent (5.4%) or incident (4.1%) PrEP use in the 6 months before or after network events, respectively. CONCLUSIONS: Suboptimal viral suppression and PrEP use among MSM in NC in HIV/syphilis contact tracing networks indicate a need for intensified intervention efforts. In particular, expanded services for previously HIV-diagnosed persons could improve viral suppression and reduce HIV transmission within these networks.	viral suppression, pre-exposure prophylaxis, contact tracing, surveillance, insurance claims, data linkage	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Bineau L.; Lambert D.; Truszczynski N.; Hansen N.; Lauckner C.	Dating app use among rural men who have sex with men and its relationship to HIV prevention and risk behaviors: a mixed-methods analysis	Rural and Remote Health	-	-	-	-	14456354	10.22605/RRH6556	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107417990&doi=10.22605%2fRRH6556&partnerID=40&md5=3ebabb8ef1884d053fb3f8dce75b9999	Introduction: Men who have sex with men (MSM) in rural areas have limited access to HIV prevention and education resources. Given the growing usage of mobile dating apps among the wider MSM population, this research sought to explore their use among MSM in rural areas and their potential for delivering HIV prevention information. Methods: Participants were recruited from different areas of the rural Southern USA. This mixed-methods study consisted of an online survey (n=85) and follow-up qualitative phone interviews with 20 survey respondents. The survey assessed dating app use, sexual behaviors, and pre-exposure prophylaxis (PrEP) awareness, usage, and attitudes among MSM in the rural, Southern USA. Interviews explored perceptions of dating apps and their potential value as a source of health and HIV prevention information. Results: Among survey respondents, 74% had used a dating app, with Grindr being the most frequently used app. Of individuals who were in a relationship, 41% had met their current partner online. Using a dating app was associated with having a greater number of sexual partners. Three-quarters of participants had heard of PrEP, but only 7% had ever received a prescription for it and less than one-third reported that it would be easy to get PrEP if they wanted it. Dating app users were more likely than non-app users to have more positive attitudes toward taking PrEP and interest in taking PrEP. In qualitative interviews, respondents expressed support for integrating HIV prevention information into dating apps. Conclusion: Dating app usage is high among rural MSM. Individuals who use these apps have more sexual partners and also are more interested in PrEP for HIV prevention, suggesting that this is an ideal group to target for PrEP education and interventions. This could be especially beneficial for MSM in rural areas, as most have difficulty accessing PrEP and PrEP education. © 2021. Article	2021	Bistoquet, Marie; Makinson, Alain; Tribout, Vincent; Perrollaz, Cyril; Bourrel, Gérard; Reynes, Jacques; Oude Engberink, Agnès	Pre-exposure prophylaxis makes it possible to better live one's sexuality and guide men who have sex with men towards a responsible approach to their health: a phenomenological qualitative study about primary motivations for PrEP.	AIDS Research and Therapy	-	-	-	-	1742-6405	10.1186/s12981-020-00327-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7791866	BACKGROUND: Pre-exposure prophylaxis (PrEP) for HIV is instrumental in the prevention of HIV for HIV-uninfected persons, by drastically reducing the risk of acquisition in the case of high-risk exposures. Despite its demonstrated efficacy, it remained under-prescribed in France until 2018. The principal aim of this study was to understand the motivations of Men who have Sex with Men (MSM) who started using PrEP in Montpellier, France. METHODS: A phenomenological study was undertaken, using semi-structured interviews with twelve participants attending the University Hospital of Montpellier for PrEP. Interviews were analysed by means of triangulation up to the point of theoretical saturation, using a semio-pragmatic method. RESULTS: Fear of HIV infection, personalised regular follow-up, and the wish to take care of one's health were the primary motivational factors. PrEP allows for a better sexual life restoring a sense of freedom despite the risks of STI, deemed manageable by PrEPers. PrEP does not modify long-term risk-taking behaviours but helps them better live their own sexuality and guides them towards a responsible approach to sexuality. Unclear information on PrEP, delivered by their family doctor, public campaigns or the media, leads to misrepresentations or negative social representation, including within the MSM community, which may delay its implementation. CONCLUSIONS: Fear of HIV infection and the benefits of regular medical follow-up to take care of one's health were motivational factors of importance for the use of PrEP by MSM in this study. PrEP transforms all existential dimensions of their lived experience, improving sexual identity and happiness. There is a need to improve professional awareness of the effectiveness of PrEP and to develop a patient centered approach, to disseminate information more widely to the general public and among MSM to reduce stigmatisation. Article	2021	Bjertrup, Pia Juul; Mmema, Nqobile; Dlamini, Velibanti; Ciglenecki, Iza; Mpala, Qhubekani; Matse, Sindy; Kerschberger, Bernhard; Wringe, Alison	PrEP reminds me that I am the one to take responsibility of my life: a qualitative study exploring experiences of and attitudes towards pre-exposure prophylaxis use by women in Eswatini.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-021-10766-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8048211	BACKGROUND: Pre-exposure-prophylaxis (PrEP) has been heralded for its potential to put women in control of preventing HIV infection, but uptake and continuation rates have been disappointing in high-incidence settings in sub-Saharan Africa. We explored structural and social factors that influenced PrEP use among young women and pregnant or breastfeeding women in rural Eswatini. METHODS: We conducted two in-depth interviews with ten women on PrEP, and one-time in-depth interviews with fourteen women who declined or discontinued PrEP. Interviews covered decision-making processes around PrEP initiation and experiences with pill-taking. In-depth interviews were conducted with nine health workers, covering experiences in delivering PrEP services, and two focus group discussions were held with men to elicit their perceptions of PrEP. Interviews and discussions were audio-recorded, translated, transcribed and analysed thematically, using an inductive approach. RESULTS: PrEP initiation and use were experienced by many women as empowering them to take control of their health and well-being, and stay HIV free, facilitating them to realise their aspirations relating to motherhood and educational attainment. However, the social norms that defined relationship dynamics with partners or family members either undermined or promoted this empowerment potential. In particular, young women were rarely supported by family members to take PrEP unless it was perceived to be for protecting an unborn child. Stigmatisation of pill-taking through its associations with HIV and the burden of daily pill-taking also contributed to PrEP discontinuation. CONCLUSIONS: Unlike many prevention tools, PrEP enabled women to achieve a sense of control over their lives. Nevertheless, women's agency to continue and adhere to PrEP was influenced by social and structural factors including gender norms, family expectations of young women, relationship dynamics and stigma related to HIV. Future interventions should address these barriers to promote PrEP use among sexually-active women. Article	2021	Blackstock O.J.; Platt J.; Golub S.A.; Anakaraonye A.R.; Norton B.L.; Walters S.M.; Sevelius J.M.; Cunningham C.O.	A Pilot Study to Evaluate a Novel Pre-exposure Prophylaxis Peer Outreach and Navigation Intervention for Women at High Risk for HIV Infection	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-020-02979-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088945151&doi=10.1007%2fs10461-020-02979-y&partnerID=40&md5=9f59c29bd8e9aecd307ccf3e886e0ac6	Pre-exposure prophylaxis (PrEP) uptake remains woefully low among U.S. women at high risk for HIV acquisition. We evaluated a pilot intervention which involved Peers providing brief PrEP education and counseling at mobile syringe exchange sites and at sex worker and syringe exchange drop-in centers followed by navigation to PrEP care. Peers recruited English-proficient, self-identified women (i.e., cisgender and transgender women and persons with other transfeminine identities) over a 3-month period and delivered the intervention to 52 HIV-negative/status unknown participants. Thirty-eight participants (73.1%) reported PrEP interest, 27 (51.9%) accepted the offer of a PrEP appointment, 13 (25.0%) scheduled a PrEP appointment, 3 (5.8%) attended an initial PrEP appointment, and none were prescribed PrEP. We found a gap between PrEP interest and connecting women to PrEP care. Further study is needed to understand this gap, including exploring innovative approaches to delivering PrEP care to women at highest risk for HIV. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Blair, Kevin J., Segura, Eddy R., Garner, Alex, Lai, Jianchao, Ritterbusch, Amy, Leon-Giraldo, Sebastian, Guilamo-Ramos, Vincent, Lake, Jordan E., Clark, Jesse L., Holloway, Ian W.	Pre-exposure prophylaxis awareness, use, and intention to use in a regional sample of Latin American geosocial networking application users in 2018–2019	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624211034618	http://search.ndltd.org/10.1177/09564624211034618	Pre-exposure prophylaxis (PrEP) access is increasing in Latin America. We explored PrEP use among Spanish-speaking, Hornet geosocial networking application users from Latin American countries with limited PrEP data via an online survey completed between December 2018 and February 2019. A total of 718 Hornet users from 10 countries were included, of whom 72.1% reported PrEP awareness. Few (5.6%) were currently taking PrEP, though 32.1% intended to take PrEP in the subsequent 6 months. PrEP awareness was lower in 18–25 year olds compared to 26+ (62.4% vs. 75.6%, aOR 0.67, 95% CI 0.46–0.97), and higher among those living in larger versus smaller cities (74.4% vs. 58.8%, aOR 1.96, 95% CI 1.25–3.07) or countries with at least partial versus no PrEP policy adoption (79.1% vs. 60.8%, aOR 2.20, 95% CI 1.56–3.12). Intention to use PrEP was higher among PrEP-eligible respondents (51.8% vs. 29.6%, aOR 2.26, 95% CI 1.26–4.07) and those recently tested for a sexually transmitted infection (35.4% vs. 25.5%, aOR 1.58, 95% CI 1.01–2.48). Efforts to expand PrEP use in Latin America should focus on national PrEP policy adoption, and research should explore barriers to awareness and use among young men who have sex with men.	homosexual Human; immunodeficiency virus men who have sex with men; prevention South America	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Blair, KJ; Segura, ER; Garner, A; Lai, JC; Ritterbusch, A; Leon-Giraldo, S; Guilamo-Ramos, V; Lake, JE; Clark, J; Holloway, IW	PrEP Awareness, Use, Intention to Use, and Information Source Among Geosocial Networking Application Users in Mexico in 2018-2019	AIDS and Behavior	-	-	-	-	1090-7165	10.1007/s10461-021-03184-1	https://pubmed.ncbi.nlm.nih.gov/33646443/	Pre-exposure prophylaxis (PrEP) has limited availability across Latin America, though access is increasing. We explored PrEP uptake in Mexico via an online survey completed by Spanish-speaking, Hornet geosocial networking application (GSN app) users without HIV (n = 2020). Most (81.3%) had heard of PrEP, 3.5% were current users, and 34.2% intended to take PrEP within six months. Current PrEP use was associated with PrEP eligibility (aOR 26.07 95%CI 13.05-52.09, p < 0.001), recent STI testing (aOR 3.79 95%CI 1.10-13.11, p = 0.035), and recent chemsex (aOR 3.02 95%CI 1.02-8.93, p = 0.046). Recent STI testing was associated with hearing about PrEP from a doctor (aOR 3.26 95%CI 1.98-5.36, p < 0.001), and those who lived in large cities were less likely to have learned about PrEP via Hornet (aOR 0.52 95%CI 0.32-0.85, p = 0.009). Interventions to increase PrEP uptake in Mexico should build upon existing health networks and utilize GSN apps for PrEP information dissemination, particularly in less populated areas. Article	2021	Blashill, Aaron J; Gordon, Janna R; Rojas, Sarah A; Ramers, Christian B; Lin, Chii-Dean; Carrizosa, Claudia M; Nogg, Kelsey A; Lamb, Kalina M; Lucido, Nicholas C; Jones, Isaiah J; Rivera, David; Cobian Aguilar, Rosa A; Brady, John P; Fuentes, Martin; Wells, Kristen J	Pilot randomised controlled trial of a patient navigation intervention to enhance engagement in the PrEP continuum among young Latino MSM: a protocol paper.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2020-040955	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8160175	INTRODUCTION: Men who have sex with men (MSM) are one of the most at-risk group for contracting HIV in the USA. However, the HIV epidemic impacts some groups of MSM disproportionately. Latino MSM comprise 25.1% of new HIV infections among MSM between the ages of 13 and 29 years. The daily medication tenofovir/emtricitabine was approved by the Food and Drug Administration for pre-exposure prophylaxis (PrEP) in 2012 and has demonstrated strong efficacy in reducing HIV acquisition. METHODS AND ANALYSIS: Through extensive formative research, this study uses a pilot randomised controlled trial design and will examine the feasibility and acceptability of a patient navigation intervention designed to address multiple barriers to improve engagement in the PrEP continuum among 60 Latino MSM between the ages of 18 and 29 years. The patient navigation intervention will be compared with usual care plus written information to evaluate the feasibility and acceptability of the intervention and study methods and the intervention's potential in improving PrEP continuum behaviours. The results will be reviewed for preparation for a future full-scale efficacy trial. ETHICS AND DISSEMINATION: This study was approved by the institutional review board at San Diego State University and is registered at ClinicalTrials.gov. The intervention development process, plan and the results of this study will be shared through peer-reviewed journal publications, conference presentations and healthcare system and community presentations. REGISTRATION DETAILS: Registered under the National Institutes of Health's ClinicalTrials.gov (NCT04048382) on 7 August 2019 and approved by the San Diego State University (HS-2017-0187) institutional review board. This study began on 5 August 2019 and is estimated to continue through 31 March 2021. The clinical trial is in the pre-results stage.	preventive medicine, HIV & AIDS, protocols & guidelines, quality in health care, public health	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review

Results from a Pre-exposure Prophylaxis Demonstration Project for At-risk Cisgender Women in the United States	Clinical Infectious Diseases	-	-	-	-	10584838	10.1093/cid/ciab328	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116468216&doi=10.1093%2fcid%2fciab328&partnerID=40&md5=360d12b4c8ac10d991bc9ef721556e52	Background: Daily oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) is effective for reducing human immunodeficiency virus (HIV) acquisition among cisgender women. We report results from the first US observational open-label demonstration project of pre-exposure prophylaxis (PrEP) among at-risk cisgender women. Methods: Adherence Enhancement Guided by Individualized Texting and Drug Levels was a 48-week, single-arm, open-label demonstration study of daily oral TDF/FTC in cisgender women ≥18 years old at risk for HIV. Adherence was supported using 2-way text messaging and titrated adherence counseling based on rapid-turnaround tenofovir diphosphate concentrations from dried blood spots. Study visits occurred at baseline, weeks 4 and 12, and quarterly through week 48. Outcomes included TDF/FTC adherence, retention, and persistence. Results: From June 2016 to October 2018, 136 cisgender women enrolled (mean age, 40 years (standard deviation, 11); 38% non-Hispanic Black and 19% Latina). At 48 weeks, 84 (62%) participants were retained and 62 (46%) remained on PrEP. More than one-third (12/31) of those on study but off PrEP throughout the study discontinued TDF/FTC because of side effects, and 1 adverse event led to study discontinuation. Of 120 participants with drug concentrations measured, 67 (56%) had at least 1 concentration consistent with 6 doses/week; 22 (18%) had consistent ≥6 doses/week across all study visits attended. There were no incident HIV infections and 4 incident bacterial sexually transmitted infections. Conclusion: Adequate PrEP adherence for protective drug concentrations was not achieved for most study participants. More work needs to be done to fully explicate the reasons for nonadherence and low retention in cisgender women. © 2021 The Author(s). Article	2021	Blumenthal, Jill; Landovitz, Raphael; Jain, Sonia; He, Feng; Kofron, Ryan; Ellorin, Eric; Ntim, Gifty M; Stockman, Jamila K; Corado, Katya; Rivet Amico, K; Moore, David J; Morris, Sheldon	Pre-Exposure Prophylaxis Perspectives, Sociodemographic Characteristics, and HIV Risk Profiles of Cisgender Women Seeking and Initiating PrEP in a US Demonstration Project.	AIDS Patient Care and STDs	-	-	-	-	1557-7449	10.1089/apc.2021.0114	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8905235	Little information is known about the cisgender women who seek and initiate pre-exposure prophylaxis (PrEP) for HIV prevention in the United States. Adherence Enhancement Guided by Individualized Texting and Drug Levels was a 48-week single-arm open-label demonstration study of daily oral tenofovir disoproxil fumaratel emtricitabine (TDF/FTC) in cisgender women ≥ 18 years old at risk for HIV. Participants were surveyed at screening and enrollment about sociodemographics, HIV risk perception and behaviors, and PrEP perspectives and aggregated into three risk groups according to HIV sexual risk behavior: being in a serodiscordant partnership (SD), engaging in sex work (SW), and having partners with unknown HIV status at risk for HIV (UP). One hundred sixty-seven women presented for screening with n = 31 screen failures. Of the 162 women completing enrollment, mean age was 40 (standard deviation 11), with 41% non-Hispanic Black, 22% non-Hispanic White, and 19% Latina. Compared with those who screened ineligible, enrolled participants were more likely to have heard of PrEP, had higher HIV risk perception, and reported higher perceived PrEP efficacy. Sixty-four women (47%) were categorized as SD, 21 (15%) as SW, and 51 (38%) as UP. The SW were more likely to report higher levels of drinking and drug use (p = 0.002) and history of intimate partner violence in the past year (p < 0.001) compared with SD and UP. Among cisgender women enrolled, there were significant differences between the three risk groups by demographics, HIV risk behavior, and PrEP perspectives, suggesting that interventions to successfully implement PrEP in US women may need to be tailored by HIV risk group. Clinical Trial Registration number: NCT02584140.	pre-exposure prophylaxis (PrEP), cisgender women, HIV prevention, risk behaviors	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Article	2021	Bonacci, Robert A; Smith, Dawn K; Ojikutu, Bisola O	Toward Greater Pre-exposure Prophylaxis Equity: Increasing Provision and Uptake for Black and Hispanic/Latino Individuals in the U.S.	American Journal of Preventive Medicine	-	-	-	1873-2607	10.1016/j.amepre.2021.05.027	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8668046	Pre-exposure prophylaxis (PrEP) is highly effective at preventing HIV acquisition and is a critical tool in the Ending the HIV Epidemic in the U.S. initiative. However, major racial and ethnic disparities across the pre-exposure prophylaxis continuum, secondary to structural inequities and systemic racism, threaten progress. Many barriers, operating at the individual, network, healthcare, and structural levels, impede PrEP access and uptake within Black and Hispanic/Latino communities. This review provides an overview of those barriers and the innovative and collaborative solutions that health departments, healthcare organizations, and community partners have implemented to increase PrEP provision and uptake among disproportionately affected communities. Promising strategies at the individual and network levels focus on increasing patient support throughout the PrEP continuum, positioning and training community members to expand knowledge of and interest in PrEP, and leveraging mobile technologies to support PrEP uptake. Healthcare-level solutions include expanding the venues and types of healthcare professionals that can provide PrEP, and structural- and policy-level options focus on financial assistance programs and health insurance expansion. Key research gaps include demonstrating that pilot studies and interventions remain effective at scale and across varied contexts. Although the last 2 decades have provided effective tools to end the HIV epidemic, realizing this vision for the U.S. will require addressing persistent and pervasive HIV-related disparities in Black and Hispanic/Latino communities. Federal, state, and local partners should expand efforts to address longstanding health and structural inequities and partner with disproportionately affected communities to rapidly expand PrEP scale-up. Article	2021	Bosco, Stephen C; Pawson, Mark; Parsons, Jeffrey T; Starks, Tyrel J	Biomedical HIV Prevention among Gay Male Couples: A Qualitative Study of Motivations and Concerns.	Journal of Homosexuality	-	-	-	1540-3602	10.1080/00918369.2019.1696105	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7274863	Pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) are highly efficacious biomedical prevention strategies, which significantly reduce the risk of HIV transmission. Yet, partnered sexual minority men (SMM) continue to exhibit poorer uptake rates especially those in a non-monogamous or serodiscordant relationship for whom PrEP is recommended. The purpose of the study was to identify factors that may facilitate or impede the uptake of PrEP or PEP among partnered SMM. This qualitative study conducted semi-structured interviews with 10 sexual minority male couples recruited from the New York City metropolitan area. Thematic analysis identified relationship-specific and structural-level factors, which influence motivation and willingness for biomedical prevention uptake. Specifically, results highlighted the tension between relationship functioning and HIV prevention. In addition, stigma and access to knowledgeable health care providers diminished interest in biomedical prevention. Findings suggest a need for interventions that frame biomedical prevention in ways that minimize social perceptions of mistrust between partners and improve access. Article	2021	Bowman E.R.; Cameron C.; Richardson B.; Kulkarni M.; Gabriel J.; Kettelhut A.; Hornsby L.; Kwiek J.J.; Turner A.N.; Malvestutto C.; Bazan J.; Koletar S.L.; Doblecki-Lewis S.; Lederman M.M.; Cameron M.; Klatt N.R.; Lake J.E.; Funderburg N.T.	In vitro exposure of leukocytes to HIV preexposure prophylaxis decreases mitochondrial function and alters gene expression profiles	Antimicrobial Agents and Chemotherapy	-	-	-	664804	10.1128/AAC.01755-20	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098666719&doi=10.1128%2fAAC.01755-20&partnerID=40&md5=71d83ab1e0c60c5a908d11088320d1be	The use of antiretroviral therapy (ART) as preexposure prophylaxis (PrEP) is an effective strategy for preventing HIV acquisition. The cellular consequences of PrEP exposure, however, have not been sufficiently explored to determine potential effects on health in individuals without HIV. In this study, peripheral blood mononuclear cells (PBMCs) from people without HIV were exposed to tenofovir disoproxil fumarate (TDF) or emtricitabine (FTC) overnight. Mitochondrial mass and function were measured by flow cytometry and an Agilent XFp analyzer. Monocyte-derived macrophages (MDMs) were differentiated in 20% autologous serum for 5 days in the presence or absence of TDF or FTC, and surface markers, lipid uptake, and efferocytosis were measured by flow cytometry. MDM gene expression was measured using transcriptome sequencing (RNA-seq). Plasma lipids were measured using mass spectrometry. PBMCs exposed to TDF or FTC had decreased maximal oxygen consumption rate (OCR) and reduced mitochondrial mass. Exposure to PrEP also increased reactive oxygen species (ROS) production from monocyte subsets. Compared to MDMs cultured in medium alone, cells differentiated in the presence of TDF (829 genes) or FTC (888 genes) had significant changes in gene expression. Further, PrEP-exposed MDMs had decreased mitochondrial mass and displayed increased lipid uptake and reduced efferocytosis. Plasma biomarkers and lipid levels were also altered in vivo in individuals receiving a PrEP regimen. In conclusion, exposure of leukocytes to TDF or FTC resulted in decreased mitochondrial function and altered functional and transcriptional profiles. These findings may have important implications for the metabolic and immunologic consequences of PrEP in populations at risk for HIV acquisition. © 2020 Bowman et al. Article	2021	Bracchi, M; Pagani, N; Dalla Pria, A; Milinkovic, A; Nwokolo, N; Thomas, L; Mandalia, S; Boffito, M; Moyle, G	A phase IV, open-label three-arm study investigating the impact of a combination of tenofovir disoproxil fumarate/emtricitabine with raltegravir or dolutegravir or elvitegravir/cobicistat on renal function in HIV-1 antiretroviral naïve patients	HIV Research and Clinical Practice	-	-	-	-	10.1080/25787489.2021.1975610	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02380984/full	Objectives: Tenofovir DF (TDF) remains one of the preferred backbone agents for naïve HIV patients starting antiretroviral treatment (ART). The impact of TDF on renal function and metabolic parameters may vary by anchor agent. We investigated the impact of TDF in combination with 3 different integrase inhibitors on tubular and glomerular function, and metabolic parameters in ART-naïve patients.Methods: Sixty patients with normal renal function were randomised (20 per arm) to TDF/emtricitabine (FTC) plus either raltegravir (RAL) (400 mg b.d.), dolutegravir (DTG) or elvitegravir/cobicistat (EVG/c) for 48 weeks.Results: 57 patients completed the study. Significant increases in RBP/creatinine ratio at week 24 were seen in all arms RAL +4.7 μg/mmol (CI 0.43 to 8.98, p = 0.032); DTG +4.96 μg/mmol (CI 0.77 to 9.15, p = 0.021); EVG/c +6.95 μg/mmol (CI 2.53 to 11.36, p = 0.002), although this was not sustained to week 48 in the RAL arm. Similar changes across the arms were observed for urinary α1microglobulin (RAL +6.20 mg/L, p = 0.030; DTG +6.30 mg/L, p = 0.025; EVG/c +8.15 mg/L, p = 0.003). Urinary β2microglobulin significantly increased at week 24 with DTG and EVG/c but remained unchanged in the RAL arm. Glomerular filtration measured with CKD-EPI creatinine-cystatin C increased significantly in the RAL arm at week 24 through 48 but declined modestly in other two arms. Total and LDL cholesterol decreased in the RAL arm, but increased in the EVG/c arm, with no significant changes in the DTG arm. Weight increased significantly from baseline with DTG but not RAL or EVG/c.Conclusion: INSTIs in combination with TDF/FTC impact differently on tubular microproteinuria, eGFR, metabolic markers and weight. Use of TDF/FTC with RAL had the least tubular effects and the most favorable metabolic profile. Article	2021	Brockmeyer, Norbert H; Potthoff, Anja; Knebel-Brockmeyer, Wiltrud; Köhler, Britta; Nambiar, Sandeep; Wach, Janet; Rodrigues Martins, Tobias; Uhrmacher, Mona; Schuppe, Ann-Kathrin; Tiemann, Carsten; Kasper, Andre; Basilowski, Miriam; Kayser, Arne; Skaletz-Rorowski, Adriane	Sexual behavior and prevention of sexually transmitted infections taking the SARS-CoV-2 pandemic into account. Data from a sexual healthcare and medicine center—WIR; Sexualverhalten und Prävention sexuell übertragbarer Infektionen unter Berücksichtigung der SARS-CoV-2-Pandemie. Daten aus einem Versorgungszentrum für sexuelle Gesundheit und Medizin – WIR	Bundesgesundheitsblatt Gesundheitsforschung Gesundheitsschutz	-	-	-	1437-1588	10.1007/s00103-021-03441-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8523933	BACKGROUND: Application-based data regarding sexual health and sexual behavior in various sexually active populations are scarce but at the same time relevant with regards to prevention and healthcare supply strategies. Given the structure of its attendees, the Walk In Ruhr (WIR) Center for Sexual Health and Medicine is able to obtain data from diverse living environments. OBJECTIVES: Based on the online HIV/STI risk test, questionnaires, and attendee data from the WIR, this study aims to deduce population-related findings with regards to age, gender, sexual orientation, and sexual and risk behavior as well as the respective needs for prevention. The influence of the SARS-CoV-19 pandemic on sexual behavior is examined by comparing various phases. METHODS: The analyzed data sources are the online HIV/STI risk test, the COWIR, and the PrEP study as well as the immunological outpatient clinic and the public health department at the WIR. RESULTS: Notwithstanding contact restrictions, sexually transmitted infections (STIs) have increased from 2019 to 2020. Apart from men having sex with men and females having sex with females, young people also have an increased risk of STIs based on sexual practices and the number of sexual contacts. A large number of bisexual and transsexual contacts was found. SARS-CoV-2 led to a decrease in sexual contacts; sexual practices continued. There was a growing proportion of STI tests and the treatment rate including partner treatment rose. DISCUSSION: Data from the WIR center show that young attendees with an active sexual life are being reached. The results from questionnaires and the online HIV/STI risk test are mirrored in increased positive STI test results. These results vary depending on sexual behavior and sexual preferences such that specific strategies for sexual education, prevention, testing, and therapy are required. Article	2021	Bruxvoort K.J.; Schumacher C.M.; Towner W.; Jones J.; Contreras R.; Ling Grant D.; Hechter R.C.	Referral Linkage to Preexposure Prophylaxis Care and Persistence on Preexposure Prophylaxis in an Integrated Health Care System	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002668	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108123895&doi=10.1097%2fQAI.0000000000002668&partnerID=40&md5=09fd6463f02eba8817c8194d7c310164	Background: Successful linkage to preexposure prophylaxis (PrEP) and retention in care are important for HIV prevention. We examined gaps in PrEP care following referral and factors associated with PrEP linkage and persistence in an integrated health care system in the United States.Methods: We identified individuals referred for PrEP from 2014 to 2017 at the Kaiser Permanente Southern California using electronic health records and assessed linkage to care, PrEP prescription orders and fills, and PrEP persistence (medication possession ratio ≥80%) in the year after the first fill. We evaluated demographic and clinical factors potentially associated with PrEP linkage and persistence using a series of multivariable modified Poisson regression models.Results: Of 2995 referred individuals, 74.9% were linked to PrEP care. Nearly all those linked to care were prescribed PrEP and filled a prescription, but only 47.4% of those who filled a prescription were persistent on PrEP. Individuals aged <25 years (vs ≥25 years), female subjects (vs males), and individuals with high-deductible insurance (vs no high deductible) were less likely to be linked to care. Individuals aged <25 years and Hispanics (vs non-Hispanic whites) were less likely to be persistent. Those with alcohol use disorder were more likely to be linked to PrEP care but less likely to be persistent. New HIV diagnoses occurred in 38 individuals, and only 1 had PrEP in possession at diagnosis.Conclusions: We observed PrEP care gaps and disparities among individuals referred for PrEP. Patient-centered interventions are needed in primary care to address barriers to successful PrEP linkage and persistence. © 2021 Wolters Kluwer Health, Inc.	health system; HIV; medication adherence; medication persistence; preexposure prophylaxis; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Buchanan A.L.; Bessey S.; Goedel W.C.; King M.; Murray E.J.; Friedman S.R.; M. Elizabeth Halloran; Marshall B.D.L.	