Article	2023	Beall, Clifford J.; Lilly, Elizabeth A.; Granada, Carolina; Treas, Kelly; Dubois, Kenneth R. 3rd; Hashmi, Shahr B.; Vazquez, Jose A.; Hagensee, Michael E.; Griffen, Ann L.; Leys, Eugene J.; Fidel, Paul L. Jr	Independent Effects of HIV and Antiretroviral Therapy on the Oral Microbiome Identified by Multivariate Analyses.	mBio	-	-	-	2150-7511	10.1128/mbio.00409-23	https://pubmed.ncbi.nlm.nih.gov/37071004/	The oral microbiome is an important predictor of health and disease. We recently reported significant yet modest effects of HIV under highly active antiretroviral therapy (ART) on the oral microbiome (bacterial and fungal) in a large cohort of HIV-positive (HIV(+)) and matched HIV-negative (HIV(-)) individuals. As it was unclear whether ART added to or masked further effects of HIV on the oral microbiome, the present study aimed to analyze the effects of HIV and ART independently, which also included HIV(-) subjects on preexposure prophylaxis (PrEP) therapy. Cross-sectional analyses of the effect of HIV devoid of ART (HIV(+) ART(-) versus matched HIV(-) subjects) showed a significant effect on both the bacteriome and mycobiome (P < 0.024) after controlling for other clinical variables (permutational multivariate analysis of variance PERMANOVA of Bray-Curtis dissimilarity). Cross-sectional analyses evaluating the effects of ART (HIV(+) ART(+) versus HIV(+) ART(-) subjects) revealed a significant effect on the mycobiome (P < 0.007) but not the bacteriome. In parallel longitudinal analyses, ART (before versus after the initiation of ART) had a significant effect on the bacteriome, but not the mycobiome, and HIV(+) and HIV(-) PrEP subjects (P < 0.005 and P < 0.016, respectively). These analyses also revealed significant differences in the oral microbiome and several clinical variables between HIV(-) PrEP subjects (pre-PrEP) and the HIV-matched HIV(-) group (P < 0.001). At the species level, a small number of differences in both bacterial and fungal taxa were identified within the effects of HIV and/or ART. We conclude that the effects of HIV and ART on the oral microbiome are similar to those of the clinical variables but collectively are modest overall. IMPORTANCE The oral microbiome can be an important predictor of health and disease. For persons living with HIV (PLWH), HIV and highly active antiretroviral therapy (ART) may have a significant influence on their oral microbiome. We previously reported a significant effect of HIV with ART on both the bacteriome and mycobiome. It was unclear whether ART added to or masked further effects of HIV on the oral microbiome. Hence, it was important to evaluate the effects of HIV and ART independently. For this, multivariate cross-sectional and longitudinal oral microbiome analyses (bacteriome and mycobiome) were conducted within the cohort, including HIV(+) ART(+) subjects and HIV(+) and HIV(-) (preexposure prophylaxis PrEP) subjects before and after the initiation of ART. While we report independent significant effects of HIV and ART on the oral microbiome, we conclude that their influence is similar to that of the clinical variables but collectively modest overall.	ART; HIV; bacteriome; mycobiome; oral microbiome. Article	2023	Beauchamp, Geetha; Donnell, Deborah; Hosek, Sybil; Anderson, Peter L; Chan, Kwun C G; Dye, Bonnie J; Mgodi, Nyaradzo; Bekker, Linda-Gail; Delany-Moretlwe, Sinead; Celum, Connie	Trust in the provider and accurate self-reported PrEP adherence among adolescent girls and young women in South Africa and Zimbabwe: HPTN 082 study.	BMC Women's Health	-	-	-	1472-6874	10.1186/s12905-023-02418-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10199602	BACKGROUND: Trust is an important cornerstone of patient-provider communication. Accurate reporting of pre-exposure prophylaxis (PrEP) adherence is vital for providers to determine who needs adherence support, especially adolescent girls and young women (AGYW) disproportionately affected by newly diagnosed HIV. METHODS: This is a secondary analysis of the HPTN 082 open-label PrEP demonstration trial. From 2016-2018, 451 AGYW aged 16-25 years were enrolled in South Africa (Cape Town and Johannesburg) and Zimbabwe (Harare). PrEP was initiated by 427, and 354 (83%) had month three patient-reported adherence responses and intracellular tenofovir diphosphate (TFV-DP) measurements. The patient-reported adherence response to 'In the past month, how often did you take the tablet?' was dichotomized as 'high' if the response was every day or most days, and 'low' if some days or not many days or never. The biomarker marker evidence of adherence in dried blood spots was defined as 'high' if TFV-DP ≥ 700, and 'low' if < 350 fmol/punch. We used multinomial logistic regression to examine if trust in the PrEP provider was associated with concordance between patient-reported adherence and intracellular tenofovir-diphosphate (TFV-DP). RESULTS: AGYW who reported trust in their providers were almost four-fold (aOR 3.72, 95% CI 1.20-11.51) more likely to have concordant adherence (high self-reported adherence and high TFV-DP concentrations) compared to discordant non-adherence (high self-reported adherence and low TFV-DP concentrations). CONCLUSION: Education and training of providers to build trusting relationships with AGYW may lead to more accurate reporting of PrEP adherence. With accurate reporting, adequate support can be provided to bolster adherence. TRIAL REGISTRATION: ClinicalTrials.gov Identifier: NCT02732730. Article	2023	Beauchamp, Geetha; Hosek, Sybil; Donnell, Deborah J; Chan, Kwun C G; Flaherty, Brian P; Anderson, Peter L; Dye, Bonnie J; Mgodi, Nyaradzo; Bekker, Linda-Gail; Delany-Moretlwe, Sinead; Celum, Connie	Development of a tool to assess HIV prevention readiness of adolescent girls and young women in HPTN 082 study.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0281728	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9956790	BACKGROUND: African adolescent girls and young women (AGYW) represent a large proportion of new HIV infections, a priority population for pre-exposure prophylaxis (PrEP), but adherence remains a challenge. A reliable, valid readiness tool would help identify AGYW motivated to take PrEP who need adherence support. METHODS: In the HPTN 082 open-label PrEP study (2016-2019), South African and Zimbabwean women ages 16-25 were administered an HIV prevention readiness measure (HPRM). The 25 items in the HPRM included medication beliefs, connection with care, disclosure of PrEP use, social support, and housing stability using a 5-point Likert scale. Exploratory factor analysis (EFA) using polychoric correlations, scale reliability, and predictive validity were performed on data from 315 participants who responded to all items. We assessed the predictive value of HPRM scores with PrEP adherence, defined as tenofovir-diphosphate (TFV-DP) concentrations in dried blood spots, as a continuous measure and dichotomized as high PrEP adherence (≥700 fmol/punch). RESULTS: EFA yielded 23 items with three subscales: self-efficacy (16 items), PrEP disclosure (4 items), and social support (3 items). Cronbach's α ranged from 0.71 to 0.92 for the overall scale and the subscales. The average overall scale and the subscales were predictive of 3-month PrEP adherence for TFV-DP concentrations: for each unit increase of the HPRM score, TFV-DP concentration increased by 103 fmol/punch (95% CI: 16, 189, p = 0.02); the highest HPRM score equated with 608 fmol/punch on average. For the self-efficacy subscale, TFV-DP increased by 90 fmol/punch (95% CI: 7, 172, p = 0.03); PrEP disclosure, 68 fmol/punch (95% CI: 19, 117 p = 0.01); and social support, 58fmol/punch (95% CI: 2, 113, p = 0.04). Higher PrEP disclosure suggests high adherence (OR 1.36, 95% CI: 1.00, 1.86, p = 0.05) and predicted persistent high adherence at both months three and six (OR: 1.50, 95% CI: 1.03, 2.21, p = 0.04). CONCLUSIONS: The HPRM scale overall and the subscales individually demonstrated good internal consistency among African young women. PrEP disclosure subscale exhibiting significant association with persistent high PrEP adherence is an important finding for PrEP adherence support programs. Future work will assess replicability and expand self-efficacy and social-support subscales after item revision. TRIAL REGISTRATION: ClinicalTrials.gov NCT02732730. Article	2023	Beauchamp, Geetha; Hosek, Sybil; Donnell, Deborah; Chan, Kwun C G; Anderson, Peter L; Dye, Bonnie J; Mgodi, Nyaradzo; Bekker, Linda-Gail; Delany-Moretlwe, Sinead; Celum, Connie	The Effect of Disclosure of PrEP Use on Adherence Among African Young Women in an Open-Label PrEP Study: Findings from HPTN 082.	AIDS and Behavior	-	-	1573-3254	10.1007/s10461-023-04175-0	https://dx.doi.org/10.1007/s10461-023-04175-0	To develop effective PrEP adherence interventions, it is important to understand the interplay between disclosure of pre-exposure prophalxis (PrEP) use, social support, and PrEP adherence. We leveraged the HPTN 082 study conducted among 451 adolescent girls and young women (AGYW) (ages 16 to 25 years, 2016 to 2019) in South Africa and Zimbabwe. Among the 349 who had month three disclosure and PrEP adherence data, 60% (n = 206) felt supported by adults, and 89% (n = 309) disclosed PrEP use to at least one person. PrEP disclosure was not associated with increased adherence, measured by intracellular tenofovir-diphosphate concentrations in dried blood spots. Women who reported having supportive adults, and disclosed to their parents, had higher adherence at 6 months with an increase of 177 fmol/punch (95% CI 12 to 343, t = 2.11, p = 0.04). PrEP interventions that help AGYW identify supportive relationships and effectively communicate the benefits of PrEP may improve PrEP adherence.Clinicaltrials.gov ID number: NCT02732730.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2023	Bebell, LM; Schreiner, A; Ngonzi, J; Boatin, AA; Byamukama, A; Parks, K; Gernand, AD; Kumbakumba, E; Bassett, IV; Siedner, MJ; Asiimwe, S; Carreon, CK; Atwine, R; Roberts, DJ	HISTOLOGIC PLACENTAL FINDINGS AMONG PEOPLE WITH HIV AND PEOPLE TAKING PREP IN PREGNANCY	Placenta	-	-	0143-4004	10.1016/j.placenta.2023.07.271	https://www.sciencedirect.com/science/article/pii/S0143400423004216?via%3Dihub	Objectives: Globally, more than one million HIV-exposed, uninfected (HEU) children are born annually and are at higher risk of adverse outcomes than HIV-unexposed children. Some adverse outcomes may originate from placental abnormalities. We aimed to determine differences in gross and histologic placental findings by maternal HIV serostatus and antiretroviral (ARV) use. Methods: We enrolled a prospective cohort of 600 people with singleton pregnancies in Mbarara, Uganda: 300 who were HIV-infected and taking antiretroviral therapy, 200 HIV-uninfected taking no ARVs, and 100 HIV-uninfected taking pre-exposure prophylaxis (PrEP). We collected placentas at delivery for evaluation. Histologic placental findings were characterized using the Amsterdam consensus criteria. Findings were compared between groups using t-tests and chi-square tests. Results: To date, we have performed gross and histologic assessment for 580 and 383 placentas, respectively. HIV- and PrEP-exposed placentas had lower mean trimmed weight (446g and 441g versus 464g, P=0.09) and lower disk thickness (1.7cm versus 1.8cm for HIV-unexposed and 1.9cm for PrEP-exposed, P=0.01). Fetal vascular malperfusion was significantly less common in HIV-exposed than HIV-unexposed and PrEP-exposed placentas (8% versus 20% and 17%, P<0.01) and more common in dolutegravir-exposed than efavirenz-exposed placentas (11% versus 6%), but there was no difference in prevalence of maternal vascular malperfusion by HIV- or ARV-exposure (P=0.68). Villitis of unknown etiology was less common in HIV-exposed placentas (4% versus 12% in HIV-unexposed and 15% in PrEP-exposed placentas; P<0.01). Acute chorioamnionitis was more common in HIV-unexposed placentas (42% versus 31% in HIV-exposed and 22% in PrEP-exposed, P=0.02). Conclusion: Placentas from people with HIV taking ARVs weigh less and are thinner. Furthermore, fetal vascular malperfusion and villitis are less prevalent in placentas from people with HIV than people without HIV, including those taking PrEP. Lower prevalence of inflammatory pathologies in HIV/ARV-exposed placentas is unexpected and may indicate reduced inflammatory response, and merit further study. Article	2023	Beckham S.W.; Sanchez T.; Fowler R.; Zlotorzynska M.; Rai M.; Sullivan P.; Vannappagari V.; Sarkar S.; Glick J.L.; Rinehart A.R.; Rawlings K.; Bridges J.F.P.	Variation in Preferences for Long-Acting Injectable Pre-Exposure Prophylaxis Among US Men Who Have Sex with Men: A Latent Class Analysis	AIDS Patient Care and STDs	-	-	10872914	10.1089/apc.2023.0109	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175357484&doi=10.1089%2fapc.2023.0109&partnerID=40&md5=efbbedbb786d8ebe43134bc195cb33f6	Cabotegravir long-acting injectable HIV pre-exposure prophylaxis (LA PrEP) is efficacious, with a good safety profile, and was approved by the US Food and Drug Administration in December 2021. Understanding variations in potential user preferences for LA PrEP may inform implementation and subsequently improve uptake and community-level effectiveness. HIV-negative, sexually active men who have sex with men (MSM) aged ‡15 years were recruited online for the 2019 American Men's Internet Survey, before LA PrEP approval. Respondents completed a discrete-choice experiment (DCE) with hypothetical LA PrEP attributes (out-of-pocket cost, perceived side effects, injection frequency, perceived stigma, service location). Latent class analysis segmented respondents into groups based on their preferences for the attributes presented, and relative importance of preference weights and willingness-to-pay were calculated. While the majority had never used daily oral PrEP, 73% of the 2489 respondents were very or somewhat likely to use LA PrEP. Three latent classes were identified from 2241 respondents in the DCE. The "side effects-averse" class was the largest group (64% of respondents) and placed 61% relative importance on side effects. The "ambivalent" class (20% of respondents) placed higher importance on stigma (17% of relative importance) than other classes. The "cost-conscious" class (16% of respondents) placed higher relative importance (62%) on cost compared with other attributes and classes. Perceived side effects were an important hypothetical barrier for LA PrEP uptake among a large proportion of potential MSM users. Minimizing out-of-pocket costs is likely to increase uptake and may be important to equitable access. Tailored communication strategies are recommended for the different groups of potential LA PrEP users. © Mary Ann Liebert, Inc.	discrete-choice experiment; HIV/AIDS; PrEP; prevention	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Beesham I.; Milford C.; Joseph Davey D.L.; Smit J.; Mansoor L.E.; Beksinska M.	Key stakeholders' perspectives on providing oral pre-exposure prophylaxis as HIV-prevention standard of care in clinical trials in South Africa	African Journal of AIDS Research	-	-	16085906	10.2989/16085906.2023.2169177	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150982782&doi=10.2989%2f16085906.2023.2169177&partnerID=40&md5=f40d1aa4d347d02aef042af146bf62f7	Introduction: HIV-prevention and endpoint-driven clinical trials enrol individuals at substantial risk of HIV. Recently, these trials have provided oral pre-exposure prophylaxis (PrEP) as HIV-prevention standard of care; however, data on PrEP uptake and use during the trial and post-trial access are lacking. Methods: We conducted once-off, telephonic, in-depth interviews from August 2020 to March 2021, with 15 key stakeholders (including site directors/leaders, principal investigators and clinicians), purposively recruited from research sites across South Africa that are known to conduct HIV-prevention and endpoint-driven clinical trials. The interview guide probed for facilitators and barriers to PrEP uptake and use during the trial, and post-trial PrEP access. Interviews were audio recorded and transcribed. Coding was facilitated using NVivo and emergent themes were identified. Results: Most stakeholders reported incorporating PrEP as part of the HIV-prevention package in HIV-prevention and endpoint-driven clinical trials. Stakeholders identified multiple barriers to PrEP uptake and use, including difficulties with daily pill taking, side effects, stigma, a lack of demand creation and limited knowledge and education about PrEP in communities. Facilitators of PrEP uptake and use included demand-creation campaigns and trial staff providing quality counselling and education. Post-trial PrEP access was frequently challenging as facilities were located a considerable distance from research sites, had long queues and inconvenient operating hours. Conclusions: Strategies to address barriers to PrEP uptake and use during trials and post-trial access, such as PrEP demand creation, education and counselling, addressing stigma, support for daily pill-taking and increased post-trial access, are urgently needed. © 2023 NISC (Pty) Ltd. Article	2023	Beesham, Ivana; Milford, Cecilia; Smit, Jenni; Joseph Davey, Dvora L; Baeten, Jared M; Heffron, Renee; Beksinska, Mags	Post-trial access to and use of pre-exposure prophylaxis in Durban, South Africa.	BMC Public Health	-	-	1471-2458	https://doi.org/10.1186/s12889-023-16139-z	https://escholarship.org/uc/item/60b4w713	BackgroundHIV endpoint-driven clinical trials increasingly provide oral pre-exposure prophylaxis (PrEP) as standard of prevention during the trial, however, among participants desiring to continue using PrEP at trial exit, little is known about post-trial PrEP access and continued use.MethodsWe conducted one-time, semi-structured, face-to-face, in-depth interviews with 13 women from Durban, South Africa, from November to December 2021. We interviewed women who initiated oral PrEP as part of the HIV prevention package during the Evidence for Contraceptive Options and HIV Outcomes (ECHO) Trial, elected to continue using PrEP at study exit, and were given a 3-month PrEP supply and referred to facilities for PrEP refills at the final trial visit. The interview guide probed for barriers and enablers to post-trial PrEP access, and current and future PrEP use. Interviews were audio-recorded and transcribed. Thematic analysis was facilitated using NVivo.ResultsOf the 13 women, six accessed oral PrEP post-trial exit, but five later discontinued. The remaining seven women did not access PrEP. Barriers to post-trial PrEP access and continued use included PrEP facilities having long queues, inconvenient operating hours, and being located far from women's homes. Some women were unable to afford transport costs to collect PrEP. Two women reported visiting their local clinics and requesting PrEP but were informed that PrEP was unavailable at the clinic. Only one woman was still using PrEP at the time of the interview. She reported that the PrEP facility was located close to her home, staff were friendly, and PrEP education and counselling were provided. Most women not on PrEP reported wanting to use it again, particularly if barriers to access could be alleviated and PrEP was easily available at facilities.ConclusionsWe identified several barriers to post-trial PrEP access. Strategies to enhance PrEP access such as a reduction in waiting queues, convenient facility operating hours, and making PrEP more widely available and accessible are needed. It is also worth noting that oral PrEP access has expanded in South Africa from 2018 till now and this could improve access to PrEP for participants exiting trials who desire to continue PrEP. Article	2023	Béhanzin, Luc; Diabaté, Souleymane; Guédou, Fernand Aimé; Matsétsé, Ella Goma; Olodo, Marius; Dossouvo, Alban; Aza-Gnandji, Marlène; Akpaka, Axel; Chagas, Elyote; Gangbo, Flore; Zannou, Djimon Marcel; Alary, Michel	Prevalence of viral hepatitis B and C in men who have sex with men enrolled in a demonstration study of pre-exposure prophylaxis for HIV in Cotonou, Benin	Pan African Medical Journal	-	-	1937-8688	10.11604/pamj.2023.46.79.41013	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10819840	Introduction: men who have sex with men (MSM) are disproportionately affected by hepatitis B virus (HBV) and hepatitis C virus (HCV) worldwide. In Benin, there are no data on MSM. The purpose of this study was to estimate HBV and HCV prevalence and HBV-associated factors in MSM who were HIV negative. Methods: we conducted an analytical cross-sectional study. A two-degree random sampling was used to recruit 204 MSM. An immunochromatographic rapid test and enzyme immunoassays were used to detect HBV and HCV antigens/antibodies. Log-binomial regression was used to identify factors associated with HBV. Results: HbsAg positivity, history of hepatitis B infection and hepatitis C prevalences were 37.7%, 8.8 %, and 0.9 %, respectively. HBsAg positivity and history of hepatitis B were more prevalent in MSM aged ≥30 years compared to younger subjects: 16.7% versus 6.4% (p<0.0001) and 66.7% versus 28.8% (p<0.0001), respectively. Sexual intercourse under the effect of drug or alcohol and living in couple were also associated with HBV. conclusion: the prevalence of hepatitis C was low, but hepatitis B was common, especially among older MSM. Screening and vaccination against hepatitis B should be strengthened in this population. Article	2023	Bekerman E.; Yant S.R.; VanderVeen L.; Hansen D.; Lu B.; Rowe W.; Wang K.; Callebaut C.	Long-acting lenacapavir acts as an effective preexposure prophylaxis in a rectal SHIV challenge macaque model	Journal of Clinical Investigation	-	-	219738	10.1172/JCI167818	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85168222664&doi=10.1172%2fJCI167818&partnerID=40&md5=484d7da767bc83ef967d210972714ecd	Long-acting antiretroviral agents for preexposure prophylaxis (PrEP) represent a promising new alternative to daily oral regimens for HIV prevention. Lenacapavir (LEN) is a first-in-class long-acting capsid inhibitor approved for the treatment of HIV-1 infection. Here, we assessed the efficacy of LEN for PrEP using a single high-dose simian-human immunodeficiency virus (SHIV) rectal challenge macaque model. In vitro, LEN showed potent antiviral activity against SHIV, as it did for HIV-1. In macaques, a single subcutaneous administration of LEN demonstrated dose proportional increases in and durability of drug plasma levels. A high-dose SHIV inoculum for the PrEP efficacy evaluation was identified via virus titration in untreated macaques. LEN-treated macaques were challenged with high-dose SHIV 7 weeks after drug administration, and the majority remained protected from infection, as confirmed by plasma PCR, cell-associated proviral DNA, and serology testing. Complete protection and superiority to the untreated group was observed among animals whose LEN plasma exposure exceeded its model-adjusted clinical efficacy target at the time of challenge. All infected animals had subprotective LEN concentrations and showed no emergent resistance. These data demonstrate effective SHIV prophylaxis in a stringent macaque model at clinically relevant LEN exposures and support the clinical evaluation of LEN for HIV PrEP in humans. Article	2023	Bell, J; Ratna, N; Migchelsen, SJ; Mohammed, H; Saunders, J	Therapeutic drug monitoring in oral HIV pre-exposure prophylaxis users with a history of bariatric surgery - a case series	Sexually Transmitted Infections	-	-	1368-4973	10.1136/sextrans-BASHH-2023.101	https://sti.bmj.com/content/99/Suppl_1/A52.2	Introduction Oral HIV pre-exposure prophylaxis (PrEP) with tenofovir disoproxil fumarate (TDF) and emtricitabine (FTC) is highly effective in preventing HIV when taken adequately. Plasma concentration for TDF of >40ng/mL has been reported to be highly predictive of protection from HIV acquisition.1 The prevalence of obesity is increasing globally with growing numbers of people undergoing bariatric surgery including gastric sleeve, Roux-en-Y gastric bypass (RYGB), or gastric banding.2 Drug absorption may decrease following bariatric surgery and there are limited data on PrEP drug concentrations and efficacy following this intervention. Methods We included PrEP-users with previous bariatric surgery who were referred to a national complex PrEP clinic between June 2021 and March 2023. We collected data on demographics, bariatric surgery history, PrEP regimen, plasma TDF/FTC trough concentrations, and HIV antibody test results via retrospective case-notes review. We undertook descriptive analyses in SPSS version 29. Results We included eight cases (Table 1); all were cis-gender men-who-have-sex-with-men [mean age = 46.6 years [standard deviation (SD) = 11.9]] taking TDF/FTC as a daily dose (DD) or event-based dose (EBD). Median time between PrEP initiation and therapeutic drug monitoring was 66 days [interquartile range (IQR) = 5.3 - 1623]. Mean plasma trough concentrations of TDF and FTC were 85.9ng/mL (SD=27.5) and 59.2ng/mL (SD=45.1) respectively. All patients had a negative HIV antibody test at follow-up after commencing PrEP (median 532 days, IQR = 111–1759)	NA	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review
Article	2023	Beltrami J.; Rao S.; Wang G.; Minor P.; Dunbar E.	HIV Linkage to Care and Pre-Exposure Prophylaxis among Persons in Non-Health Care Sites Who Are Tested for HIV for the First Time, United States, 2019	Journal of Public Health Management and Practice	-	-	10784659	10.1097/PHH.0000000000001592	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143088698&doi=10.1097%2fPHH.0000000000001592&partnerID=40&md5=24a072a03b8e8630f7c41a64f1728c93	Context: The Centers for Disease Control and Prevention recommends that all persons aged 13 to 64 years are tested for human immunodeficiency virus (HIV). However, results from US surveys show that 50% of persons and less had ever tested for HIV. Program: The Centers for Disease Control and Prevention annually funds 60 health departments to conduct comprehensive HIV prevention and surveillance activities that include HIV testing. Implementation: We selected the 31 health departments with quality data (ie, ≤20% missing or invalid values for variables to verify linkage to HIV medical care and new HIV diagnoses) in 2019. Main outcomes were new HIV diagnoses, linkage, and pre-exposure prophylaxis (PrEP) awareness and referrals. We used SAS 9.4 to conduct descriptive, chi-square, and multivariate regression analyses. Our objectives were to determine outcomes and characteristics of persons in non-health care settings who tested for HIV for the first time. Evaluation: Compared with persons who previously tested for HIV, persons who tested for the first time were more likely to be aged 13 to 29 years than aged 30 years and older (62.0% 24 295/39 192 vs 42.1% 61 911/147 087, P <.001) and have a higher percentage of new HIV diagnoses (0.6% 242/39 320 vs 0.5% 667/147 475, P <.001). Among persons who tested for the first time, overall percentages of linkage, PrEP awareness, and PrEP referral were 73.4%, 33.3%, and 30.8%, respectively. Compared with referent groups, persons who tested for the first time in the South and had a new HIV diagnosis were less likely to be linked (adjusted prevalence ratio aPR = 0.72, 95% confidence interval CI: 0.59-0.89); persons who inject drugs were less likely to be aware of PrEP (aPR = 0.84, 95% CI: 0.77-0.91); and persons in the Northeast were less likely to receive PrEP referrals (aPR = 0.28, 95% CI: 0.26-0.31). Discussion: Non-health care sites should consider increasing HIV testing, PrEP awareness, and prompt referrals to PrEP and HIV treatment services for persons who have never previously tested. © 2023 Lippincott Williams and Wilkins. Article	2023	Beltran R.M.; Schuyler A.C.; Blair C.S.; Goldbach J.T.; Castro C.A.; Holloway I.W.	"That's kind of like the big struggle right now is can we get PrEP?": Facilitators and Barriers to PrEP Uptake Among Active Duty Gay and Bisexual Men	Sexuality Research & Social Policy	-	-	18689884	10.1007/s13178-021-00622-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113155962&doi=10.1007%2fs13178-021-00622-6&partnerID=40&md5=dde693076ad5e0913bfd7e508d66efc6	Introduction: The US Military is experiencing a rise in HIV infections among gay and bisexual men (GBM) serving on active duty, yet little is known about this population's uptake of pre-exposure prophylaxis (PrEP), an evidence-based intervention for HIV prevention. This mixed methods study examines the facilitators and barriers to PrEP access and uptake among active duty GBM. Methods: Active duty GBM were recruited using respondent-driven sampling (2017 and 2018). Participants (n = 93) answered quantitative survey questions on PrEP interest and accessibility. Another set of participants (n = 10) discussed their PrEP experiences in qualitative interviews. We conducted descriptive and bivariate analyses of quantitative data, while qualitative data were analyzed using structural and descriptive coding techniques. Results: Approximately 71% of active duty GBM indicated interest in accessing PrEP. A greater proportion of those who disclosed (vs. did not disclose) their sexual orientation to their military doctor discussed (p < 0.001) or accessed (p = 0.017) PrEP. The following qualitative themes emerged: (1) providers' negative views and knowledge gaps related to PrEP; (2) lack of a systems approach to PrEP access; (3) confidentiality concerns; and (4) reliance on peer networks for PrEP guidance and support. Conclusions: Study results indicate that active duty GBM are interested in and want to discuss PrEP with their military doctors, but gaps in providers' PrEP-related knowledge and skills, as well as mistrust in the military health care system, remain. Policy Implications: A system-wide approach that addresses confidentiality concerns and removes procedural barriers to PrEP access is recommended to improve PrEP uptake in this population. © 2021, The Author(s). Article	2023	Ben Moussa, Amal; Belhiba, Ouijdane; Sodqi, Mustapha; Hajouji, Fatima Zahra; Salah, Nour Elimane Issam; Sakhri, Noureddine; Alami, Kamal; Omari, Boutaina El; Ouarsas, Lahoucine; Karkouri, Mehdi	PrEPare_Morocco a successful community-based PrEP delivery demonstration program for men who have sex with men and female sex workers in Morocco.	AIDS Care	-	-	1360-0451	10.1080/09540121.2023.2263679	https://dx.doi.org/10.1080/09540121.2023.2263679	Pre-exposure prophylaxis (PrEP) is an effective HIV prevention tool, recommended for persons at substantial risk for HIV, such as female sex workers (FSW) and men who have sex with men (MSM). We present Morocco's and the Middle East/North Africa's first PrEP demonstration project. Our pilot aimed to assess the feasibility and acceptability of a community-based PrEP program for FSW and MSM in Morocco's highest HIV prevalence cities: Agadir, Marrakech, and Casablanca. From May to December 2017, 373 eligible participants engaged in a 5-9 month program with daily oral TDF/FTC and clinic visits. Of these, 320 initiated PrEP, with 119 retained until the study's end. We report an 86% PrEP uptake, 37% overall retention, and 78% retention after 3 months. No seroconversions occurred during follow-up. These results underscore PrEP's need and acceptability among MSM and FSW and demonstrate the effectiveness of a community-based PrEP program in Morocco. These findings informed Morocco's current PrEP program and hold potential for the wider region with similar challenges. Article	2023	Bergh K.; Toska E.; Duby Z.; Govindasamy D.; Mathews C.; Reddy T.; Jonas K.	Applying the HIV Prevention Cascade to an Evaluation of a Large-Scale Combination HIV Prevention Programme for Adolescent Girls and Young Women in South Africa	AIDS and Behavior	-	-	10907165	10.1007/s10461-023-04130-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165116298&doi=10.1007%2fs10461-023-04130-z&partnerID=40&md5=a1839a3deb8a199e5e23c75237833c5e	Adolescent girls and young women (AGYW) in South Africa are at a three times higher risk of acquiring HIV than their male counterparts. The HIV prevention cascade is a tool which can be used to measure coverage of HIV prevention services, although there is limited empirical evidence to demonstrate its application in low-resourced settings. The unifying framework is a conceptualisation of the HIV prevention cascade which theorises that both motivation and access are required for an individual to effectively use an HIV prevention method. We applied this framework to data from a random sample of 127,951 beneficiaries of a combination HIV prevention programme for AGYW aged 15–24 in South Africa to measure the steps to, and identify key barriers to, effective use of male condoms and oral pre-exposure prophylaxis (PrEP) among this vulnerable population. Barriers to each step were analysed using univariate and multivariable logistic regression. Among self-reported HIV-negative AGYW who had sex in the past 6 months, effective use of condoms (15.2%), access to PrEP (39.1%) and use of PrEP (3.8%) were low. AGYW were: less likely to be motivated to use condoms if they believed that they had a faithful partner (aOR 0.44, 95% CI 0.22–0.90) or disliked condoms (aOR 0.26, 95% CI 0.11–0.57), less likely to access condoms if the place where AGYW accessed them was far away (aOR 0.25, 95% CI 0.10–0.64), more likely to effectively use condoms if they received counselling on how to use them (aOR 2.24, 95% CI 1.05–4.76), less likely to be motivated to use PrEP if they did not believe PrEP was efficacious (aOR 0.35, 95% CI 0.17–0.72), more likely to be motivated if they felt confident that they could use PrEP, and more likely to have access to PrEP if they had ever been offered PrEP (aOR 2.94, 95% CI 1.19–7.22). This combination HIV prevention programme and similar programmes should focus on risk-reduction counselling interventions for AGYW and their male partners to improve effective use of condoms and ensure easy access to condoms and PrEP by making them available in youth-friendly spaces. Our findings demonstrate that the application of HIV prevention cascades can inform AGYW HIV prevention programming in low-resourced settings. © 2023, The Author(s). Article	2023	Bero, Bridgette; Zidana, Chipo; Showa, Sarudzai Portia	PrEP retention predictors among key populations in urban areas of Zimbabwe - a machine learning approach.	African Journal of AIDS Research	-	-	1727-9445	10.2989/16085906.2023.2237002	https://dx.doi.org/10.2989/16085906.2023.2237002	Pre-exposure prophylaxis (PrEP) success depends on adherence and hence retention in care. It is vital to find factors that affect PrEP retention to make this HIV-prevention method successful. The main objectives of this study were to identify the major determinants of PrEP retention at six months from day of initiation and to determine PrEP retention clusters. Data of people who were initiated on PrEP care at Population Services International sites between 2017 and 2019 in Zimbabwe were used. Determinants of PrEP retention were identified using multivariable logistic regression and partitioning around medoids (PAM) cluster analysis to determine the number and composition of PrEP retention clusters. Significant PrEP retention determinants were found to be population type, sex, marital status, employment type, age and education level. Female sex workers were most likely to stay on PrEP compared to other users. We found that PrEP users could be grouped into three risk clusters: cluster 1 consisted of married adult males who are high-risk individuals; cluster 2 consisted of the young single men who have sex with men (MSM); and cluster 3 consisted of adult women who are separated or divorced and employed as sex workers. The retention rates were 32%, 24% and 44% for clusters 1 to 3 respectively. We conclude that adults, female sex workers, high-risk individuals, women, people without or with little education and sex workers stay on PrEP better than youths, MSM, men and educated and employed individuals. Article	2023	Bhushan, Nivedita L.; Shangase, Nosipho; Kimaru, Linda Jepkoech; Gomez-Olive, F. Xavier; Kahn, Kathleen; Pettifor, Audrey E.	HIV Related Behaviors Among Male Partners of Adolescent Girls and Young Women in Rural South Africa.	AIDS and Behavior	-	-	1573-3254 1090-7165	10.1007/s10461-022-03882-4	https://pubmed.ncbi.nlm.nih.gov/36318420/	Improving men's engagement in HIV prevention is not only essential for reducing their own HIV risk but also the risk of transmitting HIV to their female partners. We conducted a cross-sectional survey using a population-based sample of men (age 18-30) who reported being a partner of an adolescent girls and young women (AGYW) in South Africa (N = 2827). We used logit-binomial regression models to examine associations among men's partnership characteristics, HIV risk perceptions, and HIV-related behaviors and examine differences by male partner age (younger men (18-24) vs. older men (25-30)) and age difference between partners (age-concordant (< 5 years) vs. age-disparate (≥ 5 years)). Most men reported inconsistent condom use (85%) and nearly half reported engaging in transactional sex (48%). Older men were just as likely as younger men, and men with age-disparate and age-concordant partners, to inconsistently use condoms, engage in transactional sex, and perpetrate intimate partner violence. Most men also reported a very high interest in pre-exposure prophylaxis (PrEP) (77%) and half reported having an HIV test in the past year (50%). There were no differences by male partner age or age difference between partners in PrEP interest but older men and men in age-discordant relationships were more likely than younger men and men in age-concordant relationships to have an HIV test in the past year. Male partners of AGYW in South Africa are engaging in HIV-related behaviors and need HIV prevention interventions to reduce risk for themselves and their female partners. Article	2023	Biello, Katie B; Chan, Philip A; Holcomb, Richard; Ndoye, Colleen Daley; Valente, Pablo K; Maynard, Michaela; Gandhi, Monica; Mayer, Kenneth H; Mimiaga, Matthew J	PrEPare for Work: A Pilot Randomized Controlled Trial of an Intervention to Optimize HIV PrEP Outcomes Among Male Sex Workers	AIDS and Behavior	-	-	1573-3254	10.1007/s10461-023-04050-y	https://dx.doi.org/10.1007/s10461-023-04050-y	HIV pre-exposure prophylaxis (PrEP) use is limited among male sex workers, who are at exceptionally high-risk for HIV infection. We developed a theory-informed, two-pronged intervention ("PrEPare-for-Work") to optimize PrEP initiation and adherence among male sex workers, which was preliminarily evaluated in a two-stage pilot randomized controlled trial of 110 male sex workers in the US Northeast. Individuals randomized to the Stage 1 PrEPare-for-Work Case Management arm were three times as likely as those in the standard of care (SOC) arm to initiate PrEP (RR = 2.95, 95% CI = 1.57-5.57). Participants who initiated PrEP and were randomized to the Stage 2 PrEPare-for-Work Adherence Counseling arm had higher rates of prevention-effective adherence (measured via tenofovir in hair) compared to those in the SOC arm (RR = 1.7, 95% CI 0.64-4.77; 55.6% vs. 28.6%, respectively); though not statistically significant. Given the need and the promise of this pilot RCT, further efficacy testing is warranted and should be prioritized. Article	2023	Biello, Katie B; Valente, Pablo K; da Silva, Daniel Teixeira; Lin, Willey; Drab, Ryan; Hightow-Weidman, Lisa; Mayer, Kenneth H; Bauermeister, José A	Who prefers what? Correlates of preferences for next-generation HIV prevention products among a national U.S. sample of young men who have sex with men	Journal of the International AIDS Society	-	-	1758-2652	10.1002/jia2.26096	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10339006	INTRODUCTION: Pre-exposure prophylaxis (PrEP) has been available for young people for over a decade, yet only â¼15% of young people in the United States with indications for PrEP have a prescription for it. Next-generation PrEP modalities may address some of the challenges of daily oral PrEP. However, preferences for these products are unknown. METHODS: From October 2020 to June 2021, we conducted an online survey of 737 cisgender, young men who have sex with men (age 15-24 years) without HIV across the United States who reported same-sex attraction or consensual sex with another man in the past 6 months. Participants completed a conjoint experiment comparing daily oral pills, event-driven oral pills, event-driven rectal douches, intramuscular injections, intravenous broadly neutralizing antibody (bnAb) infusions and subcutaneous implants. Participants ranked the products from most to least preferred. Exploded logit models examined the association between ranked preferences of PrEP modalities and socio-demographic and behavioural characteristics. RESULTS: Participants' mean age was 21 years (SD = 2.3), and 56% identified as White. Nineteen percent were currently taking daily oral PrEP, and another 9% had previously taken it. Participants prioritized efficacy, absence of side effects and costs in the conjoint analyses. Daily oral PrEP had the highest preference ranking, followed by event-driven oral (OR = 0.89, p = 0.058), injectable (OR = 0.45, p < 0.0001), implant (OR = 0.48, p < 0.0001), bnAb infusions (OR = 0.38, p < 0.0001) and rectal douches (OR = 0.24, p < 0.0001). There were differences in PrEP preferences across age, insurance status, sexual behaviour, PrEP use history, HIV and sexually transmitted infection (STI) testing history, and STI diagnoses (omnibus tests: p < 0.05). Participants also provided reasons for selecting their top product choice: ease of use for those who chose daily oral (99%) and daily event-driven (98.5%); feel more protected against HIV for those who chose injectable (95.4%) and implants (100%); not worrying about forgetting to take it for those who chose bnAbs (93.8%); and being able to stop taking it when they want for those who chose rectal douche (90.9%). CONCLUSIONS: Next-generation modalities were less likely to be preferred over daily oral PrEP, with differences in the magnitude by socio-demographic and behavioural characteristics. Given the low uptake of daily oral PrEP, end-users' preferences for and concerns about PrEP products must be understood to ensure high acceptability and penetration.	men who have sex with men, adolescents, HIV prevention, pre-exposure prophylaxis, conjoint experiment, product preferences	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Billick, Maxime J.; Fisher, Karla N.; Myers, Samantha; Tan, Darrell H. S.; Bogoch, Isaac I.	Outcomes of Individuals Using HIV Postexposure Prophylaxis-In-Pocket ("PIP") for Low-Frequency, High-Risk Exposures in Toronto, Canada.	Journal of Acquired Immune Deficiency Syndromes	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003282	https://pubmed.ncbi.nlm.nih.gov/37850980/	BACKGROUND: HIV postexposure prophylaxis-in-pocket ("PIP") is a self-initiated, event-driven HIV prevention modality for individuals with a low frequency of HIV exposures. METHODS: A cohort of 111 patients using PIP as their primary HIV prevention modality was longitudinally evaluated for PIP self-initiation, HIV and sexual transmitted infections, and switching to other HIV prevention modalities between February 2016 and December 2022. RESULTS: A total of 111 patients had 178.7 cumulative patient-years of PIP use. PIP was self-initiated 69 times by 35 (31.5%) individuals, with 0 HIV seroconversions identified. Thirty four individuals (30.6%) transitioned from PIP to pre-exposure prophylaxis and 33 individuals (29.7%) switched from pre-exposure prophylaxis to PIP. CONCLUSIONS: PIP is a useful addition to other pharmacologic HIV prevention tools, and may help prevent infection in those with a lower frequency of unanticipated HIV exposures. Article	2023	Billioti de Gage S.; Jourdain H.; Desplas D.; Dray-Spira R.	Roll-out and effectiveness of HIV pre-exposure prophylaxis in France: An overview	Therapies	-	-	405957	10.1016/j.therap.2023.02.010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149700248&doi=10.1016%2fj.therap.2023.02.010&partnerID=40&md5=4e59b50405d5b3bb30633726b4087294	Context: Oral HIV pre-exposure prophylaxis (PrEP) has been available and fully reimbursed for people at high risk of sexually acquired HIV infection in France since January 2016. Objective: To evaluate the roll-out of PrEP use in France and its real-life effectiveness. The main results of two previously published studies were presented at the second e-congress of the EPI-PHARE scientific interest group on pharmacoepidemiology and public decision support held in June 2022, and are reported in this article. Methods: Two studies were carried out using the French National Health Data System (SNDS) covering 99% of the French population. A first study aimed to evaluate the roll-out of PrEP use in France from its implementation until June 2021, globally over the entire study period, including an assessment of the impact of the coronavirus disease 2019 (COVID-19) pandemic that started in February 2020 in France. A second study using a nested case-control design was conducted in a cohort of men at high risk of HIV acquisition included between January 2016 and June 2020 to assess the effectiveness of PrEP in the real world. Results: As of 30 June 2021, a total of 42 159 people had initiated PrEP in France. Initiations increased steadily until February 2020, then slowed down sharply from the start of the COVID-19 pandemic and resumed from the first half of 2021. PrEP users were overwhelmingly men (98%), with an average age of 36 years, living in a large urban area (74%), and of whom a minority (7%) were socioeconomically disadvantaged. Throughout the study period, the level of PrEP maintenance from one semester to the next was high (80–90%). However, for 20% of PrEP initiators, no prescription renewals were recorded during the first six months, suggesting a substantial proportion of early treatment discontinuation. A minority (21%) of PrEP renewal prescriptions were made by private practitioners. Among 46 706 men at high risk of HIV infection, 256 patients identified with HIV infection were matched with 1213 controls. PrEP was used by 29% of cases and 49% of controls. Overall, PrEP effectiveness reached 60% (95% confidence interval 46% to 71%), and was increased in people with high PrEP use (93% (84% to 97%)), or after excluding periods of treatment discontinuation (86% (79% to 92%)). PrEP effectiveness was significantly reduced in people under 30 years of age (26% (–21% to 54%)) and in socioeconomically disadvantaged people (–64% (–392% to 45%)), for whom low PrEP uptake rates or high PrEP discontinuation rates were frequently observed. Conclusion: PrEP roll-out has been strongly impacted by the COVID-19 pandemic in France. Although it has been substantial among men who have sex with men, additional measures are needed to expand access to PrEP to all other population groups that could benefit from it. Promoting adherence to PrEP (especially among young people and the socioeconomically disadvantaged) will be essential to ensure a higher level of PrEP effectiveness, which has been shown to be lower in real-life settings than in clinical trials. © 2023 The Authors	Emtricitabine; HIV infection; HIV prevention; Men who have sex with men (MSM); Pharmacoepidemiology; Pre-exposure prophylaxis (PrEP); Tenofovir disoproxil fumarate	English	France	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical
Article	2023	Blair, Kevin James; Torres, Thiago S; Hoagland, Brenda; Bezerra, Daniel R B; Veloso, Valdilea G; Grinsztejn, Beatriz; Clark, Jesse; Luz, Paula M	Moderating Effect of Pre-Exposure Prophylaxis Use on the Association Between Sexual Risk Behavior and Perceived Risk of HIV Among Brazilian Gay, Bisexual, and Other Men Who Have Sex With Men: Cross-Sectional Study	JMIR Public Health and Surveillance	-	-	2369-2960	10.2196/45134	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10587815	BACKGROUND: Gay, bisexual, and other men who have sex with men (MSM) with a higher perceived risk of HIV are more aware of and willing to use pre-exposure prophylaxis (PrEP). PrEP is an effective HIV prevention strategy, but there is a lack of data on how PrEP use might moderate the relationship between sexual risk behavior and perceived risk of HIV. Moreover, most studies measure perceived risk of HIV via a single question. OBJECTIVE: We estimated the moderating effect of PrEP use on the association between sexual risk behavior and perceived risk of HIV, measured with the 8-item Perceived Risk of HIV Scale (PRHS), among Brazilian MSM. METHODS: A cross-sectional, web-based survey was completed by Brazilian Hornet app users aged ≥18 years between February and March 2020. We included data from cisgender men who reported sex with men in the previous 6 months. We evaluated the moderating effect of current PrEP use on the association between sexual risk behavior, measured via the HIV Incidence Risk Index for MSM (HIRI-MSM), and perceived risk of HIV, measured by the PRHS. Higher HIRI-MSM (range 0-45) and PRHS (range 10-40) scores indicate greater sexual behavioral risk and perceived risk of HIV, respectively. Both were standardized to z scores for use in multivariable linear regression models. RESULTS: Among 4344 cisgender MSM, 448 (10.3%) were currently taking PrEP. Current PrEP users had a higher mean HIRI-MSM score (mean 21.0, SD 9.4 vs mean 13.2, SD 8.1; P<.001) and a lower mean PRHS score (mean 24.6, SD 5.1 vs mean 25.9, SD 4.9; P<.001) compared to those not currently taking PrEP. In the multivariable model, greater HIRI-MSM scores significantly predicted increased PRHS scores (ß=.26, 95% CI 0.22-0.29; P<.001). PrEP use moderated the association between HIRI-MSM and PRHS score (interaction term ß=-.30, 95% CI -0.39 to -0.21; P<.001), such that higher HIRI-MSM score did not predict higher PRHS score among current PrEP users. CONCLUSIONS: Our results suggest current PrEP users have confidence in PrEP's effectiveness as an HIV prevention strategy. PrEP's effectiveness, positive psychological impact, and the frequent HIV testing and interaction with health services required of PrEP users may jointly influence the relationship between sexual risk behavior and perceived risk of HIV among PrEP users. Article	2023	Blaylock, Jason M; Ewers, Evan C; Bianchi, Elizabeth J; King, David B; Casimier, Rosemary O; Erazo, Hector; Grieco, Stephen; Lay, Jenny; Peel, Sheila A; Modjarrad, Kayvon; Beckett, Charmagne G; Okulicz, Jason F; Scott, Paul T; Hakre, Shilpa	Risk of sexually transmitted infections among U.S. military service members in the setting of HIV pre-exposure prophylaxis use.	PLOS One	-	-	1932-6203	10.1371/journal.pone.0296054	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10754448	BACKGROUND: The evidence for an increased incidence of sexually transmitted infections (STIs) among patients utilizing HIV pre-exposure prophylaxis (PrEP) has been inconsistent. We assessed the risk of incident STI while on PrEP compared to periods off PrEP among military service members starting PrEP. METHODS: Incidence rates of chlamydia, gonorrhea, syphilis, hepatitis C virus, and HIV were determined among military service members without HIV prescribed daily oral tenofovir disoproxil fumarate and emtricitabine for HIV PrEP from February 1, 2014 through June 10, 2016. Hazard ratios for incident STIs were calculated using an Anderson-Gill recurrent event proportional hazard regression model. RESULTS: Among 755 male service members, 477 (63%) were diagnosed with incident STIs (overall incidence 21.4 per 100 person-years). Male service members had a significantly lower risk of any STIs (adjusted hazard ratio (aHR) 0.21, 95% CI 0.11-0.40) while using PrEP compared to periods off PrEP after adjustment for socio-demographic characteristics, reasons for initiating PrEP, surveillance period prior to PrEP initiation, and the effect of PrEP on site and type of infection in multivariate analysis. However, when stratifying for anatomical site and type of infection, the risk of extragenital pharyngeal infection (pharyngeal NG: aHR 1.84, 95% CI 0.82-4.13, p = 0.30; rectal NG: aHR 1.23, 95% CI 0.60-2.51, p = 1.00) and extragenital CT infection (pharyngeal CT: aHR 2.30, 95% CI 0.46-11.46, p = 0.81; rectal CT: aHR 1.36, 95% CI 0.81-2.31, p = 0.66) was greater on PrEP compared to off PrEP although these values did not reach statistical significance. CONCLUSIONS: The data suggest entry into PrEP care reduced the overall risk of STIs following adjustment for anatomical site of STI and treatment. Service members engaged in PrEP services also receive more STI prevention counseling, which might contribute to decreases in STI risk while on PrEP. Article	2023	Boedeker, David; Zerpa, Ethan; Drayer, Sara M	Improving Pre-exposure Prophylaxis Counseling at a Military Women's Health Care Clinic to Champion CDC and Defense Health Agency Recommendations.	Military Medicine	-	-	1930-613X	10.1093/milmed/usad058	https://dx.doi.org/10.1093/milmed/usad058	INTRODUCTION: The CDC updated their guidelines in 2021 to recommend all doctors speak about pre-exposure prophylaxis (PrEP) against human immunodeficiency virus infection with all sexually active patients. In addition, there is a demonstrated need for physicians to counsel patients on PrEP to achieve military readiness. Results from the 2018 Health Related Behaviors Survey indicate 21.8% of U.S. service members were at high risk for human immunodeficiency virus. This improvement project aimed to assess deficiencies in providers' knowledge before and after an educational intervention and describe policies clinics can adopt to adhere to CDC recommendations. MATERIALS AND METHODS: A pre-intervention survey was distributed to providers at the Walter Reed National Military Medical Center Gynecologic Surgery and Obstetrics clinic. Based on results, an educational lecture and standardized intake form were developed. Following the intervention, a post-survey was distributed to providers. A chart review was performed to determine whether PrEP counseling increased following the intervention. RESULTS: Forty-seven gynecologic providers were sent a pre- and post-intervention survey. Thirty-seven individuals completed the pre-intervention survey (response rate 78.72%), whereas 18 people completed the post-intervention survey (response rate 38.30%). Descriptive analysis suggested comfort counseling on PrEP, comfort with Defense Health Agency guidance on PrEP, and knowledge of PrEP all increased. In terms of the chart review, 81 charts were reviewed pre- and post-intervention. Although we failed to meet our target counseling rate of 70%, the number of patients who were counseled on or prescribed PrEP following our intervention was statistically significant (P = .013). CONCLUSIONS: This improvement project increased provider knowledge and comfort with PrEP, but only marginally affected behavior changes among providers. This failure may be related to the specific clinic in which the study was implemented. Further research is needed to facilitate routine counseling of PrEP among military women's health care providers.	hivcenters for disease control and prevention (u.s.)counselingmilitary personnelwomen's healthmedical records reviewpre-exposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Bogdanić N.; Begovac J.; Močibob L.; Zekan Š.; Grgić I.; Ujević J.; Rode O.D.; Židovec-Lepej S.	Hepatitis A Outbreak in Men Who Have Sex with Men Using Pre-Exposure Prophylaxis and People Living with HIV in Croatia, January to October 2022	Viruses	-	-	19994915	10.3390/v15010087	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152231764&doi=10.3390%2fv15010087&partnerID=40&md5=c9d3ed18b594b34d4fc3969bf3c1a35d	The hepatitis A virus (HAV) is a highly hepatotropic virus transmitted mainly via the fecal–oral route. The purpose of this study is to describe a prolonged HAV outbreak in HIV-infected men who have sex with men (MSM) and pre-exposure prophylaxis (PrEP) users in Croatia in 2022. Croatia has a centralized system of HIV care and the PrEP service is only available at the University Hospital for Infectious Diseases (UHID), Zagreb. We reviewed all MSM living with HIV and MSM PrEP users at UHID and identified those diagnosed with HAV between January and October 2022. During this period, a total of 1036 MSM living with HIV and 361 PrEP users were followed, and 45 (4.4%) and 32 (8.9%) were diagnosed with HAV, respectively. Most cases were diagnosed in mid-February. A total of 70.1% (726/1036) MSM living with HIV and 82.3% (297/361) PrEP users were susceptible to HAV. Sequencing information was available for 34 persons; in all cases the HAV subtype IA was found. Our findings indicate that both MSM living with HIV and HIV-uninfected PrEP users are vulnerable to HAV infection and might be a potential source for a more widespread HAV epidemic. © 2022 by the authors. Article	2023	Böhm, Lennert; Jensen, Björn-Erik Ole; Schelzig, Hubert; Luedde, Tom; Bernhard, Michael	Consultations for HIV post-exposure prophylaxis before and after health insurance coverage of pre-exposure prophylaxis to a university-based emergency department in Germany.	HIV Research and Clinical Practice	-	-	2578-7470	https://doi.org/10.1080/25787489.2023.2207977	https://pesquisa.bvsalud.org/portal/resource/pt/mdl-37151090	Background: Potential risk contacts for HIV transmission may lead to presentations to the emergency department (ED) for counseling and initiation of post-exposure prophylaxis (PEP).Objective: To examine the impact of German health insurance covering pre-exposure prophylaxis (PrEP) following Sept 1st 2019 for certain risk groups on the frequency and reasons for PEP counseling in a university-based ED in Germany.Methods: In a before-after study design, all persons aged ≥18 years who presented for PEP counseling were analyzed retrospectively. We compared characteristics of presentations in the 18 months prior to PrEP coverage on Sept 1st, 2019, with those in the following 18 months.Results: 154 ED presentations occurred in the first study period, and 155 ED presentations in the second period. Regarding the reasons for ED visits, no statistically significant difference was found occupational risk contact (18.2 vs. 26.5%, p = 0.081), sexual risk contact (74.7 vs. 69.0%, p = 0.266), other non-occupational risk contact (7.1 vs. 4.5%, p = 0.329). For men who have sex with men (MSM), no statistically significant differences were found 38.9 (n = 60) vs. 35.5% (n = 55), p = 0.537. All persons presenting to the HIV outpatient clinic after ED PEP initiation (n = 60 vs. n = 52) tested negative for HIV 3 months later.Conclusion: In this study, reasons to present for PEP counseling to a university ED showed no change following the implementation of PrEP coverage by health insurances. Therefore, PEP remains an important prevention for HIV transmission and presentations to the ED for PEP counseling may provide an opportunity to educate persons at risk of HIV infection about PrEP, thereby helping to prevent new HIV infections. Article	2023	Bonacci R.A.; Van Handel M.; Huggins R.; Inusah S.; Smith D.K.	Estimated Uncovered Costs For HIV Preexposure Prophylaxis In The US, 2018	Health Affairs	-	-	2782715	10.1377/hlthaff.2022.00523	https://www.healthaffairs.org/doi/full/10.1377/hlthaff.2022.00523	The cost of HIV preexposure prophylaxis (PrEP) medication and care is a key barrier to PrEP use. Using population-based surveys and published information, we estimated the number of people with uncovered costs for PrEP care among US adults with PrEP indications, stratified by HIV transmission risk group, insurance status, and income. Accounting for existing PrEP payer mechanisms, we estimated annual uncovered costs for PrEP medication, clinical visits, and laboratory testing based on the 2021 PrEP clinical practice guideline. Of 1.2 million US adults with PrEP indications in 2018, we estimated that 49,860 (4 percent) of them had PrEP-related uncovered costs, including 32,350 men who have sex with men, 7,600 heterosexual women, 5,070 heterosexual men, and 4,840 people who inject drugs. Of those 49,860 people with uncovered costs, 3,160 (6 percent) incurred $18.9 million in uncovered costs for PrEP medication, clinical visits, and lab testing, and 46,700 (94 percent) incurred $83.5 million in uncovered costs for only clinical visits and lab testing. The total annual uncovered costs for adults with PrEP indications were $102.4 million in 2018. The proportion of people with uncovered costs for PrEP is less than 5 percent among adults with PrEP indications, but the magnitude of costs is significant. © 2023, Project HOPE. All rights reserved. Article	2023	Bonacci, Robert A; Tanner, Mary R; Zhu, Weiming; Hayes, Tameka; Dominguez, Kenneth L; Iqbal, Kashif; Wiener, Jeffrey; Drezner, Kate; Jennings, Jacky M; Tsoi, Benjamin; Wendell, Debbie; Hoover, Karen W	HIV Prevention Services for Hispanic/Latino Persons in THRIVE, 2015-2020.	American Journal of Preventive Medicine	-	-	1873-2607	10.1016/j.amepre.2023.01.042	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10475139	INTRODUCTION: Hispanic/Latino men who have sex with men (MSM) and transgender women (TGW) are disproportionately affected by HIV in the U.S. This study evaluated HIV prevention services and outcomes among Hispanic/Latino MSM and TGW in the Targeted Highly Effective Interventions to Reduce the HIV Epidemic (THRIVE) demonstration project and consider lessons learned. METHODS: The authors described the THRIVE demonstration project services provided to Hispanic/Latino MSM and TGW in 7 U.S. jurisdictions from 2015 to 2020. HIV prevention service outcomes were compared between 1 site with (2,147 total participants) and 6 sites without (1,129 total participants) Hispanic/Latino-oriented pre-exposure prophylaxis clinical services, and Poisson regression was used to estimate the adjusted RR between sites and pre-exposure prophylaxis outcomes. Analyses were conducted from 2021 to 2022. RESULTS: The THRIVE demonstration project served 2,898 and 378 Hispanic/Latino MSM and TGW, respectively, with 2,519 MSM (87%) and 320 TGW (85%) receiving ≥1 HIV screening test. Among 2,002 MSM and 178 TGW eligible for pre-exposure prophylaxis, 1,011 (50%) MSM and 98 (55%) TGW received pre-exposure prophylaxis prescriptions, respectively. MSM and TGW were each 2.0 times more likely to be linked to pre-exposure prophylaxis (95% CI=1.4, 2.9 and 95% CI=1.2, 3.6, respectively) and 1.6 and 2.1 times more likely to be prescribed pre-exposure prophylaxis (95% CI=1.1, 2.2 and 95% CI=1.1, 4.1), respectively, at the site providing Hispanic/Latino-oriented pre-exposure prophylaxis clinical services than at other sites and adjusted for age group. CONCLUSIONS: The THRIVE demonstration project delivered comprehensive HIV prevention services to Hispanic/Latino MSM and TGW. Hispanic/Latino-oriented clinical settings may improve HIV prevention service delivery to persons in Hispanic/Latino communities. Article	2023	Ibongomin Felix, Kibone Winnie, Jerom, Okot, Osasa Simple, Madrasa Grace, Williams, Ojara Francis, Musoke, David, Peboki Peboki Francis	Pre-exposure prophylaxis use among female sex workers in Gulu city, Uganda: a community-based cross-sectional study	Therapeutic Advances in Infectious Disease	-	-	-	-	26699361	10.1177/20499361221199550	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-use-among-female-sex/docview/2805632480/se-2?accountid=9113	Background: Pre-exposure prophylaxis (PrEP) is an important intervention for reducing the risk of HIV transmission among high-risk populations such as female sex workers in Africa, where HIV prevalence remains high. We aimed to assess the use of PrEP among female sex workers in Gulu, Uganda. Methods: In this community-based cross-sectional study, we included HIV-negative female sex workers purposely selected from hotspots within Gulu city, Uganda between February and March 2023. A semi-structured questionnaire was administered to collect data on sociodemographic characteristics, reproductive data, sexual practices, and self-reported PrEP use in the past 3 months. Symptoms of depression were screened using Patient Health Questionnaire-2 tool. Predictors of PrEP use was determined using modified Poisson regression analysis model. $p < 0.05$ was considered statistically significant. Results: We enrolled 273 female sex workers with a median age of 27 (interquartile range: 24–32) years. Overall, 101 (66.3%) participants used PrEP. PrEP use was associated with; regular source of income beside sex work adjusted prevalence ratio (aPR): 2.7, 95% confidence interval (CI): 2.11–6.35, $p < 0.001$) being in a polygamous marriage (aPR: 6.9, 95% CI: 2.32–35.77, $p = 0.022$), practicing sex work in both rural and urban areas (aPR: 2.5, 95% CI: 1.48–4.35, $p < 0.001$), having symptoms of depression (aPR: 2.1, 95% CI: 1.48–7.74, $p = 0.003$), and use of postexposure prophylaxis (PEP) in the past 12 months (aPR: 6.1, 95% CI: 0.17–9.59, $p = 0.001$). Conclusion: Almost two in three of the female sex workers in Gulu city were currently using PrEP. Previous use of PEP was associated with lower use of PrEP. These findings suggest the need for targeted interventions to increase PrEP uptake and decrease HIV acquisition in this high-risk population among female sex workers, especially those with low income and limited access to healthcare. Article	2023	Bunner, Courtney Pearson; Manna, Alexandra M; Ndirangu, Jacqueline W; Browne, Felicia A; Spector, Ilene; Nybladt, Laura; Ahmed, Khadija; Wechsberg, Wendee M	The Importance of the Individual in PrEP Uptake: Multilevel Correlates of PrEP Uptake Among Adolescent Girls and Young Women in Tshwane, South Africa.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-023-04126-9	https://dx.doi.org/10.1007/s10461-023-04126-9	Adolescent girls and young women (AGYW) account for 25% of new HIV infections in South Africa. Pre-exposure prophylaxis (PrEP) is approved by the South African Government, but the factors that promote PrEP uptake among AGYW are not well understood. This study examines multilevel factors associated with PrEP uptake among AGYW in six cities and town areas in Tshwane (Pretoria), South Africa. After consent/assent, PrEP-eligible AGYW ($n = 640$) completed a questionnaire assessing factors at the individual, network/interpersonal, and community levels and were prescribed PrEP in study clinics. A multivariable model, adjusting for clustering, assessed factors associated with PrEP uptake over a 9-month period. Most participants were Black African (98.1%), unemployed (58.1%), and had a median age of 23 years. Overall, 101 (16%) participants used PrEP. PrEP use was associated with; regular source of income beside sex work adjusted prevalence ratio (aPR): 2.7, 95% confidence interval (CI): 2.11–6.35, $p < 0.001$), perceived risk of HIV (OR = 0.21), and PrEP-related shame (OR = 0.63) were correlated with lower odds of PrEP uptake (ps ≤0.004(4) 0.05). The findings highlight modifiable factors that should be addressed to support PrEP uptake efforts. Article	2023	Booker C; Murphy A.L.; Isenor J.E.; Ramsey T.D.; Smith A.J.; Bishop A.; Kelly D.V.; Woodill L.; Rachard G.; John Wilby K.	Community pharmacists' acceptance of prescribing pre-exposure prophylaxis (PrEP) for human immunodeficiency virus (HIV)	Canadian Pharmacists Journal	-	-	-	-	1715685	10.1177/17151635231152218	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149475496&doi=10.1177%2F17151635231152218&partnerID=40&md5=2168c8f7b2d996a7a3fa0f99e2c5cf8b	Background: Pre-exposure prophylaxis (PrEP) for human immunodeficiency virus (HIV) prevention is highly effective. Pharmacists can increase PrEP accessibility through pharmacist prescribing. This study aimed to determine pharmacists' acceptance of a pharmacist PrEP prescribing service in Nova Scotia. Methods: A triangulation mixed methods study consisting of an online survey and qualitative interviews was conducted with Nova Scotia community pharmacists. The survey questionnaire and qualitative interview guide were underpinned by the 7 constructs of the Theoretical Framework of Acceptability (TFA). Descriptive statistics and thematic analysis were performed on survey and interview data, respectively. Results: Of 1,000 pharmacists invited to participate, 216 completed the survey. Fifteen pharmacists participated in interviews. Interview transcripts were deductively coded according to the same constructs and then inductively coded to identify themes within each construct. Results: A total of 216 community pharmacists completed the survey, and 19 completed the interview. Pharmacists were positive about PrEP prescribing in the constructs of affective attitude (improved access), ethicality (benefits communities), intervention coherence (practice alignment) and self-efficacy (role). Pharmacists expressed concerns about burden (increased workload), opportunity costs (time to provide the service) and perceived effectiveness (education/training, public awareness, laboratory test ordering and reimbursement). Conclusion: A PrEP prescribing service has mixed acceptability to Nova Scotia pharmacists yet represents a needed eff service delivery to increase PrEP access to underserved populations. Future service development must consider pharmacists' workload, education and training as well as factors relating to laboratory test ordering and reimbursement. © The Author(s) 2023.	arthcliconmunity pharmacistsconceptual frameworkcontrolled studyhealthcategoriatic transcriptionhealth care delivery	English	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Mixed methods
Article	2023	Borsa, Alexander; Siegel, Karolynn	Navigating the Viral Divide: Sexual and Gender Minority Community Perspectives on Treatment as Prevention.	AIDS Education and Prevention	-	-	-	-	1943-2755	10.1521/aeap.2023.35.5.406	https://dx.doi.org/10.1521/aeap.2023.35.5.406	Since it was established that HIV-positive individuals who maintain an undetectable viral load are unable to sexually transmit HIV (U=U), treatment as prevention (TasP) has become an important biomedical HIV prevention option. Many have remained optimistic that TasP, combined with pre-exposure prophylaxis (PrEP), will help close the "viral divide" between those living with and without HIV. This qualitative interview study of 62 sexual and gender minority (SGM) individuals of mixed serostatuses explored community perspectives regarding TasP, including the meaning of undetectability and how U=U impacts understandings of serodifference. Five key themes emerged from interviews: (1) undetectable does not equal HIV negative, (2) PrEP is more promoted than TasP, (3) TasP increases openness to serodifferent sex, (4) rejection of TasP ebolutions, and (5) the importance of layering prevention strategies. These findings suggest that while TasP is helping to bridge the viral divide, seventeen distinctions remain prevalent and important to many SGM individuals. Article	2023	Boyd D.T.; Nelson L.E.; Hill M.J.; Whitfield D.; Raines S.R.; Akyioto S.; Estell L.; Wilton L.; Highton-Weidman L.; Shopture S.; Magnus M.; Meyer K.B.; Pawowar-Manning E.; Wallace S.E.; Parker S.D.; Wheeler D.P.	Examining the Role of Autonomy Support, Goal Setting, and Care Coordination Quality on HIV PrEP Adherence in Black Men Who Have Sex with Men: HPTN 073	AIDS Patient Care and STDs	-	-	-	-	1087-2914	10.1089/apc.2022.0139	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146139778&doi=10.1089%2Fapc.2022.0139&partnerID=40&md5=9635451a0f01ec31ece67a5c2dd554d9	Autonomy support is a concept that is derived from self-determination theory. Autonomy refers to the freedom to act as one chooses. The current study aimed to examine if autonomy support was associated with dried blood spot validated pre-exposure prophylaxis (PrEP) adherence, and whether the association was mediated by PrEP adherence goal setting and progress toward PrEP adherence goals. Our sample was drawn from Black men who have sex with men (MSM) from across three cities (Chapel Hill, NC; Los Angeles, CA; and Washington, DC) in the United States between February 2021 and September 2014. We used logistic regression to evaluate associations between study variables and path analysis to test mediation effects. Participants were, on average, 28 standard deviation (SD) = 1.12 years old and 27% were unemployed. We found that MSM who experienced high autonomy support were more likely to adhere to PrEP odds ratio (OR) = 1.17; 95% confidence interval = 1.00–1.38. MSM who set PrEP adherence goals were more likely to adhere to PrEP. Moreover, MSM who reported making progress toward their goals were also more likely to adhere to PrEP. Finally, client perception of coordination and care coordination quality were not associated with PrEP adherence. Autonomy support was associated with PrEP adherence through PrEP adherence goal setting. Autonomy support, goal setting, and care coordination quality influenced PrEP adherence among Black MSM. Our findings indicate that while it is important to set goals for PrEP adherence, goal setting may need to be accompanied by progress monitoring to achieve the maximal effect. © Copyright 2023, Mary Ann Liebert, Inc., publishers 2023.	autonomy support; Black MSM; HIV prevention; PrEP adherence	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Boyd, Donte T; Abo-Ba'are, Ganji Rabie; Zgab, Edem Yaw; Williams, Antonio T; Flores, Delmacio D	The Role of Family Support and Communication on PrEP Attitudes and Stigma Among Black Men who Sex with Men (BMSM).	Sexually Transmitted Diseases	-	-	-	-	1537-4521	10.1097/OLQ.0000000000001832	https://dx.doi.org/10.1097/OLQ.0000000000001832	BACKGROUND: This study addresses the gap in the literature on protective factors for preexposure prophylaxis (PrEP) stigma and attitudes among Black men who have sex with men (BMSM) and young adults using the Developmental Assets Framework to examine how various assets can foster resilience. We hypothesized that family support, open family communication, and communication with parents about sex and drugs can help reduce stigma and increase positive attitudes toward PrEP use. METHODS: A cross-sectional survey was administered to participants (N = 400, mean age = 23.46, standard deviation = 2.59) using Amazon Mechanical Turk, social media sites, and community-based organization. A path analysis was conducted to examine associations between stigma and positive attitudes toward PrEP and assets (family support, communication with parents about sex and drugs, and open family communication). RESULTS: Communication with parents about sex and drugs was positive and directly associated with PrEP stigma ($\beta = -0.11$, $p < 0.05$) and PrEP attitudes ($\beta = 0.12$, $p < 0.05$). Family support was directly associated with PrEP attitudes ($\beta = 0.11$, $p < 0.05$). CONCLUSIONS: The developmental asset framework in assess positive PrEP attitudes and stigma among young BMSM. Our results underscore that parents have an influence on future sexual behaviors among this population, behaviors for BMSM. In addition, their influence can be both positive by helping lowering PrEP stigma and negatively lowering PrEP attitudes. It is critical that we develop culturally competent human immunodeficiency virus and prevention and intervention programs for BMSM and their families. Article	2023	Bozzani, Fiammetta M.; Torrie-Prentholt, Fern; Qualia, Matthew; Galos, Mitzy; Isidowshi, Pitchaya P.; Giddings, Rebecca; Medley, Graham F.; Malhotra, Shelly; Torres-Rueda, Sergio	Costs and Cost-Effectiveness of Biomedical, Non-Surgical HIV Prevention Interventions: A Systematic Literature Review.	PharmacoEconomics	-	-	-	-	1179-2027 1170-7690	10.1007/s40273-022-01233-w	https://pubmed.ncbi.nlm.nih.gov/36529830/	BACKGROUND: Considerable evidence on the costs and cost-effectiveness of biomedical, non-surgical interventions to prevent human immunodeficiency virus (HIV) transmission has been generated over the last decade. This study aims to synthesize findings and identify remaining knowledge gaps to suggest future research priorities. METHODS: A systematic literature review was carried out in August 2020 using the MEDLINE, Embase, Global Health and Econlit databases to retrieve economic evaluations and costing studies of oral pre-exposure prophylaxis (PrEP), injectable long-acting PrEP, vaginal microbicide rings and gels, HIV vaccines and broadly neutralising antibodies. Studies reporting costs from the provider or societal perspective were included in the analysis. Those reporting on behavioural methods of prevention, condoms and surgical approaches (voluntary medical male circumcision) were excluded. The quality of reporting of the included studies was assessed using a checklist. RESULTS: We identified 3087 citations, of which 87 studies were retained. Most were set in low- and middle-income countries (LMICs; n = 53) and focused on the costs and/or cost-effectiveness of oral PrEP (n = 58). Only 11 studies provided cost-effectiveness estimates for injectable PrEP, vaginal microbicide rings, HIV vaccines or broadly neutralising antibodies. Of the 87 studies, 30 were published in the last 2 years. Most studies provided practical details on how the interventions would be delivered by the health system, and only three of these, all in LMICs, explicitly focused on service integration and its implications for delivery costs. Real-world programme delivery mechanisms and costs of intervention delivery were rarely considered. PrEP technologies were generally found to be cost-effective only when targeting high-risk subpopulations. Single-dose HIV vaccines are expected to be cost-effective for all groups despite substantial uncertainty around pricing. CONCLUSIONS: A lack of primary, detailed and updated cost data, including above-service level costs, from a variety of settings makes it difficult to evaluate the cost-effectiveness of specific delivery modes at scale, or to evaluate strategies for services integration. Closing this evidence gap around real-world implementation is vital, not least because the strategies targeting high-risk groups that are recommended by PrEP models may incur substantially higher costs and be of limited practical feasibility in some settings. Article	2023	Braddock, William Richard Traylor; Ocasio, Manuel A; Cornelius, W Scott; Mandani, Jaz; Fernandez, M Isabel	Increasing Participation in a TelePrEP Program for Sexual and Gender Minority Adolescents and Young Adults in Louisiana: Protocol for an SMS Text Messaging-Based Chatbot.	JMIR Research Protocols	-	-	-	-	1929-0748	10.2196/42983	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10226592/	BACKGROUND: Sexual and gender minority (SGM) adolescents and young adults (AYAs) are at increased risk of HIV infection, particularly in the Southern United States. Despite the availability of effective biomedical prevention strategies, such as pre-exposure prophylaxis (PrEP), access and uptake remain low among SGM AYAs. In response, the Louisiana Department of Health initiated the LA TelePrEP Program, which leverages the power of telemedicine to connect Louisiana residents to PrEP. A virtual TelePrEP Navigator guides users through the enrollment process, answers questions, schedules appointments, and facilitates lab testing and medication delivery. To increase the participation of SGM AYAs in the program, the TelePrEP program partnered with researchers to develop a chatbot that would facilitate access to the program and support navigator functions. Chatbots are capable of carrying out many functions that reduce employee workload, and despite their successful use in health care and public health, little is known about the acceptability of chatbots for PrEP navigation. OBJECTIVE: This study aims to describe the development of a chatbot to support navigation and linkage to SGM AYAs who could support navigator functions and disseminate PrEP-related information. METHODS: Our process was comprised of 2 phases: conceptualization phase, aspects of navigator responsibilities, program logistics, and user interactions to prioritize in chatbot programming (eg, scheduling appointments and answering questions) were identified. We also selected a commercially available chatbot platform that could execute these functions and could be programmed with minimal coding experience. In the development phase, we engaged Department of Health staff and SGM AYAs within our professional and personal networks. Five different rounds of testing were conducted with various groups to evaluate each iteration of the chatbot. After each iteration of the testing process, the research team met to discuss feedback, guide the programmer on incorporating modifications, and to evaluate the chatbot's functionality. RESULTS: Through our highly collaborative and community-engaged process, a rule-based chatbot with artificial intelligence components was successfully created. We gained important knowledge that could advance future chatbot development, including the importance of (1) limiting the use of artificial intelligence components, (2) creating a chatbot persona, and (3) implementing quality assurance testing throughout the user input. CONCLUSIONS: HIV prevention researchers can feasibly and efficiently program a rule-based chatbot with the assistance of commercially available tools. Our iterative process of engaging researchers, program personnel, and different subgroups of SGM AYAs to obtain input was key to successful chatbot development. If the results of this pilot trial show that the chatbot is feasible and acceptable to SGM AYAs, future HIV researchers and practitioners could consider incorporating chatbots as part of their programs. Article	2023	Bradford, Davie; Parman, Muriel; Levy, Sora; Turner, Wesli H; Li, Li; Lesisch, Leah; Eaton, Ellen; Crockett, Kaylee B	HIV and Addiction Service for People Who Inject Drugs: Healthcare Provider Perceptions on Integrated Care in the U.S. South.	Journal of Primary Care & Community Health	-	-	-	-	2150-1327	10.1177/21501319231161208	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10035197/	This qualitative study evaluates physician training and experience with treatment and prevention services for people who inject drugs (PWID) including medications for opioid use disorder (MOUD) and HIV pre-exposure prophylaxis (PrEP). From 2019 to 2020, 20 physicians in Alabama, Georgia, Mississippi, and Tennessee participated in 1-hour interviews. Interviews were recorded, transcribed, and coded. Interviews were conducted on both early career physicians (n = 11) and one with mid- to late career physicians (n = 3). Focus group transcripts were coded and analyzed using thematic analysis to identify barriers affecting implementation of treatment and prevention services for PWID. Respondents identified that increasing the availability of providers prescribing MOUD was a critical enabling factor for PWID seeking and receiving care. Integrated, interdisciplinary services were identified as an additional resource although those remain fragmented in the current healthcare system. Barriers to care included provider unawareness, stigma associated with substance use, and access limitations. Providers identified the interwoven risk factors associated with injection drug use that must be addressed, including the risk of HIV acquisition, notably more at the forefront in the minds of early career physicians. Additional research is needed addressing the individual education curriculum, health system, and healthcare policy to address the addiction and HIV crises in the U.S. South.	injection drug use, medications for opioid use disorder, Pre-exposure prophylaxis, healthcare providers, qualitative	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

HTLV seroprevalence in people using HIV pre-exposure prophylaxis in England	Journal of Infection	-	-	-	-	1634453	10.1016/j.jinf.2023.01.033	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146339376&doi=10.1016%2Fj.jinf.2023.01.033&partnerID=40&md5=ab3e8f4029a2738d5370bbd49bf9f376	Objectives: HTLV-1 is predominantly a sexually-transmitted infection but testing is not mentioned in HIV PrEP guidelines. We evaluated HTLV-1/HTLV-2 seroprevalence amongst HIV PrEP users in England. Methods: An unlinked anonymous seroprevalence study. Results: Amongst 2035 HIV-PrEP users, 93% were men, 76% of white ethnicity and 83% had been born in Europe. There were no HTLV-1 HTLV-2 acquisitions cases (95% confidence interval 0% - 0.18%). Conclusions: There were no HTLV-1 infections identified, likely reflecting the predominantly white and European-born individuals. Similar studies are needed worldwide to inform public health recommendations for HIV-PrEP using populations, particularly in HTLV-endemic settings. © 2023	Bisexual and other men who have sex with men (GBMSM); Gay; HIV; Pre-exposure prophylaxis; Human T-cell lymphotropic virus type 1 (HTLV-1)	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Theses and Dissertations	2023	Brady, John Patrick	The Effect of Patient Navigation for PrEP-related Health Care on Mental Health among Latinx Sexual Minority Men: Mediation through Social Support	-	-	University of California	-	-	NA	https://escholarship.org/uc/item/9g2b46j6	Rationale: Sexual minority men (SMM; e.g., men who identify as gay/bisexual and/or report same-gender attraction/sexual behavior) are disproportionately affected by internalizing disorders and symptoms (e.g., anxiety and depressive disorders/symptoms) in comparison to their heterosexual/male peers. Hispanic/Latinx SMM may be especially burdened by internalizing disorders/symptoms due to decreased access to culturally competent health care, stigma surrounding mental disorders, and stress from within the SMM community. Patient navigation (PN) is a patient-centered, individualized intervention that addresses barriers to health care access. PN has been shown to increase PrEP uptake among racial/ethnic minority SMM, but its effects on mental health are unknown. PN may reduce symptoms of depression among Hispanic/Latinx SMM by providing social support. Design: This study used secondary data analysis to examine the impact of PN on internalizing symptoms (secondary outcome) 6-month follow-up (6MFU) among a sample of Hispanic/Latinx SMM between the ages of 18 and 29 years (N = 57). Data analyzed were from a randomized controlled trial investigating the efficacy of a PN intervention (versus usual care) to assist Hispanic/Latinx SMM at high risk for HIV infection with accessing PrEP. Hispanic/Latinx SMM peer patient navigators were utilized to provide culturally competent care and decrease social stigma. Usual care consisted of written information about PrEP, sexual health and HIV prevention services, and how to access care. It was hypothesized that the PN condition would be associated with decreased internalizing symptoms and that the effect would be mediated by two social support constructs at three-month follow-up: emotional support and informational support. Data were analyzed using two analytic approaches: 1) cross-lagged panel models, and 2) latent difference score models. Results: The PN condition was not associated with a significant decrease in internalizing symptoms at 6MFU and the effect was not mediated by social support. Conclusions: Results may be related to the floor effect of internalizing symptoms at baseline, analyses that assumed changes in social support were occurring within the first three months of the study, and variability in the frequency of using PN services. Future studies would benefit from gathering data at additional time points and including participants with higher internalizing symptoms and/or lower social support. Article	2023	Budhwani, Henna; Yigit, Ibrahim; Murugi-Bass, Allysha C.; Ratner, Crissi B.; Claude, Kristina; Muessig, Kathryn E.; Highton-Weidman, Lisa B.	Development and Validation of the Youth Pre-Exposure Prophylaxis (PrEP) Stigma Scale	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03829-9	https://www.proquest.com/scholarly-journals/development-validation-youth-pre-exposure/docview/2778470192/se-2?accountid=9113	To date, there are no established scales to assess PrEP stigma among youth. We validated the Youth PrEP Stigma Scale within the Adolescent Trials Network P3 study (2019–2021). Data from sexual and gender minority youth (18–24 years) who were prescribed PrEP across nine domestic sites were evaluated (N = 225). Descriptive statistics, exploratory factor analyses, and correlations are reported. Results yielded a three-factor solution [PrEP Disapproval by Others, Enacted PrEP Stigma, and PrEP User Stereotypes] with strong factor loadings and Cronbach's alphas ranging from 0.83 to 0.90, suggesting high internal consistency reliability. Higher PrEP stigma was correlated with lower PrEP knowledge, lower PrEP self-efficacy, and greater perceived barriers to PrEP use. Findings suggest the presence of HIV stigma, stigma as a barrier to prevention, and expression of PrEP modalities, the Youth PrEP Stigma Scale could advance intervention and mechanistic research among youth at elevated risk for HIV acquisition.Resumo alternativo:Resumoellenin la ficha, no existen escalas establecidas para evaluar el estigma de la PrEP entre los jóvenes. Validamos la Escala de estigma de la PrEP para jóvenes dentro del estudio P3 de la Red de ensayos para adolescentes (2019–2021). Se evaluaron los datos de jóvenes de minorías sexuales y de género (18–24 años) a quienes se les recetó PrEP en nueve sitios nacionales (N = 225). Se informan estadísticas descriptivas, análisis factorial exploratorio y coeficientes de correlación. Los resultados arrojaron una solución de tres factores (desaprobación de PrEP por parte de otros, estigma de PrEP promulgado y estereotipos de usuarios de PrEP) con fuertes cargas factoriales y alfas de Cronbach que oscilan entre 0.83 y 0.90, lo que sugiere una excelente consistencia interna. Las correlaciones entre esta Escala, el estigma anticipado del VIH, el riesgo percibido del VIH y la divulgación de la identidad sexual fueron significativas, lo que indica un potencial para los adolescentes sólidos. Dado la persistencia de las relaciones por el VIH entre los jóvenes, el estigma como una barrera para la prevención y la expansión de las modalidades de PrEP, la Escala de estigma de la PrEP para jóvenes podría mejorar la intervención y la investigación mecánica entre los jóvenes con un riesgo elevado de contraer el VIH. Article	2023	Bunda B.A.; Reineke R.A.; Lepaycowher S.A.; Moore C.M.; Wood M.E.; McDermott Y.M.; Naresh A.	Self-Perception of HIV Risk and Interest in Pre-Exposure Prophylaxis in a General Obstetrics and Gynecology Clinic Population	Journal of Women's Health	-	-	-	-	15409996	10.1089/jwh.2023.0153	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176222368&doi=10.1089%2Fjwh.2023.0153&partnerID=40&md5=d1fdcb85ab981c705dbe0aa	Background: Pre-exposure prophylaxis (PrEP) for HIV is underutilized, particularly among providers of obstetrics and gynecology (Ob/Gyn) clinics. Lack of self-perception of HIV risk is a barrier to PrEP uptake and is a key component of construct theory of health behavior change. We sought to determine the risk of self-perception of HIV risk among Ob/Gyn attendees of general Ob/Gyn clinics in New Orleans completed a survey assessing HIV knowledge, self-perception of HIV risk, and interest in PrEP. They reviewed a brief written educational intervention on demographic and behavioral risk factors for HIV and availability of PrEP. HIV knowledge, self-perception of HIV risk, and interest in PrEP were reassessed after the intervention. Results: One-hundred seventy individuals completed the survey. Eighty-five participants (50%) expressed initial interest in PrEP. Self-perception of risk of HIV acquisition was associated with interest in PrEP. Ten of 51 (19.6%) respondents who had high self-perceived risk of HIV were interested in PrEP, compared with 75 of 159 (47.2%) of those who had low self-perceived risk ($p < 0.01$). The association remained significant in a multivariate analysis. After the intervention, the number of those who perceived themselves to be at risk of HIV increased from 11 to 25 individuals ($p < 0.01$) and 20 of those (80%) were interested in PrEP. Knowledge of HIV risk factors increased ($p < 0.01$). The intervention did not significantly alter interest in PrEP. Conclusions: Self-perception of HIV risk was associated with interest in PrEP. A brief written educational intervention increased knowledge of HIV risk factors and increased self-perception of risk of HIV. The intervention did not translate to increased interest in PrEP. © 2023 Mary Ann Liebert Inc., All rights reserved. Article	2023	Bunting S.R.; Hunt B.; Boshara A.; Jacobs J.; Johnson A.K.; Hazra A.; Glick N.	Examining the Correlation Between PrEP Use and Black:White Disparities in HIV Incidence in the Ending the HIV Epidemic Priority Jurisdictions	Journal of General Internal Medicine	-	-	-	-	8848734	10.1007/s11606-022-07687-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131509752&doi=10.1007%2fs11606-022-07687-y&partnerID=40&md5=a65a5ea2fe98ae7b413625ec773a17a9	Introduction: HIV incidence remains high in the U.S. as do disparities in new HIV diagnosis between White and Black populations and access to preventive therapies like pre-exposure prophylaxis (PrEP). The federal Ending the HIV Epidemic (EHE) initiative was developed to prioritize resources to 50 jurisdictions with high HIV incidence. Methods: We conducted secondary analyses of data (2013–2019) from the CDC, Census Bureau, and AIDSVu to evaluate the correlation between PrEP use, HIV incidence, and HIV incidence disparities. We compared the PrEP-to-need ratio (PnR) with the ratio of Black and White HIV incidence rates in 46 EHE counties. Subsequent analyses were performed for the seven states that contained multiple EHE counties. Results: These 46 counties represented 25.9% of the U.S. population in 2019. HIV incidence ranged from 10.5 in Sacramento County, CA, to 59.6 in Fulton County, GA (per 100,000). HIV incidence disparity ranged from 1.5 in Orleans Parish, LA, to 12.1 in Montgomery County, MD. PnR ranged from 26.8 in New York County, NY, to 1.46 in Shelby County, TN. Change in HIV incidence disparities and percent change in PnR were not significantly correlated (ρ = 0.06, p = 0.69). Change in overall HIV incidence was significantly correlated with increase in PnR (ρ = −0.42, p = 0.004). Conclusions: PrEP has the potential to significantly decrease HIV incidence; however, this benefit has not been conferred equally. Within EHE priority counties, we found significant HIV incidence disparities between White and Black populations. PrEP has decreased overall HIV incidence, but does not appear to have decreased HIV incidence disparity. © 2022, The Author(s), under exclusive licence to Society of General Internal Medicine.	county-level; disparity; HIV; incidence; PrEP; PrEP-to-Need	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Bunting, Samuel R; Feinstein, Brian A; Bertram, Christie; Hazra, Aniruddha; Sheth, Neeral K; Garber, Sarah S	Effects of knowledge and implicit biases on pharmacy students' decision-making regarding pre-exposure prophylaxis for HIV prevention: A vignette-based experimental study	Current Pharmacology Teaching and Learning	-	-	-	-	1877-1300	10.1016/j.cptl.2023.02.019	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10545445	INTRODUCTION: Men who have sex with men (MSM), especially Black MSM, are disproportionately affected by HIV and experience disparate prescription of pre-exposure prophylaxis (PrEP) for HIV prevention compared to White MSM. While pharmacists are essential in efforts to scale-up PrEP, little is known about the role of knowledge and implicit biases in pharmacy students' decision-making regarding PrEP, which may elucidate mechanisms for improving PrEP access and addressing disparities. METHODS: A nationwide, cross-sectional study of pharmacy students in the United States was conducted. A fictional White or Black MSM seeking PrEP was presented. Participants completed measures of PrEP/HIV knowledge, implicit racism and heterosexism, assumptions about the patient's behavior (condomless sex, extra-relational sex, adherence to PrEP), and confidence providing PrEP-related care. RESULTS: A total of 194 pharmacy students completed the study. Compared to the White patient, the Black patient was assumed to be less adherent to PrEP if prescribed. In contrast, assumptions of sexual risk behaviors if prescribed PrEP and confidence providing PrEP-related care did not differ. Additionally, implicit racism was associated with lower confidence providing PrEP-related care, whereas PrEP/HIV knowledge, implicit sexual orientation bias, and assumed sexual risk behaviors if prescribed PrEP were not associated with confidence. CONCLUSIONS: Pharmacists are essential in efforts to scale-up PrEP prescription, making pharmacy education about PrEP for HIV prevention critical. These findings suggest that implicit bias awareness training is needed. This training may reduce the influence of implicit racial bias on confidence providing PrEP-related care and improve knowledge of HIV and PrEP. Article	2023	Burley, Nathan; MacDonald, Rona; Khan, Aafreen	Emtricitabine/tenofovir alafenamide usage in a Scottish sexual health service providing HIV pre-exposure prophylaxis: A service evaluation.	International Journal of STD & AIDS	-	-	-	-	1758-1052	10.1177/09564624231220098	https://dx.doi.org/10.1177/09564624231220098	Background: In this service evaluation we evaluate the usage of emtricitabine and tenofovir alafenamide (FTC-TAF) in a large Scottish sexual health service providing Human Immunodeficiency Virus (HIV) Pre-Exposure Prophylaxis (PrEP) over a one-year period (May 2022-May 2023).Purpose: We evaluated the use of FTC-TAF as it is 30 times more expensive per 30 tablet supply than emtricitabine/tenofovir disoproxil (FTC-TDF). We sought to establish: - Number of patients initiated on FTC-TAF - Reasons for FTC-TAF initiation - Adherence to FTC-TAF. Results: Out of a total cohort of 1744 patients on HIV PrEP as of May 2023, seven patients (0.4%) had been initiated on FTC-TAF. The remainder (99.6%) were taking FTC-TDF. The majority of patients (n = 6) were initiated on FTC-TAF due to renal reasons, one patient was initiated FTC-TAF for bone mineral density concerns.Conclusions: All of the patients met eligibility criteria. In terms of adherence, three patients were regular attenders, two patients used FTC-TAF sporadically, and two had initiated and subsequently discontinued FTC-TAF altogether at the time of data analysis. FTC-TAF utilisation was lower than anticipated, initiated appropriately, and followed similar adherence patterns to FTC-TDF users. This will be helpful for financial forecasting and in the development of services where FTC-TAF is newly commissioned. Article	2023	Burns C.M.; Endres K.; Derrick C.; Cooper A.; Fabel P.; Okeke N.L.; Ahuja D.; Corneli A.; McKellar M.S.	A survey of South Carolina pharmacists' readiness to prescribe human immunodeficiency virus pre-exposure prophylaxis	Journal of the American College of Clinical Pharmacy	-	-	-	-	25749870	10.1002/jac5.1773	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150627708&doi=10.1002%2fjac5.1773&partnerID=40&md5=83dcb62332864b23c03401d6c01710e8	Introduction: Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) is largely underutilized in the Southern United States. Given their community presence, pharmacists are well positioned to provide PrEP within rural, Southern regions. However, pharmacists' readiness to prescribe PrEP in these communities remains unknown. Objective: To determine the perceived feasibility and acceptability of prescribing PrEP by pharmacists in South Carolina (SC). Methods: We distributed a 43-question online descriptive survey through the University of South Carolina Kennedy Pharmacy Innovation Center's listserv of licensed SC pharmacists. We assessed pharmacists' comfort, knowledge, and readiness to provide PrEP. Results: A total of 150 pharmacists responded to the survey. The majority were White (73%, n = 110), female (62%, n = 93), and non-Hispanic (83%, n = 125). Pharmacists practiced in retail (25%, n = 37), hospital (22%, n = 33), independent (17%, n = 25), community (13%, n = 19), specialty (6%, n = 9), and academic settings (3%, n = 4); 11% (n = 17) practiced in rural locales. Pharmacists viewed PrEP as both effective (97%, n = 122/125) and beneficial (74% n = 97/131) for their clients. Many pharmacists reported being ready (60% n = 79/130) and willing (86% n = 111/129) to prescribe PrEP, although over half (62% n = 73/118) cited lack of PrEP knowledge as a barrier. Pharmacists described pharmacies as an appropriate location to prescribe PrEP (72% n = 97/134). Conclusions: Most SC pharmacists surveyed considered PrEP to be effective and beneficial for individuals who frequent their pharmacy and are willing to prescribe this therapy if statewide statutes allow. Many felt that pharmacies are an appropriate location to prescribe PrEP but lack a complete understanding of required protocols to manage these patients. Further investigation into facilitators and barriers of pharmacy-driven PrEP is needed to enhance utilization within communities. © 2023 The Authors. Article	2023	Burns P.A.; Anyimukwu C.; Omondi A.A.; Monger M.; Ward L.; Poteat T.	Health-care providers' perspectives on an HIV patient navigation training to improve uptake of PrEP among Black sexual minority men	Health Education Research	-	-	-	-	2681153	10.1093/her/cyad005	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165767337&doi=10.1093%2fher%2fcyad005&partnerID=40&md5=03ea6b7a99a7aa5248f6f00321534cb9	This article examines implementational factors associated with an HIV patient navigation training intervention for health care professionals working with Black sexual minority men to improve access to and uptake of HIV prevention services among Black MSM. Utilizing qualitative analysis to better understand healthcare professionals' perceptions of the training program, we conducted a thematic content analysis based on constructs from Professional Network and Reach Model-Systems Model Approach (PNRSMA) framework. Data analysis revealed four major themes: 1) Knowledge and skill building, 2) Novel and Innovation, 3) Barriers to Implementation, and 4) Recommendations and Future Directions. Implementation factors such as appropriate facilitators, content, mode of delivery, learning strategies, and understanding structural barriers were important to training success. Participants highlighted innovation strategies such as the use of social media and interactive communication (e.g. role-playing and bi-directional communication) enhanced learning and skill-building. The expansion of training to include other affected groups such as women and bisexual individuals and increasing the duration of the training emerged as areas for improvement and effectiveness. Our analysis of an HIV patient navigation training revealed important findings to improve the implementation process to increase uptake of PrEP and other HIV prevention, care and treatment services. © 2023 The Author(s). Article	2023	Busang, Jacob; Zuma, Thembelihle; Herbst, Carina; Okesola, Nonhlanhla; Chimbindi, Natsayi; Dreyer, Jaco; Mtshali, Nelisiwe; Smit, Theresa; Ngubane, Samkelisiwe; Hlongwane, Siphesihle; Gumede, Dumsani; Jalazi, Ashley; Mdluli, Simphiweyenkosi; Bird, Kristien; Msane, Sithembile; Danisa, Priscilla; Hanekom, Willem; Lebina, Limakatso; Behuhuma, Ngundu; Hendrickson, Cheryl; Miot, Jacqui; Seeley, Janet; Harling, Guy; Jarolimova, Jana; Sherr, Lorraine; Copas, Andrew; Baisley, Kathy; Shahmanesh, Maryam	Thetha Nami ngithethe nawe (Let's Talk): a stepped-wedge cluster randomised trial of social mobilisation by peer navigators into community-based sexual health and HIV care, including pre-exposure prophylaxis (PrEP), to reduce sexually transmissible HIV amongst young people in rural KwaZulu-Natal, South Africa.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-023-16262-x	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10428543	BACKGROUND: Antiretroviral therapy (ART) through universal test and treat (UTT) and HIV pre-exposure prophylaxis (PrEP) substantially reduces HIV-related mortality and incidence. Effective ART based prevention has not translated into population-level impact in southern Africa due to sub-optimal coverage among youth. We aim to investigate the effectiveness, implementation and cost effectiveness of peer-led social mobilisation into decentralised integrated HIV and sexual reproductive health (SRH) services amongst adolescents and young adults in KwaZulu-Natal (KZN). METHODS: We are conducting a type 1a hybrid effectiveness/implementation study, with a cluster randomized stepped-wedge trial (SWT) to assess effectiveness and a realist process evaluation to assess implementation outcomes. The SWT will be conducted in 40 clusters in rural KZN over 45 months. Clusters will be randomly allocated to receive the intervention in period 1 (early) or period 2 (delayed). 1) Intervention arm: Resident peer navigators in each cluster will approach young men and women aged 15-30 years living in their cluster to conduct health, social and educational needs assessment and tailor psychosocial support and health promotion, peer mentorship, and facilitate referrals into nurse led mobile clinics that visit each cluster regularly to deliver integrated SRH and differentiated HIV prevention (HIV testing, UTT for those positive, and PrEP for those eligible and negative). Standard of Care is UTT and PrEP delivered to 15-30 year olds from control clusters through primary health clinics. There are 3 co-primary outcomes measured amongst cross sectional surveys of 15-30 year olds: 1) effectiveness of the intervention in reducing the prevalence of sexually transmissible HIV; 2) uptake of universal risk informed HIV prevention intervention; 3) cost of transmissible HIV infection averted. We will use a realist process evaluation to interrogate the extent to which the intervention components support demand, uptake, and retention in risk-differentiated biomedical HIV prevention. DISCUSSION: The findings of this trial will be used by policy makers to optimize delivery of universal differentiated HIV prevention, including HIV pre-exposure prophylaxis through peer-led mobilisation into community-based integrated adolescent and youth friendly HIV and sexual and reproductive health care. TRIAL REGISTRATION: ClinicalTrials.gov Identifier-NCT05405582. Registered: 6th June 2022. Article	2023	Butler, Vusile; Kutywayo, Alison; Martin, Catherine E; Pleaner, Melanie; Mojapele, Maserame V; Ncube, Sydney; Fipaza, Zukiswa; Mundeta, Bongai; Mullick, Saiqa	Implementing Differentiated and Integrated HIV Prevention Services for Adolescent Girls and Young Women: Experiences From Oral PrEP Rollout in Primary Care Services in South Africa.	Journal of Adolescent Health	-	-	-	-	1879-1972	10.1016/j.jadohealth.2023.09.003	https://dx.doi.org/10.1016/j.jadohealth.2023.09.003	PURPOSE: In South Africa, adolescent girls and young women (AGYW, aged 15-24 years) are disproportionately affected by human immunodeficiency viruses (HIV). Oral pre-exposure prophylaxis (PrEP) has been available in South Africa since 2016; however, there is limited evidence on oral PrEP implementation and integration in real-world settings, particularly among AGYW. Project PrEP is an implementation science project that sought to inform the introduction and integration of oral PrEP as part of combination HIV prevention and sexual and reproductive health services (SRH) in South Africa. The project focused on AGYW, as a priority population in need of HIV prevention. This paper presents strategies Project PrEP employed to increase oral PrEP and SRH service access and utilization. METHODS: We present strategies employed to increase oral PrEP and SRH services uptake. Using routine monitoring data, facility assessments, stakeholder engagement, training and progress reports, and observations, we share implementation lessons learned and describe how strategies can be adapted by HIV prevention programs in different contexts. RESULTS: Approximately 22, 000 people initiated on oral PrEP (December 2018-December 2021) across eight facilities and four mobile clinics. Two-thirds (67%) of initiated clients were AGYW. DISCUSSION: Lessons are to be learned from the introduction of oral PrEP as implementers prepare for the introduction of new PrEP methods. Stakeholders must be continuously engaged to ensure buy-in, and social mobilization and demand creation should be contextual, focused, and innovative. Continuous staff training is needed to reinforce knowledge, and AGYW service delivery models must be local context relevant. Article	2023	Butts S.A.; Young B.A.; Blackmon J.; Doblecki-Lewis S.	Addressing disparities in Pre-exposure Prophylaxis (PrEP) access: implementing a community-centered mobile PrEP program in South Florida	BMC Health Services Research	-	-	-	-	14726963	10.1186/s12913-023-10277-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177811038&doi=10.1186%2fs12913-023-10277-1&partnerID=40&md5=1d05fee27926cd87f607e72589db14a0	Background: Pre-exposure prophylaxis (PrEP) for HIV prevention is highly effective, but disparities in PrEP access remain considerable, particularly among Black and Latino men who have sex with men (MSM). To address this, the University of Miami Mobile PrEP Program was created, offering mobile HIV prevention/PrEP services in areas throughout South Florida where HIV incidence is high and PrEP access is geographically limited. Using a community-centered participatory approach, the program strategized and executed expansion into the Liberty City neighborhood of Miami. This study qualitatively assessed factors affecting Mobile PrEP implementation as perceived by community stakeholders, clients, and program staff. Methods: Forty-one in-depth interviews were conducted with 21 Mobile PrEP clients, 10 key informants from local health organizations, and 10 program staff. Interview questions queried perceived organizational and positional barriers and facilitators to mobile clinic implementation. Service satisfaction, setting preferences, social factors, and likelihood of recommending Mobile PrEP were also assessed. A thematic content analysis was performed using the Consolidated Framework for Implementation Research (CFIR) taxonomy as the guiding constructs for the analysis. Results: Participant statements indicated that providing no-cost services, convenient location, program-covered rideshares, individualized patient navigation, and a community-centric approach to patient care, which included staff members with shared lived experiences to increase positive interactions and renewed trust among poorly served communities, were facilitators of PrEP access and intervention uptake. The importance of program familiarization with the community before implementation, particularly for Black and African American communities, who may experience unique barriers to accessing sexual healthcare was strongly emphasized by participants. Conclusions: The Mobile PrEP intervention was found to be an acceptable and accessible mode of HIV/STI preventive care. The importance of pre-implementation community engagement and preparation is emphasized. Future research is needed to refine understanding of the intervention's components and evaluate implementation determinants in other highly impacted neighborhoods. © 2023, The Author(s). Article	2023	Cain, Demetria; Sauermikh, Daniel; Starks, Tyrel J	Client Responses to Video-Based Communication Skills Training Involving PrEP for HIV: Tailoring an Individual Sexual Health Intervention for Sexual Minority Men in Relationships.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-023-03985-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9852803	For many partnered sexual minority men (SMM), PrEP decisions are shaped by their relationships. Recent innovations in HIV risk reduction interventions tailored for partnered SMM include the integration of video-based communication skill building. The purpose of the current study was to examine the responses of 37 SMM in relationships with cismale partners to understand how actual or anticipated conversations between partners may influence PrEP decision making. Results suggested an individual intervention has the ability to elicit detailed content about interactions between partners. When SMM anticipated being in agreement with their partner about PrEP, they described few challenges to discussing HIV prevention. In contrast, when SMM anticipated relationship-related concerns about PrEP, they also anticipated conversations with their partner would be challenging and likely to involve conflict. This often-diminished SMM's motivation to engage partners and develop shared HIV-prevention goals. These SMM may benefit from integrated communications skills building to overcome challenges and work collaboratively with partners around PrEP use. Article	2023	Calabrese S.K.; Kalwicz D.A.; Dovidio J.F.; Rao S.; Modrakovic D.X.; Boone C.A.; Magnus M.; Kharfen M.; Patel V.V.; Zea M.C.	Targeted social marketing of PrEP and the stigmatization of black sexual minority men	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0285329	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159713954&doi=10.1371%2fjournal.pone.0285329&partnerID=40&md5=f98c65ff32875b6d623db6debd04d409	Disparities in HIV incidence and PrEP uptake suggest a need to prioritize Black sexual minority men (SMM) in PrEP social marketing initiatives. However, images linking Black SMM to HIV and PrEP may inadvertently reinforce stigma. We examined HIV-negative/status- unknown Black SMM's responses to targeted PrEP advertisements using mixed methods, including an experiment embedded in a longitudinal online survey (Time 1: n = 96; Time 2 eight weeks: n = 73) and four focus groups (n = 18). The full factorial experiment included between-groups and within-subjects comparisons. For between-groups comparisons, each participant was randomly assigned to view one of 12 advertisements, which varied by couple composition (Black SMM couple/Black heterosexual couple/multiple diverse couples/no couples) and campaign (PrEPare for the Possibilities/PlaySure/PrEP4Love). We examined couple composition, campaign, and interaction effects on: advertisement judgments (Time 1), PrEP stigma (Time 1), PrEP motivation (Times 1 and 2), and PrEP behavior (Time 2). For within-subjects comparisons, each participant viewed all 12 advertisements, and we examined couple composition, campaign, and interaction effects on advertisement judgments (Time 2). Focus group participants discussed advertising preferences and responded to the same set of advertisements. For between-groups and withinsubjects comparisons, we found significant couple composition effects but no or limited campaign and interaction effects on advertisement judgments. Advertisements featuring Black SMM exclusively were judged as more stigmatizing than advertisements without couples. Advertisements with diverse (vs. no) couples were considered more eye-catching and motivating. There were minimal effects of couple composition and campaign on PrEP stigma, motivation, and behavior. Focus group participants corroborated concerns about the potential for PrEP advertisements to be stigmatizing, suggesting advertisements featuring Black SMM exclusively could be alienating and fuel conspiracy theories. Focus group participants generally favored diverse and less sexualized advertisements, particularly for public spaces. Findings collectively highlight the potential for targeted PrEP advertisements to stigmatize Black SMM and support diverse representation. © 2023 Calabrese et al. Acceptability and Effectiveness of a One-Hour Healthcare Provider Intervention Integrating HIV Pre-Exposure Prophylaxis and Cultural Competence Training	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04108-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164011255&doi=10.1007%2fs10461-023-04108-x&partnerID=40&md5=b60f8a2505ff5f0cdc1a74e2c1938860	Enhanced provider training could improve PrEP access and equity. We conducted a pilot randomized controlled trial comparing (a) a one-hour, group-based provider intervention integrating PrEP and Cultural Competence (PCC) training with (b) a standard HIV continuing medical education session (n = 56). PCC participants favorably rated the intervention and reported increased PrEP knowledge. The PCC intervention increased their confidence performing PrEP-related clinical activities and intention to prescribe PrEP. The percentage of participants discussing PrEP with patients increased marginally in both study conditions. The percentage of participants who prescribed PrEP and self-rated cultural competence did not change in either study condition. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Callander D.; McManus H.; Gray R.T.; Grulich A.E.; Carr A.; Hoy J.; Donovan B.; Fairley C.K.; Holt M.; Templeton D.J.; Liaw S.-T.; McMahon J.H.; Asselin J.; Petoumenos K.; Hellard M.; Pedrana A.; Elliott J.; Keen P.; Costello J.; Keane R.; Kaldor J.; Stoové M.; Guy R.	HIV treatment-as-prevention and its effect on incidence of HIV among cisgender gay, bisexual, and other men who have sex with men in Australia: a 10-year longitudinal cohort study	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(23)00050-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85153955220&doi=10.1016%2fS2352-3018%2823%2900050-4&partnerID=40&md5=f9dfc70b20db6090d8cf342188edef45	Background: Although HIV treatment-as-prevention reduces individual-level HIV transmission, population-level effects are unclear. We aimed to investigate whether treatment-as-prevention could achieve population-level reductions in HIV incidence among gay, bisexual, and other men who have sex with men (GBM) in Australia's most populous states, New South Wales and Victoria. Methods: TAIPAN was a longitudinal cohort study using routine health record data extracted from 69 health services that provide HIV diagnosis and care to GBM in New South Wales and Victoria, Australia. Data from Jan 1, 2010, to Dec 31, 2019, were linked within and between services and over time. TAIPAN collected data from all cisgender GBM who attended participating services, resided in New South Wales or Victoria, and were 16 years or older. Two cohorts were established: one included HIV-positive patients, and the other included HIV-negative patients. Population prevalence of viral suppression (plasma HIV viral load <200 RNA copies per μL) was calculated by combining direct measures of viral load among the HIV-positive cohort with estimates for undiagnosed GBM. The primary outcome of HIV incidence was measured directly via repeat testing in the HIV-negative cohort. Poisson regression analyses with generalised estimating equations assessed temporal associations between population prevalence of viral suppression and HIV incidence among the subsample of HIV-negative GBM with multiple instances of HIV testing. Findings: At baseline, the final sample (n=101 772) included 90 304 HIV-negative and 11 468 HIV-positive GBM. 59 234 patients in the HIV-negative cohort had two or more instances of HIV testing and were included in the primary analysis. Over the study period, population prevalence of viral suppression increased from 69·27% (95% CI 66·41–71·96) to 88·31% (86·37–90·35), while HIV incidence decreased from 0·64 per 100 person-years (95% CI 0·55–0·76) to 0·22 per 100 person-years (0·17–0·28). Adjusting for sociodemographic characteristics and HIV pre-exposure prophylaxis (PrEP) use, treatment-as-prevention achieved significant population-level reductions in HIV incidence among GBM: a 1% increase in population prevalence of viral suppression corresponded with a 6% decrease in HIV incidence (incidence rate ratio IRR 0·94, 95% CI 0·93–0·96; p<0·0001). PrEP was introduced in 2016 with 17·60% uptake among GBM that year, which increased to 36·38% in 2019. The relationship between population prevalence of viral suppression and HIV incidence was observed before the availability of PrEP (IRR 0·98, 95% CI 0·96–0·99; p<0·0001) and was even stronger after the introduction of PrEP (0·80, 0·70–0·93; p=0·0030). Interpretation: Our results suggest that further investment in HIV treatment, especially alongside PrEP, can improve public health by reducing HIV incidence among GBM. Article	2023	Cambiano, Valentina; Miners, Alec; Lampe, Fiona C; McCormack, Sheena; Gill, O Noel; Hart, Graham; Fenton, Kevin A; Cairns, Gus; Thompson, Marc; Delpech, Valerie; Rodger, Alison J; Phillips, Andrew N	The effect of combination prevention strategies on HIV incidence among gay and bisexual men who have sex with men in the UK: a model-based analysis.	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(23)00204-7	https://dx.doi.org/10.1016/S2352-3018(23)00204-7	BACKGROUND: In the UK, the number of new HIV diagnoses among gay and bisexual men who have sex with men (GBMSM) has decreased substantially. We aimed to understand the contribution of different interventions in reducing HIV incidence so far; to estimate future HIV incidence with continuation of current policies and with further scaling up of current interventions; and to estimate the maximum additional annual cost that should be spent towards these interventions for them to offer value for money. METHODS: We calibrated a dynamic, individual-based, stochastic simulation model, the HIV Synthesis Model, to multiple sources of data on HIV among GBMSM aged 15 years or older in the UK. Primarily these were routine HIV surveillance data collected by the UK Health Security Agency. We compared HIV incidence in 2022 with the counterfactual incidence: if HIV testing rates stopped increasing in 2012 and the policy of antiretroviral therapy (ART) at diagnosis was not introduced in mid-2015; if pre-exposure prophylaxis (PrEP) was not introduced; if condom use was low from 2012 in all GBMSM, at levels similar to those observed in 1980; and in the first and second scenario combined. We also projected future outcomes under the assumption of continuation of current policies and considering increases in PrEP and HIV testing uptake and a decrease in condomless sex. FINDINGS: Our model estimated a 77% (90% uncertainty interval UI 61-88) decline in HIV incidence since around 2014, with an estimated 597 infections (90% UI 312-956; 1·1 per 1000 person-years 90% UI 0·6-1·8) in men aged 15-64 years in 2022. Both PrEP introduction and increased HIV testing with ART initiation at diagnosis each had a substantial effect on HIV incidence. Without PrEP introduction, we estimate there would have been 2·16 times the number of infections that actually occurred (90% UI 1·06-3·75) between 2012 and 2022; without increased HIV testing and ART initiation at diagnosis there would have been 2·18 times the number of infections that actually occurred (1·18-3·60), and if condomless sex was at the levels before the HIV epidemic, there would have been 2·27 times the number of infections that actually occurred (0·9-5·4). If rates of testing, ART use, and PrEP use remain as they are currently, there is a predicted decline in incidence to 388 HIV infections in 2025 (90% UI 226-650) and to 263 (137-433) in 2030. Increases in HIV testing and PrEP use were predicted to accelerate the decline in HIV incidence. Given the quality-adjusted life-year (QALY) benefit and a cost-effectiveness threshold of £30â000 per QALY gained, in order to be cost-effective an additional £1·62 million could be spent per year to increase testing levels by 34% (90% UI 25-46) and PrEP use by 55% (10-107). To achieve that, a 16% reduction in the cost of delivery of testing and PrEP would be required. INTERPRETATION: Combination prevention, including a PrEP strategy, played a major role in the reduction in HIV incidence observed so far in the UK among GBMSM. Continuation of current activities should lead to a continued decline; however, it is unlikely to lead to reaching the target of fewer than 50 HIV infections per year among GBMSM by 2030. It will be important to reduce costs for testing and PrEP for their continued expansion to be cost-effective. Article	2023	Cameron, Madison A; Kawamoto, Jenna; Shahoumian, Troy A; Belperio, Pamela S	Pharmacist-Led Management of HIV PrEP Within the Veterans Health Administration.	Federal Practitioner	-	-	-	-	1078-4497	10.12788/fp.0379	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10588999	Background: Uptake and access to HIV preexposure prophylaxis (PrEP) is key to reducing incident HIV infections. Pharmacists are one of the most accessible health care professionals in the United States and are well suited to address this need. Observations: We describe a model of care at the Veterans Affairs Greater Los Angeles Healthcare System in which clinical pharmacist practitioners developed and implemented a pharmacy-led PrEP clinic colocated within an infectious disease clinic. Veterans Health Administration clinical pharmacists provide direct patient care under a scope of practice that includes ordering and interpreting laboratory tests and providing PrEP prescriptions. To improve access and patient acceptability, we also used novel telemedicine modes of care to ensure flexible appointment scheduling. Conclusions: This model can be used by other federal and community-based health care organizations to implement interdisciplinary pharmacist-managed PrEP clinics and expand telehealth modalities to deliver outpatient services. Article	2023	Camila-Bolívar, María; Gomez-Peñaloza, Sheilla Andrea; Camargo-Plazas, Pilar; Peralta-Ardila, María Del Pilar; Mueses-Marín, Héctor F.; Alvarado-Llano, Beatriz; Martínez-Cajas, Jorge L.	Barriers and facilitators to HIV pre-exposure prophylaxis uptake among transgender women in Colombia: A qualitative analysis using the COM-B model.	PLOS Global Public Health	-	-	-	-	2767-3375	10.1371/journal.pgph.0001395	https://pubmed.ncbi.nlm.nih.gov/37756283/	Transgender women TGW in Colombia are disproportionately affected by HIV due to their low sociodemographic conditions, varied risk behaviours, difficulty accessing health services, and discrimination. Offering pre-exposure prophylaxis PrEP as part of a combination of prevention strategies is an appropriate option for this population to reduce their risk of HIV infection. However, little is known about how to implement a PrEP program for TGW in Colombia. Between June and October 2020, we conducted individual interviews with 16 TGW from four different cities in Colombia. The interviews assessed contextual influences, knowledge, skills, perceptions, and beliefs. We used qualitative thematic analysis to identify themes and the Capability, Opportunity, Motivation, and Behavior framework to further delineate barriers and possible interventions. After delineating the main themes across the three subdomains of the model, nine barriers were identified: one related to capability, knowledge, and perception of PrEP; six related to opportunity, which includes, family relations, sexual work environment, stable partner relations, interactions with healthcare workers, health service provision, and community interactions and opportunities; and two related to motivation, mental health, and concerns about medication side effects. Mapping barriers with interventions generated the following intervention functions: education, training, enablement, and environmental structure; and the following policy functions: communication/marketing, legislation, and changes in service provision. Examples of possible interventions are presented and discussed. Article	2023	Camp, Christina E; Chan, Carrie T	Young Adult Perspectives on Sex, Dating, and PrEP Use During the Pandemic and Improving the Future of PrEP Care	AIDS and Behavior	-	-	-	-	1090-7165	https://doi.org/10.1007/s10461-022-03970-5	https://escholarship.org/uc/item/61t264wh	Few studies have researched young adults' experiences taking HIV pre-exposure prophylaxis (PrEP) after the start of California's COVID-19 shelter-in-place (SIP) orders. The purpose of this study was to examine the experiences of young adults with sex, dating, and PrEP use during SIP and their perceptions on how to improve PrEP care in this age group. In this mixed-methods study, PrEP users ages 18-29 living in California between April 2020 and June 2021 completed a quantitative survey (N = 37) and one-on-one qualitative interviews (N = 18). Over half of survey participants reported trouble accessing PrEP care during SIP, citing difficulty obtaining medication refills, clinic appointments, and access to completing lab work. In qualitative interviews, participants expressed their preferences for more accessible PrEP service delivery across the PrEP care continuum. Despite pandemic SIP orders and trouble accessing PrEP services, young adults continued to engage in sexual behaviors. Article	2023	Cantos V.D.; Hagen K.; Duarte A.P.; Escobar C.; Batina I.; Orozco H.; Rodriguez J.; Camacho-Gonzalez A.; Siegler A.J.	Development of a Mobile App to Increase the Uptake of HIV Pre-exposure Prophylaxis Among Latino Sexual Minority Men: Qualitative Needs Assessment	JMIR Formative Research	-	-	-	-	2561326X	10.2196/43844	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149143486&doi=10.2196%2f43844&partnerID=40&md5=5b99251d291dd9a95d1ef81f97f3ea4b	Background: HIV disproportionally impacts Latino sexual minority men (SMM). Uptake of pre-exposure prophylaxis (PrEP), an effective biomedical intervention to prevent HIV, is low in this group compared with White SMM. Mobile health technology represents an innovative strategy to increase PrEP uptake among Latino SMM. Objective: We aimed to describe the qualitative process leading to the development of SaludFindr, a comprehensive HIV prevention mobile app aiming to increase PrEP uptake, HIV testing, and condom use by Latino SMM. Methods: We conducted 13 in-depth interviews with Latino SMM living in the Atlanta area to explore their main barriers and facilitators to PrEP uptake and to analyze their opinions of potential SaludFindr app functionalities. To explore potential app functions, we used HealthMindr, an existing HIV prevention app, as a template and added new proposed features intended to address the specific community needs. Results: We identified general PrEP uptake barriers that, although common among non-Latino groups, had added complexities such as the influence of religion and family on stigma. Low perceived PrEP eligibility, intersectional stigma, lack of insurance, cost concerns, and misconceptions about PrEP side effects were described as general barriers. We also identified Latino-specific barriers that predominantly hinder access to existing services, including a scarcity of PrEP clinics that are prepared to provide culturally concordant services, limited availability of Spanish language information related to PrEP access, distrust of peers as credible sources of information, perceived ineligibility for low-cost services owing to undocumented status, fear of immigration authorities, and competing work obligations that prevent PrEP clinic attendance. Health care providers represented a trusted source of information, and 3 provider characteristics were identified as PrEP facilitators: familiarity with prescribing PrEP; being Latino; and being part of lesbian, gay, bisexual, transgender, queer, intersex, and asexual (LGBTQIA+) group or ally. The proposed app was very well accepted, with a particularly high interest in features that facilitate PrEP access, including a tailored list of clinics that meet the community needs and a private platform to seek PrEP information. Spanish language availability and free or low-cost PrEP care represented the 2 main clinic criteria that would facilitate PrEP uptake. Latino representation in clinic staff and providers; clinic perception as a safe space for undocumented patients; and LGBTQIA+ representation was listed as additional criteria. Only 8 of 47 clinics listed on the Centers for Diseases Control and Prevention PrEP locator website for the Atlanta area fulfilled at least 2 main criteria. Conclusions: This study provides further evidence of the substantial PrEP uptake barriers that Latino SMM face; exposes the urgent need to increase the number of accessible PrEP-providing clinics for Latino SMM; and proposes an innovative, community-driven, and mobile technology-based tool as a future intervention to overcome some of these barriers. © JMIR Formative Research 2023.	app; barrier; biomedical intervention; community; development; HIV; HIV prevention; Latino; men; mHealth; minority; mobile app; mobile health; mobile phone; mobile technology; pre-exposure prophylaxis; PrEP; sexual minority men; SMM; technology	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Carter, Gregory; Tavares, Taran	PrEP prescription in indiana 2017-2022: Implications for clinical practice.	Research in Nursing and Health	-	-	-	-	1098-240X	10.1002/nur.22354	https://dx.doi.org/10.1002/nur.22354	The Ending the HIV Epidemic initiative is poised to eradicate HIV through increasing screening and linkage to care. Despite this, the rate of HIV testing remains inadequate, and effective preventive measures like pre-exposure prophylaxis (PrEP) are not adequately prescribed. A retrospective chart review was conducted to include 2017 through July 2022 from a large nonprofit health care system in the Midwest. Inclusion criteria included an HIV-negative diagnosis between 2017 and July 2022. Additional information includes gender, age, race/ethnicity, the primary payment method, the facility where screening occurred, history of PrEP prescription, and the provider who documented sexual health screening. Most patients were female (73%, n = 3366), followed by 27% (n = 1242) who identified as male. The majority identified as white (52.4%, n = 2415), and patients who identified as Black represented 45.3% (n = 2087) of the sample. Of the participants in the sample, n = 3030 (65.8%) did not have a documented sexual health assessment at the time of HIV screening. Black patients were 0.40 times less likely to receive a PrEP prescription than their white counterparts. Patients screened by the provider and identified with infectious disease via a sexual mode of transmission demonstrated three times increased odds of being prescribed PrEP. This research highlights the importance of updating medical records systems to capture salient sexual health factors. Ongoing professional development should be made readily available so providers can conduct comprehensive sexual health assessments. Article	2023	Casey, Eunice; Kaplan-Lewis, Emma; Gala, Kruti; Lakew, Rebecca	Successful Integration of HIV PrEP in Primary Care and Women's Health Clinical Practice: A Model for Implementation.	Viruses	-	-	-	-	1999-4915	10.3390/v15061365	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10301619	Ending the HIV Epidemic is contingent upon the increased utilization of pre-exposure prophylaxis (PrEP). The majority of PrEP in the United States is prescribed in specialty care settings; however, to achieve national implementation goals, it is necessary to expand PrEP services in primary care and women's health clinics. To this end, a prospective cohort study was conducted of health care providers participating in one of three rounds of a virtual program aimed at increasing the number of PrEP prescribers in primary care and women's health clinics within the NYC Health and Hospitals network, the public healthcare system of New York City. Provider prescribing behavior was compared at pre-intervention (August 2018-September 2019) and post-intervention (October 2019-February 2021). Among 104 providers, the number prescribing PrEP increased from 12 (11.5%) to 51 (49%) and the number of individual patients on PrEP increased from 19 to 128. The program utilized clinical integration models centering on existing STI management workflows and was associated with increased numbers of PrEP prescribers and volume of prescriptions in primary care and women's health clinics. The dissemination of similar programs could support national scale-up of PrEP. Theses and Dissertations	2023	Casmir, Edinah Nyaboke	Acceptability of HIV Pre-exposure Prophylaxis Integration into Post-abortal Care Services to Expand the Reach of PrEP among Kenyan Adolescent Girls and Young Women	-	-	University of Washington	University of Washington	-	NA	NA	http://hdl.handle.net/1773/50100	Introduction: Globally, adolescent girls and young women (AGYW) continue to bear a disproportionate burden of HIV and unintended pregnancies. In low-resource settings, including Kenya, AGYW seeking post-abortal care (PAC) often continue to engage in sex with infrequent condom use, resulting in subsequent unintended pregnancies and risk for HIV infection. This situation demonstrates the potential for integrating HIV prevention services such as PrEP into PAC services to increase reach, uptake, and efficiency. However, data informing the acceptability, feasibility, and sustainability of PAC clinics as an entry point for PrEP services, including actual service delivery, are limited. Therefore, we assessed AGYWs, providers, and the implementing partner to inform the feasibility, scale-up, and sustainability of integrating PrEP into PAC. Methods: Between June 2022 and March 2023, we conducted a cross-sectional qualitative study as part of a cluster-randomized trial piloting PrEP delivery among 15–30-year-old AGYW within PAC clinics in 14 Kenyan public and private facilities in Kiambu, Nairobi, Murang'a, and Kisumu Counties. We collected data using in-depth interviews (n=60) among purposively sampled AGYW who initiated PrEP while receiving PAC in the partner facilities, focus group discussions (n=6) among AGYW and (n=6) among PAC providers, and key informant interviews (n=18) with PAC providers and implementing partners' representatives. Interviews were audio-recorded and transcribed verbatim. The data were analyzed thematically using inductive and deductive approaches. The theoretical framework of acceptability (TFA) guided this process. Results: We found that PrEP integration into PAC was highly acceptable as an effective and timely intervention to improve reach for PrEP services since it reduced PrEP stigma and enhanced ease of access among AGYW, who could benefit the most. Additionally, providers' competence in offering integrated PrEP services, attitudes toward providing PrEP and PAC for AGYW, and AGYWs' confidence in using PrEP all influence PrEP delivery and access in PAC clinics. Moreover, staffing, availability of safe spaces, commodity management, and reporting systems are crucial in influencing the efficient integration of PrEP into PAC services. Conclusion: Integrating PrEP services into PAC was highly acceptable as an effective and timely intervention to improve PrEP services reach among Kenyan AGYW. Therefore, scaling-up integration of PrEP in PAC scale-up would improve reach for PrEP among at-risk AGYW. However, enhancing PrEP integration into PAC efficiency requires further strategies to strengthen facility operations and structure. Article	2023	Castor D.; Heck C.J.; Quigee D.; Telrandhe N.V.; Kui K.; Wu J.; Glickson E.; Yohannes K.; Rueda S.T.; Bozzani F.; Meyers K.; Zucker J.; Deacon J.; Kripke K.; Sobieszczyk M.E.; Terris-Prestholt F.; Malati C.; Obermeyer C.; Dam A.; Schwartz K.; Forsythe S.	Implementation and resource needs for long-acting PrEP in low- and middle-income countries: a scoping review	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.26110	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164541179&doi=10.1002%2fjia2.26110&partnerID=40&md5=2e015e0aba5d0ba5e093dc15007f5f33	Introduction: Several low- and middle-income countries (LMICs) are preparing to introduce long-acting pre-exposure prophylaxis (LAP). Amid multiple pre-exposure prophylaxis (PrEP) options and constrained funding, decision-makers could benefit from systematic implementation planning and aligned costs. We reviewed national costed implementation plans (CIPs) to describe relevant implementation inputs and activities (domains) for informing the costed rollout of LAP. We assessed how primary costing evidence aligned with those domains. Methods: We conducted a rapid review of CIPs for oral PrEP and family planning (FP) to develop a consensus of implementation domains, and a scoping review across nine electronic databases for publications on PrEP costing in LMICs between January 2010 and June 2022. We extracted cost data and assessed alignment with the implementation domains and the Global Health Costing Consortium principles. Results: We identified 15 implementation domains from four national PrEP plans and FP-CIP template; only six were in all sources. We included 66 full-text manuscripts, 10 reported LAP, 13 (20%) were primary cost studies-representing seven countries, and none of the 13 included LAP. The 13 primary cost studies included PrEP commodities (n = 12), human resources (n = 11), indirect costs (n = 11), other commodities (n = 10), demand creation (n = 9) and counselling (n = 9). Few studies costed integration into non-HIV services (n = 5), above site costs (n = 3), supply chains and logistics (n = 3) or policy and planning (n = 2), and none included the costs of target setting, health information system adaptations or implementation research. Cost units and outcomes were variable (e.g. average per person-year). Discussion: LAP planning will require updating HIV prevention policies, technical assistance for logistical and clinical support, expanding beyond HIV platforms, setting PrEP achievement targets overall and disaggregated by method, extensive supply chain and logistics planning and support, as well as updating health information systems to monitor multiple PrEP methods with different visit schedules. The 15 implementation domains were variable in reviewed studies. PrEP primary cost and budget data are necessary for new product introduction and should match implementation plans with financing. Conclusions: As PrEP services expand to include LAP, decision-makers need a framework, tools and a process to support countries in planning the systematic rollout and costing for LAP. © 2023 The Authors. Estradiol and Spironolactone Plasma Pharmacokinetics Among Brazilian Transgender Women Using HIV Pre-Exposure Prophylaxis: Analysis of Potential Interactions	Clinical Pharmacokinetics	-	-	-	-	3125963	10.1007/s40262-023-01248-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160927064&doi=10.1007%2fs40262-023-01248-0&partnerID=40&md5=2821d3eed14f3a438c0df97a49430608	Background and Objective: An important barrier to HIV prevention among transgender women (TGW) is the concern that oral pre-exposure prophylaxis (PrEP) negatively affects the efficacy of feminizing hormone therapy (FHT). We aimed to assess the impact of PrEP on FHT pharmacokinetics (PK) among TGW from Brazil. Methods: We performed a drug-drug interaction sub-study among TGW enrolled in a daily oral PrEP demonstration study (PrEParadas, NCT03220152). Participants had a first PK assessment (PK1) 15 days after FHT (estradiol valerate 2–6 mg plus spironolactone 100–200 mg) initiation and then started PrEP (tenofovir disoproxil fumarate 300 mg/emtricitabine 200 mg). A second PK evaluation was performed 12 weeks later (PK2). Blood samples were collected prior and after the directly observed dosing (0, 0.5, 1, 2, 4, 6, 8, and 24 hours). Pharmacokinetic parameters of estradiol, spironolactone, and metabolites were estimated by non-compartmental analysis (Monolix 2021R2, Lixoft®) and compared as geometric mean ratios (GMRs, 90% confidence interval CI). Results: Among 19 TGW who completed the substudy, median age was 26 years (interquartile range: 23–27.5). Estradiol area under the plasma concentration-time curve (AUC τ) and trough concentrations did not differ between PK1 and PK2 evaluations (GMR 90% CI: 0.89 0.76–1.04 and 1.06 0.94–1.20, respectively). Spironolactone and canrenone AUC τ were statistically lower at PK2 than PK1 (0.76 0.65–0.89 and 0.85 0.78–0.94, respectively). Canrenone maximum concentration was also lower at PK2 than PK1 (0.82 0.74–0.91). Conclusion: Estradiol PK was not influenced by PrEP concomitant use. The small differences observed in some spironolactone and canrenone PK parameters should not prevent the concomitant use of estradiol-based FHT and PrEP. Trial Registration: This trial (NCT03220152) was registered on July 18, 2017. © 2023, The Author(s). Article	2023	Cavalera, Simone; Serra, Thea; Abad-Fuentes, Antonio; Mercader, Josep V.; Abad-Somovilla, Antonio; Nardo, Fabio Di; D'Avolio, Antonio; De Nicolò, Amedeo; Testa, Valentina; Chiarello, Matteo; Baggiani, Claudio; Anfossi, Laura	Development and In-House Validation of an Enzyme-Linked Immunosorbent Assay and a Lateral Flow Immunoassay for the Dosage of Tenofovir in Human Saliva.	Biosensors	-	-	-	-	2079-6374	10.3390/bios13060667	https://www.mdpi.com/2079-6374/13/6/667	Highly active antiretroviral therapy (HAART) includes very potent drugs that are often characterized by high toxicity. Tenofovir (TFV) is a widely used drug prescribed mainly for pre-exposure prophylaxis (PreP) and the treatment of human immunodeficiency virus (HIV). The therapeutic range of TFV is narrow, and adverse effects occur with both underdose and overdose. The main factor contributing to therapeutic failure is the improper management of TFV, which may be caused by low compliance or patient variability. An important tool to prevent inappropriate administration is therapeutic drug monitoring (TDM) of compliance-relevant concentrations (ARCs) of TFV. TDM is performed routinely using time-consuming and expensive chromatographic methods coupled with mass spectrometry. Immunoassays, such as enzyme-linked immunosorbent assays (ELISAs) and lateral flow immunoassays (LFIAs), are based on antibody-antigen specific recognition and represent key tools for real-time quantitative and qualitative screening for point-of-care testing (POCT). Since saliva is a non-invasive and non-infectious biological sample, it is well-suited for TDM. However, saliva is expected to have a very low ARC for TFV, so tests with high sensitivity are required. Here, we have developed and validated a highly sensitive ELISA (IC50 1.2 ng/mL, dynamic range 0.4-10 ng/mL) that allows the quantification of TFV in saliva at ARCs and an extremely sensitive LFIA (visual LOD 0.5 ng/mL) that is able to distinguish between optimal and suboptimal ARCs of TFV in untreated saliva. Article	2023	Celum, Connie; Grinsztejn, Beatriz; Ngure, Kenneth	Preparing for long-acting PrEP delivery: building on lessons from oral PrEP	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26103	https://onlinelibrary.wiley.com/doi/epdf/10.1002/jia2.26103	INTRODUCTION: With recent approvals of long-acting (LA) HIV pre-exposure prophylaxis (PrEP) in the form of injectable cabotegravir and the dapivirine ring, programmes need to consider how to optimize the delivery of PrEP methods, including by leveraging lessons from the past decade of oral PrEP delivery. DISCUSSION: Framed around differentiated service delivery building blocks, the major considerations for the delivery of LA PrEP are how to reach the populations who would most benefit from PrEP, where to locate PrEP services, how to reduce the user burden of accessing and continuing with PrEP, and how to integrate PrEP with other services. Demand creation for LA PrEP and education about new LA PrEP options should be co-developed with communities and be positively framed. Client-facing clinical decision support tools provide information about HIV prevention and PrEP options in non-technical ways and can support their informed decision-making about PrEP. Training for providers is needed to increase their ability to ask about sexual and drug use behaviours in a non-judgmental and comfortable manner as part of risk assessment, discuss harm reduction strategies and counsel about available PrEP options that fit clients' circumstances and needs. PrEP adherence support should include supportive counselling and be tailored to address an individual's particular barriers and needs. Reminders through text messaging or calls can foster PrEP persistence, given the narrow window around dosing for injectable cabotegravir. Strategies are needed to expand PrEP delivery options, including telePrEP, pharmacy-based PrEP, key population-led services and mobile venues. Integrated delivery models are needed which include sexually transmitted infection testing and treatment, contraception for cis-women not desiring to become pregnant, PrEP for pregnant women in high HIV prevalence settings, and gender-affirming hormones and support for transgender persons. CONCLUSIONS: The outcome of expanding PrEP options through LA PrEP formulations is to increase PrEP coverage, adherence, persistence and effectiveness by offering a choice of PrEP that meets the needs of persons who would benefit from PrEP. The lessons learned from the delivery of oral PrEP about demand creation, informed client decision-making, provider training, adherence support and service delivery model are relevant to the delivery of LA PrEP and integration with other services. Article	2023	Celum, Connie; Seidman, Dominika; Travill, Danielle; Dehlendorf, Christine; Gumede, Sanele; Zewdie, Kidist; Wilson, Whitney; Morton, Jennifer F; Baeten, Jared M; Donnell, Deborah; Delany-Moretlwe, Sinead	A decision support tool has similar high PrEP uptake and increases early PrEP persistence in adolescent girls and young women in South Africa: results from a randomized controlled trial	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26154	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10460672	INTRODUCTION: African adolescent girls and young women (AGYW) have high rates of HIV acquisition and are a priority population for HIV pre-exposure prophylaxis (PrEP). PrEP implementation has been limited by AGYW's low perceived HIV risk and provider demands. A decision support tool (DST) with information about PrEP could improve clients' risk perception, knowledge about PrEP, informed decision-making and motivation to use PrEP based on their risk, facilitating PrEP delivery in primary healthcare (PHC) clinics. METHODS: We designed MyPrEP, a client-facing DST about PrEP and HIV prevention, with youth-friendly information and images. The impact of the MyPrEP tool was assessed among HIV-negative women aged 18-25 years presenting to a PHC clinic in Johannesburg, South Africa from March 2019 to 2020. AGYW were randomized by day to the DST or a general health website as the control condition. A clinician blinded to DST versus control allocation provided standard of care counselling about PrEP, offered PrEP, administered a questionnaire and conducted sexually transmitted infection testing. The primary outcome was PrEP initiation and the secondary outcome was PrEP persistence at 1 month, determined by pharmacy dispensation records. RESULTS: Of 386 AGYW screened, 353 were randomized (DST n = 172, control n = 181) with a median age of 21 years (interquartile range [IQR 20, 23) and 56% (199/353) attending the clinic for HIV testing, 46% (164/353) using contraception, 15% (53/353) using condoms consistently and 37% (108/353) with a curable sexually transmitted infection. PrEP was initiated by 97% in the DST group and 94% in the control group (OR 1.79; 95% confidence interval, CI = 0.79-1.53), of whom two-thirds planned to continue PrEP until they decided if they liked PrEP. At 1 month, PrEP persistence was 19% in the DST and 10% in the control group (OR 1.97, 95% CI 1.08-3.69). Ninety-nine percent randomized to the DST reported satisfaction with MyPrEP. CONCLUSIONS: Among AGYW attending a South African PHC clinic, PrEP uptake was >90% with two-fold higher PrEP persistence at 1 month in those randomized to use the MyPrEP DST. Given the need for strategies to support PrEP implementation and improve low PrEP persistence among African AGYW, a PrEP DST warrants further evaluation.	choice; decision support tool; HIV prevention; pre-exposure prophylaxis; South Africa; women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Cernasev A.; Barenie R.E.; Wofford B.R.; Golden J.; Walker C.	Empowering Tennessee Pharmacists to Initiate PrEP Using Collaborative Pharmacy Practice Agreements	Clinics and Practice	-	-	-	-	20397283	10.3390/clinpract13010025	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148959701&doi=10.3390%2fclinpract13010025&partnerID=40&md5=fa5a0f326c194a02a35fab99d1c5fafb	Background: The uptake of Pre-Exposure Prophylaxis (PrEP) has revolutionized the fight against the Human Immunodeficiency Virus (HIV) epidemic. Consistent obstacles remain that have influenced the slow uptake of PrEP in the United States of America (USA). In order to address these barriers, pharmacists must be included in the dispensing and management of PrEP through collaborative pharmacy practice agreements (CPPAs). Our aim for this study was to characterize pharmacists' perceptions of initiating PrEP through a CPPA in the state of Tennessee. Methods: This qualitative study was conducted in the USA in 2021 with pharmacists practicing in Tennessee. A framework and specific questions guided the thematic analysis. The words and phrases were coded inductively and later collapsed into categories and placed into emergent themes. Results: Two themes illustrate the voices of practicing pharmacists' integration in the dispensing and management of PrEP: (1) Learning from other states and previous successful CPPAs to advance and expand innovative models of patient care and (2) advocacy through public policy change to empower pharmacists to initiate PrEP. Conclusion: This qualitative study focused on exploring pharmacists' perceptions on the opportunity of initiating PrEP through a CPPA in Tennessee. These findings highlight the preparedness of pharmacists to advocate for easier initiative of PrEP in pharmacies across Tennessee, whether through relaxing existing CPPA regulation or pursuing independent prescriptive authority for pharmacists. © 2023 by the authors.	collaborative pharmacy practice agreement (CPPA); pharmacist; PrEP; USA	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Cernasev, Alina; Melton, Tyler C; Jasmin, Hilary; Barenie, Rachel E	A Qualitative Systematic Literature Review of the Role of U.S. Pharmacists in Prescribing Pre-Exposure Prophylaxis (PrEP).	Pharmacy	-	-	-	-	2226-4787	10.3390/pharmacy11010009	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9844378	Pre-Exposure Prophylaxis (PrEP) is an effective treatment to combat the human immunodeficiency virus (HIV) endemic, but the uptake of PrEP has been low in the United States (U.S.). While individuals may access PrEP via obtaining a prescription from their prescriber and having it dispensed by their pharmacist, less cumbersome access points may exist. This systematic literature review evaluates qualitative literature to explore the role of pharmacists, pharmacy services, and interprofessional collaborations for persons seeking PrEP in the United States. Four electronic databases (PubMed, Scopus, CINAHL, and Embase) were searched in February 2022 and yielded 3841 results. After excluding duplicates, two researchers reviewed 2461 studies. These results were screened for inclusion and exclusion criteria and yielded 71 studies for full review. Out of these 71 studies, five studies met the pre-selected inclusion criteria. Of the five studies, four were qualitative studies, and one was a mixed-methods study. The studies examined different aspects of initiating PrEP and diverse outcomes, such as screening for PrEP, barriers to access PrEP, feasibility to access PrEP, accessibility via community pharmacy to PrEP, and interdisciplinary collaboration between members of the healthcare team to expand patient access to PrEP. A gap in the qualitative literature focusing on U.S. pharmacists' roles in initiation and provision of PrEP for diverse populations may exist. While PrEP promotion and uptake are largely affected by convenience and accessibility, future interventions and strategies should include training pertaining to PrEP screening, stigma reduction, privacy considerations, and PrEP dispensing. Article	2023	Chai, Peter; De, Dikha; Albrechta, Hannah; Goodman, Georgia R; Takabatake, Koki; Ben-Arieh, Amy; Lee, Jasper S; Glynn, Tiffany R; Mayer, Kenneth; O'Cleirigh, Conall; Fisher, Celia	Attitudes towards participating in research involving digital pill systems to measure oral HIV pre-exposure chemoprophylaxis: a cross-sectional study among men who have sex with men with substance use in the USA.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2022-067549	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9887701	OBJECTIVES: This quantitative survey sought to understand, among men who have sex with men (MSM) with potentially problematic substance use, the attitudes towards participation in research involving digital pill systems (DPS) for HIV pre-exposure prophylaxis (PrEP) adherence measurement, and the barriers and facilitators to research participation. DESIGN: One-time, cross-sectional, online sampling-based survey. SETTING: US social networking app predominantly focused on MSM. PARTICIPANTS: MSM without HIV who reported current use of oral PrEP, potentially problematic substance use and sexual activity in the past 3 months. A total of 157 participants were eligible, passed validity checks and enrolled. OUTCOME MEASURES: Perceptions of DPS usefulness, accuracy and usability (System Usability Scale (SUS)); willingness and motivations to participate in DPS research; preferences for access to and feedback on DPS adherence data; data sharing considerations; and medical mistrust (Group-Based Medical Mistrust Scale (GBMMS)). RESULTS: Most of the sample (N=157) was white (n=119, 75.8%), gay (n=124, 79.0%) and cisgender (n=150, 95.5%). The median age was 33 years (IQR: 14). The mean GBMMS score was 13.5 (SD=5.2), and the median SUS score was 70 (IQR: 27.5). In the past 3 months, 36.3% (n=57) reported frequent use of substances before or during sex, and 62.4% (n=98) engaged in condomless sex. While most were adherent to PrEP, approximately 34.4% (n=54) expressed significant worry about daily adherence. Participants wished to monitor their PrEP adherence daily (n=66, 42.0%) and 52% (n=82) were very willing to participate in DPS-based research. The majority were minimally concerned about sharing DPS-detected adherence data with research teams (n=126, 80.3%), and were extremely willing to share these data with healthcare providers (n=109, 69.4%). CONCLUSIONS: In this sample, MSM without HIV who use substances reported willingness to use DPS to measure PrEP adherence in a research context, and identified benefits to accessing real-time, DPS-detected adherence data. Article	2023	Chaix M.-L.; Leturque N.; Gabassi A.; Charreau I.; Minier M.; Pialoux G.; Cua É.; Chidiac C.; Raffi F.; Tremblay C.; Meyer L.; Molina J.-M.; Delaugerre C.	Prevalence and incidence of HEV among men using HIV pre-exposure prophylaxis: A sub-study of the ANRS IPERGAY trial	Journal of Clinical Virology	-	-	-	-	13866532	10.1016/j.jcv.2023.105380	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147029309&doi=10.1016%2fj.jcv.2023.105380&partnerID=40&md5=94a6784c61ee572bfde539a924e4ce97	Background: Men who have sex with men (MSM) have an increased risk of infection by pathogens transmitted by the oro-fecal route. Here, we investigated the seroprevalence and incidence of hepatitis E virus (HEV) infection in 416 MSM included in the ANRS IPERGAY PrEP trial. Results: Among the 62 (14.9% (95% CI: 11.6%-18.7%) seropositive for HEV at inclusion, the only factor associated with testing seropositive for HEV was older age. Geographical origin, use of recreational drugs, number of sexual partners, status for HAV and bacterial sexually transmitted infection (STI) at inclusion were not associated. Among the 342 HEV-seronegative patients with available samples, 9 seroconverted after a median of follow-up of 2.1 years (IQR (interquartile range): 1.6; 3.0). Conclusion: Overall, the HEV incidence was 1.19% per 100 person-years 95% CI: 0.54%; 2.26%. Sexual transmission does not seem to be a major route of HEV infection in MSM, unlike HAV. © 2023	Hepatitis E virus; HIV pre-exposure prophylaxis; Incidence; MSM; Seroprevalence	English	Netherlands	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical
Article	2023	Chamberlin G.; Lopes M.D.; Iyer S.; Psaros C.; Bassett I.V.; Medeiros S.; O'Connor C.; Ard K.L.	"That was our afterparty": a qualitative study of mobile, venue-based PrEP for MSM	BMC Health Services Research	-	-	-	-	14726963	10.1186/s12913-023-09475-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159765078&doi=10.1186%2fs12913-023-09475-8&partnerID=40&md5=b9800ac10c2f7ecc0ecd9b9a2217e258	Background: HIV preexposure prophylaxis (PrEP) uptake among men who have sex with men (MSM), a group disproportionately impacted by HIV, is not commensurate with need. Settings which reduce or remove barriers to accessing care are promising venues to support PrEP uptake. PrEP provision at mobile clinics represents a novel strategy to increase PrEP access; however, the acceptability and feasibility of this approach have not been well studied. Methods: Our objective was to understand patient and staff experiences of a mobile clinic van offering PrEP and sexual health services in Boston, Massachusetts, USA. We interviewed mobile unit users and conducted focus groups with mobile unit staff and users. Data were organized using Dedoose software, and content analysis was used to identify themes of access, community, and stigma. Results: Nineteen individuals (16 patients and 3 staff members) participated in interviews (N = 13) or focus groups (N = 6). All patients identified as MSM, 63% were Hispanic or Latino, and 21% of patient interviews were conducted in Spanish. Logistical and psychological convenience facilitated service use, while the community-oriented environment improved satisfaction with care. Overall, participants supported expansion of mobile unit services and recommended changes to improve access to longitudinal care. However, some barriers to PrEP persisted, including low HIV risk perception and stigma about sexual behavior. Conclusions: Mobile units can promote sexual health and PrEP uptake, particularly for populations facing social and logistical barriers to care in traditional settings. © 2023, The Author(s). Article	2023	Champion, Jane Dimmitt; Recto, Pam	An Assessment of HIV Risk, Perceptions of Risk, and Potential Adherence to Preexposure Prophylaxis Among HIV-Negative People With Injection Drug Use Who Access Mobile Outreach Services.	Journal of Addictions Nursing	-	-	-	-	1548-7148	10.1097/JAN.0000000000000522	https://dx.doi.org/10.1097/JAN.0000000000000522	OBJECTIVE: The purpose of this study was to assess HIV risk, perceptions of risk, and potential adherence to preexposure prophylaxis (PrEP) for the prevention of HIV infection among people who inject drugs (PWID), who self-report HIV negative status and access mobile outreach intravenous drug use (IVDU) services. METHODS/SAMPLE: Participants (N = 93) were non-Hispanic White (59.1%) and Hispanic (36.6%), between the ages of 18 and 63 years, primarily male (58.1%), who reported a length of IVDU between 1 and >20 years and accessed mobile outreach IVDU services in a metropolitan area of the Southwestern United States; all self-reported HIV-negative status. Self-report questionnaires completed via iPad included HIV risk behavior, perceived risk of HIV, and beliefs about medicines. RESULTS: PWID perceived themselves at a low risk for HIV with minimal concerns about contracting HIV. High levels of comorbidities (schizophrenia, anxiety, depression, hepatitis, diabetes, and hypertension), substance use, and limited HIV protective behavior and social support existed; women reported significantly more risk behaviors and comorbidities. Positive attitudes toward and interest in use of medication for HIV prevention were present, however, with concurrent concerns regarding long-term medication use and the potential to forget medications. CONCLUSIONS: PrEP adherence for PWID presents challenges for clinicians. Addressing perceptions of PrEP, perceived and actual risk for contracting HIV, potential barriers to PrEP adherence, social support, and treatment of comorbidities in primary care and IVDU outreach services potentially enhances PrEP maintenance among PWID, notably women. Article	2023	Chan, Curtis; Holt, Martin; Broady, Timothy R.; Traeger, Michael W.; Mao, Limin; Grulich, Andrew E.; Prestage, Garrett; MacGibbon, James; Rule, John; Bavinton, Benjamin R.	Trends in Testing and Self-Reported Diagnoses of Sexually Transmitted Infections in Gay and Bisexual Men in Australia, 2017 to 2021: Analysis of National Behavioral Surveillance Surveys.	Sexually Transmitted Diseases	-	-	-	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001870	https://journals.lww.com/stdjournal/fulltext/2023/12000/trends_in_testing_and_self_reported_diagnoses_of.3.aspx	BACKGROUND: Gay, bisexual, and other men who have sex with men (GBM) are overrepresented in diagnoses of sexually transmitted infections (STIs) relative to their population size. This study assessed trends in STI testing and diagnoses among GBM in Australia. METHODS: The Gay Community Periodic Surveys are repeated cross-sectional behavioral surveillance surveys of GBM. Participants reported the number of anal swabs, throat swabs, urine samples, and blood tests for syphilis they undertook in the last year. "Frequent comprehensive testing" was defined as ≥3 of each test in the previous year. Participants reported STI diagnoses of chlamydia, gonorrhea, syphilis, and other STIs in the last year. Trends in testing and diagnoses from 2017 to 2020 and 2020 to 2021 were assessed with logistic regression models. RESULTS: We analyzed 24,488 survey responses from participants reporting casual sex in the last 6 months. Between 2017 and 2020, frequent comprehensive STI testing decreased among HIV-negative GBM on preexposure prophylaxis (PrEP) from 71.7% to 68.9% and declined further to 58.6% in 2021. Frequent comprehensive STI testing was stable during 2017-2020 among HIV-negative/untested GBM not on PrEP (17.4%-14.6%) and HIV-positive GBM (30.4%-35.1%) but declined in 2021 to 7.5% among non-PrEP-users and 25.7% among HIV-positive participants. There were minimal changes in STI diagnoses during 2017-2020, but diagnoses declined in 2021. CONCLUSIONS: Many GBM do not meet Australian STI testing guidelines that recommend quarterly testing. Further evaluation of whether this recommendation is realistic or necessary to reduce STIs among GBM is recommended. Article	2023	Chan, Curtis; Mao, Limin; Bavinton, Benjamin R.; Holt, Martin; Prankumar, Sujith Kumar; Dong, Kevin; Wark, Timothy; Chen, Timothy; Wijaya, Hendri Yulius; Wong, Horas T. H.	The impact of social connections and discrimination to HIV risk among Asian gay and bisexual men in Australia.	Sexual Health	-	-	-	-	1449-8987 1448-5028	10.1071/SH23036	https://www.publish.csiro.au/SH/SH23036	BACKGROUND: Asian gay, bisexual, and other men who have sex with men (GBMSM) are overrepresented in new HIV diagnoses in Australia. Social engagement with other GBMSM has been associated with HIV testing and pre-exposure prophylaxis (PrEP) uptake. Asian GBMSM may be socially disconnected from LGBTQ+ people, which may increase their HIV risk. This analysis assessed the contribution of social connection on HIV risk among Asian GBMSM. METHODS: Using an online cross-sectional survey of Asian GBMSM in Australia, we measured condomless anal intercourse (CLAI) in the last 6months without PrEP or an undetectable viral load (UVL), i.e. CLAI with a risk of HIV transmission. Bivariable and multivariable logistic regression models were performed to compare demographic characteristics and social engagement of participants who had CLAI without PrEP or UVL to those who had not. Analyses were restricted to participants who reported sex with casual partners in the last 6months. RESULTS: Among 509 participants who had casual partners in the last 6months, 151 (29.7%) reported CLAI without PrEP or UVL. CLAI without PrEP or UVL was negatively associated with full-time employment, and recently being tested for HIV and was positively associated with experiencing discrimination based on sexual orientation. Social engagement with LGBTQ+ people was not associated with CLAI without PrEP or UVL. CONCLUSIONS: CLAI without PrEP or UVL was not related to social connections with LGBTQ+ people but was more likely among Asian men who had experienced sexuality-related discrimination, suggesting that mitigating homophobia and biphobia may assist in improving HIV prevention among Asian GBMSM who live in Australia. Article	2023	Chapin-Bardales J.; Haaland R.; Martin A.; Holder A.; Butts V.A.; Sionean C.; Sey E.K.; Brady K.A.; Raymond H.F.; Opoku J.; Kuo I.; Paz-Bailey G.; Wejnert C.	HIV Pre-exposure Prophylaxis Persistence and Adherence among Men Who Have Sex with Men in Four US Cities	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000003160	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152172584&doi=10.1097%2fQAI.0000000000003160&partnerID=40&md5=73058bcedf90926699ccbf959f92ac8d	Background:HIV pre-exposure prophylaxis (PrEP) persistence and adherence are critical to ending the HIV epidemic in the United States.Setting:In 2017 National HIV Behavioral Surveillance, HIV-negative men who have sex with men (MSM) in 4 US cities completed a survey, HIV testing, and dried blood spots at recruitment.Methods:We assessed 3 PrEP outcomes: persistence (self-reported PrEP use at any time in the past 12 months and had tenofovir, emtricitabine, or tenofovir diphosphate detected in dried blood spots), adherence at ≥4 doses/week (self-reported past-month PrEP use and tenofovir diphosphate concentration ≥700 fmol/punch), and adherence at 7 doses/week (self-reported past-month PrEP use and tenofovir diphosphate concentration ≥1250 fmol/punch). Associations with key characteristics were examined using log-linked Poisson regression models with generalized estimating equations.Results:Among 391 MSM who took PrEP in the past year, persistence was 80% and was lower among MSM who were younger, had lower education, and had fewer sex partners. Of 302 MSM who took PrEP in the past month, adherence at ≥4 doses/week was 80% and adherence at 7 doses/week was 66%. Adherence was lower among MSM who were younger, were Black, and had fewer sex partners.Conclusions:Although persistence and adherence among MSM were high, 1 in 5 past-year PrEP users were not persistent and 1 in 5 past-month PrEP users were not adherent at levels that would effectively protect them from acquiring HIV (ie, ≥4 doses/week). Efforts to support PrEP persistence and adherence should include MSM who are young, are Black, and have less education. © Copyright 2023 Wolters Kluwer Health, Inc. Article	2023	Chase E.; Mena L.; Johnson K.L.; Prather M.; Khosropour C.M.	Patterns of Pre-exposure Prophylaxis (PrEP) Use in a Population Accessing PrEP in Jackson, Mississippi	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03845-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137933831&doi=10.1007%2fs10461-022-03845-9&partnerID=40&md5=03b9a935cf90422dfaed4991872691d8	Pre-exposure prophylaxis (PrEP) persistence is suboptimal in the United States. In the Deep South, a region with high rates of new HIV diagnosis, patterns of PrEP discontinuation remain unexplored. We evaluated data from a clinic-based PrEP program in Jackson, Mississippi and included patients initiating PrEP between August 2018 and April 2021. We considered patients to have a gap in PrEP coverage if they had at least 30 days without an active PrEP prescription; those who restarted PrEP after 30 days were classified as 'stopped and restarted' and those who never obtained a new PrEP prescription were classified as 'stopped and did not restart'. Patients without a gap in coverage were considered 'continuously on PrEP'. We estimated median time to first PrEP discontinuation and examined factors associated with time to first PrEP discontinuation. Of 171 patients who received an initial 90-day PrEP prescription; 75% were assigned male at birth and 74% identified as Black. The median time to first discontinuation was 90 days (95% CI 90–114). Twenty-two percent were continuously on PrEP, 28% stopped and restarted (median time off PrEP = 102 days), and 50% stopped and did not restart. Associations with early PrEP stoppage were notable for patients assigned sex female vs male (adjusted hazard ratio aHR = 1.6, 95% CI 1.0–2.5) and those living over 25 miles from clinic vs. 0–10 miles (aHR 1.89, 95% CI 1.2–3.0). Most patients never refilled an initial PrEP prescription though many patients re-started PrEP. Interventions to improve persistence and facilitate re-starts are needed. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Chawki, Sylvain; Goldwirt, Lauriane; Mouhebb, Mayssam El; Gabassi, Audrey; Taouk, Milad; Bichard, Iris; Loze, Bénédicte; Amara, Ali; Brand, Rhonda; Siegel, Aaron; McGowan, Ian; Costagliola, Dominique; Assoumou, Lambert; Molina, Jean-Michel; Delaugerre, Constance	Ex vivo rectal tissue infection with HIV-1 to assess time to protection following oral PrEP with TDF/FTC (a sub-study of the ANRS PREVENIR study).	AIDS	-	-	-	-	1473-5571	10.1097/QAD.0000000000003789	https://dx.doi.org/10.1097/QAD.0000000000003789	OBJECTIVES: We wished to assess time to protection from HIV-1 infection following oral tenofovir disoproxil and emtricitabine (TDF/FTC) as pre-exposure prophylaxis (PrEP), using ex vivo rectal tissue infections and drug concentration measures in blood and rectal tissue. DESIGN/METHODS: Participants from the ANRS PREVENIR study (NCT03113123) were offered this sub-study after a 14-day wash-out. We used an ex vivo model to evaluate rectal tissue HIV-1 susceptibility before and after PrEP, two hours after 2 pills or seven days of a daily pill of TDF/FTC. PrEP efficacy was expressed by the difference (after-before) of 14-day cumulative p24 antigen levels. TFV-DP and FTC-TP levels were measured in rectal tissue and PBMCs and correlated with HIV-1 infection. RESULTS: Twelve and eleven males were analysed in the 2 hours-double dose and 7 days-single dose groups, respectively. Cumulative p24 differences after-before PrEP were -144pg/ml/mg (IQR-259;-108) for the 2 hours-double dose group (pâ=â0.0005) and -179pg/ml/mg (IQR-253;-86) for the 7 days-single dose group (pâ=â0.001), with no differences between groups (pâ=â0.93). Rectal TFV-DP was below quantification after a double dose, but FTC-TP levels were similar to levels at seven days. There was a significant correlation between rectal FTC-TP levels and p24 changes after a double dose (Râ=â-0.84; pâ=â0.0001). CONCLUSIONS: Oral TDF/FTC provided similar protection against HIV-1 infection of rectal tissue 2âhours after a double dose or 7âdays of a daily dose. At 2âhours, this protection seems driven by high FTC-TP concentrations in rectal tissue. This confirms the importance of combining TDF and FTC to achieve early protection. Article	2023	Chebet, Joy J; McMahon, Shannon A; Chase, Rachel P; Tarumbiswa, Tapiwa; Maponga, Chivimbiso; Mandara, Esther; Bärnighausen, Till; Geldsetzer, Pascal	Stakeholder perspectives on interventions to improve HIV pre-exposure prophylaxis uptake and continuation in Lesotho: A participant-ranked preferences study.	PLOS Global Public Health	-	-	-	-	2767-3375	10.1371/journal.pgph.0001423	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10529554	Low uptake and high discontinuation remain major obstacles to realizing the potential of Pre-Exposure Prophylaxis (PrEP) in changing the trajectory of the HIV epidemic. We conducted a card sorting and ranking exercise with 155 local stakeholders to determine their views on the most important barriers and most promising interventions to achieving high PrEP coverage. Stakeholders were a purposive sample of PrEP policymakers and implementing partners (n = 7), healthcare providers (n = 51), and end-users (n = 97). End-users included adults who were currently using PrEP (n = 55), formerly using PrEP (n = 36), and those who were offered PrEP but declined (n = 6). Participants sorted pre-selected interventions and barriers to PrEP coverage into three piles-most, somewhat, and least important. Participants then ranked interventions and barriers in the "most important" piles in ascending order of significance. Ranked preferences were analyzed as voting data to identify the smallest set of candidates for which each candidate in the set would win in a two-candidate election against any candidate outside the set. Participants viewed a lack of PrEP awareness as the most important barrier to PrEP uptake for women, and a fear of HIV testing for men. Community-based HIV testing was ranked as the most promising intervention to improve PrEP uptake for both men and women. Perceived or experienced stigma was seen as an important barrier for PrEP continuation for both men and women, with an additional important barrier for men being daily activities that compete with the time needed to take a daily pill. Adherence counseling and multi-month PrEP prescriptions were seen as the most promising interventions to improve PrEP continuation. Our findings suggest community-based activities that generate PrEP demand (community-based HIV testing and mass media campaigns), reinforced with facility-based follow-up (counseling and multi-month prescription) could be promising interventions for PrEP programs that are aimed at the general adult population. Article	2023	Chebet, Joy J; McMahon, Shannon A; Tarumbiswa, Tapiwa; Hlalele, Hlalele; Maponga, Chivimbiso; Mandara, Esther; Ernst, Kacey; Alaofe, Halimatou; Baernighausen, Till; Ehiri, John E; Geldsetzer, Pascal; Nichter, Mark	Motivations for pre-exposure prophylaxis uptake and decline in an HIV-hyperendemic setting: findings from a qualitative implementation study in Lesotho.	AIDS Research and Therapy	-	-	-	-	1742-6405	10.1186/s12981-023-00535-x	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10324220	BACKGROUND: Pre-Exposure Prophylaxis (PrEP) has demonstrated clinical efficacy in preventing HIV infection, yet its uptake remains low. This study, conducted in five PrEP implementing districts in Lesotho, examined factors motivating persons at risk of HIV infection to adopt or reject PrEP when offered freely. METHODS: In-depth interviews were undertaken with stakeholders directly engaged with PrEP policy (n = 5), program implementation (n = 4), and use (current PrEP users = 55, former PrEP users = 36, and PrEP decliners (n = 6). Focus group discussions (n = 11, 105 total participants) were conducted with health staff directly providing HIV and PrEP services. RESULTS: Demand for PrEP was reported highest among those at greatest risk for HIV acquisition: those in serodiscordant relationships and/or engaged in sex work. Culturally sensitive PrEP counseling was described as an opportunity to transfer knowledge, build trust, and address user concerns. Conversely, top-down counseling resulted in PrEP distrust and confusion about HIV status. Key motivations for PrEP uptake revolved around sustaining core social relationships, desire for safer conception, and caring for ailing relatives. The decline of PrEP initiation was driven by a combination of individual-level factors (risk perception, perceived side effects, disbelief of the drug's efficacy and PrEP's daily pill regimen), societal factors (lack of social support and HIV-related stigma), and structural factors related to PrEP access. CONCLUSIONS: Our findings suggest strategies for effective national PrEP rollout and implementation include: (1) demand creation campaigns which highlight positive aspects of PrEP, while simultaneously addressing apprehensions for uptake; (2) strengthening health provider counseling capacity; and (3) addressing societal and structural HIV-related stigma. Providing HIV pre-exposure prophylaxis to men who have sex with men and transgender women in hospitals and community-led clinics in Thailand: acceptance, patterns of use, trends in risk behaviors, and HIV incidence	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2022.2159312	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85153123542&doi=10.1080%2f09540121.2022.2159312&partnerID=40&md5=80243e852123f95c75634067aaaf6e88	From May 2015 to June 2018, we conducted a PrEP demonstration project at two hospitals and four community-led clinics in Bangkok and Pattaya. HIV-negative, MSM and TGW aged ≥18 years old, reporting sex without a condom, were offered daily PrEP. Participants received HIV testing and completed a computer-based questionnaire at enrollment, 6 and 12 months. We collected self-reported PrEP adherence at months 1, 3, 6, 9, and 12. We used logistic regression to determine factors associated with the decision to take PrEP and calculated HIV incidence among baseline HIV-negative participants. Of 803 participants enrolled, 349 (43.5%) started PrEP. Participants were more likely to start PrEP if they were sex workers, had moderate or high self-perceived risk of HIV, or a high PrEP-knowledge score. Participants used PrEP for a median of 6.1 months. Reported condom use increased and the number of sex partners decreased during follow-up regardless of PrEP use. Six participants not-taking PrEP acquired HIV (HIV incidence 2.2 per 100 person-years), and five taking PrEP acquired HIV (HIV incidence 2.1 per 100 person-years). All five reported taking <4 pills the weeks before study visits. © 2022 Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Chen X.; Lai Y.	Knowledge domain and emerging trends in HIV pre-exposure prophylaxis: A visualization analysis via CiteSpace	Frontiers in Microbiology	-	-	-	-	1664302X	10.3389/fmicb.2023.1099132	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151450743&doi=10.3389%2ffmicb.2023.1099132&partnerID=40&md5=b7161d997bd1cae77a72afe3656fa332	Background: As an effective strategy that reduces transmission among people at high risk of human immunodeficiency virus (HIV), pre-exposure prophylaxis (PrEP) has revolutionized HIV prevention. Our study aims to provide a reference for the development of relevant research and the formulation of prevention and control policies for HIV. Methods: Through CiteSpace software, this study aims to present a comprehensive overview of the HIV PrEP knowledge structure, hotspots, and frontiers. We searched the Web of Science Core Collection for studies published between 2012 and 2022 related to HIV PrEP, and 3,243 papers remained after selection. Results: The number of HIV PrEP publications has increased over the past few years. A close integration and exchange of HIV PrEP research findings has taken place between countries and authors. Major ongoing research trends include long-term injection PrEP, the impact of chlamydia on HIV PrEP, and individual awareness of and attitudes toward HIV PrEP. Thus, more attention should be paid to innovations and breakthroughs in drugs, the factors that affect HIV transmission and susceptibility, and the future promotion of public acceptance of HIV PrEP. Conclusion: This study offers a systematic, objective, and comprehensive analysis of the related articles. It will assist scholars in understanding the dynamic evolution of HIV PrEP research and identifying future research areas to better advance the development of the field. Article	2023	Chen Y.; Saldarriaga E.M.; Montano M.A.; Ngure K.; Thuo N.; Kiptinness C.; Rafferty M.; Terris-Prestholt F.; Stergachis A.; Mugambi M.L.; Ortblad K.F.; Sharma M.	Assessing preferences for HIV pre-exposure prophylaxis (PrEP) delivery services via online pharmacies in Kenya: Protocol for a discrete choice experiment	BMJ Open	-	-	-	-	20446055	10.1136/bmjopen-2022-069195	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151743299&doi=10.1136%2fbmjopen-2022-069195&partnerID=40&md5=234f1f756e2cbdaa03512785c2c8009f	Introduction Pre-exposure prophylaxis (PrEP) is highly effective at preventing HIV acquisition, but coverage remains low in high prevalence settings. Initiating and continuing PrEP via online pharmacies is a promising strategy to expand PrEP uptake but little is known about user preferences for this strategy. We describe methods for a discrete choice experiment (DCE) to assess preferences for PrEP delivery from an online pharmacy. Methods and analysis This cross-sectional study is conducted in Nairobi, Kenya, in partnership with MYDAWA, a private online pharmacy retailer with a planned sample size of >400 participants. Eligibility criteria are: ≥18 years, not known HIV-positive and interested in PrEP. Initial DCE attributes and levels were developed via literature review and stakeholder meetings. We conducted cognitive interviews to assess participant understanding of the DCE survey and refined the design. The final DCE used a D-efficient design and contained four attributes: PrEP eligibility assessment, HIV test type, clinical consultation type and user support options. Participants are presented with eight scenarios consisting of two hypothetical PrEP delivery services. The survey was piloted among 20 participants before being advertised on the MYDAWA website on pages displaying products indicating HIV risk (eg, HIV self-test kits). Interested participants call a study number and those screened eligible meet a research assistant in a convenient location to complete the survey. The DCE will be analysed using a conditional logit model to assess average preferences and mixed logit and latent class models to evaluate preference heterogeneity among subgroups. Ethics and dissemination This study was approved by the University of Washington Human Research Ethics Committee (STUDY00014011), the Kenya Medical Research Institute, Nairobi County (EOP/NMS/HS/128) and the Scientific and Ethics Review Unit in Kenya (KEMRI/RES/7/3/1). Participation in the DCE is voluntary and subject to completion of an electronic informed consent. Findings will be shared at international conferences and peer-reviewed publications, and via engagement meetings with stakeholders. © 2023 BMJ Publishing Group. All rights reserved. Article	2023	Chen, Cindy Y; Donga, Prina; Campbell, Alicia K; Taiwo, Babafemi	Economic Burden of HIV in a Commercially Insured Population in the United States.	Journal of Health Economics and Outcomes Research	-	-	-	-	2327-2236	10.36469/001c.56928	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9865714	Background: With advances in antiretroviral therapy (ART), people with HIV infection are living longer. Pre-exposure prophylaxis (PrEP) to reduce HIV infection risk continues to be underutilized in high-risk individuals. Recent data on economic burden for patients with newly diagnosed HIV-1 or initiated with PrEP are limited. Objectives: To assess characteristics, healthcare resource utilization (HRU), and costs among adults and adolescents either with newly diagnosed HIV-1 or initiated with PrEP. Methods: This retrospective observational study utilized data from the IBM MarketScan® Commercial Claims and Encounters database. Adults with newly diagnosed HIV-1 or those initiated with PrEP were included (index date was the first HIV diagnosis or PrEP prescription, respectively, between January 1, 2016, and April 30, 2021). Corresponding cohorts of adolescents were considered exploratory. Descriptive analyses were conducted to assess baseline demographics and clinical characteristics, and all-cause and HIV-related HRU and costs per patient per month (PPPM) during follow-up. Results: Data from 18 154 adults and 220 adolescents with newly diagnosed HIV and 34 123 adults and 175 adolescents initiated with PrEP were included. Approximately 70% of adolescents and 9% of adults receiving PrEP were female. Baseline depression/anxiety was present in 16.1% and 24.6% of adults and 14.5% and 45.1% of adolescents in the HIV and PrEP cohorts, respectively. Substance abuse in the HIV and PrEP cohorts, respectively, was reported in 10.1% and 7.0% of adults, and 2.7% and 17.7% of adolescents. During follow-up, among adults with newly diagnosed HIV, mean (SD) total all-cause and HIV-related PPPM costs were $2657 ($5954) and $1497 ($4463), respectively; pharmacy costs represented 47% of all-cause costs and 67% of HIV-related costs, but only 37% of patients had an HIV-related prescription. All-cause costs PPPM for adults with PrEP were $1761 ($1938), with pharmacy costs accounting for 71%. Conclusions: Despite advances in ART, patients with newly diagnosed HIV and at-risk patients receiving PrEP continue to incur HRU costs. The chronic nature of HIV warrants further exploration of factors contributing to disease burden and opportunities to improve prevention strategies. Article	2023	Chen, Xiu; Li, Jun; Kou, Liqiu; Xie, Xiaolu; Wei, Deqing; Li, Yaling	Efficacy and safety of long-acting cabotegravir versus oral tenofovir disoproxil fumarate-emtricitabine as HIV pre-exposure prophylaxis: A systematic review and meta-analysis.	Reviews in Medical Virology	-	-	-	-	1099-1654	10.1002/rmv.2460	https://dx.doi.org/10.1002/rmv.2460	WHO guidelines recommend daily oral tenofovir disoproxil fumarate (TDF) and emtricitabine (FTC) for pre-exposure prophylaxis (PrEP) of HIV in people at high risk of HIV infection. However, due to social, psychological and other reasons, the compliance with daily oral TDF-FTC in real life is low. Long-acting cabotegravir is currently the only long-acting drug approved by the U.S. Food and Drug Administration (FDA) for HIV PrEP. Due to the long dosing interval (8 weeks), long-acting cabotegravir has low compliance requirements for people at high risk of HIV infection. We aimed to discuss the feasibility of long-acting cabotegravir to replace TDF-FTC as HIV PrEP based on efficacy and safety analyses. Randomized controlled trials were retrieved, and R software was used for meta-analysis after data extraction. and discussion: Results of the meta-analysis showed that compared with TDF-FTC, long-acting cabotegravir was associated with a lower risk of HIV infection (HR = 0.22, 95% CI: 0.08-0.59, p < 0.01), less decreased creatinine clearance (RR = 0.96, 95% CI: 0.93-0.99, p < 0.01), but more tolerated injection sites adverse events (p < 0.01). No statistically significant differences were found between long-acting cabotegravir and oral placebo in non-injection-related adverse events (creatine phosphokinase, headache, nasopharyngitis, upper respiratory tract infection and gastroenteritis) (p > 0.05). Long-acting cabotegravir has a manageable safety profile and is more effective than TDF-FTC in preventing HIV infection. Interestingly, decreased creatinine clearance occurred less frequently with long-acting cabotegravir than with TDF-FTC. Long-acting cabotegravir is very promising to replace TDF-TFC in the future, which requires more large-sample, high-quality RCTs to verify. Theses and Dissertations	2023	Chen, Yi-No Enoch; Wall, Kristin M.; Siegler, Aaron J.	Addressing HIV PrEP Care Persistence: Individual PrEP Use Trajectories and the Impact of a Home-Based PrEP Program	-	-	Emory University	Emory University	-	NA	NA	https://www.proquest.com/dissertations-theses/addressing-hiv-prep-care-persistence-individual/docview/2922322071/se-2?accountid=8113	Suboptimal persistence in HIV pre-exposure prophylaxis (PrEP) among men having sex with men (MSM) limits its effectiveness. Knowledge gap exists in understanding the long-term patterns of PrEP use. In addition, telemedicine has been proposed as a potential strategy to alleviate PrEP cessation by reducing clinic-based barriers. PrEP@Home is a home-based telemedicine PrEP system designed to minimize patient burden. Since 2019, a randomized controlled trial was launched in U.S. cities to evaluate the efficacy of PrEP@Home on the outcome of PrEP persistence, compared to the standard PrEP care. There is a need to assess whether the relative health benefits generated by PrEP@Home would be an effective investment of limited health resources. The overarching goal of this dissertation was to improve understanding of current PrEP use and potential utilities of scaling up home-based PrEP interventions.In Aim 1, we used a parametric clustering algorithm (i.e., group-based trajectory model) to group PrEP persistence trajectories over two years among samples of male PrEP users from a national pharmacy chain in the US. We identified four distinct subgroups of PrEP persistence trajectories. Based on their trajectory characteristics, they are labeled as "persistent PrEP use", "rapidly declining PrEP persistence", "PrEP initiators" (after initial decline of PrEP use), and "mid-term cessation of PrEP use". The clinically actionable typology of PrEP persistence patterns informs future PrEP persistence interventions that target heterogeneous timings of PrEP cessations. Older age, having commercial insurance as the primary payer of PrEP, and use of specialty pharmacy were associated with PrEP persistence against various patterns of non-persistence.In Aim 2, we built an individual-based simulation model parameterized with the interim PrEP@Home's trial data to assess the cost effectiveness of PrEP@Home among participants from the trial. The provision of PrEP@Home was associated with increased PrEP persistence in the early months of the trial, but the positive intervention decayed over time. Simulation results suggest that PrEP@Home program was likely an economically dominant intervention with mild superiority on the clinical scale. The probability of PrEP@Home care being cost-effective was estimated to be above 75% regardless of the common cost effectiveness thresholds for high-income countries ($50,000/QALY, $100,000/QALY) we used.In Aim 3, we used network-based HIV dynamics model to assess the population-level impact of PrEP@Home program on HIV incidence among MSM in Atlanta, GA, when scaled up. Based on the simulations per PrEP@Home's efficacy estimated from the interim trial data, scaling PrEP@Home only led to marginal reduction in cumulative HIV incidence over a 10-year period (up to 3% reduction at 100% PrEP@Home coverage). Even at maximum PrEP@Home coverage, we found that a minimum PrEP@Home's efficacy of around 60% were required to reach at least 10% HIV incidence averted over 10 years.This dissertation not only has contributed to the understanding of heterogenous PrEP persistence patterns (which may be critical for effective PrEP care and retention management in the field), but also shed light on the utility of home-based PrEP program from the cost-saving perspective. It further underscores the need for initiating and expanding other interventions along the PrEP care cascade to maximize the benefit of home-based intervention and achieve substantial reduction in cumulative HIV incidence among MSM in Atlanta. Article	2023	Chimbindi, Natsayi; Mthiyane, Nondumiso; Chidumwa, Glory; Zuma, Thembelihle; Dreyer, Jaco; Birdthistle, Isolde; Floyd, Sian; Kyegombe, Nambusi; Grundy, Chris; Cawood, Cherie; Danaviah, Siva; Smit, Theresa; Pillay, Deenan; Baisley, Kathy; Harling, Guy; Seeley, Janet; Shahmanesh, Maryam	Evaluating use of mass-media communication intervention 'MTV-Shuga' on increased awareness and demand for HIV and sexual health services by adolescent girls and young women in South Africa: an observational study.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2022-062804	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10201230	OBJECTIVE: To investigate the effect of exposure to MTV Shuga:Down South' (MTVShuga-DS) during the scale-up of combination HIV-prevention interventions on awareness and uptake of sexual reproductive health (SRH) and HIV-prevention services by adolescent girls and young women (AGYW). DESIGN: One longitudinal and three cross-sectional surveys of representative samples of AGYW. SETTING: AGYW in four South African districts with high HIV prevalence (>10%) (May 2017 and September 2019). PARTICIPANTS: 6311 AGYW aged 12-24. MEASURES: Using logistic regression, we measured the relationship between exposure to MTV Shuga-DS and awareness of pre-exposure prophylaxis (PrEP), condom use at last sex, uptake of HIV-testing or contraception, and incident pregnancy or herpes simplex virus 2 (HSV-2) infection. RESULTS: Within the rural cohort 2184 (85.5%) of eligible sampled individuals were enrolled, of whom 92.6% had at least one follow-up visit; the urban cross-sectional surveys enrolled 4127 (22.6%) of eligible sampled individuals. Self-report of watching at least one MTV Shuga-DS episode was 14.1% (cohort) and 35.8% (cross-section), while storyline recall was 5.5% (cohort) and 6.7% (cross-section). In the cohort, after adjustment (for HIV-prevention intervention-exposure, age, education, socioeconomic status), MTVShuga-DS exposure was associated with increased PrEP awareness (adjusted OR (aOR) 2.06, 95% CI 1.57 to 2.70), contraception uptake (aOR 2.08, 95% CI 1.45 to 2.98) and consistent condom use (aOR 1.84, 95% CI 1.24 to 2.93), but not with HIV testing (aOR 1.02, 95% CI 0.77 to 1.21) or acquiring HSV-2 (aOR 0.92, 95% CI 0.61 to 1.38). In the cross-sections, MTVShuga-DS was associated with greater PrEP awareness (aOR 1.7, 95% CI 1.20 to 2.43), but no other outcome. CONCLUSIONS: Among both urban and rural AGYW in South Africa, MTVShuga-DS exposure was associated with increased PrEP awareness and improved demand for some HIV prevention and SRH technologies but not sexual health outcomes. However, exposure to MTVShuga-DS was low. Given these positive indications, supportive programming may be required to raise exposure and allow future evaluation of edu-drama impact in this setting. Article	2023	Chinbunchorn, Tanat; Mayer, Kenneth H; Campbell, Juwan; Alm, Dana King; Krakower, Douglas; Marcus, Julia L; Grasso, Chris; Keuroghlian, Alex S	HIV pre-exposure prophylaxis provision by U.S. Health centers in 2021.	AIDS	-	-	-	-	1473-5571	10.1097/QAD.0000000000003774	https://dx.doi.org/10.1097/QAD.0000000000003774	OBJECTIVES: To assess HIV pre-exposure prophylaxis (PrEP) provision in U.S. health centers (HCs). DESIGN: The U.S. Ending the HIV Epidemic (EHE) initiative designated HCs as the main health care system through which PrEP scale-up occurs. HCs offer primary care to over 30 million disproportionately uninsured, racially or ethnically minoritized, and low-income patients. This study is the first to assess PrEP provision across HCs, including characteristics of clinics, patient populations, and policies associated with PrEP prescribing. METHODS: The Health Resources and Services Administration's Uniform Data System contained aggregate data on PrEP prescriptions and patient sociodemographics at HCs from January 1 through December 31, 2021, in 50 U.S. states, the District of Columbia, and 8 U.S. territories. We compared patient demographics and availability of Medicaid expansion and PrEP assistance programs at HCs that prescribed versus those that did not prescribe PrEP. RESULTS: Across 1,375 HCs serving 30,193,278 patients, 79,163 patients were prescribed PrEP. HCs that prescribed any PrEP had higher proportions of sexual, gender, racial, and ethnic minority patient populations compared with HCs that prescribed no PrEP. Compared with HCs that prescribed no PrEP, a higher proportion of HCs that prescribed PrEP were located in designated high-priority jurisdictions of the EHE initiative or states with Medicaid expansion or public PrEP assistance programs. CONCLUSIONS: HCs are critical for scaling up PrEP in minoritized populations disproportionately affected by HIV, facilitated through federal and state-level policies. These findings highlight service gaps and inform future interventions to optimize PrEP implementation and support EHE initiative goals.	ending the HIV epidemic in the U.S., federally qualified health centers, HIV preexposure prophylaxis, HIV prevention, Medicaid, racial and ethnic minorities, sexual and gender minorities	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Chinbunchorn, Tanat; Thaneerat, Natapong; Howell, Sean; Sowaprux, Teaka; Phiphatkunarnon, Panyaphon; Lujintanon, Sita; Kaewpoowat, Quanhathai; Phanuphak, Praphan; Phanuphak, Nittaya; Ramautarsing, Reshmie A	Assessment of U=U understanding, PrEP awareness, HIV risk behaviours and factors associated with low HIV knowledge among users of Hornet, an online dating application for LGBTQ, in Thailand.	Sexually Transmitted Diseases	-	-	-	-	1472-3263	10.1136/sextrans-2021-055300	https://dx.doi.org/10.1136/sextrans-2021-055300	BACKGROUND: Over 50% of HIV infections in Thailand annually occur among men who have sex with men (MSM) and transgender women who use online applications to meet their sexual partners. We conducted a cross-sectional study assessing undetectable=untransmittable (U=U) understanding, pre-exposure prophylaxis (PrEP) awareness, sexual behaviours and factors associated with HIV knowledge among users of Hornet in Thailand. METHODS: From November 2019 to January 2020, a survey was conducted using convenience sampling on Hornet in Thailand. HIV literacy was assessed via 22 questions, and multivariable linear regression was performed. RESULTS: 960 responses were assessed; median age was 34 years, the majority were MSM (80.4%), Thai (83.8%), had at least bachelor's degree (74.9%). Regarding the risk profiles, 39.1% reported inconsistent condom use, 15.0% used amphetamine-type stimulants, 56.9% had not taken PrEP in the last six months and 20.5% never had an HIV test. Only 22.8% thought that U=U was completely accurate. Lower HIV knowledge was associated with being from Africa (ß -8.13, 95% CI -14.39 to -1.87), age of 25 years or younger (ß -2.6, 95% CI -4.37 to -0.82), education less than bachelor's degree (ß -2.58, 95% CI -3.98 to -1.19), having more than one sexual partners (ß -2.41, 95% CI -4.13 to -0.69), paying three or more people to have intercourse (ß -2.5, 95% CI -4.26 to -0.74), not knowing one's HIV status (ß -3.56, 95% CI -5.45 to -1.68) and not answering about previous PrEP use (ß -4.11, 95% CI -7.86 to -0.36). Higher HIV knowledge was associated with being from Europe (ß 2.54, 95% CI 0.46 to 4.61), the Americas (ß 3.37, 95% CI 0.44 to 6.30) and previous PrEP use (ß 2.37, 95% CI 0.94 to 3.81). CONCLUSION: Among Hornet users in Thailand, the U=U message was unclear, and PrEP use was suboptimal. Large HIV knowledge gaps and high-risk behaviours were concerning. Educational campaigns in online spaces are needed to promote awareness and HIV prevention strategies. Article	2023	Chipukuma J.; Lindsay B.; Mwango L.K.; Olowski P.; Baumhart C.; Tembo K.; Olufunso A.A.; Bwale C.; Makasa P.; Muchoka M.; Tembo S.; Mbokile W.; Panda C.; Malupande S.; Lubinda R.; Bwembelo B.; Fundulu E.; Munsongo C.; Watala K.; Musonda B.; Chituwo O.; Okuku J.; Mwila A.; Muleya C.; Patel P.; Claassen C.W.	FOSTERING ACCESS TO PREP AMONG ADOLESCENT GIRLS AND YOUNG WOMEN AGED 16 TO 24 YEARS AT HIGH RISK OF HIV THROUGH THE DREAMS INITIATIVE IN FOUR DISTRICTS IN ZAMBIA	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2023.35.suppA.52	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163944725&doi=10.1521%2faeap.2023.35.suppA.52&partnerID=40&md5=8e154cffbaca62e59ace83dc533859f4	Adolescent girls and young women (AGYW) in sub-Saharan Africa remain at high risk for HIV, yet limited data exist on implementation of HIV pre-exposure prophylaxis (PrEP) for this group. We examined PrEP uptake among AGYW using a retrospective cohort enrolled in the Determined Resilient Empowered AIDS-free Mentored Safe (DREAMS) initiative in Zambia between October 2020 and March 2022. Consent was obtained from eligible AGYW at substantial risk for HIV, and they voluntarily par-ticipated in PrEP. Multivariable logistic regression was used to examine factors associated with PrEP refills following initiation. Of 4,162 HIV-negative AGYW, 3,233 (77%) were at substantial risk and initiated on PrEP. Overall, 68% of AGYW had at least one refill, but this differed significantly by age group and district. DREAMS was successful at reaching AGYW with PrEP services. More evidence is needed to assess reasons for discontinuation and to improve persistence for those with sustained HIV risk. © 2023 The Guilford Press. Article	2023	Choi S.K.; Bauermeister J.; Tingler R.C.; Johnson S.; Macagna N.; Ho K.; Hoesley C.; Liu A.; Kayange N.; Palanee-Phillips T.; Chariyalertsak S.; Gonzales P.; Piper J.M.	A latent trajectory analysis of young sexual and gender minorities' adherence to three rectal microbicide placebo formulations (MTN-035; a randomized crossover trial)	BMC Public Health	-	-	-	14712458	10.1186/s12889-023-17368-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178914114&doi=10.1186%2fs12889-023-17368-y&partnerID=40&md5=944b55e20707b328767952494a8b5abc	Background: Rectal microbicides (RM) are biomedical HIV prevention products that aim to prevent or reduce the transmission of HIV and other sexually transmitted infections (STIs). RM modalities may be beneficial for populations who have complex lifestyles, difficulties adhering to pre-exposure prophylaxis (PrEP) regimens, and/or have limited access to care. MTN-035 (DESIRE; Developing and Evaluating Short-Acting Innovations for Rectal Use), a randomized crossover trial, aimed to evaluate the safety and acceptability of, and adherence to, three placebo RM modalities (douche, insert, and suppository) prior to receptive anal intercourse. Methods: We conducted latent trajectory analysis to identify clusters of individuals who shared similar trajectories in acceptability and adherence for each product (douche, insert, and suppository) over time. We analyzed weekly short messaging service (SMS) use reports for each modality as reported by enrolled sexual and gender minority (SGM) participants. Results: Two trajectories for each product were identified: a "protocol compliant" trajectory (i.e., at least one product use occasion per week) and "high use" trajectory (i.e., more than three product use occasions per week). Participants with high use were more likely to lack access to PrEP and have higher intentions to utilize RM modalities compared to those who were protocol compliant. Conclusions: This study highlighted high adherence to RM modalities among SGM. As research into viable HIV prevention modalities continues to evolve, tailored intervention strategies are needed to support the uptake of and adherence to alternative prevention modalities that are behaviorally congruent with targeted users. Article	2023	Chou R.; Spencer H.; Bougatsos C.; Blazina I.; Ahmed A.; Selph S.	Preexposure Prophylaxis for the Prevention of HIV: Updated Evidence Report and Systematic Review for the US Preventive Services Task Force	JAMA - Journal of the American Medical Association	-	-	-	987484	10.1001/jama.2023.9865	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85168486379&doi=10.1001%2fjama.2023.9865&partnerID=40&md5=1c230bfcf7895e8e8966a907766b30aa	Importance: A 2019 review for the US Preventive Services Task Force (USPSTF) found oral preexposure prophylaxis (PrEP) associated with decreased HIV infection risk vs placebo or no PrEP in adults at increased HIV acquisition risk. Newer PrEP regimens are available. Objective: To update the 2019 review on PrEP, to inform the USPSTF. Data Sources: Ovid MEDLINE, Cochrane Database of Systematic Reviews, Cochrane Central Register of Controlled Trials, and Embase (January 2018 to May 16, 2022); surveillance through March 24, 2023. Study Selection: Randomized clinical trials of PrEP vs placebo or no PrEP or newer vs older PrEP regimens and diagnostic accuracy studies of instruments for predicting incident HIV infection. Data Extraction and Synthesis: Dual review of titles and abstracts, full-text articles, study quality, and data abstraction. Data were pooled using the DerSimonian and Laird random-effects model. Main Outcomes and Measures: HIV acquisition, mortality, and harms; and diagnostic test accuracy. Results: Thirty-two studies were included in the review (20 randomized clinical trials N = 36543 and 12 studies of diagnostic accuracy N = 5544500). Eleven trials in the 2019 review found oral PrEP associated with decreased HIV infection risk vs placebo or no PrEP (n = 18172; relative risk, 0.46 95% CI, 0.33-0.66). Higher adherence was associated with greater efficacy. One new trial (n = 5335) found oral tenofovir alafenamide/emtricitabine (TAF/FTC) to be noninferior to tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) in men who have sex with men (RR, 0.47 95% CI, 0.19-1.14). Two new trials found long-acting injectable cabotegravir associated with decreased risk of HIV infection vs oral TDF/FTC (RR, 0.33 95% CI, 0.18-0.62 in cisgender men who have sex with men and transgender women n = 4490 and RR, 0.11 95% CI, 0.04-0.31 in cisgender women n = 3178). Discrimination of instruments for predicting incident HIV infection was moderate in men who have sex with men (5 studies; n = 25488) and moderate to high in general populations of persons without HIV (2 studies; n = 5477291). Conclusions and Relevance: In adults at increased HIV acquisition risk, oral PrEP was associated with decreased risk of acquiring HIV infection compared with placebo or no PrEP. Oral TAF/FTC was noninferior to oral TDF/FTC, and injectable cabotegravir reduced the risk of HIV infection compared with oral TDF/FTC in the populations studied.. © 2023 American Medical Association. Theses and Dissertations	2023	Christian, Canice	Application of individual-level and health system-level implementation science approaches to HIV and TB prevention in Uganda	-	-	University of California	-	na	NA	https://escholarship.org/uc/item/3bw251k6	HIV and TB remain leading causes of death and disability across the globe. Highly efficacious HIV and TB prevention methods have created opportunities to prevent morbidity and mortality. Advancements in the availability of pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) have created opportunities to prevent HIV among those at high risk. Additionally, TB remains a leading cause of death among people with HIV. Isoniazid preventive therapy (IPT) reduces the incidence of active TB by approximately 40-60% but despite the breadth of evidence suggesting the benefits of IPT for people with HIV, uptake of IPT has been slow. Given the burden of TB and HIV globally, and the availability of medications to prevent HIV and treat latent TB, implementation science interventions provide an opportunity to do more to get these medications to those who need them most.In the second chapter of this dissertation, I evaluate the feasibility and preliminary effectiveness of integrating HIV prevention services into existing youth clubs in rural Uganda. As part of the intervention, we provided HIV prevention services, including access to PrEP and PEP. In addition, we taught multiple educational topics, including sexual and reproductive health, vocational training, and life skills, at these clubs over six months. In the third and fourth chapters of this dissertation, I focus on results from an implementation science intervention that was focused on the mid-level manager level of the health system in Uganda. These chapters used data from the SEARCH-IPT study in Uganda, which included a 3-year intervention among mid-level health managers with collaborative groups and leadership and management trainings to improve the uptake of TB preventive therapy for people with HIV. Overall, this body of work evaluates multiple aspects of individual-level and health system-level interventions to prevent HIV and TB infection in Uganda. Article	2023	Christian, Canice; Kabami, Jane; Kwarisiima, Dalsone; Beinamatsiko, Blian; Nakato, Hellen; Khakshi, James Ward; Sulaiman, Munshi; Komugisha, Annah; Thirumurthy, Harsha; Havlir, Diane V; Kamya, Moses R; Chamie, Gabriel	Feasibility and preliminary effectiveness of integrating HIV prevention into an adolescent empowerment and livelihood intervention at youth clubs in rural Uganda.	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2022.2147480	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10006396	The uptake of HIV prevention services is lower among youth than adults in sub-Saharan Africa. Existing youth livelihood trainings offer a potential entry point to HIV prevention services. We determined feasibility and preliminary effectiveness of integrating HIV prevention into youth clubs implementing an empowerment and livelihood for adolescents (ELA) intervention in rural Uganda. Staff conducted community mobilization for youth (15-24 years) over one month. Clubs met (3×/week) over six months, with local peer mentors trained to teach life-skills and sexual/reproductive health education. We integrated mentor-led education on HIV prevention, including pre- and post-exposure prophylaxis (PrEP/PEP). Clubs offered on-site HIV testing, a field trip to a local clinic and PrEP referrals after one month and six months. Surveys were conducted at baseline and six months. Forty-two participants (24 adolescent girls/young women (AGYW) and 18 adolescent boys/young men (ABYM)) joined the clubs. At baseline, no participants accepted referral for PrEP, whereas 5/18 (28%) sexually active, HIV-negative AGYW requested PrEP referral at follow-up. One ABYM requested PEP referral. Integration of HIV prevention services into an established ELA curriculum at mentor-led youth clubs in rural Uganda was feasible. PrEP uptake increased among sexually active AGYW. Evaluation of this approach for HIV prevention among youth merits further study. Article	2023	Christodoulou, Joan; Vincent, Eleanor; Shaw, Elizabeth; Jones, Annie S K; Rotheram-Borus, Mary Jane	Not as Clear Online? Active Visualization of How PrEP Works in the Body Improves Knowledge But Doesn't Change Behavior.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03848-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9483425	Active visualization, the use of dynamic representation of internal processes, is associated with increased knowledge and adherence to ART among people living with HIV. The current pilot intervention study tested the effectiveness of an online visualization for HIV prevention among 146 at-risk youth. Youth were randomized to a standard PrEP briefing or an online visualization. PrEP knowledge, attitudes, and uptake were self-reported at baseline and 3-months. Knowledge of PrEP increased, but there were no changes in preferences or uptake. Active visualization delivered online may be a useful educational tool for PrEP but not for shifting youth's uptake. Article	2023	Churu M.; Kulemba K.; Kapesa A.; Kajura A.; Wilfred D.; Basinda N.; Kaluvya S.; Mageda K.P.	Factors associated with adherence to oral HIV pre-exposure prophylaxis among female sex workers in the Mara Region, Tanzania: A 2022 cross-sectional study	Medicine (United States)	-	-	-	257974	10.1097/MD.0000000000034824	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85170177310&doi=10.1097%2fMD.0000000000034824&partnerID=40&md5=c12c690fa805cbb0e38988d5d22c77d1	Female sex workers (FSWs) have a higher risk of acquiring human immunodeficiency virus (HIV) infection compared with the general female population. Tanzania adopted pre-exposure prophylaxis (PrEP) use for HIV-negative key populations in 2018 as a strategy to reduce HIV transmission. We aimed to identify factors associated with PrEP adherence among FSWs in Tanzania. We conducted a cross-sectional study of FSWs using oral HIV PrEP from June-July 2022 in 5 Mara Region districts. Stata software was used to analyze the quantitative data. Poor overall PrEP adherence was observed among FSWs, with adherence of 48.3% (174/360) and 43.3% (156/360) according to pill count and self-reports, respectively. Participants living with family members had 2.32 higher odds of PrEP adherence (adjusted odds ratio aOR = 2.32, 95% confidence interval CI = 1.27-42.23, P =.006) versus participants living alone or with friends. Moreover, FSWs who preferred pill packages had 1.41 higher odds of adherence (aOR = 2.43, 95% CI = 1.41-4.19, P =.001); participants with a good perception of PrEP had 1.71 higher odds (aOR = 1.71, 95% CI = 1.01-2.91, P =.047) of PrEP adherence. We found that living with family, pill packaging, and PrEP perception played significant roles in PrEP adherence among FSWs. Interventions to improve pill packaging, social support, and the perception of PrEP among FSWs should be intensified to increase adherence in this vulnerable population. © 2023 Lippincott Williams and Wilkins. Article	2023	Clement M.E.; Lovett A.; Caldwell S.; Beckford J.; Hilgart M.; Amy C.; Flickinger T.; Dillingham R.; Ingersoll K.	Development of an mHealth App to Support the Prevention of Sexually Transmitted Infections Among Black Men Who Have Sex With Men Engaged in Pre-exposure Prophylaxis Care in New Orleans, Louisiana: Qualitative User-Centered Design Study	JMIR Formative Research	-	-	-	2561326X	10.2196/43019	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151455978&doi=10.2196%2f43019&partnerID=40&md5=b9fb09a6dfaa842cb4ae0ceea2376243	local context, such as depictions of iconic sights from the area. Mental health emerged as an important need to be addressed through the app during discussion of almost all features. Participants also stressed the importance of ensuring privacy and reducing stigma through the app. Conclusions: A PrEP adherence app was iteratively adapted with feedback from BMSM, resulting in a new app modified for the New Orleans context and with STI prevention features. Participants gave the app a new name, PCheck, to be more discreet. Next steps will assess PCheck use and STI prevention outcomes.; Background: Sexual health disparities exist for Black men who have sex with men (BMSM) in New Orleans, Louisiana. Rates of sexually transmitted infections (STIs) are high for both BMSM and those taking HIV pre-exposure prophylaxis (PrEP). Objective: In this study, we introduced an existing PrEP adherence app to new potential users—BMSM engaged in PrEP care in New Orleans—to guide app adaptation with STI prevention features and tailoring for the local context. Methods: Using a user-centered design, we conducted 4 focus group discussions (FGDs), with interim app adaptations from December 2020 to March 2021. During the FGDs, a video of the app, app website, and mock-ups were shown to participants. We asked about facilitators of and barriers to STI prevention in general, current app use, impressions of the existing app, new app features to potentially facilitate STI prevention, and how the app should be tailored for BMSM. We used applied qualitative thematic analysis to identify themes and needs of the population. Results: Overall, 4 FGDs were conducted with 24 BMSM taking PrEP. We grouped themes into 4 categories: STI prevention, current app use and preferences, preexisting features and impressions of the prep'd app, and new features and modifications for BMSM. Participants noted concern about STIs and shared that anxiety about some STIs was higher than that for others; some participants shared that since the emergence of PrEP, little thought is given to STIs. However, participants desired STI prevention strategies and suggested prevention methods to implement through the app, including access to resources, educational content, and sex diaries to follow their sexual activity. When discussing app preferences, they emphasized the need for an app to offer relevant features and be easy to use and expressed that some notifications were important to keep users engaged but that they should be limited to avoid notification fatigue. Participants thought that the current app was useful and generally liked the existing features, including the ability to communicate with providers, staff, and each other through the community forum. They had suggestions for modifications for STI prevention, such as the ability to comment on sexual encounters, and for tailoring to the ©Meredith Edwards Clement, Aidá Lovett, Sylvia Caldwell, Jeremy Beckford, Michelle Hilgart, Amy Corneli, Tabor Flickinger, Rebecca Dillingham, Karen Ingersoll. Article	2023	Clifford Rashotte, Matthew; Yoong, Deborah; Naccarato, Mark; Pico Espinosa, Oscar J.; Fisher, Karla; Bogoch, Isaac I.; Tan, Darrell Hs	Appropriate usage of post-exposure prophylaxis-in-pocket for HIV prevention by individuals with low-frequency exposures.	International journal of STD & AIDS	-	-	-	1758-1052 0956-4624	10.1177/09564624231215151	https://pubmed.ncbi.nlm.nih.gov/37963270/	PEP-In-Pocket (Post-Exposure Prophylaxis-In-Pocket, or "PIP") is a biobehavioural HIV prevention strategy wherein patients are proactively identified and given a prescription for HIV post-exposure prophylaxis (PEP) medications to self-initiate in case of high-risk exposures. We evaluated this strategy in a prospective observational study at two hospital-based clinics in Toronto, Canada. HIV-negative adults using PIP underwent chart review and completed quarterly electronic questionnaires over 12 months. The primary objective was to quantify appropriate PIP initiation, defined as starting PIP within 72 h of a high-risk exposure. Secondary objectives were to quantify HIV seroconversions, changes in sexual risk behaviour, sexual satisfaction, and satisfaction with the PIP strategy. From 11/2017 to 02/2020, 43 participants enrolled and completed ≥1 questionnaire. PIP was self-initiated on 27 occasions by 15 participants, of which 24 uses (89%) were appropriate, 2 were unnecessary, and 1 was for an unknown exposure. Chart review identified no inappropriate non-use. Over 32 person-years of testing follow-up, we observed zero HIV seroconversions. Sexual risk declined modestly over follow-up, with a HIRI-MSM (HIV Incidence Risk Index for MSM) change of -0.39 (95% CI = -0.58, -0.21 per 3 months, p < .001). Sexual satisfaction was stable over time. At 12 months, 31 (72%) remained on PIP, 8 (19%) had transitioned to pre-exposure prophylaxis and 4 (9%) were lost-to-follow-up. Among participants who remained on PIP and completed questionnaires at 12 months, 24/25 (96%) strongly/somewhat agreed that PIP decreased their anxiety about contracting HIV and 25/25 (100%) strongly/somewhat agreed that they would recommend PIP to a friend. PIP is a feasible HIV prevention strategy in carefully selected individuals at modest HIV risk. Interaction of Depot Medroxyprogesterone Acetate and Tenofovir Disoproxil Fumarate/Emtricitabine on Peripheral Blood Mononuclear Cells and Cervical Tissue Susceptibility to HIV Infection and Pharmacokinetics	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003113	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143644857&doi=10.1097%2fQAI.0000000000003113&partnerID=40&md5=2091570571ba0d10af184a51d17519f3	Background:Depot medroxyprogesterone acetate (DMPA) is a widely used contraceptive method. HIV pre-exposure prophylaxis with emtricitabine and tenofovir disoproxil fumarate (F/TDF) is highly effective in reducing HIV acquisition in women. We sought to determine the impact of DMPA on F/TDF pharmacokinetics and pharmacodynamics.Methods:Twelve healthy premenopausal cisgender women were enrolled and each completed 4 sequential conditions: (1) baseline, (2) steady-state F/TDF alone, (3) steady-state F/TDF + DMPA, and (4) DMPA alone. Assessments included clinical, pharmacokinetic, viral infectivity (ex vivo challenge of peripheral blood mononuclear cells by X4- and R5-tropic green fluorescent protein pseudoviruses and cervical tissue by HIVBaL), endocrine, immune cell phenotyping, and renal function.Results:Compared with baseline, F/TDF (± DMPA) significantly decreased both %R5- and X4-infected CD4 T cells and F/TDF + DMPA decreased cervical explant p24 (all P < 0.05). The %R5- and X4-infected CD4 T cells were higher during DMPA alone than during F/TDF periods and lower than baseline (not statistically significant). Cervical explant p24 fell between baseline and F/TDF values (not statistically significant). There were neither statistically significant differences in F/TDF pharmacokinetics, including total or renal clearance of either antiviral drug, nor changes in glomerular filtration rate with the addition of DMPA. There were few immune cell phenotypic differences across conditions.Conclusions:F/TDF decreased HIV infection in both challenge assays, whereas DMPA alone did not enhance HIV infection in either challenge assay. DMPA did not alter F/TDF pharmacokinetics or renal function. © 2023 Lippincott Williams and Wilkins. Article	2023	Colloty, Jamie; Teixeira, Miguel; Hunt, Robert	Advances in the treatment and prevention of HIV: what you need to know.	British Journal of Hospital Medicine	-	-	-	1750-8460	10.12968/hmed.2022.0502	https://pubmed.ncbi.nlm.nih.gov/37490439/	The global epidemic of HIV/AIDs has seen many advances in the development of effective treatments, including antiretroviral therapy that provides increasing sustained viral suppression, robust immune reconstitution and fewer side effects than before. Early HIV treatment regimens were notoriously complex, comprising up to 22 pills that needed to be taken at different times of the day. However, the advent of a single fixed dose combination drug formation simplified the treatment regimen so this could be taken once daily. Novel drugs are constantly being developed to provide better tolerated medications with robust, sustained viral suppression and immune reconstitution; these include long-acting injectables and implants, and preventative treatments for pre-exposure prophylaxis. This article provides an overview of emerging therapeutics for the treatment and prevention of HIV infection. Article	2023	Conserve, Donaldson F; Tun, Waimar; Hickson, DeMarc A; Gomez-Berrospi, Jennifer; Janson, Samuel; Rinola, Bukola; Durkin, Mallory; Buchanan, Christian; Morris, Christian; Saleeban, Alia; Olughu, Kelia; Pulerwitz, Julie; Kerrigan, Deanna	Adapting a community-based intervention to address social determinants of health influencing pre-exposure prophylaxis services for Black adults in Washington, District of Columbia: A study protocol.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0290631	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10624286	Community-based HIV treatment initiation and continuation helps to address social determinants of health (SDOH) barriers to care and increase antiretroviral therapy (ART) uptake and adherence. Similarly, community-based pre-exposure prophylaxis (cbPrEP) services can help address SDOH barriers such as transportation costs and stigma. However, few studies have examined cbPrEP programming in the Washington, District of Columbia (DC) area where more Blacks are disproportionately affected by HIV and have low PrEP uptake. This study aims to adapt and pilot a community-based ART intervention (cbART) intervention for cbPrEP service delivery for Black adults in the Washington, DC area. The adaptation of the cbART intervention will be informed by the ADAPT-ITT framework and the Consolidated Framework for Implementation Research. For Aim 1, in-depth and key informant interviews will be conducted with PrEP program managers at community-based organizations (N = 10), DC health department representatives (N = 8), PrEP providers (N = 10) and current and potential Black PrEP users (n = 24). The interviews will provide an initial assessment of barriers and facilitators to PrEP services and inform the decisions on how to adapt the cbART intervention for cbPrEP services. In Aim 2, we will train and pilot test the cbPrEP intervention for acceptability, feasibility, and appropriateness with Black adults (n = 60). Enrolled participants will complete a survey at baseline and at 45 days post-enrollment. In-depth interviews will be conducted with a subset (N = 16) of participants, those who did not enroll (N = 10) and providers implementing the cbPrEP intervention (N = 8). Alternative strategies to PrEP service delivery are needed to increase PrEP uptake among those most in need in the DC area. If cbPrEP delivery is found to be acceptable, feasible, and appropriate, it could have a significant impact on DC's Ending the HIV Epidemic efforts and will inform future efforts to investigate the intervention's efficacy on PrEP uptake and continuation among Black adults in DC.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Cooney E.E.; Footer K.H.A.; Glick J.L.; Passaniti A.; Howes M.; Sherman S.G.	Understanding the social and structural context of oral PrEP delivery: an ethnography exploring barriers and facilitators impacting transgender women who engage in street-based sex work in Baltimore, Maryland	AIDS Research and Therapy	-	-	-	17426405	10.1186/s12981-023-00556-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171810424&doi=10.1186%2fs12981-023-00556-6&partnerID=40&md5=3d34975ab349de2d25f036f5ecac6ae6	Transgender women who sell sex (TWSS) experience high rates of HIV acquisition. Antiretrovirals for pre-exposure prophylaxis (PrEP) represent an efficacious HIV prevention strategy. The social and structural factors affecting PrEP delivery amongst TWSS are underexplored in the literature. We conducted ethnographic research to examine how multilevel social and structural factors manifest in TWSS's lived experiences and affect PrEP delivery and use. Twenty-four transgender women were recruited from the SAPPHIRE cohort and completed interviews focused on barriers and facilitators to PrEP engagement in the context of street-based sex work. Stakeholder interviews (N = 7) were also conducted. Our findings suggest there are unique features of the risk environment that can collectively impede PrEP use among TWSS. © 2023, BioMed Central Ltd., part of Springer Nature. Article	2023	Cooney E.E.; Saleem H.T.; Stevenson M.; Aguayo-Romero R.A.; Althoff K.N.; Poteat T.C.; Beckham S.W.; Adams D.; Radix A.E.; Wawrzyniak A.J.; Cannon C.M.; Schneider J.S.; Haw J.S.; Rodriguez A.E.; Mayer K.H.; Beyrer C.; Reisner S.L.; Wirtz A.L.	PrEP initiation and discontinuation among transgender women in the United States: a longitudinal, mixed methods cohort study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.26199	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180476695&doi=10.1002%2fjia2.26199&partnerID=40&md5=bfee771f2b743a4e0b3324721323c5f4	Introduction: Transgender women in the United States experience high HIV incidence and suboptimal Pre-exposure prophylaxis (PrEP) engagement. We sought to estimate PrEP initiation and discontinuation rates and characterize PrEP discontinuation experiences among a prospective cohort of transgender women. Methods: Using a sequential, explanatory, mixed-methods design, 1312 transgender women at risk for HIV acquisition were enrolled from March 2018 to August 2020 and followed through July 2022 (median follow-up 24 months; interquartile range 15–36). Cox regression models assessed predictors of initiation and discontinuation. In-depth interviews were conducted among 18 participants, including life history calendars to explore key events and experiences surrounding discontinuations. Qualitative and quantitative data were integrated to generate typologies of discontinuation, inform meta-inferences and facilitate the interpretation of findings. Results: 21.8% (n = 286) of participants reported taking PrEP at one or more study visits while under observation. We observed 139 PrEP initiations over 2127 person-years (6.5 initiations/100 person-years, 95% CI: 5.5–7.7). Predictors of initiation included identifying as Black and PrEP indication. The rate of initiation among those who were PrEP-indicated was 9.6 initiations/100 person-years (132/1372 person-years; 95% CI: 8.1–11.4). We observed 138 PrEP discontinuations over 368 person-years (37.5 discontinuations/100 person-years, 95% CI: 31.7–44.3). Predictors of discontinuation included high school education or less and initiating PrEP for the first time while under observation. Four discontinuation typologies emerged: (1) seroconversion following discontinuation; (2) ongoing HIV acquisition risk following discontinuation; (3) reassessment of HIV/STI prevention strategy following discontinuation; and (4) dynamic PrEP use coinciding with changes in HIV acquisition risk. Conclusions: PrEP initiation rates were low and discontinuation rates were high. Complex motivations to stop using PrEP did not consistently correspond with HIV acquisition risk reduction. Evidence-based interventions to increase PrEP persistence among transgender women with ongoing acquisition risk and provide HIV prevention support for those who discontinue PrEP are necessary to reduce HIV incidence in this population. © 2023 The Authors. Journal of the International AIDS Society published by John Wiley & Sons Ltd on behalf of International AIDS Society.	discontinuation typologies; pre-exposure prophylaxis; PrEP discontinuation; PrEP initiation; prevention-effective adherence; transgender women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2023	Cornelisse, Vincent J; Murphy, Dean; Lee, Sue J; Stoove, Mark; Traeger, Michael W; Wright, Edwina J	Physical and mental health of long-term users of HIV pre-exposure prophylaxis (PrEP) in Australia: The X-PLORE Cohort.	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000003768	https://dx.doi.org/10.1097/QAD.0000000000003768	INTRODUCTION: HIV pre-exposure prophylaxis (PrEP) is highly effective at preventing HIV. We aimed to assess mental and physical health among long-term PrEP users in Australia's X-PLORE cohort. METHODS: In early 2021, 1,485 X-PLORE participants were emailed a survey covering demographics, sexual practices, ongoing PrEP use, physical and psychological diagnoses received since commencing PrEP, substance use, and impacts of the COVID-19 pandemic. Current anxiety and depression were assessed using GAD-7 and PHQ-9 questionnaires. RESULTS: Of 476 participants (completion rate 32.1%), 99.8% were cis-gender men. Median PrEP use duration was 48months (2,002 person-years), with 81.7% currently using PrEP. PrEP-related toxicity was uncommon: 2.9% reported bone fractures, 1.3% low bone density, and 4.0% reported kidney problems, largely not necessitating PrEP cessation. Most (92.0%) rated their health as "good" to "excellent", and 22.6% reported improved health since starting PrEP, often due to improved mental health. Only 6.2% reported deterioration in health since starting PrEP, largely unrelated to PrEP. The most common diagnoses were hypertension (9.9%), depression (13.2%) and anxiety (14.9%); 17.0% had PHQ-9 scores indicating current moderate-to-severe depression, which was associated with unemployment (aOR 3.90), regular cannabis use (aOR 2.49), and having ceased PrEP (aOR 2.13). CONCLUSIONS: Among long-term PrEP users, of which over 80% were currently using PrEP, self-reported PrEP toxicity was uncommon. With almost one in five PrEP users categorised as having depression, and with higher risk among those having ceased PrEP, we recommend routine screening for depression and anxiety in PrEP users and corresponding follow-up of patients no longer attending for PrEP.	na	English	United Kingdom	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Quantitative