Disseminated effects in agent-based models: A potential outcomes framework and application to inform preexposure prophylaxis coverage levels for HIV prevention	American Journal of Epidemiology	-	-	-	29262	10.1093/aje/kwaa239	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096097417&doi=10.1093%2faje%2fkwaa239&partnerID=40&md5=ad437e9dc75d26365be2c950ecf1d397	Preexposure prophylaxis (PrEP) for prevention of human immunodeficiency virus (HIV) infection may benefit not only the person who uses it but also their uninfected sexual risk contacts. We developed an agent-based model using a novel trial emulation approach to quantify disseminated effects of PrEP use among men who have sex with men in Atlanta, Georgia, from 2015 to 2017. Model components (subsets of agents connected through partnerships in a sexual network but not sharing partnerships with any other agents) were first randomized to an intervention coverage level or the control group; then, within intervention components, eligible agents were randomized to receive or not receive PrEP. We calculated direct and disseminated (indirect) effects using randomization-based estimators and report corresponding 95% simulation intervals across scenarios ranging from 10% coverage in the intervention components to 90% coverage. A population of 11,245 agents was simulated, with an average of 1,551 components identified. When comparing agents randomized to no PrEP in 70% coverage components with control agents, there was a 15% disseminated risk reduction in HIV incidence (risk ratio = 0.85, 95% simulation interval: 0.65, 1.05). Persons not on PrEP may receive a protective benefit by being in a sexual network with higher PrEP coverage. Agent-based models are useful for evaluating possible direct and disseminated effects of HIV prevention modalities in sexual networks. © 2021 The Author(s). Article	2021	Buffel, Veerle; Masquillier, Caroline; Reyniers, Thijs; Ella Van Landeghem; Wouters, Edwin; Vuylsteke, Bea; Nöstlinger, Christiana	Who falls between the cracks? Identifying eligible PrEP users among people with Sub-Saharan African migration background living in Antwerp, Belgium	PLOS One	-	-	-	NA	10.1371/journal.pone.0256269	https://www.proquest.com/scholarly-journals/who-falls-between-cracks-identifying-eligible/docview/2562504597/se-2?accountid=8113	Introduction This study produces an estimate of the proportion of eligible PrEP users among people of Sub-Saharan African background based on the Belgian PrEP eligibility criteria and examines associations with socio-economic and demographic characteristics. Methods We performed logistic regression analysis on data of a representative community-based survey conducted among Sub-Saharan African communities (n = 685) living in Antwerp. Results Almost a third (30.3%) of the respondents were eligible to use PrEP. Those who were male, single, lower educated, undocumented, and had experienced forced sex were more likely to be eligible for PrEP use. The findings highlight the importance of taking intra-, interpersonal and structural HIV risk factors into account. Conclusions The study shows high unmet PrEP needs in this population, especially among those with high vulnerability for HIV acquisition. A better understanding of barriers to PrEP use in this population group is needed to allow for equitable access. Article	2021	Bunting S.R.; Feinstein B.A.; Hazra A.; Sheth N.K.; Garber S.S.	Knowledge of HIV and HIV pre-exposure prophylaxis among medical and pharmacy students: A national, multi-site, cross-sectional study	Preventive Medicine Reports	-	-	-	22113355	10.1016/j.pmedr.2021.101590	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116621702&doi=10.1016%2fj.pmedr.2021.101590&partnerID=40&md5=323c5d9a29561aa3f62e161faef321ce	Pre-exposure prophylaxis (PrEP) is a highly effective strategy for preventing HIV. However, prescription of PrEP has not reached the scale that is necessary to meet the public health need of reducing HIV incidence. A factor contributing to this slow scale-up is limited healthcare practitioners' knowledge of PrEP, making PrEP education a priority. We conducted a national, cross-sectional study of medical (allopathic and osteopathic) and pharmacy students regarding knowledge of PrEP and HIV between October 2020 and February 2021. We included 28 items in our knowledge assessment. Analysis sought to identify gaps in knowledge as well as academic and demographic correlates of knowledge. A total of 2,353 students participated in the study (response rate = 17.0%). The overall mean HIV knowledge score was 79.6% correct. Regarding specific items, 68.7% of participants believed HIV treatment was difficult because it required many pills, and 61.1% incorrectly identified that a person with an undetectable HIV viral load could transmit the virus to their sexual partners. Overall mean PrEP knowledge was 84.1%. Approximately one-third of participants did not identify HIV-negative status as a requirement to be a PrEP candidate. Gay/lesbian participants and those who were in the late-phase of training reported higher knowledge of both HIV and PrEP than did heterosexual participants and those in the early-phase of training. This study identifies specific gaps in training on HIV prevention with PrEP that must be improved in health professions education to ensure PrEP reaches its full potential in ending the HIV epidemic. © 2021 The Author(s)	HIV; Knowledge; Medical education; Pharmacy education; Pre-exposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Bunting S.R.; Garber S.S.; Goldstein R.H.; Calabrese S.K.; Ritchie T.D.; Batteson T.J.	Health Profession Students' Awareness, Knowledge, and Confidence Regarding Preexposure Prophylaxis: Results of a National, Multidisciplinary Survey	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001263	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096190143&doi=10.1097%2fOLQ.0000000000001263&partnerID=40&md5=3139b0dc716d3b0559f963b7a7eb3d2b	Background Preexposure prophylaxis (PrEP) is a highly effective, pharmacologic method of HIV prevention. Despite its safety and efficacy, PrEP prescription remains low in those patients who are at highest risk for HIV infection. One possible reason for this may be the lack of inclusion of PrEP and HIV prevention discussions within the curricula of health professions education. Methods An online survey was administered to a cross-sectional sample of future prescribers (osteopathic/allopathic medical and physician assistant students), future nurses, and future pharmacists (n = 2085) in the United States between January and July 2019 to assess and compare awareness of PrEP, PrEP education, PrEP knowledge, and confidence in 2 areas related to PrEP. Results We show that, overall, awareness of PrEP is high among future health care providers (81.6%), with the future pharmacists reporting the greatest awareness (92.2%; P < 0.001) and more commonly reporting PrEP education (71.0%). Students had mixed knowledge of PrEP, with future pharmacists reporting the highest knowledge of PrEP. Approximately 30% of students in all disciplines reported having low confidence counseling a patient about PrEP and low confidence educating a colleague about PrEP. Knowledge of PrEP was a significant predictor of confidence counseling a patient about PrEP (P < 0.001) and educating a colleague about PrEP (P < 0.001). Conclusions This study identifies opportunities to improve and incorporate evidence-based strategies for educating future health care providers about PrEP for HIV prevention within health professions curricula. © Lippincott Williams & Wilkins. Article	2021	Bunting, Samuel R; Calabrese, Sarah K; Garber, Sarah S; Ritchie, Timothy D; Batteson, Tamzin J	Where Do Health Professions Students Learn About Pre-exposure Prophylaxis (PrEP) for HIV Prevention?	Medical Science Educator	-	-	-	2156-8650	10.1007/s40670-021-01265-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8368481	HIV pre-exposure prophylaxis (PrEP) is critical for ending the HIV epidemic, and a necessary part of health professions education. We present data from a US survey study (N = 2085) about educational experiences (coursework and extracurricular), in which medical, physician assistant, nursing, and pharmacy students received training about HIV risk factors and PrEP. We found a discrepancy between the percentage of courses covering HIV risk factors (84.7%) compared to PrEP (54.6%) for all students (P < .001), and specifically among final-year students (92.0% vs. 59.7%; P < .001). Pharmacology courses were the most common exposure to PrEP (46.0%), and 61.3% of students were introduced to PrEP through an extracurricular experience. Health professions education must present HIV risk factors in conjunction with PrEP. Article	2021	Bunting, Samuel R; Feinstein, Brian A; Hazra, Aniruddha; Garber, Sarah S	Effects of Patient Sexual Orientation and Gender Identity on Medical Students' Decision Making Regarding Preexposure Prophylaxis for Human Immunodeficiency Virus Prevention: A Vignette-Based Study	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001488	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8595697	INTRODUCTION: Preexposure prophylaxis (PrEP) is a pillar of our national strategy to end the human immunodeficiency virus (HIV) epidemic. However, one of the largest obstacles to realizing the effectiveness of PrEP is expansion of prescription to all patients at risk for HIV. In this vignette-based study, we sought to investigate medical students' decision making regarding PrEP by presenting fictional patients, all of whom had HIV risk factors based on sexual behavior. METHODS: We systematically varied patients' sexual orientation or gender identity (heterosexual female, gay male, bisexual male, transgender male, transgender female, gender nonbinary person). We assessed the medical students' willingness to prescribe PrEP to the patients, as well as their perceptions of the patients' HIV risk and behavior. RESULTS: A total of 670 US medical students completed the study. The heterosexual female patient was least frequently identified as a PrEP candidate, was viewed as least likely to adhere to PrEP, and the most likely to engage in condomless sex if prescribed PrEP; however, was considered at lower overall HIV risk. Lower perceived HIV risk and anticipated PrEP adherence were both associated with lower willingness to prescribe PrEP. Willingness to prescribe PrEP was highest for the gay male patient and lowest for the heterosexual female. CONCLUSIONS: These analyses suggest that assumptions about epidemiological risk based on patients' gender identity or sexual orientation may reduce willingness to prescribe PrEP to heterosexual women, ultimately hindering uptake in this critical population. Article	2021	Burns, Paul A; Hall, Casey D Xavier; Poteat, Tonia; Mena, Leandro A; Wong, Frank Y	Living While Black, Gay, and Poor: The Association of Race, Neighborhood Structural Disadvantage, and PrEP Utilization Among a Sample of Black Men Who Have Sex With Men in the Deep South	AIDS Education and Prevention	-	-	-	1943-2755	10.1521/aeap.2021.33.5.395	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10134438	Utilizing the Andersen Healthcare Utilization Model, we examined the role of neighborhood context on pre-exposure prophylaxis (PrEP) utilization among a sample of Black men who have sex with men (MSM) residing in a medium-sized city in the Deep South. Data were derived from a sample of 142 Black MSM aged 18-64 years who were eligible for PrEP from a community-based study known as "ACCELERATE!" We used multilevel structural equation modeling to assess PrEP use. Social support, sexual risk, and health care access were predictive of PrEP use. Notably, residing in a neighborhood with concentrated poverty was associated with decreased PrEP use. Our findings reveal neighborhood structural disadvantage is associated with decreased PrEP use among Black MSM, after adjusting of individual-level sociodemographic characteristics. There is an urgent need to develop HIV prevention interventions and programs that explicitly address structural-level factors to eliminate racial/ethnic differences in HIV. Article	2021	Busza, Joanna; Phillips, Andrew N; Mushati, Phillis; Chiyaka, Tarisai; Magutshwa, Sitholubuhle; Musemburi, Sithembile; Cowan, Frances M	Understanding early uptake of PrEP by female sex workers in Zimbabwe.	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2020.1832192	https://dx.doi.org/10.1080/09540121.2020.1832192	Female sex workers (FSW) are prioritised for increased access to pre-exposure prophylaxis (PrEP), although rates of uptake remain sub-optimal, particularly across Southern Africa. In the first two years of its availability in Zimbabwe, 37.1% of FSW in trial sites initiated PrEP and received at least one re-supply. We conducted a qualitative study on perceptions of PrEP among 19 early users selected from sites with varying rates of PrEP initiation. Narrative interviews examined the pathways taken by FSW from hearing about PrEP, through their decision to start taking it, and early experiences. FSW appreciated PrEP's introduction within familiar and trusted "friendly" services tailored for sex workers and valued positive encouragement from clinic staff and peers over negative influence from family members. They also found PrEP difficult to understand at first, and feared side effects and rare adverse complications described in information leaflets. While FSW identified individual strategies for remembering to take their medication, they also relied on structured peer adherence support, leading some FSW to actively promote the method to other FSW as "PrEP champions". Information on how early users experience a new prevention technology such as PrEP can inform design of interventions that leverage existing support structures and target key barriers. Article	2021	Cabecinha M.; Solomon D.; Rait G.; Saunders J.; Mohammed H.; McDonagh L.K.	Equity considerations in outcome measures of the HIV pre-exposure prophylaxis care continuum in high-income countries: A systematic review protocol	BMJ Open	-	-	-	20446055	10.1136/bmjopen-2020-040701	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101029257&doi=10.1136%2fbmjopen-2020-040701&partnerID=40&md5=03e7d927377f6a66024bee63cc90b75a	Introduction HIV pre-exposure prophylaxis (PrEP) is an effective intervention to reduce acquisition of HIV. PrEP provision has increased in recent years, however, it is not known whether PrEP implementation has been equitably implemented across all risk groups, particularly groups experiencing high levels of health inequity. A PrEP care continuum (PCC) has been proposed to evaluate the success of PrEP implementation programmes, but the extent to which health equity characteristics are currently taken into account in the PCC has not been described. The objectives of this proposed systematic review are to (i) identify and collate outcome measure definitions for the main stages of the PCC (awareness, acceptability, uptake, adherence and retention), (ii) describe how equity characteristics are considered in outcome definitions of the PCC and (iii) describe data sources for capturing equity characteristics. Methods and analysis Quantitative studies published between 1 January 2012 and 3 March 2020 will be included. Five databases (MEDLINE, PubMed, Embase, Cumulative Index to Nursing and Allied Health Literature, Applied Social Sciences Index and Abstracts) will be searched to identify English language publications that include an outcome measure definition of at least one of the five main stages of the PCC. Risk of bias will be assessed using the Effective Public Health Practice Project Quality Assessment Tool for Quantitative Studies. Data on outcome measure definitions and equity characteristics will be extracted. Results will be presented in a narrative synthesis and all findings will be reported in accordance with the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines. Ethics and dissemination Ethical approval is not required. The results will be disseminated via submission for publication to a peer-reviewed journal when complete. The review findings will have relevance to healthcare professionals, policymakers and commissioners in informing how to best evaluate PrEP implementation programmes and inform new implementation strategies for vulnerable and less advantaged populations. Article	2021	Cabecinha, M; Solomon, D; Rait, G; Saunders, J; Mohammed, H	IDENTIFYING THE PREP GAP: A SYSTEMATIC REVIEW EXPLORING EQUITY IN THE HIV-PREP CARE CONTINUUM IN HIGH INCOME COUNTRIES	Sexually Transmitted Infections	-	-	-	1368-4973	10.1136/sextrans-2021-sti.277	https://sti.bmj.com/content/97/Suppl_1/A105.3	Background Equitable implementation of HIV Pre-Exposure Prophylaxis (PrEP) is not well defined, particularly for populations already experiencing high levels of health inequity (e.g. people experiencing poverty or other social disadvantages). The five stages of the PrEP care-continuum (PCC) (awareness, acceptability, uptake, adherence, retention) can help evaluate PrEP implementation, but the extent to which key characteristics that are important for health equity are considered throughout the PCC has not been described. This systematic review aims to: 1) identify and collate outcome measure (OM) definitions for the PCC stages; 2) describe how key health equity characteristics are considered in these OM definitions. Methods Five databases were searched for quantitative studies published after January 1st, 2012. Data regarding study design, OM definitions, and health equity characteristics were extracted. Data were analysed using narrative synthesis. Results 11,264 papers were identified and screened; 227 were included. The majority of studies included >1 OM (67%). The most commonly reported OM was awareness (54%), followed by interest (51%) and uptake (50%). Relatively few studies reported on adherence (12%) or retention (17%). No studies described movement through the PCC from awareness to retention. The most commonly reported equity characteristics were age (86%) and race/ethnicity (80%); the least common were social capital (31%) and religion (1%). The majority of studies focused on cis-gender men who have sex with men (MSM) (48%), while other affected groups, such as cis-gender women and trans* people are less well represented (7% and 6%, respectively). Conclusion There is an unequal focus on the earlier stages of the PCC. Some key equity characteristics (e.g. age) are commonly considered, however, other important characteristics (e.g. social capital) are overlooked. These findings are relevant to healthcare professionals, policymakers and commissioners in informing how to best implement and evaluate PrEP programmes for potentially vulnerable and less advantaged populations. Article	2021	Cain, Demetria; Samrock, Steven; Jones, S Scott; Jimenez, Ruben H; Dilones, Rafael; Tanney, Mary; Outlaw, Angulique; Friedman, Lawrence; Naar, Sylvie; Starks, Tyrel J	Marijuana and illicit drugs: Correlates of condomless anal sex among adolescent and emerging adult sexual minority men.	Addictive Behaviors	-	-	-	1873-6327	10.1016/j.addbeh.2021.107018	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9055980	The association between "illicit drugs" (e.g., cocaine/crack, methamphetamine, gamma-hydroxybutyrate-GHB, ketamine, and ecstasy) and condomless anal sex (CAS) with casual partners is well established for sexual minority men (SMM). Recent evidence from adult SMM has indicated that marijuana is associated with the occurrence of CAS with casual partners above and beyond illicit drug use. The purpose of the current study was to evaluate associations between CAS and the use of marijuana and illicit drugs in a sample of young SMM (aged 15-24). Participants (n = 578) completed an online survey assessing demographics, current PrEP prescription, age, marijuana use, as well as drug use and sexual behavior in the past 90 days. A hurdle model simultaneously predicted the occurrence of CAS as well as the frequency of CAS among those reporting it. Illicit drug use was associated with both the occurrence (OR = 2.26; p = .01) and frequency of CAS (RR = 1.63; p = .02). In contrast, marijuana use was associated with the occurrence (OR = 1.69; p = .01), but not the frequency of CAS (RR = 1.07; p = .74). Findings mirror recent observations in large samples of adult SMM. While the effect size of marijuana is more modest than illicit drug use, marijuana does have significant and unique associations with the occurrence of CAS. HIV prevention services for young SMM may therefore benefit from assessing and addressing marijuana use in the context of HIV sexual behavior. Article	2021	Calabrese S.K.; Lane S.B.; Caldwell A.; Kaplan C.; Dovidio J.F.; Galvao R.W.; Ogburn D.F.; Safon C.B.; Tekeste M.; Taggart T.; Modrakovic D.; Wilbourn B.C.; Blackstock O.; Kershaw T.S.	Electronic Dissemination of a Web-Based Video Promotes PrEP Contemplation and Conversation Among US Women Engaged in Care at Planned Parenthood	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03210-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102507285&doi=10.1007%2fs10461-021-03210-2&partnerID=40&md5=3f379bb63092c6a17407596a7f451875	We evaluated the acceptability and impact of a web-based PrEP educational video among women (n = 126) by comparing two Planned Parenthood centers: one assigned to a Web Video Condition and one to a Standard Condition. Most women reported the video helped them better understand what PrEP is (92%), how PrEP works (93%), and how to take PrEP (92%). One month post-intervention, more women in the Web Video Condition reported a high level of comfort discussing PrEP with a provider (82% vs. 48%) and commonly thinking about PrEP (36% vs. 4%). No women with linked medical records initiated PrEP during 1-year follow-up. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Theses and Dissertations	2021	Calabrese, Christopher	Leveraging Online Social Networks for the Adoption of HIV Pre-Exposure Prophylaxis	-	-	University of California	-	NA	NA	https://escholarship.org/uc/item/7n14h3nx	Online social networks have the potential to influence individuals' health, from providing information to influencing beliefs and behaviors. They provide key differences from offline social networks, including the ability to maintain anonymity and make new connections in online support groups. It is important to develop an understanding on how online networks can be leveraged to influence health outcomes. The promotion of HIV pre-exposure prophylaxis (PrEP), which refers to taking a daily oral medicine to reduce the risk of contracting HIV, may benefit from the potential effects and mechanisms that online networks possess. This dissertation consists of two comprehensive studies that examine the role of online networks for PrEP adoption. The first study involves a quantitative content analysis using a theoretically grounded framework to examine Twitter discussions surrounding PrEP from April 2019 to April 2020, six months before and after the approval of Descovy for PrEP. The contents, sources, and sentiments and emotions expressed in tweets were examined. Through the lens of the Theory of Planned Behavior (TPB), I extract the beliefs and barriers that are related to PrEP adoption behaviors. Results indicate, after the approval of Descovy, there was a significant decrease in tweets on barriers to PrEP, specifically relating to access. In addition, there was a significant increase in positive emotions expressed by users. However, the lack of tweets that involve attitudes, norms, and behavioral control prompt a need for future work in addressing these beliefs when promoting the uptake of PrEP. Implications on developing message strategies are discussed. The second study involves an online, one-week network intervention employed through a mobile app. This field experiment randomly assigned participants into a social support condition or information-only control, where participants are placed into homophilous, small online groups. Both conditions involved an information component consisting of messages, guided by TPB, aimed at addressing knowledge, beliefs, and barriers related to PrEP adoption. Social support was operationalized through an online chatting tool where participants can discuss topics surrounding PrEP. Results indicate that the intervention overall increased participants' familiarity with PrEP, as well as their knowledge of how much consistent use of PrEP reduces the likelihood of HIV acquisition. Further, the intervention increased participants' intentions and attitudes toward taking PrEP, such that users had higher intentions and more positive views toward starting PrEP after the mobile app intervention compared to their baseline intentions and attitudes. Overall, these studies illuminate the potential capabilities of online networks to promote positive health behaviors. Assessing online discourse surrounding a health topic may be particularly useful for pinpointing the relevant beliefs and barriers associated with a health behavior. Through both disseminating theoretically driven, tailored messaging…	Communication; Public health; online networks; pre-exposure prophylaxis; social networks	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Mixed methods

Antimicrobial Agents and Chemotherapy	-	-	-	1098-6596	10.1128/AAC.01902-20	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7927807	Four pre-exposure prophylaxis (PrEP) users with gastro-intestinal disorders (sleeve gastrectomy, terminal ileitis, celiac disease or chronic diarrhea) and receiving oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) were included. Despite a self-reported high adherence, trough plasma tenofovir concentrations (after a supervised intake) were significantly lower than those observed in PrEP recipients without gastrointestinal disorders 21 (±9.1) vs. 138 (±85) ng/mL. PrEP users with gastrointestinal disorders may need increased TDF doses or alternative prophylactic measures.	tenofovir disoproxil fumarate, malabsorption, sleeve gastrectomy, PrEP, HIV, absorption, gastrointestinal, pharmacokinetics, tenofovir	English	United States	Western and Central Europe and North America	Italy	Western and Central Europe and North America	Italy	Western and Central Europe and North America	Clinical
Article	2021	Cambou M.C.; Landovitz R.J.	Challenges and Opportunities for Preexposure Prophylaxis	Topics in Antiviral Medicine	-	-	-	21615861	NA	https://pubmed.ncbi.nlm.nih.gov/34856093/	Despite major advances in the HIV prevention toolbox in the past decade, there remain substantial social, economic, and structural barriers to access to preexposure prophylaxis (PrEP) that prevent a universal, population-level reduction in HIV incidence. Daily oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) has been the flagship PrEP regimen, and data support a pericoital/on-demand "2-1-1" dosing schedule for men who have sex with men. Daily oral PrEP with tenofovir alafenamide combined with emtricitabine (TAF/FTC) was approved by the US Food and Drug Administration (FDA) in 2019 for all routes of exposure other than vaginal exposures. The effectiveness of daily oral TDF/FTC has not been consistent in cisgender women outside of serodifferent couples, likely owing to differences in vaginal tissue penetration of PrEP agents resulting in less "forgiveness" of nonadherence. These observations have highlighted the need for additional choices of HIV prevention strategies. Injectable long-acting cabotegravir was recently shown to be superior to daily oral TDF/FTC across risk populations. PrEP studies of islatravir are underway for a monthly oral formulation and a drug-eluting subdermal implant. Lenacapavir, with a novel mechanism of action, is under investigation as a subcutaneous injection at 6-month intervals. © 2021, IAS-USA. Article	2021	Camp, Christina; Saberi, Parya	Facilitators and barriers of 2-1-1 HIV pre-exposure prophylaxis.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0251917	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8136636	An alternative strategy for men who have sex with men (MSM) experiencing challenges with daily HIV pre-exposure prophylaxis (PrEP) includes 2-1-1 dosing. Understanding 2-1-1 PrEP facilitators and barriers, especially during the SARS-CoV-2 pandemic, may guide researchers and healthcare providers in future studies and clinical preparedness. We conducted a national cross-sectional study of MSM in the US who had taken 2-1-1 PrEP to examine facilitators and barriers of this on-demand PrEP dosing option. With the shelter-in-place orders in March 2020, this study was adapted to include questions on how the SARS-CoV-2 pandemic affected participants' PrEP use. A total of 140 individuals participated in the survey, 106 of which completed questions pertaining to the SARS-CoV-2 pandemic. The most common reasons for switching from once-daily to 2-1-1 PrEP included having sex less frequently (63.6%) and wanting to take fewer pills (46.4%). Participants reported high medication adherence based on each component of 2-1-1 PrEP dosing (>84%). The most common barriers with 2-1-1 PrEP dosing included unplanned sexual encounters resulting in missing the double-dose pre-sex (43.6%) and trouble remembering doses post-sex (29.3%). Facilitators of the 2-1-1 PrEP dosing strategy included reductions in sexual encounters (63.6%), preference to take fewer pills (46.4%), need to reduce cost (22.1%), and desire to reduce side effects (19.3%). Challenges to receiving PrEP services during the pandemic included obtaining laboratory testing (25.5%) and PrEP refills (either receipt of a refill authorization from a healthcare provider or processing of a refill from the pharmacy) (18.9%). 2-1-1 PrEP is an effective HIV prevention method; therefore, understanding facilitators and barriers of this dosing strategy can result in continuous provision of HIV prevention efforts, particularly during a pandemic. Article	2021	Canetti, Diana; Spagnuolo, Vincenzo	An evaluation of cabotegravir for HIV treatment and prevention.	Expert Opinion on Pharmacotherapy	-	-	-	1744-7666	10.1080/14656566.2020.1843635	https://dx.doi.org/10.1080/14656566.2020.1843635	Introduction: Oral pre-exposure prophylaxis (PrEP) and antiretroviral therapy (ART) represent the cornerstones of HIV infection prevention and treatment. However, despite their high efficacy, the need to take daily oral pill(s) negatively impacts long-term patient adherence. In some cases, it can also be associated with drug-drug interactions and adverse gastrointestinal effects, as well as being a constant reminder to individuals of their HIV status. The availability of long-acting non-orally administered antiretroviral drugs could, therefore, be extremely useful. Cabotegravir (CAB) is a second-generation integrase strand transfer inhibitor, characterized by a relatively high genetic barrier and good antiretroviral potency, which is administrable as a long-acting injectable suspension (LAI CAB).Areas covered: The authors present and discuss the efficacy and available safety data of LAI CAB, either when co-administered with rilpivirine (RPV; LAI CAB + RPV) for the treatment of HIV infection, or when used as single agent for HIV PrEP.Expert opinion: Cabotegravir has the potential to play a primary role in the treatment and prevention of HIV infection. The future availability of LAI CAB + RPV and LAI CAB may mark the beginning of an era of LAI ART and PrEP, respectively. Article	2021	Cannon S.M.; Graber S.; King H.L.; Hanashiro M.; Averbach S.; Moore D.J.; Blumenthal J.	PrEP University: A Multi-Disciplinary University-Based HIV Prevention Education Program	Journal of Community Health	-	-	-	945145	10.1007/s10900-021-01007-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107399529&doi=10.1007%2fs10900-021-01007-x&partnerID=40&md5=5e9485d52602ef5c5cde54fcdde04d82	The introduction of emtricitabine/tenofovir diphosphate (FTC/TDF) as pre-exposure prophylaxis (PrEP) for HIV prevention has raised questions regarding which clinicians will serve as prescribers and how providers will be educated about this HIV prevention strategy. We piloted an HIV Prevention Education Program called PrEP University (PrEP U) to address knowledge gaps in HIV prevention among medical trainees. We examined PrEP awareness and assessed learning as a result of the program, measuring knowledge before and after the lectures with an anonymous 5-question multiple choice test. A total of 198 learners participated in PrEP University, which included 127 first year medical students, and post-graduate trainees in internal medicine (n = 23), family medicine (n = 16), OBGYN (n = 13) and pharmacy (n = 19). Prior to PrEP U, 27% of all participants were not aware of PrEP and an additional 8% were unsure if they had heard of it before. Knowledge increased significantly after the education program among trainees in OBGYN (2.3 vs 3.8, p < 0.001), pharmacy (1.4 vs 2.5, p = 0.012) and school of medicine (3.3 vs 4.4, p < 0.001), with a trend seen in family medicine (2.7 vs. 3.7, p = 0.067) and internal medicine (2.7 vs 3.4, p = 0.068). Overall, an HIV Prevention Education Program was successfully administered to nearly 200 participants and resulted in improved knowledge of HIV prevention and PrEP across. Pharmacists and OBGYN physicians are two groups with an expanding role in the use of PrEP. Similar programs at other medical schools should be implemented to ensure that future physicians and pharmacists are comfortable with PrEP prescription. © 2021, The Author(s). Article	2021	Cao W.; You X.; Li J.; Peng L.; Gu J.; Hao C.; Hou F.; Wei D.; Deng Y.; Hao Y.; Mo P.K.-H.	Same-sex behavior disclosure to health care providers associated with greater awareness of pre-exposure prophylaxis	BMC Public Health	-	-	-	14712458	10.1186/s12889-021-12317-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121005107&doi=10.1186%2fs12889-021-12317-z&partnerID=40&md5=56c7fafcaf0a08a52bd911fa888a0b7a	Background: This study aimed to determine whether the disclosure of same-sex behavior to health care providers (HCPs) is associated with higher rates of prior human immunodeficiency virus (HIV) testing experience and greater awareness of immediate antiretroviral therapy (ART), Undetectable = Untransmittable (U=U), and pre-exposure prophylaxis (PrEP) among men who have sex with men (MSM). Methods: We conducted a cross-sectional survey among 689 adult males in Chengdu, China who self-reported having had anal intercourse with at least one man in the past 6 months. We measured same-sex behavior disclosure to three types of HCPs (hospital clinicians, community-based organization peer educators, and Center for Disease Control and Prevention public health specialists), and the awareness of immediate ART, U=U, and PrEP. Results: Of the 689 enrolled participants, 31.4% had disclosed their same-sex behavior to some or all of the clinicians, 83.9% had done so to the peer educators, and 56.8% had done so to the public health specialists. Approximately four in five (82.1%) of the participants had ever been tested for HIV. The awareness rate was 84.8% for immediate ART, 20.2% for U=U, and 50.7% for PrEP. After controlling for significant background variables, same-sex behavior disclosure to clinicians was associated with greater awareness of PrEP (adjusted odds ratio AOR = 1.64; 95% confidence interval CI: 1.08–2.48), but similar findings were not reported regarding disclosure to peer educators or public health specialist. Same-sex behavior disclosure to any types of HCPs was not associated with HIV testing experience, and awareness of immediate ART or U=U. Conclusions: The rates of same-sex behavior disclosure varied with different types of HCPs. Disclosure to clinicians was associated with greater awareness of PrEP, but not awareness of immediate ART or U=U. © 2021, The Author(s). Article	2021	Caplon, Amy; Alexander, Kamila A; Kershaw, Trace; Willie, Tiara C	Assessing Provider-, Clinic-, and Structural-Level Barriers and Recommendations to Pre-Exposure Prophylaxis (PrEP) Uptake: A Qualitative Investigation Among Women Experiencing Intimate Partner Violence, Intimate Partner Violence Service Providers, and Healthcare Providers.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03297-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8419149	Intimate partner violence (IPV) relates to HIV susceptibility and acquisition. Existing research examined barriers to pre-exposure prophylaxis (PrEP) uptake among women but few studies assess uptake and delivery among IPV service providers, along with provider-, clinic-, and structural-level barriers. We conducted 34 semi-structured interviews with PrEP-eligible cisgender heterosexual women experiencing IPV, Reproductive Health providers, PrEP providers, and IPV service providers in Northeast US. Systems theory was used to examine barriers from individuals who either work closely with or are part of the population. The framework method was used to draw descriptive and explanatory conclusions. Findings suggest limited knowledge for Reproductive Health and IPV Service Providers. Providers often did not feel equipped to discussed PrEP in visits or focused efforts solely on safety. Expanding PrEP awareness is necessary and marketing should include women. Future research should investigate how providers can work collaboratively across sectors to ensure women receive comprehensive trauma-informed care.	intimate partner violence, pre-exposure prophylaxis, Providers, Barriers, HIV, women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Carneiro, Pedro B; Rincon, Christopher; Golub, Sarit	Predictors of Event-Driven Regimen Choice in Current PrEP Users and Sexual Behavior Characteristics of MSM Receiving Sexual Health Services in New York City.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03203-1	https://dx.doi.org/10.1007/s10461-021-03203-1	While daily PrEP is undeniably effective, broad-based adoption remains low. Non-daily PrEP modalities, like event-driven PrEP (ED PrEP), offer an efficient way to deliver PrEP's protection to priority populations. We carried out an at-home survey with patients receiving sexual health services in a LGBTQ-clinic in New York (n = 147). Participants answered questions on ED PrEP awareness and preferences, sexual behavior, and sexual preparatory practices. Only 50% of our sample were aware of ED PrEP, about 30% met eligibility for ED PrEP, and 35% chose ED PrEP as a good HIV prevention option for them. In a robust Poisson model (n = 128), endorsement of ED PrEP as a good prevention choice was significantly more common in participants who were uninsured, preferred taking PrEP only when needed, and those who had concerns about side-effects. Furthermore, participants reported many sexual behaviors patterns and preparatory practices compatible with use of ED PrEP. Article	2021	Carneiro, Pedro B; Westmoreland, Drew A; Patel, Viraj V; Grov, Christian	Factors Associated with Being PrEP-Naïve Among a U.S. National Cohort of Former-PrEP and PrEP-Naïve Participants Meeting Objective Criteria for PrEP Care.	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-020-01791-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7881054	There is an urgent need to increase uptake and persistence in HIV pre-exposure prophylaxis (PrEP) in PrEP-eligible candidates. Little is known about the similarities and differences between groups of PrEP-naïve and former users, an important consideration for future interventions. We explored factors associated with being PrEP-naïve in a U.S. national cohort of naïve and former-PrEP users, all of whom met objective criteria for PrEP care at enrollment. Data were derived from the Together 5000 cohort study, an Internet-based U.S. national cohort of cisgender and trans men and trans women who have sex with men. Participants were recruited via ads on men-for-men geosocial networking apps. All participants were not on PrEP at the time of enrollment. We conducted bivariate analysis to explore differences between the two groups and used multivariable logistic regression to assess factors associated with being PrEP-naïve. Of the 6283 participants, 5383 (85.7%) were PrEP-naïve and 900 (14.3%) were former-PrEP users. There were significant differences between PrEP-naïve and former-PrEP users across multiple demographic variables, in addition to PrEP-related and psychosocial variables. Factors associated with being PrEP-naïve included younger age, sexual identity other than gay/queer, lower perception of candidacy for PrEP care, less willingness to take PrEP, lower access to PrEP care, and individual-level barriers such as health- and provider-related concerns. Programs and policies designed to address uptake and persistence of PrEP should be aware of these differences. Providing care in non-traditional LGBTQ-care settings, home-based PrEP interventions, and provision by healthcare providers other than physicians could improve uptake. Future research should investigate mechanisms that can improve uptake and persistence in communities in need of PrEP. Article	2021	Carter G.; Meyerson B.; Rivers P.; Crosby R.; Lawrence C.; Cope S.D.; DeBruicker D.; Levin S.; Meeks W.; Thomas C.; Turner B.; Abert C.; Coles H.; Allen A.; Gonzalez-Fagoaga E.; Grivois-Shah R.	Living at the Confluence of Stigmas: PrEP Awareness and Feasibility Among People Who Inject Drugs in Two Predominantly Rural States	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03304-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106014311&doi=10.1007%2fs10461-021-03304-x&partnerID=40&md5=d6e2b6b29d6c9a2ce4f4cc0d8e963892	We explored knowledge, beliefs, and acceptability of pre-exposure prophylaxis (PrEP) for HIV prevention with reference to stigma among people who inject drugs (PWID) in two predominately rural U.S. states. We conducted interviews with 65 current or former PWID aged 18 years or older and living in Arizona or Indiana. Most (63%) of the interviewees were not aware of PrEP. They often confused PrEP with HIV treatment, and many believed that PrEP was only for sexual risk or gay sexual risk. Once they understood that PrEP was recommended for PWID, the participants held a positive view of PrEP and felt that a once-daily pill was feasible. Experiences of stigma about drug use remained a crucial barrier to accessing healthcare and PrEP. This was often linked with anticipated or expressed homophobia. PrEP interventions among PWID must focus on education and the confluence of stigmas in which PWID find themselves when considering PrEP. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Theses and Dissertations	2021	Casas, Christian	The systemic and interpersonal barriers to HIV PrEP access among Black and Latinx transgender men and women: a qualitative study	-	-	Boston University	-	NA	NA	http://hdl.handle.net/2144/43367	There is limited data regarding human immunodeficiency virus (HIV) prevalence among transgender individuals. Further complicating the absence of knowledge, transgender women are often conflated with men who have sex with men (MSM). Approximately half of transgender men and women who live with HIV are from the Southern region of the United States (US). While transgender women are more likely to contract HIV compared to transgender men, approximately two-thirds of transgender individuals have not tested for HIV, likely leading to underreporting. Among the 14% of transgender women diagnosed with HIV/AIDS in the US, 44% are Black, (despite representing only 25% of the population in the US), and 26% are Latinx, which is four times the prevalence rate of White transgender women (7%). Pre-exposure prophylaxis (PrEP) is an HIV prevention method in which individuals at risk for HIV can take a daily pill to reduce the risk of contracting HIV. Previous PrEP research has been conducted among transgender women and men, Black and Latinx MSM, and cisgender women. However, there is limited research on barriers to PrEP adoption among Black or Latinx transgender women and men. This study aims to evaluate barriers to PrEP interest and adoption to better address issues faced by Black and Latinx transgender men and women. A meta-analysis of HIV prevalence among transgender women identified a need for HIV prevention as transgender women are at high risk for HIV. In a study with a sample of 233 transgender women in the US, only 13.7% were aware of PrEP (Wilson et al., 2016). Among studies including Black and Latinx transgender women, barriers to PrEP adoption included: medical mistrust, lack of knowledge (e.g., side effects), PrEP stigma among community members and doctors, perceived/actual discrimination regarding having sex with men by providers and advertisements, concerns regarding interactions with hormone therapy, and objections by romantic partners. Social support following PrEP use disclosure is associated with greater self-esteem for one's transgender identity and greater likelihood of PrEP use. Among black and Latinx trans men, barriers to PrEP included lack of support from family and discrimination. Other barriers that Black and Latinx cisgender women face, which may be applicable to Black or Latinx transgender women and men, are lower educational attainment, income, decreased access to healthcare services, medical mistrust, language barriers, racial bias from medical providers, and lack of social support. Awareness of PrEP has been lower among those who are less educated and whose primary care providers are unaware that they have sex with men. One study showed that those with lower income and less than a high school education were associated with poorer medication adherence and greater risk of death even when controlling for HIV treatment. In another study examining potential barriers to PrEP acceptability and adherence, efficacy and side effects were notable barriers to PrEP initiation among 78% of MSM and transgender women…	Medicine	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Qualitative
Article	2021	Celum, Connie; Hosek, Sybil; Tsholwana, Mandisa; Kassim, Sheetal; Mukaka, Shorai; Dye, Bonnie J; Pathak, Subash; Mgodi, Nyaradzo; Bekker, Linda-Gail; Donnell, Deborah J; Wilson, Ethan; Yuha, Krista; Anderson, Peter L; Agyei, Yaw; Noble, Heather; Rose, Scott M; Baeten, Jared M; Fogel, Jessica M; Adeyeye, Adeola; Wiesner, Lubbe; Rooney, James; Delany-Moretlwe, Sinead	PrEP uptake, persistence, adherence, and effect of retrospective drug level feedback on PrEP adherence among young women in southern Africa: Results from HPTN 082, a randomized controlled trial	PLOS Medicine	-	-	-	1549-1676	10.1371/journal.pmed.1003670	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8253429	BACKGROUND: Pre-exposure prophylaxis (PrEP) is highly effective and an important prevention tool for African adolescent girls and young women (AGYW), but adherence and persistence are challenging. PrEP adherence support strategies for African AGYW were studied in an implementation study. METHODS AND FINDINGS: HIV Prevention Trials Network (HPTN) 082 was conducted in Cape Town, Johannesburg (South Africa) and Harare (Zimbabwe) from October 2016 to October 2018 to evaluate PrEP uptake, persistence, and the effect of drug level feedback on adherence. Sexually active HIV-negative women ages 16-25 were offered PrEP and followed for 12 months; women who accepted PrEP were randomized to standard adherence support (counseling, 2-way SMS, and adherence clubs) or enhanced adherence support with adherence feedback from intracellular tenofovir-diphosphate (TFV-DP) levels in dried blood spots (DBS). PrEP uptake, persistence through 12 months (no PrEP hold or missed visits), and adherence were assessed. The primary outcome was high adherence (TFV-DP ≥700 fmol/punch) at 6 months, compared by study arm. Of 451 women enrolled, median age was 21 years, and 39% had curable sexually transmitted infections (STIs). Most (95%) started PrEP, of whom 55% had uninterrupted PrEP refills through 12 months. Of those with DBS, 84% had detectable TFV-DP levels at month 3, 57% at month 6, and 31% at month 12. At 6 months, 36/179 (21%) of AGYW in the enhanced arm had high adherence and 40/184 (22%) in the standard adherence support arm (adjusted odds ratio OR of 0.92; 95% confidence interval CI 0.55, 1.34; p = 0.76). Four women acquired HIV (incidence 1.0/100 person-years), with low or undetectable TFV-DP levels at or prior to seroconversion, and none of whom had tenofovir or emtricitabine resistance mutations. The study had limited power to detect a modest effect of drug level feedback on adherence, and there was limited awareness of PrEP at the time the study was conducted. CONCLUSIONS: In this study, PrEP initiation was high, over half of study participants persisted with PrEP through month 12, and the majority of young African women had detectable TFV-DP levels through month 6 with one-fifth having high adherence. Drug level feedback in the first 3 months of PrEP use did not increase the proportion with high adherence at month 6. HIV incidence was 1% in this cohort with 39% prevalence of curable STIs and moderate PrEP adherence. Strategies to support PrEP use and less adherence-dependent formulations are needed for this population. TRIAL REGISTRATION: ClinicalTrials.gov NCT02732730. Article	2021	Cernasev, Alina; Walker, Crystal; Armstrong, Drew; Golden, Jay	Changing the PrEP Narrative: A Call to Action to Increase PrEP Uptake among Women	Women (Basel, Switzerland)	-	-	-	2673-4184	10.3390/women1020011	https://www.mdpi.com/2673-4184/1/2/11	Although the incidence of new cases of human immunodeficiency virus (HIV) has decreased in the past decade, in 2018 more than 7000 women with HIV were diagnosed in the United States (US). Globally, per recent reports, 48% of the new HIV infections were among women. There is still no vaccine to prevent HIV transmission. However, pre-exposure prophylaxis (PrEP) was approved in 2012 by the Food and Drug Administration, providing a powerful tool to block HIV infection and help prevent the subsequent development of acquired immunodeficiency syndrome (AIDS). The uptake of PrEP has been slow globally and among the most vulnerable populations in the US, even though the Centers for Disease Control (CDC) recommended its use in high-risk populations, including women. Furthermore, women represent one-quarter of people living with HIV in the US; however, PrEP is underutilized in this group. Thus, it is imperative to make women's voices heard through conducting more research, ensuring sufficient access to PrEP, and enhancing knowledge about PrEP as a viable prevention strategy for women. This article aims to promote women's health by changing the narrative, providing key information on empowering women, and increasing the usage of PrEP. Article	2021	Chai, Peter R; Bustamante, Maria J; Goodman, Georgia; Mohamed, Yassir; Najarro, Jesse; Sullivan, Matthew C; Castillo-Mancilla, Jose; Coyle, Ryan P; Mayer, Kenneth H; Rosen, Rochelle K; Baumgartner, Susan L; Alpert, Pamela E; Boyer, Edward W; O'Cleirigh, Conall	A Brief Training Program to Support the Use of a Digital Pill System for Medication Adherence: Pilot Descriptive Study.	JMIR Formative Research	-	-	-	2561-326X	10.2196/26213	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8105755	BACKGROUND: Digital pill systems (DPSs), which comprise ingestible radiofrequency sensors integrated into a gelatin capsule that overencapsulates a medication, can directly measure ingestion events. OBJECTIVE: Teaching users to operate a DPS is vital to ensure the collection of actionable ingestion and adherence data. In this study, we aim to develop and pilot a training program, grounded in the Technology Acceptance Model, to instruct individuals on DPS operation. METHODS: A two-part training program, comprising in-person and text message-based components, was used with HIV-negative men who have sex with men with nonalcohol substance use, who had enrolled in a 90-day pilot demonstration study using the DPS to measure adherence to pre-exposure prophylaxis. We assessed the number of responses to text check-ins, the number and types of episodes where technical support was requested, the resolutions of such issues, and engagement with the program over the study period. Participant feedback on the program was evaluated through qualitative user experience interviews. RESULTS: A total of 15 participants were enrolled in and completed the program. Seven technical challenges related to DPS operations were reported across 5 participants. Most commonly, participants requested support connecting the wearable Reader device with their smartphone, charging the Reader, and operating the mobile app. A total of 6 issues were resolved asynchronously or in real time via phone; 1 required in-person evaluation and resolution. Preliminary qualitative findings indicate that both the in-person and remote follow-up components of the training program were perceived as acceptable. Suggested improvements included repeated DPS refresher sessions at in-person follow-up visits and enhanced written materials for the independent resolution of technological issues. CONCLUSIONS: A brief two-part DPS training program, drawing from individuals' experiences and from the Technology Acceptance Model, can provide valuable insights for users. The program also identifies and addresses several areas of actual or potential challenges related to operating a DPS and allows for the resolution of such issues within the first week of DPS use.	digital pill system, technology training, HIV prevention, PrEP, ingestible sensors, mobile phone	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Chai, Peter R; Goodman, Georgia; Bustamante, Majo; Mendez, Lizette; Mohamed, Yassir; Mayer, Kenneth H; Boyer, Edward W; Rosen, Rochelle K; O'Cleirigh, Conall	Design and Delivery of Real-Time Adherence Data to Men Who Have Sex with Men Using Antiretroviral Pre-exposure Prophylaxis via an Ingestible Electronic Sensor.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03082-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8084862	Once daily tenofovir/emtricitabine when used for pre-exposure prophylaxis (PrEP) is effective in preventing HIV acquisition but requires consistent medication adherence. The use of ingestible technologies to monitor PrEP adherence can assist in understanding the impact of behavioral interventions. Digital pill systems (DPS) utilize an ingestible radiofrequency emitter integrated onto a gelatin capsule, which permits direct, real-time measurement of medication adherence. DPS monitoring may lead to discovery of nascent episodes of PrEP nonadherence and allow delivery of interventions that prevent the onset of sustained nonadherence. Yet, the acceptance and potential use of DPS in high-risk men who have sex with men (MSM; i.e., those who engage in condomless sex and use substances) is unknown. In this investigation, we conducted individual, semi-structured qualitative interviews with 30 MSM with self-reported non-alcohol substance use to understand their responses to the DPS, willingness and perceived barriers to its use, and their perceptions of its potential utility. We also sought to describe how MSM would potentially interact with a messaging system integrated into the DPS. We identified major themes around improved confidence of PrEP adherence patterns, safety of ingestible radiofrequency sensors, and design optimization of the DPS. They also expressed willingness to interact with messaging contingent on DPS recorded ingestion patterns. These data demonstrate that MSM who use substances find the DPS to be an acceptable method to measure and record PrEP adherence. Article	2021	Chakrapani V.; Shaikh S.; Arumugam V.; Chawla U.; Mehta S.	Factors Influencing Willingness to Use Human Immunodeficiency Virus Preexposure Prophylaxis among Transgender Women in India	Transgender Health	-	-	-	2380193X	10.1089/trgh.2019.0076	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104629176&doi=10.1089%2ftrgh.2019.0076&partnerID=40&md5=2bbf900409f7d7bfa8a08ae5a0fabfa4	Purpose: High levels of human immunodeficiency virus (HIV) prevalence and inconsistent condom use among transgender women in India highlight the need for additional effective HIV prevention methods like preexposure prophylaxis (PrEP). We examined the extent of and factors influencing willingness to use PrEP among trans women in India. Methods: Between June and August 2017, we conducted a cross-sectional survey among 360 trans women recruited through community-based organizations in six cities. We assessed PrEP knowledge, condom use, attitudes toward PrEP (after providing information on PrEP), preferences in PrEP pricing and access venues, discrimination experiences, and the likelihood of using PrEP. Logistic regression analyses were conducted. Results: Participants' median age was 26 years; 50.7% had not completed high school, and 24.8% engaged in sex work. Only 17.1% reported having heard of PrEP before the survey, and 80.6% reported that they would definitely use PrEP. Trans women in sex work had 28 times higher odds of reporting willingness to use PrEP than those not in sex work (adjusted odds ratio aOR=28.9, 95% confidence interval CI=8.79-95.16, p<0.001). When compared with trans women who did not experience discrimination, the odds of reporting willingness to use PrEP was lower among trans women who had experienced discrimination from health care providers (aOR=0.25, 95% CI=0.06-0.97, p=0.04) and family members (aOR=0.08, 95% CI=0.05-0.14, p<0.001). Conclusion: Willingness to use PrEP was high among trans women, especially those in sex work, despite identified barriers (e.g., discrimination experiences). To promote PrEP uptake among at-risk trans women, the steps needed are as follows: increasing awareness about PrEP; providing easy-to-understand information on PrEP's effectiveness, side effects and interactions between PrEP and hormones; training health care providers on PrEP and cultural competency; and reducing stigmas related to PrEP use and HIV. PrEP implementation research projects to identify effective PrEP delivery strategies are urgently needed to reduce the disproportionate HIV burden among trans women in India. © Copyright 2021, Mary Ann Liebert, Inc. Article	2021	Chakrapani, Venkatesan; Newman, Peter A; Cameron, Michael; Shunmugam, Murali; Roungprakhon, Surachet; Rawat, Shruta; Baruah, Dicky; Nelson, Ruban; Tepjan, Suchon; Scarpa, Riccardo	Willingness to Use Pre-exposure Prophylaxis (PrEP) and Preferences Among Men Who have Sex with Men in Mumbai and Chennai, India: A Discrete Choice Experiment.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03253-5	https://dx.doi.org/10.1007/s10461-021-03253-5	Pre-exposure prophylaxis (PrEP) programs are planned for key populations in India. We examined PrEP awareness and willingness to use PrEP in order to support products and services for MSM. From December 2016 to March 2017, we conducted a survey and discrete choice experiment (DCE)-a technique to quantify the strength of participants' trade-off preferences among various product attributes-to assess willingness to use PrEP and related preferences. MSM were recruited from cruising sites and HIV prevention services in Mumbai and Chennai. DCE data were analyzed using mixed logit regression models and estimated marginal willingness-to-pay, the relative importance of attributes, and participants' place on different PrEP attributes. Overall, 76.6% indicated willingness to use PrEP. Efficacy had the greatest effect on choice (high vs. moderate, aOR = 19.9; 95% CI 13.0-30.4), followed by dosing frequency (intermittent vs. daily regimen, aOR = 2.02; 95% CI 1.8-2.2). Participants preferred no (vs. minor) side-effects, subsidized (vs. market) price, and government (vs. private) hospitals. Findings suggest that educational and social marketing interventions should emphasize PrEP's high efficacy and minimal side effects, and programs should provide government-subsidized PrEP with choices of intermittent or daily dosing delivered by government and private hospitals/clinics in order to optimize PrEP uptake among MSM in India. Article	2021	Chan C.T.; Vo M.; Carlson J.; Lee T.; Chang M.; Hart-Cooper G.	Pediatric Provider Utilization of a Clinical Decision Support Alert and Association with HIV Pre-exposure Prophylaxis Prescription Rates	Applied Clinical Informatics	-	-	-	18690327	10.1055/s-0041-1740484	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123432575&doi=10.1055%2fs-0041-1740484&partnerID=40&md5=3ea5eb08490a727dbcd69de96962b16	Objectives An electronic clinical decision support (CDS) alert can provide real-time provider support to offer pre-exposure prophylaxis (PrEP) to youth at risk for human immunodeficiency virus (HIV). The purpose of this study was to evaluate provider utilization of a PrEP CDS alert in a large academic-community pediatric network and assess the association of the alert with PrEP prescribing rates. Methods HIV test orders were altered for patients 13 years and older to include a hard-stop prompt asking if the patient would benefit from PrEP. If providers answered Yes or Not Sure, the CDS alert launched with options to open a standardized order set, refer to an internal PrEP specialist, and/or receive an education module. We analyzed provider utilization using a frequency analysis. The rate of new PrEP prescriptions for 1 year after CDS alert implementation was compared with the year prior using Fisher's exact test. Results Of the 56 providers exposed to the CDS alert, 70% (n = 39) responded Not sure to the alert prompt asking if their patient would benefit from PrEP, and 54% (n = 30) chose at least one clinical support tool. The PrEP prescribing rate increased from 2.3 prescriptions per 10,000 patients to 6.6 prescriptions per 10,000 patients in the year post-intervention (p = 0.02). Conclusion Our findings suggest a knowledge gap among pediatric providers in identifying patients who would benefit from PrEP. A hard-stop prompt within an HIV test order that offers CDS and provider education might be an effective tool to increase PrEP prescribing among pediatric providers. © 2022 Georg Thieme Verlag. Article	2021	Chan M.-P.S.; Morales A.; Zlotorzynska M.; Sullivan P.; Sanchez T.; Zhai C.; Albarracin D.	