Article	2023	Cornelius J.B.; Gunn L.H.; Dalton C.; Davis B.	Nurse practitioner model of care for the initiation of pre-exposure prophylaxis: A case series study	Nursing Open	-	-	-	20541058	10.1002/nop2.1381	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138689726&doi=10.1002%2fnop2.1381&partnerID=40&md5=3f43d17231fd5c767e83b95044ed6b84	Aim: The purpose of this study was to create and implement a nurse practitioner model of care in the initiation of a pre-exposure prophylaxis (PrEP) protocol with African American men who have sex with men (MSM). Design: A case series design was used to implement the protocol for a nurse practitioner PrEP-based model of care. Methods: The participatory, evidence-based, patient-focus process (PEPPA) framework and the American Association of Colleges of Nursing (AACN) Doctoral Essentials for Advanced Practice were aligned to guide the development, implementation, and evaluation of this advanced practice role in an urban medical clinic. Results: Seven African American HIV-negative MSM who received treatment under the nurse practitioner PrEP-based model of care had increased PrEP knowledge and medication adherence and did not contract a sexually transmitted infection. Conclusions: New models of care can be created to meet the Getting to Zero HIV initiative of reducing rates of HIV infections with MSM. © 2022 The Authors. Article	2023	Cosmas, Mugambi; Loice, Mbogo; William, Sinkele; Esther, Gitau; Carey, Farquhar; Tecla, Temu; David, Bukusi; John, Kinuthia; Aliza, Monroe-Wise	Oral Pre-Exposure Prophylaxis (PrEP) Awareness and Acceptability Among Persons who Inject Drugs (PWID) in Kenya: A Qualitative Investigation.	Research Square	-	-	-	na	10.21203/rs.3.rs-2512731/v1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9980217	Background: People who inject drugs (PWID) are disproportionately affected by HIV despite the availability of multiple efficacious biomedical prevention interventions including oral pre-exposure prophylaxis (PrEP). Little is known about the knowledge, acceptability, and uptake of oral PrEP among this population in Kenya. To inform the development of oral PrEP uptake optimization interventions for PWID in Kenya, we conducted a qualitative assessment to establish oral PrEP awareness and willingness to take PrEP by this group in Nairobi City. Methodology: Guided by the Capability, Opportunity, Motivation, and Behaviour (COM-B) model of health behavior change, we conducted 8 focus group discussions (FGDs) among randomly constituted samples of PWID in four harm reduction drop-in centers (DICs) in Nairobi in January 2022. The domains explored were: perceived risks (behaviour), oral PrEP awareness and knowledge (capability), motivation to use oral PrEP (behaviour), and perceptions on community uptake (motivation and opportunity). Completed FGD transcripts were uploaded to Atlas.ti version 9 and thematic analysis was conducted through an iterative process of review and discussion by two coders. Findings: There was a low level of oral PrEP awareness with only 4 of the 46 PWID having heard of PrEP; only 3 out of 46 participants had ever used oral PrEP and 2 out of 3 were no longer using it, indicating a low capacity to make decisions on oral PrEP. Most study participants were aware of the risk posed by unsafe drug injection and expressed willingness to take oral PrEP. Nearly all participants demonstrated low understanding of the role oral PrEP plays in complementing condoms in HIV prevention, presenting an opportunity for awareness creation. While the PWID were eager to learn more about oral PrEP, they favored DICs as places where they would like to obtain information and oral PrEP if they chose to use it, identifying an opportunity for oral PrEP programming interventions. Conclusion: Creation of oral PrEP awareness among PWID in Kenya is likely to improve uptake since the PWID are receptive. Oral PrEP should be offered as part of combination prevention approaches, and effective messaging through DICs, integrated outreaches, and social networks are recommended to mitigate displacement of other prevention and harm reduction practices by this population. Article	2023	Coukan, Flavien; Murray, Keitumetse-Kabelo; Papageorgiou, Vasiliki; Lound, Adam; Saunders, John; Atchison, Christina; Ward, Helen	Barriers and facilitators to HIV Pre-Exposure Prophylaxis (PrEP) in Specialist Sexual Health Services in the United Kingdom: A systematic review using the PrEP Care Continuum.	HIV Medicine	-	-	-	1468-1293	10.1111/hiv.13492	https://dx.doi.org/10.1111/hiv.13492	OBJECTIVES: HIV pre-exposure prophylaxis (PrEP) delivery in the UK is inequitable; over 95% of PrEP users were men who have sex with men (MSM) despite making up less than 50% of new HIV diagnoses. We conducted a systematic review to identify modifiable barriers and facilitators to PrEP delivery in the UK among underserved populations. METHODS: We searched bibliographic/conference databases using the terms HIV, PrEP, barriers, facilitators, underserved populations, and UK. Modifiable factors were mapped along the PrEP Care Continuum (PCC) to identify targets for interventions. RESULTS: In total, 44 studies were eligible: 29 quantitative, 12 qualitative and three mixed-methods studies. Over half (n = 24 54.5%) exclusively recruited MSM, whereas 11 were in mixed populations (all included MSM as a sub-population) and the other nine were in other underserved populations (gender and ethnicity minorities, women, and people who inject drugs). Of the 15 modifiable factors identified, two-thirds were at the PrEP contemplation and PrEParation steps of the PCC. The most reported barriers were lack of PrEP awareness (n = 16), knowledge (n = 19), willingness (n = 16), and access to a PrEP provider (n = 16), whereas the more reported facilitators were prior HIV testing (n = 8), agency and self-care (n = 8). All but three identified factors were at the patient rather than provider or structural level. CONCLUSIONS: This review highlights that the bulk of the scientific literature focuses on MSM and on patient-level factors. Future research needs to ensure underserved populations are included and prioritized (e.g. ethnicity and gender minorities, people who inject drugs) and provider and structural factors are investigated.	na	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review
Article	2023	Coulibaly, K; Bousmah, M-A-Q; Ravalihasy, A; Taeron, C; Mbiribindi, R; Senne, J-N; Gubert, F; Gosselin, A; Desgrees du Lou, A	Bridging the knowledge gap of biomedical HIV prevention tools among sub-saharan african immigrants in France. Results from an empowerment-based intervention	SSM - Population Health	-	-	-	-	10.1016/j.ssmph.2023.101468	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02610691/full	Introduction: Biomedical HIV prevention tools are available in France to prevent new infections. However, evidence suggests a lack of knowledge of these tools among sub-Saharan African immigrants, who are particularly affected by HIV due to social hardship, an indirect factor of HIV acquisition. We analysed the impact of an empowerment-based intervention on the knowledge of treatment as prevention (TasP), pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) in a population of precarious sub-Saharan African immigrants. Methods: Data were collected throughout the MAKASI project. Following an outreach approach, participants were recruited in public places based on their precarious situations and followed for six months (0, 3, 6 months) between 2018 and 2021. Participants were randomized into two groups and received an empowerment intervention sequentially (stepped wedge design). We used random-effects logistic regression models to evaluate the intervention effect on the knowledge of biomedical HIV prevention tools. ClinicalTrials.gov Identifier: NCT04468724. Results: The majority of the participants were men (77.5%), and almost half of them had arrived in France within 2 years prior to inclusion (49.3%). At baseline, 56% of participants knew about TasP, 6% knew about PEP and 4% knew about PrEP. Receiving the intervention increased the odds of knowing about PEP (aOR = 2.02 1.09–3.75; p < 0.026). Intervention effects were observed for TasP and PrEP only after 6 months. We found significant time effects for PEP (at 3 months, aOR = 4.26 2.33–7.80; p < 0.001; at 6 months, aOR = 18.28 7.39–45.24; p < 0.001) and PrEP (at 3 months, aOR = 4.02 2.10–7.72; p < 0.001; at 6 months, aOR = 28.33 11.16–71.91; p < 0.001). Conclusions: We showed that the intervention increased the knowledge of biomedical HIV prevention tools. The effect of the intervention was coupled with an important time effect. This suggested that exposure to the intervention together with other sources of information contributed to increased knowledge of biomedical HIV prevention tools among precarious sub-Saharan African immigrants.	*France; *Human immunodeficiency virus; *empowerment; *immigrant; *knowledge gap; *post exposure prophylaxis; *pre-exposure prophylaxis; *sub-Saharan African; Adult; Article; Controlled study; Human; Human experiment; Information source; Male; Nonhuman; Prevention; Randomized controlled trial	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical
Article	2023	Coulibaly, Karna; Gosselin, Anne; Carillon, Severine; Taéron, Corinne; Mbiribindi, Romain; Desgrées Du Loû, Annabel	Low knowledge of antiretroviral treatments for the prevention of HIV among precarious immigrants from sub-Saharan Africa living in the greater Paris area: Results from the Makasi project.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0287288	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10266671	INTRODUCTION: In France, combination prevention tools, particularly antiretroviral treatment for HIV prevention has been available for several years. We described the knowledge of these antiretroviral treatments among immigrants from sub-Saharan Africa, who are particularly affected by HIV, and the factors associated with this knowledge. METHODS: The data come from the Makasi study, which was conducted between 2019 and 2020 among precarious immigrants from sub-Saharan Africa recruited through a community-based outreach approach in the greater Paris area (n = 601). We described levels of knowledge of HIV treatment effectiveness (HTE), treatment as prevention (TasP), post-exposure prophylaxis (PEP), and pre-exposure prophylaxis (PrEP), by sex with chi2 test. We investigated factors associated with this knowledge with logistic regressions adjusted for sociodemographic characteristics, living conditions and sexual behaviors (p≤0.2). RESULTS: Respondents were mostly men (76%), from West Africa (61%), in precarious situation: 69% were unemployed, 74% were undocumented and 46% had no health coverage. Among this population, knowledge of HIV preventive treatments was heterogeneous. While HTE was well known (84%); TasP was known by only half of the respondents (46%), and PEP and PrEP were hardly known: 6% and 5%, respectively. Multivariate regressions models showed that these antiretroviral treatments for the prevention of HIV were better known by people with a higher level of education (PEP: aOR = 3.33 1.09-10.20, p = 0.03; HTE: aOR = 4.33 1.87-10.04, p<0.001), those who had a social network in France (TasP: aOR = 1.90, 1.33-2.73, p<0.001), those who had access to the health system and those who were exposed to sexual risks (TasP: aOR = 3.17, 1.03-9.69, p = 0.04; PrEP: aOR = 2.60 0.72-9.34, p = 0.14). CONCLUSIONS: There is a need for specific communication on antiretroviral treatment for HIV prevention that targets sub-Saharan immigrants, particularly those who have no access to the health-care system and those who are less educated.	na	English	United States	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Quantitative
Article	2023	Court, Feline de la; Wees, Daphne van; Benthem, Birgit van; Hoornenborg, Elske; Prins, Maria; Boyd, Anders	Characterizing subgroups of sexual behaviors among men who have sex with men eligible for, but not using, PrEP in the Netherlands	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0284056	https://pubmed.ncbi.nlm.nih.gov/37023009/	This study identified subgroups of sexual behaviors associated with increased STI/HIV risk among those eligible for but not using pre-exposure prophylaxis (PrEP) in order to improve PrEP uptake and prioritization in the context of restricted capacity. We used data from sexual health centers (SHCs) in the Netherlands, including all visits of eligible but non-PrEP using men who have sex with men (MSM), men who have sex with men and women (MSMW) and transgender persons between July 2019 (start of the Dutch national PrEP pilot (NPP)) and June 2021. Using latent class analysis (LCA), we identified classes of sexual behaviors (number of partners, chemsex, group sex and sex work) and explored whether these classes were associated with STI diagnosis and sociodemographics. Across 45,582 visits of 14,588 eligible non-PrEP using individuals, the best fitting LCA model contained three classes of sexual behaviors. Classes were distinguished by seldomly reported sexual behaviors (class 1; 53.5%, n = 24,383), the highest proportions of ≥6 partners and group sex (class 2; 29.8%, n = 13,596), and the highest proportions of chemsex and sex work (class 3; 16.7% of visits, n = 7,603). Visits in classes 2 and 3 (vs. class 1) were significantly more often with individuals who were diagnosed with an STI, older (≥36 vs. ≤35 years), MSMW (vs. MSM), and visiting an urban (vs. non-urban) SHC; while these visits were significantly less often with individuals from an STI/HIV endemic area. The percentage of visits at which an STI was diagnosed was 17.07% (n = 4,163) in class 1, 19.53% (n = 2,655) in class 2 and 25.25% (n = 1,920) in class 3. The highest risk of STI, and thereby HIV, was in those engaging in specific subgroups of sexual behavior characterized by frequently reporting multiple partners, group sex, sex work or chemsex. PrEP uptake should be encouraged and prioritized for these individuals.	na	English	United States	Western and Central Europe and North America	Netherlands	Western and Central Europe and North America	Netherlands	Western and Central Europe and North America	Quantitative
Article	2023	Cox, Laura Ashleigh; Martin, Catherine E; Nongena, Pelisa; Mvelase, Sanele; Kutywayo, Alison; Mullick, Saiqa	The Use of HIV Pre-exposure Prophylaxis Among Men Accessing Routine Sexual and Reproductive Health Services in South Africa.	Journal of Adolescent Health	-	-	-	1879-1972	10.1016/j.jadohealth.2023.08.017	https://dx.doi.org/10.1016/j.jadohealth.2023.08.017	PURPOSE: This study describes a cohort of men seeking oral pre-exposure prophylaxis (PrEP) services and explores their patterns of PrEP use within an implementation project seeking to integrate PrEP provision within sexual and reproductive health services in public health clinics in South Africa. METHODS: Routine program and survey data from 364 males initiated on oral PrEP between July 2020 and May 2022 were analyzed. PrEP use was examined, including time to first discontinuation and restart patterns. Factors associated with early PrEP discontinuation and PrEP restart were analyzed. RESULTS: Despite primarily focusing on access for adolescent girls and young women, PrEP services reached males with HIV prevention needs. PrEP use for ≤1 month (early discontinuation) was high at 58%; however, 18% restarted on PrEP, with 4% restarting repeatedly. Having depression symptoms was associated with early PrEP discontinuation (adjusted odds ratio AOR: 1.71, 95% CI confidence interval: 1.06-2.78). Those ≥25 years were less likely to discontinue early, as were those with a partner treated for a sexually transmitted infection in the preceding three months (AOR: 0.33, 95% CI: 0.13-0.84) and those who had been circumcised (AOR: 0.59, 95% CI: 0.36-0.96). Those 18-20 years old were less likely to restart PrEP than those ≥25 years (AOR: 0.43, 95% CI: 0.19-0.97), as were those whose partner's HIV status was unknown (AOR: 0.33, 95% CI: 0.12-0.88). DISCUSSION: This study identified interest and uptake of oral PrEP among an underrepresented population of predominantly heterosexual males seeking sexual and reproductive health services. It found high rates of early PrEP discontinuation, with a subset returning to restart PrEP. Further research is needed to determine whether these periods of PrEP use are associated with periods of HIV risk. Article	2023	Crath, RD; Rangel, JC; Gaubinger, A	Biopolitics' new iteration: Gay men, Pre-exposure prophylaxis and the pharmaco-pornographic imagination	Sexualities	-	-	-	1363-4607	10.1177/13634607211056882	https://scholarworks.smith.edu/ssw_facpubs/24/	This article builds upon Paul Preciado's conceptualisation of pharmaco-pornographic power to understand the ongoing affects and effects of Pre-Exposure Prophylaxis (PrEP) on queer men's sexual socialities and subjectivities. Drawing from a new-materialist epistemology, we analyze data from a sexual health pilot study in NYC to trace the techno-sexual health assemblages forming in queer life worlds. Our analysis suggests that these assemblages, entangling PrEP and other pharmacological substances, pornographic imaginaries together with mediatic technologies and public health rationalities, are creating paradoxical desires and practices of intimacy that are both normative and exceed rational health-actor logics and normative understandings of risk. These effects have population-level biopolitical implications. Theses and Dissertations	2023	Cristiano, Gabriela Dutra	Neoliberalização da prevenção do HIV/AIDS no Brasil e seus rebatimentos nas experiências de homens gays com o sexo e a sexualidade	-	-	Pontifícia Universidade Católica do Rio Grande do Sul	-	NA	NA	https://tede2.pucrs.br/tede2/handle/tede/10832	Esta tese tem como objetivo investigar as implicações do atual modelo oficial preventivo do HIV/Aids nas experiências de homens gays com o sexo e a sexualidade em temos neoliberais no Brasil, a fim de contribuir com formulações para a política mais condizentes com os anseios e necessidades dessa população. Para isso, foram analisadas as concepções que fundamentam o atual modelo oficial preventivo, como o "homem gay" é construído pela política e como se contrói na relação dialética com esta, além dos rebatimentos deste modelo na experiência de homens gays com o sexo e a sexualidade. Trata-se de uma pesquisa qualitativa, de nível explicativo, que em alguns momentos assume caráter mais exploratório. Fundamenta-se no materialismo dialético-crítico, na perspectiva do que vem sendo denominada de neomarxismo, ao passo que incorpora conceitos e noções de outras correntes filosóficas e teóricas. Foi adotada a análise textual discursiva (MORAES e GALIAZZI, 2007) como método para exame dos dados e para movimentar as interpretações que foram sendo tecidas a partir da triangulação (TRIVIÑOS, 1987) de elementos do contexto (capitalismo dependente, colonialismo e neoliberalismo), produções do meio (documentos produzidos para a política de prevenção) e narrativa dos sujeitos (entrevistas com homens gays). Foram analisadas cinco publicações do Ministério da Saúde que tratam do atual modelo preventivo e 18 entrevistas gravadas e transcritas. Os entrevistados foram convidados a participar da pesquisa a partir da técnica bola de neve e da criação de perfil de pesquisadora no aplicativo Grindr. Os resultados evidenciam que a flexibilidade da racionalidade neoliberal permite que esta acentue a política de prevenção de HIV/Aids de forma a incorporar modelos reivindicados pela sociedade civil, aprendizagens feitas ao longo da história social da epidemia e a fetichizante narrativa sobre liberdade e possibilidades. As concepções que fundamentam o atual modelo oficial preventivo, a Prevenção Combinada, constroem um sistema discursivo complexo e sofisticado, articulando de intervenção pautadas nos direitos humanos e em necessidades estruturais, com uma perspectiva individualizante e que responsabiliza os próprios sujeitos pelo seu cuidado. O atual modelo avança em relação à narrativa normativa sobre a camisinha ao disponibilizar e propor a combinação de diferentes recursos e estratégias de prevenção. A ampliação das alternativas para um sexo mais seguro produz alívio em relação ao trauma que a epidemia representou a sociabilidade de 9 homens gays enquanto grupo social. Embora o HIV ainda atue como um marcador para as hierarquias sexuais, outras bioidentidades e diferenciações se constituem nesse processo: bareback, indetectável, usuário de PrEP, por exemplo. Por outro lado, da forma como a política se articula hoje, o homem gay torna-se empreendedor do seu próprio cuidado. Precisa vigiar a si mesmo e aos outros e é esperado que seja um sujeito racional, bem informado, que faz a gestão do próprio risco. Ainda que efetivamente nenhum dos homens corresponda a essa expectativa, quando ela não é atendida, aparecem sentimentos como frustração, surpresa e culpa. Então, evidencia-se que estratégias de controle utilizadas pelo Estado como patologização física ou mental, hoje convivem com outras mais sofisticadas do capitalismo farmacopornográfico neoliberal: são corpos medicados, transantes, incorporados na lógica do mercado como sujeitos responsáveis por si mesmos. Conclui-se que as concepções de autonomia e liberdade, centrais para o modelo atual, estão em disputa e que é preciso resgatar alternativas presentes na perspectiva crítica de direitos humanos, promoção da saúde e educação popular. Article	2023	Crooks, Natasha; Singer, Randi B.; Smith, Ariel; Ott, Emily; Donenberg, Geri; Matthews, Alicia K.; Patil, Crystal L.; Haider, Sadia; Johnson, Amy K.	Barriers to PrEP uptake among Black female adolescents and emerging adults	Preventive Medicine Reports	-	-	-	2211-3355	10.1016/j.pmedr.2022.102062	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9712981/#:~:text=Uptake%20of%20PrEP%20has%20been,adolescent%20girls%20and%20emerging%20adults.&text=Intersectional%20life%20experiences%20exacerbate%20Black%20AEA%20resistance%20to%20PrEP.&text=Medical%20mistrust%2C%20stigma%2C%20and%20PrEP,as%20barriers%20for%20Black%20communities.	•Pre-Exposure Prophylaxis (PrEP) is medication taken to prevent HIV.•Uptake of PrEP has been limited among Black adolescent girls and emerging adults.•Intersectional life experiences exacerbate Black AEA resistance to PrEP.•Medical mistrust, stigma, and PrEP misconceptions served as barriers for Black communities.•New approaches utilizing culturally safe care to promote PrEP uptake are described. HIV/AIDS disproportionately impacts Black cisgender female adolescents and emerging adults. Pre-Exposure Prophylaxis (PrEP) reduces the risk of HIV infection; however, structural barriers may exacerbate resistance to PrEP in this population. The purpose of this paper is to understand the characteristics of age, race, gender, history, and medical mistrust as barriers to PrEP uptake among Black female adolescents and emerging adults (N = 100 respondents) between the ages of 13–24 years in Chicago. Between January and June of 2019, participants completed the survey. We used directed content analysis to examine reported barriers to PrEP uptake. The most commonly identified barriers to PrEP uptake were side effects (N = 39), financial concerns (N = 15), and medical mistrust (N = 12). Less frequently reported barriers included lack of PrEP knowledge and misconceptions (N = 9), stigma (N = 2), privacy concerns (N = 4). We describe innovative multi-level strategies to provide culturally safe care to improve PrEP acceptability among Black female adolescents and emerging adults in Chicago.These recommendations may help mitigate the effect of medical mistrust, stigma, and misconceptions of PrEP within Black communities. Article	2023	Crutchley, Rustin D.; Newsome, Cheyenne; Chen, Li Wei; Li, Debbie; Sarangarm, Preeyaporn; Min, Amy; Bowers, Dana; Coetzee, Renier; McKeirnan, Kimberly C.	Design, Implementation, and Assessment Approaches Within an Advanced Human Immunodeficiency Virus (HIV) Elective Course.	Journal of Pharmacy Practice	-	-	-	1531-1937 0897-1900	10.1177/08971900221108723	https://pubmed.ncbi.nlm.nih.gov/35704467/	Introduction: An estimated 38 million people are living with human immunodeficiency virus (HIV) worldwide. Pharmacists are well positioned to provide care to patients with HIV, but gaps in HIV education among pharmacists exist. Recognizing the need to educate and prepare future pharmacists, a 2-credit advanced HIV elective course was created for Doctor of Pharmacy students at Washington State University College of Pharmacy and Pharmaceutical Sciences in the United States, and Masters of Clinical Pharmacy students from University of Western Cape School of Pharmacy in South Africa. Methods: Course topics included diagnosis and treatment of HIV in children and adults, management of common comorbidities, pre-exposure prophylaxis, pharmacogenetic applications, and antiretroviral drug-drug interactions. Course effectiveness was evaluated using student examination results. Student perceptions were evaluated using pre- and post-course self-assessments involving abilities, confidence, and attitudes toward caring for people living with HIV. Results: Student pharmacists demonstrated competency in HIV knowledge, demonstrated skills in application to clinical-based scenarios, and reported significantly improved confidence and abilities as well as positive changes in attitudes toward people with HIV. Conclusion: This course contributed to student learning across different student cohorts in an institutional program in the United States including successful execution of distance learning and clinical application for students at a program in South Africa. Article	2023	Cui, Tracy Shicun; Lane, Benjamin; Wu, Yumeng; Ma, Jing; Fu, Rong; Hou, Jianhua; Meng, Siyan; Xie, Lu; Gu, Yuzhou; Huang, Xiaojie; Zheng, Huang; Ma, Yanling; He, Na; Meyers, Kathrine	Determinants of Willingness to Use PrEP Among Gay and Bisexual Men in China Before Implementation: A Structural Equation Modeling Assessment	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03815-1	https://www.proquest.com/scholarly-journals/determinants-willingness-use-prep-among-gay/docview/2778477754/se-2?accountid=8113	With the recent endorsement of PrEP by the Chinese government, research is urgently needed to better understand factors impacting PrEP uptake among gay, bisexual, and other men who have sex with men (GBMSM) in China. This study examined willingness to use PrEP for HIV prevention among GBMSM in China through structural equation modeling. We examined the relationship among PrEP-related attitudes, subjective norms, PrEP-related knowledge and beliefs about medicines and willingness to use PrEP. The analysis showed a good fit between the data and both the measurement model (RMSEA = 0.060) and structural model (RMSEA = 0.054). Knowledge, attitudes, and subjective norms were significantly related to intention to use PrEP, whereas the effect of general beliefs about medicines was insignificant. These effect mechanisms point to the importance of designing interventions to support PrEP uptake that target knowledge, enhance positive attitudes about PrEP within social networks, and build positive social norms around PrEP among sexually active GBMSM. Theses and Dissertations	2023	Curtis, Regis	Re-imagining HIV/AIDS: tracing evolving HIV/AIDS discourses from crisis to PrEP cinema	-	-	University of Pittsburgh	-	na	NA	http://d-scholarship.pitt.edu/44557/1/Regis_Curtis_Thesis_Final.pdf	As pre-exposure prophylaxis (PrEP) was introduced to pharmacological markets in 2012, a resurgence of HIV/AIDS representation in cinema occurred, beginning with the release of Jean-Marc Vallée's Dallas Buyers Club. Following its commercial and critical success, an increasing number of films and visual narratives depicting HIV/AIDS were and continue to be produced, their production based mainly in the anglophone world and France. These films' engagement with HIV/AIDS calls into question both mainstream and gay-male communities' relationship with HIV/AIDS, as shifting medical landscapes – the 1996 introduction of triple therapies which made HIV a manageable illness, the 2005 recommendation for broader usage of post-exposure prophylaxis, the 2012 introduction of PrEP, the 2016 birth of the Undetectable = Untransmittable (U=U) campaign, among other advances, mostly related to PrEP – have radically altered the ways in which gay male communities interact with and experience HIV/AIDS individually and community-wide. This paper aims to articulate the ways in which these medical, social, and community paradigm shifts manifest in contemporary HIV/AIDS visual narratives through the utilization of a historical framework which compares early HIV/AIDS visual narratives with their contemporary counterparts. Among the films and visual narratives explored include Théo et Hugo dans le même bateau (Ducastel and Martineau 2016), 120 battements par minute (Campillo 2017), and Ein Virus kennt keine Moral (Praunheim 1987). These comparisons function to (1) explore constructions and treatment of monogamy and promiscuity within gay-male sexual networks, and (2) understand the influence of medical paradigms on the concept of Safer Sex and sexual risk. Together, these considerations offer a way to reassess HIV/AIDS genre cinema and elucidate the current milieu in which HIV/AIDS discourses are situated.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Qualitative
Article	2023	Custer, Brian; Whitaker, Barbee I.; Pollack, Lance M.; Buccheri, Renata; Bruhn, Roberta L.; Crowder, Lauren A.; Stramer, Susan L.; Reik, Rita A.; Pandey, Suchitra; Stone, Mars; Di Germanio, Clara; Buchacz, Kate; Eder, Anne F.; Lu, Yun; Forshee, Richard A.; Anderson, Steven A.; Marks, Peter W.	HIV risk behavior profiles among men who have sex with men interested in donating blood: Findings from the Assessing Donor Variability and New Concepts in Eligibility study.	Transfusion	-	-	-	1537-2995 0041-1132	10.1111/trf.17515	https://pubmed.ncbi.nlm.nih.gov/37642154/	BACKGROUND: Individual risk assessment allows donors to be evaluated based on their own behaviors. Study objectives were to assess human immunodeficiency virus (HIV) risk behaviors in men who have sex with men (MSM) and estimate the proportion of the study population who would not be deferred for higher risk HIV sexual behaviors. STUDY DESIGN AND METHODS: Cross-sectional survey and biomarker assessment were conducted in eight U.S. cities. Participants were sexually active MSM interested in blood donation aged 18-39 years, assigned male sex at birth. Participants completed surveys during two study visits to define eligibility, and self-reported sexual and HIV prevention behaviors. Blood was drawn at study visit 1 and tested for HIV and the presence of tenofovir, one of the drugs in oral HIV pre-exposure prophylaxis (PrEP). Associations were assessed between HIV infection status or HIV PrEP use and behaviors, including sex partners, new partners, and anal sex. RESULTS: A total of 1566 MSM completed the visit 1 questionnaire and blood draw and 1197 completed the visit 2 questionnaire. Among 1562 persons without HIV, 789 (50.4%) were not taking PrEP. Of those not taking PrEP, 66.2% reported one sexual partner or no anal sex and 69% reported no new sexual partners or no anal sex with a new partner in the past 3 months. CONCLUSION: The study found that questions were able to identify sexually active, HIV-negative MSM who report lower risk sexual behaviors. About a quarter of enrolled study participants would be potentially eligible blood donors using individual risk assessment questions.	donors; regulatory and QA; transfusion-transmitted disease - HIV	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	da Costa, Alan Rodrigues; Barros, Jônatas Ferreira; Lima, Valéria Paes; Magalhães, Camila; Silva, Hellen Kássia Rezende; Deusdará, Rodolfo; de Souza Lapa, Juliana	Substance use and risky sexual behavior in the PrEP outpatient clinic at the University Hospital of Brasilia	Tropical Medicine and Infectious Disease	-	-	-	2414-6366	10.3390/tropicalmed8060323.	https://pubmed.ncbi.nlm.nih.gov/37368741/	(1) Background: To evaluate the epidemiological profile of people who use drugs at the PrEP outpatient clinic of the University Hospital of Brasilia; (2) Methods: Cross-sectional study with a review of data from medical records referring to the first medical consultation. The prevalence ratio was calculated using a Poisson regression model with robust variance; (3) Results: A total of 53% of subjects reported drug use in the last 3 months. The unadjusted prevalence ratio of drug use in trans women was PR: 9.0 (95%CI: 1.4-57.5). people who use drugs have a 1.9 times higher prevalence of STI diagnosis, and a 2.4 times higher prevalence of partners compared to non-users; (4) Conclusions: Substance use was associated with a higher STI prevalence ratio and number of sexual partners. Article	2023	da Silva Junior A.L.; Brigeiro M.; Monteiro S.	Health, enhancement and lifestyle: the use of the HIV pre-exposure prophylaxis (PrEP) among gay men, trans women and travestis; Saúde, aprimoramento e estilo de vida: o uso da profilaxia pré-exposição ao HIV (PrEP) entre homens gays, mulheres trans e travestis	Physis	-	-	-	1037331	10.1590/S0103-7331202333082	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179695215&doi=10.1590%2fS0103-7331202333082&partnerID=40&md5=4e989d06e53f7e5d0b32473671bb5dbd	The article has analyzed the meanings of the use of PrEP among gay man, trans women, and travestis in Rio de Janeiro, based on research on the biomedicalization of the response to AIDS. The analysis and interpretation of the field diary entries and interviews allowed us to describe how the use of this HIV prevention technology occurs simultaneously with other biomedical resources, aesthetics, dietary interventions, and physical exercises. We argue that such self-care is shaped according to the expectations of gender and class and the health ideals of their users. The results of the study allow us to discuss the boundaries between health, lifestyle, and enhancement. It is concluded that PrEP seems to produce a singularization in the forms of self-production, via biomedical and aesthetic-cosmetic enhancement, in a synergistic encounter between different technologies; perceived both in the routine use of the drug and in the management of its effects. For most of the people interviewed, PrEP is coupled with a previous self-care, which indicates the social location of its users in terms of class and gender and the ref lexive way from which they describe their health and themselves. © 2023, Institute de Medicina Social da UERJ. Article	2023	da Silva-Brandao R.R.; Ianni A.M.Z.	Exploring the HIV pre-exposure prophylaxis (PrEP) risk rituals: individualisation, uncertainty and social iatrogenesis	Health, Risk & Society	-	-	-	13698575	10.1080/13698575.2023.2283220	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177031167&doi=10.1080%2f13698575.2023.2283220&partnerID=40&md5=3aea5ea3d60fba3747e6d1555609be12	HIV Pre-Exposure Prophylaxis (PrEP) consists of a daily antiretroviral regimen that prevents HIV acquisition. In this article, we discuss ways in which individuals on PrEP deal with risks and uncertainties through their life experiences amid PrEP risk rituals and rational and non-rational individualisation processes. We analysed data from a web-based group of mostly gays, bisexuals and other men who have sex with men on PrEP through a thematic-content approach. We found that individuals, influenced by medical and health institutions, were involved in 'risk rituals' with profound effects on their subjective embodiment, emotions and feelings. These processes became amalgamated into conflicting objective consequences to themselves and their social networks, which included the acquisition of new diseases amid increasing ambivalences of being on PrEP. Our theoretical argument is that risk rituals were symptomatic of social iatrogenesis amid the contemporary risk and individualised society. By developing an analytical dialogue between our empirical data and modernisation theories of risk and individualisation, we sought to understand risk rituals through conflict, relational, group and institutional domains, as these layers of analysis help us grasp the core characterisation of social iatrogenesis. Drawing on these insights, we also pay attention to potential futures of injectable PrEP, considering the role of hope, the collective production of the unknown and medical action as a type of intensification of risk rituals and social iatrogenesis. © 2023 Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Dahlby, Lucia; Boyd, Jade; Knight, Rod; Philbin, Morgan; Small, Will; Kerr, Thomas; McNeil, Ryan	The perspectives of street-involved youth who use drugs regarding the acceptability and feasibility of HIV pre-exposure prophylaxis: a qualitative study.	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2022.2085868	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9930182	Street-involved youth who use drugs (YWUD) face an elevated risk of HIV acquisition and represent a key population for HIV prevention initiatives, including pre-exposure prophylaxis (PrEP). However, little is known regarding the acceptability and feasibility of PrEP uptake and adherence among this multiply-marginalized population. Semi-structured qualitative interviews were conducted with 24 street-involved YWUD (ages 17-24) to examine their perspectives toward PrEP; youth were recruited through a longitudinal prospective cohort study in Vancouver, Canada. Youth reported high levels of ambivalence toward PrEP despite engagement in HIV-related risk behaviors. This ambivalence was driven by misperceptions regarding HIV transmission, including stigmatizing associations between HIV transmission and personal hygiene. Such misperceptions led participants to enact strategies that were ineffective in preventing HIV transmission. Participants contested their inclusion as a "key population" for PrEP, which limited their enthusiasm for PrEP uptake and adherence. Participants also highlighted that wider social-structural inequities (e.g., housing vulnerability, poverty) that produced HIV-related risks were likely to undermine sustained PrEP use. Findings demonstrate the need for tailored implementation strategies to increase PrEP acceptability, including targeted education and anti-stigma interventions to increase awareness about HIV transmission. Interventions should also target structural inequities in order to fully address HIV risk and PrEP ambivalence.	HIV prevention; Vulnerable youth; pre-exposure prophylaxis; qualitative. Article	2023	Dale, Sannisha K.; Etienne, Kayla; Hall, Sidny; Lazarus, Kimberly; Nunnally, Kalenthia; Gibson, George; Bolden, Roxana; Gardner, Nadine; Sanders, Jasmyn; Reid, Rachelle; Phillips, Arnetta	Five point initiative: a community-informed bundled implementation strategy to address HIV in Black communities.	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-023-16525-7	https://bmcpublichealth.biomedcentral.com/articles/10.1186/s12889-023-16525-7	BACKGROUND: Black individuals in the U.S. remain the most disproportionately impacted by new HIV diagnoses, represent the highest portion of individuals living with HIV, and have the highest morbidity rates. Structural inequities and historical oppression are the primary drivers. Such drivers limit access to HIV prevention tools that need to be delivered with culturally congruent and community-informed approaches. METHODS: The Five Point Initiative (FPI) is a community-informed bundled implementation strategy developed and piloted between September 2019 and March 2020 in Miami, Florida in communities heavily impacted by HIV. Key components of the strategy included community consultants/experts, five categories (hence the "Five Point") of community businesses (e.g., corner stores, beauty supply stores, laundromats, mechanics, barbershops), local health organizations, an academic research program engrossed in community engaged research, and community residents who provided ongoing feedback throughout. Outcomes of FPI included (a) survey information (e.g., knowledge of and access to PrEP, barriers to care) and pilot data (acceptability and feasibility), (b) expansion of reach to Black individuals in HIV high impact zip codes in Miami, (c) insights on our bundled implementation strategy, (d) condom distribution, and (e) HIV testing. RESULTS: Over the course of six months FPI carried out 10 outreach events, partnered with 13 community businesses and 5 health organizations, engaged 677 community residents, collected health information via a survey, distributed 12,434 condoms, provided information on PrEP, and offered voluntary HIV testing (131 completed). FPI's ability to reach residents who are not being reached (e.g., (68.8% never heard of PrEP, 8% no HIV testing ever, 65.9% no primary care provider), positive feedback from residents (e.g., 70% very satisfied, 21% satisfied; 62% strongly agree and 25% agree they would participate again) and qualitative interviews with businesses provide evidence of acceptability and feasibility. Further, survey data provided insights on factors such as socio-demographics, discrimination experiences, barriers to care, social-structural factors, physical and sexual health, and mental health and substance use. CONCLUSIONS: The FPI bundled implementation strategy shows promise to deliver health prevention/intervention for HIV and other health conditions to communities facing health inequities and for whom the current system for delivering care is insufficient. Article	2023	Daly M.B.; Wong-Sam A.; Li L.; Krovi A.; Gatto G.J.; Norton C.; Luecke E.H.; Mrotz V.; Forero C.; Cottrell M.L.; Schauer A.P.; Gary J.; Nascimento-Seixas J.; Mitchell J.; van der Straten A.; Heneine W.; García-Lerma J.G.; Dobard C.W.; Johnson L.M.	Pharmacokinetic Study of Islatravir and Etonogestrel Implants in Macaques	Pharmaceutics	-	-	-	19994923	10.3390/pharmaceutics15122676	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180702315&doi=10.3390%2fpharmaceutics15122676&partnerID=40&md5=70f39b258712f0c171bd5ab7516c7ac2	The prevention of HIV and unintended pregnancies is a public health priority. Multi-purpose prevention technologies capable of long-acting HIV and pregnancy prevention are desirable for women. Here, we utilized a preclinical macaque model to evaluate the pharmacokinetics of biodegradable ε-polycaprolactone implants delivering the antiretroviral islatravir (ISL) and the contraceptive etonogestrel (ENG). Three implants were tested: ISL-62 mg, ISL-98 mg, and ENG-33 mg. Animals received one or two ISL-eluting implants, with doses of 42, 66, or 108 μg of ISL/day with or without an additional ENG-33 mg implant (51 μg/day). Drug release increased linearly with dose with median range plasma ISL levels of 1.3 1.0–2.5, 1.9 1.2–6.3 and 2.8 2.3–11.6, respectively. The ISL-62 and 98 mg implants demonstrated stable drug release over three months with ISL-triphosphate (ISL-TP) concentr54ations in PBMCs above levels predicted to be efficacious for PrEP. Similarly, ENG implants demonstrated sustained drug release with median range plasma ENG levels of 495 229–1110 pg/mL, which suppressed progesterone within two weeks and showed no evidence of altering ISL pharmacokinetics. Two of the six ISL-98 mg implants broke during the study and induced implant-site reactions, whereas no reactions were observed with intact implants. We show that ISL and ENG biodegradable implants are safe and yield sufficient drug levels to achieve prevention targets. The evaluation of optimized implants with increased mechanical robustness is underway for improved durability and vaginal efficacy in a SHIV challenge model. © 2023 by the authors.	biodegradable implant; etonogestrel; HIV pre-exposure prophylaxis; islatravir; multipurpose prevention technologies	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Dam A.; Schueller J.; Peine K.J.; Mason J.; Dorward E.; Vij A.	Turning the promise of multipurpose prevention technologies into a market reality: a commentary	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/frph.2023.1181043	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177043237&doi=10.3389%2ffrph.2023.1181043&partnerID=40&md5=e4bfb0fd6b295410278efd5cf3d9cabf	The promise of multipurpose prevention technologies (MPTs) for the prevention of HIV and unintended pregnancy are on the horizon. While many are still in clinical development, others are closer to becoming a realistic, accessible option for users, like the dual prevention pill (DPP). Researchers, governments, donors, and implementers will have to collaboratively address systems challenges to successfully introduce and scale-up MPTs. To ensure the rollout of MPTs is successful, the global community should address user and country-specific needs, coordinate with advocates and policymakers, and set a realistic plan for product introduction and scale-up that considers the needs of both family planning (FP) and HIV programs, while laying the groundwork for future new product introduction. To achieve these aims, global and regional stakeholder coordination should emphasize country-led, person-centered decision-making while addressing: (1) procurement and supply chain barriers; (2) the potential burden on health systems; and (3) the impact on current programs. 2023 Dam, Schueller, Peine, Mason, Dorward and Vij.	contraception; dual prevention pill; family planning (FP) PrEP-FP integration; HIV prevention; informed choice; MPTs; multipurpose prevention technologies; PrEP (pre-exposure prophylaxis)	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review

Compassionate use of long-acting cabotegravir plus rilpivirine for people living with HIV-1 in need of parenteral antiretroviral therapy	HIV Medicine	-	-	-	14642662	10.1111/hiv.13370	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135621906&doi=10.1111%2fhiv.13370&partnerID=40&md5=7914cde4b1684365527ba5d381de2da1	Objectives: Physicians could request compassionate use of oral and long-acting (LA) cabotegravir + rilpivirine for people living with HIV-1 under a single-patient request programme supported by ViiV Healthcare and Janssen. Outcomes are reported. Methods: Eligibility criteria included need for parenteral therapy, no primary resistance mutations to cabotegravir or rilpivirine, and established retention in care. Demographic, efficacy, and safety data were obtained from standardized programme applications and quarterly clinical updates. Individuals received a loading dose of LA cabotegravir 600 mg + rilpivirine 900 mg, followed by LA maintenance doses of 400 mg/600 mg every 4 weeks; some received lead-in oral cabotegravir and rilpivirine. Results: Through July 2020, 35 people living with HIV-1 had data available. The most frequent reason for compassionate use request was chronic non-adherence due to psychological conditions (n = 15). Of 35 people living with HIV-1, 28 had detectable viremia (median viral load 60 300 copies/mL) and seven were virologically suppressed at programme entry; 16/28 and 6/7 achieved or maintained virological suppression at data cutoff, respectively. Seven people living with HIV-1 discontinued for incomplete virological response, six with detectable viremia at initiation; six and four had new reverse transcriptase and integrase mutations at discontinuation, respectively. Six non-fatal serious adverse events were reported, two considered possibly treatment related. Four deaths were reported; none were treatment related. One individual reported two pregnancies and continued LA dosing. Conclusions: Most people living with HIV-1 had advanced disease and achieved (16/28) or maintained (6/7) virological suppression with LA therapy. Cabotegravir LA + rilpivirine LA as compassionate use provided a valuable treatment option for individuals with adherence issues with oral therapy and advanced disease. © 2022 ViiV Healthcare and The Author. Article	2023	D'Amours, Jason V.	Cultural discourses and HIV/AIDS activists' meanings about PrEP	Culture, Health & Sexuality	-	-	-	1464-5351 1369-1058	10.1080/13691058.2022.2156617	https://pubmed.ncbi.nlm.nih.gov/36527448/	Since the approval of pre-exposure prophylaxis (PrEP) for HIV prevention in 2012, research has increasingly considered how communities of men who have sex with men make sense of this prevention technology, often highlighting individual-level attitudes about PrEP. Drawing on interviews with 16 HIV activists, this study aimed to determine how activists make sense of advances in HIV prevention technology. Participants' sense-making about PrEP took the form of not merely the expression of individual attitudes, but rather reflections connected to their personal biographies and activist experience. Activists sustain seemingly contradictory discourses about PrEP, at once drawing on personal biographies and a discourse central to activist history to express scepticism about PrEP, but also other discourses to justify pharmaceutical intervention for prevention. Study findings provide evidence of the importance of attending to past and present cultural discourses when examining health advocacy groups' constructions of advances in science. Article	2023	Dana, Ruth; Sullivan, Stephen; MacGowan, Robin J.; Chavez, Pollyanna R.; Wall, Kristin M.; Sanchez, Travis H.; Stephenson, Rob; Hightow-Weidman, Lisa; Johnson, Jeffrey A.; Smith, Amanda; Sharma, Akshay; Jones, Jeb; Hannah, Marissa; Trigg, Monica; Luo, Wei; Caldwell, Joanna; Sullivan, Patrick Sean	Engaging Black or African American and Hispanic or Latino Men Who Have Sex With Men for HIV Testing and Prevention Services Through Technology: Protocol for the iSTAMP Comparative Effectiveness Trial.	JMIR Research Protocols	-	-	-	1929-0748	10.2196/43414	https://pubmed.ncbi.nlm.nih.gov/36607707/	BACKGROUND: Gay, bisexual, and other men who have sex with men (MSM), particularly Black or African American MSM (BMSM) and Hispanic or Latino MSM (HLMSM), continue to be disproportionately affected by the HIV epidemic in the United States. Previous HIV self-testing programs have yielded high testing rates, although these studies predominantly enrolled White, non-Hispanic MSM. Mobile health tools can support HIV prevention, testing, and treatment. This protocol details an implementation study of mailing free HIV self-tests (HIVSTs) nested within a randomized controlled trial designed to assess the benefit of a mobile phone app for increasing the uptake of HIV prevention and other social services. OBJECTIVE: This study was a comparative effectiveness trial of innovative recruitment and testing promotion strategies intended to effectively reach cisgender BMSM and HLMSM. We evaluated the use of a mobile app for increasing access to care. METHODS: Study development began with individual and group consultations that elicited feedback from 3 core groups: HIV care practitioners and researchers, HIV service organization leaders from study states, and BMSM and HLMSM living in the study states. Upon completion of the formative qualitative work, participants from 11 states, based on the observed areas of highest rate of new HIV diagnoses among Black and Hispanic MSM, were recruited through social networking websites and smartphone apps. After eligibility was verified, participants consented and were randomized to the intervention arm (access to the Know@Home mobile app) or the control arm (referral to web resources). We provided all participants with HIVSTs. The evaluation of the efficacy of a mobile phone app to support linkage to posttest prevention services that included sexually transmitted infection testing, pre-exposure prophylaxis initiation, antiretroviral treatment, and acquisition of condoms and compatible lubricants has been planned. Data on these outcomes were obtained from several sources, including HIVST-reporting surveys, the 4-month follow-up survey, laboratory analyses of dried blood spot cards returned by the participant, and data obtained from the state health department surveillance systems. Where possible, relevant subgroup analyses were performed. RESULTS: During the formative development phase, 9 consultations were conducted: 6 in-depth individual discussions and 3 group consultations. From February 2020 through February 2021, we enrolled 2093 MSM in the randomized controlled trial from 11 states, 1149 BMSM and 944 HLMSM. CONCLUSIONS: This study was designed and implemented to evaluate the effectiveness of recruitment strategies to reach BMSM and HMSM and of a mobile app with regard to linkage to HIV prevention or treatment services. Data were also obtained to allow for the analyses of cost and cost-effectiveness related to study enrollment, HIV testing uptake, identification of previously undiagnosed HIV, sexually transmitted infection testing and treatment, and linkage to HIV prevention or treatment services. Article	2023	D'Angelo A.B.; Mirzayi C.; Carneiro P.B.; Grov C.	Changes in Cost and Insurance Challenges to Cover PrEP between 2019 and 2021	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003180	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160334798&doi=10.1097%2fQAI.0000000000003180&partnerID=40&md5=79a3578b3cf5d8f1a15e50593ad83482	Introduction:Pre-Exposure Prophylaxis (PrEP) use continues lag estimated need among gay and bisexual men in the United States. Studies report that challenges paying for PrEP may undermine continued use. Our study aimed to measure these challenges over time.Methods:Data were taken from a US national cohort study of cisgender gay and bisexual men and transgender individuals aged 16-49 years. We analyzed data from PrEP-using participants between 2019 and 2021 and observed cost-related and insurance-related challenges participants experienced while on PrEP across time points. We report McNemar and Cochrane Q test statistics to compare differences between groups by year(s).Results:In 2019, 16.5% (n = 828/5013) of participants were on PrEP; by 2020, 21% (n = 995/4727) were on PrEP, and by 2021, 24.5% (n = 1133/4617) were on PrEP. The proportion of those experiencing challenges paying for PrEP care decreased significantly across time points for clinical appointments, laboratory work, and prescriptions. Those experiencing insurance and copay approval issues did not change significantly. Although not statistically significant, the only proportion that increased over time was those reporting PrEP-related insurance approval issues. In a post hoc analysis, we found that those reporting PrEP use in the past year who were not currently on PrEP were significantly more likely to report experiencing most PrEP challenges, when compared with current PrEP users.Discussion:We found significant reductions in insurance and cost-related challenges between 2019 and 2021. However, those who discontinued PrEP within the past year reported greater challenges paying for PrEP, suggesting that cost and insurance issues may undermine PrEP persistence. © Copyright 2023 Wolters Kluwer Health, Inc. Article	2023	Dangerfield D.T., II	A Principal Investigator as a PrEP-Using Peer Change Agent for HIV Prevention among Black Gay and Bisexual Men: An Autoethnography	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph20075309	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152343501&doi=10.3390%2fijerph20075309&partnerID=40&md5=5847ca6a20c9eb0ecff17e5bf3e4651b	HIV pre-exposure prophylaxis (PrEP) use remains suboptimal among Black gay and bisexual men (GBM). Multilevel factors such as medication costs, intersectional stigma, patient-clinician communication, medical mistrust, side effect concerns, and low perceived HIV risk (PHR) are well-established PrEP initiation barriers for this group. Peer change agents (PCAs) are culturally congruent interventionists who can circumvent multilevel PrEP barriers among Black GBM. I led an intervention as a PrEP-using PCA to improve PHR and PrEP willingness among 69 Black GBM from 2019–2022 and conducted an autoethnography to better understand multilevel barriers and identify the personal/professional challenges of being an in-group HIV interventionist serving Black SMM. Findings provide novel perspectives regarding PrEP barriers, the role of cultural homophily in behavior change interventions, and how interpersonal dynamics can impact staff fatigue, protocol fidelity, and research participation. Recommendations to prepare and support culturally congruent research staff are also provided. © 2023 by the author.	adherence; culture; intervention; social networks; stigma	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Dangerfield, Derek T; Davis, Gerrin; Pandian, Vinciya; Anderson, Janeane N	Using Motivational Interviewing to Increase HIV PrEP Initiation and Adherence: a Scoping Review.	Prevention Science	-	-	-	1573-6695	10.1007/s11121-023-01554-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10575988	Despite evidence that pre-exposure prophylaxis (PrEP) reduces HIV risk, initiation and adherence remain low among vulnerable communities. Motivational interviewing (MI) can improve HIV prevention behaviors. However, limited research identifies how MI impacts PrEP uptake and adherence. This scoping review examines essential components of MI-based interventions that aimed to improve PrEP use, including the number and duration of sessions, counselor characteristics, and interview content. We searched four databases, PubMed, CINAHL Plus, Embase, and Web of Science, and reviewed 379 articles. Studies were considered if they (a) were published between 2012 and 2023, (b) used MI independently or part of a multi-component intervention strategy, and (c) focused on improving PrEP initiation or adherence. Seven articles met inclusion criteria. Regarding intervention components, the number of MI sessions varied and duration ranged between 15 and 60 min. MI counselors varied in credentialing and demographic characteristics. MI content included PrEP education, identifying initiation and adherence barriers, and strategizing ways to overcome barriers. MI is an important component of interventions that aim to improve PrEP initiation and adherence. However, the variability and limited details across studies hinder our ability to assess MI efficacy on PrEP initiation and adherence or replicate these approaches in future interventions. Article	2023	Daniels, Joseph; De Vos, Lindsey; Bezuidenhout, Dana; Atujuna, Millicent; Celum, Connie; Hosek, Sybil; Bekker, Linda-Gail; Medina-Marino, Andrew	"I know why I am taking this pill": Young women navigation of disclosure and support for PrEP uptake and adherence in Eastern Cape Province, South Africa.	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0000636	https://journals.plos.org/globalpublichealth/article?id=10.1371/journal.pgph.0000636	There is limited understanding of the dynamic interplay between adolescent girl's and young women's (AGYW) disclosure and social support for using oral pre-exposure prophylaxis (PrEP) and adherence. Towards this, we conducted interviews with 42 AGYW enrolled in The Community PrEP Study who exhibited either high or low blood concentrations of tenofovir-diphosphate (TFV-DP) in dried blood spots. Guided by Theories of Practice, interviews and analysis focused on AGYW perspectives and experiences with PrEP disclosure, support and adherence. AGYW with high TFV-DP blood concentrations described larger social support networks and disclosure events. In contrast, those with low TFV-DP blood concentrations described disclosing to fewer people, resulting in limited social support. Participants discussed partner support, however, this support was not described as consequential to adherence, irrespective of TFV-DP levels. Those with high levels of TFV-DP in their blood described the ability to navigate social scrutiny and changes in social support, while those with low levels of TFV-DP in their blood were more likely to question their own continued use of PrEP. To facilitate AGYW's prevention-effective use of PrEP, expanded skill-building for disclosure and resiliency against changes to social support should be examined as part of PrEP services. Article	2023	Darien, Kaja; Lee, Susan; Knowles, Kayla; Wood, Sarah; Langer, Miriam D; Lazar, Nellie; Dowshen, Nadia	Health Information From Web Search Engines and Virtual Assistants About Pre-Exposure Prophylaxis for HIV Prevention in Adolescents and Young Adults: Content Analysis.	JMIR Pediatrics and Parenting	-	-	-	2561-6722	10.2196/41806	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10394601	BACKGROUND: Adolescents and young adults are disproportionately affected by HIV, suggesting that HIV prevention methods such as pre-exposure prophylaxis (PrEP) should focus on this group as a priority. As digital natives, youth likely turn to internet resources regarding health topics they may not feel comfortable discussing with their medical providers. To optimize informed decision-making by adolescents and young adults most impacted by HIV, the information from internet searches should be educational, accurate, and readable. OBJECTIVE: The aims of this study were to compare the accuracy of web-based PrEP information found using web search engines and virtual assistants, and to assess the readability of the resulting information. METHODS: Adolescent HIV prevention clinical experts developed a list of 23 prevention-related questions that were posed to search engines (Ask.com, Bing, Google, and Yahoo) and virtual assistants (Amazon Alexa, Microsoft Cortana, Google Assistant, and Apple Siri). The first three results from search engines and virtual assistant web references, as well as virtual assistant verbal responses, were recorded and coded using a six-tier scale to assess the quality of information produced. The results were also entered in a web-based tool determining readability using the Flesch-Kincaid Grade Level scale. RESULTS: Google web search engine and Google Assistant more frequently produced PrEP information of higher quality than the other search engines and virtual assistants with scores ranging from 3.4 to 3.7 and 2.8 to 3.3, respectively. Additionally, the resulting information generally was presented in language at a seventh and 10th grade reading level according to the Flesch-Kincaid Grade Level scale. CONCLUSIONS: Adolescents and young adults are large consumers of technology and may experience discomfort discussing their sexual health with providers. It is important that efforts are made to ensure the information they receive about HIV prevention methods, and PrEP in particular, is comprehensive, comprehensible, and widely available.	na	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Darlington, Caroline K; Lipsky, Rachele K; Teitelman, Anne M; Koblin, Beryl A; Davis, Annet; Walcott, Melonie; Compton, Peggy A; Tieu, Hong-Van	HIV risk perception, pre-exposure prophylaxis (PrEP) awareness, and PrEP initiation intention among women who use drugs.	Journal of Substance Use & Addiction Treatment	-	-	-	2949-8759	10.1016/j.josat.2023.209119	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10529693	INTRODUCTION: Women who use drugs (WWUD) are prime candidates for pre-exposure prophylaxis (PrEP) due to their elevated risk of acquiring HIV through biological, behavioral, and contextual factors. However, PrEP uptake among WWUD remains low. The relationship between unhealthy drug use and correlates of PrEP uptake in this vulnerable population is not well defined. The purpose of this study is to characterize the relationships between specific types and routes of drug use and several precursors of PrEP uptake among WWUD. METHODS: The study collected data via a computer-based survey from 233 women living in New York City and Philadelphia who participated in a study designed to develop and pilot a women-focused intervention for PrEP uptake. The sample of cisgender, HIV-negative women were not currently taking PrEP but considered PrEP eligible. This analysis is focused on women's HIV risk perception, PrEP awareness, PrEP initiation intention, and any use of the following drugs: barbiturates, benzodiazepines, crack cocaine, powder cocaine, hallucinogens, heroin, methamphetamines, and prescription opioids. RESULTS: Within the three months prior to study enrollment, 63.1 % of participants reported any drug use; 42 % reported polydrug use; 19.8 % had injected drugs; 75 % reported getting high or drunk before sex; and 44 % had been enrolled in drug treatment. Of our total sample, 41.2 % perceived themselves at risk for HIV infection, 41.6 % were aware of PrEP prior to the study, and 62.7 % intended to initiate PrEP after they were informed. When compared to other PrEP-eligible women, women who reported prescription opioid use and polydrug use perceived themselves at higher risk for HIV infection and had higher intention to start PrEP. However, they and women who reported injecting drugs also reported lower awareness of PrEP. CONCLUSION: These findings have implications for increasing education about PrEP and the various modes of HIV exposure to support PrEP uptake in this vulnerable population. Article	2023	Dassaye R.; Wand H.; Reddy T.; Tanser F.; Sartorius B.; Morris N.; Ramjee G.	Spatial variations in STIs among women enrolled in HIV prevention clinical trials in Durban, KwaZulu-Natal, South Africa	SAHARA J : Journal of Social Aspects of HIV/AIDS Research Alliance	-	-	-	17290376	10.1080/17290376.2023.2193238	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151573641&doi=10.1080%2f17290376.2023.2193238&partnerID=40&md5=995704b03a028bd79c021c3d82520932	South Africa is faced with a high HIV and STI prevalence and incidence, respectively, with pockets of high burden areas driving these diseases. Localised monitoring of the HIV epidemic and STI endemic would enable more effective targeted prevention strategies. We assessed spatial variations in curable STI incidence among a cohort of women enrolled in HIV prevention clinical trials between 2002 and 2012. STI incidence rates from 7557 South African women enrolled in HIV prevention trials were geo-mapped using participant household GPS coordinates. Age and period standardised incidence rates were calculated for 43 recruitment areas and Bayesian conditional autoregressive areal spatial regression (CAR) was used to identify significant patterns and spatial patterns of STI incidences in recruitment communities. Overall age and period standardised STI incidence rate were estimated as 15 per 100 PY and ranged from 6 to 24 per 100 PY. We identified five significant STI high risk areas with higher-than-expected incidence of STIs located centrally (three-locations) and southern neighbouring areas of Durban (two-locations). Younger age (<25), not married/cohabitating, parity <3 and poor education were all significant correlates of high STI communities. Findings demonstrate sustained STI incidence rates across the greater Durban area. The role of STI incidence in HIV acquisition in high HIV endemic areas need to be revisited as current highly effective PrEP interventions do not protect from STI acquisition. In these settings there is an urgent need for integrative HIV and STI prevention and treatment services. © 2023 The Author(s). Published by Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Dauria E.; Rodriguez C.; Bauerle Bass S.; Tolou-Shams M.; Christopoulos K.	Implementation strategies to screen, refer and link women involved in the carceral system to PrEP for HIV prevention	International Journal of Prisoner Health	-	-	-	17449200	10.1108/IJPH-06-2022-0037	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85158821704&doi=10.1108%2fIJPH-06-2022-0037&partnerID=40&md5=4918be5d4127653faf52f480583cc9f3	Purpose: Women involved in the carceral system (CS) experience several conditions that increase their risk for HIV (e.g. high rates of substance use, psychiatric disorders, histories of victimization). The purpose of this study is to explore perspectives on potential strategies to connect women in the CS to pre-exposure prophylaxis (PrEP) services. Design/methodology/approach: This study conducted in-depth interviews with 27 women involved in the CS eligible for PrEP. Using vignettes, interviews explored attitudes, barriers and facilitators toward PrEP screening, referral and linkage facilitated via a CS stakeholder, an mHealth application or providing PrEP service referrals during detention via a navigator. Findings: Most women were, on average, 41.3 years, from racial and ethnic minority groups (56% black/African American; 19% Latinx). Inductive thematic analysis revealed CS involved women expressed mostly positive attitudes toward CS-based PrEP implementation. Younger women were more accepting of and interested in mHealth interventions. Implementation facilitators included leveraging relationships with trusted allies (e.g. "peers") and existing systems collaborations. Recommended implementation strategies included providing HIV and PrEP-specific education and training for system stakeholders and addressing issues related to privacy, system mistrust and stigma. Originality/value: Results provide a critical foundation for the implementation of interventions to improve PrEP access for women involved in the CS and have important implications for implementation strategies for all adults involved in the CS. Improving access to PrEP among this population may also support progress toward addressing national disparities in PrEP uptake, where women, black and Latinx populations have substantial unmet need. © 2023, Emerald Publishing Limited. Theses and Dissertations	2023	David, Hollie marie	PrEP Utilization in the United States, A sub-study of the Triumph Project at UCSD	-	-	University of California	-	NA	NA	https://escholarship.org/uc/item/78t1h5gt	BackgroundHIV pre-exposure prophylaxis (PrEP) is a key to the United States' (US) Ending the HIV Epidemic plan. This research aims to 1) evaluate PrEP utilization in jurisdictions with the highest HIV new diagnosis incidence, 2) determine PrEP correlation with new HIV diagnoses, income, geopolitical, race and/or geo-spatial factors. MethodsAnalysis of 2012-2019 PrEP data implementing linear mixed methods statistical modeling. The dependent variable was county PrEP. Fixed effects were HIV diagnoses, state income, percentage of black, indigenous and people of color (BIPOC) in state populations and governor political affiliation. Random effects were regions and counties of the US. Only the 50 US jurisdictions with the highest new HIV diagnosis rates were analyzed.Results For each 10,000 U.S. dollar increase in mean income, there was a significant increase in PrEP utilization by 66.4/100,000 persons (95%CI 58.6-74.3, p<0.001). Jurisdictions with higher HIV diagnosis rates have reduced PrEP utilization -2.73/100,000 for each new 1 diagnosis per 100,000 in the population (95%CI -3.71 – -1.80,p <0.001). For each increase of BIPOC by 1 percentile point, PrEP utilization decreased by a rate of -522.34 per 100,000 prescriptions (95%CI -958.4 – -134.8,p <0.05).ConclusionFindings suggest lower income, higher rates of HIV diagnoses, and higher proportion of BIPOC persons correlate to lower rates of PrEP use. Regional location and political party of state governors was not associated with PrEP uptake. Article	2023	Davis T.L.; Mittal M.; Oragwu A.C.; Wang M.Q.; Boekeloo B.O.	Examining HIV Diagnosis and Linkage to PrEP Prescription Among Members at An Integrated Health System in the Southeast United States	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03812-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137878186&doi=10.1007%2fs10461-022-03812-4&partnerID=40&md5=c3fa37167db7bf0b86764f50ed2e968a	Pre-Exposure Prophylaxis (PrEP) is a priority method for preventing HIV infection. This study's aims were threefold: (1) identify characteristics of members of a large health maintenance organization, Kaiser Permanente Georgia (KPGA), associated with HIV infection, (2) identify which member characteristics associated with HIV were also associated with PrEP prescription, and (3) identify which HIV-associated characteristics were associated with under- or over-prescribing of PrEP. Analysis of variables from the electronic medical record revealed that age, race, gender, mental health diagnosis, STI diagnosis, and sexual orientation were independently associated with HIV diagnosis. The same characteristics were independently associated with PrEP prescription except for race. Persons identifying as Black or unknown race, women, and/or heterosexual; and who had an STI diagnosis and/or illicit drug use had lower odds of being prescribed PrEP than of having an HIV diagnosis. The implications of these findings for improving physician identification of candidates for PrEP prescription are discussed. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Davis-Ewart, Leah; Grov, Christian; Verhagen, Rachel; Manuel, Jennifer; Viamonte, Michael; Dilworth, Samantha; O'Dell, Nicole; Valentin, Omar; Carr, Sidney; Cherenack, Emily; Henderson, Chelsea; Doblecki-Lewis, Susanne; Nahum-Shani, Inbal; Carrico, Adam W	Motivational Enhancement Interventions to Increase Pre-Exposure Prophylaxis Use in Sexual Minority Men Who Use Stimulants: Protocol for a Pilot Sequential Multiple Assignment Randomized Trial.	JMIR Research Protocols	-	-	-	1929-0748	10.2196/48459	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10612012	BACKGROUND: Although pre-exposure prophylaxis (PrEP) could substantially mitigate HIV risk, sexual minority men who use stimulants commonly experience difficulties with engaging in PrEP clinical services. Motivational interviewing (MI) and contingency management (CM) reduce substance use and condomless anal sex (CAS) in this population, but these motivational enhancement interventions require modifications to promote engagement along the PrEP care continuum. OBJECTIVE: PrEP Readiness Interventions for Supporting Motivation (PRISM) is a pilot sequential multiple assignment randomized trial testing the feasibility, acceptability, and preliminary effectiveness of distinct combinations of telehealth MI and CM in 70 cisgender sexual minority men who use stimulants that are not currently taking PrEP. METHODS: A national sample was recruited via social networking applications to complete a baseline assessment and mail-in HIV testing. Those with nonreactive HIV results were randomized to receive either (1) a 2-session MI intervention focusing on PrEP use (session 1) and concomitant stimulant use or CAS (session 2) or (2) a CM intervention with financial incentives for documented evidence of PrEP clinical evaluation by a medical provider (US \$50) and filling a PrEP prescription (US \$50). At the 3-month follow-up assessment, participants who reported they had not filled a prescription for PrEP were randomized a second time to either (1) switch to a second-stage intervention (ie, MI+CM or CM+MI) or (2) continue with assessments only. Outcomes for both responders and nonresponders were reassessed at a 6-month follow-up. The primary outcome is documented evidence of filling a PrEP prescription over 6 months. Self-reported secondary outcomes include PrEP clinical evaluation by a medical provider, stimulant use, and CAS. Qualitative exit interviews were conducted with a subgroup of responders and nonresponders to characterize their experiences with the MI and CM interventions. RESULTS: Implementation of PRISM underscores challenges in reaching sexual minority men who use stimulants to optimize HIV prevention efforts. Approximately 1 in 10 (104/1060) eligible participants have enrolled. Of the 104 who enrolled, 87 (84%) completed mail-in HIV testing. We delivered 5 preliminary HIV-positive results, including posttest counseling with referrals to confirmatory testing. CONCLUSIONS: Lessons learned from PRISM underscore the central importance of a flexible, participant-centered approach to support the engagement of sexual minority men who use stimulants. Leveraging telehealth platforms to deliver motivational enhancement interventions also expanded their reach and potential public health impact with this high-priority population. Further research is needed to determine the effectiveness of telehealth MI and CM for supporting PrEP use in sexual minority men who use stimulants. Motivational interviewing (MI) and contingency management (CM) reduce substance use and condomless anal sex in this population, but these motivational enhancement interventions require adaptation to promote engagement along the PrEP care continuum. Methods: PRISM is a pilot sequential multiple assignment randomized trial (SMART) testing the feasibility, acceptability, and preliminary effectiveness of distinct combinations of telehealth MI and CM in 70 cisgender SMM who use stimulants that are not currently taking PrEP. A national sample was recruited via social networking applications to complete a baseline assessment and mail-in HIV testing. Those with non-reactive HIV results are randomized to receive either: 1) a 2-session MI intervention focusing on PrEP use (session 1) and concomitant stimulant use or condomless anal sex (session 2); or 2) a CM intervention with financial incentives for documented evidence of PrEP clinical evaluation by a medical provider ($50) and filling a PrEP prescription ($50). At the 3-month follow-up assessment, participants who report they have not filled a prescription for PrEP are randomized a second time to either: 1) Switch to a second-stage intervention (i.e., MI + CM or CM + MI); or 2) Continue with assessments only. Outcomes for both responders and non-responders are reassessed at a 6-month follow-up. The primary outcome is documented evidence of filling a PrEP prescription. Self-reported, secondary outcomes include PrEP clinical evaluation by a medical provider, stimulant use, and condomless anal sex. Qualitative exit interviews are conducted with a sub-group of responders and non-responders to characterize their experiences with the MI and CM interventions. Discussion: Implementation of this pilot SMART underscores the challenges in reaching SMM who use stimulants to optimize HIV prevention efforts such that approximately one in ten (104/1,060) eligible participants enrolled. However, 85% (70/82) of enrolled participants with non-reactive HIV results were randomized. Further research is needed to determine the effectiveness of telehealth MI and CM for supporting PrEP use in SMM who use stimulants. Trial Registration: This protocol was registered on clinicaltrials.gov (NCT04205487) on December 19, 2019.	cocaine, contingency management, methamphetamine, motivational interviewing, pre-exposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2023	Dawit, Rahel; Goedel, William C; Reid, Sean C; Doshi, Jalpa A; Nunn, Amy S; Chan, Philip A; Dean, Lorraine T	Geographic variations of PrEP reversal and abandonment among US counties.	AIDS	-	-	-	-	1473-5571	10.1097/QAD.0000000000003790	https://dx.doi.org/10.1097/QAD.0000000000003790	OBJECTIVE: In the United States (US), 1 in 5 newly insurer-approved pre-exposure prophylaxis (PrEP) prescriptions are reversed with over 70% of those reversed, being abandoned. Given the Ending the HIV Epidemic (EHE) initiative's goals, we assessed geographic variations of PrEP reversal and abandonment across EHE and non-EHE counties in the US. DESIGN: This was a cross-sectional analysis of secondary data. METHODS: Data were collected from Symphony Analytics for adults ≥18years old, with a newly prescribed PrEP claim. Using the proportion of PrEP prescriptions by county, hotspot analysis was conducted utilizing Getis Ord G∗ statistics stratified by EHE and non EHE counties. Multivariable logistic regression was used to identify factors associated with residing in hotspots of PrEP reversal or PrEP abandonments. RESULTS: Across 516 counties representing 36,204 patients, the overall PrEP reversal rate was 19.4%, while the PrEP abandonment rate was 13.7%. Reversals and abandonments were higher for non-EHE (22.7% and 17.1%) than EHE (15.6% and 10.5%) counties. In both EHE and non-EHE counties, younger age, less education, females, and an out-of-pocket cost of >$100, were significantly associated with greater likelihood of residing in hotspots of PrEP reversal or abandonment, while Hispanics, Medicaid recipients, and an out-of-pocket cost of ≤$10 had lower likelihood of residing in hotspots of reversal and abandonment. CONCLUSIONS: Findings indicate the need for implementation of focused interventions to address disparities observed in PrEP reversal and abandonment. Moreover, to improve primary PrEP adherence, national PrEP access programs should streamline and improve PrEP accessibility across different geographic jurisdictions. Article	2023	Dayton R.L.; Fonner V.A.; Plourde K.F.; Sanyal A.; Arney J.; Orr T.; Nhamo D.; Schueller J.; Limb A.M.; Torjesen K.	A Scoping Review of Oral Pre-exposure Prophylaxis for Cisgender and Transgender Adolescent Girls and Young Women: What Works and Where Do We Go from Here?	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04043-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85153972790&doi=10.1007%2fs10461-023-04043-x&partnerID=40&md5=2c15523cdff21c6e2db52922c34e0c04	Adolescent girls and young women (AGYW) are disproportionately affected by HIV, and oral pre-exposure prophylaxis (PrEP) can reduce HIV acquisition. The purpose of this scoping review was to synthesize results from interventions along the PrEP continuum for AGYW to inform research and programs. We searched electronic databases for studies published between January 2012–July 2021 and conducted secondary reference searching. Studies were included if they assessed interventions to increase PrEP interest, uptake, or continuation among AGYW. Results were synthesized narratively. Of 2168 citations identified, 50 studies were eligible for inclusion, and 20 contained AGYW-specific data. Among cisgender and transgender AGYW, studies overall demonstrated a positive impact on PrEP interest and uptake but generally attained suboptimal continuation rates. Results demonstrate feasibility of deploying PrEP across diverse settings—particularly when interventions are layered, tailored to AGYW, and include differentiated delivery—but also highlight knowledge gaps and the need for more holistic metrics of success. © 2023, The Author(s). Article	2023	De Clercq, Erik; Zhang, Zhenlan; Huang, Jie; Zhang, Min; Li, Guangdi	Biktarvy for the treatment of HIV infection: Progress and prospects.	Biochem Pharmacol	-	-	-	-	1873-2968 0006-2952	10.1016/j.bcp.2023.115862	https://pubmed.ncbi.nlm.nih.gov/37858869/	Bictegravir (BIC), a second-generation integrase strand-transfer inhibitor (INSTI) with high resilience to INSTI-resistance mutations, is integrated as a key component of Biktarvy® - a fixed-dose once-daily triple-drug regimen of bictegravir (BIC), emtricitabine (FTC) plus tenofovir alafenamide (TAF). Based on the accumulated evidence from HIV clinical trials and real-world studies, the clinical effectiveness of BIC + FTC + TAF has been proven non-inferior to other fixed-dose once-daily combinations such as dolutegravir + FTC + TAF and dolutegravir + abacavir + lamivudine. Biktarvy also shows limited drug-drug interactions and a high barrier to drug resistance. According to recent HIV guidelines, BIC + FTC + TAF is recommended as initial and long-term therapy for the treatment of HIV infection. For the pre-exposure prophylaxis, tenofovir disoproxil fumarate (TDF) or tenofovir alafenamide (TAF) remains advisable, but BIC may be possibly added to TDF or TAF. In the development of a long-acting once-monthly regimen, the novel nano-formulation of BIC + FTC + TAF could be possibly developed in the future. Prevalence of Mollicutes among men who have sex with men and transgender women aged 15 to 19 years in Salvador, North-eastern Brazil	BMC Infectious Diseases	-	-	-	-	14712334	10.1186/s12879-023-08213-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152863712&doi=10.1186%2fs12879-023-08213-z&partnerID=40&md5=e9741d82ced954642c5361dd6fdb611f	Background: Some species of Mollicutes have been associated with different pathologies of the urogenital tract in humans, with a high prevalence among adult men who have sex with men (MSM) and transgender women (TGW). However, few studies have been performed to investigate its prevalence among adolescents. In this study, we estimated the initial prevalence of Mycoplasma genitalium (MG), Mycoplasma hominis (MH), Ureaplasma urealyticum (UU), and Ureaplasma parvum (UP); the rate of misdiagnosis at different anatomical sites; and the associated factors with positive tests for Mollicutes among MSM and TGW aged 15 to 19 years enrolled in the PrEP1519 study. Methods: PrEP-1519 is the first study to investigate the effectiveness of pre-exposure prophylaxis for human immunodeficiency virus among adolescent MSM and TGW aged 15 to 19 in Latin America. Oral, anal, and urethral swabs were taken from 246 adolescents upon enrolment in the study to detect MG, MH, UU, and UP by quantitative polymerase chain reaction (qPCR). Bivariate and multivariate analyses were conducted by Poisson regression and 95% confidence intervals (95% CI) were estimated. Results: The prevalence of Mollicutes was 32.1%. UU was the most prevalent species (20.7%), followed by MH (13.4%), MG (5.7%), and UP (3.2%); 67.3% of the positive samples would have been missed if only urethral samples had been taken. Receptive anal sex (prevalence ratio PR = 1.79; 95% CI = 1.07–3.01) and clinical suspicion of sexually transmitted infection (PR = 1.62; 95% CI = 1.01–2.61) were factors associated with the detection of Mollicutes in general. Group sex (PR = 1.98; 95% CI = 1.12–3.50) and receptive anal sex (PR = 2.36; 95% CI = 0.95–5.86) were associated with the detection of Mycoplasma spp. No sociodemographic, clinical, or behavioural variable was significantly associated with the detection of Ureaplasma spp. Conclusions: A high prevalence of Mollicutes was observed among adolescent MSM and TGW, especially at extragenital sites. Further research is required to understand the epidemiological profile of high-risk adolescents in different regions and contexts, and to investigate the pathogenesis of Mollicutes in the oral and anal mucosa before routine screening can be recommended in clinical practice. © 2023, The Author(s). Article	2023	de la Court, Feline; Boyd, Anders; Coyer, Liza; van den Elshout, Mark; de Vries, Henry J C; Matser, Amy; Hoornenborg, Elske; Prins, Maria	The impact of COVID-19-related restrictions in 2020 on sexual healthcare use, pre-exposure prophylaxis use, and sexually transmitted infection incidence among men who have sex with men in Amsterdam, the Netherlands.	HIV Medicine	-	-	-	-	1468-1293	10.1111/hiv.13374	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9875115	OBJECTIVES: We studied the effects of restrictions related to the severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2; coronavirus disease 2019 COVID-19) pandemic on the use of sexual healthcare and pre-exposure prophylaxis (PrEP) and on the incidence of sexually transmitted infections (STIs) among men who have sex with men (MSM) in a prospective, open-label PrEP demonstration study (AMPrEP) in Amsterdam, the Netherlands. METHODS: We retrieved data from 2019 to 2020 for participants with one or more study visit in 2019 (n = 305) and from two COVID-19 questionnaires (2020: n = 203; 2021: n = 160). Analyses were stratified for three periods of pandemic-related restrictions (first: 15 March 2020-15 June 2020; second: 16 June 2020-15 September 2020; third: 16 September 2020-31 December 2020 or 1 April 2021 for the COVID-19 questionnaire). Endpoints included returning for care during the pandemic, PrEP use (increased/unchanged vs. deceased/stopped, relative to 2019), and any STI/HIV. We modelled determinants of care and PrEP use via multivariable logistic regression and STI incidence using piecewise Poisson regression, comparing the 2020 and 2019 periods. RESULTS: Of the 305 MSM included in the analysis, 72.8% returned for care during the pandemic, and this was significantly more likely among daily (vs. event-driven) PrEP users (p < 0.001). Increased/unchanged PrEP use ranged from 55.2% to 58.1% across the three pandemic periods and was more likely among those reporting chemsex in the first (p = 0.001) and third (p = 0.020) periods and among those reporting an increased/unchanged number of sex partners during the second period (p = 0.010). STI incidence was significantly lower in 2020 than in 2019 during the first (incidence rate ratio IRR 0.43; 95% confidence interval CI 0.28-0.68) and not significantly different during the second (IRR 1.38; 95% CI 0.95-2.00) and third (IRR 1.42; 95% CI 0.86-2.33) periods. No HIV was diagnosed. CONCLUSION: COVID-19-related restrictions coincided with reduced care and PrEP use. Changes in STI incidence suggest delayed diagnoses. Ways to ensure continued access to sexual healthcare during restrictions are needed. Article	2023	De Santis, A.; Garafoni, F.	Profilaxis pre-exposición (PrEP) al VIH, ¿qué conocemos de esta estrategia preventiva?	Boletín Farmacológico	-	-	-	-	na	NA	https://hdl.handle.net/20.500.12008/37333	La infección por el virus de la inmunodeficiencia humana (VIH) continúa incrementándose a nivel mundial pese a las enérgicas medidas preventivas, de diagnóstico y tratamiento precoces1. En este contexto surge la profilaxis pre-exposición (PrEP) como una estrategia de prevención, ya que se ha demostrado que la administración de fármacos antirretrovirales a personas expuestas y no infectadas por el VIH, puede reducir su transmisión. Organismos internacionales y locales como la Organización Mundial de la Salud (OMS) y sociedades científicas, han evaluado la PrEP y la han propuesto como una estrategia de prevención válida en contextos variados 2,3. ¿En qué consiste la PrEP? Se trata del uso de antirretrovirales como fumarato de disoproxilo de tenofovir (TDF) oral, o la fórmula combinada de TDF y emtricitabina (TDF/FTC) o TDF y lamivudina (TDF/3TC) en personas VIH negativas, y con alto riesgo de infección; siendo la combinación autorizada: TDF (300 mg) / FTC (300 mg). Existen dos pautas de administración de PrEP: un esquema diario cuando el riesgo es más frecuente de dos veces por semana y las relaciones sexuales no pueden predecirse ni postergarse 2 horas; y un esquema a demanda, cuando puede preverse la actividad sexual. Ésta última está recomendada solamente para hombres que tienen sexo con hombres (HSH), y consiste en la administración de 2 comprimidos entre 2 y 24 horas previas a la exposición, 1 comprimido a las 24 horas de la primera toma y otro a las 24 horas después (pauta 2 + 1 + 1) 4	NA	Spanish	Uruguay	Latin America and the Caribbean	Uruguay	Latin America and the Caribbean	NA	NA	Review
Article	2023	de Souza Lamônica J.; Magno L.; da Silva Santos J.E.J.; Dourado I.; dos Santos A.M.; Pereira M.	Unwillingness to prescribe PrEP by health care professionals of specialized HIV/AIDS services in Northeastern Brazil; Disposição para oferta de PrEP por profissionais de saúde de serviços especializados em HIV/aids no Nordeste do Brasil; Resistencia de los profesionales de la salud de los servicios especializados en VIH/SIDA a indicar la PrEP en el Nordeste de Brasil	Cadernos de Saúde Pública	-	-	-	-	0102311X	10.1590/0102-311XEN121322	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151537476&doi=10.1590%2f0102-311XEN121322&partnerID=40&md5=e0fc8f03b66ec0c8da1c5d87b81451f2	This study aimed to analyze factors associated with the unwillingness to prescribe pre-exposure prophylaxis (PrEP) by health care professionals of specialized HIV/AIDS services. This is a cross-sectional study with 252 health care professionals in 29 specialized care services (SCSs) in HIV/AIDS in 21 municipalities in the state of Bahia, Brazil. The inclusion criterion was that the professional had worked for at least six months in the service. Sociodemographic, occupational, and behavioral data were collected using a questionnaire. Logistic regression was performed with an estimation of crude and adjusted odds ratio (OR) and respective 95% confidence intervals (95%CI). The unwillingness to prescribe PrEP was 15.2% (95%CI: 10.8-19.6). The factors associated with unwillingness to prescribe PrEP were non-prescription of HIV self-tests for key populations (adjustedOR = 5.4; 95%CI: 1.3-22.4) nor post-exposure prophylaxis (adjustedOR = 2.00; 95%CI: 1.3-3.1), location of the SCS in the state capital (adjustedOR = 3.9; 95%CI: 1.4-10.2), and SCSs without PrEP offer (adjustedOR = 1.7; 95%CI: 1.1-2.8); professionals who have not reported the need to conduct training and courses (adjustedOR = 1.3; 95%CI: 1.1-1.8), or training with more experienced professionals (adjustedOR = 1.8; 95%CI: 1.1-3.8), was associated with a lower proportion of unwillingness to prescribe PrEP. Our results indicate that health care professionals' contextual, organizational, and training factors can contribute to PrEP indication. We suggest expanding ongoing training in combined HIV prevention among health care professionals and increasing the availability of PrEP in health services. © 2023 Fundacao Oswaldo Cruz. Article	2023	de Vos, Lindsey; Mudzingwa, Emily Krogstad; Fynn, Lauren; Atujuna, Millicent; Mugore, Matinatsa; Gandhi, Monica; Celum, Connie; Hosek, Sybil; Bekker, Linda-Gail; Daniels, Joseph; Medina-Marino, Andrew	Factors that influence adolescent girls and young women's re-initiation or complete discontinuation from daily oral PrEP use: a qualitative study from Eastern Cape Province, South Africa.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26175	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10533377	INTRODUCTION: Adolescent girls and young women (AGYW) face barriers that jeopardize their prevention-effective use of daily oral pre-exposure prophylaxis (PrEP). We sought to understand factors that influence AGYW's prolonged breaks in PrEP use, and their decisions to re-initiate or discontinue using PrEP in the context of a community-based adherence support intervention. METHODS: In-depth interviews (IDIs) were conducted between December 2019 and April 2021 with purposively selected AGYW (aged 16-25) enrolled in the Community PrEP Study (CPS) in Buffalo City Metro Health District, Eastern Cape Province, South Africa. AGYW were offered monthly PrEP for 24 months at two community-based study sites. Interview guides were informed by the Information-Motivation-Behavioural Skills Model, and data were analysed using illustrative code reports and a case analysis. RESULTS: A total of 603 participants were enrolled and initiated on PrEP in the parent study. Fifty-three IDIs were conducted with 50 CPS participants. Findings revealed that external factors (e.g. local movement, school holidays and medication side-effects) and social conflicts (e.g. discretion and partner mistrust) directly influenced breaks in PrEP usage. A decrease in one's self-perception of HIV risk prolonged the duration of these "PrEP breaks." Once PrEP refill visits were missed, some AGYW delayed returning for refills out of fear of being scolded by study staff. The differences between those participants who eventually re-initiated PrEP and those who disengaged from PrEP use can be attributed to social support and encouragement, level of familiarity with PrEP, risk perceptions, self-initiated discussions with staff and diminishing side effects. CONCLUSIONS: Despite implementing a community-based PrEP delivery platform and behavioural intervention that included support for daily oral PrEP adherence and disclosure, participants struggled with consistent daily oral PrEP use. Unpredictable life events, including local movement and schooling schedules, in addition to being judged for their perceived behaviours, pose a challenge for consistent pill pick-up for AGYW and habit formation. Long-acting injectable PrEP may mitigate a number of these external barriers. Interventions that integrate long-term planning skills, how to navigate existing social judgements and how to access sources of social support may further improve habit formation for PrEP use, regardless of its formulation.	na	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Qualitative
Article	2023	De Voux A.; Mvududu R.; Happel A.; Jaspan H.B.; Nyemba D.C.; Mashele N.; Myer L.; Davey D.L.J.	Point-of-Care Sexually Transmitted Infection Testing Improves HIV Preexposure Prophylaxis Initiation in Pregnant Women in Antenatal Care in Cape Town, South Africa, 2019 to 2021	Sexually Transmitted Diseases	-	-	-	-	1485717	10.1097/OLQ.0000000000001729	https://pubmed.ncbi.nlm.nih.gov/36630416/	Background Preexposure prophylaxis (PrEP) programs present a platform for diagnostic sexually transmitted infection (STI) testing in low- and middle-income countries, and availability of targeted STI testing has been hypothesized to influence PrEP use. We evaluated the association of STI testing modality and PrEP uptake among pregnant women in antenatal care. Methods We enrolled pregnant, HIV-uninfected women (16 years or older) at their first antenatal visit with follow-up through 12 months postpartum. Women were offered oral PrEP and tested for Chlamydia trachomatis and Neisseria gonorrhoeae using a point-of-care (POC; Cepheid, August 2019-November 2020) or laboratory-based (Thermofisher, December 2020-October 2021) test. We compared the proportion of women initiating and continuing PrEP by STI test adjusting for confounders. Results We evaluated 1194 women (median age, 26 years interquartile range, 22-31 years) with an STI result (46% POC and 54% laboratory-based). The prevalence of any STI was the same in POC-tested (28%) and laboratory-tested (28%) women - 25% versus 23% for C. trachomatis (P = 0.35) and 7% versus 9% for N. gonorrhoeae (P = 0.11). Mean time from testing to result was 0 day for POC and 26 days for laboratory testing, and mean time from testing to treatment was 3 days for POC and 38 days for laboratory testing. Receiving a POC STI test was associated with higher PrEP initiation compared with women receiving a laboratory-based test (90% vs. 78%; adjusted odds ratio, 2.1; 95% confidence interval, 1.5-2.9), controlling for age, gravidity, STI diagnosis, intimate partner violence, gestational age, employment, HIV risk perception, and cohabiting status. Conclusions Point-of-care STI testing, offering same-day results and treatment initiation, may increase PrEP initiation among pregnant women in antenatal care. © Lippincott Williams & Wilkins.	na	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2023	de Voux, Alex; Nyemba, Dorothy Chiwoniso; Silliman, Miriam; Mashele, Nyiko; Mvududu, Rufaro; Myer, Landon; Joseph Davey, Dvora	Point-of-care testing for sexually transmitted infections and HIV pre-exposure prophylaxis among pregnant women in South Africa, 2021-2022: Randomised controlled trial	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2023-055975	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180331887&doi=10.1136%2fsextrans-2023-055975&partnerID=40&md5=f384d121a6731937db468acbe3923a55	Objective: Pregnant and postpartum women (PPW) in Southern Africa are at increased risk of acquiring HIV and curable sexually transmitted infections (STIs). Oral pre-exposure prophylaxis (PrEP) is safe and effective to use during pregnancy to reduce HIV acquisition and vertical transmission. Point-of-care (POC) STI testing can identify PPW at risk of HIV and facilitate risk-differentiated and person-centred counselling to improve PrEP initiation, persistence and adherence. We evaluated the impact of POC STI testing compared with STI syndromic management on PrEP outcomes among PPW in Cape Town, South Africa. Methods: The STI and PrEP in Pregnancy Study enrolled PPW without HIV and ≤34 weeks pregnant at their regular antenatal care visit with follow-up after 1 month. PPW were randomised to receive POC STI testing or STI syndromic management. PPW randomised to POC STI testing self-collected vaginal swabs for Chlamydia trachomatis, Neisseria gonorrhoeae and Trichomonas vaginalis (Cepheid GeneXpert) testing and were offered same-day treatment if diagnosed. We compared PrEP initiation at baseline, PrEP prescription refill at 1 month (persistence) and adherence through tenofovir-diphosphate detection in dried blood spots by randomisation arm. In a secondary analysis, we evaluated the association between an STI diagnosis (positive STI test or reporting STI symptoms) with PrEP outcomes. Results: We enrolled and randomised 268 pregnant women. Twenty-eight per cent of women were diagnosed with ≥1 STI. Overall, 65% of women initiated and 79% persisted on PrEP with no significant differences by randomisation arm. Secondary analysis demonstrated that an STI diagnosis (positive STI test or reporting STI symptoms) was associated with higher PrEP initiation (adjusted relative risk=1.28; 95% CI 1.08 to 1.52), controlling for arm, maternal and gestational age. Conclusions: POC STI testing was not associated with PrEP initiation or persistence relative to syndromic management. However, improving STI diagnosis by supplementing syndromic management with POC STI testing could improve PrEP initiation among PPW. Article	2023	de Wit J.B.F.; Adam P.C.G.; den Daas C.; Jonas K.	Sexually transmitted infection prevention behaviours: health impact, prevalence, correlates, and interventions	Psychology and Health	-	-	-	-	8870446	10.1080/08870446.2022.2090560	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132851714&doi=10.1080%2f08870446.2022.2090560&partnerID=40&md5=79b64d2a5fa8b1154999a0e1e6c255d8	Sexually transmitted infections (STIs) remain a major public health threat, disproportionately affecting young people, and men who have sex with men. In this narrative review of the current state of behavioural science research on STI prevention, we consider the definition, health impacts, correlates and determinants, and interventions to promote STI prevention behaviour. Research on STI prevention behaviour has extended from a focus on abstinence, partner reduction and condom use, to also include novel preventive behaviours, notably treatment-as-prevention, pre-exposure prophylaxis (i.e., the preventive use of medicines by uninfected people), and vaccination for some STIs. Social-cognitive factors specified by, for instance the theory of planned behaviour, are critical proximal determinants of STI prevention behaviours, and related interventions can effectively promote STI prevention behaviours. Social-ecological perspectives highlight that individual-level determinants are embedded in more distal environmental influences, with social stigma especially affecting STI prevention behaviours and requiring effective intervention. Further to providing a major domain of application, STI prevention also poses critical challenges and opportunities for health psychology theory and research. We identify a need for health behaviour theory that addresses the processes linking multiple levels of influence on behaviour and provides practical guidance for multi-level behaviour change interventions adapted to specific contexts. © 2022 The Author(s). Article	2023	Dean L.T.; Predmore Z.; Skinner A.; Napoleon S.; Chan P.A.; Raifman J.	Optimizing Uptake of Long-Acting Injectable Pre-exposure Prophylaxis for HIV Prevention for Men Who Have Sex with Men	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-03986-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146540080&doi=10.1007%2fs10461-023-03986-5&partnerID=40&md5=b73f7b1dd7f4b3d1f2f737887c955d3d	Pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention tool. Long-acting injectable PrEP (LAI-PrEP) offers another opportunity to reduce HIV. However, how at-risk individuals will consider LAI-PrEP over other modes of administration is unclear. We conducted a discrete choice experiment on preferences for PrEP among a sample of N = 688 gay, bisexual, and other men who have sex with men (GBMSM). We analyzed preferences for mode of administration, side-effects, monetary cost, and time cost using a conditional logit model and predicted preference for PrEP options. LAI-PrEP was preferred, despite mode of administration being the least important PrEP attribute. Side-effects were the most important attribute influencing preferences for PrEP (44% of decision); costs were second-most-important (35% of decision). PrEP with no side-effects was the most important preference, followed by monthly out-of-pocket costs of $0. Practitioners and policymakers looking to increase PrEP uptake should keep costs low, communicate clearly about PrEP side-effects, and allow the use of patient-preferred modes of PrEP administration, including LAI-PrEP. © 2023, The Author(s). Article	2023	Del Pino H.E.; Rojas E.; Dăcus J.-D.; Durán P.; Martínez A.J.; Hernández J.A.; Ayala G.; Zea M.-C.; Schrode K.; Harawa N.T.	WOULD THE SIBLINGS OF LATINX MEN WHO HAVE SEX WITH MEN ENCOURAGE THEIR BROTHERS TO USE PrEP? FINDINGS FROM A FEASIBILITY AND ACCEPTABILITY STUDY	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2023.35.5.390	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175586362&doi=10.1521%2faeap.2023.35.5.390&partnerID=40&md5=1c041c5f0ca81b6b4e6265cce7c64d0f	We explored whether siblings can be engaged in PrEP promotion. We used the Information-Motivation-Behavior model to develop and conduct surveys and dyadic interviews with Latino men who have sex with men (LMSM) and their siblings (n = 31) and three sibling-only focus groups (n = 20). For LMSM, only n = 14 (45%) agreed they would benefit from taking PrEP, yet n = 22 (71%) would take PrEP to make their sibling worry less about them, and n = 23 (74%) requested a PrEP referral. For siblings, n = 20 (65%) believed PrEP would benefit their brother, and n = 19 (95%) in the focus groups said they would take PrEP to help their brother get started. Qualitative results include (1) siblings' support for PrEP use, (2) explicit conversations about sex were not necessary for discussing sexual health, and (3) siblings wanted to understand what they could do to encourage their brother to consider PrEP. We conclude siblings can be engaged in PrEP promotion. © 2023, Guilford Publications. All rights reserved. Article	2023	Delany-Moretlwe S.; Mgodi N.; Bekker L.-G.; Baeten J.M.; Li C.; Donnell D.; Agyei Y.; Lennon D.; Rose S.M.; Mokgatle M.; Kassim S.; Mukaka S.; Adeyeye A.; Celum C.	High prevalence and incidence of gonorrhoea and chlamydia in young women eligible for HIV pre-exposure prophylaxis in South Africa and Zimbabwe: Results from the HPTN 082 trial	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2022-055696	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152134112&doi=10.1136%2fsextrans-2022-055696&partnerID=40&md5=26fe17b9c59c5245ce7c9733f1433671	Introduction We investigated the prevalence, incidence and factors associated with sexually transmitted infections (STIs) among young African women seeking HIV pre-exposure prophylaxis (PrEP). Methods HPTN 082 was a prospective, open-label PrEP study enrolling HIV-negative sexually active women aged 16-25 years in Cape Town and Johannesburg, South Africa, and Harare, Zimbabwe. Endocervical swabs from enrolment, months 6 and 12 were tested for Neisseria gonorrhoeae (GC) and Chlamydia trachomatis (CT) by nucleic acid amplification, and Trichomonas vaginalis (TV) by a rapid test. Intracellular tenofovir-diphosphate (TFV-DP) concentrations in dried blood spots were measured at months 6 and 12. Associations between risk characteristics and STI outcomes were assessed using Poisson regression. Results Of 451 enrolled participants, 55% had an STI detected at least once. CT incidence was 27.8 per 100 person-years (py) (95% CI 23.1, 33.2), GC incidence was 11.4 per 100 py (95% CI 8.5, 15.0) and TV incidence was 6.7 per 100 py (95% CI 4.5, 9.5). 66% of incident infections were diagnosed in women uninfected at baseline. Baseline cervical infection (GC or CT) risk was highest in Cape Town (relative risk (RR) 2.38, 95% CI 1.35, 4.19) and in those not living with family (RR 1.87, 95% CI 1.13, 3.08); condom use was protective (RR 0.67, 95% CI 0.45, 0.99). Incident CT was associated with baseline CT (RR 2.01; 95% CI 1.28, 3.15) and increasing depression score (RR 1.05; 95% CI 1.01, 1.09). Incident GC was higher in Cape Town (RR 2.40; 95% CI 1.18, 4.90) and in participants with high PrEP adherence (TFV-DP concentrations ≥700 fmol/punch) (RR 2.04 95% CI 1.02, 4.08). Conclusion Adolescent girls and young women seeking PrEP have a high prevalence and incidence of curable STIs. Alternatives to syndromic management for diagnosis and treatment are needed to reduce the burden of STIs in this population. Trial registration number NCT02732730. © 2023 BMJ Publishing Group. Article	2023	Delgado F.; Hijab E.; Siira M.; Yeung H.	Perceptions and attitudes regarding HIV pre-exposure prophylaxis (PrEP) among dermatology clinicians and trainees	Archives of Dermatological Research	-	-	-	-	3403696	10.1007/s00403-022-02500-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143658307&doi=10.1007%2fs00403-022-02500-6&partnerID=40&md5=3a16576e199a8d344de04dfb1955370f	In 2020, over 1.2 million people were at risk of acquiring human immunodeficiency virus (HIV), though only 25% were prescribed pre-exposure prophylaxis (PrEP). Given the multitude of dermatologic manifestations of HIV and other sexually transmitted infections, dermatologic care can serve as the entry point to the HIV care continuum. Currently, there is limited data on specialists' perspectives on HIV PrEP prescribing. We aimed to survey clinicians and trainees in an academic dermatology department about HIV PrEP-related knowledge, attitudes, and practices. Survey questions were adapted from existing literature on HIV stigma and PrEP-related knowledge, attitudes, and practices. Composite scores for each domain were averaged and compared between clinicians and trainees using Wilcoxon's signed rank test or Fisher's exact test. Of 135 providers invited, 31 (23%) completed the survey (11 clinicians and 20 trainees). Of the 31 participants, 16 (52%) had specialized HIV experience and training. When asked about discriminatory beliefs, nine participants (29%) agreed that HIV infection is a "consequence of irresponsible behavior." PrEP knowledge was low, with 13 (42%) participants answering zero out of 3 PrEP knowledge questions correctly. Additionally, 10 (91%) clinicians reported poor knowledge of PrEP side effects, and eight clinicians (73%) indicated they were "not comfortable at all" in prescribing PrEP. No participant had prescribed PrEP, and 22 (70%) participants had never discussed PrEP with patients. Dermatology clinicians and trainees reported some levels of HIV stigma. Substantial gaps in PrEP knowledge and discussion were reported despite prior HIV discrimination training and HIV-related practice experience. Study limitations include a small sample size and a modest response rate. Addressing stigma among dermatologists and improving HIV PrEP education is vital to enhancing the healthcare outcomes of people living with HIV. © 2022, This is a U.S. Government work and not under copyright protection in the US; foreign copyright protection may apply. Article	2023	Desai J.; Krakower D.; Harris B.-L.; Culp S.; Nijhawan A.E.	HIV/Sexually Transmitted Infection Screening and Eligibility for HIV Preexposure Prophylaxis Among Women Incarcerated in an Urban County Jail	Sexually Transmitted Diseases	-	-	-	-	1485717	10.1097/OLQ.0000000000001852	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171119447&doi=10.1097%2fOLQ.0000000000001852&partnerID=40&md5=c9bc77d56cb21ee07386174b34789587	Background Incarcerated women experience high rates of HIV and sexually transmitted infections (STIs); few are offered HIV preexposure prophylaxis (PrEP). We aimed to examine HIV/STI screening rates in this population and identify PrEP eligibility. Methods Results of Chlamydia trachomatis (CT) and Neisseria gonorrhoeae (GC) urine and HIV/syphilis screening in cisgender women in the Dallas County Jail were compiled from January to October 2020. An electronic health record review was conducted for a subgroup in March 2020 to identify PrEP eligibility. Results Overall, 4398 of 13,292 women were screened for CT and 4389 of 13,292 for GC, and among them, 479 (11%) screened for HIV and 562 (13%) for syphilis. Furthermore, 462 of 4398 (11%) were positive for CT, 323 of 4389 (7%) were positive for GC, 10 of 479 (2%) had positive HIV test results, of whom 6 (1.3%) were new diagnoses and 75 (13%) had a reactive rapid plasma reagin test. In March 2020, of 541 women screened, 90 tested positive for CT or GC. Of these 90, 70 (78%) did not receive HIV or syphilis screening, including women with these risk factors: 10 (14%) were homeless, 11 (16%) reported heroin use, and 10 (14%) reported methamphetamine use. Based on the presence of an acute bacterial STI, 17% (96 of 541) were PrEP eligible. Conclusions Incarcerated women had high STI rates and other risk factors for HIV acquisition, although only 1 in 5 with acute STIs (11% overall) was also screened for HIV or syphilis. HIV prevention efforts should include comprehensive STI/HIV screening, linkage to treatment, and identification of PrEP candidates. © Lippincott Williams & Wilkins. Article	2023	Devanathan A.S.; Dumond J.B.; Anderson D.J.C.; Moody K.; Poliseno A.J.; Schauer A.P.; Sykes C.; Gay C.L.; Rosen E.P.; Kashuba A.D.M.; Cottrell M.L.	A Novel Algorithm to Improve PrEP Adherence Monitoring Using Dried Blood Spots	Clinical Pharmacology and Therapeutics	-	-	-	-	99236	10.1002/cpt.2845	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146979974&doi=10.1002%2fcpt.2845&partnerID=40&md5=69992ed1b8f9a830de505eba6b5788c5	Tenofovir diphosphate (TFVdp; an active metabolite of oral HIV pre-exposure prophylaxis (PrEP)) is measured in dried blood spots (DBS) to estimate adherence. However, TFVdp's long half-life in whole blood may lead to misclassification following a recent change in adherence. PrEP's other metabolite, emtricitabine triphosphate (FTCtp), has a shorter half-life in whole blood but adherence thresholds are undefined. We characterized DBS TFVdp and FTCtp concentrations across many dosing scenarios. Population pharmacokinetic models were fit to TFVdp and FTCtp DBS concentrations from a directly observed therapy study (NCT03218592). Concentrations were simulated for 90 days of daily dosing followed by 90 days of 1 to 7 doses/week and for event-driven PrEP (edPrEP) scenarios. Thresholds of 1,000 and 200 fmol/punch, for TFVdp and FTCtp, respectively, were reflective of taking 4 doses/week (a minimum target for effective PrEP in men). TFVdp was < 1,000 fmol/punch for 17 days after initiating daily PrEP and > 1,000 fmol/punch for 62 days after decreasing to 3 doses/week. Respectively, FTCtp was < 200 fmol/punch for 4 days and > 200 fmol/punch for 6 days. Accuracy of edPrEP adherence classification depended on duration between last sex act and DBS sampling for both measures with misclassification ranging from 9%–100%. These data demonstrate adherence misclassification by DBS TFVdp for 2 months following a decline in adherence, elucidating the need for FTCtp to estimate recent adherence. We provide proof of principle that individualized interpretation is needed to support edPrEP adherence monitoring. Our collective approach facilitates clinicians' ability to interpret DBS results and administer patient-centric interventions. © 2023 The Authors. Adapting Provider Training and Pre-Exposure Prophylaxis Advertising to Increase Pre-Exposure Prophylaxis Awareness and Uptake Among Black Cisgender Women	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2023.0188	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179423251&doi=10.1089%2fapc.2023.0188&partnerID=40&md5=d03a41686bfa494b1eca2b6e001bffdb	Black cisgender women (hereafter referred to as "women") have disproportionately high rates of HIV infection yet low rates of pre-exposure prophylaxis (PrEP) utilization. Barriers to PrEP uptake exist at the system, provider, and individual/client level. To learn how existing training and advertising can be adapted to address race- and sex-based gaps within PrEP service delivery, we conducted focus groups with providers and Black women. Participants were recruited at three health care organizations in the Midwest and South, screened for eligibility, and consented verbally. Focus groups occurred from August 2022 to February 2023. Women were asked about their knowledge and thoughts on PrEP. Providers were asked about factors influencing their decision-making about PrEP. A codebook was developed based on the Consolidated Framework for Implementation Research. Transcripts were coded using the Stanford Lightning Report Method. We completed four focus groups with 10 providers and 9 focus groups with 25 women. Three major themes emerged: (1) low comfort level and limited cultural sensitivity/competency among providers discussing HIV risk and PrEP with Black women, (2) women's concerns about PrEP's side effects and safety during pregnancy, and (3) lack of Black women representation in PrEP advertisement/educational materials. In addition, women in the South reported general medical mistrust and specific misconceptions about PrEP. PrEP trainings for providers need detailed information about the safety of PrEP for women and should include role-playing to enhance cultural competency. Likewise, PrEP advertisements/materials should incorporate information regarding side effects and images/experiences of Black women to increase PrEP awareness and uptake among this population. © Mary Ann Liebert, Inc.	advertising; Black/African American; pre-exposure prophylaxis (PrEP); providers; training; women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Devred, Inès; Kayembe, Kick; Valin, Nadia; Rougier, Hayette; Shinga, Bruce Wuembulua; Lambert-Niclot, Sidonie; Chiarabini, Thibault; Meyohas, Marie-Caroline; Lacombe, Karine	Prophylaxis by doravirine-lamivudine-tenofovir disoproxil fumarate or elvitegravir-cobicistat-emtricitabine-tenofovir alafenamide after sexual exposure to HIV.	BMC Infectious Diseases	-	-	-	-	1471-2334	10.1186/s12879-023-08544-x	https://pubmed.ncbi.nlm.nih.gov/37667182/	HIV post- exposure prophylaxis (PEP) is a prevention tool for individuals with a recent potential exposure to HIV. Doravirine has been available since 2019 in combination with tenofovir disoproxil fumarate and lamivudine and has not been evaluated as a PEP. DOR/3TC/TDF is our department's most commonly prescribed PEP treatment since 2021. This study evaluates the completion rate of the DOR/3TC/TDF as compared to EVG/c/FTC/TAF for PEP, which was the regimen prescribed until 2020 in our hospital.This retrospective observational study was conducted between January 2020 and September 2021. The subjects included consecutively were adults who consulted for an HIV sexual exposure accident and for whom DOR/3TC/TDF in 2021 or EVG/c/FTC/TAF in 2020 was prescribed. The outcomes were the completion rate in the end of treatment (28 days), the seroconversion rate, and the description of side effects.During the study period, 311 people were included: 140 treated with DOR/3TC/TDF and 171 treated with EVG/c/FTC/TAF. Considering subjects with a follow-up visit, the completion rate was 96.8% (90/93) in the DOR/3TC/TDF group, and 94.6% (123/130) in the EVG/c/FTC/TAF group (p-value: 0.53). The number of people lost to follow-up was nearly equivalent in both groups: 27.1% (38/140) in the DOR/3TC/TDF group and 23.4% (40/171) in the EVG/c/FTC/TAF group (p-value: 0.45). A side effect was described for 38% (36/94) in the DOR/3TC/TDF group, and 29.7% (38/128) in the EVG/c/FTC/TAF group. No cases of seroconversion were observed.DOR/3TC/TDF appears to have a similar safety profile to EVG/c/FTC/TAF. Due to its lower cost, it seems to be a treatment option for consideration in the context of HIV-exposure accidents.	Adherence; Completion rate; Doravirine; HIV; Post-exposure prophylaxis. Article	2023	Dharan N.J.; Jin F.; Vaccher S.; Bavinton B.; Yeung B.; Guy R.; Carr A.; Zablotska I.; Amin J.; Read P.; Templeton D.J.; Ooi C.; Martin S.J.; Ryder N.; Smith D.E.; McNulty A.; Brown K.; Price K.; Holden J.; Grulich A.E.	Characteristics of Human Immunodeficiency Virus (HIV) Seroconversions in a Large Prospective Implementation Cohort Study of Oral HIV Preexposure Prophylaxis in Men Who Have Sex with Men (EPIC-NSW)	Clinical Infectious Diseases	-	-	-	-	10584838	10.1093/cid/ciac660	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151864117&doi=10.1093%2fcid%2fciac660&partnerID=40&md5=16b904852ca8523f33254e58d2db70a1	Background: Most human immunodeficiency virus (HIV) seroconversions in people who have initiated preexposure prophylaxis (PrEP) occur in the context of insufficient adherence. We describe participants who seroconverted after being dispensed PrEP in a large PrEP implementation study in Australia. Methods: Expanded PrEP Implementation in Communities in New South Wales was an implementation study of daily oral PrEP in individuals aged ≥18 years at high risk for acquiring HIV. HIV seroconversions were defined as a positive HIV test by either antigen, antibody, or detectable HIV viral load after enrollment. Insufficient adherence, measured by dispensing logs or participant self-report, was defined as <4 PrEP doses per week. Results: A total of 9596 participants were enrolled and dispensed PrEP between 1 March 2016 and 30 April 2018; 30 were diagnosed with HIV by 31 March 2019. The median (interquartile range IQR) age was 31 (25-38) years, all identified as male, 29 (97%) identified as gay or homosexual, and 20 (69%) lived in a postcode with a low concentration of gay male residents. The median (IQR) days from first PrEP dispensing to diagnosis was 409 (347-656). There was no evidence that participants who seroconverted had been sufficiently adherent to PrEP. Nineteen (63%) participants who seroconverted were diagnosed with chlamydia, gonorrhea, syphilis, or new hepatitis C infection. One participant had resistance to emtricitabine (M184V mutation) at diagnosis. Conclusions: Participants who seroconverted were insufficiently adherent to PrEP despite being at high risk for acquiring HIV. Understanding the reasons for poor PrEP adherence in individuals who subsequently acquire HIV is critical to improving PrEP effectiveness. © 2022 The Author(s). Article	2023	Dhir Amit "Mickey"	Preexposure Prophylaxis for HIV Prevention in the United States: An Overview and Update	The American Journal of Nursing	-	-	-	-	0002936X	10.1097/01.NAJ.0000997216.21988.19	https://www.proquest.com/scholarly-journals/preexposure-prophylaxis-hiv-prevention-united/docview/2892021918/se-2?accountid=8113	There were 36,136 new HIV diagnoses in the United States and dependent areas in 2021, despite a 12% reduction in estimated HIV incidence from 2017 to 2021. The burden of HIV remains disproportionately high among certain populations, including gay and bisexual men, Black/African American individuals, and Hispanic/Latino individuals, and racial and ethnic health care disparities persist. The Ending the HIV Epidemic initiative aims to significantly reduce new infections, with a focus on HIV prevention, particularly the use of preexposure prophylaxis (PrEP). However, challenges remain in achieving equitable PrEP distribution. As frontline health care providers, nurses play a pivotal role in this battle against HIV. This article provides an update on PrEP screening recommendations, the types of PrEP available, dosing, adverse effects, and the role of nurses in patient support and monitoring. Article	2023	Diabaté S.; Béhanzin L.; Guédou F.A.; Goma-Matsétsé E.; Olodo M.; Aza-Gnandji M.; Dossouvo A.; Akpaka A.; Chagas E.; Gangbo F.; Zannou D.M.; Alary M.	Pre-exposure prophylaxis in real life: experience from a prospective, observational and demonstration project among men who have sex with men in Benin, West Africa	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.26130	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161666238&doi=10.1002%2fjia2.26130&partnerID=40&md5=663bc82983b87cfd159e5c0c9dae7007	Introduction: Since many countries in sub-Saharan Africa are willing to implement HIV oral pre-exposure prophylaxis (PrEP) for men who have sex with men (MSM), data are needed to assess its feasibility and relevance in real life. The study objectives were to assess drug uptake, adherence, condom use and number of sexual partners, HIV incidence and trends in the prevalence of gonorrhoea and chlamydia. Methods: In this oral PrEP demonstration study conducted prospectively in Benin, a combination of tenofovir disoproxil fumarate-TDF 300 mg and emtricitabine-FTC 200 mg (TDF-FTC) was offered daily or on-demand to MSM. Participants were recruited from 24 August to 24 November 2020 and followed over 12 months. At enrolment, month-6 and month-12, participants answered to a face-to-face questionnaire, underwent a physical examination and provided blood samples for HIV, gonorrhoea and chlamydia. Results: Overall, 204 HIV-negative men initiated PrEP. The majority of them (80%) started with daily PrEP. Retention rates at month-3, 6, 9 and 12 were 96%, 88%, 86% and 85%, respectively. At month-6 and month-12, respectively, 49% and 51% of the men on daily PrEP achieved perfect adherence (self-reported), that is seven pills taken during the last week. For event-driven PrEP, the corresponding proportions for perfect adherence (last seven at-risk sexual episodes covered) were 81% and 80%, respectively. The mean number (standard deviation) of male sexual partners over the last 6 months was 2.1 (1.70) at baseline and 1.5 (1.27) at month-12 (p-value for trend <0.001). Consistent condom use during the last 6 months was 34% (enrolment), 37% (month-6) and 36% (month-12). Three HIV seroconversions (2-daily and 1-event-driven) were recorded. Crude HIV incidence (95% confidence interval) was 1.53 (0.31−4.50)/100 person-years. Neisseria gonorrhoeae and/or Chlamydia trachomatis prevalence at the anal and/or pharyngeal and/or urethral sites was 28% at baseline and 18% at month-12 (p-value = 0.017). Conclusions: In West Africa, oral PrEP introduction in routine practice as a component of a holistic HIV prevention package is feasible and may not result in a significant increase in condomless sex among MSM. Since HIV incidence was still higher, additional interventions, such as culturally tailored adherence counselling, may be needed to optimize the benefits of PrEP. © 2023 The Authors. Article	2023	Díaz-Sosa, Dulce María; Guillen-Díaz-Barriga, Centli; Robles-García, Rebeca; Vega-Ramírez, Hamid	Willingness to Recommend Pre-Exposure Prophylaxis for HIV Prevention Among Mexican Non-Physician Health Providers: A Cross-Sectional Study.	Current HIV Research	-	-	-	-	1873-4251	10.2174/1570162X21666221125150535	https://dx.doi.org/10.2174/1570162X21666221125150535	BACKGROUND: Pre-exposure prophylaxis (PrEP) has recently been introduced in Mexico. Still, there are no data exploring the frequency and related factors of willingness to recommend it among non-physician health providers (Non-PHP). OBJECTIVE: Compare awareness, knowledge, attitudes, and willingness to recommend PrEP and combined HIV prevention among Mexican non-PHP. METHODS: We conducted an online survey assessing data on sociodemographics, awareness, knowledge, and willingness to recommend PrEP. We performed a descriptive and comparative analysis between those willing and unwilling to recommend PrEP. RESULTS: The final sample was 142 participants, and most were willing to recommend PrEP (79.6%). This group reported higher confidence in evaluating PrEP eligibility (90.1%, p<.01), identified that populations at increased risk of HIV would benefit the most from PrEP (p≤.05), and considered the lack of professionals to prescribe PrEP as a barrier (60.7%, p<.01), and were more likely to recommend post-exposure prophylaxis (95.6%, p<.01) compared to those not willing to recommend PrEP. On the other hand, more non-PHP unwilling to recommend PrEP considered that behavioral interventions should be prioritized over PrEP (89.3%, p<.05), PrEP should not be provided in public services (43.3%, p<.001), and the demand of PrEP users would be low to maintain PrEP as a public policy (34.5%, p<.05). CONCLUSION: A high proportion of Mexican non-PHP is willing to recommend PrEP. Still, it is necessary to increase their PrEP knowledge, including improving their prejudices and beliefs, so they can identify and refer potential PrEP users based on their risk of getting HIV. Article	2023	Dietrich J.J.; Ahmed N.; Tshabalala G.; Wu M.; Mulaudzi M.; Hornschuh S.; Atujuna M.; Muhumuza R.; Ssemata A.S.; Stranix-Chibanda L.; Nematadzira T.; Bekker L.-G.; Martinson N.; Seeley J.; Fox J.	A qualitative study to explore daily versus ondemand oral pre-exposure prophylaxis (PrEP) in young people from South Africa, Uganda and Zimbabwe	PLOS One	-	-	-	19326203	10.1371/journal.pone.0287627	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163862641&doi=10.1371%2fjournal.pone.0287627&partnerID=40&md5=3a7e9f2fe55764c3c2fd53268d3ea561	Background Adolescents in sub-Saharan Africa (SSA) remain vulnerable to HIV infection. While preexposure prophylaxis (PrEP) is highly effective in preventing HIV transmission as a daily or on-demand regimen, tailored approaches are necessary. The Combined HIV Adolescent PrEP and Prevention Study (CHAPS) is a mixed-methods research program investigating the acceptability and feasibility of implementing daily and on-demand PrEP among young people in SSA. It also aims to determine an on-demand dosing schedule for insertive sex. For this paper, we explored preferences for daily versus on-demand PrEP amongst adolescents as part of CHAPS. Methods Purposive sampling was used to recruit participants from Soweto and Cape Town (South Africa), Wakiso district (Uganda) and Chitungwiza (Zimbabwe). At the time of the study in 2018/2019, Uganda had not rolled out PrEP to the general population; in Zimbabwe, PrEP for young people was only available at selected sites with one located within the study recruitment area. In South Africa, PrEP was made available to selected high-risk groups. We conducted 60 in-depth interviews and 24 group discussions amongst young people aged 13-24 without HIV in South Africa, Uganda, and Zimbabwe. All in-depth interviews and group discussions were audio-recorded, transcribed verbatim and translated to English. Data were analysed using framework analysis. The main themes were centered around preferences for daily and on-demand PrEP. Results Reasons for on-demand preferences included stigma, pill fatigue, adherence and side effects. Reasons for daily PrEP preferences included factors related to sexual risk behaviour, continuous protection against incidents of unintentional exposure, and the increased efficacy of a daily dose. Participants at all sites preferring daily PrEP identified the same reasons, with more males than females citing inadvertent blood contact or perceived increased efficacy. Similarly, participants at all sites preferring on-demand PrEP gave the same reasons for their preferences for on-demand PrEP; the exception was South Africans who did not mention the hope of having fewer side effects by not taking daily PrEP. Additionally, more males than females cited intermittent sex as a reason for opting for on-demand PrEP. Conclusions Our study is the first known to explore and describe youth preferences for daily versus ondemand PrEP. While the choice is clear-cut, the reasons cited in the different options provide invaluable insights into their decisions, and the actual and perceived facilitators and barriers to access to PrEP. Further education is needed amongst young people, not only about PrEP but also in other areas of comprehensive sexuality education. Exploring all options of HIV prevention is crucial to provide a tailored, one-size-does-not-fit-all approach to adolescent care in SSA to reduce and, the continued and increasing risk of this preventable infection. © 2023 Dietrich et al.	na	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Mixed methods
Theses and Dissertations	2023	Ditsheko, Enole	Decoding the Public Service Announcements (PSAs) of HIV/AIDS: Evaluating Botswana's AIDS Messages and Their Impact on 15 - 24 Ages	-	-	Southern Illinois University Carbondale	-	na	NA	https://opensiuc.lib.siu.edu/dissertations/2125	The study is grounded in the concept of "Start where the people are" (Nyswander, 1956) which suggests that effective health campaigns that promote prevention strategies to enhance the quality of life for those targeted must be rooted in the prevalent cultural practices and religious values of the receivers of the slogans, themes, and taglines. Health campaigns that superimpose the values of the outsiders promoted as universalized solutions have limited effectiveness.Sub-Saharan Africa has only 1.3 billion people out of an estimated eight billion of which China and India each recording above two billion, cumulatively accounting for more than half of the world population. Yet sub-Saharan Africa is the epicenter of HIV infections with more than 68% (avert.org), or nearly 26 million out of almost 38 million people living with HIV, globally. This scenario demands that global citizens should foster effective collaborations to end human suffering. Among the ten nations in the world hardest hit by HIV, seven of them are in the southern African region where Botswana, in position three at 18.6% is trailing her next-door neighbors, Lesotho (20.9%) and Eswatini (formerly Swaziland) which leads the pack with 27.9% (UNAIDS Report 2022). This study, therefore, focuses on children and adolescents between 15 and 24 in Botswana. According to a surveillance report (Botswana AIDS Impact Survey 2021) covering the period from March to August, adolescents and youths in Botswana are a source of concern. The report puts the national prevalence at 20.8% or 329,000 persons of the reproductive population (15-49 ages) are living with HIV. This sobering picture is despite the free availability of treatment drugs at no cost since 2002, when Botswana became the first African nation to roll out antiretroviral treatment (HAART interchangeably called ARVs) that was adapted as Masa – 'a ray of hope of a new dawn' in 2002. Further, the continued increase in new HIV infections among people of ages 15 to 24 since 2010 is recorded amid major prevention campaigns sponsored through global health partnerships, translating into billions of U S dollars. Numerous HIV prevention strategies developed in the West using empirical data and technology include condom use, antiretroviral regimens known as pre-exposure prophylaxis (PrEP), and treatment as prevention popularized as undetectable equals untransmissible (U = U). Social media channels like Facebook, TikTok, YouTube, Snapchat, and Instagram are awash with these HIV prevention strategies, and the adolescent population of Botswana consumes information about everything, including these HIV prevention campaigns. These mentioned strategies seem to provide effective barriers against the intrusion of HIV in the "key populations," a United Nations preferred term to refer to members of the lesbian, gay, bisexual, transgender, queer and intravenous drug users (LGBTQI) communities in the Western nations. However, these strategies require major adjustments when launched in sub-Saharan Africa, this study's results show, or they are the right message targeted to the wrong audience, mainly because of a lack of cultural representation in the nuanced taglines, headlines, slogans, and themes. The study suggests that for HIV to be eliminated, participatory research and co-learning where Western science and technology on one hand, and African indigenous knowledge, on the other hand, can fuse in the design of strategies should be prioritized as an emergency.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Quantitative
Article	2023	Dolthammasiri P.; Harnlakorn P.; Sribenjalux W.; Meesing A.	Prevalence and Risk Factors of Sexual Transmitted Diseases in High-Risk Population: A Single Center Study in Thailand	Journal of the Medical Association of Thailand	-	-	-	1252208	10.35755/jmedassocthai.2023.S01.13778	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159385879&doi=10.35755%2fjmedassocthai.2023.S01.13778&partnerID=40&md5=a65843c44efd08c27c9ee04db751676a	Objective: Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) in men who have sex with men (MSM) and transgender women (TGW) are the recent method to prevent HIV transmission but tends to increase prevalence of sexual transmitted diseases (STDs). STDs have not been reported in our center. The authors aimed to study prevalence and risk factor of STDs in MSM and TGW. Materials and Methods: A retrospective study of 176 MSM and TGW individuals between 1st January 2012 to 30th December 2020 from test and treat clinic at Srinagarind hospital, Khon Kaen University, Khon Kaen, Thailand has been conducted. The authors collected data and medical history for demonstrating prevalence and risk factor of STDs. Results: Of 176 patients, the mean age was 27.0±6.7 years, and 171 (97.2%) patients were MSM. Thirty-four patients (19.3%) had syphilis. The prevalence of HIV infection was 17.6%, gonococcal urethritis was 6.8%, HBV infection was 3.1%, and non-gonococcal urethritis was 1.1%. Patients who were sometimes use condom with steady partner had significant risk for HIV infection (aOR 3.62 95% CI 1.46 to 9.00, p=0.03). History of previous STDs infection was statically significant associated with new event of syphilis infection (aOR 4.00 95% CI 1.32 to 11.65, p=0.02) and HIV infection (aOR 4.40 95% CI 1.93 to 9.80, p<0.001). Conclusion: Syphilis was the most common STDs. Sometimes used condom with steady partner was a risk factor for HIV infection and history of previous STDs infection was a risk factor for syphilis and HIV infection. © 2023 JOURNAL OF THE MEDICAL ASSOCIATION OF THAILAND	Men who have sex with men; STDs; Transgender women	English	Thailand	Asia and the Pacific	Thailand	Asia and the Pacific	Thailand	Asia and the Pacific	Clinical
Article	2023	Donnell, D; Gao, F; Hughes, JP; Hanscom, B; Corey, L; Cohen, MS; Edupuganti, S; Mgodi, N; Rees, H; Baeten, JM; Gray, G; Bekker, LG; Hosseinipour, M; Delany-Moretlwe, S	Counterfactual estimation of efficacy against placebo for novel PrEP agents using external trial data: example of injectable cabotegravir and oral PrEP in women	Journal of the International AIDS Society	-	-	-	na	10.1002/jia2.26118	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02578535/full	INTRODUCTION: Multiple antiretroviral agents have demonstrated efficacy for human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP). As a result, clinical trials of novel agents have transitioned from placebo- to active-controlled designs; however, active-controlled trials do not provide an estimate of efficacy versus no use of PrEP. Counterfactual placebo comparisons using other data sources could be employed to provide this information. METHODS: We compared the active-controlled study (HPTN 084) of injectable cabotegravir (CAB-LA) versus daily oral emtricitabine/tenofovir disoproxil fumarate (FTC/TDF) among women from seven countries in Africa to three external, contemporaneous randomized HIV prevention trials from which we constructed counterfactual placebo estimates. We used direct standardization via analysis weights to achieve the same distribution of person-years between the external study and HPTN 084, across strata predictive of HIV risk (country and selected risk covariates). We estimated prevention efficacy against a counterfactual placebo to provide information on the use of CAB-LA and FTC/TDF compared to no intervention. We compared the counterfactual placebo findings for FTC/TDF to previous placebo-controlled trials, adjusted for observed adherence to daily pills. RESULTS: Distribution of age and baseline prevalence of gonorrhoea and chlamydia were similar among matched counterfactual placebo and observed HPTN 084 arms after standardization. Counterfactual estimates of CAB-LA versus placebo in all three settings showed a consistent risk reduction of 93%-94%, with lower bounds of the confidence intervals above 72%. Observed adherence (quantifiable tenofovir in plasma) in HPTN 084 was 54%-56%, and estimated efficacy of daily oral FTC/TDF against a counterfactual placebo was consistent with a predicted risk reduction of 39%-40% for this level of daily pill use. CONCLUSIONS: Counterfactual placebo rates of HIV acquisition derived from external trial data in similar locations and time can be used to support estimates of placebo-based efficacy of a novel HIV prevention agent. External trial data must be standardized to be representative of the clinical trial cohort testing the novel HIV prevention agent, accounting for confounders.	*Anti-HIV Agents therapeutic use; *HIV Infections drug therapy, prevention & control; *Human immunodeficiency virus; *Organophosphonates therapeutic use; *Pre-Exposure Prophylaxis; *pre-exposure prophylaxis; *risk reduction; Adenine; Adult; Africa; Article; Chlamydia; Clinical trial; Confounding variable; Controlled study; Deoxycytidine therapeutic use; Drug therapy; Emtricitabine therapeutic use; Female; Gonorrhea; Human; Human tissue; Humans; Nonhuman; Pill; Prevalence; Prevention; Randomized controlled trial; Standardization	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Article	2023	Dourado I.; Magno L.; Greco D.B.; Zucchi E.M.; Ferraz D.; Westin M.R.; Grangeiro A.	Interdisciplinarity in HIV prevention research: the experience of the PrEP1519 study protocol among adolescent MSM and TGW in Brazil; Interdisciplinaridade na pesquisa sobre prevenção do HIV: a experiência do protocolo de estudo PrEP1519 entre HSH adolescentes e mulheres trans no Brasil; Interdisciplinariedad en la investigación de la prevención del VIH: la experiencia del protocolo de estudio PrEP1519 entre adolescentes HSH y TGW en Brasil	Cadernos de Saúde Pública	-	-	-	0102311X	10.1590/0102-311XEN143221	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151573659&doi=10.1590%2f0102-311XEN143221&partnerID=40&md5=51882d890d1525187536612c50fff354	At the end of 2017, Brazil adopted HIV pre-exposure prophylaxis (PrEP) as part of a combination prevention strategy for the most at-risk populations. However, Brazil does not have specific guidelines for PrEP use among adolescents aged < 18 years. Therefore, researchers from different health disciplines conducted PrEP1519, the first PrEP demonstration cohort study, ongoing in three Brazilian cities - Salvador, Belo Horizonte, and São Paulo - among adolescent men who have sex with men and transgender women, aged 15-19 years. This study aimed to evaluate the effectiveness of PrEP in real-world settings. Quantitative and qualitative methods were integrated to obtain data on PrEP acceptability, uptake, use, and adherence. Moreover, comprehensive services and friendly environments were implemented in the PrEP1519 clinics. This study aims to describe the collaborative efforts of interdisciplinary practices in the development of the PrEP1519 study. The articulation of researchers from different institutions and areas is challenging; but it also allows for a broader outlook on questions regarding the direction of the research, while enriching the decisions needed to be taken during the interactions and negotiations among the different individuals, including the youth team and participants. Furthermore, it reflects on the communication process between cultures and languages considering the trans-epistemic arena of knowledge production about HIV, sexually transmitted infections, PrEP, and other combination prevention strategies for adolescents. © 2023 Fundacao Oswaldo Cruz. Article	2023	Dourado I.; Soares F.; Magno L.; Amorim L.; Eustorgio Filho M.; Leite B.; Greco D.; Westin M.; Tupinambás U.; Massa P.; Miura Zucchi E.; Grangeiro A.	Adherence, Safety, and Feasibility of HIV Pre-Exposure Prophylaxis Among Adolescent Men Who Have Sex With Men and Transgender Women in Brazil (PrEP1519 Study)	Journal of Adolescent Health	-	-	-	1054139X	10.1016/j.jadohealth.2023.09.005	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175543968&doi=10.1016%2fj.jadohealth.2023.09.005&partnerID=40&md5=fbe356cb746ee775f6a3227fd0014106	Purpose: To evaluate the adherence, safety, and feasibility of pre-exposure prophylaxis (PrEP) in real-world settings among adolescent men who have sex with men (AMSM) and transgender women (ATGW). Methods: PrEP1519 is a single-arm, multicentric demonstration cohort study of daily oral PrEP among AMSM and ATGW aged 15 to 19 years in Brazil. Study visits occurred at baseline, weeks 4, 12, and then quarterly until 96 weeks. Descriptive statistics and a mixed logistic model for longitudinal data evaluated the factors associated with high adherence. Results: One thousand sixteen AMSM and ATGW accessed the PrEP1519 clinics. Of those, 998 (98.2%) underwent clinical triage. Forty one were diagnosed with human immunodeficiency viruses (HIV) at baseline (4.0%) and 79 (7.9%) were not eligible for PrEP. Of the 878, 795 (90.5%) enrolled in PrEP, 82 (10.3%) were lost to follow-up, and 713 were included. There was no significant decrease in creatinine clearance; only two participants had grade-III aspartate aminotransferase elevation. Incident HIV infection occurred in eight participants (incidence rate IR = 1.64 per 100 person-years PY): two in 15–17 years (IR = 2.24 per 100 PY) and six in 18–20 years (IR = 1.51 per 100 PY). PrEP adherence was higher among those with more years of schooling, those reporting no difficulties in PrEP use due to side effects, and who had low HIV risk perception in the past three months. Discussion: PrEP for AMSM and ATGW was safe and feasible in real-world settings. However, a higher IR among young adolescents and a higher adherence among less vulnerable people indicate the need for greater care, considering the specificities of this age group. © 2023 Society for Adolescent Health and Medicine	Adherence; Adolescent; Feasibility; Men who have sex with men; PrEP; Safety; Transgender women	English	United States	Western and Central Europe and North America	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Clinical
Article	2023	Dourado, Inês; Guimarães, Mark Drew Crosland; Kendall, Carl; Kerr, Ligia Regina Franco Sansigolo; Knauth, Daniela; Leal, Andrea Fachel; Magno, Laio; Soares, Fabiane; Silva, Luís Augusto V da; Veras, Maria Amélia; de Brito, Ana Maria	Perceived Risk of HIV Infection and Acceptability of PrEP among Men Who Have Sex with Men in Brazil	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-022-02342-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139262302&doi=10.1007%2fs10508-022-02342-3&partnerID=40&md5=7e0bfd11ce44abea3bcb1d9240940b3d	The HIV epidemic affects men who have sex with men (MSM) disproportionally in Brazil, and pre-exposure prophylaxis (PrEP) is effective for preventing HIV in this population. However, low perceived risk of HIV may influence the acceptability and decision to use PrEP. This study estimated the association between self-perception of HIV risk and acceptability of daily oral PrEP among Brazilian MSM. Respondent-driven sampling (RDS) was used for behavioral and biological surveillance to recruit 4,176 MSM 18 years or over in 12 Brazilian cities in 2016. Results were weighted using Gile's estimator in RDS Analyst software. Adjusted odds rations (OR) with 95% confidence intervals were calculated using multivariate logistic regression. Acceptability of daily oral PrEP was high (69.7%) among the 3,544 MSM available for analysis. Most participants self-reported low or moderate risk of HIV infection (67.2%) and a small proportion (9.3%) reported high risk. A dose–response relationship was observed between acceptability of PrEP and self-reported risk: PrEP acceptability was 1.88 times higher (OR 1.8; 95% CI: 1.24–2.85) among MSM whose perceived risk of HIV infection was low or moderate, and 5 times higher (OR 5.68; 95% CI: 2.54–12.73) among those who self-reported high risk compared to MSM reporting no HIV risk. MSM with the highest risk perception of HIV reported higher rates of PrEP acceptability. Given the availability of daily oral PrEP in the public health care system in Brazil, we suggest emphasizing counseling about self-perception of HIV risk as part of routine HIV prevention services. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Dowell-Day, Alexander; Dobbins, Timothy; Chan, Curtis; Fraser, Doug; Holt, Martin; Vaccher, Stefanie J.; Clifton, Brent; Zablotska, Iryna; Grulich, Andrew; Bavinton, Benjamin R.	Attitudes Towards Treatment as Prevention Among PrEP-Experienced Gay and Bisexual Men in Australia	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04019-x	https://www.proquest.com/scholarly-journals/attitudes-towards-treatment-as-prevention-among/docview/2843479825/se-2?accountid=8113	The introduction of HIV pre-exposure prophylaxis (PrEP) has the potential to impact the attitudes gay and bisexual men (GBM) who consequently choose to take PrEP have towards treatment as prevention (TasP), and the extent to which they are willing to have condomless anal intercourse (CLAI) with an HIV-positive sexual partner who has an undetectable viral load (UVL). Using a cross-sectional sample from an observational cohort study conducted from August 2018 to March 2020, we examined the extent to which PrEP-experienced GBM are willing to have CLAI with a partner who has a UVL. Simple and multiple logistic regression models were used to identify associated variables. Of the 1386 participants included in the analyses, 79.0% believed in the effectiveness of TasP, and 55.3% were willing to have CLAI with a partner who has a UVL. Wiling participants were less worried about getting HIV when taking PrEP and more likely to believe in TasP. Further research is needed to better understand the gap between belief in TasP and willingness to have CLAI with a partner who has a UVL among PrEP-experienced GBM. Article	2023	Downing M.J., Jr.; Wiatrek S.E.; Zahn R.J.; Mansergh G.; Olansky E.; Gelaude D.; Sullivan P.S.; Stephenson R.; Siegler A.J.; Bauermeister J.; Horvath K.J.; Chiasson M.A.; Yoon I.S.; Houang S.T.; Hernandez A.J.; Hirshfield S.	Video selection and assessment for an app-based HIV prevention messaging intervention: formative research	mHealth	-	-	-	23069740	10.21037/mhealth-21-53	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85158842871&doi=10.21037%2fmhealth-21-53&partnerID=40&md5=68b5f44c659af679deb5ab4cb8867e95	Background: Gay, bisexual, and other men who have sex with men (GBMSM) continue to be overrepresented in human immunodeficiency virus (HIV) infection in the United States. HIV prevention and care interventions that are tailored to an individual's serostatus have the potential to lower the rate of new infections among GBMSM. Mobile technology is a critical tool for disseminating targeted messaging and increasing uptake of basic prevention services including HIV testing, sexually transmitted infection (STI) testing, and pre-exposure prophylaxis (PrEP). Mobile Messaging for Men (M-Cubed) is a mobile health HIV prevention intervention designed to deliver video- and text-based prevention messages, provide STI and HIV information, and link GBMSM to prevention and healthcare resources. The current report describes an iterative process of identifying and selecting publicly available videos to be used as part of the M-Cubed intervention. We also conducted interviews with GBMSM to assess the acceptability, comprehension, and potential audience reach of the selected video messages. Methods: The selection of videos included balancing of specific criteria e.g., accuracy of scientific information, video length, prevention domains: HIV/STI testing, antiretroviral therapy (ART), PrEP, engagement in care, and condom use to ensure that they were intended for our GBMSM audiences: HIV-negative men who engage in condomless anal sex, HIV-negative men who do not engage in condomless anal sex, and men living with HIV. This formative study included in-depth interviews with 26 GBMSM from three U.S. cities heavily impacted by the HIV epidemic—New York City, Detroit, and Atlanta. Results: Following a qualitative content analysis, the study team identified five themes across the interviews: participant reactions to the video messages, message comprehension, PrEP concerns, targeting of video messaging, and prompted action. Conclusions: Study results informed a final selection of 12 video messages for inclusion in a randomized controlled trial of M-Cubed. Findings may serve as a guide for researchers who plan to develop HIV prevention interventions that utilize publicly available videos to promote behavioral change. Further, the findings presented here suggest the importance of developing videos with broad age and gender diversity for use in interventions such as M-Cubed, and in other health promotion settings. © mHealth. Article	2023	Doyle, Carla M; Milwid, Rachael M; Cox, Joseph; Xia, Yiqing; Lambert, Gilles; Tremblay, Cécile; Otis, Joanne; Boily, Marie-Claude; Baril, Jean-Guy; Thomas, Réjean; Blais, Alexandre Dumont; Trottier, Benoit; Grace, Daniel; Moore, David M; Mishra, Sharmistha; Maheu-Giroux, Mathieu	Population-level effectiveness of pre-exposure prophylaxis for HIV prevention among men who have sex with men in Montréal (Canada): a modelling study of surveillance and survey data	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.26194	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178850664&doi=10.1002%2fjia2.26194&partnerID=40&md5=83464c0e8326d1e73eb2547992c8beee	Introduction: HIV pre-exposure prophylaxis (PrEP) has been recommended and partly subsidized in Québec, Canada, since 2013. We evaluated the population-level impact of PrEP on HIV transmission among men who have sex with men (MSM) in Montréal, Québec's largest city, over 2013–2021. Methods: We used an agent-based mathematical model of sexual HIV transmission to estimate the fraction of HIV acquisitions averted by PrEP compared to a counterfactual scenario without PrEP. The model was calibrated to local MSM survey, surveillance, and cohort data and accounted for COVID-19 pandemic impacts on sexual activity, HIV prevention, and care. PrEP was modelled from 2013 onwards, assuming 86% individual-level effectiveness. The PrEP eligibility criteria were: any anal sex unprotected by condoms (past 6 months) and either multiple partnerships (past 6 months) or multiple uses of post-exposure prophylaxis (lifetime). To assess potential optimization strategies, we modelled hypothetical scenarios prioritizing PrEP to MSM with high sexual activity (≥11 anal sex partners annually) or aged ≤45 years, increasing coverage to levels achieved in Vancouver, Canada (where PrEP is free-of-charge), and improving retention. Results: Over 2013–2021, the estimated annual HIV incidence decreased from 0.4 (90% credible interval CrI: 0.3–0.6) to 0.2 (90% CrI: 0.1–0.2) per 100 person-years. PrEP coverage among HIV-negative MSM remained low until 2015 (<1%). Afterwards, coverage increased to a maximum of 10% of all HIV-negative MSM, or about 16% of the 62% PrEP-eligible HIV-negative MSM in 2020. Over 2015–2021, PrEP averted an estimated 20% (90% CrI: 11%–30%) of cumulative HIV acquisitions. The hypothetical scenarios modelled showed that, at the same coverage level, prioritizing PrEP to high sexual activity MSM could have averted 30% (90% CrI: 19%–42%) of HIV acquisitions from 2015-2021. Even larger impacts could have resulted from higher coverage. Under the provincial eligibility criteria, reaching 10% coverage among HIV-negative MSM in 2015 and 30% in 2019, like attained in Vancouver, could have averted up to 63% (90% CrI: 54%–70%) of HIV acquisitions from 2015 to 2021. Conclusions: PrEP reduced population-level HIV transmission among Montréal MSM. However, our study suggests missed prevention opportunities and adds support for public policies that reduce PrEP barriers, financial or otherwise, to MSM at risk of HIV acquisition. © 2023 The Authors. Article	2023	Drallmeier, Theresa; Salas, Joanne; Keegan Garrett, Elizabeth; Meyr, Ashley; Tucker, Jane; Scherrer, Jeffrey F	Differences Between General Internal Medicine and Family Medicine Physicians' Initiation of Pre-Exposure Prophylaxis.	Journal of Primary Care & Community Health	-	-	-	2150-1327	10.1177/21501319231201784	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10557417	OBJECTIVE: Preexposure Prophylaxis (PrEP) is under-utilized in primary care. Given differences in treatment approaches for other conditions between family medicine (FM) and general internal medicine (GIM), this study compared PrEP-prescribing between FM and GIM physicians. METHODS: De-identified electronic health record data from a multi-state health care system was used in this retrospective observational study. The time period from 1/1/13 to 9/30/21 was used to identify PrEP eligible patients using measures of current sexually transmitted disease and condomless sex at the time of eligibility. Receipt of PrEP was measured in the 12 months after PrEP eligibility. The odds of receiving PrEP in GIM as compared to FM was computed before and after adjusting for demographics and physical and psychiatric comorbidities. RESULTS: The majority of eligible patients were 18 to 39 years of age, 60.9% were female and 71.6% were White race. Among PrEP eligible patients, 1.1% received PrEP in the first year after index date. Receiving PrEP was significantly more likely among patients treated in GIM versus FM (OR = 2.30; 95% CI:1.63-3.25). After adjusting for covariates, this association remained statistically significant (OR = 2.02; 95% CI:1.41-2.89). CONCLUSIONS: PrEP is grossly under-utilized in primary care. The majority of Americans enter the health care system through primary care and not through HIV providers or other specialties. Therefore, educational interventions are needed to increase confidence and knowledge and to encourage PrEP prescribing by FM and GIM physicians.	cohort, health services research, preexposure prophylaxis, PrEP, primary care, prevention	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Driver, Redd; Schneider, John A.; Hickson, DeMarc A.; Timmins, Liadh; Brewer, Russell A.; Goedel, William C.; Duncan, Dustin T.	Sexual Orientation, HIV Vulnerability-Enhancing Behaviors and HIV Status Neutral Care Among Black Cisgender Sexual Minority Men in the Deep South: The N2 Cohort Study.	AIDS and Behavior	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-03984-7	https://pubmed.ncbi.nlm.nih.gov/36648630/	Black sexual minority men (SMM) in the Deep South are heavily impacted by HIV; yet studies fail to consider discordance across aspects of sexual orientation (i.e., identity, attraction, behavior) or how a lack of concordance enhances vulnerability to HIV. We sought to explore the overlap across aspects of sexual orientation and examine associations between each aspect and the number of sexual partners who engaged in HIV vulnerability-enhancing behaviors, and HIV prevention and care outcomes. A total of 204 Black SMM completed surveys, reporting their sexual identity, attraction, and behavior (i.e., sex with men only vs. sex with men and women), number of condomless sex or transactional sex (e.g., buyers vs. sellers) partners in the past 6 months, and adherence to pre-exposure prophylaxis (PrEP) or antiretroviral therapy (ART) among users. Less than one in four participants (22.5%) reported overlap in same-sex sexual orientations, while 17.1% of bisexual men reported overlap across aspects. In multivariable models, differences were found in how aspects of sexual orientation were associated with the number of partners who bought or sold sex; as well as how often participants tested for HIV in the past 12 months. Results suggest different aspects of sexual orientation have implications for addressing HIV among Black SMM in the Deep South. Article	2023	Dubov A.; Altice F.L.; Gutierrez J.I.; Wickersham J.A.; Azwa I.; Kamarulzaman A.; Gautam K.; Shrestha R.	Pre-exposure prophylaxis service among men who have sex with men in Malaysia: findings from a discrete choice experiment	Scientific Reports	-	-	-	20452322	10.1038/s41598-023-41264-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169230777&doi=10.1038%2fs41598-023-41264-5&partnerID=40&md5=7ed3aa138ec393efca97eb36f1e09a2b	Men who have sex with men (MSM) in Malaysia are disproportionately affected by HIV. As pre-exposure prophylaxis (PrEP) is being introduced, we assessed population-based PrEP delivery preferences among MSM in Malaysia. We conducted a discrete choice experiment through an online survey among 718 MSM. The survey included 14 choice tasks presenting experimentally varied combinations of five attributes related to PrEP delivery (i.e., cost, dosing strategy, clinician interaction strategy, dispensing venue, and burden of visits to start PrEP). We used latent class analysis and Hierarchical Bayesian modeling to generate the relative importance of each attribute and preference across six possible PrEP delivery programs. PrEP dosing, followed by cost, was the most important attribute. The participants were clustered into five preference groups. Two groups (n = 290) most commonly preferred on-demand, while the other three preferred injectable PrEP. One group (n = 188) almost exclusively considered cost in their decision-making, and the smallest group (n = 86) was substantially less interested in PrEP for reasons unrelated to access. In simulated scenarios, PrEP initiation rates varied by the type of program available to 55·0% of MSM. Successful PrEP uptake among Malaysian MSM requires expanding beyond daily oral PrEP to on-demand and long-acting injectable PrEP, especially at affordable cost. © 2023, Springer Nature Limited.	na	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Dubov, Alex; Krakower, Douglas S; Rockwood, Nicholas; Montgomery, Susanne	Provider Implicit Bias in Prescribing HIV Pre-exposure Prophylaxis (PrEP) to People Who Inject Drugs	Journal of General Internal Medicine	-	-	-	0884-8734	https://doi.org/10.1007/s11606-023-08040-7	https://escholarship.org/uc/item/5v02770n	BackgroundMultiple HIV outbreaks among people who inject drugs (PWIDs) have occurred in the USA since 2015, highlighting the need for additional HIV prevention tools. Despite high levels of need, pre-exposure prophylaxis (PrEP) is drastically underutilized among PWIDs. Implicit bias toward PWID held by clinicians may impede PrEP scale-up among these underserved patients. This study examined how primary care providers' (PCPs) clinical decisions related to PrEP can be impacted by biases when the patient has a history of substance use.MethodsWe conducted an online survey of PCPs (n = 208). The survey included the implicit association test (IAT) to assess unconscious attitudes toward PWIDs, direct questions regarding clinicians' explicit PWID attitudes, and an embedded experiment in which we systematically varied the risk behavior of a hypothetical patient and asked PCPs to make clinical judgments.ResultsA minority (32%) of PCPs reported explicit PWID bias. The IAT indicated strong implicit PWID bias (meant IAT score = 0.59, p < .0001) among 88% of the sample. Only 9% of PCPs had no implicit or explicit PWID bias. PWID patients were judged as less likely to adhere to a PrEP regimen, less responsible, and less HIV safety conscious than heterosexual or gay male patients. Anticipated lack of adherence mediated PCPs' intent to prescribe PrEP to PWID.ConclusionsPCPs' bias may contribute to PrEP being under-prescribed to PWID. Implicit and explicit PWID biases were common in our sample. This study illustrates the need to develop and test tailored interventions to decrease biases against PWID in primary care settings. Article	2023	Duby Z.; Bunce B.; Fowler C.; Jonas K.; Bergh K.; Govindasamy D.; Wagner C.; Mathews C.	"These Girls Have a Chance to be the Future Generation of HIV Negative": Experiences of Implementing a PrEP Programme for Adolescent Girls and Young Women in South Africa	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03750-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133647832&doi=10.1007%2fs10461-022-03750-1&partnerID=40&md5=21d06059882d63b98355c1ba9e2893c4	Daily oral pre-exposure prophylaxis (PrEP) is highly efficacious for HIV prevention. Adolescent girls and young women (AGYW) have been prioritised for PrEP delivery in South Africa. A combination HIV prevention intervention providing integrated biomedical, behavioural and structural interventions for AGYW aged 15–24 in twelve districts in South Africa characterised by high HIV prevalence, was implemented 2019–2022. We conducted qualitative interviews to explore PrEP implementation experiences with 38 individuals involved in the implementation of the combination HIV prevention programme, including programme managers and project coordinators, health care providers / nurses, social workers, counsellors, peer group trainers and outreach workers. Narratives included various challenges associated with PrEP uptake, adherence and acceptability experienced by implementers. Barriers to PrEP acceptability included AGYW fears of side effects and preference for injectable versus daily oral PrEP; resistance towards PrEP from AGYW, communities and parents due to a lack of accurate information; PrEP stigma linked to associations with antiretrovirals and assumptions of promiscuity; and issues pertaining to parental consent. Additionally, implementers faced logistical challenges related to procurement, stockouts, and supply of PrEP. Findings highlighted the critical role of parental and community acceptability of PrEP for successful implementation. Overall, PrEP was perceived by implementers as a valuable HIV prevention tool. In order to ensure the accessibility of PrEP for AGYW in South Africa, efforts to reduce stigma and foster social support for PrEP use, campaigns to raise awareness, ensure positive framing of PrEP, and build community acceptability of PrEP, are needed. © 2022, The Author(s). Article	2023	Durham S.H.; Milam A.; Waer D.; Chahine E.B.	Cabotegravir: The First Long-Acting Injectable for HIV Preexposure Prophylaxis	Annals of Pharmacotherapy	-	-	-	10600280	10.1177/10600280221102532	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133337987&doi=10.1177%2f10600280221102532&partnerID=40&md5=9f4b5c9e71dc696360d74fe7a0d74760	Objective: Review the pharmacology, pharmacokinetics, efficacy, safety, and role of long-acting injectable cabotegravir (CAB-LA) in HIV preexposure prophylaxis (PrEP). Data Sources: A literature search was performed using PubMed and Google Scholar (2012 to April 2022) with the search terms cabotegravir, preexposure prophylaxis, and PrEP. Other resources included abstracts presented at recent conferences, the manufacturer's Web site, prescribing information, and review articles. Study Selection and Data Extraction: All English-language articles of studies assessing the efficacy and safety of CAB-LA for PrEP were included. Data Synthesis: CAB-LA is the first long-acting injectable therapy approved for HIV-1 PrEP in both men and women. It is a suspension given intramuscularly every other month. CAB-LA has been shown to be more effective than daily oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) in preventing HIV-1 infection among high-risk individuals. Two phase 3 trials were stopped early on the basis of superior efficacy of CAB-LA. The most common adverse effects were injection site reactions (ISRs), although they tended to decrease over time, and few participants in clinical trials discontinued use due to ISRs. Relevance to Patient Care and Clinical Practice: CAB-LA may be particularly useful for individuals with known adherence problems to oral therapy, those with renal impairment, and those with decreased bone mineral density. However, CAB-LA is more expensive than generic TDF/FTC and may be associated with weight gain. Conclusions: CAB-LA is the first long-acting injectable agent for HIV PrEP. It is more effective than oral TDF/FTC, is well-tolerated aside from ISRs, and has few clinically significant drug-drug interactions. © The Author(s) 2022.	cabotegravir; HIV/AIDS; long-acting injectable; preexposure prophylaxis; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Dzenga T.; Moyo E.; Moyo P.; Kamangu J.; Dzinamarira T.	Factors influencing the retention of clients in oral pre-exposure prophylaxis (PrEP) care at 3 months after initiation in the Omusati region of Namibia	International Journal of Africa Nursing Sciences	-	-	-	22141391	10.1016/j.ijans.2023.100623	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173886161&doi=10.1016%2fj.ijans.2023.100623&partnerID=40&md5=516a35130bef5f730202784f7682d4e1	Background: The United Nations has set a target of ending the HIV/AIDS epidemic as a public health threat by 2030. The WHO recommended the use of oral pre-exposure prophylaxis (PrEP) for HIV prevention for all people at substantial risk of HIV infection in 2016. In Namibia since the adoption of PrEP in 2016, many clients have been initiated on PrEP. Objectives: The objectives of this study were to measure clients' rate of PrEP retention at three months and determine factors that influence it in the Omusati region of Namibia. Methods: An analytical cross-sectional design was used for this study. Three hundred and forty-five participants were selected for this study using a simple random sampling method. The data were collected from the Electronic Patient Monitoring System (EPMS). Chi-square tests and logistic regression were used for data analysis. Results: The retention rate in PrEP care at three months was 60 %. The Chi-square tests showed significant associations between age, sex, sexually transmitted infection (STI) symptoms, marital status, HIV status and viral load of partner, number of sexual partners, and retention in PrEP care at three months (p < 0.05). Logistic regression analysis revealed that females and those with STI symptoms were more likely to be retained in PrEP care, Adjusted Odds Ratio (AOR) = 2.21, 95 % CI (1.36–3.57), and AOR = 4.25, 95 % CI (1.23–14.63), respectively. Participants with HIV-negative/unknown status partners and with multiple/concurrent sexual partners were less likely to continue with PrEP, Crude Odds Ratio (COR) = 0.56, 95 % CI (0.36–0.86), COR = 0.39, 95 % CI (0.16–0.96), respectively. Conclusion: The findings of this study accentuate the need for increased provision of information on the importance of the continuation of PrEP. © 2023 The Author(s)	Factors; Namibia; Omusati; Pre-exposure prophylaxis; Retention	English	Netherlands	Western and Central Europe and North America	Namibia	Eastern and Southern Africa	Namibia	Eastern and Southern Africa	Quantitative
Article	2023	Eaton L.A.; Layland E.K.; Driver R.; Kalichman S.C.; Kalichman M.O.; Watson R.J.; Kalinowski J.; Chandler C.J.; Earnshaw V.A.	Novel Latent Profile Analysis of a Test of Concept, Stigma Intervention to Increase PrEP Uptake among Black Sexual Minority Men	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003223	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85168222031&doi=10.1097%2fQAI.0000000000003223&partnerID=40&md5=b2fc458fe8e692c08ab28260770ca103	Background:Pre-exposure prophylaxis (PrEP) has demonstrated efficacy for HIV prevention, yet uptake of PrEP among populations in urgent need of prevention tools (eg, Black sexual minority men) is limited, and stigma and medical mistrust remain strong barriers to accessing PrEP.Purpose:To evaluate a test of concept brief intervention to address stigma and medical mistrust as barriers to PrEP uptake using novel latent profile analysis.Methods:Participants (N = 177) residing in the southeastern US were randomized to 1 of 4 arms to establish the potential impact of a brief, stigma focused counseling intervention (referred to as Jumpstart) to increase PrEP uptake. We estimated intervention effect size (Cramer's V) for PrEP uptake and then explored differential intervention effects across latent profiles of psychosocial barriers to PrEP use.Results:The intervention resulted in small, but meaningful effect size, with self-reported PrEP uptake increasing across Jumpstart conditions with the control condition reporting 24% uptake and Jumpstart plus text/phone calls (the most intensive intervention arm) reporting 37% uptake, and a similar pattern emerging for biologically confirmed PrEP use. Among participants 30 and older, Jumpstart participants were more likely to move to a postintervention profile with fewer barriers than control participants and reported the highest uptake of PrEP.Conclusions:Addressing social/emotional barriers to PrEP uptake is an essential component of bridging the gap between advances being made in biomedical forms of HIV prevention, and establishing and supporting access to those advances. © 2023 Lippincott Williams and Wilkins. Article	2023	Eaton, Lisa A.; Huedo-Medina, Tania; Earnshaw, Valerie A.; Kalichman, Moira; Watson, Ryan J.; Driver, Redd; Chandler, Cristian J.; Kalinowski, Jolaade; Kalichman, Seth C.	Randomized Clinical Trial of Stigma Counseling and HIV Testing Access Interventions to Increase HIV Testing Among Black Sexual Minority Men and Transwomen.	Prevention Science	-	-	-	1573-6695 1389-4986	10.1007/s11121-023-01603-4	https://pubmed.ncbi.nlm.nih.gov/37898978/	Advances in HIV prevention tools have outpaced our ability to ensure equitable access to these tools. Novel approaches to reducing known barriers to accessing HIV prevention, such as stigma and logistical-related factors, are urgently needed. To evaluate the efficacy of a randomized controlled trial with four intervention arms to address barriers to HIV/STI testing uptake (primary outcome) and PrEP use, depression, and HIV test results (secondary outcomes). We tested a 2 × 2 research design: main effect 1-stigma-focused vs. health information evaluation-focused counseling, main effect 2-offering HIV/STI testing appointments in person vs. at home with a counselor via video chat, and the interaction of the main effects. Participants (N = 474) residing in the southeastern USA were screened and enrolled in a longitudinal trial. Intervention efficacy was established using generalized linear modeling with binomial or Poisson distributions. Intervention efficacy demonstrated an increase in HIV/STI testing uptake when testing was made available at home with a counselor via video chat vs. in person (83% vs. 75% uptake, p < .05), and participants were also more likely to test positive for HIV over the course of the study in the at-home condition (14.5% vs. 9.4%, p < .05). Stigma-focused counseling resulted in lower depression scores and greater uptake of PrEP among participants < 30 years of age when compared with health information counseling (15.4% vs. 9.6%, p < .05). In order to prevent further disparities between HIV prevention advances and access to HIV prevention tools, we must prioritize improvements in linking people to care. Novel interventions, such as those proposed here, offer a practical, evidence-based path to addressing long-standing barriers to HIV prevention strategies. Trial registration: NCT03107910. Article	2023	Echeverría-Guevara, Amanda; Coelho, Lara E.; Veloso, Valdiléa G.; Pimenta, Maria C.; Hoagland, Brenda; Moreira, Ronaldo I.; Leite, Iuri; Jalil, Emilia M.; Cardoso, Sandra W.; Torres, Thiago S.; Grinsztejn, Beatriz	Travestis, transgender women and young MSM are at high risk for PrEP early loss to follow-up in Rio de Janeiro, Brazil	Brazilian Journal of Infectious Diseases	-	-	-	1413-8670	10.1016/j.bjid.2022.102733	http://www.scielo.br/scielo.php?script=sci_arttext&pid=S1413-86702023000100201	Abstract Introduction Oral pre-exposure prophylaxis (PrEP) with emtricitabine/tenofovir (FTC/TDF) is highly effective in preventing HIV infection. This study aimed to identify factors associated with PrEP early loss to follow-up (ELFU) among gay, bisexual and other men who have sex with men (MSM), travestis and transgender women (TGW). Methodology This was a prospective cohort study evaluating TGW and MSM who initiated PrEP at the Evandro Chagas National Institute of Infectious Diseases (INI-Fiocruz) from 2014 to 2020. ELFU was defined as not returning for a PrEP visit within 180 days after first dispensation. Exposure variables included age, gender, race, education, transactional sex, condomless anal intercourse CAI (both in the past six months), binge drinking and substance use (both in past three months) and syphilis diagnosis at baseline. Multilevel logistic regression models with random intercepts and fixed slopes were used to identify factors associated with ELFU accounting for clustering of participants according to their PrEP initiation study/context (PrEP Brasil, PrEParadas, ImPrEP and PrEP SUS). Results Among 1,463 participants, the median age was 29 years (interquartile range 24-36), 83% self-identified as MSM, 17% as TGW, 24% were black, 37% mixed-black/pardo and 30% had < 12 years of education. Fifteen percent reported transactional sex, 59% reported CAI, 67% binge drinking, 33% substance use, and 15% had a syphilis diagnosis. Overall, 137 participants (9.7%) had ELFU. Younger age (18-24 years) (adjusted odds ratio aOR 1.9, 95%CI:1.2-3.2), TGW (aOR 2.8, 95%CI:1.6-4.8) and education < 12 years (aOR 1.9, 95%CI:1.2-2.9) were associated with greater odds of ELFU. Conclusion TGW, young individuals and those with lower education were at higher risk of PrEP ELFU. Our results suggest that the development of specific strategies targeting these populations should be a priority, through policies that aim to reduce the incidence of HIV infection. Article	2023	Edinger A.; Valdez D.; Walsh-Buhi E.; Bollen J.	Deep learning for topical trend discovery in online discourse about Pre-Exposure Prophylaxis (PrEP)	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03779-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135289545&doi=10.1007%2fs10461-022-03779-2&partnerID=40&md5=85890584d54e171d23468ea12d95f84c	Pre-Exposure Prophylaxis (PrEP) interventions are increasingly prevalent on social media. These data can be mined for insights about PrEP that may not be as apparent in surveys including personal musings about PrEP and barriers/facilitators to PrEP uptake. This study explores online discourse about PrEP using an interdisciplinary public health and computational informatics approach. We collected (N = 4,020) tweets using Twitter's Application Programming Interface (API). These data underwent a three-step neural network/deep learning process to identify clusters within these tweets and relative similarity/dissimilarity between clusters. We identified 25 distinct clusters from our original collection of tweets. These clusters represent general information about PrEP, how PrEP is communicated among diverse groups, and potential pockets of misinformation and disinformation regarding PrEP. Specific clusters of interest include discussions of medication side effects, social perception of PrEP usage, and concerns with costs and barriers to access of PrEP interventions. Our approach revealed diverse ways PrEP is contextualized online. Importantly this information can be leveraged to identify points of possible intervention for disinformation and misinformation about PrEP. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Eisenberg, Marla E.; Lawrence, Samantha E.; Gower, Amy L.; Rider, G. Nic; Brown, Calla; Crutcher, Val; Schuster, Andrew; Watson, Ryan J.	Are HIV Prevention Services Reaching all LGBTQ+ Youth? An Intersectional Analysis in a National Sample.	AIDS and Behavior	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04230-w	https://pubmed.ncbi.nlm.nih.gov/38085427/	Although research has examined disparities in HIV prevention behaviors, intersectional research is needed to understand who may be underserved. This study examines disparities in consistent condom use, HIV testing, and PrEP awareness and use across assigned sex, gender identity, sexual orientation, and racial/ethnic identity in a large sample of sexually active LGBTQ+ youth (mean age = 16.5) who completed the 2022 LGBTQ National Teen Survey. Four social identities were included as indicators in Chi-Square Automated Interaction Detection models to uncover disparate rates of HIV preventive behaviors. Generally, HIV testing and PrEP services were higher among gay/lesbian and queer youth assigned male, and lower among those assigned female. Certain LGBTQ+ youth may be systematically missed by these services, (e.g., those assigned female; those assigned male who also identify as bisexual, pansexual, asexual, questioning, or straight (and trans/gender diverse)). Providers should strive to serve populations who are not being reached by HIV prevention services. Article	2023	Erenrich, Rebecca K.; Braun, Rebecca A.; Torres-Mendoza, David M.; Stevenson, Olivia L.; Doan, Thuan-Huong P.; Klausner, Jeffrey D.	Effectiveness of PrEPTECH: Findings from a 180-Day Randomized Controlled Trial of a Pre-Exposure Prophylaxis Telehealth Intervention.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003375	https://pubmed.ncbi.nlm.nih.gov/38133600/	BACKGROUND: Telehealth approaches are increasingly being used to provide access to pre-exposure prophylaxis (PrEP), an effective but underused HIV prevention modality. This randomized controlled trial of PrEPTECH, a telehealth intervention for the provision of HIV PrEP, seeks to assess its effects on PrEP access. METHODS: Young men who have sex with men and transgender women in Florida and California with an indication for PrEP were randomly assigned in a 1:1 allocation to receive access to PrEPTECH or a control condition, access to an online listing of PrEP resources in their communities. This intent-to-treat analysis used logistic and linear regression to compare self-reported PrEP initiation, use, and coverage between control and intervention arm participants at 90 days and 180 days of follow-up. RESULTS: A total of 229 participants with a mean age of 23.7 years, 77.3% people of color enrolled in PrEPTECH. At 90 days, postbaseline initiation of PrEP was significantly higher among those in the PrEPTECH arm than among controls (odds ratio OR: 6.63, 95% confidence interval CI: 2.54 to 17.35), and this held true by 180 days post baseline. The count of sex acts for which participants were not protected by PrEP, PrEP adherence, and recent PrEP use at 180 days post baseline were not significantly different between the study arms. CONCLUSIONS: Receiving access to a telehealth platform for PrEP access increased PrEP initiation in this cohort of young, predominantly non-White sexual and gender minorities. PrEP telehealth may be a worthy avenue for providing access to PrEP for these populations, but additional strategies may be needed to promote adherence and persistence of PrEP use.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Escarfuller, Sebastian G.; Mitchell, Jason W.; Sanchez, Mariana	HIV Prevention Intervention-related Research with Adult, Sexual Minority Hispanic Men in the United States: A Systematic Review.	Journal of Racial and Ethnic Health Disparities	-	-	-	2196-8837	10.1007/s40615-023-01659-6	https://pubmed.ncbi.nlm.nih.gov/37340124/	The systematic review describes aims to synthesize the HIV prevention intervention-related research conducted among adult, US sexual minority Hispanic men since 2012. Following PRISMA guidelines, 15 articles representing 14 studies were included in the review: 4 randomized controlled trials, 5 pilots, and 5 formative projects. Two interventions had PrEP-related outcomes whereas 7 focused on behavioral (e.g., condoms, testing) and/or educational outcomes. Few studies used digital health. All but one study was theoretically guided. Community engagement was a common and important thread in the included studies, with community-based participatory research being the most prevalent framework. The inclusion of cultural factors varied widely, as did the availability of Spanish language or bilingual study materials. Future research opportunities are discussed and recommendations to bolster HIV prevention interventions (e.g., tailoring) are presented. These include the need for greater integration of cultural factors (e.g., nuances related to the heterogeneity of Hispanic subgroups) and mitigating critical barriers to help improve uptake of evidence-based strategies in this population. Article	2023	Eshun, Samuel Nuamah; Tampah-Naah, Anthony Mwinilanaa; Udor, Rita; Addae, David	Awareness and willingness to use pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) among sexually active adults in Ghana	HIV & AIDS Review	-	-	-	1730-1270	10.5114/hivar.2023.133168	https://hivaids.termedia.pl/Awareness-and-willingness-to-use-r-npre-exposure-prophylaxis-PrEP-r-nand-post-exposure,147649,0,2.html	Introduction: Advancement in biomedical science has led to the discovery of pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) as new strategies for prevention of human immunodeficiency virus (HIV). This current study was a quantitative analysis that sought to evaluate the awareness and willingness to use PrEP and PEP by sexually active adults in Ghana. Material and methods: The study respondents consisted of 365 sexually active adults in Ghana. A questionnaire was designed and administered to participants online using respondent-driven sampling (RDS) approach. A χ^2 test and logistic regression were employed for the analysis. Results: The study revealed a generally low awareness of PrEP and PEP. Only 25.2% of the respondents were aware of PrEP, while 20.3% were aware of PEP. Despite the low awareness rate, majority of respondents (69.3%) were willing to use PrEP and PEP for prevention of HIV. On the other hand, 30.7% of the respondents indicated their unwillingness to use PrEP and PEP citing the fear of undesirable side effects of the medications as the main reason for their decision. Conclusions: This paper calls on policy-makers to intensify advocacy for the usefulness of PrEP and PEP. The Ghana Health Service and Ghana AIDS Commission should also ensure that PrEP and PEP services are increased and include all sexually active persons in Ghana. This will ensure a great success in mitigating HIV infections in Ghana.	aids; hiv; prep; pep; sex	English	United Kingdom	Western and Central Europe and North America	Ghana	Western and Central Africa	Ghana	Western and Central Africa	Quantitative
Article	2023	Estcourt C.S.; Macdonald J.; Saunders J.; Nandwani R.; Young I.; Frankis J.; Clutterbuck D.; Steedman N.; McDaid L.; Dalrymple J.; Flowers P.	Improving HIV pre-exposure prophylaxis (PrEP) uptake and initiation: Process evaluation and recommendation development from a national PrEP program	Sexual Health	-	-	-	14485028	10.1071/SH22170	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85168431814&doi=10.1071%2fSH22170&partnerID=40&md5=9049340c964d4be1e1289b93924537b6	Background: HIV pre-exposure prophylaxis (PrEP) is key to HIV transmission elimination but implementation is challenging and under-researched. We undertook a process evaluation of the first 2 years of a national PrEP program to explore barriers and facilitators to implementation and to develop recommendations to improve implementation, focusing on PrEP uptake and initiation. Methods: Stage 1 involved semi-structured telephone interviews and focus groups (September 2018-July 2019) with geographically and demographically diverse patients seeking/using/declining/stopping PrEP (n = 39), sexual healthcare professionals (n = 54), community-based organisation service users (n = 9) and staff (n = 15) across Scotland. We used deductive thematic analysis, to derive and then map key barriers and facilitators to priority areas that experts agreed would enhance uptake and initiation. In Stage 2, we used analytic tools from implementation science to systematically generate evidence-based, theoretically-informed recommendations to enhance uptake and initiation of PrEP. Results: Barriers and facilitators were multi-levelled and interdependent. Barriers included the rapid pace of implementation without additional resource, and a lack of familiarity with PrEP prescribing. Facilitators included opportunities for acquisition of practice-based knowledge and normalisation of initiation activities. We refined our 68 'long-list' recommendations to 41 using expert input and the APEASE (Acceptability, Practicability, Effectiveness, Affordability, Side-effects, and Equity) criteria. Examples include: provision of PrEP in diverse settings to reach all in need; co-produced, culturally sensitive training resources for healthcare professionals, with focused content on non-daily dosing; meaningful collaborative working across all stakeholders. Conclusions: These evidence-based, theory informed recommendations provide a robust framework for optimising PrEP uptake and initiation in diverse settings to ensure PrEP reaches all who may benefit. © 2023 CSIRO. Article	2023	Etowa E.B.; Boakye P.N.; Antabe R.; Wong J.P.-H.	HIV-Response Intergenerational Participation Intervention Among Black Men in Ontario, Canada: Protocol for a Pilot Intervention Study	JMIR Research Protocols	-	-	-	19290748	10.2196/48829	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165973512&doi=10.2196%2f48829&partnerID=40&md5=a38479545aafe5e2a6ed11d10d88f28e	Background: Black men and their communities are more affected by HIV. Although they constitute less than 5% of the Ontarian population, they accounted for 26% of new HIV diagnoses in 2015, nearly half of which (48.6%) were attributed to heterosexual contact. HIV stigma and discrimination reinforce African, Caribbean, and Black men's HIV vulnerability by creating unsafe environments that deter them from testing and disclosure, resulting in isolation, depression, delayed diagnosis and linkage to treatment and care, and poor health outcomes. In response to these challenges, intergenerational strategies were identified from previous community-based participatory studies as best practices to reduce HIV vulnerabilities and promote resilience among heterosexual Black men and communities. The proposed intervention is premised on this recommendation of intergenerational intervention. Objective: The overarching objective is to engage heterosexual Black men and communities in cocreating a community centered, culturally safe intergenerational intervention to reduce HIV vulnerabilities and related health disparities. Methods: We will engage 12 diverse community stakeholders in Ontario, inclusive of heterosexual Black men, in 8 weekly sessions to evaluate existing evidence of effective HIV health literacy interventions, identify essential and relevant aspects, and work collaboratively to co-design the HIV-Response Intergenerational Participation (HIP) intervention for use with Black men and communities. Next, we will recruit 24 self-identified heterosexual Black men aged 18-29, 29-49, and ≥50 years. We will pilot and evaluate the HIP intervention with 24 heterosexual Black men from these 3 age groups (split as 2 events: a total of 12 participants in person in Toronto and 12 participants on the web in Windsor, London, and Ottawa). We will use the data obtained along with questionnaires from validated scales and focus groups to evaluate the effectiveness of HIP. The data will include HIV knowledge, perceived stigma toward people living with HIV, acceptance and uptake of HIV testing, preexposure prophylaxis (PrEP), postexposure prophylaxis (PEP), and condom use. We will also collect data related to perceptions about system-level factors such as discrimination, socially misconstrued masculine identity, etc. Quantitative analysis will essentially be a univariate descriptive analysis. We will use thematic analysis to highlight the results of the focus group discussions. Finally, we will disseminate the evaluation results and engage researchers, leaders, Black men, and communities to expand the project team and scale up the intervention in Ontario and across Canada. Results: Implementation commences by May 2023, and by September 2023, we should have produced, among others, an evidence-informed HIP intervention that can be adapted for use by heterosexual Black men and communities beyond Ontario. Conclusions: The pilot intervention will strengthen critical health literacy and build resilience against HIV through intergenerational dialogue among heterosexual Black men of all ages. © 2023 JMIR RESEARCH PROTOCOLS. Article	2023	Evers Y.J.; Goense C.J.D.; Hoebe C.J.P.A.; Dukers-Muijrers N.H.T.M.	Newly diagnosed HIV and use of HIV-PrEP among non-western born MSM attending STI clinics in the Netherlands: a large retrospective cohort study	Frontiers in Public Health	-	-	-	22962565	10.3389/fpubh.2023.1196958	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163996502&doi=10.3389%2ffpubh.2023.1196958&partnerID=40&md5=55eb93a1cec81485fd6658ecf167c08d	Introduction: The World Health Organization recommends HIV-PrEP for all people at risk for HIV infection, which includes men who have sex with men (MSM). Substantial part of new HIV diagnoses in the Netherlands are in non-western born MSM. This study evaluated new HIV diagnoses and reported PrEP use among non-western born MSM and compared it to western-born MSM. To inform public health efforts in the context of equitable PrEP access, we further assessed sociodemographic factors related to higher HIV risk and lower PrEP use among non-western born MSM. Methods: Surveillance data of consultations among MSM in all Dutch STI-clinics (2016–2021) were analyzed. STI-clinics provide PrEP via the national pilot-program since August 2019. In non-western born MSM (born in Eastern-Europe/Latin-America/Asia/Africa/Dutch-Antilles/Suriname), sociodemographic factors were evaluated for association with HIV (by multivariable generalized estimating equations) and reported PrEP use in the past 3 months (by multivariable logistic regression; restricted to an at-risk for HIV person-level data-subset from August 2019). Results: New HIV infections were diagnosed among 1.1% (493/44,394) of non-western born MSM-consultations (vs. 0.4% among western-born MSM, 742/210,450). Low education (aOR: 2.2, 95%CI: 1.1–2.8) and age under 25 years (aOR: 1.4, 95%CI: 1.1–1.8, vs. age above 35 years) were associated with new HIV diagnoses. PrEP use in the past 3 months was 40.7% in non-western born MSM (1,711/4,207; 34.9% among western-born MSM, 6,089/17,458). PrEP use was lower among non-western born MSM aged under 25 years (aOR: 0.3, 95%CI: 0.2–0.4), living in less urban areas (aOR: 0.7, 95%CI: 0.6–0.8), and having low education level (aOR: 0.6, 95%CI: 0.5–0.7). Conclusion: Our study confirmed that non-western born MSM are an important key population in HIV prevention. Access to HIV prevention, including HIV-PrEP, should be further optimized to all non-western born MSM at risk for HIV, and specifically to those who are younger, live in less urban areas, and have a low education level. Article	2023	Faini D.; Munseri P.; Sandstrom E.; Hanson C.; Bakari M.	Awareness, Willingness and Use of HIV Pre-Exposure Prophylaxis Among Female Sex Workers Living in Dar-es-Salaam, Tanzania	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03769-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134323713&doi=10.1007%2fs10461-022-03769-4&partnerID=40&md5=7e9c5f3abb3490dfd1835ec52a62f85e	Tanzania is in the final stages to roll out pre-exposure prophylaxis (PrEP) to Female Sex Workers (FSWs) so as to reduce new infections. PrEP demonstration projects support programming through gaining first experiences. We analyzed data from a cohort of 700 HIV negative FSWs in Dar-es-Salaam to determine proportions of FSWs who were aware, willing and used PrEP. We compared proportions at cohort enrolment and after 12 months. Logistic regression was used to determine factors associated with PrEP use. PrEP awareness increased from 67% to 97% after 12 months. Willingness was high at both time points (98% versus 96%). Only 8% (57/700) had used PrEP. Being married/cohabiting or separated/divorced/widowed and having sex with a HIV infected partner were independently associated with PrEP use. The PrEP program should focus on scaling up access as willingness to use PrEP is high. © 2022, The Author(s)	Female-sex workers; HIV prevention; Pre-exposure prophylaxis-PrEP; Tanzania	English	United States	Western and Central Europe and North America	Tanzania	Eastern and Southern Africa	Tanzania	Eastern and Southern Africa	Quantitative