Estimating the influence of Twitter on pre-exposure prophylaxis use and HIV testing as a function of rates of men who have sex with men in the United States	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002838	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105772345&doi=10.1097%2fQAD.0000000000002838&partnerID=40&md5=5410c7fd5592c16c3b74555f8997ef47	Objective(s):Acceptance of pre-exposure prophylaxis (PrEP) and testing for HIV is likely to vary as a function of the norms and communications within a geographic area. This study examined associations involving county tweets, in person communications, and HIV prevention and testing in regions with higher (vs. lower) estimated rates of men who have sex with men (MSM).Design and Methods:Ecological analyses examined (a) tweets about HIV (i.e. tweet rates per 100000 county population and topic probabilities in 1959 US counties); (b) individual-level survey data about HIV prevention and testing and communications about PrEP and HIV (N=30675 participants); and (c) estimated county-level MSM rates (per 1000 adult men).Results:In counties with higher rates of MSM, tweet rates were directly associated with PrEP use and HIV testing (rs=.06, BF10>10). Topics correlated with PrEP use (rs=-0.06 to 0.07, BF10>10) and HIV testing (rs=-0.05 to 0.06, BF10>10). Mediation analyses showed that hearing about and discussing PrEP mediated the relations between tweet rates and PrEP use (bis=0.01-0.05, BF10>100) and between topics and PrEP use (bis=-0.04- 0.05, BF10>10). Moreover, hearing about PrEP was associated with PrEP use, which was in turn associated with tweet rates (bis=0.01, BF10>100) and topics (bis=-0.03 - 0.01, BF10>10).Conclusions:Rates of MSM appear to lead to HIV tweets in a region, in person communications about PrEP, and, ultimately, actual PrEP use. Also, as more men hear about PrEP, they may use PrEP more and may tweet about HIV. © Copyright 2021 Wolters Kluwer Health, Inc. A Randomized Trial of a Brief Behavioral Intervention for PrEP Uptake among Men Who Have Sex with Men at Increased Risk for HIV Infection	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002671	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108124228&doi=10.1097%2fQAI.0000000000002671&partnerID=40&md5=873422236671791de898227190cbf557	Background:The aim of this study was to evaluate the efficacy of a novel, brief 2-session behavioral intervention to promote HIV pre-exposure prophylaxis (PrEP) uptake among men who have sex with men (MSM) who are behaviorally at risk for HIV.Setting:A pilot randomized controlled trial was conducted at a sexually transmitted infection (STI) clinic to compare a brief motivational interviewing intervention with passive referral only for PrEP uptake.Methods:MSM who scored as "high risk"on the HIV Incidence Risk index for MSM were offered a brief (15-20 minutes) motivational interviewing-based intervention at the time of STI testing to address barriers to PrEP uptake, including low risk perception, stigma, side effects, and cost. The initial session was followed by a brief, telephone booster session that lasted <10 minutes. The primary outcome was attending a clinical PrEP appointment and accepting a prescription for PrEP.Results:Participants were recruited from an urban STI clinic in the United States. A total of 86 MSM who were behaviorally at risk for HIV were enrolled in the study (N = 43 intervention; N = 43 treatment-as-usual, "TAU"). Participants randomized to the intervention were significantly more likely to attend a clinical appointment and accept a prescription for PrEP, compared with treatment-as-usual (52.3% versus 27.9%, respectively; odds ratio = 3.6; 95% confidence interval: 1.5 to 8.9; P = 0.005).Conclusions:A brief behavioral intervention focused on the initial steps in the PrEP care cascade demonstrated preliminary efficacy in promoting uptake among MSM who are behaviorally at risk for HIV. © 2021 Wolters Kluwer Health, Inc. Article	2021	Chan, CT; Hart-Cooper, G; Vo, M	PREPARING PROVIDERS TO CONSIDER PREP (PRE-EXPOSURE PROPHYLAXIS FOR HIV) THROUGH A BEST PRACTICE ADVISORY IN A LARGE ACADEMIC-COMMUNITY PEDIATRIC NETWORK	Journal of Adolescent Health	-	-	-	1054-139X	https://doi.org/10.1016/j.jadohealth.2020.12.014	https://www.jahonline.org/article/S1054-139X(20)30710-2/abstract#articleInformation	Nationally, about 40% of new HIV diagnoses are among adolescents and young adults. Pre-exposure prophylaxis (PrEP) is a daily medication that was recently FDA-approved for adolescents to reduce the risk of HIV acquisition by over 99%. However, many providers are not yet aware of PrEP. There is an urgent need for youth-focused PrEP programs to train pediatric and adolescent providers. Therefore, we designed and implemented a best practice advisory (BPA) to prompt pediatric providers to consider PrEP for patients at risk for HIV. The purpose of this project was to examine utilization of the novel PrEP BPA launched in our institution's electronic health record beginning December 2019. The goal of the BPA was to address known barriers to recommending PrEP including: lack of PrEP training, lack of system supports to facilitate PrEP prescribing, and lack of access to PrEP specialists. By critically evaluating the utilization of the BPA and making changes to address provider barriers, this project takes a critical step toward improving access to necessary HIV prevention for adolescents and young adults. As low maternal folate levels are linked with neural tube defects, we aimed to assess serum folate concentrations in women starting dolutegravir.Design:We analysed serum folate concentrations from stored plasma among women enrolled in the South African ADVANCE trial.Methods:We compared changes in mean serum folate and occurrence of low serum folate (<14.0nmol/l) at weeks 0, 12 and 24 across study arms. In ADVANCE, 1053 treatment-naïve participants were randomized to initiate tenofovir-alafenamide/emtricitabine+dolutegravir (TAF/FTC+DTG), tenofovir-disoproxil-fumarate (TDF)/FTC+DTG or TDF/FTC/efavirenz (EFV).Results:Analysis includes 406 females, mean age 31.5 years and baseline CD4+cell count 356 cells/μl. At baseline, folate concentrations were similar across treatment arms. However, serum folate increased over 12 weeks in the TAF/FTC+DTG arm (+4.0±8.1nmol/l), while folate concentrations decreased slightly in the TDF/FTC+DTG arm (-1.8±8.9nmol/l) and decreased in the TDF/FTC/EFV arm (-5.9±8.1nmol/l). Women taking TDF/FTC/EFV had low folate concentrations at both 12 and 24 weeks compared with the other arms (P<0.001). Of 26 women who became pregnant on study before week 24, folate concentrations increased between baseline and 12 weeks by a mean 2.4±7.1nmol/l in the TAF/FTC+DTG arm and 2.3±8.4nmol/l in the TDF/FTC+DTG arm, but decreased by -3.3±8.1 with TDF/FTC/EFV arm.Conclusion:Unexpectedly, no declines were noted in the dolutegravir-containing arms, and concentrations were considerably higher than in the EFV arm. The possibility that dolutegravir may block cellular uptake of folate warrants investigation. © 2021 Lippincott Williams and Wilkins. Article	2021	Chandiwana, Nomathemba C; Serenata, Celicia M; Owen, Andrew; Rannard, Steve; Pérez Casas, Carmen; Scott, Cherise; Hill, Andrew; Clayden, Polly; Flexner, Charles	Impact of long-acting therapies on the global HIV epidemic.	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000003102	https://dx.doi.org/10.1097/QAD.0000000000003102	Long-acting antiretroviral drugs have emerged as exciting treatment and preexposure prophylaxis (PrEP) options for people with HIV and at risk of HIV. Long-acting regimens may improve dosing convenience, tolerability and cost compared with current daily-based oral therapy. They can also circumvent stigma associated with oral therapy for both treatment and PrEP, thereby improving adherence and outcomes. Yet, multiple challenges remain, many specific to low-income and middle-income countries (LMICs), where the epidemic is most concentrated and HIV prevention and treatment options are limited. To optimize the use of long-acting formulations, key outstanding questions must be addressed. Uncertain costing, scale-up manufacturing, complex delivery systems and implementation challenges are potential barriers when considering the scalability of long-acting ARVs for global use.	access and barriers, long-acting antiretrovirals, low-income and middle-income countries, treatment optimization	English	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Review
Article	2021	Chandler C.J.; Creasy S.L.; Adams B.J.; Eaton L.A.; Bukowski L.A.; Egan J.E.; Friedman M.R.; Stall R.D.; Whitfield D.L.	Characterizing Biomedical HIV Prevention Awareness and Use Among Black Transgender Women in the United States	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03189-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101228291&doi=10.1007%2fs10461-021-03189-w&partnerID=40&md5=546cb495c8c6bdef2a6da3455743231e	Black transgender women (BTW) in the United States experience disproportionate rates of HIV despite biomedical prevention interventions such as pre-exposure prophylaxis (PrEP) and non-occupational post-exposure prophylaxis (nPEP). Using a sample of 490 BTW collected from 2014 to 2017, bivariate, multivariable, and multinomial analyses were conducted to determine factors associated with awareness and use of PrEP and nPEP. BTW living with HIV were more aware of PrEP than HIV-negative BTW. Structural, demographic, and trans-specific factors (e.g., experiences of homelessness, violence, and current hormone use) related to HIV risk were associated with PrEP and nPEP awareness. PrEP use was associated with behavioral HIV risks (e.g., STI diagnosis, having an HIV-positive partner, and needle-sharing) and may demonstrate risk recognition among BTW. Knowing someone using PrEP was significantly positively associated with PrEP use. Development of guidelines for PrEP and nPEP use for BTW should leverage the strengths of guidelines for other populations, while also acknowledging the unique risks for this population. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Article	2021	Chandra C.; Weiss K.M.; Kelley C.F.; Marcus J.L.; Jenness S.M.	Gaps in Sexually Transmitted Infection Screening Among Men Who Have Sex With Men in Pre-exposure Prophylaxis (PrEP) Care in the United States	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciaa1033	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112611820&doi=10.1093%2fcid%2fciaa1033&partnerID=40&md5=d49c8b98ee0675ccf4e37dc7601c6494	Background. The US Centers for Disease Control and Prevention (CDC) recommends comprehensive sexually transmitted infection (STI) screening every 3–6 months for men who have sex with men (MSM) using human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP). The gaps between these recommendations and clinical practice by region have not been quantified. Methods. We used survey data collected from the internet-based ARTnet study between 2017 and 2019 on STI screening among MSM across the United States, stratified by current, prior, and never PrEP use. Poisson regression models with robust error variance were used to model factors, including residence in the Southeast, associated with consistent ("always" or "sometimes") exposure site-specific STI screening during PrEP care. Results. Of 3259 HIV-negative MSM, 19% were currently using PrEP, 6% had used PrEP in the past, and 75% had never used PrEP. Among ever PrEP users, 87%, 78%, 57%, and 64% reported consistent screening for STIs by blood sample, urine sample or urethral swab, rectal swab, or pharyngeal swab, respectively, during PrEP care. Compared to PrEP users in all other regions, PrEP users in the Southeast were significantly less likely to be consistently screened for urogenital (adjusted prevalence ratio aPR, 0.86; 95% confidence interval CI, .76–.98) and rectal STIs (aPR, 0.76; 95% CI, .62–.93) during PrEP care. Conclusions. Substantial gaps exist between CDC recommendations for STI screening during PrEP care and current clinical practice, particularly for rectal and pharyngeal exposure sites that can harbor asymptomatic infections and for MSM in Southeast states where the STI burden is substantial. © The Author(s) 2020. Article	2021	Chang, Xiao L; Webb, Gabriela M; Wu, Helen L; Greene, Justin M; Abdulhaqq, Shaheed; Bateman, Katherine B; Reed, Jason S; Pessoa, Cleiton; Weber, Whitney C; Maier, Nicholas; Chew, Glen M; Gilbride, Roxanne M; Gao, Lina; Agnor, Rebecca; Giobbi, Travis; Torgerson, Jeffrey; Siess, Don; Burnett, Nicole; Fischer, Miranda; Shiel, Oriene; Moats, Cassandra; Patterson, Bruce; Dhody, Kush; Kelly, Scott; Pourhassan, Nader; Magnani, Diogo M; Smedley, Jeremy; Bimber, Benjamin N; Haigwood, Nancy L; Hansen, Scott G; Brown, Timothy R; Ndhlovu, Lishomwa C; Sacha, Jonah B	Antibody-based CCR5 blockade protects Macaques from mucosal SHIV transmission.	Nature Communications	-	-	-	2041-1723	10.1038/s41467-021-23697-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8184841	In the absence of a prophylactic vaccine, the use of antiretroviral therapy (ART) as pre-exposure prophylaxis (PrEP) to prevent HIV acquisition by uninfected individuals is a promising approach to slowing the epidemic, but its efficacy is hampered by incomplete patient adherence and ART-resistant variants. Here, we report that competitive inhibition of HIV Env-CCR5 binding via the CCR5-specific antibody Leronlimab protects rhesus macaques against infection following repeated intrarectal challenges of CCR5-tropic SHIVSF162P3. Injection of Leronlimab weekly at 10 mg/kg provides significant but partial protection, while biweekly 50 mg/kg provides complete protection from SHIV acquisition. Tissue biopsies from protected macaques post challenge show complete CCR5 receptor occupancy and an absence of viral nucleic acids. After Leronlimab washout, protected macaques remain aviremic, and adoptive transfer of hematologic cells into naïve macaques does not transmit viral infection. These data identify CCR5 blockade with Leronlimab as a promising approach to HIV prophylaxis and support initiation of clinical trials. Article	2021	Charest, Maxime; Sharma, Malika; Chris, Allison; Schnubb, Alexandre; Knox, David C; Wilton, James; Shahin, Rita; Chan, Arlene; Mishra, Sharmistha; Grace, Daniel; Bayoumi, Ahmed M; Maxwell, John; Bogoch, Isaac I; Tan, Darrell H S	Decentralizing PrEP delivery: Implementation and dissemination strategies to increase PrEP uptake among MSM in Toronto, Canada	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0248626	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7971529/	Pre-exposure prophylaxis (PrEP) is traditionally prescribed by HIV specialist physicians. Given finite specialist resources, there is a need to scale up PrEP delivery by decentralizing services via other healthcare professionals. We aimed to assess the feasibility of delivering PrEP to men who have sex with men (MSM) through primary care physicians and sexual health clinic nurses. We piloted a multi-component, implementation and dissemination research program to increase provision of PrEP through primary care physicians and sexual health clinic nurses in Toronto, Canada. Community-based organizations (CBOs) provided prospective participants with information cards that contained links to an online module on engaging providers in a conversation about PrEP. In our patient-initiated continuing medical education (PICME) strategy, participants saw their family doctors and gave them the card, which also contained a link to a Continuing Medical Education module. In the nurse-led strategy, participants visited one of two participating clinics to obtain PrEP. We administered an optional online questionnaire to patients and providers at baseline and six months. CBOs distributed 3043 cards. At least 339 men accessed the online module and 196 completed baseline questionnaires. Most (55%) intended to visit nurses while 21% intended to consult their physicians. Among 45 men completing follow-up questionnaires at 6 months, 31% reported bringing cards to their physicians and obtaining PrEP through them; sexual health clinics delivered PrEP to 244 patients. Participants who went through the PICME approach reported no changes in relationships with their providers. Nurses showed fidelity to PrEP prescribing guidelines. Nurse-led PrEP and patient-initiated continuing medical education (PICME) for primary care physicians are feasible strategies to increase PrEP uptake. Nurse-led PrEP delivery was preferred by most patients. Article	2021	Chas, Julie; Bauer, Rebecca; Larabi, Islam Amine; Peytavin, Gilles; Roux, Perrine; Cua, Eric; Cotte, Laurent; Pasquet, Armelle; Capitant, Catherine; Meyer, Laurence; Raffi, Francois; Spire, Bruno; Pialoux, Gilles; Molina, Jean-Michel; Alvarez, Jean-Claude	Evaluation of Drug Abuse by Hair Analysis and Self-Reported Use Among MSM Under PrEP: Results From a French Substudy of the ANRS-IPERGAY Trial.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002610	https://dx.doi.org/10.1097/QAI.0000000000002610	BACKGROUND: We used the Agence nationale de Recherches sur le sida et les hépatites virales (ANRS)-IPERGAY trial to qualitatively and quantitatively measure drug use among men who have sex with men under preexposure prophylaxis using 2 different methods, to better understand and collectively respond to risky practices. METHOD: We included 69 volunteers of the ANRS-IPERGAY trial. We measured drug use by 2 methods: (1) drug detection by hair analysis and (2) reported drug use by self-reported drug consumption. RESULTS: New psychoactive substances (NPS) and conventional drugs were detected in 53 of the 69 (77%) volunteers by hair analysis and in 39 of the 69 (57%) volunteers by questionnaires. On the 219 hair segments analyzed, the most commonly used drugs were cocaine in 47 of the 69 (68%), 3,4-methylenedioxymethamphetamine/ecstasy in 31 of the 69 (45%), and NPS in 27 of the 69 (39%). On the 1061 collected questionnaires, the most commonly used drugs were cocaine in 31 of the 69 (45%), 3,4-methylenedioxymethamphetamine/ecstasy in 29 of the 69 (42%), and NPS in 16 of the 69 (23%). Hair analysis detects more conventional drugs and/or NPS use (P < 0.05). Drug use identified by hair was significantly associated with a higher number of sexual partners in the past 2 months (P ≤ 0.001), more often casual partners (P ≤ 0.001), condomless anal sex (P ≤ 0.005), hardcore sexual practices (P ≤ 0.001), a higher number of sexually transmitted infections, and chemsex (P ≤ 0.05). CONCLUSIONS: Self-report drug use by questionnaires remains the reference tool for harm reduction at the individual level because of its feasibility and low cost. However, hair analysis is more sensitive, objectively assessing consumption, and interesting to understand uses and to be able to collectively respond to risky practices with adapted messages. Article	2021	Chasco, Emily E.; Shafer, Cody; Dillon, Dena M. B.; Owens, Seth; Ohl, Michael E.; Hoth, Angela B.	Bringing Iowa TelePrEP to Scale: A Qualitative Evaluation.	American Journal of Preventive Medicine	-	-	-	1873-2607 0749-3797	10.1016/j.amepre.2021.05.040	https://pubmed.ncbi.nlm.nih.gov/34686280/	INTRODUCTION: Regional partnerships between public health organizations and telehealth programs have the potential to expand access to HIV pre-exposure prophylaxis in rural and small urban areas. However, little is known about the best practices for such partnerships. Iowa TelePrEP, a regional public health–partnered telehealth model created by the Iowa Department of Public Health and the University of Iowa, expanded statewide between 2017 and 2019. This qualitative evaluation assessed the barriers and facilitators to statewide expansion and the lessons learned. METHODS: Key informants from public health partners across Iowa participated in a focus group and interviews between May 2019 and November 2020. Public health partners included local health departments and disease intervention specialist/partner services programs. Qualitative data were transcribed and thematically coded. Program documents and routinely collected reporting data were reviewed to provide the context for qualitative findings. Data were analyzed in 2020. RESULTS: TelePrEP expanded in 4 phases through partnerships with 12 public health partners. Public health partners referred 708 clients with pre-exposure prophylaxis indications to telenavigation; of these, 258 were navigated to TelePrEP, and 167 initiated pre-exposure prophylaxis. The facilitators of expansion included early public health partner engagement, model acceptability and inclusion of a navigator, and adaptability to local public health partner settings. The barriers included the need to adapt communication and processes to varying public health partners, difficulty in engaging underserved populations, the COVID-19 pandemic, and perceived gaps in understanding client outcomes. CONCLUSIONS: Partnerships between regional telehealth programs and local health departments can expand to the state level and increase the capacity to implement pre-exposure prophylaxis in rural and small urban settings. Partnerships should consider how to balance program adaptability to local public health partners with standardization and scalability. Article	2021	Chasco, Emily E; Hoth, Angela B; Cho, Hyunkeun; Shafer, Cody; Siegler, Aaron J; Ohl, Michael E	Mixed-Methods Evaluation of the Incorporation of Home Specimen Self-Collection Kits for Laboratory Testing in a Telehealth Program for HIV Pre-exposure Prophylaxis.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03209-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7975241	Home specimen self-collection kits with central laboratory testing may improve persistence with PrEP and enhance telehealth programs. We offered Iowa TelePrEP clients the choice of using a home kit or visiting a laboratory site for routine monitoring. Mixed-methods evaluation determined the proportion of clients who chose a kit, factors influencing choice, associations between kit use and completion of indicated laboratory monitoring, and user experience. About 46% (35/77) chose to use a kit. Compared to laboratory site use, kit use was associated with higher completion of extra-genital swabs (OR 6.33, 95% CI 1.20-33.51, for anorectal swabs), but lower completion of blood tests (OR 0.21, 95% CI 0.06-0.73 for creatinine). Factors influencing choice included self-efficacy to use kits, time/convenience, and privacy/confidentiality. Clients reported kit use was straight-forward but described challenges with finger prick blood collection. Telehealth PrEP programs should offer clients home kits and support clients with blood collection and kit completion. Theses and Dissertations	2021	Chebet, Joy	Beyond Clinical Efficacy: A Mixed Methods Examination of Pre-Exposure Prophylaxis (PrEP) Implementation for HIV Prevention in Lesotho	-	-	University of Arizona	-	NA	NA	https://repository.arizona.edu/handle/10150/661523	Background: Sub-Saharan Africa (SSA) bears a disproportionate burden of HIV/AIDS, accounting for approximately 70% of all new infections annually. Declining funding for HIV/AIDS programming in the region, coupled with disrupted services resulting from the COVID-19 pandemic, poses a risk to the gains made towards meeting the global goal of ending HIV/AIDS as a public health threat by 2030. The use of Pre-Exposure Prophylaxis (PrEP) among HIV negative individuals at substantial risk of infection has demonstrated the great promise of changing the trajectory of the HIV epidemic in SSA. When taken as prescribed, oral PrEP has demonstrated clinical efficacy of over 90%. However, slow uptake and high discontinuation rates remain major obstacles to realizing PrEP's full potential to prevent new HIV infection. Current evidence on developing and implementing PrEP programs at scale has been shaped by studies in high-income countries, and among key populations considered at high risk for HIV acquisition (i.e. Men who have sex with men, female sex workers and person who use injection drugs). Research in The Kingdom of Lesotho – a country with the second highest prevalence of HIV globally – offers unique insights as it is one of the few countries working to broaden PrEP provision from targeted groups to the general public. Goal: This dissertation aims to add to the scientific discourse on how to encourage PrEP uptake and adherence, and produce evidence-based recommendations for the introduction and scale up of PrEP to national level. Objectives: The objectives of this work were: • To map the current PrEP landscape and existing knowledgebase in PrEP-implementing districts of Lesotho, including misconceptions and perceptions and towards PrEP (Chapter 2); • To understand the context of PrEP uptake, including motivating factors that draw end-users to initiate or decline PrEP (Chapter 3); • To understand adherence challenges encountered by users in, reasons for PrEP discontinuation, and user-recommended strategies for improving adherence (Chapter 4); • To identify the most important PrEP implementation barriers in Lesotho, and corresponding helpful interventions to improve PrEP uptake and retention (Chapter 5). Methods: This dissertation is organized around findings from a qualitative implementation study conducted in five PrEP-implementing districts of Lesotho between February and June of 2019. Semi-structured in-depth interviews (N=106) were conducted in purposively sampled stakeholders directly involved in PrEP policy (n=5), program implementation (n=4), and PrEP use (current users=55, former users=36 and decliners=6). Focus group discussions (n=11, total of 105 participants) were conducted with health staff directly providing HIV and PrEP services. Interviews and discussions were digitally recorded, transcribed, and thematically analyzed using Atlas.ti. Additionally, a card sorting and ranking exercise was used to identify the most important barriers and most promising interventions according to 155 local stakeholders.…	ACESSO RESTRITO	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Mixed methods
Article	2021	Chemtob D.; Weil C.; Attal J.H.; Hawila E.; Sadeh E.N.	HIV Pre-Exposure Prophylaxis (PrEP) purchase patterns and STI occurrence among Israeli men: A cohort analysis	PLOS One	-	-	-	19326203	10.1371/journal.pone.0259168	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119526465&doi=10.1371%2fjournal.pone.0259168&partnerID=40&md5=2b9bcb9c3c56f62d3ea91211d83cb4dc	Background HIV Pre-exposure prophylaxis (PrEP) is the regular use of antiretroviral medication by people who are not infected with HIV to prevent seroconversion. Israel approved PrEP for continuous use in 2017, and Israeli Health Maintenance Organizations (HMO) offered PrEP with a copayment to eligible members. Methodology This retrospective cohort study included all people who were dispensed PrEP between September 2017 to June 2019 in the second largest HMO in Israel. Statistical analysis, including Kaplan Meier, was conducted to evaluate user PrEP purchase, adherence to medical follow- up, and clinical outcomes. Results In total, a cohort of 757 PrEP users were followed for 657.8 person-years. All but one user were male; median age was 35 years. At baseline, 0.8% had gonorrhea and 1.5% had chlamydia infections and 4.4% had recent syphilis infection. Continuous use of PrEP (without interruption/discontinuation) was observed in 29.9%, while 39.9% interrupted and 30.3% discontinued use. Median time to first interruption/discontinuation was 4.0 months. At 6-12 months after initiation, 79.8% of users had a documented HIV test, 77.3% a Chlamydia- Gonorrhea panel, and 78.9% a creatinine test. There was one new case of HIV among the cohort, five months after PrEP discontinuation. Estimated first-year infection rates were 5.0%, 8.6% and 6.8% for gonorrhea, chlamydia and first-time syphilis, respectively. Conclusions This study shows heterogeneous PrEP purchase patterns and required medical follow-up, and an increase in STIs among consistent PrEP users. Improving adherence to recommended medical follow-up during PrEP use is essential in PrEP's integration into Israel's national HIV prevention strategy. © 2021 Chemtob et al. Article	2021	Chen Y.-T.; Duncan D.T.; Del Vecchio N.; Timmins L.; Pagkas-Bather J.; Lacap S.; Hotton A.; Knox J.; Hanson H.; Koli K.; Durrell M.; Dehlin J.; Schneider J.A.	COVID-19-Related Stressors, Sex Behaviors, and HIV Status Neutral Care Among Black Men Who Have Sex With Men and Transgender Women in Chicago, USA	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002770	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124001079&doi=10.1097%2fQAI.0000000000002770&partnerID=40&md5=d74d38b522d093634f26a602823cceec	Background:COVID-19 has disproportionately impacted vulnerable populations, including Black men who have sex with men (BMSM) and transgender women (BTW). We investigated associations of COVID-19 stressors and sex behaviors with pre-exposure prophylaxis (PrEP) and antiretroviral therapy (ART) among BMSM and BTW.Methods:As part of the Neighborhoods and Networks (N2) study, we conducted virtual interviews during peak COVID-19 infectivity in Chicago among BMSM and BTW (April-July 2020). Survey questions included multilevel COVID-19 stressors, sex behaviors, and current PrEP/ART use and access. Poisson regressions were used to examining relationships between COVID-19 stressors, sex behaviors, and PrEP/ART use/access.Results:Among 222 participants, 31.8% of participants not living with HIV reported current PrEP use and 91.8% of participants living with HIV reported current ART use during the pandemic. Most (83.3% and 78.2%, respectively) reported similar or easier PrEP and ART access during the pandemic. Physical stress reaction to COVID-19 adjusted prevalence ratio aPR = 2.1; confidence interval (CI): 1.3 to 3.5 and being in close proximity with someone diagnosed with COVID-19 (aPR = 1.7; CI: 1.1 to 2.8) were associated with current PrEP use. Intimate partner violence (aPR = 2.7; CI: 1.0 to 7.2) and losing health insurance (aPR = 3.5; CI: 1.1 to 10.7) were associated with harder ART access. Travel-related financial burden was associated with harder access in PrEP (aPR = 3.2; CI: 1.0 to 10.1) and ART (aPR = 6.2; CI: 1.6 to 24.3).Conclusions:Multiple COVID-19 stressors were found to interfere with PrEP and ART use and access among BMSM and BTW. Contextually relevant strategies (eg, promoting telehealth and decreasing transportation burden) to address COVID-19 stressors and their sequelae should be considered to minimize disruption in HIV biomedical interventions. Article	2021	Chen, W; Ding, Y; Chen, J; Zhao, P; Wang, Z; Meng, X; Jia, T; Zheng, H; Yang, B; Luo, Z; Zou, H	Awareness of and preferences for preexposure prophylaxis (PrEP) among MSM at high risk of hiv infection in southern china: findings from the T2T study	BioMed Research International	-	-	-	2314-6133	10.1155/2021/6682932	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02304130/full	This study is aimed at investigating the awareness of and preferences for oral and long-acting injectable HIV preexposure prophylaxis (PrEP) and their associated factors among men who have sex with men (MSM) at high risk of HIV infection in southern China. A cross-sectional survey was conducted among 603 MSM who were recruited through a cohort study called the T2T Study at three sexual health clinics in Guangzhou, Shenzhen, and Wuxi, China, from 2017 to 2018. We collected information on HIV-negative participants' awareness of and willingness to use PrEP and its potential correlations. Univariate and multivariate logistic regressions were used for data analyses. A total of 550 HIV-negative MSM were enrolled in the study. Less than half of at-risk MSM (43.1%) had heard of PrEP before, and the rate of overall willingness to use PrEP was 65.8%, while MSM were more willing to use daily oral PrEP than long-acting injectable- (LAI-) PrEP (62.2% vs. 38.5%). MSM who had university degrees or above (aOR = 1.55, 95% CI: 1.01-2.37), used condoms during last anal sex (1.52, 1.01-2.29), and tested 3 times or more for HIV (2.45, 1.10-5.47) were more likely to be aware of PrEP. MSM who had use of gay dating apps (1.51, 1.02- 2.23), ever participated in HIV- or sexually transmitted disease (STD-) related studies (1.91, 1.24-2.94), and had heard of PrEP (3.06, 2.06-4.54) were more willing to use any regimen of PrEP. MSM at high risk of HIV infection had low awareness of PrEP and moderate willingness to use PrEP. Further studies of the implementation and promotion of PrEP targeting at-risk MSM should be performed.	*China; *Human immunodeficiency virus infection /drug therapy /prevention; *awareness; *men who have sex with men; *pre-exposure prophylaxis; Administration, Oral; Adult; Alcohol consumption; Anal intercourse; Anti-HIV Agents therapeutic use; Article; China; Circumcision; Cohort analysis; Condom use; Controlled study; Drug use; HIV Infections diagnosis, *drug therapy, *epidemiology; Health Knowledge, Attitudes, Practice; High risk population; Homosexual male; Homosexuality, Male; Human; Humans; Income; Major clinical study; Male; Mobile application; Multicenter study; Online dating; Patient Preference; Practice guideline; Pre-Exposure Prophylaxis; Randomized controlled trial; Risk Factors; Sexual behavior; Sexually transmitted disease; Young Adult; Young adult	English	United Kingdom	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Quantitative

Book Section	2021	Chevrette R.	"You fucking deserve HIV": Seeking PrEP information, disciplinary power, and queer technologies of the Self on /r/ AskGayBros	-	Post-AIDS Discourse in Health Communication: Sociocultural Interpretations	-	9781003000945	-	10.4324/9781003000945-12	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128627164&doi=10.4324%2f9781003000945-12&partnerID=40&md5=c1407bd3696ed6342421b6f9e056ee92	This book will be of great interest to all stakeholders in the HIV and AIDS response community. The authors and editors of this timely collection provide a much-needed interrogation of policy discourses that frame the "end" of HIV and AIDS in the near-term as a desirable and reachable goal. No one can argue with the objective of ameliorating the HIV pandemic, but language matters. Constructs, such as a "post-AIDS" era, an "AIDS-free generation," and "ending AIDS," do violence to people with HIV, who will continue to live with the disease for decades, even if new HIV transmissions are halted by 2030 as many campaigns aspire. The experience of people living with HIV and AIDS, which includes stigma, discrimination, marginalization, and criminalization, is not sufficiently captured by discursive structures that persistently reduce the pandemic to a biomedical, rather than a relational and social, phenomenon. The engaging historical, theoretical, and empirical analyses in this book interrogate the meanings that circulate around biological science claims-that virological suppression (resulting from use of antiretroviral drugs) leads to zero new HIV transmissions, which equals the "end of AIDS." They document the ways in which the persistent biomedicalizing of the HIV pandemic and its response shifts attention away from social and cultural processes that are as central to the story of AIDS-and to its ending-as is the virus itself.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Mixed methods