Article	2023	Fallahi M.; Guadamuz J.S.; Shooshtari A.; Qato D.M.	Changes in HIV Pre-exposure Prophylaxis (PrEP) Coverage at State and County Level During the COVID-19 Pandemic in the United States	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04180-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85172660829&doi=10.1007%2fs10461-023-04180-3&partnerID=40&md5=9c40beb590a9c050653d9abbcac9225a	This study quantifies the prevalence and trends in weekly PrEP coverage at the national, state and county-level, before and during the COVID-19 pandemic in the United States.We estimated weekly PrEP coverage using longitudinal individual-level pharmacy claims from IQVIA LRx for a cohort of PrEP users (N = 287,493) ages 16 to 85 years between December 29th, 2019 and November 8th, 2020. Weekly PrEP coverage was defined as PrEP use among individuals at high risk for HIV. We conducted an interrupted time series analysis to quantify changes in weekly PrEP coverage before (December 29th, 2019 - March 8th, 2020) and during (March 29th - November 8th, 2020) the COVID-19 pandemic at the national, state and county-level by county characteristics, specifically by EHE priority jurisdiction, racial/ethnic composition, and urbanity. Nationally, weekly PrEP coverage among individuals ages 16 to 85 at high risk for HIV declined by 11.5% (from 11.0% before to 9.5% during the pandemic; t = 8.02,p < 0.01). Weekly PrEP coverage declined in all states and most counties yet varied substantially across states and counties. Geographic disparities in weekly PrEP coverage were also observed between urban EHE priority counties with significantly lower rates in counties with ≥ 50% Black/Latinx population when compared to their counterparts (7.9% vs. 11.2%; t = 18.91,p < 0.01);these disparities were most pronounced in California and New York. Weekly PrEP coverage was much lower than the 25% annual coverage reported by the Centers for Disease Control and geographic disparities observed within states likely contribute to the persistent racial/ethnic disparities in new HIV diagnoses observed within those states. © 2023, The Author(s). Theses and Dissertations	2023	FERNANDES, DANILO EUCLIDES	Avaliação da função renal de usuários de profilaxia pré-exposição ao HIV (PREP)	-	-	UNIFESP	-	-	NA	https://repositorio.unifesp.br/handle/11600/66260	uso crônico de tenofovir tem sido associado à disfunção renal com alterações tubulares isoladas ou piora da função renal. Além de ser a primeira linha de tratamento do HIV, o tenofovir é utilizado na Profilaxia Pré- Exposição ao HIV (PrEP) para reduzir o risco de infecção em indivíduos saudáveis que fazem uso diário dessa medicação. Objetivo: Descrever a incidência do desenvolvimento de anormalidades laboratoriais funcionais renais em usuários de PrEP (tenofovir+entricitabina) oral contínuo. Material e Métodos: Trata-se de uma coorte única, prospectiva, com recrutamento de 131 usuários de PrEP oral. Incluímos indivíduos saudáveis, maiores de 18 anos de idade que procuraram espontaneamente pelo uso da PrEP oral contínua. Os participantes foram submetidos à avaliação laboratorial de função renal antes do uso de PrEP e em todas as consultas de retorno, a cada 3-4 meses até a interrupção da profilaxia. Os desfechos considerados foram ≥ 1 alteração laboratorial funcional renal – TFGe < 90 mL/min – detectada em, pelo menos, duas consultas consecutivas de acompanhamento. Resultados: A maioria dos indivíduos são homens cisgênero (98,4%), brancos (83,6%), altamente escolarizados (93,8%), jovens (34,2 ± 9,03 anos de idade), homossexuais (89,3%) e com índice de massa corporal normal (24,5 ± 3,12 kg/m2). Com 1.120 dias de seguimento, observou-se uma incidência de anormalidades laboratoriais renais de 14% com densidade de incidência de 3,5 novos casos-ano (IC 95% 1,97-6,26, p < 0,001). O uso anterior de PEP foi fator de risco para os desfechos renais (p=0,04). Conclusões: Em 131 usuários de PrEP oral contínua, 1) a densidade de alterações laboratoriais renais foi de 3,5 pessoas- ano, chegando à incidência máxima de 14% no final do seguimento, 2) a TFGe pela creatinina não chegou a ser < 60ml/min/1,73m2 e 3) os marcadores de função glomerular e tubular não precederam a redução da TFGe. Article	2023	Ferrand, John; Walsh-Buhi, Eric; Dodge, Brian; Svetina, Dubravka; Herbenick, Debby	Variations in Pre-exposure Prophylaxis (PrEP) Awareness and Healthcare Provider Interactions in a Nationally Representative Sample of American Men Aged 15-49 Years: A Cross-Sectional Study.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-023-04016-0	https://dx.doi.org/10.1007/s10461-023-04016-0	Awareness of and discussions with a healthcare provider (HCP) around pre-exposure prophylaxis (PrEP), an effective HIV prevention method, are associated with PrEP uptake, yet few studies utilize representative samples or report on these outcomes using distinct behavioral risk subgroups. This cross-sectional study utilized responses given by men on the 2017-2019 National Survey of Family Growth, a nationally representative survey of Americans aged 15-49 years. Multiple logistic regression models were used to determine how respondents' sociodemographic characteristics and HIV risk behaviors were related to PrEP awareness and HCP discussions. PrEP awareness was low (29.40%) as was the proportion who reported ever discussing PrEP with an HCP (4.48%). Odds of being PrEP aware and discussing PrEP with an HCP varied significantly within sexual behavior subgroups based on sociodemographic and behavioral characteristics highlighting the differential risks within distinct behavioral subgroupings of men. Sexual behavior subgroupings should be considered when promoting PrEP awareness and discussions as HIV risk behaviors vary considerably and sexual identity alone may not sufficiently capture one's HIV risk. Article	2023	Ferraz D.; Rossi T.A.; Zucchi E.M.; de Deus L.F.A.; Mabire X.; Ferguson L.; Magno L.; Grangeiro A.; Préau M.; Botelho F.C.; Rodrigues A.; Steele S.; Dourado I.	"I Can't Take This Shitty Quarantine Anymore": Sexual Behavior and PrEP Use Among Young Men Who Have Sex with Men and Transgender Women in Brazil During the COVID-19 Pandemic	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-022-02364-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134820617&doi=10.1007%2fs10508-022-02364-x&partnerID=40&md5=351d649c5d241b47f8f3218750a04a2	This study analyzes how the COVID-19 pandemic affected sexual behavior and use of HIV prevention methods among young transgender women (YTGW) and young gay, bisexual and other men who have sex with men (YGBMSM) participating in an HIV pre-exposure prophylaxis (PrEP) demonstration study in Brazil. Online interviews with 39 participants aged 15–22 years old were conducted between September and November 2020 and analyzed based on social constructionism and human rights-based approaches to health. The pandemic disrupted interviewees' routines, negatively affecting their life conditions. Among those who did not have a steady partner, social distance measures led to temporary interruption of sexual encounters and increased sexting and solo sex. Conversely, for those who had a steady relationship such measures contributed to increasing sexual practices and intimacy. Participants who had sexual encounters during the pandemic reported having continued to use PrEP. However, home confinement with family, lack of privacy, loss of daily routines and changes in housing impaired PrEP adherence and attendance at follow-up consultations. These results highlight the importance of maintaining HIV-service delivery for these groups during a public health crisis, as well as to address the structural drivers of the epidemic with comprehensive HIV prevention policies and by ensuring access of YGBMSM and YTGW to social protection policies. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Ferreira, R; Cannon, CEB; Buttell, F; Davidson, T	Explaining Disaster and Pandemic Preparedness at the Nexus of Personal Resilience and Social Vulnerability: An Exploratory Study	Disaster Medicine and Public Health Preparedness	-	-	-	1935-7893	10.1017/dmp.2023.78	https://pubmed.ncbi.nlm.nih.gov/37332163/	Objective:The purpose of this research was a pilot examination to identify and assess relationships among social vulnerability, personal resilience, and preparedness for a sample of US residents living in the Gulf South, who had experienced climate-related disaster (e.g., hurricanes) and the COVID-19 pandemic. Methods:Binary logistic regression was conducted using primary survey data collected in 2020 (n = 744) to identify statistically significant explanatory variables of sociodemographic characteristics and resilience, measured by the CD-RISC 10, of climate-related disaster, and pandemic preparedness. Results:Results indicate that respondents who identified as white, had more education, were in a relationship, and spoke English as a first language, as well as respondents who had exhibited greater resilience, were more likely to prepare for a climate-related disaster. Respondents who spoke English as a first language, had more education, and greater resilience were found to be statistically significant explanatory variables of pandemic preparedness. Respondents who prepared for disaster were also more likely to prepare for the pandemic. Conclusions:These findings provide insights into protective factors related to preparedness, including linkages between resilience and preparedness that can aid public health professionals in supporting resilience and preparedness efforts for impacted communities. Article	2023	Fidler N.; Vlaev I.; Schmidtke K.A.; Chow E.P.F.; Lee D.; Read D.; Ong J.J.	Efficacy and acceptability of 'nudges' aimed at promoting pre-exposure prophylaxis (PrEP) use: a survey of overseas born men who have sex with men	Sexual Health	-	-	-	14485028	10.1071/SH22113	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152972879&doi=10.1071%2fSH22113&partnerID=40&md5=c3a8c7755ef90e8998560c89c7e59954	Background: This study explores the potential for behavioural economics techniques called 'nudges' to encourage the use of HIV pre-exposure prophylaxis (PrEP) by overseas-born men who have sex with men (MSM) in Australia. We investigated the preferences of overseas-born MSM for different nudges and the effect of nudges on reported likelihood of seeking information about PrEP. Methods: We conducted an online survey of overseas-born MSM, in which they were asked: (1) how likely they and a relevant friend would be to click on PrEP advertisements that used behavioural economics strategies; and (2) what they most and least liked about each ad. We conducted ordered logistic regression of reported likelihood scores against participant age and sexual orientation, use of a model in an advertisement, use of statistics about PrEP, reference to the World Health Organization (WHO), rewards for seeking further information, and use of a call-to-action. Results: Participants (n = 324) reported higher likelihoods of clicking on advertisements with images of people, statistics about PrEP, rewards for seeking further information, and calls-to-action. They reported lower likelihoods of clicking on advertisements referencing the WHO. They had negative emotional responses to sexualised humour, gambling metaphors, and the slogan 'Live Fearlessly'. Conclusions: Overseas-born MSM prefer public health messages that feature representative messengers and statistics about PrEP. These preferences are consistent with previous data on descriptive norms (i.e. statistics about the number of peers doing the desired behaviour) and gain-framed information (i.e. focusing on what can be gained from an intervention). © 2023 The Author(s).	behavioural economics; descriptive norms; gain-framed information; HIV; messengers; nudge; pre-exposure prophylaxis; sexual health	English	United States	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative

Article	2023	Fields, Sheldon D; Gruber, Joshua; Clue, Jamaal; Rey, Gabriel Gomez; Cuervo, Helena Díaz	Prevalence of renal and bone risk factors among individuals prescribed oral pre-exposure prophylaxis for HIV.	International Journal of Infectious Diseases: Regional Edition	-	-	-	2772-7076	10.1016/j.ijregi.2023.01.004	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9922808	Objectives: The only available oral pre-exposure prophylaxis (PrEP) regimens approved in the United States to prevent HIV infection during the period covered by this study were emtricitabine/tenofovir alafenamide (F/TAF) and emtricitabine/tenofovir disoproxil fumarate (F/TDF). Both agents have similar efficacy, however F/TAF exhibits improved bone and renal health safety endpoints over F/TDF. In 2021, the United States Preventive Services Task Force recommended individuals have access to the most medically appropriate PrEP regimen. To understand the impact of these guidelines, the prevalence of risk factors to renal and bone health was evaluated among individuals prescribed oral PrEP. Methods: This prevalence study utilized the electronic health records of people prescribed oral PrEP between January 1, 2015 and February 29, 2020. Renal and bone risk factors (age, comorbidities, medication, renal function, and body mass index) were identified using International Classification of Diseases (ICD) and National Drug Code (NDC) codes. Results: Among 40 621 individuals prescribed oral PrEP, 62% had ≥1 renal risk factor and 68% had ≥1 bone risk factor. Comorbidities were the most frequent (37%) class of renal risk factors. Concomitant medications were the most prominent (46%) class of bone-related risk factors. Conclusions: The high prevalence of risk factors suggests the importance of their consideration when choosing the most appropriate regimen for individuals who may benefit from PrEP. Article	2023	Filho, Daniel Freire de Figueirêdo; Desiderio, Miguel de Melo; Lopes, Djalma Victor Martins; Teixeira, Maria das Graças Rafaela Mesquita; Medeiros, Melissa Soares	APLICATIVO "MEU PREP": EDUCAÇÃO E ACOMPANHAMENTO NA PALMA DA MÃO	The Brazilian Journal of Infectious Diseases	-	-	-	1413-8670	https://doi.org/10.1016/j.bjid.2023.102977	https://www.sciencedirect.com/science/article/pii/S1413867023002374	Introdução/Objetivo A Síndrome da Imunodeficiência Humana (Aids) é causada pela infecção dos retrovírus humanos HIV-1 ou 2, sendo o 1 a causa mais comum no mundo. Com o passar dos anos e avanços na medicina no que diz respeito ao estudo e entendimento desse vírus, ficou claro a necessidade de estimular e desenvolver estratégias de prevenção a transmissão do HIV, sendo medidas comportamentais e farmacológicas. Dessa forma, em 2012 o Food and Drugs Administration (FDA) aprovou a profilaxia pré-exposição (PrEP), que se trata de uma pílula diária que as pessoas com maior risco de contrair o vírus administram a fim de reduzir suas chances de infecção. É cada vez mais claro a necessidade de medidas que estimulem a informatização, tanto da população geral quanto dos profissionais prescritores, para um melhor manejo de situações em que indicações profiláticas pontuais poderiam evitar uma nova infecção. O objetivo desse trabalho é avaliar a importância do desenvolvimento de um aplicativo que fomente a informatização, ensino e acompanhamento do uso da PrEP, a partir da resposta de um formulário aplicado nos paciente em uma Clínica Escola em Fortaleza-CE. Métodos Foram coletados dados dos formulários preenchidos por pacientes atendidos no mês de Julho de 2023 no ambulatório de PrEP na referida clínica. Resultados Dos 147 pacientes atendidos no ambulatório supracitado, 123 (83,7%) responderam ao questionário e todos afirmaram a relevância e importância de um aplicativo que suprisse suas necessidades em relação a informações e acompanhamento durante o uso da PrEP. Está em testes a versão beta de um aplicativo, nomeado "Meu PrEP", que já se apresenta como uma ferramenta intuitiva e polivalente, apresentando duas interfaces, uma para usuários PrEP e outra para profissionais de saúde. O qual favorece a perpetuação de conteúdos educativos, controle de adesão, educação continuada de prescritores e vinculação entre usuário-prescritor. Conclusão A proposta do aplicativo móvel "Meu PrEP", para fins de favorecer, tanto o usuário de PrEP quanto o profissional que está realizando o atendimento, fomenta a expectativa de termos a perpetuação do uso da profilaxia da melhor maneira, garantindo um acompanhamento de qualidade e informações de fácil acesso, usando como base os pilares: tecnologia, educação, acompanhamento e adesão. Article	2023	Fitzgerald N.; Coltart H.; Dominguez L.; Flanagan K.; Gilleece Y.	PrEP for women in Europe: a systematic literature review	HIV Medicine	-	-	-	14642662	10.1111/hiv.13458	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85153521451&doi=10.1111%2fhiv.13458&partnerID=40&md5=c0f816f9b0428a470a8ecad8e70d0ac9	Background: Prevention of HIV transmission is fundamental to ending the HIV epidemic. Pre-exposure prophylaxis (PrEP) with oral tenofovir-emtricitabine (TDF-FTC) is an established HIV-prevention method; however, most PrEP services in Europe have been targeted at men who have sex with men (MSM). A survey in 2021 by Women Against Viruses in Europe (WAVE) showed considerable variation in PrEP access and guidance for women throughout Europe. WAVE therefore commissioned this systematic review to provide insight into PrEP provision and barriers to uptake for women in Europe. Methods: PubMed, Embase, and Scopus were searched for studies (January 2013–May 2021) that reported on actual (e.g., efficacy and safety) or hypothetical (e.g., awareness, barriers, PrEP impact models) use of oral PrEP involving women (including cis, transgender, pregnant, migrant, and breastfeeding women). Search terms included HIV, pre-exposure prophylaxis (specifically TDF-FTC), and women. Studies performed outside of the World Health Organization European region were excluded. Results: The search identified 4716 unique citations, and 45 peer-reviewed articles (44 studies) were included. The majority of these studies (34/44 77%) included recipients or potential recipients of PrEP, representing 4699 women (243 transgender women). However, few studies were women focused (4/34 12%) or took place outside of Western Europe (3/34 9%). Across the three clinical studies that reported women-specific outcomes (60 transgender women, 13 pregnant, and 19 cis women), no breakthrough infections were recorded during the use of PrEP. Lack of awareness of PrEP, low self-estimation of HIV acquisition risk, concerns about stigma, lack of protection against other sexually transmitted infections, and PrEP interaction with hormones (for transgender women) were identified as barriers to use. The remaining studies examined healthcare professionals' perceptions of PrEP (9/44 20%), asked for public opinion (2/44 5%), or modelled the potential of PrEP for HIV prevention (1/44 2%). Conclusions: This review revealed a notable lack of literature on PrEP for cis and transgender women in Europe. This is synonymous with a lack of PrEP provision for women in this region. Barriers to PrEP uptake are complex and rooted in institutional and societal stigma, which must be addressed at policy level. HIV prevention with PrEP is not 'one size fits all' and requires a nuanced gender-responsive approach. Further research into the use of PrEP in cis, pregnant, breastfeeding, and transgender women is essential if we are to stop HIV transmission by 2030. © 2023 British HIV Association.	cis women; Europe; HIV; Pre-exposure prophylaxis; PrEP; transgender women	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review
Article	2023	Fitzpatrick, Colin; Richardson, Daniel; Sherriff, Nigel; Whetham, Jennifer	Pilot evaluation of PrEP EmERGE – A novel digital health innovation designed to support sexual health clinics and HIV-PrEP users	HIV Medicine	-	-	-	14642662	10.1111/hiv.13406	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138540401&doi=10.1111%2fhiv.13406&partnerID=40&md5=1ef5a57aec3b70e8190709ca9df19621	Objective: We aimed to evaluate the usability and acceptability of a co-designed mobile health (mHealth) application (PrEP-EmERGE) within a digital health pathway to support HIV pre-exposure prophylaxis (PrEP). Methods: This was a cross-sectional study to evaluate the usability and acceptability of the PrEP-EmERGE app. Data were collected via an online survey sent to all PrEP EmERGE users in September 2021. Usability was assessed with a validated usability tool, the System Usability Scale (SUS). Acceptability was assessed using modified patient-reported experience measures (PREMs). Quantitative data were analysed using descriptive and/or inferential statistics and qualitative data (free text responses) using thematic analysis. Results: In total, 81/133 (61%) active PrEP EmERGE users completed the online survey, which was available directly from their PrEP EmERGE app: 78/81 (96%) identified as cis-male, 74/81 (91%) reported their ethnicity as 'white', 69/81 (85%) reported daily PrEP use, 7/81 (9%) reported using an event-based dosing schedule, and 5/81 (6%) were switching between dosing schedules. Overall, the median SUS score was 78/100 (interquartile range: 70–92). There were no differences in median SUS scores by PrEP dosing schedules (p = 0.78) or months of experience of using the app (p = 0.31). Overall, 73/81 (90%) would recommend the PrEP EmERGE app to a friend and 78/81 (96%) rated their satisfaction of the app as excellent, good or satisfactory. The free text responses generated three key themes: accessibility (for results and information); autonomy taking responsibility for their (sexual) health and functionality (including technical recommendations for app development and the digital health pathway). Conclusions: Innovative, co-designed digital health pathways, such as PrEP EmERGE can help sexual health services to manage increasing numbers of people accessing PrEP – ensuring that they retain access for those who need to be seen face-to-face. We report high levels of acceptability and usability during the first 4 months of this novel pathway. © 2022 The Authors. Article	2023	Fonner V.A.; Ridgeway K.; Van Der Straten A.; Lorenzetti L.; Dinh N.; Rodolph M.; Schaefer R.; Schmidt H.-M.A.; Nguyen V.T.T.; Radebe M.; Peralta H.; Baggaley R.	Safety and efficacy of long-acting injectable cabotegravir as preexposure prophylaxis to prevent HIV acquisition	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003494	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152172736&doi=10.1097%2fQAD.0000000000003494&partnerID=40&md5=5ba6fc7e5c64d1bed2ef7923d9eb39a	Objective:HIV remains a significant burden, despite expanding HIV prevention tools. Long-acting injectable cabotegravir (CAB-LA) is a new preexposure prophylaxis (PrEP) product. We reviewed existing evidence to determine the efficacy and safety of CAB-LA as PrEP to inform global guidelines.Design:Systematic review and meta-analysis.Methods:We systematically reviewed electronic databases and conference abstracts for citations on CAB-LA from January 2010 to September 2021. Outcomes included HIV infection, adverse events, drug resistance, pregnancy-related adverse events, and sexual behavior. We calculated pooled effect estimates using random-effects meta-analysis and summarized other results narratively.Results:We identified 12articles/abstracts representing four multisite randomized controlled trials. Study populations included cisgender men, cisgender women, and transgender women. The pooled relative risk of HIV acquisition comparing CAB-LA to oral PrEP within efficacy studies was 0.21 (95% confidence interval: 0.07-0.61), resulting in a 79% reduction in HIV risk. Rates of adverse events were similar across study groups. Of 19 HIV infections among those randomized to CAB-LA with results available, seven had integrase strand transfer inhibitor (INSTI) resistance. Data on pregnancy-related adverse events were sparse. No studies reported on sexual behavior.Conclusions:CAB-LA is highly efficacious for HIV prevention with few safety concerns. CAB-LA may lead to an increased risk of INSTI resistance among those who have acute HIV infection at initiation or become infected while taking CAB-LA. However, results are limited to controlled studies; more research is needed on real-world implementation. Additional data are needed on the safety of CAB-LA during pregnancy (for mothers and infants) and among populations not included in the trials. © 2023 Lippincott Williams and Wilkins. Editorial	2023	Ford C.A.	How to Provide PrEP to Every Young Person Who Needs It: A Blueprint	Journal of Adolescent Health	-	-	-	1054139X	10.1016/j.jadohealth.2023.09.008	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175528483&doi=10.1016%2fj.jadohealth.2023.09.008&partnerID=40&md5=517f5d839948cbee2cd012f0082e571a	Our supplement this month, "Lessons Learned in Providing Pre-Exposure Prophylaxis (PrEP) for HIV for Young People at Scale," addresses the critical issue of HIV prevention among adolescents and young adults. In particular, this supplement focuses on key populations in low- and middle-income countries who are disproportionately affected by the HIV/AIDS epidemic: adolescent men who have sex with men, adolescent transgender women, and adolescent girls and young women. The 11 scientific papers in this supplement report from two projects, one in Brazil and the other in South Africa. PrEP1519 targeted adolescent men who have sex with men and adolescent transgender women between the ages of 15 and 19 in three large capital cities in Brazil: Salvador, São Paulo, and Belo Horizonte. Project PrEP in South Africa aimed to introduce PrEP into comprehensive sexual and reproductive health services for adolescent girls and young women. The projects were planned, funded, and undertaken simultaneously, with both tnational teams communicating and collaborating throughout the process. What emerges from the supplement as a whole is a blueprint for the development of culturally appropriate interventions to promote PrEP uptake and adherence among key populations in other low- and middle-income countries. In a commentary, representatives from the World Health Organization and Pan American Health Organization reinforce the desperate need for HIV prevention targeted at vulnerable young people and the particular barriers they face. Carefully targeted interventions like those described in this supplement, as well as new PrEP options like long-acting injectable cabotegravir and the dapivirine vaginal ring, hold great promise in finally addressing and overcoming these barriers	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	NA	NA	Other
Article	2023	Fox J.M.; Lee M.J.; Fairhead C.L.; Ledwaba-Chapman L.M.; Nori A.V.; McQuillan O.; Wang Y.; Clarke A.; Menon-Johansson A.	Self-start HIV postexposure prophylaxis (PEPSE), to reduce time to first dose and increase efficacy	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2022-055622	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165095448&doi=10.1136%2fsextrans-2022-055622&partnerID=40&md5=740581f2a7d8ded6b287b1d411df8ab2	Background Effectiveness of HIV postexposure prophylaxis (PEPSE) correlates with speed of uptake following HIV exposure. Time to first dose has not improved in the UK for over 10 years. On-demand pre-exposure prophylaxis (PrEP) has shown that people can self-start medication for HIV prevention. We hypothesised that advanced provision of PEPSE (HOME PEPSE) for men who have sex with men (MSM) to self- initiate would reduce time to first dose following HIV exposure. Methods Phase IV, randomised, prospective, 48-week, open-label study was carried out. MSM at medium risk of acquiring HIV were randomised (1:1) to immediate or deferred standard of care (SOC) HOME PEPSE. Every 12 weeks, participants self-completed mental health/risk behaviour surveys and had HIV/sexually transmitted infection (STI) testing. HOME PEPSE comprised a 5-day pack of emtricitabine/tenofovir disoproxil fumarate/maraviroc 600 mg once daily initiated following potential exposure to HIV. If taken, participants completed a risk survey; PEPSE continuation was physician directed. Primary outcome was time from potential exposure to HIV to first PEPSE dose. Findings 139 participants randomised 1:1; 69 to immediate HOME PEPSE and 70 to deferred HOME PEPSE. Median age 30 years (IQR 26-39), 75% white, 55% UK born and 72% university educated. 31 in HOME PEPSE and 15 in SOC arm initiated PEPSE. Uptake of HOME PEPSE was appropriate in 27/31 cases (87%, 95% CI: 71% to 95%). Median time from exposure to first dose was 7.3 hours (3.0, 20.9) for HOME PEPSE and 28.5 hours (17.3, 34.0) for SOC (p<0.01). HOME PEPSE was well tolerated with no discontinuations. No significant differences in missed opportunities for PEPSE uptake, sexual behaviour or bacterial STI infections between treatment arms. Interpretation HOME PEPSE reduced the time from exposure to first-dose PEPSE by 21+ hours, with no impact on safety. This significantly improves the efficacy of PEPSE and provides an option for people declining PrEP. © Author(s) (or their employer(s)) 2023. No commercial re-use. See rights and permissions. Article	2023	Francesc López Seguí; Lerga, Unai Oyón; Laura Laguna Marmol; Coll, Pep; Andreu, Angels; Meulbroek, Michael; Guillem López Casasnovas; Oriol Estrada Cuxart; Jordi Ara Rey; Quiñones, Carles; Pérez, Félix; Fernandez, Javier; Rivero, Ángel; Laura Ricou Ríos; Bonaventura Clotet	Cost-effectiveness analysis of the daily HIV pre-exposure prophylaxis in men who have sex with men in Barcelona	PLOS One	-	-	-	NA	10.1371/journal.pone.0277571	https://www.proquest.com/scholarly-journals/cost-effectiveness-analysis-daily-hiv-pre/docview/2766403147/se-2?accountid=8113	Introduction Pre-Exposure Prophylaxis (PrEP) for HIV prevention has been implemented in several countries. Previous literature has shown that its cost-effectiveness (and, under some specifications, cost-saving character) is dependent on the reduction in price due to generics, the time-horizon and its effectiveness. The intervention has never been studied in Catalonia after the approval of the PrEP, a territory with extensive implementation. Methods Economic evaluation of the implementation of HIV pre-exposition prophylaxis using administrative data from Men who have Sex with Men (MSM) who receive the treatment (at the generic price) compared with non-implementation. A deterministic compartmental model and a social perspective with a micro-costing approach over the time horizon 2022–2062 are used. A baseline 86% effectiveness of PrEP is assumed. Results Daily oral PrEP is found to be cost-saving: discounted savings in costs are attained after 16 years, and after 40 years they reach 81 million euros. In terms of health indicators, 10,322 additional discounted QALYs are generated by the intervention. Results are sensitive to sexual behavioral patterns among MSM, the price of PrEP (reduced if offered on-demand), its effectiveness and the discount rate. Conclusions The use and promotion of PrEP in Catalonia is predicted to result in substantial health and monetary benefits because of reductions in HIV infections. Short-term investments in the promotion of PrEP will result in important cost-savings in the long term. Article	2023	Friedman, Eleanor E.; Shankaran, Shivanjali; Devlin, Samantha A.; Kishen, Ekta B.; Mason, Joseph A.; Sha, Beverly E.; Ridgway, Jessica P.	Development of a predictive model for identifying women vulnerable to HIV in Chicago.	BMC Women's Health	-	-	-	1472-6874	10.1186/s12905-023-02460-7	https://bmcwomenshealth.biomedcentral.com/articles/10.1186/s12905-023-02460-7#citeas	INTRODUCTION: Researchers in the United States have created several models to predict persons most at risk for HIV. Many of these predictive models use data from all persons newly diagnosed with HIV, the majority of whom are men, and specifically men who have sex with men (MSM). Consequently, risk factors identified by these models are biased toward features that apply only to men or capture sexual behaviours of MSM. We sought to create a predictive model for women using cohort data from two major hospitals in Chicago with large opt-out HIV screening programs. METHODS: We matched 48 newly diagnosed women to 192 HIV-negative women based on number of previous encounters at University of Chicago or Rush University hospitals. We examined data for each woman for the two years prior to either their HIV diagnosis or their last encounter. We assessed risk factors including demographic characteristics and clinical diagnoses taken from patient electronic medical records (EMR) using odds ratios and 95% confidence intervals. We created a multivariable logistic regression model and measured predictive power with the area under the curve (AUC). In the multivariable model, age group, race, and ethnicity were included a priori due to increased risk for HIV among specific demographic groups. RESULTS: The following clinical diagnoses were significant at the bivariate level and were included in the model: pregnancy (OR 1.96 (1.00, 3.84)), hepatitis C (OR 5.73 (1.24, 26.51)), substance use (OR 3.12 (1.12, 8.65)) and sexually transmitted infections (STIs) chlamydia, gonorrhoea, or syphilis. We also a priori included demographic factors that are associated with HIV. Our final model had an AUC of 0.74 and included healthcare site, age group, race, ethnicity, pregnancy, hepatitis C, substance use, and STI diagnosis. CONCLUSIONS: Our predictive model showed acceptable discrimination between those who were and were not newly diagnosed with HIV. We identified risk factors such as recent pregnancy, recent hepatitis C diagnosis, and substance use in addition to the traditionally used recent STI diagnosis that can be incorporated by health systems to detect women who are vulnerable to HIV and would benefit from preexposure prophylaxis (PrEP). Article	2023	Fu, Jiaqi; Dai, Zhenwei; Wang, Hao; Si, Mingyu; Chen, Xu; Wu, Yijin; Xiao, Weijun; Huang, Yiman; Yu, Fei; Mi, Guodong; Su, Xiaoyou	Willingness to use long-acting injectable PrEP among HIV-negative/unknown men who have sex with men in mainland China: A cross-sectional online survey.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0293297	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10586652	BACKGROUND: Men who have sex with men (MSM) are at high risk of HIV acquisition. Long-acting injectable-pre-exposure prophylaxis (LAI-PrEP), requiring less frequent dosing, is being studied as an alternative method to daily oral HIV PrEP. With the addition of this potential new prevention method, it expands the scope for a wider user choice and is expected to increase the acceptability and uptake of HIV prevention measures. The aim of our study was to explore the willingness to use LAI-PrEP and associated influential factors. METHODS: Participants were recruited from December 2020 to March 2021 through banner advertisements on web- and mobile app-based platforms on Blued, a large gay Chinese social media platform. MSM in our cross-sectional study was HIV-negative and currently lived in mainland China. Participants were asked about their willingness to use LAI-PrEP and reasons why they might be or not be willing to use LAI-PrEP. Multivariable logistic regression was used to analyze the factors associated with the willingness to use LAI-PrEP. RESULTS: In total, 969 participants met the inclusion criteria and finished the survey. Nearly twenty percent (19.5%) of participants had never tested for HIV; 66.8% of MSM had multiple male partners; and 51.6% of MSM engaged in condomless sex with their partner. About three-fifths (66.3%) of MSM were aware of PrEP, and only 3.9% of MSM had used PrEP before. The willingness to use LAI-PrEP among MSM was 74.0% (95% CI: 71.4%-76.6%). MSM with higher education levels were less likely to show a willingness to use LAI-PrEP (AOR = 0.56, 95%CI: 0.38-0.84). Participants who had a history of HIV test (AOR = 1.68, 95%CI: 1.11-2.55), were willing to use daily oral PrEP (AOR = 10.64, 95%CI:7.43-15.21), had multiple male sexual partners (AOR = 1.33, 95%CI:0.93-1.90), who used rush popper(AOR = 1.49, 95%CI:1.05-2.13), and who were aware of PEP (AOR = 1.66, 95%CI: 1.02-2.70) were more likely to show willingness to use LAI-PrEP. CONCLUSIONS: In our study, MSM had quite high awareness but low uptake of PrEP. As LAI-PrEP is expected to be approved for use in China in the future, our study of MSM highlights the need for key population-focused education programs about PrEP and healthy sexual behavior. This study also provides some evidence for LAI-PrEP use among the Chinese MSM population in the future. Article	2023	Fynn L.; Gill K.; Wallace M.; Atujuna M.; Duyver M.; Ngcobo P.; Spiegel H.; Rinehart A.; Hosek S.; Bekker L.-G.	"It's already in your body and it's preventing": a qualitative study of African female adolescent's acceptability and preferences for proxy HIV prevention methods in Cape Town, South Africa	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-023-16955-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175847069&doi=10.1186%2fs12889-023-16955-3&partnerID=40&md5=14debabb9f7f95813d11fbe686229b13	Background: Advances in biomedical HIV prevention will soon offer young women a choice of HIV prevention methods, including various pre-exposure prophylaxis (PrEP) modalities such as daily oral pills, dapivirine vaginal ring, and long-acting injectable agents. By understanding preferences for contraceptive methods, we may draw analogies for the HIV prevention needs of young women. The UChoose Study was an open-label randomised cross-over study designed to evaluate the acceptability and preference for several contraceptive options as a proxy for HIV prevention methods that use similar types of administration. The study enrolled healthy HIV uninfected young women aged 15 to 19 years. At enrolment, participants were randomly assigned to a contraceptive method for a period of 16 weeks in the form of monthly Nuvaring® (vaginal ring), daily combined oral contraceptive (daily pills), or bi-monthly injectable contraceptive (injectable). After 16 weeks, participants crossed over to another contraceptive method, and those who had received the injectable and the daily pills received the vaginal ring for another 16 weeks, whereas those who had received the vaginal ring were able to choose between the injectable and daily pills, to ensure that all participants tried the vaginal ring—the least familiar option to the study population. Results: Thirty-three participants were purposively recruited to participate in seven focus group discussions (FGD) and completed a pre-survey for their assigned group. Our sample comprised 14 participants randomised to use of the vaginal ring and daily pills and 19 participants randomised to use of the vaginal ring and injectable. For most participants, their preferences for a prevention method were based primarily on their desire to avoid negative aspects of one method rather than their positive user experience with another method. Most participants expressed initial hesitancy for trying new contraception method products; however, a lack of familiarity was moderated by a strong interest in diverse user-controlled prevention methods. Participants valued methods that had infrequent dosing and simplified use requirements. The injection and vaginal ring were preferred over daily pills as a potential HIV prevention method. Conclusion: Expanding the availability of diverse products could provide adolescents with multiple choices in HIV prevention for the uninitiated. Trial registration: ClinicalTrials.gov (NCT02404038). Article	2023	Gachigua S.G.; Karuga R.; Ngunjiri A.; Jarrahian C.; Coffey P.S.; Kilbourne-Brook M.; Otiso L.	Microarray patch for HIV prevention and as a multipurpose prevention technology to prevent HIV and unplanned pregnancy: an assessment of potential acceptability, usability, and programmatic fit in Kenya	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2023.1125159	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85158124836&doi=10.3389%2ffrph.2023.1125159&partnerID=40&md5=6427b6116341d0acc686f0df062c43c8	Background: Microarray patches (MAPs), a novel drug delivery system, are being developed for HIV pre-exposure prophylaxis (PrEP) delivery and as a multipurpose prevention technology (MPT) to protect from both HIV and unintended pregnancy. Prevention technologies must meet the needs of target audiences, be acceptable, easy to use, and fit health system requirements. Methodology: We explored perceptions about MAP technology and assessed usability, hypothetical acceptability, and potential programmatic fit of MAP prototypes using focus group discussions (FGD), usability exercises, and key informant interviews (KII) among key populations in Kiambu County, Kenya. Adolescent girls and young women (AGYW), female sex workers (FSW), and men who have sex with men (MSM) assessed the usability and acceptability of a MAP prototype. Male partners of AGYW/FSW assessed MAP acceptability as partners of likely users. We analyzed data using NVivo, applying an inductive approach. Health service providers and policymakers assessed programmatic fit. Usability exercise participants applied a no-drug, no-microneedle MAP prototype and assessed MAP features. Results: We implemented 10 FGD (4 AGYW; 2 FSW; 2 MSM; 2 male partners); 47 mock use exercises (19 AGYW; 9 FSW; 8 MSM; 11 HSP); and 6 policymaker KII. Participants reported high interest in MAPs due to discreet and easy use, long-term protection, and potential for self-administration. MAP size and duration of protection were key characteristics influencing acceptability. Most AGYW preferred the MPT MAP over an HIV PrEP-only MAP. FSW saw value in both MAP indications and voiced need for MPTs that protect from other infections. Preferred duration of protection was 1–3 months. Some participants would accept a larger MAP if it provided longer protection. Participants suggested revisions to the feedback indicator to improve confidence. Policymakers described the MPT MAP as "killing two birds with one stone," in addressing AGYW needs for both HIV protection and contraception. An MPT MAP is aligned with Kenya's policy of integrating health care programs. Conclusions: MAPs for HIV PrEP and as an MPT both were acceptable across participant groups. Some groups valued an MPT MAP over an HIV PrEP MAP. Prototype refinements will improve usability and confidence. 2023 Gachigua, Karuga, Ngunjiri, Jarrahian, Coffey, Kilbourne-Brook and Otiso.	acceptability; contraception; health product development; HIV PrEP; Kenya; microarray patch; microneedle patch; multipurpose prevention	English	Switzerland	Western and Central Europe and North America	Kenya	Eastern and Southern Africa	Kenya	Eastern and Southern Africa	Qualitative
Article	2023	Gagnon K.W.; Coulter R.W.S.; Egan J.E.; Ho K.; Hawk M.	Associations Between Sexual History Documentation in Electronic Health Records and Referral to Pre-Exposure Prophylaxis Navigator on Prescription of Pre-Exposure Prophylaxis at a Multi-Site Federally Qualified Health Center	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2023.0068	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85167763965&doi=10.1089%2fapc.2023.0068&partnerID=40&md5=2cab131e272f25bbb815e4e4e99c0baa	This cross-sectional study examined the relationships between sexual history screening (SHS) and referrals to a pre-exposure prophylaxis (PrEP) navigator (non-clinical staff member who assists patients in overcoming structural barriers to PrEP) on the proportion of days covered by PrEP for adult patients at a federally qualified health center. Patients' sociodemographics, PrEP prescriptions, referral to a PrEP navigator, and SHS data were extracted from the electronic health record (EHR). The analytic sample was 214 adult patients who were human immunodeficiency virus (HIV) negative and taking PrEP to prevent infection from January 2016 to December 2019. Mixed-effects negative binomial models were conducted accounting for clustering by patients' primary care providers. Documentation of SHS was associated with a higher proportion of days covered by PrEP (incidence rate ratio = 1.44, 95% confidence interval: 1.17–1.77). There was no significant effect of having a referral to the PrEP navigator on the proportion of days covered by PrEP, nor did having a referral to the PrEP navigator moderate the relationship between having SHS documented in the EHR and the proportion of days covered by PrEP. This study is the first to investigate the relationship between having sexual history documented in the EHR, referrals to a PrEP navigator, and their combined effect on the proportion of days covered by PrEP. Results of this study provide foundational evidence for future studies examining SHS as an opportunity to improve PrEP access and adherence and indicate the need for additional research exploring the value of PrEP navigators as an implementation strategy to overcome social and structural barriers to care. © Mary Ann Liebert, Inc. M; Linares, M	Conocimiento sobre chemsex, profilaxis pre-exposición contra el VIH (PrEP) y entrevista sexual en atención primaria: ¿estamos preparados?	Semergen	-	-	-	-	1138-3593	10.1016/j.semerg.2023.101929	https://pesquisa.bvsalud.org/portal/resource/pt/ibc-220713	Objetivo Describir el grado de conocimiento de los profesionales de atención primaria sobre la práctica del chemsex, sus potenciales efectos secundarios y la profilaxis pre-exposición (PrEP) contra el VIH. Métodos Estudio observacional, descriptivo, transversal, mediante encuesta en línea dirigida a profesionales de atención primaria. La encuesta constaba de 25 preguntas sobre: a)datos sociodemográficos; b)realización de entrevista sexual en la consulta; c)nivel de conocimiento sobre el uso de chemsex y sus complicaciones; d)grado de conocimiento sobre la PrEP, y e)necesidades formativas de los profesionales. La encuesta se diseñó en ArgisSurvey123 y se distribuyó a través de SEMERGEN mediante lista de distribución y correo corporativo. Resultados Se obtuvieron 157 respuestas durante el periodo de distribución de la encuesta (febrero-marzo 2022). La mayoría de los encuestados fueron mujeres (71,8%). El porcentaje de entrevista sexual en la práctica clínica habitual fue bajo. La mayoría de los encuestados (73%) habían oído hablar del chemsex, pero no se sentían cómodos con su conocimiento de las propiedades farmacocinéticas de las principales drogas utilizadas en esta práctica. El 52,3% de los respondedores afirmaban no tener conocimientos sobre la PrEP. Conclusiones Actualizar y dar respuesta a las necesidades formativas de los profesionales respecto al chemsex y la PrEP es fundamental para garantizar el cuidado y la calidad de la atención a nuestros pacientes (AU)	Chemsex; Profilaxis pre-exposición profilaxis; PrEP; VIH entrevista sexual y Atención Primaria; Chemsex; Pre-exposure prophylaxis; PrEP; HIV; Sexual behavior interview; Primary health care	Spanish	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Quantitative
Article	2023	Gallay P.A.; Ramirez C.M.; Baum M.M.	Acute antagonism in three-drug combinations for vaginal HIV prevention in humanized mice	Scientific Reports	-	-	-	-	20452322	10.1038/s41598-023-31695-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150668670&doi=10.1038%2fs41598-023-31695-5&partnerID=40&md5=ebc7b614c9b7972d6e2179801395e3bc	Adolescent girls and young women in low- to middle-income countries are disproportionately at risk of becoming HIV-1 infected. New non-vaccine biomedical products aimed at overcoming this global health challenge need to provide a range of safe, effective, and discreet dosage forms based on the delivery of one or more antiviral compounds. An overarching strategy involves vaginal drug administration through inserts/tablets, gels, films, and intravaginal rings. The approach derives its appeal from being women-controlled and topical, there-by potentially minimizing systemic exposure to the agents and their metabolites. Oral regimens based on tenofovir disoproxil fumarate (TDF) and emtricitabine (FTC) are established and effective in HIV-1 pre-exposure prophylaxis (PrEP), and form a promising basis for vaginal PrEP. Here, we used bone marrow/liver/thymus humanized mice to measure the in vivo efficacy against HIV-1 of single and combination antiviral compounds applied vaginally, coupled with data analysis using the Chou-Talalay mathematical model to study the dose–effect characteristics. Unexpectedly, strong antagonism was observed in drug combinations composed of TDF-FTC coupled with a third agent using a different mode of action against HIV-1. The antagonistic effect was remedied when TDF was omitted from the regimen. Our approach provides a translational template for the preclinical, rational, and systematic evaluation of drug combinations for the prevention of HIV-1, and other viral diseases. © 2023, The Author(s). Article	2023	Galmiche P.; Carayon L.; Foureur N.	Three years into the implementation of PrEP in France: What do users and health professionals say? (ANRS 95036)	Clinical Ethics	-	-	-	-	1477-7509	10.1177/14777509231174753	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159066556&doi=10.1177%2f14777509231174753&partnerID=40&md5=3682f1577a0eb683b9349530b1b99f8b	The implementation of pre-exposure prophylaxis (PrEP) as a new tool for prevention against HIV raised particular ethical concerns regarding the individuals' and the collective's best interests in France. It was questioned whether the beneficence of taking or prescribing PrEP regarding its high efficacy to protect people from HIV is always more important than the maleficence represented by the risks involved, such as healthy people taking a pill with side effects, the growth of sexually transmitted infections or the potential generalization of risk-taking sexual behaviour. The main objective of this study was to explore patients' and health professionals' ethical questioning on PrEP. Sixty-nine qualitative interviews were conducted with 45 users and 24 healthcare professionals. Overall, this study shows that those primarily concerned by PrEP tend to dismiss ethical questions regarding PrEP itself in the name of its efficacy and the empowerment it allows, but they would rather stress the impact PrEP can have on individuals' sexual behaviour and how it can affect their autonomy if it is prescribed blindly without taking into consideration the specific living context and life history of each PrEP user. © The Author(s) 2023.	ethics; PrEP; qualitative study; sexual health; sexuality	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Qualitative
Article	2023	Gandhi, Rajesh T; Bedimo, Roger; Hoy, Jennifer F; Landovitz, Raphael J; Smith, Davey M; Eaton, Ellen F; Lehmann, Clara; Springer, Sandra A; Sax, Paul E; Thompson, Melanie A; Benson, Constance A; Buchbinder, Susan P; Del Rio, Carlos; Eron, Joseph J; Günthard, Huldrych F; Molina, Jean-Michel; Jacobsen, Donna M; Saag, Michael S	Antiretroviral Drugs for Treatment and Prevention of HIV Infection in Adults: 2022 Recommendations of the International Antiviral Society-USA Panel.	JAMA - Journal of the American Medical Association	-	-	-	-	1538-3598	10.1001/jama.2022.22246	https://dx.doi.org/10.1001/jama.2022.22246	Importance: Recent advances in treatment and prevention of HIV warrant updated recommendations to guide optimal practice. Objective: Based on a critical evaluation of new data, to provide clinicians with recommendations on use of antiretroviral drugs for the treatment and prevention of HIV, laboratory monitoring, care of people aging with HIV, substance use disorder and HIV, and new challenges in people with HIV, including COVID-19 and monkeypox virus infection. Evidence Review: A panel of volunteer expert physician scientists were appointed to update the 2020 consensus recommendations. Relevant evidence in the literature (PubMed and Embase searches, which initially yielded 7891 unique citations, of which 834 were considered relevant) and studies presented at peer-reviewed scientific conferences between January 2020 and October 2022 were considered. Findings: Initiation of antiretroviral therapy (ART) is recommended as soon as possible after diagnosis of HIV. Barriers to care should be addressed, including ensuring access to ART and adherence support. Integrase strand transfer inhibitor-containing regimens remain the mainstay of initial therapy. For people who have achieved viral suppression with a daily oral regimen, long-acting injectable therapy with cabotegravir plus rilpivirine given as infrequently as every 2 months is now an option. Weight gain and metabolic complications have been linked to certain antiretroviral medications; novel strategies to ameliorate these complications are needed. Management of comorbidities throughout the life span is increasingly important, because people with HIV are living longer and confronting the health challenges of aging. In addition, management of substance use disorder in people with HIV requires an evidence-based, integrated approach. Options for preexposure prophylaxis include oral medications (tenofovir disoproxil fumarate or tenofovir alafenamide plus emtricitabine) and, for the first time, a long-acting injectable agent, cabotegravir. Recent global health emergencies, like the SARS-CoV-2 pandemic and monkeypox virus outbreak, continue to have a major effect on people with HIV and the delivery of services. To address these and other challenges, an equity-based approach is essential. Conclusions and Relevance: Advances in treatment and prevention of HIV continue to improve outcomes, but challenges and opportunities remain. Article	2023	Gangcuangco, Louie Mar A.; Eustaquio, Patrick C.	The State of the HIV Epidemic in the Philippines: Progress and Challenges in 2023.	Tropical Medicine and Infectious Disease	-	-	-	-	2414-6366	10.3390/tropicalmed8050258	https://www.mdpi.com/2414-6366/8/5/258	In the past decade, the Philippines has gained notoriety as the country with the fastest-growing human immunodeficiency virus (HIV) epidemic in the Western Pacific region. While the overall trends of HIV incidence and acquired immunodeficiency syndrome (AIDS)-related deaths are declining globally, an increase in new cases was reported to the HIV/AIDS and ART Registry of the Philippines. From 2012 to 2023, there was a 411% increase in daily incidence. Late presentation in care remains a concern, with 29% of new confirmed HIV cases in January 2023 having clinical manifestations of advanced HIV disease at the time of diagnosis. Men having sex with men (MSM) are disproportionately affected. Various steps have been taken to address the HIV epidemic in the country. The Philippine HIV and AIDS Policy Act of 2018 (Republic Act 11166) expanded access to HIV testing and treatment. HIV testing now allows for the screening of minors 15-17 years old without parental consent. Community-based organizations have been instrumental in expanding HIV screening to include self-testing and community-based screening. The Philippines moved from centralized HIV diagnosis confirmation by Western blot to a decentralized rapid HIV diagnostic algorithm (rHIVda). Dolutegravir-based antiretroviral therapy is now the first line. Pre-exposure prophylaxis in the form of emtricitabine-tenofovir disoproxil fumarate has been rolled out. The number of treatment hubs and primary HIV care facilities continues to increase. Despite these efforts, barriers to ending the HIV epidemic remain, including continued stigma, limited harm reduction services for people who inject drugs, sociocultural factors, and political deterrents. HIV RNA quantification and drug resistance testing are not routinely performed due to associated costs. The high burden of tuberculosis and hepatitis B virus co-infection complicate HIV management. CRF_01AE is now the predominant subtype, which has been associated with poorer clinical outcomes and faster CD4 T-cell decline. The HIV epidemic in the Philippines requires a multisectoral approach and calls for sustained political commitment, community involvement, and continued collaboration among various stakeholders. In this article, we outline the current progress and challenges in curbing the HIV epidemic in the Philippines. Article	2023	Garcia Iglesias J.	From training wheels to chemical condoms: Exploring narratives of PrEP discontinuation	Health	-	-	-	-	13634593	10.1177/13634593211005177	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103080048&doi=10.1177%2f13634593211005177&partnerID=40&md5=3ba1795350b10c8eb5bcd3165207b388	This paper explores experiences of PrEP, a HIV-prevention intervention, among bugchasers, gay men who eroticize HIV. While PrEP has been hailed as a "game changer" in HIV-prevention, little attention has been paid to why and how some people may discontinue it in the face of HIV risk, such as bugchasers do. This paper relies on interview data with bugchasers to discuss the process of discontinuation and its effects. The paper argues that, for these men, discontinuation is a fluid, complex, and sometimes contradictory process. It also describes how participants perceived themselves as being at different stages of discontinuation. The paper also analyzes how these men see PrEP as a barrier to intimacy, risk, and a tool to negotiate their desires and identity: through discontinuing PrEP, these men are able to reflect on and build their identities as bugchasers. © The Author(s) 2021.	adherence; discontinuation; HIV; PrEP; sexual health	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Qualitative
Article	2023	Garg P.R.; Uppal L.; Kurian K.; Heng T.; Akhtar F.; Mehra S.	Pre-exposure Prophylaxis (PrEP) Awareness, Willingness to Use, and Preferred Places for Access Among the Cambodian Female Entertainment Workers: A Cross-Sectional Study	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03877-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141631766&doi=10.1007%2fs10461-022-03877-1&partnerID=40&md5=78a3b0b9b7aa65e919779627a5dadeee	The aim of the study was to determine the awareness, desire to use, and preferred providers of pre-exposure prophylaxis (PrEP) among Female Entertainment Workers (FEWs) aged 18–35 years in Cambodia's Phnom Penh region. Of 1003 FEWs, 31.8% of them had heard of PrEP. When informed about PrEP, 67.4% said they would use PrEP and the most preferred location to access PrEP was a local non-governmental organization (NGO) (63.2%), followed by a government clinic/center (39.8%), ART clinic (26.7%), pharmacy (20.7%), and CBO (14.8%). FEWs who had heard about PrEP (aOR: 2.46; CI: 1.79–3.39) and those with no additional income source other than sex work (aOR: 1.53; CI: 1.16–2.02) were more likely to express their willingness to use PrEP. When the country is in the process of making provisions for PrEP, the study urges policymakers and programmers to take steps towards creating awareness about PrEP among key populations such as FEWs and its availability preferably through local NGOs and government clinics. © 2022, The Author(s), under exclusive license to Springer Science+Business Media, LLC, part of Springer Nature.	acceptability; accessibility; awareness; Female Entertainment Workers; HIV prevention; Pre-exposure Prophylaxis; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Gebru N.M.; Canidate S.S.; Liu Y.; Schaefer S.E.; Pavila E.; Cook R.L.; Leeman R.F.	Substance Use and Adherence to HIV Pre-Exposure Prophylaxis in Studies Enrolling Men Who Have Sex with Men and Transgender Women: A Systematic Review	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03948-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144440632&doi=10.1007%2fs10461-022-03948-3&partnerID=40&md5=8d998af870dc6f75abf7075853af3796	Optimal adherence to pre-exposure prophylaxis (PrEP) is critical, but challenging. Men who have sex with men and transgender women have high rates of HIV incidence and substance use. Substance use is associated with reduced adherence to other medications, but associations between substance use and adherence to PrEP are less clear. Thus, the current review 1) systematically evaluates the measurement of substance use and PrEP adherence in studies examining both and 2) summarizes reported findings. Peer-reviewed articles published between 2010 - April 2021 examining associations between substance use and PrEP adherence were reviewed. Fifty studies met inclusion criteria. Assessment of substance use (i.e., mostly via self-reports at baseline) and PrEP adherence (i.e., often via tenofovir diphosphate TFV-DP concentration levels at follow-up) varied considerably across studies. Many studies used categorical variables (e.g., substance use: yes/no). Studies using TFV-DP levels defined adherence consistently (i.e., TFV-DP ≥ 700 fmol/punch), with slight variations. Qualitative studies (n = 10) indicated that substance use (mainly alcohol) is related to poorer PrEP adherence. While quantitative findings to date are equivocal for alcohol, there is a pattern of findings linking stimulant use with poorer PrEP adherence. This review reveals four methodological gaps, which can be addressed in future research by: 1) use of uniform benchmarks for substance use measures, 2) prospective assessment for substance use, 3) use of continuous outcome variables wherever possible, and 4) more extensive consideration of potential confounders. Addressing these methodological gaps may help us reach more definitive conclusions regarding associations between substance use and PrEP adherence. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.	alcohol use; medication adherence; non-stimulant use; PrEP adherence; stimulant use	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Gelaude D.; Denson D.	"Why You Putting This Drug in Your Body to Fight off Something that You Don't Have?" Perceptions About PrEP Use Among Black and Latino Men Who Have Sex with Men in the U.S. South	Journal of Homosexuality	-	-	-	-	918369	10.1080/00918369.2021.2005998	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120617884&doi=10.1080%2f00918369.2021.2005998&partnerID=40&md5=a1aed501965140d6cfbb85b003031d0a	PrEP use has steadily increased since its introduction, yet uptake remains slow among MSM of color in the U.S. South. Findings presented are from a qualitative study conducted in 2016 exploring factors related to remaining HIV negative among Black (n = 99) and Latino (n = 51) MSM in Atlanta, Baton Rouge, New Orleans, Jackson, and Miami. One-hour in-depth interviews were analyzed using a qualitative content analysis approach. MSM perceived PrEP as providing relief from fear and as an insurance policy against HIV infection but were likely to consider themselves at low risk for HIV. Identified factors influencing PrEP use included side effects, medical mistrust, and stigma. Cost and access were not seen as major barriers. Findings suggest MSM of color in the South may view PrEP as too risky for their HIV prevention needs. PrEP providers can address medical mistrust, discuss side effects, and emphasize positive aspects of PrEP use to increase uptake. Article	2023	Genre N.; Christinet V.	PrEP in French-speaking Switzerland: between anxiety and trust, antiretroviral use for HIV prevention; La PrEP en Suisse romande entre anxiété et confiance Utilisation des antirétroviraux en prévention du VIH	Revue Médicale Suisse	-	-	-	-	16609379	10.53738/REVMED.2023.19.842.1714	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171900319&doi=10.53738%2fREVMED.2023.19.842.1714&partnerID=40&md5=88f752b019371b1cdec3908839034410	The preventive properties of antiretrovirals have been recognized for many years, and pre-exposure prophylaxis (PrEP) has been used in Switzerland since 2016 to prevent HIV acquisition by HIV-negative people. The aim of this article is to provide an overview of PrEP uses in French-speaking Switzerland from the experience of users of this preventive drug. The main results of our research highlight the existence of two experiential versions of PrEP, i.e. subjective definitions shared by the people concerned by the indication. The first version relates to the effects of PrEP on anxiety, where taking a preventive drug drastically reduces the fear of contamination, and the second version relates to the capacity of the drug to modulate trust between individuals. © 2023 Editions Medecine et Hygiene. Article	2023	Giddings, Rebecca; Indravudh, Pitchaya; Medley, Graham F.; Bozzani, Fiammetta; Gafos, Mitzy; Malhotra, Shelly; Terris-Prestholt, Fern; Torres-Rueda, Sergio; Quaife, Matthew	Infectious Disease Modelling of HIV Prevention Interventions: A Systematic Review and Narrative Synthesis of Compartmental Models.	PharmacoEconomics	-	-	-	-	1179-2027 1170-7690	10.1007/s40273-023-01260-z	https://link.springer.com/article/10.1007/s40273-023-01260-z	BACKGROUND: The HIV epidemic remains a major public health problem. Critical to transmission control are HIV prevention strategies with new interventions continuing to be developed. Mathematical models are important for understanding the potential impact of these interventions and supporting policy decisions. This systematic review aims to answer the following question: when a new HIV prevention intervention is being considered or designed, what information regarding it is necessary to include in a compartmental model to provide useful insights to policy makers? The primary objective of this review is therefore to assess suitability of current compartmental HIV prevention models for informing policy development. METHODS: Articles published in EMBASE, Medline, Econlit, and Global Health were screened. Included studies were identified using permutations of (i) HIV, (ii) pre-exposure prophylaxis (PrEP), circumcision (both voluntary male circumcision VMMC and early-infant male circumcision EIMC), and vaccination, and (iii) modelling. Data extraction focused on study design, model structure, and intervention incorporation into models. Article quality was assessed using the TRACE (TRAnsparent and Comprehensive Ecological modelling documentation) criteria for mathematical models. RESULTS: Of 837 articles screened, 48 articles were included in the review, with 32 unique mathematical models identified. The substantial majority of studies included PrEP (83%), whilst fewer modelled circumcision (54%), and only a few focussed on vaccination (10%). Data evaluation, implementation verification, and model output corroboration were identified as areas of poorer model quality. Parameters commonly included in the mathematical models were intervention uptake and effectiveness, with additional intervention-specific common parameters identified. We identified key modelling gaps; critically, models insufficiently incorporate multiple interventions acting simultaneously. Additionally, population subgroups were generally poorly represented-with future models requiring improved incorporation of ethnicity and sexual risk group stratification-and many models contained inappropriate data in parameterisation which will affect output accuracy. CONCLUSIONS: This review identified gaps in compartmental models to date and suggests areas of improvement for models focusing on new prevention interventions. Resolution of such gaps within future models will ensure greater robustness and transparency, and enable more accurate assessment of the impact that new interventions may have, thereby providing more meaningful guidance to policy makers. Article	2023	Gil P.K.M.; Conrado D.S.; Nascimento A.I.D.; Azevedo M.V.; da Cunha J.C.P.; Koch G.S.R.; Maciel C.G.; Ribeiro A.A.; Filho A.C.P.; Medeiros M.J.; Santos-Pinto C.D.B.; Oliveira E.F.	HIV pre-exposure prophylaxis and incidence of sexually transmitted infections in Brazil, 2018 to 2022: An ecological study of PrEP administration, syphilis, and socioeconomic indicators	PLOS Neglected Tropical Diseases	-	-	-	-	19352727	10.1371/journal.pntd.0011548	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85168779789&doi=10.1371%2fjournal.pntd.0011548&partnerID=40&md5=cab4e550a6c38398b33ce97d90c3a9d1	Background Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) is one of the pillars of a combination prevention strategy for reducing the risk of new infections caused by HIV. The daily use of antiretroviral drugs by individuals who are not infected with HIV is required to prevent infection. Although its efficacy has been well established in the literature, in recent years, the decreased supply of antiretroviral drugs has been associated with an increase in the incidence of sexually transmitted infections (STI) and changes in the social determinants of health. An ecological study was conducted covering a five-year period (2018–2022), start-ing from the year of initiation of PrEP administration in Brazilian state capitals. Principal findings Descriptive analysis was performed, and the spatial distribution of study data was taken into account. Correlation analysis was used to assess the association between PrEP administra-tion, the incidence and detection rate of STI, and socioeconomic data. The southern region showed the highest incidence rates of STI, but the northern and northeastern regions demon-strated the worst socioeconomic indicators, especially those related to illiteracy and basic sanitation. PrEP administration was significantly correlated with illiteracy (ρ =-0.658), per capita income (ρ = 0.622), public garbage collection (ρ = 0.612), syphilis (ρ = 0.628) and viral hepatitis (ρ = 0.419) incidences. Further, all STI were significantly associated with illiteracy and per capita income. Significance Our findings highlight the need to continue exploring PrEP use and rising syphilis rates. In terms of policy, PrEP administration appears to be inversely associated with regions of greater social vulnerability. Further efforts should focus on the social determinants and health needs of this population to improve access to PrEP and reduce social disparities. © 2023 Mendonça Gil et al. Article	2023	Gilles M.; Tetart M.; Huleux T.; Thill P.; Meybeck A.; Robineau O.	HIV pre-exposure prophylaxis (PrEP) knowledge among general practitioners in 2020: A French survey	Infectious Diseases Now	-	-	-	-	26669927	10.1016/j.idnow.2023.104649	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148371680&doi=10.1016%2fj.idnow.2023.104649&partnerID=40&md5=1ce3ce0a1146ae1df23cd4a4f05b73dd	Introduction: Since 2017, pre-exposure prophylaxis (PrEP) has been one of the tools in combination HIV prevention strategies. The objective of our questionnaire was to analyze the knowledge and the position of general practitioners in Hauts-de-France on PrEP. Method: This quantitative, observational, cross-sectional study was conducted in 2020 using an anonymous questionnaire sent by post to a sample of 3007 GPs. Results: Four hundred and forty-four questionnaires (14.8 %) were included. The GPs were predominantly male (n = 253, 57 %) with a median age of 47 years. The median interest shown by respondents was 7/10. One hundred and sixty participating GPs (36%) were aware of the principles of PrEP, one hundred and sixty were only aware of the title (36%) and 124 (28%) showed no awareness at all. Out of the 160 GPs who knew about PrEP, 72 % considered it effective, 30 % knew about it from a patient and 34 % declared having at least one patient using PrEP. GPs who knew about PrEP were more likely to: have graduated less than 10 years before, having seen in consultation men who have sex with men (MSMs) and, lastly; using screening practices for sexually transmitted infections that were better aligned with the recommendations than those who reported not knowing about PrEP. Conclusion: Although PrEP remains insufficiently known to GPs, many expressed eagerness to be involved. The training of health professionals and the highlighting of GPs' role in prevention could help to optimize the fight against HIV. © 2023 Elsevier Masson SAS	General practitioner; HIV; Pre-Exposure Prophylaxis (PrEP)	English	France	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Quantitative
Article	2023	Gillespie, David; de Bruin, Marijn; Hughes, Dyfrig A; Ma, Richard; Williams, Adam; Wood, Fiona; Couzens, Zoë; Jones, Adam; Hood, Kerenza	Between- and Within-Individual Sociodemographic and Psychological Determinants of PrEP Adherence Among Men Who have Sex with Men Prescribed a Daily PrEP Regimen in Wales.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-022-03890-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9628468	We investigated the determinants of daily PrEP use and coverage of condomless anal sex (CAS) by PrEP among men who have sex with men in Wales, UK. We measured PrEP use by electronic monitors and CAS by secure online surveys. We defined PrEP use based on daily medication cap openings and coverage as CAS episodes preceded by ≥ 3 days of PrEP use and followed by ≥ 2 days of PrEP use. We included 57 participants (5463 observations). An STI diagnosis was associated with lower PrEP use but also lower PrEP coverage. Older adults had higher PrEP use. A belief that other PrEP users took PrEP as prescribed was associated with lower PrEP coverage. An STI diagnosis is an important cue for an intervention, reflecting episodes of high-risk sexual behaviour and low PrEP coverage. Other results provide a basis for the development of an evidence-informed intervention for promoting coverage of PrEP. Article	2023	Gillespie, David; Williams, Adam; Wood, Fiona; Couzens, Zoë; Jones, Adam; Ma, Richard; de Bruin, Marijn; Hughes, Dyfrig A; Hood, Kerenza	Psychometric Properties of an Adapted Stigma Scale and Experiences of Stigma Associated with HIV Pre-exposure Prophylaxis Use Among Men Who have Sex with Men: A Mixed Methods Study	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03967-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145895849&doi=10.1007%2fs10461-022-03967-0&partnerID=40&md5=ab3d510b8ac0df38ee47916a8baed7e7	Stigma may influence the use of HIV pre-exposure prophylaxis (PrEP). However, there is an absence of robust measures for PrEP-related stigma. We describe an adaptation of a HIV stigma scale for use in PrEP users and experiences of PrEP users in Wales (UK) with regards to PrEP-related stigma. A mixed methods study was conducted where PrEP users completed questionnaire items about PrEP-related stigma and a subset were interviewed about their experiences of taking PrEP. We adapted items from the HIV stigma scale and assessed construct validity and internal consistency. We analysed interview data using a framework approach, with themes focussing on enacted and anticipated stigma in order to identify areas for scale refinement. Our measure had good psychometric properties but additional items may be useful (e.g. specific instances of enacted stigma, concerns around homonegativity). Further work is needed to develop this scale and validate it in a larger sample. © 2023, The Author(s). Article	2023	Giorlando K.K.; Arnold T.; Barnett A.P.; Leigland A.; Whiteley L.; Brock J.B.; Brown L.K.	Acceptability and Comfort Regarding Remotely Delivered PrEP Services in Mississippi	Journal of the International Association of Physicians in AIDS Care	-	-	-	-	23259574	10.1177/23259582231186868	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164269055&doi=10.1177%2f23259582231186868&partnerID=40&md5=15bcdc7a627631e4691de2fc03401daf	Despite the prevalence of human immunodeficiency virus (HIV) in Mississippi, access to pre-exposure prophylaxis (PrEP) is mostly limited to urban areas. Remote PrEP care via telemedicine, HIV self-testing, and prescription mail delivery can improve care in underserved communities. This mixed methods study assessed the acceptability and feasibility of using remote PrEP care, compared to alternatives. This consisted of (1) a cross-sectional survey and (2) interviews. PrEP-eligible adults were recruited from community-based organizations across Mississippi while accessing HIV testing between December 2019 and May 2022. Those surveyed (n = 63) indicated the greatest comfort in receiving PrEP via mail delivery (m = 5.14) and telemedicine (m = 4.89) and least comfort at gyms (m = 3.92). Comfort significantly differed between mail delivery and gyms (F = 2.90; P <.01). Those interviewed (n = 26) expressed relatively high comfort with remote PrEP care citing enhanced accessibility, privacy, simplicity, and quality. Remote PrEP services were acceptable and feasible among our sample, thus, should be expanded in Mississippi to address unmet needs. © The Author(s) 2023. Article	2023	Giovenco, Danielle; Pettifor, Audrey; Bekker, Linda-Gail; Filiatreau, Lindsey M; Liu, Tao; Akande, Morayo; Gill, Katherine; Atujuna, Millicent; Stein, Dan J; Kuo, Caroline	Understanding Oral Prep Interest Among South African Adolescents: The Role of Perceived Parental Support and PrEP Stigma	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03924-x	https://www.proquest.com/scholarly-journals/understanding-oral-prep-interest-among-south/docview/2807780055/se-2?accountid=8113	We examined oral PrEP interest among adolescents and its association with perceived parental support and PrEP stigma. Cross-sectional data were collected during baseline procedures of the "Our Family Our Future" intervention trial in South Africa. Adolescents (14–16 years) at elevated risk for acquiring HIV and their parents or caregivers were dyadically enrolled from 2018 to 2021. There were 879 complete adolescent-parent dyads. Among adolescents, 27% had heard about PrEP, 67% reported they would want to use PrEP, and 58% thought their parent would want them to use PrEP. Among parents, 33% had heard about PrEP and 85% reported they would want their adolescent to use PrEP. Adolescents who thought their parent would want them to use PrEP were more likely to be interested in PrEP than adolescents who thought their parent would not want them to use PrEP (adjusted prevalence ratio (aPR) = 2.11, 95% CI 1.82, 2.44). Further, adolescents with higher average PrEP stigma scores above the adolescent sample median were less likely to be interested in PrEP than adolescents with lower average PrEP stigma scores (aPR = 0.81, 95% CI 0.72, 0.91). In conclusion, parents were more supportive of their adolescent taking PrEP than adolescents perceived they would be, and perceptions of low parental support and greater PrEP stigma were associated with reduced PrEP interest among adolescents. Interventions should aim to improve adolescent-parent communication around sexual health and effective HIV prevention tools. Article	2023	Glick J.L.; Zhang L.; Rosen J.G.; Yaroshevich K.; Atiba B.; Pelaez D.; Park J.N.	A Novel Capacity-Strengthening Intervention for Frontline Harm Reduction Workers to Support Pre-exposure Prophylaxis Awareness-Building and Promotion Among People Who Use Drugs: Formative Research and Intervention Development	JMIR Formative Research	-	-	-	-	2561326X	10.2196/42418	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85154609603&doi=10.2196%2f42418&partnerID=40&md5=f75484ac854acb72f00679cd0dd4a2f7	Background: HIV prevalence among people who use drugs (PWUD) in Baltimore, Maryland, is higher than among the general population. Pre-exposure prophylaxis (PrEP) is a widely available medication that prevents HIV transmission, yet its usefulness is low among PWUD in Baltimore City and the United States. Community-level interventions to promote PrEP uptake and adherence among PWUD are limited. Objective: We describe the development of a capacity-strengthening intervention designed for frontline harm reduction workers (FHRWs) to support PrEP awareness-building and promotion among PWUD. Methods: Our study was implemented in 2 phases in Baltimore City, Maryland. The formative phase focused on a qualitative exploration of the PrEP implementation environment, as well as facilitators and barriers to PrEP willingness and uptake, among cisgender women who use drugs. This work, as well as the existing literature, theory, and feedback from our community partners, informed the intervention development phase, which used an academic-community partnership model. The intervention involved a 1-time, 2-hour training with FHRWs aimed at increasing general PrEP knowledge and developing self-efficacy promoting PrEP in practice (eg, facilitating PrEP dialogues with clients, supporting client advancement along a model of PrEP readiness, and referring clients to PrEP services). In a separate paper, we describe the conduct and results of a mixed methods evaluation to assess changes in PrEP-related knowledge, attitudes, self-efficacy, and promotion practices among FHRWs participating in the training. Results: The pilot was developed from October to December 2021 and implemented from December 2021 through April 2022. We leveraged existing relationships with community-based harm reduction organizations to recruit FHRWs into the intervention. A total of 39 FHRWs from 4 community-based organizations participated in the training across 4 sessions (1 in-person, 2 online synchronous, and 1 online asynchronous). FHRW training attendees represented a diverse range of work cadres, including peer workers, case managers, and organizational administrators. Conclusions: This intervention could prevent the HIV burden among PWUD by leveraging the relationships that FHRWs have with PWUD and by supporting advancement along the PrEP continuum. Given suboptimal PrEP uptake among PWUD and the limited number of interventions designed to address this gap, our intervention offers an innovative approach to a burgeoning public health problem. If effective, our intervention has the potential to be further developed and scaled up to increase PrEP awareness and uptake among PWUD worldwide. © Jennifer L Glick, Leanne Zhang, Joseph G Rosen, Karla Yaroshevich, Bakari Atiba, Danielle Pelaez, Ju Nyeong Park.	formative research; harm reduction; intervention development; people who use drugs (PWUD); pre-exposure prophylaxis (PrEP)	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2023	Godinez H.; Xu Q.; McMann T.J.; Li J.; Mackey T.K.	Analysis of online user discussions on Reddit associated with the transition of use between HIV PrEP therapy	Frontiers in Public Health	-	-	-	-	22962565	10.3389/fpubh.2023.1073813	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164868736&doi=10.3389%2ffpubh.2023.1073813&partnerID=40&md5=e3c70c7506bc006a84150c92f35955ac	In 2019, the U.S. Food and Drug Administration (FDA) approved emtricitabine and tenofovir alafenamide (Descovy) as another option for HIV pre-exposure prophylaxis (PrEP) prevention for high-risk adults and adolescents. With the introduction of this new PrEP, millions of current users on emtricitabine and tenofovir disoproxil fumarate (Truvada), another PrEP medication currently used to prevent HIV transmission, have options of whether to continue their current treatment regime or transition to new treatment options. The objective of this study was to conduct a descriptive analysis to characterize user-generated social media conversations on Reddit associated with FDA-approved PrEP prevention treatment options. Key themes identified were associated with perceptions, knowledge, and attitudes associated with the transition of use of different PrEP medications. Data were collected retrospectively and prospectively from the Reddit platform for posts with keywords filtered for HIV, PrEP, and FDA-approved PrEP prevention treatment from October 2020 to December 2020. We chose the Reddit platform based on prior studies that have identified PrEP user conversations and insights on access challenges for specific AIDS communities, such as gays and men who have sex with men (MSM). Reddit posts were then manually annotated using an inductive content coding approach for key themes regarding the transition of use and other emergent themes from user-generated content. Formal coding of text data was conducted with refined codes, and sub-codes created. A total of 3,120 posts were analyzed from Reddit resulting in 315 posts that were coded for PrEP and 105 posts (33.33%) specific to user discussions regarding the transition of PrEP. Overall, users expressed interest in drug switching to Descovy, particularly in the context of poorer adherence or concerns about existing side effects associated with Truvada. Other major themes included discussions about the cost of Descovy, apprehension about side effects in comparison to Truvada, insurance coverage changes, and discussions about the donation of Truvada to other users after transitioning. Among these discussions, topics related to sexual minorities, including MSM, reported concerns when considering a switch in their HIV prevention regime. Understanding the changing public perception associated with the introduction of new HIV prevention is important in the context of market access, patient safety, pharmacovigilance, and health equity, particularly among high-risk populations such as MSM. Results support the use of social media from a digital pharmacovigilance perspective to better understand emerging HIV prevention, treatment, and adherence challenges experienced by patients. PrEP Scale-Up and PEP in Central and Eastern Europe: Changes in Time and the Challenges We Face with No Expected HIV Vaccine in the near Future †	Vaccines	-	-	-	-	2076393X	10.3390/vaccines11010122	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146911661&doi=10.3390%2fvaccines11010122&partnerID=40&md5=5aa434e35fcb12bd851070eac6648895	With no expected vaccine for HIV in the near future, we aimed to define the current situation and challenges for pre- and post-exposure prophylaxis (PrEP and PEP) in Central and Eastern Europe (CEE). The Euroguidelines CEE Network Group members were invited to respond to a 27-item survey including questions on PrEP (response rate 91.6%). PrEP was licensed in 68.2%; 95 centers offered PrEP and the estimated number on PrEP was around 9000. It was available in daily (40.1%), on-demand (13.3%), or both forms (33.3%). The access rate was <1–80%. Three major barriers for access were lack of knowledge/awareness among people who are in need (59.1%), not being reimbursed (50.0%), and low perception of HIV risk (45.5%). Non-occupational PEP was available in 86.4% and was recommended in the guidelines in 54.5%. It was fully reimbursed in 36.4%, only for accidental exposures in 40.9%, and was not reimbursed in 22.72%. Occupational PEP was available in 95.5% and was reimbursed fully. Although PrEP scale-up in the region has gained momentum, a huge gap exists between those who are in need of and those who can access PrEP. Prompt action is required to address the urgent need for PrEP scale-up in the CEE region. © 2023 by the authors. Article	2023	Gökengin, Deniz; Noori, Teymur; Alemany, Andrea; Bienkowski, Carlo; Liegon, Geoffroy; Inkaya, Ahmet Çagkan; Carrillo, Jorge; Stary, Georg; Knapp, Katja; Mitja, Oriol; Molina, Jean-Michel	Prevention strategies for sexually transmitted infections, HIV, and viral hepatitis in Europe.	The Lancet Regional Health - Americas	-	-	-	-	2666-7762	10.1016/j.lanepe.2023.100738	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10625023	The current prevention efforts for STIs, HIV and viral hepatitis in the WHO European Region, especially in the Central and Eastern subregions, are hindered by healthcare disparities, data gaps, and limited resources. In this comprehensive narrative review, we aim to highlight both achievements and persisting challenges while also exploring new developments that could significantly impact the prevention of these infections in the near future. While pre-exposure prophylaxis (PrEP) for HIV has been broadly approved and implemented in 38 out of 53 countries in the region, challenges remain, including cost, limited licensing, and incomplete adherence. We explore innovative approaches like on-demand PrEP, long-acting injectable cabotegravir, and intravaginal rings that have shown promising results, alongside the use of six-monthly lenacapavir, the outcomes of which are pending. Additionally, the potential of doxycycline post-exposure prophylaxis has been discussed, revealing efficacy in reducing chlamydia and syphilis risk, but effectiveness against gonorrhoea being contingent on tetracycline resistance rates, and the need of further data to determine potential resistance development in other bacteria and its impact on the gut microbiome. We examine successful vaccination campaigns against HBV and HPV, the ongoing development of vaccines for chlamydia, syphilis, herpesvirus, and gonorrhoea, and challenges in HIV vaccine research, including lines of research with significant potential like sequential immunization, T-cell responses, and mRNA technology. This review underscores the research endeavors that pave the way for a more resilient and robust approach to combating STIs, HIV, and viral hepatitis in the region. Article	2023	Goldstein, Deborah; Ford, Nathan; Kisyeri, Nicholas; Munsamy, Maggie; Nishimoto, Lirica; Osi, Kufor; Kambale, Herve; Minior, Thomas; Bateganya, Moses	Person-centred, integrated non-communicable disease and HIV decentralized drug distribution in Eswatini and South Africa: outcomes and challenges.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26113	https://onlinelibrary.wiley.com/doi/full/10.1002/jia2.26113	INTRODUCTION: Non-communicable diseases (NCDs) are highly prevalent in people living with HIV above 50 years of age and account for increasing mortality. There is little published evidence supporting person-centred, integrated models of HIV care, hypertension and diabetes treatment in southern Africa, and no data demonstrating mortality reduction. Where clinical visits for NCDs and HIV cannot be combined, integrated medication delivery presents an opportunity to streamline care and reduce patient costs. We present experiences of integrated HIV and NCD medication delivery in Eswatini and South Africa, focusing on programme successes and implementation challenges. Programmatic data from Eswatini's Community Health Commodities Distribution (CHCD) from April 2020 to December 2021 and South Africa's Central Chronic Medicines Dispensing and Distribution (CCMDD) from January 2016 to December 2021 were provided by programme managers and are summarized here. DISCUSSION: Launched in 2020, Eswatini's CHCD provides over 28,000 people with and without HIV with integrated services, including HIV testing, CD4 cell count testing, antiretroviral therapy refills, viral load monitoring and pre-exposure prophylaxis alongside NCD services, including blood pressure and glucose monitoring and hypertension and diabetes medication refills. Communities designate neighbourhood care points and central gathering places for person-centred medication dispensing. This programme reported fewer missed medication refill appointments among clients in community settings compared to facility-based settings. South Africa's CCMDD utilizes decentralized drug distribution to provide medications for over 2.9 million people, including those living with HIV, hypertension and diabetes. CCMDD incorporates community-based pickup points, facility "fast lanes" and adherence clubs with public sector health facilities and private sector medication collection units. There are no out-of-pocket payments for medications or testing commodities. Wait-times for medication refills are lower at CCMDD sites than facility-based sites. Innovations to reduce stigma include uniformly labelled medication packages for NCD and HIV medications. CONCLUSIONS: Eswatini and South Africa demonstrate person-centred models for HIV and NCD integration through decentralized drug distribution. This approach adapts medication delivery to serve individual needs and decongest centralized health facilities while efficiently delivering NCD care. To bolster programme uptake, additional reporting of integrated decentralized drug distribution models should include HIV and NCD outcomes and mortality trends. Article	2023	Golub S.A.; Starbuck L.; Fikslin R.; Gamarel K.E.	Psychometric Evaluation and Predictive Validity of an Adapted Adherence Self-Efficacy Scale for PrEP	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03758-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133599780&doi=10.1007%2fs10461-022-03758-7&partnerID=40&md5=ae76d274a46f96014379f5ee439d4a9a	Adherence to and sustainment of HIV pre-exposure prophylaxis (PrEP) are critical to its effectiveness. Adherence self-efficacy, i.e., confidence in one's ability to adhere to a particular medication, is a key psychological determinant of health behavior that strongly predicts HIV treatment adherence but has been understudied in PrEP research. This paper describes the psychometric evaluation and validation of the PrEP Adherence Self-Efficacy Scale (PrEP-ASES), adapted from the previously validated HIV Treatment Adherence Self-Efficacy Scale (HIV-ASES). Data are drawn from two studies conducted at a community health center, one focused on gay and bisexual cisgender men and the other on transgender women. Factor analyses support a one-factor score (eigenvalue = 6.78) that explained 75.3% of the variance, with good test–retest reliability (rs > 0.40). In both studies, higher PrEP-ASES scores were associated with PrEP uptake, adherence, and sustainment. Findings support the utility of the PrEP-ASES in research and suggest the importance of addressing self-efficacy in PrEP programs and services. © 2022, The Author(s), under exclusive license to Springer Science+Business Media, LLC, part of Springer Nature. Theses and Dissertations	2023	GOMES, FABIANE SOARES.	Aceitabilidade e inicio do uso da profilaxia pré-exposição ao HIV em populações-chave para epidemia de HIV/AIDS	-	-	Universidade FEderal da Bahia	-	NA	NA	https://sigaa.ufba.br/sigaa/public/programa/noticias_desc.jsf?lc=pt_BR&id=1107&noticia=1101113	A epidemia de HIV é um problema de saúde pública no Brasil e no mundo. Entretanto, está concentrada em alguns grupos populacionais, como homens que fazem sexo com homens (HSH), travestis e mulheres transexuais (TrMT), além de outros, chamados de populações-chave para a epidemia. A profilaxia pré-exposição ao HIV (PrEP) é uma importante tecnologia de prevenção do HIV, indicada para pessoas com risco acrescido para o HIV e, no Brasil, se insere no leque de opções de estratégias de prevenção combinada. A aceitabilidade e o início do uso desta tecnologia diferem segundo populações e faixa etária, assim como seus fatores associados. E o conhecimento das etapas para uso da PrEP entre populações-chave no contexto brasileiro é limitado. Objetivo geral: Estudar a aceitabilidade e a iniciação do uso da PrEP entre populações-chave da epidemia do HIV no Brasil. Objetivos específicos: (1) Analisar a associação entre autopercepção de risco de infecção pelo HIV e a aceitabilidade da PrEP oral diária entre HSH em doze capitais brasileiras; (2) Analisar os perfis sociodemográficos e comportamentais de adolescentes HSH e TrMT quanto à iniciação do uso da PrEP em três capitais brasileiras; (3) Descrever o processo de iniciação do uso da PrEP e analisar seus preditores entre adolescentes HSH e TrMT em três capitais brasileiras. Métodos: Essa tese utilizou e analisou dados de dois estudos, e organizou os resultados em três artigos, segundo cada objetivo específico. (1) No primeiro artigo foi estimada a associação entre autopercepção de risco pelo HIV e aceitabilidade da PrEP oral diária entre HSH brasileiros. A base de dados foi de um inquérito sociocomportamental e biológico com a técnica amostral Respondent Driven Sampling (RDS), e recrutou-se 4.176 HSH com 18 anos ou mais em 12 cidades brasileiras, em 2016. Os resultados foram ponderados pelo estimador de Gile para estudos de RDS. Foram estimados odds ratiosajustados (ORa) com intervalos de confiança de 95% (IC 95%) por meio de modelos de regressão logística. (2) No segundo artigo a base de dados foi da pesquisa PrEP1519, estudo de coorte demonstrativo da efetividade da PrEP entre adolescentes HSH e TrMT (aHSH) e (aTrMT), de 15 a 19 anos, conduzido em São Paulo, Salvador e Belo Horizonte. Nesta análise, foram utilizados os dados dos participantes inscritos na coorte entre fevereiro/2019 e agosto/2021, entretanto observamos estes participantes até fevereiro de 2022 para analisar a iniciação de PrEP ao longo do período de seguimento. Os adolescentes que procuraram os serviços de PrEP foram classificados em quatro grupos, de acordo com a elegibilidade de PrEP (i.e., elegível ou não elegível), e a decisão de uso de PrEP (i.e., iniciou, não iniciou): i)participante sem indicação de uso da PrEP, não elegível; ii) elegível e iniciou o uso da PrEP na primeira consulta; iii) elegível e iniciou o uso da PrEP após a primeira consulta; e iv) com indicação de uso da PrEP, mas não iniciou o uso da PrEP. Os grupos foram descritos e comparados em relação às características sociodemográficas e comportamentais usando testes de c Exato de Fisher. As análises foram realizadas no software R v.4.1.0, considerando um nível de significância estatística de 5%. (3) No terceiro artigo foram usados os dados da linha de base da coorte PrEP1519 dos participantes inscritos no estudo entre fevereiro/2019 e fevereiro/2021. Foi aplicado um questionário sociocomportamental na primeira visita aos serviços de PrEP. Foram descritas as proporções de intenção de uso, da elegibilidade ao uso da PrEP, e do início do uso da PrEP. Foi estimada razão de prevalência ajustada (RPa) e IC 95% da associação entre fatores sociocomportamentais e demográficos e início de uso da PrEP, estratificado por faixa etária (15 a 17 anos; 18 e 19 anos), utilizando modelos de regressão logística. Resultados referentes ao primeiro objetivo: A aceitabilidade da PrEP oral diária foi elevada (69,7%) entre os 3.544 HSH que responderam ao questionário. A maioria dos participantes relatou baixo ou moderado risco de infecção pelo HIV (67,2%) e uma pequena proporção (9,3%) relatou alto risco. Foi observada uma relação dose-resposta entre a aceitabilidade de PrEP e o risco autopercebido: a aceitabilidade da PrEP foi 1,88 vezes maior (OR 1,80; IC 95%: 1,24–2,85) entre HSH cujo risco percebido de infecção pelo HIV foi baixo ou moderado, e 5 vezes maior (OR 5,68; IC 95%: 2,54–12,73) entre aqueles que relataram alto risco em comparação com os HSH que relataram não ter risco de infecção pelo HIV. Resultados referentes ao segundo objetivo: Dos 1.254 adolescentes que chegaram aos serviços do estudo PrEP1519, 61 (4,9%) não tinham indicação de usar PrEP, por contraindicação clínica ou uma avaliação que indicasse baixo risco ao HIV. Dos 1.193 elegíveis para a iniciação da PrEP no mesmo dia, 1.113 (93,3%) iniciaram a PrEP 1.054 na primeira visita (88.3%) e 59 ao longo do acompanhamento (4.9%) e 80 (6,7%) não iniciaram. Destes que iniciaram o uso da PrEP ao longo do seguimento, 50,0% começaram a usar PrEP nos primeiros 42 dias após o primeiro atendimento. Os adolescentes que iniciaram o uso da PrEP relataram alto risco de infecção pelo HIV. Resultados referentes ao terceiro objetivo: Entre os participantes recrutados, 174 (19,2%) tinham de 15 a 17 anos e 734 (80,8%) de 18 a 19 anos. A proporção de início de uso da PrEP foi de 78,2% e 77,4% para 15-17 anos e 18-19 anos, respectivamente. Os fatores associados ao início de uso da PrEP foram: ser preto ou pardo (RPa 2,31; IC 95%: 1,10 - 4,84) entre os adolescentes mais jovens de 15 a 17 anos; ter sofrido violência e/ou discriminação devido sua orientação sexual e/ou identidade de gênero (RPa 1,21; IC 95%: 1,01 - 1,46); ter recebido dinheiro ou favores em troca de sexo (RPa 1,32; IC 95%: 1.04 - 1,68); e ter tido de 2 a 5 parcerias sexuais nos últimos três meses (RPa 1,39; IC 95%: 1,15 - 1,68) entre os 18-19 anos. A relação anal receptiva desprotegida nos últimos 6 meses foi associada ao início de uso de PrEP em ambas as faixas etárias (RPa 1,98; IC 95%: 1,02 - 3,85 e RPa 1,45; IC 95%: 1,19 - 1,76 entre 15-17 anos e 18-19 anos, respectivamente). Conclusões: A PrEP é uma medida efetiva de prevenção do HIV para adultos e adolescentes de populações-chave no Brasil e no mundo. A percepção do risco de infecção pelo HIV desempenha um papel importante na aceitabilidade da PrEP. Article	2023	Gómez W.	Assessing PrEP messaging and communication: A review of the qualitative literature	Current Opinion in Psychology	-	-	-	2352250X	10.1016/j.copsyc.2023.101586	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160328026&doi=10.1016%2fj.copsyc.2023.101586&partnerID=40&md5=0af77c7cc6772fed9d17cac8ff386a40	Pre-exposure prophylaxis (PrEP) is a biomedical HIV prevention intervention approved by the FDA in 2012. Nevertheless, most sexual minority men (SMM) who could benefit from its use are not currently prescribed PrEP. The literature during the first decade of PrEP availability has suggested a diverse set of multi-level barriers and facilitators to PrEP uptake and adherence. Through a scoping review, 16 qualitative studies were surveyed to assess these barriers and facilitators, specifically regarding messaging and communication. Seven main themes were identified: information & misinformation, peer messaging, expansion of sexual experiences, relationships with providers, expectations & stigma, navigation support, and barriers to uptake & adherence. Data suggest that peer support, messaging around empowerment and agency, and PrEP's role in shifting sociosexual norms contributed to uptake and adherence. On the other hand, stigma, provider disconnection, and access issues hindered PrEP uptake and adherence. Findings could inform multi-level, strengths-based, and holistic approaches to designing effective interventions for PrEP engagement among SMM. © 2023 Elsevier Ltd	HIV; Messaging; PrEP; Qualitative research; Sexual minority men	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Gomillia C.E.; Burns P.A.; Xavier Hall C.D.; Beach L.B.	The Association of Depression, Social Determinants and PrEP Uptake Among Black Sexual Minority Men in the Deep South	Journal of Racial and Ethnic Health Disparities	-	-	-	21973792	10.1007/s40615-023-01793-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171190473&doi=10.1007%2fs40615-023-01793-1&partnerID=40&md5=2ba2871412976636f7c8e0f7040b18ac	Despite its known efficacy in reducing HIV acquisition, pre-exposure prophylaxis (PrEP) uptake and utilization remains alarmingly low among key populations, including Black sexual minority men (SMM). Additionally, research has shown that SMM are at elevated risk of adverse mental health outcomes, including depression, anxiety, illegal drug use, and suicidality. However, there is limited data examining the impact of depression on PrEP uptake among Black SMM. This study analyzes survey data obtained from the ViiV ACCELERATE! Initiative between January 2016 and September 2017 to examine the association between depressive symptoms and uptake of PrEP among a sample of HIV-negative Black SMM ages 18–65 years (N=170) residing in Mississippi, the poorest state in the USA. We found that PrEP-eligible Black SMM reporting depressive symptoms were 60% less likely to take PrEP (aOR = 0.40, CI: 0.18–0.74, p = 0.05). Similarly, PrEP-eligible men lacking health insurance were 63% less likely to start PrEP (aOR = 0.37; CI: 0.17–0.94; p = 0.035). Given the low uptake of PrEP among Black SMM, there is an urgent need for the development and implementation of combination HIV prevention interventions that incorporate access to mental health services among this highly stigmatized and marginalized population. © 2023, W. Article	2023	Goodreau, Steven M.; Delaney, Kevin P.; Zhu, Weiming; Smith, Dawn K.; Mann, Laura M.; Sanchez, Travis H.; Hamilton, Deven T.; Hoover, Karen W.	Impacts of COVID-19 on sexual behaviors, HIV prevention and care among men who have sex with men: A comparison of New York City and Metropolitan Atlanta.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0282503	https://pubmed.ncbi.nlm.nih.gov/36943832/	The COVID-19 pandemic has disrupted HIV prevention, care, and transmission opportunities. This likely varies by geography, given differences in COVID-19 burden and mandates over time, and by age, given different likelihoods of severe COVID-19 consequences. We consider changes in sexual behavior, HIV testing, pre-exposure prophylaxis (PrEP) use and antiretroviral therapy (ART) use among men who have sex with men (MSM) over the first year of the COVID-19 epidemic, comparing the Atlanta metropolitan area and New York City (NYC). We use two continuous time-series datasets and one panel dataset, assessing changes over time within city and comparing across cities, and disaggregate major findings by age. For clinical results, ART use showed by far the smallest reductions, and testing the largest. Disruptions occurred concurrently between cities, despite the major wave of COVID-19, and government mandates, occurring later in Atlanta. Test positivity increased in NYC only. In both cities, younger MSM saw the greatest reductions in testing and PrEP use, but the smallest in sexual behavior. Reduced clinical service usage would be unconcerning if stemming solely from reductions in exposure; however, the patterns for young MSM suggest that the COVID-19 epidemic likely generated new conditions for increased HIV transmission, especially in this cohort. Article	2023	Gordon K.J.; Martin C.E.; Kutywayo A.; Cox L.A.; Nongena P.; Mullick S.	Mental Health Needs of Adolescent and Young Adult PrEP Users in South Africa: Implications for Sexual and Reproductive Health Programming	Journal of Adolescent Health	-	-	-	1054139X	10.1016/j.jadohealth.2023.08.018	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175552738&doi=10.1016%2fj.jadohealth.2023.08.018&partnerID=40&md5=f2ec7ff062c9b8732a50b343a46973ea	Purpose: Poor mental health is associated with sexual and reproductive health (SRH) risks, including human immunodeficiency virus (HIV) and pre-exposure prophylaxis discontinuation. Adolescents and young people (AYP) are vulnerable to HIV and depression. This paper describes the prevalence and severity of depression and associated factors in AYP accessing SRH services in South Africa. Methods: A cross-sectional analysis of enrollment data (January 2019 to December 2021) from a cohort of individuals receiving pre-exposure prophylaxis services at eight clinics in three provinces in South Africa was conducted. Females (n = 1,074) and males (n = 231) aged 15–24 years were included. Interviewer-administered questionnaires were conducted, and the prevalence and severity of depression assessed using the Patient Health Questionnaire-9. Multivariate analysis was used to identify factors associated with depression. Results: Over 40% of participants had experienced any depression symptoms (43.7% of females, 38.5% of males). For males, experiencing intimate partner violence was the only predictor of depression symptoms (adjusted odds ratio (AOR) 8.81, 95% confidence intervals (CI) 1.03–75.44). For females, living with both parents (AOR 1.70, 95% CI 1.15–2.51), having transactional sex (AOR 1.63, 95% CI 1.00–2.65), experiencing any intimate partner violence (AOR 1.96, 95% CI 1.34–2.89), and using drugs (AOR 1.78, 95% CI 1.03–3.11) were all positively associated with depression symptoms. Resilience was a protective factor against depression symptoms for both sexes (males: AOR 0.96, 95% CI 0.93–0.98; females: AOR 0.96, 95% CI 0.95–0.97). Discussion: There is a high burden of depression among AYP accessing SRH services in South Africa. Mental health screening should be integrated into SRH and HIV prevention programs for AYP. © 2023 Society for Adolescent Health and Medicine	Adolescent; Depression; Gender-based violence; Mental health; Mental health screening; PrEP; Psychosocial; Sexual and reproductive health	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2023	Gormley M.A.; Nagy T.R.; Moschella P.; Lu Z.; Rodriguez J.; Roth P.	HIV Pre-Exposure Prophylaxis in the Emergency Department: A Systematic Review	Annals of Emergency Medicine	-	-	-	1960644	10.1016/j.annemergmed.2022.07.015	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138217242&doi=10.1016%2fj.annemergmed.2022.07.015&partnerID=40&md5=ce82063bf8c0b9c72041cce0d727d6ed	Study objective: Many emergency departments (EDs) have identified the importance of HIV prevention and have implemented steps to screen and offer preexposure prophylaxis (PrEP). The objective of this study was to systematically review existing literature that identifies PrEP eligibility in the ED and summarize outcomes along the PrEP cascade of care (awareness, interest, linkage to treatment, initiation, and retention) for patients in ED. Methods: Four databases captured all PrEP-related studies in EDs from January 1, 2013 to January 27, 2022. Data were extracted on study characteristics and outcomes, and study quality was assessed using a modified quality assessment tool by the Effective Public Health Practice Project. Results: Of the 218 articles, 16 were subjected to full-text review, and 7 met inclusion criteria. Although most studies identified patients who were PrEP eligible using criteria adapted from the 2017 Centers for Disease Control and Prevention PrEP guidelines, the number and time frame for each criterion varied. Six studies reported outcomes on the PrEP cascade of care, showing a relatively high prevalence of awareness and interest but a very low prevalence of linkage and uptake. No studies documented retention in PrEP treatment. Conclusion: Although up to a third of patients in ED assessed in the current study were PrEP eligible, less than half of PrEP-eligible participants had prior knowledge of PrEP, and very few who expressed interest in the ED were ultimately linked to PrEP treatment or initiated PrEP. Future research is necessary to identify strategies to increase PrEP education, interest, and linkage to care from the ED. © 2022 American College of Emergency Physicians	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Gotsche C.I.; Steyn P.S.; Narasimhan M.; Rodolph M.; Baggaley R.; Kiarie J.N.	Integrating pre-exposure prophylaxis of HIV infection into family planning services: A scoping review	BMJ Sexual and Reproductive Health	-	-	-	25151991	10.1136/bmjsrh-2021-201356	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164625536&doi=10.1136%2fbmjsrh-2021-201356&partnerID=40&md5=c1fb97be3cbe0b49c8d1bbb236e5fe39	Introduction The aim of this review was to map evidence of integrating pre-exposure prophylaxis (PrEP) for HIV prevention into family planning services. A comprehensive package, using a combination of PrEP and contraceptive delivery, could reduce the number of new HIV infections and/or unintended pregnancies for at-risk women and adolescent girls. Methods A scoping literature search was conducted between August 2020 and October 2020. After developing the review question, electronic databases (MEDLINE, Embase, Cochrane Library, Global Health, Web of Science) were systematically reviewed. All types of articles published from 2012 to August 2020 in English were included. The intended outcome was to identify barriers and enablers of integrating services at the client-level and provider-level. Results 38 articles met inclusion criteria, with 16 from low-and middle-income countries and 22 from high-income countries. Barriers at the client-level included a lack of risk perception associated with low uptake and continuation of PrEP and pill burden; and at the provider-level, barriers included a lack of studies on cost-effectiveness of integrating services and provider training and knowledge. Facilitators included the initiation of PrEP and contraception at the same time and by the same provider or HIV self-testing. Conclusion Mapping and synthesising current evidence, this review identified key barriers and facilitators for the integration of PrEP into family planning services for women and adolescent girls. In order to address these factors, more implementation research in a variety of settings is needed to meet women's sexual and reproductive health needs globally. © 2023 Author(s). Article	2023	Goymann Hannah; Mxolisi, Mavuso; McMahon, Shannon A; Hettema, Anita; Hughey, Allison B; Matse Sindy; Dlamini Phiwa; Kahn, Kathleen; Bärnighausen Till; Jahn, Albrecht; Bärnighausen Kate	We Should Not Be Quiet but We Should Talk': Qualitative Accounts of Community-Based Communication of HIV Pre-Exposure Prophylaxis	Qualitative Health Research	-	-	-	10497323	10.1177/10497323231181207	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164523007&doi=10.1177%2f10497323231181207&partnerID=40&md5=baedd6bfcf13408fa7dfd7da2868fa31	Community leaders play an important role in the acceptance of public health services, but little is known about their willingness to facilitate HIV pre-exposure prophylaxis (PrEP) roll-out in Eswatini. We conducted in-depth interviews (n = 25) with purposefully selected male and female community leaders in Eswatini. We analysed our data inductively using a thematic analysis approach. Community leaders feel they are important communicators of culturally appropriate PrEP messaging. Our participants described a complex social space within their communities influenced by religion, tradition, values, and HIV stigma. Community leaders see their position to provide leverage for unique, effective, and easily accessible messages and platforms to reach the community in a manner that ensures trust, relatability, familiarity, and shared faith. Community leaders feel that they are trusted and see trust manifesting in the conversations they are able to engage in, and have a reach that extends beyond formal health services. Existing PrEP programming should embed community leader participation in PrEP programming and engage the trust, knowledge, and potential of community leaders to support PrEP uptake and acceptance. © The Author(s) 2023.	community leaders; community-based communication; Eswatini; HIV prevention; PrEP; qualitative research	English	United States	Western and Central Europe and North America	Germany	Western and Central Europe and North America	Germany	Western and Central Europe and North America	Qualitative
Article	2023	Grace D.; Daroya E.; Gaspar M.; Wells A.; Hull M.; Lachowsky N.; Tan D.H.S.	Gay, bisexual, and queer men's confidence in the Undetectable equals Untransmittable HIV prevention message: longitudinal qualitative analysis of the sexual decision-making of pre-exposure prophylaxis users over time	Sexual Health	-	-	-	14485028	10.1071/SH23015	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164515537&doi=10.1071%2fSH23015&partnerID=40&md5=70e42dd916af623e6f8efc852b65620b	Background: Our objective was to understand what gay, bisexual, and queer men (GBQM) who had experience using pre-exposure prophylaxis (PrEP) thought about the 'Undetectable equals Untransmittable' (U=U) message and how it informed their sexual decision-making over time. Methods: We conducted annual longitudinal qualitative interviews (2020-22) with 17 current or former PrEP users as part of a mixed-methods implementation science study examining barriers and facilitators to PrEP awareness, access, and adherence. Over 3 years, 47 interviews were conducted with GBQM in Ontario, Canada. Interviews were transcribed verbatim and coded in NVivo following reflexive thematic analysis. Results: Participants' sexual health decision-making was informed by their confidence in biomedical HIV prevention and the person taking medication (i.e. themselves using PrEP versus a real/imagined person living with HIV (PLHIV)). Longitudinal narratives of U=U clustered around four overarching themes: (1) U=U confidence (i.e. increasing trust in U=U irrespective of their PrEP use); (2) PrEP confidence (i.e. accounts of self-reliance and PrEP as sufficient HIV protection); (3) combination confidence (i.e. trusting U=U and PrEP as a package); and (4) partner confidence (i.e. potential 'distrust' of U=U due to uncertainties about partners' medication adherence). Overall, men described increased sex with PLHIV over time, including some participants who, during earlier interviews, said they would 'never be comfortable' with serodifferent sexual partners. Conclusions: GBQM's use of PrEP shaped how they thought about U=U and sex with PLHIV. Although many GBQM embraced treatment as prevention/U=U as significant to their sexual lives, longitudinal analysis revealed its varied and uneven adoption across participants and time. © 2023 CSIRO. Article	2023	Grace D.; Gaspar M.; Wells A.; Sinno J.; Daroya E.; Montess M.; Hull M.; Lachowsky N.J.; Tan D.H.S.	Injectable Pre-Exposure Prophylaxis for HIV Prevention: Perspectives on the Benefits and Barriers from Gay, Bisexual, and Queer Men and Health System Stakeholders in Ontario, Canada	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2023.0034	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162180469&doi=10.1089%2fapc.2023.0034&partnerID=40&md5=40377906192ad9460b85f5f001b6bad	One hope surrounding long-acting HIV pre-exposure prophylaxis (PrEP) is reaching new users who could most benefit, as well as improving the experiences of oral PrEP users who may desire to switch modalities. Gay, bisexual, queer, and other men who have sex with men (GBQM) continue to make up over half of new HIV diagnoses in Canada, and oral PrEP uptake has plateaued among this population. Approval of injectable PrEP is anticipated, but there is a paucity of research to inform health promotion and implementation. Between June and October 2021, we conducted 22 in-depth interviews with GBQM oral PrEP users and non-PrEP users living in Ontario, Canada. We also conducted small focus groups or individual interviews with 20 key stakeholders (health care providers, public health officials, community-based organization staff). Interviews were audio recorded, transcribed verbatim, and analyzed in NVivo using thematic analysis. Only about one-third of GBQM had heard of injectable PrEP. Many PrEP users perceived greater convenience, adherence, and confidentiality with injectable PrEP. Some PrEP users did not anticipate switching because of needle discomfort or feeling more "in control"with oral PrEP. None of the non-PrEP users said that injectable PrEP would make them start PrEP. Injectable PrEP may offer additional convenience for GBQM; however, it did not appear to affect participants' PrEP decision-making significantly. Stakeholders noted that injectable PrEP may improve access, support adherence, and benefit marginalized groups. Some clinicians expressed concerns about the time/personnel required to make injectable PrEP available. System-level challenges in implementing injectable PrEP, including cost, must also be addressed. © 2023, Mary Ann Liebert, Inc., publishers.	and other men who have sex with men (GBQM); bisexual; Canada; gay; HIV prevention; injectable PrEP; qualitative; queer	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Qualitative
Article	2023	Graham, Susan M.; Okall, Duncan O.; Mehta, Supriya D.; Obondi, Eve; Ng'ety, George; Ochieng, Elijah; Jadwin-Cakmak, Laura; Amico, K. Rivet; Harper, Gary W.; Bailey, Robert C.; Otieno, Fredrick O.	Challenges with PrEP Uptake and Adherence Among Gay, Bisexual, and Other Men Who Have Sex with Men in Kisumu, Kenya	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03860-w	https://www.proquest.com/scholarly-journals/challenges-with-prep-uptake-adherence-among-gay/docview/2789882893/se-2?accountid=8113	Data on challenges with pre-exposure prophylaxis (PrEP) uptake and adherence among Kenyan gay, bisexual, and other men who have sex with men (GBMSM) are limited. In this mixed-methods sequential explanatory design study, our quantitative phase followed 157 at-risk, HIV-negative GBMSM who accepted PrEP and enrolled in a cohort with 12-month follow-up. Stored dried blood spots collected at two intervals were batch tested for tenofovir diphosphate (TFV-DP) concentrations at study end. Despite high self-reported adherence, only 14.6% of individuals had protective TFV-DP levels at any visit. Protective TFV-DP levels were positively associated with injection drug use and a self-assessed moderate risk of acquiring HIV, and negatively associated with time since enrolment. In our subsequent qualitative phase, an intensive workshop was conducted with the GBMSM community to identify barriers and facilitators to PrEP uptake and adherence. These data revealed numerous challenges with traditional PrEP programs that must be addressed through community collaborations.Resumo alternativo:ResumenLa evidencia respecto a desafíos existentes con aceptación y adherencia de la profilaxis previa a la exposición (PrEP) de VIH, entre los hombres homosexuales, bisexuales y otros hombres que tienen sexo con hombres (GBMSM) en Kenia es limitada. Condujimos un estudio de métodos mixtos y diseño explicativo secuencial. En la fase cuantitativa seguimos a 157 GBMSM VIH-negativos en riesgo que aceptaron PrEP y se inscribieron en una cohorte con un seguimiento de 12 meses. Analizamos, por lotes y al final del estudio, gotas de sangre seca recolectada a dos intervalos de tiempo y previamente almacenada, para determinar las concentraciones de difosfato de tenofovir (TFV-DP). A pesar de la alta adherencia autoinformada, solo el 14,6% de las personas tenían niveles protectores de TFV-DP en alguna visita. Los niveles protectores de TFV-DP se asociaron positivamente con el uso de drogas inyectables y un riesgo moderado autoevaluado de contraer el VIH, y negativamente con el tiempo transcurrido desde la inscripción. En la fase cualitativa posterior, conversamos con GBMSM de la comunidad para identificar las barreras y los facilitadores para la concientización, aceptación, adherencia y retención a PrEP. Estos datos revelaron numerosos desafíos con los programas tradicionales de PrEP que deben abordarse mediante colaboraciones comunitarias. However, an increase in the incidence among adolescents and youth has indicated a greater distance between HIV responses and the specificities of the new generations, which can maintain the epidemic for an extended period. Regards this matter, it is debated that the provision of a range of preventive methods, even if highly effective, and a conservatism that has internalized stigma within government policies, hinder the proper and essential dialogue between current preventive policies and the needs of the new generations. These generations are marked by a social representation of AIDS as a mild disease, by new gender and sexuality performances, and by the search for a more critical role in affective and sexual encounters, which includes frequent use of dating apps and substances. The hierarchy of the delivery of prevention methods is presented as a proposal for a new policy, prioritizing pre-exposure prophylaxis (PrEP) and addressing the social determinants of the HIV epidemic, including strategies to mitigate stigma. The importance of the participation of adolescents and youth in constructing the policy and the need for an intersectoral response are also reinforced. Article	2023	Grangeiro, Alexandre; Santos, Lorruan Alves do; Estevam, Denize Lotufo; Munhoz, Rosemeire; Arruda, Érico; de Moraes, Renata Amaral; de Quadros Winkler, Lisiane; Neves, Lis Aparecida de Souza; Santos, Juliane Cardoso Villela; Kruppa, Mariele; Zucchi, Eliana Miura; Escuder, Maria Mercedes; Leal, Andréa Fachel; Koyama, Mitti Ayako Hara; Peres, Maria Fernanda Tourinho; Couto, Marcia Thereza; Neto, José Eluf	Telehealth effectiveness for pre-exposure prophylaxis delivery in Brazilian public services: the Combine! Study.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26173	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10534058	INTRODUCTION: Pre-exposure prophylaxis (PrEP) delivery based on user needs can enhance PrEP access and impact. We examined whether telehealth for daily oral PrEP delivery could change the indicators of care related to prophylactic use in five Brazilian public HIV clinics (testing centres, outpatient clinics and infectious disease hospitals). METHODS: Between July 2019 and December 2020, clients on PrEP for at least 6 months could transition to telehealth or stay with in-person follow-up. Clients were clinically monitored until June 2021. A desktop or mobile application was developed, comprising three asynchronous consultations and one annual in-person consultation visit. Predictors influencing telehealth preference and care outcomes were examined. The analysis encompassed intent-to-treat (first choice) and adjustments for sexual practices, schooling, age, duration of PrEP use and PrEP status during the choice period. RESULTS: Of 470 users, 52% chose telehealth, with the adjusted odds ratio (aOR) increasing over time for PrEP use (aOR for 25-months of use: 4.90; 95% CI: 1.32-18.25), having discontinued PrEP at the time of the choice (aOR: 2.91; 95% CI: 1.40-6.06) and having health insurance (aOR: 1.91; 95% CI: 1.24-2.94) and decreasing for those who reported higher-risk behaviour (aOR for unprotected anal sex: 0.51; 95% CI: 0.29-0.88). After an average follow-up period of 1.6 years (95% CI: 1.5-1.7), the risk of discontinuing PrEP (not having the medication for more than 90 days) was 34% lower with telehealth (adjusted hazard ratio: 0.66; 95% CI: 0.45-0.97). When adjusted by mixed linear regression, no differences in adherence (measured by mean medication possession rate) were found between in-person and telehealth (p = 0.486) or at pre- and post-telehealth follow-ups (p = 0.245). Sexually transmitted infections increased between the pre-follow-up and post-follow-up choices and were not associated with in-person or telehealth (p = 0.528). No HIV infections were observed. CONCLUSIONS: Our findings indicate that telehealth for PrEP delivery can enhance service rationalization and reinforce the prevention cascade. This approach reduces prophylaxis interruptions and is mainly preferred by individuals with lower demands for healthcare services. Article	2023	Grant W.; Adan M.A.; Samurkas C.A.; Quigee D.; Benitez J.; Gray B.; Carnevale C.; Gordon R.J.; Castor D.; Zucker J.; Sobieszczyk M.E.	Effect of Participative Web-Based Educational Modules on HIV and Sexually Transmitted Infection Prevention Competency Among Medical Students: Single-Arm Interventional Study	JMIR Medical Education	-	-	-	23693762	10.2196/42197	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149897293&doi=10.2196%2f42197&partnerID=40&md5=3da1d7275061a281a94ba6309ec89bee	Background: The number of new HIV diagnoses in the United States continues to slowly decline; yet, transgender women and men who have sex with men remain disproportionately affected. Key to improving the quality of prevention services are providers who are comfortable broaching the subjects of sexual health and HIV prevention with people across the spectrum of gender identities and sexual orientations. Preservice training is a critical point to establish HIV prevention and sexual health education practices before providers' practice habits are established. Objective: The study aimed to develop participative web-based educational modules and test their impact on HIV prevention knowledge and awareness in future providers. Methods: Sexual health providers at an academic hospital, research clinicians, community engagement professionals, and New York City community members were consulted to develop 7 web-based educational modules, which were then piloted among medical students. We assessed knowledge of HIV and sexually transmitted infection prevention and comfort assessing the prevention needs of various patients via web-based questionnaires administered before and after our educational intervention. We conducted exploratory factor analysis of the items in the questionnaire. Results: Pre- and postmodule surveys were completed by 125 students and 89 students, respectively, from all 4 years of training. Before the intervention, the majority of students had heard of HIV pre-exposure prophylaxis (122/123, 99.2%) and postexposure prophylaxis (114/123, 92.7%). Before the training, 30.9% (38/123) of the students agreed that they could confidently identify a patient who is a candidate for pre-exposure prophylaxis or postexposure prophylaxis; this increased to 91% (81/89) after the intervention. Conclusions: Our findings highlight a need for increased HIV and sexually transmitted infection prevention training in medical school curricula to enable future providers to identify and care for diverse at-risk populations. Participative web-based modules offer an effective way to teach these concepts. ©William Grant, Matthew A Adan, Christina A Samurkas, Daniela Quigee, Jorge Benitez, Brett Gray, Caroline Carnevale, Rachel J Gordon, Delivette Castor, Jason Zucker, Magdalena E Sobieszczyk. Article	2023	Gras, J; Helary, M; Carette, D; Minier, M; Salmona, M; Gabassi, A; Saouzanet, M; Charreau, I; Meyer, L; Molina, JM; Delaugerre, C; PERGAY Study Grp	Prevalence, Risk Factors, and Shedding of Human Herpes Virus-8 Among Men Having Sex With Men Enrolled in a Pre-exposure Prophylaxis Study	Clinical Infectious Diseases	-	-	-	1058-4838	10.1093/cid/ciad502	https://pubmed.ncbi.nlm.nih.gov/37623814/	Background Seroprevalence and risk factors for human herpesvirus-8 (HHV-8) infection among HIV-negative men who have sex with men (MSM) on pre-exposure prophylaxis (PrEP) have not been well characterized. Our objectives were to assess the prevalence and incidence of HHV-8 infection in MSM enrolled on PrEP, and study viral shedding in seropositive participants.Methods The ANRS IPERGAY study enrolled 429 participants in France and Canada to evaluate oral PrEP for HIV-1 prevention. Stored sera samples at day 0 (D0) and last visit were tested for the detection of HHV-8 antibodies using an indirect immunofluorescence assay. Baseline characteristics were analyzed to identify risk factors associated with HHV-8 seropositivity. Among HHV-8-seropositive participants, HHV-8 DNA was quantified on available oral and anal swabs, and ORF-K1 typing performed on HHV-8 positive samples.Results One hundred participants were seropositive at D0 (prevalence of 24%; 95% CI: 20.0-28.4%) and 18/329 seroconverted during the study (incidence rate of 2.66 per 100 person-years; 95% CI: 1.57-4.20). Risk factors independently associated with baseline HHV-8 seropositivity included older age, high number of sexual partners, chemsex use, and herpes simplex virus 2 (HSV-2) seropositivity. Among HHV-8-seropositive participants with available swab(s) for virological analysis, 37/115 (32%) displayed HHV-8 oral shedding and 5/113 (4.4%) anal shedding at least once. Four patients had a positive viral load before seroconversion.Conclusions Prevalence and incidence of HHV-8 infection were high in HIV-negative PrEP users. Among seropositive participants, HHV-8 DNA is mainly detected in saliva, which may play a major role in viral transmission in this population. Clinical Trials Registration. ClinicalTrials.gov, NCT01473472.Conclusions Prevalence and incidence of HHV-8 infection were high in HIV-negative PrEP users. Among seropositive participants, HHV-8 DNA is mainly detected in saliva, which may play a major role in viral transmission in this population. Clinical Trials Registration. ClinicalTrials.gov, NCT01473472. The prevalence and incidence of HHV-8 infection are elevated in high-risk HIV-negative pre-exposure prophylaxis users. Among seropositive participants, HHV-8 DNA is mainly detected in saliva, which may play a major role in viral transmission in this population through oral sex. Agreements, Behaviour, and Change: Sex Outside the Relationship in Male HIV-negative Partners in HIV Serodiscordant Relationships in Australia, Brazil, and Thailand	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04030-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160580444&doi=10.1007%2fs10461-023-04030-2&partnerID=40&md5=def710c9828d2c0ba4c8af4da65d4407	Male HIV serodiscordant couples have diverse relationship agreements regarding sex outside the relationship. We examined the relationship agreements as described by 343 male HIV-negative partners in HIV serodiscordant relationships in Australia, Brazil and Thailand participating in a multi-year cohort study. At baseline, 125 (34.1%) HIV-negative partners reported no agreement, 115 (33.5%) had a monogamous agreement, and 103 (37.9%) had an open agreement allowing sex outside the relationship. Relationship agreements were largely stable over time, with 76% of HIV-negative men reporting the same agreement across follow up, while changes were predominantly towards having an open agreement. Behaviour largely matched relationship agreements, and the predictors of breaking an agreement by having condomless anal intercourse (CLAI) with an outside partner were CLAI within the relationship (OR = 3.17, 95%CI: 1.64–6.14, p < 0.001) and PrEP use in the last three months (OR = 3.42, 95%CI: 1.48–7.92, p = 0.004). When considering HIV transmission risk for HIV-negative men in serodiscordant relationships, greater focus needs to be placed on sex that is occurring outside the relationship and the agreements that facilitate this. © 2023, The Author(s). Article	2023	Gray, Richard T.	Impact of increased antiretroviral therapy use during the treatment as prevention era in Australia	Sexual Health	-	-	-	14485028	10.1071/SH23088	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165519548&doi=10.1071%2fSH23088&partnerID=40&md5=bdd842693cc022887b4ce1ca9859fa53	Background: We analysed the impact of increased antiretroviral therapy (ART) on HIV epidemiology and healthcare costs in Australia during the 'Treatment-as-prevention' and 'Undetectable equals Untransmissible (U=U)' eras. Methods: We conducted a retrospective modelling analysis between 2009 and 2019 to calculate the potential impact of early initiation of ART and treatment-as-prevention on HIV among gay and bisexual men (GBM). The model incorporates the change in the proportion diagnosed, treated, and virally suppressed, as well as the scale-up of oral HIV pre-exposure prophylaxis (PrEP) and the change in sexual behaviour during this period. We simulated a baseline and a no ART increase scenario and conducted a costing analysis from a national health provider perspective with cost estimates in 2019 AUD. Results: Increasing ART use between 2009 and 2019 averted an additional 1624 95% percentile interval (PI): 1220-2099 new HIV infections. Without the increase in ART, the number of GBM with HIV would have increased from 21 907 (95% PI: 20 753-23 019) to 23 219 (95% PI: 22 008-24 404) by 2019. HIV care and treatment costs for people with HIV increased by $296 (95% PI: $235-367) million AUD (assuming no change in annual healthcare costs). This was offset by a decrease in the lifetime HIV costs (with 3.5% discounting) for those newly infected of $458 (95% PI: $344-592) million AUD, giving a net cost saving of $162 (95%: $68-273) million AUD (and a benefits-to-cost ratio of 1.54). Conclusions: Increasing the proportion of Australian GBM on effective ART between 2009 and 2019 likely resulted in substantial reductions in new HIV infections and cost savings. © 2023 The Author(s) (or their employer(s)). Article	2023	Greenwell K.; Fugit R.; Nicholson L.; Wright J.	A Retrospective Comparison of HIV Pre-exposure Prophylaxis (PrEP) Outcomes Between a Pharmacist-led Telehealth Clinic and In-person Clinic in a Veteran Population	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04084-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160399369&doi=10.1007%2fs10461-023-04084-2&partnerID=40&md5=03984b3ae1c1432b25a0e2b2b65e9e90	Pre-exposure prophylaxis (PrEP) reduces human immunodeficiency virus (HIV) transmission through sexual contact by at least 90% when taken as prescribed. This retrospective cohort study evaluated differences in adherence to PrEP medication and monitoring between the physician- and nurse practitioner (NP)-led in-person setting and the pharmacist-led telehealth setting among patients followed by the infectious diseases clinic at the VA Eastern Colorado Health Care System from July 2012 to February 2021. The primary outcomes were PrEP tablets filled per person-year, serum creatinine (SCr) tests per person-year, and HIV screens per person-year. Secondary outcomes included sexually transmitted infection (STI) screens per person-year and patients lost to follow-up. 149 patients were included in the study, with 167 person-years in the in-person cohort and 153 person-years in the telehealth cohort. Adherence to PrEP medications and monitoring was similar between in-person and telehealth clinics. PrEP tablets filled per person-year was 324 in the in-person cohort and 321 in the telehealth cohort (RR = 0.99; 95% CI, 0.98-1.00). SCr screens per person-year was 3.51 in the in-person cohort and 3.37 in the telehealth cohort (RR = 0.96; 95% CI, 0.85–1.07). HIV screens per person-year was 3.55 in the in-person cohort and 3.38 in the telehealth cohort (RR = 0.95; 95% CI, 0.85–1.07). There were no new HIV infections. Additionally, patients were less likely to be lost to follow-up when followed via telehealth (11.9% vs. 30.0%), X2 (1, N = 149) = 6.85, p = 0.009. These findings indicate that pharmacist-driven delivery of PrEP via telehealth can be used to increase access to PrEP without sacrificing quality of care. © 2023, This is a U.S. Government work and not under copyright protection in the US; foreign copyright protection may apply. Article	2023	Grimsrud, Anna; Wilkinson, Lynne; Delany-Moretlwe, Sinead; Ehrenkranz, Peter; Green, Kimberly; Murenga, Maureen; Ngure, Kenneth; Otwoma, Nelson J.; Phanuphak, Nittaya; Vandevelde, Wim; Vitoria, Marco; Bygrave, Helen	The importance of the "how": the case for differentiated service delivery of long-acting and extended delivery regimens for HIV prevention and treatment.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26095	https://pubmed.ncbi.nlm.nih.gov/37439076/	INTRODUCTION: Long-acting and extended delivery (LAED) regimens for HIV treatment and prevention offer unique benefits to expand uptake, effective use and adherence. To date, research has focused on basic and clinical science around the safety and efficacy of these products. This commentary outlines opportunities in HIV prevention and treatment programmes, both for the health system and clients, that could be addressed through the inclusion of LAED regimens and the vital role of differentiated service delivery (DSD) in ensuring efficient and equitable access. DISCUSSION: The realities and challenges within HIV treatment and prevention programmes are different. Globally, more than 28 million people are accessing HIV treatment-the vast majority on a daily fixed-dose combination oral pill that is largely available, affordable and well-tolerated. Many people collect extended refills outside of health facilities with clinical consultations once or twice a year. Conversely, uptake of daily oral pre-exposure prophylaxis (PrEP) has consistently missed global targets due to limited access with high individual cost and lack of choice contributing to substantial unmet PrEP need. Recent trends in demedicalization, simplification, additional method options and DSD for PrEP have led to accelerated uptake as its availability has become more aligned with user preferences. How people currently receive HIV treatment and prevention services and their barriers to adherence must be considered for the introduction of LAED regimens to achieve the expected improvements in access and outcomes. Important considerations include the building blocks of DSD: who (provider), where (location), when (frequency) and what (package of services). Ideally, all LAED regimens will leverage DSD models that emphasize access at the community level and self-management. For treatment, LAED regimens may address challenges with adherence but their delivery should provide clear advantages over existing oral products to be scaled. For prevention, LAED regimens expand a potential PrEP user's choice of methods, but like other methods, need to be delivered in a manner that can facilitate frequent re-initiation. CONCLUSIONS: To ensure that innovative LAED HIV treatment and prevention products reach those who most stand to benefit, service delivery and client considerations during development, trial and early implementation are critical. Long-Acting Injectable Cabotegravir for HIV Preexposure Prophylaxis among Sexual and Gender Minorities: Protocol for an Implementation Study	JMIR Public Health and Surveillance	-	-	-	23692960	10.2196/44961	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85153123294&doi=10.2196%2f44961&partnerID=40&md5=8302b3ae93607c11dfc72118ee172152	Background: Long-acting injectable cabotegravir (CAB-LA) for preexposure prophylaxis (PrEP) has proven efficacious in randomized controlled trials. Further research is critical to evaluate its effectiveness in real-world settings and identify effective implementation approaches, especially among young sexual and gender minorities (SGMs). Objective: ImPrEP CAB Brasil is an implementation study aiming to generate critical evidence on the feasibility, acceptability, and effectiveness of incorporating CAB-LA into the existing public health oral PrEP services in 6 Brazilian cities. It will also evaluate a mobile health (mHealth) education and decision support tool, digital injection appointment reminders, and the facilitators of and barriers to integrating CAB-LA into the existing services. Methods: This type-2 hybrid implementation-effectiveness study includes formative work, qualitative assessments, and clinical steps 1 to 4. For formative work, we will use participatory design methods to develop an initial CAB-LA implementation package and process mapping at each site to facilitate optimal client flow. SGMs aged 18 to 30 years arriving at a study clinic interested in PrEP (naive) will be invited for step 1. Individuals who tested HIV negative will receive mHealth intervention and standard of care (SOC) counseling or SOC for PrEP choice (oral or CAB-LA). Participants interested in CAB-LA will be invited for step 2, and those with undetectable HIV viral load will receive same-day CAB-LA injection and will be randomized to receive digital appointment reminders or SOC. Clinical appointments and CAB-LA injection are scheduled after 1 month and every 2 months thereafter (25-month follow-up). Participants will be invited to a 1-year follow-up to step 3 if they decide to change to oral PrEP or discontinue CAB-LA and to step 4 if diagnosed with HIV during the study. Outcomes of interest include PrEP acceptability, choice, effectiveness, implementation, and feasibility. HIV incidence in the CAB-LA cohort (n=1200) will be compared with that in a similar oral PrEP cohort from the public health system. The effectiveness of the mHealth and digital interventions will be assessed using interrupted time series analysis and logistic mixed models, respectively. Results: During the third and fourth quarters of 2022, we obtained regulatory approvals; programmed data entry and management systems; trained sites; and performed community consultancy and formative work. Study enrollment is programmed for the second quarter of 2023. Conclusions: ImPrEP CAB Brasil is the first study to evaluate CAB-LA PrEP implementation in Latin America, one of the regions where PrEP scale-up is most needed. This study will be fundamental to designing programmatic strategies for implementing and scaling up feasible, equitable, cost-effective, sustainable, and comprehensive alternatives for PrEP programs. It will also contribute to maximizing the impact of a public health approach to reducing HIV incidence among SGMs in Brazil and other countries in the Global South. ©Beatriz Grinsztejn, Thiago Silva Torres, Brenda Hoagland, Emilia Moreira Jalil, Ronaldo Ismerio Moreira, Gabrielle O'Malley, Starley B Shade, Marcos R Benedetti, Julio Moreira, Keila Simpson, Maria Cristina Pimenta, Valdiléa Gonçalves Veloso, The ImPrEP CAB-Brasil Study Team. Online-Mediated HIV Pre-exposure Prophylaxis Care and Reduced Monitoring Frequency for Men Who Have Sex With Men: Protocol for a Randomized Controlled Noninferiority Trial (EZI-PrEP Study)	JMIR Research Protocols	-	-	-	19290748	10.2196/51023	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178226764&doi=10.2196%2f51023&partnerID=40&md5=d358ccdb71f1a63856ab41b2a21491eb	Background: Daily and event-driven HIV pre-exposure prophylaxis (PrEP) with oral tenofovir-emtricitabine is highly effective to prevent HIV in men who have sex with men (MSM). PrEP care generally consists of in-clinic monitoring every 3 months that includes PrEP dispensing, counseling, and screening for HIV and sexually transmitted infections (STIs). However, the optimal frequency for monitoring remains undetermined. Attending a clinic every 3 months for monitoring may be a barrier for PrEP. Online-mediated PrEP care and reduced frequency of monitoring may lower this barrier. Objective: The primary objective of this study is to establish the noninferiority of online PrEP care (vs in-clinic care) and monitoring every 6 months (vs every 3 months). The secondary objectives are to (1) examine differences between PrEP care modalities regarding incidences of STIs, HIV infection, and hepatitis C virus infection; retention in PrEP care; intracellular tenofovir-diphosphate concentration; and satisfaction, usability, and acceptability of PrEP care modalities; and (2) evaluate associations of these study outcomes with sociodemographic, behavioral, and psychological characteristics. Methods: This study is a 2×2 factorial, 4-arm, open-label, multi-center, randomized, controlled, noninferiority trial. The 4 arms are (1) in-clinic monitoring every 3 months, (2) in-clinic monitoring every 6 months, (3) online monitoring every 3 months, and (4) online monitoring every 6 months. The primary outcome is a condomless anal sex act with a casual partner not covered or insufficiently covered by PrEP (ie, "unprotected act") as a proxy for HIV infection risk. Eligible individuals are MSM, and transgender and gender diverse people aged ≥18 years who are eligible for PrEP care at 1 of 4 participating sexual health centers in the Netherlands. The required sample size is 442 participants, and the planned observation time is 24 months. All study participants will receive access to a smartphone app, which contains a diary. Participants are requested to complete the diary on a daily basis during the first 18 months of participation. Participants will complete questionnaires at baseline and 6, 12, 18, and 24 months. Dried blood spots will be collected at 6 and 12 months for assessment of intracellular tenofovir-diphosphate concentration. Incidence rates of unprotected acts will be compared between the online and in-clinic arms, and between the 6-month and 3-month arms. Noninferiority will be concluded if the upper limit of the 2-sided 97.5% CI of the incidence rate ratio is <1.8. Results: The results of the main analysis are expected in 2024. Conclusions: This trial will demonstrate whether online PrEP care and monitoring every 6 months is noninferior to standard PrEP care in terms of PrEP adherence. If noninferiority is established, these modalities may lower barriers for initiating and continuing PrEP use and potentially reduce the systemic burden for PrEP providers. ©Marije L Groot Bruinderink, Anders Boyd, Liza Coyer, Sophie Boers, Laura Blitz, Jean-Marie Brand, Hannelore M Götz, Martijn Stip, Joey Woudstra, Kenneth Yap, Koenraad Vermey, Amy Matser, Allard R Feddes, Vita W Jongen, Maria Prins, Elske Hoornenborg, Frenk van Harreveld, Maarten F Schim van der Loeff, Udi Davidovich.	acceptability; adherence; HIV prevention; men who have sex with men; MSM; Netherlands; pre-exposure prophylaxis; randomized controlled trial; telemedicine; usability	English	Canada	Western and Central Europe and North America	Netherlands	Western and Central Europe and North America	Netherlands	Western and Central Europe and North America	Clinical
Article	2023	Guan Y.; Qi T.; Liao Q.; Zhang R.; Chen J.; Liu L.; Shen Y.; Zhu H.; Tang Q.; Lu H.	Multi-dimensional mismatch and barriers for promoting PrEP among men who have sex with men in China: a cross sectional survey from the Demand-side	AIDS Research and Therapy	-	-	-	17426405	10.1186/s12981-022-00497-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147913970&doi=10.1186%2fs12981-022-00497-6&partnerID=40&md5=f04e7f96ef9a154ac5eb6f26781e31ee	Background: Men who have sex with men (MSM) is a key population for preventing HIV in China, yet pre-exposure prophylaxis (PrEP) is not widely accepted in this population. The objective of this manuscript was to assessed the barriers in the acknowledgement and uptake focusing the demand side. Methods: An online questionnaire survey was conducted from December 2018 to January 2019. All participants were required to scan two-dimensional code which was the online crowdsourcing survey platform to complete the electronic questionnaire anonymously. Results: Among 1915 MSM from thirty-four cities of China, 512 (26.7%) versus 1617 (84.4%) had an objective or subjective need of PrEP, respectively. One hundred and six (5.5%) reported affordability and only 23 (1.2%) had ever taken it. Age, living alone and occupation were associated with the objective needs. Age, income, sexual behavior were associated with actual usage. The participants who they had objective need to use PrEP are the population which we should focus on. Conclusion: A wide disconnect exists among the objective need, willingness, affordability and uptake of PrEP. Cost was the most prevalent barrier, accounting for 78.22% of individuals who needed and wished for PrEP but finally failed to receive it. The findings might facilitate optimizing future allocation of resources to better promote PrEP in Chinese MSM. © 2023, The Author(s). Article	2023	Guillen-Diaz-Barriga C.; Diaz-Sosa D.; Torres T.S.; Konda K.A.; Robles-Garcia R.; Hoagland B.; Benedetti M.; Pimenta C.; Grinsztejn B.; Caceres C.F.; Veloso V.G.; Vega-Ramirez H.	HIV Risk Perception and Pre-Exposure Prophylaxis (PrEP) Awareness Among Transgender Women from Mexico	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03836-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138248936&doi=10.1007%2fs10461-022-03836-w&partnerID=40&md5=01b704f4638bef5572d4878319f9f3e6	This study aimed to identify factors associated with HIV risk perception among Mexican transgender women (TGW). This cross-sectional survey was conducted online and at a public HIV clinic in Mexico City. Participants were ≥ 18 years old, self-identified as TGW, and reported not living with HIV. They answered questions on sexual behavior, HIV risk perception, and pre-exposure prophylaxis (PrEP) awareness. We performed a multivariate logistic regression to accomplish the study's objective. One hundred ninety-one TGW completed the survey. High HIV risk perception was associated with > 5 sexual partners, condomless receptive anal sex, sex with a male partner(s) of unknown HIV status, and PrEP awareness. Although most TGW reported low HIV risk perception, over half had risk sexual behavior, reflecting inaccurate risk assessment. Future interventions to improve accurate risk perception among TGW should promote HIV transmission and prevention knowledge and increase PrEP awareness and uptake. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Guimarães N.S.; Magno L.; Monteiro G.M.B.; Ramos I.C.N.; de Castro C.T.; Aranha-Rossi T.R.; Pereira M.; Dourado I.	Demand creation and retention strategies for oral pre-exposure prophylaxis for HIV prevention among men who have sex with men and transgender women: a systematic review and meta-analysis	BMC Infectious Diseases	-	-	-	-	14712334	10.1186/s12879-023-08693-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176458872&doi=10.1186%2fs12879-023-08693-z&partnerID=40&md5=5b42b5e51a0212d7e6cace9852c1d88a	Background: Men who have sex with men (MSM) and transgender women (TGW) have a disproportionately higher risk of human immunodeficiency virus (HIV) infection than other groups. Oral HIV pre-exposure prophylaxis (PrEP) is an effective prevention tool and should be offered to those at higher risk. Identifying demand creation strategies (DCS) and retention strategies (RS) to improve PrEP persistence is essential to control the HIV epidemic. Aim: We aimed to identify the (DCS and RS with higher proportions among MSM and TGW. Methods: A systematic review and meta-analysis of prospective studies were conducted, with studies retrieved from five databases until November, 2022 following the Cochrane and PRISMA guidelines. The study protocol was registered in PROSPERO (CRD42022323220). The outcomes were DCS and RS for PrEP use among MSM and TGW. Strategies used for users enrolled in the PrEP-recruited (DCS) were classified as face-to-face (peer educator recruitment at social venues, nongovernmental organizations, and parties; direct referrals by health services; friends and/or sexual partners); online (chatbot or peer educator recruitment on social media e.g., , Instagram or Facebook or dating/hook-up apps e.g., Grindr, Tinder, Badoo, and Scruff); and mixed (face-to-face and online). RS was classified as provider counseling (face-to-face by a health professional; prevention of HIV risk counseling, distribution of condoms, lubricants, and testing for HIV or other sexually transmitted infections); online counseling (text messages, chatbots, telephone calls, social media, and peer educators); and mixed (all previous strategies). Subgroup analyses were conducted for each treatment strategy. Meta-analyses were performed using the R software version 4.2.1. Results: A total of 1, 129 studies were retrieved from the five databases. After eligibility, 46 studies were included. For MSM, most DCS and RS were online at 91% (95% CI: 0.85–0.97; I2=53%), and 83% (95% CI: 0.80–0.85; I2=17%) respectively. For TGW, mixed DCS and RS were the most frequent at85% (95% CI: 0.60–1.00; I2=91%) and online counseling at 84% (95% CI: 0.64–0.95) compared to other strategies. Conclusion: Critical issues play. Pivotal role in increasing PrEP awareness among MSM and TGW, minimizing access gaps, and ensuring retention of PrEP services. Offering oral PrEP using online DCS and RS can reach and retain high numbers of MSM and TGW, and reduce HIV incidence in these populations. © 2023, The Author(s). Article	2023	Guinn D.; Espinoza L.E.	Preventive Epidemiology of PrEP Use in African American Women With a Perceived HIV Risk	Journal of Black Studies	-	-	-	-	219347	10.1177/00219347231174895	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162962972&doi=10.1177%2f00219347231174895&partnerID=40&md5=46b5f45d99ff5d4d06934be1305877ed	This study aims to examine the impact of education and household income on African American women's perception of HIV risk on PrEP use. Secondary data from the Be-PrEPared dataset on 202 African American women's attitudes toward condom use, biomedical prevention strategies, and risks associated with HIV transmission. African American women with a greater level of education and a perceived risk of HIV were more likely to utilize PrEP than African American women with a lower level of education and no reported risk of HIV. Additionally, women with a higher household income and perceived HIV risk were more likely to use PrEP as well. These associations were still present when taking HIV knowledge into account. It is the job of health practitioners and public health/health education professionals to improve PrEP interventions to be more culturally competent which will make adults more cognizant of the health issues related to HIV infection. © The Author(s) 2023. Article	2023	Gunawardana, Manjula; Remedios-Chan, Mariana; Sanchez, Debbie; Fanter, Rob; Webster, Simon; Webster, Paul; Moss, John A; Trinh, MyMy; Beliveau, Martin; Ramirez, Christina M; Marzinke, Mark A; Kuo, Joseph; Gallay, Philippe A; Baum, Marc M	Preclinical Considerations for Long-acting Delivery of Tenofovir Alafenamide from Subdermal Implants for HIV Pre-exposure Prophylaxis.	Pharmaceutical Research	-	-	-	-	1573-904X	10.1007/s11095-022-03440-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10421770	PURPOSE: Long-acting formulations of the potent antiretroviral prodrug tenofovir alafenamide (TAF) hold potential as biomedical HIV prevention modalities. Here, we present a rigorous comparison of three animal models, C57BL/6 J mice, beagle dogs, and merino sheep for evaluating TAF implant pharmacokinetics (PKs). METHODS: Implants delivering TAF over a wide range of controlled release rates were tested in vitro and in mice and dogs. Our existing PK model, supported by an intravenous (IV) dosing dog study, was adapted to analyze mechanistic aspects underlying implant TAF delivery. RESULTS: TAF in vitro release in the 0.13 to 9.8 mg d-1 range with zero order kinetics were attained. Implants with equivalent fabrication parameters released TAF in mice and sheep at rates that were not statistically different, but were 3 times higher in dogs. When two implants were placed in the same subcutaneous pocket, a two-week creep to Cmax was observed in dogs for systemic drug and metabolite concentrations, but not in mice. Co-modeling IV and TAF implant PK data in dogs led to an apparent TAF bioavailability of 9.6 in the single implant groups (compared to the IV group), but only 1.5 when two implants were placed in the same subcutaneous pocket. CONCLUSIONS: Based on the current results, we recommend using mice and sheep, with macaques as a complementary species, for preclinical TAF implant evaluation with the caveat that our observations may be specific to the implant technology used here. Our report provides fundamental, translatable insights into multispecies TAF delivery via long-acting implants.	comparative animal models, HIV pre-exposure prophylaxis, reservoir subdermal implant, tenofovir alafenamide	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Guo J.; Kang W.; Liu T.; Xu J.; Tang H.; Lyu F.; Zhang G.	Analysis of Knowledge Level and Use of Antiretroviral Pre-Exposure and Post-Exposure Prophylaxis Among MSM — China, 2019–2022	China CDC Weekly	-	-	-	-	20967071	10.46234/ccdcw2023.053	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85153493141&doi=10.46234%2fccdcw2023.053&partnerID=40&md5=a5be1a75b0521b9d7d32395acd080559	What is already known on this topic? Men who have sex with men (MSM) in China have a high rate of human immunodeficiency virus (HIV) infection. Pre-exposure prophylaxis (PrEP) and postexposure prophylaxis (PEP) have been shown to be effective in preventing HIV, which may help to contain the HIV epidemic among MSM. What is added by this report? This study found that knowledge and usage of PrEP were low among MSM, indicating that this population is at high risk for HIV infection. Promotion of PrEP and PEP among MSM is necessary to reduce the risk of HIV infection in this population. What are the implications for public health practice? PrEP and PEP are novel HIV prevention strategies that have been demonstrated to be effective and safe. To further reduce HIV transmission among MSM in China, it is necessary to promote the use of PrEP and PEP. © 2023, Chinese Center for Disease Control and Prevention. All rights reserved. Article	2023	Guo, PY; Hou, FS; Cao, WN; Guo, YW; Wei, DN; Li, JH; Hao, YT	Intimate Partner Violence and Willingness to Use Pre-Exposure Prophylaxis Among Men Who Have Sex With Men in Chengdu, China	Journal of Interpersonal Violence	-	-	-	-	0886-2605	10.1177/08862605221127197	https://pubmed.ncbi.nlm.nih.gov/36259286/	Intimate partner violence (IPV) is common in men who have sex with men (MSM). MSM also face increased risk of human immunodeficiency virus infection. However, it is not known whether IPV experience of MSM in China would affect their attitudes toward pre-exposure prophylaxis (PrEP) use. A cross-sectional study was conducted to explore the associations between different types of IPV and willingness to use PrEP in a sample of 608 MSM from November 2018 to May 2019 in Chengdu, China. Univariate and multivariate logistic regression analyses were used to explore the associations between different types of IPV and willingness to use PrEP. The average age of the participants was 31.8 +/- 12.3 years, 48.9% of them were aware of PrEP before this study, and only 7.2% were aware of long-acting injectable PrEP (LAI-PrEP). The overall willingness to use any type of PrEP in the next 6 months was 82.2%. Approximately one third of the participants (n = 198) had experienced at least one type of IPV. We found that experience of sexual perpetration was negatively associated with the willingness to use on-demand PrEP (adjusted odds ratio ORa = 0.33, 95% CI = 0.16-0.67) and the overall willingness to use any type of PrEP (ORa = 0.31, 95% CI = 0.15-0.64). The willingness to use LAI-PrEP also had negative associations with any type of monitoring IPV (ORa = 0.58, 95% CI = 0.38-0.91), controlling victimization (ORa = 0.41, 95% CI = 0.21-0.82), and emotional victimization (ORa = 0.58, 95% CI = 0.35-0.97). The findings of this study demonstrate that IPV experiences are negatively associated with willingness to use PrEP among MSM, suggesting that PrEP promotion programs should consider IPV screening and develop explicit intervention strategies for both perpetrators and victims. Article	2023	Gyamerah, Akua O; Kinzer, Ezra; Aidoo-Frimpong, Gloria; Sorensen, Guro; Mensah, Matilda D; Taylor, Kelly D; Vanderpuye, Naa Ashiley; Lippman, Sheri A	PrEP knowledge, acceptability, and implementation in Ghana: Perspectives of HIV service providers and MSM, trans women, and gender diverse individuals living with HIV.	PLOS Global Public Health	-	-	-	-	2767-3375	10.1371/journal.pgph.0001956	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10246804	Pre-exposure prophylaxis (PrEP) could help reduce HIV incidence among cis men, trans women, and gender diverse individuals assigned male at birth who have sex with men (MSM, trans women, and GDSM) in Ghana, a group that bears a high HIV burden. Our study examined PrEP knowledge and acceptability, and barriers and facilitators to its uptake and implementation through qualitative interviews with 32 MSM, trans women, and GDSM clients living with HIV, 14 service providers (SPs), and four key informants (KIs) in Accra, Ghana. We interviewed participants about their PrEP knowledge, whether MSM would take PrEP, and what factors would make it easy/difficult to uptake or implement PrEP. Interview transcripts were analyzed using thematic analysis. There was high acceptability of PrEP use and implementation among MSM, trans women, GDSM, and SPs/KIs in Ghana. MSM, trans women, and GDSM interest in, access to, and use of PrEP were shaped by intersectional HIV and anti-gay stigma; PrEP affordability, acceptability, and ease of use (e.g., consumption and side effects); sexual preferences (e.g., condomless sex vs. condom use), and HIV risk perception. Concerns raised about barriers and facilitators of PrEP use and implementation ranged from medical concerns (e.g., STIs; drug resistance); social behavioral concerns (e.g., stigma, risk compensation, adherence issues); and structural barriers (e.g., cost/affordability, govern commitment, monitoring systems, policy guidance). Targeted education on PrEP and proper use of it is needed to generate demand and dispel worries of side effects among MSM, trans women, and GDSM. Free, confidential, and easy access to PrEP must be supported by health systems strengthening, clear prescription guidelines, and anti-stigma training for providers. Article	2023	Haaland I.; Metta E.; Moen K.	The use of PrEP among men who have sex with men and transgender women as Biomedical Prevention Work: A conceptual framework	Social Science & Medicine	-	-	-	-	2779536	10.1016/j.socscimed.2023.116147	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169619893&doi=10.1016%2fj.socscimed.2023.116147&partnerID=40&md5=2ca428b603aa5a63a5cafc021b48ba41	Based on ethnographic fieldwork among men who have sex with men and transgender women in Tanzania, this article explores the various types of work that may go into enrolment into PrEP programming and using pre-exposure prophylaxis (PrEP). PrEP protects against HIV acquisition and is widely touted as an essential tool in 'ending AIDS by 2030'. While taking PrEP has often been portrayed as 'just taking a pill a day' in public health campaigns, a striking observation during fieldwork was that enrolling in PrEP programming and adhering to PrEP involved a wide range of tasks. Inspired by this fieldwork experience and the literature on sociology of work, more specifically illness work and patient work, we started to think of these tasks as work. This paper identifies the range of tasks that PrEP users in Dar es Salaam had to perform as part of their enrolment and usage of PrEP. We provide a description of these tasks, organised into three categories of work that we refer to as (a) readying work, (b) user work, and (c) social navigation work that jointly make up what we propose to call biomedical prevention work. We further suggest that this analytical framework can be applicable to other biomedical prevention methods in other contexts. © 2023 The Authors	Biomedical prevention; HIV prevention; Men who have sex with men; Men who sell sex; Pre-exposure prophylaxis; Tanzania; Transgender women; Use of biomedicine; Work	English	United Kingdom	Western and Central Europe and North America	Norway	Western and Central Europe and North America	Norway	Western and Central Europe and North America	Qualitative
Article	2023	Haaland, Richard E; Fountain, Jeffrey; Martin, Amy; Dinh, Chuong; Holder, Angela; Edwards, Tiancheng E; Lupo, L Davis; Hall, LaShonda; Conway-Washington, Christopher; Massud, Ivana; García-Lerma, J Gerardo; Kelley, Colleen F; Heneine, Walid M	Pharmacology of boosted and unboosted integrase strand transfer inhibitors for two-dose event-driven HIV prevention regimens among men	Journal of Antimicrobial Chemotherapy	-	-	-	-	3057453	10.1093/jac/dkac419	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147234492&doi=10.1093%2fjac%2fdkac419&partnerID=40&md5=6c806bbbb6b0a7c8b0960e7ad8b1ad00	Background: Event-driven HIV prevention strategies are a priority for users who do not require daily pre-exposure prophylaxis (PrEP). Regimens containing integrase strand transfer inhibitors (INSTIs) are under evaluation as alternatives to daily PrEP. To better understand INSTI distribution and inform dosing selection we compared the pharmacology of two-dose boosted elvitegravir and unboosted bictegravir regimens in MSM. Materials and methods: Blood, rectal and penile secretions and rectal biopsies were collected from 63 HIV-negative MSM aged 18–49 years. Specimens were collected up to 96 h after two oral doses of tenofovir alafenamide and emtricitabine with elvitegravir boosted by cobicistat or unboosted bictegravir given 24 h apart. Antiretroviral drugs were measured by LC-MS. Results: Mean bictegravir plasma concentrations remained above the 95% protein-adjusted effective concentration 96 h after dosing 273 (95% CI: 164–456) ng/mL whereas elvitegravir plasma concentrations became undetectable 48 h after the second dose. Bictegravir and elvitegravir reached rectal tissues within 2 h after the first dose, and elvitegravir tissue concentrations 1.07 (0.38–13.51) ng/mg were greater than bictegravir concentrations 0.27 (0.15–0.70) ng/mg. Both INSTIs became undetectable in tissues within 96 h. Elvitegravir and bictegravir were not consistently detected in penile secretions. Conclusions: Whereas bictegravir plasma concentrations persist at least 4 days after a two-oral-dose HIV prophylaxis regimen, elvitegravir accumulates in mucosal tissues. Differing elvitegravir and bictegravir distribution may result in variable mucosal and systemic antiviral activity and can inform dosing strategies for event-driven HIV prevention. © 2023 Oxford University Press. Article	2023	Haberer, Jessica E; Mujugira, Andrew; Mayer, Kenneth H	The future of HIV pre-exposure prophylaxis adherence: reducing barriers and increasing opportunities.	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(23)00079-6	https://dx.doi.org/10.1016/S2352-3018(23)00079-6	The effectiveness of HIV pre-exposure prophylaxis (PrEP) hinges on adherence, which has been restricted by multifaceted barriers. Uptake of PrEP has been impeded by poor access resulting from high costs, provider uncertainty, discrimination, stigma, and poor understanding within the health-care community and the public of who can benefit from PrEP. Other important barriers to adherence and persistence over time relate to individuals (eg, depression) and their community, partners, and family (eg, poor support), and their effects vary substantially with each person, population, and setting. Despite these challenges, key opportunities for improving PrEP adherence exist, including novel delivery systems, tailored individual interventions, mobile health and digital health interventions, and long-acting formulations. Objective monitoring strategies will help to improve adherence interventions and alignment of PrEP use with the need for HIV prevention (ie, prevention-effective adherence). The future of PrEP adherence lies in person-centred approaches to service delivery that meet the needs of individuals while creating supportive environments and facilitating health-care access and delivery. Article	2023	Haffejee F.; Fasanmi-Kana O.; Ally F.; Thandar Y.; Basdav J.	Four years later: Do South Africans know what pre-exposure prophylaxis for HIV is?	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2022.2032573	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124226244&doi=10.1080%2f09540121.2022.2032573&partnerID=40&md5=70fe23b4319626ee8c77ece44bf55ae1	HIV incidence remains high among South Africans, with low uptake of preventative measures such as condom use. Pre-exposure prophylaxis (PrEP), which protects HIV-negative individuals from infection, was first introduced in SA in 2016. This study determined the knowledge of PrEP among university students (n = 282) and primary health care clinic users (n = 358) in KwaZulu-Natal, South Africa. Data were collected using a cross-sectional survey. The study population was at high-risk of HIV infection, with early age of sexual debut, multiple concurrent sexual partners and inconsistent condom usage. Only 12.3% (n = 79) stated that they had a full understanding of PrEP, which was higher among university students (9.8%; n = 63) than clinic users (2.5%; n = 16; p < 0.001). Specific PrEP knowledge was, however, low. Health Science students did not have a better knowledge than students from other faculties. Neither did users of clinics offering PrEP have a better knowledge than users of clinics not offering PrEP. Moreover, few participants (15%; n = 96) were aware of the availability of PrEP at their local clinic. Interventions to address the low level of PrEP knowledge within the population are required, to reduce the high HIV incidence. © 2022 Informa UK Limited, trading as Taylor & Francis Group.	clinic users; HIV prevention; pre-exposure prophylaxis; South Africa; students	English	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2023	Hagberg, Lars; Gisslén, Magnus	Cohort profile: a longitudinal study of HIV infection in the central nervous system with focus on cerebrospinal fluid - the Gothenburg HIV CSF Study Cohort.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2022-070693	https://pubmed.ncbi.nlm.nih.gov/37197824/	PURPOSE: In order to enable long-term follow-up of the natural course of HIV infection in the central nervous system, a longitudinal cohort study with repeated cerebrospinal fluid (CSF) analyses at intervals over time was initiated in 1985. When antiretrovirals against HIV were introduced in the late 1980s, short-term and long-term effects of various antiretroviral treatment (ART) regimens were added to the study. PARTICIPANTS: All adult people living with HIV (PLWH) who were diagnosed at or referred to the Department of Infectious Diseases, Sahlgrenska University Hospital, Gothenburg, Sweden were asked to participate in the Gothenburg HIV CSF Study Cohort. PLWH with neurological symptoms or other clinical symptoms of HIV, as well as those with no symptoms of HIV infection, were included. Most participants were asymptomatic, which distinguishes this cohort from most other international HIV CSF studies. In addition, HIV-negative controls were recruited. These included people on HIV pre-exposure prophylaxis who served as lifestyle-matched controls to HIV-infected men who have sex with men. Since lumbar puncture (LP) is an invasive procedure, some PLHW only consented to participate in one examination. Furthermore, at the beginning of the study, several participants were lost to follow-up having died from AIDS. Of 662 PLWH where an initial LP was done, 415 agreed to continue with follow-up. Among the 415, 56 only gave permission to be followed with LP for less than 1 year, mainly to analyse the short-term effect of ART. The remaining 359 PLWH were followed up with repeated LP for periods ranging from >1 to 30 years. This group was defined as the 'longitudinal cohort'. So far, on 7 April 2022, 2650 LP and samplings of paired CSF/blood had been performed, providing a unique biobank. FINDINGS TO DATE: A general finding during the 37-year study period was that HIV infection in the central nervous system, as mirrored by CSF findings, appears early in the infectious course of the disease and progresses slowly in the vast majority of untreated PLWH. Combination ART has been highly effective in reducing CSF viral counts, inflammation and markers of neural damage. Minor CSF signs of long-term sequels or residual inflammatory activity and CSF escape (viral CSF blips) have been observed during follow-up. The future course of these changes and their clinical impact require further studies. FUTURE PLANS: PLWH today have a life expectancy close to that of non-infected people. Therefore, our cohort provides a unique opportunity to study the long-term effects of HIV infection in the central nervous system and the impact of ART and is an ongoing study. Article	2023	Haggipavlou Loukas; Hamshaw Richard J T	Barriers to PrEP Uptake in Young U.K. Men Who Have Sex With Men	Journal of Prevention and Health Promotion	-	-	-	-	26320770	10.1177/26320770231199419	https://www.proquest.com/scholarly-journals/barriers-prep-uptake-young-u-k-men-who-have-sex/docview/2907118898/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) prevents HIV contraction in HIV-negative individuals. Despite higher risks, uptake is low among young men who have sex with men (YMSM). This study investigates barriers to PrEP uptake in U.K. YMSM, where treatment has recently been approved within services. Semi-structured interviews with 10 YMSM living in the United Kingdom were analyzed using data-driven reflexive thematic analysis. Analysis highlighted three principal barriers to PrEP uptake: lack of perceived necessity, lack of knowledge, and perceived acquisition discomfort. YMSM experience unique barriers to PrEP uptake. Recommendations for tackling barriers included implementation of an online application, alongside educational measures. Article	2023	Hakim J.; Race K.	The gay scientist: Kane Race on the unexpected possibilities of experimental intimacies	Sexualities	-	-	-	-	13634607	10.1177/1363460720932392	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086578675&doi=10.1177%2f1363460720932392&partnerID=40&md5=f15f89bc3458476cca7357557ac69e64	In this interview with Jamie Hakim, Kane Race talks about his most recent monograph The Gay Science: Intimate Experiments With the Problem of HIV (2018). In The Gay Science, he explores how practices of sex and intimacy between gay men are shifting amidst what he calls the changing infrastructures of gay life – digital, chemical and communal. As such the book is empirically oriented and looks at a wide range of topics from hook-up apps, to PreP to chemsex/party 'n' play, to the history and politics of Sydney's Mardi Gras as they take place on the ground. Theoretically he blends the thought of philosophers such as Michel Foucault and Friedrich Nietzche with critical perspectives such as actor-network theory and Science and Technology Studies to argue that as scholars of sexual practice we need to pay more attention to what emerges within the contingencies of the assemblages and infrastructures that make sex between gay men possible. In so doing, the book is far more optimistic about gay sex and digital media then either popular media or influential strands of queer theory, offering path-breaking insight into the major concerns of this special issue on Chemsex Cultures. © The Author(s) 2020. Article	2023	Hamilton D.T.; Agutu C.; Sirengo M.; Chege W.; Goodreau S.M.; Elder A.; Sanders E.J.; Graham S.M.	Modeling the impact of different PrEP targeting strategies combined with a clinic-based HIV-1 nucleic acid testing intervention in Kenya	Epidemics	-	-	-	-	17554365	10.1016/j.epidem.2023.100696	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163470529&doi=10.1016%2fj.epidem.2023.100696&partnerID=40&md5=c0a84b87b6a766adae8703c9abbf5f51	Background: Up to 69% of adults who acquire HIV in Kenya seek care for acute retroviral symptoms, providing an important opportunity for early diagnosis and HIV care engagement. The Tambua Mapema Plus (TMP) trial tested a combined HIV-1 nucleic acid testing, linkage, treatment, and partner notification intervention for adults with symptoms of acute HIV infection presenting to health facilities in coastal Kenya. We estimated the potential impact on the Kenyan HIV epidemic of providing PrEP to individuals testing negative in TMP, if scaled up. Methods: We developed an agent-based simulation of HIV-1 transmission using TMP data and current Kenyan statistics. PrEP interventions were layered onto a model of TMP as standard of care, to estimate additional potential population-level impact of enrolling HIV-negative individuals identified through TMP on PrEP over 10 years. Four scenarios were modeled: PrEP for uninfected individuals in disclosed serodiscordant couples; PrEP for individuals with concurrent partnerships; PrEP for all uninfected individuals identified through TMP; and PrEP integrated into the enhanced partner services component of TMP. Findings: Providing PrEP to both individuals with concurrent partnerships and uninfected partners identified through enhanced partner services reduced new HIV infections and was efficient based on numbers needed to treat (NNT). The mean percent of infections averted was 2.79 (95%SI:−10.83, 15.24) and 4.62 (95%SI:−9.5, 16.82) when PrEP uptake was 50% and 100%, respectively, and median NNT was 22.54 (95%SI:not defined, 6.45) and 27.55 (95%SI:not defined, 11.0), respectively. Providing PrEP for all uninfected individuals identified through TMP averted up to 12.68% (95%SI:0.17, 25.19) of new infections but was not efficient based on the NNT: 200.24 (95%SI:523.81, 123.23). Conclusions: Providing PrEP to individuals testing negative for HIV-1 nucleic acid after presenting to a health facility with symptoms compatible with acute HIV adds value to the TMP intervention, provided PrEP is targeted effectively and efficiently. Article	2023	Hamilton D.T.; Hoover K.W.; Smith D.K.; Delaney K.P.; Wang L.Y.; Li J.; Hoyte T.; Jenness S.M.; Goodreau S.M.	Achieving the "Ending the HIV Epidemic in the U.S." incidence reduction goals among at-risk populations in the South	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-023-15563-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85153439497&doi=10.1186%2fs12889-023-15563-5&partnerID=40&md5=c88ea317b168795baa44bafc54c4d995	Introduction: Antiretroviral medication coverage remains sub-optimal in much of the United States, particularly the Sothern region, and Non-Hispanic Black or African American persons (NHB) continue to be disproportionately impacted by the HIV epidemic. The "Ending the HIV Epidemic in the U.S." (EHE) initiative seeks to reduce HIV incidence nationally by focusing resources towards the most highly impacted localities and populations. This study evaluates the impact of hypothetical improvements in ART and PrEP coverage to estimate the levels of coverage needed to achieve EHE goals in the South. Methods: We developed a stochastic, agent-based network model of 500,000 individuals to simulate the HIV epidemic and hypothetical improvements in ART and PrEP coverage. Results: New infections declined by 78.6% at 90%/40% ART/PrEP and 94.3% at 100%/50% ART/PrEP. Declines in annual incidence rates surpassed 75% by 2025 with 90%/40% ART/PrEP and 90% by 2030 with 100%/50% ART/PrEP coverage. Increased ART coverage among NHB MSM was associated with a linear decline in incidence among all MSM. Declines in incidence among Hispanic/Latino and White/Other MSM were similar regardless of which MSM race group increased their ART coverage, while the benefit to NHB MSM was greatest when their own ART coverage increased. The incidence rate among NHB women declined by over a third when either NHB heterosexual men or NHB MSM increased their ART use respectively. Increased use of PrEP was associated with a decline in incidence for the groups using PrEP. MSM experienced the largest absolute declines in incidence with increasing PrEP coverage, followed by NHB women. Conclusions: Our analysis indicates that it is possible to reach EHE goals. The largest reductions in HIV incidence can be achieved by increasing ART coverage among MSM and all race groups benefit regardless of differences in ART initiation by race. Improving ART coverage to > 90% should be prioritized with a particular emphasis on reaching NHB MSM. Such a focus will reduce the largest number of incident cases, reduce racial HIV incidence disparities among both MSM and women, and reduce racial health disparities among persons with HIV. NHB women should also be prioritized for PrEP outreach. © 2023, The Author(s). Article	2023	Hamilton, Deven T; Wang, Li Yan; Hoover, Karen W; Smith, Dawn K; Delaney, Kevin P; Li, Jingjing; Hoyte, Tamika; Jenness, Samuel M; Goodreau, Steven M	Potential contribution of PrEP uptake by adolescents 15-17 years old to achieving the "Ending the HIV Epidemic" incidence reduction goals in the US South	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0288588	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176436011&doi=10.1371%2fjournal.pone.0288588&partnerID=40&md5=5edca762437db8329dd325e2c5cc089b	Background The "Ending the HIV Epidemic"(EHE) initiative seeks to reduce new HIV infections in the U. S. by prioritizing federal resources towards highly impacted populations. Antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP) are essential for reaching EHE goals. Adolescents are often at increased risk for HIV because they may lack agency in negotiating their sexual partnerships and may not have the same access to treatment and prevention as adults. This study estimates the potential contribution of expanded PrEP coverage among adolescents ages 15-17 to achieving the EHE goals in the South. Methods An HIV-transmission model was built to simulate the HIV epidemic in the South. Increased ART and PrEP uptake were systematically varied with and without PrEP eligibility including individuals age<18. Results Prioritizing PrEP for adolescents had a negligible impact on incidence. At 50% uptake among eligible adolescents and 90% ART coverage, including adolescents, only improved the percentage of infections averted from 80.1% to 80.3%. In 10 of 15 scenarios explored, there was no reduction in new infections when PrEP eligibility was expanded to include adolescents age<18. At 95% ART coverage at the population-level incidence among adolescents declined by over 80%, but PrEP uptake among adolescents did not contribute to additional declines in incidence among adolescents. Conclusions Prioritizing PrEP for adolescents did not significantly contribute to reaching EHE incidence reductions goal. Focusing resources to specific adolescent populations at risk, such sexual minority males in high incidence settings, will remain an important public health goal outside the context of EHE. © 2023 This is an open access article, free of all copyright, and may be freely reproduced, distributed, transmitted, modified, built upon, or otherwise used by anyone for any lawful purpose. Article	2023	Hammond R.; Cambiano V.; Lampe F.C.; Asboe D.; Clarke A.; Gilson R.; Hart G.J.; Miltz A.R.; Nwokolo N.; Johnson A.M.; Phillips A.N.; Speakman A.; Whitlock G.; Rodger A.; Sewell J.	Predictors of starting and stopping chemsex in men who have sex with men in England: Findings from the AURAH2 prospective study	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2023-055774	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164401460&doi=10.1136%2fsextrans-2023-055774&partnerID=40&md5=d3d22a5c80d74959cab665407224172c	Background Chemsex (the use of psychoactive drugs in sexual contexts) has been associated with HIV acquisition and other STIs, so there is benefit in identifying those most likely to start chemsex to offer risk reduction interventions such as pre-exposure prophylaxis (PrEP). To date, there have been no data from a longitudinal study analysing factors most associated with starting and stopping chemsex. Methods The prospective cohort study, Attitudes to and Understanding Risk of Acquisition of HIV over Time (AURAH2), collected 4 monthly and annual online questionnaire data from men who have sex with men (MSM) from 2015 to 2018. We investigate the association of sociodemographic factors, sexual behaviours and drug use with starting and stopping chemsex among 622 men who completed at least one follow-up questionnaire. Poisson models with generalised estimating equations were used to produce risk ratios (RRs) accounting for multiple starting or stopping episodes from the same individual. Multivariable analysis was adjusted for age group, ethnicity, sexual identity and university education. Findings In the multivariable analysis, the under 40 age group was significantly more likely to start chemsex by the next assessment (RR 1.79, 95% CI 1.12 to 2.86). Other factors which showed significant association with starting chemsex were unemployment (RR 2.10, 95% CI 1.02 to 4.35), smoking (RR 2.49, 95% CI 1.63 to 3.79), recent condomless sex (CLS), recent STI and postexposure prophylaxis (PEP) use in the past year (RR 2.10, 95% CI 1.33 to 3.30). Age over 40 (RR 0.71, 95% CI 0.51 to 0.99), CLS, and use of PEP (RR 0.64, 95% CI 0.47 to 0.86) and PrEP (RR 0.47, 95% CI 0.29 to 0.78) were associated with lower likelihood of stopping chemsex by the next assessment. Interpretation Knowledge of these results allows us to identify men most likely to start chemsex, thus providing an opportunity for sexual health services to intervene with a package of risk mitigation measures, especially PrEP use. © Author(s) (or their employer(s)) 2023. Article	2023	Hamoonga T.E.; Mutale W.; Hill L.M.; Igumbor J.; Chi B.H.	"PrEP protects us": Behavioural, normative, and control beliefs influencing pre-exposure prophylaxis uptake among pregnant and breastfeeding women in Zambia	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2023.1084657	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159890143&doi=10.3389%2ffrph.2023.1084657&partnerID=40&md5=3cf70249e485acd2d1ac5bc73cd969de	Background: Although pre-exposure prophylaxis (PrEP) is recommended for pregnant and breastfeeding women at elevated HIV risk, uptake has been low in Zambia. Methods: In in-depth interviews, we explored beliefs about PrEP among 24 HIV-negative pregnant and breastfeeding Zambian women. Thematic analysis was used to identify behavioural, normative and control beliefs likely to influence PrEP uptake. Results: Most women viewed PrEP as a good method of protecting themselves and their babies from HIV infection. Partners were cited as key referents in decision making about PrEP use. Many women felt that PrEP use was not entirely in their control. Most reported that they would not use PrEP if their partners did not approve. Health care providers with negative attitudes, long distance to clinics, and extended waiting times were cited as barriers to PrEP uptake. Conclusion: HIV-negative pregnant and breastfeeding women had a positive attitude towards PrEP but barriers to uptake are multifaceted. 2023 Hamoonga, Mutale, Hill, Igumbor and Chi.	beliefs; breastfeeding; intention; pregnant; PrEP; sub-Saharan Africa; theory of planned behaviour; Zambia	English	Switzerland	Western and Central Europe and North America	Zambia	Eastern and Southern Africa	Zambia	Eastern and Southern Africa	Qualitative