Article	2021	Chiarabini T.; Lacombe K.; Valin N.	HIV pre-exposure chemoprophylaxis "prep" in general practice: Are there significant barriers?; Prophylaxie préexposition au vih (prep) en médecine générale : existe-T-il des freins ?	Santé Publique	-	-	-	9953914	10.3917/spub.211.0101	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110329838&doi=10.3917%2fspub.211.0101&partnerID=40&md5=f6c426981a4413869bb1858839170ff6	Objectives: Pre-exposure chemoprophylaxis "PrEP", a new prevention tool against HIV for high-risk populations, has been available in France since 2016 in France. The first prescription should occur in CeGIDD or hospital and, its renewal and follow-up can be made by the GP. The analysis of barriers to prescribing PrEP and its follow-up by GP is essential to guide public health actions in order to reach the objectives necessary to observe an inflection of new HIV contaminations. Methods: In this descriptive study, on general practitioners who were surveyed about their opinions and current practices of PrEP on the French territory from August to October 2018. Results: 351 responded to the survey, with an estimated response rate of 11%. Most clinicians (88.9%) supported PrEP but only 6.3% had provided it and 12.8% of them did PrEP monitoring. The non-providers self-Assessed for 97% of them, as their knowledge of PrEP was low or very low. The significant barriers to providing PrEP among non-Adopters were the lack of training received (90.6% vs 59,1% for adopters, P < 0.001), the assessment of patient as "not at risk for HIV" (29.8% vs 0%, P = 0.003), not having a private health assurance (34.7% vs 13.6%, P = 0.04), the lack of knowledge about patient sexuality (27.1% vs 4.5%, P = 0.02). The absence of a first prescription was a barrier only for PrEP follow-up and was over-represented in this group (33.3% vs 18.3% for non-Adopters, P = 0.02). Conclusion: This study shows that GPs are interested in providing PrEP despite their barriers. The management of PrEP in general practice must be improved, particularly through the training of general practitioners in the context of continuing medical education and by an institutional evolution in the extension of provide PrEP to increase the interest in global health management to overcome these barriers. © 2021 Societe Francaise de Sante Publique. Article	2021	Cho-Hee, Shrader; Arroyo-Flores, Juan; Skvoretz, John; Fallon, Stephen; Gonzalez, Victor; Safren, Steven; Algarin Angel; Johnson, Ariana; Doblecki-Lewis, Susanne; Kanamori Mariano	PrEP Use and PrEP Use Disclosure are Associated with Condom Use During Sex: A Multilevel Analysis of Latino MSM Egocentric Sexual Networks	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03080-0	https://www.proquest.com/scholarly-journals/prep-use-disclosure-are-associated-with-condom/docview/2513415168/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) is integral to HIV prevention; however, the influence of PrEP use and PrEP use disclosure on condom use is unclear among Latinx men who have sex with men (LMSM). This study explored associations of LMSM PrEP use and use disclosure on consistent dyadic condom use in the past 6 months. Participants were 130 HIV-negative PrEP and non-PrEP using LMSM ages 20–39 years. Two-level logistic regression models assessing individual- and dyadic-level predictors on condom use were fitted using R. Participants reported a mean of four sexual partners (n = 507 dyads). Participants who reported using PrEP or having more sexual partners were more likely to use condoms; however, participants who reported disclosing PrEP use were less likely to use condoms. Future longitudinal studies should characterize approaches to increase informed personal health choices and conversations about PrEP, condom use, and other HIV risk-reduction strategies using network methodologies. Article	2021	Cho-Hee, Shrader; Arroyo-Flores, Juan; Stoler, Justin; Skvoretz, John; Carrico, Adam; Doblecki-Lewis, Susanne; Kanamori Mariano	The Association Between Social and Spatial Closeness With PrEP Conversations Among Latino Men Who Have Sex With Men: JAIDS	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002777	https://www.proquest.com/scholarly-journals/association-between-social-spatial-closeness-with/docview/2587039733/se-2?accountid=8113	Background:US Latino men who have sex with men (LMSM) are a group at highest risk for HIV. One driver of HIV among LMSM is inadequate access to pre-exposure prophylaxis (PrEP) information. The social network theory of homophily suggests that sharing similar sociodemographic factors could influence PrEP conversations within networks. This study aimed to determine how the effects of homophily across sociodemographic, immigration, cultural, and PrEP-related factors are associated with PrEP-related communication.Setting:This study was conducted in Miami-Dade County, FL.Methods:Data collected between August 2018 and October 2019 included 10 sociocentric friendship groups of 13 LMSM (N = 130). Participants were recruited using respondent-driven sampling by a community-based organization in Miami. We used the multiple regression quadratic assignment procedure to identify the effects of homophily and relationship characteristics on PrEP-related conversations using R software.Results:More frequent PrEP-related conversations were associated with dyadic friendships characterized by homophily on knowledge of PrEP effectiveness, heterophily on depressive symptom severity, home addresses proximity, friend closeness, and interaction frequency. Past PrEP-related conversation frequency also increased based on heterophily on the Latino cultural value of familism (ie, emotional support to family). Racial homophily, heterophily on severity of depressive symptoms, home addresses proximity, friendship closeness, and frequency of interactions increased likelihood to encourage a friend to use PrEP.Discussion:Social and spatial closeness and homophily play a role in PrEP-related conversations. Information from social networks contextualized in geographic settings can be elucidated to contribute toward the design of novel opportunities to end HIV. Article	2021	Choi, Jae-Phil; Seo, Bo Kyeong	HIV-Related Stigma Reduction in the Era of Undetectable Equals Untransmittable: The South Korean Perspective.	Infection and Chemotherapy	-	-	-	2093-2340	10.3947/ic.2021.0127	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8731251	Since the introduction of effective antiretroviral therapy (ART) in the late 1990s, the prognosis for people living with human immunodeficiency virus (HIV) (PLWH) has dramatically improved. High-income countries like South Korea have had rapid declines in HIV-related deaths. Scientific advancements including pre-exposure prophylaxis (PrEP) and "undetectable equals untransmittable (U = U)" knowledge have contributed progress towards the goal of ending the acquired immune deficiency syndrome epidemic by 2030. However, the application of these advancements has been limited in South Korea. Evidence shows that HIV-related stigma and discrimination in healthcare settings remain strong in this region. We review key principles for stigma reduction and people-centered approaches in the era of U = U and identify three priorities: 1) immediate intervention in HIV stigma drivers in healthcare settings; 2) social stigma reduction on multiple levels; and 3) collaboration with key populations. Article	2021	Chone, Jeremias Salomão; Lima, Shirley Verônica Melo Almeida; Fronteira, Inês; Mendes, Isabel Amélia Costa; Shaaban, Ahmed Nabil; Martins, Maria do Rosário Oliveira; Sousa, Álvaro Francisco Lopes	Factors associated with chemsex in Portugal during the COVID-19 pandemic.	Revista Latino-Americana de Enfermagem	-	-	-	1518-8345	10.1590/1518-8345.4975.3474	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8432586	OBJECTIVE: to investigate the factors associated with the practice of sex under the influence of drugs (chemsex) among Portuguese men who have sex with men during the period of social distancing to prevent the COVID-19. METHOD: online survey applied in May 2020 to a sample of 1,301 participants living in Portugal, recruited according to Respondent Driven Sampling and via social media Facebook®. Descriptive and bivariate analyses were performed along with logistic regression to calculate adjusted Odds Ratio (ORa). RESULTS: the prevalence of chemsex was 20.2%. The likelihood of practicing chemsex increased with group sex (ORa: 28.4, 95%CI 16.93-47.49); unprotected sex (ORa: 7.1 95%CI 4.57-10.99); the use of pre-exposure prophylaxis (PrEP) to prevent COVID-19 (ORa: 4.2, 95%CI 2.71-6.39) and COVID-19 testing (ORa: 1.9, 95%CI 1.15-3.10). CONCLUSION: the practice of chemsex among men who have sex with men during the COVID-19 pandemic in Portugal was very frequent and may support greater understanding of the role and impact of sexual behavior on the COVID-19 transmission rates and the current pandemic situation in Portugal. Article	2021	Chounta, Vasiliki; Overton, Edgar T; Mills, Anthony; Swindells, Susan; Benn, Paul D; Vanveggel, Simon; van Solingen-Ristea, Rodica; Wang, Yuanyuan; Hudson, Krischan J; Shaefer, Mark S; Margolis, David A; Smith, Kimberly Y; Spreen, William R	Patient-Reported Outcomes Through 1 Year of an HIV-1 Clinical Trial Evaluating Long-Acting Cabotegravir and Rilpivirine Administered Every 4 or 8 Weeks (ATLAS-2M).	Patient	-	-	-	1178-1661	10.1007/s40271-021-00524-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8563641	BACKGROUND: Advances in HIV-1 therapeutics have led to the development of a range of daily oral treatment regimens, which share similar high efficacy rates. Consequently, more emphasis is being placed upon the individual's experience of treatment and impact on quality of life. The first long-acting injectable antiretroviral therapy for HIV-1 (long-acting cabotegravir + rilpivirine CAB + RPV LA) may address challenges associated with oral treatment for HIV-1, such as stigma, pill burden/fatigue, drug-food interactions, and adherence. Patient-reported outcomes (PROs) collected in an HIV-1 clinical trial (ATLAS-2M; NCT03299049) comparing participants' experience with two dosing regimens (every 4 weeks Q4W vs. every 8 weeks Q8W) of CAB + RPV LA are presented herein. METHODS: PRO endpoints evaluated through 48 weeks of therapy included treatment satisfaction (HIV Treatment Satisfaction Questionnaire HIVTSQ), treatment acceptance ("General Acceptance" domain of the Chronic Treatment Acceptance ACCEPT® questionnaire), acceptability of injections (Perception of Injection PIN questionnaire), treatment preference (questionnaire), and reasons for switching to/continuing long-acting therapy (exploratory endpoint; questionnaire). Participants were randomized 1:1 to receive CAB + RPV LA Q8W or Q4W. Results were stratified by prior CAB + RPV exposure in either preplanned or post hoc analyses. RESULTS: Overall, 1045 participants were randomized to the Q8W (n = 522) and Q4W (n = 523) regimens; 37% (n = 391/1045) had previously received CAB + RPV in ATLAS. For participants without prior CAB + RPV exposure, large increases from baseline were reported in treatment satisfaction in both long-acting arms (HIVTSQ status version), with Q8W dosing statistically significantly favored at Weeks 24 (p = 0.036) and 48 (p = 0.004). Additionally, improvements from baseline were also observed in the "General Acceptance" domain of the ACCEPT questionnaire in both long-acting arms for participants without prior CAB + RPV exposure; however, no statistically significant difference was observed between arms at either timepoint (Week 24, p = 0.379; Week 48, p = 0.525). Significant improvements (p < 0.001) in the "Acceptance of Injection Site Reactions" domain of the PIN questionnaire were observed from Week 8 to Weeks 24 and 48 in both arms for participants without prior CAB + RPV exposure. Participants with prior CAB + RPV exposure reported high treatment satisfaction (mean HIVTSQ status version: Q8W 62.2/66.0; Q4W 62.0/66.0), treatment acceptance (mean: Q8W 89.3/100; Q4W 91.2/100), and acceptance of injection site reactions (mean 5 = not at all acceptable; 1 = totally acceptable: Q8W 1.72; Q4W 1.59) at baseline/Week 8 that were maintained over time. Participants without prior CAB + RPV exposure who received Q8W dosing preferred this regimen over oral CAB + RPV (98%, n = 300/306). Among those with prior Q4W exposure, 94% (n = 179/191) preferred Q8W dosing versus Q4W dosing (3%, n = 6/191) or oral CAB + RPV (2%, n = 4/191). CONCLUSIONS: Both long-acting regimens provided high treatment satisfaction and acceptance, irrespective of prior CAB + RPV exposure, with most participants preferring Q8W dosing over both the Q4W regimen and their previous daily oral regimen. The PRO data collected at Week 48 support the therapeutic potential of CAB + RPV LA. FUNDING: ViiV Healthcare and Janssen. Article	2021	Chow E.P.F.; Hocking J.S.; Ong J.J.; Phillips T.R.; Schmidt T.; Buchanan A.; Rodriguez E.; Maddaford K.; Fairley C.K.	Changes in PrEP use, sexual practice, and use of face mask during sex among msm during the second wave of COVID-19 in Melbourne, Australia	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002575	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099902322&doi=10.1097%2fQAI.0000000000002575&partnerID=40&md5=18f945c40b3142367467c9082bade355	Background: A second wave of COVID-19 began in late June in Victoria, Australia. Stage 3 then Stage 4 restrictions were introduced in July-August. This study aimed to compare the use of preexposure prophylaxis (PrEP) and sexual practices among men who have sex with men taking PrEP between May-June (post-first lockdown) and July-August (second lockdown). Methods: This was an online survey conducted among men who have sex with men who had their PrEP managed at the Melbourne Sexual Health Centre, Australia. A short message service with a link to the survey was sent to 503 PrEP clients who provided consent to receive a short message service from Melbourne Sexual Health Centre in August 2020. Results: Of the 192 participants completed the survey, 153 (80%) did not change how they took PrEP. Of the 136 daily PrEP users, 111 (82%) continued to take daily PrEP, 3 (2%) switched to ondemand PrEP, and 22 (16%) stopped PrEP in July-August. Men generally reported that they had no partners or decreased sexual activities during second lockdown compared with post-first lockdown; the number of casual sex partners (43% decreased vs. 3% increased) and the number of kissing partners (36% decreased vs. 3% increased). Most men reported no chemsex (79%) or group sex (77%) in May-August. 10% (13/127) of men had ever worn face masks during sex in May-August. Conclusion: During the second wave of COVID-19 in Victoria, most men did not change the way they used PrEP but the majority had no risks or reduced sexual practices while one in 10 men wore a face mask during sex. © 2020 Wolters Kluwer Health, Inc. Article	2021	Chow, Eric P F; Lee, Darren; Bond, Stephanie; Fairley, Christopher K; Maddaford, Kate; Wigan, Rebecca; Fehler, Glenda; Lange, Sigrid A; De Petra, Vesna; Bissessor, Melanie; Bradshaw, Catriona S; Howden, Benjamin P; Hocking, Jane S; Williamson, Deborah A; Chen, Marcus Y	Nonclassical Pathogens as Causative Agents of Proctitis in Men who Have Sex With Men.	Open Forum Infectious Diseases	-	-	-	2328-8957	10.1093/ofid/ofab137	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8521645	BACKGROUND: This study aimed to identify enteric and sexually acquired rectal pathogens, other than chlamydia and gonorrhea, associated with symptomatic proctitis in men who have sex with men (MSM). METHODS: Anorectal swab samples were obtained from MSM presenting with rectal symptoms and a clinical diagnosis of proctitis at the Melbourne Sexual Health Centre between January 2017 and March 2019. Samples that tested positive for Neisseria gonorrhoeae and Chlamydia trachomatis were excluded. As a comparison group, anorectal samples were also obtained from MSM not reporting symptoms of proctitis between November 2018 and February 2019. Samples from both groups were tested for 15 viral, bacterial, and protozoal enteric pathogens using polymerase chain reaction. RESULTS: Anorectal samples from 499 men with symptomatic proctitis and 506 asymptomatic men were analyzed. Age, HIV status, and pre-exposure prophylaxis (PrEP) use did not differ between men with proctitis and asymptomatic men. Treponema pallidum was more common in men with proctitis (risk difference RD, 3.6%; 95% CI, 2.0%-5.2%). Most men with anorectal T. pallidum presented with painful anal primary infections. Shigella spp. was more common among men with proctitis compared with asymptomatic men (RD, 1.8%; 95% CI, 0.1%-3.5%). Most men with Shigella did not report diarrhea. Mycoplasma genitalium was more common in men with proctitis (RD, 4.3%; 95% CI, 1.1%-7.5%). Herpes simplex virus (HSV)-1 (RD, 10.1%; 95% CI, 6.8%-13.3%) and HSV-2 (RD, 7.2%; 95% CI, 4.5%-10.0%) were more common with proctitis. CONCLUSIONS: Testing for T. pallidum, Shigella, and HSV should be considered in MSM presenting with symptomatic proctitis. These data provide support for M. genitalium as a significant cause of proctitis. A comprehensive diagnostic evaluation is required for MSM with proctitis.	enteric pathogens; Mycoplasma genitalium; men who have sex with men; rectal infection; Shigella; sexually transmitted infection; syphilis. Article	2021	Chow, Eric P F; Vodstrcil, Lenka A; Williamson, Deborah A; Maddaford, Kate; Hocking, Jane S; Ashcroft, Melinda; De Petra, Vesna; Bradshaw, Catriona S; Fairley, Christopher K	Incidence and duration of incident oropharyngeal gonorrhoea and chlamydia infections among men who have sex with men: prospective cohort study.	Sexually Transmitted Diseases	-	-	-	1472-3263	10.1136/sextrans-2020-054764	https://dx.doi.org/10.1136/sextrans-2020-054764	OBJECTIVES: This prospective cohort study aimed to determine the natural history and incidence of oropharyngeal gonorrhoea and chlamydia among a cohort of men who have sex with men (MSM) over a 12-week period, and to examine risk factors associated with incident oropharyngeal infections. METHODS: MSM either aged ≥18 years and had a diagnosis of oropharyngeal gonorrhoea by nucleic acid amplification test (NAAT) in the past 3 months or aged 18-35 years who were HIV-negative taking pre-exposure prophylaxis (PrEP) were eligible for this study. Enrolled men were followed up for 12 weeks. Oropharyngeal swabs were collected at week 0 (baseline) and week 12 (end of study). Between these time points, weekly saliva specimens and the number of tongue kissing, penile-oral and insertive rimming partners were collected by post. Oropharyngeal swabs and saliva specimens were tested by NAAT for Neisseria gonorrhoeae and Chlamydia trachomatis. Poisson regression was performed to examine the risk factors (weekly number of partners) associated with incident oropharyngeal infections. RESULTS: A total of 100 MSM were recruited. The incidence of oropharyngeal gonorrhoea and chlamydia was 62 (95% CI 37 to 105) and 9 (95% CI 2 to 35)/100 person-years, respectively. The median duration of incident oropharyngeal infection with gonorrhoea was 28 days (IQR=21-36, n=7). The incidence rate ratio (IRR) for oropharyngeal gonorrhoea increased with an increased number of kissing partners (IRR=1.08; 95% CI 1.03 to 1.12) an increased number of penile-oral sex partners (IRR=1.07, 95% CI 1.01 to 1.14) but not with an increased number of insertive rimming partners (IRR=1.11, 95% CI 0.96 to 1.29) or other demographic factors. The IRR and duration of incident oropharyngeal chlamydia were not calculated due to the small number of cases (n=2). CONCLUSIONS: MSM have a high incidence of oropharyngeal gonorrhoea and the median duration of infection was less than 3 months. Article	2021	Claassen C.W.; Mumba D.; Njelesani M.; Nyimbili D.; Mwango L.K.; Mwitumwa M.; Mubanga E.; Mulenga L.B.; Chisenga T.; Nichols B.E.; Hendrickson C.; Chitembo L.; Okuku J.; O'Bra H.	Initial implementation of PrEP in Zambia: Health policy development and service delivery scale-up	BMJ Open	-	-	-	20446055	10.1136/bmjopen-2020-047017	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85109591127&doi=10.1136%2fbmjopen-2020-047017&partnerID=40&md5=a4237d7bc11305beed324f46ca87547e	Daily pre-exposure prophylaxis (PrEP) for HIV prevention is highly effective, but not yet widely deployed in sub-Saharan Africa. We describe how Zambia developed PrEP health policy and then successfully implemented national PrEP service delivery. Zambia introduced PrEP as a key strategy for HIV prevention in 2016, and established a National PrEP Task Force to lead policy advocacy and development. The Task Force was composed of government representatives, regulatory agencies, international donors, implementation partners and civil society organisations. Following an implementation pilot, PrEP was rolled out nationally using risk-based criteria alongside a national HIV prevention campaign. In the first year of implementation, ending September 2018, 3626 persons initiated PrEP. By September 2019, the number of people starting PrEP increased by over sixfold to 23327 persons at 728 sites across all ten Zambian provinces. In the first 2years, 26953 clients initiated PrEP in Zambia, of whom 31% were from key and priority populations. Continuation remains low at 25% and 11% at 6 and 12 months, respectively. Risk-based criteria for PrEP ensures access to those most in need of HIV prevention. Healthcare worker training in PrEP service delivery and health needs of key and priority populations is crucial. PrEP expansion into primary healthcare clinics and community education is required to reach full potential. Additional work is needed to understand and address low PrEP continuation. Finally, a task force of key stakeholders can rapidly develop and implement health policy, which may serve as a model for countries seeking to implement PrEP. © Author(s) (or their employer(s)) 2021. Article	2021	Clark, Jesse; Reisner, Sari; Perez-Brumer, Amaya; Huerta, Leyla; Sanchez, Hugo; Moriarty, Kathleen; Luque, Maria Mamani; Okochi, Hideaki; Salazar, Ximena; Mimiaga, Matthew; Sanchez, Jorge; Gandhi, Monica; Mayer, Kenneth H; Lama, Javier R	TransPrEP: Results from the Pilot Study of a Social Network-Based Intervention to Support PrEP Adherence Among Transgender Women in Lima, Peru.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03117-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8084919	We conducted a pilot randomized controlled trial of a social network-based intervention to promote PrEP adherence among transgender women (TW) in Lima, Peru. We enrolled 89 TW from six social networks and cluster-randomized them 1:1 to standard of care (n = 44) or the TransPrEP intervention (n = 45). Core workshops discussed strategies to support PrEP adherence and defined group adherence objectives. Maintenance workshops discussed participants' experiences taking PrEP and collective adherence goals. At 3-month follow-up, we evaluated 40 participants and obtained 29 hair samples for tenofovir level measurements. Though no significant differences were observed, 36.4% (4/11) of participants of TransPrEP participants and 10.0% (1/10) of control participants had tenofovir levels > 0.023 ng/mg, consistent with ≥ 4 doses per week. 81.8% (9/11) of intervention and 40.0% (4/10) of control participants had any detectable tenofovir in their hair. Pilot assessment of our network-based intervention suggested a trend towards improved PrEP adherence, measured objectively, for TW in Peru.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Theses and Dissertations	2021	Claudio, Ashley	Addressing Missed Opportunity PrEP Patients due to Provider Competency	-	-	California State University System	-	NA	NA	http://hdl.handle.net/10211.3/219595	HIV has disproportionately affected people of color, specifically men who have sex with men (MSM). In 2018, Latinx and African American MSM made up 27% and 42% of new HIV diagnosis in the United States. Pre-exposure prophylaxis (PrEP) an HIV prevention tool has shown to be highly effective with over 1.1 million adults possibly benefiting from the medication but only a minority are using PrEP. Given the high number of people who would benefit from PrEP, primary care providers (PCPs) such Northeast Valley Health Corporation (NEVHC) are joining the End the Epidemic movement by disseminating PrEP to those most at risk for HIV, although providers remain hesitant about its effectiveness and guidelines for prescribing due to lack of provider training. The proposed project is an educational intervention for NEVHC providers to increase the uptake of PrEP by discussing PrEP efficacy, clinical practice guidelines, and the identification of high risk for HIV individuals. Using the Health Belief Model and Theory of Reasoned Action as frameworks we will address the barriers, increase knowledge and self -efficacy to prescribing PrEP. As rates of HIV remain stagnant and people continue to engage in risky behaviors, PrEP provides a layer of protection for these individuals. Ensuring NEVHC providers can identify, provide education, and prescribe this medication can help lower the rates of HIV among Latinx and AA MSM as well as other at-risk groups in turn helping end the HIV epidemic. Article	2021	Clement M.E.; Nicchitta M.; Sun Y.; Ellis A.; Chakraborty H.; McGee K.; Eagle C.; Frye J.; Taylor D.; Okeke N.L.; Johnston B.; Seña A.C.; McKellar M.	Preexposure Prophylaxis Outcomes in an Urban Community in North Carolina: Discontinuation of Care and Sexually Transmitted Infections	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001288	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102091003&doi=10.1097%2fOLQ.0000000000001288&partnerID=40&md5=b7a5d89819ec022ee88570fc76d9b035	Background Few studies have examined long-term outcomes among persons who initiate preexposure prophylaxis (PrEP) in the South, including PrEP discontinuation and sexually transmitted infection (STI) rates. Methods Care discontinuation (>6 months without a PrEP appointment) and incident STIs were evaluated for patients at 2 PrEP clinics in Durham, NC. We tested for predictors of discontinuation as a binary variable using logistic regression. Model covariates included age, race/ethnicity, sex, known HIV-positive partner, commercial sex work, men who have sex with men (MSM) versus not MSM, type of insurance, and clinic site. A similar analysis was completed for STI incidence, controlling for days in the study. Results Among 271 patients, mean age was 33.2 years, 46.9% were Black and 11.1% were Latino, 81.2% were MSM, and 32% were uninsured. Preexposure prophylaxis was discontinued in 47%, and another 11% had intermittent care. Sexually transmitted infection incidence was 45.4/100 person-years, and 5 patients were diagnosed with HIV at baseline or in follow-up. Men who have sex with men were less likely to discontinue PrEP relative to non-MSM (odds ratio OR, 0.26; 95% confidence interval CI, 0.10-0.64). Baseline STI was associated with a higher likelihood of incident STI (OR, 8.19; 95% CI, 3.69-19.21), whereas care discontinuation was associated with a lower likelihood of STI (OR, 0.28; 95% CI, 0.11-0.65). Conclusions Preexposure prophylaxis programs in the Southern United States are reaching uninsured and predominantly Black and Latino MSM, but discontinuation rates are high despite elevated rates of incident STI and HIV. Further work is required to elucidate causes of PrEP discontinuation and encourage persistence in care. © Lippincott Williams & Wilkins.	pre-exposure prophylaxis (PrEP); discontinuation; persistence; sexually transmitted infections; syphilis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Clifford-Rashotte, Matthew; Fawcett, Natalie; Fowler, Barbara; Reinhart, Jeffrey; Tan, Darrell H S	Assessing the Potential for Nurse-Led HIV Pre- and Postexposure Prophylaxis in Ontario.	Canadian Journal of Nursing Research	-	-	-	1705-7051	10.1177/0844562120924269	https://dx.doi.org/10.1177/0844562120924269	BACKGROUND AND PURPOSE: HIV prevention efforts in Ontario require increased implementation of strategies including post- and pre-exposure prophylaxis. Access to these interventions could be improved by their provision through nurse-led models of care. We assessed nurses' readiness to deliver these interventions using a behavioral change framework. METHODS: We distributed an online survey to nurses in every Ontario sexual health clinic, HIV clinic, and community health center between March-June 2018, to determine the level of support for nurse-led postexposure prophylaxis/pre-exposure prophylaxis; we also explored nurses' "capabilities," "opportunities," and "motivations" for providing postexposure prophylaxis/pre-exposure prophylaxis. RESULTS: Overall, 72.7% of respondents supported implementation of both nurse-led postexposure prophylaxis and pre-exposure prophylaxis. More experienced nurses were less likely to support postexposure prophylaxis and pre-exposure prophylaxis (adjusted odds ratio = 0.55 per decade nursing, 95% confidence interval (0.37, 0.82)). Nurses reported a high degree of knowledge of topics related to postexposure prophylaxis/pre-exposure prophylaxis, with the exception of creatinine interpretation. CONCLUSIONS: Ontario nurses report high levels of support for nurse-led postexposure prophylaxis and pre-exposure prophylaxis and are well positioned to provide these interventions. Targeted education and implementation efforts are needed to engage these nurses in postexposure prophylaxis and pre-exposure prophylaxis delivery.	acesso restrito	English	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Quantitative