Article	2023	Hamoonga T.E.; Mutale W.; Hill L.M.; Igumbor J.; Chi B.H.	Salient beliefs and intention to use pre-exposure prophylaxis among pregnant and breastfeeding women in Zambia: Application of the Theory of Planned Behaviour	Global Public Health	-	-	-	-	17441692	10.1080/17441692.2023.2184483	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149573132&doi=10.1080%2f17441692.2023.2184483&partnerID=40&md5=3e3d23d6c690f50ea50967a921cef6db	Primary HIV prevention is a priority for pregnant and breastfeeding women in sub-Saharan Africa; however, such services should be designed to optimise uptake and continuation. Between September and December 2021, we enrolled 389 women who were not living with HIV into a cross-sectional study from antenatal/postnatal settings at Chipata Level 1 Hospital. We used the Theory of Planned Behaviour to study the relationship between salient beliefs and intention to use pre-exposure prophylaxis (PrEP) among eligible pregnant and breastfeeding women. On a seven-point scale, participants had positive attitudes towards PrEP (mean = 6.65, SD = 0.71), anticipated approval of PrEP use from significant others (mean = 6.09, SD = 1.51), felt confident that they could take PrEP if they desired (mean = 6.52, SD = 1.09) and had favourable intentions to use PrEP (mean = 6.01, SD = 1.36). Attitude, subjective norms, and perceived behavioural control significantly predicted intention to use PrEP respectively ($\beta = 0.24$; $\beta = 0.55$; $\beta = 0.22$, all $p < 0.01$). Social cognitive interventions are needed to promote social norms supportive of PrEP use during pregnancy and breastfeeding. © 2023 The Author(s). MASIBAMBANE—LADIES CHAT: DEVELOPING AN ONLINE GENDER-ENHANCED PREP INFORMATION-MOTIVATION WORKSHOP FOR YOUNG SOUTH AFRICAN WOMEN	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2023.35.1.14	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147457231&doi=10.1521%2faeap.2023.35.1.14&partnerID=40&md5=a00631d68b97e4fca2694951e2f315ff	This article describes the processes of transforming an in-person group-based intervention to promote uptake of PrEP among young woman in South Africa to an online interactive "workshop" during the COVID-19 pandemic. Beginning in person and continuing virtually, we used a step-by-step partici-patory approach with multiple stakeholder groups to develop nine activities to increase knowledge about, as well as motivation and intention to take PrEP, and to address gender-based barriers to PrEP. Activities were informed by our theoretical framework and formative work with young women ages 18–25. We demonstrate how we developed a gender-enhanced online PrEP workshop that was interactive, group-based, and in accordance with elements of established successful intervention design; why WhatsApp emerged as the most accessible application for the young women in our workshop; and how an intervention with a hybrid approach—alternating between chat box and live sessions—combined with verbal, written, and emoji-based communication enabled interaction among participants. © 2023 The Guilford Press. Article	2023	Hanna-Walker V.; Simon K.A.; Lawrence S.E.; Driver R.; Kalinowski J.; Watson R.J.; Eaton L.A.	Black Sexual Minority Men's Stigma-Based Experiences Surrounding Pre-exposure Prophylaxis in the Southern United States	LGBT Health	-	-	-	-	23258292	10.1089/lgbt.2022.0118	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152174909&doi=10.1089%2flgbt.2022.0118&partnerID=40&md5=d4d7c90a308ba1d3ae563334b389dca5	Purpose: Intersecting experiences of stigma related to pre-exposure prophylaxis (PrEP) influence PrEP uptake among Black sexual minority men (BSMM) living in the southern United States; however, it is unclear what stigmatized identities and behaviors are impacted when accessing human immunodeficiency virus prevention options. To inform identity-specific PrEP interventions, this study examined stigma in BSMM's lives relating to intersecting experiences of PrEP stigma. Methods: We conducted 32 virtual, semistructured qualitative interviews with BSMM residing in the southeastern United States between February and April 2019. Results: We identified three themes (anticipated stigma, experiences of prejudice and stereotyping, and negative attitudes) and one subtheme within negative attitudes (othering social/sexual groups). Across all themes, PrEP stigma was often manifested through stigma against BSMM's sexual orientation or sexual behavior. BSMM in othering social/sexual groups displayed instances of cognitive dissonance by regularly expressing negative attitudes about and explicitly distancing themselves from social/sexual groups based on sexual orientation and sexual behavior. BSMM's race and gender were rarely mentioned as being stigmatized. Conclusions: Interventions focused on PrEP use could benefit from expanding their definition of PrEP stigma to include a stronger emphasis on intersecting identities and work to reduce cognitive dissonance in BSMM in the form of internalized homophobia. Article	2023	Harfouch, Omar; Comstock, Emily; Kaplan, Roman; Benator, Debra; Rivasplata, Heather; Wilson, Eleanor	Impact of the COVID-19 Pandemic on the PrEP Cascade at Two Veterans Affairs Healthcare Systems.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04146-5	https://pubmed.ncbi.nlm.nih.gov/37542627/	Overall, fewer Veterans were eligible for PrEP in 2020, compared to 2019, and 2018 (Maryland Veterans Affairs Health Care System- MVAHCS-: n = 890 (2020), n = 1533 (2019); Washington DC Veterans Affairs Medical Center -DC VAMC- n = 1119 (2020), n = 1716 (2019)). While the proportion of Veterans engaged in PrEP out of those eligible for PrEP increased in 2020 compared to 2019 at both sites (MVAHCS: 5.73% (2020) vs. 3.39% (2019) p-value = 0.006; F = 7.58, and DC VAMC: 15.91% (2020) vs. 9.38% (2019) p-value < 0.001; F = 27.64), the absolute number of Veterans engaged in PrEP remained unchanged (MVAHCS n = 51 (2020) and n = 52 (2019); DC VAMC n = 178 (2020) and n = 161 (2019)). Engagement in PrEP was significantly lower among Black Veterans compared to White Veterans at the DC VAMC across all FY with a widening gap in 2020. Cisgender women were less likely to be engaged in PrEP compared to cisgender men at both sites and throughout all FY with a wider gender gap in 2020. There were no significant differences in retention in PrEP between FY.Anticipated improvements in linkage, engagement, and retention in PrEP in 2020 at the MVAHCS and DC VAMC may not have been seen due to the COVID-19 pandemic. Furthermore, engagement rates in PrEP remained low overall, particularly among Black Veterans and cisgender women. Novel PrEP delivery models are needed to engage these populations in PrEP following the COVID-19 pandemic. Interactive dashboards and tele-PrEP may have played a big role in sustained retention in PrEP at the VHA. Article	2023	Haribhai S.; Khadka N.; Mvududu R.; Mashele N.; Bekker L.-G.; Gorbach P.; Coates T.J.; Myer L.; Joseph Davey D.L.	Psychosocial determinants of pre-exposure prophylaxis use among pregnant adolescent girls and young women in Cape Town, South Africa: A qualitative study	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624231152776	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151073597&doi=10.1177%2f09564624231152776&partnerID=40&md5=0ac5a167e42e3cc45cf3786dc0d215dd	Background: In South Africa, at least 7.5 million people (age ≥15 years) are living with Human Immunodeficiency Virus (HIV). In 2020, 220,000 new infections occurred, approximately one-third of which were among cisgender adolescent girls and women (age ≥15 years). The perspectives of pregnant adolescent girls and young women (AGYW) as key, targeted end-users of pre-exposure prophylaxis (PrEP) in this setting are not well known. Methods: We purposively recruited participants enrolled in an ongoing cohort study at an urban antenatal clinic in Cape Town, South Africa for in-depth interviews between July–September 2020. We restricted our analysis to pregnant AGYW (age: 16–25 years) who initiated daily oral PrEP (Tenofovir/Emtricitabine) antenatally and self-reported either high PrEP persistence (≥25 days in the past 30 days and no missed PrEP collection), or low PrEP persistence and/or discontinuation (missing >5 days in the last 30 days or missed PrEP collection). The findings were organized thematically, per the adapted Health Behavior Model (2000), using Nvivo-v.1.5. Results: We interviewed 18 AGYW (mean age = 22 years), at a mean of 14 weeks postpartum. Higher self-esteem and high-quality study provider-client relationships, including empathic psychosocial support, facilitated PrEP continuation. Reported barriers included unstable social structure characteristics (i.e., financial hardship) and individual factors (i.e., unintended pregnancy, parental rejection, and inadequate peer- and non-cohabiting partner support). Participants self-perceived a need for PrEP, feeling susceptible to non-consensual, forced sex, or considering partners' (presumed) sexual risk-taking. Limited community awareness regarding PrEP availability and/or perceived complexity in navigating health system access to PrEP, impede continuation. Conclusions: PrEP-focused healthcare access pathways for pregnant and postpartum AGYW need to be simplified. Further research is needed on health system determinants (i.e., structural barriers, provider-client interactions, and related outcomes) of oral PrEP utilization. In 2022, South Africa announced regulatory approval of long-acting PrEP options (i.e., the dapivirine ring for non-pregnant women and injectable cabotegravir, respectively); these may mitigate implementation barriers reported in this study. However, the safety and efficacy of long-acting PrEP (e.g., injectables, implants) among pregnant or breastfeeding women, specifically, remains to be confirmed in this setting. © The Author(s) 2023. Article	2023	Harkness A.; Lozano A.; Bainter S.; Mayo D.; Hernandez Altamirano D.; Rogers B.G.; Prado G.; Safren S.A.	Engaging Latino sexual minority men in PrEP and behavioral health care: multilevel barriers, facilitators, and potential implementation strategies	Journal of Behavioral Medicine	-	-	-	-	1607715	10.1007/s10865-022-00371-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143748459&doi=10.1007%2fs10865-022-00371-w&partnerID=40&md5=c8d6bdca27571a5c53e34dda04165e8b	Latino sexual minority men (LSMM) are affected by HIV and behavioral health disparities. Evidence-based HIV-prevention and behavioral health (BH) services are not sufficiently scaled up to LSMM. The current study identified multilevel barriers and facilitators to LSMM's use of HIV-prevention and BH services. LSMM (N = 290) in South Florida, a US HIV epicenter, completed a battery of measures potentially associated with pre-exposure prophylaxis (PrEP) and BH treatment use. Stochastic search variable selection (SSVS) followed by multiple linear regression analyses identified variables associated with engagement in PrEP and BH treatment. Multilevel determinants of PrEP and BH treatment engagement were identified, with most identified determinants being at the relational level (e.g., stigma, discrimination based on income and immigration status, personal recommendation for treatment). Individual (e.g., knowledge, self-efficacy) and structural (e.g., financial stress) determinants were also identified. Accordingly, modifiable leverage points to enhance the reach of PrEP and BH treatment to LSMM include educating and enhancing the perceived relevance of services, de-stigmatizing and normalizing via peer examples, bolstering self-efficacy, and building trust. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Harkness, Audrey; Morales, Vanessa; Atuluru, Pranusha; Jaramillo, Jahn; Safren, Steven A; Balise, Raymond; Turner, DeAnne	PrEP and Behavioral Health Treatment Referral Among HIV Test Counselors in Miami-Dade County: A Rapid Qualitative Study Using the Consolidated Framework for Implementation Research	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04184-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173112990&doi=10.1007%2fs10461-023-04184-z&partnerID=40&md5=9df78fa854171fc53ce56279c1c1742e	HIV test counselors are well positioned to refer individuals to pre-exposure prophylaxis (PrEP) and behavioral health treatments. HIV test counselors in Miami-Dade County (N = 20), a priority jurisdiction for Ending the HIV Epidemic, completed interviews to assess determinants of PrEP and behavioral health treatment referrals. To identify determinants, we used a rapid deductive qualitative analysis approach and the Consolidated Framework for Implementation Research (CFIR). Identified determinants sometimes served as facilitators (e.g., relative priority, leadership importance) and sometimes as barriers (e.g., lack of access to knowledge and information, available resources for referrals) to making referrals. We also observed differences in determinants between PrEP and behavioral health referrals. For example, complexity (perceived difficulty of the referral) was a barrier to behavioral health more often than PrEP referral. Our findings suggest that determinants across many CFIR domains affect referral implementation, and the corresponding need for multiple implementation strategies to improve implementation of PrEP and behavioral health referrals in the context of HIV testing. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.$	Behavioral health; Determinants; HIV testing; Implementation; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Harrington K.R.V.; Chandra C.; Alohan D.I.; Cruz D.; Young H.N.; Siegler A.J.; Crawford N.D.	Examination of HIV Preexposure Prophylaxis Need, Availability, and Potential Pharmacy Integration in the Southeastern US	JAMA Network Open	-	-	-	-	25743805	10.1001/jamanetworkopen.2023.26028	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165933052&doi=10.1001%2fjamanetworkopen.2023.26028&partnerID=40&md5=d497a796cbe45ec3429df13c19a27432	Importance: Daily preexposure prophylaxis (PrEP) use can prevent up to 99% of HIV infections; however, PrEP uptake is low due to poor access to PrEP-prescribing locations for populations at increased risk for HIV, especially in the southeastern US. Pharmacies are a feasible option to increase PrEP access, but little is known about how they could complement current PrEP-prescribing locations. Objective: To examine geographic distributions of current PrEP-prescribing locations compared with pharmacies and the facility to need ratios (PFNRs) according to HIV risk in the Southeast and describe the potential reach of pharmacies to expand PrEP access. Design, Setting, and Participants: Data for this cross-sectional study of PrEP-prescribing locations and pharmacies were compiled from January 1 to December 31, 2021. States or specific counties in the Southeast included in this study were jurisdictions identified as high-priority areas for the Ending the HIV Epidemic in the US (EHE) initiative. Exposure: Expansion of HIV prevention services to pharmacies. Main Outcomes and Measures: Choropleth maps of 5-year HIV risk per 100000 persons were developed for EHE jurisdictions in the southeastern US. PrEP-prescribing locations (obtained from a national database of PrEP prescribers) and pharmacies (obtained from state pharmacy boards) were overlayed on HIV risk maps. The PFNRs by state were calculated as number of facilities (PrEP-prescribing locations or pharmacies) divided by 5-year HIV risk per 100000 persons. Lower PFNRs indicated lower geographic availability of locations to meet the needs of the population at risk for HIV. The PFNRs for current PrEP-prescribing locations vs pharmacies were compared. Results: Among the 2 southeastern states and 13 counties in 4 southeastern states included, PrEP-prescribing locations were unequally distributed across EHE areas, with substantially fewer in areas at high risk for HIV. Pharmacies were evenly dispersed across areas regardless of HIV risk. The mean PFNR across all states for current PrEP-prescribing locations was 0.008 (median, 0.000 IQR, 0.000-0.003); for pharmacies, it was 0.7 (median, 0.3 IQR, 0.01-0.1). The PFNRs were at least 20.3 times higher for pharmacies compared with PrEP-prescribing locations. States with the greatest potential increase in PFNRs with expansion to pharmacies included Kentucky, South Carolina, and Tennessee. Conclusions and Relevance: The findings of this cross-sectional study suggest that expanding HIV prevention services to pharmacies in EHE areas in the Southeast could significantly increase capacity to reach individuals at increased risk of HIV transmission. Legislation aimed at allowing pharmacists to prescribe PrEP and provide HIV prevention services may be an important next step in ending the HIV epidemic.. © 2023 American Medical Association. Article	2023	Harris L.M.; Kerr J.C.; Skidmore B.D.; Ghare S.; Reyes-Vega A.; Remenik-Zarauz V.; Samanapally H.; Anwar R.U.; Rijal R.; Bryant K.; Hall M.T.; Barve S.	A conceptual analysis of SBIRT implementation alongside the continuum of PrEP awareness: domains of fit and feasibility	Frontiers in Public Health	-	-	-	22962565	10.3389/fpubh.2023.1310388	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182826726&doi=10.3389%2ffpubh.2023.1310388&partnerID=40&md5=95eb95e4471eb827dcfa598b79fe5c6d	Screening, Brief Intervention, and Referral to Treatment (SBIRT) is a supplementary intervention that can be incorporated into the Pre-Exposure Prophylaxis (PrEP) Care Continuum, complementing initiatives and endeavors focused on Human Immunodeficiency Virus (HIV) prevention in clinical care and community-based work. Referencing the Transtheoretical Model of Change and the PrEP Awareness Continuum, this conceptual analysis highlights how SBIRT amplifies ongoing HIV prevention initiatives and presents a distinct chance to address identified gaps. SBIRT's mechanisms show promise of fit and feasibility through (a) implementing universal Screening (S), (b) administering a Brief Intervention (BI) grounded in motivational interviewing aimed at assisting individuals in recognizing the significance of PrEP in their lives, (c) providing an affirming and supportive Referral to Treatment (RT) to access clinical PrEP care, and (d) employing client-centered and destigmatized approaches. SBIRT is uniquely positioned to help address the complex challenges facing PrEP awareness and initiation efforts. Adapting the SBIRT model to integrate and amplify HIV prevention efforts merits further examination. Article	2023	Hart, Trevor A; Noor, Syed W; Berlin, Graham W; Skakoon-Sparling, Shayna; Tavangar, Farideh; Tan, Darrell; Lambert, Gilles; Grace, Daniel; Lachowsky, Nathan John; Jollimore, Jody; Sang, Jordan; Parlette, Abbie; Lal, Allan; Apelian, Herak; Moore, David; Cox, Joseph	Pre-exposure prophylaxis and bacterial sexually transmitted infections (STIs) among gay and bisexual men.	Sexually Transmitted Diseases	-	-	-	1472-3263	10.1136/sextrans-2021-055381	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10176373	OBJECTIVES: While pre-exposure prophylaxis (PrEP) prevents HIV acquisition among gay, bisexual and other men who have sex with men (GBM), PrEP-using GBM may be more likely to engage in sexual behaviours associated with bacterial STIs. We examined associations between PrEP use, condomless anal sex (CAS), number of anal sex partners, oral sex and bacterial STI diagnoses among GBM living in Canada's three largest cities. METHODS: Among HIV-negative/unknown-status GBM in the baseline of the Engage cohort study, we fit a structural equation model of the associations between any PrEP use, sexual behaviours and bacterial STI diagnosis. We estimated direct and indirect paths between PrEP use and STI via CAS, number of anal sex partners and oral sex. RESULTS: The sample included 2007 HIV-negative/unknown status GBM in Montreal, Toronto and Vancouver. There was a significant direct association between PrEP use and current STI diagnosis (β=0.181; 95% CI: 0.112 to 0.247; p<0.001), CAS (β=0.275; 95% CI: 0.189 to 0.361; p<0.001) and number of anal sex partners (β=0.193; 95% CI: 0.161 to 0.225; p<0.001). In the mediated model, the direct association between PrEP use and STIs was non-significant. However, the indirect paths from PrEP to CAS to STIs (β=0.064; 95% CI: 0.025 to 0.120; p=0.008), and from PrEP to greater number of anal sex partners to CAS to STIs were significant (β=0.059; 95% CI: 0.024 to 0.108; p=0.007). CONCLUSIONS: Our study adds to the growing awareness that PrEP use among GBM may be associated with bacterial STIs because PrEP users have more anal sex partners and are more likely to engage in CAS. The results underscore the importance of providing effective STI counselling and regular STI testing to PrEP users, adapting PrEP care and related STI testing to individual needs, and the need for effective prevention strategies for bacterial STIs. Article	2023	Hartmann, Miriam; Roberts, Sarah T; Triplett, Noah; Tenza, Siyanda; Maboa, Onthatile; Mampuru, Lydia; Mayisela, Nonkululeko; Mbewe, Dorica; Tolley, Elizabeth E; Reddy, Krishnaveni; Palanee-Phillips, Thesla; Montgomery, Elizabeth T	Development of a relationship counselling website to identify and mitigate risk of intimate partner violence in the context of women's PrEP use.	PLOS Digital Health	-	-	-	2767-3170	10.1371/journal.pdig.0000329	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10424861	Discreet, accessible interventions are urgently needed to mitigate the risk of intimate-partner violence (IPV) and other relationship barriers that women encounter to using HIV prevention methods such as pre-exposure prophylaxis (PrEP). We adapted a counsellor-administered intervention, CHARISMA, into a mobile-optimized website to enhance accessibility and reduce human resources required for HIV prevention and relationship counseling. Using human-centered design and participatory methods, CHARISMA was adapted through workshops with former CHARISMA in-person intervention participants (n = 14; ages 18-45) and web development 'sprints' combined with cognitive interviews (n = 24). 'CHARISMA mobile' was then beta-tested with 81 women naïve to the in-person intervention. In beta-testing, participants used a 'think aloud' process to provide feedback on ease of use and rated design, functionality, comprehension, confidentiality, safety, and usefulness on a scale of 1 to 5 via a survey. Data were conducted in four rounds, interspersed with rapid assessment according to go/no-go criteria, and website adaptations. The updated website was pilot tested for 'real-world' feasibility and acceptability among 159 women using their own smartphones at a location of their choice. Feedback was measured via surveys and website analytics. Workshops and cognitive interviews generated insights on technology use, contextual adaptations, and confidentiality, which were integrated into the beta version. The beta version met all 'go' criteria and was further adapted for pilot testing. In pilot testing, users found the website was useful (mean rating 4.54 out of 5), safe (4.5 out of 5), and had few concerns about confidentiality (1.75, representing low concern). On average, users rated the website more than 4 stars out of 5. Beta and pilot-testing suggested the smartphone-optimized website was well-accepted, relevant, engaging, feasible to administer, discreet and safe. Results contributed to a refined website, suitable for adaptations to other contexts and further evaluation where outcomes related to PrEP use and relationships should be assessed. Article	2023	Hartmann, Miriam; Triplett, Noah; Roberts, Sarah T; Lanham, Michele; Reddy, Krishnaveni; Tenza, Siyanda; Mayisela, Nonkululeko; Mbewe, Dorica; Maboa, Ontathile; Mampuru, Lydia; Tolley, Elizabeth E; Palanee-Phillips, Thesla; Montgomery, Elizabeth T	Changes in relationships, HIV risk, and feelings towards PrEP: findings from a qualitative explanatory study among participants in the CHARISMA intervention trial.	BMC Women's Health	-	-	-	1472-6874	10.1186/s12905-023-02603-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10464438	BACKGROUND: Intimate partner violence (IPV) and other relationship-based challenges have been demonstrated to reduce women's ability to use pre-exposure prophylaxis (PrEP) effectively for HIV prevention. The Community Health Clinical Model for Agency in Relationships and Safer Microbicide Adherence (CHARISMA) intervention was designed to mitigate these challenges and increase South African women's agency to use PrEP. The CHARISMA randomized controlled trial did not identify statistically significant differences in PrEP adherence or relationship dynamics between the intervention and control arms. As such, the aim of this explanatory qualitative sub-study was to understand women's experiences with the CHARISMA trial and explore reasons for the null results. METHODS: Twelve CHARISMA trial participants were purposively selected to participate in serial in-depth interviews, which took place at the trial end and 3 months later. Participants represented individuals who had received each of the three counselling modules, 1) healthy communication counselling, 2) PrEP disclosure counselling, or 3) IPV counselling, as well as those in the control arm who received IPV standard-of-care counselling. RESULTS: A thematic case analysis revealed numerous positive relationship outcomes among intervention participants, including identifying and ending unhealthy relationships, gaining a sense of personal empowerment, and enacting more positive behaviors and HIV risk reduction strategies in subsequent relationships. These positive shifts were occasionally described as contributing to decisions to discontinue PrEP use, which may partly explain the limited impact of the intervention on PrEP adherence. CONCLUSIONS: Future investigations of counselling interventions addressing relationship-based barriers to PrEP use should account for changing risk dynamics and need for PrEP. Article	2023	Hascher K.; Jaiswal J.; Lorenzo J.; LoSchiavo C.; Burton W.; Cox A.; Dunlap K.; Grin B.; Griffin M.; Halkitis P.N.	Why aren't you on PrEP? You're a gay man': reification of HIV 'risk' influences perception and behaviour of young sexual minority men and medical providers	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2021.2018501	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122074890&doi=10.1080%2f13691058.2021.2018501&partnerID=40&md5=dff37cec70aab45b0898a674701951dd	Public health models and medical interventions have often failed to consider the impact of reductionist HIV 'risk' discourse on how sexual minority men interpret, enact and embody biomedical knowledge in the context of sexual encounters. The aim of this study was to use an anthropological lens to examine sexual minority men's perception of HIV risk and experience within the medical system in order to examine the influence of risk discourse on their health, behaviour and social norms. In-depth interviews (n = 43) were conducted with a racially, ethnically and socioeconomically diverse sample of young sexual minority men and explored HIV-related beliefs and experiences, as well as their interactions with healthcare providers. Findings suggest that the stigmatisation of behaviours associated with HIV appears to be shaped by three key forces: healthcare provider perceptions of sexual minority men as inherently 'risky', community slut-shaming, and perceptions of risk related to anal sex positioning. Stigmatising notions of risk appear to be embodied through sexual health practices and identities vis-à-vis preferred anal sex positions and appear to influence condom use and PrEP initiation. © 2021 Informa UK Limited, trading as Taylor & Francis Group.	healthcare; HIV prevention; HIV risk; PrEP; sexual minority men	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Haubrick K.K.; Whiteley L.; Arnold T.; Leigland A.; Ward L.M.; Brock J.B.; Brown L.K.	Impact of Homophobia and Racism on Comfort Receiving Pre-exposure Prophylaxis at Various Locations Among Black MSM in Mississippi	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03918-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141743905&doi=10.1007%2fs10461-022-03918-9&partnerID=40&md5=fb5ad41c19c861d0ea8576e606551dc	Pre-exposure prophylaxis (PrEP) is underutilized among Black men who have sex with men (BMSM) in the Southern United States. We assessed comfort receiving PrEP at various locations among 65 BMSM. Chi-square and t-tests explored associations between demographics, experienced homophobia and racism, and comfort receiving PrEP. BMSM with greater experienced homophobia were less comfortable at academically affiliated clinics X2(2, N = 59) = 10.61, p = 0.01, CBOs X2(3, N = 59) = 10.02, p = 0.02, and STI/HIV clinics X2(3, N = 59) = 8.63, p = 0.04. Those with greater experienced racism were more comfortable receiving PrEP by mail X2(3, N = 61) = 9.40, p = 0.02. Homophobia and racism influence preferences of BMSM for where and how they receive PrEP care. Private modes of PrEP delivery and interventions targeting provider and organizational bias should be explored. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Hawkinson D.E.; Operario D.; Hess S.; van den Berg J.J.	Bridging the age gap: intergenerational communication of HIV risk and prevention among younger and older men who have sex with men	AIDS Care	-	-	-	9540121	10.1080/09540121.2022.2085865	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131520915&doi=10.1080%2f09540121.2022.2085865&partnerID=40&md5=62d56598f81d295d227e918b32d6e32f	Trends in HIV incidence and prevalence vary between younger MSM (YMSM) and older MSM (OMSM). HIV prevention was revolutionized with the advent of pre-exposure prophylaxis (PrEP), but uptake of PrEP among OMSM is relatively unknown. Community connectedness among MSM is a strong driver of prevention. This qualitative study sought to explore similarities and differences between YMSM and OMSM's knowledge, perceptions, and barriers of HIV prevention and understand how intergenerational communication may enhance engagement in prevention, especially PrEP. Twenty semi-structured, in-depth interviews (ten YMSM and ten OMSM) were conducted with HIV-negative, non-monogamous MSM aged 18–24 and 55+ years. Interviews were transcribed and coded using NVivo 12 to identify themes within each age group and compare between age groups. YMSM expressed greater knowledge and more positive perceptions of PrEP than OMSM. OMSM felt that PrEP use increased engagement in sexual risk behavior. Both groups emphasized a need for more conversations between different age groups of MSM to educate each other about forms of prevention and reduce stigma. Intergenerational communication among MSM about HIV risk and prevention strategies may be an effective way to address the generational gaps in knowledge and perceptions and enhance engagement in HIV prevention. © 2022 Informa UK Limited, trading as Taylor & Francis Group. Theses and Dissertations	2023	Hayden, Emma R	PrEP Initiation as a Predictor of Alcohol-Related Sexual Risk Among Young Men Who Have Sex with Men	-	-	STARS/University of Central Florida	-	NA	NA	https://stars.library.ucf.edu/etd2023/78	HIV infection is a significant public health concern, particularly among young men who have sex with men (YMSM). Pre-exposure prophylaxis (PrEP) is highly effective in preventing HIV infection among YMSM when taken as prescribed. However, there may be unintended behavioral consequences associated with PrEP initiation, with previous studies finding associations between PrEP use and increased sexual risk behaviors such as condomless anal sex (CAS). Further, problematic alcohol use, to which YMSM are particularly vulnerable, may also play a role in increasing sexual risk as engaging in sexual behaviors while under the influence of alcohol has been associated with CAS and other sexual risk behaviors. Previous literature has proposed risk compensation theory as a basis for this change in sexual risk behaviors following PrEP initiation. However, results have been mixed, and fewer studies have examined risk compensation specifically among YMSM or explored the role of alcohol-related sexual behaviors in this relationship. The present study aims to examine risk compensation theory as a mechanism for the relationship between PrEP initiation and alcohol-related sexual behaviors among YMSM. We hypothesized that the trajectory of PrEP initiation would be positively associated with alcohol-related sexual behaviors across 18 months. Consistent with hypothesis, a combined latent difference score and latent trajectory model revealed a positive association between PrEP initiation and alcohol-related sexual behaviors between baseline and 18-month follow-up in a sample of YMSM. These results are consistent with previous research identifying a high-risk period following PrEP initiation among an already vulnerable group (YMSM), with implications for risk assessment and interventions targeting alcohol-related sexual behaviors among YMSM. This study also highlights the role of alcohol use in increasing sexual risk following PrEP initiation. Findings may aid in reducing adverse sexual outcomes among YMSM who initiate PrEP and ultimately contribute to the minimization of sexual health disparities among YMSM. Article	2023	Hayes R.; Nutland W.; Rayment M.; Wayal S.; Apea V.; Clarke A.; McOwan A.; Sullivan A.; Desai M.; Jajja A.; Rice B.; Horne R.; McCormack S.; Gafos M.	"Sex without fear": exploring the psychosocial impact of oral HIV pre-exposure prophylaxis on gay men in England	AIDS Research and Therapy	-	-	-	17426405	10.1186/s12981-023-00568-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176461220&doi=10.1186%2fs12981-023-00568-2&partnerID=40&md5=19aefd0fc65d8b7f8ffbe38200f34484	Gay, bisexual, and other men who have sex with men (GBMSM) experience a high prevalence of psychosocial health problems, such as harmful substance use and depression, as well as being disproportionately affected by HIV. HIV Pre-Exposure Prophylaxis (PrEP) may provide psychosocial benefits beyond its intended purpose of reducing HIV infection. We explore the psychosocial impact of oral PrEP use on gay men in England using qualitative data from the PROUD study. From February 2014 to January 2016, semi-structured in-depth interviews were conducted with 40 gay men and one trans woman. Participants were purposively recruited based on trial arm allocation, adherence, and sexual risk behaviours. By removing HIV risk from sex, PrEP improves users' wellbeing by reducing HIV-related anxiety and internalised stigma and increasing HIV prevention self-efficacy, sexual pleasure, and intimacy. In turn, these psychological changes may influence behaviour in the form of greater sexual freedom, reduced harmful drug use, and more protective sexual health behaviours. However, PrEP may create internal conflict for some gay men, due to its disruption of social norms around condom use and its perceived influence on their sexual behaviour leading to reduced condom self-efficacy. These findings provide a baseline of PrEP's psychosocial impact amongst some of the first PrEP users in England and supports calls to consider the psychosocial impact of PrEP in prescribing guidelines. © 2023, The Author(s). Article	2023	Hazra A.; Landovitz R.J.; Marzinke M.A.; Quinby C.; Creticos C.	Breakthrough HIV-1 infection in setting of cabotegravir for HIV pre-exposure prophylaxis	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003644	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166442323&doi=10.1097%2fQAD.0000000000003644&partnerID=40&md5=033e7d9f65cfd0b9c870ad716bee5847	Objective:We describe the first case of HIV-1 infection in the setting of long-acting injectable cabotegravir (CAB-LA) for HIV pre-exposure prophylaxis to occur in the real world.Design:Case report.Methods:Electronic medical records were reviewed to assess patient history and CAB-LA administration details. Plasma fourth-generation HIV-1/2 Ag/Ab combination immunoassay and HIV-1 RNA quantitative PCR were performed at each injection visit.Results:We report a 28-year-old sex-diverse person assigned male at birth who acquired HIV-1 infection 91 days after transitioning from tenofovir alafenamideemtricitabine to CAB-LA despite on-time dosing and appropriate laboratory monitoring.Conclusion:This patient's history suggests HIV infection despite on-time and appropriate CAB-LA injections. To our knowledge, this is the first case of CAB-LA pre-exposure prophylaxis failure outside the setting of a clinical trial and highlights diagnostic and management challenges that may occur with such breakthrough infections. © 2023 Lippincott Williams and Wilkins. Article	2023	Hazra, Aniruddha; Stanford, Kimberly; Schneider, John; Davis, Andrew	Introducing a Sexual Wellness Clinic to an At-Risk Population Through the Emergency Department.	Academic medicine : journal of the Association of American Medical Colleges	-	-	-	1938-808X 1040-2446	10.1097/ACM.0000000000005182	https://pubmed.ncbi.nlm.nih.gov/36867003/	Rates of sexually transmitted infections (STIs) in the United States have continued to increase for nearly a decade as state and local health departments across the country have divested from sexual health services. The resulting closure of municipal STI clinics has led many uninsured and underinsured patients to rely on emergency departments for their sexual health needs. The authors describe the creation of the novel Sexual Wellness Clinic at University of Chicago Medicine in February 2019. The clinic provides comprehensive sexual health care to establish linkage to pre-exposure prophylaxis (PrEP) for HIV, primary care, and other essential services to patients presenting to the emergency department for STI care. Since operationalization, the Sexual Wellness Clinic has served 560 unique patients; 50.5% (n = 283) were cisgender male and 49.5% (n = 277) were cisgender female. The majority of patients were African American (93.4%, n = 523), non-Hispanic or Latinx (96.1%, n = 538), between 18 and 29 years old (62.3%, n = 350), and had Medicaid or were uninsured (84.3%, n = 472). New syphilis diagnoses were identified in 23.5% (132/560) of patients; gonococcal and chlamydial infections were confirmed in 14.6% (82/560) and 13.4% (75/560) of patients, respectively. Same-day PrEP was initiated for 16.1% (90/560) of patients, of which 56.7% were cisgender female. The Sexual Wellness Clinic identified unique candidates for PrEP, notably a large proportion of Black cisgender women; however, further work is needed to support the ongoing PrEP cascade. Identifying these new populations with untreated STIs and other HIV risk factors for targeted, innovative interventions is integral to HIV elimination and STI control efforts. Article	2023	Heilmann E.; Okuku J.; Itoh M.; Hines J.Z.; Prieto J.T.; Phiri M.; Watala K.; Nsofu C.; Luhana-Phiri M.; Vlahakis N.; Kabongo M.; Kaliki B.; Minchella P.A.; Musonda B.	Measuring Oral Pre-exposure Prophylaxis (PrEP) Continuation Through Electronic Health Records During Program Scale-Up Among the General Population in Zambia	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03966-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145327553&doi=10.1007%2fs10461-022-03966-1&partnerID=40&md5=bc97e35d7cf7d681d223e995927d7f82	HIV pre-exposure prophylaxis (PrEP) is being scaled-up in Zambia, but PrEP continuation data are limited by paper-based registers and aggregate reports. Utilization of Zambia's electronic health record (EHR) system, SmartCare, may address this gap. We analyzed individuals aged ≥ 15 years who initiated PrEP between October 2020 and September 2021 in four provinces in Zambia in SmartCare versus aggregate reports. We measured PrEP continuation using Kaplan–Meier survival analysis and Cox proportional hazards models. SmartCare captured 29% (16,791/58,010) of new PrEP clients; 49% of clients continued at one month, and 89% discontinued PrEP by February 2022. Women were less likely than men to discontinue PrEP (adjusted hazard ratio aHR: 0.89, 95% CI 0.86–0.92, z = − 6.99, p < 0.001), and PrEP clients aged ≥ 50 years were less likely to discontinue PrEP compared to clients 15–19 years (aHR: 0.53, 95% CI 0.48–0.58, z = − 13.04, p < 0.001). Zambia's EHR is a valuable resource for measuring individual-level PrEP continuation over time and can be used to inform HIV prevention programs. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Henderson, Mary; Schmidt, Heather-Marie A; Chitembo, Lastone; Peralta, Hortencia; Alaama, Ahmed S; Johnson, Cheryl; Baggaley, Rachel; Schaefer, Robin	The Future of Pre-Exposure Prophylaxis (PrEP) for HIV Prevention: A Global Qualitative Consultation on Provider Perspectives on New Products and Differentiated Service Delivery.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-023-04093-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10589125	Differentiated service delivery and new products, such as long-acting injectable cabotegravir (CAB-LA) and the dapivirine vaginal ring (DVR), could increase uptake and use of pre-exposure prophylaxis (PrEP) for HIV prevention. We explored PrEP provider perspectives on differentiated PrEP service delivery and new PrEP products to inform World Health Organization (WHO) guidelines and programme implementation. 150 PrEP providers who participated in a WHO survey were randomly selected and 67 were invited for interviews based on geographic representation, provider cadre, gender, experience with community-based PrEP service delivery, and familiarity with new PrEP products. Semi-structured interviews were conducted virtually. Key themes were inductively extracted relating to differentiated service delivery and benefits and concerns regarding new PrEP products. 30 PrEP providers from 24 countries were interviewed. Across regions, providers were supportive of differentiated service delivery to respond to clients' needs and preferences, maintain services during COVID-19, and ensure access for priority populations that may face access challenges. Providers welcomed prospects of offering CAB-LA to their clients but had concerns about HIV testing, costs, and the demands on clinic-based services, including staff who can administer injections. Providers felt the DVR was potentially important for some cisgender women, especially young clients and female sex workers, and raised fewer concerns compared to injectable PrEP. Providers' views are critical for the development of guidelines and implementing programmes that will best serve PrEP users. Understanding areas where provider capacities and biases may create barriers can define opportunities for training and support to ensure that providers can deliver effective programmes. Article	2023	Hensen, Bernadette; Floyd, Sian; Phiri, Mwelwa M.; Schaap, Ab; Sigande, Lucheka; Simuyaba, Melvin; Mwenge, Lawrence; Zulu-Phiri, Rosemary; Mwape, Louis; Fidler, Sarah; Hayes, Richard; Simwinga, Musonda; Ayles, Helen	The impact of community-based, peer-led sexual and reproductive health services on knowledge of HIV status among adolescents and young people aged 15 to 24 in Lusaka, Zambia: The Yathu Yathu cluster-randomised trial.	PLOS Medicine	-	-	-	1549-1676 1549-1277	10.1371/journal.pmed.1004203	https://pubmed.ncbi.nlm.nih.gov/37083700/	BACKGROUND: The growing population of adolescents and young people (AYP) aged 15 to 24 in sub-Saharan Africa face a high burden of HIV in many settings. Unintended pregnancies among adolescent girls in the region remain high. Nonetheless, the sexual and reproductive health (SRH) service needs of AYP have remained underserved. We conducted a cluster-randomised trial (CRT) to estimate the impact of community-based, peer-led SRH service provision on knowledge of HIV status and other SRH outcomes, including met need for contraceptives. METHODS AND FINDINGS: Yathu Yathu was a cluster-randomised trial (CRT) conducted from 2019 to 2021 in 2 urban communities in Lusaka, Zambia. The communities were divided into 20 zones (approximately 2,350 AYP/zone) that were randomly allocated to the Yathu Yathu intervention or control arm. In each intervention zone, a community-based hub, staffed by peer support workers, was established to provide SRH services. In 2019, a census was conducted in all zones; all consenting AYP aged 15 to 24 were given a Yathu Yathu card, which allowed them to accrue points for accessing SRH services at the hub and health facility (intervention arm) or the health facility only (control arm). Points could be exchanged for rewards, thus acting as an incentive to use SRH services in both arms. We conducted a cross-sectional survey in 2021 to estimate the impact of Yathu Yathu on the primary outcome: knowledge of HIV status (self-reporting living with HIV or HIV testing in the last 12 months) and secondary outcomes, including use of pre-exposure prophylaxis (PrEP) in the last 12 months, current use of antiretroviral therapy (ART), and met need for contraceptive services. The sampling was stratified on sex and age group, and we analysed data at cluster-level using a two-stage process recommended for CRTs with <15 clusters/arm. A total of 1,989 AYP consented to participate in the survey (50% male); consent was similar across arms (63% consent/arm). Across zones, knowledge of HIV status ranged from 63.6% to 81.2% in intervention zones and 35.4% to 63.0% in control zones. Adjusting for age, sex, and community, knowledge of HIV status was higher in the intervention arm compared to control (73.3% versus 48.4%, respectively, adjusted prevalence ratio (PR) 1.53 95% CI 1.36, 1.72; p < 0.001). By age and sex, results were similar. There was no evidence for impact on any secondary outcomes, including current use of ART and met need for contraceptives. There were no adverse events reported in either arm. A key limitation of our trial is that approximately 35% of the AYP randomly selected for participation in the endline survey could not be reached. CONCLUSIONS: Delivering community-based, peer-led SRH services increased knowledge of HIV status among AYP, both males and females, compared with the control arm. Scaling up the highly effective Yathu Yathu strategy has the potential to make a substantial contribution to increasing access to HIV prevention and care services for young people. However, additional implementation research is needed to understand how to improve uptake of broader SRH services, beyond uptake of HIV testing. Article	2023	Herns S.; Panwala R.; Pfeil A.; Sardinha M.; Rossi V.; Blumenthal J.; Hill L.	Predictors of PrEP retention in at risk patients seen at a HIV primary care clinic in San Diego	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624231179276	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162949363&doi=10.1177%2f09564624231179276&partnerID=40&md5=5e787f87613878e40f9a2f71f2974225	Background: Adherence to medication and retention in care are key contributors to the efficacy of pre-exposure prophylaxis (PrEP) for prevention of HIV. Therefore, it is important to understand factors that may impact retention in various settings that prescribe PrEP. Methods: We evaluated factors associated with retention in care 3 and 12 months after PrEP initiation at a primary care HIV clinic in San Diego. Retention was defined as having an office/virtual visit within 1 month from the 3- or 12-months time point or interacting with the clinic leading to medication being refilled. Results: A total of 199 patients were included. Retention rates were 74.4% and 52.8% at 3 and 12 months respectively. In the multivariate analysis, reporting depression or anxiety was associated with being retained in care (p = 0.004) and identifying as cisgender female was associated with lack of retention (p = 0.04) at 3 months. Testing positive for a sexually transmitted infection was associated with 12-months retention (p = 0.004); however, this was likely influenced by difference in the frequency of testing in those retained versus not retained. Conclusion: Ongoing efforts to determine the optimal method for provision of PrEP care that supports retention for different populations at risk for HIV, are needed. © The Author(s) 2023. Article	2023	Heron J.E.; McManus H.; Vickers T.; Ryan K.; Wright E.; Carter A.; Stoove M.; Asselin J.; Grulich A.; Donovan B.; Guy R.; Varma R.; Chen M.; Ryder N.; Lewis D.A.; Templeton D.J.; O'Connor C.C.; Gracey D.M.; Bastian L.; Bateson D.; Bowden S.; Boyd M.; Callander D.; Aung H.L.; Cogle A.; Costello J.; Dimech W.; Dittmer J.; El-Hayek C.; Ellard J.; Fairley C.; Franklin L.; Hellard M.; Hocking J.; Kim J.; McGill S.; Nolan D.; Patel P.; Pendle S.; Polkinghorne V.; Nguyen L.; Nguyen T.; O'Connor C.; Reed P.; Roth N.; Selvey C.; Traeger M.; Walker M.; West M.	Renal impairment associated with tenofovir disoproxil fumarate for antiretroviral therapy and HIV pre-exposure prophylaxis: An observational cohort study	PLOS One	-	-	-	19326203	10.1371/journal.pone.0280339	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148952763&doi=10.1371%2fjournal.pone.0280339&partnerID=40&md5=024b2768675d0156dfef95cd29357578	Background Tenofovir disoproxil fumarate (TDF) is associated with adverse renal outcomes when prescribed for HIV infection. There are few data concerning real-world renal outcomes amongst patients prescribed TDF for pre-exposure prophylaxis (PrEP). Methods and findings Data were extracted from 52 sexual health clinics across Australia from 2009–2019. All patients prescribed TDF-containing antiretroviral therapy and PrEP were included. Rates of renal impairment (a fall in eGFR to <60 ml/min/1·73m2) were calculated for people living with HIV (PLWHIV) prescribed TDF and HIV negative PrEP-users. Risk factors were assessed using Cox-proportional hazards models. Sensitivity analysis of risk using 1:1 propensity-score matching to adjust for potential imbalance in HIV and PrEP cohorts was conducted. 5,973 patients on PrEP and 1,973 PLWHIV were included. There were 39 (0.7%) instances of renal impairment in the PrEP group and 81 (4.1%) in the PLWHIV cohort (hazard ratio HR:0.35 95% confidence interval CI: 0.22–0.56). Rates of renal impairment were 4.01/1000 person-years (95%CI:2.93–5.48) in the PrEP cohort and 16.18/1000 person-years (95%CI:13.01–20.11) in the PLWHIV cohort (p<0.001). Predictors of renal impairment were: older age (40–49 years (HR:5.09 95%CI: 2.12–12.17) and 50–82 years (HR:13.69 95%CI: 5.92–31.67) (compared with 30–39 years) and baseline eGFR<90ml/min (HR:61.19 95%CI: 19.27–194.30). After adjusting for age and baseline eGFR the rate of renal impairment remained lower in the PrEP cohort (aHR:0.62 95%CI: 0.40–0.94, p = 0.023). In propensity-matched analysis using 1,622 patients per cohort the risk of renal impairment remained higher in the PLWHIV cohort (log-rank p = 0.001). Conclusion Patients prescribed TDF-based PrEP had lower rates of renal impairment than patients prescribed TDF for HIV infection. In propensity analysis, after matching for some risk factors, rates of renal impairment remained higher amongst patients with HIV. © 2023 Heron et al. Dose finding study for on-demand HIV pre-exposure prophylaxis for insertive sex in sub-Saharan Africa: results from the CHAPS open label randomised controlled trial	EBioMedicine	-	-	-	23523964	10.1016/j.ebiom.2023.104648	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161688423&doi=10.1016%2fj.ebiom.2023.104648&partnerID=40&md5=82241872d5a879421909e70012985d22	Background: The efficacy of on-demand HIV pre-exposure prophylaxis (PrEP) for men in sub-Saharan Africa has not been evaluated, and the on-demand PrEP dosing requirement for insertive sex remains unknown. Methods: HIV-negative males 13–24 years, requesting voluntary medical male circumcision (VMMC), were enrolled into an open-label randomised controlled trial (NCT03986970), and randomised 1:1:1:1:1:1:1:1:1 to control arm or one of eight arms receiving emtricitabine-tenofovir disoproxil fumarate (F/TDF) or emtricitabine-tenofovir alafenamide (F/TAF) over one or two days, and circumcised 5 or 21 h thereafter. The primary outcome was foreskin p24 concentrations following ex vivo HIV-1BaL challenge. Secondary outcomes included peripheral blood mononuclear cell (PBMC) p24 concentration, and drug concentrations in foreskin tissue, PBMCs, plasma and foreskin CD4+/CD4-cells. In the control arm, post-exposure prophylaxis (PEP) activity of non-formulated tenofovir-emtricitabine (TFV-FTC) or TAF-FTC was assessed with ex vivo dosing 1, 24, 48 or 72 h post-HIV-1 challenge. Findings: 144 participants were analysed. PrEP with F/TDF or F/TAF prevented ex vivo infection of foreskins and PBMCs both 5 and 21 h after PrEP dosing. There was no difference between F/TDF and F/TAF (p24day15 geometric mean ratio 1.06, 95% confidence interval: 0.65–1.74). Additional ex vivo dosing did not further increase inhibition. In the control arm, PEP ex vivo dosing was effective up to 48 post-exposure diminishing thereafter, with TAF-FTC showing prolonged protection compared to TFV-FTC. Participants receiving F/TAF had higher TFV-DP concentrations in foreskin tissue and PBMCs compared with F/TDF, irrespective of dose and sampling interval; but F/TAF did not confer preferential TFV-DP distribution into foreskin HIV target cells. FTC-TP concentrations with both drug regimens were equivalent and ~1 log higher than TFV-DP in foreskin. Interpretation: A double dose of either F/TDF or F/TAF given once either 5 or 21 h before ex vivo HIV-challenge provided protection across foreskin tissue. Further clinical evaluation of pre-coital PrEP for insertive sex is warranted. Article	2023	Herrera M.C.; Darien K.; Wood S.; Hadland S.E.; Metzger D.; Dowshen N.	A Qualitative Study of Barriers and Facilitators to Integrating Medications for Opioid Use Disorder and HIV Preexposure Prophylaxis for Adolescents and Young Adults	Journal of Addiction Medicine	-	-	-	19320620	10.1097/ADM.0000000000001195	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176337787&doi=10.1097%2fADM.0000000000001195&partnerID=40&md5=201700471b96b22f838f27fe0ce8686a	Background The syndemic of substance use and human immunodeficiency virus (HIV) is a well-recognized global phenomenon that threatens to undermine the priorities outlined by the National Institutes of Health "Ending the HIV Epidemic"initiative. There are few published studies on preexposure prophylaxis (PrEP) for adolescents and young adults (AYAs) with opioid use disorder (OUD) despite increasing availability of biomedical prevention options and Centers for Disease Control and Prevention recommendations to offer PrEP to this group. Methods Healthcare providers who previously prescribed medications for OUD (MOUDs) and/or PrEP for AYA were purposively sampled. Audio-recorded in-depth individual interviews were conducted using chart-stimulated recall to explore barriers and facilitators to integrated MOUD and HIV prevention services. Interviews were double-coded, and qualitative analysis was performed using a modified grounded theory. Results Of 19 providers sampled, most were physicians (63%). All recommended HIV screening at varying intervals; however, few counseled on (19%) or prescribed (11%) PrEP to patients on MOUD. Barriers to PrEP prescriptions included patient-level (ie, stigma surrounding PrEP use, adherence challenges, and competing social or mental healthcare needs), provider (perception of low risk, lack of training/experience), and system-level factors (including restricted visit types). Facilitators of PrEP prescriptions included patient-initiated requests, electronic health record system reminders, and the availability of consistent support staff (ie, navigators, certified recovery specialists). Conclusions Our study confirms that discussions about HIV prevention and PrEP prescriptions may be rare for AYA patients receiving MOUD. Further research is needed to develop interventions that increase the integration of PrEP delivery within the context of OUD care among this key AYA population. © 2023 Wolters Kluwer Health, Inc. Article	2023	Hicks S.; Abuna F.; Odhiambo B.; Dettinger J.C.; Sila J.; Oketch G.; Sifuna E.; Ngumbau N.; Gómez L.; John-Stewart G.C.; Kinuthia J.; Wagner A.D.	Integrating PrEP in maternal and child health clinics in Kenya: analysis of a service availability and readiness assessment (SARA) survey	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/frph.2023.1206150	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165161424&doi=10.3389%2ffrph.2023.1206150&partnerID=40&md5=8a2d81443257873a24a8734167647c6d	Background: Risk of HIV acquisition is high during pregnancy and postpartum, and pre-exposure prophylaxis (PrEP) is recommended for peripartum populations. Integrating PrEP into maternal and child health (MCH) clinics is feasible and acceptable. Understanding clinics' service availability and readiness is essential for effective scale up. Methods: The PrEP in Pregnancy, Accelerating Reach and Efficiency study (PrEPARE; NCT04712994) engaged PrEP-experienced facilities previously linked to a programmatic or research study in Western Kenya to document available services and commodities via a modified service availability and readiness assessment (SARA) survey with 20 PrEP tracer items covering: staffing/guidelines, services/equipment, and medicines/commodities. Facilities' prior study engagement occurred between 2017 and 2019; SARA survey data was collected between April 2020 and June 2021. Descriptive statistics were stratified by prior study engagement. ANOVA tests assessed associations between facility characteristics and gaps. Fisher's tests assessed differences in commodity availability and stockouts. Results: Of the 55 facilities surveyed, 60% had received PrEP training in the last two years, 95% offered PrEP integrated into MCH, and 64% and 78% had both auditory and visual privacy in PrEP and HIV testing services (HTS) delivery spaces, respectively. Supervision frequency was heterogeneous, but 82% had received a supervision visit within 3 months. Availability of commodities was variable and the most commonly unavailable commodities were PrEP in MCH (71% available) and risk assessment screening tool (RAST) and PrEP cards (60% and 75% available, respectively). The number of service and commodity gaps per facility ranged from zero to eight (median: 3; IQR: 2, 5). The most frequent gaps were: PrEP training and risk assessment cards (40% each), lack of privacy in PrEP (36%) and HIV testing services (31%) spaces, PrEP pills in MCH (29%), and PrEP cards (25%). There were no differences in mean number of gaps by county, previous study engagement, or public vs. private status. Level 4 facilities had fewer gaps (mean 2.2) than level 2, 3, and 5 facilities (mean 5.7, 4.5, and 5.3 respectively; p < 0.001). Conclusions: PrEP service availability and readiness was generally high across MCH facilities. However, there is a need for increased frequency of provider training and supportive supervision focused on fidelity. To address key commodity stockouts such as PrEP pills, implementation of electronic logistics management information systems may be needed. Targeting these gaps is essential to effectively scale up integrated PrEP delivery, especially among facilities with limited infrastructure. 2023 Hicks, Abuna, Odhiambo, Dettinger, Sila, Oketch, Sifuna, Ngumbau, Gómez, John-Stewart, Kinuthia and Wagner.	commodities; health facilities (MeSH); postpartum; pre-exposure prophylaxis (PrEP); pregnancy; service readiness and availability; supervision	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Hicks, Sarah; Abuna, Felix; Odhiambo, Ben; Dettinger, Julia C; Ngumbau, Nancy; Gómez, Laurén; Sila, Joseph; Oketch, George; Sifuna, Enock; Weiner, Bryan J; John-Stewart, Grace C; Kinuthia, John; Wagner, Anjuli D	Comparison of methods to engage diverse stakeholder populations in prioritizing PrEP implementation strategies for testing in resource-limited settings: a cross-sectional study.	Implementation Science Communications	-	-	-	2662-2211	10.1186/s43058-023-00457-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10337117	BACKGROUND: There is a lack of consensus about how to prioritize potential implementation strategies for HIV pre-exposure prophylaxis (PrEP) delivery. We compared several prioritization methods for their agreement and pragmatism in practice in a resource-limited setting. METHODS: We engaged diverse stakeholders with clinical PrEP delivery and PrEP decision-making experience across 55 facilities in Kenya to prioritize 16 PrEP delivery strategies. We compared four strategy prioritization methods: (1) "past experience surveys" with experienced practitioners reflecting on implementation experience (N = 182); (2 and 3) "pre- and post-small-group ranking" surveys before and after group discussion (N = 44 and 40); (4) "go-zone" quadrant plots of perceived effectiveness vs feasibility. Kendall's correlation analysis was used to compare strategy prioritization using the four methods. Additionally, participants were requested to group strategies into three bundles with up to four strategies/bundle by phone and online survey. RESULTS: The strategy ranking correlation was strongest between the pre- and post-small-group rankings (Tau: 0.648; p< 0.001). There was moderate correlation between go-zone plots and post-small-group rankings (Tau: 0.363; p = 0.079) and between past-experience surveys and post-small-group rankings (Tau: 0.385; p = 0.062). For strategy bundling, participants primarily chose bundles of strategies in the order in which they were listed, reflecting option ordering bias. Neither the phone nor online approach was effective in selecting strategy bundles. Participants agreed that the strategy ranking activities conducted during the workshop were useful in prioritizing a final set of strategies. CONCLUSIONS: Both experienced and inexperienced stakeholder participants' strategy rankings tended to prioritize strategies perceived as feasible. Small group discussions focused on feasibility and effectiveness revealed moderately different priorities than individual rankings. The strategy bundling approach, though less time- and resource-intensive, was not effective. Future research should further compare the relative effectiveness and pragmatism of methodologies to prioritize implementation strategies. Article	2023	Hicks, Sarah; Odhiambo, Ben; Abuna, Felix; Dettinger, Julia C; Ngumbau, Nancy; Gómez, Laurén; Sila, Joseph; Oketch, George; Sifuna, Enock; Weiner, Bryan J; John-Stewart, Grace; Kinuthia, John; Wagner, Anjuli D	Selecting implementation strategies to improve implementation of integrated PrEP for pregnant and postpartum populations in Kenya: a sequential explanatory mixed methods analysis	Implementation Science Communications	-	-	-	26622211	10.1186/s43058-023-00481-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85168323263&doi=10.1186%2fs43058-023-00481-9&partnerID=40&md5=8f0d05cf292bb26e6018b2cb043d5e35	Background: There is a higher risk for HIV acquisition during pregnancy and postpartum. Pre-exposure prophylaxis (PrEP) is recommended during this period for those at high risk of infection; integrated delivery in maternal and child health (MCH) clinics is feasible and acceptable but requires implementation optimization. Methods: The PrEP in Pregnancy, Accelerating Reach and Efficiency study (PrEPARE; NCT04712994) engaged stakeholders to prioritize determinants of PrEP delivery (using Likert scores) and prioritize PrEP delivery implementation strategies. Using a sequential explanatory mixed methods design, we conducted quantitative surveys with healthcare workers at 55 facilities in Western Kenya and a stakeholder workshop (including nurses, pharmacists, counselors, and county and national policymakers), yielding visual plots of stakeholders' perceived feasibility and effectiveness of the strategies. A stepwise elimination process was used to identify seven strategies for empirical testing. Facilitator debriefing reports from the workshop were used to qualitatively assess the decision-making process. Results: Among 146 healthcare workers, the strongest reported barriers to PrEP delivery were insufficient providers and inadequate training, insufficient space, and high volume of patients. Sixteen strategies were assessed, 14 of which were included in the final analysis. Among strategies ranked from 182 healthcare workers and 44 PrEP policymakers and implementers, seven strategies were eliminated based on low post-workshop ranking scores (bottom 50th percentile) or being perceived as low feasibility or low effectiveness for at least 50% of the workshop groups. The top seven strategies included delivering PrEP within MCH clinics instead of pharmacies, fast-tracking PrEP clients to reduce waiting time, delivering PrEP-related health talks in waiting bays, task shifting PrEP counseling, task shifting PrEP risk assessments, training different providers to deliver PrEP, and retraining providers on PrEP delivery. All top seven ranked strategies were grouped into bundles for subsequent testing. Facilitator debriefing reports generally aligned with rankings but noted how stakeholders' decision-making changed when considering the impact of strategies on facility staff and non-PrEP clients. Conclusions: The most impactful barriers to integrated PrEP delivery in MCH clinics were insufficient staffing and space. Implementation strategies prioritized through multiple methods of stakeholder input focused on co-location of services and increasing clinic efficiency. Future testing of these stakeholder-prioritized strategy bundles will be conducted to assess the effectiveness and implementation outcomes. © 2023, BioMed Central Ltd. Article	2023	Higgins D.M.; Riba A.; Alderton L.; Wendel K.A.; Scanlon J.; Weise J.; Gibson N.; Obafemi O.	Evaluation of the Impact and Outcomes of a Rapid Transition to Telehealth PrEP Delivery at a Sexual Health Clinic during the COVID-19 Pandemic	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001872	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176509097&doi=10.1097%2fOLQ.0000000000001872&partnerID=40&md5=18b8ad1759bb122627e7a4e6ee3bda76	Background Increasing human immunodeficiency virus (HIV) preexposure prophylaxis (PrEP) use is a critical part of ending the HIV epidemic. In response to the COVID-19 pandemic, many PrEP services transitioned to a telehealth model (telePrEP). This report evaluates the effect of COVID-19 and the addition of telePrEP on delivery of PrEP services at the Denver Sexual Health Clinic (DSHC), a regional sexual health clinic in Denver, CO. Methods Before COVID-19, DSHC PrEP services were offered exclusively in-clinic. In response to the pandemic, after March 15, 2020, most PrEP initiation and follow-up visits were converted to telePrEP. A retrospective analysis of DSHC PrEP visits compared pre-COVID-19 (September 1, 2019 to March 15, 2020) to post-COVID-19 (March 16, 2020 to September 30, 2020) visit volume, demographics, and outcomes. Results The DSHC completed 689 PrEP visits pre-COVID-19 and maintained 96.8% (n = 667) of this volume post-COVID-19. There were no differences in client demographics between pre-COVID-19 (n = 341) and post-COVID-19 PrEP start visits (n = 283) or between post-COVID-19 in-clinic (n = 140) vs telePrEP start visits (n = 143). There were no differences in 3- to 4-month retention rates pre-COVID-19 (n = 17/43) and post-COVID-19 (n = 21/43) (P = 0.52) or between in-clinic (n = 12/21) and telePrEP clients (n = 9/22) in the post-COVID-19 window (P = 0.37). Also, there were no significant differences in lab completion rates between in-clinic (n = 140/140) and telePrEP clients (n = 138/143) (P = 0.06) and prescription fill rates between in-clinic (n = 115/136) and telePrEP clients (n = 116/135) in the post-COVID-19 window (P = 0.86). Conclusions Implementation of TelePrEP enabled the DSHC to sustain PrEP services during the COVID-19 pandemic without significant differences in demographics, engagement, or retention in PrEP services. © Lippincott Williams & Wilkins. Article	2023	Hill M.; Smith J.; Elimam D.; Mustafaa G.; Wortley P.; Taylor B.; Harris O.	Ending the HIV epidemic PrEP equity recommendations from a rapid ethnographic assessment of multilevel PrEP use determinants among young Black gay and bisexual men in Atlanta, GA	PLOS One	-	-	-	19326203	10.1371/journal.pone.0283764	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151420093&doi=10.1371%2fjournal.pone.0283764&partnerID=40&md5=0196b5407ce424aa5e08266bb78bbc95	Background Efforts to mitigate HIV transmission among gay and bisexual men have not been sufficient to level persistent racial inequities which now extend to the use of daily oral pre-exposure prophylaxis (PrEP) for HIV prevention. Community-involved ethnographic research is crucial to galvanizing collaboration between patients, researchers, and policymakers to identify the social determinants of emerging PrEP inequities. In partnership with community key informants, we conducted a Rapid Ethnographic Assessment (REA) of multilevel PrEP use determinants among young Black gay and bisexual (YBGBM) men in the metropolitan Atlanta area to inform the development and coordination of local HIV programs. Methods In the assessment, we drew upon the perspectives of local clinicians, community-based organization leaders, health educators, and PrEP clients to identify barriers and facilitators to PrEP use among YBGBM through interviews (N = 23). Data were collected from September 2020 –to January 2021 and were analyzed through a staged deductive-inductive thematic analysis. The themes were later summarized and presented to community stakeholder participants to facilitate member-checking. Results Our analyses revealed structural, cultural, relationship, and developmental factors which shaped PrEP use. The most prominent being "ease of access to PrEP" (structural level), "provider support" (interpersonal), and "life-stage traits" (individual). Our results also contribute novel information concerning the axes of intersectional stigma (spatial, racial, sexual identity, and HIV) among YBGBM in Atlanta and its divergent effects on PrEP use. Conclusion Increased PrEP use among YBGBM, particularly among those living in the south, is essential to ending the domestic HIV epidemic. Altogether, our results emphasize the need for PrEP program modifications, which increase flexibility in methods and modes of access and are culturally adapted to the needs of YBGBM. There is also a need for resources that holistically focus on mental health, trauma, and racism as critical components of support. Copyright: © 2023 Hill et al. Article	2023	Hill M.J.; Heads A.M.; Suchting R.; Stotts A.L.	A survey with interventional components delivered on tablet devices versus usual care to increase pre-exposure prophylaxis uptake among cisgender Black women: a pilot randomized controlled trial	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-023-08019-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146918046&doi=10.1186%2fs12879-023-08019-z&partnerID=40&md5=fffd29f497d190b3a0a56a19de24c9cf	Background: Cisgender (cis) Black women in the USA are more likely to become HIV positive during their lifetime than other women. We developed and implemented a behavioral intervention, Increasing PrEP (iPrEP), the first pilot randomized controlled trial (RCT) aimed at motivating cis Black women to be willing to use PrEP for HIV prevention and attend an initial PrEP clinic visit following an emergency department visit. Methods: Eligible participants were Black cisgender women ages 18–55 years who acknowledged recent condomless sex and substance use. Participants were randomized to iPrEP or usual care (UC). iPrEP is a survey-based intervention designed to raise awareness and knowledge about PrEP. Participants completed an assessment of knowledge of and willingness to use PrEP before and after the intervention, then received a warm-hand off with referral to a local PrEP clinic. Enrolled participants were followed for 6 months. Results: Forty enrolled participants were ages 18–54 years. Education levels varied evenly between some high school education and graduate education. Most participants were single (n = 25) or married (n = 7). Twenty-two participants were employed full-time. Pre-test results indicated that 21 of 40 participants had heard of PrEP. All participants identified PrEP as a daily HIV prevention medication. For those randomized to iPrEP, the odds of knowing about PrEP at post-test, when controlling for baseline, were higher relative to UC (OR = 5.22, 95%CrI = 0.50, 94.1. iPrEP did not have any effect on willingness relative to UC. The estimate for iPrEP on willingness is marginally higher (4.16 vs. 4.04; i.e., 0.12 points higher); however, the posterior probability of 67.9% does not suggest a strong degree of evidence in favor of an effect. During the post-test, those receiving iPrEP were less ready to take PrEP than those receiving UC. Conclusions: Findings suggest that iPrEP increased knowledge about the PrEP medication but had a negative impact on readiness to take PrEP relative to UC. It is imperative that future research among cisgender Black women carefully considers the content provided in interventions designed to increase PrEP use, balancing the benefits of PrEP with the side effects and daily pill burden. Article	2023	Hill, Samantha V.; Sohail, Maira; Bhagat, Delima; Ball, Amy; Smith, Theolishia V.; Coyne-Beasley, Tamera; Simpson, Tina Y.; Elopre, Latesha; Matthews, Lynn T.	"Sex. Maybe We Should Do Things to be Healthy About It." Adolescent-Caregiver Discussions About Sex.	The Journal of Adolescent Health : Official Publication of the Society for Adolescent Medicine	-	-	-	-	1879-1972 1054-139X	10.1016/j.jadohealth.2022.12.021	https://pubmed.ncbi.nlm.nih.gov/36781324/	PURPOSE: Adolescents are disproportionately burdened with HIV. Numerous barriers limit adolescent pre-exposure prophylaxis (PrEP) use for HIV prevention. We explored adolescent-caregiver perspectives on discussing sexual health and PrEP to inform future caregiver interventions as a possible strategy to promote PrEP use. METHODS: We conducted separate in-depth interviews with adolescents aged 14-18 living in Alabama and their parent/guardian (caregiver). Interviews explored attitudes about sex, knowledge and attitudes about HIV prevention and PrEP, and attitudes about PrEP communication within adolescent-caregiver groups. Thematic analysis of adolescent and caregiver interviews was conducted independently and then triangulated to compare shared themes. RESULTS: Nine adolescents and seven caregivers contributed to five dyads and two triads. Adolescents had a median age of 16 years (range 14-18); five were girls (55%), and five were non-Hispanic Black (55%). Most caregivers were mothers (5, 71%), non-Hispanic Black (5, 71%), with a median age of 41 (36-56) years. All adolescents expressed willingness to involve their caregiver around PrEP use. Major themes included as follows: 1) caregiver efforts to overcome cultural taboos about sex and sexuality foster adolescents' willingness to talk with caregivers about sex; 2) evolving societal norms and reflections on their own upbringings motivate caregivers to discuss and support adolescents with sexual health; and 3) caregivers desire to engage in sexual health discussions with providers and support their teens with PrEP. DISCUSSION: As socio-cultural norms around sex evolve, adolescent-caregiver discussions about sexual health and PrEP may be an opportunity to increase PrEP use and reduce HIV infections among select adolescent sub-populations. Health Care Provider Decisions to Initiate Oral HIV Preexposure Prophylaxis in New York City Public Sexual Health Clinics	Sexually Transmitted Diseases	-	-	-	-	1485717	10.1097/OLQ.0000000000001782	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159569601&doi=10.1097%2fOLQ.0000000000001782&partnerID=40&md5=5b8247db693cb87391e808a5f9f5259e	Background Oral HIV preexposure prophylaxis (PrEP) is safe and effective but underutilized. Health care providers' beliefs about PrEP and attitudes toward people who could benefit may affect PrEP access. Methods This mixed-methods study (2016-2018) was conducted in 8 New York City public sexual health clinics that implemented a PrEP program. Data included 32 in-depth qualitative interviews with clinicians, quantitatively coded to reflect their PrEP beliefs; a provider questionnaire; and 6 months of medical record visit data for these providers. Among patients with a PrEP indication, we examined the odds of a patient being initiated on PrEP associated with providers' PrEP beliefs and demographic characteristics, and patient characteristics. Results Providers reported strong support for offering PrEP to eligible patients. The majority denied concerns about possible development of drug-resistant viral strains, giving PrEP to people who might not benefit, and PrEP toxicity. Nevertheless, about one-third agreed with each of these concerns, and 55% thought PrEP use might limit condom use. Of 2176 patients with a PrEP indication, 20% were initiated. Providers with more restrictive PrEP beliefs did not have lower odds of initiating patients on PrEP. Women as well as Black and Latinx patients were less likely to be initiated on PrEP. Conclusions Contrary to our hypotheses, providers' negative PrEP beliefs did not seem to reduce initiation of PrEP for eligible patients. This may be attributable to clear clinical protocols, strong staff support, and training on implementing PrEP in this setting. Racial and gender disparities in PrEP uptake urgently require attention. © Lippincott Williams & Wilkins. Article	2023	Hoffmann, Christian; Jessen, Heiko; Wyen, Christoph; Grunwald, Stephan; Noe, Sebastian; Teichmann, Jörn; Krauss, Anja-Sophie; Kolarikal, Henning; Scholten, Stefan; Schuler, Christoph; Bickel, Markus; Roll, Clemens; Kreckel, Peter; Köppe, Siegfried; Straub, Matthias; Klausen, Gerd; Lenz, Johannes; Esser, Stefan; Jensen, Björn; Rausch, Michael; Unger, Stefan; Pauli, Ramona; Härter, Georg; Müller, Matthias; Masuhr, Anja; Schäfer, Guido; Seybold, Ulrich; Schellberg, Sven; Schneider, Jochen; Monin, Malte Benedikt; Wolf, Eva; Spinner, Christoph D.; Boesecke, Christoph	Clinical characteristics of monkeypox virus infections among men with and without HIV: A large outbreak cohort in Germany.	HIV Medicine	-	-	-	-	1468-1293 1464-2662	10.1111/hiv.13378	https://onlinelibrary.wiley.com/doi/10.1111/hiv.13378	BACKGROUND: Since May 2022, increasing numbers of monkeypox virus (MPXV) infections have been reported from across Europe and North America. Studies, mainly from Africa, have suggested a higher risk for severe MPXV cases in people living with HIV. METHODS: This was a retrospective study of all confirmed MPXV infections observed in the participating centres since 19 May 2022. We conducted a chart review to evaluate clinical characteristics, comorbidities, and coinfections, including HIV, viral hepatitis, and sexually transmitted infections (STIs). RESULTS: By 30 June 2022, a total of 546 MPXV infections were reported from 42 German centres. All patients were men who have sex with men (MSM), of whom 256 (46.9%) were living with HIV, mostly with a preserved immune system and with viral suppression. In total, 232 (42.5%) MSM were also taking HIV pre-exposure prophylaxis (PrEP) and 58 (10.6%) MSM had no known HIV infection or PrEP use. The median age was 39 years (range 20-67), and comorbidities were rare. However, 52.4% and 29.4% of all patients had been diagnosed with at least one STI within the last 6 months or within the last 4 weeks, respectively. The most frequent localizations of MPXV infection were genital (49.9%) and anal (47.9%), whereas fever (53.2%) and lymphadenopathy (42.6%) were the most frequent general symptoms. The hospitalization rate was low (4.0%), and no fatal course was observed. The clinical picture showed no apparent differences between MSM with or without HIV. CONCLUSIONS: In this preliminary cohort analysis from a current large outbreak among MSM in Germany, the clinical picture of MPXV infection did not differ between MSM with and without HIV. Severe courses were rare and hospitalization rates were low. However, most patients were relatively healthy, and only a few people living with HIV were viremic or severely immunosuppressed. Article	2023	Hollcroft, Madison R; Gipson, June; Barnes, Alicia; Mena, Leandro; Dombrowski, Julia C; Ward, Lori M; Khosropour, Christine M	PrEP Acceptance among Eligible Patients Attending the Largest PrEP Clinic in Jackson, Mississippi	Journal of the International Association of Physicians in AIDS Care	-	-	-	-	23259574	10.1177/23259582231167959	https://www.proquest.com/scholarly-journals/prep-acceptance-among-eligible-patients-attending/docview/2920194372/se-2?accountid=8113	Compared to other states in the United States, Mississippi has the lowest uptake of PrEP relative to the number of people newly diagnosed with HIV in the state. Open Arms Healthcare Center is the largest provider of PrEP in Mississippi, and has systematically documented PrEP eligibility, offers, and acceptance (ie, agreed to undergo a clinical PrEP evaluation) from 2017 to mid-2020. In encounter-based analyses, we examined factors associated with PrEP acceptance. Among 721 encounters where patients were eligible for PrEP, staff offered PrEP at 680 (94%) of encounters (526 unique individuals); individuals accepted a PrEP offer at 58% of encounters. Accepting a PrEP offer was lowest (15.8%) among transgender/non-binary individuals and highest (93.3%) among individuals who reported having sex partners living with HIV. This clinic's model worked to offer PrEP to a highly impacted population, though there is a need to enhance PrEP acceptance for key groups such as transgender/non-binary individuals. Article	2023	Holt M.; Chan C.; Broady T.R.; MacGibbon J.; Mao L.; Smith A.K.J.; Rule J.; Bavinton B.R.	Variations in HIV Prevention Coverage in Subpopulations of Australian Gay and Bisexual Men, 2017–2021: Implications for Reducing Inequities in the Combination Prevention Era	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04172-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85172212186&doi=10.1007%2fs10461-023-04172-3&partnerID=40&md5=649d3e79acb530f170c9549ab4439566	Using repeated behavioural surveillance data collected from gay and bisexual men (GBM) across Australia, we assessed trends in HIV prevention coverage (the level of 'safe sex' achieved in the population by the use of effective prevention methods, including condoms, pre-exposure prophylaxis PrEP and having an undetectable viral load). We stratified these trends by age, country of birth/recency of arrival, sexual identity, and the proportion of gay residents in the participant's suburb. Among 25,865 participants with casual male partners, HIV prevention coverage increased from 69.8% in 2017 to 75.2% in 2021, lower than the UNAIDS target of 95%. Higher levels of coverage were achieved among older GBM (≥ 45 years), non-recently-arrived migrants, and in suburbs with ≥ 10% gay residents. The lowest levels of prevention coverage (and highest levels of HIV risk) were recorded among younger GBM (< 25 years) and bisexual and other-identified participants. Younger, recently-arrived, and bisexual GBM were the most likely to use condoms, while PrEP use was concentrated among gay men, 25–44-year-olds, and in suburbs with more gay residents. The use of undetectable viral load was most common among participants aged ≥ 45 years. Our analysis shows that high HIV prevention coverage can be achieved through a mixture of condom use, PrEP use, and undetectable viral load, or by emphasising PrEP use. In the Australian context, younger, bisexual and other-identified GBM should be prioritised for enhanced access to effective HIV prevention methods. We encourage other jurisdictions to assess the level of coverage achieved by combination prevention, and variations in uptake. © 2023, The Author(s). Article	2023	Holt, Martin; Chan, Curtis; Broady, Timothy R.; Mao, Limin; MacGibbon, James; Rule, John; Wilcock, Ben; Prestage, Garrett; Bavinton, Benjamin R.	Adjusting Behavioural Surveillance and Assessing Disparities in the Impact of COVID-19 on Gay and Bisexual Men's HIV-Related Behaviour in Australia.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-022-03788-1	https://link.springer.com/article/10.1007/s10461-022-03788-1	COVID-19 has disrupted sexual behaviour and access to health systems. We adapted regular HIV behavioural surveillance of gay and bisexual men (GBM) in Australia in response to COVID-19, assessed the impact on the profile of the sample, the participants' HIV-related behaviour, and whether COVID-19 may have accentuated existing disparities in the Australian HIV epidemic. Data collected from five states during July 2017-June 2021 were included (N = 31,460). The emphasis on online recruitment after COVID-19 led to smaller sample sizes, greater geographic reach, and a higher proportion of bisexual-identifying participants. Most participants (88.1%) reported physical distancing and 52.1% had fewer sex partners due to COVID-19. In the COVID-19-affected rounds (July 2020-June 2021), the number of male partners, recent HIV testing and pre-exposure prophylaxis (PrEP) use all fell, and HIV risk among the smaller group of participants who reported casual sex increased. COVID-related changes were generally more pronounced among GBM aged under 25 years, participants from suburbs with fewer gay residents, and bisexual men. These groups should be prioritised when encouraging GBM to reengage with HIV testing services and effective prevention methods, like condoms and PrEP. Article	2023	Hong C.; Huh D.; Schnall R.; Garofalo R.; Kuhns L.M.; Bruce J.; Batey D.S.; Radix A.; Belkind U.; Hidalgo M.A.; Hirshfield S.; Pearson C.R.	Changes in high-risk sexual behavior, HIV and other STI testing, and PrEP use during the COVID-19 pandemic in a longitudinal cohort of adolescent men who have sex with men 13 to 18 years old in the United States	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03850-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138764417&doi=10.1007%2fs10461-022-03850-y&partnerID=40&md5=117ddd28c5fcc53fb1603c4afbd7cd91	The COVID-19 pandemic has disrupted sexual health services among those most vulnerable to HIV acquisition, such as adolescent men who have sex with men (AMSM). We sought to characterize the changes in sexual-risk behaviors, HIV and other STI testing, and pre-exposure prophylaxis (PrEP) use among a longitudinal cohort of AMSM aged 13 to 18 years before and during the COVID-19 pandemic. We observed a significant decline in HIV testing and a marginal decrease in other STI testing since the pandemic began in March 2020. Outreach efforts and innovative remote delivery of sexual health services are needed to support access to healthcare services among AMSM as the pandemic persists. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.	adolescent MSM; condomless anal sex; coronavirus; health disparities; HIV prevention; prevalence rates; prospective analysis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Hong, Chenglin	Characterizing the Impact of the COVID-19 Pandemic on HIV PrEP care: A Review and Synthesis of the Literature	AIDS and Behavior	-	-	-	-	1090-7165	https://doi.org/10.1007/s10461-022-03941-w	https://escholarship.org/uc/item/3t45457k	The global COVID-19 pandemic and associated lockdown measures have caused disruptions to sexual health services and created additional barriers to the continuity of HIV pre-exposure prophylaxis (PrEP) among key populations. This review provides an examination of the influences of the pandemic on engagement in the PrEP care continuum. Using the PRISMA guideline, 46 studies were included in this review and the synthesis. Most of the studies were conducted in high-income settings through quantitative analysis. A majority of studies examining the changes in PrEP use suggested a decline or discontinuation in PrEP uptake during the pandemic. The most common reasons for stopping using PrEP were perceived barriers to PrEP-related care, pandemic-related behavior changes such as fewer sexual partners, and reduced perceived risk of HIV infection. Limited studies documenting an increase in PrEP uptake were all in specific PrEP optimizing programs. During the pandemic, there is also an emerging trend of switching to on-demand PrEP from daily oral PrEP. Future studies should understand the mechanism of strategies that facilitated the improvements during the pandemic. PrEP implementation programs should consider alternative PrEP modalities and provide consistent and comprehensive knowledge about correct information. Article	2023	Hong, Yangsun	Extending the Influence of Presumed Influence Hypothesis: Information Seeking and Prosocial Behaviors for HIV Prevention.	Health Communication	-	-	-	-	1532-7027	10.1080/10410236.2021.1975902	https://dx.doi.org/10.1080/10410236.2021.1975902	The influence of presumed influence hypothesis (IPI hypothesis) explains that people have biased perceptions of media influence and they change their behavior based on such perceptions. This study explicated the mechanisms of influence of presumed influence in health communication by integrating the theoretical explanations of the IPI hypothesis with theories of normative influence. The causal chains of the IPI hypothesis were examined using an experimental methodology with a HIV prevention, PrEP (pre-exposure prophylaxis). The results supported the expectations. Presumed exposure to health messages about PrEP shaped presumed influence of the messages on others, which in turn affected one's own intentions for information seeking and prosocial behaviors about PrEP. The findings also show that descriptive norms and injunctive norms interact with presumed influence differently. This study discusses the potential benefits of the IPI hypothesis in health communication. Article	2023	Hornuss, Daniel; Mathé, Philipp; Usadel, Susanne; Zimmermann, Stefan; Müller, Matthias; Rieg, Siegbert	Already current practice? A snapshot survey on doxycycline use for prevention of sexually transmitted infections in parts of the German MSM community.	Infection	-	-	-	-	1439-0973	10.1007/s15010-023-02086-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10665247	PURPOSE: Recent studies point toward a potential benefit of doxycycline use for post-exposure prophylaxis (PEP) or pre-exposure prophylaxis (PrEP) to prevent sexually transmitted infections (STIs). Although prescribing doxycycline in a prophylactic intention is not generally recommended yet, we noticed an increasing number of inquiries from individuals within the LGBTQ community for doxycycline prescriptions. METHODS: We conducted an anonymous online survey to evaluate the current extent of doxycycline use for PEP or PrEP within the LGBTQ community using REDCap electronic data capture tools. Participants gained access to the online survey through a QR code on posters in the premises of our STI outpatient department and at LGBTQ community-related events in the south-western region of Germany. Additional access was provided by a direct link shared on social media profiles for men having sex with men (MSM), transgender, and queers. RESULTS: 96 of 99 responses were eligible for analysis. Twenty-two participants (23%) indicated to have already used doxycycline for PEP and six participants (6%) used doxycycline for PrEP. The majority of participants used pills left over from previous doxycycline treatment. Forty percent of indicated modes of access were without a regular prescription, e.g., by provision from acquaintances (with or without healthcare profession) or by ordering online. CONCLUSION: Our study shows that the concept of doxycycline use for prevention of STIs is already well known and applied in the LGBTQ community. Further analysis, especially modeling studies, are needed to evaluate strategies aiming to reduce doxycycline intake (PEP/PrEP versus repeated targeted therapies) and improve sexual health outcomes within the community. Article	2023	Horvath K.J.; Ma J.; Storholm E.D.; Black A.; Klaphake J.; Baker J.V.	The Use of Daily and On-Demand Oral Pre-Exposure Prophylaxis Dosing Strategies Among Young Adult Gay, Bisexual and Other Men who have Sex with Men Enrolled in an mHealth Adherence Intervention	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04077-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159714924&doi=10.1007%2fs10461-023-04077-1&partnerID=40&md5=dc9d1537992d0ab40375e6ea96f8a393	Pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention option for gay, bisexual and other men who have sex with men (GBMSM). However, with newer PrEP options, a greater understanding of whether and why GBMSM switch dosing strategies is needed to inform clinical practice and research. We assessed the dosing strategies (daily or on-demand) of GBMSM enrolled in an mHealth PrEP adherence pilot intervention at four timepoints over approximately 10 months. Among GBMSM with complete data (n = 66), a consistent daily dosing strategy was used by most (73%) participants across all time points, while on-demand PrEP was used at least once during the study period by 27% of participants. A higher percentage of on-demand PrEP users self-reported as Asian/Pacific Islander and had less positive attitudes toward PrEP, adjusting for key sociodemographic variables and intervention arm. Daily PrEP users reported high numbers of sexual partners, and the primary reason that they would switch to on-demand PrEP is reduced sexual activity. At the final assessment, 75% of participants were taking daily PrEP, of whom 27% reported that they would like to switch to another option, including on-demand and long-acting injectable PrEP. While findings were largely descriptive, they showed that switches in PrEP dosing strategies are relatively common and PrEP strategy choice may vary across racial and ethnic groups. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Hsu J.-H.; Ku S.W.-W.; Chen T.-W.; Li C.-W.; Huang P.; Wu H.-J.; Bourne A.; Strong C.	Preferences for long-acting pre-exposure prophylaxis among gay, bisexual and other men who have sex with men in Taiwan: findings from the 2021 HEART Survey	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.26163	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169998921&doi=10.1002%2fjia2.26163&partnerID=40&md5=fde84ea87b70c0be49bc22b772d158be	Introduction: While various antiretrovirals have been studied as potential candidates for long-acting pre-exposure prophylaxis (PrEP), the bimonthly injectable cabotegravir—the first long-acting form of PrEP—was approved in 2021. Event-driven (ED) PrEP has been the most prevalent dosing regimen among gay, bisexual and other men who have sex with men (GBMSM) in Taiwan, providing a unique setting to observe the preferences for long-acting PrEP in a community where the daily regimen is not the mainstream method. This study aimed to determine the preferences for the different forms and dosing intervals of long-acting PrEP that are currently in the development pipeline. Methods: We conducted a survey in 2021 by convenience sampling the users of social networking applications for GBMSM in Taiwan. Our survey included questions on sexual behaviours, current PrEP regimens and the preferences for potential candidates of long-acting PrEP, such as implants, intramuscular and subcutaneous injections. We compared the Likert-scale preference ratings for potential long-acting options, and conducted logistic regression analysis to examine the factors associated with a preference for bimonthly intramuscular injections (2M IM) over ED and daily PrEP regimens, respectively. Results: A total of 1728 responses were eligible for analysis. Three percent of respondents (n = 52) were daily PrEP users; 11.5% (n = 198) were ED PrEP users. When not considering cost, current PrEP users—regardless of their original dosing regimen—were most likely to express preferences for monthly oral PrEP, followed by a 6-month subcutaneous injection (6M SC) and 2M IM. However, among non-current PrEP users, monthly oral PrEP was the most preferred form, followed by ED, daily oral and 6M SC injectable. Multivariable logistic regression revealed that current daily users, those willing to take PrEP in the next 6 months and those with more sex partners in the last 12 months had a significant correlation with preferences for the 2M IM injectable over the ED PrEP. Conclusions: The monthly oral form was the most preferable long-acting PrEP among GBMSM in Taiwan. Current daily PrEP users preferred the 2M IM injectable over the ED PrEP, which made the 2M IM injectable a potential alternative. Further studies should focus on how the cost and delivery affect PrEP preferences and their actual uptake. © 2023 The Authors. Article	2023	Huang P.	Sexual health as surplus: the marketization of PrEP in Taiwan	BioSocieties	-	-	-	-	17458552	10.1057/s41292-022-00273-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126145333&doi=10.1057%2fs41292-022-00273-9&partnerID=40&md5=2ea10da5bc4224952902a2c5a5a017ed	The global implementation of pre-exposure prophylaxis (PrEP)—a HIV prevention medicine—has evoked new hopes of ending AIDS. In 2016, a group of Taiwanese and Thai doctors and AIDS advocates initiated a PrEP delivery online platform to assist gay Taiwanese men to access the less expensive, generic versions of PrEP in Thailand. Drawing on science and technology studies, this article investigates how gay men's bodies and sexualities and PrEP's promise of ending AIDS become intertwined with the political and cultural economy of governmental regulation, pharmaceutical innovation, and personal mobility and pleasure. Building on the ethnographic fieldwork conducted in Taiwan and Thailand, it scrutinizes changing definitions of sexual health and surplus values of PrEP in two intertwined social settings: One is that of Taiwan's online PrEP delivery system, which mediated between the top-down biomedical regulation of the pharmaceutical industry and Taiwanese state, and the other one is the transnational commercial transitions, which mediated through commercial ventures and individual recreational and consumer activities. By moving across various social landscapes, the article not only acknowledges the constraints put upon the individual by processes of commodification but also recognizes the possibilities and potentialities that are enacted by laypersons' desires and migratory practices. © 2022, The Author(s), under exclusive licence to Springer Nature Limited. Article	2023	Huang Y.; Tian R.; Zhou Z.; Xu J.; Agins B.; Zou H.; Chen Q.; Sun Z.; Zhong Q.; Ma Z.; Jiang H.	HIV Pre-Exposure Prophylaxis Use on a Global Scale Among Men Who Have Sex with Men: A Systematic Review and Meta-Analysis	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2022.0198	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152483307&doi=10.1089%2fapc.2022.0198&partnerID=40&md5=8e3a4a8f05ae1bf90ff39ab08d44c2c3	Knowledge of the proportion of Pre-Exposure Prophylaxis (PrEP) use among men who have sex with men (MSM) and the specific gaps in PrEP use can stimulate enhanced focus on HIV prevention policies and programs. To summarize the proportion of PrEP use and explore the temporal trend in the proportion of PrEP use and factors associated with PrEP use among MSM on a global scale, we searched PubMed, Embase, Web of Science Core Collection, and APA PsycINFO for studies reporting on the use of HIV PrEP among MSM before April 2022. Freeman-Tukey double arc-sine transformation and random-effects models were used to pool estimates. A total of 147 articles involving 395,218 MSM were included. The pooled proportions of PrEP use among MSM and PrEP-eligible MSM were 11.23% 95% confidence interval (CI): 9.71-12.84 and 16.04% (95% CI: 11.99-23.36), respectively. The proportion of PrEP use varied among countries with different support policies. β regressions with the logit link showed that the proportion of PrEP use has increased in recent years. Interrupted time series analyses further supported that the approval of PrEP use would decrease the number of new HIV diagnoses among MSM. The main factors associated with PrEP use include health insurance, having a regular medical provider, prior HIV testing, past use of PrEP or Post-Exposure Prophylaxis, social networks, and stigma. Although the proportion of PrEP use among MSM has remained low, it has increased in recent years. More studies are needed to explore the factors associated with PrEP use, especially for PrEP-eligible MSM in low- and middle-income countries. © Copyright 2023, Mary Ann Liebert, Inc., publishers 2023. Adults on pre-exposure prophylaxis (tenofovir-emtricitabine) have faster clearance of anti-HIV monoclonal antibody VRC01	Nature Communications	-	-	-	-	20411723	10.1038/s41467-023-43399-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177837729&doi=10.1038%2fs41467-023-43399-5&partnerID=40&md5=e8b03e65a6d0a0ad9b7586e7b3203dc4	Broadly neutralizing monoclonal antibodies (mAbs) are being developed for HIV-1 prevention. Hence, these mAbs and licensed oral pre-exposure prophylaxis (PrEP) (tenofovir-emtricitabine) can be concomitantly administered in clinical trials. In 48 US participants (men and transgender persons who have sex with men) who received the HIV-1 mAb VRC01 and remained HIV-free in an antibody-mediated-prevention trial (ClinicalTrials.gov #NCT02716675), we conduct a post-hoc analysis and find that VRC01 clearance is 0.08 L/day faster (p = 0.005), and dose-normalized area-under-the-curve of VRC01 serum concentration over-time is 0.29 day/mL lower (p < 0.001) in PrEP users (n = 24) vs. non-PrEP users (n = 24). Consequently, PrEP users are predicted to have 14% lower VRC01 neutralization-mediated prevention efficacy against circulating HIV-1 strains. VRC01 clearance is positively associated (r = 0.33, p = 0.03) with levels of serum intestinal Fatty Acid Binding protein (I-FABP), a marker of epithelial intestinal permeability, which is elevated upon starting PrEP (p = 0.04) and after months of self-reported use (p = 0.001). These findings have implications for the evaluation of future HIV-1 mAbs and postulate a potential mechanism for mAb clearance in the context of PrEP. © 2023, The Author(s). Article	2023	Hull, S; Alade, T; Moriarty, P; Scott, R; Sinks, H; Zack, J	The Association Between Medical Distrust and the Intention to Initiate Preexposure Prophylaxis (PrEP) in HIV-Seronegative Cisgender Women of Color Within the DC Area	OBSTETRICS AND GYNECOLOGY	-	-	-	-	0029-7844	10.1097/01.AOG.0000931088.65427.7d	https://www.ingentaconnect.com/content/wk/aog/2023/00000141/a00105s1/art00307	INTRODUCTION: Black cisgender women bear a disproportionate burden of the U.S. human immunodeficiency virus (HIV) epidemic, compared to women of other racial groups. Preexposure prophylaxis (PrEP) is a highly effective prevention tool. Evidence indicates that Black women are interested in initiating PrEP, but low utilization persists in this population. Historical mistreatment of women of color and the resulting distrust erect barriers to open communication and shared decision-making with health care providers. METHODS: Using an IRB-approved questionnaire, we surveyed 186 consenting adults (83% Black, 9% White, 3% American Indian/Alaskan Native, 4% Other), who were PrEP eligible, HIV seronegative, cisgender women, recruited from family planning and obstetrics and gynecology specialty clinics in Washington, DC. We tested the interaction of patient racial identification and group-based medical mistrust on intentions to use PrEP, as mediated by intentions to discuss PrEP with a health care provider during the imminent clinical interaction. RESULTS: Results indicate significant moderated mediation of the interaction between race and distrust on intention to initiate PrEP at 3 months (index −0.3093, SE 0.1886, 95% CI [−0.7455,−0.0122]) and 12 months (index −0.3248, SE 0.1987, 95% CI [−0.7827,−0.0040]) through anticipated discussion with a provider. CONCLUSION: When distrust is low, Black women had stronger intentions to utilize PrEP (relative to women of other racial groups). This was explained by stronger intentions to discuss PrEP with the provider during the clinical visit. This relationship was nonsignificant at moderate and high levels of distrust. These results underscore the critical importance of provider-initiated discussion of PrEP with women to improve health equity. Article	2023	Hull, Shawnika J; Duan, Xuejing; Brant, Ashley R; Peng Ye, Peggy; Lotke, Pamela S; Huang, Jim C; Coleman, Megan E; Nalls, Patricia; Scott, Rachel K	Understanding Psychosocial Determinants of PrEP Uptake Among Cisgender Women Experiencing Heightened HIV Risk: Implications for Multi-Level Communication Intervention	Health Communication	-	-	-	-	10410236	10.1080/10410236.2022.2145781	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142302913&doi=10.1080%2f10410236.2022.2145781&partnerID=40&md5=37997954cf311f2e9dac315d6ddcb193	Pre-exposure prophylaxis (PrEP) is a highly effective daily pill that decreases the likelihood of HIV acquisition by up to 92% among individuals at risk for HIV. PrEP can be discretely used, autonomously controlled, and in place at the time of risk exposure, making it an especially promising method for HIV prevention for cisgender women (CGW). But, PrEP is underutilized by CGW relative to the demonstrable need. We apply the Integrative Model of Behavioral Prediction to identify the critical psychosocial factors that shape CGW's intentions to use PrEP and their relevant underlying beliefs. We surveyed (N = 294) community- and clinic-recruited PrEP eligible CGW to understand the relative importance of attitudes, norms, and efficacy in shaping PrEP intentions. We utilized structural equation modeling to identify the relevant paths. We inspected the summary statistics in relation to three message three selection criteria. We identified beliefs that demonstrated (1) an association with intention, (2) substantial room to move the population, (3) practicality as a target for change through communication intervention. Results show that PrEP awareness was low. When women learned about PrEP, they voiced positive intentions to use it. There were significant and positive direct effects of SE (0.316***), attitudes (0.201**), and subjective norms (0.249***) on intention to initiate PrEP. We illustrate the strategic identification of beliefs within the relevant paths using the 3 belief selection criteria. We also discuss implications for social and structural communication interventions to support women's HIV prevention. © 2022 The Author(s). Published with license by Taylor & Francis Group, LLC. Article	2023	Hunter L.A.; Packel L.J.; Chitle P.; Beltran R.M.; Rafie S.; De Martini L.; Dong B.; Harris O.; Holloway I.W.; Ochoa A.M.; McCoy S.I.	Opportunities to Increase Access to HIV Prevention: Evaluating the Implementation of Pharmacist-Initiated Pre-exposure Prophylaxis in California	Open Forum Infectious Diseases	-	-	-	-	23288957	10.1093/ofid/ofad549	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178389919&doi=10.1093%2fofid%2fofad549&partnerID=40&md5=b2ac191b238f37de4db5bf6b140f2561	Background. Pharmacies are a promising setting through which to expand access to human immunodeficiency virus (HIV) prevention, including pre-exposure and post-exposure prophylaxis (PrEP and PEP, respectively). We aimed to evaluate and inform the implementation of California's Senate Bill 159 (2019), allowing pharmacists to independently prescribe PrEP and PEP. Methods. From October through December 2022, we conducted a cross-sectional study of 919 California pharmacists and pharmacy students, primarily recruited via the email listservs of professional organizations. Participants completed an online survey assessing the implementation of pharmacist-initiated PrEP/PEP, including knowledge, attitudes, practices, perceived barriers, and implementation preferences elicited through a discrete choice experiment. Results. Among 919 participants (84% practicing pharmacists, 43% in community pharmacies), 11% and 13% reported that pharmacists at their pharmacy initiate PrEP and PEP, respectively. Most believed that pharmacist-initiated PrEP/PEP is important (96%) and were willing to provide PrEP (81%); fewer (27%) had PrEP/PEP training. Common implementation barriers were lack of staff/time and payment for pharmacist services. Participants preferred PrEP implementation models with in-pharmacy rapid oral HIV testing and pharmacists specifically hired to provide PrEP services. Conclusions. Despite pharmacists' supportive attitudes, Senate Bill 159 implementation in California pharmacies remains limited, in part due to policy-level and organizational-level barriers. Ensuring PrEP/PEP-related payment for services and sufficient workforce capacity is key to leveraging pharmacists' role in HIV prevention. © The Author(s) 2023. Article	2023	Hurley E.A.; Mayatsa J.; Matovu J.K.B.; Schuetz N.; Wanyenze R.; Wagner G.; Goggin K.	Piloting Gain and Loss-Framed PrEP and Childbearing Messaging to Promote HIV Testing in Uganda: Perspectives from Couples and Providers	Journal of Health Communication	-	-	-	-	10810730	10.1080/10810730.2023.2251919	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85168856358&doi=10.1080%2f10810730.2023.2251919&partnerID=40&md5=b7799cec232d7adebcb1ee54f3fcb653	Fears of relationship dissolution and the inability to bear healthy children remain barriers to HIV testing in sub-Saharan Africa. Pre-exposure prophylaxis (PrEP) carries both clinical and symbolic benefits that counter these fears. We conducted a pilot messaging intervention through Uganda's assisted partner notification (APN) program, where providers assist HIV-positive index clients in notifying sexual partners and encourage testing. We randomized providers at three clinics to implement phone scripts over two months with (1) gain-framed or (2) loss-framed information about PrEP and childbearing; or (3) usual care. In 23 in-depth interviews with providers, index clients, and partners, five major themes emerged on intervention acceptability and feasibility: (1) value of PrEP and childbearing messaging in APN; (2) value of this messaging coming earlier in APN; (3) overall preference for gain-framed messages; (4) need to tailor timing of messaging; and (5) need for messaging outside of APN. Register data (109 index clients, 145 partners) indicated most index clients (95%) wanted their potential conception partners informed about PrEP. Preliminary trends suggest the intervention sites outperformed usual care in testing rates among potential conception partners. Messaging that highlights PrEP and safe childbearing may be a promising new communication strategy to promote HIV testing. ©, Copyright © Taylor & Francis Group, LLC. Article	2023	Hurwitz K.E.; Isehunwa O.O.; Hendrickson K.R.; Jaggernath M.; Kriel Y.; Smith P.M.; Mathenjwa M.; Bennett K.; Psaros C.; Baeten J.M.; Bangsberg D.R.; Haberer J.E.; Smit J.A.; Matthews L.T.	Adherence to daily, oral TDF/FTC PrEP during periconception among HIV-exposed South African women	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2023.1263422	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174635401&doi=10.3389%2ffrph.2023.1263422&partnerID=40&md5=d3fb757d9db1ea715734e9d04e464353	Background: Daily, oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) as pre-exposure prophylaxis (PrEP) reduces HIV acquisition for African women. Adherence is key to efficacy and patterns of adherence can be highly variable in real-world settings. Using group-based trajectory modeling (GBTM), we sought to identify distinct patterns of periconception PrEP adherence and evaluate potential baseline predictors of such adherence trajectories. Methods: We conducted a single-arm longitudinal study for women aged 18–35 years living in Durban, South Africa with personal or partner plans for pregnancy with a partner with HIV or of unknown serostatus. Participants were offered safer conception counseling, including daily oral PrEP; women who initiated PrEP were given a bottle with an electronic pillcap that recorded when device opens. Weekly adherence to daily PrEP was modeled using GBTM with a censored normal outcome distribution as a function of weeks since PrEP initiation. The number and functional form of the adherence trajectory groups were primarily selected based on Bayesian information criteria (BIC) and confirmed by mean estimated probabilities of group membership. A multivariable version of the selected model assessed baseline predictors of membership in adherence trajectory groups. Results: Overall mean (95% CI) adherence to PrEP was 63% (60%, 67%). We identified four groups of women with distinct patterns of adherence: (1) high (i.e., ≥6 doses per week) steady adherence throughout follow-up (22% of PrEP initiators); (2) moderate (i.e., 4–5 doses per week), but steady adherence (31%); (3) initially high, but consistently declining adherence (21%); and (4) initially moderate adherence, followed by a rapid decline and subsequent rebound (26%). In multivariable-adjusted analyses, older age was associated with membership in the high, steady adherence group as compared to the group identified with an adherence trajectory of initially high, then decline, and finally a rebound. Conclusions: GBTM is useful for exploring potential heterogeneity in longitudinal patterns of medication adherence. Although a large proportion of women in this study achieved high levels of adherence by electronic pillcap initially, far fewer women maintained these levels consistently. Knowledge of different adherence trajectories could be used to develop targeted strategies for optimizing HIV prevention during periconception. 2023 Hurwitz, Isehunwa, Hendrickson, Jaggernath, Kriel, Smith, Mathenjwa, Bennett, Psaros, Baeten, Bangsberg, Haberer, Smit and Matthews.	adherence; group-based trajectory modeling (GBTM); HIV prevention; oral pre-exposure prophylaxis (PrEP); periconception; women	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Huyst V.; Dewinter J.; Noens I.; Platteau T.; Tsoumanis A.	Measuring the prevalence of autistic traits in a cohort of adults living with HIV or taking HIV pre-exposure prophylaxis and mapping safer-sex barriers and facilitators: a study protocol	BMJ Open	-	-	-	-	20446055	10.1136/bmjopen-2023-075667	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173561810&doi=10.1136%2fbmjopen-2023-075667&partnerID=40&md5=0c9e8eff7430da5ad69ad24777fe1faf	Introduction Autistic individuals identify with a wider range of sexual orientations than non-autistic individuals, including higher rates of bisexual orientation in autistic men. Gay, bisexual and other men who have sex with men are at greater risk for HIV. Prevalence data of autistic traits in people living with HIV or using Pre-Exposure Prophylaxis (PrEP) for HIV are lacking so far. Such data, combined with insights in barriers and facilitators for safer sex in autistic people living with HIV or using PrEP, are a first step to improve health support for autistic people in HIV clinics. This support is crucial since autistic individuals have worse physical and mental health outcomes. The objective of this research is to determine the prevalence of autistic traits within the group of people living with HIV or using PrEP in Belgium and to describe specific facilitators and barriers for sexual safer behaviour in people living with HIV and PrEP users with autistic traits. Methods and analysis The research is a cross-sectional, observational and multicentre study with recruitment of individual participants. The research consists of two phases. In phase 1, adults coming for HIV/AIDS care or HIV PrEP in participating Belgian HIV Reference Centres will be invited to fill in the validated Autism Spectrum Quotient questionnaire. In phase 2, participants with a score above the predefined cut-off for autistic traits (>26), who agreed to be informed about this score, will be invited to complete an additional survey, inquiring facilitators and barriers for sexual safer behaviour. Ethics and dissemination of results Institutional Review Board Institute of Tropical Medicine Antwerp, 25 July 2022, REF 1601/22 and University Hospital of Antwerp, 12 September 2022, Project ID 3679: BUN B3002022000111. Study results will be published in peer-reviewed journals and presented to Belgian HIV Reference Centres and at conferences. © Author(s) (or their employer(s)) 2023. Re-use permitted under CC BY-NC. Article	2023	Ichite A.; Jean-Gilles M.; Rosenberg R.; Abbamonte J.; Dévieux J.G.	Assessing the Preliminary Efficacy of a Nonrandomized, Clinic-Based HIV Risk Reduction Pilot Intervention for PrEP-Initiated, Alcohol- and Other Drug-Using Women of Color in Miami, FL	Journal of Racial and Ethnic Health Disparities	-	-	-	-	21973792	10.1007/s40615-022-01482-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146343927&doi=10.1007%2fs40615-022-01482-5&partnerID=40&md5=6481162fa44d797df5326535fb0b51b6	In this paper, we assessed the preliminary efficacy and acceptability of a quasi-experimental, clinic-based sexual risk reduction pilot intervention for pre-exposure prophylaxis (PrEP)-initiated, alcohol- and other drug-using women of color and explored their self-reported barriers to, and facilitators of, PrEP use. Using a mixed methods design, analyses incorporated pre- and post-intervention study assessment data from 38 women and semi-structured process evaluations using a subsample of 25. The intervention administered over an 8-week period consisted of 4 one-on-one in person educational sessions, a process evaluation, and study assessments conducted at baseline and 3 and 6 months. Post intervention, statistically significant changes in sexual risk scores were not observed; however, we found significant decreases in alcohol use (Z = − 3.02, p =.003, η^2 =.41). Process evaluation data revealed interpersonal relationships as a key motivator for PrEP initiation as well as a prominent barrier to PrEP use; these relationships rarely facilitated adherence. Overall, women found the intervention to be acceptable and reported a wide range of benefits of participation—most notably its therapeutic benefits. Findings from this study provide preliminary evidence of the potential for the Talking PrEP with Women of Color intervention to improve risky behaviors, knowledge, and attitudes related to sexual risk taking. Furthermore, findings suggest that interventions to increase PrEP uptake and adherence in at-risk women may benefit from supporting them in accurately estimating their risk for HIV and increasing their sense of social support. © 2023, The Author(s). Article	2023	Íncera-Fernández D.; Román-González F.J.; Moreno-Guillén S.; Gámez-Guadix M.	Sexualized drug use, risky sexual behaviors, and prevention strategies among gay, bisexual, and other men who have sex with men	Drugs: Education, Prevention and Policy	-	-	-	-	9687637	10.1080/09687637.2023.2225245	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163713481&doi=10.1080%2f09687637.2023.2225245&partnerID=40&md5=29f22aa803f6b011d66134797008d752	Aims: This study aimed to analyze the prevalence of sexualized drug use (SDU) and determine its association with a comprehensive set of sociodemographic characteristics, risky sexual behaviors, prevention measures for human immunodeficiency virus (HIV) and other sexually transmitted infections (STI), and STI diagnosis in Spain. Methods: The sample consisted of 493 men who have sex with men between 18 and 78 years old (M age = 32.58, SD = 11.05). Findings: Approximately 37.9% of the participants had participated in SDU. Participants who practiced SDU were significantly more likely to be older and have more casual sexual partners and engage in less conventional sexual practices than those who did not. In addition, SDU was associated with less consistent condom use and greater use of Pre-Exposure Prophylaxis (PrEP) compared to participants who did not practice SDU. Finally, the STI diagnosis was also significantly related to SDU. However, when condom use and PrEP was included and controlled in the model along with STI diagnosis, SDU was no longer related to a higher likelihood of STI diagnosis. Conclusions: These results reveal the need to strengthen programs to foster risk-reduction behaviors and reduce the incidence of health implications associated with SDU. © 2023 Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Iqbal, Kashif; Dong, Xueyuan; Zhu, Weiming; Wiener, Jeffrey; Dominguez, Kenneth L.; Tanner, Mary R.; Kourtis, Athena P.; Singh, Sonia; Hoover, Karen W.	Decreased Human Immunodeficiency Virus Diagnosis Rates Among Black and Hispanic or Latino Men Who Have Sex With Men in US Jurisdictions Supported by the THRIVE Demonstration Project, 2014-2019.	Clinical Infectious Diseases	-	-	-	-	1537-6591 1058-4838	10.1093/cid/ciac774	https://academic.oup.com/cid/article/76/2/307/6702535	BACKGROUND: Black and Hispanic/Latino men who have sex with men (MSM) are disproportionately affected by human immunodeficiency virus (HIV). In the Targeted Highly Effective Interventions to Reverse the HIV Epidemic (THRIVE) demonstration project, 7 community collaboratives were developed to provide comprehensive HIV prevention services for these populations. METHODS: We analyzed National HIV Surveillance System data to determine the number of HIV diagnoses for each year from 2014 to 2019 among Black, Hispanic/Latino, and White MSM in 7 THRIVE-eligible Metropolitan Statistical Areas (MSAs) that were awarded funding and 12 THRIVE-eligible MSAs that were not awarded funding. We used generalized linear Poisson regression models to estimate adjusted estimated annual percentage changes (EAPCs) with 95% confidence intervals for HIV diagnosis rates controlling for HIV prevalence, viral suppression, HIV testing rates, preexposure prophylaxis (PrEP) prescription rates, poverty, education, and insurance status. RESULTS: We found larger estimated decreases in HIV diagnosis rates in THRIVE jurisdictions compared with non-THRIVE jurisdictions. The adjusted EAPC among Black MSM was -8.2 (-11.7 to -4.6) in THRIVE MSAs compared with -4.2 (-7.8 to -0.4) in non-THRIVE MSAs. The adjusted EAPC among Hispanic/Latino MSM was -8.6 (-12.2 to -4.8) in THRIVE MSAs compared with -2.6 (-5.1 to -0.1)in non-THRIVE MSAs. The adjusted EAPC among White MSM was -7.6 (-12.0 to -3.1) in THRIVE MSAs compared with 5.9 (1.8-10.1) in non-THRIVE MSAs. CONCLUSIONS: The THRIVE community collaborative model was associated with a decrease in HIV diagnoses among Black and Hispanic/Latino MSM. To achieve the goals of the US Ending the HIV Epidemic initiative, effective interventions aimed to increase PrEP use need to be focused on Black and Hispanic/Latino MSM. Article	2023	Irie W.C.; Mahone A.; Nakka R.; Ghebremichael M.	Factors Associated with Comfort Discussing PrEP with Healthcare Providers among Black Cisgender Women	Tropical Medicine and Infectious Disease	-	-	-	-	24146366	10.3390/tropicalmed8090436	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85172113179&doi=10.3390%2ftropicalmed8090436&partnerID=40&md5=e8f3fd57d7139d52bd75a6a136845e73	Preexposure prophylaxis (PrEP) for HIV prevention uptake remains low among Black cisgender women in the United States, despite their disproportionate HIV burden. This study aimed to examine factors associated with Black women's comfort discussing PrEP with healthcare providers and its link to their interest in PrEP use. A cross-sectional survey was conducted with a national sample of 315 Black cisgender women. Descriptive statistics and logistic regression models were utilized for data analysis. The results showed that 79% of Black women felt comfortable discussing PrEP with their healthcare provider. Age, recent healthcare provider visit, interest in PrEP, and positive social norms were associated with increased odds of comfort in discussing PrEP, while anticipated PrEP disapproval and stigma were associated with decreased odds. Older age was related to greater comfort, potentially due to increased familiarity and self-efficacy in discussing sexual health. Recent healthcare utilization indicated positive provider relationships, facilitating discussions about sexual health. Anticipating support from social networks positively influenced comfort levels. Conversely, PrEP-related stigma and anticipated disapproval were barriers to comfort. These findings highlight the importance of provider–patient communication and social support in facilitating PrEP engagement among Black cisgender women. Interventions should consider age-appropriate strategies and address structural and provider biases to improve PrEP discussions and promote HIV prevention. © 2023 by the authors. Article	2023	Irie, Whitney; Mahone, Anais; Nakka, Raja; Ghebremichael, Musie	Confidence in Ability to Communicate With Sexual Partners About PrEP Among Black Cisgender Women.	AIDS Education and Prevention	-	-	-	-	1943-2755 0899-9546	10.1521/aeap.2023.35.5.333	https://guilfordjournals.com/doi/10.1521/aeap.2023.35.5.333	This study explored the factors associated with Black women's confidence in their ability to engage male sexual partners in discussions about PrEP. Communication about PrEP with male partners is an important, yet minimally explored, outcome in PrEP research among Black women in heterosexual partnerships. Among 315 respondents, results show significant differences in anticipated stigma and interest in PrEP between a binary outcome variable being confident and not-confident discussing PrEP with sexual partners. Further, factors such as employment, worrying about HIV infection, interest in taking oral PrEP, subjective norms, injunctive norms, and descriptive norms were associated with Black women's higher odds of confidence in their ability to engage sexual partners about PrEP. Conversely, PrEP disapproval and stigma resulted in lower odds of Black women's confidence in their ability to engage sexual partners about PrEP. Results indicate the need for continued investigation of confidence and, relatedly, communication about PrEP among heterosexual couples and communitylevel interventions normalizing PrEP discussions and uptake. Article	2023	Isehunwa O.O.; Hill S.V.; Menninger A.T.; Hubner B.; Krakower D.; Long D.M.; Pratt M.C.; Clement M.E.; Van Wagoner N.; Lanzi R.G.; Simpson T.; Elopre L.; Matthews L.T.	A Multicomponent Intervention to Train and Support Family Medicine Providers to Promote Pre-exposure Prophylaxis (PrEP) for Adolescent Girls and Young Women in the Deep South: Protocol for the PrEP-Pro Study	JMIR Research Protocols	-	-	-	19290748	10.2196/44908	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151476116&doi=10.2196%2f44908&partnerID=40&md5=5680c31054c6cf13311a240144fc927a	Background: Pre-exposure prophylaxis (PrEP) is a highly effective biomedical prevention intervention and a major strategy for reducing the HIV burden in the United States. However, PrEP provision and uptake remain lower than estimated needs, and in ways that may exacerbate HIV disparities among Black adolescent girls and young women in the southern United States. Data suggest that gaps in provider knowledge of HIV epidemiology and PrEP and skills assessing sexual health practices are important barriers to provision and uptake, with limited evidence-based interventions to address these gaps. Objective: This paper describes the "PrEP-Pro" intervention, a multicomponent intervention to train and support family medicine (FM) trainees to promote PrEP for adolescent girls and young women in Alabama. Methods: The PrEP-Pro intervention comprises 3 main components guided by the Capability-Opportunity-Motivation-Behavior (COM-B) model for behavioral change and the Consolidated Framework for Implementation Research (CFIR): (1) provider HIV epidemiology and PrEP education, (2) sexual history taking, and (3) PrEP Champions. In phase 1, we will work with community advisory boards (providers and clients) and then conduct focus groups with FM trainees to adapt content to train FM residents on HIV epidemiology and PrEP and develop implementation strategies, including provider-facing tools and client-facing educational materials. In phase 2, we will pretest and then pilot-test the initially adapted PrEP-Pro intervention with FM trainees. FM trainees will complete baseline, 3-, and 6-month questionnaires post PrEP-Pro intervention. We will also conduct in-depth interviews (IDIs) with FM pilot participants, adolescent girls and young women who accessed care after the PrEP-Pro pilot, and key stakeholders. The primary outcomes are PrEP-Pro acceptability and feasibility, which would be assessed using validated instruments at months 3 (among pretest participants) and 6 (among pilot participants). Secondary outcomes will also be assessed, including PrEP knowledge, sexual history-taking attitudes and practices, PrEP prescriptions among adolescent girls and young women encounters, and sexually transmitted infections (STIs) and HIV testing among adolescent girls and young women encounters in 6 months. Results: Study results will be disseminated to practices, state health officials, and other key stakeholders to solicit feedback on implementation opportunities and challenges to inform a hybrid effectiveness implementation trial. Our results will also be presented at local and national conferences and submitted to peer-reviewed journals. Conclusions: As PrEP grows, there is a pressing need to train FM providers and develop appropriate, contextually relevant tools to support PrEP implementation. The PrEP-Pro intervention is a multicomponent intervention to train FM residents across Alabama on sexual history-taking, PrEP provision for adolescent girls and young women, and supporting practice-based PrEP Champions. The PrEP-Pro intervention is anticipated to increase PrEP prescriptions for adolescent girls and young women and expand comprehensive sexual and reproductive health care for adolescent girls and young women in rural and urban Alabama. © Oluwaseyi O Isehunwa, Samantha V Hill, Alex Tobias Menninger, Brook Hubner, Douglas Krakower, Dustin M Long, Madeline C Pratt, Meredith E Clement, Nicholas Van Wagoner, Robin Gaines Lanzi, Tina Simpson, Latesha Elopre, Lynn T Matthews.	adolescent girls and young women (AGYW); community; family medicine; family medicine trainees; HIV; pre-exposure prophylaxis (PrEP); PrEP Pro intervention; prevention; reproductive health; sexual health; teens; training; young women	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Ismail A.; Magni S.; Katahoire A.; Ayebare F.; Siu G.; Semitala F.; Kyambadde P.; Friedland B.; Jarrahian C.; Kilbourne-Brook M.	Exploring user and stakeholder perspectives from South Africa and Uganda to refine microarray patch development for HIV PrEP delivery and as a multipurpose prevention technology	PLOS One	-	-	-	19326203	10.1371/journal.pone.0290568	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169403545&doi=10.1371%2fjournal.pone.0290568&partnerID=40&md5=d4d6c65241b65f3d36559d2002c7e671	Background Oral HIV pre-exposure prophylaxis (PrEP) is highly effective, but alternative delivery options are needed to reach more users. Microarray patches (MAPs), a novel drug-delivery system containing micron-scale projections or "microneedles" that deliver drugs via skin, are being developed to deliver long-acting HIV PrEP and as a multipurpose prevention technology to protect from HIV and unintended pregnancy. We explored whether MAP technology could meet user and health system needs in two African countries. Methods Researchers in South Africa and Uganda conducted 27 focus group discussions, 76 mock-use exercises, and 31 key informant interviews to explore perceptions about MAPs and specific features such as MAP size, duration of protection, delivery indicator, and health system fit. Participants included young women and men from key populations and vulnerable groups at high risk of HIV and/or unintended pregnancy, including adolescent girls and young women; female sex workers and men who have sex with these women; and men who have sex with men. In Uganda, researchers also recruited young women and men from universities and the community as vulnerable groups. Key stakeholders included health care providers, sexual and reproductive health experts, policymakers, and youth activists. Qualitative data were transcribed, translated, coded, and analyzed to explore perspectives and preferences about MAPs. Survey responses after mock-use in Uganda were tabulated to assess satisfaction with MAP features and highlight areas for additional refinement. Results All groups expressed interest in MAP technology, reporting perceived advantages over other methods. Most participants preferred the smallest MAP size for ease of use and discreetness. Some would accept a larger MAP if it provided longer protection. Most preferred a protection duration of 1 to 3 months or longer; others preferred 1-week protection. Upper arm and thigh were the most preferred application sites. Up to 30 minutes of wear time was considered acceptable; some wanted longer to ensure the drug was fully delivered. Self-administration was valued by all groups; most preferred initial training by a provider. Conclusions Potential users and stakeholders showed strong interest in/acceptance of MAP technology, and their feedback identified key improvements for MAP design. If a MAP containing a high-potency antiretroviral or a MAP containing both an antiretroviral and hormonal contraceptive is developed, these products could improve acceptability/uptake of protection options in sub-Saharan Africa. © 2023 Ismail et al. Article	2023	Iwuji C.; Martin C.E.; Pillay D.; Shamu P.; Nzenze S.; Murire M.; Cox L.A.; Miners A.; Llewellyn C.; Mullick S.	Implementation preferences for the management of sexually transmitted infections in the South African health system: A discrete choice experiment	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2023-055816	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176379967&doi=10.1136%2fsextrans-2023-055816&partnerID=40&md5=034c6b488d8b29e7081a2a11dbbd637e	Objectives Despite strengthening HIV prevention with the introduction of pre-exposure prophylaxis (PrEP), STI services have remained relatively unchanged and the standard of care remains syndromic management. We used a discrete choice experiment to investigate service users' preferences for the diagnosis and treatment of STIs in South Africa. Methods Between 1 March 2021 and 20 April 2021, a cross-sectional online questionnaire hosted on REDCap was administered through access links sent to WhatsApp support groups for HIV PrEP users and attendees of two primary healthcare clinics and two mobile facilities in the Eastern Cape and Gauteng provinces aged between 18 and 49 years. Participants either self-completed the questionnaire or received support from a research assistant. We used a conditional logit model for the initial analysis and latent class model (LCM) to establish class memberships, with results displayed as ORs and probabilities. Results We enrolled 496 individuals; the majority were female (69%) and <30 years (74%). The LCM showed two distinct groups. The first group, comprising 68% of the participants, showed a strong preference for self-sampling compared with no sampling (OR 2.16, 95% CI 1.62 to 2.88). A clinic follow-up appointment for treatment was less preferable to same-day treatment (OR 0.78, 95% CI 0.63 to 0.95). Contact slip from index patient (OR 0.86, 95% CI 0.76 to 0.96) and healthcare professional (HCP)-initiated partner notification (OR 0.63, 95% CI 0.55 to 0.73) were both less preferable than expedited partner treatment (EPT). The second group included 32% of participants with a lower preference for self-sampling compared with no sampling (OR 0.65, 95% CI 0.41 to 1.04). There was no treatment option that was significantly different from the others; however, there was a strong preference for HCP-initiated partner notification to EPT (OR 1.53, 95% CI 1.10 to 2.12). Conclusions Our results suggest that service users preferred STI testing prior to treatment, with the majority preferring self-taken samples and receiving aetiology-based treatment on the same day. © Author(s) (or their employer(s)) 2024. Article	2023	Izadi L.H.; Mmeje O.; Drabo E.F.; Perin J.; Martin S.; Coleman J.S.	An effectiveness-implementation trial protocol to evaluate PrEP initiation among U.S. cisgender women using eHealth tools vs. standard care	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/frph.2023.1196392	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163622125&doi=10.3389%2ffrph.2023.1196392&partnerID=40&md5=f11622fc5bd7b40abdafb486b742b360	Background: The United States' (U.S.) initiative to End the HIV Epidemic aims to reduce new HIV infections in areas of high HIV prevalence. Despite national efforts to reduce HIV incidence, cisgender women continue to represent approximately one out of every five new HIV diagnoses in the U.S. Taking pre-exposure prophylaxis (PrEP) is an effective HIV prevention strategy; however, PrEP initiation among cisgender women is suboptimal, with only 10% of eligible women receiving PrEP prescriptions in 2019. Methods: We designed a trial to test the effectiveness of interventions to increase PrEP initiation, while evaluating the implementation strategy (hybrid type II trial) in seven obstetrics and gynecology (OB/GYN) clinics (two federally qualified health centers, three community-based, and two academic) in Baltimore, Maryland. A total of 42 OB/GYN providers will be enrolled and randomized (1:1:1) into one of three clinical trial arms (standard of care, patient-level intervention, or multi-level intervention). Eligible patients of enrolled providers will receive a sexual health questionnaire before their appointment through the electronic health record's (EHR) patient portal. The questionnaire will be scored in three tiers (low, moderate, and high) to assess HIV risk. Patients at low risk will be offered an HIV test only, while those who score medium or high risk will be included in the clinical trial and assigned to the clinical trial arm associated with their provider. Differences in PrEP initiation, our primary outcome, across the three arms will be analyzed using generalized linear mixed-effect models with logistic regression. We will adjust results for demographic differences observed between arms and examine PrEP initiation stratified by patient's and provider's race and ethnicity.Additionally, a comprehensive economic analysis for each intervention will be conducted. Discussion: We hypothesize that gathering information on sensitive sexual behaviors electronically, communicating HIV risk in an understandable and relatable format to patients and OB/GYN providers, and deploying EHR alerts will increase PrEP initiation and HIV testing. Trial Registration: The trial is registered with ClinicalTrials.gov (NCT05412433) on 09 June 2022. https://clinicaltrials.gov/ct2/show/NCT05412433?term=NCT05412433&draw=2&rank=1. 2023 Izadi, Mmeje, Drabo, Perin, Martin and Coleman.	cisgender women; digital health; EHR intervention; ending the HIV epidemic (EHE); HIV prevention; pre-exposure prophylaxis (PrEP)	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Jackson K.J.; Chitle P.; McCoy S.I.; White D.A.E.	A Systematic Review of HIV Pre-exposure Prophylaxis (PrEP) Implementation in U.S. Emergency Departments: Patient Screening, Prescribing, and Linkage to Care	Journal of Community Health	-	-	-	945145	10.1007/s10900-023-01320-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180263288&doi=10.1007%2fs10900-023-01320-7&partnerID=40&md5=43e9aeb2c6f714a53630b5afbe8770ca	In the pursuit of ending the HIV epidemic, U.S. emergency departments (EDs) have emerged as a valuable setting to increase HIV testing and linkage to care. There is limited data available, however, describing the incorporation of HIV prevention initiatives in U.S. EDs. Over the last decade, HIV pre-exposure prophylaxis (PrEP) has significantly changed the HIV prevention landscape globally and very little is known about the provision of PrEP in U.S. EDs. To address this gap in the literature, we conducted a systematic review of peer-reviewed quantitative studies and conference abstracts spanning July 2012 - October 2022. Of 433 citations, 11 articles and 13 abstracts met our inclusion criteria, representing 18 unique studies addressing PrEP screening, prescribing, and/or linkage to PrEP care. Most studies describe screening processes to identify PrEP-eligible patients (n = 17); most studies leveraged a patient's STI history as initial PrEP eligibility screening criteria. Fewer studies describe PrEP prescribing (n = 2) and/or linkage to PrEP care (n = 8). Findings from this systematic review highlight the potential for U.S. EDs to increase PrEP uptake among individuals at risk for HIV infection. Despite a growing number of studies exploring processes for incorporating PrEP into the ED setting, such studies are small-scale and time limited. Models providing prescribing PrEP in the ED show higher initiation rates than post-discharge engagement models. Electronic health record (EHR)-based HIV screening is valuable, but post-ED linkage rates are low. Our findings emphasize the need to establish best practices for initiating and supporting prevention effective PrEP use in the ED setting. © 2023, The Author(s). Article	2023	JadKarim, Luzan; Wickersham, Jeffrey; Gautam, Kamal; Azwa, Iskandar; Saifi, Rumana; Khati, Antoine; Paudel, Kiran; Ha, Toan; Shrestha, Roman	Correlates of never testing for HIV among men who have sex with men in Malaysia: A cross-sectional study.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0294937	https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0294937	INTRODUCTION: HIV testing uptake remains very low among men who have sex with men (MSM) in Malaysia, a subgroup still bearing a disproportionate HIV burden. Therefore, we sought to identify and measure factors associated with never-testing for HIV among Malaysian MSM to further characterize this subgroup and inform future public health interventions addressing low testing rates in the country. METHODS: We conducted a cross-sectional online survey among Malaysian MSM (August to September 2021). Participants completed questionnaires, including socio-demographic characteristics, HIV/STI testing practices, drug- and sex-related behaviors, and knowledge and attitudes toward HIV prevention services. Out of 1,799 completed surveys, 870 were included in the analysis after eliminating duplicates and incomplete surveys. We used logistic regression to determine factors associated with never-testing for HIV. RESULTS: Overall, one-third of the study participants (33.8%) reported having never tested for HIV. Of those who reported to have tested for HIV (n = 576), half reported that they had tested for HIV in the past 6 months (50.3%). In multivariable logistic regression, MSM with HIV sero-concordant partner (aOR = 3.44, 95% CI = 1.56-7.60), without a prior diagnosis of a sexually transmitted infection (aOR = 2.83, 95% CI = 1.46-5.49), unaware of pre-exposure prophylaxis (PrEP; aOR = 2.71, 95% CI = 1.74-4.21), unaware of someone taking PrEP (aOR = 1.64, 95% CI = 1.15-2.35), and unwilling to use PrEP (aOR = 2.48, 95% CI = 1.43-4.30) had higher odds of never been tested for HIV. In contrast, MSM who were older (aOR = 0.95, 95% CI = 0.93-0.97) and of the Malaya ethnic group (aOR = 0.59, 95% CI = 0.37-0.95) had lower odds of never testing for HIV. CONCLUSION: Our findings shed light on the characteristics of HIV never-testers among MSM in Malaysia. The results indicate the need for innovative strategies to increase the uptake of HIV testing services among members of the MSM community. Article	2023	Jaiswal, Jessica; Griffin, Marybec; LoSchiavo, Caleb; Cox, Amanda; Hascher, Kevin; Dunlap, Kandyce; Walters, Suzan; Burton, Wanda M.; Grin, Benjamin; Mumba, Mercy; Eaton, Ellen	Challenges to Providing Integrated HIV Prevention in Substance Use Treatment Settings: Frontline Staff Perspectives on HIV and Sex-Related, Education, Communication and Stigma.	Substance Use and Misuse	-	-	-	1532-2491 1082-6084	10.1080/10826084.2023.2257308	https://www.tandfonline.com/doi/full/10.1080/10826084.2023.2257308	INTRODUCTION: Substance use treatment settings can play a critical role in ending the HIV epidemic. Community-based methadone clinics are potentially useful sites to offer biomedical HIV prevention, but little is known about how clinicians and other clinic staff communicate with patients about sexual behavior and HIV-related topics. METHODS: Thirty semi-structured interviews were conducted at two methadone clinics in Northern New Jersey. Participants included medical providers (physicians, RNs, DNPs), methadone counselors, intake coordinators, lab technicians, and other auxiliary staff members. Results: Three major themes were identified: (1) HIV education is primarily provided by external organizations, (2) there is limited staff-patient communication around HIV and sexual behaviors, and (3) HIV stigma is prevalent among staff and patients. CONCLUSION: To implement PrEP in methadone treatment settings, clinic staff must be able to engage in non-judgmental communication about HIV and sex with patients. Additionally, federal and state funding for HIV prevention in substance use treatment settings must be prioritized to enable clinics to access the necessary training and resources. Article	2023	Jalil, Emilia Moreira	A Peer-Led Digital Intervention to Reduce HIV Prevention and Care Disparities Among Young Brazilian Transgender Women (The BeT Study): Protocol for an Intervention Study	JMIR Res Protoc	-	-	-	NA	10.2196/44157	https://pubmed.ncbi.nlm.nih.gov/36735296/	Background: The HIV epidemic continues to disproportionately burden marginalized populations despite the availability of effective preventive and therapeutic interventions. Transgender women are severely affected by HIV worldwide including in Brazil and other low- and middle-income countries, with evidence of increasing new infections among young people. There is an urgent need for youth-specific HIV prevention and care interventions for young transgender women in Brazil. Objective: This study aims to (1) address stigma in the Brazilian public health system and (2) reduce barriers to HIV care and prevention with systems navigation among young transgender women aged 18-24 years in Rio de Janeiro, Brazil. Methods: The Brilhar e Transcender (BeT) study is a status-neutral, peer-led, single-arm digital intervention study enrolling 150 young transgender women in Rio de Janeiro, Brazil. The intervention was pilot tested and refined using data from a formative phase. The BeT intervention takes place over 3 months, is delivered remotely via mobile phone and in person by peers, and comprises three components: (1) BeT sessions, (2) digital interactions, and (3) automated messages. Eligibility criteria include identifying as transgender women, being aged 18-24 years, speaking in Portuguese, and living in the Rio de Janeiro metropolitan area in Brazil. The primary outcomes are HIV incidence, pre-exposure prophylaxis uptake, linkage to HIV care, and viral suppression. Primary outcomes were assessed at baseline and quarterly for 12 months. Participants respond to interviewer-based surveys and receive tests for HIV and sexually transmitted infections. Results: The study has been approved by the Brazilian and the US local institutional review boards in accordance with all applicable regulations. Study recruitment began in February 2022 and was completed in early July 2022. Plans are to complete the follow-up assessment of study participants on July 2023, analyze the study data, and disseminate intervention results by December 2023. Conclusions: Interventions to engage a new generation of transgender women in HIV prevention and care are needed to curb the epidemic. The BeT study will evaluate a digital peer-led intervention for young transgender women in Brazil, which builds on ways young people engage in systems and uses peer-led support to empower transgender youth in self-care and health promotion. A promising evaluation of the BeT intervention may lead to the availability of this rapidly scalable status-neutral HIV intervention that can be translated throughout Brazil and other low- and middle-income countries for young transgender women at high risk of or living with HIV. Article	2023	Jansen van Vuuren C.J.; Lewis L.; Harkoo I.; Dawood H.; Mansoor L.E.	Experience with Contraceptive Dosage Forms and Interest in Novel PrEP Technologies in Women	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04072-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160249251&doi=10.1007%2fs10461-023-04072-6&partnerID=40&md5=1dc171002d9dc454c8842e7b4dfad195	New pre-exposure prophylaxis (PrEP) strategies tailored to the needs and expectations of individuals at risk of HIV acquisition are needed. In the CAPRISA 082 prospective cohort study in KwaZulu-Natal, South Africa, sexually active women aged 18 to 30 reported, through interviewer-administered questionnaires, on their prior contraceptive experience and interest in both approved and potential future PrEP dosage forms (oral PrEP, long-acting injectable PrEP, and PrEP implants) between March 2016 and February 2018. Univariable and multivariable Poisson regression models with robust standard errors were used to detect associations between women's prior and current contraceptive use and interest in PrEP options. Of 425 women enrolled, 381 (89.6%) had used at least one modern female contraceptive method previously, with injectable depot medroxyprogesterone acetate (DMPA) being used by 79.8% (n = 339). Women were more likely to show interest in a future PrEP implant if they were currently using (aRR 2.1, CI 1.43–3.07, p = 0.0001) or had ever used (aRR 1.65, CI 1.14–2.40, p = 0.0087) a contraceptive implant, and were more likely to choose an implant as their first choice method than the implant-naïve (current users aRR 3.2, CI 1.79–5.73, p < 0.0001; "ever" users aRR 2.12, CI 1.16–3.86, p = 0.0142). Women were more interested in injectable PrEP if they had used injectable contraceptives (current users aRR 1.24, CI 1.06–1.46, p = 0.0088; "ever" users aRR 1.72, CI 1.20–2.48, p = 0.0033); and were more interested in oral PrEP if they had ever used oral contraceptives (aRR 1.3, CI 1.06–1.59, p = 0.0114). This apparent relationship between women's contraceptive experience and their interest in novel forms of PrEP in an equivalent dosage form may play a future role in strengthening HIV prevention efforts in women at high risk of HIV acquisition. © 2023, The Author(s). Article	2023	Jaramillo, Jahn; Reyes, Nequiel; Atuluru, Pranusha; Payen, Naomie; Taylor, Kayla; Safren, Steven A; Saber, Rana; Harkness, Audrey	Peer ambassador stories: formative qualitative research to enhance the reach of PrEP, HIV testing, and behavioral health treatments to LMSM in South Florida	AIDS Care	-	-	-	9540121	10.1080/09540121.2023.2287736	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181470102&doi=10.1080%2f09540121.2023.2287736&partnerID=40&md5=a4b7c2093121f769d6a8f4582a71704e	Existing HIV prevention interventions, such as pre-exposure prophylaxis (PrEP), and behavioral health treatments inadequately reach Latino men who have sex with men (LMSM) in the US. This study involved formative research to inform the content, design, and implementation of a scalable, low resource implementation strategy–peer ambassador stories–stories from peers to normalize using PrEP, HIV testing, and behavioral health treatment. We conducted semi-structured interviews with 20 LMSM to elucidate their content, design, and implementation preferences for peer ambassador stories. Men were asked about story prompts, story contributor characteristics, story platform features, design preferences, and recommendations for enhancing the adoption and use of the peer ambassador technology platform among LMSM. Interviews were transcribed and analyzed via rapid qualitative analysis. Qualitative analyses identified 14 themes within 4 pre-specified domains. Collectively, the themes unified around the central concept that technology-delivered peer ambassador stories require a personalized, relational, culturally relevant touch to be acceptable and appropriate for LMSM. This study suggests that disseminating peer ambassador stories using electronic platforms and audio/video formats may enhance the reach of services and if they are personalized, relational, and culturally relevant. Findings have broad implications for informing other peer-based strategies to mitigate HIV disparities among LMSM. © 2023 Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Jenkins, Sarah Y; Resar, Danielle; Panos, Zachary; Staple, Alan; Watkins, Melynda; Ripin, David; Amole, Carolyn	Securing accelerated access to long-acting injectable cabotegravir for HIV prevention in low- and middle-income countries	Journal of the International AIDS Society	-	-	-	NA	10.1002/jia2.26101	https://www.proquest.com/scholarly-journals/securing-accelerated-access-long-acting/docview/2836191198/se-2?accountid=8113	IntroductionReductions in HIV acquisition have slowed, and the global community is significantly off track from global goals. Oral pre-exposure prophylaxis (PrEP) alone cannot address the diverse needs of the millions of people at risk of HIV acquisition. Long-acting injectable cabotegravir (CAB-LA) received United States Food and Drug Administration approval for HIV prevention in December 2021. When studied, CAB-LA demonstrated high effectiveness, provides months of protection versus daily use, is preferred by some users and has the potential to achieve commodity cost reduction. These factors position CAB-LA to catalyse transformation in HIV prevention. Significant work must be undertaken to ensure at-scale uptake in low- and middle-income countries. Leveraging decades of product introduction experience, Clinton Health Access Initiative (CHAI) has developed an innovative roadmap to support equitable CAB-LA introduction, comprising tightly executed market-shaping, product development, regulatory, and programmatic and implementation action.DiscussionProven models exist (e.g. long-acting reversible contraceptives, paediatric tuberculosis treatment and antiretrovirals (ARVs), such as paediatric dolutegravir and tenofovir disoproxil fumarate, lamivudine, and dolutegravir) for partnership-driven, accelerated, impactful product introduction. Based on learnings from these models and needs in the prevention space, CHAI developed a roadmap to maximize the near-term impact of CAB-LA and accelerate the development of, access to and impact of quality-assured, low-cost generic CAB-LA. This roadmap is intended to inform introduction planning and investment decision-making across a range of stakeholders, including donors, governments, manufacturers and other partners working in the HIV prevention space. Elements include (1) ensuring coordination and alignment across partners, and avoiding redundancy experienced during oral PrEP introduction; (2) preparing national programmes and providing support to maximize impact, including the development of national policies, guidelines and introduction plans; system strengthening; quantification and procurement; and addressing evidence needs, among other areas; (3) supporting community engagement, ensuring that demand generation and delivery approaches are person-centred and community-led; (4) incentivizing generic product development through, for example, milestone-based commercialization incentives and product development cost-sharing; and (5) expediting regulatory reviews.ConclusionsAccelerating access to affordable, generic CAB-LA can transform progress towards HIV epidemic control. This vision of impact at scale in prevention is achievable, if informed by results-backed approaches to introduction. Article	2023	Jenkins, Wiley D.; Phillips, Gregory 2nd; Rodriguez, Christofer A.; White, Megan; Agosto, Stacy; Luckey, Georgia S.	Behaviors associated with HIV transmission risk among rural sexual and gender minority and majority residents.	AIDS Care	-	-	-	1360-0451 0954-0121	10.1080/09540121.2023.2179592	https://www.tandfonline.com/doi/full/10.1080/09540121.2023.2179592	Multiple rural states and communities experience elevated rates of human immunodeficiency virus (HIV), often associated with diminished healthcare access and increased drug use. Though a substantial proportion of rural populations are sexual and gender minorities (SGM), little is known of this group regarding substance use, healthcare utilization, and HIV transmission behaviors. During May-July 2021, we surveyed 398 individuals across 22 rural Illinois counties. Participants included cisgender heterosexual males (CHm) and females (CHf) (n = 110); cisgender non-heterosexual males and females (C-MSM and C-WSW; n = 264); and transgender individuals (TG; n = 24). C-MSM participants were more likely to report daily-to-weekly alcohol and illicit drug use prescription medication misuse (versus CHf; aOR = 5.64 2.37-13.41, 4.42 1.56-12.53, and 29.13 3.80-223.20, respectively), and C-MSM participants more frequently reported traveling to meet with romantic/sex partners. Further, more C-MSM and TG than C-WSW reported healthcare avoidance and denial due to their orientation/identity (p < 0.001 and p = 0.011, respectively); 47.6% of C-MSM and 58.3% of TG had not informed their provider about their orientation/identity; and only 8.6% of C-MSM reported ever receiving a pre-exposure prophylaxis (PrEP) recommendation. More work is needed to explore the substance use and sexual behaviors of rural SGM, as well as their healthcare interactions, to better target health and PrEP engagement campaigns. Article	2023	Jennings Mayo-Wilson, Larissa; Peterson, Summer K.; Kiyingi, Joshua; Nabunya, Proscovia; Sensoy Bahar, Ozge; Yang, Lyla S.; Witte, Susan S.; Ssewamala, Fred M.	Examining Cash Expenditures and Associated HIV-Related Behaviors Using Financial Diaries in Women Employed by Sex Work in Rural Uganda: Findings from the Kyaterekera Study.	International Journal of Environmental Research and Public Health	-	-	-	1660-4601 1661-7827	10.3390/ijerph20095612	https://www.mdpi.com/1660-4601/20/9/5612	BACKGROUND: Women employed by sex work (WESW) have a high risk of human immunodeficiency virus (HIV) infection and experience economic barriers in accessing care. However, few studies have described their financial lives and the relationship between expenditures and HIV-related behaviors. METHODS: This exploratory study used financial diaries to collect expenditure and income data from WESW in Uganda over 6 months. Data were collected as part of a larger trial that tested the efficacy of an HIV prevention intervention method. Descriptive statistics were used to quantify women's income, relative expenditures, and negative cash balances. Bivariate and multivariate logistic regressions were used to examine the odds of sexual risk behavior or use of HIV medications for several cash scenarios. RESULTS: A total of 163 WESW were enrolled; the participants mean age was 32 years old. Sex work was the sole source of employment for most WESW (99%); their average monthly income was $62.32. Food accounted for the highest proportion of spending (44%) followed by sex work (20%) and housing expenditures (11%). WESW spent the least on health care (5%). Expenditures accounted for a large but variable proportion of these women's income (56% to 101%). Most WESW (74%) experienced a negative cash balance. Some also reported high sex work (28%), health care (24%), and education (28%) costs. The prevalence of condomless sex (77%) and sex with drugs/alcohol (70%) was high compared to use of ART/PrEP (Antiretroviral therapy/Pre-exposure prophylaxis) medications (45%). Women's cash expenditures were not statistically significantly associated with HIV-related behaviors. However, the exploratory study observed a consistent null trend of lower odds of condomless sex (adjusted odds ratio (AOR) = 0.70, 95% confidence interval (CI): 0.28-1.70), sex with drugs/alcohol (AOR = 0.93, 95% CI: 0.42-2.05), and use of ART/PrEP (AOR = 0.80, 95% CI: 0.39-1.67) among women who experienced a negative cash balance versus those who did not. Similar trends were observed for other cash scenarios. CONCLUSION: Financial diaries are a feasible tool to assess the economic lives of vulnerable women. Despite having paid work, most WESW encountered a myriad of financial challenges with limited spending on HIV prevention. Financial protections and additional income-generating activities may improve their status. More robust research is needed to understand the potentially complex relationship between income, expenditures, and HIV risk among vulnerable sex workers. Article	2023	Jennings Mayo-Wilson, Larissa; Yen, Bing-Jie; Nabunya, Proscovia; Bahar, Ozge Sensoy; Wright, Brittanni N.; Kiyingi, Joshua; Filippone, Prema L.; Mwebembezi, Abel; Kagaayi, Joseph; Tozan, Yesim; Nabayinda, Josephine; Witte, Susan S.; Ssewamala, Fred M.	Economic Abuse and Care-seeking Practices for HIV and Financial Support Services in Women Employed by Sex Work: A Cross-Sectional Baseline Assessment of a Clinical Trial Cohort in Uganda.	Journal of Interpersonal Violence	-	-	-	1552-6518 0886-2605	10.1177/08862605221093680	https://journals.sagepub.com/doi/10.1177/08862605221093680	Economic hardship is a driver of entry into sex work, which is associated with high HIV risk. Yet, little is known about economic abuse in women employed by sex work (WESW) and its relationship to uptake of HIV prevention and financial support services. This study used cross-sectional baseline data from a multisite, longitudinal clinical trial that tests the efficacy of adding economic empowerment to traditional HIV risk reduction education on HIV incidence in 542 WESW. Mixed effects logistic and linear regressions were used to examine associations in reported economic abuse by demographic characteristics, sexual behaviors, HIV care-seeking, and financial care-seeking. Mean age was 31.4 years. Most WESW were unmarried (74%) and had less than primary school education (64%). 48% had savings, and 72% had debt. 93% reported at least one economic abuse incident. Common incidents included being forced to ask for money (80%), having financial information kept from them (61%), and being forced to disclose how money was spent (56%). WESW also reported partners/relatives spending money needed for bills (45%), not paying bills (38%), threatening them to quit their job(s) (38%), and using physical violence when earning income (24%). Married/partnered WESW (OR = 2.68, 95% CI:1.60-4.48), those with debt (OR = 1.70, 95% CI:1.04-2.77), and those with sex-work bosses (OR = 1.90, 95% CI:1.07-3.38) had higher economic abuse. Condomless sex (β = +4.43, p < .05) was higher among WESW experiencing economic abuse, who also had lower odds of initiating PrEP (OR = .39, 95% CI:.17-.89). WESW experiencing economic abuse were also more likely to ask for cash among relatives (OR = 2.36, 95% CI:1.13-4.94) or banks (OR = 2.12, 95% CI:1.11-4.03). The high prevalence of HIV and economic abuse in WESW underscores the importance of integrating financial empowerment in HIV risk reduction interventions for WESW, including education about economic abuse and strategies to address it. Programs focusing on violence against women should also consider economic barriers to accessing HIV prevention services. Article	2023	Ji, Yadong	THE POWER OF "WE": USING INCLUSIVE PRONOUNS IN NORM-BASED MESSAGES TO PROMOTE PREP-RELATED INFORMATION SEEKING AMONG MEN WHO HAVE SEX WITH MEN	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2023.35.4.268	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166421557&doi=10.1521%2faeap.2023.35.4.268&partnerID=40&md5=d855a4ba89346f76ead72ade88542bc6	Pre-exposure prophylaxis (PrEP) is an effective medicine preventing HIV transmission. This study designs and tests normative messages that promote PrEP-related information seeking among men who have sex with men (MSM) (n = 410). Two factors were manipulated in normative messaging: type of norm (descriptive "people do" vs. injunctive "people should") and type of pronoun (individual "you" vs. collective "we"). The results favored the use of descriptive normative appeal and collective pronouns in normative message design. For health campaigns that target MSM's PrEP-related behaviors, this study suggests that descriptive norms may increase behavioral changes whereas injunctive norms may appear intrusive and backfire. At the same time, using inclusive agency assignment (e.g., pronouns) may encourage HIV prevention through provoking solidarity considerations. © 2023 The Guilford Press. Article	2023	Jin G.; Shi H.; Du J.; Guo H.; Yuan G.; Yang H.; Zhu Z.; Zhang J.; Zhang K.; Zhang X.; Lu X.; Xu W.; Wang S.; Hao J.; Sun Y.; Su P.; Zhang Z.	Pre-Exposure Prophylaxis Care Continuum for HIV Risk Populations: An Umbrella Review of Systematic Reviews and Meta-Analyses	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2023.0158	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179065655&doi=10.1089%2fapc.2023.0158&partnerID=40&md5=faa9305365b77e965f4d46e134bd9f5b	Pre-exposure prophylaxis (PrEP) is an effective biomedical strategy for HIV prevention. This umbrella review is aimed at providing a comprehensive summary of the current status of each stage of the PrEP care cascade. A systematic literature search was conducted in PubMed, Embase, and Cochrane. Additionally, a Measurement Tool to Assess Systematic Reviews 2 (AMSTAR-2) tool and Preferred Reporting Items for Systematic Review and Meta-Analysis (PRISMA) checklist were used to evaluate their methodological and reporting quality, respectively. A total of 30 systematic reviews met the inclusion criteria. According to the results of methodological quality assessment, 3 reviews were rated as low, while 27 as critically low. Furthermore, the results of the reporting quality evaluation revealed a mean score of 23.03 for the included reviews. Across all the reviews, awareness of PrEP was generally moderate in all populations, and the acceptability was even higher compared with awareness. Unfortunately, the PrEP uptake among different groups was even less optimal, although the adherence was almost above moderate, and several barriers that hindered the utilization of PrEP were identified, and the most common are as follows: cost, stigma, lack of knowledge, mistrust, low risk perception, and more. Although PrEP has proven to be an effective prevention method to date, the promotion of PrEP failed to achieve the anticipated outcome. To reinforce the generalization of and use of PrEP, and effectively control HIV transmission, it is urgent to identify the underlying causes of low uptake rates so that efficient interventions can be implemented. © Mary Ann Liebert, Inc. Theses and Dissertations	2023	Johansen, Marianne	HI-viruksen ehkäisy lääkkeellisin keinoin : sairaanhoitajan ammatillinen osaaminen	-	-	Theseus	-	NA	NA	http://www.theseus.fi/handle/10024/799164	The aim of this thesis was to produce PowerPoint -slideshow for nurse students about HIV (human immunodeficiency virus) and its medical prevention. The main subject was got to know prevention of HIV by medical means and to examine what nurse's expertise and skills are required during preventive medication. The thesis was carried out in co-operation with Tampere University of Applied Sciences. The data was collected mainly from the literature from the internet and through interview. A nurse from Tampere's University Hospital was interviewed for this study about Nurse's expertise and skills during preventive medication of HIV. The results of making this thesis were, that nurses need to have more education of HIV so they can reach out the patients who would benefit from pre-exposure prophylaxis medication. A nurse from Tampere's University Hospital who was interviewed for this thesis told that there are still prejudices towards people with HIV infection. That is also why nurses need to have more education about HIV and its medical prevention, so prejudices set by health care workers can decrease. Article	2023	John S.A.; Zapata J.P.; Dang M.; Pleuhs B.; O'Neil A.; Hirshfield S.; Walsh J.L.; Petroll A.E.; Quinn K.G.	Exploring preferences and decision-making about long-acting injectable HIV pre-exposure prophylaxis (PrEP) among young sexual minority men 17–24 years old	Scientific Reports	-	-	-	20452322	10.1038/s41598-023-32014-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151182091&doi=10.1038%2fs41598-023-32014-8&partnerID=40&md5=a90c26e1fc3887553cf2e056a4dac677	Intramuscular cabotegravir for long-acting injectable HIV pre-exposure prophylaxis (i.e., LAI-PrEP) was approved by the U.S. FDA in 2021. We sought to explore LAI-PrEP decision-making among a nationwide sample of young sexual minority men (YSMM) 17–24 years old. In 2020, HIV-negative/unknown YSMM (n = 41) who met CDC criteria for PrEP were recruited online to participate in synchronous online focus groups eliciting preferences and opinions about LAI-PrEP, as well as the impact of a potential self-administered option. Data were analyzed using inductive and deductive thematic analysis with constant comparison. Preferences and decision-making about LAI-PrEP varied widely among YSMM, with participants frequently comparing LAI-PrEP to oral PrEP regimens. We identified five key themes related to LAI-PrEP decision-making including concerns about adherence to PrEP dosing and clinic appointments, awareness and knowledge of PrEP safety and efficacy data, comfort with needles, minimizing PrEP stigma, and considerations of self-administration. YSMM acknowledged more PrEP options as beneficial to supporting uptake and persistence. © 2023, The Author(s). Article	2023	Johnson A.K.; Devlin S.; Haider S.; Oehler C.; Rivera J.; Alvarez I.; Ridgway J.	Evaluation of multiple data sources for predicting increased need for HIV prevention among cisgender women: understanding missed opportunities for Pre-exposure Prophylaxis (PrEP)	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-023-08719-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176134814&doi=10.1186%2fs12879-023-08719-6&partnerID=40&md5=cb27468174788e9ef532da3af54e0548	Background: Ciswomen constitute a disproportionately low percentage of pre-exposure prophylaxis for HIV prevention (PrEP) users compared to men. Despite PrEP's effectiveness, women are 5.25 times less likely to take PrEP than men. Identifying women who have increased reasons for HIV prevention and educating and offering PrEP to these women is crucial to reducing HIV transmission and overall health equity. However, the best method of identifying women at highest risk of acquiring HIV remains unknown. This study aimed to identify common HIV risk factors and data sources for identifying these common factors (e.g., electronic medical record data, open source neighborhood data), as well as potential intervention points and missed opportunities for PrEP linkage. Methods: We conducted an evaluation of multiple data sources: semi-structured qualitative interviews, electronic medical record (EMR) chart abstraction, and open source data abstraction. We accessed EMRs for enrolled participants and all participants signed a standard release of medical information (ROI) form for all institutions at which they had received medical care for the five-year period preceding their HIV diagnosis. Data were abstracted using a standardized procedure. Both structured and unstructured fields (i.e., narrative text of free notes) within the EMR were examined and included for analysis. Finally, open data sources (e.g., STI cases, HIV prevalence) were examined by community area of Chicago. Open data sources were used to examine several factors contributing to the overall Economic Hardship Index (EHI) score. We used these calculated scores to assess the economic hardship within participants' neighborhoods. Results: A total of 18 cisgender women with HIV participated in our study. Participants were mostly Black/African American (55.6%) and young (median age of 34). Our analysis identified two main themes influencing HIV risk among participants: contextual factors and relationship factors. Further, potential pre-diagnosis intervention points and missed opportunities were identified during reproductive health/prenatal visits, behavioral/mental health visits, and routine STI testing. Our evaluation of multiple data sources included investigating the presence or absence of information in the EMR (STI history, HIV testing, substance use, etc.) as well as whether pertinent information could be gathered from open access sources. Conclusion: Ciswomen recently diagnosed with HIV identified many shared experiences, including syndemic conditions like mental illness and substance abuse, sex with men who have sex with men, and frequent moving in areas with high HIV incidence prior to their diagnosis. It is imperative that providers ask patients about social history, information about partners, and other key variables, in addition to the standardized questions. Findings can be used to better recognize ciswomen most vulnerable to HIV and offer PrEP to them, reducing HIV transmission. © 2023, The Author(s). Article	2023	Johnson M.M.; Brooks N.; Amico K.R.	Missed Opportunities When We Focus only on Risk: Using the Concerns Based Conversation Starter to Identify Potential PrEP Candidates	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-03993-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146892191&doi=10.1007%2fs10461-023-03993-6&partnerID=40&md5=437130285fb069985d92a2fde81ee618	Collection and use of self-reported HIV sexual risk-behaviors to identify pre-exposure prophylaxis (PrEP) candidates is common practice in PrEP providing and referral services. Critiques of this strategy highlight overreliance on self-report and contribution to ongoing PrEP stigma. As an alternative (or complimentary) approach, we evaluated a 5-item Concerns Based Conversation Starter (CBCS) that could be used to identify individuals who could benefit from PrEP. The CBCS was included in the 2019 cycle of the American Men's Internet Survey. Item responses were characterized overall and in relation to CDC risk-based PrEP indication and reported willingness to use PrEP. In total, 1606 HIV-negative men who have sex with men not on PrEP were evaluated. Of these, 50% were below the age of 25, 11% Black, 16% Latino, and 64% White. Across the sample, 61% (986) met risk-based criteria for PrEP indication, 80% (1278) were identified by the CBCS, and 52% (835) were flagged by both. The CBCS uniquely identified 28% (443) for follow-up PrEP discussions that would have been missed by a risk-based only approach. Only 9% (151) of the sample had risk-based indication but did not report concerns. Over half of those flagged by the CBCS expressed willingness to use PrEP. The CBCS identified more people than a risk-based indication approach, with most also reporting an interest in using PrEP. A small percentage of risk-indicated participants were 'missed' by the CBCS. As PrEP options and access points expand, implementation tools like the CBCS can facilitate more wide-scale, values-focused PrEP implementation. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Johnson, Ariana L; Butts, Stefani A; Rodriguez, Edda; Craker, Lacey; Kanamori, Mariano; Doblecki-Lewis, Susanne	"Test-To-PrEP": Assessing Reach and Adoption of a New Approach to Increase HIV Testing and PrEP Knowledge Using HIV Self-Test Kit Distribution Through PrEP Clients' Social Networks.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000003294	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10651164	BACKGROUND: HIV self-testing (HIVST) can increase the reach of HIV testing. Preexposure prophylaxis (PrEP) clients may be ideal distributors of HIVST kits and PrEP information within their social networks. This study uses the Reach, Effectiveness, Adoption, Implementation, and Maintenance framework to evaluate the distribution of HIVST bundled with PrEP information ("Test-to-PrEP" kits) among egocentric friendship networks of PrEP users. METHODS: The study was conducted in Miami from November 2021 to March 2022. Enrolled PrEP clients (egos; n = 100) were offered Test-to-PrEP kits for distribution. Egos and Test-to-PrEP kit users completed brief online surveys. Descriptive statistics are reported for participants, their reported network members, and users of the Test-to-PrEP kits. Logistic and Poisson regression assessed the relationship between characteristics of egos, alters, and the distribution of Test-to-PrEP kits. RESULTS: The 100 enrolled egos reported a total of 414 alters. Participants received 293 Test-to-PrEP kits for distribution with 47 of the 100 participants distributing at least 1 kit. Of those who scanned the quick-response code and responded to the survey, 16.2% reported no previous HIV test and 38.5% reported no prior knowledge of PrEP; 32.5% reported interest in distributing Test-to-PrEP kits, 3 successfully distributed kits, and 2 initiated PrEP. CONCLUSIONS: An approach using PrEP clients' social networks can disseminate HIVST bundled with PrEP information to critical populations including individuals lacking knowledge of PrEP or who have never been tested for HIV. Future studies will assess whether this use of network effects can increase reach and efficiency of HIV testing and PrEP information distribution. Theses and Dissertations	2023	Jonathan David Walter Mullins	Are individual-level psychosocial resiliencies associated with the use of Combination HIV prevention strategies among HIV-seronegative middle-aged and aging men who have sex with men?	-	-	Universidade do Porto	-	NA	NA	https://hdl.handle.net/10216/156032	Background: Men who have sex with men (MSM) over the age of 50 are at high risk of HIV infection. With the introduction of highly effective biomedical prevention strategies like pre-exposure prophylaxis (PrEP), MSM now have more options to prevent HIV than ever before. However, the selection of appropriate behavioral or biomedical prevention strategies can be challenging. There is limited information on the association between resilience and HIV prevention strategies in older MSM. Research on this topic could inform future strengths-based interventions to promote the use of CHP strategies in this population. Objectives: The goal of our study was to investigate the relationship between individual-level psychosocial resilience and the selection of CHP strategies among HIV-negative older MSM in the US. Methods: This cross-sectional study used data from the "Understanding Patterns of Healthy Aging in Men Who Have Sex with Men" sub-study of the Multicenter AIDS Cohort Study. Participants' self-reported use of HIV prevention strategies such as condom use, abstention from anal sex, pre-exposure prophylaxis use, post-exposure prophylaxis use, pulling out before cumming, and discussion viral load and HIV status before sex were used to develop latent classes of CHP strategies in a previous study by Meanley et al (2022). The three latent classes identified were high CHP overall, high anal sex abstention, and low prevention overall. Multivariate models adjusting for age, race/ethnicity, education, condomless anal sex, alcohol consumption, and recreational drug use were used to assess the association between individual-level psychosocial resilience as measured by the RS-14 scale and membership in latent classes of CHP strategies. Results: Our sample included 293 HIV-negative older MSM who were mostly white (82.6%) and college educated (94.9%), with a median age of 63. The low CHP overall class included 43.0% of the sample, low prevention overall included 42.0%, and high anal sex abstention included 15.0%. We found a statistically significant association between every 5-unit increase in RS-14 score and membership in the high CHP overall class when compared with the low CHP overall class (OR: 1.121 95% CI: 1.014-1.241). Conclusions: Our results aligned with emerging research that has found a positive association between resilience and HIV prevention strategies used by MSM. However, previous work has not focused on older populations of MSM or combination HIV prevention strategies, making our results a valuable contribution to the HIV prevention field. These findings can inform the development of resilience-based interventions in this population. Article	2023	Jones M.K.D.; Jones K.; Almirol E.; Payne G.; Graves B.; Schneider J.A.; Rijos D.; Zawitz C.; Zimmerman R.; Seal D.W.; Brewer R.; DrPH R.B.	Examining the Awareness, Acceptability, and Adoption of Conventional and non-conventional Forms of Pre-Exposure Prophylaxis (PrEP) for HIV Prevention Among jail-involved Black Sexual Minority men (BSMM) and Black Transgender Women (BTW) in Two Diverse US Cities	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03866-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140293767&doi=10.1007%2fs10461-022-03866-4&partnerID=40&md5=cd464db703c952e34a3ca17191c0025d	Black sexual minority men (BSMM) and Black transgender women (BTW) are disproportionately impacted by HIV and incarceration in the United States. In-depth interviews (N=34) and ongoing thematic analysis guided by the Exploration Phase of the Exploration, Preparation, Implementation, Sustainment framework were conducted to uncover key themes focused on the awareness, acceptability, and early adoption of conventional (i.e., daily oral pill) and non-conventional forms of PrEP (i.e., long-acting injectable, e-prescription for pick up post release) among jail-involved BSMM and BTW in Chicago, Illinois and Baton Rouge, Louisiana. The majority of participants were cisgender BSMM (88%) and were enrolled in Chicago (65%). There was greater awareness, availability, and adoption of conventional PrEP and non-conventional PrEP e-prescription for pick up post release among Chicago participants compared with Baton Rouge participants. Participants were largely receptive to all three forms of PrEP and stated a high need for HIV prevention in jails and immediately following release. PrEP stigma emerged as a major barrier to conventional daily PrEP adoption while incarcerated; potential misuse (e.g., pill selling) as a potential barrier to PrEP eprescription; and needle aversion and added clinic time as potential barriers to longacting injectable (LAI)-PrEP. Participants indicated that PrEP e-prescription could help support continuity of care post release and highlighted reduced stigma, convenience, and longer-term HIV protection as benefits for LAI-PrEP. Study findings provided context-specific information to inform the implementation of future PrEP interventions for jail-involved BSMM and BTW in two highly HIV-impacted jurisdictions. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Jones, Jeb; Butler, Gareth; Woody, Meaghan; Castel, Amanda D.; Kulie, Paige; Sheets, Martha; Scheim, Ayden I.; Reisner, Sari L.; Valencia, Rachel; Wang, Minglun; Stekler, Joanne D.; Sullivan, Patrick S.; Stephenson, Rob	Preferences for and Experiences of an HIV-Prevention Mobile App Designed for Transmasculine People: Pilot Feasibility Trial and Qualitative Investigation.	JMIR Formative Research	-	-	-	2561-326X	10.2196/51055	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10557014/	BACKGROUND: Transmasculine people are at risk for HIV; yet few HIV prevention interventions have been developed for this population. We adapted an existing HIV prevention smartphone app for cisgender men who have sex with men to meet the sexual health needs of transmasculine people. OBJECTIVE: This study aims to assess the acceptability of the adapted app, Transpire, among transmasculine people living in Atlanta, Georgia, and Washington, DC, via in-depth interviews of participants in a pilot feasibility trial. METHODS: Participants used the Transpire app for 3 months as part of a pilot study of the app. Eligible participants were aged 18-34 years. There were no eligibility criteria with respect to race and ethnicity, and most participants were non-Hispanic White. At the end of the follow-up, participants were invited to participate in web-based in-depth interviews to discuss their experiences using the app and feedback on design and content. Interviews were transcribed and coded using a constant comparative approach. Three main themes were identified: sexual behavior, app experiences and feedback, and pre-exposure prophylaxis. RESULTS: Overall, participants found the app acceptable and thought that it would be a useful tool for themselves and their peers. Participants reported appreciating having a comprehensive information source available to them on their phones and reported learning more about HIV, sexually transmitted infections, and pre-exposure prophylaxis via the app. They also reported appreciating the inclusive language that was used throughout the app. Although the app included some resources on mental health and substance use, participants reported that they would have appreciated more resources and information in these areas as well as more comprehensive information about other health concerns, including hormone therapy. Representative quotes are presented for each of the identified themes. CONCLUSIONS: There is a desire to have greater access to reliable sexual health information among transmasculine people. Mobile apps like Transpire are an acceptable intervention to increase access to this information and other resources. More evidence is needed, however, from more racially and ethnically diverse samples of transmasculine people. Article	2023	Jones, Jeb; Stephenson, Rob; Edwards, O Winslow; Merrill, Leland; Martinez, Cristian Acero; Sullivan, Patrick S	Willingness to Participate in and Preferences for Studies of mHealth HIV Prevention Interventions: Cross-Sectional Study Among Sexual and Gender Minority Groups in the Southern United States.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-023-04005-3	https://dx.doi.org/10.1007/s10461-023-04005-3	A number of mobile HIV prevention interventions have been developed to increase uptake of HIV prevention services such as HIV testing and pre-exposure prophylaxis (PrEP). Most of these interventions have been tested among urban populations. However, sexual and gender minority (SGM) groups in rural areas might also benefit from mobile HIV prevention interventions. These groups have heightened experiences of stigma and discrimination and have limited access to culturally competent healthcare. We conducted a survey of SGM participants in the southern United States to assess willingness to use the common features of mobile HIV prevention interventions and to participate in research studies of these interventions and to compare the results between rural and non-rural respondents. We found few differences in willingness to use common features of mobile HIV prevention interventions based on rurality and high levels of cellular connectivity across participants. Based on these results, rural residence is not a barrier to using mobile HIV prevention interventions. Article	2023	Jongen V.W.; Van Der Loeff M.F.S.; Van Den Elshout M.; Wijstma E.; Coyer L.; Davidovich U.; De Vries H.J.C.; Prins M.; Hoornenborg E.; Boyd A.	Bacterial sexually transmitted infections are concentrated in subpopulations of men who have sex with men using HIV pre-exposure prophylaxis	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003676	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173659044&doi=10.1097%2fQAD.0000000000003676&partnerID=40&md5=0c81f753c5a8e0e6c4a23c8cc1cedcef	Objective:Studies have shown varying trends in incidence of sexually transmitted infections (STIs) among individuals using HIV pre-exposure prophylaxis (PrEP). Characterization of individuals at increased risk for STIs may offer an opportunity for targeted STI screening.Design:Group-based trajectory modelingMethods:We screened participants from the AMPrEP demonstration project (2015-2020) for urogenital, anal, and pharyngeal chlamydia and gonorrhea, and syphilis every 3 months and when needed. We identified trajectories of STI incidence within individuals over time and determinants of belonging to a trajectory group. We calculated cumulative proportions of STIs within STI trajectory groups.Results:Three hundred and sixty-six participants with baseline and at least one screening visit during follow-up were included (median follow-up time = 3.7 years interquartile range, IQR = 3.5-3.7). We identified three trajectories of STI incidence: participants with a mean of approximately 0.1 STIs per 3 months ('low overall', 52% of the population), participants with a mean 0.4 STI per 3 months ('medium overall', 43%), and participants with high and fluctuating (between 0.3 and 1 STIs per 3 months) STI incidence ('high and fluctuating', 5%). Participants in the 'low overall' trajectory were significantly older, and reported less chemsex and condomless anal sex with casual partners than participants in the other trajectories. Participants in the 'high and fluctuating' and 'medium overall' groups accounted for respectively 23 and 64% of all STIs observed during follow-up.Conclusions:STI incidence was concentrated in subpopulations of PrEP users who were younger, had more chemsex and condomless anal sex. Screening frequency for STIs could be reduced for subpopulations with low risk for incident STIs. © 2023 The Author(s). Published by Wolters Kluwer Health, Inc. C. de Vries; Prins, Maria; Laga, Marie; Vuylsteke, Bea; Boyd, Anders	Trajectories of PrEP use among men who have sex with men: a pooled analysis of two prospective, observational cohort studies	Journal of the International AIDS Society	-	-	-	NA	10.1002/jia2.26133	https://www.proquest.com/scholarly-journals/trajectories-prep-use-among-men-who-have-sex-with/docview/2842690244/se-2?accountid=8113	IntroductionDaily and event-driven oral pre-exposure prophylaxis (PrEP) reduce the risk of HIV acquisition. PrEP use can vary over time, yet little is known about the trajectories of PrEP use irrespective of the chosen PrEP regimens among men who have sex with men (MSM).MethodsUsing data from a mobile, web-based diary application collected daily from 17 August 2015 until 6 May 2018, we analysed PrEP use and sexual behaviour in two large cohorts, AMPrEP (Amsterdam, the Netherlands) and Be-PrEP-ared (Antwerp, Belgium). In both cohorts, participants could choose between daily and event-driven oral PrEP every 3 months. We used group-based trajectory modelling to identify trajectories of PrEP use over time and their determinants. In addition, we estimated the incidence rate of chlamydia, gonorrhoea and syphilis within these trajectories.ResultsWe included 516 MSM (n = 322 AMPrEP; n = 194 Be-PrEP-ared), of whom 24% chose event-driven PrEP at PrEP initiation. Participants contributed 225,015 days of follow-up (median = 508 days IQR = 429−511). Four distinct PrEP use trajectories were identified: ≤2 tablets per week ("low frequency," 12% of the total population), 4 tablets per week ("variable," 17%), "almost daily" (31%) and "always daily" (41%). Compared to participants with "low frequency" PrEP use, participants with "variable" (odds ratio OR = 2.18, 95% confidence interval CI = 1.04−4.60) and "almost daily" PrEP use were more often AMPrEP participants (OR = 2.64, 95% CI = 1.27−5.49). "Almost daily" PrEP users were more often employed (OR = 6.76, 95% CI = 2.10−21.75) and were younger compared to participants with "low frequency" PrEP use. In addition, the number of days on which anal sex occurred was lower among participants with "low frequency" PrEP use compared to the other groups (all p<0.001). Compared to "low frequency" PrEP users, the incidence rates of chlamydia and gonorrhoea were higher for participants with "almost daily" and "always daily" PrEP use.ConclusionsWe uncovered four distinct PrEP use trajectories, pointing to different patterns of PrEP use in practice beyond the two-regimen dichotomy. These trajectories were related to sexual behaviour and rates of sexually transmitted infection. Tailoring PrEP care according to different PrEP use patterns could be an important strategy to improve efficient PrEP delivery. Article	2023	Jongen, Vita W; Zimmermann, Hanne M L; Goedhart, Marit; Bogaards, Johannes A; Davidovich, Udi; Coyer, Liza; de Vries, Henry J C; Prins, Maria; Hoornenborg, Elske; Schim van der Loeff, Maarten F	Can we screen less frequently for STI among PrEP users? Assessing the effect of biannual STI screening on timing of diagnosis and transmission risk in the AMPrEP Study.	Sexually Transmitted Infections	-	-	-	1472-3263	10.1136/sextrans-2022-055439	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10176338/	BACKGROUND: In many countries, HIV pre-exposure prophylaxis (PrEP) users are screened quarterly for STIs. We assessed the consequences of less frequent STI testing. We also assessed determinants of asymptomatic STI and potential for onward transmission. METHODS: Using data from the AMPrEP study, we assessed the proportion of syphilis, and genital, anal, and pharyngeal chlamydia and gonorrhoea diagnoses which would have been delayed with biannual versus quarterly screening. We assessed the potential for onward transmission by examining reported condomless anal sex (CAS) in periods after to-be-omitted visits when screening biannually. We assessed determinants of incident asymptomatic STIs using Poisson regression and calculated individual risk scores on the basis of the coefficients from this model. RESULTS: We included 366 participants. Median follow-up was 47 months (IQR 43-50). 1,183STIs were diagnosed, of which 932(79%) asymptomatic. With biannual screening, 483 asymptomatic STIs (52%) diagnoses would have been delayed at 364 study visits. Of these visits, 129 (35%), 240 (66%) and 265 (73%) were followed by periods of CAS with steady, known casual or unknown casual partners, respectively. Older participants had a lower risk of asymptomatic STI (incidence rate ratio (IRR) 0.86/10-year increase, 95% CI 0.80 to 0.92), while CAS with known (IRR 1.36, 95% CI 1.10 to 1.68) and unknown (IRR 1.86, 95% CI 1.48 to 2.34) casual partners and chemsex (IRR 1.51, 95% CI 1.28 to 1.78) increased the risk. The individual risk scores had limited predictive value (sensitivity=0.70 (95% CI 0.66 to 0.74), specificity=0.50 (95% CI 0.48 to 0.51)). CONCLUSION: Reducing the STI screening frequency to biannually among PrEP users will likely result in delayed diagnoses, potentially driving onward transmission. Although determinants for asymptomatic STIs were identified, predictive power was low. Article	2023	Joshi, Shivali; Namuddu, Catherine; Kasujja, Francis Xavier; Mirembe, Miriam; Homsy, Jaco; Seeley, Janet; King, Rachel	PrEP uptake and persistence amongst HIV-negative women who exchange sex for money or commodities in Kampala, Uganda: A qualitative inquiry assessing the influence of pregnancy.	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0000434	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10298783/	Pregnant young women who exchange sex for money or commodities are at elevated biological and social risk for HIV acquisition. PrEP serves as an effective means of HIV prevention, including during pregnancy. This study aimed to explore attitudes, experiences and challenges with PrEP to understand what motivates or limits PrEP uptake and adherence specifically during pregnancy among this population of young women. Semi-structured interviews were conducted with 23 participants, recruited from the Prevention on PrEP (POPPi) study in the Good Health for Women Project clinic in Kampala, Uganda. POPPi's inclusion criteria comprised of HIV-uninfected women, aged 15-24, who exchange sex for money or commodities. Interviews focused on experience with PrEP and pregnancy. Data were analyzed utilizing a framework analysis approach. Key themes were comprised of participant barriers to and facilitators of PrEP uptake and adherence. Reasons for PrEP initiation included desire for autonomy and agency, mistrust of partners, and social support. Participants expressed challenges with initiating or sustaining their use of PrEP, including pregnancy, PrEP access and perceived or felt stigma. During pregnancy, participants' primary motivators for altering PrEP use were either understanding of PrEP safety for their baby or changes in perceptions of their HIV risk. Many of these factors were similar across participants who had experience with pregnancy and those who did not. This study highlights the importance of addressing barriers to and facilitators of PrEP uptake and persistence, especially during pregnancy where risk is elevated, with a multi-level approach. Community-oriented education, stigma reduction activities alongside access to PrEP, can serve as means for adherence. The development of robust PrEP support services and guidelines regarding PrEP use during pregnancy among high-risk women, and strategies for their implementation, are of utmost importance for the control of HIV in key populations and the elimination of mother-to-child transmission of HIV. Article	2023	Josma D.; Morris J.; Hopkins R.; Quamina A.; Siegler A.J.; Holland D.; S. Sullivan P.; Harrington K.R.V.; Alohan D.I.; Crawford N.D.	Comparing open-ended question methods to vignette methods to explore willingness to obtain pre-exposure prophylaxis access in pharmacies among black men who have sex with men	AIDS Care	-	-	-	9540121	10.1080/09540121.2023.2185193	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150516205&doi=10.1080%2f09540121.2023.2185193&partnerID=40&md5=68808dac7dd6939fd5390460d80614e0	Black men who have sex with men (BMSM) are at higher risk of HIV transmission than any other group; however, their uptake of the highly effective HIV prevention medication, pre-exposure prophylaxis (PrEP), is low. In collaboration with a communitybased organization in Atlanta, Georgia, we explored ten HIV-negative BMSM's willingness to obtain PrEP in pharmacies using standard open-ended and vignette qualitative methods. Three overarching themes were identified: privacy, patient-pharmacist interactions, and HIV/STI screening. While open-ended questions allowed participants to provide broad answers on their willingness to receive prevention services at a pharmacy, the vignette drew out specific responses to facilitate in-pharmacy PrEP delivery. Using both openended questions and vignette data collection strategies, BMSM reported high willingness to screen for and uptake PrEP in pharmacies. However, the vignette method allowed for greater depth. Open-ended questions elicited responses that highlighted general barriers and facilitators of PrEP dispensing in pharmacies. However, the vignette allowed participants to customize a plan of action that would best fit their needs. Vignette methods are underutilized in HIV research and may be helpful in supplementing standard open-ended interview questions to uncovering unknown challenges about health behaviors and obtain more robust data on highly sensitive research topics in HIV research. © 2023 Informa UK Limited, trading as Taylor & Francis Group.	health disparities; HIV prevention; MSM; PrEP; qualitative research methods	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Kabaghe, Alinune Nathanael; Singano, Victor; Payne, Danielle; Maida, Alice; Nyirenda, Rose; Mirkovic, Kelsey; Jahn, Andreas; Patel, Pragna; Brown, Kristin; Farahani, Mansoor; Kayigamba, Felix; Tenthani, Lyson; Ogollah, Francis; Auld, Andrew; Zulu, Fatima; Msungama, Wezi; Wadonda-Kabondo, Nellie	Awareness of and willingness to use oral pre-exposure prophylaxis (PrEP) for HIV prevention among sexually active adults in Malawi: results from the 2020 Malawi population-based HIV impact assessment.	BMC Infectious Diseases	-	-	-	1471-2334	10.1186/s12879-023-08683-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10589952/	BACKGROUND: The World Health Organization recommends Pre-Exposure Prophylaxis (PrEP) for all populations at substantial risk of HIV infection. Understanding PrEP awareness and interest is crucial for designing PrEP programs; however, data are lacking in sub-Saharan Africa. In Malawi, oral PrEP was introduced in 2018. We analyzed data from the 2020 Malawi Population-based HIV Impact Assessment (MPHIA) to assess PrEP awareness and factors associated with PrEP interest in Malawi. METHODS: MPHIA 2020 was a national cross-sectional household-based survey targeting adults aged 15 + years. Oral PrEP was first described to the survey participants as taking a daily pill to reduce the chance of getting HIV. To assess awareness, participants were asked if they had ever heard of PrEP and to assess interest, were asked if they would take PrEP to prevent HIV, regardless of previous PrEP knowledge. Only sexually active HIV-negative participants are included in this analysis. We used multivariable logistic regression to assess sociodemographic factors and behaviors associated with PrEP interest. All results were weighted. RESULTS: We included 13,995 HIV-negative sexually active participants; median age was 29 years old. Overall, 15.0%, 95% confidence interval (CI): 14.2-15.9% of participants were aware of PrEP. More males (adjusted odds ratio (aOR): 1.3, 95% CI: 1.2-1.5), those with secondary (aOR: 1.5, 95% CI: 1.2-2.0) or post-secondary (aOR: 3.4, 95% CI: 2.4-4.9) education and the wealthiest (aOR: 1.6, 95% CI: 1.2-2.0) were aware of PrEP than female, those without education and least wealthy participants, respectively. Overall, 73.0% (95% CI: 71.8-74.1%) of participants were willing to use PrEP. Being male (aOR: 1.2; 95% CI: 1.1-1.3) and having more than one sexual partner (aOR: 1.7 95% CI: 1.4-1.9), were associated higher willingness to use PrEP. CONCLUSIONS: In this survey, prior PrEP knowledge and use were low while PrEP interest was high. High risk sexual behavior was associated with willingness to use PrEP. Strategies to increase PrEP awareness and universal access, may reduce HIV transmission. Article	2023	Kabami J.; Kakande E.; Chamie G.; Balzer L.B.; Petersen M.L.; Camlin C.S.; Nyabuti M.; Koss C.A.; Bukusi E.A.; Kamya M.R.; Havlir D.V.; Ayieko J.	Uptake of a patient-centred dynamic choice model for HIV prevention in rural Kenya and Uganda: SEARCH SAPPHIRE study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.26121	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164037801&doi=10.1002%2fjia2.26121&partnerID=40&md5=6edd51284f629773762d2cef49a6f79d	Introduction: Person-centred HIV prevention delivery models that offer structured choices in product, testing and visit location may increase coverage. However, data are lacking on the actual uptake of choices among persons at risk of HIV in southern Africa. In an ongoing randomized study (SEARCH; NCT04810650) in rural East Africa, we evaluated the uptake of choices made when offered in a person-centred, dynamic choice model for HIV prevention. Methods: Using the PRECEDE framework, we developed a person-centred, Dynamic Choice HIV Prevention (DCP) intervention for persons at risk of HIV in three settings in rural Kenya and Uganda: antenatal clinic (ANC), outpatient department (OPD) and in the community. Components include: provider training on product choice (predisposing); flexibility and responsiveness to client desires and choices (pre-exposure prophylaxis PrEP/post-exposure prophylaxis PEP, clinic vs. off-site visits and self- or clinician-based HIV testing) (enabling); and client and staff feedback (reinforcing). All clients received a structured assessment of barriers with personalized plans to address them, mobile phone access to clinicians (24 hours/7 days/week) and integrated reproductive health services. In this interim analysis, we describe the uptake of choices of product, location and testing during the first 24 weeks of follow-up (April 2021−March 2022). Results: A total of 612 (203 ANC, 197 OPD and 212 community) participants were randomized to the person-centred DCP intervention. We delivered the DCP intervention in all three settings with diverse populations: ANC: 39% pregnant; median age: 24 years; OPD: 39% male, median age 27 years; and community: 42% male, median age: 29 years. Baseline choice of PrEP was highest in ANC (98%) vs. OPD (84%) and community (40%); whereas the proportion of adults selecting PEP was higher in the community (46%) vs. OPD (8%) and ANC (1%). Personal preference for off-site visits increased over time (65% at week 24 vs. 35% at baseline). Interest in alternative HIV testing modalities grew over time (38% baseline self-testing vs. 58% at week 24). Conclusions: A person-centred model incorporating structured choice in biomedical prevention and care delivery options in settings with demographically diverse groups, in rural Kenya and Uganda, was responsive to varying personal preferences over time in HIV prevention programmes. © 2023 The Authors. Preferences for oral PrEP dosing among adolescent boys and young men in three sub-Saharan African countries	PLOS One	-	-	-	19326203	10.1371/journal.pone.0285132	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173657914&doi=10.1371%2fjournal.pone.0285132&partnerID=40&md5=4848ae3e6a10e6238f6cf4487dda4589	Background HIV remains a leading contributor to the disease burden in sub-Saharan Africa, with adolescents and young people disproportionately affected. Optimising pre-exposure prophylaxis (PrEP) uptake has predominantly focused on women and adult men who have sex with men. We explore adolescent boys and young men's PrEP uptake preferences in South Africa, Uganda, and Zimbabwe. Methods A cross-sectional sequential exploratory mixed-methods study amongst males aged 13–24 years was conducted between April and September 2019 as part of the CHAPS trial. Group discussions (GDs) and In-Depth Interviews (IDIs) focused on motivations and hindrances for HIV testing, PrEP preference, and reasons for the uptake of PrEP. A thematic approach was used to analyse the qualitative data. A quantitative survey following the qualitative work covered questions on demographics, HIV risk and PrEP preferences (on-demand vs. daily). For quantitative analysis, we fitted logistic regression models to determine factors associated with on-demand vs daily PrEP preference. Results Overall, 647 adolescent boys and young men (median age 20, IQR: 17–22) were enrolled. Of these, 422 (65.22%) preferred on-demand PrEP (South Africa 45.45%, Uganda 76.80%, Zimbabwe 70.35%; p<0.001). Factors independently associated with on-demand PrEP included country (South Africa, adjusted odds ratio (aOR) = 0.19 95%CI:0.1–0.3 compared to Uganda) and advanced planning of sex >24 hours in advance aOR = 1.4 (0.9–2.3) compared to <2 hours. Qualitatively, participants commonly believed they were not at risk of HIV acquisition most of the time and thought that on-demand PrEP would be suitable as they tend to plan sexual activity in advance. Conclusion Preference for on-demand PrEP is high in young males. The qualitative data support a preference for on-demand PrEP in those who plan sex in advance. HIV intervention programs should offer both on-demand and daily PrEP to engage more adolescent boys and young men in HIV prevention practices. Copyright: © 2023 Kakande et al. Article	2023	Kakande E.R.; Ayieko J.; Sunday H.; Biira E.; Nyabuti M.; Agengo G.; Kabami J.; Aoko C.; Atuhaire H.N.; Sang N.; Owaranganise A.; Litunya J.; Mugoma E.W.; Chamie G.; Peng J.; Schrom J.; Bacon M.C.; Kamya M.R.; Havlir D.V.; Petersen M.L.; Balzer L.B.	A community-based dynamic choice model for HIV prevention improves PrEP and PEP coverage in rural Uganda and Kenya: a cluster randomized trial	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.26195	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178850947&doi=10.1002%2fjia2.26195&partnerID=40&md5=d0804f71fa36d90e71b8cede3ed788e9	Introduction: Optimizing HIV prevention may require structured approaches for providing client-centred choices as well as community-based entry points and delivery. We evaluated the effect of a dynamic choice model for HIV prevention, delivered by community health workers (CHWs) with clinician support, on the use of biomedical prevention among persons at risk of HIV in rural East Africa. Methods: We conducted a cluster randomized trial among persons (≥15 years) with current or anticipated HIV risk in 16 villages in Uganda and Kenya (SEARCH; NCT04810650). The intervention was a client-centred HIV prevention model, including (1) structured client choice of product (pre-exposure prophylaxis PrEP or post-exposure prophylaxis PEP), service location (clinic or out-of-clinic) and HIV testing modality (self-test or rapid test), with the ability to switch over time; (2) a structured assessment of patient barriers and development of a personalized support plan; and (3) phone access to a clinician 24/7. The intervention was delivered by CHWs and supported by clinicians who oversaw PrEP and PEP initiation and monitoring. Participants in control villages were referred to local health facilities for HIV prevention services, delivered by Ministry of Health staff. The primary outcome was biomedical prevention coverage: a proportion of 48-week follow-up with self-reported PrEP or PEP use. Results: From May to July 2021, we enrolled 429 people (212 intervention; 217 control): 57% women and 35% aged 15–24 years. Among intervention participants, 58% chose PrEP and 58% chose PEP at least once over follow-up; self-testing increased from 52% (baseline) to 71% (week 48); ≥98% chose out-of-facility service delivery. Among 413 (96%) participants with the primary outcome ascertained, average biomedical prevention coverage was 28.0% in the intervention versus 0.5% in the control: a difference of 27.5% (95% CI: 23.0–31.9%, p<0.001). Impact was larger during periods of self-reported HIV risk: 36.6% coverage in intervention versus 0.9% in control, a difference of 35.7% (95% CI: 27.5–43.9, p<0.001). Intervention effects were seen across subgroups defined by sex, age group and alcohol use. Conclusions: A client-centred dynamic choice HIV prevention intervention, including the option to switch between products and CHW-based delivery in the community, increased biomedical prevention coverage by 27.5%. However, substantial person-time at risk of HIV remained uncovered. © 2023 The Authors. Article	2023	Kalichman, Seth C.; Shkembi, Bruno; El-Krab, Renee	Geometric approach to measuring intersectional stigma among black sexual minority men: reliability and validity in an HIV prevention context.	Sexual Health	-	-	-	1449-8987 1448-5028	10.1071/SH23021	https://www.publish.csiro.au/SH/SH23021	BACKGROUND: Stigma and discrimination experiences attributable to multiple intersecting facets of the self (e.g. intersectional stigma) pose substantial challenges to accessing health services, including HIV prevention. While there have been theoretical advances in understanding multiple co-occurring stigmas, there are few psychometric instruments available to assess intersectional stigma. We have developed an approach to assessing intersectional stigma that conceptualises an intersection in geometric terms, defined as the line that connects points on two (or more) stigma dimensions and calculates scores derived from the geometric definition of intersecting lines. METHODS: Following pilot studies to derive items and response formats, we administered newly developed enacted stigma (24-items) and anticipated stigma (17-items) scales with attributions to race and sexual minority status for stigma experiences to a sample of 422 Black sexual minority men at risk for HIV recruited through social media platforms. RESULTS: The enacted and anticipated intersectional stigma scales, including subscales representing discrimination, interpersonal and felt stigma demonstrated evidence for reliability and construct validity. The enacted stigma scales were associated with medical mistrust, whereas the anticipated stigma scales predicted perceived barriers to using pre-exposure prophylaxis for HIV prevention. CONCLUSIONS: The intersectional stigma scales offer greater specificity in measuring stigma experiences attributed to race, sexual minority status and the intersection of racial-sexual minority status. Article	2023	Kalinowski, Jolaade; Layland, Eric K.; Eaton, Lisa A.; Watson, Ryan J.	Strong Ethnic Identity Buffers the Association of Heterosexism with Substance Use Among Black Sexual Minority Men.	Journal of Racial and Ethnic Health Disparities	-	-	-	2196-8837 2197-3792	10.1007/s40615-022-01312-8	https://pubmed.ncbi.nlm.nih.gov/35556225/	INTRODUCTION: Heterosexist stigma, including microaggressions experienced in their own racial/ethnic communities, may partially explain disproportionate levels of substance use involvement among Black sexual minority men (BSMM). A strong sense of ethnic identity may provide BSMM with a protective resource. The purpose of this study was to explore associations between ethnic identity and substance use in BSMM. METHODS: Data were from Black sexual minority men (n = 390 M(age) = 25.28; SD = 2.81) in the PrEP and Substance Use National Survey collected from March 2020 to August 2020 that included self-reported cannabis, cocaine, methamphetamines, inhalants, hallucinogens, prescription drugs misuse, and overall substance use involvement. Using zero-inflated negative binomial regression, we assessed the association between heterosexist microaggressions within BSMM's racial/ethnic communities and substance use involvement, moderated by subjective sense of ethnic identity. RESULTS: More than half of participants reported past 3-month substance use. Heterosexist microaggressions were associated with higher relative risk of cannabis use involvement (RR = 1.76; 95% CI 1.13-2.73) and overall substance use involvement (RR = 2.23; 95% CI 1.39-3.56). Stronger ethnic identity buffered the association of heterosexism on substance use involvement (cannabis: RR = 0.82; 95% CI 0.72-0.95; overall: RR = 0.77; 95% CI 0.66-0.89). CONCLUSION: Nurturing ethnic identity development and reducing heterosexist stigma in Black communities may be a culturally responsive, two-pronged approach to reducing substance use involvement among BSMM. BSMM with strong ethnic identity demonstrated resilience to heterosexist stigma. Future research should examine the extent to which ethnic identity may be cultivated as a protective resource against substance use involvement. Article	2023	Kalwicz D.A.; Rao S.; Modrakovic D.X.; Zea M.C.; Dovidio J.F.; Magnus M.; Kharfen M.; Patel V.V.; Calabrese S.K.	There are people like me who will see that, and it will just wash over them': Black sexual minority men's perspectives on messaging in PrEP visual advertisements	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2022.2157491	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145503708&doi=10.1080%2f13691058.2022.2157491&partnerID=40&md5=607df6e1c6b23012a6ff16af9b1b87c1	The high incidence of HIV among US Black sexual minority men is a public health crisis that pre-exposure prophylaxis (PrEP) for HIV can help address. Public health campaigns, which often include pictures of Black sexual minority men alongside PrEP-related messaging, have been developed to encourage PrEP awareness and uptake. However, the acceptability of the messaging within these campaigns among Black sexual minority men is unclear. We conducted four focus groups with 18 HIV-negative Black sexual minority men in Washington, DC to explore their perspectives regarding promotional messaging (textual elements) in PrEP visual advertisements, including their reactions to three large-scale public health campaigns. Primary themes included: (1) the need for additional information about PrEP, (2) preference for slogan simplicity, (3) the desire to normalise PrEP use, and (4) mixed views on the inclusion of condoms. Results indicated that the messaging in current PrEP visual advertisements may not sufficiently address Black sexual minority men's questions about PrEP. Providing basic PrEP information and methods to access more information; using simple, unambiguous language; presenting PrEP use in a destigmatising, normalising fashion; and conveying the relevance of condoms if included in the advertisement could help increase the acceptability of future PrEP advertising among Black sexual minority men. © 2023 Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Kamakura M.; Fukuda D.; Kuroishi N.; Ainiwaer D.; Hattori J.	Exploring Current Practice, Knowledge, and Challenges of Sexually Transmitted Infection/HIV Management and Pre-Exposure Prophylaxis Among Japanese Health Care Professionals: A Cross-Sectional Web Survey	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2023.0013	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159169868&doi=10.1089%2fapc.2023.0013&partnerID=40&md5=56d1191cf6542ff74e0165bc35969a2b	We conducted a web-based survey targeting physicians in specialties of treating sexually transmitted infection (STI) and/or human immunodeficiency virus (HIV) patients to understand the current STI/HIV care practices and their acceptability of and barriers to the prescription of pre-exposure prophylaxis (PrEP) in Japan. A descriptive analysis was used to summarize survey responses. Univariate and multivariable logistic regression were performed to identify factors associated with willingness to prescribe PrEP. Of 316 survey respondents, 57 were specialized in HIV, 90 STI/Urology/Proctology, 55 Obstetrics/Gynecology, and 114 General Practice/Internal Medicine/Dermatology. Proportion of HIV-specialized physicians who interview the patients about risk behaviors tended to be higher than other physician groups (84.2% vs. 54.8%, 47.3%, and 50.9%, respectively), and 53 - 75% of non-HIV-specialized physicians reported that they were incapable of making decisions on HIV medications. Higher PrEP knowledge enhanced the willingness to recommend and prescribe PrEP drugs (odds ratio: 2.31, 95% confidence interval: 1.30-4.10, p = 0.0044), and 45.4% physicians with no PrEP knowledge raised the concern of incapability to respond and manage when an individual is infected with HIV. Educational opportunities on management and prevention measures for both STI and HIV may encourage non-HIV-specialized physicians to be involved in HIV care and to enhance initiation of HIV tests and adoption of PrEP. Article	2023	Kamitani E.; Mizuno Y.; Deluca J.B.; Collins C.B.	Systematic review of alternative HIV preexposure prophylaxis care delivery models to improve preexposure prophylaxis services	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003601	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164844926&doi=10.1097%2fQAD.0000000000003601&partnerID=40&md5=91d8f5f985f2102d281ce424d567e59b	Objectives:To identify types, evidence, and study gaps of alternative HIV preexposure prophylaxis (PrEP) care delivery models in the published literature.Design:Systematic review and narrative synthesis.Methods:We searched in the US Centers for Disease Control and Prevention (CDC) Prevention Research Synthesis (PRS) database through December 2022 (PROSPERO CRD42022311747). We included studies published in English that reported implementation of alternative PrEP care delivery models. Two reviewers independently reviewed the full text and extracted data by using standard forms. Risk of bias was assessed using the adapted Newcastle-Ottawa Quality Assessment Scale. Those that met our study criteria were evaluated for efficacy against CDC Evidence-Based Intervention (EBI) or Evidence-Informed Intervention (EI) criteria or Health Resources and Services Administration Emergency Strategy (ES) criteria, or for applicability by using an assessment based on the Reach, Effectiveness, Adoption, Implementation, and Maintenance framework.Results:This review identified 16 studies published between 2018 and 2022 that implemented alternative prescriber (n = 8), alternative setting for care (n = 4), alternative setting for laboratory screening (n = 1), or a combination of the above (n = 3). The majority of studies were US-based (n = 12) with low risk of bias (n = 11). None of the identified studies met EBI, EI, or ES criteria. Promising applicability was found for pharmacists prescribers, telePrEP, and mail-in testing.Conclusions:Delivery of PrEP services outside of the traditional care system by expanding providers of PrEP care (e.g. pharmacist prescribers), as well as the settings of PrEP care (e.g. telePrEP) and laboratory screening (i.e. mail-in testing) may increase PrEP access and care delivery. © 2023 Lippincott Williams and Wilkins. Article	2023	Kamitani Emiko; Wichser, Megan E; Mizuno Yuko; DeLuca, Julia B; Higa, Darrel H	What Factors Are Associated With Willingness to Use HIV Pre-exposure Prophylaxis (PrEP) Among U.S. Men Who Have Sex With Men Not on PrEP? A Systematic Review and Meta-analysis	The Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000384	https://www.proquest.com/scholarly-journals/what-factors-are-associated-with-willingness-use/docview/2779204578/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP), an antiretroviral medication to prevent HIV, is becoming more widely available in the United States since the Federal Drug Administration approved it in 2012. However, PrEP use among men who have sex with men (MSM) is still limited and many MSM who are willing to take PrEP are not on PrEP. We performed a systematic review to identify factors associated with willingness to use PrEP among MSM who are not on PrEP. The majority of the 23 relevant studies had low risk of bias and used a cross-sectional design. Willingness was associated with being Hispanic/Latino (odds ratio OR = 1.68, 95% confidence interval CI 1.01-2.78), Black (OR = 1.41, 95% CI 1.02-1.95), younger (OR = 1.08, 95% CI 1.02-1.15), having no college degree (OR = 1.37, 95% CI 1.12-1.59), or low income (OR = 1.21, 95% CI 1.12-1.32). A higher proportion of MSM who had recent condomless anal sex (OR = 1.85, 95% CI 1.49-2.29) were diagnosed with sexually transmitted infection (OR = 1.60, 95% CI 1.27-2.01), or MSM who had multiple sex partners (OR = 1.58, 95% CI 1.07-2.32) were more willing to use PrEP compared with their respective counterparts. Findings suggest that MSM with racial/ethnic minority status, low-socioeconomic status, younger age, and engagement in HIV risk behaviors are willing to take PrEP but may lack access. Study limitations include the inability to conduct meta-analyses on certain predictor variables due to a small number of studies. This review identified MSM subpopulations who may benefit from interventions increasing PrEP access. Article	2023	Kamitani, Emiko; Mizuno, Yuko; Koenig, Linda J	Strategies to Eliminate Inequity in PrEP Services in the US South and Rural Communities.	Journal of the Association of Nurses in AIDS Care	-	-	-	1552-6917	10.1097/JNC.0000000000000437	https://dx.doi.org/10.1097/JNC.0000000000000437	ABSTRACT: Inequity in preexposure prophylaxis (PrEP) care in the US South and rural communities is likely attributed to Social Determinants of Health and structural issues beyond individuals' control. We describe three approaches to modify PrEP care practice models to make access easier-"normalizing," "digitalizing," and "simplifying." "Normalizing" approaches are defined as practice models where medical providers who have access to PrEP candidates prescribe PrEP routinely (e.g., primary care providers, community pharmacists); these approaches are found to be highly applicable in real-world settings. Telehealth and other dHealth tools are examples of "digitalizing" PrEP, and their use has been increasing rapidly since the COVID-19 pandemic. "Simplifying" PrEP care (e.g., with HIV self-testing, on-demand PrEP) is highlighted in the most recent World Health Organization PrEP guideline. Identifying, implementing, and scaling up these new strategies can allow PrEP candidates to access it, potentially addressing inequities and promoting HIV risk reduction in the US South and rural communities. Article	2023	Kang W.-T.; Zhang G.; Liu T.-T.; Yang X.; Guo J.-H.; Cheng L.-L.; Tang H.-L.; Wang J.-J.	Knowledge awareness and its influencing factors of HIV pre-exposure prophylaxis among MSM	Chinese Journal of Disease Control and Prevention	-	-	-	16743679	10.16462/j.cnki.zhjbkz.2023.01.016	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148520655&doi=10.16462%2fj.cnki.zhjbkz.2023.01.016&partnerID=40&md5=be211bf3abe9c17b821cb8a4f10aadc3	Objective To understand the knowledge awareness and its influencing factors of HIV pre-exposure prophylaxis (PrEP) among men who have sex with men (MSM) in different cities and years. Methods In 2019 and 2021, an electronic questionnaire was used to collect information including sociodemographic characteristics, PrEP knowledge awareness, and behavior characteristics of MSM in Beijing, Shenzhen, and Kunming. Questionnaires were collected by community organizations. Then the influencing factors of PrEP knowledge awareness were analyzed. Results A total of 4 889 questionnaires were collected in the three cities, including 2 399 in 2019 and 2 490 in 2021. The knowledge awareness rates of PrEP in 2019 and 2021 were 6. 29% and 25. 02% respectively. In 2019, multivariate logistic regression analysis model showed that ages (25−<34 years old: OR = 1. 685, 95% CI: 1. 007−2. 821; ≥ 35 years old: OR = 2. 01, 95% CI: 1. 156−3. 497), consulted PrEP (OR = 1. 731, 95% CI: 1. 050−2. 855), heard of PEP (Post-exposure prophylaxis) (OR = 3. 178, 95% CI: 2. 079−4. 860) were related to the PrEP knowledge awareness. In 2021, multivariate logistic regression analysis showed that education (universities or colleges: OR = 3. 291, 95% CI: 1. 595−6. 793; master degree or above:OR = 4. 507, 95% CI: 2. 104− 9. 652), consulted PrEP (OR = 2. 591, 95% CI: 1. 906−3. 521), heard of PEP (OR = 5. 855, 95% CI: 3. 071−11. 161), used PEP (OR = 1. 619, 95% CI: 1. 191−2. 200), used stimulant (OR = 0. 623, 95% CI: 0. 492−0. 789), tested HIV in a year (3−4 times: OR = 2. 140, 95% CI: 1. 265−3. 619; ≥5: OR = 3. 414, 95% CI: 1. 987−5. 865) were related to the PrEP knowledge awareness. Conclusions PrEP knowledge awareness in 2021 has increased significantly compared with 2019 among MSM, but remained low overall. The age, education, HIV testing times, knowledge awareness and uptake of PEP were related to the PrEP knowledge awareness. Comprehensive measures should be continued to strengthen the publicity and education of PrEP to MSM and improve their correct understanding of PrEP. © 2023, Publication Centre of Anhui Medical University. Article	2023	Kania Z.; Mijas M.; Grabski B.; Gąsiorowski J.; Pliczko M.	HIV pre-exposure prophylaxis (PrEP) for transgender and nonbinary persons. Literature review and guidelines for professionals	Psychiatria Polska	-	-	-	332674	10.12740/PP/OnlineFirst/144821	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180329070&doi=10.12740%2fPP%2fOnlineFirst%2f144821&partnerID=40&md5=0da512e9db0c9c01215 0f29b6daeee3c	Transgender and nonbinary (TG/NB) persons are listed as one of the key populations in the context of HIV, due to increased risk of HIV infection in this group. HIV prevention, which includes a variety of available methods, should therefore be included in the comprehensive health care for TG/NB persons. One such method is the pre-exposure prophylaxis (PrEP), whose high effectiveness in preventing HIV transmission has already been demonstrated in numerous studies conducted in the cisgender population. However, the available empirical data on its use in TG/NB persons are limited in many respects. This issue is also practically absent in the Polish literature; as a consequence, there are significant gaps in recommendations for professionals involved in the prevention of HIV among TG/NB persons and professionals involved in the comprehensive health care for TG/NB persons. This article 1) outlines the issue of the use of PrEP among TG/NB persons, including the associated challenges for professionals (specialising in physical, as well as mental health); 2) demonstrates the possible applicability of PrEP in TG/NB populations based on available research findings; 3) summarises good practices in counselling and PrEP-related psychoeducational activities, as part of the comprehensive health care for TG/NB individuals. © 2023 Polish Psychiatric Association. Theses and Dissertations	2023	Karidioula, Jean Marie	Facteurs de prédiction de l'intention des hommes ayant des relations sexuelles avec d'autres hommes au Bénin de continuer l'usage de la Prophylaxie Pré Exposition au VIH	-	-	Université Laval	-	NA	NA	http://hdl.handle.net/20.500.11794/122826	L'infection à virus de l'immunodéficience humaine (VIH) demeure un problème de santé publique mondiale. La majorité des nouvelles infections concernent les populations clés dont les hommes ayant des relations sexuelles avec d'autres hommes (HARSAH). L'usage de la prophylaxie préexposition (PrEP) orale, moyen de prévention de l'infection à VIH sûr et efficace, trouve son intérêt au sein de cette population. Dans le cadre d'un projet visant à démontrer la faisabilité de la PrEP orale chez les HARSAH du Bénin, nous avons analysé les facteurs qui prédisaient l'intention de continuer à utiliser la PrEP à la fin du projet, après 12 mois de suivi. La PrEP orale était proposée en prise quotidienne ou à la demande (avant l'adoption d'un comportement à risque élevé pour le VIH). La préférence des HARSAH pour la PrEP orale ou la PrEP injectable (Cabotégravir injectable à longue durée d'action), si elle était disponible, a été également évaluée. La cohorte a été suivie d'août 2020 à décembre 2021. Les variables à l'étude faisaient partie d'un modèle intégrateur de prédiction du comportement comprenant la théorie de l'action raisonnée, la théorie du comportement planifié et la théorie des comportements interpersonnels. Une régression logistique multivariée a été utilisée pour déterminer les facteurs prédictifs de l'intention de continuer à prendre la PrEP orale. L'aire sous la courbe Receiver Operating Characteristic (ROC) a permis de déterminer la capacité prédictive du modèle. La préférence pour le Cabotégravir a été évaluée avec le test exact de Fisher. Les participants recrutés étaient 204 dont 84,8% ont participé à la visite finale. L'intention de continuer l'utilisation de la PrEP était forte selon l'échelle de Likert chez 54,9% de ces participants. La perception de contrôle, la norme identitaire, la norme morale (qui sont des construits du modèle intégrateur et l'inquiétude d'être infecté par le VIH sous PrEP prédisaient tous positivement une forte intention alors que le niveau d'étude était associé négativement avec la forte intention. La capacité prédictive du modèle était de 93,5% témoignant de sa bonne performance. Le désir de changement pour la PrEP injectable était plus marqué chez les HARSAH sous PrEP quotidienne que chez ceux sous PrEP à la demande (54,5% vs 36,1%, p = 0,0119). Les hommes sous PrEP quotidienne considéraient aussi la PrEP injectable comme étant la plus acceptable (55,4%, vs 34,4%, p < 0,001). Les variables du modèle intégrateur étaient de bons prédicteurs de l'intention. La PrEP injectable pourrait être une bonne alternative à la PrEP orale quotidienne. De plus, elle permettrait d'atténuer les problèmes d'observance liés à la PrEP orale quotidienne. Article	2023	Karnik, Niranjan S.; Kuhns, Lisa M.; Hotton, Anna L.; Del Vecchio, Natascha; McNulty, Moira; Schneider, John; Donenberg, Geri; Keglovitz Baker, Kristin; Diskin, Rose; Muldoon, Abigail; Rivera, Juan; Summersett Williams, Faith; Garofalo, Robert	Findings From the Step Up, Test Up Study of an Electronic Screening and Brief Intervention for Alcohol Misuse in Adolescents and Young Adults Presenting for HIV Testing: Randomized Controlled Efficacy Trial.	