Article	2021	Coleman C.G.; Sales J.M.; Escoffery C.; Piper K.N.; Powell L.; Sheth A.N.	Primary Care and Pre-exposure Prophylaxis Services in Publicly Funded Family Planning Clinics in the Southern United States	Journal of General Internal Medicine	-	-	-	8848734	10.1007/s11606-020-06509-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099458099&doi=10.1007%2fs11606-020-06509-3&partnerID=40&md5=043c1e322f344faab59b5f84c267377a	Background: HIV pre-exposure prophylaxis (PrEP) is underutilized by US women. Cost and resource concerns are barriers to PrEP delivery in settings that see men. Family planning clinics may be ideal PrEP delivery settings for women, but as they are not uniform in their clinical services, cost and resource concerns may vary. Objective: We examined factors that influence perceptions of costs and resources related to PrEP delivery in Title X–funded family planning clinics in Southern states, which overlaps with high HIV-burden areas. Design: We conducted a web-based survey among a convenience sample of clinicians and administrators of Title X clinics across 18 Southern states (DHHS regions III, IV, VI). We compared cost- and resource-related survey items and other clinic- and county-level variables between clinics by whether their clinics also provided other primary care services. We analyzed interviews for cost and resource themes. Participants: Title X clinic staff in the South. Key Results: Among 283 unique clinics, a greater proportion of clinics that also provided primary care currently provided PrEP compared with those that did not provide primary care (27.8% vs. 18.3%, p = 0.06), but this difference was not statistically significant. Among 414 respondents in clinics that were not providing PrEP, those in clinics with primary care services were more likely to respond that they had the necessary financial resources (p < 0.01) and staffing (p < 0.01) for PrEP implementation compared to those without primary care services. In interviews, respondents differed on concerns about costs of labs and staffing based on whether their clinic had concomitant primary care services or not. Conclusions: Among publicly funded Southern family planning clinics, current PrEP provision was higher among clinics with concomitant primary care. Among clinics not providing PrEP, those with concomitant primary care services have lower perceived cost and resource barriers and therefore may be optimal for expanding PrEP among women. © 2021, Society of General Internal Medicine.	family planning; HIV; PrEP; Title X; women's health	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2021	Collins, Pamela Y.; Velloza, Jennifer; Concepcion, Tessa; Oseso, Linda; Chwastiak, Lydia; Kemp, Christopher G.; Simoni, Jane; Wagenaar, Bradley H.	Intervening for HIV prevention and mental health: a review of global literature.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25710	https://pubmed.ncbi.nlm.nih.gov/34164934/	INTRODUCTION: Numerous effective HIV prevention options exist, including behaviour change interventions, condom promotion and biomedical interventions, like voluntary medical male circumcision and pre-exposure prophylaxis. However, populations at risk of HIV also face overlapping vulnerabilities to common mental disorders and severe mental illness. Mental health status can affect engagement in HIV risk behaviours and HIV prevention programmes. We conducted a narrative review of the literature on HIV prevention among key populations and other groups vulnerable to HIV infection to understand the relationship between mental health conditions and HIV prevention outcomes and summarize existing evidence on integrated approaches to HIV prevention and mental healthcare. METHODS: We searched five databases for studies published from January 2015 to August 2020, focused on HIV prevention and mental health conditions among key populations and individuals with serious mental illness. Studies were included if they evaluated an HIV prevention intervention or assessed correlates of HIV risk reduction and included assessment of mental health conditions or a mental health intervention. RESULTS AND DISCUSSION: We identified 50 studies meeting our inclusion criteria, of which 26 were randomized controlled trials or other experimental designs of an HIV prevention intervention with or without a mental health component. Behaviour change interventions were the most common HIV prevention approach. A majority of studies recruited men who have sex with men and adolescents. Two studies provided distinct approaches to integrated HIV prevention and mental health service delivery. Overall, a majority of included studies showed that symptoms of mental disorder or distress are associated with HIV prevention outcomes (e.g. increased risky sexual behaviour, poor engagement in HIV prevention behaviours). In addition, several studies conducted among groups at high risk of poor mental health found that integrating a mental health component into a behaviour change intervention or linking mental health services to combination prevention activities significantly reduced risk behaviour and mental distress and improved access to mental healthcare. CONCLUSIONS: Evidence suggests that mental health conditions are associated with poorer HIV prevention outcomes, and tailored integrated approaches are urgently needed to address overlapping vulnerabilities among key populations and other individuals at risk. Article	2021	Colombini, Manuela; Scorgie, Fiona; Stangl, Anne; Harvey, Sheila; Ramskin, Lethabo; Khoza, Nomhle; Mashauri, Emma; Baron, Deborah; Lees, Shelley; Kapiga, Saidi; Watts, Charlotte; Delany-Moretlwe, Sinead	Exploring the feasibility and acceptability of integrating screening for gender-based violence into HIV counselling and testing for adolescent girls and young women in Tanzania and South Africa.	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-021-10454-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7927237	BACKGROUND: Gender-based violence (GBV) undermines HIV prevention and treatment cascades, particularly among women who report partner violence. Screening for violence during HIV testing, and prior to offering pre-exposure prophylaxis (PrEP) to HIV uninfected women, provides an opportunity to identify those at heightened HIV risk and greater potential for non-adherence or early discontinuation of PrEP. The paper describes our experience with offering integrated GBV screening and referral as part of HIV counselling and testing. This component was implemented within EMPOWER, a demonstration project offering combination HIV prevention, including daily oral PrEP, to young women in South Africa and Tanzania. METHODS: Between February 2017 and March 2018, a process evaluation was conducted to explore views, experiences and practices of stakeholders (study participants and study clinical staff) during implementation of the GBV screening component. This article assesses the feasibility and acceptability of the approach from multiple stakeholder perspectives, drawing on counselling session observations (n = 10), in-depth interviews with participants aged 16-24 (n = 39) and clinical staff (n = 13), and notes from debriefings with counsellors. Study process data were also collected (e.g. number of women screened and referred). Following a thematic inductive approach, qualitative data were analysed using qualitative software (NVivo 11). RESULTS: Findings show that 31% of young women screened positive for GBV and only 10% requested referrals. Overall, study participants accessing PrEP were amenable to being asked about violence during HIV risk assessment, as this offered the opportunity to find emotional relief and seek help, although a few found this traumatic. In both sites, the sensitive and empathetic approach of the staff helped mitigate distress of GBV disclosure. In general, the delivery of GBV screening in HCT proved to be feasible, provided that the basic principles of confidentiality, staff empathy, and absence of judgment were observed. However, uptake of linkage to further care remained low in both sites. CONCLUSION: Most stakeholders found GBV screening acceptable and feasible. Key principles that should be in place for young women to be asked safely about GBV during HIV counselling and testing included respect for confidentiality, a youth-friendly and non-judgmental environment, and a functioning referral network. Article	2021	Colyer, Sean; Lachowsky, Nathan J; Schmidt, Axel J; Adam, Barry D; Paquette, Dana; Hart, Trevor A; Brennan, David J; Blais, Martin; Kroch, Abigail E	Measures of HIV Pre-exposure Prophylaxis Uptake Among Gay, Bisexual, and Other Men Who Have Sex with Men in Canada and Demographic Disparities Among Those at Elevated Likelihood for HIV Acquisition.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03336-3	https://dx.doi.org/10.1007/s10461-021-03336-3	HIV pre-exposure prophylaxis (PrEP) is an effective prevention tool being scaled up in Canada. We describe PrEP uptake and identify demographic correlates of uptake among gay, bisexual, and other men who have sex with men (gbMSM) at elevated HIV risk using data from an online survey of gbMSM residing in Canada between Oct 2017 and Jan 2018. Among the 969 participants at elevated HIV risk who had recently tested for HIV, 96.0%, 83.3%, 72.6%, and 39.7% reported awareness, knowledge, acceptability, and pursuit of PrEP, respectively; 27.1% had ever and 24.6% were currently taking PrEP. The strongest correlate of PrEP uptake was living in a city of ≥ 500,000 inhabitants; others included being open to all or almost all family, friends, and colleagues regarding sexual attraction to men, greater financial coping, and being 30-49 years of age. Improved upscaling of PrEP in Canada may be accomplished through consideration of these disparities.	na	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Quantitative
Article	2021	Constanza A.P.; Valeria S.Á.	Acceptability of pre-exposure prophylaxis for HIV prevention among gay men and other men who have sex with men: Analysis of LAMIS 2018-Chile; Aceptabilidad a usar profilaxis pre-exposición para VIH en hombres gay y otros hombres que tienen sexo con hombres: Indagación en LAMIS 2018 Chile	Revista Chilena de Infectologia	-	-	-	7161018	10.4067/s0716-10182021000500655	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133476720&doi=10.4067%2fs0716-10182021000500655&partnerID=40&md5=f38cde13ff2a511d56d63ded3e48fac1	Background: Chile is facing a re-emergence of the HIV epidemic, concentrated among men who have sex with men (MSM). Pre-exposure prophylaxis (PrEP) is a biomedical intervention that effectively prevents HIV transmission among MSM. Aim: The study was designed to estimate acceptability of PrEP and identify factors associated with PrEP-related attitudes and behaviors among MSM using LAMIS 2018 - Chile data. Methods: Data were taken from the LAMIS 2018 - Chile study, a cross-sectional study of gay, bisexual, transgender, and other MSM. Our subsample included 3976 participants with self-reported HIV-negative or unknown status who responded to sociodemographic questions and items related to PrEP. Bivariate analysis and multivariate logistic regression analysis were performed to identify factors associated with acceptability of PrEP. Results and Discussion: A total of 55.7% of the sample reported high PrEP acceptability. Logistic regression indicated that engaging in sex without a condom (ORa = 1.67, IC 95% 1.42-1.97) and having previously used PrEP (ORa = 1.99, IC 95% 1.41-1.62) were associated with high acceptability to use PrEP, while having a stable partner was associated with low acceptability. The estimate of PrEP acceptability was relatively high among participants. However, interventions to increase awareness and promote demand for PrEP may be beneficial. Furthermore, this study demonstrates the need for non-governmental organizations to participate in such strategies and for measures that address regionally-relevant emerging phenomena. © 2021, Sociedad Chilena de Infectologia. Article	2021	Cooper R.L.; Juarez P.D.; Morris M.C.; Ramesh A.; Edgerton R.; Brown L.L.; Mena L.; MacMaster S.A.; Collins S.; Juarez P.M.; Tabatabai M.; Brown K.Y.; Paul M.J.; Im W.; Arcury T.A.; Shinn M.	Recommendations for Increasing Physician Provision of Pre-Exposure Prophylaxis: Implications for Medical Student Training	Inquiry (United States)	-	-	-	469580	10.1177/00469580211017666	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106622398&doi=10.1177%2f00469580211017666&partnerID=40&md5=5f62e516ffa9d53790999ff1610bfdf2	There is growing evidence that pre-exposure prophylaxis (PrEP) prevents HIV acquisition. However, in the United States, approximately only 4% of people who could benefit from PrEP are currently receiving it, and it is estimated only 1 in 5 physicians has ever prescribed PrEP. We conducted a scoping review to gain an understanding of physician-identified barriers to PrEP provision. Four overarching barriers presented in the literature: Purview Paradox, Patient Financial Constraints, Risk Compensation, and Concern for ART Resistance. Considering the physician-identified barriers, we make recommendations for how physicians and students may work to increase PrEP knowledge and competence along each stage of the PrEP cascade. We recommend adopting HIV risk assessment as a standard of care, improving physician ability to identify PrEP candidates, improving physician interest and ability in encouraging PrEP uptake, and increasing utilization of continuous care management to ensure retention and adherence to PrEP. © The Author(s) 2021. Article	2021	Cooper R.L.; Tabatabai M.; Juarez P.D.; Ramesh A.; Morris M.C.; Brown K.Y.; Arcury T.A.; Shinn M.; Mena L.A.; Juarez P.-M.	Pre-Exposure Prophylaxis Training among Medical Schools in the United States	Journal of Primary Care and Community Health	-	-	-	21501319	10.1177/21501327211028713	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85109086019&doi=10.1177%2f21501327211028713&partnerID=40&md5=7d48c3c2df5a2572d8f6d9daf47b62e5	Pre-Exposure Prophylaxis (PrEP) has been shown to be an effective method of HIV prevention for men who have sex with-men (MSM) and -transgender women (MSTGWs), serodiscordant couples, and injection drug users; however fewer than 50 000 individuals currently take this regimen. Knowledge of PrEP is low among healthcare providers and much of this lack of knowledge stems from the lack or exposure to PrEP in medical school. We conducted a cross sectional survey of medical schools in the United States to assess the degree to which PrEP for HIV prevention is taught. The survey consisted Likert scale questions assessing how well the students were prepared to perform each skill associated with PrEP delivery, as well as how PrEP education was delivered to students. We contacted 141 medical schools and 71 responded to the survey (50.4%). PrEP education was only reported to be offered at 38% of schools, and only 15.4% reported specific training for Lesbian, Gay, Bisexual, and Transgender (LGBT) patients. The most common delivery methods of PrEP content were didactic sessions with 11 schools reporting this method followed by problem-based learning, direct patient contact, workshops, and small group discussions. Students were more prepared to provide PrEP to MSM compared to other high-risk patients. Few medical schools are preparing their students to prescribe PrEP upon graduation. Further, there is a need to increase the number of direct patient contacts or simulations for students to be better prepared. © The Author(s) 2021. Article	2021	Cooper S.C.; Doonachar A.; Santella A.J.	PrEP Attitudes from MSM and Transwomen in the Largest Suburban HIV Epidemic in the USA	Sexuality Research & Social Policy	-	-	-	18689884	10.1007/s13178-020-00518-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099060540&doi=10.1007%2fs13178-020-00518-x&partnerID=40&md5=94b0891feea36211ca1248ea7c47df1a	Introduction: Long Island has the largest suburban human immunodeficiency virus (HIV) epidemic in the USA with an estimated 5,730 people living with HIV/AIDS in 2018 (most recent data). While pre-exposure prophlaxis (PrEP) is a promising primary intervention strategy to reduce HIV incidence, the uptake of this biomedical prevention strategy has been very low. Factors such as homophobia, stigma, and discrimination against men who have sex with men (MSM) and transgender women still exist in the community through provider interactions, and negatively affect the well-being of these populations. The aim of this study was to examine PrEP knowledge, attitudes, and practices among MSM and transgender women on Long Island. Methods: Fifteen interviews were conducted with MSM and transgender women; interviews were transcribed and analyzed using an inductive method involving constant comparison. Results: Four main themes emerged from our analysis: (1) participants have high agency in accessing and utilizing HIV-related biomedical prevention services; (2) participants had limited understanding of what PrEP is and what it means to be on PrEP; (3) PrEP-user stigma and costs are the biggest barriers to initiating and remaining on PrEP; and (4) E-health, credible Internet-resources, and technology-based programming are needed to support current and potential PrEP users. Conclusions: This study, the first study of PrEP attitudes in a suburban environment, highlights the need for evidence-based health promotion and sexual health interventions designed for suburban gender and sexual minorities that are evidence-based and go beyond goal setting and improving self-efficacy. © 2021, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Cordioli M.; Gios L.; Huber J.W.; Sherriff N.; Folch C.; Alexiev I.; Dias S.; Nöstlinger C.; Gama A.; Naseva E.; Valkovičová Staneková D.; Marcus U.; Schink S.B.; Rosinska M.; Blondeel K.; Toskin I.; Mirandola M.	Estimating the percentage of European MSM eligible for PrEP: Insights from a bio-behavioural survey in thirteen cities	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2020-054786	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099437634&doi=10.1136%2fsextrans-2020-054786&partnerID=40&md5=f395d412929c2382f85a8c9453fe1e93	Objectives This paper aims to estimate the percentage of European men who have sex with men (MSM) who may benefit from pre-exposure prophylaxis (PrEP), applying the three most widely used HIV risk indices for MSM (MSM Risk Index, Menza score, San Diego Early Test (SDET) score) and drawing on a large-scale multisite bio-behavioural survey (Sialon II). Methods The Sialon II study was a bio-behavioural survey among MSM implemented in 13 European cities using either time-location sampling or respondent-driven sampling. Biological and behavioural data from 4901 MSM were collected. Only behavioural data of HIV-negative individuals were considered. Three widely used risk indices to assess HIV acquisition risk among MSM were used to estimate individual HIV risk scores and PrEP eligibility criteria. Results 4219 HIV-negative MSM were considered. Regardless the HIV risk score used and the city, percentages of MSM eligible for PrEP were found to range between 5.19% and 73.84%. Overall, the MSM Risk Index and the Menza score yielded broadly similar percentages, whereas the SDET Index provided estimates constantly lower across all cities. Although all the three scores correlated positively (r>0.6), their concordance was highly variable (0.01<CCC<0.62). Conclusion Our findings showed the impact of different scoring systems on the estimation of the percentage of MSM who may benefit from PrEP in European cities. Although our primary aim was not to compare the performance of different HIV risk scores, data show that a considerable percentage of MSM in each city should be offered PrEP in order to reduce HIV infections. As PrEP is highly effective at preventing HIV among MSM, our findings provide useful, practical guidance for stakeholders in implementing PrEP at city level to tackle HIV infections in Europe. © 2021 Author(s). Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002685	https://dx.doi.org/10.1097/QAI.0000000000002685	BACKGROUND: PrEPX was an Australian HIV pre-exposure prophylaxis (PrEP) study conducted between 2016 and 2018. This analysis aimed to estimate hepatitis C (HCV) incidence and explore likely modes of transmission. SETTING: Cohort study of PrEP users in Victoria, Australia. METHODS: HCV tests were conducted at enrollment and every 12 months thereafter. HCV incident cases were identified from laboratory data. Likely modes of transmission were inferred from computer-assisted self-interviews, medical records, and interviews. RESULTS: Among 3202 PrEPX participants tested for HCV at baseline, HCV RNA-positive prevalence was 0.22% (95% confidence interval: 0.09 to 0.45). Among participants testing HCV antibody-negative or RNA-negative at baseline, 2058 had at least one follow-up HCV test. Eight incident HCV cases were identified during 2111 person-years of follow-up (incidence 0.38/100 person-years); all were primary infections in men who had sex with men. Clinical, laboratory, and computer-assisted self-interviews data were available for all, and 6 cases were interviewed. Three cases were attributable to injecting drug use (IDU). A fourth case reported IDU, but his HCV was attributable to sexual transmission. Four other cases reported no IDU and probably acquired HCV sexually. Most cases reported anal trauma in the context of condomless receptive anal intercourse during group sex at sex-on-premises venues. CONCLUSIONS: In PrEPX, HCV incidence was low compared to international PrEP studies, and most cases were sexually acquired. Our findings highlight the need for HCV prevention messaging by clinicians, in sex-on-premises venues, and on digital platforms used to arrange group sex; and the need for HCV screening among some PrEP-using men who have sex with men.	na	English	United States	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Mixed methods

Journal of Clinical Investigation	-	-	-	1558-8238	10.1172/JCI148013	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8592547	Persons living with HIV (PLWH) are at increased risk of tuberculosis (TB). HIV-associated TB is often the result of recent infection with Mycobacterium tuberculosis (M. tuberculosis) followed by rapid progression to disease. Alveolar macrophages (AMs) are the first cells of the innate immune system that engage M. tuberculosis, but how HIV and antiretroviral therapy (ART) affect the anti-mycobacterial response of AMs is not known. To investigate the impact of HIV and ART on the transcriptomic and epigenetic response of AMs to M. tuberculosis, we obtained AMs by bronchoalveolar lavage from 20 PLWH receiving ART, 16 control subjects who were HIV-free (HC), and 14 subjects who received ART as preexposure prophylaxis (PrEP) to prevent HIV infection. Following in vitro challenge with M. tuberculosis, AMs from each group displayed overlapping but distinct profiles of significantly up- and downregulated genes in response to M. tuberculosis. Comparatively, AMs isolated from both PLWH and PrEP subjects presented a substantially weaker transcriptional response. In addition, AMs from HC subjects challenged with M. tuberculosis responded with pronounced chromatin accessibility changes while AMs obtained from PLWH and PrEP subjects displayed no significant changes in their chromatin state. Collectively, these results revealed a stronger adverse effect of ART than HIV on the epigenetic landscape and transcriptional responsiveness of AMs.	AIDS/HIV; Epigenética; Perfil de expressão; Doença infecciosa; Tuberculose. Article	2021	Costa, Adriano Henrique Caetano; Gonçalves, Tonantzin Ribeiro	"Os vulneráveis dos vulneráveis": masculinidades e Profilaxia Pós-Exposição no serviço de saúde no Sul do Brasil	Sexualidad, Salud y Sociedad - Revista Latinoamericana	-	-	-	1984-6487	https://doi.org/10.7440/res64.2018.03	https://www.redalyc.org/articulo.oa?id=293369761017	Based on an ethnography work with users and health professionals from a specialized HIV/AIDS Service in Southern Brazil, the article discussed the application of new prevention strategies in vulnerable populations, especially among men. It argues the importance of considering the ways created and adapted by men to manage the risks of HIV infection. It also addresses how prevention practices and messages are shaped by individuals and communities, as a way of adapting them to their sexual desires and practices, with gender relationships and vulnerabilities playing a central role in the users and health professionals' use of the health policies and the available biotechnological tools. In this sense, the article sheds light on how the construction of masculinities conforms the way in which men trigger HIV/ AIDS prevention strategies. Theses and Dissertations	2021	COSTA, OTAVIO LUIZ	Os Diversos Usos da PrEP: as narrativas e discursos dos usuários sobre prevenção e HIV/Aids	-	-	UNIVERSIDADE FEDERAL DO PARANÁ	-	-	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=10964143	O objetivo da presente dissertação é compreender o conjunto de discursos e dispositivos que compõem a profilaxia pré-exposição (PrEP) e a pessoa que adota essa estratégia para prevenção a infecção pelo HIV/Aids. Através do referencial teórico da genealogia do poder e da ética de si propostos por Michel Foucault, a pesquisa compreende o arquivo que compõe esta tecnologia de prevenção ao vírus do HIV elencando o conjunto de relações sociais que emanam desse dispositivo, os processos de subjetivação, sujeição e reflexividade, as representações discursivas sobre HIV/Aids e a PrEP e as redes de poder e saber. Para tal, foram utilizados três arquivos analisados para construção do conhecimento realizado nesta pesquisa, que são: a participação do pesquisador em um projeto de testagem para o HIV realizado por uma ONG de Curitiba, o Grupo Dignidade; a aplicação de um questionário voltado para homens gays e outros homens que fazem sexo com homens (HSH); e a entrevista com onze pessoas que usam ou utilizaram a PrEP. Para construir a genealogia da PrEP foi necessário pensar os discursos sobre os processos de saúde e doença bem como a discussão sobre o campo das políticas públicas de HIV/Aids, elencando seus principais momentos e como ocorreu a formulação da agenda pública dessa questão no país. Enquanto conclusão do estudo, constata-se que a adoção a PrEP enquanto medida de prevenção ao HIV relaciona aspectos da ordem subjetiva e pessoal bem como os aspectos biopolíticos presentes no discurso oficial de prevenção. Article	2021	Cotte, Laurent; Veyer, David; Charreau, Isabelle; Péré, Hélène; Cua, Eric; Carette, Diane; Chas, Julie; Capitant, Catherine; Chidiac, Christian; Fléjou, Jean-François; Fouéré, Sébastien; Heard, Isabelle; Meyer, Laurence; Puech, Julien; Tremblay, Cécile; Delaugerre, Constance; Molina, Jean-Michel	Prevalence and Incidence of Human Papillomavirus Infection in Men Having Sex With Men Enrolled in a Pre-exposure Prophylaxis Study: A Sub-study of the Agence Nationale de Recherches sur le SIDA et les Hépatites Virales "Intervention Préventive de l'Exposition aux Risques avec et pour les hommes Gays" Trial.	Clinical Infectious Diseases	-	-	-	1537-6591	10.1093/cid/ciaa002	https://dx.doi.org/10.1093/cid/ciaa002	BACKGROUND: Human papillomavirus (HPV) infection is more frequent in men having sex with men (MSM) who are living with human immunodeficiency virus (HIV) than in MSM without HIV. There are currently no data regarding HPV infections in preexposure prophylaxis (PrEP)-using MSM. METHODS: MSM living without HIV who were enrolled in the Agence Nationale de Recherches sur le SIDA et les Hépatites Virales "Intervention Préventive de l'Exposition aux Risques avec et pour les hommes Gays" PrEP study were prospectively enrolled. Anal, penile, and oral samples were collected at baseline and every 6 months for HPV detection and genotyping. Anal swabs for cytology were obtained at baseline and at 24 months. RESULTS: We enrolled 162 participants. The prevalences of any HPV genotypes at baseline were 92%, 32%, and 12% at the anal, penile, and oral sites, respectively. High-risk (HR) HPV genotypes were observed in 84%, 25%, and 10% of anal, penile, and oral baseline samples, respectively. Nonavalent HPV vaccine genotypes were observed in 77%, 22%, and 6% of anal, penile, and oral baseline samples, respectively. Multiple infections were observed in 76%, 17%, and 3% of cases at the anal, penile, and oral sites, respectively. The most frequent HR genotypes were HPV 53, 51, and 16 in anal samples; HPV 33, 39, and 73 in penile samples; and HPV 66 in oral samples. The incidence of any HPV genotype at the anal site was 86.2/1000 person-months and the incidence of HR-HPV genotypes was 72.3/1000 person-months. The baseline cytology was normal in 32% of cases and was classified as atypical squamous cells of undetermined significance, low-grade squamous intra-epithelial lesion, high-grade squamous intra-epithelial lesion (HSIL), and atypical squamous cells that cannot exclude HSIL in 23%, 40%, 5%, and 1% of cases, respectively. CONCLUSIONS: PrEP users have a similar risk of HPV infection as MSM living with HIV and the risk is much higher than that previously reported in MSM living without HIV.	HIV negative; HPV; MSM; PrEP. Article	2021	Cox, Joseph; Apelian, Herak; Moodie, Erica E M; Messier-Peet, Marc; Hart, Trevor A; Grace, Daniel; Moore, David M; Lachowsky, Nathan J; Armstrong, Heather L; Jollimore, Jody; Skakoon-Sparling, Shayna; Rodrigues, Ricky; Tan, Darrell H S; Maheu-Giroux, Mathieu; Noor, Syed W; Lebouché, Bertrand; Tremblay, Cecile; Olarewaju, Gbolahan; Lambert, Gilles	Use of HIV pre-exposure prophylaxis among urban Canadian gay, bisexual and other men who have sex with men: a cross-sectional analysis of the Engage cohort study.	CMAJ Open	-	-	-	2291-0026	10.9778/cmajo.20200198	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8177951	BACKGROUND: In Canada, gay, bisexual and other men who have sex with men (GBM) are disproportionately affected by HIV. Our objective was to describe access to HIV pre-exposure prophylaxis (PrEP) and identify factors associated with not using PrEP among self-reported HIV-negative or HIV-unknown GBM. METHODS: This was a cross-sectional analysis of the Engage study cohort. Between 2017 and 2019, sexually active GBM aged 16 years or more in Montréal, Toronto and Vancouver were recruited via respondent-driven sampling (RDS). Participation included testing for HIV and sexually transmitted and blood-borne infections, and completion of a questionnaire. We examined PrEP access using a health care services model and fit RDS-adjusted logistic regressions to determine correlates of not using PrEP among those for whom PrEP was clinically recommended and who were aware of the intervention. RESULTS: A total of 2449 GBM were recruited, of whom 2008 were HIV-negative or HIV-unknown; 1159 (511 in Montréal, 247 in Toronto and 401 in Vancouver) met clinical recommendations for PrEP. Of the 1159, 1100 were aware of PrEP (RDS-adjusted proportion: Montréal 84.6%, Toronto 94.2%, Vancouver 92.7%), 678 had felt the need for PrEP in the previous 6 months (RDS-adjusted proportion: Montréal 39.2%, Toronto 56.1%, Vancouver 49.0%), 406 had tried to access PrEP in the previous 6 months (RDS-adjusted proportion: Montréal 20.6%, Toronto 33.2%, Vancouver 29.6%) and 319 had used PrEP in the previous 6 months (RDS-adjusted proportion: Montréal 14.5%, Toronto 21.6%, Vancouver 21.8%). Not using PrEP was associated with several factors, including not feeling at high enough risk, viewing PrEP as not completely effective, not having a primary care provider and lacking medication insurance. INTERPRETATION: Although half of GBM met clinical recommendations for PrEP, less than a quarter of them reported use. Despite high levels of awareness, a programmatic response that addresses PrEP-related perceptions and health care system barriers is needed to scale up PrEP access among GBM in Canada.	na	English	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Quantitative
Article	2021	Craddock, Jaih B; Mangum, Laurenia C; Aidoo-Frimpong, Gloria; Whitfield, Darren L	The Associations of HIV Pre-Exposure Prophylaxis Interest and Sexual Risk Behaviors Among Young Black Women.	AIDS Patient Care and STDs	-	-	-	1557-7449	10.1089/apc.2020.0259	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8262384	The uptake of pre-exposure prophylaxis (PrEP) is low among young Black cisgender heterosexual women, although this subgroup faces a higher burden of new HIV diagnoses. This study explored the association between sexual risk and prevention behaviors, and oral PrEP and vaginal PrEP ring interest among young Black women (YBW). A sample of YBW (N = 208) 18-25 years of age completed a self-administered questionnaire assessing sexual risk and prevention behaviors, HIV and sexually transmitted infection (STI) testing, and PrEP interest from June to December 2018. Results revealed that 103 YBW were interested in taking oral or vaginal PrEP, with 43% interested in oral PrEP use only, 28% interested in vaginal PrEP use only, and 29% interested in both oral and vaginal PrEP use. Logistic regressions revealed that YBW who had sex in the last 1-4 weeks or 3-6 months had lower odds of being interested in oral PrEP and YBW who had sex in the last 1-4 weeks had lower odds of being interested in vaginal PrEP compared with those whose last sexual encounter occurred in the last week. A large percentage of our sample was unaware of PrEP at the time of survey administration, but after learning about PrEP became more interested in potential PrEP use. This indicates that more education about the benefits of PrEP coupled with harm reduction counseling to lower their risk of STI and HIV infections is necessary to increase PrEP interest among YBW. Article	2021	Crawford, Natalie D; Albarran, Taynel; Chamberlain, Allison; Hopkins, Roderick; Josma, Dorie; Morris, Joseph; Onwubiko, Udodirim N	Willingness to Discuss and Screen for Pre-Exposure Prophylaxis in Pharmacies Among Men Who Have Sex With Men.	Journal of Pharmacy Practice	-	-	-	1531-1937	10.1177/0897190020904590	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10443399	OBJECTIVE: To determine the willingness to discuss and be screened for pre-exposure prophylaxis (PrEP) in pharmacies among MSM. METHODS: Led by Georgia's Fulton County Board of Health, this study surveyed individuals who attended 2 Atlanta-based Gay Pride events in 2018. This analysis was limited to those who identified as men who have sex with men (MSM) who were not HIV positive and reported never using PrEP. Multivariable regression was used to determine the correlates of willingness to discuss and be screened for PrEP in-pharmacy. RESULTS: Most (69%) were willing to discuss PrEP with pharmacy staff and 61.35% were willing to be screened for PrEP in-pharmacy. Those who were interested in PrEP were significantly more willing to discuss PrEP in-pharmacy compared to those not interested in PrEP (prevalence ratio PR: 1.65; 95% confidence interval 95% CI: 1.11-2.48). Race was not associated with willingness to discuss PrEP with pharmacy staff. However, black MSM (BMSM) were less willing to be screened in pharmacies than white MSM, until we accounted for interest in PrEP (PR: 1.27; 95% CI: 1.09-1.48). DISCUSSION: Pharmacies may be an optimal setting to expand PrEP access to reach racial minorities who have the highest need but are not being reached. Pharmacy-based PrEP discussions and screening could improve awareness of HIV status and increase PrEP knowledge and uptake. Future studies should determine optimal pharmacy conditions under which PrEP screening and uptake are acceptable for BMSM.	acesso restrito	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Crepaz N.; Mullins M.M.; Higa D.; Gunn J.K.L.; Salabarría-Peña Y.	A rapid review of disparities in HIV prevention and care outcomes among Hispanic/Latino men who have sex with men in the united states	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2021.33.4.276	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113496415&doi=10.1521%2faeap.2021.33.4.276&partnerID=40&md5=f37898ccc4380fca08263251f2c3cd02	In the United States, Hispanic/Latino men who have sex with men (HLMSM) are disproportionally affected by HIV. We conducted a rapid review of national surveillance data to examine disparities in HIV prevention and care outcomes among HLMSM. Thirteen reports provided relevant data from 2011 to 2018. Compared to White MSM, a higher percentage of HIV-negative HLMSM reported not taking PrEP and engaging in condomless sex; a lower percentage of HIV-negative HLMSM at risk for HIV reported PrEP awareness and use; and a lower percentage of HIV-positive HLMSM were aware of their status, linked to HIV care, and virally suppressed. Viral suppression rates in HLMSM were better among Ryan White clients than the national rates, suggesting that access to comprehensive care/ services reduces disparities. Findings also call for identifying individual, social, and structural factors contributing to condomless sex without PrEP use and HIV status unawareness and identifying best approaches for scaling up comprehensive care/services. © 2021 The Guilford Press. Article	2021	Cui, Sitong; Ding, Haibo; Huang, Xiaojie; Wang, Hui; Tang, Weiming; Leuba, Sequoia I; Ye, Zehao; Jiang, Yongjun; Geng, Wenqing; Xu, Junjie; Shang, Hong	Factors Influencing Clinicians' Willingness to Prescribe Pre-exposure Prophylaxis for Persons at High Risk of HIV in China: Cross-sectional Online Survey Study.	