JMIR Mental Health	-	-	-	2368-7959	10.2196/43653	https://pubmed.ncbi.nlm.nih.gov/36989027/	BACKGROUND: Substance use, particularly binge drinking of alcohol and noninjection substance use, is associated with increased risk for HIV infection among youth, but structured substance use screening and brief intervention are not often provided as part of HIV risk reduction. OBJECTIVE: The purpose of the study was to test the efficacy of a fully automated electronic screening and brief intervention, called Step Up, Test Up, to reduce alcohol misuse among adolescents and young adults presenting for HIV testing. Secondary objectives were reduction in sexual risk and uptake of pre-exposure prophylaxis (PrEP) for HIV prevention. METHODS: Youth aged 16 years to 25 years who presented for HIV testing at community-based locations were recruited for study participation. Those who screened at moderate to high risk on the Alcohol Use Disorders Identification Test were randomized (1:1) to either an electronic brief intervention or a time-attention control. The primary outcome was change in alcohol use at 1, 3, 6, and 12-month follow-ups. Negative binomial and log binomial regression analyses with generalized estimating equations were conducted to evaluate the intervention efficacy. RESULTS: Among a sample of 329 youth, there were no significant differences in alcohol use outcomes between conditions over time or at the 1, 3, 6, or 12-month time points. In terms of secondary outcomes, there was evidence of reduction in condomless insertive anal sex under the influence of alcohol and drugs at 12 months compared with 3 months in the intervention versus the attention control condition (incidence rate ratio=0.15, 95% CI 0.05-0.44); however, there were no other significant differences in sexual risk and no difference in PrEP engagement. CONCLUSIONS: We found no effect of electronic brief intervention to reduce alcohol use and some effect on sexual risk among youth aged 16 years to 25 years who present for HIV testing. Article	2023	Karver, TS; Pascual-Bernaldez, M; Berni, A; Hnoosh, A; Castagna, A; Messiaen, P; Puerto, MJG; Bloch, M; Adachi, E; Sinclair, G; Felizarta, F; Angel, JB; Sutton, K; Sutherland-Phillips, D; D'Amico, R; Kerrigan, D	Factors Associated with Health Care Providers' Preference for Forgoing an Oral Lead-In Phase When Initiating Long-Acting Injectable Cabotegravir and Rilpivirine in the SOLAR Clinical Trial	AIDS Patient Care and STDs	-	-	-	NA	10.1089/apc.2022.0168	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02533331/full	Cabotegravir and rilpivirine long-acting (LA) antiretroviral therapy (ART) demonstrated similar safety and efficacy in maintaining viral suppression among participants switching from daily oral to LA ART in the Extension Phase of the FLAIR trial. The Phase IIIb SOLAR study comparing efficacy and safety of daily oral versus LA ART every 2 months allowed participants and health care providers (HCPs) to choose an oral lead-in (OLI) before LA initiation or proceed by immediately starting with injections (SWI). We conducted an online survey among SOLAR HCPs (n = 110) in 13 countries to assess reasons for choosing OLI versus SWI. Logistic regression was used to identify factors influencing this decision. Thirty-two percent of HCPs reported a future preference to use OLI, whereas 54% reported a future preference for SWI. HCPs had greater odds of reporting future intentions for SWI if they were from Continental Europe versus North America adjusted odds ratio (aOR): 3.83, p < 0.05, from sites with a greater number of participants who initiated LA ART without OLI (aOR: 1.56, p < 0.01), and those who reported comfort with the medication safety profile (aOR: 6.39, p < 0.01). HCPs who participated in LA ART trials before SOLAR had decreased odds of reporting a preference for SWI compared to those with no prior LA ART trial experience (aOR: 0.11; p < 0.01). Results indicated higher intentions to SWI over OLI among HCPs initiating participants on LA ART. A major factor associated with SWI was provider comfort with safety data, reinforcing the role of continued training regarding an SWI approach.	*Anti-HIV Agents therapeutic use; *HIV Infections drug therapy; *Human immunodeficiency virus infection /drug therapy; Clinical trial; Human; Humans; Phase 3 clinical trial; Pyridones therapeutic use; Rilpivirine therapeutic use	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Article	2023	Katz A.W.K.; Roberts S.; Rousseau E.; Khoza M.N.; Mogaka F.; Bukusi E.; Delany-Moretlwe S.; Bekker L.-G.; Morton J.F.; Johnson R.; Baeten J.M.; Celum C.; Van Der Straten A.	Qualitative Analysis Using Social Maps to Explore Young Women's Experiences with Social Support of their Oral PrEP Use in Kenya and South Africa	Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000363	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146696133&doi=10.1097%2fJNC.0000000000000363&partnerID=40&md5=4e2e6b8b9f49954d3fbd003828b9bcdb	Daily oral pre-exposure prophylaxis (PrEP) adherence is challenging. We explored African adolescent girls and young women's (AGYW) perceptions of the social influencers of their PrEP use and the social influencers' PrEP knowledge and support (six focus group discussions; 33 South African and Kenyan AGYW) in the Prevention Options for Women Evaluation Research demonstration project. Participants completed a social mapping exercise indicating strength and direction of influence of members in their social networks. Mothers and counselors were identified as positive influencers and most influential by >50% of participants, sex partners were labeled negative influencers or both positive and negative, and best friends were mostly positive influencers. HIV-and PrEP-related stigma were the major reasons influencers were identified as negative. Participants wanted their social networks to be better educated about PrEP by someone other than the AGYW themselves (e.g., clinic staff) and to support their PrEP use. To improve PrEP adherence, community-and peer-based PrEP sensitization and delivery interventions should be evaluated. © 2023 Elsevier USA. All rights reserved. Article	2023	Katz I.T.; Ngure K.; Kamolloh K.; Ogello V.; Okombo M.; Thuo N.B.; Owino E.; Garrison L.E.; Lee Y.S.; Nardell M.F.; Anyacheblu C.; Bukusi E.; Mugo N.; Baeten J.M.; Haberer J.E.	Multi-level Factors Driving Pre-exposure Prophylaxis Non-initiation Among Young Women at High Risk for HIV in Kenya	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03748-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135535658&doi=10.1007%2fs10461-022-03748-9&partnerID=40&md5=a4557925e565ca53b80e7e9334c7ee0e	Few studies have focused on understanding pre-exposure prophylaxis (PrEP) non-initiation among young, high-risk women in sub-Saharan Africa. This study aimed to qualitatively explore why young women in Kenya at high-risk for HIV chose not to enroll in a PrEP adherence trial. We performed 40 semi-structured interviews with young high-risk women assessing concerns about PrEP and/or study participation. We also assessed community-level factors influencing decision-making around PrEP through 10 focus groups involving peers, young men, caregivers, and community leaders. Our qualitative data reflect the complexity of navigating barriers preventing PrEP initiation in settings where taking PrEP may be perceived as immoral behavior. Framed within the context of risk perception, the decision to start PrEP may run counter to the potential risk of losing support from one's community. Our findings suggest that approaches addressing social norms, while de-medicalizing HIV prevention services, are needed to further increase PrEP uptake among young Kenyan women. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Kaufman, Michelle R.; Wright, Kate; Eschliman, Evan L.; Levine, Deborah; Simon, Jeannette	A Mobile App to Assist the Mentors of African American Young Men Who Have Sex With Men: Usability Study.	JMIR Formative Research	-	-	-	2561-326X	10.2196/48515	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10638633/	BACKGROUND: Mentoring can promote positive youth development. Owing to social and structural factors, young people in underresourced communities often lack adequate access to mentors, and naturally occurring mentors are more common than formal, programmatic mentors. There is little information on the impact of naturally occurring mentors on youth in general and even less on the role that mentors may play in promoting healthy outcomes in sexual and gender minority youth. African American young men who have sex with men (YMSM) are more likely to reside in communities with limited access to formalized mentorship programs and may benefit from naturally occurring mentoring relationships that address health outcomes, specifically related to HIV. OBJECTIVE: This study is a usability test of a mobile app designed for the mentors of African American YMSM to increase mentors' knowledge of and confidence in talking about HIV prevention and related topics with mentees. METHODS: Following consent, eligible and naturally occurring mentoring pairs involving African American YMSM in Baltimore; Philadelphia; and Washington, District of Columbia, tested the app, UrbanMentorHub, for usability. Participants downloaded the app and used it for 1 month, completed pre- and postintervention surveys, and participated in a follow-up focus group discussion. Participants' sociodemographic characteristics and HIV- and mentorship-related measures were characterized using descriptive statistics. Wilcoxon signed rank tests were used to test for pre- and postintervention differences in knowledge, confidence, and outcome expectancy measures. Focus group discussions were audio recorded and transcribed. Transcripts were thematically coded and analyzed to identify ways that UrbanMentorHub could be improved in the mentoring context. RESULTS: Nine mentorship pairs participated in this usability study (N=18). Mentors obtained high scores on knowledge, confidence, outcome expectancies, skills, and intentions related to HIV and mentoring. No pre- or postintervention changes were observed in these measures. Mentors reported usually initiating conversations around HIV testing and pre-exposure prophylaxis; mentees and mentors equally initiated conversations on sexual practices and same-sex relationships. Mentors reported sexual practices as the most frequently discussed topic in the past month and pre-exposure prophylaxis being the least discussed. Mentees reported high comfort with HIV-related conversations. No pre- or postintervention change was observed regarding HIV knowledge. Most mentees reported having discussed most HIV-related topics with their mentor in the past month. Mentor feedback on the app was mostly neutral, although they reported positive perceptions of the idea of the app, indicating the potential for addressing a need in their communities. Mentors suggested ways to improve the app content and design elements. CONCLUSIONS: Although there was no observed statistical change in measured outcomes, and qualitative feedback was overall neutral, the results of this usability study can inform future work to design and promote interventions and resources that support mentoring relationships for African American YMSM. Article	2023	Kaul C.M.; Moore B.E.; Kaplan-Lewis E.; Casey E.; Pitts R.A.; Pirallo P.P.; Lim S.; Kapadia F.; Cohen G.M.; Khan M.; Mgbako O.	EquiPrEP: An implementation science protocol for promoting equitable access and uptake of long-acting injectable HIV preexposure prophylaxis (LAI-PrEP)	PLOS One	-	-	-	19326203	10.1371/journal.pone.0291657	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171900171&doi=10.1371%2fjournal.pone.0291657&partnerID=40&md5=5a6292bf6a7d2264872007196bd448e01	Background Long-acting injectable HIV pre-exposure prophylaxis (LAI-PrEP) was approved by the U.S. Food and Drug Administration in December 2021. This initial phase of implementation represents a prime opportunity to ensure equitable LAI-PrEP provision to communities often underrepresented in PrEP care before disparities in access and uptake emerge. Herein, we describe the EquiPrEP Project which utilizes an equity-oriented implementation science framework to optimize LAI-PrEP rollout in an urban safety-net clinic in New York City. Methods The primary objectives of this project are to: (1) increase LAI-PrEP initiation overall; (2) increase uptake among groups disproportionately impacted by the HIV epidemic; (3) preserve high PrEP retention while expanding use; and (4) identify barriers and facilitators to LAI-PrEP use. EquiPrEP will enroll 210 PrEP-eligible participants into LAI-PrEP care with planned follow-up for one year. We will recruit from the following priority populations: Black and/or Latine men who have sex with men, Black and/or Latine cisgender women, and transgender women and nonbinary individuals. To evaluate implementation of LAI-PrEP, we will utilize equity-focused iterations of the Reach, Effectiveness, Adoption, Implementation, Maintenance (RE-AIM) framework and the Consolidated Framework for Implementation Research (CFIR), in addition to longitudinal surveys and qualitative interviews. Discussion Novel LAI-PrEP formulations carry tremendous potential to revolutionize the field of HIV prevention. Implementation strategies rooted in equity are needed to ensure that marginalized populations have access to LAI-PrEP and to address the structural factors that hinder initiation and retention in care. © 2023 Kaul et al. Article	2023	Keddem, Shimrit; Agha, Aneeza; Morawej, Sabrina; Buck, Amy; Cronholm, Peter; Sonalkar, Sarita; Kearney, Matthew	Characterizing Twitter Content About HIV Pre-exposure Prophylaxis (PrEP) for Women: Qualitative Content Analysis	Journal of Medical Internet Research	-	-	-	1438-8871	doi: 10.2196/43596.	https://pubmed.ncbi.nlm.nih.gov/37166954/	HIV remains a persistent health problem in the United States, especially among women. Approved in 2012, HIV pre-exposure prophylaxis (PrEP) is a daily pill or bimonthly injection that can be taken by individuals at increased risk of contracting HIV to reduce their risk of new infection. Women who are at risk of HIV face numerous barriers to HIV services and information, underscoring the critical need for strategies to increase awareness of evidence-based HIV prevention methods, such as HIV PrEP, among women. We aimed to identify historical trends in the use of Twitter hashtags specific to women and HIV PrEP and explore content about women and PrEP shared through Twitter. This was a qualitative descriptive study using a purposive sample of tweets containing hashtags related to women and HIV PrEP from 2009 to 2022. Tweets were collected via Twitter's API. Each Twitter user profile, tweet, and related links were coded using content analysis, guided by the framework of the Health Belief Model (HBM) to generate results. We used a factor analysis to identify salient clusters of tweets. A total of 1256 tweets from 396 unique users were relevant to our study focus of content about PrEP specifically for women (1256/2908, 43.2% of eligible tweets). We found that this sample of tweets was posted mostly by organizations. The 2 largest groups of individual users were activists and advocates (61/396, 15.4%) and personal users (54/396, 13.6%). Among individual users, most were female (100/166, 60%) and American (256/396, 64.6%). The earliest relevant tweet in our sample was posted in mid-2014 and the number of tweets significantly decreased after 2018. We found that 61% (496/820) of relevant tweets contained links to informational websites intended to provide guidance and resources or promote access to PrEP. Most tweets specifically targeted people of color, including through the use of imagery and symbolism. In addition to inclusive imagery, our factor analysis indicated that more than a third of tweets were intended to share information and promote PrEP to people of color. Less than half of tweets contained any HBM concepts, and only a few contained cues to action. Lastly, while our sample included only tweets relevant to women, we found that the tweets directed to lesbian, gay, bisexual, transgender, queer (LGBTQ) audiences received the highest levels of audience engagement. These findings point to several areas for improvement in future social media campaigns directed at women about PrEP. First, future posts would benefit from including more theoretical constructs, such as self-efficacy and cues to action. Second, organizations posting on Twitter should continue to broaden their audiences and followers to reach more people. Lastly, tweets should leverage the momentum and strategies used by the LGBTQ community to reach broader audiences and destigmatize PrEP use across all communities. Article	2023	Kenyon, Chris; Herrmann, Björn; Hughes, Gwenda; de Vries, Henry J. C.	Management of asymptomatic sexually transmitted infections in Europe: towards a differentiated, evidence-based approach.	The Lancet Regional Health - Europe	-	-	-	2666-7762	10.1016/j.lanepe.2023.100743	https://www.thelancet.com/journals/lanepe/article/PIIS2666-7762(23)00162-X/fulltext	Most sexually transmitted infections (STIs) can be accurately diagnosed and treated during asymptomatic carriage. Widespread screening for these STIs is therefore assumed to be an effective way to reduce their prevalence and associated disease. In this review, we provide evidence that this is the case for HIV and syphilis. However, for other STIs such as Neisseria gonorrhoeae and Chlamydia trachomatis, our review reveals that the evidence that screening reduces infection prevalence and associated disease is weak. There is also growing evidence of harms from screening that might outweigh any benefits. The harms include the increased consumption of antimicrobials that follows frequent screening and increased detection of asymptomatic STIs in key populations, such as men who have sex with men taking HIV pre-exposure prophylaxis, and associated risk of antimicrobial resistance in target and non-target organisms. There may also be psycho-social harm associated with an STI diagnosis. We conclude that in the absence of symptoms, in high STI prevalence populations frequent STI screening should be limited to HIV and syphilis. Article	2023	Kerman, Jared; Brewer, Russell; Hotton, Anna; Flores, Rey; Devlin, Samantha A.; Friedman, Eleanor E.; Schneider, John A.; McNulty, Moira C.	Multi-Level and Intersectional Stigma Experienced by Black Transgender Women in Chicago: a Qualitative Study to Inform Sociostructural Interventions for Reducing Stigma and Improving Health Outcomes.	Journal of Racial and Ethnic Health Disparities	-	-	-	2196-8837	10.1007/s40615-023-01853-6	https://pubmed.ncbi.nlm.nih.gov/37957538/	BACKGROUND: Stigma contributes to health disparities including increased HIV vulnerability among minority communities. Black transgender women experience multiple forms of stigma (e.g., anticipated, experienced), which can result in poor HIV-related outcomes. We utilized an adapted social ecological model (ASEM) to better understand the levels at which stigma is encountered and its impact on lived experience, particularly related to making healthcare decisions. METHODS: Semi-structured interviews and two focus groups (n = 38) were conducted with Black transgender women and Black transfeminine individuals in Chicago from 2016 to 2017. Participants were asked about discrimination in the community, healthcare experiences, and their thoughts and decision-making process with their healthcare provider regarding HIV pre-exposure prophylaxis. We conducted thematic analysis and organized our findings based on the levels of the ASEM: individual, interpersonal, organizational, community, and structural. RESULTS: Participants experienced and anticipated stigma at each ASEM level. Stigma was not experienced in isolation: stigma experienced at one level caused anticipated stigma at other levels and internalized stigma leading to negative self-image. In each case, stigma adversely impacted health outcomes (e.g., medication nonadherence, disengagement from care). Stigma within healthcare settings, medication-related stigma, and stigma directed at appearance and identity are particularly detrimental to shared decision-making with a healthcare provider. CONCLUSIONS: Recognizing and valuing Black transgender women's experience with stigma are essential for developing social and structural interventions that may work collaboratively across multiple levels of lived experience to reduce stigma and healthcare disparities faced by Black transgender women. Article	2023	Khadka N.; Gorbach P.M.; Nyemba D.C.; Mvududu R.; Mashele N.; Javanbakht M.; Nianogo R.A.; Aldrovandi G.M.; Bekker L.-G.; Coates T.J.; Myer L.; Joseph Davey D.L.	Evaluating the use of oral pre-exposure prophylaxis among pregnant and postpartum adolescent girls and young women in Cape Town, South Africa	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/frph.2023.1224474	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173959164&doi=10.3389%2ffrph.2023.1224474&partnerID=40&md5=ff2eaf28a513bf76e790c91686f32746	Background: Adolescent girls and young women (AGYW) in South Africa are at a higher risk of acquiring HIV. Despite the increasing availability of daily oral pre-exposure prophylaxis (PrEP) for HIV prevention, knowledge on PrEP use during pregnancy and postpartum periods at antenatal care (ANC) facilities remains inadequate. Methods: Data from HIV-uninfected pregnant women in Cape Town, South Africa, were used in this study. These women aged 16–24 years were enrolled in the PrEP in pregnancy and postpartum (PrEP-PP) cohort study during their first ANC visit. Using the PrEP cascade framework, the outcomes of the study were PrEP initiation (prescribed tenofovir disoproxil fumarate and emtricitabine at baseline), continuation (returned for prescription), and persistence quantifiable tenofovir diphosphate (TFV-DP) in dried blood samples. The two primary exposures of this study were risk perception for HIV and baseline HIV risk score (0–5), which comprised condomless sex, more than one sexual partner, partner living with HIV or with unknown serostatus, laboratory-confirmed sexually transmitted infections (STIs), and hazardous alcohol use before pregnancy (Alcohol Use Disorders Identification Test for Consumption score ≥ 3). Logistic regression was used to examine the association between HIV risk and PrEP, adjusting for a priori confounders. Results: A total of 486 pregnant women were included in the study, of which 16% were "adolescents" (aged 16–18 years) and 84% were "young women" (aged 19–24 years). The adolescents initiated ANC later than the young women median = 28 weeks (20–34) vs. 23 weeks (16–34), p = 0.04. Approximately 41% of the AGYW were diagnosed with sexually transmitted infection at baseline. Overall, 83% of the AGYW initiated PrEP use during their first ANC. The percentage of PrEP continuation was 63% at 1 month, 54% at 3 months, and 39% at 6 months. Approximately 27% consistently continued PrEP use through 6 months, while 6% stopped and restarted on PrEP use at 6 months. With a higher risk score of HIV (≥2 vs. ≤1), the AGYW showed higher odds of PrEP continuation adjusted odds ratio: 1.85 (95% CI: 1.12–3.03) through 6 months, adjusting for potential confounders. Undergoing the postpartum period (vs. pregnant) and having lower sexual risk factors were found to be the barriers to PrEP continuation. TFV-DP concentration levels were detected among 49% of the AGYW, and 6% of these women had daily adherence to PrEP at 3 months. Conclusions: AGYW were found to have high oral PrEP initiation, but just over one-third of these women continued PrEP use through 6 months. Pregnant AGYW who had a higher risk of acquiring HIV (due to condomless sex, frequent sex, and STIs) were more likely to continue on PrEP use through the postpartum period. Pregnant and postpartum AGYW require counseling and other types of support, such as community delivery and peer support to improve their effective PrEP use through the postpartum period. Clinical Trial Number: ClinicalTrials.gov, NCT03826199. 2023 Khadka, Gorbach, Nyemba, Mvududu, Mashele, Javanbakht, Nianogo, Aldrovandi, Bekker, Coates, Myer and Joseph Davey.	adherence; AGYW; breastfeeding; cohort studies; oral pre-exposure prophylaxis; pregnant; South Africa	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Theses and Dissertations	2023	Khadka, Nehaa	Oral pre-exposure prophylaxis delivery among HIV-negative pregnant and postpartum women in antenatal clinics of Cape Town, South Africa: Adolescent Girls and Young Women, Intimate Partner Violence, and Prevention-effective Adherence	-	-	University of California	-	NA	NA	https://escholarship.org/uc/item/82b7474p	HIV acquisition risks remain high for pregnant and breastfeeding populations in South Africa. Oral pre-exposure prophylaxis (PrEP) with tenofovir disoproxil fumarate/emtricitabine (TDF-FTC) can be used daily during periods of sexual activity to prevent HIV infections for cisgender women. In 2021, oral PrEP became the standard of care for HIV prevention during pregnancy and breastfeeding periods. The objective of this dissertation was to evaluate trends in oral PrEP initiation, continuation, and adherence among adolescent girls and young women, women experiencing intimate partner violence, and by sexual behaviors throughout gestational periods and postpartum. We used data from the PrEP in Pregnancy and Postpartum (PrEP-PP) study, a prospective cohort in Cape Town of 1200 participants without HIV. The PrEP-PP study provided HIV prevention counselling and offered PrEP to pregnant and breastfeeding women.The first study evaluated the oral PrEP cascade framework among adolescent girls and young women (AGYW) in the PrEP-PP study. Approximately 83% of AGYW initiated PrEP at their first antenatal care (ANC visit), 34% continued PrEP at 6 months, and 11% stopped and restarted. AGYW with a higher HIV risk had an increased adjusted likelihood of continuing PrEP through 6 months (adjusted odds ratioOR:1.91 95% CI, 1.15-3.16). About 7% of AGYW had high adherence to PrEP at 6 months. The second study examined the relationship between recent and past-year intimate partner violence (IPV) experienced by pregnant and postpartum women and oral PrEP continuation and adherence. Women who experienced past-year IPV were less likely to discontinue PrEP(adjusted hazards ratio: 0.80 (95% CI: 0.61, 1.06) and had higher adherence(quantifiable tenofovir-diphosphateTFV-DP in dried blood spots; aOR=1.82 (95% CI: 1.02, 3.25) at 6-month follow-up visits. The third study evaluated prevention-effective adherence by gestational trimesters of pregnancy and postpartum. Prevention-effective adherence(initiation/quantifiable TFV-DP or reported use during follow-up among those engaging in condomless sex) was 65% overall, with the highest adherence in trimester 1(81%) and lowest at early postpartum(49%). There was a positive association between engaging in condomless sex and PrEP use(quantifiable TFV-DP or self-reported use; adjusted risk ratio:1.88; 95% CI: 1.67, 2.12). In conclusion, AGYW during pregnancy and postpartum had high oral uptake, but retention in PrEP by 6 months was low. Those with higher HIV risks are more likely to continue PrEP. Pregnant/postpartum women who experienced past-year IPV were more likely to stay in the study and had greater adherence. The findings suggest that pregnant and postpartum women align their PrEP use with their potential HIV risks. Implementing violence screening and oral PrEP counselling (with conversations about changing HIV risks) at ANC may improve HIV prevention for women during pregnancy and postpartum in South Africa and beyond. Article	2023	Khan, Tehseen; Coultas, Clare; Kieslich, Katharina; Littlejohns, Peter	The complexities of integrating evidence-based preventative health into England's NHS: lessons learnt from the case of PrEP	Health Research Policy and Systems	-	-	-	14784505	10.1186/s12961-023-00998-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161903661&doi=10.1186%2fs12961-023-00998-4&partnerID=40&md5=099f349fd46a81d2b7192df2857297b8	Background: The integration of preventative health services into England's National Health Service is one of the cornerstones of current health policy. This integration is primarily envisaged through the removal of legislation that blocks collaborations between NHS organisations, local government, and community groups. Aims and objectives: This paper aims to illustrate why these actions are insufficient through the case study of the PrEP judicial review. Methods: Through an interview study with 15 HIV experts (commissioners, activists, clinicians, and national health body representatives), we explore the means by which the HIV prevention agenda was actively blocked, when NHS England denied responsibility for funding the clinically effective HIV pre-exposure prophylaxis (PrEP) drug in 2016, a case that led to judicial review. We draw on Wu et al.'s (Policy Soc 34:165–171, 2016) conceptual framing of 'policy capacity' in undertaking this analysis. Results: The analyses highlight three main barriers to collaborating around evidence-based preventative health which indicate three main competence/capability issues in regard to policy capacity: latent stigma of 'lifestyle conditions' (individual-analytical capacity); the invisibility of prevention in the fragmented health and social care landscape related to issues of evidence generation and sharing, and public mobilisation (organizational-operational capacity); and institutional politics and distrust (systemic-political capacity). Discussion and conclusion: We suggest that the findings hold implications for other 'lifestyle' conditions that are tackled through interventions funded by multiple healthcare bodies. We extend the discussion beyond the 'policy capacity and capabilities' approach to connect with a wider range of insights from the policy sciences, aimed at considering the range of actions needed for limiting the potential of commissioners to 'pass the buck' in regard to evidence-based preventative health. © 2023, The Author(s). Article	2023	Kherghehpoush S.; McKeirnan K.C.	The role of community pharmacies in the HIV and HCV care continuum	Exploratory Research in Clinical and Social Pharmacy	-	-	-	26672766	10.1016/j.rcsop.2022.100215	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152078080&doi=10.1016%2fj.rcsop.2022.100215&partnerID=40&md5=a054e097fd9932024b4c0ebcb7f2c2fa	Introduction: In 2019, there were over 1.1 million people living with human immunodeficiency virus (HIV) and 2.4 million people living with hepatitis C virus (HCV) in the United States. One in seven (14%) are unaware of their HIV infection and almost half of all HCV infections are undiagnosed. People with unstable housing are disproportionately affected by HIV and HCV. The present study will evaluate interventions by community pharmacists that may reduce HIV and HCV transmission and promote linkage to care. Methods: This study was conducted in an independent community pharmacy in Spokane, Washington. Eligible study participants were walk-in patients of the pharmacy, over the age of 18, and experiencing homelessness. Pharmacy patients were excluded if they had a history of HIV or HCV diagnosis, received a screening for HIV or HCV in the last six months or were unable to give informed consent. The intervention included administration of HIV and HCV point-of-care testing (POCT) using a blood sample, risk determination interview, comprehensive HIV and HCV education, and personalized post-test and risk mitigation counseling followed by referral to partnering health clinics. Results: Fifty participants were included in the final data analysis. Twenty-two participants (44%) had a reactive HCV POCT, and one participant had a reactive HIV POCT. Of the 94% of participants who reported illicit drug use, 74% reported injection drug use. Seventy-six percent (n = 38) qualified for PrEP. Pharmacist referrals were made for 28 participants and 71% were confirmed to have established care. Conclusion: Individuals experiencing homelessness are at an increased risk for acquiring HIV and HCV due to risky sexual behaviors and substance misuse. PrEP is underutilized in the U.S. and pharmacist involvement in the HIV and HCV care continuum may have a significant impact in improving linkage and retention in care of difficult to treat populations. © 2023	HCV; HIV; Homelessness; Pharmacy practice; Point-of-care testing	English	Netherlands	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Khosropour C.M.; Riley T.; Healy E.; Backus K.V.; Gomillia C.E.; Mena L.; Lockwood K.R.; Gordon F.M.; Means A.R.; Ward L.M.	Persistence in a pharmacist-led, same-day PrEP program in Mississippi: a mixed-methods study	BMC Public Health	-	-	-	14712458	10.1186/s12889-023-16072-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161933443&doi=10.1186%2fs12889-023-16072-1&partnerID=40&md5=0813dc68c915ec70303291d2197d97cf	Introduction: Mississippi has one of the highest rates of HIV in the United States but low PrEP uptake. Understanding patterns of PrEP use can improve PrEP initiation and persistence. Methods: This is a mixed-method evaluation of a PrEP program in Jackson, Mississippi. Between November 2018-December 2019, clients at high risk for HIV attending a non-clinical testing site were referred to a pharmacist for same-day PrEP initiation. The pharmacist provided a 90-day PrEP prescription and scheduled a follow-up clinical appointment within three months. We linked client records from this visit to electronic health records from the two largest PrEP clinics in Jackson to determine linkage into ongoing clinical care. We identified four distinct PrEP use patterns, which we used for qualitative interview sampling: 1) filled a prescription and linked into care within three months; 2) filled a prescription and linked into care after three months; 3) filled a prescription and never linked into care; and 4) never filled a prescription. In 2021, we purposively sampled patients in these four groups for individual interviews to ascertain barriers and facilitators to PrEP initiation and persistence, using guides informed by the Theory of Planned Behavior. Results: There were 121 clients evaluated for PrEP; all were given a prescription. One-third were less than 25 years old, 77% were Black, and 59% were cisgender men who have sex with men. One-quarter (26%) never filled their PrEP prescription, 44% picked up the prescription but never linked into clinical care, 12% linked into care at some point after three months (resulting in a gap in PrEP coverage), and 18% linked into care within 3 months. We interviewed 26 of 121 clients. Qualitative data revealed that cost, stigmas related to sexuality and HIV, misinformation about PrEP, and perceived side effects were barriers to uptake and persistence. Individuals' desire to stay healthy and the support of PrEP clinic staff were facilitators. Conclusions: The majority of individuals given a same-day PrEP prescription either never started PrEP or stopped PrEP within the first three months. Addressing noted barriers of stigma and misinformation and reducing structural barriers may increase PrEP initiation and persistence. © 2023, The Author(s). Article	2023	Khumalo, Philisiwe Ntombenhle; Mkhonta, Siphiwesihle Sibonisiwe; Kindandi, Kikanda; Matse, Sindy; Dlamini, Phinda Brian; Tukei, Vincent; Machekano, Rhoderick; Woelk, Godfrey	Uptake of and intention to use oral pre-exposure prophylaxis for HIV among pregnant and post-natal women in Eswatini: a cross-sectional survey.	Frontiers in Public Health	-	-	-	2673-3153	10.3389/frph.2023.1253384	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10641516	Introduction: In Eswatini, HIV incidence among women of childbearing age is 1.45%. Eswatini introduced oral pre-exposure prophylaxis (PrEP) for HIV prevention in 2016 and requires that all HIV-negative pregnant and post-natal women (PPW) visiting health care facilities be offered PrEP. Methods: Between September-November 2021, we conducted a survey among HIV-negative PPW from 16 purposively selected healthcare facilities in the Hhohho and Shiselweni regions in Eswatini. We interviewed consenting HIV-negative PPW using a structured questionnaire to collect data on PrEP knowledge, attitudes, intentions, and practices, as well as information on partner HIV status and stigma. Multivariate logistic regression was used to determine predictors of PrEP use and intention, adjusted for significant covariates. Results: Of 1,484 PPW women approached, 1,149 consented and were interviewed, of whom 704 (61.3%) were post-partum and 445 (38.7%) pregnant. The median age was 25 years Interquartile Range (IQR) = 21-30 years, with 533 (46.4%) 18-24 years old. Among the 1,149 women, 930 (80.7%) had ever heard about PrEP; 635 (55.3%) had knowledge about PrEP; 183 (15.9%) were currently using PrEP; and 285 (24.8%) had ever used PrEP. Increased odds of PrEP use were associated having HIV-positive male partner (aOR:7.76, 95%CI 3.53- 17.04); positive attitudes to PrEP (aOR:1.56, 95%CI: 1.02-2.40); and high self-efficacy (aOR:1.49, 95%CI:1.13-1.98). Among 864 women who never used PrEP, 569 (65.3%) intended to use PrEP in the future. Odds of intention to use PrEP were higher among women with low levels of education (aOR:2.23, 95% CI: 1.32-3.77); who ever heard about PrEP (aOR:1.69, 95%CI:1.12-2.56); and had high self-efficacy (aOR:1.57, 95% CI: 1.31-1.87). Regarding stigma, among all women, 759 (66%) either agreed or strongly agreed that people would think they have HIV if they were to use PrEP; 658 (57.3%) reported they would be labelled as having multiple sex partners; 468 (40.7%) reported that their partner would think they are having risky sex with other people. Of 102 women who had discontinued PrEP, a majority stopped due to side effects 32 (35.2%). Conclusion: Only about 50% of women had knowledge of PrEP, and PrEP uptake among PPW was low, though intention to use appeared high. More efforts to reduce stigma and promote PrEP use, including adequate information on side effects, are needed. Article	2023	Kim C.-M.; Zhao V.; Brito De Mello M.; Baggaley R.; Johnson C.C.; Spielman E.; Fairley C.K.; Zhang L.; de Vries H.; Klausner J.; Zhao R.; Ong J.J.	Determining the screening frequency for sexually transmitted infections for people who use HIV pre-exposure prophylaxis: a systematic review and meta-analysis	International Journal of Infectious Diseases	-	-	-	12019712	10.1016/j.ijid.2023.01.007	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148947230&doi=10.1016%2fj.ijid.2023.01.007&partnerID=40&md5=88f1c46743ccbfb1f4fa502d8f90b531	Objectives: Although the World Health Organization recommends 'frequent' screening of sexually transmitted infections (STI) for people who use pre-exposure prophylaxis for HIV, there is no evidence for optimal frequency. Methods: We searched five databases and used random-effects meta-analysis to calculate pooled estimates of STI test positivity. We narratively synthesized data on secondary outcomes, including adherence to recommended STI screening frequency and changes in STI epidemiology. Results: Of 7477 studies, we included 38 for the meta-analysis and 11 for secondary outcomes. With 2-3 monthly STI screening, the pooled positivity was 0.20 (95% confidence interval CI: 0.15-0.25) for chlamydia, 0.17 (95% CI: 0.12-0.22) for gonorrhea, and 0.07 (95% CI: 0.05-0.08) for syphilis. For chlamydia and gonorrhea, the positivity was approximately 50% and 75% lower, respectively, in studies that screened 4-6 monthly vs 2-3 monthly. There was no significant difference in the positivity for syphilis in studies that screened 4-6 monthly compared to 2-3 monthly. Adherence of clients to recommended screening frequency varied significantly (39-94%) depending on population and country. Modeling studies suggest more frequent STI screening could reduce incidence. Conclusion: Although more frequent STI screening could reduce delayed diagnoses and incidence, there remain significant knowledge gaps regarding the optimal STI screening frequency. © 2023 The Authors	HIV; Pre-exposure prophylaxis; PrEP; Screening; Sexually transmitted infections	English	Netherlands	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Review
Article	2023	Kim H.; Martin E.	Barriers to accessing pre-exposure prophylaxis among women experiencing intimate partner violence in the United States: a systematic literature review	AIDS Care	-	-	-	9540121	10.1080/09540121.2022.2121959	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138323743&doi=10.1080%2f09540121.2022.2121959&partnerID=40&md5=ec12c91e48a3e30af143c8f11f5e29c4	Women experiencing intimate partner violence (IPV) are at increased risk of human immunodeficiency virus (HIV) infection but have limited uptake of pre-exposure prophylaxis (PrEP). We systematically reviewed the existing evidence for the association between IPV and PrEP use, and barriers to accessing PrEP among women with a history of IPV in the United States. A keyword search of PubMed, CINAHL, ScienceDirect, and Web of Science for relevant articles within the United States from 2012 to 2022 yielded 133 articles, of which 15 were ultimately included in the analysis. A qualitative synthesis of evidence suggests that the association between IPV and PrEP awareness, PrEP acceptability, PrEP use, and HIV risk perception was contingent on the mediating or moderating effects of women's relationship status, social network characteristics, and the timing and types of IPV. Controlling partners' reactions and a lack of independent decision-making in the abusive relationship were salient barriers. The methodological quality of qualitative studies was high; however, there were important risks of bias among quantitative and mixed-method studies. Additional studies are needed to understand barriers to PrEP use among women with IPV in more diverse settings and to provide rigorous evidence for developing targeted HIV prevention strategies for them. © 2022 Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Kimball A.A.; Zhu W.; Leonard J.; Wei W.; Ravichandran I.; Tanner M.R.; Huang Y.-L.A.; Hoover K.W.; Kourtis A.P.	HIV Preexposure Prophylaxis Provision among Adolescents: 2018 to 2021	Pediatrics	-	-	-	314005	10.1542/peds.2023-062599	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175661466&doi=10.1542%2fpeds.2023-062599&partnerID=40&md5=f15a515267440c05ba9b4dd9dec36cfe	BACKGROUND AND OBJECTIVES: HIV preexposure prophylaxis (PrEP) is safe, effective, and was approved for adolescents in 2018. Adolescents and young adults make up 20% of HIV diagnoses in the United States. Our objective was to describe trends in adolescents prescribed PrEP during 2018 through 2021 and characteristics of these adolescents and their PrEP providers. METHODS: We identified adolescents aged 13 to 19 years with oral PrEP prescriptions during 2018 through 2021 in a national pharmacy database using a validated algorithm. We assessed trends by calculating the overall percentage change and estimated annual percentage change with 95% confidence intervals. We described characteristics of adolescents and their PrEP providers in 2021. We performed χ2 analyses to assess differences by sex and age group. RESULTS: The number of adolescents prescribed PrEP increased 76.2% from 2018 to 2021 (estimated annual percentage change: 18.0% 95% confidence interval: 16.6–19.5), despite decreases in 2020. We observed increases among all sex and age groups, with larger increases among older adolescents aged 18 to 19 years. The majority of the 6444 adolescents prescribed PrEP in 2021 were male (82.6%) and aged 18 to 19 years (87.8%). Among 2455 physician PrEP providers, 29.6% were pediatricians, with varying specialty distributions by adolescent age group (P < .001). Among the 217 pediatricians who prescribed PrEP to adolescents aged 13 to 17 years, 67.7% were general pediatricians. CONCLUSIONS: PrEP provision for adolescents has increased, largely among older and male adolescents. The availability of PrEP provides an important opportunity for pediatric providers to take an active role in HIV prevention. © 2023 American Academy of Pediatrics. All rights reserved. Article	2023	Kimball, Anne A.; Zhu, Weiming; Tanner, Mary R.; Iqbal, Kashif; Dominguez, Kenneth L.; Henny, Kirk D.; James, Anthony; Elamin, Fatima; Drezner, Kate; Bruce, Josh; Torres, Mary Evelyn; Price, Ashley; Hubbard, Stephanie J.; Hoover, Karen W.; Barrington, Darnell; Barrow, Genevieve; Cox, Mary Beth; Fox, Anthony; Gruber, Deann; Jennings, Jacky M.; Jessie-Hill, Deidra; Kharfen, Michael; Martin, Elaine; Pettigrew, Kenneth; Raiford, Jerris; Robinson, William T.; Shankar, Aparna; Tsoi, Benjamin; Wood, Lucila	The Effect of Navigation on Linkage to a PrEP Provider Among PrEP-Eligible Men who have Sex with Men in a U.S. Demonstration Project	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03931-y	https://www.proquest.com/scholarly-journals/effect-navigation-on-linkage-prep-provider-among/docview/2807779296/se-2?accountid=8113	Our objective is to evaluate the effect of navigation on linkage to a PrEP provider among PrEP-eligible men who have sex with men (MSM) in THRIVE, a demonstration project in seven U.S. public health jurisdictions during 2015–2020. We describe PrEP linkage and navigation use among MSM in THRIVE. We performed multivariable probit regression modeling, controlling for demographic covariates, to estimate the association between navigation and linkage to a PrEP provider among MSM and to assess for disparities in linkage to PrEP among MSM who used navigation. Among 9538 PrEP-eligible MSM, 51.3% used navigation and 53.8% were linked to PrEP. From the three sites where navigation was optional and the main form of PrEP support, MSM who used navigation were 16.69 times (95% CI 13.07–21.32) more likely to link to PrEP compared with MSM who did not use navigation. Among 4895 MSM who used navigation from all sites, Black MSM were 21% less likely to link to PrEP compared with White MSM (aRR 0.79; 95% CI 0.74–0.83). Navigation is a promising strategy for improving uptake of PrEP among U.S. MSM, but disparities persist. Addressing the underlying causes of inequities will be important to end the HIV epidemic. Article	2023	Kimball, Anne A.; Zhu, Weiming; Yu, Lei; Tanner, Mary R.; Iqbal, Kashif; Dominguez, Kenneth L.; Shankar, Aparna; Drezner, Kate; Musgrove, Karen; Mayes, Eric; Robinson, William T.; Schumacher, Christina; Delaney, Kevin P.; Hoover, Karen W.	Benefits of Frequent HIV Testing in the THRIVE Demonstration Project: United States, 2015-2020.	American Journal of Public Health	-	-	-	1541-0048 0090-0036	10.2105/AJPH.2023.307341	https://pubmed.ncbi.nlm.nih.gov/37410983/	Objectives. To describe HIV testing among clients in the Targeted Highly Effective Interventions to Reverse the HIV Epidemic (THRIVE) demonstration project and evaluate testing frequency. Methods. We identified factors associated with an average testing frequency of 180 days or less compared with more than 180 days using adjusted Poisson regression models. We performed the Kaplan-Meier survival analysis to compare time to diagnosis by testing frequency. Results. Among 5710 clients with 2 or more tests and no preexposure prophylaxis (PrEP) prescription, 42.4% were tested frequently. Black/African American clients were 21% less likely and Hispanic/Latino clients were 18% less likely to be tested frequently than were White clients. Among 71 Black/African American and Hispanic/Latino cisgender men who have sex with men and transgender women with HIV diagnoses, those with frequent testing had a median time to diagnosis of 137 days, with a diagnostic testing yield of 1.5% compared with those tested less frequently, with 559 days and 0.8% yield. Conclusions. HIV testing at least every 6 months resulted in earlier HIV diagnosis and was efficient. Persons in communities with high rates of HIV who are not on PrEP can benefit from frequent testing, and collaborative community approaches may help reduce disparities. Article	2023	Kincaid, Ross; Gibbs, Jo; Dalrymple, Jenny; Henderson, Lindsay; Frankis, Jamie; Estcourt, Claudia	Delivering HIV prevention medication online: Findings from a qualitative study exploring the acceptability of an online HIV pre-exposure prophylaxis (PrEP) care pathway among service users and healthcare professionals.	Digit Health	-	-	-	2055-2076	10.1177/20552076231217816	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10693220	Objective: Eliminating HIV transmission worldwide could become a reality with the advent of HIV pre-exposure prophylaxis (PrEP) where people take HIV medication to prevent HIV acquisition. Incorporating digital health into PrEP provision could help services scale up and meet increasing demand. We aimed to explore the prospective acceptability of a novel online PrEP care pathway (the ePrEP clinic) among PrEP users and healthcare professionals. The ePrEP clinic is composed of online postal self-sampling for HIV and other sexually transmitted infections, an online consultation, and remote medication provision. Methods: We conducted semi-structured interviews with 15 PrEP users recruited from a large sexual health service and online cohort, and focus groups with nine healthcare professionals from the same sexual health service (May to December 2021). We analysed data using framework analysis. Results: Participants found the ePrEP clinic highly acceptable, anticipating that it would provide convenience, empower PrEP users, and increase capacity within sexual health services. The need for blood self-sampling was a considerable barrier for some. Participants anticipated that the ePrEP clinic would be appropriate for established PrEP users with adequate digital health literacy and no medically significant conditions requiring in-clinic monitoring. Participants highlighted the need for support, including access to in-clinic care, and the integration of the ePrEP clinic within existing services. Conclusions: Our findings provide clear justification for the development of the ePrEP clinic as an addition to in-clinic PrEP care pathways and provide useful insights for those developing digital services for other conditions incorporating testing, consultations, and prescribing. Article	2023	King, Helen L.; Park, Eunsol; Blanchard, Hannah; Alvarez, Kristin S.; Harms, Michael; Broker, Paul	Implementation of Sexual Health Curriculum Series: Educational Initiative to Increase STI Screening and Treatment in Dallas, Texas.	Journal of Community Health	-	-	-	1573-3610 0094-5145	10.1007/s10900-023-01224-6	https://pubmed.ncbi.nlm.nih.gov/37119350/	OBJECTIVE: A new monthly virtual education curriculum on sexual healthcare was launched in 2021. This is an analysis of the pilot education series designed to increase primary care providers' knowledge of sexual health best practices including taking thorough sexual histories, STI screening and treatment, and PrEP prescribing. METHODS: A Sexual Health Curriculum Series was developed as part of a quality improvement initiative at a large urban safety-net hospital in Dallas County, Texas. Didactic sessions were administered to primary care providers and staff via a virtual meeting platform once a month from May 2021 to April 2022. RESULTS: A total of 52 participants completed the pre-series survey, and 21 participants filled out the final post-series survey. 70% of respondents who completed the post-series survey reported that they learned new information that was incorporated into their practice. The average percentage correct on individual pre-session surveys was 60% compared to 63% on individual post-session surveys (p = 0.03). CONCLUSION: Sexual health education is an important tool to help primary care providers adhere to sexual health best practices. There is a need for ongoing implementation of innovative strategies to improve knowledge and adherence to sexual health best practices. A sexual health curriculum may be effective in helping primary providers recognize patients at increased risk and apply evidence-based guidelines to their practices. Article	2023	Kinuthia, J; Dettinger, JC; Stern, J; Ngumbau, N; Ochieng, B; Gómez, L; Abuna, F; Watoyi, S; Marwa, M; Odinga, D; Wagner, AD; Richardson, BA; Pintye, J; Baeten, JM; John-Stewart, G	Risk-based versus universal PrEP delivery during pregnancy: a cluster randomized trial in Western Kenya from 2018 to 2019	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26061	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02526064/full	INTRODUCTION: Integrating pre-exposure prophylaxis (PrEP) delivery for pregnant and postpartum women within maternal and child health (MCH) clinics is feasible and acceptable. It is unknown whether a risk-guided model would facilitate appropriate PrEP use among MCH attendees better than universally offering PrEP. METHODS: The PrEP Implementation for Mothers in Antenatal Care (PrIMA) study was a cluster randomized trial to assess two models for PrEP delivery among pregnant women seeking routine MCH care at 20 public clinics in Kenya between January 2018 and July 2019 (NCT03070600). In the Universal arm, all participants received PrEP counselling and self-selected whether to initiate PrEP. In the Targeted arm, participants underwent an HIV risk assessment, including an objective risk-scoring tool and an offer of HIV self-tests for at-home partner testing; those determined to be at high risk received a PrEP offer. Participants were followed through 9 months postpartum. Primary outcomes included incident HIV and appropriate PrEP use (defined as PrEP uptake among those at high risk and no PrEP uptake for those not at risk). Outcomes were compared using intention-to-treat analyses, adjusting for baseline HIV risk and marital status. RESULTS: Among 4447 women enrolled, the median age was 24.0 years (interquartile range IQR: 20.9, 28.3), and most were married (84.8%). The median gestational age at enrolment was 24 weeks (IQR: 20, 30). Women in the Targeted arm were more likely to be at high risk for HIV acquisition at baseline (51.6% vs. 33.3%). During 4638 person-years (p-yr) of follow-up, there were 16 maternal HIV infections with no difference in maternal HIV incidence between arms: 0.31/100 p-yr (95% CI: 0.15, 0.65) Targeted and 0.38/100p-yr (95% CI: 0.20, 0.73) Universal (adjusted relative risk aRR: 0.85 CI: 0.28, 2.55). There was no significant difference in the frequency of appropriate PrEP use between the arms (68.2% vs. 59.1% in Targeted vs. Universal, respectively) (aRR: 1.03 CI: 0.96, 1.10). CONCLUSIONS: Given comparable maternal HIV incidence and PrEP uptake in Universal and Targeted approaches, and the simplicity that universal PrEP offers, our findings suggest that universal PrEP counselling is optimal for integrating PrEP in MCH systems. Article	2023	Kinvig, Hannah; Rajoli, Rajith K. R.; Pertinez, Henry; Vora, Lalitkumar K.; Volpe-Zanutto, Fabiana; Donnelly, Ryan F.; Rannard, Steve; Flexner, Charles; Siccardi, Marco; Owen, Andrew	Physiologically Based Pharmacokinetic Modelling of Cabotegravir Microarray Patches in Rats and Humans.	Pharmaceutics	-	-	-	1999-4923	10.3390/pharmaceutics15122709	https://pubmed.ncbi.nlm.nih.gov/38140050/	Microarray patches (MAPs) are currently under investigation as a self-administered, pain-free alternative used to achieve long-acting (LA) drug delivery. Cabotegravir is a potent antiretroviral that has demonstrated superior results over current pre-exposure prophylaxis (PrEP) regimens. This study aimed to apply physiologically based pharmacokinetic (PBPK) modelling to describe the pharmacokinetics of the dissolving bilayer MAP platform and predict the optimal dosing strategies for a once-weekly cabotegravir MAP. A mathematical description of a MAP was implemented into a PBPK model, and empirical models were utilised for parameter estimation. The intradermal PBPK model was verified against previously published in vivo rat data for intramuscular (IM) and MAP administration, and in vivo human data for the IM administration of LA cabotegravir. The verified model was utilised for the prediction of 300 mg, 150 mg and 75 mg once-weekly MAP administration in humans. Cabotegravir plasma concentrations >4 × protein-adjusted 90% inhibitory concentration (PA-IC(90)) (0.664 µg/mL) and >8 × PA-IC(90) (1.33 µg/mL) were set as targets. The 75 mg, 150 mg and 300 mg once-weekly cabotegravir MAP regimens were predicted to sustain plasma concentrations >4 × PA-IC(90,) while the 300 mg and 150 mg regimens achieved plasma concentrations >8 × PA-IC(90). These data demonstrate the potential for a once-weekly cabotegravir MAP using practical patch sizes for humans and inform the further development of cabotegravir MAPs for HIV PrEP. Online HIV prophylaxis delivery: Protocol for the ePrEP Kenya pilot study	Frontiers in Public Health	-	-	-	22962565	10.3389/fpubh.2023.1054559	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150196838&doi=10.3389%2ffpubh.2023.1054559&partnerID=40&md5=b76418c1fa56fde32a64dc94a798667e	Background: Online pharmacies in Kenya provide sexual and reproductive health products (e.g., HIV self-testing, contraception) and could be leveraged to increase the reach of HIV pre-exposure and post-exposure prophylaxis (PrEP/PEP) to populations who do not frequently attend health facilities. To date, evidence is limited for operationalizing online PrEP/PEP delivery and the type of populations reached with this differential service delivery model. Methods: The ePrEP Kenya Pilot will deliver daily oral PrEP and PEP via MYDAWA, a private online pharmacy retailer, to clients in Nairobi for 18 months. Potential clients will obtain information about PrEP/PEP on MYDAWA's sexual wellness page and self-screen for HIV risk. Individuals ≥18 years, identified as at HIV risk, and willing to pay for a blood-based HIV self-test and PrEP/PEP delivery will be eligible for enrollment. To continue with online PrEP/PEP initiation, eligible clients will purchase a blood-based HIV self-test for 250 KES (~USD 2) delivered to their setting of choice for 99 KES (~USD 1), upload an image of their self-test result, and attend a telemedicine visit with a MYDAWA provider. During the telemedicine visit, providers will screen clients for PrEP/PEP eligibility, including clinical concerns (e.g., kidney disease), discuss self-test results, and complete counseling on PrEP/PEP use and safety. Providers will refer clients who self-test HIV positive or report any existing medical conditions to the appropriate services at healthcare facilities that meet their preferences. Eligible clients will be prescribed PrEP (30-day PrEP supply at initiation; 90-day PrEP supply at follow-up visits) or PEP (28-day supply) for free and have it delivered for 99 KES (~USD 1). We will measure PrEP and PEP initiation among eligible clients, PEP-to-PrEP transition, PrEP continuation, and implementation outcomes (e.g., feasibility, acceptability, and costs). Discussion: Establishing pathways to increase PrEP and PEP access is crucial to help curb new HIV infections in settings with high HIV prevalence. The findings from this study will provide evidence on the implementation of online pharmacy PrEP and PEP service delivery that can help inform guidelines in Kenya and similar settings. Article	2023	Kitonsa J.; Kansiime S.; Kusemererwa S.; Onyango M.; Nayiga B.; Kabarambi A.; Mugisha J.O.; Kaleebu P.; Ruzagira E.	Changes in self-reported risky sexual behaviour indicators among adults receiving regular risk reduction counselling and optional initiation of pre-exposure prophylaxis in an HIV vaccine preparedness study in Masaka, Uganda	Global Health Action	-	-	-	16549880	10.1080/16549716.2023.2242672	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166749842&doi=10.1080%2f16549716.2023.2242672&partnerID=40&md5=7a211236939c7cf2826b52fc280c2b02	Background: HIV risk reduction counselling may reduce risk-taking behaviours. Yet, concerns remain about risk compensation among individuals initiating pre-exposure prophylaxis (PrEP). Objective: We assessed changes in risky sexual behaviour indicators among HIV vaccine preparedness study participants who received regular risk reduction counselling and referral for PrEP in Masaka, Uganda. Methods: Adults (18–39 years) at high risk of HIV infection were enrolled in the study between July 2018 and December 2021. Data were collected on socio-demographic factors (baseline) and self-reported sexual risk behaviours (baseline, six monthly). HIV testing and risk-reduction counselling and referral for PrEP were done quarterly. Participants who had completed at least 1 year of follow-up were included in the analysis. Proportional differences and McNemar chi-square tests were used to assess changes in the prevalence of self-reported risky sexual behaviour indicators between baseline and 1 year. Logistic regression was used to assess the predictors of unchanged/increased HIV risk at 1 year. Results: Three hundred participants 132 (44%) females, 152 (51%) aged ≤24 years were included in this analysis. Eighty-one (27%) participants initiated PrEP at 1 year. Compared to baseline, there were significant reductions in the prevalence of the following self-reported HIV risk indicators at 1 year (overall, among non-PrEP initiators, and among PrEP initiators): transactional sex, ≥6 sexual partners, unprotected sex with ≥3 partners, sex while drunk, and sexually transmitted infection diagnosis/treatment. Percentage differences ranged from 10% for individuals reporting at least six sexual partners to 30% for those reporting unprotected sex with three or fewer sexual partners. There was weak evidence of association between female gender and unchanged/increased HIV risk at 1 year (adjusted OR: 1.35, 95% CI (0.84–2.17)). No other indicators, including PrEP use, were associated with unchanged/increased HIV risk at 1 year. Conclusion: Regular risk-reduction counselling may reduce risky sexual behaviour, while PrEP initiation may not lead to risk compensation. © 2023 The Author(s). Article	2023	Kleinmann, W; Warncke, K; Adhikari, EH	High rates of HIV PrEP prescriptions after standardized counseling of high-risk pregnant patients	American Journal of Obstetrics and Gynecology	-	-	-	0002-9378	10.1016/j.ajog.2022.11.715	https://www.ajog.org/article/S0002-9378(22)01599-X/fulltext	Objective: HIV pre-exposure prophylaxis (PrEP) counseling and uptake in pregnancy is historically limited, although rising sexually transmitted infection rates suggest a critical need for an HIV prevention strategy in this population. Historically, our practice was to provide PrEP to individuals with known HIV-positive partners in pregnancy. We expanded to implement standardized HIV PrEP counseling targeted to high-risk pregnant patients treated for syphilis in an ambulatory prenatal clinic. Study Design: We prospectively studied HIV-negative pregnant patients receiving ambulatory prenatal care, including treatment for syphilis, at an urban, public hospital system. At visits for penicillin treatment, standardized PrEP counseling was conducted (Table 1). Repeat counseling was offered for patients not accepting PrEP at the initial opportunity. Acceptance was documented, with a 3-month prescription given to those who accepted. Medication dispensation was verified by linked pharmacy record review. We compared characteristics of those who accepted versus declined PrEP. Results: From March 3rd through May 31st 2022, 27 patients met inclusion criteria, received PrEP counseling, and were offered PrEP. Of these, 14 (52%) accepted while 13 (48%) declined. Among 16 non-Hispanic Black, 9 Hispanic White, and 2 non-Hispanic White patients offered PrEP, acceptance rates were 10 (63%), 4 (44%), and 0, respectively. Gestational age and number of counseling sessions were similar. Among the 14 pregnant patients who accepted PrEP, 5 (36%) prescriptions were dispensed from our ambulatory pharmacy to 1 Hispanic White patient and 4 non-Hispanic Black patients. Conclusion: In an urban safety-net hospital, a majority of high-risk pregnant patients who received standardized HIV PrEP counseling during treatment for syphilis accepted PrEP. Literature suggests 2.1% of all women eligible for PrEP have a prescription. Standardized PrEP counseling targeted to the highest-risk patients may increase frequency of PrEP prescriptions. Article	2023	Kluisza L.; Attoh-Okine N.-D.; Nguyen N.; Robbins R.N.; Leu C.-S.; Liotta L.; Morrison C.; Dolezal C.; Remien R.H.; Wiznia A.; Abrams E.J.; Mellins C.A.	Condomless Sex Among HIV-affected AYA in an Era of Undetectable = Untransmittable and Pre-exposure Prophylaxis	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04020-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148446324&doi=10.1007%2fs10461-023-04020-4&partnerID=40&md5=78dd6f58f1c1e1a92b1038d25c10c576	Given poor adherence to treatment and prevention techniques, condomless sex jeopardizes adolescents and young adults (AYA) with perinatally-acquired HIV-infection (PHIV) or perinatal HIV-exposure who are uninfected (PHEU). We examined condomless sex and its association with PHIV-status, psychiatric disorder, and sociodemographics. Data come from a US-based study of primarily Black and Latinx AYAPHIV and AYAPHEU (N = 340). Linear regression models examined condomless sex longitudinally by PHIV-status, psychiatric trajectories, and sociodemographics. Rates of viremia (AYAPHIV) and PrEP use (AYAPHEU) were assessed. 56% of participants reported recent condomless sex, with higher prevalence among: AYAPHEU vs. AYAPHIV (24% vs. 19%, p = 0.017); Latinx vs. non-Latinx AYA (25% vs. 17%, p = 0.014); and AYA with increasing psychiatric comorbidity (44%) and consistent anxiety (23%) vs. low-level disorder (17%; p < 0.05). AYAPHIV had high rates of unsuppressed viral load and AYAPHEU limited PrEP use. Preventing condomless sex is challenging within AYAPHIV and AYAPHEU. Developing accessible combination HIV/mental health interventions is much-needed. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Knight D.; Saleem H.T.; Stockman J.K.; Willie T.C.	Experiences of Black Women in the United States Along the PrEP Care Continuum: A Scoping Review	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03960-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145907470&doi=10.1007%2fs10461-022-03960-7&partnerID=40&md5=7a61f01bf77e2aa44e857735cee2f6ed	Black women are disproportionately affected by HIV in the U.S. PrEP could decrease the risk of acquiring HIV. This scoping review seeks to understand the experiences of Black women along the PrEP Care Continuum. We searched PubMed, Embase, PsycInfo, and Google Scholar to identify peer-reviewed studies published between July 16, 2012, and December 15, 2021. Articles were included if they discussed PrEP among Black women in the U.S. Two authors screened titles/abstracts and full-text articles. One author extracted and thematically summarized findings (n = 33). Black women reported low levels of PrEP awareness and knowledge, and negative experiences with providers. Women also experienced negative perceptions of PrEP from their social networks, stigma, and mistrust. Future research should focus on helping Black women to overcome PrEP-related barriers. Additionally, future research should further examine barriers to PrEP initiation, adherence, and retention for Black women, as only three studies discussed these aspects of the Continuum. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Knittel A.K.; Jackson J.B.; Swartzwelder R.A.; Ferguson E.G.; Hulshult H.; Adimora A.A.	PrEP and HIV prevention decision-making among social network members of women who have experienced incarceration: a qualitative study	AIDS Care	-	-	-	9540121	10.1080/09540121.2023.2182872	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150635718&doi=10.1080%2f09540121.2023.2182872&partnerID=40&md5=5f7718dd991d710edf41fea288fb14cf	Incarceration and HIV are a syndemic for US women, yet very few women who have experienced incarceration use pre-exposure prophylaxis (PrEP) for HIV. We conducted semi-structured interviews with 32 participants recruited by women who have experienced incarceration from their social networks, informed by the modified social ecological model for PrEP. Emergent themes from the interviews included individual-level (low personal HIV risk assessment, personal responsibility for HIV prevention, and decisions in addiction versus recovery), network-level (influential sex partners and the importance of trust, supportive treatment peers, and high-risk but indifferent drug use networks), community-level (stigma, and mitigation of stigma in supportive substance use disorder treatment environments), and public policy-level (incarceration and PrEP cost and access) determinants. PrEP interventions for women who have experienced incarceration and their networks will need to incorporate contingency planning into HIV risk assessment, navigate complex network dynamics, and be situated in trusted contexts to address structural barriers. © 2023 Informa UK Limited, trading as Taylor & Francis Group.	incarceration; Pre-exposure prophylaxis; women	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Knittel, Andrea K; Ferguson, Ella G; Jackson, Jamie B; Adimora, Adaora A	The influence of social relationships on PrEP attitudes among women with incarceration experience in the Southeastern USA	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2021.2023760	https://www.proquest.com/scholarly-journals/influence-social-relationships-on-prep-attitudes/docview/2760022439/se-2?accountid=8113	Women who have experienced incarceration face a disproportionately high risk of acquiring HIV. Despite efficacy of pre-exposure prophylaxis (PrEP) for HIV, very few women with incarceration histories are using PrEP. Our objective was to learn how sexual, drug-use and social relationships shape decisions about PrEP among women who have experienced incarceration. We used an inductive approach to analyse data from four focus groups undertaken with women who had previously experienced incarceration recruited from three community-based organisations. We identified public policy (medical distrust, lack of prevention in prisons and jails, and cost and coverage of PrEP); community (incarceration stigma, gossip as prevention); social and sexual network (positive peer and parenting relationships, distrust of sexual partners, and networks as a source of risk); and individual-level (active addiction or recovery, change after incarceration, and medical concerns) factors influencing the use of PrEP. Actions and interventions to improve PrEP uptake among women who have experienced incarceration must take account of the multilevel context of HIV prevention decisions. HIV Prevention and Care Among Black Cisgender Sexual Minority Men and Transgender Women: Protocol for an HIV Status-Neutral Cohort Study Using an Observational-Implementation Hybrid Approach.	JMIR Research Protocols	-	-	-	1929-0748	10.2196/48548	https://pubmed.ncbi.nlm.nih.gov/38039075/	BACKGROUND: Black cisgender gay, bisexual, and other sexual minority men (SMM) and transgender women (TW) continue to be heavily affected by HIV. Further research is needed to better understand HIV prevention and care outcomes in this population. In particular, there is a need for research examining the impact of substance use and sleep health on HIV prevention and treatment outcomes among Black SMM and TW. OBJECTIVE: This paper outlines the study methods being used in the recently launched follow-up study to the Neighborhoods and Networks (N2) study, which we refer to as N2 Part 2 (N2P2). N2P2 aims to address this gap in the literature, build off the findings of the original N2 study, and identify socioenvironmental determinants of health, including whether neighborhood and network factors mediate and moderate these relationships. METHODS: Building on the N2 cohort study in Chicago from 2018 to 2022, N2P2 used a prospective longitudinal cohort design and an observational-implementation hybrid approach. With sustained high levels of community engagement, we aim to recruit a new sample of 600 Black SMM and TW participants residing in the Chicago metropolitan statistical area. Participants are asked to participate in 3 study visits across an 18-month study period (1 visit every 9 months). Four different forms of data are collected per wave: (1) an in-person survey, (2) biological specimen collection, (3) a daily remote ecological momentary assessment for 14 days after each study visit, and (4) data from electronic health records. These forms of data collection continue to assess neighborhood and network factors and specifically explore substance use, sleep, immune function, obesity, and the implementation of potential interventions that address relevant constructs (eg, alcohol use and pre-exposure prophylaxis adherence). RESULTS: The N2P2 study was funded in August 2021 by the National Institute of Drug Abuse (R01DA054553 and R21DA053156) and National Heart, Lung, and Blood Institute (R01HL160325). This study was launched in November 2022. Recruitment and enrollment for the first wave of data collection are currently ongoing. CONCLUSIONS: The N2P2 study is applying innovative methods to comprehensively explore the impacts of substance use and sleep health on HIV-related outcomes among an HIV status-neutral cohort of Black SMM and TW in Chicago. This study is applying an observational-implementation hybrid design to help us achieve findings that support rapid translation, a critical priority among populations such as Black SMM and TW that experience long-standing inequities with regard to HIV and other health-related outcomes. N2P2 will directly build off the findings that have resulted from the original N2 study among Black SMM and TW in Chicago. These findings provide a better understanding of multilevel (eg, individual, network, and neighborhood) factors that contribute to HIV-related outcomes and viral suppression among Black SMM and TW. Article	2023	Kohler S.; Dalal S.; Hettema A.; Matse S.; Bärnighausen T.; Paul N.	Out-of-pocket Expenses and Time Spent on Clinic Visits Among HIV Pre-exposure Prophylaxis Users and Other Clinic Attendees in Eswatini	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03859-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139678372&doi=10.1007%2fs10461-022-03859-3&partnerID=40&md5=348574fe7444e7648823688eacdad6e4	User costs constitute a barrier to the uptake of HIV pre-exposure prophylaxis (PrEP), but their magnitude appears rarely assessed. In this prospective observational study, we assessed self-reported out-of-pocket expenses (OOPE) and time spent on clinic visits during a PrEP demonstration project in Eswatini. At six public primary care clinics, 240 PrEP users and other clinic attendees were interviewed after a clinic visit. Among the 79.2% of clinic attendees reporting any medical OOPE (e.g., expenses for consultations or drugs) and/or non-medical OOPE (e.g., expenses for transport, food, or phone use), the median total OOPE was $1.36 (IQR 0.91–1.96). Non-medical OOPE occurred mostly due to transport expenses. The median travel time for a clinic visit was 1.0 h (IQR 0.67–2.0). The median time spent in the clinic was 2.0 h (IQR 1.15–3.0). The median opportunity cost of a clinic visit was $7.54 (IQR 5.42–11) when valuing time spent on a clinic visit with Eswatini's per-capita gross domestic product. Our findings can guide measures to reduce the user costs of PrEP in Eswatini and other contexts in which oral PrEP is provided through health care facilities. © 2022, The Author(s). Theses and Dissertations	2023	Kolstee, Johann	Changes to the perception of HIV prevention strategies, risks, and norms during rapid PrEP uptake among gay and bisexual men in Australia	-	-	University of New South Wales	-	NA	https://doi.org/10.26190/unsworks/25041	http://hdl.handle.net/1959.4/101334	Men who have sex with men still comprise most new HIV cases in Australia. Condoms were the main HIV risk reduction strategy used for most of the HIV epidemic. Over the past decade, gay and bisexual men (GBM) have adopted a range of HIV risk reduction strategies, including PrEP. These changes have shifted HIV prevention norms in place for decades. In this thesis, I set out to understand how these changes affected how GBM negotiated sex and HIV risk, with a particular focus on GBM who struggle to use an effective HIV prevention method, despite the broader range available. A community-based, social public health approach was taken, with a focus on understanding the impact of PrEP practices and recommendations to improve health promotion. National survey data were analysed on changing attitudes to condoms among GBM. Cohort study data were used to identify the characteristics of GBM who did not consistently use HIV risk reduction strategies. Qualitative interviews were undertaken with GBM in Sydney to explore why some do not use a HIV risk reduction strategy and changing practices of HIV and PrEP disclosure. The survey data found consistently negative attitudes towards condoms among GBM and that it had become harder to discuss condom use with partners as PrEP use increased. Men who did not consistently use any HIV prevention strategy were younger, less educated, preferred receptive anal intercourse, and were less socially engaged with GBM. In qualitative analysis, the characteristics of encounters that featured little or no HIV risk reduction included: familiarity and trusting partners; pleasure and intoxication; expectations that partners were using PrEP or HIV treatment as prevention; and sometimes feelings of inevitability about acquiring HIV. In the context of increasing PrEP use, clear expectations about HIV and PrEP disclosure had not yet emerged, with some GBM only disclosing online and others not at all. The rapid uptake of PrEP has changed the way that GBM negotiate sex and HIV risk. As condoms have become harder to discuss with partners and no clear norms about PrEP disclosure have yet emerged, negotiating risk has become more complicated. GBM not using any HIV risk reduction strategy should be supported to adopt one compatible with situations in which they experience risk. This is important to increase community knowledge about effective HIV prevention strategies and support GBM to negotiate sex when there are no clear norms or expectations about disclosure. Article	2023	Kolstee, Johann; Prestage, Garrett; Philpot, Steven; Bavinton, Benjamin; Hammoud, Mohamed; Keen, Phillip; Holt, Martin	The effect of pre-exposure prophylaxis (PrEP) on negotiating casual sex between gay men: disclosure, assumptions, and communication.	Sexual Health	-	-	-	1449-8987	10.1071/SH22095	https://dx.doi.org/10.1071/SH22095	BACKGROUND: The disclosure of HIV status and pre-exposure prophylaxis (PrEP) use can be important in the negotiation of safe sex. With the rapid uptake of PrEP in Australia, norms and expectations about discussion and disclosure may have changed. METHODS: We explored the disclosure of PrEP use, HIV status and communication with sex partners by HIV-negative gay men in Sydney, Australia. We conducted semi-structured interviews from October 2017 to May 2018 and analysed data using a codebook thematic analysis approach. RESULTS: Participants had a variety of expectations of what they should tell their partners and what they expected in return. For some participants, PrEP had negated the need for any discussion about HIV. Many participants assumed their partners would find information about their HIV status or PrEP use on their online profiles or that partners would ask, if necessary. CONCLUSIONS: Building a stronger, shared understanding among gay men that disclosure and discussion no longer automatically occur before sexual encounters may be useful.	casual sex, communication, gay men, HIV disclosure, HIV prevention, HIV risk reduction, HIV status, PrEP. Article	2023	Konopasky, Abigail; Gadegbeku, Annette B.; McCrea, Leon; McDonald, Paige; Corr, Patrick G.; Ward, Maranda C.	Teaching at the Convergence of Pandemics and Historically Excluded Patient Populations: The Challenges, and Importance, of Culturally Responsive Communication.	Teaching and Learning in Medicine	-	-	-	1532-8015 1040-1334	10.1080/10401334.2023.2245382	https://pubmed.ncbi.nlm.nih.gov/37615428/	Issue: Historically excluded patient populations-particularly racial, ethnic, and sexually and gender minoritized people-experience gross inequities in health, worsened by the HIV and COVID-19 pandemics. Culturally responsive communication (CRC) is a vital tool health professionals can use to address these inequities. Yet, CRC can be challenging to teach, particularly during pandemics. The authors argue that pandemics magnify the powerful intersecting oppressions of heterosexism, racism, transphobia, nationalism, and sexism, essentially targeting Othered bodies for dying, a phenomenon known as necropolitics. Evidence: Five aspects of pandemics make teaching CRC more difficult and, because of the magnification of necropolitics, more critical. First, pandemics heighten teachers' and learners' personal frailties, engendering worries about their own and their families' health and increasing cognitive load. This can make it difficult for them to embrace the discomfort required of CRC, particularly when an increased patient load is squeezing instructional time. Second, guidelines for HIV and COVID-19 testing, prevention, and treatment are ever-changing, often faster than the pace of curriculum development and instructor professional development. Third, for instructors who may already be stretched thin, it is challenging to prepare learners for the variability in how their future practice contexts may address HIV and COVID-19 and, further, how to take a social justice approach to assess and resist the distinct equity issues of each of these contexts. Fourth, pandemics cause uncertain access to patient information about testing, disease status, and vaccination or pre-exposure prophylaxis. This worsens already disparate outcomes for minoritized patients and adds to the complexity of CRC curricula. Finally, virtual care is more prevalent in pandemics and teaching CRC in online contexts can be difficult. Implications: To address these challenges, we adopt the Dimensionality and R4P Health Equity Framework as a tool for evaluating academic programs for CRC so that it remains robust amidst pandemics. This tool addresses the varied social positions and identities (i.e., "dimensions") that present different opportunities for health. We offer specific evaluation questions programs can ask and approaches they can take to (a) redress past harms through removing existing racist, heteronormative and transphobic structures and repairing the damage they have done; (b) plan for a more equitable future by restructuring via policy and organizational change and providing programs that address intersectional disadvantage; and (c) critically evaluate the present by remediating current damage immediately until restructuring efforts are fully functional. As Martin Luther King, Jr. stated, "Of all the forms of inequality, injustice in healthcare is the most shocking and inhuman because it often results in physical death." It is our imperative to teach CRC with intentionality; otherwise we will support necropolitics as we continue to condone disproportionate morbidity and mortality for racialized and queer bodies. Article	2023	Koss, CA; Ayieko, J; Kabami, J; Balzer, LB; Kakande, E; Sunday, H; Nyabuti, M; Wafula, E; Shade, S; Biira, E; Opel, F; Atuhaire, HN; Okochi, H; Ogachi, S; Gandhi, M; Bacon, MC; Bukusi, EA; Chamie, G; Petersen, ML; Kamya, MR; Havlir, DV	Dynamic choice HIV prevention intervention at outpatient departments in rural Kenya and Uganda: a randomized trial	AIDS	-	-	-	1473-5571 0269-9370	10.1097/QAD.0000000000003763	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02618311/full	OBJECTIVE: HIV prevention service delivery models that offer product choices, and the option to change preferences over time, may increase prevention coverage. Outpatient departments in sub-Saharan Africa diagnose a high proportion of new HIV infections, but are an understudied entry point to biomedical prevention. DESIGN: Individually randomized trial of dynamic choice HIV prevention (DCP) intervention vs. standard-of-care (SOC) among individuals with current/anticipated HIV exposure risk at outpatient departments in rural Kenya and Uganda (SEARCH; NCT04810650). METHODS: Our DCP intervention included 1) product choice (oral pre-exposure prophylaxis PrEP or post-exposure prophylaxis PEP) with option to switch over time, 2) HIV provider- or self-testing, 3) service location choice (community vs. clinic-based), 4) provider training on patient-centered care. Primary outcome was proportion of follow-up covered by PrEP/PEP over 48 weeks assessed via self-report. RESULTS: We enrolled 403 participants (61% women; median 27 years, IQR 22,37). In the DCP arm, 86% ever chose PrEP, 15% ever chose PEP over 48 weeks; selection of HIV self-testing increased from 26% to 51% and of out-of-facility visits from 8% to 52%. Among 376/403 (93%) with outcomes ascertained, time covered by PrEP/PEP was higher in DCP (47.5%) vs. SOC (18.3%); difference=29.2% (95%CI:22.7-35.7%; p < 0.001). Effects were similar among women and men (28.2% and 31.0% higher coverage in DCP, respectively) and larger during periods of self-reported HIV risk (DCP 64.9% vs. SOC 26.3%; difference=38.6%; 95%CI:31.0-46.2%; p < 0.001). CONCLUSION: A dynamic choice HIV prevention intervention resulted in two-fold greater time covered by biomedical prevention products compared to standard-of-care in general outpatient departments in eastern Africa.	*Human immunodeficiency virus infection; *Kenya; *Uganda; *outpatient department; Adult; Article; Controlled study; Female; Follow up; Health care delivery; Health care quality; Human; Major clinical study; Male; Outcome assessment; Patient care; Post exposure prophylaxis; Prevention; Pre-exposure prophylaxis; Randomized controlled trial; Self report; Self-testing	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Krakower D.S.; Lieberman M.; Marino M.; Hwang J.; Mayer K.H.; Marcus J.L.	Implementing an Automated Prediction Model to Improve Prescribing of HIV Preexposure Prophylaxis.	NEJM Catalyst Innovations in Care Delivery	-	-	-	26420007	10.1056/CAT.23.0215	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176768758&doi=10.1056%2fCAT.23.0215&partnerID=40&md5=29edbb5a7e2564661650b5c010a2fc8d	Summary Antiretroviral preexposure prophylaxis (PrEP) is nearly 100% effective at decreasing HIV acquisition but is underused in priority populations. Primary care clinicians need tools to help them identify persons likely to benefit from PrEP use and prescribe it when appropriate. The researchers developed and validated an automated decision support tool with interactive alerts in the electronic health record to increase PrEP discussions and prescribing in primary care. They piloted the tool at three federally qualified health centers and assessed feasibility, acceptance by clinicians, and preliminary impact on PrEP care. Of 33,803 patients who visited the pilot clinics from July 2022 through January 2023, providers received PrEP alerts at the point of care for 2.2% of patients, demonstrating feasibility. Although numbers of PrEP prescriptions remained low, the proportion of all patients with new PrEP prescriptions was 4.5 times higher at pilot clinics compared with matched control clinics (0.09% vs. 0.02%). Implementation of the decision support tool was associated with a statistically nonsignificant 5.5% increase in HIV tests per 100 patients. In qualitative interviews, providers said the tool facilitated PrEP discussions with patients, particularly for those patients who would not have initiated discussions because of stigma. The researchers found that acceptance, use, and impact of machine-learning models for PrEP depends on collaborating with and building trust among providers, including blending a data-driven approach to identifying patients at increased risk for HIV acquisition with providers' traditional decision-making framework. These approaches could be useful for health care organizations seeking to implement automated prediction models across all areas of medicine. © 2023 Massachusetts Medical Society. Article	2023	Kremer C.; Kamali A.; Kuteesa M.; Seeley J.; Hens N.; Nsubuga R.N.	Modelling the impact of combining HIV prevention interventions on HIV dynamics in fishing communities in Uganda	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-023-08113-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150791544&doi=10.1186%2fs12879-023-08113-2&partnerID=40&md5=a8d809c219ced3081429e1fe8350c292	Background: In countries with mature generalized HIV epidemics such as Uganda, there are still groups of individuals that are disproportionately affected. Among the key populations in Uganda are fishing communities, which make up about 10% of the population. Compared to the general population, HIV prevalence and incidence among individuals living in these communities is high. This high HIV burden has been attributed to several factors including limited access to prevention and treatment services as well as ongoing high-risk sexual behaviour. Methods: We investigated the impact of combined HIV prevention interventions on HIV transmission dynamics in high-risk fishing communities in Uganda using a deterministic compartmental model. The model was calibrated to seroprevalence data from a census performed in 2014. To account for remaining uncertainty in the calibrated model parameters, 50 000 simulated scenarios were modelled to investigate the impact of combined prevention interventions. Results: The projected HIV incidence decreased from 1.87 per 100 PY without intervention scale-up to 0.25 per 100 PY after 15 years (2014–2029) of intervention scale-up. A potential combination achieving this 87% reduction in incidence over 15 years in Ugandan FCs included condom use in about 60% of sexual acts, 23% of susceptible men circumcised, 87% of people living with HIV aware of their status, 75% of those on ART, and about 3% of susceptible individuals on oral PrEP. Uncertainty analysis revealed relative reductions in incidence ranging from 30.9 to 86.8%. Sensitivity analyses suggested that condom use and early ART were the most important interventions. Conclusion: Reducing HIV incidence, as well as prevalence and AIDS-related mortality, in these high-risk fishing communities in Uganda is attainable over 15 years with a combination prevention package. Our projected intervention coverage levels are well within the national targets set by the Uganda government and enable coming close to reaching the UNAIDS 95-95-95 targets to end AIDS as a public health threat by 2030. © 2023, The Author(s). Article	2023	Kreniske P.; Namuyaba O.I.; Kasumba R.; Namatovu P.; Ssewamala F.; Wingood G.; Wei Y.; Ybarra M.L.; Oloya C.; Tindyebwa C.; Ntulo C.; Mujune V.; Chang L.W.; Mellins C.A.; Santelli J.S.	Mobile Phone Technology for Preventing HIV and Related Youth Health Problems, Sexual Health, Mental Health, and Substance Use Problems in Southwest Uganda (Youth Health SMS): Protocol for a Pilot Randomized Controlled Trial	JMIR Research Protocols	-	-	-	19290748	10.2196/49352	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182573537&doi=10.2196%2f49352&partnerID=40&md5=361ed30661672c993a85f8a3198ecd60	Background: East and Southern Africa have the highest HIV incidence and prevalence in the world, with adolescents and young adults being at the greatest risk. Despite effective combination prevention tools, including the recently available pre-exposure prophylaxis (PrEP), HIV incidence among adolescents and young adults in Uganda remains high, and PrEP use remains low. Mental health and substance use (behavioral health) play a role in sexual behavior and decision-making, contributing to an increase in the risk for acquiring HIV. Interventions that target multiple HIV risk factors, including sexual and mental health and problematic substance use, are crucial to ending the HIV epidemic. Yet few interventions addressing HIV related health disparities and comorbidities among adolescents and young adults in East and Southern Africa currently exist. Objective: This study aims to evaluate the acceptability and feasibility of Kirabo, an SMS text message intervention informed by the information, motivation, and behavior model and to be disseminated through secondary schools. The study will gather preliminary estimates of Kirabo's effectiveness in increasing HIV testing and linking users to mental health counselors. Methods: We identified Mobile 4 Reproductive Health for adaptation using the assessment, decision, administration, production, topical experts, integration, training, testing (ADAPT-ITT) framework. Mobile 4 Reproductive Health is an evidence-based automated 2-way SMS text messaging and interactive voice response platform that offers sexual and reproductive health information and links users to HIV clinics in East Africa. Through ADAPT-ITT we refined our approach and created Kirabo, an SMS text message-based intervention for linking adolescents and young adults to health services, including HIV testing and mental health counseling. We will conduct a 2-arm randomized controlled trial in Masaka, Uganda. Adolescents (N=200) will be recruited from local schools. Baseline sociodemographic characteristics, HIV test history, and behavioral health symptoms will be assessed. We will evaluate acceptability and feasibility using surveys, interviews, and mobile phone data. The preliminary efficacy of Kirabo in increasing HIV testing and linking users to mental health counselors will be evaluated immediately after the intervention and at the 3-month follow-up. We will also assess the intervention's impact on self-efficacy in testing for HIV, adopting PrEP, and contacting a mental health counselor. Results: Intervention adaptation began in 2019. A pretest was conducted in 2021. The randomized controlled trial, including usability and feasibility assessments and effectiveness measurements, commenced in August 2023. Conclusions: Kirabo is a tool that assists in the efforts to end the HIV epidemic by targeting the health disparities and comorbidities among adolescents in Uganda. The intervention includes local HIV clinic information, PrEP information, and behavioral health screening, with referrals as needed. Increasing access to prevention strategies and mitigating factors that make adolescents and young adults susceptible to HIV acquisition can contribute to global efforts to end the HIV epidemic. © Philip Kreniske, Olive Imelda Namuyaba, Robert Kasumba, Phionah Namatovu, Fred Ssewamala, Gina Wingood, Ying Wei, Michele L Ybarra, Charlotte Oloya, Costella Tindyebwa, Christina Ntulo, Vincent Mujune, Larry W Chang, Claude A Mellins, John S Santelli. Article	2023	Kroch, Abigail; O'Byrne, Patrick; Orser, Lauren; MacPherson, Paul; O'Brien, Kristen; Light, Lucia; Kang, Ryu; Nyambi, Agatha	Increased PrEP uptake and PrEP-RN coincide with decreased HIV diagnoses in men who have sex with men in Ottawa, Canada.	Canada Communicable Disease Report	-	-	-	1188-4169	10.14745/ccdr.v49i06a04	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10911788	Background: We sought to evaluate if increased uptake of HIV pre-exposure prophylaxis (PrEP) correlated to population-level changes in human immunodeficiency virus (HIV) epidemiology, in a setting with an integrated PrEP delivery system centred on a public health nurse-led PrEP clinic and referral process. Methods: This study was conducted in Ottawa, Canada, where all positive HIV test results are reported to the public health units. Risk factor information is also collected by nurses and subsequently entered into a provincial database. We extracted these data for Ottawa from 2017 to 2021 and restricted our analyses to first-time diagnoses. Results: We identified 154 persons with a new HIV diagnosis. Over this period, the number of new diagnoses among men who have sex with men, the group most targeted for PrEP, decreased by 50%-60%. We did not identify changes in the number of new diagnoses based on race, intravenous drug use or among women. Conclusion: Increasing PrEP uptake in Ottawa in 2017 to 2021 coincided with a significant decrease in new HIV diagnoses among men who have sex with men. PrEP uptake in Ottawa, particularly by those most at risk, is likely supported by an integrated approach via PrEP-RN, a nurse-led public health program where individuals diagnosed with syphilis or rectal gonorrhea or chlamydia receive an automatic offer of PrEP. While these findings cannot causally link PrEP-RN or PrEP with this reduction in new HIV diagnoses, these changes in HIV epidemiology in Ottawa occurred exclusively among the group targeted for PrEP. These data highlight the efficacy and importance of PrEP. Article	2023	Krogstad Mudzingwa E.; de Vos L.; Atujuna M.; Fynn L.; Mugore M.; Mabandla S.; Hosek S.; Celum C.; Bekker L.-G.; Daniels J.; Medina-Marino A.	High study participation but diverging adherence levels: qualitatively unpacking PrEP use among adolescent girls and young women over two years in Eastern Cape, South Africa	Journal of Behavioral Medicine	-	-	-	1607715	10.1007/s10865-023-00462-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179332575&doi=10.1007%2fs10865-023-00462-2&partnerID=40&md5=aa03cf53322075f51665c166bc3c1458	In Southern and Eastern Africa, initiation of daily oral pre-exposure prophylaxis (PrEP) for HIV prevention has been high among adolescent girls and young women (AGYW) offered PrEP. However, persistence and prevention-effective use of PrEP among this critical group continues to be a challenge. We conducted a qualitative sub-study of AGYW from the Community PrEP Study in Eastern Cape Province, South Africa who had high rates of pick up for monthly PrEP refills over two years, but differing levels of PrEP adherence based on tenofovir-diphosphate (TFV-DP) measurements in dried blood spots (DBS). Contrasting 22 AGYW with low versus high levels of TFV-DP in DBS, we qualitatively explored factors which influenced PrEP persistence vs. non-persistence, unique patterns of PrEP use (e.g., discarding or stockpiling), and participant recommendations for improving AGYW prevention-effective use of PrEP in the future. Results showed that PrEP misconceptions and mistrust among participants' social networks negatively influenced adherence. In comparison, supportive families and/or partners and personal trust that PrEP works positively influenced adherence. Those with low adherence described being motivated to come to the site for other study benefits (e.g., reimbursement money, snacks, sanitary pads) and discarding PrEP to avoid stigma associated with being seen with pills. Future PrEP implementation strategies should focus on involving families and partners in PrEP support for AGYW and minimizing PrEP stigma at a community level. Trial registration NCT03977181. Article	2023	Kuhns L.M.; Perloff J.; Johnson A.K.; Paul J.L.; Pleasant K.; Evans K.; Denson D.J.; Gelaude D.J.; Bessler P.A.; Diskin R.; Cervantes M.; Garofalo R.; Hotton A.L.	A cross-sectional analysis of psychosocial and structural barriers and facilitators associated with PrEP use among a sample of transgender women in Chicago, IL	AIDS Research and Therapy	-	-	-	17426405	10.1186/s12981-023-00516-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85153543441&doi=10.1186%2fs12981-023-00516-0&partnerID=40&md5=396974727654e3688c5daf6411b7a4a0	Background: Expanding pre-exposure prophylaxis (PrEP) among transgender women in the United States is an important strategy to meet national HIV prevention goals, however self-reported use of PrEP is low in this group. Methods: This study reports the findings of a cross-sectional analysis of the relationship of barriers as well as facilitators to recent PrEP use among transgender women enrolled in an evaluation of the TransLife Care project (Chicago, Illinois), a structural intervention designed to meet basic needs. We computed multivariable prevalence ratios for barriers, facilitators and recent PrEP use, controlling for demographics. Results: Findings suggest that psychosocial and structural barriers, including moderate/high alcohol use, stimulant use, and history of incarceration were all positively associated with recent PrEP use among urban transgender women. In addition, a psychosocial facilitator, gender affirmation, was positively associated with recent PrEP use, while, while collective self-esteem, a was negatively associated with it. Finally, common indications for PrEP have high sensitivity, but low specificity and predictive value for identifying those on PrEP. Conclusion: We conclude that despite a large gap in PrEP use among those with indications, individuals experiencing psychosocial and structural barriers are more likely to use PrEP, and facilitators, such as psychological sense of affirmed gender may support its use. Article	2023	Kurek T.; Picillo E.; Shelton J.; Griffith S.; DeNagy J.	HIV Pre-exposure Prophylaxis at Two Urban Obstetrics/Gynecology Clinics in Buffalo: Awareness and Attitudes Among Non-Hispanic Black vs. Latinx Patients	Journal of Racial and Ethnic Health Disparities	-	-	-	21973792	10.1007/s40615-022-01408-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137942424&doi=10.1007%2fs40615-022-01408-1&partnerID=40&md5=475c7044c7c64eb53a241db2fda6edd7	Purpose: Non-Hispanic Black and Latinx women are disproportionately affected by HIV when compared to the general population. This study evaluated awareness of and attitude towards PrEP, self-perceived HIV infection risk, and factors constituting high-risk behavior for HIV infection at two general OB/GYN clinics in Erie County, which exhibited a 31.6% increase in HIV cases from 2019 to 2020. Methods: One thousand twenty-five self-administered surveys were analyzed. Results: Of participants, 69.3% were non-Hispanic Black, 13.4% were Latinx, and 22.4% were White. There was no significant difference in awareness of or attitude toward PrEP between non-Hispanic Black and Latinx participants (p = 0.197, p = 0.467). Latinx participants exhibited the lowest awareness of PrEP compared with non-Hispanic Black and White participants (p = 0.002). Conclusions: In our high-risk group, most participants had low self-perceived risk of HIV infection and low awareness of PrEP, and most were unwilling or unsure as to whether they would take PrEP. This calls attention to a need for improved counseling regarding PrEP and what constitutes risk of HIV infection at our general OB/GYN clinics, with a potential focus on Latinx individuals. © 2022, W. Article	2023	Labudde, Emily J; Gillespie, Scott; Wood, Anna; Middlebrooks, Lauren; Gooding, Holly C; Morris, Claudia R; Camacho-Gonzalez, Andres	HIV in youth prevention in the emergency department initiative: A survey of pediatric emergency medicine providers.	American Journal of Emergency Medicine	-	-	-	1532-8171	10.1016/j.ajem.2023.07.041	https://dx.doi.org/10.1016/j.ajem.2023.07.041	BACKGROUND: The incidence of HIV among adolescents remains high, and adolescents are known to participate in sexual behaviors that increase their risk for HIV, such as unprotected sex and sex with multiple partners. HIV pre-exposure prophylaxis (PrEP) has been shown to be effective at preventing HIV when taken daily and is approved by the FDA for use in adolescents. Efforts to screen patients in adult emergency departments and connect them with PrEP services have been validated. We surveyed pediatric emergency medicine (PEM) providers to determine their knowledge of PrEP, prescribing practices, willingness to prescribe, and barriers to a screening protocol in the pediatric emergency department (PED). METHODS: We administered a survey to a multidisciplinary group of PEM providers to measure knowledge, use, willingness, and implementation barriers to PrEP as well as elements needed for a successful referral system. RESULTS: A total of 87 responses were included for analysis. While 79.1% of all providers had heard of PrEP, only 14.8% of prescribing providers had ever discussed PrEP with a patient, and none had ever prescribed PrEP. Overall, 76.3% of all providers were knowledgeable about PrEP based on answers to true/false questions, with prescribing providers significantly more likely to be knowledgeable compared to nurses (p = 0.005). Knowledgeable providers had higher willingness scores to refer for PrEP compared to providers who were not knowledgeable. Ninety-two percent of providers felt a PrEP referral process from the PED would be feasible. Creation of an eligibility algorithm and educational materials were the most common efforts providers preferred to make them more likely to refer for PrEP. The most notable barriers perceived by providers included patient noncompliance with therapy (20.9%), acceptance of PrEP discussion among patients and parents (19.8%), and cost of therapy (15.1%). CONCLUSION: PEM providers are knowledgeable about PrEP but have little experience with discussing or prescribing PrEP. Their willingness to refer for PrEP and anticipated feasibility of a PrEP referral system is encouraging. These results support the need for future educational efforts among PEM providers and creation of referral systems for PrEP services from the PED. Article	2023	Lade C.; MacPhail C.; Rutherford A.	Provider views of pre-exposure prophylaxis (PrEP) for cisgender women - where do women fit in HIV elimination in Australia?	Sexual Health	-	-	-	14485028	10.1071/SH23163	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180006062&doi=10.1071%2fSH23163&partnerID=40&md5=b173901498f66aa0be3e78b5050b9184	Background. HIV pre-exposure prophylaxis (PrEP) in Australia has largely been targeted at gay, bisexual and other men who have sex with men. In the context of HIV elimination, the aim of this qualitative study was to explore PrEP prescribing for Australian cisgender women from the provider's perspective. Methods. Semi-structured interviews were held with Australian prescribers in 2022. Participants were recruited through relevant clinical services, newsletter distribution and snowball sampling. Interviews were audio-recorded, transcribed and analysed thematically. Results. Seventeen prescribers participated, of whom 9 were sexual health physicians and 10 worked in New South Wales. All reported limited clinical experience prescribing PrEP for women. Potential enablers to PrEP prescribing to women included education for women and clinicians, easily identifiable risk factors, individualised risk assessment and expansion of existing services. Barriers were limited PrEP awareness among women and prescribers, difficulties with risk assessment and consult and service limitations. The type of service recommended for PrEP provision varied among participants. Conclusions. Clinician experience of PrEP prescribing to Australian cisgender women is limited, with substantial barriers to access perceived by prescribers. Targeted education to PrEP prescribers, updated national PrEP guidelines to include women as a distinct group and further research regarding women's preferred model of PrEP access are required. Clarity of clinical ownership over PrEP implementation for women and, more broadly, women's sexual health, is essential in order to achieve HIV elimination in Australia. © 2023 The Author(s). Article	2023	Ladeira, MC; Miranda, MLD	Chemistry of Pre-exposure Prophylaxis (PrEP) and Brazil's Protagonism in the Fight Against HIV/AIDS: Exploring the Theme with High School Seniors	ORBITAL - The Electronic Journal of Chemistry	-	-	-	1984-6428	10.17807/orbital.v15i1.18047	https://periodicos.ufms.br/index.php/orbital/article/view/18047	The Pre-exposure Prophylaxis (PrEP) for the prevention of human immunodeficiency virus (HIV) infection consists in using antiretroviral medicine before sexual exposure to the virus to decrease probability of infection. The PrEP is capable of preventing the virus infection and promoting a healthier sexual life. Brazil has been a reference in HIV treatment not only because it was the first country in Latin America to offer free antiretroviral treatment to virus carriers but also because it participated in the Initiative in Pre-exposure Prophylaxis (iPrEP), a study that was carried out in several countries worldwide and proved effectiveness of the PrEP. Medication distributed by the Brazilian Public Health System (SUS) is quite unknown to the population. To mitigate current proliferation of sexually transmitted diseases (STDs) and increase in pregnancy cases among adolescents, sexual orientation has been intensified in schools and, thus, it has also become their responsibility, rather than parents' responsibility alone. Therefore, this study aimed at carrying out dynamic and dialogic interventions about the PrEP in classes taught to High School seniors who attend technical courses in Commerce and in Development of Digital Games at the Instituto Federal do Triangulo Mineiro - Campus Uberlandia Centro, Uberlandia, Minas Gerais (MG), Brazil. A dialogical Chemistry class was taught to show students several images and chemical structures of active ingredients found in the medication (PrEP). Besides, students answered a questionnaire with open questions anonymously to evaluate the effect of the class on their learning about sexual education, HIV/AIDS and, mainly, the PrEP. Students showed much interest in the tasks and interacted positively. Results of the questionnaire enabled to observe students' increase in knowledge about the PrEP. In sum, this study enabled the PrEP to be better disseminated, since doubts were mitigated. GRAPHICS . PrEP program experience in a hospital HIV unit. Description of baseline user profile and identification of opportunities for improvement; Experiencia de un programa de profilaxis preexposición en una unidad de virus de la inmunodeficiencia humana hospitalaria. Descripción del perfil basal del usuario e identificación de oportunidades de mejora	Enfermedades Infecciosas y Microbiología Clínica	-	-	-	0213005X	10.1016/j.eimc.2021.04.005	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106603787&doi=10.1016%2fj.eimc.2021.04.005&partnerID=40&md5=36123597472be8de640b4605a0357c38	Introduction: Pre-Exposure Prophylaxis (PrEP) is a biomedical intervention to prevent HIV infection in seronegative people at high risk of becoming infected. This strategy was endorsed in October 2019 by the Spanish Ministry of Health. Objective: To present the PrEP initial experience in the HIV Unit of the Hospital Clinic de Barcelona, paying special attention to the analysis of the vulnerability factors in the cohort. Materials and methods: Retrospective, descriptive study. The epidemiological, sociodemographic, and clinical characteristics of the users included in the program during the first year are analyzed, paying particular attention to Infections, risky practices, and substance use. Results: 190 individuals were included, 177 men and 12 trans women with a mean age of 35 years (8 SD). 70% had higher education, and half had Spanish nationality. An average of 10 couples per trimester and 60% reported unprotected anal sex. 31% had at least one positive PCR for STIs, with N. gonorrhoeae being the most prevalent microorganism (51%) and the rectal sample the most affected (21%). 63% reported chemsex use, 19% polydrug use, and 8% "slamming". Half expressed concern about consumption and/or sexual practices and 25% the need for help. Conclusions: The PrEP user profile attended in our Hospital Unit justifies the creation of multidisciplinary teams that allow us to provide holistic attention to the sexual life of these people. © 2021 The Authors	chemsex; Human immunodeficiency virus; pre-exposure prophylaxis; sexually transmitted infections	English	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Clinical

Esta estrategia fue aprobada por el Ministerio de Salud de España en octubre de 2019. Objetivo: Presentar la experiencia inicial de la PrEP en la Unidad de VIH del Hospital Clínic de Barcelona, poniendo especial atención en el análisis de los factores de vulnerabilidad de la cohorte. Materiales y métodos: Estudio retrospectivo, descriptivo. Se analizan las características epidemiológicas, sociodemográficas y clínicas basales de los usuarios incluidos en el programa durante el primer año de funcionamiento, prestando particular atención a las infecciones, las prácticas de riesgo y el consumo de sustancias. Resultados: Se incluyeron 190 individuos, 177 hombres y 12 mujeres transexuales con una edad media de 35 años (8DE). El 70% tenía estudios superiores y la mitad nacionalidad española. Informaron de tener 10 parejas de media al trimestre y el 60% de practicar sexo anal desprotegido. El 31% presentó al menos una PCR positiva para ITS, siendo la N. gonorrhoeae el germen más prevalente (51%) y la muestra rectal la más afectada (21%). El 63% reportó el uso de chemsex, el 19% policonsumo y el 8% slamming. La mitad expresó su preocupación por el consumo y/o prácticas sexuales y un 25% la necesidad de ayuda. Conclusiones: El perfil del usuario de PrEP visitado en nuestra unidad hospitalaria justifica la creación de equipos multidisciplinares que permitan prestar una atención holística de la vida sexual de estas personas.(AU)	Human immunodeficiency viruspre-exposure prophylaxissexually transmitted infectionschemsex	Spanish	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Clinical

Article	2023	Lake, Jordan E.; Miao, Hongyu; Bowman, Emily R.; Clark, Jesse L.; Hyatt, Ana N.; Kettelhut, Aaren; Lama, Javier R.; Reisner, Sari L.; Mayer, Kenneth H.; Perez-Brumer, Amaya; Funderburg, Nicholas	Gender-affirming hormone therapy decreases d-dimer but worsens insulin sensitivity in transgender women.	HIV Medicine	-	-	-	-	1468-1293 1464-2662	10.1111/hiv.13522	https://pubmed.ncbi.nlm.nih.gov/37386803/	OBJECTIVES: Gender-affirming hormonal therapies (GAHT) and HIV increase cardiovascular risk for transgender women (TW), yet there is a paucity of data quantifying cardiometabolic changes following GAHT initiation, particularly among TW with HIV. METHODS: The Féminas study enrolled TW from October 2016 to March 2017 in Lima, Peru. Participants reported sexual activity that was high risk for HIV acquisition or transmission. All were tested for HIV/ sexually transmitted infection and were given access to GAHT (oestradiol valerate and spironolactone), HIV pre-exposure prophylaxis (PrEP) or antiretroviral therapy (ART) for 12 months. Biomarker measurement was done on stored serum, whereas fasting glucose and lipids were measured in real time. RESULTS: In all, 170 TW (32 with HIV, 138 without HIV) had median age 27 years and 70% prior GAHT use. At baseline, PCSK9, sCD14, sCD163, IL-6, sTNFRI/II, CRP and EN-RAGE levels were significantly higher in TW with HIV than in TW without HIV. High-density lipoprotein and total cholesterol were lower and insulin and glucose parameters were similar. All TW with HIV started ART, but only five achieved virological suppression at any time. No TW without HIV initiated PrEP. Over 6 months, all participants initiated GAHT and had worsening insulin, glucose and HOMA-IR. Large d-dimer decreases also occurred. Similar changes occurred in TW with and without HIV. CONCLUSIONS: In this unique cohort of TW, GAHT decreased d-dimer but worsened insulin sensitivity. Because PrEP uptake and ART adherence were very low, observed effects are primarily attributed to GAHT use. Further study is needed to better understand cardiometabolic changes in TW by HIV serostatus. Article	2023	Lamônica, Juliana de Souza; Magno, Laio; Santos, Julia Elen Jesus da Silva; Dourado, Ines; Santos, Adriano Maia dos; Pereira, Marcos	Unwillingness to prescribe PrEP by health care professionals of specialized HIV/AIDS services in Northeastern Brazil	Cadernos de Saúde Pública	-	-	-	-	1678-4464	10.1590/0102-311xen121322	http://www.scielosp.org/scielo.php?script=sci_arttext&pid=S0102-311X2023000505008	This study aimed to analyze factors associated with the unwillingness to prescribe pre-exposure prophylaxis (PrEP) by health care professionals of specialized HIV/AIDS services. This is a cross-sectional study with 252 health care professionals in 29 specialized care services (SCSs) in HIV/AIDS in 21 municipalities in the state of Bahia, Brazil. The inclusion criterion was that the professional had worked for at least six months in the service. Sociodemographic, occupational, and behavioral data were collected using a questionnaire. Logistic regression was performed with an estimation of crude and adjusted odds ratio (OR) and respective 95% confidence intervals (95%CI). The unwillingness to prescribe PrEP was 15.2% (95%CI: 10.8-19.6). The factors associated with unwillingness to prescribe PrEP were non-prescription of HIV self-tests for key populations (adjustedOR = 5.4; 95%CI: 1.3-22.4) nor post-exposure prophylaxis (adjustedOR = 2.00; 95%CI: 1.3-3.1), location of the SCS in the state capital (adjustedOR = 3.9; 95%CI: 1.4-10.2), and SCSs without PrEP offer (adjustedOR = 1.7; 95%CI: 1.1-2.8); professionals who have not reported the need to conduct training and courses (adjustedOR = 1.3; 95%CI: 1.1-1.8), or training with more experienced professionals (adjustedOR = 1.8; 95%CI: 1.1-3.8), was associated with a lower proportion of unwillingness to prescribe PrEP. Our results indicate that health care professionals' contextual, organizational, and training factors can contribute to PrEP indication. We suggest expanding ongoing training in combined HIV prevention among health care professionals and increasing the availability of PrEP in health services. Efficacy and safety of long-acting cabotegravir compared with daily oral tenofovir disoproxil fumarate plus emtricitabine to prevent HIV infection in cisgender men and transgender women who have sex with men 1 year after study unblinding: a secondary analysis of the phase 2b and 3 HPTN 083 randomised controlled trial	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(23)00261-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176459338&doi=10.1016%2fS2352-3018%2823%2900261-8&partnerID=40&md5=db05105251630046013abb5c394cec4a	Background: Injectable cabotegravir was superior to daily oral tenofovir disoproxil fumarate plus emtricitabine for HIV prevention in two clinical trials. Both trials had the primary aim of establishing the HIV prevention efficacy of long-acting injectable cabotegravir pre-exposure prophylaxis (PrEP) compared with tenofovir disoproxil fumarate plus emtricitabine daily oral PrEP. Long-acting PrEP was associated with diagnostic delays and integrase strand-transfer inhibitor (INSTI) resistance. This report presents findings from the first unblinded year of the HIV Prevention Trials Network (HPTN) 083 study. Methods: The HPTN 083 randomised controlled trial enrolled HIV-uninfected cisgender men and transgender women at elevated HIV risk who have sex with men, from 43 clinical research sites in Africa, Asia, Latin America, and the USA. Inclusion criteria included: a negative HIV serological test at the screening and study entry, undetectable HIV RNA levels within 14 days of study entry, age 18 years or older, overall good health as determined by clinical and laboratory evaluations, and a creatinine clearance of 60 mL/min or higher. Participants were randomly allocated to receive long-acting injectable cabotegravir or daily oral tenofovir disoproxil fumarate plus emtricitabine PrEP. After study unblinding, participants remained on their original regimen awaiting an extension study. HIV infections were characterised retrospectively at a central laboratory. Here we report the secondary analysis of efficacy and safety for the first unblinded year. The primary outcome was incident HIV infection. Efficacy analyses were done on the modified intention-to-treat population using a Cox regression model. Adverse events were compared across treatment groups and time periods (blinded vs unblinded). This trial is registered with ClinicalTrials.gov, NCT02720094. Findings: Of the 4488 participants who contributed person-time to the blinded analysis, 3290 contributed person-time to the first unblinded year analysis between May 15, 2020, and May 14, 2021. Updated HIV incidence in the blinded phase was 0·41 per 100 person-years for long-acting injectable cabotegravir PrEP and 1·29 per 100 person-years for daily oral tenofovir disoproxil fumarate plus emtricitabine PrEP (hazard ratio HR 0·31 95% CI 0·17–0·58, p=0·0003). HIV incidence in the first unblinded year was 0·82 per 100 person-years for long-acting PrEP and 2·27 per 100 person-years for daily oral PrEP (HR 0·35 0·18–0·69, p=0·002). Adherence to both study products decreased after study unblinding. Additional infections in the long-acting PrEP group included two with on-time injections; three with one or more delayed injections; two detected with long-acting PrEP reinitiation; and 11 more than 6 months after their last injection. Infection within 6 months of cabotegravir exposure was associated with diagnostic delays and INSTI resistance. Adverse events were generally consistent with previous reports; incident hypertension in the long-acting PrEP group requires further investigation. Interpretation: Long-acting injectable cabotegravir PrEP retained high efficacy for HIV prevention in men and transgender women who have sex with men during the first year of open-label follow-up, with a near-identical HR for HIV risk reduction between long-acting injectable cabotegravir and daily oral tenofovir disoproxil fumarate plus emtricitabine PrEP during the first year after unblinding compared with the blinded period. Extended follow-up further defined the risk period for diagnostic delays and emergence of INSTI resistance. Article	2023	Landovitz, Raphael J.; Scott, Hyman; Deeks, Steven G.	Prevention, treatment and cure of HIV infection.	Nature reviews. Microbiology	-	-	-	-	1740-1534 1740-1526	10.1038/s41579-023-00914-1	https://pubmed.ncbi.nlm.nih.gov/37344551/	The development of antiretroviral therapy for the prevention and treatment of HIV infection has been marked by a series of remarkable successes. However, the efforts to develop a vaccine have largely failed, and efforts to discover a cure are only now beginning to gain traction. In this Review, we describe recent progress on all fronts - pre-exposure prophylaxis, vaccines, treatment and cure - and we discuss the unmet needs, both current and in the coming years. We describe the emerging arsenal of drugs, biologics and strategies that will hopefully address these needs. Although HIV research has largely been siloed in the past, this is changing, as the emerging research agenda is marked by multiple cross-discipline synergies and collaborations. As the limitations of antiretroviral drugs as a means to truly end the epidemic are becoming more apparent, there is a great need for continued efforts to develop an effective preventative vaccine and a scalable cure, both of which remain formidable challenges. Article	2023	Lanier P.; Kennedy S.; Snyder A.; Smith J.; Napierala E.; Talbert J.; Hammerslag L.; Humble L.; Myers E.; Whittington A.; Smith J.; Bachhuber M.; Austin A.; Blount T.; Stehlin G.; Lopez-De Fede A.; Nguyen H.; Bruce J.; Grijalva C.G.; Krishnan S.; Otter C.; Horton K.; Seiler N.; Pearson W.S.	STI Testing among Medicaid Enrollees Initiating PrEP for HIV Prevention in Six Southern States	Southern Medical Journal	-	-	-	-	384348	10.14423/SMJ.0000000000001564	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160967686&doi=10.14423%2fSMJ.0000000000001564&partnerID=40&md5=78e5e5ddd259d0bf4fc30bbbe0044aeb	Objectives The purpose of this study was to measure sexually transmitted infection (STI) testing among Medicaid enrollees initiating preexposure prophylaxis (PrEP) to prevent human immunodeficiency virus. Secondary data are in the form of Medicaid enrollment and claims data in six states in the US South. Methods Research partnerships in six states in the US South developed a distributed research network to accomplish study aims. Each state identified all first-time PrEP users in fiscal year 2017-2018 (combined N = 990) and measured the presence of STI testing for chlamydia, syphilis, and gonorrhea through 2019. Each state calculated the percentage of individuals with at least one STI test during 3-, 6-, and 12-month follow-up periods. Results The proportion of first-time PrEP users that received an STI test varied by state: 37% to 67% of all of the individuals in each state who initiated PrEP received a test within the first 6 months of PrEP treatment and 50% to 77% received a test within the first 12 months. Conclusions Although the Centers for Disease Control and Prevention recommends STI testing at least every 6 months for PrEP users, our analysis of Medicaid data suggests that STI testing occurs less frequently than recommended in populations at elevated risk of syphilis, gonorrhea, and chlamydia. © Lippincott Williams & Wilkins.	delivery of health care; health services research; HIV; Medicaid; sexually transmitted infections	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Theses and Dissertations	2023	Lapointe, Hope Ryan	Development and implementation of sequencing strategies to combat global epidemics of viral pathogens	-	-	University of British Columbia	-	NA	10.14288/1.0435601	http://hdl.handle.net/2429/85645	Deoxyribonucleic acid (DNA) sequencing technologies allow novel research and public health opportunities to characterize and intervene in viral outbreaks across the globe. The overarching aim of this thesis is to utilize various sequencing technologies to characterize viral pathogens for different purposes. Here, three different sequencing approaches for monitoring the human pathogens Human Immunodeficiency Virus (HIV), Hepatitis C Virus (HCV), and Severe Acute Respiratory Syndrome Coronavirus 2 (SARS-CoV-2) are discussed. HIV genotyping can be utilized to identify drug resistance-associated mutations and guide HIV treatment. However, access to such testing is currently insufficient in resource-limited settings to enable routine genotypic HIV drug resistance testing. Retrospective studies in the form of resistance surveys can be performed to assess population-level HIV drug resistance. Here, two large HIV resistance surveys were performed for Eswatini and Malawi to identify the proportion of individuals with pre-existing HIV drug resistance. These data were pivotal in these countries' selection of HIV treatments for their populations. Sequencing also has the potential to identify the time of viral infection based the accumulation of mutations in the genome. A discussion is provided where this approach is used in the context of identifying causes of failure of tenofovir pre-exposure prophylaxis for preventing HIV infection. Conversely, phylogenetic analysis of sequence data, which reveals the relatedness between viral sequences, can inform outbreak monitoring. Another discussion on the practical and ethical considerations of utilizing HIV sequence data is provided. The second objective of this thesis is to develop and implement newer "next-generation" sequencing platforms to better characterize genetic patterns amongst other viruses. A genotype-independent sequencing assay for the Hepatitis C Virus (HCV) on the Illumina MiSeq is described and validated. This assay enables parallel identification of the HCV infection genotype, as well as detection of any resistance-associated mutations. Additionally, a nanopore sequencing assay was rapidly deployed during the onset of the COVID-19 pandemic to sequence the causative agent, SARS-CoV-2. A final study describes the development of a SARS-CoV-2 sequencing strategy in collaboration with the Artic Network. This thesis supports the ongoing use of sequencing to characterize viral pathogens for therapy optimization and molecular epidemiology. Human Immunodeficiency Virus Seroconversion among Men Who Have Sex with Men Who Use Event-Driven or Daily Oral Pre-Exposure Prophylaxis (CohMSM-PrEP): A Multi-Country Demonstration Study from West Africa	Clinical Infectious Diseases	-	-	-	-	10584838	10.1093/cid/ciad221	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85170241005&doi=10.1093%2fcid%2fciad221&partnerID=40&md5=f035be04524dc36f27d3249e469db07e	Background: Data on human immunodeficiency virus (HIV) seroconversion among men who have sex with men (MSM) using pre-exposure prophylaxis (PrEP) in West Africa are needed. This study aimed to document HIV seroconversion and associated determinants, PrEP adherence, plasma drug concentrations, and HIV drug resistance in MSM using event-driven or daily PrEP in Burkina Faso, Côte d'Ivoire, Mali, and Togo. Methods: A prospective cohort study was conducted in 2017-2021 among HIV-seronegative MSM aged 18 or over who were at high risk of HIV infection. Participants could choose between event-driven and daily PrEP, switch regimens, and discontinue or restart PrEP. The determinants of HIV incidence were investigated using a multivariate mixed-effects Poisson regression analysis. Results: A total of 647 participants were followed for a total time of 1229.3 person-years. Of 5371 visits, event-driven PrEP was chosen in 3873 (72.1%), and daily PrEP in 1400 (26.1%). HIV incidence was 2.4 per 100 person-years (95% confidence interval CI 1.5-3.6) for event-driven PrEP, and 0.6 per 100 person-years (95% CI 1.2-3) for daily PrEP (adjusted incidence rate ratio 4.40, 95% CI 1.00-19.36, P =. 050). Adequate adherence was lower with event-driven than daily PrEP (44.3% vs 74.9%, P <. 001). Plasma drug concentrations were undetectable in 92 (97.9%) of the 94 measures taken for 23 participants who seroconverted. Only 1 participant had resistance to PrEP drugs. Conclusions: HIV seroconversions mainly occurred in participants who chose event-driven PrEP. The study's data highlighted major difficulties with adherence to this regimen. Improving adherence to event-driven PrEP constitutes a major research and public health priority in this context. © 2023 The Author(s). Article	2023	Lavoie M.-C.C.; Blanco N.; Mwango L.K.; Nichols B.E.; Whittington A.; Lindsay B.; Adebayo O.; Mujansi M.; Tembo K.; Hachaambwa L.; Mumba D.; Musonda B.; Claassen C.W.	Addressing the Need for a Preexposure Prophylaxis Monitoring and Evaluation Implementation Guide: Experience From Zambia	Global Health Science and Practice	-	-	-	-	2169575X	10.9745/GHSP-D-22-00396	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159236473&doi=10.9745%2fGHSP-D-22-00396&partnerID=40&md5=dcfb63c5cc58845821aa3dd56c0df17e	Background: The HIV care continuum comprises well-defined steps and indicators. In contrast, indicators along the preexposure prophylaxis (PrEP) cascade are still in the early stages of implementation. Monitoring and evaluation (M&E) of PrEP services is critical to optimizing PrEP uptake and adherence during periods of HIV risk. We provide an overview of global indicators for PrEP, describe the development process and outcomes of Zambia's 2022 National Pre-Exposure Prophylaxis (PrEP) Program Monitoring & Evaluation Implementation Guide, and discuss the guide's implications for other countries in sub-Saharan Africa. National M&E Guide Development Process: During the scale-up of PrEP, the Zambia Ministry of Health (MOH) and the National HIV/AIDS/STI/TB Council recognized the need for a national unified monitoring system to guide the effective implementation of PrEP services. Stakeholders from the MOH, civil society, professional organizations, funding agencies, and implementing partners developed the National Pre-Exposure Prophylaxis (PrEP) Program Monitoring & Evaluation Implementation Guide. This guide is aligned with the existing global indicators from the World Health Organization and the U.S. President's Emergency Plan for AIDS Relief and adapted to the country's needs, context, and health information systems. Zambia's experience in developing the guide has highlighted the importance of strengthening client-level monitoring systems for HIV prevention, ensuring flexibility of the PrEP monitoring system to accommodate PrEP delivery modalities and differentiated service delivery models, and training health workers to enhance PrEP services and deliver care PrEP services along the continuum to prevent HIV acquisition effectively. Conclusions: Using a collaborative and consensus-based approach, Zambia developed its first national PrEP M&E implementation guide to provide standardized guidelines for optimizing the delivery, monitoring, and evaluation of PrEP service delivery. Zambia's experience can inform other countries in sub-Saharan Africa as they develop national M&E implementation approaches for PrEP. © Lavoie et al. Article	2023	Lavoie, Marie-Claude C; Okui, Lillian; Blanco, Natalia; Stoebenau, Kirsten; Magidson, Jessica F; Gokatweng, Gadzikanani; Ikgopoleng, Kaizer; Charurat, Manhattan E; Ndwapi, Ndwapi	Feasibility and acceptability of peer-delivered interventions using mHealth for PrEP services among adolescent girls and young women in DREAMS program in Botswana.	Global Health Action	-	-	-	-	1654-9880	10.1080/16549716.2023.2231256	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10355684	BACKGROUND: Adolescent girls and young women accounted for 25% of all new HIV infections despite representing only 10% of the population in Sub Saharan Africa. PEPFAR has launched the Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe (DREAMS) initiative, a comprehensive HIV prevention program including PrEP services. Among adolescent girls and young women, PrEP adherence is currently sub-optimal. Tailored strategies for adolescent girls and young women to improve access and use of PrEP delivery are urgently needed to maximise its potential. Recommended interventions include peer-delivered interventions using mobile technology. However, data on the feasibility and acceptability of this approach is limited for SSA. OBJECTIVES: We assessed the feasibility and perceived acceptability of providing mHealth peer-delivered interventions to support PrEP services among adolescent girls and young women in Botswana. METHODS: This cross-sectional study included HIV-negative women aged 18-24 years old seeking health services at DREAMS-supported facilities. Participants completed a survey assessing the feasibility and perceived acceptability of the mHealth peer-delivered interventions, which included the Acceptability of Intervention Measure (AIM). Descriptive analyses were performed. RESULTS: A total of 131 participated in the study. Overall, 89% owned a mobile phone (feasibility). There was no difference in cell phone ownership between participants from rural and urban settings. Among participants, 85% reported interest in participating in a mHealth peer-delivered intervention if it was available to them. Regarding perceived acceptability for mHealthpeer support groups for PrEP, the average score on the AIM was 3.8 out of 5 (SD = 0.8). CONCLUSION: mHealthpeer-delivered interventions appear to be feasible and perceived acceptable among adolescent girls and young women in Botswana. This modality should be incorporated into PEPFAR's programmatic toolkit of implementation strategies to improve PrEP services. Article	2023	Leblanc J.-F.; Custer B.; Van de Laar T.; Drews S.J.; Germain M.; Lewin A.	HIV Pre-Exposure Prophylaxis, Blood Donor Deferral, Occult Infection, and Risk of HIV Transmission by Transfusion: A Fine Balance Between Evidence-Based Donor Selection Criteria and Transfusion Safety	Transfusion Medicine Reviews	-	-	-	-	8877963	10.1016/j.tmrv.2023.150754	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85172463053&doi=10.1016%2fj.tmrv.2023.150754&partnerID=40&md5=b263502eea536a1ecb07f3871dad92d	Pre- and postexposure prophylaxis for human immunodeficiency virus (HIV) are key to reducing the transmission of this virus. Furthermore, low-toxicity, long-acting formulations provide additional clinical benefits, in particular easier adherence to treatment and prevention. However, breakthrough HIV infections can occur despite the use of pre-exposure prophylaxis (PrEP), mainly due to suboptimal adherence or multi-drug resistant HIV strains. Albeit rare, PrEP breakthrough infections have also been reported in fully adherent patients. Should such breakthrough infection occur in an eligible blood donor, PrEP might suppress viremia and delay antibody seroconversion, thereby masking the infection and increasing the risk of transfusion transmission. This possibility has raised concerns in the blood transfusion community but remains little documented. Therefore, a literature search was performed to assess the state of knowledge on the risk of PrEP breakthrough infection, with a particular focus on the risk of HIV entering the blood supply. Evidently, PrEP breakthrough infections are rare, although the risk is not zero. Moreover, a fraction of individuals — blood donors — do not disclose PrEP use according to various surveys and measurements of HIV PrEP analytes. Additionally, viremia and seroconversion may remain undetectable or close to the limit of detection for a long time after cessation of PrEP, particularly with long-acting antiretrovirals. Therefore, current recommendations to defer donors for at least 3 months after the last dose of oral PrEP or 2 years for long-acting PrEP appear justified, as they safeguard the blood supply and public trust toward the system. These recommendations help to safeguard blood safety and public trust in the blood supply. © 2023 Elsevier Inc. Article	2023	Lee F.; Khanna A.S.; Hallmark C.J.; Lavingia R.; McNeese M.; Zhao J.; McNeese M.L.; Khuwaja S.; Ardestani B.M.; Collier N.; Ozik J.; Hotton A.L.; Harawa N.T.; Schneider J.A.; Fujimoto K.	Expanding Medicaid to Reduce Human Immunodeficiency Virus Transmission in Houston, Texas: Insights from a Modeling Study	Medical Care	-	-	-	-	257079	10.1097/MLR.0000000000001772	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143557838&doi=10.1097%2fMLR.0000000000001772&partnerID=40&md5=7f87450e8a658b3f291cc4a57c0882fe	Context: Medicaid expansion has been nationally shown to improve engagement in the human immunodeficiency virus (HIV) treatment and prevention continua, which are vital steps to stopping the HIV epidemic. New HIV infections in the United States are disproportionately concentrated among young Black men who have sex with men (YBMSM). Houston, TX, is the most populous city in the Southern United States with a racially/ethnically diverse population that is located in 1 of 11 US states that have not yet expanded Medicaid coverage as of 2021. Methods: An agent-based model that incorporated the sexual networks of YBMSM was used to simulate improved antiretroviral treatment and pre-exposure prophylaxis (PrEP) engagement through Medicaid expansion in Houston, TX. Analyses considered the HIV incidence (number of new infections and as a rate metric) among YBMSM over the next 10 years under Medicaid expansion as the primary outcome. Additional scenarios, involving viral suppression and PrEP uptake above the projected levels achieved under Medicaid expansion, were also simulated. Results: The baseline model projected an HIV incidence rate of 4.96 per 100 person years (py) and about 368 new annual HIV infections in the 10th year. Improved HIV treatment and prevention continua engagement under Medicaid expansion resulted in a 14.9% decline in the number of annual new HIV infections in the 10th year. Increasing viral suppression by an additional 15% and PrEP uptake by 30% resulted in a 44.0% decline in new HIV infections in the 10th year, and a 27.1% decline in cumulative infections across the 10 years of the simulated intervention. Findings: Simulation results indicate that Medicaid expansion has the potential to reduce HIV incidence among YBMSM in Houston. Achieving HIV elimination objectives, however, might require additional effective measures to increase antiretroviral treatment and PrEP uptake beyond the projected improvements under expanded Medicaid. © 2023 Lippincott Williams and Wilkins. Article	2023	Lee J.J.; Li Verdugo J.; Xiao A.Y.; Vo K.	Digital Interventions to Enhance PrEP Uptake and Adherence Through Stigma Reduction	Current HIV/AIDS Reports	-	-	-	-	15483568	10.1007/s11904-023-00685-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178923033&doi=10.1007%2fs11904-023-00685-7&partnerID=40&md5=c1ad716987c1ab93b6c764cf0586955b	Purpose of Review: Although pre-exposure prophylaxis (PrEP) is effective for reducing risk of HIV transmission, stigma persists as a barrier to HIV prevention. Digital technologies present opportunities to access hard-to-reach populations and increase the efficiency of established interventions. This review examines current digital interventions addressing stigma to improve PrEP-related outcomes. Recent Findings: Digital technologies are increasingly used for HIV prevention and include a wide range of formats. Recent interventions focused on stigma and PrEP tend to engage mobile phone-related technology and focus on younger populations with particular attention to men who have sex with men and transgender women. Summary: Digital interventions that address stigma are promising for improving PrEP-related outcomes. No single technology currently demonstrates consistent superiority. Limited access to PrEP and heightened stigma in under-resourced countries present challenges for interventions supporting diverse communities. Further research should examine how digital interventions can reduce stigma beyond the individual level to enhance PrEP use and explore opportunities to improve and integrate approaches to stigma measurement. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Lee J.S.; Batchelder A.W.; Stanton A.M.; Westphal L.; Klevens R.M.; Mayer K.H.; O'Cleirigh C.	Structural vulnerabilities and PrEP awareness among Boston heterosexuals and people who inject drugs at risk for HIV: findings from 2018 to 2019 cycles from the Boston, MA site of the NHBS	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2023.2288646	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179954783&doi=10.1080%2f09540121.2023.2288646&partnerID=40&md5=324dda1b2dccabaad943939cae86c8ff	Little is known about biopsychosocial factors relating to pre-exposure prophylaxis (PrEP) awareness among people with either heterosexual or injection drug use HIV risk behaviors. Participants engaged in vaginal/anal sex with a person of the opposite sex (N = 515) or were people who injected drugs (PWID; N = 451) in the past 12 months from 2018-2019 in Boston, MA. We examined associations between PrEP awareness and: homelessness; perceived HIV-related stigma; country of birth; bacterial STDs, chlamydia, and/or gonorrhea in the past 12 months, lifetime hepatitis C virus (HCV) infection, sexual orientation, and poverty. More PWID (36.8%) were aware of PrEP than people with heterosexual HIV risk (28%; p =.001). Among people with heterosexual risk, homelessness (aOR = 1.99, p =.003), and among PWID: homelessness (aOR = 2.11, p =.032); bacterial STD (aOR = 2.96, p =.012); chlamydia (aOR = 6.14, p =.008); and HCV (aOR = 2.40, p <.001) were associated with increased likelihood of PrEP awareness. In the combined sample: homelessness (aOR = 2.25, p <.001); HCV (aOR = 2.18, p <.001); identifying as homosexual (aOR = 3.71, p =.036); and bisexual (aOR = 1.55, p =.016) were each associated with PrEP awareness. Although having an STD, HCV, identifying as homosexual or bisexual, and experiencing homelessness were associated with increased PrEP awareness, most participants were unaware of PrEP. Efforts to increase PrEP awareness could engage PWID and heterosexual HIV risk behavior. © 2023 Informa UK Limited, trading as Taylor & Francis Group.	homelessness; people who inject drugs; Pre-exposure prophylaxis (PrEP); PrEP awareness; sexually transmitted infection	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Lee L.C.; Pollak B.A.; Coffey C.P.	Implementing a collaborative practice agreement for HIV pre-exposure prophylaxis in the primary care setting	Journal of the American Pharmacists Association	-	-	-	-	15443191	10.1016/j.japh.2022.09.011	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139819504&doi=10.1016%2fj.japh.2022.09.011&partnerID=40&md5=0fbe8ad5284459aa42c05dd71492e989	Background: Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) medications are highly effective at reducing HIV transmission despite their underutilization. Pharmacists can be involved in HIV PrEP management through collaborative practice agreements (CPAs). Objectives: This study aimed to (1) describe the development of a CPA for a pharmacist-led HIV PrEP service within an outpatient primary care clinic and (2) describe the growth of the HIV PrEP CPA service after implementation. Practice description: The service was developed and implemented within a network of 7 outpatient general internal medicine (GIM) clinics associated with a large academic medical center. Pharmacists are embedded in the clinics and provide care alongside an interprofessional team. Practice innovation: An HIV PrEP CPA was developed and implemented by primary care pharmacists to increase access to HIV PrEP therapy through pharmacist-led visits. The pharmacist-led visits were piloted at one site before expanding to the other primary care clinics. Evaluation methods: Data were analyzed using an electronic health record-generated report that included all patients prescribed HIV PrEP medications by a GIM primary care provider (PCP) within the last year. The report was generated before the start of the intervention in October 2021 and again in May 2022. Retrospective chart review was then used to identify prescribing patterns and referrals to the pharmacy HIV PrEP CPA. Results: Seven months after the start of the HIV PrEP CPA, 122 patients were prescribed HIV PrEP by a GIM PCP. Thirty-four patients (27.9%) were newly started on HIV PrEP by a GIM PCP since the beginning of the initiative. A total of 53 patient referrals (43.4%) were placed to the pharmacy team. Five of the 7 GIM clinics have established pharmacist-led HIV PrEP services. Conclusion: This report describes the successful development and implementation of a pharmacist-led HIV PrEP CPA in Ohio. © 2022 American Pharmacists Association®	Community Pharmacy ServicesHIVHIV InfectionsHumansPharmacistsPre-Exposure ProphylaxisPrimary Health CareRetrospective Studies	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Lee, Jane J; Barry, Michael P; Kerani, Roxanne P; Sanchez, Travis H; Katz, David A	The Pre-exposure Prophylaxis (PrEP) Care Continuum Among English-Speaking Latino Sexual Minority Men in the United States (2014-2020).	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000003187	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10272091	BACKGROUND: There is limited understanding of the pre-exposure prophylaxis (PrEP) care continuum specific to Latino/x gay, bisexual, and other sexual minority men (SMM) that encompasses the population residing outside of large metropolitan or urban areas. SETTING: We examined trends and characteristics associated with the PrEP care continuum with data from the 2014-2020 cycles of the American Men's Internet Survey, an annual online cross-sectional behavioral survey of cisgender SMM in the United States. METHODS: We calculated PrEP continuum outcomes overall and by year among Hispanic/Latino SMM (n = 9010). We used generalized estimating equations with Poisson links to examine (1) temporal trends (2014-2020) in each step of the PrEP continuum and PrEP use in the past year stratified by PrEP eligibility and (2) correlates of each step of the PrEP continuum in 2020 using multivariable models. RESULTS: Among 2283 Latino SMM in 2020, 84% reported PrEP awareness, 30% discussed PrEP with a provider, 15% used PrEP in the past year, and 12% were currently using PrEP. PrEP awareness increased from 52% in 2014 to 84% in 2020; and PrEP use in the past year increased from 4% in 2014 to 15% in 2020. In the multivariable models, age and PrEP eligibility were associated with PrEP use in the past year, and urban-rural classification was associated with current PrEP use. CONCLUSIONS: While most of the Latino SMM are aware of PrEP, significant gaps remain in this population in discussing PrEP with a provider and using PrEP that require tailored strategies to enhance access to HIV prevention services. Article	2023	Lee, Jane J; Robles, Gabriel; Leyva Vera, Christopher A; Orellana, E Roberto; Graham, Susan M; Nguyen, Anh-Minh; Wei, Yingying; Sanchez, Abraham Hernandez; Dombrowski, Julia C; Simoni, Jane M	A Peer-Based Intervention to Increase HIV and Sexually Transmitted Infection Testing Among Latinx Immigrant Sexual Minority Men in the US Pacific Northwest: Pilot Randomized Controlled Trial Conducted During the COVID-19 Pandemic.	JMIR Formative Research	-	-	-	-	2561-326X	10.2196/45871	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10372765	BACKGROUND: Hispanic and Latinx gay, bisexual, and other sexual minority men (SMM) are disproportionately affected by HIV in the United States. With the availability of self-testing services, HIV and sexually transmitted infection (STI) testing may be more accessible for Latinx immigrant SMM who face obstacles to obtaining HIV-related services. Combining the potential of self-testing kits and the influence of peer educators may present an opportunity to increase HIV and STI testing and preexposure prophylaxis (PrEP) uptake or linkage to HIV care among Latinx immigrant SMM. OBJECTIVE: This study aimed to develop and pilot a peer intervention to distribute HIV and STI self-testing kits and provide peer counseling based on the information-motivation-behavioral skills model to increase PrEP uptake and HIV and STI testing among Latinx immigrant SMM. Our evaluation focused on determining the differences in HIV testing, STI testing, and PrEP uptake outcomes between the intervention and control groups. METHODS: We conducted semistructured interviews with community stakeholders to elicit factors to consider for training and intervention. The interview findings informed the development of the intervention and peer training protocols. We piloted the intervention with Latinx immigrant SMM and randomly assigned participants to the intervention group, who received peer counseling and HIV and STI self-testing kits, or the control group, who only received peer counseling. We administered baseline, 1-week, 6-week, and 12-week follow-up surveys to assess behaviors related to HIV testing, STI testing, and PrEP uptake. Owing to the COVID-19 pandemic, the intervention components were delivered via web-based modalities. Chi-square tests were performed to examine the associations between HIV testing, STI testing, and PrEP motivation and behaviors across the study arms (intervention vs control). We conducted Cramer V test to determine the strength of the association between study arm and each of the outcome variables. We also assessed the impact of the COVID-19 pandemic on participants. RESULTS: Overall, 50 (intervention, n=30 and control, n=20) Latinx immigrant SMM participated in the program. Participants reported life disruptions owing to COVID-19, with 68% (34/50) reporting job loss after the declaration of the pandemic. After intervention participation, a higher proportion of participants in the intervention group reported having been tested for STIs (76% vs 36.8%; P=.01; Cramer V=0.394). Among the participants in the intervention group, 91% (21/23) reported being motivated to use PrEP compared with 59% (10/17) in the control group (P=.02; Cramer V=0.385). CONCLUSIONS: By facilitating access to HIV and STI testing through peer-delivered information, motivational support, and behavioral skills training as well as the provision of self-testing kits, our intervention demonstrated the potential to increase HIV prevention behaviors in Latinx immigrant SMM. Peer-based programs that offer self-testing and internet-based modes of accessing information may be a feasible strategy for reaching Latinx immigrant SMM. Article	2023	Lee, Jasper S; Albrechta, Hannah; Goodman, Georgia R; De, Dikha; Takabatake, Koki; O'Cleirigh, Conall; Mayer, Kenneth H; Fisher, Celia; Carnes, Chris T; Chai, Peter R	Diversity in Digital Pill Systems: Differences in Perceptions and Attitudes Towards Use of a Digital Pill System for HIV Pre-Exposure Prophylaxis Among Men Who Have Sex with Men with Diverse Racial and Ethnic Identities.	Proc Annu Hawaii Int Conf Syst Sci	-	-	-	-	1530-1605	NA	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9843706	Nonadherence, particularly among men who have sex with men (MSM) with substance use disorders, increases the risk of HIV acquisition. Measuring adherence to HIV pre-exposure chemoprophylaxis (PrEP), and responding to suboptimal adherence or changes in adherence behavior remains a challenging public health problem. Despite the importance of accurate adherence measurement, there is no gold standard for detecting medication ingestion events in HIV research. Current adherence measures indirectly infer ingestion events or measure medication concentrations over time, yet such approaches fail to provide direct confirmation of ingestions and contextual information surrounding adherence and nonadherence. A digital pill system (DPS) - a novel tool that leverages ingestible radiofrequency sensors to measure actual ingestion events - may advance adherence measurement in HIV research. We examined and compared the willingness of MSM across racial and ethnic identities to operate a DPS in the context of PrEP adherence measurement and suggest potential future applications of this technology. Article	2023	Lehmann C.; Mullins T.L.K.	Attitudes Toward and Experiences With Discussing Pre-exposure Prophylaxis With Sexual Partners Among US Adolescents and Young Adults Living With HIV	Journal of Adolescent Health	-	-	-	-	1054139X	10.1016/j.jadohealth.2023.04.030	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162095281&doi=10.1016%2fj.jadohealth.2023.04.030&partnerID=40&md5=b2ba496878a690ea8ead4f85f70e58a4	Purpose: Sexual partners of youth living with HIV are a key population for pre-exposure prophylaxis (PrEP). Among youth engaged in HIV medical care, we examined awareness of PrEP and experiences with and attitudes toward discussing PrEP with sexual partners. Methods: We recruited 25 15–24-year olds from an adolescent/young adult HIV clinic to complete individual interviews. Interviews assessed demographics, PrEP knowledge, sexual behaviors, and experiences with, intentions toward, barriers, and facilitating factors to discussing PrEP with partners. Transcripts were analyzed using framework analysis. Results: Mean age was 18.2 years. Twelve participants were cis-female, 11 cis-male, and two transgender female. Seventeen participants (68%) identified as Black, non-Hispanic. Nineteen acquired HIV sexually. Of 22 participants who had ever had sex, eight reported condomless sex in the prior 6 months. Most youth (17/25) were aware of PrEP. Only 11 participants had discussed PrEP with a partner; 16 reported high intention to discuss PrEP with future partners. Barriers to discussing PrEP with partners included participant-related barriers (i.e., discomfort disclosing HIV status), partner-related barriers (i.e., not open to or unfamiliar with PrEP), relationship-related barriers (i.e., new relationship, lack of trust), and stigma about HIV. Facilitating factors included positive relationship factors, educating partners about PrEP, and partners being receptive to learning about PrEP. Discussion: Although many youth living with HIV were aware of PrEP, fewer had discussed PrEP with a partner. PrEP use by partners of these youth may be improved by educating all youth about PrEP and offering opportunities for partners to meet with clinicians to discuss PrEP. © 2023 Society for Adolescent Health and Medicine	Adolescent; HIV; Prevention; Prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	LeMasters K.; Krajewski T.; Nowotny K.; Oser C.; Mollan K.; Brinkley-Rubinstein L.	Context specific HIV risk: evidence from screening into the southern pre-exposure prophylaxis study (SPECS)	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2022.2059054	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129141503&doi=10.1080%2f09540121.2022.2059054&partnerID=40&md5=5405336807551a832a0c13023d32edd6	While Pre-exposure prophylaxis (PrEP) is efficacious in preventing HIV, little is known about PrEP use among those on community supervision. The Southern Pre-Exposure Prophylaxis Study (SPECS) investigates barriers and facilitators for PrEP initiation and use among adults on community supervision (e.g., probation, parole). Challenges to PrEP use in this setting are abundant. SPECS uses a mixed-methods sequential design, including a multi-site, prospective cohort study in three southern states–North Carolina, Florida, and Kentucky. This analysis describes individual demographic, criminal legal, and HIV risk factor characteristics, by site and enrollment status. Pooled association analyses accounted for site via stratified statistical tests. Between June 2019-March 2020, SPECS screened 702 individuals and enrolled 276 participants (39%). Of those who were eligible, 98% agreed to enroll. Age, gender, and sexual orientation varied by enrollment and by site, while race/ethnicity varied by site but not enrollment status. Criminal legal histories varied by enrollment and HIV risk factors varied by site. SPECS provides a granular and detailed assessment of HIV risk in three diverse southern settings. It highlights how the level and type of HIV risk varies by location and by nature of criminal legal involvement and calls for the need for context-specific interventions for HIV prevention. © 2022 The Author(s). Article	2023	LeMasters, Katherine; Benson, Angela; Corsi, Christopher; Krajewski, Taylor; Seide, Kapriskie; Brinkley-Rubinstein, Lauren; Nowotny, Kathryn	Collateral consequences of COVID-19 for people on probation and parole.	Health & Justice	-	-	-	-	2194-7899	10.1186/s40352-023-00221-0	https://pubmed.ncbi.nlm.nih.gov/36995422/	BACKGROUND: While the severe detrimental impact of COVID-19 on incarcerated people is well known, little is known about the experience of COVID-19 on those on community supervision. Our objective was to better understand the experience of the COVID-19 pandemic and its collateral consequences for those on community supervision (e.g., probation, parole). Beginning in December 2020, we conducted 185 phone surveys about COVID-19 with participants in The Southern Pre-Exposure Prophylaxis (PrEP) Study across its three sites - Florida, Kentucky, and North Carolina. We conducted rapid assessment interviews with both closed- and open-ended questions. We calculated descriptive statistics for close-ended questions and conducted a content analysis for open-ended questions. RESULTS: The COVID-19 pandemic affected those on community supervision through their experiences in the community and while incarcerated with over one-quarter of participants being reincarcerated during this time. In addition to many (128/185) experiencing COVID-19 symptoms, about half (85/185) of participants reported a diagnosis in their network with 16 of those participants losing loved ones to the pandemic. Participants experienced disruptions to their social network, healthcare, and livelihoods. Though many maintained their support systems, others felt isolated and depressed. Experiences during COVID-19 exacerbated difficulties already faced by those with criminal involvement. CONCLUSIONS: The public health community must recognize those experiencing probation and parole, not only those housed in carceral facilities, as disproportionately impacted by the COVID-19 pandemic. We must tailor programs and services to meet their needs. Article	2023	Leonard S.; Sotindjo T.; Brophy J.; Tan D.H.S.; Nashid N.	HIV pre-exposure prophylaxis: It is time to consider harm reduction care for adolescents in Canada	Paediatrics and Child Health	-	-	-	-	12057088	10.1093/pch/pxac115	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174188585&doi=10.1093%2fpch%2fpxac115&partnerID=40&md5=9f87e7899d2dc5baa32eabd57f5e28a3	Youth (aged 15 to 29 years) account for one quarter of new HIV cases in Canada. Of those, men-who-have-sex-with-men make up one third to one half of new cases in that age range. Moreover, Indigenous youth are over-represented in the proportion of new cases. The use of emtricitabine/tenofovir disoproxil fumarate as pre-exposure prophylaxis (PrEP) significantly reduces the risk of HIV acquisition in adults. Its use was expanded to include youth over 35 kg by the U.S. Food and Drug Administration in 2018. However, PrEP uptake remains low among adolescents. Prescriber-identified barriers include lack of experience, concerns about safety, unfamiliarity with follow-up guidelines, and costs. This article provides an overview of PrEP for youth in Canada, and its associated safety and side effect profiles. Hypothetical case vignettes highlight some of the many demographics of youth who could benefit from PrEP. We present a novel flow diagram that explains the baseline workup, prescribing guidelines, and follow-up recommendations in the Canadian context. Additional counselling points highlight some of the key discussions that should be elicited when prescribing PrEP. © 2023 The Author(s). Article	2023	Leung, Erick; Cottrell, Mackenzie L.; Sykes, Craig; White, Nicole; Kashuba, Angela D. M.; Dumond, Julie B.	A multicompartment population PK model to predict tenofovir and emtricitabine mucosal tissue concentrations for HIV prevention.	CPT: Pharmacometrics & Systems Pharmacology	-	-	-	-	2163-8306	10.1002/psp4.13042	https://pubmed.ncbi.nlm.nih.gov/37814498/	A priori use of mathematical modeling and simulation to predict outcomes from incomplete adherence or reduced frequency dosing strategies may mitigate the risk of clinical trial failure with HIV pre-exposure prophylaxis regimens. We developed a semi-physiologic population pharmacokinetic model for two antiretrovirals and their active intracellular metabolites in three mucosal tissues using pharmacokinetic data from a phase I, dose-ranging study. Healthy female volunteers were given a single oral dose of tenofovir disoproxil fumarate (150, 300, or 600 mg) or emtricitabine (100, 200, or 400 mg). Simultaneous co-modeling of all data was performed on a Linux cluster. A 16 compartment, bolus input, linear kinetic model best described the data, containing 986 observations in 23 individuals across three matrices and four analytes. Combined with a defined efficacious concentration target in mucosal tissues, this model can be used to optimize the dose and dosing frequency through Monte-Carlo simulations. High-Risk Sexual Activities and Condom Use Patterns during Group Sex among Men Who Have Sex with Men in Melbourne, Australia	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000003211	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164293542&doi=10.1097%2fQAI.0000000000003211&partnerID=40&md5=997fd70a31183e03504e9e9d053e81fc	Background:Few studies have examined the types of sexual activities and condom use during group sex among men who have sex with men (MSM). This study aimed to examine sexual activities and condom use during group sex.Setting:A cross-sectional survey among MSM attending a sexual health clinic in Melbourne, Australia, between May 2019 and March 2020.Method:Participants were asked whether they had engaged in group sex (sex involving more than 2 participants) within the past 3 months, the number of people involved, the sexual activities they engaged in, and their condom use during the most recent group sex.Results:More than a quarter (26.8%, 287 of 1071) had engaged in group sex in the past 3 months, and the median number of people involved was 3 (interquartile range 3-4), including the participant. Fellatio was the most common activity in group sex (94.4%, 271 of 287), followed by kissing (85.7%, 246 of 287) and anal sex (79.8%, 229 of 287). The proportion of men who always used condoms and changed condoms between partners was 27.0% (48 of 178) for insertive and 32.3% (52 of 161) for receptive anal sex. Compared with men not taking pre-exposure prophylaxis (PrEP), men living with HIV (adjusted odds ratio aOR: 2.35; 95% confidence interval CI: 1.20 to 4.59) and men taking PrEP (aOR: 3.07; 95% CI: 2.21 to 4.26) had higher odds of engaging in group sex after adjusting for confounders.Conclusion:Two-thirds of MSM either did not use condoms or did not change condoms between partners during group sex, which may increase sexually transmitted infection transmission between partners. © 2023 Lippincott Williams and Wilkins. Article	2023	Lewis, Joseph; Melendez-Torres, G J	Prep-Tok: a queer critical discourse analysis of TikToks regarding HIV-related pre-exposure prophylaxis.	Culture, Health & Sexuality	-	-	-	-	1464-5351	10.1080/13691058.2023.2224414	https://dx.doi.org/10.1080/13691058.2023.2224414	Human immunodeficiency virus (HIV) continues to present a public health problem, and pre-exposure prophylaxis (PrEP) offers a promising preventative intervention; however, its uptake remains low, so investigating determinants of use is essential. This article applies queer critical discourse analysis to a corpus of 121 TikToks sampled via the TikTok algorithm, coded and refined into three overarching content categories: 'what makes a PrEP user?', 'what is PrEP as a drug?', and 'sexual health and HIV'. Examples from within these categories reveal four underlying discursive themes: (1) stigmatisation of HIV as a 'gay disease' with a poor prognosis; (2) stigmatisation of gay men as unsafe, high-risk and untrustworthy; (3) stigmatisation of PrEP as increasing 'unsafe' sexual practices; (4) poor healthcare and education gay men and other beneficiaries of PrEP. These themes are influenced by a broad spectrum of homophobic and heteronormative discourses available with specific examples reflecting parts of this spectrum from predominantly perpetuating to occasionally challenging. The findings report complementary evidence obtained from other media platforms yet offer a unique take while suggesting useful avenues for future public health messaging relating to PrEP which may be used to inform the next steps against HIV. Article	2023	Li C.; Xiong Y.; Liu H.; Luo D.; Tucker J.D.; Maman S.; Matthews D.D.; Fisher E.B.; Tang W.; Muessig K.E.	Multifaceted Barriers to Rapid Roll-out of HIV Pre-exposure Prophylaxis in China: A Qualitative Study Among Men Who Have Sex with Men	International Journal of Behavioral Medicine	-	-	-	-	10705503	10.1007/s12529-023-10177-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85158089230&doi=10.1007%2fs12529-023-10177-y&partnerID=40&md5=551c7c7e9985875a3233bb97d52cae9b	Background: Oral pre-exposure prophylaxis (PrEP) as a safe and effective antiretroviral medicine-based prevention against HIV has not been widely adopted by gay, bisexual, and other men who have sex with men (MSM) in China. A deeper understanding of barriers and facilitators to PrEP uptake is needed to inform the development of effective interventions. Method: During July–August 2020, we conducted one-on-one semi-structured interviews with 31 Chinese MSM with varied PrEP use experiences (PrEP-naïve, former, and current PrEP users). Interviews were digitally recorded and transcribed in Chinese. Informed by the Information-Motivation-Behavioral Skills Model (IMB), we analyzed the data using a thematic analysis approach to identify the barriers and facilitators to PrEP uptake among Chinese MSM. Results: Major barriers to PrEP uptake among MSM in the sample included uncertainty about PrEP efficacy and lack of PrEP education (information), concerns over potential side effects and cost (motivation), and difficulties in identifying authentic PrEP medications and managing PrEP care (behavioral skills). Facilitators include the perceived benefit of PrEP in improving the quality of sex life and control over health. At the contextual level, we also identified barriers to PrEP access from a thriving informal PrEP market and stressors related to being MSM. Conclusion: Our findings identified a need to invest in non-discriminatory public health messaging of PrEP, explore options for MSM-friendly provision of PrEP outside of traditional HIV care settings, and be attentive to the unique context of an established informal PrEP market in future PrEP initiatives. © 2023, International Society of Behavioral Medicine. Article	2023	Liu Q.; Yang X.; Xue H.; Tang H.	Analysis of on-demand adherence and related factors in men who have sex with women versus HIV pre-exposure prophylaxis services via the internet;	Chinese Journal of Endemiology	-	-	-	-	-	-	2546450	10.3760/cma.j.cn112338-20220210-00902	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175352726&doi=10.3760%2Fcma.j.cn112338-20220210-00902&partnerID=40&md5=6c6a6aea07507367298b969c7bc1662	Objective To understand the compliancy to on-demand HIV pre-exposure prophylaxis (PrEP) and related factors in men who have sex with men (MSM) accessing to PrEP service through an Internet platform. Methods A cross-sectional study method was used to recruit survey respondents through the Hoer Health platform from July 6 to August 30, 2022, and a questionnaire survey on the current status of medication use was conducted in MSM who use PrEP through the platform and take medication on demand. The MSM's information collected in the survey mainly included socio-demographic characteristics, behavioral characteristics, PrEP awareness and medication adherence, PrEP awareness and the status of dose taking. Univariate and multivariate logistic regression models were used to analyze related factors of on-demand PrEP. Results A total of 330 MSM who met the recruitment criteria were included during the survey period, with a valid response rate of 96.7% (330/341). In the questionnaire survey, The age of the 330 MSM was (27.00, 32.00) years old, 87.3% (288/330) had a bachelor's degree or above, 70.3% (232/330) had a monthly income of 5 000 to 15 000 yuan, 83.9% (277/330) had been in a relationship for 6 months or more, 85.9% (283/330) had been tested for HIV in the past 6 months, and 40.9% of them had average monthly income (10 000 yuan (1$≈7.0$) and multivariate logistic analysis showed that the MSM with good awareness of PrEP had relatively better compliancy to PrEP compared with those with poor awareness of PrEP (aOR=2.43, 95%CI:1.11-5.32). Conclusions The compliancy to on-demand PrEP was good in MSM who accessed to the services through Internet platform, but there is still a need to strengthen PrEP promotion in MSM for the further improvement of PrEP compliancy and reduction of the risk for HIV infection in this population. © 2023 Research in Plant Disease. Article	2023	Liu Y.; Chu Z.; Wang H.; Huang X.J.; Chen Y.K.; Wang H.; Zou D.; Jiang Y.J.; Geng W.Q.; Hu Q.; Zhou B.; Shang H.	Willingness to take long-acting injectable pre-exposure prophylaxis among men who have sex with men who participated in the CROPrEP study: a cross-sectional online study	BMC Public Health	-	-	-	-	-	-	14712458	10.1186/s12889-023-17325-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159661216&doi=10.1186%2Fs12889-023-17325-9&partnerID=40&md5=1b7f8b3f67b2ce931f1d1e1ce9c923b2	Introduction: Evidence on the willingness of men who have sex with men (MSM) with oral pre-exposure prophylaxis (PrEP) experience, especially those with suboptimal adherence, to take long-acting injectable PrEP (LAI-PrEP) is critical to guide future LAI-PrEP implementations. Objective: The objective was to assess the willingness of MSM with oral PrEP experience to take LAI-PrEP and potential correlates. Methods: MSM who participated in the China Real-world Study of Oral PrEP (CROPrEP) were enrolled in this study. Information on the willingness of MSM to take LAI-PrEP and potential correlates was collected using a self-administered questionnaire. Univariate and multivariate logistic regression models were fitted to identify factors associated with willingness to take LAI-PrEP. Results: A total of 612 former CROPrEP participants (PCPs) were included in the analysis. The median age was 25 (IQR: 23-30) years. Most PCPs were willing to take LAI-PrEP (57.1%) or were willing to take but LAI-PrEP, PCPs with no less than two sexual male partners (aOR = 1.54, 95% CI: 1.04, 2.28; P = 0.031), those with male partners with unknown HIV statuses (aOR = 2.04, 95% CI: 1.31, 3.18; P = 0.002), those with occasional/drug use (aOR = 1.58, 95% CI: 1.05, 2.40; P = 0.030), and those with HIV-2 positivity (aOR = 2.15, 95% CI: 1.30, 3.57; P = 0.003) were more willing to take LAI-PrEP, while ID-PrEP users (aOR = 0.66, 95% CI: 0.45, 0.98; P = 0.037) and PCPs with suboptimal oral PrEP adherence (aOR = 0.58, 95% CI: 0.38, 0.90; P = 0.026) were less willing to take LAI-PrEP. Conclusion: LAI-PrEP has good prospects for expanding PrEP coverage. However, PCPs with suboptimal oral PrEP adherence are less likely to take LAI-PrEP. Further intervention and implementation efforts are needed to improve the willingness of MSM to use LAI-PrEP, and sexual health should be considered during the discussion about PrEP initiation. © 2023, The Author(s).	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Article	2023	Liu, Albert Y.; Buchbinder, Susan P.	CROI 2023: Epidemiologic Trends and Prevention for HIV and Other Sexually Transmitted Infections.	Topics in Antiviral Medicine	-	-	-	-	-	-	2161-5853 2161-5861	NA	https://pubmed.ncbi.nlm.nih.gov/37315512/	At the 2023 Conference on Retroviruses and Opportunistic Infections (CROI), several investigators used tests of recent HIV infection to track which populations are currently most heavily impacted by HIV and to estimate HIV infection rates in these populations. Assisted partner notification for HIV was successfully applied for spouses of persons with HIV and sexual and injection partners of people who inject drugs. Several studies found that men who have sex with men (MSM) and transgender women who were offered HIV pre-exposure prophylaxis (PrEP) were interested in using long-acting injectable PrEP. Several strategies for improving HIV testing uptake in these populations. Doxycycline administered as 200 mg post sexual exposure significantly reduced the risk of syphilis, chlamydia, and gonorrhea infection in men who have sex with men but did not prevent bacterial sexually transmitted infections (STIs) in cis-gender women, reasons for this discrepancy are currently being explored. Although oral HIV preexposure prophylaxis (PrEP) is increasingly being used in populations at greatest need of prevention tools, PrEP uptake and persistence remain low in a number of key populations, including people who inject drugs. Several innovative delivery models show early promise in addressing gaps along the PrEP continuum. The successful use of injectable cabotegravir PrEP in several populations was presented at this conference, although uptake remains low globally. The pipeline of novel long-acting and rapid-onset PrEP agents appears to be robust, including implants, vaginal rings, and topical inserts, with several presentations focusing on preclinical and early clinical trials.	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Book Section	2023	Llenza G.	The impact of antiretroviral therapies and PrEP on gay men	-	Relationally Queer: a Pink Therapy Guide for Practitioners	-	-	-	978-1-4521-19725	-	10.4324/9781003260561-12	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173156434&doi=10.4324%2F9781003260561-12&partnerID=40&md5=5301e178e574e8816305f6bb7c49ab0	In this chapter, Llenza explains that the HIV and AIDS epidemic since the early 1980s meant a dramatic change to gay men's lives, their sexuality and how they relate as sexual beings. Antiretroviral Therapy (ART) development to treat HIV and PrEP to prevent it has brought new changes to gay men's sexuality and sexual behaviour. This chapter provides sex and oral relationship therapists with key concepts, instruments and knowledge about the impact of ART on gay men's sexuality, exploring how HIV trauma and the trauma of homophobia made a link between sex and desire with shame and fear. Understanding ART and PrEP are breaking this association. Most people with HIV in treatment have an undetectable viral load, meaning they cannot transmit the virus. This is transforming the definition of safer sex among gay men, changing the conversation and behaviour around HIV disclosure, stigma, sex negotiation, desire, assumptions, barebacking, condoms, secrecy and slut-shaming. With case studies and examples of creative therapeutic interventions, Llenza offers appropriate tools to allow the therapeutic process and alliance. © 2023 selection and editorial matter, Silva Nerea and Domaic Davies; individual chapters, the contributors.	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Article	2023	Lorenzetti L.; Dinh N.; van der Straten A.; Fonner V.; Ridgeway K.; Rodolph M.; Schaefer R.; Schmidt H.-M.A.; Baggaley R.	Systematic review of the values and preferences regarding the use of injectable pre-exposure prophylaxis to prevent HIV acquisition	Journal of the International AIDS Society	-	-	-	-	-	-	17582652	10.1002/jia2.26107	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164163826&doi=10.1002%2Fjia2.26107&partnerID=40&md5=9728405304d4f0bf5e0d1d7a0ab0bf	Introduction: Pre-exposure prophylaxis (PrEP) is an important HIV prevention option. Two randomized trials have provided efficacy evidence for long-acting injectable cabotegravir (CAB-LA) as PrEP. In considering CAB-LA as an additional PrEP modality for people at substantial risk of HIV, it is important to understand community response to injectable PrEP. We conducted a systematic review of values, preferences and perceptions of acceptability for injectable PrEP to inform global guidance and implementation. Methods: We searched for peer-reviewed and grey literature published between 1 January 2010 and 1 September 2021. There were no restrictions on location. A two-stage review process assessed references against eligibility criteria. Data from included studies were organized by countries from the Theoretical Framework of Acceptability. Results: We included 62 unique references. Most studies were observational, cross-sectional and qualitative. Over half of the studies were conducted in North America. Men who have sex with men were the most frequently studied group. Most studies (57/62) examined injectable PrEP, including hypothetical injectables (35/57) or future products like CAB-LA (22/57). Six studies examined CAB-LA specifically. There was overall interest in and often a preference for injectable PrEP, though there was variation within and across groups and regions. Many stakeholders indicated that injectable PrEP could help address adherence challenges associated with daily or on-demand dosing for oral PrEP and may be a better lifestyle fit for individuals seeking privacy, discretion and infrequent dosing. End-users reported concerns, including fear of needles, injection site pain and body location, logistical challenges and waning or incomplete protection. Discussion: Despite an overall preference for injectable PrEP, end-users' preferences for different injectable PrEP characteristics varied substantially. Some preferred CAB-LA's 8-week dosing, while others preferred the flexibility of dosing more frequently over time and end-users may switch between prevention options. There will be a greater understanding of enacted preference as more end-users are offered anti-retroviral (ARV)-containing injectables. Future research should focus on equitable implementation, including real-time decision-making and how trained healthcare providers can support choice. Conclusions: Given overall acceptability, injectable PrEP should be included as part of a menu of prevention options, allowing end-users to select the modality that suits their preferences, needs and lifestyle. © 2023 World Health Organization, licensee by International AIDS Society. Article	2023	Lozano, Alyssa; Jaramillo, John; Prado, Guillermo; Sefton, Steven A; Harkness, Audrey	Barriers and facilitators to PrEP use and HIV testing for subgroups of Latino sexual minority men	AIDS Care	-	-	-	-	-	-	09540121	10.1080/09540121.2023.2210699	https://www.proquest.com/scholarly-journals/barriers-facilitators-prep-use-hiv-testing/docview/2839589862/se-2?accountid=9133	Pre-exposure prophylaxis (PrEP) and HIV testing inadequately reach Latina/o sexual minority men (LSMM), fueling HIV disparities. This study identified determinants of LSMM's PrEP use and HIV testing and examined differences across subgroups (i.e., age and immigrant history). First, we identified the most to least endorsed barriers and facilitators of PrEP use and HIV testing in a sample of LSMM (n = 161; ages 18–40 years old, and (2) across immigration histories (U.S. born, recent immigrant, established immigrant). Next, we examined differences in barrier/facilitator ratings across these age and immigration status groups. Key overall determinants were cost, knowledge, and perceived benefit/need. However, there was variation in determinants across age groups (i.e., cost, affordability, navigation support, and normalization) and immigration statuses (i.e., language, immigration concerns, and HIV knowledge). There were also differences across service types; mistrust and concerns was a barrier related to PrEP but not HIV testing. We found unique and common multilevel factors across prevention services and subgroups. Language, cost, and clinic/system issues are key barriers to accessing HIV prevention that should be considered when developing implementation strategies to enhance the reach of these services to LSMM.	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Article	2023	Louis H.; Li G.; Duncan D.T.; Sullivan P.S.; Ransome Y.	Spatial accessibility of pre-exposure prophylaxis (PrEP): different measure choices and the implications for detecting shortage areas and examining its association with social determinants of health	Annals of Epidemiology	-	-	-	-	-	-	10472797	10.1016/j.annepidem.2023.07.004	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85167736604&doi=10.1016%2Fj.annepidem.2023.07.004&partnerID=40&md5=a07b4a3387a1250dda0c41d1264e9e1a	Purpose: We examine how various pre-exposure prophylaxis (PrEP) accessibility measures impact the detection of PrEP shortage areas and the relation of shortage areas to social determinants of health (SDOH). Methods: Using ZIP Code Tabulation Areas (ZCTAs) in New York City as a case study, we compared 25 measures of spatial PrEP accessibility across four categories, including density, proximity, two-step floating catchment area (2SFCA), and Gaussian 2SFCA (G2SFCA). Bayesian spatial regression models were used to examine how PrEP accessibility is associated with SDOH. Results: Using density to measure PrEP accessibility for small areas such as ZCTAs poses challenges to statistical modeling because the measured accessibility values are highly skewed with excess zeros, leading to the necessity of using complex models such as the two-part mixture model. When G2SFCA measures are used, which account for distance decay effects and the competition from the PrEP demand side, findings on PrEP shortage area detection and the association between PrEP accessibility and SDOH were more consistent and less sensitive to spatial scales (i.e., varying from 10- to 30-minute driving). Conclusions: This study suggests the nascent research on PrEP accessibility measurement and sheds light on selecting an appropriate measure to assess spatial disparities in PrEP accessibility and its associations with SDOH. © 2023 Elsevier Inc.	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Article	2023	Louis, Hui; Ransome, Yusuf	County-Level Spatiotemporal Patterns of Non HIV Diagnoses and Pre-exposure Prophylaxis (PrEP) Use in Mississippi, 2014–2018: A Bayesian Analysis of Publicly Accessible Censored Data	Annals of the American Association of Geographers	-	-	-	-	-	-	24694452	10.1080/24694452.2022.2080040	https://www.proquest.com/scholarly-journals/county-level-spatiotemporal-patterns-non-hiv/docview/2716142605/se-2?accountid=9133	In the South region of the United States, HIV is disproportionately high and levels of pre-exposure prophylaxis (PrEP) use, which is highly effective in reducing the risk of acquiring HIV, are among the lowest across the country. Simultaneously examining the geographical distributions of both new HIV diagnoses and PrEP use as well as how they evolve over time at the county level is valuable for developing locally tailored intervention programs to target areas most in need of help. There is scant research on this topic using publicly accessible data sets, however, partly because of statistical challenges in modeling censored spatiotemporal data. This study fills this gap by applying a Bayesian spatiotemporal model to analyze interval-censored new HIV diagnoses and left-censored PrEP user data sets in Mississippi at the county level from 2014 to 2018. Results from a simulation study and the Mississippi data application show that the Bayesian model with the Besag–York–Mollié spatial structure and time trends performs well in estimating censored values and regression coefficients as well as detecting hot spots. At the state level, new HIV diagnoses had a stable trend and PrEP use clearly increased during the study period. DeSoto and Hinds counties warrant special attention because their trends in new HIV diagnoses departed from the state-level trend. We demonstrate that publicly accessible, censored new HIV diagnosis and PrEP user data could be analyzed in ways that yield robust results, which can help health departments and other stakeholders more confidently identify areas for increased efforts to aggressive HIV prevention.Resumo alternativo:美国南部的艾滋病毒感染（HIV）感染率特别高，而有效降低HIV感染风险的暴露前预防（PrEP）的使用量也十美国最低水平，探讨HIV新诊断和PrEP使用的地理分布及其在县级水平下的时间演变，有助于开展获得更好的预防和应对艾滋病毒的干预方案。然而，由于在基于公开数据的建模在统计上的挑战，与了很多社会问题。本研究应用贝叶斯时空模型来分析区间审查的艾滋病毒诊断和左审查的PrEP用户数据，密西西比州的数据应用和模拟研究表明，贝叶斯模型在估计审查值和回归系数以及检测热点方面表现良好。在州一级，新的艾滋病毒诊断呈现稳定趋势，PrEP的使用量在研究期间明显增加。DeSoto县和Hinds县的趋势偏离了州一级的趋势，因此需要特别关注。我们证明，当这些数据以各种方式进行分析以产生稳健的结果时，可以帮助卫生部门和其他有关方面更有把握地确定HIV新报到的优先地区。	Pre-exposure prophylaxis; pre-exposure prophylaxis; Mississippi; Disease surveillance; Bayesian analysis; Bayesian statistics; Censored data; Statistical analysis; Poisson distribution; Pyrosulfuric medicine; Trends; new HIV diagnosis; Bayesian analysis; censored data; spatiotemporal statistics; Mathematical models; Accessibility; Human immunodeficiency virus--HIV; United States--US; Prevention programs; Health risks; Medical diagnoses; Datasets; Bayesian theory; Coefficients; Geographical distribution; Probability theory; Regression coefficients; Spatiotemporal data; Values	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

METHODS: We conducted an open-label, randomized study involving MSM and transgender women who were taking preexposure prophylaxis (PrEP) against human immunodeficiency virus (HIV) infection (PrEP cohort) or living with HIV infection (persons living with HIV infection PLWH cohort) and who had had Neisseria gonorrhoeae (gonorrhea), Chlamydia trachomatis (chlamydia), or syphilis in the past year. Participants were randomly assigned in a 2:1 ratio to take 200 mg of doxycycline within 72 hours after condomless sex (doxycycline postexposure prophylaxis) or receive standard care without doxycycline. STI testing was performed quarterly. The primary end point was the incidence of at least one STI per follow-up quarter. RESULTS: Of 501 participants (327 in the PrEP cohort and 174 in the PLWH cohort), 67% were White, 7% Black, 11% Asian or Pacific Islander, and 30% Hispanic or Latino. In the PrEP cohort, an STI was diagnosed in 61 of 570 quarterly visits (10.7%) in the doxycycline group and 82 of 257 quarterly visits (31.9%) in the standard-care group, for an absolute difference of -21.2 percentage points and a relative risk of 0.34 (95% confidence interval CI, 0.24 to 0.46; P<0.001). In the PLWH cohort, an STI was diagnosed in 36 of 305 quarterly visits (11.8%) in the doxycycline group and 39 of 128 quarterly visits (30.5%) in the standard-care group, for an absolute difference of -18.7 percentage points and a relative risk of 0.38 (95% CI, 0.24 to 0.60; P<0.001). The incidences of the three evaluated STIs were lower with doxycycline than with standard care; in the PrEP cohort, the relative risks were 0.45 (95% CI, 0.32 to 0.65) for gonorrhea, 0.12 (95% CI, 0.05 to 0.25) for chlamydia, and 0.13 (95% CI, 0.03 to 0.59) for syphilis, and in the PLWH cohort, the relative risks were 0.43 (95% CI, 0.26 to 0.71), 0.26 (95% CI, 0.12 to 0.57), and 0.23 (95% CI, 0.04 to 1.29), respectively. Five grade 3 adverse events and no serious adverse events were attributed to doxycycline. Of the participants with gonorrhea culture available, tetracycline-resistant gonorrhea occurred in 5 of 13 in the doxycycline groups and 2 of 16 in the standard-care groups. CONCLUSIONS: The combined incidence of gonorrhea, chlamydia, and syphilis was lower by two thirds with doxycycline postexposure prophylaxis than with standard care, a finding that supports its use among MSM with recent bacterial STIs. Article	2023	Luz P.M.; Deshpande V.; Kazemian P.; Scott J.A.; Shebl F.M.; Spaeth H.; Pimenta C.; Stern M.; Pereira G.; Struchiner C.J.; Grinsztejn B.; Veloso V.G.; Freedberg K.A.	Impact of pre-exposure prophylaxis uptake among gay, bisexual, and other men who have sex with men in urban centers in Brazil: a modeling study	BMC Public Health	-	-	-	14712458	10.1186/s12889-023-15994-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161881561&doi=10.1186%2fs12889-023-15994-0&partnerID=40&md5=2a6922e1772edd63127bdbd2ea7b4e4e	Background: Men who have sex with men (MSM) in Brazil remain disproportionately affected by HIV. We estimated the potential incidence reduction by five years with increased uptake of publicly-funded, daily, oral tenofovir/emtricitabine (TDF/FTC) for HIV pre-exposure prophylaxis (PrEP) among MSM using the Cost Effectiveness of Preventing AIDS Complications microsimulation model. We used national data, local studies, and literature to inform model parameters for three cities: Rio de Janeiro, Salvador, and Manaus. Results: In Rio de Janero, a PrEP intervention achieving 10% uptake within 60 months would decrease incidence by 2.3% whereas achieving 60% uptake within 24 months would decrease incidence by 29.7%; results were similar for Salvador and Manaus. In sensitivity analyses, decreasing mean age at PrEP initiation from 33 to 21 years increased incidence reduction by 34%; a discontinuation rate of 25% per year decreased it by 12%. Conclusion: Targeting PrEP to young MSM and minimizing discontinuation could substantially increase PrEP's impact. © 2023, The Author(s). Article	2023	L'Yavanc, Thomas; Gosset, Daniel; Plathey, Marine; Jedrzejewski, Thibaut; Gazalet, Philippe; Lasry, Stéphane; Pierre, Nadège; Kachal, Abdessamad; Fremondiere, Marc; Ohayon, Michel; Palich, Romain	Is There a Reduction in Chemsex Practice in Men Who Have Sex With Men During COVID-19 Lockdown? Results of the CheRRLock Study.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003153	https://pubmed.ncbi.nlm.nih.gov/36562613/	BACKGROUND AND AIMS: Chemsex is a growing concern among men who have sex with men (MSM). COVID-19 lockdowns have had consequences on social and sexual interactions. We aimed to assess changes in chemsex practices during COVID-19 lockdown in France among MSM and factors associated with maintaining or increasing chemsex practice. METHODS: Repeated face-to-face questionnaires were conducted at "Le 190" Sexual Health Center, Paris, France, exploring lifestyle, sexual, and chemsex practices, COVID-19 concerns and mental health before and during second lockdown in France (30/10/2020-15/12/2020). Inclusion criteria were chemsex practices at least 3 times throughout lifetime and at least once in the 3 months before second lockdown. The primary end point was the proportion of participants who declared having stopped, decreased, maintained, or increased their chemsex practice during lockdown. Univariable and multivariable logistic regressions were used to analyze factors associated with evolutions of chemsex practice. RESULTS: Ninety-three MSM were included: 66% HIV-positive and 30% taking PrEP. Drugs most used were cathinones (91%) and GHB/GBL (52%). Participants reported stopping, decreasing, maintaining, and increasing chemsex drugs use in 14%, 22%, 22%, and 42% of cases, respectively. Despite this overall increase in chemsex practice, MSM decreased their number of sexual partners. Factors significantly associated with maintaining or increasing chemsex drugs use were feeling lonely (OR = 3.24), craving (OR = 4.51), and working during lockdown (OR = 3.27), contrasting with fear of COVID-19 (OR = 0.31). CONCLUSION: Restriction measures lead to changes in sexual behavior and seem to increase chemsex practice. Maintaining care for most isolated patients should be a priority in COVID-19 context. Article	2023	Ma J.; Chase G.E.; Black A.; Klaphake J.; Garcia-Myers K.; Baker J.V.; Horvath K.J.	Attitudes Toward and Beliefs in the Effectiveness of Biomedical HIV Prevention Strategies Among Emerging and Young Adult Sexual Minority Men	International Journal of Behavioral Medicine	-	-	-	10705503	10.1007/s12529-023-10244-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180254579&doi=10.1007%2fs12529-023-10244-4&partnerID=40&md5=fbde78dd8f46ebee6d40e5dab919c8f9	Background: Pre-exposure prophylaxis (PrEP) and HIV treatment as prevention, which underlies the Undetectable = Untransmittable (U = U) campaign, are two effective biomedical approaches for HIV prevention among sexual minority men (SMM). Attitudes toward PrEP and U = U may differ between SMM emerging adults (EA: 18–24 years old) and young adults (YA: 25–29 years old) to drive differences in sexual behavior. However, to date, few studies assessed the degree to which YAs and EAs differ in their beliefs in the effectiveness of PrEP and U = U. Method: A national sample of 80 SMM in the USA (M age = 25.1 years; 53.7% racial/ethnic minority; 38.8% EA; 61.3% YA) participated in a 6-month mHealth intervention for PrEP adherence. Non-parametric tests assessed differences in sexual behaviors and attitudes toward the effectiveness of PrEP and U = U between EAs and YAs using baseline data. Results: Compared to EAs, higher proportions of YAs trusted PrEP's effectiveness and considered condom use unnecessary after taking PrEP. More YAs than EAs were willing to engage in sexual behaviors that they felt too risky before learning about U = U and were more comfortable having condomless sex with HIV-positive partners. Conversely, a greater proportion of EAs than YAs preferred to use condoms even when their partners are on anti-HIV medications. Conclusion: Overall, YAs trusted the effectiveness of U = U and PrEP more than EAs, underscoring developmental differences in SMM's perspectives on biomedical HIV prevention tools. Our findings underscore the importance of tailoring messages on biomedical HIV prevention options differently for EAs and YAs to optimize uptake. © 2023, International Society of Behavioral Medicine. Article	2023	Maasoumy, Benjamin; Ingiliz, Patrick; Spinner, Christoph D.; Cordes, Christiane; Stellbrink, Hans-Jürgen; Schulze Zur Wiesch, Julian; Schneeweiß, Stephan M.; Deterding, Katja; Müller, Tobias; Kahlhöfer, Julia; Dörge, Petra; von Karpowitz, Maria; Manns, Michael P.; Wedemeyer, Heiner; Cornberg, Markus	Sofosbuvir plus velpatasvir for 8 weeks in patients with acute hepatitis C: The HepNet acute HCV-V study.	JHEP Reports: Innovation in Hepatology	-	-	-	2589-5559	10.1016/j.jhepr.2022.100650	https://www.jhep-reports.eu/article/S2589-5559(22)00222-1/fulltext	BACKGROUND & AIMS: EASL guidelines recommend 8 weeks of treatment with sofosbuvir plus velpatasvir (SOF/VEL) for the treatment of acute or recently acquired HCV infection, but only 6- and 12-week data are available. Therefore, the aim of this study was to evaluate the safety and efficacy of a shortened 8-week SOF/VEL treatment for acute HCV monoinfection. METHODS: In this investigator-initiated, prospective, multicentre, single-arm study, we recruited 20 adult patients with acute HCV monoinfection from nine centers in Germany. Patients received SOF/VEL (400/100 mg) as a fixed-dose combination tablet once daily for 8 weeks. The primary efficacy endpoint was the proportion of patients with sustained virological response 12 weeks after the end of treatment (SVR12). RESULTS: The median HCV RNA viral load at baseline was 104,307 IU/ml; the distribution of HCV genotypes was as follows: GT1a/1b/2/3/4: n = 12/1/1/3/3. Thirteen (65%) of the 20 patients were taking medication for HIV pre-exposure prophylaxis. SVR12 was achieved in all patients who complied with the study protocol (n = 18/18 100%, per protocol analysis), but the primary endpoint was not met in the intention-to-treat analysis (n = 18/20 90%) because two patients were lost to follow-up. One serious adverse event (unrelated to study drug) occurred during 12 weeks of post-treatment follow-up. CONCLUSIONS: The 8-week treatment with SOF/VEL was well tolerated and highly effective in all adherent patients with acute HCV monoinfection. Early treatment of acute hepatitis C might effectively prevent the spread of HCV in high-risk groups. CLINICAL TRIAL NUMBER: NCT03818308. IMPACT AND IMPLICATIONS: The HepNet acute HCV-V study (NCT03818308), an investigator-initiated, single-arm, multicenter pilot study, demonstrates the efficacy and safety of 8 weeks of daily treatment with the fixed-dose combination sofosbuvir/velpatasvir (400/100 mg) in patients with acute hepatitis C virus (HCV) infection. All patients who completed therapy and were followed-up achieved sustained virologic response. Thus, early treatment with SOF/VEL which might effectively prevent the spread of HCV in high-risk groups can be recommended for patients with acute HCV monoinfection.	direct-acting antivirals; ALT, alanine aminotransferase; HCV, hepatitis C virus; hepatitis C elimination; ULN, upper limit of normal; acute HCV infection; ITT, intention-to-treat; LLOQ, lower limit of quantification; PP, per protocol; recently acquired infection; SVR, sustained virologic response	English	United States	Western and Central Europe and North America	Germany	Western and Central Europe and North America	Germany	Western and Central Europe and North America	Clinical
Article	2023	MacDonald C.B.; Murphy A.L.; Isenor J.E.; Ramsey T.D.; Furlotte K.; Smith A.J.; Bishop A.; Kelly D.V.; Woodill L.; Booker C.; Wilby K.J.	Target users' acceptance of a pharmacist-led prescribing service for pre-exposure prophylaxis (PrEP) for human immunodeficiency virus (HIV)	Canadian Pharmacists Journal	-	-	-	17151635	10.1177/17151635231177027	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162687633&doi=10.1177%2f17151635231177027&partnerID=40&md5=22e668c10cdb5a1d14177bb6153a3854	Background: Pre-exposure prophylaxis (PrEP) for human immunodeficiency virus (HIV) is a highly effective way to reduce virus transmission. There have been increasing calls to improve access to PrEP in Canada. One way to improve access is by having more prescribers available. The objective of this study was to determine target users' acceptance of a PrEP-prescribing service by pharmacists in Nova Scotia. Methods: A triangulation, mixed-methods study was conducted consisting of an online survey and qualitative interviews underpinned by the Theoretical Framework of Acceptability (TFA) constructs (affective attitude, burden, ethicality, intervention coherence, opportunity cost, perceived effectiveness and self-efficacy). Participants were those eligible for PrEP in Nova Scotia (men who have sex with men or transgender women, persons who inject drugs and HIV-negative individuals in serodiscordant relationships). Descriptive statistics and ordinal logistic regression were used to analyze survey data. Interview data were deductively coded according to each TFA construct and then inductively coded to determine themes within each construct. Results: A total of 148 responses were captured by the survey, and 15 participants were interviewed. Participants supported pharmacists' prescribing PrEP across all TFA constructs from both survey and interview data. Identified concerns related to pharmacists' abilities to order and view lab results, pharmacists' knowledge and skills for sexual health and the potential for experiencing stigma within pharmacy settings. Conclusion: A pharmacist-led PrEP-prescribing service is acceptable to eligible populations in Nova Scotia. The feasibility of PrEP prescribing by pharmacists should be pursued as an intervention to increase access to PrEP. © The Author(s) 2023.	adultagedArticleawarenesscross-sectional studyfemalehumanhuman experimentHuman immunodeficiency virusinterviewmalemedication compliancepatient compliancepharmacistpre-exposure prophylaxisprescriptionquestionnaireself conceptsemi structured interviewsexual health	English	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	New Zealand	Asia and the Pacific	Mixed methods
Article	2023	MacDonald J.; Estcourt C.S.; Flowers P.; Nandwani R.; Frankis J.; Young I.; Clutterbuck D.; Dalrymple J.; McDaid L.; Steedman N.; Saunders J.	Improving HIV pre-exposure prophylaxis (PrEP) adherence and retention in care: Process evaluation and recommendation development from a nationally implemented PrEP programme	PLOS One	-	-	-	19326203	10.1371/journal.pone.0292289	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173637136&doi=10.1371%2fjournal.pone.0292289&partnerID=40&md5=d2c2ce98002502bd580bfa7d04c63245	Introduction HIV pre-exposure prophylaxis (PrEP), in which people take HIV medication to prevent HIV acquisition, underpins global HIV transmission elimination strategies. Effective prevention needs people to adhere to PrEP and remain in care during periods of risk, but this is difficult to achieve. We undertook a process evaluation of Scotland's PrEP programme to explore barriers and facilitators to PrEP adherence and retention in care and to systematically develop evidence-based, theoretically-informed recommendations to address them. Methods We conducted semi-structured interviews and focus groups (09/2018-07/2019) with patients who identified as gay or bisexual men and were either using PrEP, had declined the offer of PrEP, had stopped PrEP, or had been assessed as ineligible for PrEP (n = 39 of whom n = 5 (13%) identified as trans, median age 31 years and interquartile range 14 years), healthcare professionals involved in PrEP provision (n = 54 including specialist sexual health doctors and nurses of various grades, PrEP prescribing general practitioners, health promotion officers, midwifes, and a PrEP clinical secretary), and clients (n = 9) and staff (n = 15) of nongovernmental organisations with an HIV prevention remit across Scotland. We used thematic analysis to map key barriers and facilitators to priority areas that could enhance adherence and retention in care. We used implementation science analytic tools (Theoretical Domains Framework, Intervention Functions, Behaviour Change Technique Taxonomy, APEASE criteria) and expert opinion to systematically generate recommendations. Results Barriers included perceived complexity of on-demand dosing, tendency for users to stop PrEP before seeking professional support, troublesome side-effects, limited flexibility in the settings/timings/nature of review appointments, PrEP-related stigma and emerging stigmas around not using PrEP. Facilitators included flexible appointment scheduling, reminders, and processes to follow-up non-attenders. Examples of the 25 recommendations include: emphasising benefits of PrEP reviews and providing appointments flexibly within individualised PrEP care; using clinic systems to remind/recall PrEP users; supporting PrEP conversations among sexual partners; clear on-demand dosing guidance; encouraging good PrEP citizenship; detailed discussion on managing side-effects and care/coping planning activities. Conclusions PrEP adherence and retention in care is challenging, reducing the effectiveness of PrEP at individual and population levels. We identify and provide solutions to where and how collaborative interventions across public health, clinical, and community practice could address these challenges. Article	2023	MacGibbon J.; Bavinton B.R.; Drysdale K.; Murphy D.; Broady T.R.; Kolstee J.; Molyneux A.; Power C.; Paynter H.; de Wit J.; Holt M.	Explicit Relationship Agreements and HIV Pre-exposure Prophylaxis Use by Gay and Bisexual Men in Relationships	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-022-02382-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135751452&doi=10.1007%2fs10508-022-02382-9&partnerID=40&md5=0b21469846aa5e3f769f995e3721152b	Relationship agreements are important for HIV prevention among gay and bisexual men (GBM) in relationships, with research earlier in the HIV epidemic often finding that agreements specified monogamy or condom use with casual partners. There is evidence that HIV pre-exposure prophylaxis (PrEP) has shifted sexual practices among some men in relationships, such as allowing condomless sex with casual partners, but there has been little attention paid to relationship agreements among GBM who use PrEP. In this paper, we analyzed national, Australian, cross-sectional data from an online survey completed by non-HIV-positive GBM in 2021 (N = 1,185). Using logistic regression, we identified demographic characteristics, sexual practices and the types of relationship agreement that were associated with PrEP use among GBM in relationships. Using Pearson's chi-squared tests, we explored whether PrEP users in relationships reported similar sexual practices to PrEP users not in relationships. PrEP use among GBM in relationships was independently associated with older age, identifying as gay, being in a non-monogamous relationship, having a spoken (explicit) relationship agreement, having a primary HIV-negative partner taking PrEP or a primary partner living with HIV, reporting recent condomless casual sex, reporting an STI diagnosis in the past year, and knowing at least one other PrEP user. We found that PrEP users in relationships had similar sexual practices to PrEP users not in relationships. GBM in relationships who have casual sex and who meet PrEP suitability criteria may be good candidates for PrEP. Our findings suggest that explicit relationship agreements remain important for HIV prevention, and they support PrEP use among GBM in relationships. © 2022, The Author(s). Article	2023	MacGibbon, James; Bavinton, Benjamin R.; Broady, Timothy R.; Ellard, Jeanne; Murphy, Dean; Calabrese, Sarah K.; Kalwicz, David A.; Heath-Paynter, Dash; Molyneux, Angus; Power, Cherie; Heslop, Andrew; de Wit, John; Holt, Martin	Familiarity with, perceived accuracy of, and willingness to rely on Undetectable=Untransmittable (U=U) among gay and bisexual men in Australia: results of a national cross-sectional survey.	Sexual Health	-	-	-	1449-8987 1448-5028	10.1071/SH23050	https://pubmed.ncbi.nlm.nih.gov/37380171/	BACKGROUND: The Undetectable=Untransmittable (U=U) message has been promoted since it was demonstrated that viral suppression through HIV treatment prevents sexual transmission between serodiscordant partners (HIV treatment as prevention). Our study assessed familiarity with, perceived accuracy of, and willingness to rely on U=U in a national sample of gay and bisexual men in Australia. METHODS: We conducted a national, online cross-sectional survey in April-June 2021. Eligible participants were gay, bisexual and queer men and non-binary people who lived in Australia. Logistic regression was used to identify factors associated with familiarity, perceived accuracy and willingness to rely on U=U (by having condomless sex with a partner with HIV who has an undetectable viral load). RESULTS: Of 1280 participants, most were familiar with U=U (1006/1280; 78.6%), the majority of whom believed U=U was accurate (677/1006; 67.3%). Both familiarity and perceived accuracy were higher among participants living with HIV, followed by pre-exposure prophylaxis (PrEP) users, HIV-negative participants not taking PrEP, and untested/unknown status participants. Knowing at least one person living with HIV, among other factors, was associated with familiarity and perceived accuracy of U=U; and familiarity was associated with perceived accuracy. Among participants familiar with U=U, less than half were willing to rely on U=U (473/1006; 47.0%). Familiarity with U=U and knowing at least one person living with HIV were associated with willingness to rely on U=U, among other factors. CONCLUSIONS: We found familiarity with U=U was associated with perceived accuracy and willingness to rely upon it. There is an ongoing need to educate gay and bisexual men (particularly HIV-negative men) about U=U and its benefits. Article	2023	Maddox V.; Vallely P.; Brailsford S.R.; Harvala H.	Virological safety of the UK blood supply in the era of individual risk assessments and HIV PrEP	Transfusion Medicine	-	-	-	9587578	10.1111/tme.12993	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169819953&doi=10.1111%2ftme.12993&partnerID=40&md5=90b2268b6c449725815aef02ae4e26bf	A more individualised donor selection policy was implemented in the UK in 2021, which replaced the previous 3-month deferral for men who have sex with men (MSM). Other blood services have a variety of policies in place to ensure the virological safety of blood components, ranging from an indefinite ban on MSM, to a defined period of exclusion, or to an individualised risk assessment that is not based on gender or sexual orientation. Justification of these policies should be based on scientific evidence including assessment of lengths of virological window periods, infectious disease epidemiology within donor populations and donation screening assay sensitivities. Developments in molecular technology and assays which can detect both antibodies and antigens in the very early stages of infection have significantly reduced the risk in most developed countries. However, the increasing usage of pre-exposure prophylaxis (PrEP) to prevent acquisition of HIV infection after possible high-risk sexual contact within the UK blood donor population has been recently noted. It has brought with it new diagnostic challenges within blood screening, notably possible non-detection of HIV RNA and serological markers following PrEP use despite potential infectivity. The use of other testing strategies such as detection of HIV DNA and screening for non-declared PrEP usage should be investigated further. © 2023 British Blood Transfusion Society.	blood donation; blood safety; donor deferral; HIV; PrEP	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review