JMIR Public Health and Surveillance	-	-	-	2369-2960	10.2196/24235	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8214180	BACKGROUND: Pre-exposure prophylaxis (PrEP) is an effective HIV prevention measure. Clinicians play a crucial role in PrEP implementation, and their knowledge, attitudes, and career experience may affect their willingness to prescribe PrEP. However, little is known about the attitudes and willingness of clinicians to prescribe PrEP in countries without PrEP-specific guidelines. OBJECTIVE: We aimed to determine the factors associated with clinicians being willing to prescribe PrEP in China. METHODS: Between May and June 2019, we conducted an online cross-sectional survey of clinicians in 31 provinces across the six administrative regions in China on the WeChat smartphone app platform. Multivariable logistic regression was used to determine factors associated with willingness to prescribe PrEP. RESULTS: Overall, 777 HIV clinicians completed the survey. Most of the respondents had heard of PrEP (563/777, 72.5%), 31.9% (248/777) thought that PrEP was extremely effective for reducing the risk of HIV infection, and 47.2% (367/777) thought that it was necessary to provide PrEP to high-risk groups. After adjusting for age, gender, ethnicity, and educational background of the clinicians, the following factors signi¬cantly increased the odds of the clinicians being willing to prescribe PrEP: having worked for more than 10 years, compared to 5 years or less (adjusted odds ratio aOR 2.82, 95% CI 1.96-4.05); having treated more than 100 patients living with HIV per month, compared to 50 patients or fewer (aOR 4.16, 95% CI 2.85-6.08); and having heard of PrEP (aOR 7.32, 95% CI 4.88-10.97). Clinicians were less likely to be willing to prescribe PrEP if they were concerned about poor adherence to PrEP (aOR 0.66, 95% CI 0.50-0.88), the lack of PrEP clinical guidelines (aOR 0.47, 95% CI 0.32-0.70), and the lack of drug indications for PrEP (aOR 0.49, 95% CI 0.32-0.76). CONCLUSIONS: About half of all clinicians surveyed were willing to prescribe PrEP, but most surveyed had a low understanding of PrEP. Lack of PrEP clinical guidelines, lack of drug indications, and less than 11 years of work experience were the main barriers to the surveyed clinicians' willingness to prescribe PrEP. Development of PrEP clinical guidelines and drug indications, as well as increasing the availability of PrEP training, could help improve understanding of PrEP among clinicians and, thus, increase the number willing to prescribe PrEP. Article	2021	Cui, Yang; Johnsen, Luke; Thimm, Matthew; Tuddenham, Susan; Rosecrans, Amanda; Davey-Rothwell, Melissa; Ghanem, Khalil; Chaulk, Patrick; Olthoff, Glen; Greenbaum, Adena; Page, Kathleen R	Awareness of and Interest in Pre-Exposure Prophylaxis among Patients Receiving Services at Public Sexually Transmitted Disease Clinics in an Urban Setting	Journal of Health Care for the Poor and Underserved	-	-	-	10492089	10.1353/hpu.2021.0039	https://www.proquest.com/scholarly-journals/awareness-interest-pre-exposure-prophylaxis-among/docview/2507722102/se-2?accountid=8113	The goal of this study was to assess awareness of, interest in, and sources of knowledge about pre-exposure prophylaxis (PrEP) among 1,464 HIV-uninfected patients from public STD clinics in Baltimore. Logistic regression analyses were conducted to examine factors associated with PrEP awareness and interest. Results suggest PrEP awareness and interest in knowing more about PrEP was highest among men who reported sex with men or with both men and women. White patients were more likely to be aware of PrEP than African American patients, and those reporting consistent condom use were more likely to have heard about PrEP than those who never used condoms. The major source of knowledge about PrEP was health care providers. Findings can inform future prioritization of locally targeted PrEP programs to enhance access to and uptake of PrEP among those most at risk for HIV transmission. Article	2021	Cui, Zhuang; Huang, Huijie; Zhang, Tiantian; Yu, Zeyang; Zhang, Honglu; Yao, Tingting; Song, Desheng; Chen, Yang; Peixoto, Elissa; Wang, Chun; Wang, Xiaomeng; Yang, Jie; Liu, Yuanyuan; Li, Changping; Ma, Jun	Low awareness of and willingness to use PrEP in the Chinese YMSM: An alert in YMSM HIV prevention.	HIV Medicine	-	-	-	1468-1293	10.1111/hiv.12990	https://dx.doi.org/10.1111/hiv.12990	OBJECTIVES: Despite being a key population in whom to initiate pre-exposure prophylaxis (PrEP), the awareness of and willingness to use PrEP are still unclear in Chinese young men who have sex with men (YMSM). We report factors associated with PrEP awareness and willingness in the population. METHODS: From 1 August to 31 December 2018, 495 participants aged 15-24 years were included in a cross-sectional study about awareness of and willingness to use PrEP among YMSM. Logistic regression models were used to identify factors associated with two outcomes: awareness of PrEP; and willingness to use PrEP. RESULTS: Among 495 eligible participants, 129 participants (26.1%) knew about PrEP. PrEP awareness among YMSM was associated with higher education level adjusted odds ratio (aOR) = 1.812, 95% CI: 1.113-2.951 and previous HIV testing (aOR = 3.507, 95% CI: 1.261-9.752). YMSM with shorter local residence time (aOR = 0.317, 95% CI: 0.101-0.992) and internet-based partner-seeking (aOR = 0.171, 95% CI: 0.096-0.305) were less likely to be aware of PrEP. In those with previous knowledge of PrEP, 36 (27.9%) conveyed their willingness to use it. PrEP willingness was associated with internet-based partner-seeking (aOR = 9.593, 95% CI: 1.965-46.844). The main barriers influencing those who knew about PrEP but refused to use it were the high price of PrEP (69.9%), the need to use condoms consistently (52.7%), and concerns about side effects (39.8%) and effectiveness of prevention (22.6%). CONCLUSIONS: Chinese YMSM have low awareness of and willingness to use PrEP. Adequate PrEP promotions should be implemented, especially on the Internet and dating software. Article	2021	Dah, Ter Tiero Elias; Yaya, Issifou; Sagaon-Teyssier, Luis; Coulibaly, Alou; Kouamé, Malan Jean-Baptiste; Agboyibor, Mawuényégan Kouamivi; Maiga, Kader; Traoré, Issa; Mora, Marion; Palvadeau, Paméla; Rojas-Castro, Daniela; Diallo, Fodié; Mensah, Ephrem; Anoma, Camille; Keita, Bintou Dembélé; Spire, Bruno; Laurent, Christian	Adherence to quarterly HIV prevention services and its impact on HIV incidence in men who have sex with men in West Africa (CohMSM ANRS 12324 - Expertise France).	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-021-10994-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8141121	BACKGROUND: Access to tailored HIV prevention services remains limited for West African MSM. We assessed adherence to quarterly HIV prevention services and its impact on HIV incidence in MSM followed up in four cities in Burkina Faso, Côte d'Ivoire, Mali, and Togo. METHODS: We performed a prospective cohort study between 2015 and 2018. HIV-negative MSM aged over 18 benefited from quarterly medical visits which included a clinical examination, HIV testing, screening and treatment for other sexually transmitted infections, peer-led counselling and support, and the provision of condoms and lubricants. Determinants of adherence to quarterly follow-up visits and incident HIV infections were identified using generalized estimating equation models and Cox proportional hazard models, respectively. RESULTS: 618 MSM were followed up for a median time of 20.0 months (interquartile range 15.2-26.3). Overall adherence to quarterly follow-up visits was 76.5% (95% confidence interval CI 75.1-77.8), ranging from 66.8% in Abidjan to 87.3% in Lomé (p < 0.001). 78 incident HIV infections occurred during a total follow-up time of 780.8 person-years, giving an overall incidence of 10.0 per 100 person-years (95% CI 8.0-12.5). Adherence to quarterly follow-up visits was not associated with the risk of incident HIV infection (adjusted hazard ratio 0.80, 95% CI 0.44-1.44, p = 0.545). CONCLUSIONS: Strengthening HIV prevention services among MSM in West Africa, including the use of PrEP, will be critical for controlling the epidemic, not only in this key population but also in the general population. Quarterly follow-up of MSM, which is essential for PrEP delivery, appears feasible. Article	2021	Dai, Minhao; Grant Harrington, Nancy	Understanding Beliefs, Intention, and Behavior on Daily PrEP Uptake Among MSM in California and New York.	AIDS Education and Prevention	-	-	-	1943-2755	10.1521/aeap.2021.33.2.129	https://dx.doi.org/10.1521/aeap.2021.33.2.129	Pre-exposure prophylaxis (PrEP) is an effective daily prevention medicine to reduce the risks of HIV infections. Even though the number of PrEP users has been rapidly growing in the United States since 2012, only approximately 5% of the men who have sex with men (MSM) population is currently taking PrEP. This study examined PrEP uptake among MSM using the integrative model of behavioral prediction (IMBP) as the theoretical framework. The authors conducted formative elicitation interviews and a cross-sectional survey with MSM. Among the survey respondents, half of them were PrEP takers and half were not. The path modeling results showed that attitudes and norms predicted behavioral intention, and intention predicted PrEP uptake among MSM. The results also identified the strongest attitudinal predictors and normative referents of PrEP uptake. The study offers practical implications in helping professionals and scholars to understand PrEP uptake among MSM in a theoretically grounded way.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2021	Dai, Minhao; Harrington, Nancy Grant	Intention to Behavior: Using the Integrative Model of Behavioral Prediction to Understand Actual Control of PrEP Uptake Among Gay Men.	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-020-01802-y	https://dx.doi.org/10.1007/s10508-020-01802-y	PrEP is an effective daily prevention medicine used to reduce risks of HIV infections. Previous research has pointed out the intention-behavior gap on PrEP uptake among gay men. The current study built on research examining how the integrative model of behavioral prediction (IMBP) factors influences PrEP uptake among gay men to explore how actual control variables, namely skills and environmental constraints, moderated the intention-behavior relationship. We used results from formative interviews to construct a survey and collected data from 420 gay men. Results showed several factors that were associated with PrEP uptake among gay men. Specifically, the lack of access to an LGBTQ-friendly healthcare provider(s) and lack of English fluency had significant main effects on PrEP uptake behavior, while lack of access to a healthcare provider and lack of healthcare system knowledge were significant moderators of the intention-behavior relationship. This study advances our understanding of the IMBP and offers practical implications for PrEP promotion. Limitations and suggestions for future studies are discussed.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	D'angelo A.B.; Westmoreland D.A.; Carneiro P.B.; Johnson J.; Grov C.	Why Are Patients Switching from Tenofovir Disoproxil Fumarate/Emtricitabine (Truvada) to Tenofovir Alafenamide/Emtricitabine (Descovy) for Pre-Exposure Prophylaxis?	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2021.0033	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112779007&doi=10.1089%2fapc.2021.0033&partnerID=40&md5=e1de10959cc693d33d753353495796a9	Safety differences between tenofovir alafenamide/emtricitabine (TAF) and tenofovir disoproxil fumarate/emtricitabine (TDF/FTC)-formulated pre-exposure prophylaxis (PrEP) appear to have little clinical significance for most PrEP users. Furthermore, generic TDF-formulated PrEP is projected to decrease the price of PrEP. Thus, efforts to shift PrEP users to TAF-formulated PrEP should be considered in light of their potential to undermine efforts to scale-up PrEP nationally. Data are taken from Together 5,000, a US national cohort study predominantly composed of cisgender gay and bisexual men. In 2019-2020, 5034 participants completed their 24-month assessment, which measured whether participants were switching from TDF (Truvada) to TAF (Descovy) for PrEP, and why. Of those reporting PrEP-use (n = 1009), 277 reported using Descovy for PrEP, and 223 provided a reason for switching to Descovy. A content analysis was used to code participant's reasons for switching. Over half (56%) of participants reported that their doctor recommended switching to Descovy. Without mentioning a provider recommendation, 32% of participants reported that perceived improved safety of Descovy, compared with Truvada, motivated their decision to change their prescription. Other factors cited included the smaller size of the pill and "newness"of Descovy. Further, several participants mentioned negative advertising about Truvada as rationale for switching. Although scientific consensus supports the safety of both TDF/FTC and TAF, our results suggest that current messaging through physicians and other sources have emphasized superior safety of TAF-implying that TDF/FTC may not be safe in the long term. Efforts to shift users onto TAF may undermine public perception of TDF-formulated PrEP. © 2021 Mary Ann Liebert, Inc.	brand-name drug; HIV prevention; MSM; PrEP; qualitative research	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	D'Angelo, Alexa B; Davis Ewart Leah N; Koken Juline; Bimbi, David; Brown, Justin T; Grov, Christian	Barriers and Facilitators to Pre-exposure Prophylaxis Uptake Among Black Women: A Qualitative Analysis Guided by a Socioecological Model	The Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000241	https://www.proquest.com/scholarly-journals/barriers-facilitators-pre-exposure-prophylaxis/docview/2626859779/se-2?accountid=8113	Black women experience disparities in HIV incidence. Pre-exposure prophylaxis (PrEP) is a once-daily pill that can prevent HIV transmission. To enhance PrEP uptake among Black women, it is essential to examine their perceptions of PrEP. In 2018, 33 Black women in New York City completed interviews about their attitudes, knowledge, and perceived barriers and facilitators to PrEP use. Emergent themes were organized using a socioecological model. Participants identified barriers at the sociocultural level, including stigma, medical mistrust, and health care avoidance. At the community level, health care access issues and limited community knowledge were reported. Partner-level barriers included trust in partners and meaning attributed to PrEP use within the context of monogamy. Individual-level barriers included low perceived risk and concerns about PrEP's safety and efficacy. Our findings can inform future PrEP research with Black women, as well as PrEP implementation efforts aimed at increasing uptake among this population. Article	2021	D'Angelo, Alexa B; Lopez-Rios, Javier; Flynn, Anthony W P; Holloway, Ian W; Pantalone, David W; Grov, Christian	Insurance- and medical provider-related barriers and facilitators to staying on PrEP: results from a qualitative study.	Translational Behavioral Medicine	-	-	-	1613-9860	10.1093/tbm/ibz191	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7963286	Pre-exposure prophylaxis (PrEP) is a highly effective biobehavioral strategy for preventing HIV acquisition. Although PrEP uptake has increased steadily, discontinuation rates are high among members of key populations like gay and bisexual men (GBM). Understanding the challenges that arise for PrEP users is key to better PrEP implementation and sustained use over time. We report on barriers that arose for PrEP-using GBM, as well as facilitating factors that aided PrEP persistence, with the goal of informing PrEP implementation efforts. In 2015-2016, 103 PrEP-using GBM in NYC completed qualitative interviews about their engagement with PrEP, including their experiences navigating PrEP-related medical care. Interviews were transcribed verbatim, coded, and analyzed thematically. Over half of participants (53%) received their PrEP-related care from their primary care provider (PCP), one-third (33%) from a community-based health clinic, and 13% from multiple medical providers. Emergent themes regarding the barriers and facilitators to PrEP persistence fell into two categories: insurance- and medical appointment-related barriers and facilitators to continued PrEP use. The experiences of PrEP-using GBM can provide useful insights for providers, program developers, and policymakers aiming to improve the implementation of PrEP. To support PrEP persistence, reliable insurance coverage, cost-assistance, and easy appointment scheduling are key to maintenance. Removing insurance- and appointment-related barriers to persistence may prove essential for sustaining use among GBM.	counseling; education; prevention	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Dangerfield D.T., II; Kuo I.; Magnus M.; Beauchamp G.; Fields S.D.; Nelson L.R.; Shoptaw S.; Wilton L.; Wheeler D.P.	Sexual Risk Profiles Among Black Sexual Minority Men: Implications for Targeted PrEP Messaging	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-021-02066-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116043641&doi=10.1007%2fs10508-021-02066-w&partnerID=40&md5=9cadaa0f8a3f9b4930973bdda3725001	Black gay, bisexual, and other Black sexual minority men (BSMM) continue to experience some of the largest sexual health disparities in the U.S. Engaging BSMM in PrEP is crucial to improving sexual health outcomes and reducing disparities. However, knowledge of the profiles of sexual risk and PrEP initiation among this group is limited. This study used latent class analysis to identify HIV risk and PrEP initiation patterns among BSMM in the HPTN 073 Study (n = 226). Guided by current Centers for Disease Control screening guidelines, latent class indicators included relationship status, condom use, number of sexual partners, substance use, sexually transmitted infection (STI) history, and partner HIV status. Age and PrEP initiation were used in a multinomial regression to identify correlates of class membership. Three latent classes were identified: Single, Condomless Partners, Single, Multiple Partners, and Serodiscordant Partners. Single, Condomless Partners had the highest conditional probabilities of having greater than three male partners, substance use before sex, and receiving an STI diagnosis. Serodiscordant Partners had a 100% conditional probability of condomless sex and having a male partner living with HIV. BSMM who initiated PrEP were less likely to be classified as Single, Condomless Partners than Serodiscordant Partners (AOR = 0.07, 95% CI = 0.02, 0.66). Findings support the need for culturally relevant tailored and targeted messaging for BSMM with multiple sexual risk indicators. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Dauria, Emily F; Levine, Andrew; Hill, Samantha V; Tolou-Shams, Marina; Christopoulos, Katerina	Multilevel Factors Shaping Awareness of and Attitudes Toward Pre-exposure Prophylaxis for HIV Prevention among Criminal Justice-Involved Women.	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-020-01834-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8276158	Although pre-exposure prophylaxis (PrEP) is a key tool in HIV prevention efforts, little is known about PrEP as a prevention strategy for criminal justice-involved (CJI) women. The purpose of this study was to examine multilevel factors shaping PrEP awareness and acceptability among CJI women. Between January 2017 and December 2017, we conducted 52 interviews with CJI women at high risk for HIV and stakeholders from the criminal justice (CJ) and public health (PH) systems. Interviews explored awareness of PrEP and the multilevel factors shaping PrEP acceptability. Data were analyzed using inductive thematic analysis and executive summaries. Atlas.ti facilitated analyses. The majority of CJI women (n = 27) were, on average, 41.3 years, from racial and ethnic minority groups (56% Black/African-American; 19% Latinx) and reported engaging in recent high-risk behavior (nearly 60% engaged in transactional sex, 22% reported ≥ 4 sexual partners, and 37% reported injection drug use). Of system stakeholders (n = 25), 52% represented the CJ sector. Although CJI women were generally unaware of PrEP, attitudes toward PrEP were enthusiastic. Barriers to PrEP acceptability included medication side effects (individual level); distrust in HIV prevention mechanisms (community level); lack of local HIV prevention efforts among high-risk women (public policy/HIV epidemic stage level). Factors promoting PrEP included perceived HIV risk (individual level); PrEP being an HIV prevention method that women can control without partner negotiation (social and sexual network level); and availability of public health insurance (community level). Despite low awareness of PrEP, CJI women expressed positive attitudes toward PrEP. To improve PrEP access for CJI women, implementation efforts should address barriers and leverage facilitators across multiple levels to be maximally effective. Article	2021	D'Avanzo, Paul A; Bass, Sarah Bauerle; Kelly, Patrick J; Brajuha, Jesse; Gutierrez-Mock, Luis	Community Belonging and Attitudes Towards HIV Pre-Exposure Prophylaxis (PrEP) Among Transgender Women	AIDS and Behavior	-	-	-	1090-7165	https://doi.org/10.1007/s10461-021-03183-2	https://escholarship.org/uc/item/69f0927n	For transgender (trans) women, community belonging may play an important role in shaping perceptions of HIV Pre-Exposure Prophylaxis (PrEP). A cluster analysis was performed using data obtained from a survey administered to 128 trans women residing in Philadelphia, PA and the San Francisco Bay area, CA. Six items assessing feelings of community belongingness among trans women produced three distinct clusters. Associations were examined between cluster membership and perceptual items including beliefs about PrEP, experiences with healthcare, patient self-advocacy, and perceived trusted sources for PrEP information. Clusters were demographically comparable apart from age. There were significant differences noted between trust in various communication channels and perceptions of PrEP; the least community-connected cluster had less trust and more negative perceptions of PrEP. Analyses suggest that psychographic differences exist based on perceived community belongingness in this population, and this in turn may be consequential in determining how information about PrEP is communicated and diffused to trans women for whom PrEP may be indicated. Article	2021	Davey, Dvora Joseph; Knight, Lucia; Markt-Maloney, Jackie; Tsawe, Nokwazi; Gomba, Yolanda; Mashele, Nyiko; Dovel, Kathryn; Gorbach, Pamina; Bekker, Linda-Gail; Coates, Thomas J	"I had Made the Decision, and No One was Going to Stop Me" —Facilitators of PrEP Adherence During Pregnancy and Postpartum in Cape Town, South Africa	AIDS and Behavior	-	-	-	1090-7165	10.1007/s10461-021-03320-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107220024&doi=10.1007%2fs10461-021-03320-x&partnerID=40&md5=05a4a1e647e0edfcc376d2482ba1b0e6	PrEP is safe and effective but requires adherence during potential HIV exposure, yet the facilitators of long-term maternal adherence are not well understood. We conducted semi-structured interviews with 25 postpartum women who reported high adherence (PrEP use ≥ 25 days in last 30-days and never missed a PrEP prescription in pregnancy/postpartum period) within a PrEP service for pregnant and postpartum women. A thematic approach guided an iterative process of coding and analysis. Themes identified as drivers of optimal PrEP use were HIV risk perception, mainly because of partner's behaviors and unknown serostatus, and a strong desire to have a baby free of HIV. Reported disclosure of PrEP use facilitated PrEP adherence. Women discussed having partner and family support, which included reminders to take PrEP daily. Primary barriers were anticipated or experienced stigma, overcome through education of partners and family about PrEP. Pregnant women experienced transient side-effects, but found ways to continue, including taking PrEP at night. PrEP programs for pregnant and postpartum women should integrate strategies to assist women with realistic appraisals of risk and teach skills for disclosure and securing support from significant others. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Ddaaki, William; Strömdahl Susanne; Yeh, Ping Teresa; Rosen, Joseph G; Jackson, Jade; Nakyanjo Neema; Kagaayi, Joseph; Godfrey, Kigozi; Nakigozi Gertrude; Kathryn, Grabowski M; Chang, Larry W; Reynolds, Steven J; Nalugoda Fred; Ekström, Anna Mia; Kennedy, Caitlin E	Qualitative Assessment of Barriers and Facilitators of PrEP Use Before and After Rollout of a PrEP Program for Priority Populations in South-central Uganda	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03360-3	https://www.proquest.com/scholarly-journals/qualitative-assessment-barriers-facilitators-prep/docview/2590778215/se-2?accountid=8113	Uganda piloted HIV pre-exposure prophylaxis (PrEP) for priority populations (sex workers, fishermen, truck drivers, discordant couples) in 2017. To assess facilitators and barriers to PrEP uptake and adherence, we explored perceptions of PrEP before and experiences after rollout among community members and providers in south-central Uganda. We conducted 75 in-depth interviews and 12 focus group discussions. We analyzed transcripts using a team-based thematic framework approach. Partners, family, peers, and experienced PrEP users provided adherence support. Occupational factors hindered adherence for sex workers and fishermen, particularly related to mobility. Pre-rollout concerns about unskilled/untrained volunteers distributing PrEP and price-gouging were mitigated. After rollout, awareness of high community HIV risk and trust in PrEP effectiveness facilitated uptake. PrEP stigma and unexpected migration persisted as barriers. Community-initiated, tailored communication with successful PrEP users may optimize future engagement by addressing fears and rumors, while flexible delivery and refill models may facilitate PrEP continuation and adherence. Article	2021	De Baetselier, Irith; Kenyon, Chris; Vanden Berghe, Wim; Smet, Hilde; Wouters, Kristien; Van den Bossche, Dorien; Vuylsteke, Bea; Crucitti, Tania	An alarming high prevalence of resistance-associated mutations to macrolides and fluoroquinolones in Mycoplasma genitalium in Belgium: results from samples collected between 2015 and 2018.	Sexually Transmitted Diseases	-	-	-	1472-3263	10.1136/sextrans-2020-054511	https://dx.doi.org/10.1136/sextrans-2020-054511	OBJECTIVES: The number of reported cases of multiresistant Mycoplasma genitalium (MG) is increasing globally. The aim of this study was to estimate the prevalence of macrolide and possible fluoroquinolone resistance-associated mutations (RAMs) of MG in Belgium. METHODS: The study was performed retrospectively on two sets of MG-positive samples collected in Belgium between 2015 and 2018. The first set of samples originated from routine surveillance activities and the second set came from a cohort of men who have sex with men (MSM) using pre-exposure prophylaxis to prevent HIV transmission. Detection of RAMs to macrolides and fluoroquinolones was performed on all samples using DNA sequencing of the 23S ribosomal RNA gene, the gyrA gene and the parC gene. RESULTS: Seventy-one per cent of the MG samples contained a mutation conferring resistance to macrolides or fluoroquinolones (ParC position 83/87). RAMs were more frequently found among men compared with women for fluoroquinolones (23.9% vs 9.1%) and macrolides (78.4% vs 27.3%). Almost 90% of the MG infections among MSM possessed a RAM to macrolides (88.4%). In addition, 18.0% of the samples harboured both macrolides and fluoroquinolone RAMs; 3.0% in women and 24.2% in MSM. Being MSM was associated with macrolide RAMs (OR 15.3), fluoroquinolone RAMs (OR 3.8) and having a possible multiresistant MG infection (OR 7.2). CONCLUSION: The study shows an alarmingly high prevalence of MG with RAMs to macrolides and fluoroquinolones in Belgium. These results highlight the need to improve antimicrobial stewardship in Belgium in order to avoid the emergence of untreatable MG. Article	2021	De Baetselier, Irith; Reyniers, Thijs; Platteau, Tom; Wouters, Kristien; Nöstlinger, Christiana; Cuylaerts, Vicky; Buyze, Jozefien; Laga, Marie; Kenyon, Chris; Crucitti, Tania; Vuylsteke, Bea	Recurrent Sexually Transmitted Infections Among a Cohort of Men Who Have Sex With Men Using Preexposure Prophylaxis in Belgium Are Highly Associated With Sexualized Drug Use.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001424	https://dx.doi.org/10.1097/OLQ.0000000000001424	BACKGROUND: Men who have sex with men (MSM) experiencing recurrent sexually transmitted infections (STIs) may play a crucial role in the STI epidemic. However, there is limited understanding of what kind of behavior leads to recurrent STIs. METHODS: A total of 179 MSM using preexposure prophylaxis were followed up for 18 months and were screened quarterly for chlamydia, gonorrhea, and syphilis from 2015 to 2018 in Belgium. Participants were stratified into 3 different groups (no STI, one STI episode, recurrent STI episodes during the study). Sociodemographic and sexual behavioral characteristics were compared between the 3 groups, and significant associations with recurrent STI were explored using multivariate logistic regression models. RESULTS: A total of 62.0% (n = 111/179) of participants experienced at least one STI during the study, and more than 1 in 3 became reinfected with an STI at another visit (n = 66/179 36.9%). Participants experiencing recurrent STIs reported the highest frequency of sexualized drug use (86.4%) compared with participants experiencing one (60.0%) or no STI (47.1%). Therefore, sexualized drug use was highly associated with recurrent STIs (adjusted odds ratio aOR. 4.35). Other factors associated with recurrent STIs were being younger than 40 years (aOR, 3.29), had a high number (>4) of nonsteady partners with whom receptive (aOR, 1.17) or insertive (aOR, 1.12) condomless anal intercourse occurred in the last 3 months. CONCLUSIONS: Sexualized drug use was the greatest risk factor for having recurrent STIs. Tailoring prevention and care, including specialized services tackling problematic drug use in a sexual context, may help to curb the STI epidemic among MSM. Article	2021	De Baetselier, Irith; Tsoumanis, Achilleas; Florence, Eric; Van den Berghe, Wim; Crucitti, Tania; Van den Bossche, Dorien; Kenyon, Chris	Did Pre-exposure Prophylaxis Roll-Out Influence the Epidemic of Rectal Lymphogranuloma Venereum in Belgium? Results From the National Surveillance System.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002524	https://journals.lww.com/jaids/abstract/2021/01010/did_pre_exposure_prophylaxis_roll_out_influence.4.aspx	BACKGROUND: An increase of lymphogranuloma venereum (LGV) in HIV negative men who have sex with men is reported in several European countries including Belgium before the implementation of pre-exposure prophylaxis (PrEP). SETTING: The epidemiological characteristics of the male rectal LGV epidemic in Belgium were explored before and after the introduction of PrEP. METHODS: Segmented regression models were used to examine a change in trends before and after the introduction of PrEP in the male rectal LGV epidemic in Belgium and among men attending a large HIV/sexually transmitted infection clinic in Antwerp, Belgium. RESULTS: Although an increase of 69% was noted in absolute numbers in 2019 compared with 2018 (140 vs 83 cases) in Belgium, models showed that the rate of increase did not change after the introduction of PrEP. More than half of the cases were found in HIV-negative men (56.2%) in 2019, but no difference in the magnitude of the trend was found after the introduction of PrEP. Nevertheless, the data reveal that a statistical significant increase of LGV prevalence was noted among non-HIV-positive men in an HIV/sexually transmitted infection clinic after the implementation of PrEP. Indeed, LGV prevalence in the Antwerp male PrEP cohort increased from 0.8% in 2017 to 2.4% in 2019. CONCLUSIONS: The trend of LGV increase did not accelerate after the introduction of PrEP. Continued surveillance in men who have sex with men irrespective of their HIV status is required for the management and control of the LGV epidemic. Article	2021	de Dieu Tapsoba, Jean; Zangeneh, Sahar Z; Appelmans, Eline; Pasalar, Siavash; Mori, Kira; Peng, Lily; Tao, Janice; Drain, Paul; Okomo, Gordon; Bii, Stanley; Mukabi, James; Zobrist, Stephanie; Brady, Martha; Obanda, Rael; Madiang, Daniel Oluoch; Cover, Jane; Duerr, Ann; Chen, Ying Qing; Obong'o, Christopher	Persistence of oral pre-exposure prophylaxis (PrEP) among adolescent girls and young women initiating PrEP for HIV prevention in Kenya.	