Article	2023	Maddox, Victoria; Reynolds, Claire; Amara, Alieu; Else, Laura; Brailsford, Susan R; Khoo, Saye; Harvala, Heli	Undeclared pre-exposure or post-exposure prophylaxis (PrEP/PEP) use among syphilis-positive blood donors, England, 2020 to 2021.	Eurosurveillance	-	-	-	1560-7917	10.2807/1560-7917.ES.2023.28.11.2300135	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10021473	An individualised blood donor selection policy was implemented in the United Kingdom from summer 2021. We have investigated the impact of this policy by comparing the extent of undeclared use of HIV pre-exposure or post-exposure prophylaxis (PrEP/PEP) before and after this change. The rate of PrEP usage in syphilis-positive male blood donors has not changed since individualised donor assessment was implemented but provides continuing evidence of undisclosed PrEP use which may be associated with current or past higher-risk sexual behaviours. Theses and Dissertations	2023	MAGALHAES, BRENDA DE ALMEIDA PERRET	PROFILAXIA PRÉ E PÓS EXPOSIÇÃO AO HIV: CONHECIMENTO DOS PROFISSIONAIS E ESTUDANTES DA SAÚDE DE UM HOSPITAL UNIVERSITÁRIO NO EXTREMO SUL DO BRASIL	-	-	Universidade Federal do Rio Grande do Sul	-	-	NA	NA	A IST, a causada pelo vírus da imunodeficiência humana (HIV) ocasiona a síndrome da 3 imunodeficiência adquirida (aids). O HIV é um dos maiores desafios para a saúde pública, pois 4 ainda não se conhece a cura para essa condição, e ainda que seja tratável muitos indivíduos não 5 têm acesso ao tratamento, principalmente em países de baixa renda. O uso de antirretrovirais 6 como prevenção tem se mostrado um método efetivo, as profilaxias pré e pós exposição ao HIV 7 fazem parte destes métodos, ambas possuem grande importância devido à sua eficácia em 8 prevenir a infecção pelo vírus. A região sul do país possui taxas preocupantes em relação ao 9 número de novos casos e as taxas de mortalidade causadas pelo HIV e pela aids, por isso, o 10 objetivo do trabalho foi avaliar o conhecimento dos profissionais e estudantes das áreas da 11 saúde de um Hospital Universitário do município de Rio Grande acerca das profilaxias pré e 12 pós exposição ao HIV (PrEP e PEP). A pesquisa foi realizada com profissionais da saúde 13 (médicos, enfermeiros, técnicos em enfermagem e farmacêuticos) que atuam no Hospital 14 Universitário Dr. Miguel Riet Corrêa Jr. (HU-FURG/Ebserh), e estudantes de ensino superior 15 dos cursos de Enfermagem e Medicina da Universidade Federal do Rio Grande (FURG), através 16 de um questionário online. Os resultados deste trabalho comprovam que as taxas de 17 conhecimento/acerto tanto sobre PrEP quanto sobre PEP foram maiores para os profissionais 18 do que para os estudantes. Quanto ao nível de distinção entre ambas, o conhecimento sobre a 19 PEP foi maior ao da PrEP, tanto para os profissionais quanto para os estudantes. Destaca-se que 20 para algumas questões básicas sobre as profilaxias, o conhecimento tanto dos estudantes quanto 21 dos profissionais foi considerado insuficiente. Dentre os achados desta pesquisa observou-se 22 que para questões como: 'Sabe o que é PrEP ou PEP?' (p=0,001); 'Uso de preservativo durante 23 a PrEP?' (p=0,002); 'Idade para início da PrEP?' (p=0,000); 'Indicação da PEP?' (p=0,002); 24 'Tempo de duração da PEP?' (p=0,005); 'Materiais sem risco para transmissão do HIV' 25 (p=0,044); 'Indicação de PEP após contato com urina sem luva' (p=0,036); e 'Indicação de PEP 26 após contato de pele íntegra com escarro' (p=0,023), os estudantes de enfermagem sabiam 27 menos que os de medicina. Os resultados também mostram que profissionais com tempo de 28 formação menor ou igual a cinco anos obtiveram menos acertos nas questões: Uso de 29 preservativo durante a PrEP?' (p=0,002); 'Exame sorologia PrEP?' (p=0,019); 'Enfermeiro 30 prescreve PrEP?' (p=0,001); 'Enfermeiro prescreve PEP?' (p=0,025). Este estudo evidencia a 31 necessidade de estratégias para divulgação destas profilaxias, tanto no meio dos profissionais 32 quanto entre os estudantes. Article	2023	Magno, L; de Medeiros, DS; Soares, F; Grangeiro, A; Caires, P; Fonseca, T; Westin, MR; Dourado, I	Factors associated to HIV prevalence among adolescent men who have sex with men in Salvador, Bahia State, Brazil: baseline data from the PrEP1519 cohort	Cadernos de Saúde Pública	-	-	-	0102-311X	10.1590/0102-311XEN154021	https://www.scielo.br/j/csp/a/tqc6YvvRqNw7kWnztRQRsng/abstract/?lang=en	Adolescent men who have sex with men (AMSM) are at a heightened vulnera-bility for human immunodeficiency virus (HIV). This study aimed to estimate the prevalence of HIV and associated individual, social, and programmatic factors among AMSM in Salvador, Bahia State, Brazil. This is a cross-sec-tional study which analyzed baseline data from the PrEP1519 cohort in Sal-vador. Descriptive, bivariate, and multivariate analyses were conducted using the dimensions of vulnerability to HIV as hierarchical levels of analysis. Lo-gistic regression models were used to estimate the odds ratios (OR) of the asso-ciation between predictor variables and HIV infection. The prevalence of HIV infection among the 288 AMSM recruited to the project was 5.9% (95%CI: 3.7-9.3). Adjusted analysis showed a statistically significant association be-tween self-identifying as a sex worker (OR = 3.74, 95%CI: 1.03-13.60) and HIV infection. Other associations with borderline statistical significance were the use of application programs to find sexual partners (OR = 3.30, 95%CI: 0.98-11.04), low schooling level (OR = 3.59, 95%CI: 0.96-13.41), failing to be hired or being dismissed from a job because of sexual orientation (OR = 2.88, 95%CI: 0.89-9.28), and not using health services as a usual source of care (OR = 3.14, 95%CI: 0.97-10.17). We found a high HIV prevalence among AMSM in Salvador. Furthermore, our study found that individual, social, and programmatic factors were associated with HIV infection among these AMSM. Article	2023	Magno, Laio; Soares, Fabiane; Zucchi, Eliana Miura; Eustórgio, Marcos; Grangeiro, Alexandre; Ferraz, Dulce; Greco, Dirceu; Escuder, Maria Mercedes; Dourado, Ines	Reaching Out to Adolescents at High Risk of HIV Infection in Brazil: Demand Creation Strategies for PrEP and Other HIV Combination Prevention Methods	Archives of Sexual Behavior	-	-	-	00040002	10.1007/s10508-022-02371-y	https://www.proquest.com/scholarly-journals/reaching-out-adolescents-at-high-risk-hiv/docview/2770820007/se-2?accountid=8113	Using baseline data from the PrEP1519 cohort, in this article we aimed to analyze: (i) the effectiveness of demand creation strategies (DCS) to enroll adolescent men who have sex with men (AMSM) and adolescent transgender women (ATGW) into an HIV combination prevention study in Brazil; (ii) the predictors of DCS for adolescents' enrollment; and (iii) the factors associated with DCS by comparing online and face-to-face strategies for enrollment. The DCS included peer recruitment (i.e., online and face-to-face) and referrals from health services and non-governmental organizations (NGOs). AMSM and ATGW who agreed to participate in the study could opt to enroll in either PrEP (PrEP arm) or to use other prevention methods (non-PrEP arm). Bivariate and multivariate analyses were conducted and logistic regression odds ratios were estimated. The DCS reached 4529 AMSM and ATGW, the majority of which were derived online (73.8%). Of this total, 935 (20.6%) enrolled to participate (76.6% in PrEP arm and 23.4% in non-PrEP arm). The effectiveness of enrolling adolescents into both arms was greater via direct referrals (235/382 and 84/382, respectively) and face-to-face peer recruitment (139/670 and 35/670, respectively) than online (328/3342). We found that a combination under DCS was required for successful enrollment in PrEP, with online strategies majorly tending to enroll adolescents of a higher socioeconomic status. Our findings reinforce the need for DCS that actively reaches out to all adolescents at the greatest risk for HIV infection, irrespective of their socioeconomic status. Article	2023	Magnus M.; Yellin H.; Langlands K.; Balachandran M.; Turner M.; Jordan J.; Ramin D.; Kuo I.; Siegel M.	Overcoming structural barriers to diffusion of HIV pre-exposure prophylaxis	Journal of Medicine Access	-	-	-	27550834	10.1177/27550834231214958	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179371893&doi=10.1177%2f27550834231214958&partnerID=40&md5=bc2cbe883ba2d499ca30f1e4ba5e92a5	HIV prevention with antiretroviral medication in the form of pre-exposure prophylaxis (PrEP) offers a critical tool to halt the HIV pandemic. Barriers to PrEP access across drug types, formulations, and delivery systems share remarkable commonalities and are likely to be generalizable to future novel PrEP strategies. Appreciation of these barriers allows for planning earlier in the drug-development pathway rather than waiting for the demonstration of efficacy. The purpose of this article is to propose a core set of considerations that should be included in the drug-development process for future PrEP interventions. A literature synthesis of key barriers to PrEP uptake in the United States was conducted to elucidate commonalities across PrEP agents and delivery methods. Based on the published literature, we divided challenges into three main categories of structural barriers: (1) provider and clinic characteristics; (2) cost considerations; and (3) disparities and social constructs, with potential solutions provided for each. Pragmatic strategies for examining and overcoming these barriers before future PrEP regulatory approval are recommended. If these strategies are considered well before the time of commercial availability, the potential for PrEP to interrupt the HIV pandemic will be greatly enhanced. © The Author(s) 2023. Article	2023	Mahlare, E; Ramutshila, E; Musekiwa, A; Kuonza, L; Mabuto, T	Knowledge, attitudes and practices of oral HIV pre-exposure prophylaxis (PrEP) among healthcare workers in the Ekurhuleni District, South Africa	South African Medical Journal (SAMJ)	-	-	-	0256-9574	10.7196/samj.2023.v113i12.1171	http://www.scielo.org.za/scielo.php?script=sci_arttext&pid=S0256-95742023001300011&lang=pt	BACKGROUND: Prevention of new HIV infections is crucial for controlling the HIV epidemic. Despite HIV pre-exposure prophylaxis (PrEP) being one of the highly effective approaches to preventing HIV, and being freely available through primary healthcare clinics (PHCs), the uptake of HIV PrEP in South Africa (SA) is low OBJECTIVE: To understand knowledge, attitudes and practices (KAPs) of healthcare workers responsible for generating demand for HIV PrEP services, or identifying clients eligible for HIV PrEP services in PHCs in Ekurhuleni District, South Africa METHODS: We conducted a cross-sectional interviewer-administered survey among healthcare workers from 45 randomly selected PHCs in Ekurhuleni District. We collected information on participant characteristics and their KAPs regarding HIV PrEP service delivery. KAP scores were developed using a priori cut-off points and participants were categorised into levels of KAPs. We performed descriptive and multivariable logistic regression analysis in line with the study objectives RESULTS: We enrolled 160 study participants from 1 May to 30 June 2022. About two-thirds of the participants (64.4%) were highly knowledgeable about HIV PrEP, and 58.1% self-reported practices that were considered to be good. Notably, 73.1% of participants had negative attitudes toward HIV PrEP delivery. Participants who were aged >50 years had poor HIV PrEP knowledge (adjusted odds ratio (aOR) 0.1; 95% confidence interval (CI) 0.0 - 0.4; p=0.01) compared with participants <30 years old. Participants aged 30 - 40 years had poor HIV knowledge although their association is not statistically significant. Nurses had higher HIV PrEP knowledge (aOR 11.1; 95% CI 3.8 - 32.4, p<0.001) compared with health promoters. Both nurses (aOR=0.2, 95% CI 0.1 - 0.6; p<0.001) and HIV testing service counsellors (aOR 0.3; 95% CI 0.1 - 0.9; p=0.02) had negative attitudes toward HIV PrEP, compared with health promoters. Nurses had better practices in HIV PrEP delivery compared with health promoters (aOR 2.5; 95% CI 1.0 - 5.9; p=0.04 CONCLUSION: Among the healthcare workers tasked with generating demand and identifying clients eligible for HIV PrEP services, low knowledge of HIV PrEP and negative attitudes towards HIV PrEP may be barriers to the uptake of HIV PrEP. Training healthcare workers on HIV PrEP is recommended	NA	English	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2023	Mahomed, Sharana; Garrett, Nigel; Capparelli, Edmund V; Osman, Farzana; Mkhize, Nonhlanhla N; Harkoo, Ishana; Gengiah, Tanuja N; Mansoor, Leila E; Baxter, Cheryl; Archary, Derseree; Yende-Zuma, Nonhlanhla; Samsunder, Natasha; Carlton, Kevin; Narpala, Sandeep; McDermott, Adrian B; Doria-Rose, Nicole A; Moore, Penny L; Morris, Lynn; Abdool Karim, Quarraisha; Mascola, John R; Abdool Karim, Salim S	Safety and pharmacokinetics of escalating doses of neutralising monoclonal antibody CAP256V2LS administered with and without VRC07-523LS in HIV-negative women in South Africa (CAPRISA 012B): a phase 1, dose-escalation, randomised controlled trial.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(23)00003-6	https://dx.doi.org/10.1016/S2352-3018(23)00003-6	BACKGROUND: Young women in sub-Saharan Africa continue to bear a high burden of HIV infection. Combination anti-HIV monoclonal antibodies are a potential HIV prevention technology that could overcome adherence challenges of daily oral pre-exposure prophylaxis. In this phase 1 clinical trial we aimed to determine the safety and pharmacokinetic profile of the broadly neutralising monoclonal antibody CAP256V2LS. METHODS: CAPRISA 012B, a first-in-human dose-escalation phase 1 trial evaluated the safety, pharmacokinetics, and neutralisation activity of CAP256V2LS alone and in combination with VRC07-523LS in young HIV-negative women in Durban, South Africa. Groups 1 and 2 were open label with CAP256V2LS administered at 5 mg/kg and 10 mg/kg intravenously and 5 mg/kg, 10 mg/kg, and 20 mg/kg subcutaneously. In group 3, participants were randomly allocated to receive a combination of CAP256V2LS and VRC07-523LS at 10 mg/kg and 20 mg/kg subcutaneously comixed with ENHANZE, a recombinant human hyaluronidase. Once safety was established in the first three participants, dose escalation took place sequentially following review of safety data. Primary endpoints were the proportion of participants with mild, moderate, and severe reactogenicity or adverse events, graded as per the Division of AIDS toxicity grading. The trial is registered on the Pan African Clinical Trial Registry, PACTR202003767867253, and is recruiting. FINDINGS: From July 13, 2020, to Jan 13, 2021, 42 HIV-negative women, aged 18-45 years, were enrolled. All 42 participants, eight with intravenous and 34 with subcutaneous administration, completed the trial. There were no serious adverse events or dose-limiting toxicities. Most commonly reported symptoms following intravenous administration were headaches in seven (88%) and nausea in four (50%) participants. Commonly reported symptoms following subcutaneous administration were headache in 31 (91%), chills in 25 (74%), and malaise or fatigue in 19 (56%) participants. Adverse events included transient lymphocytopenia in eight (19%), proteinuria in nine (21%), elevated aspartate aminotransferase in ten (24%), and alanine aminotransferase in five (12%) participants. INTERPRETATION: CAP256V2LS administered alone and in combination with VRC07-523LS was safe with favourable pharmacokinetics and neutralisation activity, supporting further assessment in larger clinical studies. FUNDING: European and Developing Countries Clinical Trials Partnership, South African Medical Research Council, and South African Department of Science and Innovation. BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2023-076843	https://pubmed.ncbi.nlm.nih.gov/37640457/	INTRODUCTION: Women-controlled HIV prevention technologies that overcome adherence challenges of available daily oral pre-exposure prophylaxis and give women a choice of options are urgently needed. Broadly neutralising monoclonal antibodies (bnAbs) administered passively may offer a valuable non-antiretroviral biological intervention for HIV prevention. Animal and human studies have demonstrated that bnAbs which neutralise HIV can prevent infection. The optimal plasma antibody concentrations to confer protection against HIV infection in humans is under intense study. The Centre for the AIDS Programme of Research in South Africa (CAPRISA) 012C trial will evaluate extended safety and pharmacokinetics of CAP256V2LS and VRC07-523LS among young HIV-negative South African and Zambian women. The study design also allows for an evaluation of a signal of HIV prevention efficacy. METHODS AND ANALYSIS: CAPRISA 012 is a series of trials with three distinct protocols. The completed CAPRISA 012A and 012B phase 1 trials provided critical data for the CAPRISA 012C trial, which is divided into parts A and B. In part A, 90 participants were randomised to receive both CAP256V2LS and VRC07-523LS at 20 mg/kg or placebo, subcutaneously every 16 or 24 weeks. Part B will enrol 900 participants in South Africa and Zambia who will be randomised in a 1:1 ratio and receive an initial loading dose of 1.2 g of CAP256V2LS and VRC07-523LS or placebo followed by 600 mg of CAP256V2LS and 1.2 g of VRC07-523LS or placebo subcutaneously every 6 months. Safety will be assessed by frequency and severity of reactogenicity and other related adverse events. Pharmacokinetics of both antibodies will be measured in systemic and mucosal compartments over time, while participants will be monitored for breakthrough HIV infections. ETHICS AND DISSEMINATION OF STUDY FINDINGS: The University of KwaZulu-Natal Biomedical Research Ethics Committee and South African Health Products Regulatory Authority have approved the trial (BREC/00002492/2021, SAHPRA20210317). Results will be disseminated through conference presentations, peer-reviewed publications and the clinical trial registry. TRIAL REGISTRATION NUMBER: PACTR202112683307570. Article	2023	Majam M.; Segal B.; Fieggen J.; Smith E.; Hermans L.; Singh L.; Phatsoane M.; Arora L.; Lalla-Edward S.T.	Utility of a machine-guided tool for assessing risk behaviour associated with contracting HIV in three sites in South Africa	Informatics in Medicine Unlocked	-	-	-	23529148	10.1016/j.imu.2023.101192	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148056893&doi=10.1016%2fj.imu.2023.101192&partnerID=40&md5=9c7614af86dbcd17ce08c6cab2a4b702	Introduction: Digital data collection and the associated mobile health technologies have allowed for the recent exploration of artificial intelligence as a tool for combatting the HIV epidemic. Machine learning has been found to be useful both in HIV risk prediction and as a decision support tool for guiding pre-exposure prophylaxis (PrEP) treatment. This paper reports data from two sequential studies evaluating the viability of using machine learning to predict the susceptibility of adults to HIV infection using responses from a digital survey deployed in a high burden, low-resource setting. Methods: 1036 and 593 participants were recruited across two trials. The first trial was a cross-sectional study in one location and the second trial was a cohort study across three trial sites. The data from the studies were merged, partitioned using standard techniques, and then used to train and evaluate multiple different machine learning models and select and evaluate a final model. Variable importance estimates were calculated using the PIMP and SHAP methodologies. Results: Characteristics associated with HIV were consistent across both studies. Overall, HIV positive patients had a higher median age (34 IQR: 29–39 vs 26 IQR 22–33, p < 0.001), and were more likely to be female (155/703 22% vs 107/927 12%, p < 0.001). HIV positive participants also had more commonly gone a year or more since their last HIV test (183/262 70% vs 540/1368 39%, p < 0.001) and were less likely to report consistent condom usage (113/262 43% vs 758/1368 55%, p < 0.001). Patients who reported TB symptoms were more likely to be HIV positive. The trained models had accuracy values (AUROCs) ranging from 78.5% to 82.8%. A boosted tree model performed best with a sensitivity of 84% (95% CI 72–92), specificity of 71% (95% CI 67–76), and a negative predictive value of 95% (95% CI 93–96) in a hold-out dataset. Age, duration since last HIV test, and number of male sexual partners were consistently three of the four most important variables across both variable importance estimates. Conclusions: This study has highlighted the synergies present between mobile health and machine learning in HIV. It has been demonstrated that a viable ML model can be built using digital survey data from an low-middle income setting with potential utility in directing health resources. © 2023 The Authors	HIV; HIV risk Assessment; Machine guided tool; Machine learning; ML; Predictive analysis; PrEP; Supervised learning	English	Netherlands	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Theses and Dissertations	2023	Maldonado Rodriguez, Leonardo; Jean, Judy	The Presumption of the Usage of Pre-Exposure Prophylaxis (PrEP) to Prevent HIV and STDS in Wilton Manors, FL	-	-	Keiser University	-	NA	NA	https://www.proquest.com/dissertations-theses/presumption-usage-pre-exposure-prophylaxis-prep/docview/2863704707/se-2?accountid=8113	Pre-exposure prophylaxis, or PrEP, is a prophylactic therapy recommended to HIV- negative individuals at an elevated risk of developing an infectious disease. However, data shows that PrEP users are more likely to contract sexually transmitted diseases (STDs). This study examines the relationship between pre-exposure prophylaxis and the incidence of STDs among the lesbian, gay, bisexual, transgender, queer, questioning, and others (LGBTQ+) community in Wilton Manors, Florida. PrEP's effectiveness in preventing HIV infection has been questioned, but it is routinely used to prevent other sexually transmitted diseases. The Health Belief Model (HBM) and the Trans-Theoretical Model (TTM) were applied in this study to determine how PrEP and its association with STDs affect individuals' attitudes and behaviors. The survey method, distributed via email and social media, allowed respondents to offer personal information regarding their sexual health and practices in an anonymous and secure environment. Although there is a modest potential for bias stemming from study participants' responses, efforts were taken to mitigate the effects of such difficulties. These results are crucial for comprehending how PrEP and STD prevention overlap in the LGBTQ+ population. These findings may inform public health policy, preventative programs, and educational strategies, thereby contributing to the sexual health and well-being of the LGBTQ+ population. This can enhance underserved people's public health and quality of life. Article	2023	Mann S.	Pre-Exposure Prophylaxis and HIV Incidence	B.E. Journal of Economic Analysis and Policy	-	-	-	19351682	10.1515/bejeap-2023-0087	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171734993&doi=10.1515%2fbejeap-2023-0087&partnerID=40&md5=9e8f2ea623d6768040cb02ba2910083b	Pre-Exposure Prophylaxis (PrEP) is a drug that, as demonstrated in clinical trials, when taken makes the user virtually immune to HIV. This has led to numerous countries making the drug available, but little is known about the population level effects of PrEP. Using panel data from 40 European countries I study the effect of countries adopting WHO recommendations to make PrEP available to citizens. I demonstrate that PrEP availability leads to around 15-20% fewer new HIV infections. My results indicate that PrEP can be an effective tool in reducing HIV incidence. © 2023 Walter de Gruyter GmbH, Berlin/Boston. Article	2023	Mann, Laura M.; Sanchez, Travis; Stephenson, Rob; Sullivan, Patrick S.; Jenness, Samuel M.	The Impact of the COVID-19 Pandemic on Sexual Behavior and HIV Prevention and Treatment Services Among U.S. Men Who Have Sex With Men in the Post-Lockdown Era.	American Journal of Men's Health	-	-	-	1557-9891 1557-9883	10.1177/15579883231168602	https://pubmed.ncbi.nlm.nih.gov/37081746/	Early in the COVID-19 pandemic, disruptions to sexual health services and changes to sexual behavior due to the first COVID-19 lockdowns were common among U.S. gay, bisexual, and other men who have sex with men (GBMSM). Less is known about the persistence of these changes after this initial lockdown period. These changes have long-term implications for HIV prevention for current and future pandemic periods. This study collected information on COVID-related impacts on sexual behavior and HIV-related health service disruptions from a cohort of U.S. GBMSM at three time points during the COVID-19 pandemic. We observed that COVID-related disruptions to sexual behavior continued from early lockdown periods through December 2020. Although early interruptions to pre-exposure prophylaxis (PrEP) access resolved in later 2020 and interruptions to antiretroviral therapy (ART) adherence were minimal, extended disruptions were observed in HIV testing, sexually transmitted infection (STI) testing, HIV care clinical visits, and HIV viral load testing. Although sexual behavior did not return to prepandemic levels in late 2020, the reduced access to HIV prevention, testing, and treatment services during this period could result in an overall increased HIV transmission rate, with long-term impacts to the trajectory of the U.S. HIV epidemic. Additional resources and programs are needed to address challenges created by the COVID-19 pandemic, as well as prepare for future potential pandemics and other disruptive events. Article	2023	Mansergh, G; Sullivan, PS; Kota, KK; Daskalakis, D	Pre-exposure prophylaxis in the era of emerging methods for men who have sex with men in the USA: the HIV Prevention Cycle of Care model	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(22)00309-5	https://pubmed.ncbi.nlm.nih.gov/36525980/	Expanding on previous work, we present an HIV Prevention Cycle of Care model to facilitate understanding of the complexity of issues involved in pre-exposure prophylaxis implementation for gay, bisexual, and other men who have sex with men (MSM) in the USA, including individual, client-provider, and overarching issues such as health equity, stigma, and prevention nomenclature. The HIV prevention cycle of care applies to MSM who test negative for HIV. The Prevention Cycle of Care model includes seven steps: prevention knowledge, prevention self-awareness and preferences, prevention motivation, health-care access and cost, provider issues, adherence and persistence, and periodic reassessment and adjustment. HIV prevention is complex in an era of emerging multiple modalities, and more research is needed to successfully implement pre-exposure prophylaxis options over time and across diverse communities of MSM who are sexually active. Article	2023	Mansergh, Gordon; Kota, Krishna Kiran; Carnes, Neal; Gelaude, Deborah	Refusal of Daily Oral PrEP: Implementation Considerations and Reported Likelihood of Using Various HIV Prophylaxis Products in a Diverse Sample of MSM.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000003134	https://dx.doi.org/10.1097/QAI.0000000000003134	BACKGROUND: An important subgroup of gay, bisexual, and other men who have sex with men (MSM) with behavioral indications refuse daily oral pre-exposure prophylaxis (PrEP) when recommended by a provider. Emerging HIV prophylaxis products (eg, injectable, event-driven) offer more options to MSM who refuse daily PrEP. In this article, we assess reasons for refusal and likelihood to use various products among MSM who refused PrEP. METHODS: MSM who reported anal sex without condoms or PrEP and refused daily oral PrEP in the past 6 months were recruited from clinics, community venues, and online in Atlanta, Chicago, and Raleigh-Durham. Men were asked their main reason for recently refusing daily PrEP and likelihood of using various PrEP options in the future. Bivariate and multivariable regression models were used to estimate associations. RESULTS: MSM (n = 93; 70% Black, 48% age 18-29 years) reported their main reason for refusing daily PrEP were potential side effects (35%), a daily pill regimen (22%), and not having enough information (18%). Reported likelihood of using PrEP products was 58% for penile gel, 54% for event-driven oral, 52% for injectable, and 50% for daily PrEP. MSM who reported daily regimen as the main reason for refusing PrEP had greater odds of likelihood to use an injectable adjusted odds ratio (AOR) = 5.21, 95% confidence interval (CI): 1.32 to 20.52. Younger men (18-29 vs 30+ years) had greater odds of likelihood to use condoms (AOR = 3.40, 95% CI: 1.15 to 10.04) and daily PrEP (AOR = 2.76, 95% CI: 1.06 to 7.16); there were no product preference differences by race. CONCLUSION: Most men who refused daily PrEP indicated likelihood of using some form of PrEP in the future. Article	2023	Mapetla K.S.; Mokgatle M.M.; Oguntibeju O.O.	Barriers and facilitators influencing the uptake and acceptability of HIV pre-exposure prophylaxis amongst commercial female sex workers in Tshwane district, Gauteng province: A descriptive study	International Journal of Innovative Research and Scientific Studies	-	-	-	26176548	10.53894/ijirss.v6i4.1952	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180228294&doi=10.53894%2fijirss.v6i4.1952&partnerID=40&md5=39d15e112b720914e0a0648d680dc875	While there have been great advances in HIV prevention methods in recent years, such as daily pre-exposure prophylaxis (PrEP) and combination antiretrovirals used as Treatment as Prevention (TaSP), access to care, compliance, and consistent follow-up with treatment remain barriers to care in high-risk populations. The purpose of this study was to explore the barriers and facilitators for the uptake and acceptability of PrEP among female sex workers in Tshwane District, South Africa. A descriptive qualitative research design was used. Female sex workers (FSW) aged 18 years and above were purposively sampled to participate in the study. The research team approached a minimum of 24 female sex workers until data saturation was achieved. The results showed that barriers such as a shortage of PrEP, side effects of PrEP, unawareness of collection points, reliance on pills, stigmatization, and absence of clinics influenced the uptake and acceptability of PrEP. The study also reported on facilitators that enhance the uptake and acceptability of PrEP among sex workers in Tshwane District. These facilitators include knowledge and awareness, perceived HIV risk, availability of mobile clinics, the effectiveness of PrEP, easier accessibility of information, awareness programmes, fear of infection, and preventative measure. This study established the barriers and facilitators that potentially influence the uptake and acceptability of PrEP among female sex workers in the Tshwane District, Gauteng Province, South Africa. © 2023 by the authors. Article	2023	Maragh-Bass A.C.; Williams T.; Agarwal H.; Dulin A.K.; Sales J.; Mayer K.H.; Siegler A.J.	Exploring Stigma, Resilience, and Alternative HIV Preventive Service Delivery Among Young Men who Have Sex with Men of Color	Clinical Nursing Research	-	-	-	10547738	10.1177/10547738231184295	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164504523&doi=10.1177%2f10547738231184295&partnerID=40&md5=b46b4364fb461a0b846e362f9a588cbb	Stigmatization on the basis of race, sexuality, gender identity, and/or use of pre-exposure prophylaxis (PrEP) exacerbates HIV disparities for young men who have sex with men of color (YMSM). We explored resilience, healthcare experiences, stigma, and impact of coronavirus disease 2019 (COVID-19) on PrEP care needs among YMSM of color through virtual in-depth interviews. Analyses used adapted grounded theory/constant comparison. Regarding healthcare-based stigma, participants enacted multilevel resilience which was critical to their care retention during COVID-19 (Themes 1 and 2). Some participants noted that remote care could minimize healthcare stigma and promote retention in care and/or on PrEP (Theme 3). Participants were interested in long-acting injectable (LAI) PrEP but expressed concerns about cost, effectiveness, and side effects (Theme 4). Community-based venues like pharmacies were preferred spaces for getting LAI PrEP injections (Theme 4). Although expansion of telehealth that helped mitigate care retention challenges during COVID-19 was temporary, continued telehealth use may reduce stigmatization and promote long-term retention and PrEP persistence. © The Author(s) 2023.	home-based HIV care; long-acting injectable PrEP; multilevel resilience; PrEP MSM; PrEP MSM of color; stigma	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Maragh-Bass, Allysha C.; Aimone, Elizabeth V.; Aikhuele, Eseohe O.; Macqueen, Kathleen	Exploring intersectional stigma and COVID-19 impact on human immunodeficiency virus service provision for African Americans in a Southern city.	Journal of Clinical Nursing	-	-	-	1365-2702 0962-1067	10.1111/jocn.16539	https://onlinelibrary.wiley.com/doi/epdf/10.1111/jocn.16539	AIMS/OBJECTIVES: Through interviews with clinical service providers, we explored stigma's impact on HIV service provision for African Americans during COVID-19. BACKGROUND: African Americans experience disproportionate rates of HIV and COVID-19. We explored COVID-19's impact on HIV services for African American adults in a Southern city. DESIGN: The study was qualitative and observational. METHODS: Key informant interviews were conducted (n = 11) across two healthcare centres and two community-based organisations and thematically analysed using phenomenological approaches by two coders. Interviews explored pre- and post-COVID-19 service provision and parallels between COVID-19 and HIV, particularly as related to stigma. The COREQ checklist was utilised to ensure research quality. RESULTS: According to the providers interviewed, all providers offered HIV prevention/treatment, but PrEP and preventive services diminished greatly early in the COVID-19 pandemic. Successful transition to telehealth depended on existing telehealth use. Challenges exacerbated by COVID-19 included food/housing insecurity and physical distancing constraints. Clients' COVID-19 informational needs shifted from concerns to vaccine requests over time. Interviewees stated HIV and COVID-19 both carry 'risk taking'; however, HIV risk was more physically intimate than COVID-19. Notably, some providers used stigmatising language referring to clients with HIV/COVID and omitted person-centred language. CONCLUSIONS: Findings suggest need to address challenges in telehealth to improve client experiences now and for future pandemics. More research is needed to examine intersectional stigmatisation of COVID-19 and HIV for African Americans to design person-centred counselling interventions. RELEVANCE TO CLINICAL PRACTICE: Results demonstrate need for provider training to reframe stigma discussions using client centeredness, educating African Americans on HIV and COVID-19 prevention, and coordination with local organisations to address multiple care needs. PATIENT/PUBLIC CONTRIBUTION: This research highlights needs of clients based on the views of healthcare providers caring for predominantly African American communities in a Southern city. However, no patients, service users, caregivers or members of the public were directly involved in this study. Essay	2023	Maragh-Bass, Allysha C; Stoner, Marie C D; Castellanos-Usigli, Antón; Agarwal, Harsh; Katz, Ariana W K; Patani, Henna; Sukhija-Cohen, Adam; Campbell, Lauren; Arreola, Sonya; Saberi, Parya	New preexposure prophylaxis options need updated counseling approaches: reframing 'risk' in HIV prevention counseling for young sexual and gender minorities of color.	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000003563	https://dx.doi.org/10.1097/QAD.0000000000003563	For nearly four years, HIV prevention science has seen renewed focus and funding allocations towards 'ending the HIV epidemic'. One pillar is the prevention of new HIV transmissions by using proven interventions, including preexposure prophylaxis (PrEP) [1]. Existing PrEP uptake interventions need more research to examine how to adequately tailor them to populations who continue to experience HIV inequities, including young adults of color who identify as sexual and gender minorities (YSGM) in the United States [2]. The Centers for Disease Control and Prevention (CDC) surveillance data from 2018 show that YSGM of color had disproportionately high HIV diagnoses in the United States, with Black/African Americans having the highest numbers, followed by Hispanic/Latino individuals [3]. Recent PrEP-to-need ratios (the ratio of PrEP users in 1 year to those newly diagnosed with HIV in the prior year) were lower for YSGM of color than their white counterparts, showing inadequate utilization of PrEP, despite higher rates of HIV diagnoses [4]. Although regional variations exist, disparities remain for YSGM irrespective of the rollout of new PrEP assistance programs [5]. These disparities also remain, despite recent mandates in some states for LGBT health training to healthcare providers, such as in California [6].	adherence; ending the HIV epidemic; health equity; HIV/AIDS; LGBT health; MSM; sex positivity; sexual pleasure	English	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Other
Article	2023	Marcus U.; Schink S.B.; Weber C.	HIV pre-exposure prophylaxis and diagnoses of sexually transmitted infections – observational data from German checkpoints, 01/2019–08/2021	BMC Public Health	-	-	-	14712458	10.1186/s12889-023-15570-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151962967&doi=10.1186%2fs12889-023-15570-6&partnerID=40&md5=82bcf987bc7325c8c3f625bcd69e84cb	Background: The impact of starting HIV pre-exposure prophylaxis (PrEP) on diagnoses of sexually transmitted infections (STI) remains unclear. We used data from German HIV/STI Checkpoints collected from 01/2019 to 08/2021 to determine the impact of PrEP use on syphilis, gonorrhoea and chlamydia diagnoses. Methods: We used self-reported data on demographics, sexual behaviour, testing and PrEP use, as well as lab-confirmed diagnoses from visits to HIV/STI Checkpoints in Germany. PrEP use was categorized as (1) never used; (2) intention to use; (3) former use; (4) current on-demand use; (5) daily use. In multivariate regression analyses (MRA) with gonorrhoea, chlamydia, and syphilis diagnoses as outcomes, we controlled for age, number of sexual partners, number of condomless anal intercourse (CAI) partners in the last six months, and testing recency. Results: For the analysis, we included 9,219 visits for gonorrhoea and chlamydia testing and 11,199 visits for syphilis testing conducted at checkpoints from 01/2019 to 08/2021. MRA identified age (aOR 0.98; 95%CI 0.97–0.99), number of sexual partners in the past six months (aOR 4.90; 95%CI 2.53–9.52 for 11 + partners), and use of chemsex substances (aOR 1.62; 95%CI 1.32–2.00) as risk factors for gonorrhoea, while age (aOR 0.99; 95%CI 0.98–1.00), number of CAI partners (aOR 3.19; 95%CI 2.32–4.41 for 5 + partners), partner sorting (aOR 1.30; 95%CI 1.09–1.54), and use of chemsex substances (aOR 1.29; 95%CI 1.05–1.59) were risk factors for chlamydia infections. For syphilis, the number of CAI partners (aOR 3.19; 95%CI 1.60–6.34 for 5 + partners) was found to be the only significant risk factor. There was a strong association between PrEP use and the number of sexual partners (≤ 5 vs.>5: aOR 3.58; 95%CI 2.15–5.97 for daily PrEP use), the number of CAI partners in the past six months (≤ 1 vs.>1: aOR 3.70; 95%CI 2.15–6.37 for daily PrEP use), and the number of STI tests performed (suggesting higher testing frequency). Both outcomes were also related to partner sorting, chemsex, and selling sex. Conclusions: Checkpoint visits reporting current PrEP use or intention to start PrEP correlated with eligibility criteria for PrEP, i.e. high partner numbers, inconsistent condom use during anal intercourse, and use of chemsex drugs. Use of HIV-specific prevention methods such as HIV serosorting, PrEP sorting, and viral load sorting was reported more frequently. (Daily) PrEP use was an independent risk factor for a chlamydia diagnosis only. © 2023, The Author(s). Article	2023	Marcus U.; Schmidt D.; Schink S.B.; Koppe U.	Analysis of HIV pre-exposure prophylaxis (PrEP) needs and PrEP use in Germany among men who have sex with men	Journal of Public Health (Germany)	-	-	-	21981833	10.1007/s10389-022-01699-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125671638&doi=10.1007%2fs10389-022-01699-y&partnerID=40&md5=eb4f6e682a00a8a38bd1cb67e7ace343	Aims: We aim to estimate the number of HIV pre-exposure prophylaxis (PrEP) users among men having sex with men (MSM) in Germany from 2017 through 2020, and analyse if PrEP needs expressed in 2017 might have been met by the expansion of PrEP until 2020. Subject and methods: We estimated the number of PrEP users by using drug prescription data and information on on-demand/intermittent PrEP use from online surveys to determine the proportion of on-demand/intermittent and daily PrEP use as well as the average number of PrEP pills used. The number of MSM in need of PrEP in 2017 was estimated based on four groups defined among respondents to a large online survey, combining respondents with PrEP use intention and respondents indicating substantial sexual risks. The size of each group was estimated based on self-selection biases. MSM with PrEP need in 2017 were compared with the estimated number of persons taking PrEP by June 2020. Results: We estimated a total of 15,600 to 21,600 PrEP users in Germany by the end of June 2020, corresponding to 40–55% of men with PrEP use intention in 2017. A correlation between the regional distribution of PrEP use intention in 11/2017 and actual PrEP use by 06/2020 suggested an unequal regional distribution of unsatisfied needs. The number of men with unmet PrEP needs ranged between 27,500 and 93,000 in 06/2020. Conclusion: PrEP use in Germany has increased considerably between 10/2017 and 06/2020, but large regional inequalities persist. PrEP is not yet readily accessible, and there is a need to expand services and encourage uptake. © 2022, The Author(s). Article	2023	Martin C.E.; Cox L.A.; Nongena P.; Butler V.; Ncube S.; Sawry S.; Mullick S.	Patterns of HIV Pre-exposure Prophylaxis use Among Adolescent Girls and Young Women Accessing Routine Sexual and Reproductive Health services in South Africa	Journal of Adolescent Health	-	-	-	1054139X	10.1016/j.jadohealth.2023.08.004	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175579833&doi=10.1016%2fj.jadohealth.2023.08.004&partnerID=40&md5=f44aad781d05f13fe639591620ef6146	Purpose: This study describes the patterns of pre-exposure prophylaxis (PrEP) use among adolescent girls and young women (AGYW) initiated on daily oral PrEP for the prevention of HIV, within routine sexual and reproductive health services in South Africa. Methods: We analysed clinical and survey data from a nested cohort of 967 AGYW initiated on oral PrEP between January 2019 and December 2021 in four geographical clusters in South Africa. We describe the periods of PrEP use, and the proportion who discontinued and subsequently restarted PrEP. Logistic regression analyses were conducted to determine factors associated with early PrEP discontinuation, PrEP use for ≥4 months and PrEP restart. Results: PrEP use for ≤1 month was high (68.6%), although 27% returned and restarted PrEP; and 9% restarted more than once. Initiating PrEP at a mobile clinic (AOR 2.10, 95% CI 1.51 – 2.93) and having a partner known to be HIV negative or whose HIV status was unknown (AOR 7.11, 95% CI 1.45 – 34.23; AOR 6.90, 95% CI 1.44 – 33.09) were associated with PrEP use for ≤1 month. AGYW receiving injectable contraceptives were more likely to restart PrEP (AOR 1.61, 95% CI 1.10 – 2.35). Compared to those aged 15–17 years, participants 18 – 20 and 21 – 24 years were less likely to restart PrEP (AOR 0.51, 95% CI 0.35 – 0.74; AOR 0.60, 95%, CI 0.41 – 0.87), as were those initiating PrEP at a mobile clinic compared to a fixed facility (AOR 0.66, 95% CI 0.47 – 0.92). Discussion: Although early PrEP discontinuation was high, it appears that PrEP use is frequently cyclical in nature. Further research is needed to determine if these cycles of PrEP correlate to periods of perceived or actual vulnerability to HIV, which may also be cyclical. PrEP delivery presents a unique opportunity to address multiple unmet health needs of young people. © 2023 Society for Adolescent Health and Medicine	Adolescent girls and young women; AGYW; Contraception; HIV; Pre-exposure prophylaxis; PrEP; Prevention; Service integration; Sexual and reproductive health; South Africa	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2023	Martin, Anna K.; Perryman, Tyshaun; Bernstein, Judith A.; Taylor, Jessica L.; Cruz, Ricardo; Muroff, Jordana; Samet, Jeffrey H.; Assoumou, Sabrina A.	Peer recovery coaching for comprehensive HIV, hepatitis C, and opioid use disorder management: The CHORUS pilot study.	Drug and Alcohol Dependence Reports	-	-	-	2772-7246	10.1016/j.dadr.2023.100156	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10126838/	INTRODUCTION: Amidst a surge in HIV and hepatitis C virus (HCV) infections in persons who use drugs, medications that effectively prevent HIV and treat opioid use disorder and HCV remain underutilized. METHODS: We developed a 6-month peer recovery coaching intervention (brief motivational interviewing followed by weekly virtual or in-person coaching) and collected data on uptake of medications for opioid use disorder (MOUD), HIV pre-exposure prophylaxis (PrEP), and HCV treatment. The primary outcomes were intervention acceptability and feasibility. RESULTS: At a Boston substance use disorder bridge clinic, we enrolled 31 HIV-negative patients who used opioids. Participants reported high intervention satisfaction at 6 months (95% "satisfied" or "very satisfied"). At study completion, 48% of the participants were on MOUD, 43% who met CDC guidelines were on PrEP, and 22% with HCV were engaged with treatment. CONCLUSIONS: A peer recovery coaching intervention is feasible and acceptable, with positive preliminary findings regarding MOUD, PrEP and HCV treatment uptake. Article	2023	Martin, Veronica O; Tesha, Novatus A; Sunguya, Bruno F	Uptake of Oral HIV Pre-Exposure Prophylaxis (PrEP) and Associated Factors among Female Sex Workers in Tanga, Tanzania	Viruses	-	-	-	NA	10.3390/v15102125	https://www.proquest.com/scholarly-journals/uptake-oral-hiv-pre-exposure-prophylaxis-prep/docview/2882849545/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) prevents HIV infection among female sex workers (FSW). WHO recommends the use of Tenofovir disoproxil fumarate for use in oral PrEP regimens (TDF). Emtricitabine (FTC) 200 mg/Tenofovir Disoproxil Fumarate (TDF) 300 mg (Truvada) daily is the approved PrEP regimen in Tanzania. Evidence is limited on oral PrEP uptake and its associated factors in countries with a high burden of HIV, such as Tanzania. This study aimed to examine the uptake of oral PrEP and its associated factors among FSW in the Tanga region of Tanzania. This community-based cross-sectional study was conducted among 428 FSW. Data were collected through face-to-face interviews and analyzed using STATA version 17 and RDSAT. Logistic regression was used to examine the associations of independent factors and PrEP uptake among study participants. About 55% of the recruited FSW used oral PrEP. FSW with three or more children were 2.41 times more likely to take oral PrEP (AOR 2.41, 95% CI: 1.08–4.25, p < 0.05). Moreover, those with a positive attitude were more likely to use oral PrEP (AOR 2.8, 95% CI: 1.88–4.17, p < 0.05). Poor belief was a barrier to PrEP use, and side effects of the drugs were a reason for the discontinuation of PrEP services. Most of the participants preferred PrEP services to be provided in the community. Oral PrEP uptake was 55%. Efforts to scale up PrEP for FSW should address misconceptions regarding PrEP, PrEP sensitization, and improving access through community-based intervention. Theses and Dissertations	2023	Martinez, Miguel Angel	Unhealthy Alcohol Use and HIV-1 Risk Behaviors and PrEP Adherence Among Gay, Bisexual, and Other Men Who Have Sex with Men (GBMSM) in Kenya	-	-	University of Washington	-	NA	NA	http://hdl.handle.net/1773/50165	Background: Gay, bisexual, and other men who have sex with men (GBMSM) in sub-SaharanAfrica experience disproportionate rates of stigma and its social repercussions, including high rates of alcohol use. The burden of HIV in sub-Saharan Africa also disproportionally affects GBMSM populations. This work aimed to assess the variability of drinking patterns and determine associations between unhealthy alcohol use and HIV risk behaviors and adherence to HIV prevention medication among GBMSM in Kenya. Methods: A secondary analysis of the Anza Mapema Mbili study, which followed HIV negativemen for one year, was conducted to assess the prevalence of unhealthy drinking, as measured by phosphatidyl ethanol (PEth), and determine its association with (1) several HIV risk factors (condomless anal intercourse, multiple sex partners, and forced sexual violence) and (2) adherence to pre-exposure prophylaxis (PrEP). Descriptive statistics were used to identify differences between participants with and without unhealthy drinking at baseline. McNemar's test was used to assess whether the prevalence of unhealthy drinking changed over study visits. Generalized estimating equations with logit links and exchangeable correlation structures were used to determine associations between unhealthy drinking and study outcomes after adjustment for potential confounders. Results: The prevalence of unhealthy drinking as determined by the first collected PEthmeasure was 56% (95% CI: 47% – 64%). The prevalence of unhealthy drinking did not change significantly over the next study visit where PEth was collected. Participants who had unhealthy drinking were, on average, 3.4 years older as compared to those without unhealthy drinking. Further, a larger proportion of those in the unhealthy drinking category were classified as having "Hazardous/Harmful Drinking" via the AUDIT test as compared to those without unhealthy drinking (62.0% vs. 27.4%, respectively). A borderline significant association was found between unhealthy alcohol use (<= 200 ng/ml of PEth) and lower odds of having multiple sex partners, but there were no statistically significant associations with condomless anal intercourse, forced sex, or PrEP adherence. Conclusion: Unhealthy alcohol use, as measured by PEth, was found in the majority of GBMSMstudy participants and did not change over follow-up. Unhealthy alcohol use was associated with older age and AUDIT score > 8 but was not strongly associated with HIV risk behaviors or PrEP adherence. Further work is needed to understand better the role of alcohol use, drinking patterns, and social harms in HIV risk perception and engagement in preventative measures among GBMSM. Theses and Dissertations	2023	MARTINEZ, YUPPIEL FRANMIL	Avaliação de fatores preditores de sífilis e adesão a PrEP oral diária entre Gays, Bissexuais e outros Homens que fazem Sexo com Homens (HSH), Mulheres Transgênero e Travestis (MTTr) com risco substancial de infecção pelo HIV em estudo multicêntrico demonstrativo da efetividade da profilaxia Pré-Exposição (PrEP). Estudo PrEP1519 Brasil	-	-	UFMG	-	-	NA	http://hdl.handle.net/1843/61832	Os jovens e adolescentes são um grupo desproporcionalmente acometido pelo HIV. Ser adolescente ou jovem gay, bissexual, travesti ou transgênero, é enfrentar desafios ainda maiores em termos de risco e vulnerabilidade ao HIV e outras infecções sexualmente transmissíveis, fato pelo qual estes grupos representam uma população-chave para a implementação de intervenções estruturais, comportamentais e biomédicas. A PrEP é uma estratégia que tem se mostrado segura e eficaz na prevenção da infecção pelo HIV, entre esta e outras populações-chave. Entretanto, ainda se sabe muito pouco sobre o real impacto de seu uso em jovens e adolescentes. O presente estudo tem como objetivo geral avaliar a efetividade, segurança e adesão da Profilaxia Pré-Exposição (PrEP) entre adolescentes Gays, Bissexuais e outros Homens que fazem Sexo com Homens (HSH), Mulheres Transgênero e Travestis (MTTr) com risco substancial de infecção pelo HIV. De forma mais aprofundada, objetivou-se avaliar os fatores sociodemográficos e de práticas sexuais basais relacionados com a prevalência de sífilis na entrada e os marcadores ou preditores de adesão à PrEP por autorrelato. O projeto PrEP1519 é um estudo de coorte demonstrativo multicêntrico brasileiro, aprovado pelo comitê de ética em pesquisa da OMS, pela CONEP e COEP das Universidades participantes (UFMG, UFBA e USP). A inclusão foi voluntária após processo de consentimento livre e esclarecido e assinatura dos Termos de Consentimento ou Assentimento (TCLE, TALE). Os participantes foram alocados em dois grupos: com ou sem uso de PrEP, conforme avaliação de vulnerabilidade e preferência. As análises foram realizadas com as diversas dimensões de vulnerabilidade de infecção ao HIV, e modelos de regressão logística foram construídos para estimar as razões de chance da associação entre as variáveis preditoras e os níveis de adesão nas visitas M1, M6 e M12, assim como sua associação com um teste treponêmico positivo para sífilis na entrada do estudo. Foram analisados 935 participantes. A idade mediana foi 19 anos (IIQ: 18-19), 69% (645) se auto declararam como negros (pardos/pretos), 91,1% (852) como homens cisgênero e 8,8% (82) como mulheres trans ou travestis. Aproximadamente 26% (251) dos participantes apresentaram ao longo dos 12 meses de seguimento uma adesão insuficiente, inferior a 90% por autorrelato. Na análise multivariada final, uma maior chance de adesão insuficiente foi associada com estar desempregado (OR = 1,34; IC95%: 1,00-1,81), ter relações sexuais em troca de dinheiro ou favores (OR =1,75; IC95%: 1,10-2,79) e ter uma autopercepção de risco de infecção pelo HIV <6 (OR = 1,51; IC95%: 1,06-2,16). Por outro lado, a prevalência de sífilis na linha de base foi de 21,3%. No modelo final de regressão logística, as seguintes variáveis estiveram associadas com chances maiores de sífilis: autorrelato de episódio de IST nos últimos 12 meses (OR = 5,92; IC95%: 3,74-9,37), ser profissional do sexo (OR = 3,39; IC95%: 1,32-8,78) e ter menos de 11 anos de escolaridade (OR = 1,76; IC95%: 1,13-2,74). Nossos dados reiteram conhecidos fatores de vulnerabilidade e apontam a necessidade de fortalecer os programas de PrEP na saúde pública com adequada discussão sobre classe social, raça, gênero, sexualidade e prevenção combinada, assim como, ampliar e facilitar o acesso a todas as ferramentas de prevenção combinada, incluída a PrEP, para esta faixa etária. Article	2023	Martins G.B.; Pinheiro T.F.; Ferraz D.; Grangeiro A.; Zucchi E.M.	Use of HIV prevention methods and contexts of the sexual practices of adolescent gay and bisexual men, travestis, and transgender women in São Paulo, Brazil; O uso de métodos de prevenção do HIV e o contexto das práticas sexuais de adolescentes homens gays e bissexuais, travestis e mulheres transgênero na cidade de São Paulo, Brasil; Uso de métodos de prevención del VIH y contextos de prácticas sexuales de adolescentes gays y hombres bisexuales, travestis y mujeres transgénero en São Paulo, Brasil	Cadernos de Saúde Pública	-	-	-	0102311X	10.1590/0102-311XEN161521	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151574014&doi=10.1590%2f0102-311XEN161521&partnerID=40&md5=d2442da0e84c43bad2cced7b5f29927b	We aimed to understand the perspective and use of HIV prevention methods in context of the sexual practices of adolescent gay and bisexual men, travestis, and transgender women (TGW). In-depth interviews and focus group discussions were conducted with 22 adolescent gay and bisexual men, travestis, and TGW aged between 15 and 19 years in São Paulo, Brazil, as part of the formative research of the PrEP1519 study, an ongoing daily oral pre-exposure prophylaxis (PrEP) demonstration study among adolescents. Participants' knowledge repertoire about prevention methods and their experience with them concentrated on condoms, which were regarded as the most well-known, "compulsory" practice, whose use was an individual responsibility. Prior HIV/STI testing was reported by a few participants as a measure to decide to discontinue condom use in stable relationships, whereas seeking testing after condomless sex was an attempt to repair a "failure" in prevention. The importance of commercial sex was striking among TGW and travestis, in which condom use often depended on clients' decision, and drug use and risk of violence hindered decision-making and self-care. Adolescents showed little knowledge, frequent confusion, and no experience with post-exposure prophylaxis and PrEP. An incipient appropriation of the diversity of prevention methods and a rigid normativity about the use of condoms are key drivers in adolescents' perception and use of HIV prevention methods. Adolescents' risk management seems to be restricted in terms of their autonomy and ability to assess exposure across contexts, failing to include antiretroviral-based (ARV) methods, thus requiring tailored and context-sensitive strategies for an effective combination prevention approach. © 2023 Fundacao Oswaldo Cruz. Article	2023	Marzinke, Mark A.; Fogel, Jessica M.; Wang, Zhe; Piwowar-Manning, Estelle; Kofron, Ryan; Moser, Amber; Bhandari, Pradip; Gollings, Ryann; Bushman, Lane R.; Weng, Lei; Halvas, Elias K.; Mellors, John; Anderson, Peter L.; Persaud, Deborah; Hendrix, Craig W.; McCauley, Marybeth; Rinehart, Alex R.; St Clair, Marty; Ford, Susan L.; Rooney, James F.; Adeyeye, Adeola; Chariyalertsak, Suwat; Mayer, Kenneth; Arduino, Roberto C.; Cohen, Myron S.; Grinsztejn, Beatriz; Hanscom, Brett; Landovitz, Raphael J.; Eshleman, Susan H.	Extended Analysis of HIV Infection in Cisgender Men and Transgender Women Who Have Sex with Men Receiving Injectable Cabotegravir for HIV Prevention: HPTN 083.	Antimicrobial Agents and Chemotherapy	-	-	-	1098-6596 0066-4804	10.1128/aac.00053-23	https://pubmed.ncbi.nlm.nih.gov/36995219/	HPTN 083 demonstrated that injectable cabotegravir (CAB) was superior to oral tenofovir disoproxil fumarate-emtricitabine (TDF-FTC) for HIV prevention in cisgender men and transgender women who have sex with men. We previously analyzed 58 infections in the blinded phase of HPTN 083 (16 in the CAB arm and 42 in the TDF-FTC arm). This report describes 52 additional infections that occurred up to 1 year after study unblinding (18 in the CAB arm and 34 in the TDF-FTC arm). Retrospective testing included HIV testing, viral load testing, quantification of study drug concentrations, and drug resistance testing. The new CAB arm infections included 7 with CAB administration within 6 months of the first HIV-positive visit (2 with on-time injections, 3 with ≥1 delayed injection, and 2 who restarted CAB) and 11 with no recent CAB administration. Three cases had integrase strand transfer inhibitor (INSTI) resistance (2 with on-time injections and 1 who restarted CAB). Among 34 CAB infections analyzed to date, diagnosis delays and INSTI resistance were significantly more common in infections with CAB administration within 6 months of the first HIV-positive visit. This report further characterizes HIV infections in persons receiving CAB preexposure prophylaxis and helps define the impact of CAB on the detection of infection and the emergence of INSTI resistance. Article	2023	Marzinke, Mark A; Hanscom, Brett; Wang, Zhe; Safren, Steven A; Psaros, Christina; Donnell, Deborah; Richardson, Paul A; Sullivan, Philip; Eshleman, Susan H; Jennings, Andrea; Feliciano, Kailazarid Gomez; Jalil, Emilia; Coutinho, Carolina; Cardozo, Nadir; Maia, Bernardo; Khan, Taimur; Singh, Yashna; Middelkoop, Keren; Franks, Julie; Valencia, Javier; Sanchez, Naiymah; Lucas, Jonathan; Rooney, James F; Rinehart, Alex R; Ford, Susan; Adeyeye, Adeola; Cohen, Myron S; McCauley, Marybeth; Landovitz, Raphael J; Grinsztejn, Beatriz	Efficacy, safety, tolerability, and pharmacokinetics of long-acting injectable cabotegravir for HIV pre-exposure prophylaxis in transgender women: a secondary analysis of the HPTN 083 trial.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(23)00200-X	https://dx.doi.org/10.1016/S2352-3018(23)00200-X	BACKGROUND: The HIV Prevention Trials Network (HPTN) 083 trial showed that long-acting injectable cabotegravir was more effective than tenofovir disoproxil fumarate plus emtricitabine in preventing HIV in cisgender men and transgender women who have sex with men. We aimed to characterise the cohort of transgender women included in HPTN 083. METHODS: HPTN 083 is an ongoing, phase 2b/3, randomised, multicentre, double-blind, double-dummy clinical trial done at 43 sites in seven countries (Argentina, Brazil, Peru, the USA, South Africa, Thailand, and Viet Nam). HIV-negative participants were randomly assigned (1:1) to receive injectable cabotegravir or tenofovir disoproxil fumarate plus emtricitabine. The study design and primary outcomes of the blinded phase of HPTN 083 have already been reported. An enrolment minimum of 10% transgender women was set for the trial. Here we characterise the cohort of transgender women enrolled from Dec 6, 2016, to May 14, 2020, when the study was unblinded. We report sociodemographic characteristics, use of gender affirming hormone therapy, and behavioural assessments of the transgender women participants. Laboratory testing and safety evaluations are also reported. The trial is registered at ClinicalTrials.gov, NCT02720094. FINDINGS: HPTN 083 enrolled 570 transgender women (304 tenofovir disoproxil fumarate plus emtricitabine; 266 injectable cabotegravir). Transgender women were primarily from Asia (225 39%) and Latin America (205 36%); 330 (58%) reported using gender affirming hormone therapy. Intimate partner violence was common (270 47% reported emotional abuse and 172 30% reported physical abuse) and 323 (57%) reported a history of childhood sexual abuse. 159 (28%) transgender women disagreed that they were at risk for HIV, and 142 (25%) screened positive for depressive symptoms. During study follow-up, incidence of syphilis was 16·25% (95% CI 13·28–19·69), rectal gonorrhoea was 11·66% (9·14–14·66), and chlamydia was 20·61% (17·20–24·49). Frequency of adverse events was similar between the treatment groups. Nine seroconversions occurred among transgender women during the blinded phase of the study (seven in the tenofovir disoproxil fumarate plus emtricitabine group and two in the injectable cabotegravir group); overall incidence was 1·19 per 100 person-years (95% CI 0·54–2·25): 1·80 per 100 person-years (0·73–3·72) in the tenofovir disoproxil fumarate plus emtricitabine group and 0·54 per 100 person-years (0·07–1·95) in the injectable cabotegravir group (hazard ratio 0·34 95% CI 0·08–1·56). Cabotegravir concentrations did not differ by gender affirming hormone therapy use. INTERPRETATION: HIV prevention strategies for transgender women cannot be addressed separately from social and structural vulnerabilities. Transgender women were well represented in HPTN 083 and should continue to be prioritised in HIV prevention studies. Our results suggest that injectable cabotegravir is a safe and effective pre-exposure prophylaxis option for transgender women. Article	2023	Masenyetse, Lieketseng J; Greenberg, Lauren; Samonyane, Felleng; Sekepe, Bokang; Mokone, Majoalane; Mokone, Mafusi J; Tukei, Vincent J; Beres, Laura K	Oral HIV pre-exposure prophylaxis use among pregnant and postpartum women: results from real-world implementation in Lesotho.	Frontiers in Public Health	-	-	-	2673-3153	10.3389/frph.2023.1221752	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10425268/	Introduction: Lesotho has reached epidemic control, PrEP is an important component in maintaining that and in reaching the goal of eliminating mother-to-child transmission. Methods: We conducted a retrospective review of existing, routine PrEP health records in 26 health facilities in Lesotho. PrEP visit data were collected for pregnant and postpartum women screened for PrEP and/or enrolled in PrEP programs from 1 January 2019 through 30 June 2021 with follow-up data collected up to the date of data abstraction per site between October 2021 and May 2022. Poisson regression with robust variance was used to evaluate the association between patient characteristics and continuation of PrEP. Results: Indications for starting PrEP were significantly associated with continuation in PrEP use. Women starting PrEP due to having a partner known to be living with HIV were the most likely to return for follow-up. In all age groups, the most common reason for starting PrEP was being in a serodiscordant relationship, though the proportion varies by age. Conclusion: As Lesotho is now in the process of optimizing PrEP use among pregnant and postpartum women, it is critical to revise data sources to capture information that will link PrEP records and ANC/PNC records and document pregnancy/postpartum status in order to better understand PrEP use and gaps in this population. Article	2023	Massey, Eugene S G; Bazzi, Angela R; Sian, Carlos R; Gebel, Christina M; Bernstein, Judith A; Assoumou, Sabrina A	"I've been 95% safe": perspectives on HIV pre-exposure prophylaxis at a drug detoxification center: a qualitative study	AIDS Care	-	-	-	9540121	10.1080/09540121.2022.2031853	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124257102&doi=10.1080%2f09540121.2022.2031853&partnerID=40&md5=766510cbd3c90315160f960617445d6b	Pre-exposure prophylaxis (PrEP) decreases human immunodeficiency virus (HIV) acquisition among persons who inject drugs (PWID); however, its uptake has been suboptimal. We explored HIV risk perceptions and PrEP interest among drug detoxification center patients in the context of the ongoing opioid overdose epidemic. We conducted in-depth interviews of patients (n = 24) and professional key informants (n = 10 physicians, case managers, nurses, and harm reduction educators), and thematic analysis of coded data. The mean age of participants (patients) was 37 years; 54% identified as male and 67% as White. Although 71% reported injecting drugs and 62% had condomless sex in the past 6 months, participants had mixed HIV risk perceptions, and some viewed PrEP as an undesirable indicator of elevated HIV risk. Nevertheless, many participants viewed drug detoxification as a first step towards embarking on a "healthier lifestyle," with some narratives identifying opportunities for delivering PrEP information and services in this setting. Opportunities exist to expand PrEP at drug detoxification centers, but initiatives are needed to educate patients and staff on indications and benefits of this prevention tool. Interventions are also needed to determine the best strategies for implementing PrEP adoption in this setting. © 2022 Informa UK Limited, trading as Taylor & Francis Group.	drug detoxification center; Human immunodeficiency virus; persons who inject drugs; pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Massey, Katherine; Vardanega, Vittoria; Chaponda, Mas; Eddowes, Lucy A.; Hearmon, Natalie	Investigating zero transmission of HIV in the MSM population: a UK modelling case study.	Archives of Public Health = Archives belges de sante publique	-	-	-	0778-7367 2049-3258	10.1186/s13690-023-01178-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10659044/	BACKGROUND: UNAIDS 90-90-90 goals for HIV have been surpassed in the UK, with focus now moving to ending transmission by 2030. The concept of zero transmission is complex and many factors can influence transmission. We aimed to investigate how the target of zero transmission might be reached in the UK. METHODS: We developed a de novo Markov state transition open cohort model of HIV with a 50-year time horizon, which models six key screening, treatment and prevention parameters, including treatment-as-prevention (TasP) and pre-exposure prophylaxis (PrEP). We studied the anticipated HIV epidemic trajectory over time in men who have sex with men (MSM), with and without changing the six key parameters, defining zero transmission as a 60% reduction in incidence compared with 2010 incidence. RESULTS: Zero transmission in the MSM population was not achieved within the model's time horizon in our base case scenario, when the six key parameters were set to their 2019 values. Several future scenarios were explored, including a combination approach to preventing HIV transmission through increasing five key parameter values and considering three different TasP values; zero transmission was achieved by 2030 in the scenario where TasP was increased from its current level of 97-99%, avoiding 48,969 new HIV cases over the time horizon and reducing the lifetime risk of acquiring HIV for HIV-negative MSM not using PrEP from 13.65 to 7.53%. CONCLUSIONS: Zero transmission in the UK MSM population can be reached by the target year of 2030 with bold changes to HIV policy. A combination approach such as the UK Government's 'Towards Zero' Action plan, impacting multiple policies and including an increase in TasP, has the potential to achieve meaningful reductions in HIV transmission and meet this ambitious goal. Article	2023	Mataboge, Paballo; Mthimkhulu, Nqaba; Kutywayo, Alison; Martin, Catherine E.; Mazibuko, Mbali; Kwatsha, Khanyiswa; Makalela, Nthabiseng; Briedenhann, Elmari; Butler, Vusile; Bothma, Rutendo; Mullick, Saiqa	Preferences, educational messaging, and demand creation channels for multipurpose-prevention technologies (MPTs) among women in South Africa.	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-023-16904-0	https://pubmed.ncbi.nlm.nih.gov/37880628/	BACKGROUND: South African women, including female sex workers (FSWs), are disproportionately affected by HIV, experience a high unmet need for contraception and high rates of sexually transmitted infections (STIs). Products that address the interlinked risk between HIV, unplanned pregnancy, and other STIs are needed. There are several multipurpose-prevention technologies (MPTs) in development, aimed at preventing both HIV and pregnancy. This study aimed to explore educational messaging and demand creation channels to improve the potential uptake of a hypothetical MPT implant, using participatory action research. It also aimed to look at product and service provision attributes preferred by potential end users. METHODS: Between July and August 2022, 303 PrEP-eligible adolescent girls and young women (AGYW) (18-24 years), women > 24 years, and FSWs (≥ 18 years) participated in 4-hour workshops, where they were asked about their ideal messaging and demand creation channels and their preferences for different attributes of an MPT implant. Quantitative descriptive analysis was conducted to determine the frequency and ranking for each demand creation message, channel, and each product and service provision attribute, by population group. A chi-square test was used to assess MPT implant characteristics associated with age. Qualitative data were analysed using deductive and thematic analysis. RESULTS: A total of 104 AGYW, 157 women > 24 years, and 42 FSWs participated in the PAR workshops. Participants preferred demand creation messages that were empowering, motivational and encouraged body autonomy. The use of slang was popular. Community radio stations and newspapers, social media, and information at hospitals and clinics were participants' preferred MPT demand creation channels because they were easily accessible. Providing long-term and dual HIV and pregnancy protection, receiving implant services at the local clinic, manageable side effects, discreet and private implant, and numbing the area before insertion and removal, were the most preferred product and service provision attributes. CONCLUSION: Early considerations for women's product preferences are key to product development. Educational messaging around the MPT implant should be empowering and in local languages, this may motivate women to learn more about it and use it. Multiple demand creation channels should be used to engage both young and older populations, which may ensure better reach. Article	2023	Matos, LA; Lujan, RA	Culturally Targeted Video Intervention to Increase PrEP Use Intentions Among Latinx Sexual Minority Men: a Pilot Randomized Controlled Trial	Hispanic Health Care International	-	-	-	NA	10.1177/15404153231210436	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02625408/full	Background: Latinx sexual minority men experience the greatest second highest human immunodeficiency virus (HIV) burden in the United States. Pre-exposure prophylaxis (PrEP) is the most effective HIV prevention tool available, however, PrEP uptake remains low among this group. Methods: This two-arm pilot randomized controlled trial study aimed to assess the feasibility and preliminary efficacy of delivering an online culturally targeted video intervention that aims to increase PrEP uptake intentions among Latinx sexual minority men. The intervention group received a culturally targeted video that contained the same PrEP information as the control group and incorporated positive aspects of Latinx masculinity (i.e., caballerismo). Participants were recruited through Amazon's MTurk crowd-sourcing platform. A total of twenty-five participants met the study inclusion criteria (N = 25). Results: The control group had a higher mean PrEP intentions score (M: 3.3, 95% CI: 2.7-3.9) when compared with the intervention group. A moderate, negative, linear correlation was observed between machismo and PrEP intention scores (r = -.34). In contrast, a small, positive correlation was found between caballerismo and PrEP intentions (r = .19). Conclusions: While the culturally targeted video intervention did not increase PrEP use intentions, the study highlights the importance of understanding and addressing cultural factors such as Latin masculinity.	*Hispanic; *Human immunodeficiency virus; *Theory of Planned Behavior; *pre-exposure prophylaxis; *sexual and gender minority; *videorecording; Adult; Article; Clinical article; Controlled study; Crowdsourcing; Cultural factor; Feasibility study; Human; Human experiment; Machismo; Male; Masculinity; Nonhuman; Randomized controlled trial	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

High PrEP uptake and objective longitudinal adherence among HIV-exposed women with personal or partner plans for pregnancy in rural Uganda: A cohort study	PLOS Medicine	-	-	-	15491277	10.1371/journal.pmed.1004088	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149461758&doi=10.1371%2fjournal.pmed.1004088&partnerID=40&md5=9d9a61c18b9bdde753ee34c694379caf	Background In Uganda, fertility rates and adult HIV prevalence are high, and many women conceive with partners living with HIV. Pre-exposure prophylaxis (PrEP) reduces HIV acquisition for women and, therefore, infants. We developed the Healthy Families-PrEP intervention to support PrEP use as part of HIV prevention during periconception and pregnancy periods. We conducted a longitudinal cohort study to evaluate oral PrEP use among women participating in the intervention. Methods and findings We enrolled HIV-negative women with plans for pregnancy with a partner living, or thought to be living, with HIV (2017 to 2020) to evaluate PrEP use among women participating in the Healthy Families-PrEP intervention. Quarterly study visits through 9 months included HIV and pregnancy testing and HIV prevention counseling. PrEP was provided in electronic pillboxes, providing the primary adherence measure ("high" adherence when pillbox was opened ≥80% of days). Enrollment questionnaires assessed factors associated with PrEP use. Plasma tenofovir (TFV) and intraerythrocytic TFV-diphosphate (TFV-DP) concentrations were determined quarterly for women who acquired HIV and a randomly selected subset of those who did not; concentrations TFV ≥40 ng/mL and TFV-DP ≥600 fmol/punch were categorized as "high." Women who became pregnant were initially exited from the cohort by design; from March 2019, women with incident pregnancy remained in the study with quarterly follow-up until pregnancy outcome. Primary outcomes included (1) PrEP uptake (proportion who initiated PrEP); and (2) PrEP adherence (proportion of days with pillbox openings during the first 3 months following PrEP initiation). We used univariable and multivariable-adjusted linear regression to evaluate baseline predictors selected based on our conceptual framework of mean adherence over 3 months. We also assessed mean monthly adherence over 9 months of follow-up and during pregnancy. We enrolled 131 women with mean age 28.7 years (95% CI: 27.8 to 29.5). Ninety-seven (74%) reported a partner with HIV and 79 (60%) reported condomless sex. Most women (N = 118; 90%) initiated PrEP. Mean electronic adherence during the 3 months following initiation was 87% (95% CI: 83%, 90%). No covariates were associated with 3-month pill-taking behavior. Concentrations of plasma TFV and TFV-DP were high among 66% and 47%, 56% and 41%, and 45% and 45% at months 3, 6, and 9, respectively. We observed 53 pregnancies among 131 women (1-year cumulative incidence 53% 95% CI: 43%, 62%) and 1 HIV-seroconversion in a non-pregnant woman. : Mean pillcap adherence for PrEP users with pregnancy follow-up (N = 17) was 98% (95% CI: 97%, 99%). Study design limitations include lack of a control group. Conclusions Women in Uganda with PrEP indications and planning for pregnancy chose to use PrEP. By electronic pillcap, most were able to sustain high adherence to daily oral PrEP prior to and during pregnancy. Differences in adherence measures highlight challenges with adherence assessment; serial measures of TFV-DP in whole blood suggest 41% to 47% of women took sufficient periconception PrEP to prevent HIV. These data suggest that women planning for and with pregnancy should be prioritized for PrEP implementation, particularly in settings with high fertility rates and generalized HIV epidemics. Future iterations of this work should compare the outcomes to current standard of care. Copyright: © 2023 Matthews et al. Article	2023	Matthews, Randolph P; Zang Xiaowei; Barrett, Stephanie E; Athanas, Koynov; Goodey, Adrian; Heimbach Tycho; Weissler, Vanessa L; Leyssens Carlien; Reynders, Tom; Xu, Zhiqing; Rottey Sylvie; Vargo, Ryan; Robertson, Michael N; Aubrey, Stoch S; Iwamoto, Marian	A Randomized, Double-Blind, Placebo-Controlled, Phase 1 Trial of Radiopaque Islatravir-Eluting Subdermal Implants for Pre-exposure Prophylaxis Against HIV-1 Infection: JAIDS	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003135	https://www.proquest.com/scholarly-journals/randomized-double-blind-placebo-controlled-phase/docview/2778624933/se-2?accountid=8113	Background:Islatravir (MK-8591) is a deoxyadenosine analog in development for the treatment and prevention of HIV-1 infection. An islatravir-eluting implant could provide an additional option for pre-exposure prophylaxis (PrEP).Setting:Previous data support a threshold islatravir triphosphate concentration for PrEP of 0.05 pmol/106 cells in peripheral blood mononuclear cells. Prototype islatravir-eluting implants were previously studied to establish general tolerability and pharmacokinetics (PKs) of islatravir relative to the threshold level.Methods:In this randomized, double-blind, placebo-controlled, phase 1 trial, a next-generation radiopaque islatravir-eluting implant (48 mg, 52 mg, or 56 mg) or placebo implant was placed for a duration of 12 weeks in participants at low risk of HIV infection. Safety and tolerability, as well as PK for islatravir parent and islatravir triphosphate from plasma and peripheral blood mononuclear cells, were assessed throughout placement and 8 weeks after removal.Results:In total, 36 participants (8 active and 4 placebo per dose arm) were enrolled and completed this study. Implants were generally well tolerated, with no discontinuations due to an adverse event, and no clear dose-dependence in implant-related adverse events. No clinically meaningful relationships were observed for changes in laboratory values, vital signs, or electrocardiogram assessments. Mean islatravir triphosphate levels at day 85 (0.101–0.561 pmol/106 cells) were above the PK threshold for all dose levels.Conclusion:Islatravir administered using a subdermal implant has the potential to be an effective and well-tolerated method for administering PrEP to individuals at risk of acquiring HIV-1. Article	2023	Mazumder, Christina; Dollah, Annabel; Ouda, Rosebel; Okombo, Moses; Nyakina, Judith; Makia, Monica L.; Dettinger, Julia C.; Gómez, Laurén; Marwa, Mary; Ochieng, Ben; Abuna, Felix; Gwayi-Chore, Claire; Pintye, Jillian; Kinuthia, John; John-Stewart, Grace; Pfeiffer, James; Mugambi, Melissa L.	Understanding factors influencing home pregnancy test use among women in western Kenya: A qualitative analysis.	Frontiers in Reproductive Health	-	-	-	2673-3153	10.3389/frph.2023.1092001	https://pubmed.ncbi.nlm.nih.gov/37091549/	BACKGROUND: There are limited data on home pregnancy test use among women in low-and-middle-income countries. A prior survey found that only 20% of women in western Kenya used a home pregnancy test to confirm their pregnancies before going to antenatal care. This qualitative study aims to understand why women do not use home pregnancy tests in early pregnancy. METHODS: From April 2021 to July 2021, we interviewed women from four antenatal care clinics in Homa Bay and Siaya counties. We recruited women previously enrolled in the PrEP Implementation for Mothers in Antenatal care (PrIMA) study, a cluster-randomized trial that evaluated the best approaches to implementing PrEP in maternal and child health clinics in Western Kenya (NCT03070600). Interviews were conducted via phone, audio recorded, translated, and transcribed verbatim. We coded and analyzed the transcripts to capture factors influencing women's capability, opportunity, and motivation to use home pregnancy tests. RESULTS: We conducted 48 semistructured interviews with women aged 21-42 years. Twenty-seven women did not use a home pregnancy test in their most recent pregnancy. Seventeen of these women reported not using a home pregnancy test before. Lack of knowledge, mistrust in the accuracy of tests, preferring to rely on signs and symptoms of pregnancy or get a test from the health facility, cost, and accessibility were key barriers to home pregnancy test use. CONCLUSION: Improving the uptake of home pregnancy testing during early pregnancy will require efforts to enhance community knowledge of test use and associated benefits and reduce cost burdens by making tests more affordable and accessible.	antenatal care; qualitative analysis; COM-B model; home pregnancy tests; western Kenya	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	Kenya	Eastern and Southern Africa	Qualitative

Article	2023	Mbotwa, Christopher H; Kazaura, Method R; Moen, Kåre; Leshabari, Melkizedeck T; Metta, Emmy; Mmbaga, Elia J	Retention in an mHealth App Aiming to Promote the Use of HIV Pre-Exposure Prophylaxis Among Female Sex Workers in Dar es Salaam, Tanzania: Prospective Cohort Study.	JMIR mHealth and uHealth	-	-	-	-	2291-5222	10.2196/46853	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10595516	Background: Increasing access to smartphones in sub-Saharan Africa offers an opportunity to leverage mobile health (mHealth) technology to improve access to health care in underserved populations. In the domain of HIV prevention, mHealth interventions can potentially contribute to solving the challenges of suboptimal adherence to pre-exposure prophylaxis (PrEP) and low retention in PrEP services among populations most vulnerable to HIV acquisition. However, there is a gap in the knowledge about the use of such interventions in sub-Saharan Africa. Objective: This study aims to evaluate the extent and predictors of retention in an mHealth app (Jichunge) that aims to promote adherence to PrEP and retention in PrEP care among female sex workers in Dar es Salaam, Tanzania. Methods: A prospective cohort of female sex workers residing in Dar es Salaam were recruited, using respondent-driven sampling. All participants were provided with the Jichunge app as they started PrEP. A questionnaire was used to collect data on sociodemographics and other structural factors, while app use data for the 60-day period following the first 150 days of being in the intervention arm were extracted from the app's back end. A multivariable log-binomial model was used to determine predictors of 6-month retention in the Jichunge app. Results: A total of 470 female sex workers were recruited. Nearly three-quarters of participants (206/284, 72.5%) who came to the 6-month follow-up visit no longer had the Jichunge app on their phones. The majority of these participants (193/206, 93.7%) no longer had access to the app because of issues related to their phones. Data extracted from the back end of the app showed that the use of the app declined over time, and only 13.4% (63/470) of the participants were retained (continued to use the app) after 6 months of intervention. At 6 months, women aged ≥35 years were >2 times more likely to use the app than women aged 18 to 24 years (adjusted risk ratio aRR 2.2, 95% CI 1.2-4.1; P=.01). Furthermore, retention in the app was higher among participants who demonstrated high PrEP awareness at baseline (aRR 1.8, 95% CI 1.1-3; P=.01) and among those who had experienced financial difficulties due to health care spending (aRR 1.9, 95% CI 1.2-3.2; P=.01). Conclusions: Most female sex workers (206/284, 72.5%) who were enrolled in PrEP care in Tanzania no longer used the Jichunge app after 6 months. Retention in the app at 6 months was predicted by older age, high PrEP awareness, and financial difficulties due to health care spending. Strategies for the long-term retention of participants in mHealth apps, such as systems for reinstallations of apps, should be considered during the design phase. "PROTECTED MEANS ARMED": PERSPECTIVES ON PRE-EXPOSURE PROPHYLAXIS (PREP) AMONG WOMEN WHO ENGAGE IN SEX WORK AND USE DRUGS IN KAZAKHSTAN	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2023.35.5.347	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174749732&doi=10.1521%2faeap.2023.35.5.347&partnerID=40&md5=4de292a4d8af2e22c1c04b967311ca4a	Pre-exposure prophylaxis (PrEP) for HIV prevention has recently become available in Kazakhstan, but women engaged in sex work who use drugs (WESW-UD) could benefit from tailored approaches to support uptake and adherence. To better understand how best to support WESW-UD at each stage of the PrEP continuum (awareness, acceptability, uptake, and adher-ence), we analyzed data from 30 in-depth interviews and four focus groups with 48 WESW-UD from two cities in Kazakhstan. We conducted thematic analysis to characterize perceptions, barriers, and motivators within each step of the PrEP continuum. Participants reported low awareness, but high interest in PrEP. Motivating factors included optimizing health and increased confidence. Participants expressed many preferences and concerns regarding PrEP modality and delivery. Participants also described how orga-nizational mistrust and social support can prevent or facilitate PrEP uptake or adherence. Kazakhstan's scale-up of PrEP should consider the needs and preferences of WESW-UD to ensure equitable access. © 2023 The Guilford Press. Article	2023	McElyea J.; Bistransin K.; Bana S.; Alvarez K.S.; Brown L.S.; Persaud D.; King H.	Impact of a clinical pharmacist within an HIV PrEP program for patients experiencing homelessness	Journal of the American Pharmacists Association	-	-	-	-	15443191	10.1016/j.japh.2022.09.003	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139319366&doi=10.1016%2fj.japh.2022.09.003&partnerID=40&md5=5b7f686ada3c92a420cb319a49dc3edf	Background: Human immunodeficiency virus (HIV) continues to be a concern in the United States despite pre-exposure prophylaxis (PrEP) being a highly recommended preventative option. Homeless populations have a significantly increased risk of HIV acquisition, and recent literature found attrition to PrEP care being concentrated in demographics common to these populations. Pharmacist-led PrEP programs may be a feasible option to combat this attrition, as they have shown high rates of patient satisfaction and pharmacist comfortability in other populations. Objectives: To evaluate PrEP uptake and the continuum of care before and after a Clinical Pharmacy Specialist (CPS) expanded HIV prevention services within a primary care setting for persons experiencing homelessness. Methods: We compared a retrospective cohort of patients experiencing homelessness who received an initial PrEP prescription during a pre-CPS period and those with an initial PrEP prescription after CPS. Charts were reviewed through the surrounding time period of a 3-month and a 6-month PrEP follow-up appointment. Outcomes evaluated included number of initial PrEP prescriptions, dispensations of PrEP, PrEP discontinuations, patient retention in PrEP care, and new HIV diagnoses. Results: A total of 40 patients were included, with 10 initial PrEP prescriptions in the pre-CPS population and 30 in the post-CPS one. Both groups largely represented those disproportionately impacted by HIV. After CPS, more patients were enrolled in patient assistance programs (100% vs. 44%; P < 0.01), and more patients picked up the first PrEP dispensation (80% vs. 40%; P = 0.04). The overall population had low dispensation rates and retention to care. Having no CPS management and a lack of medical appointment attendance trended toward attrition of care, and having no patient assistance program enrollment significantly led to attrition of care. Conclusion: These findings may prompt further studies and adaptations to PrEP care among persons experiencing homelessness, including the utilization of pharmacists to improve patient outcomes. © 2022	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	McKetchnie, Samantha M; White, Bradley; Fontenot, Holly; Dormitzer, Julian; Psaros, Christina; Fitch, Calvin; O'Cleirigh, Conall; Mayer, Kenneth H; Krakower, Douglas S	Perspectives of Young Men Who Have Sex with Men on PrEP Adherence and Peer Navigation: A Qualitative Study.	Archives of Sexual Behavior	-	-	-	-	1573-2800	10.1007/s10508-023-02579-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10330054	HIV incidence is disproportionately high among young cisgender men who have sex with men (YMSM), but YMSM are less likely than adults to use HIV pre-exposure prophylaxis (PrEP). Among YMSM living with HIV, peer navigation programs have been effective in linkage to care and increasing medication adherence; such programs may aid HIV-uninfected YMSM in overcoming barriers to engagement in PrEP care. We conducted 32 semi-structured qualitative interviews at a community health center in Massachusetts, USA, specializing in sexual and gender minority health with four sub-groups of YMSM who: (1) had never discussed PrEP with a medical provider, (2) had discussed PrEP with a medical provider but declined a prescription, (3) were prescribed PrEP and have sub-optimal adherence (taking fewer than 4 pills per week), and (4) were prescribed PrEP and were optimally adherent. Domains addressed in the interviews included knowledge of PrEP and HIV prevention, barriers and facilitators to PrEP adherence, and attitudes toward peer navigation for PrEP. Interviews were transcribed and coded using thematic analysis methodology. Multiple themes emerged from the interviews, including finding that perceived costs, anticipated stigma, sexual activity, and relationship status influence PrEP uptake and adherence; establishing pill-taking routines is an important adherence facilitator; and peer navigators could offer benefits for PrEP adherence. Article	2023	McManus K.A.; Fuller B.; Killelea A.; Strumpf A.; Powers S.D.; Rogawski McQuade E.T.	Geographic Variation in Qualified Health Plan Coverage and Prior Authorization Requirements for HIV Preexposure Prophylaxis	JAMA Network Open	-	-	-	-	25743805	10.1001/jamanetworkopen.2023.42781	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176451216&doi=10.1001%2fjamanetworkopen.2023.42781&partnerID=40&md5=5ea730cf82b77c015e119ba50168702f	IMPORTANCE HIV preexposure prophylaxis (PrEP) is a key component of the Ending the HIV Epidemic (EHE) Initiative to curb new HIV diagnoses. In October 2019, emtricitabine/tenofovir alafenamide was added as an approved formulation for PrEP in addition to emtricitabine/tenofovir disoproxil fumarate; despite availability of another formulation with a similar prevention indication, variations in coverage may limit access. OBJECTIVE To assess qualified health plan (QHP) coverage, prior authorization (PA) requirements, and specialty tiering for emtricitabine/tenofovir disoproxil fumarate and emtricitabine/tenofovir alafenamide following emtricitabine/tenofovir alafenamide approval as a PrEP treatment. DESIGN, SETTING, AND PARTICIPANTS This cross-sectional study analyzed QHPs in the US that were compliant with the Patient Protection and Affordable Care Act from 2018 to 2020. QHPs were categorized by region and EHE priority jurisdictions. Data analysis occurred from March 2022 to March 2023. EXPOSURES Enrollment in a qualified health plan certified by the Patient Protection and Affordable Care Act. MAIN OUTCOMES AND MEASURES Annual variation in QHP coverage and PA requirement for emtricitabine/tenofovir disoproxil fumarate and/or emtricitabine/tenofovir alafenamide. Descriptive statistics were reported for all outcomes. A secondary outcome was whether the PrEP formulation was determined by the QHP to be placed on a specialty drug tier. RESULTS A total of 58 087 QHPs (19 533 for 2018; 17 007 for 2019; and 21 547 for 2020) were analyzed. QHPs covered emtricitabine/tenofovir disoproxil fumarate (19 165 QHPs 98.1% in 2018; 16 970 QHPs 99.8% in 2019; 20 045 QHPs 94.8% in 2020) at a higher rate than emtricitabine/tenofovir alafenamide (17 391 QHPs 91.9% in 2018; 15 757 QHPs 92.7% in 2019; 18 836 QHPs 87.4% in 2020). QHPs in the South required exclusive PA (ie, PA for 1 of the formulations even if the QHP covered both) for emtricitabine/tenofovir disoproxil fumarate and emtricitabine/tenofovir alafenamide at the highest rates in all 3 years. In the South, the rate of PA for emtricitabine/tenofovir disoproxil fumarate increased from 806 of 8023 QHPs (10.0%) in 2018 to 3466 of 7401 QHPs (46.8%) in 2020. QHPs with exclusive PA requirement for emtricitabine/tenofovir disoproxil fumarate were higher in EHE jurisdictions than non-EHE jurisdictions (difference: 2018, 0.9 percentage points; 2019, 3.5 percentage points; 2020, 29.1 percentage points). QHPs were more likely to place emtricitabine/tenofovir disoproxil fumarate on a specialty tier compared with emtricitabine/tenofovir alafenamide (difference: 2018, 1.8 percentage points; 2019, 3.7 percentage points; 2020, 4.1 percentage points). CONCLUSIONS AND RELEVANCE In this cross-sectional study, despite similar indications for biomedical prevention, QHPs were more likely to cover emtricitabine/tenofovir disoproxil fumarate than emtricitabine/tenofovir alafenamide, and QHPs were also more likely to subject emtricitabine/tenofovir disoproxil fumarate to PA or place it on a specialty tier despite the broader clinical indication. QHP PA requirements of emtricitabine/tenofovir disoproxil fumarate following emtricitabine/tenofovir alafenamide approval does not reflect clinical guidelines. The requirements could reflect differences in clinical indication, manufacturer discounts, or anticipation of a changing regulations and emerging generics. High rates of exclusive PA for emtricitabine/tenofovir disoproxil fumarate in areas where rates of HIV diagnoses are highest and PrEP is most needed (eg, the South and EHE priority jurisdictions) is concerning; policy solutions to address the growing PrEP health equity crisis could include regulator actions and a national PrEP program. © 2023 American Medical Association. PrEP PERSISTENCE SUPPORT AND MONITORING IN AREAS OF HIGH HIV BURDEN IN THE MIDWESTERN UNITED STATES	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2023.35.3.235	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164269026&doi=10.1521%2faeap.2023.35.3.235&partnerID=40&md5=cbc331f40edd39704f9948cbcb9fba39	Monitoring pre-exposure prophylaxis (PrEP) metrics can guide service delivery yet does not occur routinely. We developed a survey to understand current practices for monitoring PrEP at PrEP-providing organizations in Illinois and Missouri. The survey was distributed from September through November 2020; 26 organizations participated. Most respondents indi-cated ongoing efforts to screen for PrEP eligibility (66.7%), link to care (87.5%), and retain clients in care (70.8%); 70.8% reported collecting data on PrEP initiation, 41.7% on retention in care, and 37.5% on missed visits. Barriers to monitoring PrEP metrics included lack of IT support (69.6%), manual processes (69.6%), and lack of staff resources (65.2%). Most respondents offered clients support for PrEP retention and adherence and wanted to expand interventions for PrEP persistence, yet fewer monitored corresponding metrics. To enhance PrEP implementation, organizations should improve monitoring and evaluation of PrEP metrics along the entire continuum and respond with appropriate services to support clients. © 2023 The Guilford Press.	adherence; EHE; Ending the HIV Epidemic; HIV; persistence; pre-exposure prophylaxis; PrEP; PrEP care continuum	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Medland, Nicholas Andrew; Fraser, Doug; Bavinton, Benjamin R; Jin, Fengyi; Grulich, Andrew E; Paynter, Heath; Guy, Rebecca; McManus, Hamish	Discontinuation of government subsidized HIV pre-exposure prophylaxis in Australia: a whole-of-population analysis of dispensing records.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26056	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9883116	INTRODUCTION: HIV pre-exposure prophylaxis (PrEP) has been government subsidized in Australia since April 2018 and while uptake is high among men who have sex with men, rates of discontinuation are also high. The aims of this study were to examine the impact of discontinuation on overall PrEP usage, the proportion of PrEP users who discontinue and the predictors of discontinuation. METHODS: We used linked de-identified dispensing records of all government subsidized PrEP in Australia between April 2018 and September 2021: a whole-of-population data set. Defining discontinuation as 180 days or more without PrEP after the final dispensed supply, we calculated the number of people who discontinued at each 6-month interval during the study period, the proportion who had discontinued 2 years after the first supply and, using Cox regression, predictors of discontinuation. RESULTS: Of 49,164 people dispensed PrEP (98.5% male, median age 34 years), 40.3% (19,815) had discontinued by September 2021. Within 2 years of their first supply, 11,150 (37.7%) of 29,549 PrEP users had discontinued, including 10.0% after a single dispensed supply. Large variations were observed, particularly according to prescriber characteristics: discontinuation was higher among people prescribed PrEP by low caseload (≤10 patients) prescribers (61.2%) than by high caseload (>100 patients) prescribers (31.1%, p<0.001), and by prescribers practising in areas with low estimated prevalence (<1.0%) of gay men (64.1%) than high (>5%) prevalence (36.7%, p<0.001). Women and younger people were more likely to discontinue, while patients receiving a higher level of government subsidy were less likely. The independent predictors of discontinuation with the greatest effect size were female sex (adjusted hazards ratio aHR 2.99, p<0.001), low estimated gay prevalence of prescriber location (aHR 1.98, p<0.001) and low prescriber PrEP caseload (aHR 1.79, p<0.001). CONCLUSIONS: There are high rates of PrEP discontinuation in Australia and some populations are at increased risk of discontinuation. Strategies are needed to support persistence on PrEP and the re-starting of PrEP during periods of risk. Article	2023	Mehmandoust, Mohammad; Soylak, Mustafa; Erk, Nevin	Innovative molecularly imprinted electrochemical sensor for the nanomolar detection of Tenofovir as an anti-HIV drug.	Talanta	-	-	-	-	1873-3573 0039-9140	10.1016/j.talanta.2022.123991	https://www.sciencedirect.com/science/article/abs/pii/S0039914022007871	Tenofovir (TNF) is an antiviral medicine that is utilized to treat the human immunodeficiency virus (HIV). However, its level must be controlled in the human body and environment at the risk of causing kidney and liver problems. Therefore, determining TNF concentration in real samples with more advanced, inexpensive, and accurate sensing systems is essential. In this work, a novel electrochemical nanosensor for TNF determination based on molecularly imprinted polymer (MIP) on the screen-printed electrode modified with functionalized multi-walled carbon nanotubes, graphitic carbon nitride, and platinum nanoparticles (MIP-Pt@g-C(3)N(4)/F-MWCNT/SPE) was constructed through the electro-polymerization approach. The molecularly imprinted polymers were prepared on the electrode surface with TNF as the template molecule and 2-aminophenol (2-AP) as the functional monomer. Moreover, factors that affect sensor response were optimized. Pt@g-C(3)N(4)/F-MWCNT nanocomposite had an excellent synergistic effect on MIP, allowing rapid and specific identification of the test substance. The results demonstrated that the electro-polymerization of 2-AP supplies large amounts of functional groups for the binding of the template molecules, which remarkably enhances the sensitivity and specific surface area of the MIP sensor. This surface enlargement increased the analyte accessibility to imprinted molecular cavities. Under optimum conditions, the oxidation peak current had a linear relationship with TNF concentration ranging from 0.005 to 0.69 μM with a low detection limit of 0.0030 μM (S/N = 3). The results demonstrated that the designed MIP sensor possesses acceptable sensitivity, repeatability, and reproducibility toward TNF determination. Moreover, the developed sensor was applied to biological and water samples to determine TNF, and satisfactory recovery results of 95.6-104.8% were obtained (RSD less than 10.0%). We confirm that combining as-synthesized nanocomposite Pt@g-C(3)N(4)/F-MWCNT with MIP improves the limitations of MIP-based nanosensors. The proposed electrode is also compatible with portable potentiostats, allowing on-site measurements and showing tremendous promise as a point-of-care (POC) diagnostic platform. Article	2023	Merle, James Lorenz; Li, Dennis; Keiser, Brennan; Zamantakis, Alithia; Queiroz, Artur; Gallo, Carlos G.; Villamar, Juan A.; McKay, Virginia; Zapata, Juan Pablo; Mustanski, Brian; Benbow, Nanette; Smith, Justin D.	Categorising implementation determinants and strategies within the US HIV implementation literature: a systematic review protocol.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2022-070216	https://bmjopen.bmj.com/content/13/3/e070216	INTRODUCTION: Despite decreased rates of new infections, HIV/AIDS continues to impact certain US populations. In order to achieve the goals laid out in the Ending the HIV Epidemic (EHE) in the US initiative, implementation science is needed to expand the sustained use of effective prevention and treatment interventions, particularly among priority populations at risk for and living with HIV/AIDS. Over 200 HIV-related implementation studies have been funded by the US National Institutes of Health. Therefore, a comprehensive review of the literature identifying implementation determinants (barriers and facilitators) and categorising implementation strategies across the continuum of HIV prevention and care in the USA is appropriate and needed to enhance current knowledge and help achieve the goals laid out in the EHE national strategic plan. METHODS AND ANALYSIS: This systematic review protocol follows the Preferred Reporting Items for Systematic Reviews and Meta-Analyses guidelines. Between November 2020 and January 2022, a broad database search strategy of Ovid MEDLINE, PsycINFO and Web of Science was conducted to capture implementation-related studies along the HIV prevention and care continuum. Articles were eligible for inclusion if they were: conducted in the USA, published after the year 2000, written in English, related to HIV/AIDS, focused on outcomes related to dissemination and implementation (ie, did not test/evaluate/explore implementation determinants or strategies) and were behavioural studies (ie, not basic science). We plan to conduct three systematic reviews to identify and categorise determinants and strategies associated with three HIV focus areas: pre-exposure prophylaxis, testing/diagnosing and linkage to care, and treatment. Determinants will be coded according to an adapted Consolidated Framework for Implementation Research 2.0. Implementation strategies and outcomes will be categorised in accordance with existing taxonomies and frameworks. ETHICS AND DISSEMINATION: Ethics approval is not applicable. No original data will be collected. Results will be disseminated through peer-reviewed publications, conference presentations and via online tools. PROSPERO REGISTRATION NUMBER: CRD42021233089. Article	2023	Merrill, KG; Atujuna, M; Emerson, E; Blachman-Demner, D; Bray, BC; Bekker, LG; Donenberg, GR	Preliminary effectiveness and implementation outcomes of the IMARA-South Africa sexual health intervention on adolescent girls and young women: a pilot randomized trial	PLOS Global Public Health	-	-	-	-	NA	10.1371/journal.pgph.0001092	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02637786/full	Family-based interventions may help reduce the risk of HIV and other sexually transmitted infections (STI) among adolescent girls and young women (AGYW) in sub-Saharan Africa but few have been tested. We examined the preliminary effectiveness and implementation outcomes of Informed, Motivated, Aware, and Responsible Adolescents and Adults-South Africa (IMARA-SA), an evidence-based intervention for South African AGYW (15-19 years) and their female caregivers. We piloted IMARA-SA in the Western Cape using an individually randomized experimental design and average follow-up at 11 months. Primary outcomes were HIV Testing and Counselling (HTC) uptake, STI incidence (gonorrhea, chlamydia), and pre-exposure prophylaxis (PrEP) uptake. Secondary outcomes were self-reported sexual risk behavior (condom use at last sex, consistency of condom use, substance use during sex, and number of sexual partners) and PrEP adherence. We examined four implementation outcomes: reach, feasibility, acceptability, and fidelity. Data from 59 AGYW (mean = 17.2 years) were analyzed at baseline (n = 29 from IMARA-SA, 30 from a health promotion control group). At follow-up, 51 (86%) completed surveys and 39 (66%) presented for HTC, STI testing, and/or PrEP. Compared to controls, fewer IMARA-SA participants tested positive for an STI (22% versus 38%), more IMARA-SA participants took up PrEP (68% versus 45%), and four of five secondary outcomes favored the IMARA-SA group at follow-up. These differences did not reach statistical significance. HTC uptake at follow-up was 100% in both groups. All AGYW-FC dyads agreed to participate in the study (reach). In the IMARA-SA group, 76% of dyads completed the intervention (feasibility), and over 76% of acceptability ratings from AGYW and their FC had the highest Likert rating. Fidelity of intervention delivery was 95%. IMARA-SA is a promising strategy for reducing HIV/STI risk among South African AGYW. We found strong evidence of reach, feasibility, acceptability, and fidelity. A fully powered randomized controlled trial is warranted. Trial registration: Clinical trials.gov registration number: NCT05504954. Article	2023	Meyer-Rath, Gesine; Jamieson, Lise; Pillay, Yogan	What will it take for an injectable ARV to change the face of the HIV epidemic in high-prevalence countries? Considerations regarding drug costs and operations.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26106	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10338998	INTRODUCTION: The proven effectiveness of injectable cabotegravir (CAB-LA) is higher than that of any other HIV prevention intervention ever trialled or implemented, surpassing medical male circumcision, condoms and combination antiretroviral treatment. Based on our own analyses and experience with the South African oral pre-exposure prophylaxis (PrEP) programme, we review the supply and demand side factors that would need to be in place for a successful rollout of CAB-LA, and delineate lessons for the launch of other long-acting and extended delivery (LAED) antiretroviral drugs. DISCUSSION: On the supply side, CAB-LA will have to be offered at a price that makes the drug affordable and cost-effective to low- and middle-income countries, especially those with high HIV prevalence. An important factor in lowering prices is a guaranteed market volume, which in turn necessitates the involvement of large funders, such as PEPFAR and the Global Fund, and a fairly rapid scale-up of the drug. Such a scale-up would have to involve speedy regulatory approval and WHO pre-qualification, swift integration of CAB-LA into national guidelines and planning for large enough manufacturing capacity, including the enabling of local manufacture. On the demand side, existing demand for HIV prevention products has to be harnessed and additional demand created, which will be aided by designing CAB-LA programmes at the primary healthcare or community level, and involving non-traditional outlets, such as private pharmacies and doctors' practices. CONCLUSIONS: CAB-LA could be the game changer for HIV prevention that we have been hoping for, and serve as a useful pilot for other LAEDs. A successful rollout would involve building markets of a guaranteed size; lowering the drug's price to a level possibly below the cost of production, while also lowering the cost of production altogether; harnessing, creating and sustaining demand for the product over the long term, wherever possible, in national programmes rather than single demonstration sites; and establishing and maintaining manufacturing capacity and supply chains. For this, all parties have to work together-including originator and generic manufacturers, donor organizations and other large funders, and the governments of low- and middle-income countries, in particular those with high HIV prevalence. Article	2023	Meyers, Kathrine; Nguyen, Nadia; Zucker, Jason E.; Kutner, Bryan A.; Carnevale, Caroline; Castor, Delivette; Sobieszczyk, Magdalena E.; Yin, Michael T.; Golub, Sarit A.; Remien, Robert H.	The Long-Acting Cabotegravir Tail as an Implementation Challenge: Planning for Safe Discontinuation.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-022-03816-0	https://pubmed.ncbi.nlm.nih.gov/36056997/	The long-acting feature of cabotegravir, an integrase-inhibitor highly effective in preventing acquisition of HIV in adolescents and adults, is both its greatest strength and a challenge to its implementation. Cab-LA is administered at 8-week intervals (after an initial loading dose) but has a long, variable drug "tail" that may leave users vulnerable to future drug resistance if they contract HIV during this critical period. The potential for cab-LA to meaningfully contribute to ending the HIV Epidemic is hindered by, among other factors, limited resources to guide patients and providers on how to safely discontinue injections. We suggest three key strategies to overcome this specific challenge: (1) Comprehensive patient education and counseling about the drug tail; (2) Training and coaching PrEP care teams, including clinical and non-clinical staff, on communication around the tail; (3) Adherence support strategies, including monitoring of cabotegravir drug levels after discontinuation, for a personalized medicine approach to safe discontinuation. Article	2023	Meyers, Kathrine; Quigee, Daniela; Zucker, Jason; Carnevale, Caroline; Klein, Joshua; Kim, Tae Y; Sobieszczyk, Magdalena E	The Index of Engagement in PrEP Care: Evaluation of Psychometric Properties and Predictive Potential.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000003246	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10593486	BACKGROUND: The Index of Engagement in HIV Care is a psychometrically valid 10-item self-report measure with predictive power to classify individuals to higher and lower odds of disengaging from HIV care. Given high rates of disengagement from preexposure prophylaxis (PrEP) care, we adapted the HIV Index to PrEP. METHODS: We evaluated the psychometric properties of the PrEP-Index in a cross-sectional validation among PrEP-eligible persons seen in an HIV Prevention Program and conducted exploratory analysis to assess its potential utility as a prognostic tool. The PrEP Index contains 10 items with answers ranging from (1) not at all to (5) extremely. Possible PrEP-Index scores ranged from 10 to 50, with higher sum scores representing higher levels of engagement. RESULTS: Study participants were cisgender men who have sex with men, and racially and ethnically diverse (non-Hispanic White = 39.2%). Factor analyses supported the 1-factor structure. Among 347 respondents, 118 individuals (34.0%) were available for predictive validity analysis. The PrEP Index score was positively associated with visit constancy at 6 months (= 0.2261; 95% confidence interval: 0.0363 to 0.4051). Finally, a patient scoring 45 on the PrEP-Index will be classified as not returning within 6 months (sensitivity = 0.73, specificity = 0.65). CONCLUSIONS: The PrEP-Index is a psychometrically valid and reliable scale that demonstrates potential utility in identifying individuals at elevated risk of falling out of PrEP care by 6 months, the time point by which the majority of PrEP discontinuations occur. The PrEP-Index could be a useful clinical prognostic tool to allow for efficient resource targeting by clinics to improve engagement in PrEP care. Article	2023	Mgodi, Nyaradzo M; Murewanhema, Grant; Moyo, Enos; Samba, Chesterfield; Musuka, Godfrey; Dzinamarira, Tafadzwa; Brown, Joelle M	Advancing the use of Long-Acting Extended Delivery formulations for HIV prevention in sub-Saharan Africa: challenges, opportunities, and recommendations.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26115	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10338997	INTRODUCTION: The burden of HIV in sub-Saharan Africa (SSA) remains unacceptably high, and disproportionately affects girls and women. While the introduction of oral HIV pre-exposure prophylaxis (PrEP) in 2012 revolutionized HIV prevention, its effectiveness is dependent on user adherence and its implementation in SSA has faced numerous challenges. Patient-level, interpersonal and structural barriers, including, for example, daily pill burden, side effects, lack of partner support, testing and disclosure, and costs have been found to reduce adherence to oral PrEP. DISCUSSION: Long-acting extended delivery (LAED) formulations for PrEP, such as injectable long-acting cabotegravir (CAB-LA) and dapivirine vaginal ring (DPV-VR) are critical additions to the HIV prevention toolkit and are especially important for populations such as adolescent girls and young women (AGYW) and other key populations who remain at significant risk of HIV acquisition while facing substantial barriers to preventive services. These LAED formulations have been shown to result in better adherence and fewer side effects, with CAB-LA being superior to oral PrEP in reducing the risk of HIV acquisition. They can be used to overcome user burden and adherence challenges. However, the successful rollout of the DPV-VR and CAB-LA may be hampered by issues such as a shortage of healthcare providers (HCPs), inadequate parenteral medication infrastructure, increased workload for HCPs, patient concerns, the price of the medications and the possibility of drug resistance. CONCLUSIONS: SSA must develop laboratory capabilities for monitoring patients on LAED formulations and enhance research on developing more non-injectable LAED formulations. There is a need to train and retain more HCPs, implement task shifting, invest in healthcare infrastructure and integrate healthcare services. To reduce costs and improve availability, the region must advocate for patent license waivers for LAED formulations and procure drugs collectively as a region. Article	2023	Milali M.P.; Resar D.; Kaftan D.; Campbell J.; Olowu A.; Edwards D.; Platais I.; Kim H.-Y.; Jenkins S.; Bershteyn A.	Cost-effectiveness of the dual prevention pill for contraception and HIV pre-exposure prophylaxis	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2023.1144217	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161004262&doi=10.3389%2ffrph.2023.1144217&partnerID=40&md5=ac8788813ec1a0823f8575d79f2e34e6	Introduction: Women in sub-Saharan Africa (SSA) experience the world's highest rates of both HIV infection and unintended pregnancy. The Dual Prevention Pill (DPP) is a novel multipurpose prevention technology (MPT) that co-formulates HIV pre-exposure prophylaxis (PrEP) and combined hormonal oral contraception into a single daily pill. As a dual indication product, the DPP may be preferred by women facing these overlapping health risks. However, most SSA countries face severe healthcare resource constraints. Research is needed to assess whether, in what populations, and in what use cases the DPP would be cost-effective. Methods: We augmented an agent-based SSA HIV model with maternal health parameters including unintended pregnancy, abortion, and maternal mortality. Based on a previous market analysis, we assumed a primary DPP user population of current oral contraceptive users ages 25–49, and alternative user populations in different risk groups (age 15–24, sex workers, HIV-serodiscordant couples) and baseline product use profiles (unmet need for contraception, oral PrEP use, condom use). In three geographies (western Kenya, Zimbabwe, South Africa), we estimated HIV infections averted, pregnancies averted, disability-adjusted life-years (DALYs) averted, and the incremental cost-effectiveness ratio (ICER) over a 30-year time horizon, assuming equivalent adherence to the DPP as to oral contraceptives, higher adherence, or lower adherence. Results: The DPP is likely to be a cost-effective alternative to oral PrEP among users in need of contraception. Among women not already using PrEP, the DPP is likely to be cost-saving in sex workers and serodiscordant couples. The DPP is unlikely to be cost-effective in oral contraceptive users in the general population. Switching from oral contraception to the DPP could be net harmful in some settings and populations if it were to substantially reduce adherence to oral contraception. Results were robust to a range of time horizons or discount rates. Conclusion: The DPP has the potential to be cost-effective and cost-saving in populations at substantial HIV risk. Outcomes are sensitive to adherence, implying that effective counseling and decision-making tools for users considering the DPP will be essential. More research is needed to understand real-life adherence patterns and ensure health benefits achieved from contraception alone are not lost. 2023 Milali, Resar, Kaftan, Campbell, Olowu, Edwards, Platais, Kim, Jenkins and Bershteyn.	cost-Effectiveness; daly; dual prevention pill; HIV; hiv prevention; multipurpose prevention technologies; oral contraception pill; prEP	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2023	Miley K.L.; Tran N.K.; Elopre L.; Groves A.; Stockman J.K.; Bazzi A.R.; Carrico A.; Mazzella S.; Roth A.M.	A Note on Preexposure Prophylaxis Preferences Among Women Who Inject Drugs	Sexually Transmitted Diseases	-	-	-	-	1485717	10.1097/OLQ.0000000000001768	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171203055&doi=10.1097%2fOLQ.0000000000001768&partnerID=40&md5=51f8926038c4d22fb640312552c169ce	We informed women who inject drugs about different preexposure prophylaxis (PrEP) formulations; they then ranked their preferences. Daily oral PrEP was most preferred, followed by injectable PrEP and vaginal rings/gels, especially among women of color. Multiple PrEP options should be discussed with women who inject drugs to increase uptake. © Lippincott Williams & Wilkins. Article	2023	Miller, Amanda P; Shoptaw, Steven; Moucheraud Corrina; Mvududu Rufaro; Essack Zaynab; Gorbach, Pamina M; Myer Landon; Davey Dvora L Joseph	Recent Alcohol Use Is Associated With Increased Pre-exposure Prophylaxis (PrEP) Continuation and Adherence Among Pregnant and Postpartum Women in South Africa: JAIDS	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000003133	https://www.proquest.com/scholarly-journals/recent-alcohol-use-is-associated-with-increased/docview/2775811965/se-2?accountid=8113	Background:South African women experience high levels of alcohol use and HIV infection during the perinatal period. Oral pre-exposure prophylaxis (PrEP) is highly effective at reducing HIV risk. We examined associations between alcohol use and PrEP use during pregnancy and postpartum.Methods:The PrEP in Pregnant and Postpartum Women study is a prospective observational cohort of 1200 HIV-negative pregnant women enrolled at first antenatal care visit and followed through 12 months' postpartum in Cape Town, South Africa. The analytic sample comprised pregnant women who initiated PrEP at baseline and were not censored from study follow-up before 3-month follow-up. We examined associations between any or hazardous alcohol use (Alcohol Use Disorders Identification Test—Consumption score ≥3) in the year before pregnancy and PrEP continuation and adherence during pregnancy (self-report of missing <2 doses in past 7 days and biomarker-confirmed with tenofovir diphosphate in dried blood spots).Results:Of 943 women on PrEP (median age of 26 years), 50% reported recent alcohol use before pregnancy, and 33% reported hazardous use. At 3-month follow-up, 58% of women were still using PrEP; 41% reported recent adherence, and 23% were biomarker-confirmed adherent. In multivariable models, hazardous alcohol use was associated with increased odds of continuing PrEP adjusted odds ratio (aOR) = 1.54, 95% confidence interval (CI): 1.16–2.06, self-reported PrEP adherence (aOR = 1.41, 95% CI: 1.07–1.87), and biomarker-confirmed PrEP adherence (aOR = 1.35 95% CI: 0.98, 1.87). Associations were similar in models of any alcohol use and PrEP continuation/adherence.Conclusions:Pregnant and postpartum women who reported recent alcohol use had increased odds of continuing to take PrEP, indicating that higher risk women may continue on oral PrEP. Article	2023	Misra, Kavita; Huang, Jamie S; Udeagu, Chi-Chi N; Forgione, Lisa; Xia, Qiang; Torian, Lucia V	Pre-exposure prophylaxis (PrEP) use history in people with antiretroviral resistance at HIV diagnosis: Findings from New York City HIV surveillance and partner services, 2015-2022.	Clinical Infectious Diseases	-	-	-	-	1537-6591	10.1093/cid/ciad699	https://dx.doi.org/10.1093/cid/ciad699	BACKGROUND: Drug resistance may be acquired in people starting HIV pre-exposure prophylaxis (PrEP) during undiagnosed infection. Population-based estimates of PrEP-related resistance are lacking. METHODS: We used New York City surveillance and partner services data to measure the effect of PrEP use (tenofovir disoproxil fumarate/tenofovir alafenamide fumarate with emtricitabine) history on baseline prevalence of M184I/V mutations in people diagnosed with HIV, 2015-2022. PrEP use was categorized as "Recent" defined as PrEP stopped ≤ 90 days before diagnosis, "Past" as PrEP stopped >90 days before diagnosis, and "No known use". Resistance associated mutations were determined using the Stanford Algorithm. We used log binomial regression to generate adjusted relative risk (aRR) of M184I/V by PrEP use history in people with and without acute HIV infection (AHI). RESULTS: Of 4,246 newly diagnosed people with a genotype ≤30 days of diagnosis, 560 (13%) had AHI, 136 (3%) reported recent, and 124 (35%) past PrEP use; 98 (2%) harbored M184I/V. In people with AHI, recent PrEP use was associated with 6 times greater risk of M184I/V than no known use (aRR: 5.86; 95% confidence interval CI: 2.49-13.77). In people without AHI, risk of M184I/V in recent users was 7 times (aRR:7.26; 95% CI: 3.98-13.24), and in past users, 4 times that of people with no known use (aRR: 4.46; 95% CI: 2.15-9.24). CONCLUSIONS: PrEP use was strongly associated with baseline M184I/V in NYC, regardless of AHI. Ordering a nucleic acid test when indicated after assessment of exposure, antiretroviral history and AHI symptoms can decrease PrEP initiation in people with undetected infection. Article	2023	Mistler, Colleen B.; Shrestha, Roman; Gunstad, John; Collins, Linda; Madden, Lynn; Huedo-Medina, Tania; Sibilio, Brian; Copenhaver, Nicholas M.; Copenhaver, Michael	Application of the multiphase optimisation strategy (MOST) to optimise HIV prevention targeting people on medication for opioid use disorder (MOUD) who have cognitive dysfunction: protocol for a MOST study.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2023-071688	https://pubmed.ncbi.nlm.nih.gov/37399447/	INTRODUCTION: People who inject drugs (PWID) have remained a contributor to the consistent HIV incidence rates in the US for decades. Pre-exposure prophylaxis (PrEP) is a promising biomedical intervention for HIV prevention among individuals at risk for HIV infection, including PWID. However, PWID report the lowest rates of PrEP uptake and adherence among at-risk groups. Tailored HIV prevention interventions must include strategies that compensate for cognitive dysfunction among PWID. METHODS AND ANALYSIS: Using the multiphase optimisation strategy, we will be conducting a 16-condition factorial experiment to investigate the effects of four different accommodation strategy components to compensate for cognitive dysfunction among 256 PWID on medication for opioid use disorder. This innovative approach will inform optimisation of a highly effective intervention to enhance PWID's ability to process and utilise HIV prevention content to improve PrEP adherence and HIV risk reduction in a drug treatment setting. ETHICS AND DISSEMINATION: The institutional review board at the University of Connecticut approved this protocol (H22-0122) with an institutional reliance agreement with APT Foundation Inc. All participants are required to sign an informed consent form prior to engaging in any study protocols. The results of this study will be disseminated on national and international platforms through presentations at major conferences and journals. TRIAL REGISTRATION NUMBER: NCT05669534. Article	2023	Mitchell K.M.; Boily M.-C.; Hanscom B.; Moore M.; Todd J.; Paz-Bailey G.; Wejnert C.; Liu A.; Donnell D.J.; Grinsztejn B.; Landovitz R.J.; Dimitrov D.T.	Estimating the impact of HIV PrEP regimens containing long-acting injectable cabotegravir or daily oral tenofovir disoproxil fumarate/emtricitabine among men who have sex with men in the United States: a mathematical modelling study for HPTN 083	The Lancet Regional Health - Americas	-	-	-	-	2667193X	10.1016/j.lana.2022.100416	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148010178&doi=10.1016%2fj.lana.2022.100416&partnerID=40&md5=a6a3e53577b3014a86b72d508325e779	Background: The HPTN 083 trial demonstrated superiority of HIV pre-exposure prophylaxis (PrEP) containing long-acting injectable cabotegravir (CAB) to daily oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) among men who have sex with men (MSM). We compared the potential population-level impact of TDF/FTC and CAB among MSM in Atlanta, Georgia. Methods: An MSM HIV transmission model was calibrated to Atlanta-specific data on HIV prevalence and PrEP usage (percentage of uninfected MSM on PrEP), assuming only PrEP-indicated MSM used PrEP. CAB effectiveness (efficacy × adherence) of 91% was estimated using data from HPTN 083 and previous TDF/FTC trials. We estimated HIV infections averted over 5/10 years if TDF/FTC use were maintained, or if all TDF/FTC users switched to CAB in January 2022 (vs. no PrEP or continued TDF/FTC use). CAB scenarios with 10%/20% more users were also considered. Progress towards Ending the HIV Epidemic (EHE) goals (75%/90% fewer HIV infections in 2025/2030 vs. 2017) was estimated. Findings: We predicted TDF/FTC at current usage (~28%) would avert 36.3% of new HIV infections (95% credible interval 25.6–48.7%) among all Atlanta MSM over 2022–2026 vs. no PrEP. Switching to CAB with similar usage may prevent 44.6% (33.2–56.6%) infections vs. no PrEP and 11.9% (5.2–20.2%) infections vs. continued TDF/FTC. Increasing CAB usage 20% could increase the incremental impact over TDF/FTC to 30.0% over 2022–2026, getting ~60% towards reaching EHE goals (47%/54% fewer infections in 2025/2030). Reaching the 2030 EHE goal would require 93% CAB usage. Interpretation: If CAB effectiveness were like HPTN 083, CAB could prevent more infections than TDF/FTC at similar usage. Increased CAB usage could contribute substantially towards reaching EHE goals, but the usage required to meet EHE goals is unrealistic. Article	2023	Mitchell, Holly D.; Whitlock, Gary; Zdravkov, Jey; Olsson, Jenny; Silalang, Panida; Bardsley, Megan; Blomquist, Paula B.; Jenkins, Claire; Thomson, Nicholas R.; Field, Nigel; Hughes, Gwenda	Prevalence and risk factors of bacterial enteric pathogens in men who have sex with men: A cross-sectional study at the UK's largest sexual health service.	The Journal of Infection	-	-	-	-	1532-2742 0163-4453	10.1016/j.jinf.2022.10.033	https://pubmed.ncbi.nlm.nih.gov/36343788/	OBJECTIVES: Outbreaks of bacterial enteric pathogens (BEPs) in men who have sex with men (MSM) associated with antimicrobial resistance are a public health concern. We investigated the prevalence and risk factors of BEPs in MSM to inform infection control. METHODS: We conducted a cross-sectional study at a London sexual health clinic between 20/12/2017 and 06/02/2018. Residual rectal swabs from MSM attending for sexually transmitted infection (STI) testing were anonymously tested for a range of BEPs using real-time PCR. A sub-set of samples were tested for the mphA gene (a marker of azithromycin resistance). Results were linked to electronic health records. RESULTS: BEPs were detected in 207 of 2116 participants, giving an overall prevalence of 9.8% (95% CI 8.5%-11.1%) ranging from 0.8% (0.4%-1.2%) for Shigella to 4.9% (4.0%-5.9%) for Enteroaggregative E. coli. MSM with BEPs were more likely to have a history of bacterial STIs (p = 0.010), to report more sexual partners (p<0.001), and among HIV-negative MSM, to report current HIV pre-exposure prophylaxis use (p<0.001). Gastrointestinal symptoms were rare (1.7%) and not associated with BEPs. 41.3% of MSM with BEPs and 14.1% of those without BEPs carried mphA (P<0.001). Among the former, this was associated with a history of bacterial STIs (51.5% vs 31.1%, p = 0.003). CONCLUSIONS: One in ten MSM had a BEP detected and most did not report symptoms. MphA carriage was common, particularly among those with BEPs. Bacterial STI treatment might contribute to selection of resistant gut organisms, emphasising the need for better antimicrobial stewardship. Article	2023	Mizushima D.; Nagai Y.; Mezzio D.; Harada K.; Piao Y.; Barnieh L.; El Moustaid F.; Cawson M.; Taniguchi T.	Cost-effectiveness analysis of HIV pre-exposure prophylaxis in Japan	Journal of Medical Economics	-	-	-	-	13696998	10.1080/13696998.2023.2233824	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164846646&doi=10.1080%2f13696998.2023.2233824&partnerID=40&md5=57f1a2be9bc62fa115e6cda16f2d5329	Background: While global efforts have been made to prevent transmission of HIV, the epidemic persists. Men who have sex with men (MSM) are at high risk of infection. Despite evidence of its cost-effectiveness in other jurisdictions, pre-exposure prophylaxis (PrEP) for MSM is neither approved nor reimbursed in Japan. Method: The cost-effectiveness analysis compared the use of once daily PrEP versus no PrEP among MSM over a 30-year time horizon from a national healthcare perspective. Epidemiological estimates for each of the 47 prefectures informed the model. Costs included HIV/AIDS treatment, HIV and testing for sexually transmitted infections, monitoring tests and consults, and hospitalization costs. Analyses included health and cost outcomes, as well as the incremental cost-effectiveness ratio (ICER) reported as the cost per quality-adjusted life year (QALY) for all of Japan and each prefecture. Sensitivity analyses were performed. Findings: The estimated proportion of HIV infections prevented with the use of PrEP ranged from 48% to 69% across Japan, over the time horizon. Cost savings due to lower monitoring costs and general medical costs were observed. Assuming 100% coverage, for Japan overall, daily use of PrEP costs less and was more effective; daily use of PrEP was cost-effective at a willingness to pay threshold of ¥5,000,000 per QALY in 32 of the 47 prefectures. Sensitivity analyses found that the ICER was most sensitive to the cost of PrEP. Interpretation: Compared to no PrEP use, once daily PrEP is a cost-effective strategy in Japanese MSM, reducing the clinical and economic burden associated with HIV. © 2023 The Author(s). Article	2023	Mizushima D.; Takano M.; Aoki T.; Ando N.; Uemura H.; Yanagawa Y.; Watanabe K.; Gatanaga H.; Kikuchi Y.; Oka S.	Effect of tenofovir-based HIV pre-exposure prophylaxis against HBV infection in men who have sex with men	Hepatology	-	-	-	-	2709139	10.1097/HEP.0000000000000384	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159738451&doi=10.1097%2fHEP.0000000000000384&partnerID=40&md5=c4c4ee4391f990eaea93ce895c37624b	Background and Aims: Men who have sex with men (MSM) are vulnerable to contracting HBV as a sexually transmitted infection. We evaluated the incidence of HBV infection (HBI) and the prophylactic effect of tenofovir-based pre-exposure prophylaxis (PrEP) on HBI in an MSM cohort. Methods: and Results: MSM who were older than 16 years were enrolled from January 2018 and followed up until June 2021 and tested for HIV, bacterial sexually transmitted infections, and HBsAg/ HBsAb and HBcAb every 3 months based on inclusion criteria, including HBsAg, HBcAb, HBsAb, and HIV negativity at enrollment. HBI was defined as seroconversion of HBsAg or HBcAb status. The log-rank test was used to evaluate the prophylactic effect of PrEP against HBI. As a substudy, individuals excluded from the main study due to HBs Ab positivity were evaluated for HBI incidence. Among 1577 MSM, 786 participants (546 PrEP nonusers, 131 daily PrEP users, and 109 event-driven PrEP users) met the criteria and were included. The annual incidence of HBV among PrEP nonusers (3.8%, 21 infections, with 559.5 person-years) was significantly higher (p = 0.018, log-rank test) than that among daily PrEP users 0.77%, 1 infection (admitted nonadherence), with 129.3 person-years and event-driven PrEP users (no infection with 93.8 person-years). Although the incidence of HBI and HIV infection decreased with PrEP use, the incidence of other sexually transmitted infections was higher in both daily and event-driven PrEP users. The annual incidence of HBV among HBsAb-positive and HBcAb-negative PrEP nonusers was 1.8% (3 infections, with 167.5 person-years). Conclusions: Tenofovir-based PrEP prevented HBI among MSM in a real-world setting. © 2023 The Authors. Article	2023	Mogaka, Felix Ong'era; Stewart, Jenell; Omollo, Victor; Bukusi, Elizabeth	Challenges and Solutions to STI Control in the Era of HIV and STI Prophylaxis.	Current HIV/AIDS Reports	-	-	-	-	1548-3576 1548-3568	10.1007/s11904-023-00666-w	https://pubmed.ncbi.nlm.nih.gov/37751130/	PURPOSE OF REVIEW: This article reviews current efforts to control bacterial sexually transmitted infections (STIs) among HIV pre-exposure prophylaxis (PrEP) users and outlines the opportunities and challenges to controlling STIs within HIV PrEP programs. RECENT FINDINGS: The incidence of STIs continues to rise globally especially among HIV PrEP users, with an estimated 1 in 4 PrEP users having a curable bacterial STI. STIs and HIV comprise a syndemic needing dual interventions. The majority of STIs are asymptomatic, and when testing is available, many STIs occur in extragenital sites that are missed when relying on urine testing or genital swabs. Optimal testing and treatment, including testing for antimicrobial resistance, pose difficulties in high income countries and is essentially non-existent in most low- and middle-income countries. Novel STI primary prevention strategies, like doxycycline post-exposure prophylaxis (PEP) for STI prevention, have proven to be highly efficacious in some populations. A few jurisdictions have issued normative guidelines and position statements for doxycycline PEP; however, clinical standards for implementation and data on public health impact are limited. STI incidence rates are high and rising in sexually active populations. Sexual health programs should leverage the expansion of HIV PrEP delivery services to integrate STI testing, surveillance, and novel STI prevention services. Article	2023	Mogaka, Jerusha Nyaboge; Otieno, Felix Abuse, Akim, Emelie; Bröms-Sofia, Kristin; Dettinger, Julia; Gomez, Lauren; Marwa, Mary; Odhiambo, Ben; Ngare, Kenneth; Rosen, Kesher; Sharma, Manisha; John-Stewart, Grace; Richardson, Barbra; Stern, Joshua; Unger, Jennifer; Udren, Jenna; Watsyi, Sulphine; Patrye, Jillian; Kinuthia, John	A Text Messaging-Based Support Intervention to Enhance Pre-exposure Prophylaxis for HIV Prevention Adherence During Pregnancy and Breastfeeding: Protocol for a Randomized Controlled Trial.	-	JMIR Research Protocols	-	-	-	1929-0748	10.2196/41170	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9926544/	BACKGROUND: Cisgender women in Kenya are at elevated risk of HIV acquisition during pregnancy and post partum. Acute HIV infection during pregnancy and breastfeeding accounts for approximately one-third of all vertical HIV transmissions. The World Health Organization recommends offering oral tenofovir-based pre-exposure prophylaxis (PrEP) to pregnant and postpartum women who are HIV-exposed and at substantial ongoing risk of HIV infection. However, PrEP uptake and adherence remain suboptimal among pregnant women in Kenya. Approximately half of pregnant women discontinue PrEP within 30 days of initiation. Therefore, it is crucial to develop PrEP adherence strategies that enhance support for adherence when postpartum events and health issues pose challenges to sustaining PrEP adherence. OBJECTIVE: We are conducting a randomized controlled trial to determine the effect of a bidirectional communication platform named Mobile Solutions for Women's and Children's Health (mWACh), which utilizes two-way SMS text messaging between patients and remote nurses to support PrEP adherence and address maternal health concerns in real time during the postpartum period. METHODS: The mWACh-PrEP study is a randomized trial designed to support PrEP adherence during the postpartum period by comparing mWACh-PrEP to the standard of care (ie, in-clinic adherence counseling) among women who are HIV negative and initiating PrEP. Purposive sampling was used to select 5 facilities offering PrEP in antenatal clinics in Kisumu and Siaya Counties, and block randomization will be used to divide participants into groups. Participants in the intervention arm will receive a customized messaging curriculum via SMS text messages targeted toward their stage postpartum (ie, 1-6 weeks, 7-14 weeks, 15-24 weeks, and 25-52 weeks postpartum) and will be encouraged to respond to questions about their experiences. Participants will be followed up on a previous study of directly observed dosing conditions, we will use a hair tenofovir concentration cutoff of 0.020 ng/mg (corresponding to 7 doses/week) as the primary adherence outcome measured at 6 months post partum (binary outcome). Qualitative interviews and cost-effective analyses will be conducted to understand the feasibility, acceptability, and economic impact of the intervention. RESULTS: Enrollment began in March 2022 and is projected to continue until July 2023, with follow-up through March 2024. The study results are expected to be reported in 2025. CONCLUSIONS: This trial will provide insights into using mobile health to enhance PrEP adherence among pregnant and postpartum mothers. Additionally, the findings will have implications for the use of mobile health technology to improve adherence to other daily medications during the postpartum period. Article	2023	Moncayo J.E.; Pérez-Arévalorelos M.M.; Villegas-Trujillo L.M.; Rodríguez-Ortiz A.	ADHERENCE TO ORAL PRE-EXPOSURE PROPHYLAXIS INTERVENTION BY TRANSGENDER WOMEN: A SYSTEMATIC REVIEW	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2023.35.5.362	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175569073&doi=10.1521%2Faeap.2023.35.5.362&partnerID=40&md5=38c0f5441294fc8bc9e93246251fe071	Prevalence of human immunodeficiency virus (HIV) is higher in transgender populations. Pre-exposure prophylaxis (PrEP) intervention is successful in reducing HIV acquisition. We aimed to investigate the adherence to oral PrEP by HIV-negative transgender women (TW). We followed the Cochrane Handbook for Systematic Reviews of Interventions and the PRISMA State-ment. We searched in Well, OVID, Scopus, MEDLINE, and the Cochrane Central Register of Controlled Trials databases. Participation and adherence to the intervention were few for TW compared to men who have sex with men (MSM), and it was measured mostly by self-report [72.7%] or tenofovir-diphosphate/emtricitabine triphosphate dried blood spot (45.5%). Awareness should increase and the effect of oral PrEP on gender-affirming hormone therapy should be explained to TW at the beginning of the trials. One limitation is that our sample size was dominated by two This studies with 378/ six workers. Future studies should evaluate adherence to new PrEP modalities. © 2023 The Guilford Press.	adherence; HIV; pre-exposure prophylaxis; transgender women	English	United States	Western and Central Europe and North America	Colombia	Latin America and the Caribbean	Colombia	Latin America and the Caribbean	Review

Acceptability of the Dapivirine Vaginal Ring and Oral Tenofovir Among African Users in Late Stage of Pregnancy	-	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04203-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175811614&doi=10.1007%2Fs10461-023-04203-z&partnerID=40&md5=9c080a4e7c2d972165d5d8e0a65fcfd3	The Microbicide Trials Network 042 study (MTN-042/DELIVER) is a two-arm, randomized, open-label Phase 3b trial that is evaluating the safety, adherence, and acceptability of the monthly ring and daily oral PrEP among HIV-uninfected pregnant people in four African countries. This analysis focuses on acceptability data captured qualitatively from a subset (n = 48) of the 150 people in the first cohort of the trial who were enrolled in late-stage pregnancy at 36 to 38 weeks gestational age and followed until after delivery. Single IDIs were conducted by trained interviewers and audio recorded with participant consent. Data were analyzed using a structured guide. Data excerpts of key codes pertaining to acceptability, pregnancy, and maternal health were summarized, reviewed and interpreted by multinational analyst teams. Although the product use period was relatively short, the data suggested several acceptability findings that may directly translate to longer durations of product use in pregnancy. The first was the overarching maternal sentiment that being able to protect both oneself and their baby was highly valued. The second was the importance of counseling support from providers not only because participants used methods that might generate side effects, but because pregnancy itself is a period of time in which a person is likely to experience side effects. The third was the similar to and different from those in other trials, both study products were generally liked, but the oral was described as easy to use. Concerns about ring and oral PrEP use could be addressed with provider counseling and support and should form an essential component robust among pregnant people. © 2023, The Author(s). Article	2023	Moodley, Dhayendre; Lombard, Carl; Govender, Vani; Naidoo, Megeshnee; Desmond, Alicia C; Naidoo, Kimesh; Mthlongo, Ottocia; Sibhlalane, Mzabalazi; Newell, Marie-Louise; Clark, Richard; Rooney, James F; Grey, Glenda	Pregnancy and postnatal safety outcomes of timing of initiation of daily oral tenofovir disoproxil fumarate and emtricitabine pre-exposure prophylaxis for HIV prevention (CAPRISA): an open-label, randomised, non-inferiority trial.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(22)00369-1	https://dx.doi.org/10.1016/S2352-3018(22)00369-1	BACKGROUND: The safety of tenofovir disoproxil fumarate and emtricitabine as pre-exposure prophylaxis (PrEP) in pregnant women not living with HIV is uncertain. We aimed to compare pregnancy and neonatal outcomes in women exposed and not exposed to PrEP during pregnancy. METHODS: In this single-site, open-label, randomised, non-inferiority trial in Durban, South Africa, we evaluated pregnancy and neonatal outcomes in pregnant women aged 18 years or older, not living with HIV, and at 14-28 weeks' gestation at the time of enrolment. Eligible participants were randomly assigned (1:1) using a computer-generated randomisation sequence with variable block sizes to receive daily oral PrEP (tenofovir disoproxil fumarate 300 mg and emtricitabine 200 mg) or no PrEP. Participants in the PrEP group received a monthly supply of once daily oral tenofovir disoproxil fumarate 300 mg and emtricitabine 200 mg. Participants in the delivered PrEP group received standard of care for HIV prevention. The primary outcomes were the occurrence of preterm live birth (<37 weeks gestational age) and very preterm birth (<34 weeks gestational age) determined by neonatal dating, low birthweight (<2500 g), very low birthweight (<1500 g), stillbirth (≥20 weeks gestational age), and small for gestational age (birthweight less than the tenth percentile). Post-natal safety outcomes will be reported elsewhere. We used binomial regression models to estimate risk differences and two-sided 90% CIs. Immediate PrEP was non-inferior to delivered PrEP if the upper bound of the 90% CI of the risk difference was less than the upper prespecified non-inferiority margin for preterm birth (7·5%), very preterm birth (2·0%), low birthweight (3·5%), very low birthweight (1·2%), stillbirth (1·0%), and small for gestational age (3·7%). All outcomes were analysed in the intention-to-treat population. This study is registered with ClinicalTrials.gov, NCT02270775. FINDINGS: Between Sept 25, 2017, and Dec 6, 2019, we screened 693 women, of whom 540 were randomly assigned to immediate PrEP (n=271) or delivered PrEP (n=269). The arms were generally similar: the median gestational age was 19 weeks (IQR 15·2) for immediate PrEP and 16·23 for delivered PrEP. The risk difference between the immediate PrEP group and the delivered PrEP group for preterm birth was -4·7% (90% CI -10·7 to 1·2; immediate PrEP was non-inferior), for very preterm birth was 0·6% (-1·4 to 2·6; immediate PrEP was non-inferior), for low birthweight was -1·4% (-5·4 to 2·6; immediate PrEP was non-inferior), for very low birthweight was 0·2% (-1·4 to 1·8; immediate PrEP was non-inferior), for stillbirth was 0·2% (-1·2 to 1·6; immediate PrEP was non-inferior), for small for gestational age was 0·9% (-3·2 to 2·9; immediate PrEP was non-inferior). INTERPRETATION: In our study, PrEP was not associated with preterm birth or small for gestational age infants. Our data support the use of tenofovir disoproxil fumarate and emtricitabine in pregnancy and our reassuring findings can be used to allay safety concerns among pregnant women. Article	2023	Mugwanya K.K.; Pidgeon A.; Schaulina T.; Irungu E.M.; Bukusi E.; Mugo N.; Morton J.; Odoyo J.; Ngare K.; Baeten J.M.	Patterns of PrEP continuation and coverage in the first year of use: a latent class analysis of a programmatic PrEP trial in Kenya	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.26137	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85153837264&doi=10.1002%2Fjia2.26137&partnerID=40&md5=ae0b670eec3031fc3b127169c1f5b3dd	Pre-exposure prophylaxis (PrEP) with tenofovir (TFV) disoproxil fumarate and emtricitabine administered orally daily is effective in preventing human immunodeficiency virus (HIV) acquisition in both men and women. PrEP adherence, however, the additional efficacy relationship to cisgender women has not been well established. We characterized the adherence–efficacy curve to guide policy on using HIV incidence and plasma TFV concentration data from three trials (FEM-PrEP, VOICE and Partners PrEP). We imputed TFV dried blood spot (TFV-DBS) concentrations, a measure of long-term adherence, from TFV quantification by using data from the HIV Prevention Trials Network 082 study, which measured both TFV-DP and TFV concentrations. Two, four and seven pills per week reduced HIV incidence 59.3%, 69% (95% credible interval (CrI) 29.8–85.8%), 83.8% (95% CI 51.7–94.8%) and 95.1% (95% CI 72.6–100%), respectively. Our adherence–efficacy curve can be validated and updated by HIV prevention studies that directly measure TFV-DP concentrations. The curve suggests that high adherence confers high protection in cisgender women. However, the lower efficacy with partial adherence highlights the need for new PrEP products and interventions to increase adherence. © 2023, The Author(s), under exclusive licence to Springer Nature America, Inc. Article	2023	Mujugira, A; Kasirangi, B; Mujabia, J; Nakyanzi, A; Bagaya, M; Kamoulime, B; Nakamanzi, A; Nakidwago, GK; Kasaita, V; Tweyegye, CC; Nampewo, O; Nsubuga, R; Nyanzi, KB; Mawonge, T; Wyatt, MA; Ware, NC; Haberer, JE	"I felt special!" a qualitative study of peer-delivered HIV self-tests, STI self-sampling kits and PrEP for transgender women in Uganda	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26201	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10070580/	INTRODUCTION: Peer delivery is a client-centred approach that could maximize the coverage and impact of HIV services for transgender women (TGW). We conducted qualitative interviews to examine how peer-delivered HIV self-testing (HIVST), sexually transmitted infection self-sampling (STISS) and oral pre-exposure prophylaxis (PrEP) influenced prevention choices among TGW and their intimate partners in Uganda. METHODS: Within a cluster randomized trial of peer-delivered HIVST, STISS and PrEP among HIV-negative TGW (NCT04328623), we conducted IDI qualitative interviews with 30 TGW, 15 intimate partners and 30 TGW peers (August 2021-February 2022). TGW interviews explored: (1) HIV self-test and PrEP experiences; (2) HIVST with intimate partners; and (3) descriptions of self-sampling for STI-testing. Partner interviews explored: (1) descriptions of HIV risks in intimate partner; and (2) descriptions of experiences with HIVST. We used framework analysis. RESULTS: Themes/topics included: (1) intervention delivery experiences; and (2) recommendations for peer-delivered HIV prevention services to TGW, including psychological support and coping strategies. Qualitative data were collected from 75 participants (30 TGW, 15 intimate partners and 30 TGW peers). TGW reported positive experiences with peer delivery of HIVST, STISS and PrEP. Peers provided psychological support to HIVST-kits and PrEP refills to coping for individual's health and wellbeing by providing stigma coping strategies. Peer psychosocial support empowered research participants to become "HIVST ambassadors," teach non-study TGW about self-testing and PrEP, and encourage linkage to care. (2) HIVST with intimate partners and mutual disclosure of HIV status strengthened partnered relationships. PrEP use after both partners tested HIV negative implied infidelity. (3) Self-sampling enabled TGW to take control of their STI testing and avoid the embarrassment of exposing their bodies. Privacy and confidentiality motivated the uptake of STI testing and treatment. CONCLUSIONS: In this sample of TGW from Uganda, peer delivery of HIVST, STISS and PrEP refills benefited individual prevention efforts and extended to a new linkage of TGW not engaged in care. Integrating peer services into differentiated HIV delivery could increase HIV/STI test coverage and PrEP use in this vulnerable population.	*HIV Infections diagnosis, prevention & control; *Sexually Transmitted Diseases diagnosis, prevention & control; *Transgender Persons; Female; Humans; Intimate Partners; Male; Qualitative Research; Uganda; Homosexuality, Male; Sexual Behavior; Uganda	English	United States	Western and Central Europe and North America	Uganda	Eastern and Southern Africa	United States	Western and Central Europe and North America	Qualitative
Article	2023	Mugoya, Andrew; Ndayanzi, Agnes; Donnell, Deborah; Boyer, Jade; Stein, Gabrielle; Bukenya, Michelle; Nalubega, Ruth; Kyomuguhu, Juliet; Birungi, Juliet E.; Ssembiwa, Paul; Nsubuga, Rogers; Mwonge, Timothy R.; Musingizi, Joshua; Sharma, Manisha; Celum, Connie L.	Partner testing with HIV self-test distribution by Ugandan pregnant women living with HIV: a randomized trial.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26156	https://pubmed.ncbi.nlm.nih.gov/37675834/	INTRODUCTION: Secondary distribution of HIV self-tests (HIVST) by HIV-negative pregnant women to male partners increases men's testing rates. We examined whether this strategy promotes male partner testing for pregnant women living with HIV (PWLHIV). METHODS: We conducted an open-label individually randomized trial in Kampala, Uganda, in which PWLHIV ≥18 years who reported a partner of unknown HIV status were randomized 2:1 to secondary distribution of HIVST for male partner(s) or standard-of-care (SOC). Antenatal women were enrolled at 20-32 weeks' gestation and followed until 12 months post-partum. Male partners were offered confirmatory HIV testing and facilitated linkage to antiretroviral treatment (ART) or oral pre-exposure prophylaxis (PrEP). Using intention-to-treat analysis, primary outcomes were male partner testing at the clinic and initiation on PrEP or ART evaluated through 12 months post-partum. ClinicalTrials.gov, NCT03840733. RESULTS: From November 2018 to March 2020, 580 PWLHIV were enrolled with a median age of 27 years (interquartile range IQR 23-30); 332 were randomized to HIVST and 168 to SOC with 437 PWLHIV (87.4%) completing 12 months follow-up post-partum. Of 236 male partners who tested at the clinic and enrolled (47.2%), their median age was 31 years (IQR 27-36), 49 (88.3%) men with HIV started ART and 113 (61.1%) HIV-negative men started PrEP. There was no intervention effect on male partner testing (hazard ratio HR 1.04; 95% confidence interval CI 0.78-1.37) or time to ART or PrEP initiation (HR 1.07; 95% CI 0.80-1.43). At 12 months post-partum, 95% (315/332) and 94% (158/168) of PWLHIV in the HIVST and SOC arms were virally suppressed (VL <1000 copies/mL), respectively. Social harms related to study participation were experienced by six women (HIVST = 5, SOC = 1). CONCLUSIONS: Almost half of the partners of Ugandan PWLHIV tested for HIV with similar HIV testing rates and linkage to ART or PrEP among the secondary distribution of HIVST and SOC arms. Although half of men became aware of their HIV serostatus and linked to services, additional strategies to reach male partners of women at antenatal care are needed to increase HIV testing and linkage to services among men. Article	2023	Morgan, Ethan; Dyer, Christina; Feinstein, Brian A; Ricks, JaNelle	PrEP use and stigma among a sample of older adults in Columbus, Ohio.	International Journal of STD & AIDS	-	-	-	1758-1052	10.1177/09564624221140967	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10116638/	INTRODUCTION: Despite older adults (age ≥45805.50 years) continuing to account for 1 in 6 new HIV diagnoses, the majority of research has focused on young adults. Assessing PrEP use and stigma among this understudied population is key to achieving the U.S.'s goals of Ending the HIV Epidemic, a federal initiative focusing on reducing new HIV infections by at least 90% by 2030. METHODS: Data for this analysis came from the Columbus Health Aging Project (N = 796). This study was designed to assess several domains of health among adults aged 50 years and older in Columbus, Ohio. Multiple logistic and linear regression models were used to examine the associations between sociodemographic factors and past 6-month PrEP use, PrEP stigma, and concurrent use of PrEP and other prevention methods. RESULTS: Participants' average age was 64.5 years (SD = 10.5), 52.6% were female, 47.4% were male, 16.8% were Black/African American, and 83.2% were White. Past 6-month PrEP use was 3.4% (CI: 2.49, 12.56), significant lesbians (aOR = 2.24; 95% CI: 1.05, 4.80), and those living with family members or roommates (aOR = 4.39; 95% CI: 1.49, 12.43) were each more likely to report past 6-month PrEP use relative to cisgender women, heterosexuals, and those living with a spouse/partner, respectively. Relative to cisgender women, PrEP-related stigma was lower among transgender women (ß = -5.05; 95% CI: -8.44, -1.66) and higher among cisgender men (ß = 1.96; 95% CI: 0.46, 3.46). CONCLUSION: Future research should aim to continue developing a firm understanding of PrEP use and stigma among older adults to reduce HIV risk among this population and to understand unique needs of sub-populations of older adults. Article	2023	Mosnier, Emilie; Arrigo, Fernande; Richard, Elodie; Heyer, Meraine; Michels, David; Vandemoortele, Stephanie; Girard, Gabriel; Nagot, Nicolas; Reginault, Hippolyte; Mosnier, Marine; Inegbeze, Grace; Ross, Perrine; Spire, Bruno; Eldin, Carole	Effectiveness of a Community Empowerment Intervention to Improve Access to Pre-exposure Prophylaxis to Migrant Women Sex Workers: Protocol for a Mixed Methods Implementation Study.	JMIR Research Protocols	-	-	-	1929-0748	10.2196/42844	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10434960/	BACKGROUND: The World Health Organization recommends pre-exposure prophylaxis (PrEP) for all populations at substantial risk of HIV infection. However, at-risk women vary rarely use PrEP in France-this represents a critical issue among migrant women sex workers (MWSWs). Previous studies on PrEP use among women sex workers or migrants focused on individual or social determinants of motivation. However, operational studies in real-word settings using a holistic population approach to maximize PrEP adherence among MWSWs are lacking. OBJECTIVE: FASSETS (ie, "Favoriser l'Accès à la Santé Sexuelle des Travailleuses du Sexe"; English: "facilitate the access to Sexual Health in women sex workers") is a pro-holistic, multilevel, mixed methods study aiming to improve global knowledge of and access to sexual health care and PrEP among MWSWs through targeted empowerment strategies. METHODS: This study comprises several phases: (1) phase 1: an initial qualitative study combining individual interviews and focus groups with stakeholders and MWSW to explore their knowledge, representations, and experiences regarding sexual health and PrEP; (2) phase 2: the development of a community empowerment intervention to improve access to sexual health services and the implementation of PrEP access among MWSWs and for respondent-driven sampling (RDS); (3) phase 2: the size of the hidden MWSW population is estimated, in Ile-de-France, through capture-recapture (the RDS survey will serve as "recapture"); (3) phase 3: a longitudinal cohort will be formed through RDS to represent the MWSW population with a goal of 150 inclusions-this cohort will be followed up for 12 months, and sequential questionnaires exploring medical history, knowledge of sexual health, HIV, and sexually transmitted infections, risk practices, care routes, and conditions will be administered at inclusion (month 0) and months 3, 6, and 12 to measure the following interventional phase's outcomes; and (4) phase 4: an interventional study with community empowerment actions about sexual health and PrEP will be conducted with community health workers, standardized questionnaires and semistructured interviews, observations, and focus groups will highlight MWSWs' experiences with empowerment resources, concerns about sexual health, and especially PrEP use or uptake, and we will evaluate whether and how community-adapted empowerment actions conducted by community health workers are effective in increasing access to sexual health, prevention and screening of sexually transmitted infections, and PrEP knowledge and access among MWSWs. RESULTS: Recruitment commenced on March 1, 2022. We estimate the follow-up period to end on September 30, 2023. CONCLUSIONS: This multiphase study will provide robust evidence about the magnitude of the MWSW population in Ile-de-France, their sexual health needs, and the effectiveness of empowerment actions to improve access to PrEP and sexual health care. The findings will help inform other HIV programs and contribute to national individual and collective community health empowerment approaches can facilitate access to PrEP and its initiators, use, and adherence in this vulnerable population. Article	2023	Moya E.M.D.; Rodrigues D.S.	Fractional-order modeling for injectable and oral HIV pre-exposure prophylaxis	Mathematical Modelling and Control	-	-	-	2576-8966	10.3934/mmc.2023013	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163168138&doi=10.3934%2Fmmc.2023013&partnerID=40&md5=9c1c4e0bce50dc80d4e8f4b7c4dbf9f5	The search for therapies and prevention methods for HIV infection is essential for controlling the virus in a population. In this paper, we introduce a fractional order mathematical model to study the impact of the oral to the injectable Pre-Exposure Prophylaxis (PrEP) modalities, which is a completely new in terms of public health. For that, we consider current antiretroviral therapies, implementation and the impact of PrEP on the case diagnosis. To investigate the model, besides the use of fractional order derivatives, we also consider illustrative cases by means of demographic data from Brazil and parameter values from the literature. We compare the influence on incidence, prevalence, diagnosis, and mortality of oral PrEP with the injectable PrEP, which is the new current trend on the subject. As a result, an increasing in incidence, prevalence and also mortality are revealed by augmented fractional order of derivatives for both PrEP modalities, but PrEP reached better results in its oral modality. Despite the need for further studies, this contribution is intended as a first preliminary step to contribute to decision-making by health authorities. © 2023 the Author(s), licensee AIMS Press.	fractional derivatives; HIV; Pre-Exposure Prophylaxis; public health	English	Netherlands	Western and Central Europe and North America	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Quantitative
Article	2023	Moyo P.L.; Nunu W.N.	Oral Pre-Exposure Prophylaxis Accessibility, Knowledge, Barriers, and Facilitators Among Men Who Have Sex With Men in Bulawayo, Zimbabwe	American Journal of Men's Health	-	-	-	1557983	10.1177/15579883231207481	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175961113&doi=10.1177%2F15579883231207481&partnerID=40&md5=e0570521ce4fcd0cac254c6a3ca77e	Great strides have been made globally toward ending HIV and AIDS as a threat by 2030, although the rate of new HIV infections among men who have sex with men remains very high. Due to their risk of acquiring HIV and AIDS, utilization of pre-exposure prophylaxis (PrEP) can potentially reduce the risk of HIV transmission among this population. This study sought to analyze the accessibility, knowledge, and perceived barriers and facilitators to accessing PrEP by men who have sex with men. The quantitative method was conducted on 45 men who have sex with men through questionnaires loaded on Kobo Collect. Chi-square test, odds ratio, and logistic regression were used to associate different demographic characteristics with knowledge and significance of barriers to PrEP access using STATA 15. A total of 45 PrEP and locations was created using QGIS. About 84% of respondents accessed pills from friendly facilities. The remaining accessed them from public hospitals, mainly Mpilo and United Bulawayo Hospitals. Over 90% of the respondents were found to be highly knowledgeable. Notably, barriers included lack of information, fear of side effects, pills not accessible, pill taste, odor, and size, stigma, and lack of protection from other sexually transmitted infections. Facilitators were educated about PrEP, the existence of friendly health facilities, making pills available at all times, partner support, increased number of friendly health facilities and support groups. Maximizing the potential of PrEP as an efficient HIV-prevention intervention among this population requires ongoing efforts to remove barriers and promote facilitators. Article	2023	Moyo P.L.; Nunu W.N.	Oral Pre-exposure Prophylaxis Uptake and Acceptability Among Men Who Have Sex With Men: A Scoping Review of the Literature	American Journal of Men's Health	-	-	-	1557983	10.1177/15579883231201729	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174035278&doi=10.1177%2F15579883231201729&partnerID=40&md5=0b6604d3980f0b629dd8739d2b169fe1	Despite the global effort to end the human immunodeficiency virus (HIV) and acquired immunodeficiency syndrome (AIDS) epidemic as a global threat by 2030, the rate of new HIV infections worldwide remains unacceptably high, especially among men who have sex with men. Pre-exposure prophylaxis (PrEP) is a highly effective biomedical HIV prevention intervention that can reduce the risk of acquiring HIV. However, it is imperative to assess the uptake and acceptability of PrEP. This study investigated the willingness, availability, accessibility, and knowledge and identified barriers to using PrEP among this population. A scoping literature review search was conducted on research papers published in English and focused on men who have sex with men and their use of PrEP. These were independently screened and coded. Of about 1,202 literature sources, 55 were included in the study. Findings reported that the uptake and acceptability of PrEP were influenced by knowledge and perception of being high risk. Generally, PrEP uptake and understanding were high in North America, Latin America, and Europe and low in Asia and Africa. Low uptake and acceptability have been largely attributed to fear of side effects, societal stigma, cost, and perception of not being at risk. Noted facilitators to PrEP use include education, availability of free pills, support groups, and friendly health care facilities. Health intervention programs to increase the use of PrEP must be backed by appropriate legal and regulatory frameworks. © The Author(s) 2023.	acceptability; HIV and AIDS; men who have sex with men; pre-exposure prophylaxis; uptake	English	United States	Western and Central Europe and North America	Zimbabwe	Eastern and Southern Africa	Zimbabwe	Eastern and Southern Africa	Review
Article	2023	Mpofu, Mqondisi; Lebni, Li Tey; Jusine, Lepik; Katherine J; Moore, David M; Hull, Mark; Bucuzo, Nic; Serede, Paul; Berrios, Rolando; Montano, John S G; Lima, Yvonne D	Process description of developing HIV prevention monitoring indicators for a province-wide pre-exposure prophylaxis (PrEP) program in British Columbia, Canada.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0283025	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10001606/	In 2018, the pre-exposure prophylaxis (PrEP) program was initiated in British Columbia (BC), Canada, providing PrEP at no cost to qualifying residents. This observational study discussed the steps to develop key evidence-based monitoring indicators and their calculation using real-time data. The indicators were conceptualized, developed, assessed and approved by the Technical Monitoring Committee of representatives from five health authority regions in BC, the BC Ministry of Health, the BC Centre for Disease Control, and the BC Centre for Excellence in HIV/AIDS. Indicator development followed the steps adopted from the United States Centers for Disease Control and Prevention framework for program evaluation in public health. The assessment criteria for indicators were relevance, data quality, indicator validity, existing scientific evidence, indicator informativeness, indicator computing feasibility, client confidentiality maintenance capacity, indicator accuracy, and administrative considerations. Cluster data analysis was conducted to identify PrEP clinics with similar characteristics. Ten indicators were developed: (1) PrEP clinic engagement, (2) PrEP clinic retention, (3) PrEP clinic discontinuation, (4) PrEP clinic characteristics by type and by the health authority, new clients dispensed PrEP, clients per provider, key quantifying HIV risk factor(s), client status, PrEP usage type, PrEP quantity dispensed, syphilis and HIV testing and incident cases, and adverse drug reaction events. Cumulative clients' data (n = 6966; 99% cis-gender males) identified an increased new client enrollment and an unexpected drop during the COVID-19 pandemic. About 80% dispensed PrEP from the Vancouver Coastal health authority. The HIV incidence risk index for men who have sex with men score ≥10 was the most common qualifying risk factor. The framework we developed integrating indicators was applied to monitor our PrEP program, which could help reduce the public health impact of HIV. Article	2023	Mutombedzi, Caroline; Chirinda, Libert; Charcka, Gift T; Chirenje, Z Mike; Mgodi, Nyaradzo M	Efficient regulatory approval of two novel HIV prevention interventions in a resource-limited setting: experiences from Zimbabwe.	Frontiers in Public Health	-	-	-	2673-3153	10.3389/fph.2023.1279124	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10806040/	The global burden of HIV remains unacceptably high despite significant progress made in HIV treatment and prevention. There is an urgent need to scale up the comprehensive HIV prevention strategies that include pre-exposure prophylaxis (PrEP). Oral PrEP is highly effective in preventing HIV acquisition when taken regularly, but this remains a challenge for some at-risk individuals. Therefore, there is a need for other HIV prevention options. The dapivirine vaginal ring (DVR) and long-acting injectable cabotegravir (CAB-LA) are novel biomedical interventions that are safe and efficacious for HIV pre-exposure prophylaxis. However, access to these interventions in sub-Saharan Africa (SSA) has been limited by lengthy regulatory processes. We describe the regulatory review process of the Medicines Control Authority of Zimbabwe (MCAZ) was the first SSRA globally to approve the DVR in July 2021 and the first in Africa to approve CAB-LA for HIV prevention in July 2022. The regulatory review process for DVR and CAB-LA by MCAZ took 4.5 and 5.5 months, respectively. This efficient review process of the two interventions by MCAZ, a regulatory body in a resource-limited setting, provides important lessons to shorten timelines between the completion of the clinical development process and the registration of essential medicines. Article	2023	Murphy, Luke; Bowra, Andrea; Adams Ellithia; Robinson, Cabello; Clark, Jesse L; Konda Kelika; Perez-Brumer Amaya	PrEP policy implementation gaps and opportunities in Latin America and the Caribbean: a scoping review	Therapeutic Advances in Infectious Disease	-	-	-	-	20499361	10.1177/20499361231164030	https://www.proquest.com/scholarly-journals/prep-policy-implementation-gaps-opportunities/docview/2920164983/se-2?accountid=8113	Background: Pre-exposure prophylaxis (PrEP) is an important tool for HIV prevention in Latin America and the Caribbean (LAC). Yet, little is known about the PrEP policies landscape in the region. Addressing this gap, this scoping review assessed current PrEP policies throughout LAC to better understand existing PrEP implementation gaps and identify opportunities to improve access. Methods: We conducted a scoping review, using a modified PRISMA extension, through 28 July 2022, to identify country-level PrEP policies. Data were collected in English, Spanish, French, and Portuguese utilizing online platforms for screening and data extraction (Google Forms, Zotero, and Excel). Extracted data were divided by data source, including country-level government policies, gray literature, and peer-reviewed literature, with at least one full-text reviewer and data extractor per publication. An iterative summative content analysis was performed to compare and interpret themes across phases and data sources. Results: Of the 33 countries in LAC, 22 (67%) had policies approving daily oral PrEP for HIV prevention, which outlined specific key populations, including men who have sex with men, transgender women, sex workers, and serodiscordant couples. Generic tenofovir disoproxil fumarate/emtricitabine has been approved in 15 of the 33 countries, and 13 of the 33 countries have incorporated PrEP into their public health system. No countries were found to have approved cabotegravir. Costing data were reported by only one country, Ecuador, in its national health ministry guidelines. Findings also document a lag between the media/gray-literature announcement of PrEP and implementation of policies. Conclusion: Findings underscore significant advances in PrEP policies in the region and signal opportunities for greater PrEP implementation. Since 2017, an increasing number of countries have begun to provide PrEP to communities at heightened need, although significant gaps remain. Policy approval is a key step to further increasing access to PrEP in LAC, necessary to reduce the burden of HIV in LAC, specifically among marginalized populations. Article	2023	Musinguzi N.; Ngure K.; Bukusi E.A.; Mugo N.R.; Baeten J.M.; Anderson P.L.; Haberer J.E.	Performance of Multiple Adherence Measures for pre-exposure Prophylaxis (PrEP) Among Young Women in Kenya	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04111-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162693821&doi=10.1007%2fs10461-023-04111-2&partnerID=40&md5=0153d9a2191a21f4a21aff690dc37a01	Understanding PrEP adherence is key in the formulation of HIV prevention strategies; however, measurement of adherence can be challenging. We compared multiple adherence measures in a two-year study of young Kenyan women at high risk of HIV acquisition. Among 289 participants, concordance between electronic adherence monitoring (EAM) and tenofovir diphosphate (TFV-DP) in dried blood spots ranged from 57 to 72% depending on selected thresholds. Using area under the receiver operating curve, discrimination of quantifiable TFV-DP was high at 0.85 with EAM and low at 0.49–0.54 for multiple self-reported measures. Correlation between EAM and self-reported measures was low (r < 0.11) although correlation within self-reported measures was moderate (r > 0.69). These findings indicate that both TFV-DP and EAM are useful PrEP adherence tools. Adherence would benefit from better availability of less expensive versions of EAM for research. Additionally, further research on TFV-DP thresholds is needed to inform interpretation and use in understanding PrEP adherence in this population. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Musinguzi, Nicholas; Pyra, Maria; Bukusi, Elizabeth A; Mugo, Nelly R; Baeten, Jared M; Haberer, Jessica E	Trajectories of Oral PrEP Adherence Among Young Kenyan Women: Implications for Promoting Effective PrEP Use.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-022-03753-y	https://dx.doi.org/10.1007/s10461-022-03753-y	Using data from a 2-year study of young women at high HIV risk in Thika and Kisumu, Kenya, we identified group-based trajectories of PrEP adherence based on electronic pillcap-monitoring and assessed potentially associated demographic and socio-behavioral factors. Among 348 women, we selected a three-trajectory adherence model: low and declining (N = 211, 61%), moderate but declining (N = 119, 34%) and steady high adherers (N = 18, 5%). We also identified a two-trajectory HIV risk model based on self-perceived risk in the past week: high and increasing (N = 28, 8%) and steady low (N = 320, 92%) risk. The Kisumu site was associated with the moderate but declining and steady high adherence trajectories, while increasing VOICE risk score was associated with the low and declining adherence trajectory. We found no association between the adherence and risk trajectories. Our findings suggest adherence support may need tailoring by setting. Early, sustained support may also help those at highest risk of non-adherence. Article	2023	Mussina, Kamilla; Kadyrov, Shirali; Kashkynbayev, Ardak; Yerdessov, Sauran; Zhakhina, Gulnur; Sakko, Yesbolat; Zollanvari, Amin; Gaipov, Abduzhappar	Prevalence of HIV in Kazakhstan 2010-2020 and Its Forecasting for the Next 10 Years.	HIV/AIDS (Auckland, New Zealand)	-	-	-	-	1179-1373	10.2147/HIV.S413876	https://pubmed.ncbi.nlm.nih.gov/37426767/	BACKGROUND: HIV is a growing public health burden that threatens thousands of people in Kazakhstan. Countries around the world, including Kazakhstan, are facing significant problems in predicting HIV infection prevalence. It is crucial to understand the epidemiological trends of infectious diseases and to monitor the prevalence of HIV in a long-term perspective. Thus, in this study, we aimed to forecast the prevalence of HIV in Kazakhstan for 10 years from 2020 to 2030 by using mathematical modeling and time series analysis. METHODS: We use statistical Autoregressive Integrated Moving Average (ARIMA) models and a nonlinear epidemic Susceptible-Infected (SI) model to forecast the HIV infection prevalence rate in Kazakhstan. We estimated the parameters of the models using open data on the prevalence of HIV infection among women and men (aged 15-49 years) in Kazakhstan provided by the Kazakhstan Bureau of National Statistics. We also predict the effect of pre-exposure prophylaxis (PrEP) control measures on the prevalence rate. RESULTS: The ARIMA (1,2,0) model suggests that the prevalence of HIV infection in Kazakhstan will increase from 0.29 in 2021 to 0.47 by 2030. On the other hand, the SI model suggests that this parameter will increase to 0.60 by 2030 based on the same data. Both models were statistically significant by Akaike Information Criterion corrected (AICc) score and by the goodness of fit. HIV prevention under the PrEP strategy on the SI model showed a significant effect on the reduction of the HIV prevalence rate. CONCLUSION: This study revealed that ARIMA (1,2,0) predicts a linear increasing trend, while SI forecasts a nonlinear increase with a higher prevalence of HIV. Therefore, it is recommended for healthcare providers and policymakers use this model to calculate the cost required for the regional allocation of healthcare resources. Moreover, this model can be used for planning effective healthcare treatments. Article	2023	Mustanski, Brian; Ryan, Daniel T; Spinelli, Matthew A; Gandhi, Monica; Newcomb, Michael E	Urine point-of-care tenofovir test demonstrates strong predictive clinical and research utility.	AIDS	-	-	-	-	1473-5571	10.1097/QAD.0000000000003710	https://dx.doi.org/10.1097/QAD.0000000000003710	BACKGROUND: Preexposure prophylaxis (PrEP) significantly reduces HIV infection risk but is dependent on adherence. Available approaches to measuring adherence have limitations related to accuracy, cost, practicality, and timeliness. This study compared the performance of two methods implementable in clinics and research studies interview and urine point of care (POC) assay to the gold-standard for measuring recent and longer term adherence in dried blood spots (DBS). METHODS: Participants were recruited from RADAR, a cohort study of young MSM, or via online advertisements. At 3 monthly visits, an interviewer administered 7-day timeline follow-back (TLFB) questionnaire, DBS samples were tested for tenofovir-diphosphate (TFV-DP) to estimate average dosing over the prior month and emtricitabine-triphosphate (FTC-TP) to assess recent dosing (past 2-3âdays), and a urine POC TFV test to qualitatively assess recent adherence (past 4âdays). RESULTS: Eighty-three PrEP users contributed 163 observations. At visit 1, self-reported adherence was 86% (4+ doses in last 7âdays), versus urine TFV (74%), DBS FTC-TP (76%), and DBS TFV-DP (69%). The objective measures of short-term adherence performed similarly well in predicting longer term adherence. In multivariable logistic regression analyses, the urine assay was a significant predictor of DBS TFV-DP (adjusted ORâ=â19.4, P â<â0.0001); self-report did not add significantly. CONCLUSION: The urine POC TFV assay had excellent predictive values for adherence and self-report did not add significantly to prediction. The POC assay provides results in several minutes to enable same-visit counseling, requires no specialized training, and is projected to be low-cost. Article	2023	Muyanga, Naume; Isunju, John Bosco; Ssekamatte, Tonny; Nalugya, Aisha; Oputan, Patience; Kiguli, Juliet; Kibira, Simon Peter S.; Wafula, Solomon Tsebeni; Ssekamatte, David; Mugambe, Richard K.; Wanyenze, Rhoda K.; Orza, Luisa	Understanding the effect of gender-based violence on uptake and utilisation of HIV prevention, treatment, and care services among transgender women: a qualitative study in the greater Kampala metropolitan area, Uganda.	BMC Women's Health	-	-	-	-	1472-6874	10.1186/s12905-023-02402-3	https://bmcwomenshealth.biomedcentral.com/articles/10.1186/s12905-023-02402-3	BACKGROUND: Transwomen (also known as transgender women) are disproportionately affected by all forms of gender-based violence (GBV). The high prevalence of physical, sexual and emotional violence not only predisposes transwomen to HIV infection but also limits the uptake/access to HIV prevention, care, and treatment services. Despite the high prevalence of HIV infection and GBV among transwomen, there is limited evidence on how GBV affects the uptake and utilisation of HIV prevention, care, and treatment services. Therefore, this qualitative study explored how GBV affects uptake and utilisation of HIV prevention, treatment, and care services among transwomen in the Greater Kampala Metropolitan Area (GKMA), Uganda. METHODS: This participatory qualitative study was conducted among transwomen in the GKMA. A total of 20 in-depth interviews, 6 focus group discussions, and 10 key informant interviews were conducted to explore how GBV affects the uptake and utilisation of HIV prevention, treatment, and care services among transwomen. Data were analysed using a thematic content analysis framework. Data were transcribed verbatim, and NVivo version 12 was used for coding. RESULTS: At the individual level, emotional violence suffered by transwomen led to fear of disclosing their HIV status and other health conditions to intimate partners and healthcare providers respectively; inability to negotiate condom use; and non-adherence to antiretroviral therapy (ART). Sexual violence compromised the ability of transwomen to negotiate condom use with intimate partners, clients, and employers. Physical and emotional violence at the community level led to fear among transwomen traveling to healthcare facilities. Emotional violence suffered by transwomen in healthcare settings led to the limited use of pre-exposure prophylaxis and HIV testing services, denial of healthcare services, and delays in receiving appropriate care. The fear of emotional violence also made it difficult for transwomen to approach healthcare providers. Fear of physical violence such as being beaten while in healthcare settings made transwomen shun healthcare facilities. CONCLUSION: The effects of GBV on the uptake and utilisation of HIV prevention, care, and treatment services were observed in individual, community, and healthcare settings. Across all levels, physical, emotional, and sexual violence suffered by transwomen led to the shunning of healthcare facilities, denial of healthcare services, delays in receiving appropriate care, and the low utilisation of post-exposure prophylaxis, and HIV testing services. Given its effects on HIV transmission, there is a need to develop and implement strategies/ interventions targeting a reduction in GBV. Interventions should include strategies to sensitize communities to accept transwomen. Healthcare settings should provide an enabling environment for transwomen to approach any healthcare provider of their choice without fear of experiencing GBV. Pharmaceutical Manufacturing Plan for Africa is critical for pandemic preparedness, prevention and response	Journal of Public Health in Africa	-	-	-	-	20389922	10.4081/jphia.2023.2861	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175143885&doi=10.4081%2fjphia.2023.2861&partnerID=40&md5=468a7e6fc7661da93137a9e10e618995	No abstract available	healthcare systems; HIV; pandemic preparedness; pandemic response; pharmaceutical manufacturing in Africa; vaccine technology; viral suppression; World Health Organisation	English	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Other
Article	2023	Nadarzynski, Tom; Nutland, Will; Samba, Phil; Bayley, Jake; Witzel, T. Charles	The Impact of First UK-Wide Lockdown (March-June 2020) on Sexual Behaviors in Men and Gender Diverse People Who Have Sex with Men During the COVID-19 Pandemic: A Cross-Sectional Survey.	Archives of Sexual Behavior	-	-	-	-	1573-2800 0004-0002	10.1007/s10508-022-02458-6	https://pubmed.ncbi.nlm.nih.gov/37841674/	The global COVID-19 pandemic resulted in strict social distancing measures restricting close physical contact. Men (cis and trans) and other gender diverse people who have sex with men (MGDSM) are at higher risk of sexually transmitted infections (STIs) and may have experienced changes in sexual behavior during government restrictions on social and sexual contact. We aimed to examine self-reported sexual behavior of MGDSM during the first UK-wide lockdown to identify the characteristics of the individuals who might most require sexual health promotion and clinical support. In April-May 2020, we conducted an online survey of MGDSM, promoted on social media and Grindr. Our exploratory approach used descriptive analysis to identify self-reported changes in sexual behavior and performed regression analyses to identify correlates of casual sex during the lockdown. A total of 1429 respondents completed the survey: mean age 36 years, 84% White, 97% male or trans male, 98% assigned male sex at birth, 2% female or non-binary, 65% degree educated or higher. During the lockdown, 76% reported not having any casual sex partners. While the majority reported reduced casual sex, 3% reported an increase in casual sex with one person and 2% with three or more people (group sex). About 12% of the sample engaged in casual sex with only one person and 5% with four or more sexual partners during the lockdown. Reporting casual sex during lockdown was associated with: lower level of education OR = 2.37 95% CI 1.40-4.01; identifying as a member of an ethnic minority OR = 2.271.40-3.53; daily usage of sexual networking apps OR = 2.241.54-3.25; being less anxious about contracting SARS-CoV-2 through sex OR = 1.661.12-2.44; using PrEP before lockdown OR = 1.751.20-2.56; continuing to use PrEP OR = 2.791.76-4.57; and testing for STIs during lockdown OR = 2.651.76-3.99. A quarter of respondents remained sexually active with casual partners, indicating a need to provide STI screening services and health promotion targeted to groups most likely to have need over this period. Future research is required to better understand how to support sexual and gender minorities to manage sexual risk in the context of pandemic public health initiatives. Article	2023	Nagai, Henry; Adiibokah, Edward; Tagoe, Henry; Tun, Waimar; Pilgrim, Nanlesta A; Ankomah, Augustine; Rahman, Yussif Ahmed Abdul; Addo, Stephen Ayisi; Atuahene, Stephen Kyeremeh; Essandoh, Emmanuel; Maher, Sean; Kowalski, Mark	Policymakers' and healthcare providers' perspectives on the introduction of oral pre-exposure prophylaxis for key populations in Ghana.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-023-15871-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10240747	BACKGROUND: Key populations (KPs) such as female sex workers (FSWs), men who have sex with men (MSM), people who inject drugs (PWID), and their partners contribute more than a quarter (27.5%) of new HIV infection in Ghana. Oral pre-exposure prophylaxis (PrEP) can substantially reduce HIV acquisition among this group. While the available research indicates KPs willingness to take PrEP in Ghana, little is known about the position of policymakers and healthcare providers on the introduction of PrEP for KPs. METHODS: Qualitative data were collected from September to October 2017 in the Greater Accra (GA) and Brong-Ahafo (BA) regions of Ghana. Key informant interviews were conducted with 20 regional and national policymakers and supplemented with In-depth Interviews with 23 healthcare providers to explore their level of support for PrEP and their perspectives on challenges and issues to consider for oral PrEP implementation in Ghana. Thematic content analysis was used to unearth the issues emerging from the interviews. RESULTS: Policymakers and healthcare providers in both regions expressed strong support for introducing PrEP for KPs. Key concerns regarding oral PrEP introduction included potential for behavioral disinhibition, non-adherence and side effects of medication, cost and long-term financial implications, and stigma related to HIV and key populations. Participants stressed the need to integrate PrEP into existing services and the provision of PrEP should start with high risk groups like sero-discordant couples, FSWs and MSM. CONCLUSIONS: Policymakers and providers recognize the value of PrEP in cubing new HIV infections but have concerns about disinhibition, non-adherence, and cost. Therefore, the Ghana health service should roll-out a range of strategies to address their concerns including: sensitization with providers to mitigate underlying stigma towards KPs, particularly MSM, integration of PrEP into existing services, and innovative strategies to improve continued use of PrEP. Article	2023	Nair, Gonasagrie; Celum, Connie; Szydlo, Daniel; Brown, Elizabeth R; Akello, Carolyne A; Nakalega, Rita; Macdonald, Pippa; Milan, Gakiema; Palanee-Phillips, Thesla; Reddy, Krishnaveni; Tahuringana, Eunice; Muhlanga, Felix; Nakabiito, Clemensia; Bekker, Linda-Gail; Siziba, Bekezela; Hillier, Sharon L; Baeten, Jared M; Garcia, Morgan; Johnson, Sherri; McClure, Tara; Levy, Lisa; Livant, Edward; Jacobson, Cindy; Soto-Torres, Lydia; van der Straten, Ariane; Hosek, Sybil; Rooney, James F; Steytler, John; Bunge, Katherine; Parikh, Urvi; Hendrix, Craig; Anderson, Peter; Ngure, Kenneth	Adherence, safety, and choice of the monthly dapivirine vaginal ring or oral emtricitabine plus tenofovir disoproxil fumarate for HIV pre-exposure prophylaxis among African adolescent girls and young women: a randomised, open-label, crossover trial.	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(23)00227-8	https://dx.doi.org/10.1016/S2352-3018(23)00227-8	BACKGROUND: Half of new HIV acquisitions in Africa occur in adolescent girls and young women. Pre-exposure prophylaxis (PrEP) with oral tenofovir disoproxil fumarate plus emtricitabine or the monthly dapivirine vaginal ring is efficacious but has lower adherence and effectiveness among adolescent girls and young women. We aimed to assess product adherence, safety, and choice of oral PrEP compared with the dapivirine ring among African adolescent girls and young women. METHODS: MTN-034/REACH was a randomised, open-label, phase 2a crossover trial among HIV-seronegative, non-pregnant adolescent girls and young women aged 16-21 years at four clinical research sites in South Africa, Uganda, and Zimbabwe. Participants were randomly assigned (1:1) to either the dapivirine ring or daily oral PrEP (200 mg of emtricitabine and 300 mg of tenofovir disoproxil fumarate) for 6 months, then switched to the other product option for 6 months, followed by a third 6-month period in which participants were given a choice of oral PrEP, the dapivirine ring, or neither. Fixed block randomisation was used, stratified by site. The primary adherence endpoint was use of each product during the randomised periods, with high use defined as tenofovir-diphosphate concentrations greater than or equal to 700 fmol/punch (associated with taking an average of four or more tablets per week in the previous month) and greater than or equal to 4 mg dapivirine released from the returned ring (continuous use for 28 days in the previous month) based on residual drug concentrations. The primary safety endpoint was grade 2 or higher adverse events during each randomised period of 24 weeks of ring and oral PrEP. This trial is registered at ClinicalTrials.gov, NCT03593655. FINDINGS: From Feb 6, 2019 to Sept 9, 2021, 396 adolescent girls and young women were screened, 247 of whom were enrolled and randomly assigned (6 months of the ring followed by 6 months of oral PrEP n=124; 6 months of oral PrEP followed by 6 months of the ring n=123). Median age was 18 years (IQR 17-19). 54 grade 2 or higher product-related adverse events were reported during oral PrEP and five during dapivirine ring use, with no product-related serious adverse events. High adherence was observed in 753 (57%) of the 1316 oral PrEP visits and 806 (57%) of the 1407 dapivirine ring visits. Four women acquired HIV during follow-up. INTERPRETATION: Adherence was moderately high and similar between oral PrEP and the dapivirine ring with favourable safety and tolerability. Oral PrEP and the dapivirine ring are effective, safe, and well tolerated HIV prevention options for adolescent girls and young women who would benefit from a choice of PrEP formulations to meet their needs and preferences. Article	2023	Nakalega R.; Mukiza N.; Menge R.; Kizito S.; Babirye J.A.; Kuteesa C.N.; Mawanda D.; Mulumba E.; Nabukeera J.; Ggita J.; Nakanjako L.; Akello C.; Mirembe B.G.; Lukyamuzi Z.; Nakaye C.; Kataike H.; Maena J.; Etima J.; Nabunya H.K.; Biira F.; Nagawa C.; Heffron R.; Celum C.; Gandhi M.; Mujugira A.	Feasibility and acceptability of peer-delivered HIV self-testing and PrEP for young women in Kampala, Uganda	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-023-16081-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162046866&doi=10.1186%2fs12889-023-16081-0&partnerID=40&md5=de6da68f800d3b6ffa16e7115e0cff3d	Background: Adolescent girls and young women (AGYW) account for 29% of new HIV infections in Uganda despite representing just 10% of the population. Peer support improves AGYW linkage to HIV care and medication adherence. We evaluated the feasibility and acceptability of peer delivered HIV self-tests (HIVST) and oral pre-exposure prophylaxis (PrEP) to young women in Uganda. Methods: Between March and September 2021, we conducted a pilot study of 30 randomly selected young women, aged 18–24 years, who had received oral PrEP for at least three months, but had suboptimal adherence as measured by urine tenofovir testing (< 1500 ng/ml). Participants were offered daily oral PrEP and attended clinic visits three and six months after enrollment. Between clinic visits, participants were visited monthly by trained peers who delivered HIVST and PrEP. Feasibility and acceptability of peer-delivered PrEP and HIVST (intervention) were measured by comparing actual versus planned intervention delivery and product use. We conducted two focus groups with young women, and five in-depth interviews with peers and health workers to explore their experiences with intervention delivery. Qualitative data were analyzed using thematic analysis. Results: At baseline, all 30 enrolled young women (median age 20 years) accepted peer-delivered PrEP and HIVST. Peer delivery visit completion was 97% (29/30) and 93% (28/30) at three and six months, respectively. The proportion of participants with detectable tenofovir in urine was 93% (27/29) and 57% (16/28) at months three and six, respectively. Four broad themes emerged from the qualitative data: (1) Positive experiences of peer delivered HIVST and PrEP; (2) The motivating effect of peer support; (3) Perceptions of female controlled HIVST and PrEP; and (4) Multi-level barriers to HIVST and PrEP use. Overall, peer delivery motivated young women to use HIVST and PrEP and encouraged persistence on PrEP by providing non-judgmental client-friendly services and adherence support. Conclusion: Peer delivery of HIVST and oral PrEP was feasible and acceptable to this sample of young women with suboptimal PrEP adherence in Uganda. Future larger controlled studies should evaluate its effectiveness among African AGYW. © 2023, The Author(s). Article	2023	Nakambale H.N.; Roche S.D.; Mogere P.; Omollo V.; Kuo A.P.; Stergachis A.; Baeten J.M.; Bukusi E.; Ngure K.; Mugambi M.L.; Ortblad K.F.	Barriers to and strategies for early implementation of pharmacy-delivered HIV PrEP services in Kenya: An analysis of routine data	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2023.1023568	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150219505&doi=10.3389%2ffrph.2023.1023568&partnerID=40&md5=b6b75a1067dd0173e5cac83d7e5fdf09	Background: For individuals who face challenges accessing clinic-based HIV pre-exposure prophylaxis (PrEP), differentiated service delivery models are needed to expand access and reach. During a pilot study testing a novel pharmacy-delivered oral PrEP model in Kenya, we used routine programmatic data to identify early implementation barriers and actions that providers and study staff took in response to the barriers. Methods: We trained pharmacy providers at five private pharmacies in Kisumu and Kiambu Counties to initiate and continue clients at risk of HIV acquisition on PrEP for a fee of 300 KES per visit (~$3 USD) using a prescribing checklist with remote clinician oversight. Research assistants stationed at the pharmacies completed weekly observation reports of pharmacy-delivered PrEP services using a structured template. We analyzed reports from the first 6 month of implementation using content analysis and identified multi-level early implementation barriers and actions taken to address these. We then organized the identified barriers and actions according to the Consolidated Framework for Implementation Research (CFIR). Results: From November 2020 to May 2021, research assistants completed 74 observation reports (~18/pharmacy). During this period, pharmacy providers screened 496 potential PrEP clients, identified 425 as eligible for pharmacy-delivered PrEP services, and initiated 230 (54%) on PrEP; 125 of 197 (63%) clients eligible for PrEP continuation refilled PrEP. We identified the following early implementation barriers to pharmacy-delivered PrEP services (by CFIR domain): high costs to clients (intervention characteristics), client discomfort discussing sexual behaviors and HIV testing with providers (outer setting), provider frustrations that PrEP delivery was time-consuming and disruptive to their workflow (inner setting), and provider hesitancy to deliver PrEP due to concerns about encouraging sexual promiscuity (characteristics of individuals). To help address these, pharmacy providers implemented a self-screening option for behavioral HIV risk assessment for prospective PrEP clients, allowed flexible appointment scheduling, and conducted pharmacy PrEP trainings for newly hired staff. Conclusion: Our study provides insight into early barriers to implementing pharmacy-delivered PrEP services in Kenya and potential actions to mitigate these barriers. It also demonstrates how routine programmatic data can be used to understand the early implementation process. 2023 Nakambale, Roche, Mogere, Omollo, Kuo, Stergachis, Baeten, Bukusi, Ngure, Mugambi and Ortblad.	differentiated service delivery; HIV prevention; implementation science; PrEP; private pharmacies	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	Kenya	Eastern and Southern Africa	Qualitative
Article	2023	Namukisa, Mary; Kamacooko, Onesmus; Lunkuse, Jane Frances; Ruzagira, Eugene; Price, Matt A.; Mayanja, Yunia	Incidence of unintended pregnancy and associated factors among adolescent girls and young women at risk of HIV infection in Kampala, Uganda.	Frontiers in Reproductive Health	-	-	-	-	2673-3153	10.3389/frph.2023.1089104	https://pubmed.ncbi.nlm.nih.gov/36910339/	BACKGROUND: In sub-Saharan Africa, one in every five young women becomes pregnant, and 50% of these are unintended. Pregnancies in adolescent girls and young women (AGYW) are associated with poorer maternal and neonatal outcomes and a high abortion rate, yet data are still limited on incident pregnancies among AGYW in vulnerable situations. We studied the incidence and factors associated with unintended pregnancy among AGYW who were frequently engaged in transactional sex in Kampala, Uganda. METHODS: We analyzed data from a study that investigated the uptake of oral pre-exposure prophylaxis among AGYW from January 2019 to December 2020. Volunteers attended 3-monthly study visits for 12 months each. Contraceptive services were provided to interested volunteers free of charge. Interviewers collected data on sociodemographics, sexual behavior, reproductive health outcomes, and substance use. Pregnancy was determined by testing for beta-human chorionic gonadotropin hormone in urine. The pregnancy incidence rate was estimated using the Kaplan-Meier technique, and logistic regression was used to determine the correlates of pregnancy. RESULTS: We included 285 volunteers with a mean age of 19.9 standard deviation (SD), ± 2.24 years; 54.7% had attained secondary school education or higher, 57.2% were single (never married), 92.6% reported engaging in transactional sex, 21.0% reported sex work as their main job, 51.9% consumed alcohol in the month prior to the interview, of whom 12.8% consumed alcohol daily, and 25.3% had Chlamydia trachomatis/Neisseria gonorrhoeae. The mean age at first sexual intercourse was 15.7 (SD, ±2.1) years. We recorded 44 pregnancies over 187.2 person-years of follow-up, an incidence of 23.5 per 100 person-years 95% confidence interval (CI), 17.5-31.6. Incident pregnancies were more likely among volunteers who had ≥10 sexual partners in the past 3 months adjusted risk ratio (aRR) 1.97; 95% CI, 1.05-3.70 and those who reported not using contraception (aRR 5.89; 95% CI, 2.74-12.66). Incident pregnancies were less likely among those who reported alcohol consumption in the past month (aRR 0.52; 95% CI, 0.30-0.90). CONCLUSION: The incidence of unintended pregnancy was high despite the availability of free contraceptive services. We recommend sociobehavioral studies to explore this further. Sexual and reproductive health campaigns should strengthen demand creation and motivation to use contraception among young women with multiple sexual partners.	pregnancy; sub-Saharan Africa; adolescents; young women; contraception	English	Switzerland	Western and Central Europe and North America	Uganda	Eastern and Southern Africa	United States	Western and Central Europe and North America	Mixed methods
Article	2023	Nawej Tshikung, Olivier; Segeral, Olivier; Cavassini, Matthias; Calmy, Alexandra	News in HIV infection, long-acting injectable treatments.	Revue Médicale Suisse	-	-	-	-	1660-9379	10.53738/REVMED.2023.19.812.243	https://pubmed.ncbi.nlm.nih.gov/36723657/	Long-acting injectable therapies have been added to the pharmacological arsenal available for the management of HIV infection, whether in the form of monotherapy (injectable cabotegravir) as part of pre-exposure prophylaxis (PrEP) or dual therapies (injectable cabotegravir/rilpivirine) for the treatment of HIV. These treatments are the subject of new international recommendations following the publication of pivotal trials, the results of which will be presented in this review. We will also discuss the practical modalities of their implementation as well as the challenges to be faced in the future. Article	2023	Ndimande-Khoza M.N.; Katz A.W.K.; Moretlwe-Delany S.; Travill D.; Rousseau E.; Omollo V.; Morton J.; Johnson R.; Bekker L.-G.; Bukusi E.A.; Baeten J.; Celum C.; van der Straten A.; Roberts S.T.	Family influences on oral PrEP use among adolescent girls and young women in Kenya and South Africa	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0292529	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176785443&doi=10.1371%2fjournal.pone.0292529&partnerID=40&md5=08e8a6a0f97e357645957887cf9ca1e9	Introduction Effective use of oral HIV pre-exposure prophylaxis (PrEP) has been lower among African adolescent girls and young women (AGYW) than among older women, young men who have sex with men, and serodiscordant heterosexual couples in the region. Efforts to build PrEP support have centered around peers and male partners, but the family may also play an important role. This qualitative study aimed to describe family influence on PrEP use among AGYW in three African cities. Methods POWER (Prevention Options for Women Evaluation Research) was a PrEP demonstration project among 2550 AGYW (16–25 years old) in Johannesburg and Cape Town, South Africa and Kisumu, Kenya conducted from 2017 to 2020. In-depth interviews and focus group discussions were conducted with 136 AGYW participants to explore their PrEP views and experiences, including awareness and interest in PrEP; barriers and facilitators to uptake and use; the influence of family, peers, intimate partners, and community; and the key types of support for their PrEP use. Transcripts were coded and analysed thematically. Results The decision to initiate PrEP was associated with fear and anxiety linked to anticipated stigma from family members, and with family's lived HIV experience. Family disclosure, especially to mothers, was important to participants, as most lived with their families and considered it essential for them to obtain their mother's approval to use PrEP. Most family members, particularly mothers, provided instrumental, emotional, informational and appraisal support to participants using PrEP, including reminders, encouragement, and problem-solving. Participants reported that family members with insufficient information about PrEP safety and efficacy and who voiced concerns were a substantial barrier to their use. However, they often became supportive after receiving more PrEP information. Conclusion Families, particularly mothers, can play an important role in supporting PrEP use. PrEP programmes should leverage family support to help with PrEP persistence by providing basic information to families about PrEP safety and efficacy. AGYW using PrEP should be encouraged to selectively disclose PrEP use to build support and counseled on how to disclose and address family concerns. Copyright: © 2023 Ndimande-Khoza et al. Article	2023	Nelson, Aurelie; Bheemraj, Kalisha; Dean, Sarah Schoetz; de Voux, Alex; Hlatshwayo, Lerato; Mvududu, Rufaro; Berkowitz, Natacha; Neumuller, Caroline; Jacobs, Shahida; Fourie, Stephanie; Coates, Thomas; Bekker, Linda-Gail; Myer, Landon; Davey, Dvora Joseph	Integration of HIV pre-exposure prophylaxis (PrEP) services for pregnant and breastfeeding women in eight primary care clinics: results of an implementation science study.	Research Square	-	-	-	-	NA	10.21203/rs.3.rs-3648622/v1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10690321	Background: Although HIV vertical transmission (VT) has declined significantly in sub-Saharan Africa, incident HIV infection in pregnant and postpartum women is estimated to account for roughly one-third of VT. Oral pre-exposure prophylaxis (PrEP) for pregnant and breastfeeding women (PBFW) is part of the recommended guidelines in South Africa since 2021; however, integration of PrEP services within antenatal (ANC) and postnatal care (PNC) remains limited. Methods: Between March 2022 and September 2023, we evaluated the acceptability, feasibility and sustainability of integrating PrEP for PBFW in high-HIV prevalence clinics after training and mentoring health care providers (HCP). We used the Reach Effectiveness-Adoption Implementation Maintenance (RE-AIM) framework to evaluate the intervention. Acceptability and maintenance were defined as the proportion of PBFW without HIV who initiated PrEP and the proportion of women continuing PrEP at 3 months in ANC or PNC services. Feasibility was defined as the proportion of trained HCPs (HIV lay counsellors and nurses/ midwives) who provided PrEP according to national guidelines, measured through post-training surveys and in-service assessments. Sustainability was defined as number of facilities and providers that continued to provide PrEP for PBFW past the mentoring period. Results: In 8 facilities providing ANC and PNC, we trained 224 HCP (127 nurses and 37 counsellors). Of those, we mentored 60 nurses, midwives and HIV counsellors working with PBFW, with 72% of nurse/midwives and 65% of counsellors scoring over 8/10 on the final mentoring assessment Overall, 12% (1493/12,614) of HIV-negative pregnant women started PrEP and 41% of those continued PrEP at 3-months. Among the HIV-negative breastfeeding women in postnatal care, 179/1315 (14%) initiated PrEP and 25% continued PrEP at 3-months. All 8 facilities continued providing PrEP 3-months after handover of the clinics. Conclusion: Integration of PrEP services in ANC and services for breastfeeding women was feasible, acceptable and sustainable. Acceptability and PrEP continuation showed improvement over time. Barriers to the PrEP integration were observed including the lack of regular HIV testing of breastfeeding mothers and need for ART-trained nurses to prescribe PrEP. Enablers included motivated and dedicated staff. Article	2023	Newman P.A.; Tepjan S.; Fongkaew K.; Akkakanjanasupar P.; de Lind van Wijngaarden J.W.; Chonwanarat N.	Multilevel Factors Impacting PrEP Engagement Among Young Gay Men and Young Transgender Women in Thailand: A Qualitative Analysis	Journal of the International Association of Physicians in AIDS Care	-	-	-	-	23259574	10.1177/23259582231188221	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165021477&doi=10.1177%2f23259582231188221&partnerID=40&md5=0d343bc7e97050316c1ad43666cc9c55	Half of new HIV infections in Thailand are among young people, the majority of whom are young gay and other men who have sex with men (YMSM) and young transgender women (YTGW). Amid low pre-exposure prophylaxis (PrEP) coverage, we explored practice-based factors that impact PrEP engagement among YMSM and YTGW. In 2018, we conducted 4 focus group discussions with 20 YMSM and 5 YTGW, and 22 in-depth interviews (5 in 2022) with healthcare providers (HCPs), community-based organization (CBO)/nongovernmental organization (NGO) staff, and peer educators. The inclusion of PrEP in universal healthcare coverage, including YMSM and YTGW, is a substantial facilitator of PrEP use; however, systemic barriers at microsocial (lack of communication about PrEP from HCPs, teachers, parents), mesosocial (healthcare-service fragmentation, lack of PrEP-competent HCPs), and macrosocial levels (annual quotas, no PrEP without HIV-testing, HIV- and sexual-stigma) constrain and disincentivize adolescents' engagement with PrEP. National scale-up of youth-friendly and LGBT-affirmative CBO/NGO clinics, HCP training, and tailored programs to support adolescents' adherence may promote PrEP engagement among YMSM and YTGW in Thailand. © The Author(s) 2023.	adolescents; healthcare providers; HIV prevention; MSM; pre-exposure prophylaxis; qualitative research; Thailand; transgender youth	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Thailand	Asia and the Pacific	Qualitative
Article	2023	Ngure, K; Browne, E; Reddy, K; Friedland, B; Van Der Straten, A; Palanee-Phillips, T; Nakalega, R; Nabunya, H; Siziba, B; Soto-Torres, L; Nair, G; Garcia, M; Celum, C; Roberts, S	Correlates of Adherence to Oral Pre-Exposure Prophylaxis (PrEP) and the Dapivirine Vaginal Ring among Adolescent Girls and Young Women (AGYW) Participating in the MTN-034/REACH Trial	Journal of the International Association of Physicians in AIDS Care	-	-	-	-	-	10.1177/23259582231196717	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02661535/full	Background: Adolescent girls and young women (AGYW) in sub-Saharan Africa have high risk of HIV acquisition. Oral pre-exposure prophylaxis (PrEP) and the monthly dapivirine vaginal ring (ring) are effective HIV prevention options, however, many AGYW face challenges using them consistently. We evaluated correlates of adherence to PrEP and the ring among AGYW in the MTN-034/REACH study. Method: We enrolled 247 AGYW aged 16-21 years in South Africa, Uganda and Zimbabwe (ClinicalTrials.gov: NCT03074786). In a crossover design, participants were randomized to the order of PrEP or ring use for 6 months each, followed by a 6-month choice period. We assessed potential adherence correlates - individual, interpersonal, community, study, and product-related factors - quarterly via self-report. We measured biomarkers of adherence monthly; high adherence was ≥4 mg dapivirine released from returned rings or intracellular tenofovir diphosphate levels ≥700 fmol/punch from DBS. We tested associations between correlates and high adherence using generalized estimating equations. Results: The average probability of high adherence during the crossover period was 0.60 for the ring and 0.57 for PrEP (p= 0.30). High adherence to PrEP was significantly associated with having an older primary partner (p=0.04), not having exchanged sex in the past 3 months (p=0.02), and rating PrEP as highly acceptable (p=0.003). High ring adherence was significantly associated with unstable housing (p=0.01), disclosing ring use to a male family member (p=0.01), and noting a social benefit from study participation (p=0.03). All associations were moderate, corresponding to about 6% -10% difference in the proportion with high adherence. Adherence was not associated with sexual behavior and other factors. Conclusion: In our multinational study, correlates of adherence among African AGYW differed for PrEP and the ring, highlighting the benefit of offering multiple PrEP options. However, all associations were modest in scale, suggesting that additional research is needed to identify strong drivers of consistent PrEP or ring use.	*mouth cavity; *pre-exposure prophylaxis; *vagina ring; Adolescent; Adult; Aged; Conference abstract; Crossover procedure; Drug concentration; Drug therapy; Female; Housing; Human; Major clinical study; Male; Patient compliance; Prevention; Probability; Self report; Sexual behavior; South Africa; Uganda; Zimbabwe	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Ngure, Kenneth; Friedland, Barbara A; Szydlo, Daniel W; Roberts, Sarah T; Garcia, Morgan; Levy, Lisa; Akello, Carolyne A; Reddy, Krishnaveni; Palanee-Phillips, Thesla; Macdonald, Pippa; Siziba, Bekezela; Soto-Torres, Lydia; Hosek, Sybil; Hillier, Sharon L; Nair, Gonasagrie; Celum, Connie; van der Straten, Ariane	Baseline preferences for oral pre-exposure prophylaxis (PrEP) or dapivirine intravaginal ring for HIV prevention among adolescent girls and young women in South Africa, Uganda and Zimbabwe (MTN-034/IPM-045 study).	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0287525	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10289422	INTRODUCTION: Adolescent girls and young women (AGYW) in sub-Saharan Africa are disproportionately affected by the HIV epidemic and face an array of challenges using proven behavioral and biomedical prevention methods. To address the urgent need for expanding prevention options, we evaluated the baseline preferences of HIV prevention methods among participants enrolled in the MTN-034/REACH crossover trial along with their stated product preference prior to product initiation. METHODS: AGYW aged 16-21 years were enrolled at 4 study sites: Cape Town and Johannesburg, South Africa; Kampala, Uganda; and Harare, Zimbabwe and randomly assigned to the sequence of using oral PrEP and the dapivirine ring for 6 months each, followed by a choice period in which they could choose either product (or neither) for an additional six months. Eligible AGYW were HIV-negative, not pregnant and using effective contraception for at least two months prior to enrollment. Descriptive statistics were used to summarize demographic and behavioral data while multinomial analysis was used to determine predictors of stated product preference (ring or oral PrEP). RESULTS: Of the 247 AGYW enrolled in REACH, 34% were aged 16-17 and 89% had a primary partner.The median age of sexual debut was 16 years and 40% had ever been pregnant. At screening, 35% of participants were diagnosed with a sexually transmitted infection (STI), 39% had an AUDIT-C score associated with harmful drinking and 11% reported intimate partner violence in the past 6 months. Overall, 28% of participants, had CESD-10 scores suggestive of depressive symptoms (≥12) in the past week. At baseline, similar proportions stated a preference for the ring and oral PrEP (38.1% and 40.5% respectively), with 19% of participants stating they preferred both products equally. Only study site was significantly associated with product preference (P<0.05) with AGYW from Johannesburg having higher odds of preferring the ring and those from Kampala having higher odds of preferring both options equally. CONCLUSIONS: We successfully enrolled African AGYW with a clear unmet need for HIV prevention. The balanced preference between the two products suggests that multiple biomedical prevention options may be appealing to this age group and could address their prevention needs. Article	2023	Nhean, Salin; Tseng, Alice; Sheehan, Nancy L; Bogoch, Isaac I	Use and safety of appearance and performance enhancing supplements in gay, bisexual, and other men who have sex with men receiving daily tenofovir disoproxil fumarate/emtricitabine as HIV pre-exposure prophylaxis.	AIDS Care	-	-	-	-	1360-0451	10.1080/09540121.2022.2121958	https://dx.doi.org/10.1080/09540121.2022.2121958	Appearance- and performance-enhancing supplements (APES) may be associated with liver and renal toxicity, but use is often under-reported. This study describes the use and safety of APES among gay, bisexual, and other men-who-have-sex with men (gbMSM) attending an urban HIV pre-exposure prophylaxis (PrEP) clinic. A cross-sectional study was conducted between February 2018 to September 2018 to assess APES usage in gbMSM taking daily tenofovir disoproxil fumarate/emtricitabine for PrEP. Renal and liver function were assessed from electronic medical records. Among 50 participants (98% male, median 32 years, 52% White, on PrEP for a median 4.4 years), 72% reported lifetime APES use, with 52% currently using APES (median 1.5 products/person) and 28% never used APES. The most common products included whey protein, creatine supplements and anabolic steroids. The primary reason for APES use was to increase muscle mass. Three (12%) current APES users had elevated serum creatinine (stage 1) versus zero (0%) in the non-APES group. Two (8%) current APES users experienced grade 3-4 ALT/AST elevations versus zero (0%) in the non-APES group. APES usage among gbMSM taking PrEP was high and may be associated with liver/renal lab abnormalities. Increased awareness of APES use and potential toxicity is encouraged to enhance safety. Article	2023	Nicholls, Emily Jay; Policek, Nicoletta; Volny-Anne, Alain; Spire, Bruno; Burns, Fiona; Ruiz-Burga, Elisa; Tariq, Shema	A systematic review of qualitative research on recently acquired HIV.	AIDS	-	-	-	-	1473-5571 0269-9370	10.1097/QAD.0000000000003697	https://pubmed.ncbi.nlm.nih.gov/37650757/	OBJECTIVES: Recently acquired HIV is a critical time when people may experience debilitating symptoms and is when they are most likely to pass HIV on. Qualitative research offers insights into lived experiences and a deeper understanding of the contextual factors underlying HIV acquisition. We aimed to synthesize qualitative literature on recently acquired HIV. DESIGN: Systematic review and textual narrative synthesis. METHODS: We searched MEDLINE, CINAHL Plus, PsycINFO and Sociology Database. Articles were screened, and two authors completed full text review and data extraction. Quality appraisal was conducted (Critical Appraisal Skills Programme Qualitative Studies Checklist) and certainty of findings graded (GRADE-CERQual). RESULTS: We reviewed 1890 articles (1554 following de-duplication), excluding 1539. Fifteen articles were included and an additional article was included after updating the search. We identified 15 themes, three of which we have high confidence in: recent acquisition of HIV facilitates understanding of circumstances of HIV acquisition; indeterminate HIV tests generate uncertainty and anxiety; and people with recently acquired HIV are motivated to reduce risk of onward transmission. CONCLUSIONS: Our findings highlight the importance of continued research into recently acquired HIV, as well as the need for support to manage the emotional impact of indeterminate test results and negotiate risk reduction. We found no studies exploring sexual risk in the context of recently acquired HIV, or use of pre-exposure prophylaxis or treatment as prevention. The literature is primarily focused on HIV acquisition from an individual and behavioural perspective, neglecting important aspects of lived experience such as immediate ART, stigma, and health and wellbeing. Article	2023	Nishimoto L.; Ikani P.; Achanya J.; Idowu A.; Olisa A.L.; Walker C.F.; Gottlieb A.; Akolo C.	Expanding Access to Oral Preexposure Prophylaxis for PeopleWho Inject Drugs in Bayelsa and Niger States, Nigeria	Global Health Science and Practice	-	-	-	-	2169575X	10.9745/GHSP-D-22-00370	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149154527&doi=10.9745%2fGHSP-D-22-00370&partnerID=40&md5=a1d32a45d82c68b1d7414cf1cb060ba7	Introduction: While oral preexposure prophylaxis (PrEP) is recommended for all individuals with substantial risk of acquiring HIV, people who inject drugs (PWID) have not been prioritized for oral PrEP services in most settings. The Meeting Targets and Maintaining Epidemic Control (EpiC) project implemented a comprehensive community-based program to increase access to and uptake of oral PrEP services among PWID in Bayelsa and Niger States, Nigeria. Program Description: EpiC established partnerships with communitybased organizations working with the PWID community, identified hotspots (common locations for socialization and drug use), and engaged PWID in tailoring oral PrEP services. The HIV prevention package provided in hotspots and drop-in centers included HIV testing, oral PrEP, postexposure prophylaxis, sexually transmitted infection screening and management, condoms and lubricants, PWID-specific risk reduction counseling, and referrals to other support programs. At drop-in centers, paralegal and psychosocial services were also provided. Peer outreach workers led outreach efforts. All PWID who tested HIV negative were eligible for oral PrEP screening. National oral PrEP eligibility criteria included: no suspicion of acute HIV infection, absence of proteinuria, and willingness to use oral PrEP as prescribed. We used descriptive analysis of routine programmatic data to illustrate program outcomes. Results: From January 2020 to September 2021, 13,286 HIV tests were completed for PWID. Of these, 12,111 (91.16%) had negative results. Among those testing negative, 8,190 (67.62%) were screened for oral PrEP eligibility, and 2,661 (32.49%) were eligible. A total of 2,659 PWID (100% 312/312 among eligible females; 99.91% 2,347/2,349 among eligible males) initiated oral PrEP. Lessons Learned: Provision of oral PrEP services to PWID in Nigeria is feasible through a peer-led, differentiated, and holistic approach that addresses structural barriers among the PWID community. Greater efforts are needed to understand the needs and barriers to better tailor HIV services to reach females and other subpopulations in this community that are harder to reach. © 2023 Nishimoto et al. Article	2023	Nogueira N.F.; Luisi N.; Salazar A.S.; Cherenack E.M.; Raccamarich P.; Klatt N.R.; Jones D.L.; Alcaide M.L.	PrEP awareness and use among reproductive age women in Miami, Florida	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0286071	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161173586&doi=10.1371%2fjournal.pone.0286071&partnerID=40&md5=0005506ba7437d04459f3d7820549f94	Background Miami, Florida is an epicenter of the HIV epidemic in the US, with 20% of new HIV infections occurring in women. Despite effectiveness of Pre-Exposure Prophylaxis (PrEP) in preventing HIV, only 10% of eligible women benefit from its use. Setting This study evaluates PrEP awareness and use, and factors associated with PrEP awareness among sexually active women in Miami, Florida. Methods Results reported in this study included cross-sectional data that were collected as part of a baseline visit from a parent study. Cis-gender, HIV-negative, 18-45-year-old, sexually active women were recruited as part of a study evaluating recurrent bacterial vaginosis and HIV risk. Participants completed questionnaires assessing socio-demographics, HIV risk factors, prior history of HIV testing and reproductive tract infections, PrEP awareness and use. Relationships between variables and PrEP awareness were analyzed and multivariable logistic regression identified variables strongly associated with PrEP awareness. Results Among the 295 women enrolled, median age was 31 (24–38) years, 49% Black, 39% White, and 34% Hispanic. Of 63% who knew about PrEP, only 5% were on PrEP. Women with income below poverty line (OR = 2.001.04,3.87;p = 0.04), more male sexual partners in past month (OR = 1.301.01,1.68;p = 0.04), lifetime HIV testing (OR = 6.422.83,14.52; p<0.01), and current bacterial vaginosis (OR = 2.281.18,4.40;p = 0.01) were more likely to be aware of PrEP. Lower odds of PrEP awareness were associated with being Black (OR = 0.380.15,0.96;p = 0.04), Hispanic (OR = 0.180.08,0.39;p<0.01), heterosexual (OR = 0.29 0.11,0.77;p<0.01), and reporting inconsistent condom use during vaginal sex (OR = 0.21 0.08,0.56;p<0.01). Conclusion PrEP awareness is low among reproductive age women in a high-risk setting. Culturally tailored interventions are needed to increase PrEP awareness and uptake, especially among Black and Hispanic women with inconsistent condom use during vaginal sex with male partners. © 2023 Nogueira et al. Article	2023	Nolan, Nathanial S.; Fracasso Francis, Sarah M.; Marks, Laura R.; Beekmann, Susan E.; Polgreen, Philip M.; Liang, Stephen Y.; Durkin, Michael J.	Harm Reduction: A Missing Piece to the Holistic Care of Patients Who Inject Drugs.	Open Forum Infectious Diseases	-	-	-	-	2328-8957	10.1093/ofid/ofad402	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10428197/	BACKGROUND: The rise in injection drug use (IDU) has led to an increase in drug-related infections. Harm reduction is an important strategy for preventing infections among people who inject drugs (PWID). We attempted to evaluate the harm reduction counseling that infectious diseases physicians provide to PWID presenting with infections. METHODS: An electronic survey was distributed to physician members of the Emerging Infections Network to inquire about practices used when caring for patients with IDU-related infections. RESULTS: In total, 534 ID physicians responded to the survey. Of those, 375 (70%) reported routinely caring for PWID. Most respondents report screening for human immunodeficiency virus (HIV) and viral hepatitis (98%) and discussing the risk of these infections (87%); 63% prescribe immunization against viral hepatitis, and 45% discuss HIV preexposure prophylaxis (PrEP). However, 55% of respondents (n = 205) reported not counseling patients on safer injection strategies. Common reasons for not counseling included limited time and a desire to emphasize antibiotic therapy/medical issues (62%), lack of training (55%), and believing that it would be better addressed by other services (47%). Among respondents who reported counseling PWID, most recommended abstinence from IDU (72%), handwashing and skin cleansing before injection (62%), and safe disposal of needles/drug equipment used before admission (54%). CONCLUSIONS: Almost all ID physicians report screening PWID for HIV and viral hepatitis and discussing the risks of these infections. Despite frequently encountering PWID, fewer than half of ID physicians provide safer injection advice. Opportunities exist to standardize harm reduction education, emphasizing safer injection practices in conjunction with other strategies to prevent infections (eg, HIV PrEP or hepatitis A virus/hepatitis B virus vaccination).	harm reduction; substance use disorder; patients who inject drugs	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Article	2023	Norwood A.; Zuñiga J.A.	Knowledge and Attitude about Pre-exposure Prophylaxis among Primary Care Clinicians at a Federally Qualified Health Center in Central Texas: A Cross-sectional Study	Journal of the Association of Nurses in AIDS Care	-	-	-	-	10553290	10.1097/JNC.0000000000000353	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146714771&doi=10.1097%2fJNC.0000000000000353&partnerID=40&md5=c70816fc8754c167d82342e5f770f910	Pre-exposure prophylaxis (PrEP) for HIV prevention is a highly effective tool in preventing HIV, yet PrEP is underprescribed. Primary care providers are ideally positioned to increase access to and awareness of PrEP, but health care providers' knowledge of PrEP greatly varies. To evaluate PrEP knowledge and attitudes of primary care providers, we conducted a descriptive cross-sectional study examining primary providers' knowledge and concerns about PrEP. Participants (n = 122) included physicians, nurses, pharmacists, and residency trainees in family medicine, internal medicine, and obstetrics. Despite high awareness of PrEP among these primary care providers (91.7%), fewer reported feeling comfortable prescribing PrEP (62.5%), and the average number of PrEP prescriptions per provider written in the last 6 months was less than 1. PrEP remains key to preventing HIV, but prescriptions remain low. Health care providers would benefit from additional education and training on communicating with their patients about sexual health and HIV prevention. © 2023 Elsevier USA. All rights reserved. Sexual Practices and Predisposition to PrEP Use Among Men Ages 50 Years and Older Who Have Sex With Men: A Cross-Sectional Study	Journal of the Association of Nurses in AIDS Care	-	-	-	-	10553290	10.1097/JNC.0000000000000433	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173612104&doi=10.1097%2fJNC.0000000000000433&partnerID=40&md5=fd85204b3bbbf5e2b30bd1b088b952f2	This study aimed to evaluate the sexual practices of men ages 50 years or older who have sex with men (MSM) and factors influencing their predisposition to use preexposure prophylaxis (PrEP). An analytical cross-sectional study was conducted in Brazil and Portugal with 718 MSM. Of these, 278 (38.7%) were categorized as being at high risk for HIV based on the HIV Incidence Risk Index (HIRI), and 418 (58.2%) expressed a predisposition to use PrEP. Overall, sociodemographic factors and specific sexual practices increased the likelihood of being classified as high risk for HIV, particularly sexual position and sexual activity. However, factors that influenced the predisposition to use PrEP included age group, receptive anal sex, knowledge of postexposure prophylaxis, high HIRI score, and a history of syphilis. These findings underscore the urgent need for health services to provide comprehensive and adequate attention to the realities of this population, considering its complexities and specificities. © 2023 Elsevier USA. Article	2023	Nyagah, Wawira; Segal, Kate; Feltham, Jess; Ash, Alex; Major, Jocelyn; Masani, Moowa	How might we motivate uptake of the Dual Prevention Pill? Findings from human-centered design research with potential end users, male partners, and healthcare providers.	Frontiers in Public Health	-	-	-	-	2673-3153	10.3389/frph.2023.1254953	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10646541/	Multipurpose prevention technologies (MPTs) combining contraception with HIV prevention offer a promising solution to uptake and adherence challenges faced with oral pre-exposure prophylaxis (PrEP). The Dual Prevention Pill (DPP), which combines oral PrEP with an oral contraceptive pill (OCP), could address unmet need for family planning (FP) and HIV prevention. This study aimed to identify barriers and motivators for DPP uptake to inform the development of a DPP demand generation strategy and broader introduction efforts for MPTs. Materials and methods Qualitative, ethnographic research employing human-centered design techniques was conducted in Kenya, South Africa, and Zimbabwe. A research consortium conducted 45 immersions, 34 key informant interviews, and 12 friendship circles with potential end users, male romantic partners, healthcare providers (HCPs), and cultural commentators. Creative concepts were subsequently co-created and validated in workshops with end users, male partners, and HCPs. Results Four major themes emerged. Women struggled to balance personal motivations with societal expectations. Relationship goals strongly influenced sexual and reproductive health decisions, particularly related to financial security and social status. Negative experiences, such as untrustworthy partners, were significant triggers for OCP and PrEP use. Lastly, male partners were concerned about the DPP upending gender norms but held more positive individual attitudes. Five initial audience segments for the DPP were identified: women seeking enjoyment outside of their primary relationship; new mothers adhering to social norms; women wanting to maintain romantic relationships; women at risk of unintended pregnancy; and women with unfaithful partners. Segments informed the development of three communication themes, with the preferred route highlighting the DPP as a tool to prepare for life's unpredictability. DiscussionTo effectively generate demand for the DPP, several strategies should be considered. Connecting with women's diverse identities and goals and celebrating their individuality is crucial. Linking the DPP to relationship goals reframes it as a means to protect relationships rather than a risk. Leveraging negative triggers through targeted media campaigns empowers women to take control of their sexual health during challenging moments. A balance in channel placement is necessary to raise public awareness while using more discrete channels for potentially controversial messages with male partners and wider communities.	pre-exposure prophylaxis, oral contraception, HIV prevention, family planning, multi-purpose prevention technologies, end users, human-centered design, demand generation	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Qualitative
Article	2023	O'Byrne, Patrick; Musten, Alexandra; McCready, Lance; Robinson, Robin; Durrant, Garfield; Tigert, Jason; Orser, Lauren	HIV self-testing enabled access to testing for Black persons: The GetaKit study.	Research in Nursing and Health	-	-	-	-	1098-240X 0160-6891	10.1002/nur.22293	https://pubmed.ncbi.nlm.nih.gov/36573589/	In Ontario, new HIV diagnoses continue to affect gay, bisexual, and other men who have sex with men (gbMSM) and persons of African, Caribbean, or Black (ACB) ethnicities. Because treatment and suppressed viral loads flow from diagnosis, testing is key. We sought to determine the outcomes of online ordering and mail-out of free at-home HIV self-testing in Ontario, Canada. We implemented the GetaKit study to offer such free HIV self-testing using the INSTI® test and offered it via a website (GetaKit.ca) to eligible persons in Ontario. From April 1, 2021 to January 31, 2022, we distributed kits to 1551 persons; 40% were white and 26% were ACB. We found that ACB participants were less likely to fulfill established criteria for HIV PrEP, such as previous sexually transmitted infections diagnoses and drug use, despite having a similar test positivity rate. We also found that ACB women, who may represent a larger number of new infections than previously thought, did not have a higher rate of first-time testing. Our results suggest that HIV self-testing can enable testing, but that work is required to increase uptake among ACB persons and women. Overall, HIV self-testing thus corresponded with increased testing among persons who were Black, yet lower rates of results reporting. Patient or Public Contributions: Community members from the AIDS Committee of Ottawa, Max Ottawa, and Black Cap, and nurses from Ottawa Public Health were involved in the design, promotion, and implementation of this study. Article	2023	Ocasio, Manuel A; Fernandez, M Isabel; Cortese, Steven; Kampa, Kathryn	Piloting a digital campaign to promote awareness of the Louisiana TelePrEP program among sexual and gender minority young adults.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0290149	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10464984/	Despite the proven efficacy of pre-exposure prophylaxis (PrEP) in preventing HIV acquisition, PrEP is underutilized by sexual and gender minority young adults in the 13 states in the United States "South." In this paper, we describe the process we used to develop a digital campaign to promote awareness and engagement of sexual and gender minority young adults in the Louisiana Department of Health's TelePrEP Program and provide campaign performance metrics. In Phase 1, we conducted formative research that informed campaign development and strategy. In total, 109 sexual and gender minority young adults completed a survey of PrEP constructs (e.g., facilitators, barriers). We also conducted three, sequential focus groups to iteratively generate, revise and refine the digital material. In collaboration with our strategic marketing partner (SMP), we developed 3 different ads and 1 video ad to promote on web and mobile-in app display, as well as Facebook, Instagram, and YouTube. Phase 2 focused on campaign implementation and evaluation (e.g., number of impressions, user activities on LA TelePrEP landing page). In the first few weeks of the campaign, data from tracking pixels indicated minimal activities on the landing page. We paused to revamp the campaign. Our SMP determined that a more young adult-focused landing page could bolster engagement. We created a new landing page and reran the campaign for 33 days. We saw substantially more user activities on the new landing page (n = 382) compared to the LA TelePrEP landing page (n = 185). Overall, we had 730,665 impressions and 475 link clicks. By collaborating with our SMP, we effectively and efficiently translated our community-engaged formative research into relevant and engaging digital content. This pilot study is one of the first to demonstrate the importance of using tracking pixels to monitor real-time user data to optimize performance of a digital PrEP campaign. Article	2023	Ogbuagu, Onyema; Sharma, Manas; Igiraneza, Grace; Andrews, Laurie; Tuan, Jessica; Barakat, Lydia A.	HIV risk profile and prevention needs of individuals seeking monkeypox (mpox) vaccination in an urban clinic in the U.S.: a brief report.	BMC Infectious Diseases	-	-	-	-	1471-2334	10.1186/s12879-023-08075-5	https://pubmed.ncbi.nlm.nih.gov/36890468/	BACKGROUND: Our study survey assessed HIV risk profile and pre-exposure prophylaxis (PrEP) use among HIV-negative individuals seeking mpox vaccination, elucidating HIV prevention gaps and opportunities. METHODS: Anonymous cross-sectional surveys were self-administered at an urban academic center clinic in New Haven, CT, U.S. (August 18-November 18, 2022). Inclusion criteria included adults presenting for mpox vaccination who consented to the study. The study assessed STI risk (sexual practices, STI history, substance use). For HIV-negative participants, PrEP knowledge, attitudes, and preferences were assessed. RESULTS: Eighty-one of 210 individuals approached completed surveys (survey acceptance and completion rate 38.6%). Majority were cisgender-male (76/81; 93.8%), Caucasian (48/79; 60.8%), with median age 28 years (IQR-15). Nine of 81 (11.5%) self-reported HIV-positivity. Median sexual partner number (6 months prior) was 4 (IQR-5.8). Majority, 89.9% and 75.9%, reported insertive and receptive anal intercourse, respectively. 41% reported lifetime STI history, of whom 12.3% had an STI 6 months prior. Majority (55.8%) used ≥ 1 illicit substance; 87.7% moderate alcohol use. Among HIV-negative respondents, most (95.7%) were aware of PrEP, but only 48.4% used PrEP. CONCLUSION: Individuals seeking mpox vaccination engage in behaviors placing them at increased STI risk and would benefit from PrEP assessment. Article	2023	Ogello, Vallery; Ngure, Kenneth; Thuo, Nicholas; Burns, Bridget; Rono, Bernard; Oware, Kevin; Kiptiness, Catherine; Mugo, Nelly; Bukusi, Elizabeth; Garrison, Lindsey; Baeten, Jared M; Haberer, Jessica E	"Yes, I'm reminded, but it doesn't mean I'm taking them": Experiences with Short Message Service Reminder Use in Real-time Monitoring of HIV PrEP among Young Women in Kenya.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-022-03744-z	https://dx.doi.org/10.1007/s10461-022-03744-z	Adherence to oral pre-exposure prophylaxis (PrEP) is challenging, and cellular technology offers a promising opportunity for support. However, a recent randomized controlled trial found that SMS reminders did not improve PrEP adherence. We used qualitative methods to explore the trial participants' experiences with the SMS intervention. We conducted serial in-depth interviews with 54 young Kenyan women, using inductive and deductive content analysis . Initially, SMS reminders were highly acceptable. Participants expressed enthusiasm with receiving the reminders because of the coded nature of the SMS reminders; they also helped in 'habit forming' with daily adherence. However, overtime, participants reported growing concerns about privacy, self-efficacy, and responsibility and SMS fatigue. Participants also reported other challenges, including phone loss, poor telephone network, and lack of electricity. Further research to explore if SMS reminders in alternative formats or with different frequency is needed, in addition to identification of alternate adherence support strategies. Article	2023	Ogolla, Mercelline; Nyabiage, Omoto Lennah; Musingila, Paul; Gachau, Susan; Odero, Theresa M A; Odoyo-June, Elijah; Ochanda, Boniface; Appolonia, Aoko; Katiku, Elizabeth; Joseph, Rachael; Ogolla, Cirrilus; Otieno, Linda; Odhiambo, Francesca; Truong, Hong-Ha M	Uptake and continuation of HIV pre-exposure prophylaxis among women of reproductive age in two health facilities in Kisumu County, Kenya.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26069	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10009800/	INTRODUCTION: In 2020, Kenya had 19,000 new HIV infections among women aged 15+ years. Studies have shown sub-optimal oral pre-exposure prophylaxis (PrEP) use among sub-populations of women. We assessed the uptake and continuation of oral PrEP among women 15-49 years in two health facilities in Kisumu County, Kenya. METHODS: A retrospective cohort of 262 women aged 15-49 years, initiated into oral PrEP between 12 November 2019 and 31 March 2021, was identified from two health facilities in the urban setting of Kisumu County, Kenya. Data on baseline characteristics and oral PrEP continuation at months 1, 3 and 6 were abstracted from patient records and summarized using descriptive statistics. Missing data in the predictor variables were imputed within the joint modelling multiple imputation framework. Using logistic regression, we evaluated factors associated with the discontinuation of oral PrEP at month 1. RESULTS: Of the 66,054 women screened, 320 (0.5%) were eligible and 262 (82%) were initiated on oral PrEP. Uptake was higher among women 25-29 years as compared to those 15-24 years (77% vs. 33%). Oral PrEP continuation declined significantly with increasing duration of follow-up; 37% at month 1, 21% at month 3 and 12% at month 6 (p<0.05). In the adjusted analysis, women 15-24 years had lower adjusted odds of continuing at month 1 than women ≥25 years (adjusted odds ratio aOR: 0.41, 95% CI: 0.21-0.82). There was no association between being sero-discordant and continuation of oral PrEP at month 1 (aOR: 1.21, 95% CI 0.59-2.50). Women from the sub-county hospital were more likely to continue at month 1 of follow-up compared to women enrolled in the county referral hospital (aOR 5.11; 95% CI 2.24-11.70). CONCLUSIONS: The low eligibility for oral PrEP observed among women 15-49 years in an urban setting with high HIV prevalence calls for a review of the screening process to validate the sensitivity of the screening tool and its proper application. The low uptake and continuation among adolescent girls and young women underscores the need to identify and address specific patient- and facility-level barriers affecting different sub-populations at risk for HIV acquisition. Article	2023	Ogundare M.O.; Allan F.; Desai A.P.; Dirajlal-Fargo S.; Minich N.M.; Gripshover B.M.	Integrating HIV Pre-Exposure Prophylaxis (PrEP) Education During Medical Residency: Training Outcomes and Suggestions for Learning Effectiveness	Journal of Primary Care and Community Health	-	-	-	-	21501319	10.1177/21501319231207313	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176365500&doi=10.1177%2f21501319231207313&partnerID=40&md5=5c02a225aa1399607d5156f00597805b	Human immunodeficiency virus (HIV) infection is now preventable with pre-exposure prophylaxis (PrEP) drugs, however, barriers to PrEP implementation include primary-care physician (PCP) knowledge-gap and lack of comfort prescribing and managing PrEP. We hypothesized that integrating HIV-PrEP education during medical-residency would help address these problems and developed a 40-minute case-based lecture focused on the 2021 United States Preventative Services Taskforce (USPSTF) oral HIV-PrEP guidelines and integrated this into our residency's core curriculum. We analyzed data from physician-trainees who voluntarily completed a pre- and post-lecture survey measuring HIV-PrEP "knowledge" and "self-assessed readiness to independently initiate and manage PrEP." Independent group analysis was completed via the Mann-Whitney U and Pearson Chi-square 2-sided test with P-value <0.05 deemed significant. Of the total of 189 residents invited to the lecture, 130 (69%) completed the pre-survey while 107 (57%) completed the post-survey. Per knowledge-assessment: the median number of correctly answered questions rose from a pre-lecture baseline of 4/9 (44%) to 8/9 (89%) following the education intervention (P <.001). When asked about comfort initiating and managing HIV-PrEP on their own, 7/130 (5.4%) responded in agreement pre-lecture, but this rose to 55/107 (51.4%) post-lecture (P <.001). Our study revealed PrEP training during residency was effective per stated objectives and may be an important tool to increase PrEP delivery/uptake to achieve the target goals for the National HIV/AIDS Strategy. © The Author(s) 2023.	anti-HIV agents/therapeutic use; education; graduate; HIV infections/prevention and control; medical; physicians; pre-exposure prophylaxis; primary care	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Oka, S; Holohan, V; Shirasaka, T; Choi, JY; Kim, Y-S; Chamay, N; Patel, P; Polli, JW; Ford, SL; Crauwels, H; Garside, L; D'Amico, R; Latham, C; van Solingen-Ristea, R; Baugh, B; van Wyk, J	Asian participants' experience in phase 3/3b studies of long-acting cabotegravir and rilpivirine: efficacy, safety, pharmacokinetic, and virological outcomes through week 96	HIV Medicine	-	-	-	-	NA	10.1111/hiv.13588	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02648831/full	Objectives: Cabotegravir + rilpivirine (CAB + RPV) dosed monthly or every 2 months is the first complete long-acting (LA) regimen recommended by treatment guidelines for the maintenance of HIV-1 virological suppression. This post hoc analysis summarizes outcomes for Asian participants through week 96. Methods: Data from Asian participants naive to CAB + RPV randomized to receive dosing every 4 weeks (Q4W) or every 8 weeks (Q8W) in the FLAIR (NCT02938520) and ATLAS-2M (NCT03299049) phase 3/3b studies were pooled. The proportion of participants with plasma HIV-1 RNA ≥50 and <50 copies/mL (per FDA Snapshot algorithm), incidence of confirmed virological failure (CVF; two consecutive HIV-1 RNA ≥200 copies/mL), pharmacokinetics, safety, and tolerability through week 96 were assessed. Results: Overall, 41 Asian participants received CAB + RPV (Q8W, n = 17; Q4W, n = 24). At week 96, 83% (n = 34/41) of participants maintained HIV-1 RNA <50 copies/mL, none had HIV-1 RNA ≥50 copies/mL, and 17% (n = 7/41) had no virological data. No Asian participant met the CVF criterion. Drug-related adverse events occurred in 44% (n = 18/41) of participants; none were Grade ≥3. All injection site reactions were Grade 1 or 2; median duration was 2 days and most resolved within 7 days (90%, n = 390/435). CAB and RPV trough concentrations remained well above their respective protein-adjusted 90% inhibitory concentrations (CAB, 0.166 µg/mL; RPV, 12 ng/mL) through week 96. Conclusions: CAB + RPV LA demonstrated high efficacy, with no participants having CVF, and an acceptable safety profile in Asian participants through week 96. These data support CAB + RPV LA as a complete regimen for the maintenance of HIV-1 virological suppression in Asian individuals.	*Asian; *antiretroviral therapy; Adult; Adverse drug reaction; Article; Controlled study; Drug combination; Drug therapy; Drug withdrawal; Female; Food and Drug Administration; Human; Incidence; Injection site reaction; Major clinical study; Male; Multicenter study; Pharmacokinetics; Phase 3 clinical trial; Post hoc analysis; Randomized controlled trial; Side effect; Trough concentration	English	United Kingdom	Western and Central Europe and North America	Japan	Asia and the Pacific	Singapore	Asia and the Pacific	Clinical
Article	2023	Okeke, Nwora Lance; Ware, Kenric B.; Campbell, Russell; Taylor, Jamilah; Hung, Frances; Questell, Caroline; Brickler, Mildred P.; Smith, Ukamaka D.; Nawas, George T.; Hanlen-Rosado, Emily; Chan, Cliburn; Bosworth, Hayden B.; Aifah, Angela; Corneli, Amy	Evidence2Practice (E2P): Leveraging Implementation Science to Promote Careers in HIV Research Among Students From Historically Black Colleges and Universities.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003263	https://pubmed.ncbi.nlm.nih.gov/37707851/	BACKGROUND: The HIV research workforce is not representative of populations most affected by the epidemic. Innovative educational programs are needed to motivate diverse student populations to pursue careers in HIV research. METHODS: The Duke University Center for AIDS Research Evidence2Practice (E2P) program is a 3-day interactive workshop that introduces students from Historically Black Colleges and Universities (HBCU) to HIV pre-exposure prophylaxis, implementation science, and human-centered design. Participants develop 1-page action plans to increase awareness and uptake of pre-exposure prophylaxis on their campus. The program was evaluated using a partially mixed-method concurrent equal status study design with pre-program and post-program surveys and in-depth interviews. RESULTS: Among the 52 participating students, 44 completed the preworkshop survey, 45 completed the postworkshop survey, and 10 participated in an in-depth interview. Most participants identified as Black or African American and cisgender female. Participating in the E2P program was associated with: (1) an increase in median interest in pursuing a career in HIV research (P < 0.01) and (2) a decrease in median perceived difficulty in starting a career in HIV research (P < 0.01). Several students described that a lack of knowledge about initiating an HIV research career, a perceived lack of qualifications and knowledge about HIV science, and limited experience were major barriers to considering careers in HIV research. CONCLUSIONS: The E2P program enhanced HBCU students' interest in careers related to HIV research and improved their self-efficacy to pursue such careers. On-campus educational enrichment initiatives, led by active HIV researchers and clinicians, should be a critical part of diversifying the HIV workforce. Article	2023	Olakunde B.O.; Ujam C.; Ndukwe C.D.; Falola-Anoemuah Y.; Olaifa Y.; Oladele T.T.; Yahaya H.B.; Ogundipe A.	Barriers to the uptake of oral pre-exposure prophylaxis among young key populations in Nigeria	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624231220099	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179943546&doi=10.1177%2f09564624231220099&partnerID=40&md5=341e2a66ecbbe031aed5cc4281a2f7c1	Background: Young key populations (YKP) contribute to the burden of HIV in Nigeria and are a priority population for oral pre-exposure prophylaxis (PrEP). However, their uptake of PrEP remains low. We assessed the main barriers to PrEP uptake and the variation among YKP (15–24 years) in Nigeria. Methods: This study was a secondary data analysis of the 2020 Integrated Biological & Behavioural Surveillance Survey conducted among key populations (KP), including female sex workers (FSW), men who have sex with men (MSM), people who inject drugs (PWID), and transgender people (TG), in 12 states in Nigeria. A closed-ended question asking the main reason for not taking PrEP among KP who had never taken PrEP was included in the surveillance questionnaire. We collapsed the responses into six barrier themes. Using multinomial logistic regression analysis, we examined the association between the barriers (dependent variable) and KP group (independent variable), controlling for age, educational attainment, religion, marital status, employment status, and geopolitical zone. Results: A total of 1776 YKP were included in this study. The most cited barriers by KP group were: lack of access (28.3%) and fear of side effects (28.3%) by FSW; lack of interest (37.1%) by MSM; low risk perception (65.5%) by PWID; and lack of access (34.4%) by TG. The odds of reporting fear of side effects, lack of access, lack of interest, and nonspecific/others reasons were significantly different by KP group. Conclusions: The barriers limiting the uptake of PrEP among YKP vary by KP group. Our results highlight the need for KP-specific interventions to improve the uptake of PrEP among YKP in Nigeria. © The Author(s) 2023. Article	2023	Oliveira, Danilo Araujo de; Sales, Shirlei	A Profilaxia Pré-Exposição (PrEP): tensões e disputas quanto ao sexo em pelo no currículo bareback	Pro-posições	-	-	-	-	1980-6248	https://doi.org/10.1590/1980-6248-2021-0072	https://www.scielo.br/j/pp/a/zwRNLdvHgjj6CKN6VyX4K3m/#	Resumo Este artigo traz parte dos resultados de uma pesquisa de doutorado. A análise foi elaborada sob a perspectiva curricular pós-crítica. Compreendemos, no presente texto, que o currículo não se restringe às disciplinas escolares, mas se constitui em diferentes espaços e artefatos culturais. A metodologia utilizada articulou elementos da netnografia e análise do discurso de inspiração foucaultiana de um blog e três perfis do twitter. Nomeamos o conjunto heterogêneo de ditos localizados nesses sites de currículo bareback. O argumento desenvolvido é o de que, nesse currículo, produz-se a posição de sujeito preper, constituída com marcas específicas a partir da demanda do uso da Profilaxia Pré-Exposição (PrEP). Essas marcas, no âmbito da prática sexual bareback, evidenciam tensões no modo de funcionamento da pedagogia anti-aids centrada no preservativo como método de prevenção. Abstract This article brings part of the results of doctoral research. The analysis was conducted from a post-critical curricular perspective. We understand in this text that the curriculum is not restricted to school subjects, but constituted in different spaces and cultural artifacts. The methodology used articulated elements of netnography and analysis of the Foucauldian-inspired discourse from a blog and three Twitter profiles. We name the heterogeneous set of statements located on these bareback curriculum websites. The argument developed is that in this curriculum, the position of preper subject is produced, constituted with specific marks based on the demand for the use of PrEP. These marks, in the context of bareback sexual practice, show tensions in how anti-aids pedagogy centered on condoms works as a prevention method.	currículo; bareback; PrEP; preservativo	Portuguese	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Qualitative
Article	2023	Oliveira, Renata Lúcia e Silva e; Silva, Luís Augusto Vasconcelos da; Duarte, Filipe Mateus; Brasil, Sandra Assis; Castellanos, Marcelo Eduardo Pfeiffer; Magno, Laio; Dourado, Ines	Building bridges to care: the experience of peer navigation in enabling linkage to PrEP for adolescent men who have sex with men and transgender women	Cadernos de Saúde Pública	-	-	-	-	0102-311X	10.1590/0102-311xen176821	http://www.scielo.br/scielo.php?script=sci_arttext&pid=S0102-311X2023001305006&lang=pt	Vulnerable populations are at increased risk for HIV/AIDS, especially adolescent men who have sex with men (AMSM) and adolescent travestis and transgender women (ATGW). Pre-exposure prophylaxis (PrEP) is one component of combination HIV prevention and is already available for these populations in Brazil. However, ensuring its uptake entails certain challenges since inequality and barriers have traditionally marked access and linkage to the related public health services. Peer navigation could be a way of mediating the linkage process because it involves peers keeping track of others' care schedules, dynamically fostering linkage to care according to the needs of users and the actors involved in their everyday care contexts. Therefore, this study proposes analyzing peer-navigator-mediated linkage to PrEP care for 15- to 19-year-old MSM and transgender women from the PrEP1519 project in Salvador, Bahia State, Brazil. In total, 15 field notebooks/diaries, written in April-July 2019, by four peer navigators were analyzed, as were the transcripts of one focal group and 20 semi-structured interviews with adolescents (17 MSM and three trans women) between June and December 2019. Linkage via peer navigator and participant is influenced by emotional dynamics and shared personal characteristics. It is fluid and unstable and calls for care practices to be shaped to meet each participant's needs. For peer navigation to be adopted as a care strategy for sexually transmitted infection prevention and treatment, it should envisage not only increased linkage to care but also sensitivity to service users' specific characteristics and lived experiences. Article	2023	O'Malley, Teagen L; Krier, Sarah E; Bainbridge, Maura; Hawk, Mary E; Egan, James E; Burke, Jessica G	Women's perspectives on barriers to potential PrEP uptake for HIV prevention: HIV risk assessment, relationship dynamics and stigma.	Culture, Health & Sexuality	-	-	-	-	1464-5351	10.1080/13691058.2022.2099016	https://dx.doi.org/10.1080/13691058.2022.2099016	HIV remains a significant health issue for women, and multiple overlapping factors shape women's HIV-related risk. Pre-exposure prophylaxis (PrEP) offers critical advantages over other existing options, yet it remains significantly underused among women in the USA where limited work has explored women's opinions on barriers to potential PrEP use. Using open-ended text responses from a sample of women seeking care at a US urban family planning health centre, this study aimed to understand perceptions of factors affecting potential PrEP use. Three themes concerning key factors impacting potential PrEP use emerged: HIV risk assessment, relationship dynamics, and anticipated stigma. Women's assessment of HIV risk suggests that identifying women in clinical settings as having low self-perceived risk may overlook the complexity of how women determine HIV-related risk and prevention needs. Women frequently referenced relationship dynamics when considering PrEP and discussed anticipated partner reactions about use contributing to non-use. Fear or worry of stigma were expressed as motivations to not use PrEP. Study results highlight the importance of public health and health care professionals normalising PrEP as a strategy in women's HIV prevention and sexual health decision-making. Woman-centred PrEP education, screening and communication strategies reflective of their unique HIV-related risk context are needed. Article	2023	Omo-Emmanuel U.K.; Udah D.C.; Airiagbonbu B.O.; Usman H.B.; Jegede F.E.; Aka-Okeke C.; Osula F.O.; Abiodun F.A.	Assessment of Awareness, Willingness, and Practice of Human Immunodeficiency Virus Pre-Exposure Prophylaxis Among Female Sex Workers in Uyo, Akwa Ibom, Nigeria	Texila International Journal of Public Health	-	-	-	-	25203134	10.21522/TIJPH.2013.11.04.Art003	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181499083&doi=10.21522%2fTIJPH.2013.11.04.Art003&partnerID=40&md5=863c622eda2680a829d994f3f7eaa7db	This study investigated the awareness, willingness, and practice of HIV Pre-Exposure Prophylaxis (PrEP) among female sex workers (FSWs) in Uyo, Akwa Ibom State, Nigeria. Conducted between June and August 2020, the cross-sectional research engaged 344 HIV-negative FSWs attending services at Uyo's One-Stop Shop for key populations services. Through a semi-structured questionnaire, data were collected on awareness, willingness, and practice of PrEP, and subsequently analyzed using statistical methods. The study's participants had a mean age of 29.06±5.20 years, with 68.6% falling between 25-34 years old. Notably, 76.5% were adequately aware of PrEP, while 8.1% expressed willingness to use it, and 42.4% had practiced PrEP. Factors like age, marital status, and years engaged in sex work were found to significantly influence awareness of PrEP. Participants aged 25-34 years, those previously married, and those with fewer years in sex work exhibited greater PrEP awareness. The frequency of first-time and boyfriend clients per week impacted willingness and practice of PrEP, with the former positively influencing willingness and the latter negatively affecting practice. Engaging in unprotected sex was also found to negatively correlate with PrEP practice. These findings highlight that while awareness of PrEP is relatively high among FSWs, willingness to use and actual practice of PrEP remain low. The study underscores the importance of tailored health education programs targeting FSWs, to enhance awareness and encourage adoption of effective HIV preventive measures. By addressing factors like age, marital status, and specific aspects of sex work, interventions could be designed to increase PrEP utilization, thereby contributing to the reduction of HIV transmission in this population. © 2023, Texila International Journal (TIJ). Article	2023	Omollo, Victor; Asewe, Magdaline; Mogere, Peter; Maina, Gakuo; Kuo, Alexandra P; Odoyo, Josephine; Oware, Kevin; Baeten, Jared M; Kohler, Pamela; Owens, Tamara; Bukusi, Elizabeth A; Ngure, Kenneth; Ortblad, Katrina F	The Fidelity of a Pharmacy-Based Oral HIV Pre-Exposure Prophylaxis Delivery Model in Kenya.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000003208	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10337311/	BACKGROUND: HIV pre-exposure prophylaxis (PrEP) delivery at private pharmacies is a promising new differentiated service delivery model that may address barriers to PrEP delivery at public health care facilities. We measured the fidelity of this model (ie, delivery as intended) in a pilot study in Kenya. SETTING: Five private, retail pharmacies in Kisumu and Thika Counties. METHODS: Trained pharmacy providers delivered PrEP services, including identifying eligible clients, counseling on HIV risk, assessing PrEP safety, testing for HIV, and dispensing PrEP. Pharmacy clients completed surveys that assessed the fidelity of the services received after each visit. Standardized client actors (ie, mystery shoppers) were trained on 4 different case scripts, then made unannounced pharmacy visits, and then completed a 40-item checklist that assessed the fidelity and quality of service delivery components. RESULTS: From November 2020 to December 2021, 287 clients initiated and 159 (55%) refilled PrEP. At initiation, most clients were counseled on PrEP adherence (99%, 284 of 287) and potential side effects (97%, 279 of 287) and all received provider-assisted HIV self-testing before PrEP dispensing (findings consistent across refill visits). Nine standardized client actors completed 15 pharmacy visits. At each visit, most actors were asked about their behaviors associated with HIV risk (80%, 12/15) and all were counseled on PrEP safety and side effects. All actors reported that pharmacy providers treated them with respect. CONCLUSIONS: In this first pilot study of pharmacy-delivered PrEP services in Africa, the fidelity of service delivery was high, suggesting that trained providers at private pharmacies can deliver quality PrEP services. Article	2023	Orkin, Chloe; Schapiro, Jonathan M; Perno, Carlo F; Kuritzkes, Daniel R; Patel, Parul; DeMoor, Rebecca; Dorey, David; Wang, Yongwei; Han, Kelong; Van Eygen, Veerle; Crauwels, Herta; Ford, Susan L; Latham, Christine L; St Clair, Marty; Polli, Joseph W; Vanveggel, Simon; Vandermeulen, Kati; D'Amico, Ronald; Garges, Harmony P; Zolopa, Andrew; Spreen, William R; van Wyk, Jean; Cutrell, Amy G	Expanded Multivariable Models to Assist Patient Selection for Long-Acting Cabotegravir + Rilpivirine Treatment: Clinical Utility of a Combination of Patient, Drug Concentration, and Viral Factors Associated With Virologic Failure.	Clinical Infectious Diseases	-	-	-	-	1537-6591	10.1093/cid/ciad370	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10654860/	BACKGROUND: Previously reported post hoc multivariable analyses exploring predictors of confirmed virologic failure (CVF) with cabotegravir + rilpivirine long-acting (CAB + RPV LA) were expanded to include data beyond week 48, additional covariates, and additional participants. METHODS: Pooled data from 1651 participants were used to explore dosing regimen (every 4 or every 8 weeks), demographic, viral, and pharmacokinetic covariates as potential predictors of CVF. Prior dosing regimen experience was accounted for using 2 populations. Two models were conducted in each population-baseline factor analyses exploring factors known at baseline and multivariable analyses exploring baseline factors plus postbaseline model-predicted CAB/RPV trough concentrations (4 and 44 weeks postinjection). Retained factors were evaluated to understand their contribution to CVF (alone or in combination). RESULTS: Overall, 1.4% (n = 23/1651) of participants had CVF through 152 weeks. The presence of RPV resistance-associated mutations, human immunodeficiency virus-1 subtype A6/A1, and body mass index ≥30 kg/m2 were associated with an increased risk of CVF (P < .05 adjusted incidence rate ratio), with participants with ≥2 of these baseline factors having a higher risk of CVF. Lower model-predicted CAB/RPV troughs were additional factors retained for multivariable analyses. CONCLUSIONS: The presence of ≥2 baseline factors (RPV resistance-associated mutations, A6/A1 subtype, and/or body mass index ≥30 kg/m2) was associated with increased CVF risk, consistent with prior analyses. Inclusion of initial model-predicted CAB/RPV trough concentrations (≤first quartile) did not improve the prediction of CVF beyond the presence of a combination of ≥2 baseline factors, reinforcing the clinical utility of the baseline factors in the appropriate use of CAB + RPV LA.	cabotegravir; long-acting antiretroviral therapy; multivariable analysis; rilpivirine; virologic response. Article	2023	Orozco-Chinome J.E.; Picón-Jaimes Y.A.; Lozada-Martinez I.D.; Molina-Franky J.; Bolaño Romero M.P.; Acevedo-López D.	Knowledge, attitudes and experience of physicians working in Chile toward the prescription of pre-exposure prophylaxis (PrEP): A cross-national survey	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624231160576	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152367513&doi=10.1177%2f09564624231160576&partnerID=40&md5=8a6976a9d3d3b4ecb217b55b68277bee	Background: Pre-exposure prophylaxis (PrEP) involves administering antiretroviral drugs to prevent human immunodeficiency virus (HIV) infection in at-risk subjects. Chile is considered one of the countries with the highest number of new cases per year of HIV infections. Methods: A nationwide cross-sectional study was carried out in Chile. A questionnaire of physicians' attitudes toward the prescription of PrEP was used. Results: 632 doctors responded correctly the survey. 58.5% (n = 370) were women, and median age was 34 years (IQR 25–43). 55.4% (n = 350) responded that they have never prescribed antiretrovirals for HIV-negative individuals to prevent HIV infection, and only 10.1% have prescribed PrEP. 60.8% (n = 384) mentioned having informed about the possibility of using antiretroviral post-exposure prophylaxis in case of risky sexual activity. 76.3% (n = 482) believed that each institution should formulate internal protocols for administering these drugs, and 98.4% (n = 622) stated that with the currently available evidence, PrEP should be suggested to cope with the HIV pandemic. Conclusion: It was concluded that knowledge, attitudes and experience toward PrEP prescribing are variable and related to patient care. However, Chile has a marked tendency in favor of this therapy, which is similar to that reported in studies worldwide. © The Author(s) 2023. Article	2023	Orser L.; Elmekki M.; Francoeur M.; O'Byrne P.	HIV prevention for women: Exploring the uptake of pre- and postexposure prophylaxis (PrEP and PEP) among cis and trans women accessing nurse-led HIV prevention services in Ottawa, Canada (PrEP-RN)	Canadian Journal of Human Sexuality	-	-	-	-	11884517	10.3138/cjhs.2022-0039	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181041683&doi=10.3138%2fcjhs.2022-0039&partnerID=40&md5=67e3bb477785481fb7d499968912ca515	In response to increased HIV prevention efforts (PEP and PrEP), HIV rates in Ontario have decreased among gay men. By extension, the proportion of first-time HIV diagnoses in cis and trans women has increased, prompting concern for ongoing HIV transmissions. Presently, uptake of HIV prevention services among women is limited, largely due to variability of HIV-specific risk factors. To explore HIV prevention use among women, a retrospective review was completed of participants in a nurse-led HIV prevention service (PEP-RN and PrEP-RN) in Ottawa, Canada. Results showed 10% uptake for PEP and 3% uptake for PrEP among women. For PEP, 32 women presented for assessment, and 25 were initiated. Most PEP initiations were made following a potential sexual exposure to HIV, and 36% involved a partner who was HIV positive and not virally suppressed. For PrEP, offers for referral were made to 59 women; 28 declined, and 31 accepted. Among women who declined PrEP, 32% were HIV contacts, and among those who accepted, 80% were due to reported sexual or substance use practices. The highest PrEP engagement occurred among women receiving services in a safer opiate supply program. The high uptake of PEP suggests this could be a useful strategy to reducing HIV transmission rates in women. In addition, women receiving PrEP could benefit from a more supportive approach to care, including assistance with mediation use and regular contact with nurses. In using a more collaborative and gender-based approach to HIV prevention care, progress can be made in addressing ongoing HIV inequities among women. © Sex Information and Education Council of Canada, 2023. Article	2023	Orser L.; O'Byrne P.	Multiple, active-offer referrals for HIV pre-exposure prophylaxis by nurses yields high uptake among gay, bisexual, and other men who have sex with men	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624231220084	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178907827&doi=10.1177%2f09564624231220084&partnerID=40&md5=294b1848405f4f00c65ea0e4de3b361f	Introduction: Current Canadian guidelines focus on indications and uptake of preexposure prophylaxis (PrEP) among groups at-risk for HIV, such as gay, bisexual, and men who have sex with men (GBM). Less, however, is known about the outcomes of PrEP offers. This study presents on the responses of GBM to multiple offers for PrEP. Methods: In Ottawa, Canada, we instituted Canada's first nurse-led PrEP program, pre-exposure prophylaxis by nurses (PrEP-RN), where nurses offered PrEP referrals to persons with indicators for HIV. Responses to offers from nurses and HIV diagnoses were recorded and assessed for multiple occurrences based on responses. Descriptive analyses were used to report frequencies and percentages of findings and chi-square analyses were conducted to determine significance based on HIV risk for those who accepted versus declined PrEP. Results: Over a 4-year period, 644 PrEP offers were made to 236 unique patients, all of whom were GMB, the majority of whom identified as male. Of the eligible patients, 50.8% accepted and 50.0% declined after multiple offers. Seven trajectories were identified in terms of reasons for accepting or declining PrEP. PrEP referrals made based on clinical guidelines and to those who had changes in risk factors over time were significantly correlated with PrEP acceptance. We noted five HIV diagnoses, all of which were among GBM who declined PrEP at least once. Conclusions: Based on these findings, it appears multiple PrEP may yield increased PrEP acceptance among a sample of GBM. © The Author(s) 2023. Article	2023	Orser L.; O'Byrne P.; Holmes D.	Patient perspectives on the role of nurses in HIV pre-exposure prophylaxis care (PrEP-RN)	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0288283	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165345232&doi=10.1371%2fjournal.pone.0288283&partnerID=40&md5=5efc24d3e6b3c280df50e0eab59f3082	Introduction In response to ongoing new HIV diagnoses among gay, bisexual, and other men who have sex with men (gbMSM) and limited access points for HIV pre-exposure prophylaxis (PrEP) care, we established Canada's first nurse-led HIV prevention service in Ottawa, Canada—PrEP-RN. As part of this service, registered nurses became the primary provider in PrEP delivery and monitoring. Objectives To (1) gather patients' sentiments and experiences related to nurse-led PrEP and (2) identify the implications for nurses working in sexual healthcare. Methodology Qualitative interviews were conducted with 14 gbMSM participants who had received, or were presently enrolled in, HIV prevention care from nurses in the PrEP-RN clinic. Interview transcripts were reviewed and analyzed using thematic analysis. Results Our analysis revealed two major themes of: The Sexual Health Nurse as the Expert and Patients Reliance on Nurses. The first theme discussed patients' positive attitudes toward nurses, in terms of the knowledge nurses possessed and the kind and efficient services they. The accommodating nature of nurses, however, led patients to become dependent on their care, which was the focus of the second theme. This reliance on nurses created challenges when patients transitioned from PrEP-RN to alternate providers for ongoing care. Conclusion These findings were examined to understand the effect of patients' perceptions of nurses on nursing practice. Despite patients' confidence in nurses' ability to provide PrEP care, the expectations they placed onto nurses to address the totality of their needs created competing demands for nurses to be both a leader in HIV prevention care—and fulfill the image of the caring, healthcare 'hero', which created feelings of moral distress among nurses. As increasing initiatives focus on task-shifting of healthcare roles to nurses, understanding the patients' perspective is essential in maintaining effective nurse-patient relationships. © 2023 Orser et al. Article	2023	Ortblad K.F.; Kwach B.; Zhang S.; Asewe M.; Ongwen P.A.; Malen R.C.; Harkey K.; Odoyo J.; Gathii P.; Rota G.; Sharma M.; Were D.K.; Ngure K.; Omollo V.; Bukusi E.A.	Measuring the performance of HIV self-testing at private pharmacies in Kenya: a cross-sectional study	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.26177	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174577943&doi=10.1002%2fjia2.26177&partnerID=40&md5=28517d3be271ae21f89b48525e2fb00b	Introduction: HIV self-testing (HIVST) has the potential to support daily oral pre-exposure prophylaxis (PrEP) delivery in private pharmacies, but many national guidelines have not approved HIVST for PrEP dispensing. In Kenya, pharmacy providers are permitted to deliver HIVST, but often do not have the required certification to deliver rapid diagnostic testing (RDT). We estimated the performance of provider-delivered HIVST compared to RDT, the standard of care for PrEP delivery, at private pharmacies in Kenya to inform decisions on the use of HIVST for PrEP scale-up. Methods: At 20 pharmacies in Kisumu County, we trained pharmacy providers (pharmacists and pharmaceutical technologists) on blood-based HIVST and client assistance (if requested). We recruited pharmacy clients purchasing sexual and reproductive health-related products (e.g. condoms) and enrolled those ≥18 years with self-reported behaviours associated with HIV risk. Enrolled clients received HIVST with associated provider counselling, followed by RDT by a certified HIV testing services (HTS) counsellor. Pharmacy providers and clients independently interpreted HIVST results prior to RDT (results interpreted only by the HTS counsellor). We calculated the sensitivity and specificity of pharmacy provider-delivered HIVST compared to HTS counsellor-administered RDT. Results: Between March and June 2022, we screened 1691 clients and enrolled 1500; 64% (954/1500) were female and the median age was 26 years (IQR 22–31). We additionally enrolled 40 providers; 42% (17/40) were pharmacy owners and their median years of experience was 6 (IQR 4–10). The majority (79%, 1190/1500) of clients requested provider assistance with HIVST and providers spent a median of 20 minutes (IQR 15–43) with each HIVST client. The sensitivity of provider-delivered HIVST at the pharmacy was high when interpreted by providers (98.5%, 95% CI 97.8%, 99.1%) and clients (98.8%, 95% CI 98.0%, 99.3%), as was the specificity of HIVST in this setting (provider-interpretation: 96.9%, 95% CI 89.2%, 99.6%; client-interpretation: 93.8%, 95% CI 84.8%, 98.3%). Conclusions: When compared to the national HIV testing algorithm, provider-delivered blood-based HIVST at private pharmacies in Kenya performed well. These findings suggest that blood-based HIVST may be a useful tool to support PrEP initiation and continuation at private pharmacies and potentially other community-based delivery settings. © 2023 The Authors. Article	2023	Ortblad K.F.; Mogere P.; Omollo V.; Kuo A.P.; Asewe M.; Gakuo S.; Roche S.; Mugambi M.; Mugambi M.L.; Stergachis A.; Odoyo J.; Bukusi E.A.; Ngure K.; Baeten J.M.	Stand-alone model for delivery of oral HIV pre-exposure prophylaxis in Kenya: a single-arm, prospective pilot evaluation	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.26131	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161649197&doi=10.1002%2fjia2.26131&partnerID=40&md5=3e9d757d8ca07e2ce8d121a867fc79cf	Introduction: The delivery of daily, oral HIV pre-exposure prophylaxis (PrEP) at private pharmacies may overcome barriers to PrEP delivery at public healthcare facilities, including HIV-associated stigma, long wait times and overcrowding. Methods: At five private, community-based pharmacies in Kenya, a care pathway for PrEP delivery (ClinicalTrials.gov: NCT04558554) was piloted—the first of its kind in Africa. Pharmacy providers screened clients interested in PrEP for HIV risk, then used a prescribing checklist to identify clients without medical conditions that might contraindicate PrEP use, counsel them on PrEP use and safety, conduct provider-assisted HIV self-testing and dispense PrEP. For complex clinical cases, a remote clinician was available for consultation. Clients who did not meet the checklist criteria were referred to public facilities for free services delivered by clinicians. Pharmacy providers dispensed a 1-month PrEP supply at initiation and a 3-month supply thereafter at a client fee of 300 KES (~$3 USD) per visit. Results: From November 2020 to October 2021, pharmacy providers screened 575 clients, identified 476 who met the prescribing checklist criteria and initiated 287 (60%) on PrEP. Among pharmacy PrEP clients, the median age was 26 years (IQR 22–33) and 57% (163/287) were male. The prevalence of behaviours associated with HIV risk was high; 84% (240/287) reported sexual partners with unknown HIV status and 53% (151/287) reported multiple sexual partners (past 6 months). PrEP continuation among clients was 53% (153/287) at 1 month, 36% (103/287) at 3 months and 21% (51/242) at 7 months. During the pilot observation period, 21% (61/287) of clients stopped and restarted PrEP and overall pill coverage was 40% (IQR 10%–70%). Nearly, all pharmacy PrEP clients (≥96%) agreed or strongly agreed with statements regarding the acceptability and appropriateness of pharmacy-delivered PrEP services. Conclusions: Findings from this pilot suggest that populations at HIV risk frequently visit private pharmacies and PrEP initiation and continuation at pharmacies is similar to or exceeds that at public healthcare facilities. Private pharmacy-based PrEP delivery, conducted entirely by private-sector pharmacy staff, is a promising new delivery model that has the potential to expand PrEP reach in Kenya and similar settings. © 2023 The Authors. Article	2023	Orthbal, Katrina F; Bershon, Ashley R; Mogren, Peter; Kipninossa, Catherine; Gakuo, Stephen; Mbuire, Sarah; Thomas, Katherine K; Mugo, Nelly R; Barnes, Jarod M; Ngure, Kenneth	Effect of 6-Month HIV Preexposure Prophylaxis Dispensing With Interim Self-testing on Preexposure Prophylaxis Continuation at 12 Months: A Randomized Noninferiority Trial.	JAMA Network Open	-	-	-	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10275123	Importance: Daily oral HIV preexposure prophylaxis (PrEP) delivery requires quarterly clinic visits for HIV testing and drug refilling that are costly to health systems and clients. Objective: To evaluate whether 6-month PrEP dispensing supported with interim HIV self-testing (HIVST) could be noninferior PrEP continuation outcomes at 12 months compared with standard quarterly clinic visits. Design, Setting, and Participants: This randomized noninferiority trial was conducted from May 2018 to May 2021 with 12 months of follow-up among PrEP clients aged 18 years or older who were returning for their first refill at a research clinic in Kiambu County, Kenya. Intervention: Participants were randomized 2:2 to (1) 6-month PrEP dispensing with semiannual clinic visits and interim HIVST at 3 months or (2) standard-of-care (SOC) PrEP delivery with 3-month dispensing, quarterly clinic visits, and clinic-based HIV testing. Main Outcomes and Measures: Prespecified 12-month outcomes included recent HIV testing (any in past 6 months), PrEP refilling, and PrEP adherence (electrolyte tenofovir-diphosphate concentrations in dried blood spots). Binomial regression models were used to estimate risk differences (RDs), and a 1-sided 95% CI lower bound (LB) of -10% or greater was interpreted as noninferior. Results: A total of 495 participants were enrolled, with 329 enrolled in the intervention group and 166 enrolled in the SOC group; 330 (66.7%) were women, 295 (59.6%) were in serodiscordant relationships, and the median (IQR) age was 31 (27-40) years. At 12 months, 241 individuals in the intervention group (73.3%) and 120 in the SOC group (72.3%) returned to clinic. In the intervention group, recent HIV testing was noninferior (230 individuals (69.9%) compared with the SOC group (116 (69.9%); RD, -0.33%; 95% CI LB, -7.44%). PrEP refilling was noninferior (RD, 0.00%; 95% CI LB, -5.40%) and PrEP adherence was noninferior (RD, 0.00%; 95% CI LB, -5.40%) in the intervention group (131 (83.9%) compared with the SOC group (78 (82.2%; RD, 4.96%; 95% CI LB, -2.46%). No HIV seroconversions were observed over the follow-up period. Conclusions and Relevance: In this analysis of secondary trial end points at 1 year, semiannual PrEP dispensing with interim HIVST resulted in noninferior recent HIV testing and PrEP adherence compared with SOC quarterly PrEP dispensing. This novel model has the potential to optimize PrEP delivery. Article	2023	Ouseaine Y.M.; Alhaite C.; Ringa V.; Lydie N.; Volter A.	Health Literacy as a Mediator of the Relationship Between Socioeconomic Position and Pre-Exposure Prophylaxis Uptake Among Men Who Have Sex with Men Living in France	Health Literacy Research and Practice	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149685678&doi=10.3928%2f24748307-20230224-01&partnerID=40&md5=b2f8b7db1b317a0b4f36d2f1981178c2	BACKGROUND: In recent decades, several research studies have mentioned a potential mediating effect of health literacy (HL) on the relationship between socioeconomic position and health outcomes. However, no study to date has investigated this hypothesis on HIV prevention behaviors. OBJECTIVE: The present study aimed to evaluate whether HL mediates the relationship between socioeconomic status (SES) and pre-exposure prophylaxis (PrEP) uptake in men who have sex with men (MSM). METHODS: The study is based on data collected in the Enquête Rapport au Sexe report to sex 2019 survey, an anonymous, self-administered online cross-sectional survey in France conducted between February 16, 2019 and March 31, 2019. Data on education level and perceived financial situation were used as measures of SES, whereas HL was assessed from the Health Literacy Questionnaire's "Ability to actively engage with health care providers" scale. Mediation analysis was performed using a model-based causal moderated mediation analysis package in R software. Analyses were adjusted for age, place of residence, marital status, and sexual support. KEY RESULTS: The study sample included 1,772 MSM living in France. The HL scale's mean score was 3.2 (standard deviation = 0.6) on a 4-point scale. Most participants had a university degree (1,000 [56.4%]) and perceived their income as comfortable (62%). Overall, PrEP uptake was low (9.3%). The analyses did not show a moderating effect of HL on the relationship between education and PrEP uptake. However, a total mediation effect of HL was observed on the relationship between perceived financial situation and uptake. CONCLUSIONS: In the context of PrEP uptake, MSM ability to actively engage with health care providers may offset the effect of a difficult financial situation. In the current French context, where PrEP is now also available in general practitioner settings, this result could inform the development of training and support policies for health professionals and the way in which sexual health issues are addressed in consultations. Here, we report the antiretroviral therapy-as-long-acting-suppression (ATLAS)-2M study week 152 results. METHODS: ATLAS-2M is a phase 3b, randomized, multicenter study assessing the efficacy and safety of CAB+RPV LA every 8 weeks (Q8W) versus every 4 weeks (Q4W). Virologically suppressed (HIV-1 RNA <50 copies/mL) individuals were randomized to receive CAB+RPV LA Q8W or Q4W. Endpoints and analyses were descriptive. RESULTS: A total of 1045 participants received CAB+RPV LA (Q8W, n = 522; Q4W, n = 523). CAB+RPV LA Q8W demonstrated noninferior efficacy versus Q4W during week 2 (96.2% vs 95.8%; difference, 0.4%; 95% confidence interval, -3.0% to 3.8%) and 1.0% (n = 5) of participants having HIV-1 RNA ≥50 copies/mL, respectively, who attained treatment difference being 1.7% (95% CI: 0.1-3.3%), meeting the 4% noninferiority threshold. At week 152, 87% of participants maintained HIV-1 RNA <50 copies/mL with CAB+RPV LA Q8W (Q4W, 87%; n = 456; Q8W, 86%; n = 449). Overall, 12 (2.3%) participants in the Q8W arm had CVF. Eight and 10 participants with CVF had treatment-emergent, resistance-associated mutations to RPV and integrase inhibitors, respectively. Safety profiles were comparable, with no new safety signals observed since week 48. CONCLUSIONS: These data demonstrate virologic suppression durability with CAB+RPV LA Q8W or Q4W for ≥ 3 years and confirm long-term efficacy, safety, and tolerability of CAB+RPV LA as a complete regimen to maintain HIV-1 virologic suppression.	1058-4838	10.1093/cid/ciad820	*Anti-HIV Agents adverse effects; *HIV Infections drug therapy; *HIV Seropositivity drug therapy; *HIV-1 genetics; Adult; Anti-Retroviral Agents therapeutic use; Humans; RNA, Viral; Rilpivirine adverse effects; Viral Load	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Owaru, Kevin; Adiema, Lydia; Rono, Bernard; Violette, Lauren R; McClelland, R Scott; Donnell, Deborah; Scorville, Caitlin W; Oakeyo, Josephine; Baeten, Jared M; Bukusi, Elizabeth; Stewart, Jenell	Characteristics of Kenyan women using HIV PrEP enrolled in a randomized trial on doxycycline postexposure prophylaxis for sexually transmitted infection prevention.	BMC Women's Health	-	-	-	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10232580	INTRODUCTION: The global incidence of sexually transmitted infections (STIs) has been rapidly increasing over the past decade, with more than one million curable STIs being acquired daily. Young women in sub-Saharan Africa have a high prevalence and incidence of both curable STIs and HIV. The use of doxycycline as a prophylaxis to prevent STIs is promising; however, clinical trials, to date, have only been conducted among men who have sex with men (MSM) in high-income settings. We describe the characteristics of participants enrolled in the first trial to determine the efficacy of doxycycline post-exposure prophylaxis (PEP) to prevent STIs among women using oral pre-exposure prophylaxis (PrEP) for HIV prevention in Kenya and Uganda. METHODS: DoxyPrEPe PEP compared with standard of care (e.g., quarterly STI screening and treatment) to reduce incident bacterial STIs - Neisseria gonorrhoeae, Chlamydia trachomatis, and Treponema pallidum among Kenyan women aged ≥18 0000;18 and <30 years. All were also taking HIV pre-exposure prophylaxis (PrEP). We describe the baseline characteristics, STI prevalence, and STI risk perception at participants. RESULTS: Between February 2020 and November 2021, 489 women were enrolled. The median age was 24 years (IQR 21-27), the majority were married (66.1%), 370 women (82.4%) reported having a primary sex partner, and 33% had sex with new partners in the three months prior to enrolment. Two-thirds (67.3%, 268 women) did not use condoms, 36.7% reported transactional sex, and 43.2% suspected their male partners of having sex with other women. Slightly less than half (45.9%, 206 women) were recently recruited (enrolled more than 6 months after being exposed) to an STI. The prevalence of STIs was 17.9%, with C. trachomatis accounting for the majority of infections. Perceived risk of STIs was not associated with the detection of an STI. CONCLUSION: Young cisgender women using HIV PrEP in Kenya and enrolled in a trial of doxycycline postexposure prophylaxis had a high prevalence of curable STIs and represent a target population for an STI prevention intervention.	1472-6874	10.1186/s12905-023-02413-3-0	Cisgender young women; Doxycycline post-exposure prophylaxis; HIV; PrEP; STI	English	United Kingdom	Western and Central Europe and North America	Kenya	Eastern and Southern Africa	United States	Western and Central Europe and North America	Clinical
Article	2023	Owens C.	HIV pre-exposure prophylaxis awareness, practices, and comfort among urban and rural family medicine physicians	Journal of Rural Health	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141540068&doi=10.1111%2fjrh.12722&partnerID=40&md5=8368d51cd0b6b9f9b0b03cf3810ddf3	Purpose: HIV rates are increasing in rural areas, and adolescents are disproportionately affected. HIV pre-exposure prophylaxis (PrEP) is a daily pill that is effective at preventing HIV; however, PrEP uptake among adolescents is low. PrEP is dependent on primary care providers (PCPs) prescribing it, but research has overwhelmingly sampled urban PCPs. This study compared the PrEP awareness, practices, and comfort among urban and rural family medicine PCPs. Methods: A cross-sectional survey was conducted among family medicine physicians practicing in urban and rural counties. Participants were recruited survey between July 15 and August 5, 2022. Participants completed items assessing their demographic characteristics and PrEP awareness, practices, and comfort. A chi-square test and multiple logistic regression were used to determine rural/urban differences. Findings: Rural family medicine physicians were less comfortable than urban family medicine physicians in providing sexual risk reduction counseling to adolescents, telling an adolescent patient their HIV test result was HIV positive, and implementing all of the PrEP clinical activities for adolescents. Conclusions: Education, skill-building, and collaborative partnership interventions could improve the comfort levels of rural family medicine physicians in implementing the PrEP guidelines for their adolescent patients. Future research is needed to understand the factors that explain the differences in PrEP-related attitudes and practices between urban and rural family medicine physicians. Results from such studies could inform provider-based interventions that ultimately increase PrEP use and decrease HIV rates among rural adolescents. © 2022 National Rural Health Association.	08907435	10.1111/jrh.12723	comfort; family medicine physicians; HIV pre-exposure prophylaxis; knowledge	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Owens C.; Brandenburg D.; Grant M.J.; Carter K.; Hoffman M.; Hubach R.D.	PARENTAL CONCERNS OF THEIR SEXUAL AND GENDER MINORITY ADOLESCENTS USING HIV PRE-EXPOSURE PROPHYLAXIS	AIDS Education and Prevention	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147457582&doi=10.1521%2faeap.2023.35.1.83&partnerID=40&md5=c4e3b0ba6c01a2331e356080bb6b6e41	Although parents of sexual and gender minority (SGM) adolescents are key stakeholders in SGM adolescents using HIV pre-exposure prophylaxis (PrEP), there is limited understanding of parental concerns and attitudes about their SGM adolescents taking PrEP. Fifty-four parents in the West South Central region of the U.S. completed an online, mixed-method, cross-sectional questionnaire to explore their concerns and questions about PrEP. Quantitative and qualitative results show parents were most concerned about side effects, drug interactions and medication adherence, and slightly less concerned about condomless sex. Parents are less worried about picking PrEP from a pharmacy or returning to follow-up lab testing every three months. Most parents reported receiving medication information their adolescent takes from a medical provider and the media. Findings from this study can inform the development of parent-based PrEP interventions. Without further parent-based research and programming, SGM adolescents may continue to be disproportionately affected by HIV. © 2023 The Guilford Press.	8999546	10.1521/aeap.2023.35.1.85	concerns; parents; PrEP; questions; sexual and gender minority adolescents	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2023	Owens C.; Carter K.; Grant M.J.; Hubach R.D.; Hoffman M.	An Exploratory Study of the PrEP Modality Preferences Among a Convenience Sample of Parents of Sexual and Gender Minority Adolescents	Journal of Adolescent Health	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152705842&doi=10.1016%2fj.jadohealth.2023.02.015&partnerID=40&md5=58c6ea0f9ae79c7c7929748bc7ba0bbb	Purpose: Parents' attitudes toward contraceptive delivery methods have been shown to impact their adolescents' use of contraceptive methods. However, little is known about the HIV pre-exposure prophylaxis (PrEP) delivery method preferences among a convenience sample of 53 parents of SGM adolescents AMAB who live in Texas. Methods: Participants completed an online survey where they selected their preferred PrEP method the their SGM adolescent AMAB to use. PrEP as a daily oral pill, a bimonthly injectable, or a yearly implant. Parents answered an open-ended question about their reasons for choosing their preferred method. We analyzed data through descriptive statistics and inductive content analysis. Results: Findings from this convenience sample suggest that there is not one PrEP delivery method that parents of SGM adolescents AMAB prefer: one third of parents (33.3%) selected PrEP as a daily oral pill, 45.3% selected PrEP as a bimonthly injectable, and 21.2% selected PrEP as an annual implant. Parents cited multiple reasons for their PrEP method preference, including ease of use, effectiveness, and safety. Conclusions: Findings from this study suggest that PrEP delivery should be flexible to meet the needs of parents. Overall, this formative exploratory study sets the stage for future research and intervention development in increasing parental knowledge, preferences, and preference motivations for PrEP delivery methods. © 2023 Society for Adolescent Health and Medicine	10541395	10.1016/j.jadohealth.2023.02.015	Delivery method; HIV; Parents; Pre-exposure prophylaxis; Sexual and gender minority adolescent	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Owens C.; Currie J.M.; Hoffman M.; Grant M.J.; Hubach R.D.	Implementation Factors Associated With Primary Care Providers' Intention to Prescribe HIV PrEP to Adolescents in the United States	Journal of Adolescent Health	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152469644&doi=10.1016%2fj.jadohealth.2023.02.014&partnerID=40&md5=ce9b5b765a2cd72445d27c4b2bfbe1	Purpose: To the United States, adolescents (those 13–18 years old) are a key age group of those at risk for and affected by HIV. Although HIV pre-exposure prophylaxis (PrEP), one promising HIV prevention tool, is approved for eligible adolescents to use, adolescent access to PrEP is limited by primary care providers' (PCPs) willingness to prescribe it. This study examined which Theoretical Domains Framework factors are associated with PCPs' intention to prescribe PrEP to sexually active adolescents. Methods: A total of 770 licensed PCPs practicing family medicine, internal medicine, or pediatrics in the United States completed an online cross-sectional questionnaire. Participants were recruited through a Qualtrics panel. We used a hierarchical regression to assess the association of demographics, practice characteristics, sexual health care practices, and the 30 Theoretical Domains Framework factors with intention to prescribe PrEP to sexually active adolescents aged 13–18 years old. Results: Although nearly all PCPs had heard of PrEP (98.2%), only 39.2% reported prescribing it. Multivariable analyses revealed that PCPs' intention to prescribe PrEP was associated with 10 Theoretical Domains Framework factors: knowledge, skills, professional role, belief capacity, belief consequence, environmental resource, social influence, and emotion. Discussion: Our findings demonstrate that the Theoretical Domains Framework can be employed to understand the intrapersonal, interpersonal, and environmental factors associated with PCPs' intention to prescribe sexually active adolescents PrEP. Implementation strategists will need to implement interventions that improve provider knowledge, attitudes, and skills related to prescribing PrEP to eligible adolescents. © 2023 Society for Adolescent Health and Medicine	10541395	10.1016/j.jadohealth.2023.02.007	Attitude; HIV; Intention; Physician prescribing pattern; Pre-exposure prophylaxis; Primary care physicians; Sexual health; Theoretical Domains Framework	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2023	Owens C.; Grey S.J.; Carter K.; Hoffman M.; Mullen C.; Hubach R.D.	Implementation Facilitators and Barriers for Primary Care Providers Prescribing Daily Oral PrEP to Adolescents in the United States	AIDS Patient Care and STDs	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169470540&doi=10.1089%2fapc.2023.0096&partnerID=40&md5=f826c9e6c8a9bd9e907d9500d0d57	Primary care providers (PCPs) are critical in prescribing human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) to adolescents at risk of HIV. More research is needed to identify facilitators and barriers PCPs encounter in prescribing PrEP to eligible adolescents post-Food and Drug Administration (FDA) approval. This online cross-sectional survey examined the PrEP implementation facilitators and barriers PCPs encounter in prescribing daily oral PrEP to adolescents in the United States. Participants were recruited through a Qualtrics panel. We used a hierarchical regression to assess the association of demographics, practice characteristics, sexual health care practices, and the 30 Theoretical Domains Framework factors with intention to prescribe PrEP to sexually active adolescents aged 13–18 years old. Results: Although nearly all PCPs had heard of PrEP (98.2%), only 39.2% reported prescribing it. Article	2023	Pena E.D.; Westin M.R.; Duarte M.J.; Greco M.; Silva A.P.; Martinez Y.F.; Tupinambás U.; Greco D.B.	When prevention is the best remedy: HIV pre-exposure prophylaxis (PrEP) among adolescents gays and transgender women in Belo Horizonte, Minas Gerais State, Brazil. Quando a prevenção é o melhor remédio: profilaxia pré-exposição do HIV (PrEP) entre adolescentes gays e mulheres transgêneros em Belo Horizonte, Minas Gerais, Brasil. Cuando la prevención es el mejor remedio: profilaxis previa a la exposición al VIH (PrEP) entre adolescentes gays y mujeres transgéneros en Belo Horizonte, Minas Gerais, Brasil	Cadernos de Saúde Pública	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151373776&doi=10.1590%2f0102-311x00097921&partnerID=40&md5=7dac9016e0aeaec8b8	Based on the incorporation of pre-exposure prophylaxis (PrEP) as an HIV prevention strategy and considering the need to comprehend the use of medication among young people, this article analyzes narratives of gay men and transgender women from Belo Horizonte, Minas Gerais State, Brazil, participating in the PrEPVS19 study. This is a qualitative research, based on the interpretive anthropology, developed by 10 in-depth interviews with PrEP users between February and November 2019. The results showed that was seen as the main motivation for participating in the study and as a strategy combined with the use of condoms, whether as additional prevention, or assuming the leading role. The medication revealed signs built by the gender performances and the sexual practices, in which the pill was seen as a symbol of virility, and the condom, of femininity. The medication was also seen as a tool to strengthen the relationship with the couples, which did not mean that reliance on the association with HIV did not exist, mainly in the virtual context. In the family environment, they reported questions about the preventive function of the medication and the voluntary nature of the participation in the study. The youth's narratives revealed plural meanings of the medication and its social use, composing both the boys' and girls' performances. The signs attributed to the medication indicated that in addition to maintenance of health, the medication improves life and sexual freedom. © 2023 Fundacao Oswaldo Cruz. Article	2023	Peppercord, Toby; Cross, Samuel; Hill, Andrew	Cabotegravir-Global Access to Long-Acting Pre-exposure Prophylaxis for HIV.	Open Forum Infectious Diseases	-	-	-	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9830290/	A novel injectable pre-exposure prophylaxis, cabotegravir, has greater efficacy and acceptability than oral tenofovir/emtricitabine for prevention of HIV infection. Cabotegravir is currently priced at $22 200 per year, >165 times higher than the $65-$319 estimated cost-effectiveness threshold for middle-income countries (MICs). Following civil society pressure, ViiV provided access to generic versions in 90 countries, including 31 MICs, through voluntary licensing. We estimate that 1.2 million people could be reached with generic cabotegravir in MICs, 1.1 million of whom live in countries with per-capita gross domestic product (GDP) per capita. There were 38 countries excluded from the ViiV-MPP deal despite having a GDP per capita lower than the highest-income country. Although economic growth is expected to increase the number of people living in countries above the threshold, 1.2 billion people (30% global population), with an incidence of 122 000 (8%). For cabotegravir to have a significant impact on HIV infections, millions will need to be treated at affordable prices in a wide range of countries.	2328-8957	10.1093/ofid/ofad673	HIV; PrEP; access; cabotegravir	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative
Article	2023	Pereira M.; Castro C.T.D.; Magno L.; Oliveira T.D.A.; Gomes F.S.; Neves F.M.F.; Nascimento P.R.D.S.D.; Dourado I.	Adverse effects of daily oral pre-exposure prophylaxis in men who have sex with men and transgender women: A systematic review and meta-analysis. Efeitos adversos da profilaxia pré-exposição oral diária para homens que fazem sexo com homens e mulheres transgênero: Revisão sistemática e metanálise. Efectos adversos de la profilaxis preexposición oral diaria para hombres que tienen relaciones sexuales con hombres y mujeres trans: revisión sistemática y metanálisis	Cadernos de Saúde Pública	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179463648&doi=10.1590%2f0102-311XEN089522&partnerID=40&md5=e9e07ab31d2d5f0f9d	The adverse effects of oral pre-exposure prophylaxis (PrEP) using tenofovir disoproxil fumarate are barriers to PrEP initiation and continuation. AI+though serious effects are rare and predictable, evidence for the assessment among men who have sex with men (MSM) and transgender women (TGW) is still limited. This study assesses the adverse effects of daily oral PrEP in MSM and TGW. This is a systematic review and meta-analysis of clinical tri+als and cohort studies on the use of daily oral PrEP selected from the PubMed/MEDLINE, Embase, LILACS, and Cochrane CENTRAL databases. Data extraction included adverse effects and changes in renal and hepatic mark+ers. Random effects models were used to summarize the risk of adverse effects throughout the study. Heterogeneity was assessed using the Cochran's Q test and the inconsistency test (I2). The risk of bias and the certainty of the evi+dence were assessed using the Cochrane Collaboration recommendations. The search identified 653 references. Of these, 10 were selected. All studies assessed the eligibility of renal and hepatic markers. The use of daily oral PrEP was not associated with grade 3 or 4 adverse events (RR = 0.99; 95%CI: 0.83–1.18; I2 = 26.1%), any serious adverse event (RR = 1.04; 95%CI: 0.58–1.87; I2 = 88.4%), grade 3+4 creatinine level (RR = 0.66; 95%CI: 0.24–1.84; I2 = 79.9%), and grade 3 or 4 hypophosphatemia (RR = 0.86; 95%CI: 0.15–2.10). The certainty of the evidence ranged from high for the outcomes analyzed. Daily oral PrEP is safe and well-tolerated by MSM and TGW. Adverse effects were minimal and evenly distributed between intervention and control. © 2023 Fundacao Oswaldo Cruz. Article	2023	Perry B.; Mokokwe N.; Agot K.; Ngoje D.O.; Strack R.; Cornell A.	MULTILEVEL FACTORS INFLUENCING INTERRUPTIONS IN PREP USE AMONG YOUNG WOMEN IN SIAYA COUNTY, KENYA	AIDS Education and Prevention	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169415260&doi=10.1521%2faeap.2023.35.2.141&partnerID=40&md5=4046ea0b0ba0f03402157b79ca6f8cd8	Young women in sub-Saharan Africa continue to be disproportionately at risk for HIV. Oral pre-exposure prophylaxis (PrEP) can reduce women's HIV risk when taken daily throughout their "amount of risk" for HIV. However, adherence to oral PrEP is challenging for many women. This study explored factors influencing PrEP interruptions among young women in Siaya County, Kenya. Through group discussions and in-depth interviews, 30 participants described PrEP and their social network members (female peers, male partners/peers, family, and community members) shared photographs and identified broad social categories of PrEP interruptions, including (1) widespread misinformation about PrEP, (2) social pressures from religious communities, (3) health care staff recommendations to interrupt PrEP use, (4) partner rejection of PrEP, (5) changes in women's risk awareness, and (6) a personal desire to occasionally pause daily use. Collectively, participants identified strategies to address these challenges. These findings can inform future programs targeting the broader social-ecological influences on young women's persistent use of PrEP. © 2023 The Guilford Press.	8999546	10.1521/AEAP.2023.35.2.141	HIV; Kenya; persistence; PrEP; social ecology; young women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Kenya	Eastern and Southern Africa	Qualitative
Article	2023	Peyriere H.; Jacquet J.-M.; Peries M.; Tolbost V.; Bouche B.; Mauboussin J.-M.; Makinson A.; Portelli C.; Ferreyra M.; Rouanet I.; Montoya-Ferrer A.; El-Mdjaoui S.; Cortesi-Bonilla F.; Fraisse T.; Gras F.; Lauvollard D.; Nugat N.; Reynes J.; Donnadieu-Rigole H.	Chemsex in HIV pre-exposure prophylaxis users: Assessment of mood disorders and addictive behavior	Fundamental and Clinical Pharmacology	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143846666&doi=10.1111%2ffcp.12854&partnerID=40&md5=90253630675163a3b492ea96a6220ec3	The assessment of mood disorders and addiction linked to the practice of chemsex a of interest given the psychoactive substances used. The aim of this study was to assess risky sexual and addictive behavior to chemsex and related anxiety/depression symptoms in individuals receiving HIV pre-exposure prophylaxis (PrEP). In this cross-sectional study, all adults presenting for PrEP renewal at French sexual health centers were enrolled from January 2019 to March 2019. Participants completed a questionnaire on chemsex (i.e., the use of psychoactive substances before/during sex), including adapted Alcohol, Smoking and Substance Involvement Screening Test (ASSIST) questions, and questions on anxiety/depression (Hospital Anxiety and Depression Scale) and sexual compulsivity (Hypersexual Disorder Screening Inventory Depression Scale. In the last 3 months before enrollment, 35.9% (94/236) of participants reported chemsex. The main psychoactive substances consumed during chemsex were cannabis (74.4%), gamma-hydroxybutyrate (66.3%), and other psychostimulants (60%). The median score of the chemsex-focused ASSIST was 0 [QR25–75: 3–15; 72.2% of participants had a score justifying at least a brief intervention [14]. In multivariate analyses, anxiety and callousness consumption were associated with an ASSIST score >6 OR 13.01 (95%CI: 1.68–662.3), P = 0.0082, and OR 8.468 (95%CI 2.066–43.058), P = 0.0014, respectively. The level of addiction to the practice of chemsex can be difficult to estimate for the user, and the ASSIST makes it possible to evaluate the addiction and to direct the subjects toward specialized consultations of addictology, sexual health, or PrEP renewals. The implementation of the modified ASSIST in these consultations can allow early systematic screening and counseling. © 2022 Société Française de Pharmacologie et de Thérapeutique. Article	2023	Parunbos, Julie; Castilho, Maria; Matos, Klein, Helena Espellet; Miranda, Caroline; Perin, Fernanda Steiner; Passoni, Patienne; Veloso, Valdiléa G.; Grinsztejn, Beatriz	Custos de implementação do cabotegravir injetável de longa duração como profilaxia ao HIV no Brasil	Physis	-	-	-	http://www.scielo.br/scielo.php?script=sci_arttext&pid=S0103-73312023000100836	Resumo O artigo descreve a estimação dos custos potenciais, sob a ótica do Ministério da Saúde (MS), da implementação do medicamento cabotegravir injetável de longa duração (CAB-LA) no Sistema Único de Saúde, como alternativa para a prevenção à infecção pelo HIV a partir da estratégia nacional de prevenção combinada. Utilizou-se o instrumental analítico de custeio de valor para elaborar a cadeia de valor do CAB-LA com a identificação dos seus elos e atividades. Foram definidos três cenários de demanda com base em dados da população-alvo, variando em abrangência geográfica, e calculados os custos potenciais. A cadeia de valor do CAB-LA é dividida em três grandes elos: produção, incorporação e assistência farmacêutica. Somente o último é considerado para o cálculo dos custos sob responsabilidade orçamentária do MS. Os custos potenciais estimados em 2022 variaram de R$ 15 milhões a R$ 19 milhões no cenário de demanda baixa, média e alta, respectivamente. O estudo apresenta os custos potenciais para o MS, incluindo a necessidade de testes e procedimentos, de forma a orientar os gestores públicos e o próprio processo de incorporação. A matriz de preço do CAB-LA é uma importante limitação para os resultados.	0103-7331	10.1590/s0103-73312023033021	HIV; Pre-Exposure Prophylaxis; Profilaxia pré-exposição; Aids; Brazilian Unified Health System; CAB-LA; Cadeia de valor; Sistema Único de Saúde; Value chain	Portuguese	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Quantitative

Potential cost-effectiveness of community availability of tenofovir, lamivudine, and dolutegravir for HIV prevention and treatment in east, central, southern, and west Africa: a modelling analysis	The Lancet Global Health	-	-	-	-	2214109X	10.1016/S2214-109X(23)00383-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171269750&doi=10.1016%2fS2214-109X%2823%2900383-2&partnerID=40&md5=30b2917bb3b88837f0f457296cf8d5603	Background: Post-exposure prophylaxis (PEP) offers protection from HIV after condomless sex, but is not widely available in a timely manner in east, central, southern, and west Africa. To inform the potential pilot implementation of such an approach, we modelled the effect and cost-effectiveness of making PEP consisting of tenofovir, lamivudine, and dolutegravir (TLD) freely and locally available in communities without prescription, with the aim of enabling PEP use within 24 h of condomless sex. Free community availability of TLD (referred to as community TLD) might also result in some use of TLD as pre-exposure prophylaxis (PrEP) and as antiretroviral therapy for people living with HIV. Methods: Using an existing individual-based model (HIV Synthesis), we explicitly modelled the potential positive and negative effects of community TLD. Through the sampling of parameter values we created 1000 setting-scenarios, reflecting the uncertainty in assumptions and a range of settings similar to those seen in east, central, southern, and west Africa (with a median HIV prevalence of 14·8% in women and 8·1% in men). For each setting scenario, we considered the effects of community TLD. TLD PEP was assumed to have at least 90% efficacy in preventing HIV infection after condomless sex with a person living with HIV. Findings: The modelled effects of community TLD availability based on an assumed high uptake of TLD resulted in a mean reduction in incidence of 31% (90% range over setting scenarios, 6% increase to 57% decrease) over 20 years, with an HIV incidence reduction over 50 years in 91% of the 1000 setting scenarios, deaths averted in 55% of scenarios, reduction in costs in 92% of scenarios, and disability-adjusted life-years averted in 64% of scenarios with community TLD. Community TLD was cost-effective in 90% of setting scenarios and cost-saving (with disability-adjusted life-years averted) in 58% of scenarios. When only examining setting scenarios in which there was lower uptake of community TLD, community TLD is cost-effective in 92% of setting scenarios. Interpretation: The introduction of community TLD, enabling greater PEP access, is a promising approach to consider further in pilot implementation projects. Article	2023	Phillips, G; Hall, CDX; Rodriguez-Ortiz, AE; Davoudpour, S; Rusie, L; Feinstein, BA; Beach, LB	Disparities in PrEP Eligibility and Uptake at the Intersection of Sexual Identity and Behavior: Results from a Federally Qualified Health Center in Chicago	Sexuality Research & Social Policy	-	-	-	-	1868-9884	10.1007/s13178-023-00835-x	https://link.springer.com/article/10.1007/s13178-023-00835-x	IntroductionUse of pre-exposure prophylaxis (PrEP) is an effective biomedical intervention contributing to Ending the HIV Epidemic (EHE) in the USA. However, PrEP effectiveness is hindered by inadequate uptake among populations vulnerable to HIV. This study examines the relationships between sexual behavior/identity and PrEP eligibility and uptake while controlling for race/ethnicity (given evidence of racial/ethnic disparities in PrEP eligibility and update).MethodsData for this study were collected between 2012 and 2020 from the electronic medical record (EMR) from a Federally Qualified Health Center (FQHC) in Chicago. A series of bivariate and four parallel logistic regressions (one each for transgender women, cisgender women, transgender men, and cisgender men) were conducted to examine factors associated with PrEP eligibility, controlling for race/ethnicity. Two additional regressions examined PrEP uptake-measured by first and second prescription outcomes-among cisgender men. All models controlled for age, monthly income, year of initial appointment, and primary clinic location.ResultsGay/lesbian cisgender women who have sex with men only (WSMO) were less likely to be eligible for PrEP than their heterosexual WSMO counterparts. Bisexual and heterosexual cisgender women who have sex with men and women (WSMW) were less likely to be eligible for PrEP than heterosexual cisgender WSMO. Gay/lesbian cisgender WSMO were less likely to be eligible for PrEP than those cisgender WSMO who identified as heterosexual. Regardless of sexual identity, men who have sex with women only (MSWO) were less likely to be eligible for PrEP than men who have sex with men only (MSMO). Heterosexual cisgender MSMO and men who have sex with men and women (MSMW) were less likely to be eligible for PrEP compared to their gay cisgender MSMO peers. Compared to gay cisgender MSMO, gay and bisexual cisgender MSMW were more likely to be eligible for PrEP. Similarly, among cisgender men, those who did not identify as gay were significantly less likely to receive a first PrEP prescription compared to gay MSMO with odds of receiving a second PrEP prescription being lower for bisexual MSMW, and heterosexual MSMW and MSWO compared to gay MSMO. Moreover, among transgender women and transgender men, both Latinx and Black patients were more likely to be eligible for PrEP than their White counterparts. However, for cisgender men, both Latinx and Black patients were less likely than their White peers to be eligible for PrEP.ConclusionsAlthough assessment of PrEP eligibility relies on a number of criteria, the former CDC guidelines emphasized sexual behavior, particularly the gender(s) of sexual partners, as the most salient focus, our findings highlight the missed opportunities of not also including sexual identity in prior guidelines. While the new CDC guidelines use a more holistic approach to eligibility, assessment of sexual identity and behavior at intake are key to ensuring culturally appropriate and inclusive messaging.Policy ImplicationsPrEP eligibility criteria should be revisited and revised, particularly for cisgender and transgender women, who are frequently missed by current guidelines. Also, more attention is needed to ensure that advertisements and clinical encounters do not perpetuate monosexist viewpoints, including bisexual erasure. Article	2023	Philpot S.P.; Murphy D.; Chan C.; Haire B.; Wells N.; Fraser D.; Grulich A.E.; Bavinton B.R.	Identifying Patterns of Discontinuing and Recommencing Pre-exposure Prophylaxis in the Context of Sexual Behavior Among Gay and Bisexual Men in Australia	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04013-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148500049&doi=10.1007%2fs10461-023-04013-3&partnerID=40&md5=b1fd3ff92b8d00102b4e3c05da0cfc72	We mapped gay and bisexual men's (GBM) patterns of using pre-exposure prophylaxis (PrEP) over time and explored sexual behavior as PrEP use changed. We conducted semi-structured interviews between June 2020 and February 2021 with 40 GBM living in Australia who had changed their PrEP use since initiating. There was considerable diversity in patterns of discontinuation, suspension, and recommencement of PrEP. Reasons for changing PrEP use mostly centered on accurate perceived changes to HIV risk. Twelve participants reported condomless anal intercourse with casual or fuckbuddy partners after discontinuing PrEP. These sex events were unanticipated, condoms were not a preferred option, and other risk reduction strategies were applied inconsistently. Service delivery and health promotion can support safer sex among GBM when PrEP use fluctuates by promoting event-driven PrEP and/or non-condom-based risk reduction methods during periods off daily PrEP, and guiding GBM to better recognize changing circumstances of risk and when to recommence PrEP. © 2023, The Author(s). Article	2023	Philpot S.P.; Prestage G.; Holt M.; Maher L.; Haire B.; Bourne A.; Hammoud M.A.	Reasons for not Using HIV Pre-Exposure Prophylaxis (PrEP) among Gay and Bisexual Men in Australia: Mixed-Methods Analyses from a National, Online, Observational Study	Behavioral Medicine	-	-	-	-	8964289	10.1080/08964289.2022.2033159	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125314855&doi=10.1080%2f08964289.2022.2033159&partnerID=40&md5=42eb932d5287d255912c9e967778b809	Although approximately 31,000 Australian gay and bisexual men (GBM) are eligible for HIV pre-exposure prophylaxis (PrEP), only 18,500 people currently use it, indicating a need to investigate why GBM do not use it. This article uses data from a national, online, observational study. It adopts a mixed-methods analysis to responses to survey questions asking about reasons Australian GBM were not using PrEP in 2018, according to their level of HIV risk as delineated by the Australian PrEP prescribing guidelines at the time. Participants responded to check-box questions and had the option to respond to a qualitative free-text question. Results showed that just over one-fifth of men were at higher risk of HIV acquisition. Compared to lower-risk men, higher-risk men were more likely to indicate PrEP was too expensive and more likely to cite embarrassment asking for it. Reasons for not using PrEP included a lack of personal relevance, poor accessibility or knowledge, concerns about PrEP's inability to protect against STIs, potential side effects, and a preference for condoms. We conclude that health promotion more effectively targeting GBM who may benefit the most from PrEP may be valuable. © 2022 Taylor & Francis Group, LLC. Article	2023	Phiri, Ditebogo L.; Rees, Kate; Davies, Natasha	Outcomes of a model for re-testing HIV-negative index contacts in Sedibeng, South Africa.	Southern African Journal of HIV Medicine	-	-	-	-	2078-6751 1608-9693	10.4102/sajhivmed.v24i1.1482	https://pubmed.ncbi.nlm.nih.gov/37293602/	BACKGROUND: Index contact testing is an HIV case-finding approach that elicits sexual or needle-sharing partners, as well as biological children, of people living with HIV (PLHIV) and offers them HIV testing services. OBJECTIVES: We aim to describe the results of an innovative project in Sedibeng District that expanded index testing by retesting previously negative contacts and incorporating status-neutral testing. METHOD: We used registers to identify people who previously tested HIV-negative through index testing from March 2019 to September 2021. The individuals were telephonically traced and offered HIV retesting. Data were collected on a weekly basis using REDCap(®). We monitored the number of individuals called, those who came back for retest, and their HIV results. RESULTS: Fifteen counsellors contacted 968 people over 12 months. Forty-eight percent (462 out of 968) of those called returned for testing. Of those, 121 (26%) tested positive. Overall, 66 out of 276 (24%) men with HIV and 55 out of 186 (30%) women with HIV were identified and linked to antiretroviral treatment (ART). Fifty-seven percent (194 out of 341) of clients who tested HIV-negative were offered, and 124 out of 194 (64%) initiated, pre-exposure prophylaxis (PrEP). All individuals who retested HIV-positive had a new diagnosis; none reported having had another positive test result between the original negative and the positive retest. CONCLUSION: Revisiting index clients with a previous negative HIV test result is worthwhile, creating an opportunity to identify undiagnosed PLHIV and high-risk people for PrEP. The high positivity rate highlights the importance of providing a sero-neutral approach to HIV testing, including integrating prevention messaging and linkage to PrEP services.	pre-exposure prophylaxis; seroconversion; U=U; HIV case-finding; index contacts testing; REDCAP; routine data; sero-different couples	English	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2023	Pickel J.; Fiks A.G.; Karavite D.; Maleki P.; Beidas R.S.; Dowshen N.; Petsis D.; Gross R.; Wood S.M.	Provider perspectives on clinical decision support to improve HIV prevention in pediatric primary care: a multiple methods study	Implementation Science Communications	-	-	-	-	26622211	10.1186/s43058-023-00394-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165271415&doi=10.1186%2fs43058-023-00394-7&partnerID=40&md5=46009c3cdb10b850f68278a7fc388e1f	Background: Clinical decision support (CDS) is a promising intervention for improving uptake of HIV testing and pre-exposure prophylaxis (PrEP). However, little is known regarding provider perspectives on acceptability, appropriateness, and feasibility of CDS for HIV prevention in pediatric primary care, a key implementation setting. Methods: This was a cross-sectional multiple methods study utilizing surveys and in-depth interviews with pediatricians to assess acceptability, appropriateness, and feasibility of CDS for HIV prevention, as well as to identify contextual barriers and facilitators to CDS. Qualitative analysis utilized work domain analysis and a deductive coding approach grounded in the Consolidated Framework of Implementation Research. Quantitative and qualitative data were merged to develop an Implementation Research Logic Model to conceptualize implementation determinants, strategies, mechanisms, and outcomes of potential CDS use. Results: Participants (n = 26) were primarily white (92%), female (88%), and physicians (73%). Using CDS to improve HIV testing and PrEP delivery was perceived as highly acceptable (median score 5), IQR 4–5), appropriate (5, IQR 4–5), and feasible (4, IQR 3.75–4.75) using a 5-point Likert scale. Providers identified confidentiality and time constraints as two key barriers to HIV prevention care spanning every workflow step. With respect to desired CDS features, providers sought interventions that were integrated into the primary care workflow, standardized to promote universal testing yet adaptable to the level of a patient's HIV risk, and addressed providers' knowledge gaps and bolstered self-efficacy in providing HIV prevention services. Conclusions: This multiple methods study indicates that clinical decision support in the pediatric primary care setting may be an acceptable, feasible, and appropriate intervention for improving the reach and equitable delivery of HIV screening and PrEP services. Design considerations for CDS in this setting should include deploying CDS interventions early in the visit workflow and prioritizing standardized but flexible designs. © 2023, The Author(s). Article	2023	Pico-Espinosa, Oscar Javier; Hull, Mark; Gaspar, Mark; Lachowsky, Nathan; Grace, Daniel; Truong, Robinson; Mohammed, Saira; MacPherson, Paul; Woodward, Kevin; Tan, Darrell H. S.	Disjuncture between self-perceived and clinically assessed risk of HIV among gay, bisexual, and other men who have sex with men in Ontario and British Columbia, Canada.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-023-16065-0	https://pubmed.ncbi.nlm.nih.gov/37312073/	BACKGROUND: Self-perceived and clinically assessed HIV risk do not always align. We compared self-perceived and clinically assessed risk of HIV and the reasons for self-perceived low risk of HIV among gay, bisexual, and other men who have sex with men (GBM) from large urban centers in Ontario and British Columbia, Canada. METHODS: Never PrEP users recruited from sexual health clinics or online, completed a cross-sectional survey between July/2019 and August/2020. We contrasted self-perceived HIV risk against criteria from the Canadian PrEP guidelines and participants were categorized as concordant or discordant. We used content analysis to categorize participants' free-text explanations for perceived low HIV risk. These were compared with answers to quantitative responses about condomless sex acts and number of partners. RESULTS: Of 315 GBM who self-perceived low risk of HIV, 146 (46%) were considered at high risk according to the guidelines. Participants with discordant assessment were younger, had less years of formal education, were more likely to be in an open relationship and were less likely to self-identify as gay. Reasons for self-perceived low HIV risk in the discordant group were condom use (27%), being in a committed relationship/having one main partner (15%), having no or infrequent anal sex (12%) and having few partners (10%). CONCLUSIONS: There is a disjuncture between self-perceived and clinically assessed risk of HIV. Some GBM may underestimate their HIV risk and clinical criteria may overestimate risk. Bridging these gaps requires efforts to increase HIV risk awareness in the community, and refinement of clinical assessments based on individualized discussions between the provider and the user. Article	2023	Pico-Espinosa, Oscar Javier; Hull, Mark; MacPherson, Paul; Grace, Daniel; Lachowsky, Nathan; Gaspar, Mark; Mohammed, Saira; Truong, Robinson; Tan, Darrell H S	Reasons for not using pre-exposure prophylaxis for HIV and strategies that may facilitate uptake in Ontario and British Columbia among gay, bisexual and other men who have sex with men: a cross-sectional survey.	CMAJ Open	-	-	-	-	2291-0026	10.9778/cmajo.20220113	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10310342	BACKGROUND: Pre-exposure prophylaxis (PrEP) for HIV is underutilized. We aimed to identify barriers to use of PrEP and strategies that may facilitate its uptake. METHODS: Gay, bisexual and other men who have sex with men, aged 19 years or older and living in Ontario and British Columbia, Canada, completed a cross-sectional survey in 2019-2020. Participants who met Canadian PrEP guideline criteria and were not already using PrEP identified relevant barriers and which strategies would make them more likely to start PrEP. We described the barriers and strategies separately for Ontario and BC. RESULTS: Of 1527 survey responses, 260 respondents who never used PrEP and met criteria for PrEP were included. In Ontario, the most common barriers were affordability (43%) and concern about adverse effects (42%). In BC, the most common reasons were concern about adverse effects (41%) and not feeling at high enough risk (36%). In Ontario, preferred strategies were short waiting time (63%), the health care provider informing about their HIV risk being higher than perceived (62%), and a written step-by-step guide (60%). In BC, strategies were short waiting time (68%), people speaking publicly about PrEP (68%), and the health care provider counselling about their HIV risk being higher than perceived (64%), adverse effects of PrEP (65%) and how well PrEP works (62%). INTERPRETATION: Concern about adverse effects and not self-identifying as having high risk for HIV were common barriers, and shorter waiting times may increase PrEP uptake. In Ontario, the findings suggested lack of affordability, whereas in BC, strategies involving health care providers were valued. Article	2023	Pike, Carey; Bekker, Linda-Gail	Interrogating the promise of long-acting HIV pre-exposure prophylaxis.	Trends in Molecular Medicine	-	-	-	-	1471-499X	10.1016/j.molmed.2022.11.003	https://dx.doi.org/10.1016/j.molmed.2022.11.003	Oral HIV pre-exposure prophylaxis (PrEP) is a well-established product that provides a safe and highly effective way for individuals to protect themselves against HIV infection. However, hopes of a significant reduction in HIV incidence have been disappointing because of low uptake, adherence challenges to a daily pill regimen, and consistently high discontinuation rates within 6 months of initiation. Long-acting agents have been long awaited for their potential to facilitate adherence and to offer a choice between PrEP products. As the first long-acting agents enter the market, with more poised to follow, questions around how to integrate long-acting agents into oral PrEP platforms, and what the potential advantages and pitfalls of this integration will be, now need to be considered. Article	2023	Pike, Carey; Rousseau, Elzette; Bekker, Linda-Gail	Promises and potential pitfalls of long-acting injectable pre-exposure prophylaxis.	South African Journal of HIV Medicine	-	-	-	-	2078-6751	10.4102/sajhivmed.v24i1.1497	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10713495	The number of products that can provide pre-exposure prophylaxis (PrEP) for HIV prevention is expanding, with three now approved in South Africa (oral Tenofovir-based PrEP, injectable Cabotegravir, and a Dapivirine-based vaginal ring) and more in the development pipeline. Although highly effective and safe, oral PrEP products have not reduced HIV incidence in South Africa to the extent seen in other countries, primarily due to adherence challenges, rapidly diminishing persistence over time, and insufficient scale-up of PrEP service delivery. The Dapivirine vaginal ring, which provides 1-month-long protection, provides women with a new and discreet choice for PrEP; however, it is Cabotegravir long-acting (CAB LA) that is anticipated to land the largest impact. Administered as an intramuscular injection given every 2 months, CAB LA is safe, highly efficacious, and expected to become available in South Africa in late 2023. Yet, clinical and implementation questions remain, including the need to understand and characterise breakthrough HIV infections amongst CAB LA users, knowledge of how to package each PrEP product in a new context of PrEP choice, and how to avoid the remedicalisation of PrEP access following extensive efforts to make oral PrEP delivery differentiated and community based.	HIV prevention, pre-exposure prophylaxis, long-acting PrEP, Cabotegravir long-acting, injectable PrEP	English	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Review
Article	2023	Pintye J.; Kinuthia J.; Abuna F.; Anderson P.L.; Dettinger J.C.; Gomez L.; Haberer J.E.; Marwa M.M.; Ngumbau N.; Omondi P.; Odhiambo B.; Stern J.; Watoyi S.; Baeten J.M.; John-Stewart G.	HIV pre-exposure prophylaxis initiation, persistence, and adherence during pregnancy through the postpartum period	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000003617	https://pubmed.ncbi.nlm.nih.gov/37289583/	Objective:We evaluated pre-exposure prophylaxis (PrEP) initiation, persistence, and adherence measured via tenofovir-diphosphate (TFV-DP) concentrations in dried blood spots (DBS) among women offered PrEP during pregnancy.Methods:We prospectively analyzed data from participants in the PrIMA Study (NCT03070600) who were offered PrEP during the second trimester and followed through 9 months postpartum. At follow-up visits (monthly in pregnancy; 6weeks, 6months, 9months postpartum), self-reported PrEP use was assessed, and DBS were collected for quantifying TFV-DP concentrations.Results:In total, 2949 participants were included in the analysis. At enrollment, median age was 24years interquartile range IQR) 21-29, gestational age 24weeks (IQR 20-28), and 4% had a known partner living with HIV. Overall, 405 (14%) participants initiated PrEP in pregnancy with higher frequency among those with risk factors for HIV acquisition, including >2 lifetime sexual partners, syphilis during pregnancy, forced sex, and intimate partner violence (P<0.05). At 9 months postpartum, 58% of PrEP initiators persisted with PrEP use, of which 54% self-reported not missing any PrEP pills in the last 30days. Among DBS randomly selected from visits where participants persisted with PrEP (n=427), 50% had quantifiable TFV-DP. Quantifiable TFV-DP was twice as likely in pregnancy than postpartum adjusted risk ratio (aRR) = 1.90, 95% confidence interval (CI) 1.40-2.57, P<0.001. Having a partner known to be living with HIV was the strongest predictor of PrEP initiation, persistence, and quantifiable TFV-DP (P<0.001).Conclusions:PrEP persistence and adherence waned postpartum, though over half of PrEP initiators persisted through 9-months postpartum. Interventions should prioritize increasing knowledge of partner HIV status and sustaining adherence in the postpartum period. © 2023 Lippincott Williams and Wilkins. Article	2023	Piper, Kaitlin N; Anderson, Katherine M; Kokubun, Caroline W; Sheth, Anandi N; Sales, Jessica	Using qualitative comparative analysis to understand the conditions that produce successful PrEP implementation in family planning clinics.	Implementation Science Communications	-	-	-	-	2662-2211	10.1186/s43058-023-00450-2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10251711	BACKGROUND: Title X-funded family planning clinics have been identified as optimal sites for delivery of pre-exposure prophylaxis (PrEP) for HIV prevention to U.S. women. However, PrEP has not been widely integrated into family planning services, especially in the Southern U.S., and data suggest there may be significant implementation challenges in this setting. METHODS: To understand contextual factors that are key to successful PrEP implementation in family planning clinics, we conducted in-depth qualitative interviews with key informants from 38 family planning clinics (11 clinics prescribed PrEP and 27 did not). Interviews were guided by constructs from the Consolidated Framework for Implementation Research (CFIR), and qualitative comparative analysis (QCA) was used to uncover the configurations of CFIR factors that led to PrEP implementation. RESULTS: We identified 3 distinct construct configurations, or pathways, that led to successful PrEP implementation: (1) high "Leadership Engagement" AND high "Available Resources"; OR (2) high "Leadership Engagement" AND NOT located in the Southeast region; OR (3) high "Access to Knowledge and Information" AND NOT located in the Southeast region. Additionally, there were 2 solution paths that led to absence of PrEP implementation: (1) low "Access to Knowledge and Information" AND low "Leadership Engagement"; OR (2) low "Available Resources" AND high "External Partnerships". DISCUSSION: We identified the most salient combinations of co-occurring organizational barriers or facilitators associated with PrEP implementation across Title X clinics in the Southern U.S. We discuss implementation strategies to promote pathways that led to implementation success, as well as strategies to overcome pathways to implementation failure. Notably, we identified regional differences in the pathways that led to PrEP implementation, with Southeastern clinics facing the most obstacles to implementation, specifically substantial resource constraints. Identifying implementation pathways is an important first step for packaging multiple implementation strategies that could be employed by state-level Title X grantees to help scale up PrEP. Article	2023	Pitts R.A.; Ban K.; Greene R.E.; Kapadia F.; Braithwaite R.S.	Sustaining PrEP Prescriptions at a Safety-Net Hospital in New York City During COVID-19: Lessons Learned	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-03977-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145847669&doi=10.1007%2fs10461-023-03977-6&partnerID=40&md5=ce377084375cc6fd187aee4757afcada	To understand the impact of COVID-19-related disruptions on PrEP services, we reviewed PrEP prescriptions at NYC Health + Hospitals/Bellevue from July 2019 through July 2021. PrEP prescriptions were examined as PrEP person-equivalents (PrEP PE) in order to account for the variable time of refill duration (i.e., 1–3 months). To assess "PrEP coverage", we calculated PrEP medication possession ratios (MPR) while patients were under study observation. Pre-clinic closure, mean PrEP PE = 244.2 (IQR 189.2, 287.5; median = 252.5) were observed. Across levels of clinic closures, mean PrEP PE = 247.3, (IQR 215.5, 265.4; median = 219.9) during 100% clinic closure, 255.4 (IQR 224, 284.3; median = 249.0) during 80% closure, and 274.6 (IQR 273.0, 281.0; median = 277.2) during 50% closure were observed. Among patients continuously prescribed PrEP pre-COVID-19, the mean MPR declined from 83% (IQR 72–100%; median = 100%) to 63% (IQR 35–97%; median = 66%) after the onset of COVID-19. For patients newly initiated on PrEP after the onset of COVID-19, the mean MPR was 73% (IQR 41–100%; median = 100%). Our ability to sustain PrEP provisions, as measured by both PrEP PE and MPR, can likely be attributed to our pre-COVID-19 system for PrEP delivery, which emphasizes navigation, same-day initiation, and primary care integration. In the era of COVID-19 as well as future unforeseen healthcare disruptions, PrEP programs must be robust and flexible in order to sustain PrEP delivery. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Platt L.; Shebl F.M.; Qian Y.; Spanos N.; Nolan C.P.; Ard K.L.; Bassett I.V.	Pre-exposure Prophylaxis Persistence at a Diverse Sexual Health Clinic: Comparison of the pre-COVID-19 era to the COVID-19 era	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-03996-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147381867&doi=10.1007%2fs10461-023-03996-3&partnerID=40&md5=a3db918bfae7f0b3abd7782b6a01a68d	The COVID-19 pandemic interrupted health care delivery and exacerbated disparities. Many sexual health clinics transitioned to telemedicine, including for pre-exposure prophylaxis (PrEP). We conducted a retrospective cohort study of patients at an urban sexual health clinic to assess the likelihood and predictors of PrEP persistence in the year following PrEP initiation. We compared patients starting PrEP in the four months preceding the first COVID surge to those starting PrEP one year prior. We found lower PrEP persistence in the COVID cohort compared to the pre-COVID cohort (50.8% vs. 68.9%, respectively). In both cohorts, most care was provided through in-person visits and telemedicine was rare. In the pre-COVID cohort, older patients and those identifying as non-Hispanic White were more likely to persist on PrEP. In the COVID cohort, these disparities in PrEP persistence were not observed. Flexible models of care may facilitate equitable care engagement and re-engagement. © 2023, The Author(s). Article	2023	Polo, Rosa; García-Albéniz, Xabier; Terán, Carolina; Morales, Miguel; Rial-Crestelo, David; Garcinuño, M. Angeles; García Del Toro, Miguel; Hita, César; Gómez-Sirvent, Juan Luis; Buzón, Luis; Díaz de Santiago, Alberto; Arellano, Jose Pérez; Sanz, Jesus; Bachiller, Pablo; Alfaro, Elisa Martínez; Díaz-Brito, Vicente; Masiá, Mar; Hernández-Torres, Alicia; Guerra, Jose M.; Santos, Jesús; Arazo, Piedad; Muñoz, Leopoldo; Arribas, Jose Ramon; Martínez de Salazar, Pablo; Moreno, Santiago; Hernán, Miguel A.; Del Amo, Julia	Daily tenofovir disoproxil fumarate/emtricitabine and hydroxychloroquine for pre-exposure prophylaxis of COVID-19: a double-blind placebo-controlled randomized trial in healthcare workers.	Clinical Microbiology and Infection	-	-	-	-	1469-0691 1198-743X	10.1016/j.cmi.2022.07.006	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9352647/	OBJECTIVES: To assess the effect of hydroxychloroquine (HCQ) and Tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) as pre-exposure prophylaxis on COVID-19 risk. METHODS: EPICOS is a double-blind, placebo-controlled randomized trial conducted in Spain, Bolivia, and Venezuela. Healthcare workers with negative SARS-CoV-2 IgM/IgG test were randomly assigned to the following: daily TDF/FTC plus HCQ for 12 weeks, TDF/FTC plus HCQ placebo, HCQ plus TDF/FTC placebo, and TDF/FTC placebo plus HCQ placebo. Randomization was performed in groups of four. Primary outcome was laboratory-confirmed, symptomatic COVID-19. We also studied any (symptomatic or asymptomatic) COVID-19. We compared group-specific 14-week risks via differences and ratios with 95% CIs. RESULTS: Of 1002 individuals screened, 926 (92.4%) were eligible and there were 14 cases of symptomatic COVID-19: 220 were assigned to the TDF/FTC plus HCQ group (3 cases), 231 to the TDF/FTC plus HCQ placebo group (3 cases), 233 to the TDF/FTC plus HCQ placebo group (3 cases), and 223 to the double placebo group (5 cases). Compared with the double placebo group, 14-week risk ratios (95% CI) of symptomatic COVID-19 were 0.39 (0.00-1.98) for TDF + HCQ, 0.34 (0.00-2.06) for TDF, and 0.49 (0.00-2.29) for HCQ. Corresponding risk ratios of any COVID-19 were 0.51 (0.21-1.00) for TDF + HCQ, 0.81 (0.44-1.49) for TDF, and 0.73 (0.41-1.38) for HCQ. Adverse events were generally mild. DISCUSSION: The target sample size was not met. Our findings are compatible with both benefit and harm of pre-exposure prophylaxis with TDF/FTC and HCQ, alone or in combination, compared with placebo. Article	2023	Pons-Faudoa, Fernanda P.; Di Trani, Nicola; Capuani, Simone; Campa-Carranza, Jocelyn Nikita; Nehete, Bharti; Sharma, Suman; Shelton, Kathryn A.; Bushman, Lane R.; Abdelmawla, Farah; Williams, Martin; Roon, Laura; Nerguizian, David; Chua, Corrine Ying Xuan; Ittmann, Michael M.; Nichols, Joan E.; Kimata, Jason T.; Anderson, Peter L.; Nehete, Pramod N.; Arduino, Roberto C.; Grattoni, Alessandro	Long-acting refillable nanofluidic implant confers protection against SHIV infection in nonhuman primates.	Science Translational Medicine	-	-	-	-	1946-6242 1946-6234	10.1126/scitranslmed.adg2887	https://pubmed.ncbi.nlm.nih.gov/37379369/	The impact of pre-exposure prophylaxis (PrEP) on slowing the global HIV epidemic hinges on effective drugs and delivery platforms. Oral drug regimens are the pillar of HIV PrEP, but variable adherence has spurred development of long-acting delivery systems with the aim of increasing PrEP access, uptake, and persistence. We have developed a long-acting subcutaneous nanofluidic implant that can be refilled transcutaneously for sustained release of the HIV drug islatravir, a nucleoside reverse transcriptase translocation inhibitor that is used for HIV PrEP. In rhesus macaques, the islatravir-eluting implants achieved constant concentrations of islatravir in plasma (median 3.14 nM) and islatravir triphosphate in peripheral blood mononuclear cells (median 0.16 picomole per 10(6) cells) for more than 20 months. These drug concentrations were above the established PrEP protection threshold. In two unblinded, placebo-controlled studies, islatravir-eluting implants conferred 100% protection against infection with SHIV(SF162P3) after repeated low-dose rectal or vaginal challenge in male or female rhesus macaques, respectively, compared to placebo control groups. The islatravir-eluting implants were well tolerated with mild local tissue inflammation and no signs of systemic toxicity over the 20-month study period. This refillable islatravir-eluting implant has potential as a long-acting drug delivery system for HIV PrEP. Article	2023	Pons-Faudoa, Fernanda P.; Di Trani, Nicola; Capuani, Simone; Hernandez, Nathanael; Wood, Anthony M.; Nehete, Bharti; Niles, Jean; Shelton, Kathryn A.; Kezar, Sarah; Bushman, Lane R.; Chua, Corrine Ying Xuan; Ittmann, Michael M.; Anderson, Peter L.; Nehete, Pramod N.; Arduino, Roberto C.; Nichols, Joan E.; Grattoni, Alessandro	Changes in local tissue microenvironment in response to subcutaneous long-acting delivery of tenofovir alafenamide in rats and non-human primates.	Journal of Controlled Release	-	-	-	-	1873-4995 0168-3659	10.1016/j.jconrel.2023.04.037	https://www.sciencedirect.com/science/article/pii/S0168365923002870?ref=pdf_download&fr=RR-2&rr=891ffd897813a414	Several implantable long-acting (LA) delivery systems have been developed for sustained subcutaneous administration of tenofovir alafenamide (TAF), a potent and effective nucleotide reverse transcriptase inhibitor used for HIV pre-exposure prophylaxis (PrEP). LA platforms aim to address the lack of adherence to oral regimens, which has impaired PrEP efficacy. Despite extensive investigations in this field, tissue response to sustained subcutaneous TAF delivery remains to be elucidated as contrasting preclinical results have been reported in the literature. To this end, here we studied the local foreign body response (FBR) to sustained subdermal delivery of three forms of TAF, namely TAF free base (TAF(fb)), TAF fumarate salt (TAF(fs)), and TAF(fb) with urocanic acid (TAF-UA). Sustained constant drug release was achieved via titanium-silicon carbide nanofluidic implants previously shown to be bioinert. The analysis was conducted in both Sprague-Dawley (SD) rats and rhesus macaques over 1.5 and 3 months, respectively. While visual observation did not reveal abnormal adverse tissue reaction at the implantation site, histopathology and Imaging Mass Cytometry (IMC) analyses exposed a local chronic inflammatory response to TAF. In rats, UA mitigated foreign body response to TAF in a concentration-dependent manner. This was not observed in macaques where TAF(fb) was better tolerated than TAF(fs) and TAF-UA. Notably, the level of FBR was tightly correlated with local TAF tissue concentration. Further, regardless of the degree of FBR, the fibrotic capsule (FC) surrounding the implants did not interfere with drug diffusion and systemic delivery, as evidenced by TAF PK results and fluorescence recovery after photobleaching (FRAP). Article	2023	Popping S.; Nichols B.E.; Appelman B.; Biemond J.J.; Vergouwe M.; Rosendaal F.R.; Van Der Valk M.; De Bree G.J.; Wiersinga W.J.; Birnie E.	Health Outcomes and Cost-effectiveness of Monoclonal SARS-CoV-2 Antibodies as Pre-exposure Prophylaxis	JAMA Network Open	-	-	-	-	25743805	10.1001/jamanetworkopen.2023.21985	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164255061&doi=10.1001%2fjamanetworkopen.2023.21985&partnerID=40&md5=b8474e5d8eb0f00a7f5f8d8bdc4d8850	Importance: Pre-exposure prophylaxis with neutralizing SARS-CoV-2 monoclonal antibodies (mAbs PrEP) prevents infection and reduces hospitalizations and the duration thereof for COVID-19 and death among high-risk individuals. However, reduced effectiveness due to a changing SARS-CoV-2 viral landscape and high drug prices remain substantial implementation barriers. Objective: To assess the cost-effectiveness of mAbs PrEP as COVID-19 PrEP. Design, Setting, and Participants: For this economic evaluation, a decision analytic model was developed and parameterized with health care outcome and utilization data from individuals with high risk for COVID-19. The SARS-CoV-2 infection probability, mAbs PrEP effectiveness, and drug pricing were varied. All costs were collected from a third-party payer perspective. Data were analyzed from September 2021 to December 2022. Main Outcomes and Measures: Health care outcomes including new SARS-CoV-2 infections, hospitalization, and deaths. The cost per death averted and cost-effectiveness ratios using a threshold for prevention interventions of $22000 or less per quality-adjusted life year (QALY) gained. Results: The clinical cohort consisted of 636 individuals with COVID-19 (mean SD age 63 18 years; 341 54% male). Most individuals were at high risk for severe COVID-19, including 137 (21%) with a body mass index of 30 or higher, 60 (9.4%) with hematological malignant neoplasm, 108 (17%) post-transplantation, and 152 (23.9%) who used immunosuppressive medication before COVID-19. Within the context of a high (18%) SARS-CoV-2 infection probability and low (25%) effectiveness the model calculated a short-term reduction of 42% ward admissions, 31% intensive care unit (ICU) admissions, and 34% deaths. Cost-saving scenarios were obtained with drug prices of $275 and 75% or higher effectiveness. With a 100% effectiveness mAbs PrEP can reduce ward admissions by 70%, ICU admissions by 97%, and deaths by 92%. Drug prices, however, need to reduce to $550 for cost-effectiveness ratios less than $22000 per QALY gained per death averted and to $2200 for ratios between $22000 and $88000. Conclusions and Relevance: In this study, use of mAbs PrEP for preventing SARS-CoV-2 infections was cost-saving at the beginning of an epidemic wave (high infection probability) with 75% or higher effectiveness and drug price of $275. These results are timely and relevant for decision-makers involved in mAbs PrEP implementation. When newer mAbs PrEP combinations become available, guidance on implementation should be formulated ensuring a fast rollout. Nevertheless, advocacy for mAbs PrEP use and critical discussion on drug prices are necessary to ensuring cost-effectiveness for different epidemic settings. © 2023 American Medical Association. Article	2023	Popping, Stephanie; Haspels, Sabine; Gotz, Hannelore M.; van der Meijden, W. C. J. P. M.; van den Elshout, Mark; Rijnders, Bart J.	Low Hepatitis C Virus Prevalence among Men Who Have Sex with Men Attending Public Health Services in The Netherlands.	Viruses	-	-	-	-	1999-4915	10.3390/v15122317	https://pubmed.ncbi.nlm.nih.gov/38140558/	The hepatitis C virus (HCV) prevalence is high among men who have sex with men (MSM) with HIV in the Netherlands. Large reductions in HCV incidence among MSM with HIV, however, have occurred since treatment with direct-acting antivirals. Over the years, a broader understanding of the HCV epidemic has shown that HCV infections are not solely restricted to MSM with HIV, but they also occur among HIV-negative MSM. Currently, HCV testing among HIV-negative MSM is only provided for PrEP users and is not part of routine sexually transmitted infection (STI) screening among HIV-negative MSM who are not using PrEP. In this study, we screened 1885 HIV-negative MSM who did not participate in a PrEP program, with over 1966 STI screening visits at four different public health clinic sites. Among the 1885 MSM, only one person had a new HCV infection, resulting in a 0.05% (95% confidence interval 0.0-0.3) incidence. Based on our findings, we can conclude that systematic HCV testing at STI clinics may not yield significant benefits for this particular population. Article	2023	Powers K.A.; Mutale W.; Rosenberg N.E.; Graybill L.A.; Mollan K.R.; Freeborn K.; Saidi F.; Maman S.; Mulenga P.L.; Jahn A.; Nyirenda R.K.; Stringer J.S.A.; Vermund S.H.; Chi B.H.	Combination HIV prevention during pregnancy and the post-partum period in Malawi and Zambia: a mathematical modelling analysis	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.26128	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164243438&doi=10.1002%2fjia2.26128&partnerID=40&md5=c89b720700f9ec367fe2a0d39ef9d6	Introduction: Despite widespread success in reducing vertical HIV transmission, most antenatal care (ANC) programmes in eastern and southern Africa have not emphasized primary prevention of maternal HIV acquisition during pregnancy and lactation/breastfeeding. We hypothesized that combination HIV prevention interventions initiated alongside ANC could substantially reduce maternal HIV incidence. Methods: We constructed a multi-state model describing male-to-female HIV transmission in steady heterosexual partnerships during pregnancy and lactation/breastfeeding, with initial conditions based on population distribution estimates for Malawi and Zambia in 2020. We modelled individual and joint increases in three HIV prevention strategies at or soon after ANC initiation: (1) HIV testing of male partners, resulting in HIV diagnosis and less condomless sex among those with previously undiagnosed HIV; (2) initiation (or re-initiation) of suppressive antiretroviral therapy (ART) for male partners with diagnosed but unsuppressed HIV; and (3) adherent pre-exposure prophylaxis (PrEP) for HIV-negative female ANC patients with HIV-diagnosed or unknown-status male partners. We estimated the percentage of within-couple, male-to-female HIV transmissions that could be averted during pregnancy and lactation/breastfeeding with these strategies, relative to base-case conditions in which 45% of undiagnosed male partners become newly HIV diagnosed via testing, 75% of male partners with diagnosed but unsuppressed HIV initiate/re-initiate ART and 0% of female ANC patients start PrEP. Results: Increasing uptake of any single strategy by 20 percentage points above base-case levels averted 10%–11% of maternal HIV acquisitions during pregnancy and lactation/breastfeeding in the model. Joint uptake increases of 20 percentage points in two interventions averted an estimated 19%–23% of transmissions, and with a 20-percentage-point increase in uptake of all three interventions, 29% were averted. Strategies achieving 95% male testing, 90% male ART initiation/re-initiation and 40% female PrEP use reduced incident infections by 45%. Conclusions: Combination HIV prevention strategies provided alongside ANC and sustained through the post-partum period could substantially reduce maternal HIV incidence during pregnancy and lactation/breastfeeding in eastern and southern Africa. © 2023 The Authors. Article	2023	Poxon A.; Leis M.; McDermott M.; Kariri A.; Kaul R.; Kimani J.	Emergency departments as under-utilized venues to provide HIV prevention services to female sex workers in Nairobi, Kenya	International Journal of Emergency Medicine	-	-	-	-	18651372	10.1186/s12245-023-00516-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85167460649&doi=10.1186%2fs12245-023-00516-x&partnerID=40&md5=54738cf5fd67f60cfb751a21501c9ab9	Background: Female sex workers (FSW) in sub-Saharan Africa are disproportionately affected by HIV and remain a key target population for efforts to reduce transmission. While HIV prevention tools such as PEP and PrEP are available through outpatient FSW clinics, these services are underused. Emergency medicine is a rapidly expanding field in Kenya and may provide a novel venue for initiating or optimizing HIV prevention services. This study examined the characteristics of FSW from Nairobi, Kenya, who had utilized an emergency department (ED) during the past year to broaden our understanding of the patient factors related to usage. Methods: An anonymous questionnaire was administered to a convenience sample of 220 Nairobi FSW attending dedicated clinics from June to July 2019. The participants were categorized into those who attended an ED over the past year (acute care users) and clinic-only users (control). A modified version of the WHO Violence Against Women Instrument assessed gender-based violence. Multivariable negative binomial logistic regressions evaluated predictors of health care use among these populations. Results: Of the total 220 women (median IQR age 32 27–39), 101 and 116 were acute care and control populations, respectively. Acute care users had 12.7 ± 8.5 healthcare visits over a 12-month period, and the control population had 9.1 ± 7.0 (p < 0.05). ED attendance did not improve the PrEP usage, with 48.5%, and 51% of acute care and clinic users indicated appropriate PrEP use. Patient factors that correlated with health care utilization among acute care users included client sexual violence (OR 2.2 1.64–2.94, p < 0.01), PrEP use (OR 1.54 (1.25–1.91), < 0.01), and client HIV status (OR 1.35 (1.02–1.69), p < 0.01). Conclusions: Many FSW at high risk for HIV were not accessing HIV prevention tools despite attending a dedicated FSW clinic offering such services. FSW who had attended an ED over the past year had a higher prevalence of HIV risk factors, demonstrating that emergency departments may be important acute intervention venues to prevent HIV transmission in this population. These results can guide policy design, health care provider training, and facility preparedness to support strategies aimed at improving HIV prevention strategies for FSW in Kenyan ED's. © 2023, Springer-Verlag GmbH Germany, part of Springer Nature. Article	2023	Prata, Maiky Carneiro da Silva; Romão, Vanessa Ribeiro; dos Santos, Dandara Jesus; Yamaçake, Alexandre	IMPACTO DA IMPLEMENTAÇÃO DA LINHA DE CUIDADO INTEGRAL A TRAVESTIS E TRANSSEXUAIS NA ADESÃO AO USO DA PREP NO MUNICÍPIO DE DIADEMA	The Brazilian Journal of Infectious Diseases	-	-	-	-	1413-8670	10.1016/j.bjid.2023.103017	https://www.bjid.org.br/en-impacto-da-implementacao-da-linha-articulo-S1413867023002775	Introdução A população de travestis e transexuais (TT) historicamente teve direitos negligenciados, sendo exposta a maior situação de vulnerabilidade. Tais condições adversas favorecem a esta população contextos sociais de violência e marginalização, como a prostituição e uso de álcool e drogas que aumenta a vulnerabilidade deste grupo populacional as infecções sexualmente transmissíveis (IST) em especial ao HIV/AIDS, onde é conhecido que em algumas regiões do mundo há até 66 vezes mais probabilidade de travestis e mulheres transexuais contraírem HIV, além de prevalências desta infecção que podem variar de 30 a 40% entre TT, em especial entre mulheres trans. Objetivo descrever o impacto no incremento de adesão ao uso da PREP entre TT após implementação do ambulatório de cuidado integral a esta população no Município de Diadema. Métodos compilados do período de agosto de 2019 até junho de 2023, analisados segundo: identidade de gênero. A obtenção, organização e tabulação dos dados foram realizadas utilizando-se o programa computacional Microsoft Excel 97. Resultados Foram admitidos 343 usuários de PREP neste período, 94% de pessoas cis gênero, sendo a maioria de homens cis gays, 5,2% de mulheres trans e travestis e 0,2% de homens trans. Chama atenção que antes de setembro de 2021, data da inauguração do serviço de atendimento a pessoas TT no município, o percentual de usuários de PREP de TT não chegava nem a 2,3% e após a implementação do serviço de atendimento a pessoas TT com as devidas ações de sensibilização, atreladas ao acompanhamento hormonal individualizado, estas pessoas tiveram mais facilidade de acesso a PREP e com isto maior procura e adesão por este método de prevenção. Além do uso orientado de hormônios, ter a mesma unidade de dispensação para a profilaxia do HIV facilitou o seguimento da PREP, estratégia esta que reduziu barreiras de acesso e impactou no incremento de usuários de PREP entre pessoas TT no município, diminuindo assim a vulnerabilidade ao HIV desta população. Conclusão Evidencia-se a necessidade de integração dos serviços de hormonizacao para pessoas TT aos serviços especializados em prevenção as infecções sexualmente transmissíveis e HIV/AIDS, para que a PREP seja não utilizada apenas por homens cis gays, mas também tenha ampliado seu acesso para a população de TT, que tem a maior vulnerabilidade a infecção do HIV. Article	2023	Pravosud, Vira; Ballard, April M; Holloway, Ian W; Young, April M	Integrating long-acting injectable treatment to improve medication adherence among persons living with HIV and opioid use disorder: study protocol.	AIDS and Behavior	-	-	-	-	1573-3254	doi.org/10.1186/s13722-023-00418-6	https://ascpjournal.biomedcentral.com/articles/10.1186/s13722-023-00418-6	Oral antiretroviral therapy (ART) has been effective at reducing mortality rates of people with HIV. However, despite its effectiveness, people who use drugs face barriers to maintaining ART adherence. Receipt of opioid agonist treatment, in the context of HIV care, is associated with medication adherence and decreased HIV viral loads. Recent pharmacological advancements have led to the development of novel long-acting, injectable, medications for both HIV (cabotegravir co-administered with rilpivirine) and OUD (extended-release buprenorphine). These therapies have the potential to dramatically improve adherence by eliminating the need for daily pill-taking. Despite the extensive evidence base supporting long-acting injectable medications for both HIV and OUD, and clinical guidelines supporting integrated care provision, currently little is known about how these medications may be optimally delivered to this population. This paper presents the study design for the development of a clinical protocol to guide the delivery of combined treatment for HIV and OUD using long-acting injectable medications. Article	2023	Price G.; Hubach R.D.; Currin J.M.; Owens C.	Knowledge, sex, and region associated with primary care providers prescribing adolescents HIV pre-exposure prophylaxis	Scientific Reports	-	-	-	-	20452322	10.1038/s41598-023-44165-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173303022&doi=10.1038%2fs41598-023-44165-9&partnerID=40&md5=f544fb3fc5249cbbe811cd0d0da5ecb9	Although HIV pre-exposure prophylaxis (PrEP) effectively and safely prevents HIV among adolescents, uptake of PrEP is low. Adolescents must have primary care providers (PCPs) prescribe them PrEP, making PCPs critical actors in PrEP delivery. However, research has primarily investigated determinants of PCPs' intention to prescribe adolescents PrEP rather than the determinants of performing the behavior itself. We examined the demographic, clinical practice, and implementation determinants of PCPs previously prescribing PrEP to adolescents. PCPs were recruited from a national Qualtrics panel of licensed medical providers in the United States from July 15-August 19, 2022. The Theoretical Domains Framework informed the implementation determinants measured. A multivariable logistic regression was used. PCPs who were more knowledgeable of the CDC guidelines (aOR 2.97, 95% CI 2.16–4.10), who were assigned male at birth (aOR 1.64, 95% CI 1.03–2.59), and who practiced in the Western region (aOR 1.85, 95% CI 1.04–3.30) had greater odds of prior prescribing adolescents PrEP. Provider-based educational interventions should be designed, implemented, and tested to encourage PCPs to prescribe PrEP to eligible adolescents. © 2023, Springer Nature Limited. Article	2023	Primdahl N.L.; Skovdal M.	The workings of Pre-Exposure Prophylaxis (PrEP) citizenship amongst queer men in Denmark	Women, Gender and Research	-	-	22456937	10.7146/KKF.V35I1.133799	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166337870&doi=10.7146%2fKKF.V35I1.133799&partnerID=40&md5=c58ebe7fa5e79b6fcd67edde8eb2422f	In 2019, oral Pre-Exposure Prophylaxis (PrEP), a HIV prevention pill, was made available for 'at-risk' populations in Denmark, with uptake primarily seen amongst men who have sex with men. While PrEP has revolutionised HIV prevention by simultaneously providing sexual freedom and protection from HIV, it is accompanied by firm medical and social surveillance, through which, some commentators argue, PrEP citizenships are produced. This article draws on visual ethnographic data to explore how PrEP users in Denmark experience and reflect on the types of 'work' involved with, and moralities arising from, this PrEP citizenship. We argue that PrEP citizenship is contingent on the resources and abilities of individuals to proactively engage with this 'work' and balance the moral ambiguities of PrEP in relation to both local communities and their obligations concerning the Danish welfare state. © 2023 Lavoisier. Article	2023	Protiere C.; Sagaon-Teyssier L.; Donadille C.; Sow A.; Gaubert G.; Girard G.; Mora M.; Assoumou L.; Beniguel L.; Michels D.; Ghosn J.; Costagliola D.; Rojas Castro D.; Molina J.-M.; Spire B.	Perception of PrEP-related stigma in PrEP users: Results from the ANRS-PREVENIR cohort	HIV Medicine	-	-	14642662	10.1111/hiv.13491	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152384049&doi=10.1111%2fhiv.13491&partnerID=40&md5=cbb0ce9f98cd536fb502b6a1b5028a98	Introduction: Since the advent of HIV pre-exposure prophylaxis (PrEP), stigma has been shown to be a major barrier to its uptake and adherence. It is therefore essential to define the proportion of users who consider that PrEP can negatively impact their image and the factors associated with this perception. Method: We performed a multivariable logistic regression on data from the 2567 participants in the ANRS-PREVENIR study who answered the outcome question. Results: Almost one-third of the sample (comprising mostly cisgender men who have sex with men 94.3%) considered that taking PrEP could give others a negative image of them. Younger participants (adjusted odds ratio aOR 0.98; 95% confidence interval CI 0.97–0.99) and more psychologically vulnerable participants (i.e., lower self-esteem score aOR 0.98; 95% CI 0.96–0.99 and higher depression score aOR 1.02; 95% CI 1.00–1.03) were also more likely to have this perception. In contrast, participants encouraged to take PrEP by their main partner (aOR 0.67; 95% CI 0.51–0.88) and friends (aOR 0.79; 95% CI 0.66–0.95), and those who protected themselves more because they had knowledge of their most recent sexual partner's HIV status (aOR 0.83; 95% CI 0.69–0.99) and systematic use of PrEP and/or condoms during intercourse in the previous 3 months (aOR 0.80; 95% CI 0.67–0.96) were less likely to have this perception. Discussion: Given the strong interrelation between stigmatization (real or perceived), risky behaviours and adherence, our results emphasize the need for HIV prevention campaigns to promote a positive image of PrEP users. They also show that stigmatization and its effects need to be fully considered to improve HIV prevention offers to current and potential PrEP users who are most likely to be psychologically vulnerable. © 2023 The Authors. Article	2023	Psaros C.; Goodman G.R.; McDonald V.W.; Ott C.; Blyler A.; Rivas A.; Shan L.; Campbell M.; Underwood E.; Krakower D.; Elopre L.; Kudroff K.; Sherr K.H.; Kempf M.-C.	Protocol for WeExPAnd: A prospective, mixed-methods pilot demonstration study to increase access to pre-exposure prophylaxis among women vulnerable to HIV infection in the Southern USA	BMJ Open	-	-	20446055	10.1136/bmjopen-2023-075250	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161254501&doi=10.1136%2fbmjopen-2023-075250&partnerID=40&md5=09336d4601f4b15c8bc2e8516fb832d0	Introduction African American women (AA), particularly those living in the Southeastern USA, experience disproportionately high rates of HIV infection. Pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention tool that may circumvent barriers to traditional HIV prevention tools, such as condom use; however, very little is known about how to improve PrEP access and uptake among AA women who may benefit from PrEP use. This project aims to understand how to increase PrEP access among AA women in the rural Southern USA, which may ultimately affect HIV incidence in this population. Methods and analysis The goal of the current study is to systematically adapt a patient-provider communication tool to increase PrEP uptake among AA women receiving care at a federally qualified health centre in Alabama. We will use an iterative implementation process, by assessing the feasibility, acceptability and preliminary impact of the tool on PrEP uptake, using a pilot preintervention/postintervention design (N=125). We will evaluate women's reasons for declining a referral to a PrEP provider, reasons for incomplete referrals, reasons for not initiating PrEP after a successful referral and ongoing PrEP use at 3 and 12 months after PrEP initiation among our sample. The proposed work will significantly contribute to our understanding of factors impacting PrEP uptake and use among AA women, particularly in underserved areas in the Deep South that are heavily impacted by the HIV epidemic and experience worse HIV-related health outcomes relative to other areas in the USA. Ethics and dissemination This protocol has been approved by the Institutional Review Board (IRB) at University of Alabama at Birmingham (Birmingham, AL; protocol 300004276). All participants will review a detailed informed consent form approved by the IRB and will provide written or verbal informed consent prior to enrolment. Results will be disseminated through peer-reviewed manuscripts, reports, and local, national and international presentations. Trial registration number NCT04373551. © Author(s) (or their employer(s)) 2023. Re-use permitted under CC BY-NC. No commercial re-use. See rights and permissions. Published by BMJ. Article	2023	Psaros C.; Hill-Rorie J.; Quint M.; Horvitz C.; Dormitzer J.; Biello K.B.; Krakower D.S.; Safren S.A.; Mimiaga M.J.; Sullivan P.; Hightow-Weidman L.B.; Mayer K.H.	A qualitative exploration of how to support PrEP adherence among young men who have sex with men	AIDS Care	-	-	9540121	10.1080/09540121.2023.2240070	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85172766781&doi=10.1080%2f09540121.2023.2240070&partnerID=40&md5=f58c8cbaa09528abe213731bf97639c7	New HIV infections disproportionately affect young men who have sex with men (YMSM). PrEP is effective in preventing HIV acquisition; however, adherence is critical and is often suboptimal among YMSM. Interventions addressing the unique PrEP adherence challenges faced by YMSM are needed. We conducted qualitative interviews with 20 HIV-negative, YMSM (ages 15-24) with a PrEP indication and 11 healthcare professionals to inform adaption of a PrEP adherence intervention (Life-Steps for PrEP) for YMSM. We explored environmental, healthcare, and individual factors influencing uptake, adherence, attitudes, and perspectives (including desired modifications) on the Life-Steps intervention. Interviews were analyzed using content analysis. Of YMSM study participants (mean age 21.6) 55% were White, 15% Hispanic, and 5% Black. Most YMSM were PrEP-experienced (70%). Healthcare professionals (6 prescribers, 1 nurse, 2 health educators, 2 other/unspecified) averaged 6.9 years of experience caring for YMSM. All described stigma as a barrier to PrEP; YMSM expressed concern around being perceived as "risky" and concern about inadvertent PrEP disclosure if family/friends found their medication, or if parental insurance was used. Difficulty with planning for potential adherence challenges were identified by both groups. YMSM highlighted benefits of a nurse-led intervention (i.e., adding "legitimacy"), but stressed need for nonjudgmental, "savvy" interventionists. YMSM expressed a desire for comprehensive YMSM-specific sexual health information. These findings informed modification and expansion of Life-Steps content. Results highlight key potential barriers, many of which center around privacy. Content that addresses PrEP stigma, disclosing PrEP use, navigating insurance, and planning ahead in a nonjudgmental environment by trusted providers emerged as important components of a YMSM-focused delivery of Life-Steps for PrEP. © 2023 Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Pyra, Maria; Kline, J.; Taylor, O.; Rusie, L.; Schafer, T.; Motley, D.; Johnson, A. K.	Changes in HIV Prevention and Sexual Experiences During the COVID-19 Pandemic: A Mixed-Methods Study.	Journal of Acquired Immune Deficiency Syndromes	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003229	https://pubmed.ncbi.nlm.nih.gov/37256682/	BACKGROUND: STI and HIV services and infection rates were affected during the COVID-19 pandemic, because of changes in access to health care and individual behavior. Understanding how individuals made decisions around prevention and sexual activities during different phases of the pandemic is useful to addressing the rising rates of STIs and HIV. SETTING: Federally-qualified health center focused on sexual and gender minority health, Chicago IL, 2021. METHODS: Patients with a history of PrEP use who were contacted by the PrEP retention team as part of standard care were invited to complete an online survey. A subset of survey participants were then contacted to complete one-on-one interviews. Participants were asked about two distinct periods: November 2020 to January 2021 and February to June 2021. RESULTS: From the 356 survey participants (mostly young, insured, and experienced with PrEP), more than half maintained their number of sex partners during the early pandemic and most also maintained PrEP use; during the later pandemic, most reported more or the same number of sex partners and almost all maintained PrEP use. From interviews, we identified diverse and changing experiences regarding sexual practices throughout the pandemic; whereas many participants changed PrEP use in accordance with sexual practices, many others maintained PrEP use as a habit. COVID-19 prevention was also a factor in sexual activities, particularly prevaccination. CONCLUSION: Many PrEP users try to align their HIV prevention with their sexual exposures and establish PrEP as a long-term habit. Removing financial and access barriers is important to improve PrEP use and STI testing. Article	2023	Quinn K.G.; Dickson-Gomez J.; Craig A.; John S.A.; Walsh J.L.	Intersectional Discrimination and PrEP uSe Among Young Black Sexual Minority Individuals: The Importance of Black LGBTQ Communities and Social Support	AIDS and Behavior	-	-	10907165	10.1007/s10461-022-03763-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133460116&doi=10.1007%2fs10461-022-03763-w&partnerID=40&md5=71c67a52be21347c60aa0e30ec5ff9c8	Intersectional stigma and discrimination have increasingly been recognized as impediments to the health and well-being of young Black sexual minority men (YBSMM) and transgender women (TW). However, little research has examined the relationship between intersectional discrimination and HIV pre-exposure prophylaxis (PrEP) outcomes. This study with 283 YBSMM and TW examines the relationship between intersectional discrimination and current PrEP use and likelihood of future PrEP use. Path models were used to test associations between intersectional discrimination, resilience and social support, and PrEP use and intentions. Individuals with higher levels of anticipated discrimination were less likely to be current PrEP users (OR = 0.59, p =.013), and higher levels of daily discrimination were associated with increased likelihood of using PrEP in the future (B = 0.48 (0.16), p =.002). Greater discrimination was associated with higher levels of resilience, social support, and connection to the Black LGBTQ community. Social support mediated the effect of day-to-day discrimination on likelihood of future PrEP use. Additionally, there was a significant and negative indirect effect of PrEP social concerns on current PrEP use via Black LGBTQ community connectedness. The results of this study highlight the complexity of the relationships between discrimination, resilience, and health outcomes. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Raccagni A.R.; Galli L.; Lucente M.F.; Candela C.; Lolatto R.; Trentacapilli B.; Ponta G.; Messina E.; Gianotti N.; Castagna A.; Nozza S.	High Propensity to Switch to Long-acting Injectable HIV PrEP with Cabotegravir in a Cohort of Oral PrEP Experienced Men who Have Sex with Men in Italy	AIDS and Behavior	-	-	10907165	10.1007/s10461-023-04197-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173084873&doi=10.1007%2fs10461-023-04197-8&partnerID=40&md5=dc285affb5286b30704d18b7d5a01e36	Aim was to investigate the propensity to switch to long-acting injectable HIV pre-exposure prophylaxis (PrEP) with cabotegravir among oral PrEP-experienced men who have sex with men. Out of 377 PrEP users, 325 (86.2%) were interested (would like = 210) or considering (would consider = 115) switch to long-acting PrEP. At multivariable analysis, the odds ratio of interest in long-acting PrEP in non-adherent vs. adherent individuals to oral PrEP was 5.03 (95%CI = 1.73–14.61,p = 0.003) and of consideration 1.63 (95%CI = 0.51–5.23,p = 0.410). We observed very high propensity to switch to long-acting PrEP, particularly among non-adherent users. Rapid availability of long-acting PrEP might address unmet needs of PrEP users in Italy. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Raccagni, Angelo Roberto; Ceccarelli, Daniele; Trentacapilli, Benedetta; Galli, Laura; Lolatto, Riccardo; Canetti, Diana; Bruzzesi, Elena; Candela, Caterina; Castagna, Antonella; Nozza, Silvia	Viral Hepatitis and Human Papillomavirus Vaccination During HIV Pre-Exposure Prophylaxis: Factors Associated With Missed Vaccination.	Journal of Acquired Immune Deficiency Syndromes	-	-	1944-7884	10.1097/QAI.0000000000003216	https://dx.doi.org/10.1097/QAI.0000000000003216	BACKGROUND: We evaluated factors associated with lack of triple vaccination (hepatitis A virus HAV, hepatitis B virus HBV, and human papillomavirus HPV) among men who have sex with men using pre-exposure prophylaxis (PrEP). SETTING: PrEP users at the San Raffaele Scientific Institute, Italy, with ≥1 follow-up visit (May 2017-2022). METHODS: Participants were considered protected if (1) before PrEP access: positive serology (IgG-HAV+, hepatitis B surface antigen >10 mUI/mL) or vaccination history was recorded and (2) after starting PrEP: ≥1 dose of each vaccination was administered. Individuals were considered fully protected if they received the following before/during PrEP access: HAV vaccination/infection, HBV vaccination/infection, and HPV vaccination. χ 2 and Kruskal-Wallis tests were used to compare characteristics of those fully, partially, and not protected. Factors associated with the lack of triple vaccination were assessed by using multivariable logistic regression and classification tree analysis. RESULTS: Overall, 473 men who have sex with men were considered: 146 (31%) were fully protected, 231 (48%) partially, and 96 (20%) were not. Daily-based PrEP users (fully: 93, 63.7%; partially: 107, 46.3%; and not protected: 40, 41.7%; P = 0.001) and those with a sexually transmitted infection at the first visit (43, 29.5%; 55, 23.8%; 15, 15.6%; P = 0.048) were more frequently fully protected. At multivariable analysis, the odds of lack of triple vaccination was lower among daily-based users (adjusted odds ratio = 0.47, 95% confidence interval = 0.31-0.70, P < 0.001). Classification tree analysis showed that among daily-based users, with sexually transmitted infection prior and at the first PrEP visit, there was a lower chance of lack of triple vaccination (P = 44%). CONCLUSIONS: Strategies targeting PrEP users at risk of missing HAV, HBV, and HPV vaccinations need to be implemented, focusing mostly on event-based users. Article	2023	Raifman J.; Cheng D.M.; Skinner A.; Hatzenbuehler M.L.; Mayer K.H.; Stein M.D.	State same-sex marriage policies and pre-exposure prophylaxis implementation among men who have sex with men in the United States	Journal of the International AIDS Society	-	-	17582652	10.1002/jia2.26180	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177648254&doi=10.1002%2fjia2.26180&partnerID=40&md5=133567ba188aa1110161f71eb71e400	Introduction: More than 70% of new HIV diagnoses in the United States were among men who have sex with men (MSM) in 2019. Pre-exposure prophylaxis (PrEP) is a transformative innovation for reducing human immunodeficiency virus (HIV) infections. Structural stigma against sexual minorities, including in the form of state-level policies, may affect PrEP implementation. We evaluated whether lower structural stigma reflected by earlier year of state same-sex marriage legalization was associated with increased male PrEP prescriptions and male PrEP-to-need ratio (PnR), a ratio of PrEP prescriptions to new HIV diagnoses. Methods: We used 2012−2019 AIDSVu data on male PrEP prescriptions and male PnR in each US state and year. We used generalized estimating equations to evaluate the relationship between the timing of implementing state same-sex marriage policies and the outcomes of male PrEP prescriptions per 100,000 people and the male PnR. We adjusted for calendar year, Medicaid expansion and the political party of the governor in each state. Results: State implementation of same-sex marriage policies in earlier, relative to later, periods was associated with increases in the rate of male PrEP prescriptions and in the male PnR. Specifically, implementing state same-sex marriage policies between 2004 and 2011 and between 2012 and 2013 were each associated with greater rates of male PrEP prescriptions relative to implementing same-sex marriage policies between 2014 and 2015. Implementing state same-sex marriage policies between 2004 and 2011 as well as between 2012 and 2013 were both significantly associated with a greater male PnR relative to implementing same-sex marriage policies between 2014 and 2015. By 2019, the difference in male PrEP prescriptions was 137.9 (97.3−175.5) per 100,000 in states that implemented same-sex marriage in 2004−2011 and 27.2 (23.3−30.5) per 100,000 in states that implemented same-sex marriage from 2012 to 2013, relative to states that implemented same-sex marriage in 2014−2015. Conclusions: Earlier implementation of state same-sex marriage policies was associated with greater rates of male PrEP prescriptions. Reducing state-level structural stigma may improve HIV prevention among MSM in the United States. © 2023 The Authors. Article	2023	Ramadhani H.O.; Crowell T.A.; Nowak R.G.; Adebajo S.; Kayode B.O.; Ononaku U.; Baral S.D.; Ndembi N.; Charurat M.E.	Determinants of Preexposure Prophylaxis Cascade Among Sexual and Gender Minorities in Nigeria	Sexually Transmitted Diseases	-	-	1485717	10.1097/OLQ.0000000000001841	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85167844283&doi=10.1097%2fOLQ.0000000000001841&partnerID=40&md5=aabab390e271be855502c64ba4f7c7dc	Background Preexposure prophylaxis (PrEP) is effective in preventing human immunodeficiency virus (HIV) infection among sexual and gender minorities (SGMs). We evaluated the characteristics associated with engagement in 7 steps of the PrEP cascade among SGMs in Nigeria. Methods Sexual and gender minorities without HIV from the Abuja site of TRUST/RV368 cohort who were surveyed on awareness of and willingness to use PrEP were approached for PrEP initiation upon availability of oral daily PrEP. To understand gaps in the uptake of oral daily PrEP, we categorized the HIV PrEP cascade as (i) education about PrEP, (ii) interest in PrEP, (iii) successful contact, (iv) appointment scheduled, (v) appointment attendance, (vi) PrEP initiation, and (vii) plasma protective levels of tenofovir disoproxil fumarate. Multivariable logistic regression models were used to determine factors associated with each of the 7 steps in the HIV PrEP cascade. Results Of 788 participants, 718 (91.1%) showed interest in taking oral daily PrEP every day and/or after a sexual act, 542 (68.8%) were successfully contacted, 433 (54.9%) scheduled an appointment, 409 (51.9%) attended a scheduled appointment, 400 (50.8%) initiated oral daily PrEP, and 59 (7.4%) had protective levels of tenofovir disoproxil fumarate. Of initiators of PrEP, 23 (5.8%) seroconverted at a rate of 13.9 cases/100 person-years. Better social support, larger network density, and higher education were associated with engagement in 4 to 5 components of the cascade. Conclusions Our data highlight a gap between willingness and actual PrEP use. Despite PrEP's effectiveness in preventing HIV, the optimal impact of PrEP for SGMs in sub-Saharan Africa will require multifaceted approaches that combine social support, education, and destigmatization. © 2023 American Sexually Transmitted Diseases Association.All rights reserved. Article	2023	Ramanaik S.; Sinha A.P.; Mukherjee A.; Pujar A.; Subramanyam K.; Gopalan A.; Washington R.	Acceptability of PrEP among MSM and transgender communities-Qualitative findings from two metropolitan cities in India	PLOS One	-	-	19326203	10.1371/journal.pone.0281984	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148773348&doi=10.1371%2fjournal.pone.0281984&partnerID=40&md5=538b31fbe1611a7fe6cf43761ca40539	Background Global evidence suggests that Pre-Exposure Prophylaxis (PrEP) plays a pivotal role in reducing new HIV-infections among key populations (KP). However, the acceptability of PrEP differs across different geographical and cultural settings and among different KP typologies. Men who have sex with men (MSM) and transgender (TG) communities in India have around 15-17 times higher prevalence of human immunodeficiency virus (HIV) than the general population. The low rates of consistent condom use and poor coverage of HIV testing and treatment among the MSM and transgender communities highlight the need for alternative HIV prevention options. Methods We used data from 20 in-depth interviews and 24 focused group discussions involving 143 MSM and 97 transgender individuals from the two metropolitan cities (Bengaluru and Delhi) in India to qualitatively explore their acceptability of PrEP as a HIV prevention tool. We coded data in NVivo and conducted extensive thematic content analysis. Results Awareness and use of PrEP were minimal among the MSM and transgender communities in both cities. However, on being provided with information on PrEP, both MSM and transgender communities expressed willingness to use PrEP as an additional HIV-prevention tool, to complement inability to consistently use condoms. PrEP was also perceived as a tool that could enhance the uptake of HIV-testing and counseling services. PrEP awareness, availability, accessibility and affordability were identified as determining factors that could influence its acceptability. Challenges such as stigma and discrimination, interrupted supply of drugs and non-community-friendly drug dispensing sites were identified barriers to continuing PrEP. Conclusions Using qualitative data from two Indian settings, this study provides community perspectives and recommendations to stakeholders and policymakers for introduction of PrEP into programs as a prevention tool among MSM and transgender communities in India. © 2023 Ramanaik et al. A randomized clinical trial of on-demand oral pre-exposure prophylaxis does not modulate lymphoid/myeloid HIV target cell density in the foreskin	AIDS	-	-	2699370	10.1097/QAD.0000000000003619	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166442104&doi=10.1097%2fQAD.0000000000003619&partnerID=40&md5=c0b2931576d329a4836d49a4b802931b	Objectives:As topical pre-exposure prophylaxis (PrEP) has been shown to cause immune modulation in rectal or cervical tissue, our aim was to examine the impact of oral PrEP on lymphoid and myeloid changes in the foreskin in response to dosing and timing of drug administration.Design:HIV-negative male individuals (n=144) were recruited in South Africa and Uganda into an open-label randomized controlled trial in a 1:1:1:1:1:1:1:1:1 ratio to control arm (with no PrEP) or one of eight arms receiving emtricitabine-tenofovir disoproxil fumarate (F/TDF) or emtricitabine-tenofovir alafenamide (F/TAF) at one of two different doses, 5 or 21h before undergoing voluntary medical male circumcision (VMMC).Methods:After dorsal-slit circumcision, foreskin tissue sections were embedded into Optimal Cutting Temperature media and analysed, blinded to trial allocation, to determine numbers of CD4+CCR5+, CD1a+cells and claudin-1 expression. Cell densities were correlated with tissue-bound drug metabolites and p24 production after ex-vivo foreskin challenge with HIV-1bal.Results:There was no significant difference in CD4+CCR5+or CD1a+cell numbers in foreskins between treatment arms compared with the control arm. Claudin-1 expression was 34% higher (P=0.003) in foreskin tissue from participants receiving PrEP relative to controls, but was no longer statistically significant after controlling for multiple comparisons. There was neither correlation of CD4+CCR5+, CD1a+cell numbers, or claudin-1 expression with tissue-bound drug metabolites, nor with p24 production after ex-vivo viral challenge.Conclusion:Oral doses and timing of on-demand PrEP and in-situ drug metabolite levels in tissue have no effect on numbers or anatomical location of lymphoid or myeloid HIV target cells in foreskin tissue. © 2023 Lippincott Williams and Wilkins. Article	2023	Ramgopal, MN; Castagna, A; Cazanave, C; Diaz-Brito, V; Dretler, R; Oka, S; Osiyemi, O; Walmsley, S; Sims, J; Di Perri, G; Sutton, K; Sutherland-Phillips, D; Berni, A; Latham, CL; Zhang, F; D'Amico, R; Pascual Bernáldez, M; Van Solingen-Ristea, R; Van Eygen, V; Patel, P; Chounta, V; Spreen, WR; Garges, HP; Smith, K; van Wyk, J	Efficacy, safety, and tolerability of switching to long-acting cabotegravir plus rilpivirine versus continuing fixed-dose bictegravir, emtricitabine, and tenofovir alafenamide in virologically suppressed adults with HIV, 12-month results (SOLAR): a randomised, open-label, phase 3b, non-inferiority trial	The Lancet HIV	-	-	23523018	10.1016/S2352-3018(23)00136-4	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02594633/full	BACKGROUND: Cabotegravir plus rilpivirine is the only approved complete long-acting regimen for the maintenance of HIV-1 virological suppression dosed every 2 months. The SOLAR study aimed to compare long-acting cabotegravir plus rilpivirine every 2 months with continued once-daily bictegravir, emtricitabine, and tenofovir alafenamide for the maintenance of HIV-1 virological suppression in adults living with HIV. METHODS: SOLAR is a randomised, open-label, multicentre, phase 3b, non-inferiority study. The study was done in 118 centres across 14 countries. Participants with HIV-1 RNA less than 50 copies per mL were randomly assigned (2:1), stratified by sex at birth and BMI, to either long-acting cabotegravir (600 mg) plus rilpivirine (900 mg) dosed intramuscularly every 2 months or to continue daily oral bictegravir (50 mg), emtricitabine (200 mg), and tenofovir alafenamide (25 mg). Participants randomly assigned to long-acting therapy had a choice to receive cabotegravir (30 mg) plus rilpivirine (25 mg) once daily as an optional oral lead-in for approximately 1 month. The primary efficacy endpoint was the proportion of participants with virological non-response (HIV-1 RNA ≥50 copies per mL; the US Food and Drug Administration snapshot algorithm, 4% non-inferiority margin; modified intention-to-treat exposed population) at month 11 (long-acting start with injections group) and month 12 (long-acting with oral lead-in group and bictegravir, emtricitabine, and tenofovir alafenamide group). The study is registered with ClinicalTrials.gov, NCT04542070, and is ongoing. FINDINGS: 837 participants were screened between Nov 9, 2020, and May 31, 2021, and 687 were randomly assigned to switch treatment or continue existing treatment. Of 670 participants (modified intention-to-treat exposed population), 447 (67%) switched to long-acting therapy (274 61% of 447 start with injections; 173 39% of 447 with oral lead-in) and 223 (33%) continued bictegravir, emtricitabine, and tenofovir alafenamide. Baseline characteristics were similar; median age was 37 years (range 18-74), 118 (18%) of 670 were female sex at birth, 207 (31%) of 670 were non-White, and median BMI was 25·9 kg/m2 (IQR 23·3-29·5). At month 11-12, long-acting cabotegravir plus rilpivirine showed non-inferior efficacy versus bictegravir, emtricitabine, and tenofovir alafenamide (HIV-1 RNA ≥50 copies per mL, five 1% of 447 vs one <1% of 223), with an adjusted treatment difference of 0·7 (95% CI -0·7 to 2·0). Excluding injection site reactions, adverse events and serious adverse events were similar between groups. No treatment-related deaths occurred. More long-acting group participants had adverse events leading to withdrawal (25 6% of 454 vs two 1% of 227). Injection site reactions were reported by 316 (70%) of 454 long-acting participants; most (98%) were grade 1 or 2. INTERPRETATION: These data support the use of long-acting cabotegravir plus rilpivirine dosed every 2 months as a complete antiretroviral regimen that has similar efficacy to a commonly used integrase strand transfer inhibitor-based first-line regimen, while addressing unmet psychosocial issues associated with daily oral treatment. Article	2023	Ramos S.D.; Du Bois S.	Facilitators and Barriers to Pre-Exposure Prophylaxis Uptake Willingness for Full-Service Sex Workers: A Social–Ecological Approach	Sociological Inquiry	-	-	380245	10.1111/soin.12589	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179964276&doi=10.1111%2fsoin.12589&partnerID=40&md5=cfb02ee9f4222708e404b65e475a6c9b	Full-service sex workers (FSSWs) are at heightened risk of contracting HIV due to facing multi-level challenges to sexual health. This study investigated factors associated with willingness to use Pre-Exposure Prophylaxis (PrEP)—a daily HIV preventative medication, among FSSWs. Using social–ecological theory, an online survey was developed with initial guidance from a local sex worker advocacy organization to assess barriers and facilitators to PrEP uptake willingness. The survey was disseminated with the assistance of local and national sex work advocacy organizations. In our sample of FSSWs (n = 83), two barriers and two facilitators initially were associated with PrEP uptake. However, in adopting a more conservative analysis, only anticipating stigmatizing disapproval from others for using PrEP and providing others with PrEP knowledge maintained statistical significance. These two variables collectively explained nearly 30% of the variance in PrEP uptake willingness. Implications for both future research and clinical work with FSSWs are discussed. © 2023 The Authors. Article	2023	Ramos S.D.; Woodward H.; Kannout L.; Du Bois S.	Dimensional Reduction in Barriers and Facilitators to Pre-exposure Prophylaxis (PrEP) Uptake Willingness for Full-Service Sex Workers	Archives of Sexual Behavior	-	-	40002	10.1007/s10508-023-02742-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176470209&doi=10.1007%2fs10508-023-02742-z&partnerID=40&md5=271c7d7f95666f49f40b81aae9ffefc7	Full-Service Sex Workers (FSSWs) face heightened risk of acquiring HIV, yet exhibit relatively low adoption of pre-exposure prophylaxis (PrEP)—an antiviral that substantially reduces HIV acquisition risk. Little work examines barriers and facilitators to PrEP uptake willingness among FSSWs. This study aimed to identify the distinct components of barriers and facilitators to PrEP uptake willingness for FSSWs. Here, we subjected 19 PrEP barriers and facilitators identified in the literature to a principal component analysis (PCA) among a sample of 83 FSSWs. Preliminary statistics supported factorability of data. PCA revealed three distinct components of barriers and facilitators that explained 62.80% of the total variance in survey responses. We labeled these components Behavioral and Social Concerns (α = 0.93), Access and Affordability (α = 0.67), and Biologically Based Health Concerns (α = 0.79). This study shows promise for future clinical and research utility of these factors and provides a basis for future psychometric studies of barriers and facilitators to PrEP uptake willingness among FSSWs. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Ramraj T.; Chirinda W.; Jonas K.; Govindasamy D.; Jama N.; McClinton Appollis T.; Zani B.; Mukumbang F.C.; Basera W.; Hlongwa M.; Turawa E.B.; Mathews C.; Nicol E.	Service delivery models that promote linkages to PrEP for adolescent girls and young women and men in sub-Saharan Africa: A scoping review	BMJ Open	-	-	20446055	10.1136/bmjopen-2022-061503	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150961722&doi=10.1136%2fbmjopen-2022-061503&partnerID=40&md5=1eeff57797f9861b9b6952166f76e72f	Background Pre-exposure prophylaxis (PrEP) is an emerging biomedical prevention intervention. Documenting PrEP service delivery models (SDMs) that promote linkage to and continuation of PrEP will inform guidelines and maximise roll-out. Objectives To synthesise and appraise the effectiveness and feasibility of PrEP SDMs designed to promote linkage to PrEP care among adolescent girls and young women (AGYW) and men in sub-Saharan Africa (SSA). Eligibility criteria Primary quantitative and qualitative studies published in English and conducted in SSA were included. No restrictions on the date of publication were applied. Sources of evidence Methodology outlined in the Joanna Briggs Institute reviewers' manual was followed. PubMed, Cochrane library, Scopus, Web of Science and online-conference abstract archives were searched. Charting methods Data on article, population, intervention characteristics and key outcomes was charted in REDCap. Results and conclusion Of the 1204 identified records, 37 (met the inclusion criteria. Health facility-based integrated models of PrEP delivery with family planning, maternal and child health or sexual and reproductive services to AGYW resulted in PrEP initiation of 16%-90%. Community-based drop-in centres (66%) was the preferred PrEP outlet for AGYW compared with public clinics (25%) and private clinics (9%). Most men preferred community-based delivery models. Among individuals who initiated PrEP, 50% were men, 62% were <35 years old and 97% were tested at health fairs compared with home testing. Integrated antiretroviral therapy (ART)-PrEP delivery was favoured among serodiscordant couples with 82.9% of couples using PrEP or ART with no HIV seroconversions. PrEP initiation within healthcare facilities was increased by perceived client-friendly services and non-judgemental healthcare workers. Barriers to PrEP initiation included distance to travel to and time spent at health facilities and perceived community stigma. PrEP SDMs for AGYW and men need to be tailored to the needs and preferences for each group. Programme implementers should promote community-based SDMs to increase PrEP initiation among AGYW and men. © Author(s) (or their employer(s)) 2023. Re-use permitted under CC BY-NC. Article	2023	Randolph, Schenita D; Johnson, Ragan; Jeter, Elizabeth; McGee, Kara; Johnson, Allison	UPDOs Protective Styles, a Multilevel Intervention to Improve Pre-exposure Prophylaxis Uptake Among Black Cisgender Women: Pretest-Posttest Evaluation.	Journal of the Association of Nurses in AIDS Care	-	-	1552-6917	10.1097/JNC.0000000000000424	https://dx.doi.org/10.1097/JNC.0000000000000424	ABSTRACT: In the United States, Black cisgender women account for one in five new HIV infections with Black Americans, accounting for 57% of new diagnoses in the South. Pre-exposure prophylaxis (PrEP) is 99% effective at preventing HIV. Still, Black women's uptake remains at 2% due to multiple documented barriers, including lack of awareness and knowledge, mistrust, stigma, and low perceived risk. Culturally relevant interventions leveraging trusted venues, such as beauty salons, can overcome these barriers. This article reports preliminary results of an intervention to improve PrEP knowledge and awareness, PrEP stigma, PrEP trust, and uptake among Black cisgender women. This multilevel, mixed-methods study used a community-engagement approach to develop and pilot a salon-based intervention, Using PrEP and Doing it for Ourselves (UPDOs) Protective Styles. The intervention improved knowledge, awareness, and trust around PrEP among Black cisgender women. PrEP use stigma within interpersonal relationships decreased, but low perceived risk and social stigma remained constant. Culturally and socially acceptable interventions like UPDOs Protective Styles can model health care delivery to improve trust, thus improving uptake over time for this population. Article	2023	Rangaka, Molebogeng X.; Frick, Mike; Churchyard, Gavin; García-Basteiro, Alberto L.; Hatherill, Mark; Hanekom, Willem; Hill, Philip C.; Hamada, Yohhei; Quaife, Matthew; Vekemans, Johan; White, Richard G.; Cobelens, Frank	Clinical trials of tuberculosis vaccines in the era of increased access to preventive antibiotic treatment.	The Lancet Respiratory medicine	-	-	2213-2619 2213-2600	10.1016/S2213-2600(23)00084-X	https://pubmed.ncbi.nlm.nih.gov/36966794/	Approximately 10·6 million people worldwide develop tuberculosis each year, representing a failure in epidemic control that is accentuated by the absence of effective vaccines to prevent infection or disease in adolescents and adults. Without effective vaccines, tuberculosis prevention has relied on testing for Mycobacterium tuberculosis infection and treating with antibiotics to prevent progression to tuberculosis disease, known as tuberculosis preventive treatment (TPT). Novel tuberculosis vaccines are in development and phase 3 efficacy trials are imminent. The development of effective, shorter, and safer TPT regimens has broadened the groups eligible for TPT beyond people with HIV and child contacts of people with tuberculosis; future vaccine trials will be undertaken in an era of increased TPT access. Changes in the prevention standard will have implications for tuberculosis vaccine trials of disease prevention, for which safety and sufficient accrual of cases are crucial. In this paper, we examine the urgent need for trials that allow the evaluation of new vaccines and fulfil the ethical duty of researchers to provide TPT. We observe how HIV vaccine trials have incorporated preventive treatment in the form of pre-exposure prophylaxis, propose trial designs that integrate TPT, and summarise considerations for each design in terms of trial validity, efficiency, participant safety, and ethics. Article	2023	Rao A.; Mhlophe H.; Pretorius A.; Mcingana M.; Mcloughlin J.; Shipp L.; Baral S.; Hausler H.; Schwartz S.; Lesko C.	Effect of implementation strategies on pre-exposure prophylaxis persistence among female sex workers in South Africa: an interrupted time series study	The Lancet HIV	-	-	23523018	10.1016/S2352-3018(23)00262-X	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178370205&doi=10.1016%2fS2352-3018%2823%2900262-X&partnerID=40&md5=6da5da3e0ec3df90ffe06a82b48e36ca	Background: A disproportionate number of new HIV infections in South Africa are among female sex workers; pre-exposure prophylaxis (PrEP) for HIV prevention is freely available to female sex workers in the country, but unique barriers challenge PrEP persistence. TB HIV Care, a large South African non-profit organisation that provides daily oral PrEP (tenofovir disoproxil fumarate and emtricitabine), has implemented multiple strategies to improve PrEP persistence. We aimed to evaluate the effect of different implementation strategies on PrEP persistence in a large-scale real-world setting. Methods: In this interrupted time series study, we estimated level changes in 1-month oral PrEP persistence associated with roll-out of various implementation strategies among female sex workers across nine districts in South Africa. We used routinely collected data from TB HIV Care programme files from June 7, 2016, to April 30, 2021. Poisson regression of 1-month persistence was used to assess the effect of these strategies. In secondary analyses, we tested the association between each of the strategies and 4-month persistence. Findings: The median 1-month PrEP persistence for female sex workers was 33% (IQR 27–40). SMS support and refill reminders were associated with an 11% relative increase in 1-month persistence (risk ratio RR 1·11, 95% CI 1·02–1·26) and clinical mentoring for PrEP providers was associated with a 127% relative increase (RR 2·27, 95% CI 1·94–2·66) among female sex workers. The loyalty rewards programme was negatively associated with 1-month persistence (RR 0·71, 95% CI 0·67–0·83). Although clinical mentoring improved 4-month persistence, SMS support text messages had no significant effect. Interpretation: Identification and subsequent use of clinical mentoring for PrEP providers and SMS support and refill reminders might improve the usefulness of PrEP overall to prevent new HIV infections among female sex workers. PrEP persistence remains an important issue, and strategies to build on our findings are needed. Article	2023	Rao, Amrita; Lesko, Catherine; Mhlophe, Hlengiwe; Rucinski, Katherine; Mcingana, Mfezi; Pretorius, Anje; Mcloughlin, Jennifer; Baral, Stefan; Beyrer, Chris; Hausler, Harry; Schwartz, Sheree	Longitudinal patterns of initiation, persistence, and cycling on preexposure prophylaxis among female sex workers and adolescent girls and young women in South Africa.	AIDS	-	-	1473-5571	10.1097/QAD.0000000000003500	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10079574	OBJECTIVE: Female sex workers (FSW) and adolescent girls and young women (AGYW) face a disproportionately high risk of HIV in South Africa. Oral preexposure prophylaxis (PrEP) can avert new infections, but its effectiveness is linked to consistent use. Early discontinuation of PrEP in this population is high, but less is known about longitudinal patterns of PrEP use, including patterns of re-initiation and cycling. DESIGN: Longitudinal descriptive analysis of routine program data. METHODS: Between 2016 and 2021, 40 681 FSW and AGYW initiated PrEP at TB HIV Care, the largest PrEP provider to this population in South Africa and were included. Using survival analyses and group-based trajectory modeling, we described patterns of initiation, discontinuation, re-initiation, and cycling. RESULTS: Total initiations increased over the life of the program for both FSW and AGYW. About 40% of FSW 0.41, 95% confidence interval (CI) 0.40-0.42 and AGYW (0.38, 95% CI 0.37-0.38) remained on PrEP at one month. FSW were more likely to restart PrEP, however <10% restarted PrEP within a year of initiation. Three latent trajectory groups of PrEP use were identified for FSW (low use, early cycling, and ongoing cycling) and two for AGYW (low use and ongoing cycling). Persistence was negatively associated with initiation among AGYW, but there was no clear relationship among FSW. Those initiating later in the program and older women had a reduced risk of discontinuation. CONCLUSIONS: Persistence on PrEP was low, but cycling on and off PrEP was common, with early missed visits and inconsistent, but ongoing use. A push to increase PrEP initiations needs to factor in readiness and persistence support, to achieve public health impact. Article	2023	Rastegar J.; Hu A.; Chung L.; Stevens L.; Dixon S.W.; Schwab P.; Ellis J.J.	HIV preexposure prophylaxis treatment patterns in a national health plan population	Journal of Managed Care and Specialty Pharmacy	-	-	23760540	10.18553/jmcp.2023.29.12.1267	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179014714&doi=10.18553%2fjmcp.2023.29.12.1267&partnerID=40&md5=9e3f8e2b1ecaf9b54c3026abae53c104	BACKGROUND: Medication nonadherence diminishes the benefits of preexposure prophylaxis (PrEP) for the 1.2 million Americans at risk for HIV exposure. OBJECTIVE: To describe HIV PrEP treatment patterns among Medicare Advantage Prescription Drug (MAPD) plan and commercially insured beneficiaries. METHODS: This retrospective cohort study identified patients aged 16 to 89 years with at least 1 dispensing of emtricitabine-tenofovir disoproxil fumarate from July 2012, through December 2020, or emtricitabine-tenofovir alafenamide from October 2019 through December 2020, and who were continuously enrolled at least 12 months prior to and following the earliest PrEP claim. Outcomes were HIV PrEP adherence measured by proportion of days covered (PDC) using 2 binary thresholds of 0.60 (4 doses/week) and 0.80 (5-6 doses/week) and duration of index treatment episode, total time on treatment, and total number of prescription fills. RESULTS: The study cohort of 707 (292 MAPD plan, 415 commercial) was predominantly made up of male patients (90.0%) and resided in the South (78.9%) with a mean age of 46.2 years (MAPD plan: 54.5, commercial: 40.4). Both populations engaged in high-risk sexual behavior (All: 18.7%, MAPD plan: 16.8%, commercial: 20.0%) and experienced sexually transmitted infections (All: 3.3%, MAPD plan: 2.1%, commercial: 4.1%). The mean index treatment episode length was 297.0 days (MAPD plan: 283.6, commercial: 306.5). Total time on treatment was 477.3 days (MAPD plan: 450.7, commercial 496.0). At 3 months, 84.9% (MAPD plan: 83.6%, commercial: 85.8%) and at 12 months, 58.7% (MAPD plan: 57.2, commercial: 59.8) of patients achieved a PDC of at least 0.80. At 3 months, 100.0% (MAPD plan: 100.0%, commercial: 100.0%), and at 12 months, 74.3% (MAPD plan: 70.2%, commercial: 76.9%) of patients achieved a PDC of at least 0.60. The cohort had a mean of 16.4 fills of 30 days (MAPD plan: 16.4, commercial: 16.3) supply. CONCLUSIONS: There is an opportunity for clinical programs to focus on improving longer- term PrEP adherence among individuals at risk for HIV exposure. © 2023, Academy of Managed Care Pharmacy. Article	2023	Rawat P.; Imam S.S.; Gupta S.	Formulation of Cabotegravir Loaded Gold Nanoparticles: Optimization, Characterization to In-Vitro Cytotoxicity Study	Journal of Cluster Science	-	-	10407278	10.1007/s10876-022-02261-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128835249&doi=10.1007%2fs10876-022-02261-2&partnerID=40&md5=8d2b74591a7b94b7455e8e2de5b041d6	The effective and preventive treatment of HIV is one of the difficult challenges worldwide. It requires the development of an effective prophylactic strategy to prevent HIV/AIDS. This study aimed to synthesize Cabotegravir (CAB)-biodegradable gold (Au) nanoparticles by using pectin as a reducer and stabilizer. CAB-GNPs were prepared by the slightly modified Turkevich method. CAB-GNPs were optimized using Box Behnken design for independent variables gold chloride (A), pectin (B) and pH range (C). The effects of independent variables were observed on particle size (Y1) and encapsulation efficiency (Y2). The results of the study revealed that the optimized nanoparticles (GLN7) had a particle size of 3.9 ± 0.1 nm and encapsulation efficiency of 97.2 ± 3.9%. TEM study showed the spherical shape particles. The in-vitro drug release revealed 62.1 ± 0.5% release of CAB in simulated gastric buffer (pH 1.2) and 45.5 ± 2.8% in physiological buffer (pH 7.4). In-vitro cytotoxicity study and antibacterial activity depicted the safety of the prepared NPs by showing lesser toxicity than pure CAB. From the results, our experimental outcomes concluded that CAB gold nanoparticles composed of pectin may constitute a preferred embodiment for the delivery of CAB. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Rawlins-Pilgrim S.; Wheelock A.; Streed C.G., Jr.; Higham M.; Krakower D.S.; Taylor J.L.	Survey assessment of HIV pre-exposure prophylaxis availability in student health services in New England colleges and universities	Journal of American College Health	-	-	7448481	10.1080/07448481.2023.2232465	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165310705&doi=10.1080%2f07448481.2023.2232465&partnerID=40&md5=df5d6854e6c962a854d70772f53a32ff	Objective: To determine HIV pre-exposure prophylaxis (PrEP) availability at student health services (SHS) in New England. Methods: We conducted an electronic survey of medical directors of SHS at New England colleges and universities. We measured the availability and volume of PrEP prescribing, barriers and facilitators to prescribing and provider knowledge. Results: Of 143 institutions surveyed, 39% completed questionnaires; 75% were private and 93% were 4 years. Thirty-six percent of institutions did not offer PrEP. Those offering PrEP started a mean of 2.0 per 1000 students/year. PrEP was available at more schools with higher vs. lower endowments (100 vs. 38%, p = 0.002), 4- vs. 2-year programs (68 vs. 0%, p = 0.042), and private vs. public schools (73 vs. 38%, p = 0.043). Conclusions: PrEP was not available at one in three New England SHS and prescribing rates at institutions that offered PrEP were low. Interventions are needed to improve PrEP access. © 2023 Taylor & Francis Group, LLC. Article	2023	Reddy K.; Palanee-Phillips T.; Heffron R.	Awareness of Heightened Sexual and Behavioral Vulnerability as a Trigger for PrEP Resumption Among Adolescent Girls and Young Women in East and Southern Africa	Current HIV/AIDS Reports	-	-	15483568	10.1007/s11904-023-00680-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178395404&doi=10.1007%2fs11904-023-00680-y&partnerID=40&md5=f053e8a3d5df41a7e1209462eb701391	Purpose of Review: East and Southern Africa are the epicenter of the HIV epidemic. High HIV incidence rates among adolescent girls and young women (AGYW) remain stable over the last decade despite access to daily oral PrEP. Some settings have experienced high PrEP uptake among AGYW; however, discontinuation has been high. This review sought to understand drivers of PrEP discontinuation in this population in order to identify potential mechanisms to facilitate PrEP restart and optimize PrEP use. Recent Findings: Drivers of PrEP discontinuation included low perceived HIV acquisition risk, PrEP-associated side effects, pill burden, family/sexual partner disapproval, lack of/intermittent sexual activity, PrEP use stigma, fear of intimate partner violence, misinformation about long-term PrEP use, and limited/inconsistent access to PrEP. Summary: The most frequently reported driver of PrEP discontinuation was low perceived HIV acquisition risk. This indicates that innovative interventions to help AGYW recognize their HIV risk and make informed decisions about PrEP use are urgently needed. © 2023, The Author(s). Article	2023	Reichheld, Sarah J; Pellowski, Jennifer A; Wilson-Barthes, Marta; Galárraga, Omar	Barriers and facilitators to scaling up access to HIV pre-exposure prophylaxis among key populations: A qualitative study of the incentive-based PrEP Seguro program in Mexico.	SSM Qualitative Research in Health	-	-	2667-3215	10.1016/j.ssmqr.2023.100357	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10720609	Introduction: Daily oral pre-exposure prophylaxis (PrEP) is highly safe and effective for HIV prevention, yet barriers to PrEP access and adherence persist among key populations. In Mexico, incentive-based pilot programs have been effective in improving PrEP adherence among male sex workers. Understanding the experiences of providers and program implementers is critical to integrating PrEP adherence programs as part of standard care in Mexico and similar settings. Methods: We conducted 17 in-depth informational interviews with care providers and staff responsible for administering PrEP to key populations (men who have sex with men, male sex workers, transgender women) in Mexico City. Interviews explored successes and challenges surrounding current PrEP implementation, as well as adaptations that could facilitate national scale-up of PrEP programs in Mexico. Informant transcripts were analyzed using a hybrid inductive-deductive thematic analysis approach utilizing CFIR constructs for the initial codebook while allowing for inductive findings. Results: Three key themes emerged from informant interviews as important for promoting PrEP programs in Mexico: 1) increasing individual PrEP access, 2) strengthening quality of care, and 3) improving organizational and structural support. Conclusions: PrEP in Mexico is currently only available in a few clinics with high patient populations, and siloed HIV services, stigma, and a lack of inter-organizational collaboration remain persistent barriers to PrEP uptake. Promoting government collaboration and increasing financial support for community-based organizations is needed to expand PrEP access. Tailored, destigmatizing information about PrEP services needs to be diffused among both staff and patients to strengthen care quality. Article	2023	Reiriz M.; Rodríguez-Expósito B.; Jiménez-García A.J.; Uceda S.; Arias N.	Pre-Exposure Prophylaxis, Anxiety, Depression and Sexual Satisfaction Among Men Who Have Sex With Men; Profilaxis Pre-Exposición, Ansiedad, Depresión y Satisfacción Sexual en Hombres que Tienen Sexo con Otros Hombres	Psicothema	-	-	2149915	10.7334/psicothema2022.230	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149271375&doi=10.7334%2fpsicothema2022.230&partnerID=40&md5=ecf999f8536b673f27a9371b560d1379	Background: Pre-exposure prophylaxis (PrEP) has been implemented as a prevention against HIV; however, its impact on mental health, sexual and life satisfaction has not been addressed. Method: We assessed 114 HIV-negative participants from Spain with ages ranging from 19 to 58 years; 60.5% were PrEP users (n = 69) and 39.5% were non-users (n = 45). They completed five questionnaires about life and sexual satisfaction, depression and anxiety. We performed correlations and multiple regression analyses. Results: The PrEP group showed a statistically significant relationship between better sexual satisfaction, and greater life satisfaction. The PrEP group also showed a statistically significant negative relationship with depression and anxiety which was not found in PrEP non-users. Moreover, we found that younger PrEP users had higher scores in anxiety and lower scores in depression than older users. The hierarchical regression analyses also showed that number of sexual partners was a major predictor in the PrEP group for NSSS. Conclusions: The indirect correlation between sexual satisfaction, depression, and anxiety in the PrEP group underlines the benefits of PrEP for patients' sex lives such as increased sexual liberties due to lower anxiety and mental comfort when experiencing chemsex. © 2023, Colegio Oficial de Psicologos Asturias. Article	2023	Reisner, Sari L.; Aguayo-Romero, Rodrigo A.; Perez-Brumer, Amaya; Salazar, Ximena; Nunez-Curto, Aron; Orozco-Poore, Casey; Silva-Santisteban, Alfonso	A life course health development model of HIV vulnerabilities and resiliencies in young transgender women in Peru.	Global Health Research and Policy	-	-	-	2397-0642	10.1186/s41256-023-00317-y	https://ghrp.biomedcentral.com/articles/10.1186/s41256-023-00317-y	BACKGROUND: Globally transgender women (TW) are at heightened vulnerability for HIV infection. In Lima Peru, sharp increases in HIV prevalence are seen among TW ages 25 years and older highlighting the need for early HIV prevention efforts for young TW. This study conducted in-depth qualitative interviews to elucidate the social and developmental contexts of HIV vulnerability for young TW in Lima Peru. METHODS: Between November 2019 and February 2020, young TW ages 16-24 years (n = 21) in Lima Peru were purposively sampled using in-person (e.g., face-to-face outreach) and online (e.g., social media, networking websites) social network-based methods. Interviews were conducted in Spanish and a rapid qualitative analysis was conducted using a modified immersion crystallization methodology to identify themes. RESULTS: Five themes emerged, informing the conceptualization of a Life Course Health Development Model of HIV Vulnerabilities and Resiliencies: (1) interpersonal contexts (family, school, partners, sexual debut, trans mothers); (2) structural vulnerabilities (poverty, educational constraints, migration, hostile environments, sex work, police violence); (3) concomitant mental health and psychosocial factors (discrimination, violence, depression, suicidality, substance use, life hopes/dreams/future expectations); (4) gender affirmation processes (gender identity development, hormones, surgery, legal name/gender marker change); (5) HIV prevention and treatment barriers (PrEP uptake, HIV care, condom use, risk reduction). CONCLUSIONS: Young TW experience formidable developmental challenges associated with transphobia, violence, and pre-maturely facing accelerated milestones. Developmentally and culturally appropriate interventions to mitigate HIV vulnerability in Peru are needed, including those that consider co-occurring stigma-related conditions in adolescence and young adulthood. Article	2023	Restar A.J.; Quilantang M.I.; Wickersham J.; Adia A.; Guigayoma J.; Bermudez A.N.; Galárraga O.; Flores D.D.; Cu-Uvin S.; Nazareno J.; Operario D.; Sison O.	Predictors of PrEP awareness, PrEP discussion and interest in long-acting injectable PrEP among Filipina transfeminine adults	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.26080	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161674261&doi=10.1002%2fjia2.26080&partnerID=40&md5=c995f70954f66d77ad4b4a7cfdcc0a5a	Introduction: Transfeminine adults are impacted by the HIV epidemic in the Philippines, and newly approved modalities of pre-exposure prophylaxis (PrEP), including long-acting injectable (LAI-PrEP), could be beneficial for this group. To inform implementation, we analysed PrEP awareness, discussion and interest in taking LAI-PrEP among Filipina transfeminine adults. Methods: We utilized secondary data from the #ParaSaAtin survey that sampled Filipina transfeminine adults (n = 139) and conducted a series of multivariable logistic regressions with lasso selection to explore factors independently associated with PrEP outcomes, including awareness, discussion with trans friends and interest in LAI-PrEP. Results: Overall, 53% of Filipina transfeminine respondents were aware of PrEP, 39% had discussed PrEP with their trans friends and 73% were interested in LAI-PrEP. PrEP awareness was associated with being non-Catholic (p = 0.017), having previously been HIV tested (p = 0.023), discussing HIV services with a provider (p<0.001) and having high HIV knowledge (p = 0.021). Discussing PrEP with friends was associated with older age (p = 0.040), having experienced healthcare discrimination due to transgender identity (p = 0.044), having HIV tested (p = 0.001) and having discussed HIV services with a provider (p < 0.001). Very interested in LAI-PrEP was associated with living in Central Visayas (p = 0.045), having discussed HIV services with a provider (p = 0.001) and having discussed HIV services with a sexual partner (p = 0.008). Conclusions: Implementing LAI-PrEP in the Philippines requires addressing systemic improvements across personal, interpersonal, social and structural levels in healthcare access, including efforts to create healthcare settings and environments with providers who are trained and competent in transgender health and can address the social and structural drivers of trans health inequities, including HIV and barriers to LAI-PrEP. © 2023 The Authors. Article	2023	Restar, Arjee; Minalga, Brian J.; Quilantang, Ma Irene; Adamson, Tyler; Dusic, Emerson; van der Merwe, Leigh-Ann; Millet, Greg; Rosadiño, Danvic; Laguing, Tanya; Lett, Elle; Everhart, Avery; Phillips, Gregory 2nd; Janamnuaysook, Rena; Seekaew, Pich; Baker, Kellan; Ashley, Florence; Wickersham, Jeffrey; Wallace, Stephaun E.; Operario, Don; Gamarel, Kristi E.	Mapping Community-Engaged Implementation Strategies with Transgender Scientists, Stakeholders, and Trans-Led Community Organizations.	Current HIV/AIDS Reports	-	-	-	1548-3576 1548-3568	10.1007/s11904-023-00656-y	https://link.springer.com/article/10.1007/s11904-023-00656-y	PURPOSE OF REVIEW: Pre-exposure prophylaxis (PrEP) represents one of the most effective methods of prevention for HIV, but remains inequitable, leaving many transgender and nonbinary (trans) individuals unable to benefit from this resource. Deploying community-engaged PrEP implementation strategies for trans populations will be crucial for ending the HIV epidemic. RECENT FINDINGS: While most PrEP studies have progressed in addressing pertinent research questions about gender-affirming care and PrEP at the biomedical and clinical levels, research on how to best implement gender-affirming PrEP systems at the social, community, and structural levels remains outstanding. The science of community-engaged implementation to build gender-affirming PrEP systems must be more fully developed. Most published PrEP studies with trans people report on outcomes rather than processes, leaving out important lessons learned about how to design, integrate, and implement PrEP in tandem with gender-affirming care. The expertise of trans scientists, stakeholders, and trans-led community organizations is essential to building gender-affirming PrEP systems. Article	2023	Reyniers T.; Babo S.A.Y.; Ouedraogo M.; Kanta I.; Ekon Agbégnigan L.; Rojas D.; Eubanks A.; Anoma C.; Dah T.T.E.; Mensah E.; Dembélé Keita B.; Spire B.; Vuylsteke B.; Laurent C.	Strategies to improve PrEP uptake among West African men who have sex with men: a multi-country qualitative study	Frontiers in Public Health	-	-	-	22962565	10.3389/fpubh.2023.1165327	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85158899904&doi=10.3389%2ffpubh.2023.1165327&partnerID=40&md5=c33051e5ae7254b2edf012f597772b4c	Introduction: West African men who have sex with men (MSM) remain at substantial risk of contracting HIV. Pre-exposure prophylaxis (PrEP) can be an effective game-changer in reducing the number of HIV infections in MSM communities. To optimize the roll-out of PrEP, we need to better understand how we can increase its uptake. The objective of this study was to explore the perceptions of West African MSM toward PrEP and their proposed strategies to overcome barriers to PrEP uptake within their communities. Methods: Between April 2019 and November 2021, we conducted 12 focus group discussions with 97 MSM not taking PrEP, and 64 semi-structured interviews with MSM taking PrEP, in Burkina Faso, Côte d'Ivoire, Mali, and Togo. Data collection and analysis were guided and conducted by local research teams, enabling a community-based participatory approach. A coordinating researcher collaborated with these local teams to analyze the data guided by a grounded theory approach. Results: The results show that participants were generally positive toward PrEP and that MSM communities have become more aware of PrEP for the study. We identified three main strategies for increasing PrEP uptake. First, participants proposed to raise awareness and improve knowledge of HIV as they considered the self-perceived risk of MSM in their communities to be low. Second, because of existing misconceptions and false information, participants proposed to improve the dissemination of PrEP to allow for informed choices, e.g., via peers or PrEP users themselves. Third, as oral PrEP also entails a risk of being associated with HIV or homosexuality, strategies to avoid stigmatization (e.g., hiding pills) were deemed important. Discussion: These findings indicate that the roll-out of oral PrEP and other future PrEP modalities should be accompanied by raising awareness and improving knowledge on HIV, and wide dissemination of information that focuses on the health-promoting aspect of these tools. Tailored delivery and long-acting PrEP modalities will be important to avoid potential stigmatization. Sustained efforts to prevent discrimination and stigmatization based on HIV status or sexual orientation continue to be highly important strategies to address the HIV epidemic in West Africa. Article	2023	Reyniers, Thijs; Fiorentino, Marion; Babo, Stéphane Alain Yoro; Ouedraogo, Mamadou; Kanta, Ibrahima; Agbegnigan, Laurette Ekon; Rojas, Daniela; Anoma, Camille; Dah, Ter Tiero Elias; Mensah, Ephrem; Keita, Bintou Dembélé; Spire, Bruno; Vuylsteke, Bea; Laurent, Christian	The Perceived Added Value of Bimonthly Injectable Pre-Exposure Prophylaxis According to West African Men Who Have Sex with Men: A Focus Group Study.	