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2020.1822505	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7981281	The Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe (DREAMS) Initiative aims to reduce HIV infections among adolescent girls and young women (AGYW) in Africa. Oral pre-exposure prophylaxis (PrEP) is offered through DREAMS in Kenya to eligible AGYW in high burden counties including Kisumu and Homa Bay. This study examines PrEP persistence among AGYW in high burden community-based PrEP delivery settings. We evaluated PrEP persistence among AGYW in the DREAMS PrEP program in Kisumu and Homa Bay using survival analysis and programmatic PrEP refill data collected between March through December 2017. Among 1,259 AGYW who initiated PrEP during the study period, the median persistence time in the program was 56 days (95% CI: 49-58 days) and the proportion who persisted 3 months later was 37% (95% CI: 34-40%). Persistence varied by county (p < 0.001), age at PrEP initiation (p = 0.002), marital status (p = 0.008), transactional sex (p = 0.002), gender-based violence (GBV) experience (p = 0.009) and current school attendance (p = 0.001) at DREAMS enrollment. Persistence did not vary with orphan status, food insecurity, condom use, age at first sexual encounter or engagement in age-disparate sex at DREAMS enrollment. Targeted strategies are needed to improve AGYW retention in the PrEP program. Article	2021	De França, FAP; Silva, PGD; Fonteles, MMD	The Impact of Alcohol and Illicit Drug use on Adherence to HIV Pre-exposure Prophylaxis among Men who have Sex with Men	Journal of Young Pharmacists	-	-	-	0975-1483	10.5530/jyp.2021.13.51	https://www.jyoungpharm.org/sites/default/files/tmp/JYoungPharm-13-3-251_0.pdf	Objectives: To investigate the degree of Men who have Sex with Men (MSM) adherence to antiretrovirals Tenofovir/Emtricitabine (TFC/FTC), drugs for the Pre-exposure Prophylaxis to the human immunodeficiency virus (PrEP). Methods: This is a cross-sectional and retrospective study carried out in a reference service in infectology in Ceara-Brazil. MSM with at least three recorded medical follow-ups were included in the study. We considered as ideal adherence those users who took at least 80% of the doses within 90 days. Bivariate analysis (X-2 or Fisher's exact) was carried out to investigate the association between ideal adherence to PrEP and the use of alcohol and illicit drugs. Results with a p-value <0.05 were taken into consideration. Results: A total of 167 individuals participated in the survey. MSM stopped taking 668 doses of PrEP in three months, of which 16.2% (n=27) had an adherence rate >80%. Nevertheless, alcohol and illicit drug use accounted for 41.4% (n=69). Among the most commonly used narcotics were marijuana and cocaine, 42.7% (n=35) and 18.3% (n=15), respectively. It was observed that optimal adherence (>80%) was better in individuals who did not use alcohol and illicit drugs compared to those who did (p=0.003). Conclusion: MSM adhered satisfactorily to PrEP; however, it was observed that individuals who used illicit drugs and alcohol when had their degree of adherence to TDF/FTC weakened when compared to those who did not use them. Thus, it becomes necessary to pay attention to such aspects to provide alternatives for increasing adherence in highpriority populations. Article	2021	de Sousa A.F.L.; de Oliveira L.B.; Queiroz A.A.F.L.N.; de Carvalho H.E.F.; Schneider G.; Camargo E.L.S.; de Araújo T.M.E.; Brignol S.; Mendes I.A.C.; Fronteira I.; McFarland W.	Casual sex among men who have sex with men (Msm) during the period of sheltering in place to prevent the spread of covid-19	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph18063266	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102726177&doi=10.3390%2fijerph18063266&partnerID=40&md5=9b796396881bee7cb002a17ec66f51a6	Objectives: We investigated the extent to which Brazilian and Portuguese Men Who Have Sex with Men (MSM) had casual sex partners outside their homes during the period of sheltering in place for the COVID-19 pandemic. Methods: An online survey was conducted in Brazil and Portugal in April, during the period of social isolation for COVID-19, with a sample of 2361 MSMs. Recruitment was done through meeting apps and Facebook. Results: Most of the sample (53.0%) had casual sex partners during sheltering. Factors that increased the odds of engaging in casual sex in Brazil were having group sex (aOR 2.1, 95%CI 1.3–3.4), living in an urban area (aOR 1.6, 95%CI 1.1–2.2), feeling that sheltering had a high impact on daily life (aOR 3.0, 95%CI 1.1–8.3), having casual instead of steady partners (aOR 2.5, 95%CI 1.8–3.5), and not decreasing the number of partners (aOR 6.5, 95%CI 4.2–10.0). In Portugal, the odds of engaging in casual sex increased with using Facebook to find partners (aOR 4.6, 95%CI 3.0–7.2), not decreasing the number of partners (aOR 3.8, 95%CI 2.9–5.9), usually finding partners in physical venues (pre-COVID-19) (aOR 5.4, 95%CI 3.2– 8.9), feeling that the isolation had a high impact on daily life (aOR 3.0, 95%CI 1.3–6.7), and HIV-positive serostatus (aOR 11.7, 95%CI 4.7–29.2). Taking PrEP/Truvada to prevent COVID-19 was reported by 12.7% of MSM. Conclusions: The pandemic has not stopped most of our MSM sample from finding sexual partners, with high-risk sexual behaviors continuing. © 2021 by the authors. Licensee MDPI, Basel, Switzerland. Article	2021	Dean L.T.; Chang H.-Y.; Goedel W.C.; Chan P.A.; Doshi J.A.; Nunn A.S.	Novel population-level proxy measures for suboptimal HIV preexposure prophylaxis initiation and persistence in the USA	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003030	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121493193&doi=10.1097%2fQAD.0000000000003030&partnerID=40&md5=ff989167e1be55256d8edcbfa999b890	Objective:In the United States (USA), HIV preexposure prophylaxis (PrEP) use is suboptimal. Population-level metrics on PrEP use are limited and focus on prescriptions issued rather than how much prescriptions are picked up. We introduce PrEP reversals, defined as when patients fail to pick up PrEP prescriptions at the pharmacy point-of-sale, as a proxy for PrEP initiation and persistence.Design:We analysed PrEP pharmacy claims and HIV diagnoses from a Symphony Health Solutions dataset across all US states from 1 October 2015 to 30 September 2019.Methods:We calculated the percentage of individuals who were newly prescribed PrEP and who reversed (i.e. patient did not pick up an insurance-approved prescription and pharmacy withdrew the claim), delayed (reversed and then picked up within 90 days), very delayed (reversed and then picked up between 90 and 365 days), or abandoned (not picked up within 365 days), and subsequent HIV diagnosis within 365 days.Results:Of 59219 individuals newly prescribed PrEP, 19% reversed their index prescription. Among those, 21% delayed initiation and 8% had very delayed initiation. Seventy-one percent of patients who reversed their initial prescription abandoned it, 6% of whom were diagnosed with HIV - -three times higher than those who persisted on PrEP.Conclusion:Nearly one in five patients newlyprescribed PrEP reversed initial prescriptions, leading to delayed medication access, being lost to PrEP care, and dramatically higher HIV risk. Reversals could be used for real-time nationwide PrEP population-based initiation and persistence tracking, and for identifying patients that might otherwise be lost to care. © 2021 Lippincott Williams and Wilkins. Article	2021	Delabre R.M.; Bernier A.; Sánchez F.; Vilotitch A.; Chanos S.; Cosmaro M.L.; Langanke H.; Mey C.; James C.; Duken S.B.; Schlegel V.; Stranz R.; Jonas K.J.; Spire B.; Castro D.R.	"Yes, I'm interested in taking PrEP!": PrEP interest among women respondents to the European community-based survey "Flash! PrEP in Europe"	PLOS One	-	-	-	19326203	10.1371/journal.pone.0246037	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101316178&doi=10.1371%2fjournal.pone.0246037&partnerID=40&md5=b787f7cf5087180858a7a49ab7b98162	The World Health Organization recommends pre-exposure prophylaxis (PrEP) for all populations at substantial risk of HIV infection, including women. However, data regarding PrEP interest among women is lacking, particularly in Europe. Factors associated with interest in using PrEP were assessed among women respondents to the Flash! PrEP in Europe (FPIE) survey. This community-based cross-sectional study, conducted in 12 European countries, aimed to assess PrEP knowledge and interest. "High objective risk" (HOR) was assessed using established risk criteria following EACS and CDC guidelines. Factors associated with interest in using PrEP were assessed in univariable and multivariable logistic regression models. Among 678 women, 12.5% (n = 85) were considered at HOR, 46.8% (n = 317) indicated prior PrEP knowledge and 18.0% (n = 122) reported interest in using PrEP. Among women at HOR, 40.0% (n = 34) were interested in PrEP. Factors significantly associated with PrEP interest in the final multivariable model were: younger age (18–29 years) (aOR 1.9195CI: 1.07; 3.41), bad self-perceived financial status (1.841.09; 3.11), migrant status (south to north) (2.871.05; 7.89), single or dating relationship status (1.931.23; 3.03), sexual abuse history (1.861.17; 2.97), "rather high"/ "high" self-perceived HIV risk (3.211.32; 7.81), and HOR (2.491.42; 4.35). These results show that women at HOR and those who perceived themselves to be at high risk are interested in using PrEP. There is a critical need for targeted information and improved access to PrEP to increase uptake of this HIV prevention tool to meet PrEP interest among women. Copyright: © 2021 Delabre et al. "What Is This PrEP?" - Sources and Accuracy of HIV Pre-Exposure Prophylaxis (PrEP) Awareness Among Adolescent Girls and Young Women Attending Family Planning and Maternal Child Health Clinics in Western Kenya	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002782	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123647465&doi=10.1097%2fQAI.0000000000002782&partnerID=40&md5=c418b45268bcdd4bebeb726c9ba6b8b4	Background:Pre-exposure prophylaxis (PrEP) delivery to adolescent girls and young women (AGYW) is scaling up in sub-Saharan African countries. Understanding how AGYW learn about PrEP is needed to inform programs seeking to reach AGYW with HIV prevention tools.Methods:AGYW (ages 15-24), attending routine family planning and maternal child health clinics in Kisumu, Kenya, participated in in-depth interviews. AGYW were recruited if they either declined or accepted PrEP when offered that day in clinic or were currently or previously on PrEP. Thematic analysis was used to identify key themes related to the type and quality of knowledge sources from which AGYW first became aware of PrEP.Results:Overall, 140 in-depth interviews were conducted with AGYW. The median age was 21.5 years (interquartile range: 20.0-23.0), 65% of participants were married, and almost half (45.7%) were currently taking PrEP. Participants reported learning about PrEP from 3 primary sources: (1) clinic-based education; (2) friends, family, or other PrEP users; and (3) media and community outreach. Participants who reported learning about PrEP from friends or family were highly enthusiastic about PrEP. The accuracy and completeness of knowledge varied with most inaccuracies around the cost, dosing, and who benefits from PrEP. Community outreach campaigns provided fewer details, resulting in more inaccurate information and distrust of information received.Conclusion:PrEP information reaches AGYW through many sources with variable accuracy and completeness. Training providers and peer leaders to disseminate thorough and accurate PrEP information when counseling AGYW could positively impact acceptance and proper use. © 2021 Lippincott Williams and Wilkins. Article	2021	Di Ciaccio, M; Fressard, L; Sagaon-Teyssier, L; Protiere, C; Gatey, C; Chas, J; Cotte, L; Castro, DR; Meyer, L; Molina, JM; Préau, M; Spire, B	What are the situational and behavioral factors associated with condomless anal sex without on-demand PrEP in MSM?	AIDS	-	-	-	0269-9370	10.1097/01.aids.0000724468.18549.1a	https://pubmed.ncbi.nlm.nih.gov/32287072/#:~:text=The%20following%20factors%20were%20positively,and%20sexual%20intercourses%20under%20the	Objective: This study aimed to identify situational and behavioral factors associated with condomless anal sex without on-demand PrEP in the open-label extension (OLE) study of the ANRS-IPERGAY trial. Methods: Univariable and multivariable modified Poisson regressions with a generalized estimating equation (GEE) were used. The attributable risk percentage for each explanatory variable and for condomless anal sex without PrEP was calculated. Results: In the OLE, 19% of anal intercourses were unprotected (i.e. no PrEP or condom). Of these, 85% were attributable to sexual intercourse with main partners and 47% with HIV-negative partners. The following factors were positively associated with condomless anal sex without PrEP: a depressive episode in the previous 12 months [aR (95% CI), P-value: 1.49 (1.02--2.17), 0.039], a higher number of sexual intercourses during the previous 4 weeks [1.01 [1.002--1.02], 0.014], and sexual intercourses under the influence of alcohol [1.45 (1.10--1.92), 0.008]. By contrast, condomless anal sex without PrEP was less frequent during sexual intercourses with known casual, unknown casual and multiple partners [0.20 (0.14--0.30), <0.001; 0.10 (0.05--0.20), <0.001; 0.11 (0.05--0.29), <0.001, respectively], as well as with HIV+ partners with an undetectable viral load and HIV+ partners with a detectable/unknown viral load or unknown serology status [0.57 (0.38--0.86), 0.007; 0.52 (0.32--0.87), 0.012, respectively]. Conclusion: Choosing to have condomless anal sex without PrEP depends primarily on the sexual partner's characteristics (level of intimacy, serological status). This reflects a form of rationality in HIV risk management. However, our results raise questions about the true efficacy of managing HIV risk using this approach.	Objective: This study aimed to identify situational and behavioral factors associated with condomless anal sex without on-demand PrEP in the open-label extension (OLE) study of the ANRS-IPERGAY trial. Article	2021	Di Ciaccio, Marion; Sagaon-Teyssier, Luis; Protière, Christel; Mimi, Mohamed; Suzan-Monti, Marie; Meyer, Laurence; Rojas Castro, Daniela; Pialoux, Gilles; Pintado, Claire; Molina, Jean Michel; Préau, Marie; Spire, Bruno	Impact of HIV risk perception on both pre-exposure prophylaxis and condom use.	Journal of Health Psychology	-	-	-	1461-7277	10.1177/1359105319883927	https://dx.doi.org/10.1177/1359105319883927	Risk perception is one of the several important factors impacting sexual health behaviours. This study investigated the evolution of HIV risk perception on pre-exposure prophylaxis adherence and condom use in men who have sex with men at high risk of HIV and associated factors. Group-based trajectory modelling helped in identifying patterns of risk perception, pre-exposure prophylaxis adherence and condom use over time. The association between the former and the latter two dimensions was then investigated. An estimated 61 per cent (p < 0.001) of participants perceiving low risk and 100 per cent (p < 0.001) of those perceiving high risk had systematic pre-exposure prophylaxis adherence, while an estimated 49 per cent (p < 0.001) and 99.8 per cent (p < 0.001), respectively, reported low-level condom use.	na	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Quantitative
Article	2021	Diabaté, S; Kra, O; Biékoua, Y J; Pelletier, S J; Osso, D G; Diané, B; N'Dhatz-Ebagnitchié, M; Ahouada, C; Kobena, A K; Alary, M	Pre-exposure prophylaxis among men who have sex with men in Côte d'Ivoire: a quantitative study of acceptability	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1785997	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087553969&doi=10.1080%2f09540121.2020.1785997&partnerID=40&md5=1ed1cc5c315b589a1ec17a6a809c8387	This cross sectional study was conducted in 2018 in Côte d'Ivoire to assess PrEP acceptability among men who have sex with men (MSM). Two hundred and one men were asked on their intention to use PrEP if made available. Logistic regression accounting for the sampling design was used to analyze associations between high PrEP acceptability and different independent variables including barriers and facilitators. Participants were mostly young (mean age = 25 years), educated (82% with secondary/postsecondary education) and single (95.5%). On average, 3.4 episodes of anal sex were reported monthly and 37.8% of men did not use a condom at last sex. Most MSM (72.6%) had heard of PrEP before enrollment. Overall, 35.3% reported that they would use PrEP very probably if made available. In multivariate analysis, factors associated with high PrEP acceptability were condom use at last sexual intercourse (Odds ratio (OR) = 2.51; 95%Confidence interval (95%CI) = 1.45–4.33); insertive sex as compared to versatile sex (OR = 2.56; 95%CI = 1.14–5.67); free PrEP delivery (OR = 2.45; 95%CI = 1.07–5.59), concerns about side effects (OR = 0.66; 95%CI = 0.48–0.90), and being preoccupied by the fact that post-PrEP antiretroviral therapy could be inefficient (OR = 0.25; 95%CI = 0.14–0.44). PrEP implementation among MSM in Côte d'Ivoire should be accompanied by awareness raising campaigns explaining its utility. © 2020 The Author(s). Article	2021	Dietrich J.J.; Atujuna M.; Tshabalala G.; Hornschuh S.; Mulaudzi M.; Koh M.; Ahmed N.; Muhumuza R.; Ssemata A.S.; Otwombe K.; Bekker L.-G.; Seeley J.; Martinson N.A.; Terris-Prestholt F.; Fox J.	A qualitative study to identify critical attributes and attribute-levels for a discrete choice experiment on oral pre-exposure prophylaxis (PrEP) delivery among young people in Cape Town and Johannesburg, South Africa	BMC Health Services Research	-	-	-	14726963	10.1186/s12913-020-05942-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098795280&doi=10.1186%2fs12913-020-05942-8&partnerID=40&md5=be5406856a38cc19dd6d7ecf486383ea	Background: The uptake and adherence of daily oral PrEP has been poor in high-risk populations in South Africa including young people. We used qualitative research methods to explore user preferences for daily and on-demand oral PrEP use among young South Africans, and to inform the identification of critical attributes and attribute-levels for quantitative analysis of user preferences, i.e. a discrete choice experiment (DCE). Methods: Data were collected between September and November 2018 from eight group discussions and 20 in-depth interviews with young people 13 to 24 years in Cape Town and Johannesburg. Using a convenience sampling strategy, participants were stratified by sex and age. Interviewers used a semi-structured interview guide to discuss several attributes (dosing regimen, location, costs, side effects, and protection period) for PrEP access and use. Group discussions and in-depth interviews were audio-recorded, transcribed verbatim and translated to English. We used framework analysis to explore context-specific attributes and attribute-levels for delivering oral PrEP in South Africa. The adolescent community advisory board, expert and study team opinions were consulted for the final DCE attributes and levels. Results: We enrolled 74 participants who were 51% (n = 38/74) male, had a median age of 18.5 Interquartile range = 16–21.25 years, 91% (n = 67/74) identified as heterosexual and 49% (n = 36/74) had not completed 12th grade education. Using the qualitative data, we identified five candidate attributes including (1) dosing regimen, (2) location to get PrEP, (3) cost, (4) route of administration and (5) frequency. After discussions with experts and the study team, we revised the DCE to include the following five attributes and levels: dosing regime: daily, and on-demand PrEP; location: private pharmacy, public clinic, mobile clinic, ATM); cost: free-of-charge, R50 (~2GBP), R265 (~12GBP); side effects: nausea, headache, rash; and duration of protection: fulltime protection versus when PrEP is used). Conclusions: There is limited literature on qualitative research methods describing the step-by-step process of developing a DCE for PrEP in adolescents, especially in resource-constrained countries. We provide the process followed for the DCE technique to understand user preferences for daily and on-demand oral PrEP among young people in South Africa. © 2021, The Author(s). Article	2021	Digre P.; Avoundjian T.; Johnson K.; Peyton D.; Lewis C.; Barnabas R.V.; Golden M.R.; Khosropour C.M.	Barriers, Facilitators, and Cost of Integrating HIV-Related Activities into Sexually Transmitted Disease Partner Services in Jackson, Mississippi	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001296	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102089328&doi=10.1097%2fOLQ.0000000000001296&partnerID=40&md5=0d52753184ed16152b4abcc14872c322	Background Many US health departments now integrate HIV-related outcomes (e.g., relinkage to HIV care and preexposure prophylaxis PrEP) into sexually transmitted disease (STD) partner services (PS) programs. We sought to determine the barriers, facilitators, and cost of integrating these activities into PS. Methods From 2016 to 2018, the Mississippi State Department of Health integrated 3 new activities into STD PS: HIV testing for partners of HIV-negative men who have sex with men with gonorrhea/chlamydia, relinkage to HIV care for STD PS recipients previously diagnosed with HIV, and PrEP referrals. We conducted direct observations and interviews with disease intervention specialists (DIS) in Jackson to assess barriers and facilitators to implementing these activities. We completed time and motion studies with 8 DIS and case tracking forms for 90 unique cases to estimate the incremental staff time and associated personnel cost of added services compared with a standard PS case. Results Disease intervention specialists were optimistic about integrating HIV-related activities but noted disparate data systems, nonsystematic documentation, and lack of training as barriers. The mean time for a standard STD PS case without HIV-related activities was 195 minutes (cost, $77.69/case). The cost to conduct PS for HIV-negative men who have sex with men with gonorrhea/chlamydia was 36% higher than a standard case. Integrating relinkage to care and PrEP referrals resulted in a 44% and 20% increase in cost, respectively. Conclusions Integrating HIV care relinkage and PrEP referrals into STD partner services was generally acceptable by DIS and added marginal cost per case. Coupling these cost metrics with an assessment of the effectiveness of these activities can inform prioritization of partner services activities. © Lippincott Williams & Wilkins.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Dijkstra M.; Mohamed K.; Kigoro A.; Mumba T.; Mahmoud S.; Wesonga A.; Mukuria N.; Oduor T.; Gichuru E.; Van Der Loeff M.F.S.; Palmer S.; Graham S.M.; Van Der Elst E.M.; Sanders E.J.	Peer Mobilization and Human Immunodeficiency Virus (HIV) Partner Notification Services among Gay, Bisexual, and Other Men Who Have Sex with Men and Transgender Women in Coastal Kenya Identified a High Number of Undiagnosed HIV Infections	Open Forum Infectious Diseases	-	-	-	23288957	10.1093/ofid/ofab219	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119680354&doi=10.1093%2fofid%2fofab219&partnerID=40&md5=f25e2ee1a3f92aecf351c99d404ae9d0	Background: Human immunodeficiency virus (HIV) partner notification services (HPN), peer mobilization with HIV self-testing, and acute and early HIV infection (AEHI) screening among gay, bisexual, and other men who have sex with men (GBMSM) and transgender women (TGW) were assessed for acceptability, feasibility, and linkage to antiretroviral therapy (ART) and preexposure prophylaxis (PrEP) services. Methods: Between April and August 2019, peer mobilizers mobilized clients by offering HIV oral self-tests and immediate clinic referral for clients with AEHI symptoms. Mobilized participants received clinic-based rapid antibody testing and point-of-care HIV RNA testing. Newly diagnosed participants including those derived from HIV testing services were offered immediate ART and HPN. Partners were recruited through HPN. Results: Of 772 mobilized clients, 452 (58.5%) enrolled in the study as mobilized participants. Of these, 16 (3.5%) were HIV newly diagnosed, including 2 (0.4%) with AEHI. All but 2 (14/16 87.5%) initiated ART. Thirty-five GBMSM and TGW were offered HPN and 27 (77.1%) accepted it. Provider referral identified a higher proportion of partners tested (39/64 60.9% vs 5/14 35.7%) and partners with HIV (27/39 69.2% vs 2/5 40.0%) than index referral. Of 44 enrolled partners, 10 (22.7%) were newly diagnosed, including 3 (6.8%) with AEHI. All 10 (100%) initiated ART. PrEP was initiated among 24.0% (103/429) mobilized participants and 28.6% (4/14) partners without HIV. Conclusions: HPN, combined with a peer mobilization-led self-testing strategy and AEHI screening for GBMSM and TGW, appears to be acceptable and feasible. These strategies, especially HPN provider referral, effectively identified undiagnosed HIV infections and linked individuals to ART and PrEP services. © 2021 The Author(s). Article	2021	Dijkstra, Maartje; Prins, Henrieke; Prins, Jan M.; Reiss, Peter; Boucher, Charles; Verbon, Annelies; Rokx, Casper; de Bree, Godelieve	Cohort profile: the Netherlands Cohort Study on Acute HIV infection (NOVA), a prospective cohort study of people with acute or early HIV infection who immediately initiate HIV treatment.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2020-048582	https://bmjopen.bmj.com/content/11/11/e048582	PURPOSE: Initiation of combination antiretroviral therapy (cART) during acute or early HIV-infection (AEHI) limits the size of the viral reservoir and preserves immune function. This renders individuals who started cART during AEHI promising participants in HIV-cure trials. Therefore, we established a multicentre prospective cohort study in the Netherlands that enrols people with AEHI. In anticipation of future cure trials, we will longitudinally investigate the properties of the viral reservoir size and HIV-specific immune responses among cohort participants. PARTICIPANTS: Participants immediately initiate intensified cART: dolutegravir, emtricitabine/tenofovir and darunavir/ritonavir (DRV/r). After 4 weeks, once baseline resistance data are available, DRV/r is discontinued. Three study groups are assembled based on the preparedness of individuals to participate in the extensiveness of sampling. Participants accepting immediate treatment and follow-up but declining additional sampling are included in study group 1 ('standard') and routine diagnostic procedures are performed. Participants willing to undergo blood, leukapheresis and semen sampling are included in study group 2 ('less invasive'). In study group 3 ('extended'), additional tissue (gut-associated lymphoid tissue, peripheral lymph node) and cerebrospinal fluid sampling are performed. FINDINGS TO DATE: Between 2015 and 2020, 140 individuals with AEHI have been enrolled at nine study sites. At enrolment, median age was 36 (IQR 28-47) years, and 134 (95.7%) participants were men. Distribution of Fiebig stages was as follows: Fiebig I, 3 (2.1%); II, 20 (14.3%); III, 7 (5.0%); IV, 49 (35.0%); V, 39 (27.9%); VI, 22 (15.7%). Median plasma HIV RNA was 5.9 (IQR 4.7-6.7) log10 copies/mL and CD4 count 510 (IQR 370-700) cells/mm(3). Median time from cART initiation to viral suppression was 8.0 (IQR 4.0-16.0) weeks. FUTURE PLANS: The Netherlands Cohort Study on Acute HIV infection remains open for participant enrolment and for additional sites to join the network. This cohort provides a unique nationwide platform for conducting future in-depth virological, immunological, host genetic and interventional studies investigating HIV-cure strategies. Article	2021	Djordevic, J; Silva, CJ	A stochastic analysis of the impact of fluctuations in the environment on pre-exposure prophylaxis for HIV infection	Soft Computing	-	-	-	1432-7643	10.1007/s00500-019-04611-1	https://link.springer.com/article/10.1007/s00500-019-04611-1	We propose a stochastic model for HIV/AIDS transmission where pre-exposure prophylaxis is considered as a prevention measure for new HIV infections. A white noise is introduced into the model, representing fluctuations in the environment that manifest themselves on the transmission coefficient rate. We prove the existence and uniqueness of a global positive solution of the stochastic model and establish conditions under which extinction and persistence in mean hold. Numerical simulations are provided which illustrate the theoretical results, and conclusions are derived on the impact of the fluctuations in the environment on the number of the susceptible individuals that are under pre-exposure prophylaxis. Theses and Dissertations	2021	Dlamini, Buyisiwe Lorraine.	The communicative role played by social workers in the introduction and uptake of oral pre-exposure prophylaxis(oral prep) in Vulindlela.	-	-	University of KwaZulu-Natal	-	na	NA	https://researchspace.ukzn.ac.za/handle/10413/19704	Since the discovery of HIV and Aids many efforts to reduce the spread of the virus have been taken, these include biomedical interventions such as male circumcision, male and female condoms and PrEP. Several HIV prevention methods have been effective to curb the spread of HIV infections, with Voluntary Male Medical Circumcision (VMMC) and PrEP, have shown impact in overall reduction of HIV transmission. (Moodley, et al., 2016). PrEP has been shown to reduce the risk of HIV infection from unprotected sex by over 90 percent, and from injecting drugs by more than 70 percent (CDC, 2019). Biomedical interventions have been shown to be more effective when implemented in conjunction with behavioral interventions, and where contextual factors such as cultural context are considered in the implementation of such interventions (Baxter & Karim, 2016) A key factor that surfaces from the various studies considered here is that, biomedical interventions have less efficacy when used independently but works best with behavioral interventions rooted in various social and cultural contexts of those targeted. Such behavioral interventions including peer education, mass media communication, school-based sex education programmes, socioeconomic interventions and behavioural counselling, have opened up a greater scope for clinical social work in South Africa, and have been demonstrated to be instrumental in targeted awareness among adolescents and young adults (Baxter & Karim, 2016; AVERT, 2019; Morojele, et al., 2006). Biomedical HIV prevention technologies, such as antiretroviral pre-exposure prophylaxis (PrEP) hold huge potential to substantially reduce HIV acquisition in high-risk populations globally (Giovenco, 2019). Although many people who could benefit from PrEP are still unaware of its existence hence the need for social workers to raise awareness through education and interventions directed at sociostructural change in the communities. This dissertation provides an understanding of the communicative role played and can play by social workers in the future uptake and introduction to HIV prevention methods in Vulindlela. This study investigates the level of knowledge amongst social workers working with HIV clients. By employing a culture-centred approach (CCA) and the Social Ecology Model of communication and Health Behaviour (SEMCHB), this dissertation seeks to reach a holistic understanding of how social workers communicate with their clients about HIV prevention methods and their level of knowledge about HIV prevention methods such as PrEP. A phenomenological approach was adopted for this research study. Three interviews were held separately with social workers working in Vulindlela using semi – structured questionnaires to collect data. Thematic analysis was used to develop themes that emerged from the data collected. Key findings of the study revealed that social workers were heavily integrated in the communities in which they work and therefore have increased community exposure to play an…	Social workers – KwaZulu-Natal – Vulindlela.; Social workers – Health communication.; Healthcare communication.; HIV/AIDS – Prevention.; Pre-exposure prophylaxis (PrEP)	English	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	-	-	Qualitative