AIDS Patient Care and STDs	-	-	-	1557-7449	10.1089/apc.2023.0097	https://dx.doi.org/10.1089/apc.2023.0097	Bimonthly long-acting injectable pre-exposure prophylaxis (LAI-PrEP) can become an important additional tool for HIV prevention among West African men who have sex with men (MSM). The objective was to explore the perceived added value of LAI-PrEP as an HIV prevention tool among MSM in Burkina Faso, Côte d'Ivoire, Mali, and Togo. We conducted eight focus group discussions among 62 HIV-negative MSM between April and May 2021. Participants were recruited via local community-based clinics. Data collection and analysis were guided by grounded theory and community-based participatory approaches. Participants were generally knowledgeable about HIV, and explained particular barriers for HIV prevention in their communities (e.g., denial of HIV). The added value of LAI-PrEP relative to condoms was similar to oral pre-exposure prophylaxis (PrEP) in terms of perceived advantages (e.g., improved sexual satisfaction) or disadvantages (e.g., no protection against other sexually transmitted infections). Compared with oral PrEP, LAI-PrEP was perceived to provide better protection against HIV and to be more convenient (e.g., no need to be mindful of intake and less risk for stigma). Concerns included fear of needles, doubts about efficacy, potential side effects, and difficulties for ensuring timely injections (e.g., when traveling abroad). The results demonstrate that injectable PrEP can be of particular interest to subgroups of West African MSM, although existing HIV prevention tools such as condoms and oral PrEP will remain valuable alongside of, or instead of, LAI-PrEP. Increasing awareness about HIV and tackling discrimination based on sexual orientation continue to be crucial factors to be addressed for HIV prevention. Article	2023	Richterman A.; Ghadimi F.; Teitelman A.M.; Moore K.; Acri T.; North H.; Lopez K.; Ou V.; Van Pelt A.E.; Momplaisir F.	Acceptability and Feasibility of a Mobile Phone Application to Support HIV Pre-exposure Prophylaxis Among Women with Opioid Use Disorder	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04060-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152258500&doi=10.1007%2fs10461-023-04060-w&partnerID=40&md5=6b826b5c228938f8b12b830d80eb60b0	Despite evidence supporting HIV pre-exposure prophylaxis (PrEP) effectiveness, very few women with opioid use disorder (OUD) take PrEP. Interventions that improve medication assisted treatment (MAT) uptake and adherence may also be beneficial for PrEP. The reSET-O mobile phone app is a component of the evidence-based Therapeutic Education System, which improves retention and abstinence for people with OUD. To better understand use of this mobile health tool as a support for PrEP among women with OUD, pre-implementation contextual inquiry is needed. Therefore, we set out to assess target user characteristics, implementation barriers, feasibility, and acceptability of reSET-O. We recruited women with OUD receiving care from a community-based organization in Philadelphia to complete semi-structured interviews. All participants were prescribed reSET-O. We interviewed 20 participants (average age 37 years; 70% white, 15% Hispanic, 5% Black) from 5/2021 to 2/2022. We used an integrated analysis approach combining modified grounded theory and implementation science constructs. Half reported recent injection drug use, and 6 were taking buprenorphine. Mental health symptoms were common, and half described engaging in transactional sex. The majority expressed strong interest in PrEP. Participants reported the app would be highly acceptable for PrEP and MAT adherence support, but only two redeemed the prescription. The most common barriers included phone and internet access. Our findings highlight potential implementation challenges for the use of such an app to support PrEP use in this population. Poor uptake of the app at follow-up indicates that initial prescription redemption is a major barrier to reSET-O implementation. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Ridgway J.P.; Devlin S.A.; Friedman E.E.; Enaholo O.E.; Pyra M.; Hirschhorn L.R.; Haider S.; Ducheny K.; Johnson A.K.	POWER Up-Improving pre-exposure prophylaxis (PrEP) uptake among Black cisgender women in the Southern United States: Protocol for a stepped-wedge cluster randomized trial (SW-CRT)	PLOS One	-	-	-	19326203	10.1371/journal.pone.0285858	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159762474&doi=10.1371%2fjournal.pone.0285858&partnerID=40&md5=4b64e482609cae577a726483b8c96f4e	Background HIV disproportionately affects Black/African American cisgender women (hereafter women) in the United States. Despite its proven effectiveness, pre-exposure prophylaxis (PrEP) for HIV prevention remains vastly under-prescribed to women based on their need. Increasing PrEP uptake and persistence among women is crucial to reducing HIV transmission; however, there have been few studies designed specifically for women. This article describes the study protocol used to assess the feasibility, acceptability, and effectiveness of implementation strategies to improve PrEP uptake and persistence among Black women in the Midwest and South. Methods PrEP Optimization among Women to Enhance Retention and Uptake (POWER Up) is an evidence-based, woman-focused set of five implementation science strategies that addresses barriers of PrEP utilization at the provider, patient, and clinic levels. POWER Up includes 1) routine PrEP education for patients, 2) standardized provider training, 3) electronic medical record (EMR) optimization, 4) PrEP navigation, and 5) PrEP clinical champions. These strategies will be adapted to specific clinics for implementation, tested via a stepped-wedge trial, and, if effective, packaged for further dissemination. Discussion We will utilize a stepped-wedge cluster randomized trial (SW-CRT) to measure change in PrEP utilization across diverse geographic areas. Preparation for adapting and implementing the bundle of strategies is needed to determine how to tailor them to specific clinics. Implementation challenges will include adapting strategies with the available resources at each site, maintaining stakeholder involvement and staff buy-in, adjusting the study protocol and planned procedures as needed, and ensuring minimal crossover. Additionally, strengths and limitations of each strategy must be examined before, during, and after the adaptation and implementation processes. Finally, the implementation outcomes of the strategies must be evaluated to determine the real-world success of the strategies. This study is an important step toward addressing the inequity in PrEP service delivery and increasing PrEP utilization among Black women in the U.S. © 2023 Ridgway et al. Article	2023	Riley T.; Anaya G.; Gallegos P.A.; Castaneda R.; Khosropour C.M.	Pre-exposure Prophylaxis Use and Discontinuation in a Federally Qualified Health Center in a Mexico-US Border City	Journal of Racial and Ethnic Health Disparities	-	-	-	21973792	10.1007/s40615-023-01807-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173122586&doi=10.1007%2fs40615-023-01807-y&partnerID=40&md5=123473da379fe7787f35d0b3dce9a209	Background: Latino men who have sex with men (MSM) experience disproportionately high rates of HIV diagnoses in the United States. Pre-exposure prophylaxis (PrEP) use is critical to reduce this inequity, but PrEP awareness, access, and use are low among Latino MSM. This study aims to describe patterns of PrEP persistence and discontinuation among predominately Latino MSM accessing PrEP in a federally qualified health center (FQHC) in El Paso, Texas. Methods: This retrospective cohort comprised individuals who were eligible for PrEP at a FQHC in El Paso, Texas, between January 30, 2019, and August 15, 2021. We defined hierarchical categories of PrEP use and discontinuation, which was defined as more than 120 days between PrEP visits. We used Kaplan–Meier survival plots to estimate median time to first PrEP discontinuation. Results: There were 292 patients evaluated for PrEP; 91% were Latino. The majority of PrEP patients (70%, 205/292) experienced any PrEP discontinuation, and the median time to first PrEP discontinuation was 202 days (95% CI: 179–266). The proportion of patients who remained on PrEP at 3 months after initiation was 82% (95% CI: 76%, 87%) and at 6 months after initiation was 55% (95% CI: 46%, 62%). Conclusion: While 3-month PrEP retention was high in this predominately Latino MSM patient population, PrEP discontinuation was common. Interventions that enhance longer-term persistence and support for restarting PrEP are needed to reduce the persistent ethnoracial disparities in HIV incidence. © 2023, The Author(s). Article	2023	Riley T.; Bender M.; Wang X.; Mena L.; Gipson J.; Barnes A.; Johnson K.L.; Backus K.V.; Gomillia C.E.; Ward L.M.; Khosropour C.M.	HIV Incidence Among Individuals Accessing Pre-Exposure Prophylaxis in Jackson, Mississippi	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2023.0026	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164276807&doi=10.1089%2fapc.2023.0026&partnerID=40&md5=c27d741f41cdf72543b4654073e2d82c	Although pre-exposure prophylaxis (PrEP) is an efficacious biomedical intervention, the effectiveness of same-day PrEP programs has not been widely studied. We utilized data from three of the four largest PrEP providers in Mississippi from September 2018 to September 2021 linked to the Mississippi State Department of Health's Enhanced HIV/AIDS reporting system. HIV diagnosis was defined as testing newly positive for HIV at least 2 weeks after the initial PrEP visit. We calculated the cumulative incidence and incidence rate of HIV per 100 person-years (PY). Person-time was calculated as time from the initial PrEP visit to (1) HIV diagnosis or (2) December 31, 2021 (HIV surveillance data end date). We did not censor individuals if they discontinued PrEP to obtain an estimate of PrEP effectiveness rather than efficacy. Among the 427 clients initiating PrEP during the study period, 2.3% 95% confidence interval (CI): 0.9-3.8 subsequently tested positive for HIV. The HIV incidence rate was 1.18 per 100 PY (95% CI: 0.64-2.19) and median time to HIV diagnosis after the initial PrEP visit was 321 days (95% CI: 62-686). HIV incidence rates were highest among transgender and nonbinary individuals 10.35 per 100 PY (95% CI: 2.59-41.40) compared with cisgender men and women, and among people racialized as Black 1.45 per 100 PY (95% CI: 0.76-2.80) compared with White and other racialized groups. These findings indicate a need for more clinical and community interventions that support PrEP persistence and restarts among those at high risk of HIV acquisition. Theses and Dissertations	2023	RIVAS, DIANA REYNA ZEBALLOS	Adesão e descontinuidade da profilaxia pré-exposição ao HIV (PrEP) entre adolescentes homens que fazem sexo com homens, travestis e mulheres transexuais no Brasil	-	-	Universidade Federal da Bahia	-	-	NA	NA	Desde 2017, a profilaxia pré-exposição ao HIV (PrEP) oral diária é oferecida gratuitamente pelo Sistema Único de Saúde brasileiro, e em 2022 a oferta foi estendida para adolescentes a partir dos 15 anos, sexualmente ativos e com risco aumentado de adquirir a infecção pelo HIV. Para garantir a eficácia na implementação da PrEP, é fundamental ter ferramentas custo-efetivas para identificar adolescentes que precisam de suporte adicional de adesão, bem como identificar fatores individuais, sociais e programáticos que possam levar à descontinuidade precoce da PrEP. Objetivos: 1) sumarizar a evidência sobre a performance de medidas de adesão à PrEP; 2) avaliar a performance de medidas indiretas de adesão entre adolescentes homens que fazem sexo com homens (AMSM) e adolescentes travestis e mulheres trans (ATrMT) no Brasil; 3) estimar a descontinuidade de PrEP e investigar fatores associados entre AMSM e ATrMT. Métodos: Três artigos foram desenvolvidos para responder aos objetivos da tese. 1) Uma revisão sistemática de estudos que avaliaram a performance de medidas de adesão à PrEP. Incluíram-se estudos em indivíduos sem infecção por HIV que utilizaram PrEP oral diária com tenofovir disoproxil fumarato e emtricitabina (TDF/FTC). O padrão de referência foi a quantificação da PrEP em amostras de sangue seco (DBS) ou plasma. Foram avaliadas as seguintes medidas indiretas: autorrelato, contagem de comprimidos, registros de farmácia e monitoramento eletrônico. O risco de viés foi avaliado utilizando o QUADAS-2. 2) Trata-se de um estudo de acurácia diagnóstica com dados do estudo PrEP1519, a primeira coorte demonstrativa de PrEP que incluiu AMSM e ATrMT de 15 a 19 anos em três capitais brasileiras: Salvador, Belo Horizonte e São Paulo. O padrão de referência foi a concentração de tenofovir-difosfato (TFV-DP) em DBS. Três medidas indiretas foram avaliadas: razão de posse de medicamentos (MPR), contagem de comprimidos e autorrelato. Calculamos a área sob a curva (AUC) para níveis protetores de TFV-DP (≥800 fmol/punch). Sensibilidade (SE) e especificidade (SP) foram calculadas para os pontos de corte estabelecidos. 3) Um estudo de coorte foi conduzido com adolescentes que iniciaram a PrEP no estudo PrEP1519. A descontinuidade da PrEP foi definida como a ausência de posse de PrEP por mais de 90 dias. Foram utilizadas curvas de Kaplan-Meier para analisar as probabilidades de descontinuidade. A regressão de Cox foi empregada para estimar os Hazard Ratios ajustados (aHR) com intervalos de confiança de 95% (IC 95%). Resultados: 1) A revisão incluiu 16 artigos. A avaliação do risco de viés mostrou que a maioria dos estudos tinha baixo risco de viés. O estudo encontrou alta variabilidade entre as medidas de adesão, sendo que o autorrelato de adesão o método mais utilizado. 2) A quantificação de TFV-DP foi realizada em 302 amostras de DBS de 188 participantes. A AUC foi de 0,59 para MPR, 0,69 para contagem de comprimidos e 0,75 para autodeclaração. Ao combinar MPR e autodeclaração, a AUC aumentou para 0,77. Os pontos de corte identificados pelo índice de Youden foram 0,91 para MPR, 83,3% para autodeclaração e 58,7% para contagem de comprimidos, com sensibilidades correspondentes de 0,80, 0,97 e 0,92, e especificidades de 0,40, 0,46 e 0,38. Para pontos de corte equivalentes a uso de 7 dias, as especificidades foram 0,57, 0,80 e 0,91, respectivamente. 3) Entre 829 adolescentes que iniciaram a PrEP, a taxa de incidência de descontinuidade foi de 75,6 por 100 pessoas-ano. A probabilidade de descontinuidade foi de 52,61% no primeiro ano. Na análise multivariada, ATrMT (aHR: 1,63; IC95%: 1,23 - 2,16) e adolescentes com percepção de risco média (aHR: 1,29; IC95%: 1,02 - 1,64) ou baixa (aHR: 1,65; IC95%: 1,29 – 2,12) tiveram mais risco de descontinuidade; enquanto adolescentes com parceiro vivendo com HIV tiveram um menor risco de descontinuidade (aHR: 0,57; IC95%: 0,35 – 0,91). Conclusões: A tese apresenta importantes contribuições para o monitoramento da adesão à PrEP entre adolescentes de populações chave para epidemia do HIV/aids. Medidas indiretas podem ser facilmente implementadas na prática clínica de rotina e representam uma alternativa para medir a adesão à PrEP, especialmente em contextos com recursos limitados, levando em consideração suas limitações ao identificar adolescentes com baixa adesão. A combinação de medidas fornece informações mais precisas sobre a adesão. Além disso, a taxa de descontinuidade da PrEP entre adolescentes é elevada, e está associada com a percepção de risco e a vulnerabilidade das mulheres trans. A implementação da PrEP em adolescentes deve ser acompanhada de estratégias eficazes para monitoramento da adesão e abordagem de fatores que possam diminuir a descontinuidade. Article	2023	Rivera A.V.; Lopez J.M.; Braunstein S.L.	Exploring the Association Between Gender Affirmation and PrEP use Among Transgender Women in New York City	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03944-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144930457&doi=10.1007%2fs10461-022-03944-7&partnerID=40&md5=0042fe591beffa6c39e6fb21cd473f65	Black and Hispanic/Latina transgender women are inequitably impacted by HIV; yet gaps in PrEP use exist. Among a sample of mostly Black and Hispanic/Latina transgender women in New York City, we aim to examine whether PrEP use was associated with gender affirmation and the use of gender-affirming health services. We found that PrEP use was more prevalent among those who used hormone therapy and those who had a provider they were comfortable speaking to about gender-related issues. In separate models, these associations were attenuated when adjusting for race/ethnicity, with those who use hormones being marginally more likely to report PrEP use and with Hispanic/Latina transgender women being more likely to have used PrEP, compared to Black transgender women. We found evidence of a potential association between medical gender affirmation and PrEP use. More research is needed to explore the social and structural contexts that are influenced by race/ethnicity that may serve to prevent PrEP uptake. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Rivera C.G.; Zeuli J.D.; Smith B.L.; Johnson T.M.; Bhatia R.; Otto A.O.; Temesgen Z.	HIV Pre-Exposure Prophylaxis: New and Upcoming Drugs to Address the HIV Epidemic	Drugs	-	-	-	126667	10.1007/s40265-023-01963-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179323261&doi=10.1007%2fs40265-023-01963-9&partnerID=40&md5=00f14b5de4931ab5b726dc2cf5e99c90	Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) provides a critical intervention toward ending the HIV epidemic and protecting people with reasons to utilize PrEP. PrEP options continue to expand as new administration modalities offer the potential to tailor PrEP use for individual success. We have provided the evidence for new and emerging antiretroviral agents for PrEP (cabotegravir, lenacapavir, dapivirine, and broadly neutralizing antibodies), divided into pharmacology, animal model, and human data, accompanied by a summary and suggested place in therapy. Cabotegravir is a US Food and Drug Administration (FDA)-approved intramuscular injection given every 2 months with a strong body of evidence demonstrating efficacy for HIV PrEP, lenacapavir administered subcutaneously every 6 months is currently under investigation for HIV PrEP, dapivirine vaginal ring is an available PrEP option for women in certain areas of Africa, and broadly neutralizing monoclonal antibodies have been challenged in demonstrating efficacy in phase 1–2 study for HIV PrEP to date. Clinical literature for individual agents is discussed with data from major studies summarized in tables. This review provides a detailed overview of recently available and premier candidate PrEP drugs. © 2023, The Author(s), under exclusive licence to Springer Nature Switzerland AG. Article	2023	Rivera, Adovich S; Pak, Katherine J; Mefford, Matthew T; Hechter, Rulin C	Use of Tenofovir Alafenamide Fumarate for HIV Pre-Exposure Prophylaxis and Incidence of Hypertension and Initiation of Statins.	JAMA Network Open	-	-	-	2574-3805	10.1001/jamanetworkopen.2023.32968	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10495863	Importance: Pre-exposure prophylaxis (PrEP) is an important tool for preventing HIV infection. However, PrEP's impact on cardiometabolic health is understudied. Objective: To examine the risk of incident hypertension and statin initiation among adult (age ≥18 years) health plan members starting PrEP with tenofovir alafenamide fumarate (TAF) compared with propensity score-matched adults taking tenofovir disoproxil fumarate (TDF). Design, Setting, and Participants: This retrospective cohort study used electronic health records (EHRs) from Kaiser Permanente Southern California. Adult members starting PrEP in Kaiser Permanente Southern California between October 2019 and May 2022 were included. Propensity score matching with multiple imputation (50 matched data sets) was conducted to generate 1 TAF:4 TDF matched data sets with balanced baseline covariates. Exposures: PrEP initiation with either TAF or TDF during the study period. Main Outcomes and Measures: Incident hypertension and statin initiation within 2 years of PrEP initiation were ascertained through blood pressure and outpatient pharmacy records, respectively. Risk differences and odds ratios (ORs) were estimated using logistic regression and g-computation. Results: A total of 6824 eligible individuals were identified (mean SD age, 33.9 10.3 years; 6618 97% male). This pool was used to generate 2 cohorts without baseline hypertension or statin use for matching (hypertension: n = 5523; statin: n = 6149) In both cohorts, those starting PrEP with TAF were older and were more likely to be non-Hispanic White compared with those starting with TDF. In matched analysis adjusting for baseline covariates, TAF use was associated with elevated risk of incident hypertension (TAF: n = 371; risk difference, 0.81 95% CI, 0.12-1.50; OR, 1.64 95% CI, 1.05-2.56). TAF use was also associated with elevated risk of statin initiation (TAF: n = 382; risk difference, 0.85 95% CI, 0.37-1.33; OR, 2.33 95% CI, 1.41-3.85). Subgroup analyses restricted to individuals 40 years and older at PrEP initiation showed similar results with larger risk difference in statin initiation (risk difference, 4.24 95% CI, 1.82-6.26; OR, 3.05 95% CI, 1.64-5.67). Conclusions and Relevance: In this study of people taking PrEP, TAF use was found to be associated with higher incident hypertension and statin initiation compared with TDF use, especially in those 40 years or older. Continued monitoring of blood pressure and lipids for TAF users is warranted. Article	2023	Roberts S.T.; Mancuso N.; Williams K.; Nabunya H.K.; Mposula H.; Mugocha C.; Mvinjelwa P.; Garcia M.; Szydlo D.W.; Soto-Torres L.; Ngure K.; Hosek S.	How a menu of adherence support strategies facilitated high adherence to HIV prevention products among adolescent girls and young women in sub-Saharan Africa: a mixed methods analysis	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.26189	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176007295&doi=10.1002%2fjia2.26189&partnerID=40&md5=12b2e75b1c1b22de5e7c723ff1ee23e1	Introduction: Effective use of pre-exposure prophylaxis (PrEP) has been low among adolescent girls and young women (AGYW) in sub-Saharan Africa. The MTN-034/REACH trial offered AGYW a menu of adherence support strategies and achieved high adherence to both daily oral PrEP and the monthly dapivirine vaginal ring. Understanding how these strategies promoted product use could inform the design of adherence support systems in programmatic settings. Methods: REACH was a randomized crossover trial evaluating the safety of and adherence to the ring and oral PrEP among 247 HIV-negative AGYW (ages 16–21) in South Africa, Uganda and Zimbabwe from January 2019 to September 2021 (NCT03593655). Adherence support included monthly counselling sessions with drug-level feedback (DLF) plus optional daily short message service (SMS) reminders, weekly phone or SMS check-ins, peer support clubs, "peer buddies" and additional counselling. Counsellors documented adherence support choices and counselling content on standardized forms. Through focus groups, serial in-depth interviews (IDIs) and single IDIs (n = 119 total), we explored participants' experiences with adherence support and how it encouraged product use. Results: Participants received counselling at nearly all visits. DLF was provided at 54.3% of sessions and, across sites, 49%–68% received results showing high adherence for oral PrEP, and 73%–89% for the ring. The most popular support strategies were in-person clubs and weekly calls, followed by online clubs, additional counselling and SMS. Preferences differed across sites but were similar for both products. Qualitative results demonstrated that the REACH strategies supported adherence by providing information about HIV and PrEP, continually motivating participants, and supporting the development of behavioural skills and self-efficacy, aligning with the Information, Motivation, and Behavioural Skills (IMB) model. Effectiveness was supported by three foundational pillars: strong interpersonal relationships with counsellors; ongoing, easily accessible support and resources; and establishing trust in the counsellors and study products through counsellor relationships, peer-to-peer exchange and DLF. Conclusions: Implementation programmes could support effective PrEP use by offering a small menu of counsellor- and peer-based support options that are youth-friendly and developmentally appropriate. The same menu options can support both ring and oral PrEP users, though content should be tailored to the individual products. © 2023 The Authors. Article	2023	Roberts, Sarah T; Hartmann, Miriam; Minnis, Alexandra M; Otticha, Sophie Odek; Browne, Erica N; Montgomery, Elizabeth T; Agot, Kawango	Breaking down relationship barriers to increase PrEP uptake and adherence among adolescent girls and young women in Kenya: safety and preliminary effectiveness results from a pilot cluster-randomized trial.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26198	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10733161	INTRODUCTION: Oral pre-exposure prophylaxis (PrEP) has the potential to reduce HIV acquisition among adolescent girls and young women (AGYW) in sub-Saharan Africa, a priority population for epidemic control. However, intimate partner violence (IPV) and low relationship power can create significant challenges to PrEP use. The Tu'Washindi intervention aimed to increase PrEP use by addressing relationship- and violence-related barriers among AGYW enrolled in the DREAMS Initiative in Siaya County, Kenya. METHODS: Our multi-level, community-based intervention was piloted in a cluster-randomized controlled trial conducted at six DREAMS sites from April to December 2019 (NCT03938818). Three intervention components were delivered over 6 months: an eight-session empowerment-based support club, community sensitization targeted towards male partners and a couples' PrEP education event. Participants were ages 17-24, HIV negative and either eligible for, or already taking, PrEP. Over 6 months of follow-up, we assessed IPV (months 3 and 6) and PrEP uptake and continuation (month 6) through interviewer-administered questionnaires; PrEP adherence was assessed with Wisepill electronic monitoring devices. These outcomes were compared using adjusted Poisson and negative binomial regression models. RESULTS: We enrolled 103 AGYW with median age of 22 years (IQR 20-23); one-third were currently taking PrEP and 45% reported IPV in the past 3 months. Retention was 97% at month 6. Compared to the control arm, intervention arm participants were more likely to initiate PrEP, if not already using it at enrolment (52% vs. 24%, aRR 2.28, 95% CI 1.19-4.38, p = 0.01), and those taking PrEP had more days with device openings (25% of days vs. 13%, aRR 1.94, 95% CI 1.16-3.25, p = 0.01). Twenty percent of participants reported IPV during follow-up. There were trends towards fewer IPV events (aIRR 0.66, 95% CI 0.27-1.62, p = 0.37) and fewer events resulting in injury (aIRR 0.21, 95% CI 0.04-1.02, p = 0.05) in the intervention versus control arm. CONCLUSIONS: Tu'Washindi shows promise in promoting PrEP uptake and adherence among AGYW without concomitant increases in IPV; however, adherence was still suboptimal. Further research is needed to determine whether these gains translate to increases in the proportion of AGYW with protective levels of PrEP adherence and to evaluate the potential for the intervention to reduce IPV risk. Article	2023	Robles, Gabriel; López-Matos, Jonathan; Cienfuegos-Szalay, Jorge; Rodríguez-Díaz, Carlos E.; Rendina, H. Jonathon	The use of a Spanish-translated PrEP Stigma Scale among the Latino sample of the UNITE cohort study	Stigma and Health	-	-	-	2376-6972, 2376-6972	10.1037/sah0000433	https://www.proquest.com/scholarly-journals/use-spanish-translated-prep-stigma-scale-among/docview/2762135028/se-2?accountid=8113	Preexposure prophylaxis (PrEP)–related stigma is linked to inadequate PrEP uptake, yet there are no validated scales to test this association among Spanish-speaking Latino sexual minority men (SMM). The present study examined if the Spanish-translated PrEP Stigma Scale (PSS) was psychometrically appropriate for implementing in Spanish language–dominant Latino SMM. Recruitment was conducted using geosocial networking applications, social media sites, and email blasts (N = 3,049). First, we utilized item response theory (IRT) modeling to evaluate the reliability of the PSS items and the latent construct across both language groups (n English = 2,844 and n Spanish = 205). Subsequently, we applied the PSS scale in a theoretical application by examining its association with key steps in the PrEP uptake cascade (i.e., perceived PrEP candidacy, PrEP willingness, PrEP intentions, and having spoken to provider about PrEP) stratified by language. Results of the IRT analyses provided evidence that the translated version of the PSS was appropriate for use among this sample. Further, among English respondents, PrEP stigma was negatively associated with perceived PrEP candidacy (B = −0.30, p ≤ .001), PrEP willingness (B = −0.46, p ≤ .001), and PrEP intentions (B = −0.23, p = .003). PrEP stigma, among Spanish respondents, was not significantly associated with any of the PrEP cascade steps. This study demonstrated that the PSS scale performs adequately for both English- and Spanish-speaking Latino SMM. However, researchers and health professionals alike should pay close attention to the nuanced effects in U.S.-based English- and Spanish-language samples as PrEP stigma may impact the PrEP cascade for one language sample and not the other. Article	2023	Rodriguez A.; Horvath K.J.; Dowshen N.; Voss R.; Warus J.; Jacobs M.; Kidd K.M.; Inwards-Breland D.J.; Blumenthal J.	Awareness and utilization of pre-exposure prophylaxis and HIV prevention services among transgender and non-binary adolescent and young adults	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/frph.2023.1150370	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184159667&doi=10.3389%2ffrph.2023.1150370&partnerID=40&md5=44e21cea3952ad40dade231cf82ba6be	Introduction: Transgender and gender non-binary (TGNB) individuals are disproportionally affected by HIV and face high rates of discrimination and stigmatization, resulting in limited access to HIV prevention services. Pre-exposure prophylaxis (PrEP) is highly efficacious for reducing the risk of HIV transmission. However, little research is available regarding PrEP awareness and utilization among TGNB adolescents and young adults (AYA). Methods: TGNB AYA ages 15–24 years old were recruited between December 2021 and November 2022 for participation in a one-time, anonymous online survey study to assess PrEP awareness and perceptions, as well as barriers to its use. Participants were recruited from seven academic centers offering gender-affirming care to TGNB AYA across the United States. Results: Of the 156 TGNB AYA individuals who completed the survey, most (67%) were aware of PrEP; however, few (7%) had been prescribed PrEP. Many (60%) had not spoken to a medical provider and, even if the medication was free and obtained confidentially, most participants did not plan to take PrEP due to low perceived HIV risk, lack of PrEP knowledge, and concern about interactions between their hormone therapy and PrEP. Discussion: These findings underscore the need for broad PrEP educational efforts for both TGNB AYA and their providers to improve knowledge, identify potential PrEP candidates among TGNB AYA and improve access by addressing identified barriers. 2024 Rodriguez, Horvath, Dowshen, Voss, Warus, Jacobs, Kidd, Inwards-Breland and Blumenthal.	adolescents; awareness; non-binary; pre-exposure prophylaxis; transgender; young adults	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Rodriguez C.A.; Mitchell J.W.	HIV Prevention Research With U.S. Military Service Members: A Systematic Review	Military Medicine	-	-	-	1930613X	10.1093/milmed/usac018	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141804355&doi=10.1093%2fmilmed%2fusac018&partnerID=40&md5=27a14d05a293a2da99d8c487f7776723	INTRODUCTION: With the goal of maintaining mission readiness, the U.S. Department of Defense monitors a variety of health behaviors among its active duty military service members, including sexual health, HIV, and other sexually transmitted infections. Newer biomedical approaches to HIV prevention and care (e.g., Treatment as Prevention (TasP) via Pre-exposure Prophylaxis (PrEP) and undetectable = untransmissible of antiretroviral therapy (ART/U = U) have evolved over the last few years and are now available. However, the last systematic review on HIV prevention among military populations was published in 2005, calling for the need to provide an update on what HIV prevention research has been conducted with U.S. active duty service members. MATERIALS AND METHODS: PRISMA guidelines were followed to identify articles that met pre-determined eligibility criteria. Several electronic databases were searched, including PubMed. The review focused on HIV prevention research conducted with the U.S. Military (i.e., active duty service members). Inclusion criteria for articles centered on population (U.S. active duty service members aged 17 years and older), language (published in English), study focus (epidemiological, intervention), study design (descriptive, quasi-experimental, and experimental), date of publication, and research focus. Studies with a descriptive focus to understand HIV-related risk behaviors, use of prevention strategies (e.g., condoms, testing, PrEP), and prescribing practices for uptake of prevention strategies among U.S. military service members (i.e., by providers, uptake from nonproviders) were included. Studies that focused on intervening or changing HIV risk (i.e., interventions) among U.S. military service members were also included. RESULTS: The findings in this review were reported based on the PRISMA guidelines. A total of 2,270 articles were identified through electronic databases. Of the 2,270 articles, 809 articles were removed for duplication. Titles and abstracts were reviewed for the remaining 1,461 articles. Of the 1,461 articles, 1,432 were excluded for not meeting the inclusion criteria. In total, 29 studies met the inclusion criteria and were included in this review. Studies were organized into 3 tables based on study focus and target population (e.g., active duty, U.S. military service members who were providers vs. nonproviders). CONCLUSIONS: The present systematic review describes 29 HIV prevention studies that have been conducted with active duty service members in the U.S. Military since 2000. Overall, most included studies were descriptive, epidemiological studies conducted with active duty service members who were not providers. There were few interventions that reported some success in improving prevention knowledge and condom use. None of the interventions included newer evidence-based strategies of TasP. Although some research had been conducted about PrEP, particularly with providers, there is a clear need for additional studies and interventions to include TasP, given the evidence base of these approaches for reducing acquisition and/or onward transmission of HIV. © The Association of Military Surgeons of the United States 2022. Perspectives on long-acting formulations of pre-exposure prophylaxis (PrEP) among men who have sex with men who are non-adherent to daily oral PrEP in the United States	BMC Public Health	-	-	-	14712458	10.1186/s12889-023-16382-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85168977553&doi=10.1186%2fs12889-023-16382-4&partnerID=40&md5=b0bbf66aa48789bb0a2d905b3fc00af9	Introduction: Pre-exposure prophylaxis (PrEP) persistence among men who have sex with men (MSM) in real world clinical settings for HIV prevention is suboptimal. New longer-acting formulations of PrEP are becoming available, including injectables, subdermal implants, and other oral medications. These longer-acting formulations have the potential to improve retention among those who have challenges remaining adherent to daily oral PrEP. Methods: We interviewed 49 MSM who had initiated but discontinued oral PrEP at three diverse clinics across the United States. We examined participants' perspectives about long-acting PrEP formulations and how long-acting options could affect PrEP use using thematic analysis. Results: Participants were not very knowledgeable about long-acting formulations of PrEP but were open to learning about them and considering use. Participants were concerned about safety and efficacy of products given that they were still newer and/or in development. Finally, participants had clear preferences for oral pills, injectables, and then subdermal implants and were most interested in options that reduced the number of visits to the clinic. Conclusion: Long-acting formulations of PrEP are acceptable to MSM with suboptimal PrEP persistence and have the potential to improve PrEP persistence. However, many felt they needed more information on safety, efficacy, and use to consider these options. As these long-acting formulations are implemented, public health campaigns and clinical interventions to encourage may maximize uptake particularly among those who are not currently adherent to daily oral PrEP. © 2023, BioMed Central Ltd., part of Springer Nature. Article	2023	Rogers B.G.; Harkness A.; Satyanarayana S.; Pachankis J.; Safren S.A.	Individual, Interpersonal, and Structural Factors That Influence Intentions to Use Pre-exposure Prophylaxis Among Sexual Minority Men in Miami	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-021-02263-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129703751&doi=10.1007%2fs10508-021-02263-7&partnerID=40&md5=f0eaa1cf9b5e928263dd81adaf8ceec5	Pre-exposure prophylaxis for HIV or "PrEP" holds great promise for reducing HIV incidence. However, in certain geographic settings, like Miami, a US HIV epicenter, uptake of PrEP has been paradoxically very low compared to other areas of the country. The goal of the current study was to examine factors associated with low uptake of PrEP in young sexual minority men in Miami. Qualitative data were extracted from conversations during voluntary HIV/STI counseling and testing sessions with 24 young sexual minority men, most of whom identified as racial/ethnic minorities. These sessions were completed as part of a baseline visit for a combined mental and sexual health intervention trial. Thematic analysis of transcripts revealed barriers and facilitators associated with PrEP uptake at multiple levels (individual, interpersonal, and economic and healthcare systems barriers). Individual-level themes included concerns about the safety of PrEP, risk compensation, and taking daily oral medication; and potential benefits of PrEP as a backup plan to condom use to reassure and reduce worry about HIV. Interpersonal-level themes included lack of knowledgeable and affirming medical providers, changing norms within the community around "safe sex," and PrEP use in serodiscordant partnerships. Economic and healthcare systems barriers included challenges to accessing PrEP because of a lack of insurance and high out-of-pocket cost. These data can be used to inform the development of interventions aligned with Ending the HIV Epidemic priorities to increase PrEP use among young sexual minority men living in an HIV epicenter. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Rogers, Brooke G; Sosnowy, Collette; Chan, Philip A; Patel, Rupa R; Mena, Leandro A; Arnold, Trisha; Gomillia, Courtney; Zanowick-Marr, Alexandra; Curoe, Kate; Underwood, Ashley; Villalobos, Jesus; Chu, Christina; Galipeau, Drew; Montgomery, Madeline; Nunn, Amy S	Factors associated with suboptimal retention in HIV pre-exposure prophylaxis care among men who have sex with men.	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2022.2129036	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10083191	Despite the efficacy of HIV pre-exposure prophylaxis (PrEP), retention in care in the United States remains suboptimal. The goal of this study was to explore factors that lead to suboptimal retention in PrEP care for men who have sex with men (MSM) in real-world clinical settings in the United States. Trained interviewers conducted semi-structured interviews with MSM (N = 49) from three clinics who had been engaged in PrEP care in the Midwest (n = 15), South (n = 15), and Northeast (n = 19) geographic regions and had experienced a lapse in PrEP use. Factors that emerged as related to suboptimal retention in PrEP care included structural factors such as transportation and out-of-pocket costs; social factors such as misinformation on media and in personal networks; clinical factors such as frequency and timing of appointments; and behavioral factors such as changes in sexual behavior and low perceived risk for HIV. Participants suggested reducing the out-of-pocket costs of medications and lab visits, having flexible appointment times, culturally responsive services, and comprehensive patient navigation to help retention in care. These findings leveraged real-world experiences and opinions of patients to inform gaps in current services and how to make changes to optimize PrEP care. Article	2023	Rosadiño, John Danvic T.; Pagtakhan, Ronivin G.; Briñes, Matthew T.; Dinglasan, Jeanno Lorenz G.; Cruz, Denis P.; Corciega, John Oliver L.; Pagtakhan, Aeronne B.; Regencia, Zypher Jude G.; Baja, Emmanuel S.	Implementation of unassisted and community-based HIV Self-Testing (HIVST) during the COVID-19 pandemic among Men-who-have-sex-with-Men (MSM) and Transgender Women (TGW): A demonstration study in Metro Manila, Philippines.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0282644	https://pubmed.ncbi.nlm.nih.gov/36893109/	OBJECTIVE: The study aimed to demonstrate the feasibility of an unassisted and community-based HIV self-testing (HIVST) distribution model and to evaluate its acceptability among men-having-sex-with-men (MSM) and transgender women (TGW). METHODS: Our demonstration study focused on implementing the HIVST distribution model in Metro Manila, Philippines. Convenience sampling was done with the following inclusion criteria: MSM or TGW, at least 18 years old, and had no previous HIV diagnosis. Individuals taking HIV pre-exposure prophylaxis, on antiretroviral therapy, or female sex at birth were excluded. The implementation of the study was done online using a virtual assistant and a delivery system via courier due to COVID-19-related lockdowns. Feasibility was measured by the number of HIVST kits successfully delivered and utilized and the HIV point prevalence. Moreover, acceptability was evaluated by a 10-item system usability scale (SUS). HIV prevalence was estimated with linkage to care prioritized for reactive participants. RESULTS: Out of 1,690 kits distributed, only 953 (56.4%) participants reported their results. Overall, HIV point prevalence was 9.8%, with 56 (60.2%) reactive participants linked to further testing. Furthermore, 261 (27.4%) of respondents self-reported, and 35 (13.4%) of the reactive participants were first-time testers. The HIVST service had an overall median and interquartile range (IQR) SUS score of 82.5 (IQR: 75.0, 90.0), rendering the HIVST kits very acceptable. CONCLUSIONS: Our study suggests the acceptability and feasibility of HIVST among the MSM and TGW in Metro Manila, Philippines, regardless of their age or HIV testing experience. In addition, other platforms of information dissemination and service delivery of HIVST should be explored, including access to online instructional videos and printed materials, which may facilitate easier use and interpretation of results. Furthermore, due to our study's limited number of TGW respondents, a more targeted implementation strategy to reach the TGW population is warranted to increase their access and uptake of HIVST. Article	2023	Rosas Cancio-Suárez M.; Díaz-Álvarez J.; Ron R.; Martínez-Sanz J.; Serrano-Villar S.; Moreno S.; Sánchez-Conde M.	From Innovation to Implementation: The Evolution of HIV Pre-Exposure Prophylaxis and Future Implications	Pathogens	-	-	-	-	20760817	10.3390/pathogens12070924	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166391327&doi=10.3390%2fpathogens12070924&partnerID=40&md5=519b6e591575dc37c68dbca737cf81b9	Pre-exposure prophylaxis (PrEP) is a highly effective HIV-prevention strategy that involves the continuous administration of antiretroviral drugs to HIV-negative individuals with a substantial risk of contracting an HIV infection. The use of PrEP has shown a reduction in the risk of HIV acquisition through sexual intercourse by up to 99%. Despite its effectiveness, PrEP uptake remains low among populations at high risk of HIV infection. This highlights the need for further research in strategies to enhance awareness and uptake of PrEP amongst these specific populations. This article presents a comprehensive overview of the existing literature on the effectiveness of PrEP in reducing HIV transmission rates. Additionally, we examine the obstacles related to PrEP implementation and uptake and put forward potential strategies to raise awareness and improve its use among populations at an increased risk of contracting HIV. © 2023 by the authors. Article	2023	Rosen J.G.; Zhang L.; Pelaez D.; Park J.N.; Glick J.L.	A Capacity-Strengthening Intervention to Support HIV Pre-exposure Prophylaxis (PrEP) Awareness-Building and Promotion by Frontline Harm Reduction Workers in Baltimore, Maryland: A Mixed Methods Evaluation	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03971-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145506617&doi=10.1007%2fs10461-022-03971-4&partnerID=40&md5=6c43140e9b31a45f07f1d4a22694bfaa	Pre-exposure prophylaxis (PrEP) is a promising but underutilized HIV prevention tool among people who inject drugs (PWID). We developed and piloted an intervention to bolster PrEP promotion competencies among frontline harm reduction workers (FHRW) serving PWID clients in Baltimore, Maryland. Between December 2021 and February 2022, we developed and facilitated four trainings, which included didactic and practice-based/role-playing components, with 37 FHRW from four organizations. FHRW completed three structured surveys (pretest, posttest, 6-week posttest) and in-depth interviews (n = 14) to measure changes in PrEP promotion competencies attributable to training participation. PrEP knowledge and self-efficacy increased significantly (p < 0.001) from pretest to posttest, sustained through 6-week posttest. The proportion of FHRW discussing PrEP with clients doubled during the evaluation period (30–67%, p = 0.006). Feeling empowered to discuss PrEP and provision of population-tailored PrEP information were facilitators of PrEP promotion, while limited client interaction frequency/duration, privacy/confidentiality concerns, and anticipated PrEP stigma by clients inhibited PrEP promotion. Our capacity-strengthening intervention successfully increased PrEP knowledge, self-efficacy, and promotion among FHRW, affirming the adaptability and feasibility of integrating our training toolkit into FHRW practice across implementation settings. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Rosen, Aviana O.; Wickersham, Jeffrey A.; Altice, Frederick L.; Khati, Antoine; Azwa, Iskandar; Tee, Vincent; Jeri-Wahrhaftig, Alma; Luces, Jeffrey Ralph; Ni, Zhao; Kamarulzaman, Adeeba; Saifi, Rumana; Shrestha, Roman	Barriers and Facilitators to Pre-Exposure Prophylaxis by Men Who Have Sex with Men and Community Stakeholders in Malaysia	International Journal of Environmental Research and Public Health	-	-	-	-	16617827	10.3390/ijerph20095669	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159141697&doi=10.3390%2fijerph20095669&partnerID=40&md5=d7bf23646ce3e0b32e9141f8bbed8ab5	Background: Men who have sex with men (MSM) in Malaysia are disproportionately affected by HIV. Pre-exposure prophylaxis (PrEP) is an evidence-based HIV prevention strategy; yet, uptake remains low among Malaysian MSM, who have a limited understanding of barriers to PrEP. Methods: We employed the nominal group technique (NGT), a structured mixed-methods strategy to understand the barriers and facilitators to PrEP use among Malaysian MSM, combined with a qualitative focus group. Six virtual focus group sessions, three among MSM (n = 20) and three among stakeholders (n = 16), were conducted using a video-conferencing platform. Rank-ordering of barriers from NGT was recorded, and thematic analysis was conducted for content. Results: Similar barriers were reported by MSM and community stakeholders, with aggregated costs associated with PrEP care (e.g., consultation with a clinician, medication, laboratory testing) being the greatest barrier, followed by limited knowledge and awareness of PrEP. Additionally, the lack of access to PrEP providers, the complex clinical protocol for PrEP initiation and follow-up, and social stigma undermined PrEP delivery. Qualitative discussions identified potential new strategies to overcome these barriers, including expanded outreach efforts to reach hard-to-reach MSM, a 'one-stop' delivery model for PrEP services, a patient-centered decision aid to guide PrEP uptake, and easy access to LGBT-friendly PrEP providers. Conclusion: Current barriers may be overcome through governmental subsidy for PrEP and evidence-informed shared decision aids to support both MSM and PrEP providers. © 2023 by the authors. Article	2023	Rosen, Elias P.; White, Nicole; Gilliland, William M. Jr; Gerona, Roy R.; Gandhi, Monica; Amico, K. Rivet; Mayer, Kenneth H.; Gulick, Roy M.; Kashuba, Angela D. M.	Mass spectrometry imaging of hair identifies daily maraviroc adherence in HPTN 069/ACTG A5305.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0287449	https://pubmed.ncbi.nlm.nih.gov/37352285/	Objective measures of adherence for antiretrovirals used as pre-exposure prophylaxis (PrEP) are critical for improving preventative efficacy in both clinical trials and real-world application. Current objective adherence measures either reflect only recent behavior (eg days for plasma or urine) or cumulative behavior (eg months for dried blood spots). Here, we measured the accumulation of the antiretroviral drug maraviroc (MVC) in hair strands by infrared matrix-assisted laser desorption electrospray ionization (IR-MALDESI) mass spectrometry imaging (MSI) to evaluate adherence behavior longitudinally at high temporal resolution. An MSI threshold for classifying daily adherence was established using clinical samples from healthy volunteers following directly observed dosing of 1 to 7 doses MVC/week. We then used the benchmarked MSI assay to classify adherence to MVC-based PrEP regimens in hair samples collected throughout the 48-week HPTN069/ACTGA5305 study. We found that only ~32% of investigated hair samples collected during the study's active dosing period showed consistent daily PrEP adherence throughout a retrospective period of 30 days, and also found that profiles of daily individual adherence from MSI hair analysis could identify when patients were and were not taking study drug. The assessment of adherence from MSI hair strand analysis was 62% lower than adherence classified using paired plasma samples, the latter of which may be influenced by white-coat adherence. These findings demonstrate the ability of MSI hair analysis to examine daily variability of adherence behavior over a longer-term measurement and offer the potential for longitudinal comparison with risk behavior to target patient-specific adherence interventions and improve outcomes. Article	2023	Rosen, Joseph G; Toomre, Teagan; C To; Olatunde, Praise F; Cooper, Lyra; Glick, Jennifer L; Park, Ju Nyeong	Communicative appeals and messaging frames in visual media for HIV pre-exposure prophylaxis promotion to cisgender and transgender women	Culture, Health & Sexuality	-	-	-	-	13691058	10.1080/13691058.2022.2116111	https://www.proquest.com/scholarly-journals/communicative-appeals-messaging-frames-visual/docview/2843993273/se-2?accountid=8113	Women in the USA represent 15% of new HIV diagnoses but only 5% of pre-exposure prophylaxis (PrEP) users. We sought to characterise communicative appeals and messaging frames used in US visual media to cultivate PrEP demand among cisgender and transgender women using content analysis methodology. We catalogued and coded media items (images and videos) from US PrEP marketing campaigns featuring women. Production and content characteristics were abstracted, and communicative appeals from media items were qualitatively coded in duplicate. We then descriptively summarised production and content characteristics and identified discrete subgroups of media items, clustering around specific messaging frames, through qualitative thematic analysis. Racial/ethnic minorities and sexual/gender minority women were heavily featured, and numerous media items leveraged cognitive and social communicative appeals to promote PrEP. We identified three unique messaging frames emerging from coded media items, portraying PrEP as: (1) necessary prevention (protection frame), (2) a desirable yet accessible commodity (aspiration frame), and (3) a conduit to sexual autonomy (empowerment frame). To effectively communicate PrEP information and promote PrEP to women, PrEP marketing should leverage alternative appeals (subjective norms, self-efficacy), address anticipated barriers to uptake (stigma, cost, medication interactions), and deconstruct misconceptions of PrEP use(rs). Article	2023	Ross, Jonathan; Betancourt, Gabriela S.; Andrade, Eli A.; Klein, Augustus; Marrero, Lissette; Morales, Gustavo A.; Rivera, Sage; Watnick, Dana L.; Patel, Viraj V.	Collaborative PrEP Implementation Strategies for Latino Men Who have Sex with Men: A Health Center-Community Consensus Process	Journal of Community Health	-	-	-	-	945145	10.1007/s10900-023-01266-w	https://www.proquest.com/scholarly-journals/collaborative-prep-implementation-strategies/docview/2873639724/se-2?accountid=8113	Community-based organizations (CBOs) deliver services in culturally-responsive ways, and could effectively partner with health centers to deliver HIV pre-exposure prophylaxis (PrEP) to Latino men who have sex with men (LMSM). However, few such models exist. We conducted a planning study in collaboration with three CBOs serving LMSM to identify optimal PrEP delivery strategies for health centers and CBOs to implement jointly. We established a Community Expert Panel (CEP) of eight client-facing CBO and health center staff. Over 6 months, the panel met monthly to identify collaborative strategies for PrEP delivery, using a modified Delphi method consisting of the following steps: (1) brainstorming strategies; (2) rating strategies on acceptability, appropriateness and feasibility; (3) review of data from qualitative focus group discussions with CBO clients; and (4) final strategy selection. The panel initially identified 25 potential strategies spread across three categories: improving communication between health centers and CBOs; using low-barrier PrEP options (e.g. telemedicine), and developing locally-relevant, culturally-sensitive outreach materials. Focus groups with CBO clients highlighted a desire for flexible options for PrEP-related care and emphasized trust in CBOs. The final package of strategies consisted of: (1) a web-based referral tool; (2) telemedicine appointments; (3) geographically-convenient options for lab specimen collection; (4) tailored print and social media; and (5) regular coaching sessions with CBO staff. Through a community-engaged process, we identified a package of PrEP delivery strategies that CBOs and health centers can implement in partnership, which have the potential to overcome barriers to PrEP for LMSM. Article	2023	Ross, S; Garcia, D; Villa, G; Crossman, J; Fitzpatrick, C; Richardson, D	HIV pre-exposure prophylaxis use among gender-diverse people attending a sexual health service	Sexually Transmitted Infections	-	-	-	-	1368-4973	doi.org/10.1136/sextrans-BASHH-2022.26	https://sti.bmj.com/content/98/Suppl_1/A14.1	Abstract Introduction Estimates of HIV prevalence amongst gender minorities are determined exclusively from scarce data for transgender women (TGW) who, globally, are disproportionately affected by HIV.1 Data for transgender men (TGM) and non-binary individuals (NBI) are extremely limited. Transgender people are often identified as an underserved group for HIV prevention, however data on use of pre-exposure prophylaxis (PrEP) for HIV are lacking.2 3 This study aimed to determine the prevalence of PrEP use amongst transgender attendees at our sexual health service. Methods All transgender people attending a single integrated sexual health service throughout 2021 were identified through GUMCAD coding and/or attendance at the services' specialist trans clinic. Notes were reviewed for demographic data, PrEP eligibility and use. Confidence intervals (CI) were estimated with binomial exact test. Results 108 patients were identified; 41/108 (38%) TGM, 38/108 (35%) TGW and 29/108 (27%) NBI. Median age was 36 years (IQR=24-38). 5(5%) were living with HIV, all TGW. 21/103 (20%) HIV negative patients were eligible for PrEP as per national guidelines. PrEP eligibility could not be determined from records for 15/103 (15%). 16/103 (16%, 95%CI=10-24) were currently using PrEP, 6(15%) TGM, 7(18%) TGW and 3(10%) NBI). A further 4 had previously used PrEP. Discussion To our knowledge this is the first description of PrEP use amongst transgender people from a UK sexual health clinic. Only a small proportion were currently using PrEP, with most deemed not eligible. Further research is needed to determine whether this is reflective of the wider transgender population and to identify their diverse sexual health needs. Article	2023	Rossotti R.; Nava A.; Baiguera C.; Calzavara D.; D'Amico F.; Fanti D.; Bana N.B.; Vismara C.; Cernuschi M.; Scaglione F.; Puoti M.	High prevalence of anal papillomavirus infection in men who have sex with men PrEP users	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2022-055447	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135192408&doi=10.1136%2fsextrans-2022-055447&partnerID=40&md5=5786fc3cde8f0c10b8c891b47974bb43	Objectives Human papillomavirus (HPV) is the most common STI and is associated with a wide range of diseases from anogenital warts to malignancies. Anal HPV infection is considerably more common in men who have sex with men (MSM) living with HIV. Aims of the present study are to (i) describe the prevalence of anal HPV infection in MSM who started pre-exposure prophylaxis (PrEP) and (ii) analyse factors associated with anal infection from genotypes that would be covered by nonavalent vaccination. Methods This monocentric, cross-sectional study included all subjects who started PrEP from May 2018 to November 2021. PrEP candidates underwent full behavioural and clinical evaluation, including digital anal rectal examination and swabbing for HPV determination. Descriptive statistics, Mann-Whitney U test for continuous and χ 2 tests for categorical variables were adopted. Unadjusted and adjusted regression analyses were performed to assess factors associated with positive anal swabs and to the presence of genotypes covered by the nonavalent vaccination. Results The analysis included 288 subjects: anal swabs tested positive in 87.2% of cases, 79.2% of the subjects had a high-risk genotype (mainly 16), whereas 67.4% had a genotype covered by nonavalent vaccine. Sexual role was the only factor associated with anal HPV infection. Use of recreational drugs and a diagnosis of ≥2 STIs correlated with the presence of genotypes that would have been covered by vaccine, while previous vaccination had a protective role. Conclusions PrEP candidates showed a high prevalence of anal HPV infection, especially due to high-risk genotypes, comparable to what has been reported in MSM living with HIV. © 2023 BMJ Publishing Group. Article	2023	Rossotti, R; Tavelli, A; Calzavara, D; De Bona, A; Vinti, P; Muccini, C; Tesoro, D; Bossolasco, S; Cernuschi, M; Monforte, AD	Impact of COVID Pandemic on Sexual Habits and Pre-exposure Prophylaxis Retention in Care in a Community-Based Service	Sexuality Research & Social Policy	-	-	-	-	1868-9884	10.1007/s13178-023-00849-5	https://www.researchgate.net/publication/372624875_Impact_of_COVID_Pandemic_on_Sexual_Habits_and_Pre-exposure_Prophylaxis_Retention_in_Care_in_a_Community-Based_Service	BackgroundCOVID pandemic had a significant impact on most social and medical activities, including sexual habits and access to pre-exposure prophylaxis (PrEP). The aim of our study is to describe the number of subjects who discontinued PrEP after the first lockdown, and the change of sexual behaviors in those who continued despite social restrictions.MethodsThis monocentric, retrospective analysis included all subjects attending a community-based service who started PrEP before February 2020. Data were collected from self-administered questionnaires.ResultsThe analysis included 166 individuals: among them, 56 (33.7%) did not continue attending visits after the first lockdown: the largest part (32, 19.3%) decided to temporarily postpone prophylaxis until the end of the pandemic. One hundred and ten subjects continued PrEP: they were mainly males (98.2%) with a median age of 39 (IQR 32-46) years. After the general lockdown, there were no changes in terms of sexual habits (number of partners and intercourses), number of pills taken, use of alcohol and drugs, and incidence of sexually transmitted infections.ConclusionCOVID-19 had an impact on PrEP users attending a community-based service in terms of persons who stopped the prophylaxis. Nevertheless, in those who decided to continue, sexual habits did not change significantly compared to pre-pandemic period. Pathogens	-	-	-	-	2076-0817	10.3390/pathogens12060798	https://pubmed.ncbi.nlm.nih.gov/37375488/	Mpox is traditionally considered a zoonotic disease with endemic circulation in Africa, but the 2022-2023 outbreak reached an unprecedented high number of cases in non-endemic countries, so that it was declared a public health emergency of international concern. The reasons for this extensive global spread, characterized by sexual transmission amongst men who have sex with men (MSM), have not been fully clarified. The existence of asymptomatic carriers with viable viral shedding might be an explanation and is under-debated after retrospective studies suggested that infection without symptoms might have a prevalence of 6.5%. We aimed to prospectively assess the presence of mpox infection in asymptomatic high-risk MSM using HIV pre-exposure prophylaxis and living with HIV. We selected individuals with no signs of active infection nor suggestive symptoms in the previous 21 days. Eligible individuals collected oral and anal swabs to undergo point-of-care testing for mpox and completed a 21-days follow-up. Seventy-two individuals were enrolled, and none tested positive for mpox infection nor developed symptoms during follow-up. We selected a high-risk population with a significant history of sexual exposure, but we failed to detect any asymptomatic infection. This observation might have important consequences in terms of contact management and epidemic control. Article	2023	Rotsaert A.; Reyniers T.; Vanhamel J.; Van Landeghem E.; Vanbaelen T.; Van Mieghem H.; Nöstlinger C.; Laga M.; Vuylsteke B.	Putting 2-1-1 into Practice: PrEP Users' Knowledge of Effectively Starting and Stopping Oral PrEP Use	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03911-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142287362&doi=10.1007%2fs10461-022-03911-2&partnerID=40&md5=61fb66de6b4a801af0b022af63f1ad61	Starting and stopping oral HIV pre-exposure prophylaxis (PrEP) in a way that compromises its effectiveness should be avoided. Between September 2020 and June 2021, we assessed self-perceived and actual knowledge of effectively starting and stopping oral PrEP through an online survey among 206 PrEP users assigned male at birth in Belgium. We examined associations between incorrect start-and-stop knowledge and socio-demographics, sexual behaviour and PrEP use, using bi- and multi-variable logistic regression. The majority of men (84.9%) perceived their start-and-stop knowledge as 'very good', but only 62.1% of all men correctly indicated how to effectively start and stop with PrEP. Using PrEP daily adjusted OR 2.12, 95% CI (1.06–4.28), p = 0.034 was significantly associated with incorrect start-and-stop knowledge. To enable PrEP users to effectively use PrEP, they need to be better informed about how to start and stop use, irrespective of the dosing regimen. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature.	2-1-1; Adherence; HIV prevention; MSM; On-demand; PrEP	English	United States	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Quantitative
Article	2023	Rotsaert A.; Smekens T.; Vuylsteke B.; van der Loeff M.S.; Hensen B.; Nöstlinger C.; Wouters E.; Vanhamel J.; Scheerder G.; Reyniers T.	Patterns of PrEP and condom use among PrEP users in Belgium: a web-based longitudinal study	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-023-15786-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160221894&doi=10.1186%2fs12889-023-15786-6&partnerID=40&md5=fa566e4e8d8a6689460b653aa08b3d71	Background: Tailoring pre-exposure prophylaxis (PrEP) service delivery is key to scaling-up PrEP uptake. Optimal implementation of tailored services requires, among other things, insights into patterns of PrEP use, sexual behaviours and condom use over time. Methods: Between September 2020 and January 2022, we conducted a web-based, longitudinal study among PrEP users in Belgium. In three questionnaire rounds every six-months, we assessed PrEP and condom use, and sex with steady, casual and anonymous partners in the preceding three months. Based on the patterns of PrEP use in the preceding three months, we identified distinct PrEP use categories. We investigated differences in baseline socio-demographics and sexual behaviours by PrEP use category using Fisher's exact and one-way ANOVA tests. Patterns in PrEP and condom use over time were examined using descriptive analyses and visualised in alluvial diagrams. Results: In total, 326 participants completed the baseline questionnaire, and 173 completed all three questionnaires. We identified five distinct PrEP use categories: daily (≥ 90 pills), almost daily (75–89 pills), long period (> 7 consecutive days and < 75 pills) with or without additional short period use, short period (1–7 consecutive days and < 75 pills) and no PrEP use (0 pills). During the study, percentages of individuals in each PrEP use category varied, but did not change significantly over time. At baseline, daily and almost daily users were more likely to report five or more casual sex partners, ten or more anonymous sex partners and anal sex on a weekly basis with casual or anonymous partners compared to those using PrEP for long or short periods. Up to 12.6% (n = 16/127) of participants reporting anal sex with casual or anonymous partners, indicated always using condoms and PrEP with these partners. One in three (n = 23/69) participants who reported anal sex with steady partners had condomless anal sex and did not use PrEP with these partners; with casual or anonymous partners less than 3% reported this. Conclusions: Our findings show that there is little variation in PrEP use over time and that PrEP use was associated with sexual behaviours, which could be taken into account when designing tailored PrEP care. © 2023, The Author(s). Article	2023	Rousseau E.; Wu L.; Heffron R.; Baeten J.M.; Celum C.L.; Travill D.; Delany-Moretlwe S.; Bekker L.-G.; Bukusi E.; Omollo V.; van der Straten A.; O'Malley G.; Haberer J.E.; Morton J.F.; Johnson R.E.; Roberts S.T.	Association of sexual relationship power with PrEP persistence and other sexual health outcomes among adolescent and young women in Kenya and South Africa	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2023.1073103	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85161991809&doi=10.3389%2ffrph.2023.1073103&partnerID=40&md5=22d1e97fc63a98aebf2b8a1c76a8b9fd	Introduction: Gendered power inequalities impact adolescent girls' and young women's (AGYW) sexual and reproductive health (SRH) outcomes. We investigated the influence of sexual relationship power on AGYW's SRH outcomes, including HIV pre-exposure prophylaxis (PrEP) persistence. Methods: The POWER study in Kisumu, Kenya, and Cape Town and Johannesburg, South Africa provided PrEP to 2,550 AGYW (aged 16–25). AGYW's perceived power in their primary sexual relationship was measured among the first 596 participants enrolled using the Sexual Relationship Power Scale's (SRPS) relationship control sub-scale. Multivariable regression was used to test for (1) key sociodemographic and relationship characteristics associated with relationship power; and (2) the association of relationship power with SRH outcomes including PrEP persistence. Results: In this cohort, the mean SRPS score was 2.56 (0.49), 542 (90.9%) initiated PrEP; 192 (35.4%) persisted with PrEP at 1 month of which 46 (24.0% of 192) persisted at 6 months. SRPS were significantly lower among AGYW who cohabited with their sex partner (−0.14, 95% CI: −0.24 to −0.04, p = 0.01), or had ≥1 sex partner (−0.10, 95% CI: −0.19 to −0.00, p = 0.05). AGYW with lower SRPS were more likely to not know their partner's HIV status (aOR 2.05, 95% CI: 1.27 to 3.33, p < 0.01), but SRPS was not associated with PrEP persistence, STI infection, condom, or hormonal contraception use. Discussion: AGYW's reasons for initiating PrEP and reasons for continuously using PrEP may be different. While low relationship power was associated with perceived HIV vulnerability, AGYW's PrEP persistence may be influenced by more than relationship power. 2023 Rousseau, Wu, Heffron, Baeten, Celum, Travill, Delany-Moretlwe, Bekker, Bukusi, Omollo, van der Straten, O'Malley, Haberer, Morton, Johnson and Roberts.	adolescent girls and young women (AGYW); pre-exposure prophylaxis (PrEP); PrEP persistence; sexual and reproductive health outcomes; sexual relationship power	English	Switzerland	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2023	Rugira E.; Biracyaza E.; Umubyeyi A.	Uptake and Persistence on HIV Pre-Exposure Prophylaxis Among Female Sex Workers and Men Having Sex with Men in Kigali, Rwanda: A Retrospective Cross-Sectional Study Design	Patient Preference and Adherence	-	-	-	-	1177889X	10.2147/PPA.S427021	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85172727850&doi=10.2147%2fPPA.S427021&partnerID=40&md5=bb78477a738414af26b8b8a57b790bc7	Background: Although HIV pre-exposure prophylaxis (PrEP) is known for its effectiveness in preventing HIV transmission; there is a global rise in HIV infection rates, particularly prominent in sub-Saharan Africa. This health concern is mostly evident among highrisk groups, namely Female Sex Workers (FSWs) and Men who have Sex with Men (MSMs), both of whom are more susceptible to sexually transmissible infections. This research examined the persistence, uptake, and associated predictors of PrEP utilization within the FSW and MSM populations. Methods: A cross-sectional study design was conducted involving 4872 individuals from the FSW and MSM groups who were enrolled in a PrEP program across 10 health centers participating in a pilot initiative. The study population was subject to a year-long follow-up period commencing on March 1st, 2019. To evaluate the determinants of PrEP utilization within FSW and MSM groups, bivariate logistic analyses and multivariate logistic regression models were employed. Results: The findings revealed that the occurrence of PrEP uptake was 45.55% (n=2219) among FSWs and 35.42% (n=17 participants) among MSM. Regarding PrEP persistence, MSM (88.24%, n=15 participants) presented higher PrEP proportion than FSWs (78.5%, n=1742 women). Our findings disclosed that individuals aged 25–34 years (aOR=0.82; 95% CI=0.72–0.93, p=0.002), 35–44 years (aOR=0.83; 95% CI=0.71–0.97, p=0.017), and 55 years and older (OR=0.14; 95% CI=0.04–0.48, p=0.002) exhibited lower likelihoods of having low PrEP uptake than those aged 15–19 years. Moreover, individuals residing with their families (aOR=0.71; 95% CI=0.58–0.87, p<0.001), living with roommates (aOR=0.7; 95% CI=0.5–0.97, p=0.032) displayed lower odds for experiencing low PrEP uptake than their counterparts living alone. Conclusion: This study highlighted the low uptake of PrEP among participants when compared to previous studies. These results revealed significant influences of age and living conditions on PrEP usage. © 2023 Rugira et al. Article	2023	Ruiz-Burga E.; Tariq S.; Touloumi G.; Gill J.; Nicholls E.J.; Sabin C.; Mussini C.; Meyer L.; Volny Anne A.; Carlander C.; Grabar S.; Jarrin I.; Van Der Valk M.; Wittkop L.; Spire B.; Pantazis N.; Burns F.M.; Porter K.	CASCADE protocol: exploring current viral and host characteristics, measuring clinical and patient-reported outcomes, and understanding the lived experiences and needs of individuals with recently acquired HIV infection through a multicentre mixed-methods observational study in Europe and Canada	BMJ Open	-	-	-	-	20446055	10.1136/bmjopen-2022-070837	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159741229&doi=10.1136%2fbmjopen-2022-070837&partnerID=40&md5=68ee8c4467a213f5e8dbd227254ba0af	Introduction Despite the availability of pre-exposure prophylaxis (PrEP) and antiretroviral therapy (ART), 21 793 people were newly diagnosed with HIV in Europe in 2019. The Concerted action on seroconversion to AIDS and death in Europe study aims to understand current drivers of the HIV epidemic; factors associated with access to, and uptake of prevention methods and ART initiation; and the experiences, needs and outcomes of people with recently acquired HIV. Methods and analysis This longitudinal observational study is recruiting participants aged ≥16 years with documented laboratory evidence of HIV seroconversion from clinics in Canada and six European countries. We will analyse data from medical records, self-administered questionnaires, semistructured interviews and participatory photography. We will assess temporal trends in transmitted drug resistance and viral subtype and examine outcomes following early ART initiation. We will investigate patient-reported outcomes, well-being, and experiences of, knowledge of, and attitudes to HIV preventions, including PrEP. We will analyse qualitative data thematically and triangulate quantitative and qualitative findings. As patient public involvement is central to this work, we have convened a community advisory board (CAB) comprising people living with HIV. Ethics and dissemination All respective research ethics committees have approval for data to contribute to international collaborations. Written informed consent is required to take part. A dissemination strategy will be developed in collaboration with CAB and the scientific committee. It will include peer-reviewed publications, conference presentations and accessible summaries of findings on the study's website, social media and via community organisations. © The Author(s)	EPIDEMIOLOGIC STUDIES; HIV & AIDS; INFECTIOUS DISEASES; Primary Prevention	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Mixed methods
Article	2023	Russ, Savanah; Zhang, Chen; Przybyla, Sarahmona; Liu, Yu	Racial Differences of Psychosocial Characteristics, HIV Risk-Taking and HIV Prevention Uptake between Men Who Have Sex with Men Only and Men Who Have Sex with Men and Women: A Community-Based Study in Two US Cities.	Journal of Homosexuality	-	-	-	-	1540-3602	10.1080/00918369.2022.2048160	https://dx.doi.org/10.1080/00918369.2022.2048160	Bisexual behavior preference plays an important role in shaping HIV risks among men who have sex with men (MSM), yet few studies have examined the racial differences in the patterns of sexual risk and HIV prevention uptake between men who have sex with men and women (MSMW) and men who have sex with men only (MSMO). We conducted a community-based study to identify and compare psychosocial characteristics, sexual risks, HIV testing frequency, and pre-exposure prophylaxis (PrEP) engagement between Black and White MSMW and MSMO in two US cities. Findings indicate that White MSMW were most likely to engage in HIV risk-taking behaviors (e.g., alcohol/drug use before sex, condomless/group sex), while Black MSMW were least likely to recently test for HIV or report awareness (aPR: 0.32, 95% CI: 0.17-0.61), willingness (aPR: 0.58, 95% CI: 0.30-0.98), and use (aPR: 0.59, 95% CI: 0.31-0.93) of PrEP. Findings from our study supplement salient information for designing culturally tailored HIV prevention interventions for specific MSM subgroups in the US. Article	2023	Rutstein, Sarah E; Miller, William C	Planning for PrEP: are national surveillance data sufficient?	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(23)00297-7	https://pubmed.ncbi.nlm.nih.gov/38040473/	Biomedical pre-exposure prophylaxis (PrEP) prevents HIV acquisition when taken as prescribed. Increased access, uptake, and persistent use of PrEP are essential to achieve global targets of eliminating HIV transmission. Effective tools to monitor the clinical outcomes and economic implications of evolving PrEP implementation strategies are needed to inform national programme development and financial planning. Strategies to use routinely collected clinical and surveillance data to monitor PrEP use are appealing if these data can accurately capture key metrics of PrEP eligibility and outcomes. Article	2023	Saberi P.; Mehtani N.J.; Sayegh A.; Camp C.E.; Chu C.	Understanding HIV Pre-Exposure Prophylaxis Questions of U.S. Health Care Providers: Unique Perspectives from the PrEPline Clinical Teleconsultation Service	Telemedicine and e-Health	-	-	-	-	15305627	10.1089/tmj.2022.0145	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150311378&doi=10.1089%2ftmj.2022.0145&partnerID=40&md5=923ce4fe9fd339609843c490a0b4575f	Introduction: Fewer than a quarter of people considered to have factors associated with HIV acquisition are prescribed pre-exposure prophylaxis (PrEP) in the United States. Prior studies demonstrate disparities in provider comfort and knowledge regarding PrEP, suggesting a need for provider capacity building to support widespread PrEP availability. This study examined real-world PrEP clinical questions/cases from providers to a teleconsultation service to identify knowledge gaps and improve PrEP-related training materials and clinical guidelines. Methods: The National Clinician Consultation Center (NCCC) PrEPline provides educational teleconsultation services on clinical decision-making related to PrEP for U.S. health care providers. The NCCC PrEP consultation data collected between 2017 and 2020 were reviewed and systematically categorized by clinical topics, subtopics, and complexity levels (low, moderate, and high). Results: Within the study period, the PrEPline provided 1,754 teleconsultations. More than three quarters came from advanced practice nurses and physicians. The topics of questions commonly focused on medication-based HIV prevention strategies (22.7%), PrEP laboratory ordering/monitoring (17.4%), and side effects and contraindications (14.6%). The majority of teleconsultations (57.9%) involved sharing information that was directly available/addressed in the Centers for Disease Control and Prevention (CDC) 2017 PrEP Guidelines (i.e., low complexity). Discussion: The low frequency of consultations from nonphysician and non-nurse practitioner providers may suggest a need for increased training and collaborative opportunities for other types of providers. The high percentage of low-complexity inquiries may reveal a desire for capacity-building materials specifically designed for practicing providers (e.g., abridged versions of guidelines). This study may inform future research, best clinical practices, and aid in the development of training materials to increase providers' HIV prevention comfort and knowledge. © Copyright 2023, Mary Ann Liebert, Inc., publishers 2023.	clinical consultation; health care provider; HIV pre-exposure prophylaxis; PrEP; teleconsultation	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Sahay, Seema; Bangar, Sampada; Chandhiok, Nomita	Demonstration project of oral TDF-containing PrEP, administered, once-daily orally to men having sex with men (MSM) and transgender women (TGW) in India: Study protocol.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0287454	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10289442	BACKGROUND: India has successfully reduced Human Immuno-deficiency Virus (HIV) incidence, with a 66% decline since the year 2000 has been seen; however, control among Men having sex with Men (MSM) and transgender women (TGW) remains a critical challenge. Oral Pre-Exposure Prophylaxis (PrEP) may help close a critical HIV prevention gap for MSM and TGW in India; however, no studies to date have evaluated the feasibility of oral PrEP among MSM and TGW in India. METHODS: The proposed study aims at understanding the implementation of the provision of daily oral-Tenofovir (TDF) containing PrEP among MSM and TGW through the clinic and community-based delivery models in Pune, Maharashtra, and Jalandhar, Punjab respectively in India. The study aims at estimating PrEP adherence, facilitators, and barriers to PrEP use, retention, acceptability, and willingness to pay for PrEP. After the screening, eligible participants (n = 600) will receive PrEP medicines and will be monitored quarterly for HIV, STIs, and renal and liver toxicity for 12 months as per the schedule of events. The primary outcomes of interest are PrEP acceptability, PrEP adherence, retention rate, adverse medical events, and sexual behavioural changes with PrEP use and breakthrough infections while on PrEP. The study will assess the feasibility of two service delivery models; however, the data from the two service delivery models will be analyzed independently and will not be compared for feasibility and other outcome indicators. The study has been initiated after obtaining appropriate regulatory approvals. DISCUSSION: PrEP is efficacious in preventing HIV among high-risk population however there are scarce data on providing PrEP to MSM and TGW. The study will provide critical evidence to programs and policymakers on the implementation of PrEP in a "real world" setting, among MSM and TGW in India including identifying populations that can benefit most from this additional HIV prevention intervention along with acceptable delivery strategies and means of support for adherence. TRIAL REGISTRATION: Not applicable being a demonstration project. Efficacy is already proven. Article	2023	Saidi F.; Phanga T.; Graybill L.A.; Mollan K.R.; Hill L.M.; Sibande W.; Msowoya G.; Thom A.; Rosenberg N.E.; Freeborn K.; Amico K.R.; Phiri S.; Mutale W.; Chi B.H.	Acceptability of a Combination Adherence Strategy to Support HIV Antiretroviral Therapy and Pre-exposure Prophylaxis Adherence During Pregnancy and Breastfeeding in Malawi	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04116-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163751399&doi=10.1007%2fs10461-023-04116-x&partnerID=40&md5=c073b86fe16ceba9d312cf5c33aa6dbf	In two parallel pilot studies, we implemented a combination adherence intervention of patient-centered counselling and adherence supporter training, tailored to support HIV treatment (i.e., antiretroviral therapy) or prevention (i.e., pre-exposure prophylaxis, or PrEP) during pregnancy and breastfeeding. Using a mixed-methods approach, we evaluated the intervention's acceptability. We investigated engagement, satisfaction, and discussion content via survey to all 151 participants assigned to the intervention arm (51 women living with HIV, 100 PrEP-eligible women without HIV). We also conducted serial in-depth interviews with a subgroup (n = 40) at enrollment, three months, and six months. In the quantitative analysis, the vast majority reported high satisfaction with intervention components and expressed desire to receive it in the future, if made available. These findings were supported in the qualitative analysis, with favorable comments about counselor engagement, intervention content and types of support received from adherence supporters. Overall, these results demonstrate high acceptability and provide support for HIV status-neutral interventions for antiretroviral adherence. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Sánchez-Mendoza, Vanessa	Una revisión de alcance de las intervenciones bioconductuales para mejorar la continuidad de la atención de la PrEP en América Latina	Acta Colombiana de Psicología	-	-	-	-	NA		http://www.scielo.org.co/scielo.php?script=sci_abstract&pid=S0123-91552023000200141&lng=es&nrm=is	Según la literatura, las intervenciones bioconductuales o estrategias combinadas reducirían el riesgo de infección por VIH en más de 7000 nuevos casos cada día, lo que contribuiría a la batalla que enfrenta América Latina, región en la que, a pesar de la alta incidencia y prevalencia del VIH, el acceso a la PrEP (profilaxis preexposición) es muy limitado. De acuerdo con las directrices de PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses), el objetivo de esta investigación fue realizar una revisión de alcance para evaluar la evidencia de los datos de resultados disponibles sobre intervenciones bioconductuales y programas para abordar las brechas en el continuo de atención de PrEP en América Latina. La búsqueda se realizó en las bases de datos EBSCOhost, WoS, Scopus y ProQuest, e incluyó todos los estudios publicados de 2010 a 2021. Se identificaron ciento ochenta y seis estudios, y se evaluaron de acuerdo con los criterios de elegibilidad en seis etapas, iniciando por la eliminación de duplicados hasta la selección de estudios que cumplieran los criterios previamente mencionados; al final se eligieron cinco estudios, los cuales fueron sometidos a la evaluación de calidad metodológica, incluyendo el cumplimiento de los lineamientos éticos. Los resultados muestran que las intervenciones bioconductuales que promueven la PrEP en América Latina son efectivas para aumentar el uso del condón, disminuir el riesgo de VIH y aumentar la conciencia, la aceptación, la adherencia y la retención de la PrEP. El número limitado de intervenciones en el continuo de atención de la PrEP indica la necesidad de adoptar marcos científicos de difusión e implementación (D&I); marcos que podrían ayudar a facilitar la traducción de prácticas, intervenciones y políticas basadas en la evidencia para abordar la crisis del VIH en América Latina. Article	2023	Sandset T.	PrEP, Pharmakon, and Ambivalence in the Era of Nordic HIV Prevention	Women, Gender and Research	-	-	-	-	22456937	10.7146/KKF.V35I1.133743	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166227825&doi=10.7146%2fKKF.V35I1.133743&partnerID=40&md5=836a2af76e51c0d8dc03d0c808b0e5fb	Using Derrida's notion of pharmakon (again from Plato), I bring attention to how we can utilize the notion of pharmakon as an analytical framing device for thinking about the entanglements between pharmaceuticals, historical HIV narratives, and the contemporary landscape of HIV in the Nordic region. This article establishes a disciplinary conjecture by arguing that pharmakon as a framing device might add to our understanding of the, at times, polemical discourses around PrEP in Scandinavia and elsewhere, and also to our understanding of PrEP as a 'reluctant object' in the phrasing of Kane Race. I argue, through a theoretical reading, that PrEP as pharmakon has much to offer as a way of framing PrEP, particularly when it comes to trying to unpack some of the ambivalence that has surrounded PrEP as a preventive drug against HIV. By doing so, this article aims to (i) introduce a new theoretical reading of PrEP which so far has not been attended to in the literature, and (ii) by doing so, connect this way of framing PrEP to the Nordic setting in particular, and the historical development of HIV histories in the Nordic region. © 2023 The Author(s).	ambivalence; HIV; pharmakon; PrEP; Scandinavia	English	Germany	Western and Central Europe and North America	Norway	Western and Central Europe and North America	Norway	Western and Central Europe and North America	Qualitative
Article	2023	Sandset T.; Villadsen K.; Heggen K.; Engebretsen E.	Discipline for pleasure: a new governmentality of HIV prevention	BioSocieties	-	-	-	-	17458552	10.1057/s41292-021-00257-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116379966&doi=10.1057%2fs41292-021-00257-1&partnerID=40&md5=d48af6a99c6d0adc518d536f0bfbea2c	This article explores recent HIV prevention campaigns for pre-exposure prophylaxis (PrEP), focusing on how they integrate pleasure and desire in their calls for self-discipline through a continual use of pharmaceuticals. This emerging type of health promotion, here represented by ads promoting the preventive use of pharmaceuticals, no longer simply approaches target groups with demands to abstain from harmful substances or practices and thus control risks, but also includes messages that recognize individuals' habits, values, and their desires for pleasure. Drawing on Foucault's work concerning discipline and security, we suggest that a novel, permissive discipline is emerging in contemporary HIV prevention. Further guided by Barthes's theory of images, we analyse posters used in prevention campaigns, scrutinizing their culture-specific imagery and linguistic messages, i.e. how the words and images interact. We conclude that these campaigns introduce a new temporality of prevention, one centred on pleasure through the pre-emption and planning that PrEP enables. © 2021, The Author(s), under exclusive licence to Springer Nature Limited. Article	2023	Sang J.M.; Wang L.; Moore D.M.; Barath J.; Lal A.; Hart T.A.; Skakoon-Sparling S.; Noor S.W.; Chown S.; Lambert G.; Cox J.; Jollimore J.; Parlette A.; Apelian H.; Grace D.; Lachowsky N.J.	Examining Associations Between Resilience and PrEP Use Among HIV-negative GBM in Toronto, Montreal and Vancouver	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04031-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149339960&doi=10.1007%2fs10461-023-04031-1&partnerID=40&md5=83d04b8404c5fd83a7150b33f5a329dd	This study evaluated the association between resilience and PrEP use among a population-based sample of Canadian gay, bisexual, and other men who have sex with men (GBM). Sexually active GBM aged ≥ 16 years old were recruited via respondent-driven sampling (RDS) in Toronto, Montreal, and Vancouver from 02/2017 to 07/2019. We conducted a pooled cross-sectional analysis of HIV-negative/unknown GBM who met clinical eligibility for PrEP. We performed multivariable RDS-II-weighted logistic regression to assess the association between scores on the Connor-Davidson Resilience-2 Scale and PrEP. Mediation analyses with weighted logistic and linear regression were used to assess whether the relationship between minority stressors and PrEP use was mediated by resilience. Of 1167 PrEP-eligible GBM, 317 (27%) indicated they took PrEP in the past six months. Our multivariable model found higher resilience scores were associated with greater odds of PrEP use in the past six months (aOR = 1.13, 95%CI = 1.00, 1.28). We found that resilience reduced the effect of the association between heterosexist discrimination and PrEP use. Resilience also mediated the relationship between internalized homonegativity and PrEP use and mediated the effect of the association between LGBI acceptance concern and PrEP use. Overall, PrEP-eligible GBM with higher resilience scores had a greater odds of PrEP use in the past six months. We also found mixed results for the mediating role of resilience between minority stress and PrEP use. These findings underline the continued importance of strength-based factors in HIV prevention. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Sang, Jordan M; Moore, David M; Wang, Lu; Chia, Jason; Toy, Junine; Montaner, Julio; Skakoon-Sparling, Shayna; Cox, Joseph; Lambert, Gilles; Grace, Daniel; Hart, Trevor A; Lal, Allan; Jollimore, Jody; Lachowsky, Nathan J	Examining the secondary impacts of the COVID-19 pandemic on syndemic production and PrEP use among gay, bisexual and other men who have sex with men (GBM) in Vancouver, Canada.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-023-17049-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10614320	BACKGROUND: The secondary impacts of the COVID-19 pandemic may disproportionately affect gay, bisexual, and other men who have sex with men (GBM), particularly related to HIV prevention and treatment outcomes. We applied syndemic theory to examine PrEP disruptions during the height of the COVID-19 pandemic in Vancouver, Canada. METHODS: Sexually-active GBM, aged 16 + years, were enrolled through respondent-driven sampling (RDS) from February 2017 to August 2019. Participants completed a Computer-Assisted Self-Interview every six months and data were linked to the BC PrEP Program (program responsible for publicly funded PrEP in the province) to directly measure PrEP disruptions. The analysis period for this study was from March 2018-April 2021. We used univariable generalized linear mixed models to examine (1) six-month trends for syndemic conditions: the prevalence of moderate/severe depressive or anxiety symptoms, polysubstance use, harmful alcohol consumption, intimate partner violence, and (2) six-month trends for PrEP interruptions among HIV-negative/unknown GBM. We also applied 3-level mixed-effects logistic regression with RDS clustering to examine whether syndemic factors were associated with PrEP interruptions. RESULTS: Our study included 766 participants, with 593 participants who had at least one follow-up visit. The proportion of respondents with abnormal depressive symptoms increased over the study period (OR = 1.35; 95%CI = 1.17, 1.56), but we found decreased prevalence for polysubstance use (OR = 0.89; 95%CI = 0.82, 0.97) and binge drinking (OR = 0.74; 95%CI = 0.67, 0.81). We also found an increase in PrEP interruptions (OR = 2.33; 95%CI = 1.85, 2.94). GBM with moderate/severe depressive symptoms had higher odds (aOR = 4.80; 95%CI = 1.43, 16.16) of PrEP interruptions, while GBM with experiences of IPV had lower odds (aOR = 0.38; 95%CI = 0.15, 0.95) of PrEP interruptions. GBM who met clinical eligibility for PrEP had lower odds of experiencing PrEP interruptions (aOR = 0.25; 95%CI = 0.11, 0.60). CONCLUSION: There were increasing PrEP interruptions since March 2020. However, those most at risk for HIV were less likely to have interruptions. Additional mental health services and targeted follow-up for PrEP continuation may help to mitigate the impacts of the COVID-19 pandemic on GBM. Article	2023	Santos, Carina C.; de M Lima, Fernanda W.; Magno, Laio; Soares, Fabiane; Ferraz, Dulce; Grangeiro, Alexandre; Zucchi, Eliana Miura; Préau, Marie; Mabire, Xavier; Matos, Helen R. S. S.; Dourado, Inês	Seroprevalence of anti-SARS-CoV-2 antibodies and factors associated with infection among adolescent men who have sex with men and transgender women in Salvador, Brazil.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-022-14969-x	https://bmcpublichealth.biomedcentral.com/articles/10.1186/s12889-022-14969-x	BACKGROUND: Brazil was strongly affected by the COVID-19 pandemic and the impact of the pandemic on sexual and gender minorities' youth remains unknown. This study aimed to estimate the seroprevalence of SARS-CoV-2 antibodies and associated factors among adolescent men who have sex with men (AMSM) and transgender women (ATGW) participants of a human immunodeficiency virus (HIV) pre-exposure prophylaxis cohort study (PrEP1519). METHODS: This is a cross-sectional design conducted between June and October 2020 in Salvador, Brazil. Serum samples were collected from AMSM and ATGW aged 16-21 years between June-October 2020. IgG and IgM anti-SARS-CoV-2 were detected by chemiluminescence immunoassay, and data were collected through a socio-behavioral questionnaire. RESULTS: Among the 137 participants, the seroprevalence of anti-SARS-CoV-2 IgG and IgM was 20.4%; 16.8% of the participants were positive for IgG, and 11.7% for IgM. In the multivariable analysis, the seroprevalence was two times higher among those who never wore masks (OR= 2.22; 95% CI: 1.08-4.57) and among those who believed that they could be easily cured of the disease (OR= 2.05; 95% CI: 1.05-4.01). CONCLUSIONS: The high seroprevalence of SARS-CoV-2 antibodies among gender and sexual minority youth seems to be informed by behaviors and attitudes that contrast with public health measures and the potential severity of the disease when vaccination was still not available. Article	2023	Santos, Lorruan Alves dos; Unsain, Ramiro Fernandez; Brasil, Sandra Assis; Silva, Luís Augusto Vasconcelos da; Duarte, Filipe Mateus; Couto, Marcia Thereza	PrEP perception and experiences of adolescent and young gay and bisexual men: an intersectional analysis; Percepção e experiências da PrEP de homens gays e bissexuais jovens e adolescentes: uma análise interseccional; Percepción y experiencias de la PrEP de adolescentes y hombres jóvenes gais y bisexuales: análisis interseccional	Cadernos de Saúde Pública	-	-	-	-	0102311X	10.1590/0102-311XEN134421	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151573769&doi=10.1590%2f0102-311XEN134421&partnerID=40&md5=d36bc6467342751be2ba532785263528	Studies indicate gaps in knowledge about the barriers to access and adhere to HIV pre-exposure prophylaxis (PrEP) in adolescents. In this article, we explore the perceptions and experiences of young gay, bisexual, and other men who have sex with men (YGBMSM) of the search, use and adherence to PrEP, considering their positions according to social markers of difference such as race/skin color, gender, sexuality, and social status. Intersectionality provides theoretical and methodological tools to interpret how the interlinking of these social markers of difference constitutes barriers and facilitators in the PrEP care continuum. The analyzed material is part of the PrEP1519 study and is comprised of 35 semi-structured interviews with YGBMSM from two Brazilian capitals (Salvador and São Paulo). The analyses suggest connections between social markers of difference, sexual cultures, and the social meanings of PrEP. Subjective, relational and symbolic aspects permeate the awareness of PrEP in the range of prevention tools. Willingness to use and adhere to PrEP is part of a learning process, production of meaning, and negotiation in the face of getting HIV and other sexually transmittable infections and the possibilities of pleasure. Thus, accessing and using PrEP makes several adolescents more informed about their vulnerabilities, leading to more informed decision-making. Interlinking the PrEP continuum of care among YGBMSM with the intersections of the social markers of difference may provide a conceptual framework to problematize the conditions and effects of implementing this prevention strategy, which could bring advantages to HIV prevention programs. © 2023 Fundacao Oswaldo Cruz. Article	2023	Sarah Bauerle Bass; Kelly, Patrick JA; Brajuha, Jesse; Gutierrez-Mock, Luis; D'Avanzo, Paul; Herrera, Samantha; Sevelius, Jae	Using social marketing strategies to develop and pretest PrEP education materials for transgender women	Journal of Social Marketing	-	-	-	-	20426763	10.1108/JSOCM-08-2022-0169	https://www.proquest.com/scholarly-journals/using-social-marketing-strategies-develop-pretest/docview/2818640296/se-2?accountid=8113	PurposeThe purpose of this study was to develop pre-exposure prophylaxis (PrEP) education materials that directly address the needs of trans women. PrEP medication is an effective HIV prevention strategy, but some groups at high risk of HIV, such as transgender (trans) women, have suboptimal uptake and adherence. Most PrEP marketing has been aimed fat men who have sex with men (MSM) and include trans women as part of that audience, but this strategy ignores important differences in perceptions of and barriers to PrEP.Design/methodology/approachThis study used a social marketing approach grounded in exchange theory to systematically develop and pretest PrEP messaging and communication materials for trans women through qualitative (focus groups: n = 5, 34 participants) and quantitative (surveys: n = 128) methods in Philadelphia and the San Francisco Bay area. Segmentation analysis, perceptual mapping and vector message modeling techniques were used to create three-dimensional visualizations of PrEP perceptions to identify highly targeted messaging. Working with trans artists, the authors developed prototype materials using the targeted messaging and pretested these (n = 11) in both locations for feedback on content, look and insight on appropriate intervention strategies.FindingsUsing segmentation and perceptual mapping, this study identified key PrEP messaging across different subgroups, including by demographic and psychographic variables. Differences by group were determined to not be significant and overall messages that would resonate with all groups were built into the materials. Pretesting sessions indicated high acceptability of the messaging and trans women-centered approach to increase PrEP uptake.Originality/valueTo the best of the authors' knowledge, this is the first study to use a social marketing framework to create targeted PrEP communication materials for trans women in partnership with trans women. Article	2023	Satish S.; Bravo L.; McAllister A.; Teitelman A.M.; Sonalkar S.	Provision of HIV preexposure prophylaxis to female patients seeking family planning services in the United States	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000003398	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143645516&doi=10.1097%2fQAD.0000000000003398&partnerID=40&md5=953767b19831068006ff195e4cd5ac10	Objective:We conducted a scoping review to assess barriers to and facilitators of integrating HIV preexposure prophylaxis (PrEP) and family planning (FP) at the patient, provider, and implementation levels, and to identify gaps in knowledge.Methods:We conducted a search of five bibliographic databases from database inception to March 2022: PubMed, CINAHL, Embase, Web of Science and Scopus. Two reviewers screened abstracts and full texts to determine eligibility based on a priori inclusion and exclusion criteria. We categorized studies by their relevance to patient, provider, and implementation barriers, and extracted data based on prespecified elements.Results:Our initial search strategy yielded 1151 results, and 34 publications were included. Barriers to PrEP implementation in family planning settings included low PrEP knowledge among patients, hesitance to take PrEP due to perceived stigma, decreased willingness of providers unfamiliar with PrEP to prescribe PrEP, and limited financial and staffing resources that make prescribing and monitoring PrEP difficult. Facilitators included robust training for providers, stigma reduction efforts, leadership engagement, and increased resources specifically in settings with processes in place that ease the process of prescribing and monitoring PrEP.Conclusion:Advances in implementation strategy development, stigma reduction, and drug development will be essential to reinforcing PrEP care in family planning settings and thereby reducing the incidence of HIV in women through highly effective pharmacologic HIV prevention methods. © 2023 Lippincott Williams and Wilkins. Article	2023	Savoie, S J; Leonhard, C; Smith, M; Drake, M	Predicting and influencing PrEP use: the role of motivational and attitudinal factors	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2023.2176427	https://www.proquest.com/scholarly-journals/predicting-influencing-prep-use-role-motivational/docview/2839589161/se-2?accountid=8113	This study examined PrEP attitude and HIV risk factors associated with PrEP motivation and evaluated the efficacy of a mock public health video that addresses both motivational and stigma issues for improving PrEP uptake over a standard educational video. Gay, bisexual, and other men who have sex with men (GBMSM; N = 604) were enrolled. One-way between subject analysis of variance (ANOVA) and post-hoc comparisons revealed that GBMSM in later stages of change had significantly higher endorsement of positive PrEP attitudes, PrEP stigma, objective and perceived HIV risk, HIV worry, and valued health benefits of PrEP more. Stepwise multiple regression revealed five significant predictors of PrEP motivation: HIV worry, objective HIV risk, anticipated PrEP stigma, positive PrEP attitudes, and perceived social consequences of PrEP use. Video conditions did not differ in their impact on PrEP attitudes or motivation; however, regardless of video condition, participants experienced a pre- to post-video increase in positive PrEP attitudes and motivation. Findings suggest HIV worry, objective HIV risk, positive PrEP attitudes, and perceived PrEP health benefits are important factors to optimize PrEP motivation, which can inform secondary prevention efforts. Further study is needed on promotional PrEP campaigns that disconfirm stigmatizing PrEP misconceptions. Article	2023	Schaaf, Jannik; Weber, Timm; von Wagner, Michael; Stephan, Christoph; Carney, Jonathan; Köhler, Susanne Maria; Voigt, Alexander; Noll, Richard; Storf, Holger; Müller, Angelina	Interviews with HIV Experts for Development of a Mobile Health Application in HIV Care-A Qualitative Study.	Healthcare	-	-	-	-	2227-9032	10.3390/healthcare11152180	https://www.mdpi.com/2227-9032/11/15/2180	The Communication and Tracing App HIV (COMTRAC-HIV) project aims to develop a mobile health application for integrated care of HIV patients due to the low availability of those apps in Germany. This study addressed organizational conditions and necessary app functionalities, especially for the care of late diagnosed individuals (late presenters) and those using pre-exposure prophylaxis. We followed a human-centered design approach and interviewed HIV experts in Germany to describe the context of use of the app. The interviews were paraphrased and analyzed with a qualitative content analysis. To define the context of use, user group profiles were defined and tasks derived, which will represent the functionalities of the app. A total of eight experts were included in the study. The results show that the app should include a symptom diary for entering symptoms, side effects, and their intensity. It offers chat/video call functionality for communication with an HIV expert, appointment organization, and sharing findings. The app should also provide medication overview and reminders for medications and appointments. This qualitative study is a first step towards the development of an app for HIV individuals in Germany. Further research includes involving patients in the initial app design and test design usability. Low incidence of HIV infection and decreasing incidence of sexually transmitted infections among PrEP users in 2020 in Germany	Infection	-	-	-	-	3008126	10.1007/s15010-022-01919-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139120183&doi=10.1007%2fs15010-022-01919-3&partnerID=40&md5=eb88d56a8c4a7cd8694610260ccc9140	Introduction: Objectives of this study, as part of a nation-wide HIV pre-exposure prophylaxis (PrEP) evaluation project, were to determine the incidence of infections with HIV, chlamydia, gonorrhea, syphilis, hepatitis A/B/C in persons using PrEP, and to describe the health care funded PrEP use in Germany. Additionally, factors associated with chlamydia/gonorrhea and syphilis infections were assessed. Methods: Anonymous data of PrEP users were collected at 47 HIV-specialty centers from 09/2019–12/2020. Incidence rates were calculated per 100 person years (py). Using longitudinal mixed models, we analyzed risk factors associated with sexually transmitted infections (STIs). Results: 4620 PrEP users were included: 99.2% male, median age 38 years (IQR 32–45), 98.6% men who have sex with men (MSM). The median duration of PrEP exposure was 451 days (IQR 357–488), totaling 5132 py. Four HIV infections were diagnosed, incidence rate 0,078/100py (95% CI 0.029–0.208). For two, suboptimal adherence was reported and in the third case, suboptimal adherence and resistance to emtricitabine were observed. One infection was likely acquired before PrEP start. Incidence rates were 21.6/100py for chlamydia, 23.7/100py for gonorrhea, 10.1/100py for syphilis and 55.4/100py for any STI and decreased significantly during the observation period. 65.5% of syphilis, 55.6% of chlamydia and 50.1% of gonorrhea cases were detected by screening of asymptomatic individuals. In a multivariable analysis among MSM younger age, PrEP start before health insurance coverage and daily PrEP were associated with greater risk for chlamydia/gonorrhea. Symptom triggered testing and a history of STI were associated with a higher risk for chlamydia/gonorrhea and syphilis. A significantly lower risk for chlamydia/gonorrhea and syphilis was found for observations during the COVID-19 pandemic period. Conclusions: We found that HIV-PrEP is almost exclusively used by MSM in Germany. A very low incidence of HIV infection and decreasing incidence rates of STIs were found in this cohort of PrEP users. The results were influenced by the SARS-CoV-2 pandemic. Rollout of PrEP covered by health insurance should be continued to prevent HIV infections. Increased PrEP availability to people at risk of HIV infection through the elimination of barriers requires further attention. Investigation and monitoring with a longer follow-up would be of value. © 2022, The Author(s). Article	2023	Schmidt D.; Kollan C.; Schewe K.; Hanhoff N.; Rüsenberg R.; Friebe M.; Schikowski T.; Schink S.B.; Marcus U.; Koppe U.; Jansen K.; Streeck H.; Ottensmeyer P.; an der Heiden M.; Bannert N.; M'Bayo R.; Ceres M.; Weber L.; Sweers H.; Schmidt A.J.; Tietz H.; Danan E.; Bendig J.; Kloep S.; Neumann A.; Valbert F.; Wasem J.; Bartmeyer B.; Bremer V.	Evaluating the introduction of HIV pre-exposure prophylaxis as a benefit of statutory health insurance (EvE-PrEP): Highly effective protection against HIV without an increase in sexually transmitted infections; Evaluation der Einführung der HIV-Präexpositionsprophylaxe als Leistung der gesetzlichen Krankenversicherung (EvE-PrEP): Hocheffektiver Schutz vor HIV und keine Zunahme von sexuell übertragbaren Infektionen	Bundesgesundheitsblatt - Gesundheitsforschung - Gesundheitsschutz	-	-	-	-	14369990	10.1007/s00103-023-03733-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164839421&doi=10.1007%2fs00103-023-03733-0&partnerID=40&md5=396dfc5290df084a5ef584d91c453181	Background: We investigated the impact of HIV pre-exposure prophylaxis (PrEP) as a new service of the statutory health insurance (SHI) on the incidence of HIV and other sexually transmitted infections (STIs) in Germany. In addition, PrEP needs and access barriers were analyzed. Methods: The following data were evaluated as part of the evaluation project: HIV and syphilis notification data and extended surveillance by the Robert Koch Institute (RKI), pharmacy prescription data, SHI routine data, PrEP use in HIV-specialty care centers, Checkpoint, the BRAHMS and PrApp studies, as well as a community board. Results: The majority of PrEP users were male (98–99%), primarily aged between 25–45 years, and predominantly of German nationality or origin (67–82%). The majority were men who have sex with men (99%). With regard to HIV infections, PrEP proved to be highly effective. There were only isolated cases of HIV infections (HIV incidence rate 0.08/100 person years); in most cases the suspected reason was low adherence. The incidences of chlamydia, gonorrhea, and syphilis did not increase but remained almost the same or even decreased. A need for information on PrEP for people in trans*/non-binary communities, sex workers, migrants, and drug users emerged. Needs-based services for target groups at increased risk of HIV are necessary. Discussion: PrEP proved to be a very effective HIV prevention method. The partly feared indirect negative influences on STI rates were not confirmed in this study. Due to the temporal overlap with the containment measures during the COVID-19 pandemic, a longer observation period would be desirable for a conclusive assessment. © 2023, The Author(s). Article	2023	Schmidt M.A.; Salas S.B.; Donald J.L.; Gift T.L.; Tao G.	Impact of the Early COVID-19 Pandemic on theNumber of HIV Preexposure Prophylaxis Uses and the Proportion of Preexposure Prophylaxis Users Receiving Sexually Transmitted Infection Testing Services	Sexually Transmitted Diseases	-	-	-	-	1485717	10.1097/OLQ.0000000000001726	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152605811&doi=10.1097%2fOLQ.0000000000001726&partnerID=40&md5=4cb769086598d8da4c9e8958c132f75b	Background: With the potential impact of the COVID-19 pandemic on HIV preexposure prophylaxis (PrEP) care management, we assessed the number of PrEP users and sexually transmitted infection (STI) testing-eligible PrEP users, STI testing rates, and prevalence between prepandemic (January 1, 2018-March 31, 2020) and early-pandemic (April 1, 2020-September 30, 2020) periods. Methods: In this retrospective cohort study, a PrEP user for a given quarter is defined as either a previous PrEP user or a PrEP initiator who has at least 1-day coverage of tenofovir/emtricitabine in the given quarter. The STI testing-eligible PrEP users for a given quarter were defined as those persons whose runout date (previous dispense date + days of tenofovir/emtricitabine supply) was in the given quarter. Results: The quarterly number of PrEP users increased from the first quarter of 2018 to the first quarter of 2020 and then decreased in the second and third quarter of 2020. Among STI testing-eligible PrEP users who had ≤14 days between runout and next refill date, gonorrhea and chlamydia screening testing rates were 95.1% for prepandemic and 93.4% for early pandemic (P = 0.1011). Among all STI testing-eligible PrEP users who were tested for gonorrhea and chlamydia, gonorrhea prevalence was 6.7% for prepandemic and 5.7% for early pandemic (P = 0.3096), and chlamydia prevalence was 7.0% for prepandemic and 5.8% for early pandemic (P = 0.2158). Conclusions: Although the early COVID-19 pandemic resulted in lower numbers of PrEP users and PrEP initiators, individuals who remained continuous users of PrEP maintained extremely high rates of bacterial STI screening. With high STI prevalence among PrEP users, assessments of PrEP care management are continuously needed. Copyright © 2022 American Sexually Transmitted Diseases Association. All rights reserved. Article	2023	Schoenberg P.; Edwards O.W.; Merrill L.; Martinez C.A.; Stephenson R.; Sullivan P.S.; Jones J.	Willingness to use and preferences for long-acting injectable PrEP among sexual and gender minority populations in the southern United States, 2021–2022: cross-sectional study	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.26077	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150835529&doi=10.1002%2fjia2.26077&partnerID=40&md5=5aaec293b8d02f77cbf30b10dcadbfb5	Introduction: Long-acting injectable (LAI) pre-exposure prophylaxis (PrEP) for HIV prevention was approved by the U.S. Food and Drug Administration in 2021. LAI PrEP is more effective than oral PrEP. However, it is not clear whether the groups most at risk of HIV in the United States will use LAI PrEP. Willingness to use LAI PrEP and preference for LAI versus oral PrEP has not been reported for sexual and gender minority (SGM) people in the southern United States, where the HIV epidemic is concentrated. Our goal was to assess willingness to use LAI PrEP and preference for oral versus LAI PrEP among SGM people in the southern United States and to assess differences in willingness by demographics and sexual behaviour. Methods: We conducted an online, cross-sectional survey of SGM people aged 15–34 years in the southern United States (n = 583). Participants reported willingness to use LAI PrEP and preferences for LAI PrEP versus daily oral PrEP. We assessed bivariate associations and adjusted prevalence ratios for the LAI-PrEP-related outcomes and key demographic and behavioural characteristics. Results: Overall, 68% of all participants (n = 393) reported being willing to use LAI PrEP that provides protection against HIV for 3 months. Of those, most (n = 320, 81%) indicated a preference for using LAI PrEP, compared to a daily oral pill or no preference. Willingness to use LAI PrEP was more common among transgender and non-binary participants and participants who engaged in condomless anal intercourse in the last 6 months. Hispanic participants were more likely and non-Hispanic Black participants were less likely to report willingness to use LAI PrEP compared to non-Hispanic White participants. Conclusions: Willingness to use LAI PrEP was high among SGM people in the southern United States, although there were some important differences in willingness based on demographic characteristics. Decreased willingness to use LAI PrEP among groups who are disproportionately affected by the HIV epidemic, such as non-Hispanic Black SGM people, could exacerbate existing disparities in HIV incidence. LAI PrEP is an acceptable option among SGM populations in the southern United States, but strategies will be needed to ensure equitable implementation. © 2023 The Authors. Article	2023	Schuettfort G.; Groh A.; Kann G.; Haberl A.; Herrmann E.; Wetzstein N.; Vehreschild M.J.G.T.; Stephan C.	Sexually transmitted diseases in people living with HIV after implementation of cost coverage of HIV pre-exposure prophylaxis by statutory health insurance in Germany	HIV Medicine	-	-	-	-	14642662	10.1111/hiv.13353	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134529738&doi=10.1111%2fhiv.13353&partnerID=40&md5=5bb41ae3a95014d8bad1ac459b32a2cf	Objectives: After pre-exposure prophylaxis (PrEP) was introduced, rates of sexually transmitted infections (STIs) increased among PrEP users. However, data on STI trends in people living with HIV since then are limited. Since September 2019, PrEP has been covered by statutory German health insurance (SHI) in vulnerable groups. This study aimed to determine whether this coverage of PrEP costs affected STI rates in people living with HIV (specifically, men who have sex with men). Methods: All patients of the HIVCENTER Frankfurt diagnosed with at least one STI within the observation period were retrospectively enrolled in the study. STIs included infection with Treponema pallidum, Chlamydia trachomatis, Neisseria gonorrhoeae, and/or Trichomonas vaginalis. The observation period covered 1 year before and 1 year after the coverage of PrEP costs by German SHI. Data were collected from outpatient clinic records. Results: In total, 143 patients were enrolled in the study. The observation period was September 2018 to August 2019 for group 1 (n = 73) and September 2019 to August 2020 for group 2 (n = 70). The most frequent STIs were syphilis and infections due to chlamydia, gonococci, and trichomonads, in descending order. Infections with T. pallidum occurred more often in group 2 than in group 1 (60.0% vs. 50.7%; p = 0.253) as did chlamydia (37.1% vs. 28.8%; p = 0.286). Conclusions: A tendency for an increased ratio of STIs in people living with HIV was observed after the introduction of PrEP coverage by German SHI. STIs should be discussed intensively with people living with HIV, since the communities of PrEP users and people living with HIV overlap, and changes in risk behaviour might influence both groups. © 2022 The Authors. Article	2023	Schwartz J.; Grimm J.; Jamison C.	PrEP on TikTok: benefits, barriers, and possibilities	Communication Research Reports	-	-	-	-	8824096	10.1080/08824096.2023.2269080	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174407591&doi=10.1080%2f08824096.2023.2269080&partnerID=40&md5=d27fd06bb7790a9b640d969b883c24ee	HIV remains a serious problem in the U.S. particularly for men who have sex with men. PrEP is an intervention that can dramatically decrease the risk of HIV infection. Because rates of PrEP adoption have been lower than anticipated, researchers have called for new tactics for promoting PrEP. For this reason, we analyzed PrEP messaging on TikTok. In an analysis guided by the Health Belief Model, we found that discussions of PrEP benefits and barriers were most common on TikTok. Severity and susceptibility were least common. We distilled these findings into suggestions for promoting PrEP adoption. © 2023 Eastern Communication Association. Article	2023	Scott R.K.; Deyarmond M.; Marwitz S.; Huang J.C.; Moriarty P.; Visconti A.J.; Beverley J.; Elion R.; Coleman M.; Hull S.J.	Implementation of an Educational Intervention to Improve HIV Pre-Exposure Prophylaxis Services for Women in an Urban Sexual Health Clinic	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2023.0107	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171420240&doi=10.1089%2fapc.2023.0107&partnerID=40&md5=a777129aa256ccb56e406395be287e83	To test the hypothesis that implementation of a multicomponent, educational HIV pre-exposure prophylaxis (PrEP) intervention to promote universal PrEP services for cisgender women (subsequently "women") in sexual and reproductive health centers would improve the proportion of women screened, offered, and prescribed PrEP, we implemented a multicomponent, educational intervention in a Washington D.C. Department of Health-sponsored sexual health clinic. The clinic serves a patient population with high-potential exposure to HIV. The intervention included clinic-wide PrEP trainings, an electronic health record prompt for PrEP counseling by providers, and educational videos in the waiting room. We collected preimplementation data from March 22, 2018 to July 4, 2018, including 331 clinical encounters for 329 women. Between July 5, 2018 and July 1, 2019, there were 1733 clinical encounters for 1720 HIV-negative women. We used mixed methods to systematically assess intervention implementation using the Reach Effectiveness Adoption Implementation Maintenance framework. Additionally, we assessed the interventions' acceptability and feasibility among providers through semistructured interviews. The proportion of women screened by providers for PrEP (5.6% preimplementation to a mean of 89.2% of women during the implementation period, p < 0.01), offered (6.2 to 69.8%, p < 0.01), and prescribed PrEP (2.6 to 8.1%, p < 0.01) by providers increased significantly in the implementation period. Providers and clinic staff found the intervention both highly feasible and acceptable and demonstrated increased knowledge of PrEP and HIV prevention associated with the clinic-wide trainings. Our results demonstrate the effectiveness of a low-cost educational intervention to increase provision of integrated PrEP services in an urban sexual health clinic serving women with high-potential exposure to HIV. Article	2023	Scott R.K.; Hull S.J.; Huang J.C.; Ye P.P.; Lotke P.; Beverley J.; Moriarty P.; Balaji D.; Ward A.; Holiday J.; Brant A.R.; Elion R.; Visconti A.J.; Coleman M.	Intention to Initiate HIV Pre-exposure Prophylaxis Among Cisgender Women in a High HIV Prevalence U.S. City	Women's Health Issues	-	-	-	-	10493867	10.1016/j.whi.2023.05.009	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165439045&doi=10.1016%2fj.whi.2023.05.009&partnerID=40&md5=7386027c1b944b03bc7dd7fa558118bb	Objective: Our objective was to identify the individual, interpersonal, community, health-system, and structural factors that influence HIV pre-exposure prophylaxis (PrEP) initiation among cisgender women seeking sexual and reproductive health care in a high HIV prevalence community to inform future clinic-based PrEP interventions. Methods: We collected anonymous, tablet-based questionnaires from a convenience sample of cisgender women in family planning and sexual health clinics in the District of Columbia. The survey used the lens of the socio-ecological model to measure individual, interpersonal, community, institutional, and structural factors surrounding intention to initiate PrEP. The survey queried demographics, behavioral exposure to HIV, perceived risk of HIV acquisition, a priori awareness of PrEP, intention to initiate PrEP, and factors influencing intention to initiate PrEP. Results: A total of 1437 cisgender women completed the survey. By socio-ecological level, intention to initiate PrEP was associated with positive attitudes toward PrEP (odds ratio OR, 1.56; 95% confidence interval CI, 1.13–2.15) and higher self-efficacy (OR, 1.32; 95% CI, 1.02–1.72) on the individual level, perceived future utilization of PrEP among peers and low fear of shame/stigma (OR, 1.65; 95% CI, 1.33–2.04) on the community level, and having discussed PrEP with a provider (OR. 2.39; 95% CI, 1.20–4.75) on the institutional level. Conclusion: Our findings highlight the importance of multilevel, clinic-based interventions for cisgender women, which promote sex-positive and preventive PrEP messaging, peer navigation to destigmatize PrEP, and education and support for women's health medical providers in the provision of PrEP services for cisgender women. © 2023 The Authors	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Scott R.K.; Yu Y.; Marzinke M.A.; Coleman J.S.; Hendrix C.W.; Bies R.	Clinical trial simulation to evaluate tenofovir disoproxil fumarate/emtricitabine HIV pre-exposure prophylaxis dosing during pregnancy	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2023.1224580	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173684859&doi=10.3389%2ffrph.2023.1224580&partnerID=40&md5=cd5d9fcccaca9314ecf74664ce7fde05	Objective: To evaluate upward-adjustment of tenofovir disoproxil fumarate (TDF)/emtricitabine (FTC) pre-exposure prophylaxis (PrEP) dosing during pregnancy in order to maintain target plasma concentrations associated with HIV protection. Design: Population pharmacokinetic (PK) modeling and clinical trial simulation (CTS). Material and methods: We developed population pharmacokinetic models for TFV and FTC using data from the Partners Demonstration Project and a PK study of TDF/FTC among cisgender women by Coleman et al., and performed an in-silico simulation. Pregnancy-trimester was identified as a significant covariate on apparent clearance in the optimized final model. We simulated 1,000 pregnant individuals starting standard daily oral TDF/FTC (300 mg/200 mg) prior to pregnancy. Upon becoming pregnant, simulated patients were split into two study arms: one continuing standard-dose and the other receiving double standard-dose throughout pregnancy. Results: Standard-dose trough TFV concentrations were significantly lower in pregnancy compared to pre-pregnancy, with 34.0%, 43.8%, and 65.1% of trough plasma concentrations below the lower bound of expected trough concentrations presumed to be the protective threshold in the 1st, 2nd, and 3rd trimesters, respectively. By comparison, in the simulated double-dose group, 10.7%, 14.4%, and 27.8% of trough concentrations fell below the estimated protective thresholds in the 1st, 2nd, and 3rd trimesters, respectively. The FTC trough plasma concentration during pregnancy was also lower than pre-pregnancy, with 45.2% of the steady-state trough concentrations below the estimated protective group concentrations of FTC. In the pregnancy-adjusted double-dose group, 24.1% of trough plasma concentrations were lower than protective levels. Conclusions: Our simulation shows >50% of research participants on standard dosing would have 3rd trimester trough plasma TFV concentrations below levels associated with protection. This simulation provides the quantitative basis for the design of prospective TDF/FTC studies during pregnancy to evaluate the safety and appropriateness of pregnancy-adjusted dosing. 2023 Scott, Yu, Marzinke, Coleman, Hendrix and Bies.	clinical trial simulation; emtricitabine; HIV infection; population pharmacokinetic modeling; pre-exposure prophylaxis; pregnancy; tenofovir	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Segal, Kate; Harris, Danielle M; Carmone, Andy; Haddad, Lisa B; Hadigal, Sanjay; Hatzold, Karin; Jones, Chris; Lathrop, Eva; Mason, Jennifer; Mikulich, Meridith	Equipping providers to offer novel MPTs: Developing counseling messages for the Dual Prevention Pill in clinical studies and beyond.	Frontiers in Public Health	-	-	-	-	2673-3153	10.3389/frph.2023.1155948	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10239831	Introduction: The pipeline for multi-purpose prevention technologies includes products that simultaneously prevent HIV, pregnancy and/or other sexually transmitted infections. Among these, the Dual Prevention Pill (DPP) is a daily pill co-formulating oral pre-exposure prophylaxis (PrEP) and combined oral contraception (COC). Clinical cross-over acceptability studies for the DPP require training providers to counsel on a combined product. From February 2021-April 2022, a working group of eight HIV and FP experts with clinical and implementation expertise developed counseling recommendations for the DPP based on existing PrEP/COC guidance. Assessment of policy/guidelines options and implications: The working group conducted a mapping of counseling messages from COC and oral PrEP guidance and provider training materials. Six topics were prioritized: uptake, missed pills, side effects, discontinuation and switching, drug interactions and monitoring. Additional evidence and experts were consulted to answer outstanding questions and counseling recommendations for the DPP were developed. Missed pills was the topic with the most complexity, raising questions about whether women could "double up" on missed pills or skip the last week of the pack to recover protection faster. Uptake required aligning the time to reach protective levels for both DPP components and explaining the need to take DPP pills during week 4 of the pack. The potential intensity of DPP side effects, given the combination of oral PrEP with COC, was an important consideration. Discontinuation and switching looked at managing risk of HIV and unintended pregnancy when stopping or switching from the DPP. Guidance on drug interactions contended with differing contraindications for COC and PrEP. Monitoring required balancing clinical requirements with potential user burden. Actionable recommendations: The working group developed counseling recommendations for the DPP to be tested in clinical acceptability studies. Uptake: Take one pill every day for the DPP until the pack is empty. Days 1-21 contain COC and oral PrEP. Days 22-28 do not contain COC to allow for monthly bleeding, but do contain oral PrEP and pills should be taken to maintain HIV protection. Take the DPP for 7 consecutive days to reach protective levels against pregnancy and HIV. Missed pills: If you miss 1 pill multiple times in a month or 2+ consecutive pills, take the DPP as soon as you remember. Do not take more than 2 pills in a day. If 2+ consecutive pills are missed, only take the last missed pill and discard the other missed pills. Side effects: You may experience side effects when you start using the DPP, including changes to monthly bleeding. Side effects are typically mild and go away without treatment. Discontinuation/switching: If you decide to discontinue use of the DPP, but want to be protected from HIV and/or unintended pregnancy, in most cases, you can begin using PrEP or another contraceptive method right away. Drug interactions: There are no drug-drug interactions from combining oral PrEP and COC in the DPP. Certain medications are not recommended due to their contraindication with oral PrEP or COC. Monitoring: You will need to get an HIV test prior to initiating or restarting the DPP, and every 3 months during DPP use. Your provider may recommend other screening or testing. Discussion: Developing recommendations for the DPP as a novel MPT posed unique challenges, with implications for efficacy, cost, and user and provider comprehension and burden. Incorporating counseling recommendations into clinical cross-over acceptability studies allows for real-time feedback from providers and users. Supporting women with information to use the DPP correctly and confidently is critically important for eventual scale and commercialization. Article	2023	Segosebe, Kebafe; Kirwan, Mitchell; Davis, Kelly Cue	Barriers to Condom Negotiation and Use Among Female Sex Workers in the United States and United States-Mexico Border Cities: A Systematic Review.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04009-z	https://link.springer.com/article/10.1007/s10461-023-04009-z	Despite the effectiveness of male condoms, many Female Sex Workers (FSWs) report using condoms infrequently with multiple clients during sexual activity. As such, inconsistent condom use by FSWs is a public health concern as it can increase STI and HIV transmission. This systematic review synthesized extant evidence regarding barriers to condom use experienced by FSWs in the U.S and U.S. - Mexico border towns. The search was conducted through PubMed, CINAL, Cochrane, Medline, and PsychInfo. Studies were included if: they were conducted in the U.S. or U.S. - Mexico border, their target population was FSWs, they examined condom use barriers experienced by FSWs, and they were published in English between 2011 and February 2021. Condom use barriers among FSWs were reported in all the articles including alcohol consumption and drug use before sex, venue stability, socio-economic status vulnerability, violence and gendered power dynamics, trust of regular clients, and age. The review findings indicate the need to develop interventions promoting condom use for both FSWs and their clients, as well as alternative interventions for HIV prevention such as pre-exposure prophylaxis (PrEP). Article	2023	Sell J.; Chen R.; Huber C.; Parascando J.; Nunez J.	Primary Care Provider HIV PrEP Knowledge, Attitudes, and Prescribing Habits: A Cross-Sectional Survey of Late Adopters in Rural and Suburban Practice	Journal of Primary Care and Community Health	-	-	-	-	21501319	10.1177/21501319221147254	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145956258&doi=10.1177%2f21501319221147254&partnerID=40&md5=ebacb4bc0a5a30ba121e6c91a713c4b2	Objective: Pre-exposure prophylaxis (PrEP) is a recommended strategy for HIV prevention, yet PrEP prescribing rates in primary care remain low. The aim of this study was to further describe the current knowledge, attitudes, and prescribing behaviors of HIV PrEP in primary care providers with a focus on the perceived barriers and facilitators to PrEP prescribing. Methods: Cross-sectional survey of primary care providers at rural and suburban practices in a large academic institution. Results: Survey response rate was 48.0% (n = 134). Most respondents (96.3%) reported little clinical experience in care of persons living with HIV. Respondents self-reported positive attitudes and high overall knowledge of PrEP with low prescribing rates and less comfort with lab testing. More respondents are asked about PrEP by patients (54%) than start conversations about PrEP with patients (39%). Family Physicians and providers 5 to 10 years from completion of training overall reported higher knowledge, attitudes and prescribing behaviors. Lack of PrEP education was identified as the greatest barrier and an electronic medical record order set as the greatest facilitator to prescribing PrEP. Conclusions: With the goal to end the HIV epidemic, PrEP provision in nonurban primary care settings may be an important strategy for increased access to PrEP and reduced HIV transmission. This study, which includes a variety of providers that possess high knowledge, yet low experience prescribing PrEP, likely demonstrates the limitations of interventions which solely focus on provider education. System-based practice solutions, such as order sets, may be needed to target infrequent prescribers of PrEP. © The Author(s) 2023. Article	2023	Sensoy Bahar, Ozge; Nabunya, Proscovia; Nabayinda, Josephine; Witte, Susan; Kiyingi, Joshua; Nsubuga, Edward; Schriger, Simone; Nattabi, Jennifer; Mayo-Wilson, Larissa Jennings; Nakigudde, Janet; Tozan, Yesim; Ssewamala, Fred M.	"I decided in my heart I have to complete the sessions": A qualitative study on the acceptability of an evidence-based HIV risk reduction intervention among women engaged in sex work in Uganda.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0280138	https://pubmed.ncbi.nlm.nih.gov/36634037/	BACKGROUND: The HIV burden remains a critical public health concern and women engaged in sex work WESW are at significantly higher risk compared to the general adult population. Similar to other sub-Saharan African countries, Uganda reports high rates of HIV prevalence among WESW. Yet, they have not been targeted by theory-informed HIV prevention intervention approaches. METHODS: We conducted semi-structured in-depth interviews with 20 WESW upon intervention completion to explore their experiences with an evidence-based HIV risk reduction intervention that was implemented as part of a combination intervention tested in a clinical trial in Uganda (2018-2023). Specifically, we explored their initial motivations and concerns for participating in the intervention, barriers and facilitators to attendance, and their feedback on specific intervention characteristics. RESULTS: The main expectations revolved around access to health-related information, including information on STIs, HIV, and PrEP as well as on how one can protect themselves while engaging in sex work. Initial concerns were around potential breach of confidentiality and fear of arrest. The main facilitators for session attendance were the motivation to learn health-related information, the attitude of facilitators, and the incentives received for participation, whereas main challenges were related to family commitments and work schedules. WESW appreciated the group format of the intervention and found the location and times of the intervention delivery acceptable. DISCUSSION AND CONCLUSIONS: Overall, our findings suggest that the HIV risk reduction intervention was appropriate and acceptable to WESW. Yet, WESW experience unique concerns and barriers that need to be accounted for when designing interventions targeting this population, especially in resource-limited settings where sex work is illegal and highly stigmatized. Article	2023	Serrano, Vanessa B; Moore, David J; Morris, Sheldon; Tang, Bin; Liao, Antony; Hoenigl, Martin	Efficacy of Daily Text Messaging to Support Adherence to HIV Pre-Exposure Prophylaxis (PrEP) among Stimulant-Using Men Who Have Sex with Men	Substance Use & Misuse	-	-	-	-	1082-6084	https://doi.org/10.1080/10826084.2023.2165409	https://escholarship.org/uc/item/6xf8b7r8	Background: Men who have sex with men (MSM) who use stimulants are at increased risk for HIV infection. Adherence to pre-exposure prophylaxis (PrEP) reduces the risk of HIV infection. We evaluated the efficacy of the individualized Texting for Adherence Building (iTAB) intervention for PrEP adherence compared to standard of care (SoC) among 119 MSM who use stimulants (cocaine, methamphetamine and/or other amphetamine) from the California Collaborative Treatment Group 595 randomized control trial.Method: Three ordered levels of PrEP adherence (non-adherence, adequate adherence, and near-perfect adherence) were compared between intervention arms across study visits (weeks 12 and 48) using ordinal logistic regressions.Results: The effect of intervention arm was not significant in the final model; however, there was a 38% decrease in odds (OR = 0.62, p=.023) of having near-perfect adherence (versus non-adherence or adequate adherence) at week 48 compared to week 12, indicating a significant effect of time. In a follow-up analysis examining week 48 only, logistic regression examining PrEP adherence showed that receiving iTAB (compared to SoC) trended toward higher odds of near-perfect adherence relative to adequate adherence (OR = 2.48, p=.061). Higher HIV knowledge resulted in higher odds (OR = 1.72, p=.020) of near-perfect adherence (versus non-adherence or adequate adherence).Conclusion: HIV knowledge may influence PrEP adherence, and most notably, the iTAB intervention may support near-perfect adherence relative to adequate adherence. Article	2023	Sethi A.K.; Haldar P.; Rai S.K.; Kant S.; Rajan S.; Kumar P.; Mishra J.K.; Singh B.	Low awareness but high acceptability of pre-exposure prophylaxis for HIV among men who have sex with men and transgender persons in Delhi, India	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624231174936	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162988272&doi=10.1177%2f09564624231174936&partnerID=40&md5=2cf7636d8b97273f558560dc71efa9b4	Background: HIV pre-exposure prophylaxis (PrEP) is part of India's HIV prevention policy. We aimed to determine awareness of and willingness-to-use PrEP among men-who-have-sex-with-men (MSM) and transgender-persons (TG) in Delhi, India. Methods: A cross-sectional study was conducted at five purposively selected targeted-intervention projects in Delhi. Participants included self-identified MSM/TG aged ≥18 years, with negative/unknown HIV serostatus. A structured interview schedule, developed using formative research, was used. Primary outcomes were awareness of, and willingness-to-use PrEP. Socio-demographic and behaviour variables included age, living situation, education, anal-sex, condom-use and experiences of physical-violence. Determinants of outcome were identified in univariable logistic regression; variables associated at p <.25 were included in multivariable regression models. Results: Of 400 (224 MSM, 176 TG), mean ± SD age 25.7 ± 7.2 years, 14.5% (95% CI 11.0, 18.0) were aware of PrEP, while 63.3% (95% CI: 58.6, 68.1) reported willingness-to-use PrEP. PrEP-awareness was independently associated with formal-education (adjusted odds ratio; AOR = 1.20), professional occupation (AOR = 5.45) and condom-use (AOR = 3.07). Willingness-to-use PrEP was higher if participants had recent anal-sex (AOR = 2.29), had used condoms during anal-sex (AOR = 2.09), or recently experienced physical-violence (AOR = 3.65). Conclusions: PrEP awareness was low, but most were willing to use PrEP, implying that communication is key to PrEP awareness and uptake. © The Author(s) 2023.	acceptability; Awareness; India; men who have sex with men; pre-exposure prophylaxis; prevalence; transgender persons	English	United Kingdom	Western and Central Europe and North America	India	Asia and the Pacific	India	Asia and the Pacific	Quantitative

Person-centered HIV PrEP for cisgender women	Nature Medicine	-	-	-	-	10788956	10.1038/s41591-023-02618-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176460272&doi=10.1038%2fs41591-023-02618-8&partnerID=40&md5=af875e21cc7290e1cb4e73345ef2af76	Two modelling studies offer compelling evidence that less-than-perfect adherence to HIV pre-exposure prophylaxis can still provide reasonable protection for cisgender women — providing optimism for a more person-centered approach and lower discontinuation rates	NA	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Review
Article	2023	Shan, Duo; Xue, Hui; Yu, Fei; Zan, Xingkai; Liu, Hui; Liu, Jiaye; Han, Mengjie; Zhang, Dapeng	Understanding the Uptake and Outcomes of Non-occupational Postexposure Prophylaxis Use Through an Online Medical Platform in China: Web-Based Cross-sectional Study.	Journal of Medical Internet Research	-	-	-	-	1438-8871	10.2196/42729	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10238955	BACKGROUND: To date, non-occupational postexposure prophylaxis (PEP) has been widely accepted as a safe and effective intervention for HIV in many countries, yet it remains an underutilized prevention strategy in China. Evidence indicated a high demand for PEP among Chinese men who have sex with men, but the uptake and access to PEP service remain limited. In an era of rapid development of web-based technology, online medical platforms in China hold great promise in facilitating PEP provision and delivery by addressing problems such as accessibility, convenience, privacy protection, and antidiscrimination by integrating online and offline resources. However, there is a paucity of data concerning the uptake and outcomes of online PEP in China. OBJECTIVE: The aim of this study is to explore online PEP service provision and understand PEP uptake and outcome through a web-based cross-sectional study. METHODS: From January 2020 to June 2021, we conducted a retrospective web-based survey among those seeking online PEP services via the internet medical platform "HeHealth" using a structured questionnaire. Participants were surveyed on sociodemographic characteristics, sexual and drug-related behaviors, history of preexposure prophylaxis (PrEP) usage, and PEP uptake. Statistical analysis included descriptive analysis, chi-square test, and multivariable logistic regression. P values <.05 were deemed statistically significant. RESULTS: No HIV seroconversions were observed among 539 PEP users. Our sample demonstrated that most participants seeking online PEP services were gay (397/539, 73.7%), single (470/539, 87.2%), having an education of more than 12 years (493/539, 91.5%), and with an average monthly income of more than 7000 RMB (1 RMB=US $0.14) or more (274/539, 50.8%). Sexual exposures accounted for 86.8% (468/539) of the cases, with anal sex being the most common indication (389/539, 72.2%) for seeking PEP use. Among 539 participants, 60.7% (327/539) sought online PEP for relatively low-risk exposures, whereas 39.3% (212/539) were considered high-risk exposures. Nearly all (537/539, 99.6%) initiated PEP within 72 hours and 68.6% (370/539) within 24 hours of exposure. All users (539/539) were prescribed a 3-drug regimen, with mostly comprising 3TC/TDF+DTG (lamivudine, tenofovir disoproxil fumarate, and dolutegravir; 293/539, 54.4%), followed by FTC/TDF+DTG (emtricitabine, tenofovir disoproxil fumarate, and dolutegravir; 158/539, 29.3%). The adjusted model showed that greater odds of PrEP usage were associated with an age of 35 years or older versus the age group of 25-34 years (adjusted odds ratio AOR 2.04, 95% CI 1.24-3.37), having an education of 17 years or more versus an education of 12 years or less (AOR 3.14, 95% CI 1.29-7.62), average monthly income of 20,000 RMB or more versus less than 3000 RMB (AOR 2.60, 95% CI 1.09-6.23), and having high-risk sexual behavior during PEP treatment (AOR 2.20, 95% CI 1.05, 3.69). CONCLUSIONS: The 0% infection rate in this study demonstrated that online PEP could be a valuable risk-reduction option to improve HIV prevention service within China. However, further research is needed to better facilitate PrEP transition among online PEP users. Article	2023	Sharma, Akshay; Gandhi, Monica; Sallabank, Gregory; Merrill, Leland; Stephenson, Rob	Perceptions and Experiences of Returning Self-collected Specimens for HIV, Bacterial STI and Potential PrEP Adherence Testing among Sexual Minority Men in the United States.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-022-03846-8	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9466335	Few studies among gay, bisexual and other men who have sex with men (GBMSM) have examined facilitators and barriers to self-collecting specimens for extragenital STI screening, and none have evaluated attitudes towards self-collecting hair samples that can be utilized for PrEP drug level testing to assess adherence. To address this gap, we interviewed 25 sexually active GBMSM who were offered a choice to self-collect and return finger-stick blood samples (for actual HIV testing), pharyngeal swabs, rectal swabs and urine specimens (for actual gonorrhea and chlamydia testing), and hair samples (to visually determine their adequacy for PrEP drug level testing): 11 who returned all, 4 who returned some, and 10 who did not return any. Participants found self-collecting finger-stick blood samples and rectal swabs more challenging than other specimens. Frequently discussed facilitators of return included an opportunity to confirm one's HIV or STI status, limited access to a healthcare provider and a desire to advance research focusing on home-based testing. Commonly cited barriers to return included low self-efficacy pertaining to self-collection and apprehension around the possibility of delay or loss of specimens during transit. Offering additional support such as real-time video conferencing may prove helpful in future field-based research with GBMSM. Article	2023	Sharma, Akshay; Lacombe-Duncan, Ashley; Sallabank, Gregory	HIV and STI Testing Among South Asian Gay, Bisexual, and Other Men Who Have Sex With Men in the United States.	American Journal of Men's Health	-	-	-	-	1557-9891 1557-9883	10.1177/15579883231185240	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10333639/	South Asian gay, bisexual, and other men who have sex with men (GBMSM) in the United States are subsumed under the broad, heterogeneous category of Asian GBMSM in national surveillance systems. Disaggregated data on their rates of HIV and sexually transmitted infection (STI) testing are not publicly reported. This is problematic as the diversity of ancestries, cultures, and customs across subgroups of Asian GBMSM may contribute to differential HIV and STI testing experiences. To address this deficit in knowledge, 115 South Asian GBMSM recruited through social media advertising and peer referral were surveyed about their patterns of HIV and STI testing. In the past 6 months, almost two-thirds (n = 72, 62.61%) had two or more male sex partners, and more than a quarter (n = 33, 28.70%) had condomless anal sex with two or more male partners. In the past year, more than one in four (n = 32, 27.83%) had not been tested for HIV, and more than two in five (n = 47, 40.87%) had not been tested for STIs. The prevalence of past-year HIV and STI testing was lower among participants aged ≥35 years and those who had never used pre-exposure prophylaxis. Participants who were partnered were less likely to have been tested for HIV, and those who were born outside the United States were less likely to have been tested for STIs in the past year. Findings highlight gaps in domestic HIV- and STI-prevention efforts with respect to adequately engaging South Asian GBMSM and suggest that some segments of this subgroup may benefit from targeted outreach. Article	2023	Sharma, I; Hill, A	Global Human Immunodeficiency Virus Incidence Analysis and Implications for Affordability Using Long-Acting Cabotegravir Versus Continuous and Event-Driven Oral Preexposure Prophylaxis	Clinical Infectious Diseases	-	-	1058-4838	10.1093/cid/ciad537	https://academic.oup.com/cid/article/78/2/346/7239103	Background The HIV Prevention Trials Network (HPTN) 083/084 trials showed up to 88% increased efficacy of long-acting cabotegravir (CAB-LA) versus continuous oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC). However, CAB-LA's high price limits the number of people who can be treated within fiscal prevention budgets. Global human immunodeficiency virus (HIV) prevention budgets are highly limited, with TDF/FTC widely available as a low-cost generic. In randomized clinical trials, event-driven TDF/FTC has shown similar preventive efficacy to continuous TDF/FTC. Methods A systematic review of global HIV incidence studies was conducted. Weighted incidence was calculated in each at-risk population. HIV infection rates were evaluated for 5 prevention strategies, with additional CAB-LA scenarios considering reductions in incidence of 66%, 79%, and 88%. Cost-effectiveness was evaluated for CAB-LA, continuous TDF/FTC, and event-driven TDF/FTC. Using weighted incidence and an assumed 100 000 target population, annual HIV infection rates by population were calculated for each prevention strategy. Results Ninety-eight studies in 5,126 100 individuals were included. Incidence per 100 person-years ranged from 0.03 (blood donors) to 3.82 (people who inject drugs). Using the number needed to treat to benefit for each strategy, a mean incidence of 2.6 per 100 person-years in at-risk populations, and a 100 000 target population, current-price continuous CAB-LA cost $949 497 per HIV infection successfully prevented, followed by target-price CAB-LA ($11 653), continuous TDF/FTC ($4231), and event-driven TDF/FTC ($1923).Conclusion High prices of CAB-LA limit southern treatable within fiscal budgets. Low-cost event-driven TDF/FTC consistently prevents the most HIV infections within fiscal budgets. This systematic review and analysis investigated HIV incidence in at-risk populations globally. Analysis of 5 prevention strategies found that, across all populations, event-driven tenofovir/emtricitabine was cheapest per infection prevented, thus could avert more infections within budget, despite a lower number needed to treat to benefit. Article	2023	Sharpe J.D.; Siegler A.J.; Sanchez T.H.; Gaeur J.L.; Sullivan P.S.	Effects of mode of transportation on PrEP persistence among urban men who have sex with men	AIDS Care	-	-	9540121	10.1080/09540121.2021.2121375	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108405442&doi=10.1080%2f09540121.2021.2121375&partnerID=40&md5=ae8fdc6d4a36c3038bbbc7f2ed9b2266	Little is known about the effect of travel-related factors, such as mode of transportation, on retention in PrEP care, or PrEP persistence. We used data from the 2020 American Men's Internet Survey and conducted multilevel logistic regression to estimate the association between mode of transportation used for healthcare and PrEP persistence among urban gay, bisexual, and other men who have sex with men (MSM) in the U.S. MSM using public transportation were less likely to report PrEP persistence (aOR, 0.51; 95% CI: 0.28–0.95) than MSM using private transportation. There were no significant differences between MSM using active transportation (aOR, 0.70; 95% CI: 0.36–1.36) and MSM using private transportation. Transportation-related interventions and policies are needed to address structural barriers to accessing PrEP services and to improve PrEP persistence in urban areas. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Shaw G.; Schaefer R.; Schmidt H.-M.A.; Madden A.; Chang J.; Mozolevska A.; Mutsunga-Rudzve B.; Mangadas Kenneth N.; Vernier A.; Baggaley R.; Rodolph M.; Macdonald V.	Pre-exposure prophylaxis (PrEP) for HIV prevention among people who inject drugs: a global mapping of service delivery	Harm Reduction Journal	-	-	14777517	10.1186/s12954-023-00729-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147939858&doi=10.1186%2fs12954-023-00729-6&partnerID=40&md5=6c21ed1f603cea1698f876d1ea6c9cb4	Background The World Health Organization (WHO) recommends oral pre-exposure prophylaxis (PrEP) for all people at substantial risk of HIV as part of combination prevention. The extent to which this recommendation has been implemented globally for people who inject drugs is unclear. This study mapped global service delivery of PrEP for people who inject drugs. Methods: Between October and December 2021, a desk review was conducted to obtain information on PrEP services for people who inject drugs from drug-user-led networks and HIV, harm reduction, and human rights stakeholders. Websites of organizations involved in HIV prevention or services for people who inject drugs were searched. Models of service delivery were described in terms of service location, provider, and package. Results: PrEP services were identified in 27 countries (15 high-income). PrEP delivery models varied within and across countries. In most services, PrEP was delivered by community-led services without direct links to other harm reduction services. In three countries, PrEP services were also provided at methadone clinics; in 14 countries, PrEP services were provided through community-based models and at clinics. Most services provided condoms, lubricant, and risk reduction counseling alongside PrEP. Conclusions: PrEP is available for people who inject drugs in a minority of countries that inject drugs. There is potential to expand PrEP services for people who inject drugs within harm reduction programs, notably through community-based and peer-led services. PrEP should never be offered instead of evidence-based harm reduction programs for people who inject drugs; however, it could be offered as an additional HIV prevention choice as part of a comprehensive harm reduction program. © 2023, World Health Organization. Pre-exposure prophylaxis uptake concerns in the Democratic Republic of the Congo: Key populations and healthcare workers perspectives	PLOS One	-	-	19526203	10.1371/journal.pone.0286977	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175819872&doi=10.1371%2fjournal.pone.0286977&partnerID=40&md5=09bae2eec9051a7e1641b67a2a6d7	Key populations (KP) in the Democratic Republic of the Congo (DRC), including female sex workers (SW), are disproportionally affected by HIV. Quantitative feedback surveys were conducted at seven health facilities in DRC to the KP clients enrolled in pre-exposure prophylaxis (PrEP) services to measure benefits and risks of the PrEP services. The survey also collected satisfaction with PrEP services and experiences of stigma at the health facilities. Thirty female SW, 30 male sex workers (MSW), and 30 transgender women (TGW) were enrolled in the survey. Most participants (n = 83, 92.2%) identified their primary reason for starting PrEP was fear of side effects (47%) although few KP reported having experienced side effects (14%). 16(78 concerned with clients that experienced and anticipated side effects were a primary PrEP uptake concern, along with costs of clinic visits. Article	2023	Sheth A.N.; Enders K.P.; McCumber M.; Poindu M.A.; Ramakrishnan A.; Seles J.M.	State-level clustering in PrEP implementation factors among family planning clinics in the Southern United States	Frontiers in Public Health	-	-	22962565	10.3389/fpubh.2023.1214411	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85167344729&doi=10.3389%2ffpubh.2023.1214411&partnerID=40&md5=fc1e56bbf75588b9fa8f34a7dfd212ba	Background: Availability of PrEP-providing clinics is low in the Southern U.S., a region at the center of the U.S. HIV epidemic with significant HIV disparities among minoritized populations, but little is known about state-level differences in PrEP implementation in the region. We explored state-level clustering of organizational constructs relevant to PrEP implementation in family planning (FP) clinics in the Southern U.S. Methods: We surveyed providers and administrators of FP clinics not providing PrEP in 18 Southern states (Feb–Jun 2018, N = 414 respondents from 224 clinics) on three constructs: readiness to implement PrEP, PrEP knowledge/attitudes, implementation climate, leadership engagement, and available resources. We analyzed each construct using linear mixed models. A principal component analysis identified six principal components, which were inputted into a K-means clustering analysis to examine state-level clustering. Results: Three clusters (C1–3) were identified with low, three, and four states, respectively. Canonical variable 1 separated C1 and C2 from C3 and was primarily driven by PrEP readiness, HIV-specific implementation climate, PrEP-specific leadership engagement, PrEP attitudes, PrEP knowledge, and general resource availability. Canonical variable 2 distinguished C2 from C1 and was primarily driven by PrEP-specific resource availability, PrEP attitudes, and general implementation climate. All C3 states had expanded Medicaid, compared to 1 C1 state (none in C2). Conclusion: Cosmetics relevant for PrEP implementation exhibited state-level clustering, suggesting that tailored strategies could be leveraged to address state-level factors. Future work should explore the role of Medicaid expansion and other policy factors in PrEP implementation constructs. The role of Medicaid expansion and state-level policies in PrEP implementation warrants further exploration. Article	2023	Shibesh, Birkeyesh Fromhane; Admas, Angaw Bitew; Lake, Amanvich Woodie; Getu, Samuel Belikadie; Worede, Daniel Tsegaye	Uptake of retrovirol pre-exposure prophylaxis and its associated factors among female sex workers, Northwest Ethiopia.	AIDS Research and Therapy	-	-	1742-6405	10.1186/s12981-023-00573-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10026696/	BACKGROUND Pre-exposure prophylaxis is the use of antiretroviral medications by HIV-negative individuals to prevent infection before exposure. Ethiopia has made progress in reducing new HIV infections, but the burden remains high with ongoing challenges in prevention uptake. This study examined the utilization and factors associated with pre-exposure prophylaxis among female sex workers. METHODS: A community-based cross-sectional study design was conducted in Bahir Dar city administrations among female sexual workers in 2022. The variables were collected using a pre-tested and structured questionnaire. Epi data for data entry and social package for social science for analysis were used. RESULT: Overall, 15.9% (CI: 12.8-21.1) of female sexual workers received pre-exposure prophylaxis. Parental living condition (only father alive AOR = 0.23, 95% CI, 0.02-0.64; only mother alive AOR = 0.31, 95% CI, 0.02-0.74), marital status being single (AOR = 0.27, 95% CI, 0.04-0.94), having history of STI (AOR = 2.82, 95% CI, 1.60-4.75) were associated with pre-exposure prophylaxis uptake. CONCLUSION: This study showed low pre-exposure prophylaxis uptake. The study identified a lack of awareness, parental living condition, marital status, and history of STI as associated factors. To increase pre-exposure prophylaxis uptake and reduce HIV infection, 95% awareness campaign, tailored support, targeted interventions, and collaboration with key groups are needed. Article	2023	Shipton L.; Gu F.; Scofori T.; Marvin C.	Missed Opportunities for HIV Testing and PrEP Education in a High-risk Population at a Safety-net Health Care System	Journal of Health Care for the Poor and Underserved	-	-	1049duplicate2023	10.1353/hpu.2023.0007	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148707718&doi=10.1353%2fhpu.2023.0007&partnerID=40&md5=802a3c0fd311c2a02dcd5f458e8188a3	The U.S. Ending the HIV Epidemic initiative was launched in 2019 with the goal of reducing new HIV infections by 90% by 2030. In this retrospective chart review in 2019, we determined the incidence of HIV testing and PrEP prescribing practices without known HIV+ who were diagnosed with gonorrhea or chlamydia in a safety-net health care system. Results showed 50% of patients were screened for HIV, and chlamydia tests had a follow-up HIV test within 90 days and 19% of individuals testing positive for gonorrhea received PrEP education within 180 days. Initial care in an emergency department and female gender were associated with a lower likelihood of follow-up HIV testing and PrEP counseling. There are missed opportunities to offer HIV testing and PrEP education to those at risk of HIV acquisition. © McHenry Medical College. Article	2023	Silva-Sánchez C.A.; Castillo V.P.	Intention to use pre-exposure prophylaxis in men who have sex with men in Chile: a view from the planned behavior theory; Intención de uso de la profilaxis pre-exposición en hombres que tienen sexo con hombres en Chile: una mirada desde la teoría del comportamiento planificado	Salud, Ciencia y Tecnologia	-	-	27969711	10.56294/saludcyt2023671	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182859616&doi=10.56294%2fsaludcyt2023671&partnerID=40&md5=93dc811a7970823276c99e0b7e4b6ddb	Introduction: pre-exposure prophylaxis (PrEP) effectively prevents HIV in men who have sex with men (MSM). Chile recently incorporated PrEP as a strategy against HIV/AIDS. Despite its effectiveness, worldwide PrEP uptake among MSM is low. The theory of planned behavior (TPB) is one of the most popular psychosocial models used to predict behavior. Objective: to predict the intention to use PrEP among MSM using the TPB in Chile. Methods: 183 MSM were recruited online. The TPB constructs (attitude, subjective norms, behavioral control, and intention to use) were measured in addition to knowledge variables, sociodemographic aspects, and sexual risk behaviors. We use linear regression models to analyze the influence of these variables. Results: the perception of favorable social norms (B=0.356 p<0.03), higher perception of behavioral control (B=0,4 p<0,01), and positive PrEP attitudes (B=0,189 p<0,01) were significantly related to intention to use PrEP. Knowledge, sociodemographic, sexual risk behaviors, and sociodemographic variables were not associated with intention to use PrEP. Conclusion: the TPB contributes to understanding the intention to use PrEP in MSM in Chile. © 2023. Los autores. Article	2023	Silvestri, Francesca; Alvarez, Natalie; Omara Afzal; Urbina, Antonio E; Dolan, Siobhan M; Andres Ramirez Zamudio	Training obstetrician gynecologists in HIV PrEP (pre-exposure prophylaxis): a 2-year experience	Sexually Transmitted Infections	-	-	13684973	10.1136/sextrans-2022-055691	https://www.proquest.com/scholarly-journals/training-obstetrician-gynecologists-hiv-prep-pre/docview/2893834572/se-2?accountid=9113	Objective/We aimed to evaluate the efficacy of PrEP (pre-exposure prophylaxis) training sessions for OBGYN (obstetrician gynaecologist) providers given underutilisation of PrEP among women despite a high HIV burden.MethodsThree separate training sessions were held for providers in the OBGYN department at an academic medical centre in New York City from 2019 to 2021. The 1-hour training sessions were conducted by HIV specialists as in-person lectures or online live lectures. Participants were surveyed after the training on metrics of PrEP awareness, knowledge and comfort with management. Two-sample t tests were used to compare differences in proportions of binomial variables and differences in means of Likert-scored answers pertaining and post-training exam.ResultsFifteen respondents completed the survey in 2019, 11 in 2020 and 12 in 2021. Before the training, 40% (n=12) of participants were aware of PrEP, 20% (n=6) were comfortable prescribing it and 0% (n=0) had ever prescribed it. After the training, there was an increase in understanding the epidemiology of HIV transmission (40% to 97%, p<0.00), familiarity with the PrEP clinical trials (30% to 97%, p<0.00), comfort in determining PrEP candidacy (mean score 2.3 to 4.1, p<0.00) and comfort prescribing PrEP (mean score 2.0 to 3.6, p<0.00). After the trainings, the majority of participants reported feeling 'comfortable' or 'very comfortable' in determining PrEP candidacy and prescribing PrEP with follow-up.ConclusionsImplementation of PrEP training courses for OBGYN providers increases confidence for PrEP and providing PrEP with follow-up and knowledge and comfort in identifying and managing patients who may benefit from PrEP services. Increasing training among OBGYN providers serving women at risk for HIV infection is an effective tool to narrow gaps in PrEP access. Article	2023	Simmons K.; Fitzpatrick C.; Richardson D.	Sexually transmitted infection testing and prevalence among MSM using event-based dosing HIV pre-exposure prophylaxis	Sexual Health	-	-	14485928	10.1071/SH22192	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152935378&doi=10.1071%2fSH22192&partnerID=40&md5=223e6aeeee0f9e2ad7d1a0f6aa0f9579	Event-based dosing (EBD) of HIV PrEP is as effective at preventing HIV transmission in MSM as daily dosing. There are limited data on the differences in STI testing frequency between MSM using EBD-PrEP and daily dosing. A total of 20% of 418 PrEP users were using EBD-PrEP and had a lower number of sexual partners (22 (27%) v. 162 (42%), P = 0.02) but were STIs less frequently (118 (18%) v. 69 (50%), P < 0.001), but were diagnosed with a similar number of STIs (0.95% vs 54%, P = 0.54) compared to daily users. More research is needed to understand the optimal frequency for STI testing in MSM using EBD PrEP. © 2023 The Author(s). Article	2023	Simon K.A.; Hanna-Walker V.; Clark A.N.; Driver R.; Kalinowski J.; Watson R.J.; Eaton L.A.	"This Is To Help Me Move Forward": The Role of PrEp in Harnessing Sex Positivity and Empowerment Among Black Sexual Minority Men in the Southern United States	Journal of Sex Research	-	-	224499	10.1080/00224499.2022.2131704	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146946263&doi=10.1080%2f00224499.2022.2131704&partnerID=40&md5=f8c4fa40b8b1b865a94ec2a4d6b328a4	In the United States (U.S.), Black sexual minority men (BSMM) are disproportionately burdened by HIV. Prevention advances, such as HIV pre-exposure prophylaxis (PrEP), play a key role in reducing HIV transmission and improving our understanding of sexual expression and health. Despite these advances, little is known regarding the potential link between PrEP use and sex positivity, including the benefits that BSMM see in accessing PrEP. We conducted a thematic analysis of 32 interviews with BSMM in the Southern U.S. regarding their PrEP beliefs. We developed five themes: (1) Sexual freedom, (2) Agency and empowerment, (3) Making PrEP normative, (4) Behavioral health practices, and (5) Committed relationship tensions. Our findings suggest that BSMM are increasingly concerned about freedom of choice and invested in sexual empowerment as related to their PrEP use. Further, unanticipated benefits, community support, and relationship tensions are salient factors in considerations of PrEP use among BSMM. PrEP may be a harm reduction option for how we might understand a broader movement toward sexual empowerment and positivity, and the pivotal role that PrEP serves in this movement. © 2022 The Society for the Scientific Study of Sexuality. Article	2023	Simon, Lesley; Jackson, Tyrik; King, William; Beals, Dean; Washington, Tabitha; Miller, Matthew; Pogreszewski, Stan	FADE OUT HIV: An Educational Intervention Allying Black Community Barbers, Their Clients, and Community Clinicians.	Journal of Continuing Medical Education	-	-	2833-8073	10.1080/28338073.2023.2269674	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10558629/	Black individuals in the United States are less likely to use medication to prevent HIV (pre-exposure prophylaxis, or PrEP) than White individuals and are significantly more likely to receive a new HIV diagnosis. Because of America's long history of unethical medical and research practices and ongoing prejudice and bias, Black Americans have mistrust towards the medical community. This distrust, along with the social determinants of health, leads to low participation in health care. Health interventions at culturally "safe" and familiar venues are a popular strategy to engage Black Americans in health care. In the United States, approximately 18 Black barbershops in the Black community and the ability of barbers/stylists as a venue for delivering interventions has been documented. We describe FADE OUT HIV, a program designed to increase barbers/knowledge of prevalence of HIV in the Black community; facilitate/discussions between Black barbers and their Black clients about HIV/exposure, prevention, and treatment; provide free HIV tests forbarbers' clients; and educate community clinicians on live andshadowing webcasts about HIV prevention and treatment. Clinician educators were designed to facilitate HIV screening and ensure that the barber clients would be referred to clinicians who were knowledgeable about HIV. The learning objectives of the education were focused on barriers that prevent HIV screening and PrEP prescription and strategies to overcome these barriers, monitoring recommendations for people using PrEP, the benefits and limitations of new and in-development PrEP, and the importance of rapid and PrEP initiation and retention in HIV care. As a result of this programme, 308 HIV tests were administered to barber clients at hosted events in Los Angeles and clinician knowledge and competence increased by 33% and 34%, respectively.	disparities, HIV, barber, Black men, pre-exposure prophylaxis, PrEP, testing	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2023	Singh, Yvona Devi; Singh, Vijay Kumar; Dahanwal, Sanjay J.	Utilization of Chemometric-Aided UV Spectrophotometric Methods for Concurrent Assessment of Emtricitabine, Tenofovir Disoproxil Fumarate, Elvitegravir, and Cobicistat in Tablet Formulation.	Journal of AOAC International	-	-	1944-7922 1060-3271	10.1093/jaoacint/qsad067	https://pubmed.ncbi.nlm.nih.gov/37289523/	BACKGROUND Emtricitabine (ETC), tenofovir disoproxil fumarate (TNF), elvitegravir (EVG), and cobicistat (CBI) are antiviral drugs used to treat human immunodeficiency virus (HIV) infections. OBJECTIVE: To develop chemometric-aided UV spectrophotometric methods for concurrent estimation of the aforementioned drugs used to treat HIV. This method can be used to reduce modification of the calibration model by assessing the absorbance at various points in the zero-order spectra within the selected wavelength range. Additionally, it eliminates interfering signals and provides sufficient sensitivity and selectivity. METHODS: The zero-order UV, first-order derivative, and ratio first-order derivative spectrophotometric methods, namely, absorbance, first derivative, and ratio first derivative methods, were established for the concurrent assessment of EVG, CBI, TNF, and ETC in tablet formulations. The proposed methods were applied to decrease complexity of overlapped spectra (e.g., spectral interference) to maximize sensitivity and the lowest error. These approaches were performed in accordance with International Council on Harmonization (ICH) criteria and compared to the reported HPLC method. RESULTS: The proposed methods were used to measure EVG, CBI, TNF, and ETC in the ranges of 3.38, 3.30, 5.50, and 5.70 μg/mL, respectively, with an excellent correlation coefficient (≥ 0.998). The accuracy and precision results were found to be within the acceptable limits. No statistical difference was observed between the proposed and reported studies. CONCLUSION: The chemometric-aided UV spectrophotometric approaches could be considered as alternatives to chromatographic procedures in the pharmaceutical industry for routine analysis and testing of readily accessible commercial formulations. HIGHLIGHTS: Novel chemometric-assisted UV spectrophotometric techniques were developed for assessment of multicomponent antiviral combinations in single-tablet formulations. The proposed methods were performed without using harmful solvents, tedious preparation, or expensive instruments. The proposed methods were compared statistically with a reported HPLC method. Assessment of EVG, CBI, TNF, and ETC was performed without interference from excipients in their multicomponent formulations. Article	2023	Sismayr T.; Nhamo D.; Chatora K.; Chapwanya G.; Mevoyo T.; Ncube G.; Bruno C.; Harris E.L.; Skelley K.D.	Early implementation learnings on acceptability and feasibility of "V": a multi-level PrEP intervention designed with and for adolescent girls and young women in Zimbabwe	Health Research Policy and Systems	-	-	14784505	10.1186/s12961-023-01040-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85172969398&doi=10.1186%2fs12961-023-01040-3&partnerID=40&md5=c19a2fc13fc1554535f9e8516a926e4bi	Introduction: Adolescent girls and young women (AGYW) remain disproportionately affected by HIV in Zimbabwe. Several HIV prevention options are available, including oral tenofovir-based pre-exposure prophylaxis (PrEP), but uptake and use among AGYW remain suboptimal. Implementation of the "V" intervention, a multi-level PrEP intervention for AGYW, began in 2021. This study characterizes early learnings from implementing a multi-level intervention consisting of fashionable branding (including a "V Starter Kit"), service integration, and peer-education and support throughout a young women's journey using oral PrEP across four phases of implementation, from creating demand, preparing for PrEP, initiation of PrEP, and adherence to PrEP. Methods: A mixed methods implementation research study was undertaken, including site observations and interviews to assess the acceptability of "V" and its relevance to target users, as well as the feasibility of integrating "V" with existing service delivery models. Interviews (n = 46) were conducted with healthcare workers, Brand Ambassadors, and young women purposively sampled from four implementation sites. Interview data was analyzed thematically using the framework method for qualitative data management and analysis. Project budgets and invoices were used to compile unit cost and procurement data for all "V" materials. Results: "V" was acceptable to providers and young women due to attractive branding coupled with factual and thought-provoking messaging, establishing "a girl code" for discussing PrEP, and addressing a gap in contraceptive services. The "V" model was feasible to implement, although challenges were encountered with stock-outs of "V" materials and integrating "V" with existing services essential. FAQ insert, gift case, makeup bag, reminder sticker – were 83.61 per AGYW initiated on PrEP. Conclusions: "V" is a novel approach that is an acceptable and feasible multi-level intervention to improve PrEP access, uptake, and continuation among AGYW, which works through empowering AGYW to take control of their HIV prevention needs. In considering "V" for scale up in Zimbabwe, higher volume procurement and a customized lighter package of "V" materials, while still retaining V's core approach, should be explored. © 2023, BioMed Central Ltd., part of Springer Nature. Article	2023	Skinner A.; Stein M.D.; Dean L.T.; Oldenburg C.E.; Mimiaga M.J.; Chan P.A.; Mayer K.H.; Rudman J.	Same-Sex Marriage Laws, Provider-Patient Communication, and PrEP Awareness and Use Among Gay, Bisexual, and Other Men Who have Sex with Men in the United States	AIDS and Behavior	-	-	10907165	10.1007/s10461-022-03923-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141716327&doi=10.1007%2fs10461-022-03923-y&partnerID=40&md5=2152f65c660fa85a792fa3b2f6fb7d3f	State-level structural stigma and its consequences in healthcare settings shape access to pre-exposure prophylaxis (PrEP) for HIV prevention among gay, bisexual, and other men who have sex with men (GBMSM). Our objective was to assess the relationships between same-sex marriage laws, a measure of structural stigma at the state level, provider-patient communication about sex, and GBMSM awareness and use of PrEP. Using data from the Fenway Institute's MSM Internet Survey collected in 2013 (N = 2290), we conducted modified Poisson regression analyses to evaluate associations between same-sex marriage legality, measures of provider-patient communication, and PrEP awareness and use. Living in a state where same-sex marriage was legal was associated with PrEP awareness (aPR 1.27; 95% CI 1.14, 1.41), as were feeling comfortable discussing with primary care providers that they have had sex with a man (aPR 1.63; 95% CI 1.46, 1.82), discussing with their primary care provider ways to prevent sexual transmission of HIV (aPR 1.39; 95% CI 1.26, 1.54). Each of these three measures of provider-patient communication were additionally associated with PrEP awareness and use. In sum, structural stigma was associated with reduced PrEP awareness and use. Policies that reduce stigma against GBMSM may help to promote PrEP and prevent HIV transmission. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. "It will not be easy to accept": Parents conflicting attitudes towards pre-exposure prophylaxis for HIV prevention amongst adolescent girls and young women	Research in Social and Administrative Pharmacy	-	-	-	-	15517411	10.1016/j.sapharm.2022.10.008	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144084777&doi=10.1016%2fj.sapharm.2022.10.008&partnerID=40&md5=9ecd8c3d7a2896a5672dc5ac9ea57beb	Background: Pre-exposure prophylaxis, or PrEP, is a pill that has been hailed as a 'game changer' for HIV prevention, based on the belief it provides adolescent girls and young women (AGYW) with a level of user-control. However, engagement with PrEP is often dependent on societal factors, such as social attitudes towards gender, sexuality, and PrEP. As parents' communication on sexual and reproductive health issues with AGYW are central to HIV prevention, it is critical to explore how parents talk and think about PrEP. Objective: To examine parental attitudes towards PrEP for HIV prevention amongst adolescent girls and young women in eastern Zimbabwe. Method: A qualitative interview study with 14 parents from two districts in Manicaland, eastern Zimbabwe. Interviews were transcribed, translated, and subjected to thematic network analysis. The concept of 'attitudes' steered the analytical work. Results: Parents' attitudes towards PrEP are conflictual, multi-layered, and contingent on the context in which they reflect and talk about PrEP. While parents aspired to be supportive of innovative HIV prevention methods and wanted to see girl-children protected from HIV, they struggled to reconcile this positive and accepting attitude towards PrEP with traditional 'good girl' notions, which stigmatize pre-marital sex. Although a few parents articulated an acceptance of PrEP use amongst their daughters, for many this was simply not possible. Many parents thus co-produce public gender orders that prevent adolescent girls and young women from engaging with PrEP. Conclusions: While parents' conflicting attitudes towards PrEP may provide spaces and opportunities for change, harmful gender norms and negative attitudes towards PrEP must be addressed at a community and cultural level. Only then can parents and their children have productive conversations about sexual health. © 2022 The Authors	AGYW; Parental attitudes; PrEP; Sexuality stigma; Zimbabwe	English	United States	Western and Central Europe and North America	Denmark	Western and Central Europe and North America	Denmark	Western and Central Europe and North America	Qualitative
Article	2023	Slama L.; Porcher R.; Linard F.; Chakvetadze C.; Cros A.; Carillon S.; Gallardo L.; Viard J.-P.; Molina J.-M.	Injectable long acting antiretroviral for HIV treatment and prevention: perspectives of potential users	BMC Infectious Diseases	-	-	-	-	14712334	10.1186/s12879-023-08071-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148372157&doi=10.1186%2fs12879-023-08071-9&partnerID=40&md5=679fdc451981c2d02e808f584a5585b6	Background: The use of long acting injectable (LAA) antiretroviral drugs may be an alternative option for HIV treatment and prevention. Our study focused on patient perspectives to understand which individuals, among people with HIV (PWH) and pre-exposure prophylaxis (PrEP) users, would constitute the preferential target for such treatments in terms of expectations, tolerability, adherence and quality of life. Methods: The study consisted in one self-administrated questionnaire. Data collected included lifestyle issues, medical history, perceived benefits and inconveniences of LAA. Groups were compared using Wilcoxon rank tests or Fisher's exact test. Results: In 2018, 100 PWH and 100 PrEP users were enrolled. Overall, 74% of PWH and 89% of PrEP users expressed interest for LAA with a significantly higher rate for PrEP users (p = 0.001). No characteristics were associated with acceptance of LAA in both groups in term of demographics, lifestyle or comorbidities. Conclusion: PWH and PrEP users expressed a high level of interest in LAA, since a large majority seems to be in favor of this new approach. Further studies should be conducted to better characterize targeted individuals. © 2023, The Author(s). Article	2023	Smit, Frerik; Masvawure, Tsitsi B.	Barriers and Facilitators to Acceptability and Uptake of Pre-Exposure Prophylaxis (PrEP) Among Black Women in the United States: a Systematic Review.	Journal of Racial and Ethnic Health Disparities	-	-	-	-	2196-8837	10.1007/s40615-023-01729-9	https://pubmed.ncbi.nlm.nih.gov/37531021/	OBJECTIVES: Pre-exposure prophylaxis (PrEP) provides a salient avenue to address the profound HIV-related health disparities that Black women in the United States face. This systematic review assessed the acceptability of PrEP within this population, and identified barriers and facilitators to its acceptability and uptake. METHODS: We searched PubMed and Web of Science using 48 search input combinations; this produced 338 unique articles, 16 of which were included in the review. RESULTS: We analyzed the results using the socio-ecological model (SEM). Findings indicate generally positive attitudes towards PrEP among Black women, although acceptance levels vary widely. Individual-level barriers included inadequate levels of PrEP awareness and knowledge, low HIV-risk perception, and concerns about adherence and side effects; interpersonal-level barriers were the influence of sexual and romantic partners and stigma from family; societal-level barriers included lack of PrEP marketing towards Black women, medical mistrust, cost, and structural violence. The main facilitators at the individual-level were PrEP education and information; at the interpersonal-level, distrust in sexual partners, healthcare provider encouragement, and social support; at the societal-level, PrEP accessibility, and affordability. No community-level barriers or facilitators were identified. CONCLUSIONS: PrEP should be marketed directly to Black women in the US and campaigns should highlight this medication's effectiveness, accessibility, affordability, and safety. Medical mistrust must also be addressed to enable Black women to feel comfortable following their healthcare providers' advice regarding PrEP. Article	2023	Smith A.K.J.; Lancaster K.; Rhodes T.; Holt M.	Dosing practices made mundane: Enacting HIV pre-exposure prophylaxis adherence in domestic routines	Sociology of Health and Illness	-	-	-	-	1419889	10.1111/1467-9566.13687	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163086056&doi=10.1111%2f1467-9566.13687&partnerID=40&md5=ac0a339f4ac542ea527ec71630c1fb50	Maintaining routines of medication dosing requires effort amidst the variabilities of everyday life. This article offers a sociomaterial analysis of how the oral HIV prevention regimen, pre-exposure prophylaxis (PrEP), is put to use and made to work, including in situations which disrupt or complicate dosing regimes. Other than a daily pill, PrEP can be taken less frequently based on anticipated sexual activity and HIV risk, including 'on-demand' and 'periodic' dosing. Drawing on 40 interviews with PrEP users in Australia in 2022, we explore PrEP and its dosing as features of assemblages in which bodies, routines, desires, material objects and the home environment interact. Dosing emerges as a practice of coordination involving dosette boxes, blister packs, alarms, partners, pets, planning sex, routines and domestic space, and as an effect of experimentations with timing to suit life circumstances and manage side effects. Dosing is materialised in the mundane; a practice that is made to work, as well as domesticated, in its situations. Although there are no 'simple' solutions to adherence, our analysis offers practical insights into how routine, planning and experimentation come together to capacitate PrEP to work in people's lives, in sometimes unexpected ways, including through adaptations of PrEP dosing. © 2023 The Authors. Article	2023	Smith, Ariel U.; Khawly, Gabriella M.; Jann, Janna; Zetina, Ana Paola Mata; Padilla, Janeth; Schnall, Rebecca	A Review of Serious Gaming as an Intervention for HIV Prevention.	Current HIV/AIDS Reports	-	-	-	-	1548-3576 1548-3568	10.1007/s11904-023-00659-9	https://pubmed.ncbi.nlm.nih.gov/37213045/	PURPOSEOF REVIEW: Young people face the highest number of new HIV infections globally. With today's increasing access to smartphones, serious games have been viewed as an effective means of improving knowledge and behavioral outcomes. This systematic review describes current HIV prevention serious games and their relationship with HIV-related knowledge and behavioral outcomes. RECENT FINDINGS: A search of HIV prevention serious games was conducted using PubMed, CINAL, IEEE, Web of Science, and Google Scholar. A total of 31 papers were identified, which consist of 20 studies and 11 protocols. Results for knowledge, attitudes, intentions, and behaviors were mixed. Two interventions reported improvement in PrEP usage and optimal dosing. Gaming appears to be a viable and engaging method to improve knowledge, attitudes, and behavioral outcomes to promote HIV prevention among diverse groups of adolescents and young adults globally. However, additional research is needed to understand how to implement this modality effectively. Article	2023	Smith, Jennifer; Bansi-Matharu, Loveleen; Cambiano, Valentina; Dimitrov, Dobromir; Bershteyn, Anna; van de Vijver, David; Kripke, Katharine; Revill, Paul; Boily, Marie-Claude; Meyer-Rath, Gesine; Taramusi, Isaac; Lundgren, Jens D; van Oosterhout, Joep J; Kuritzkes, Daniel; Schaefer, Robin; Siedner, Mark J; Schapiro, Jonathan; Delany-Moretlwe, Sinead; Landovitz, Raphael J; Flexner, Charles; Jordan, Michael; Venter, Francois; Radebe, Mopo; Ripin, David; Jenkins, Sarah; Resar, Danielle; Amole, Carolyn; Shahmanesh, Maryam; Gupta, Ravindra K; Raizes, Elliot; Johnson, Cheryl; Inzaule, Seth; Shafer, Robert; Warren, Mitchell; Stansfield, Sarah; Paredes, Roger; Phillips, Andrew N	Predicted effects of the introduction of long-acting injectable cabotegravir pre-exposure prophylaxis in sub-Saharan Africa: a modelling study	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(22)00365-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148354881&doi=10.1016%2fS2352-3018%2822%2900365-4&partnerID=40&md5=46bb2cdb64e5bf928856d6113c828100	Background: Long-acting injectable cabotegravir pre-exposure prophylaxis (PrEP) is recommended by WHO as an additional option for HIV prevention in sub-Saharan Africa, but there is concern that its introduction could lead to an increase in integrase-inhibitor resistance undermining treatment programmes that rely on dolutegravir. We aimed to project the health benefits and risks of cabotegravir-PrEP introduction in settings in sub-Saharan Africa. Methods: With HIV Synthesis, an individual-based HIV model, we simulated 1000 setting-scenarios reflecting both variability and uncertainty about HIV epidemics in sub-Saharan Africa and compared outcomes for each with and without cabotegravir-PrEP introduction. PrEP use is assumed to be risk-informed and to be used only in 3-month periods (the time step for the model) when having condomless sex. We consider three groups at risk of integrase-inhibitor resistance emergence: people who start cabotegravir-PrEP after (unknowingly) being infected with HIV, those who seroconvert while on PrEP, and those with HIV who have residual cabotegravir drugs concentrations during the early tail period after recently stopping PrEP. We projected the outcomes of policies of cabotegravir-PrEP introduction and of no introduction in 2022 across 50 years. In 50% of setting-scenarios we considered that more sensitive nucleic-acid-based HIV diagnostic testing (NAT), rather than regular antibody-based HIV rapid testing, might be used to reduce resistance risk. For cost-effectiveness analysis we assumed in our base case a cost of cabotegravir-PrEP drug to be similar to oral PrEP, resulting in a total annual cost of USD$144 per year ($114 per year and $264 per year considered in sensitivity analyses), a cost-effectiveness threshold of $500 per disability-adjusted life years averted, and a discount rate of 3% per year. Findings: Reflecting our assumptions on the appeal of cabotegravir-PrEP, its introduction is predicted to lead to a substantial increase in PrEP use with approximately 2·6% of the adult population (and 46% of those with a current indication for PrEP) receiving PrEP compared with 1·5% (28%) without cabotegravir-PrEP introduction across 20 years. As a result, HIV incidence is expected to be lower by 29% (90% range across setting-scenarios 6–52%) across the same period compared with no introduction of cabotegravir-PrEP. In people initiating antiretroviral therapy, the proportion with integrase-inhibitor resistance after 20 years is projected to be 1·7% (0–6·4%) without cabotegravir-PrEP introduction but 13·1% (4·1–30·9%) with. Cabotegravir-PrEP introduction is predicted to lower the proportion of all people on antiretroviral therapy with viral loads less than 1000 copies per mL by 0·9% (–2·5% to 0·3%) at 20 years. For an adult population of 10 million an overall decrease in number of AIDS deaths of about 4540 per year (–13 000 to –300) across 50 years is predicted, with little discernible benefit with NAT when compared with standard antibody-based rapid testing. AIDS deaths are predicted to be averted with cabotegravir-PrEP introduction in 99% of setting-scenarios. Across the 50-year time horizon, overall HIV programme costs are predicted to be similar regardless of whether cabotegravir-PrEP is introduced (total mean discounted annual HIV programme costs per year across 50 years is $151·3 million vs $150·7 million), assuming the use of standard antibody testing. With antibody-based rapid HIV testing, the introduction of cabotegravir-PrEP is predicted to be cost-effective under an assumed threshold of $500 per disability-adjusted life year averted in 82% of setting-scenarios at the cost of $144 per year, in 52% at $264, and in 87% at $114. Interpretation: Despite leading to increases in integrase-inhibitor drug resistance, cabotegravir-PrEP introduction is likely to reduce AIDS deaths in addition to HIV incidence. Long-acting cabotegravir-PrEP is predicted to be cost-effective if delivered at similar cost to oral PrEP with antibody-based rapid HIV testing. Article	2023	Smith, Philip John; Daniels, Joseph; Bekker, Linda-Gail; Medina-Marino, Andrew	What motivated men to start PrEP? A cross-section of men starting PrEP in Buffalo city municipality, South Africa.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-023-15306-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9979577	BACKGROUND: Compared to women, South African men are less likely to know their HIV status (78% vs. 89%), have suppressed viral loads (82% vs. 90%), or access HIV prevention services. To achieve epidemic control where heterosexual sexual behavior drives transmission, interventions to improve the uptake of HIV testing services (HTS) and prevention services must also target cis-gendered, heterosexual men. There is limited understanding of these men's needs and wants with regards to accessing pre-exposure prophylaxis (PrEP). METHODS: Adult men (≥ 18 years) from a peri-urban community in Buffalo City Municipality were offered community-based HTS. Those who received a negative HIV test result were offered community-based, same-day oral PrEP initiation. Men initiating PrEP were invited to participate in a study exploring men's HIV prevention needs and reasons for initiating PrEP. An in-depth interview guide, developed using the Network-Individual-Resources model (NIRM), explored men's perceived HIV acquisition risk, prevention needs, and preferences for PrEP initiation. Interviews were conducted by a trained interviewer in isiXhosa or English, audio-recorded and transcribed. Thematic analysis was used, guided by the NIRM to generate findings. RESULTS: Twenty-two men (age range 18-57 years) initiated PrEP and consented to study participation. Men reported elevated HIV acquisition risk associated with alcohol use and condom-less sex with multiple partners as facilitators driving PrEP initiation. They anticipated social support from family members, their main sexual partner and close friends for their PrEP use, and discussed other men as important sources of support for PrEP initiation. Nearly all men expressed positive views of people using PrEP. Participants believed HIV testing would be a barrier for men interested in accessing PrEP. Men recommended that access to PrEP be convenient, rapid, and community-based (i.e., not clinic-based). DISCUSSION: Self-perceived risk for HIV acquisition was a major facilitator for men's PrEP initiation. Although men expressed positive perceptions of PrEP users, they noted that HIV testing may be a barrier to PrEP initiation. Finally, men recommended convenient access points to facilitate PrEP initiation and sustained use. Gender-responsive interventions tailored to men's needs, wants, and voices will facilitate their uptake of HIV prevention services, and help to end the HIV epidemic. Important steps for PrEP uptake among adolescent men who have sex with men and transgender women in Brazil	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0281654	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151808001&doi=10.1371%2fjournal.pone.0281654&partnerID=40&md5=a3578e96409941d4dd882e56e03447e5	HIV Pre-exposure prophylaxis (PrEP) is an effective prevention tool, but there are still few studies about PrEP uptake among adolescents. We aimed to analyze the PrEP uptake process and factors associated with daily oral PrEP initiation among adolescent men who have sex with men (aMSM) and transgender women (aTGW) in Brazil. Baseline data from the first demonstration PrEP cohort study among aMSM and aTGW 15–19 years old (yo) ongoing in three large Brazilian cities (PrEP1519). After completing informed consent procedures, participants were enrolled in the cohort from February/2019 to February/2021. A socio-behavioral questionnaire was applied. Factors associated with PrEP initiation were assessed using a logistic regression model with adjusted prevalence ratios (aPR) and 95% confidence intervals (95%CI). Among recruited participants, 174 (19,2%) were aged 15–17 yo and 734 (80,8%) 18–19 yo. The rate of PrEP initiation was 78.2% and 77.4% for 15–17 yo and 18–19 yo, respectively. Factors associated with PrEP initiation were: black or mixed race (aPR 2.31; 95%CI: 1.10–4.84) among the younger adolescents 15–17 yo; experienced violence and/or discrimination due to their sexual orientation or gender identity (aPR 1.21; 95%CI: 1.01–1.46); transactional sex (aPR 1.32; 95%CI: 1.04–1.68); and having had between 2 to 5 sexual partners in the previous three months (aPR 1.39; 95%CI: 1.15–1.68) among those 18–19 yo. Unprotected receptive anal intercourse in the previous six months was associated with PrEP initiation in both age groups (aPR 1.98; 95%CI: 1.02–3.85 and aPR 1.45; 95%CI: 1.19–1.76 among 15–17 yo and 18–19 yo, respectively). The biggest challenge to promoting PrEP use for aMSM and aTGW was in the first steps of the PrEP uptake process. Once they were linked to the PrEP clinic, initiation rates were high. © 2023 Soares et al. Article	2023	Soares F.; Magno L.; Pinto J.A., Jr; Grangeiro A.; Bruxvoort K.; Greco D.; Dourado I.	Same-Day Initiation of Oral Pre-Exposure Prophylaxis is High Among Adolescent Men Who Have Sex With Men and Transgender Women in Brazil	Journal of Adolescent Health	-	-	-	-	1054139X	10.1016/j.jadohealth.2023.09.002	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175549611&doi=10.1016%2fj.jadohealth.2023.09.002&partnerID=40&md5=6bbdddba50009920753c7f029da06f47	Purpose: This study analyzed the sociodemographic and behavioral characteristics of adolescent men who have sex with men (aMSM) and transgender women (aTGW) initiating oral pre-exposure prophylaxis (PrEP) in human immunodeficiency virus (HIV) prevention clinics. Methods: PrEP1519 is a prospective, multicenter, open-label PrEP demonstration cohort study of aMSM and aTGW aged 15–19 years living in three large Brazilian capital cities. For this analysis, we included adolescents who enrolled in PrEP1519 from February 2019 to August 2021. Adolescents who visited PrEP clinics were classified into four groups based on PrEP eligibility and on their decision to use PrEP: (1) ineligible for same-day PrEP initiation; (2) eligible for same-day PrEP initiation, initiated PrEP at first visit; (3) eligible for PrEP initiation, initiated PrEP after the first visit; and (4) eligible for same-day PrEP initiation but declined. The groups that were eligible for same-day PrEP initiation were compared using the Chi-square and Fisher's exact tests. Results: Of the 1,254 adolescents enrolled in the PrEP1519 study, 61 (4.9%) were considered ineligible for same-day PrEP initiation. Of the 1,193 eligible for same-day PrEP initiation, 1,113 (93.3%) initiated PrEP 1,054 initiated PrEP in the first visit (88.3%) and 59 in subsequent visits (4.9%) and 80 (6.7%) did not. Despite 90% of the PrEP decliners reporting a low risk of HIV infection, most reported condomless anal sex in the past six months (70%). Discussion: Same-day PrEP initiation among aMSM and aTGW was high, highlighting that this strategy was important to promote PrEP initiation among adolescents with increased vulnerability to HIV in Brazil. © 2023 Society for Adolescent Health and Medicine	Adolescents; HIV; Men who have sex with men; PrEP; Prevention; Transgender women	English	United States	Western and Central Europe and North America	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Clinical
Article	2023	Sohail M.; Boutwell A.; Johnson B.; Van Der Pol B.; Marrazo J.; Mugavero M.; Chapman-Lambert C.; Elopre L.	Factors Associated with Willingness to Use Preexposure Prophylaxis among Black Cisgender Women Residing in Rural and Urban Areas: A Cross-Sectional Study	Sexually Transmitted Diseases	-	-	-	-	1485717	10.1097/OLQ.0000000000001858	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175200519&doi=10.1097%2fOLQ.0000000000001858&partnerID=40&md5=5ab422c8196c24cc3a412aa374236d6e	Background Black cisgender women (CGW) are disproportionately impacted by the human immunodeficiency virus (HIV) epidemic in the United States. Black women account for 57% of the total new diagnoses among CGW. In addition, Black CGW women are 9 times more likely to be diagnosed with HIV than their White counterparts. Methods We conducted surveys (September 2019-March 2020) and collected information on sociodemographics, HIV/preexposure prophylaxis (PrEP) knowledge, HIV/PrEP stigma, sexual practices, and other factors identified as PrEP barriers among Black CGW (n = 795). This cross-sectional study used logistic regression models to assess intrapersonal, interpersonal, and structural factors among individuals willing to use PrEP versus individuals unwilling or unsure to use PrEP. Results Our study population had a mean age of 37 years, predominantly lived in urban areas (65%), had stable housing (96.7%), and had private insurance/Medicare (78.2%). Overall, 29.6% reported willingness to use PrEP, 35.6% reported unwillingness to use PrEP, and 34.8% were unsure of PrEP use. The multivariable analysis showed that, compared with individuals reporting unwillingness/unsure to PrEP use, those reporting willingness to use PrEP were younger (adjusted odds ratio AOR; 95% confidence interval {CI}, 0.97 0.96-0.99), had lower odds of intimate partner violence (AOR 95% CI, 0.87 0.78-0.98), and higher odds of organizational religiosity (AOR 95% CI, 1.10 1.01-1.20), HIV knowledge (AOR 95% CI, 1.08 1.03-1.13), and perceived need for PrEP (AOR 95% CI, 6.38 3.36-12.11). Conclusions Preexposure prophylaxis willingness among Black CGW was impacted by individual-level, interpersonal, and structural factors. Improving PrEP willingness and uptake among Black CGW will require multilevel interventions. © Lippincott Williams & Wilkins. Article	2023	Sokoll, Paulo Roberto; Migliavaca, Celina Borges; Siebert, Uwe; Schmid, Daniela; Arvandi, Marjan	Prevalence of Mycoplasma genitalium infection among HIV PrEP users: a systematic review and meta-analysis.	Sexually Transmitted Diseases	-	-	-	-	1472-3263	10.1136/sextrans-2022-055687	https://dx.doi.org/10.1136/sextrans-2022-055687	OBJECTIVES: To summarise the prevalence of Mycoplasma genitalium (MG) and antibiotic-resistant MG infection among HIV pre-exposure prophylaxis (PrEP) users. METHODS: We searched MEDLINE, Embase, Web of Science and Global Index Medicus up to 30 September 2022. We included studies reporting the prevalence of MG and/or antibiotic-resistant MG infection among PrEP users. Two reviewers independently searched for studies and extracted data. A systematic review with random-effects meta-analysis was performed to quantitatively summarise the results of included studies. The critical appraisal of included studies was conducted with the Joanna Briggs Institute checklist for prevalence studies and the quality of evidence was assessed with Grading of Recommendations Assessment, Development and Evaluation (GRADE). RESULTS: A total of 15 studies were included in the systematic review, with 2341 individuals taking PrEP. Studies were conducted in high-income level countries between 2014 and 2019. Median age of participants varied from 23.5 to 40 years. The majority were men (85%) and among them, 93% were men who have sex with men. To identify MG, urine samples were analysed in 14 studies, rectal or anal swabs in 12 studies, oral or pharyngeal swabs in 9 studies, and urethral or vaginal in 3 studies. The pooled point prevalence of MG among PrEP users was 16.7% (95% CI 13.6% to 20.3%; 95% prediction interval (95% PI) 8.2% to 31.1%). The pooled point prevalence of macrolide-resistant infections was 82.6% (95% CI 70.1% to 90.6%; 95% PI 4.7% to 99.8%) and the prevalence of fluoroquinolone-resistant infections was 14.3% (95% CI 1.8% to 42.8%). Individuals taking PrEP have a higher chance of being infected with MG compared with those not taking PrEP (OR 2.30; 95% CI 1.6 to 3.4). The quality of evidence was very low to moderate. CONCLUSION: We observed a high prevalence of MG and its macrolide resistance among PrEP users, highlighting the need to reinforce prevention strategies against sexually transmitted infections in this population. Article	2023	Sonalkar, Sarita; Kete, Corinne; McAllister, Arden; Afreen, Ryan; Kaufman, Jason; Short, William; Keddem, Shimrit	Perceptions of HIV risk screening strategies among patients seeking abortion, contraception, and pregnancy loss management in the United States.	Contraception	-	-	-	-	1879-0518 0010-7824	10.1016/j.contraception.2023.110063	https://www.sciencedirect.com/science/article/abs/pii/S0010782423001361	OBJECTIVES: Women make up nearly a fifth of new human immunodeficiency virus (HIV) infections yearly in the United States, more than half of which could have been prevented with broader use of HIV pre-exposure prophylaxis (PrEP). We aimed to qualitatively assess (1) acceptability of an HIV risk screening strategy and PrEP provision in a family planning setting, and (2) the influence of family planning visit type (abortion, pregnancy loss management, or contraception) on HIV risk screening acceptability. STUDY DESIGN: Guided by the P3 (practice-, provider-, and patient-level) model for preventive care interventions, we conducted three focus group discussions including patients who had experienced induced abortion, early pregnancy loss (EPL), or contraception care. We developed a codebook of a priori and inductive concepts, and categorized themes by practice, provider, and patient considerations. RESULTS: We included 24 participants. Practice-level considerations included overall positive feelings about being screened for PrEP eligibility during family planning visits, though some expressed reservations about screening during EPL visits. Provider-level themes included the concept of screening tools as entry points into conversation and education, and the importance of nonjudgment in discussing sexually transmitted infection (STI) prevention. Participants often had to initiate STI prevention discussions and felt that contraception was overemphasized by their providers compared with STI prevention and PrEP care. Patient-level themes included the stigma of STIs and oral PrEP, and the dynamic nature of STI risk. CONCLUSIONS: Participants in our research had genuine interest in learning about PrEP during family planning visits. Findings from our research support the consistent inclusion of STI prevention education into family planning clinical practice using patient-centered STI screening methods. IMPLICATIONS: Family planning encounters, including visits for contraception and abortion, are generally appropriate times to discuss HIV PrEP. Patient-centered conversations are an important adjunct to HIV risk screening tools. Article	2023	Sönmez İ.; Mesías-Gazmuri J.; Barbara J.C.; Adell H.; Meroño M.; Villar M.; Folch C.	Factors associated with PrEP knowledge and intention to use PrEP among HIV-negative men and trans women sex workers in Spain	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2023.2196392	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152558745&doi=10.1080%2f09540121.2023.2196392&partnerID=40&md5=4929f3d8d2410481d2bfd9ec450cd52a	Lack of data regarding knowledge and intention to use pre-exposure prophylaxis (PrEP) among sex workers exists in Spain. We conducted a cross-sectional analysis based on data from SexCohort study, which included male (MSW) and trans women sex workers (TWSW), aged ≥18 and recruited in two community-based centres in Barcelona, Spain. Of 116 TWSW and 79 MSW, 49.1% and 58.2% had factual knowledge of PrEP, and 40.3% and 70.1% had the intention to use PrEP, respectively. In the multivariable analyses, we found that education and condomless anal sex with stable partners were associated with PrEP knowledge. Regarding intention to use PrEP, TWSW were less likely than MSW to report an intention to use it (aOR = 0.35, 95% CI: 0.16–0.74). Furthermore, intention to use PrEP was associated with being foreign-born, practicing chemsex, and visiting a medical service in the last 12 months. The results of this study inform future trans-specific guidance for PrEP to be effectively implemented in Spain. © 2023 Informa UK Limited, trading as Taylor & Francis Group. Article	2023	Sophus, Amber I.; Mitchell, Jason W.; Sales, Jessica McDermott; Braun, Kathryn	"Our Community Comes First": Investigating Recruitment Ads That Represent and Appeal to Black Women for Online, HIV-Related Research Studies.	Journal of Racial and Ethnic Health Disparities	-	-	-	-	2196-8837	10.1007/s40615-023-01800-5	https://link.springer.com/article/10.1007/s40615-023-01800-5	BACKGROUND: Black women are underrepresented in health-related research. Consulting Black women in the creation of recruitment materials may help increase their representation in research studies, but few of these recruitment materials have been evaluated. This manuscript reports on the impact of two ads (one featuring older women and one featuring younger women) created through multiple focus group sessions with Black women. The purpose of the ads were to recruit Black women to participate in an online research study about HIV prevention and pre-exposure prophylaxis, PrEP. MATERIALS AND METHODS: Questions about the ads were embedded in the eligibility screener for inclusion in the online parent research study. Respondents were asked which ad they saw, what they liked about it, and what about the ad piqued their interest in the study. RESULTS: In total, 301 Black women completed the eligibility screener for the online study and answered questions pertaining to the two ads. Most participants reported seeing the ad with younger women (260/301, 86.4%). Representation of Black women (n = 70), ad design (n = 64), relevance to Black women and the Black community (n = 60), and comprehensiveness of ad content (n = 38) were the top 4 ad features respondents liked. Relevance to Black women and the Black community (n = 104) as well as ad content (n = 54) (i.e., study purpose, location, duration, images, incentive) were the top two reasons provided about ads that piqued respondent's interest in the online study. CONCLUSION: Findings showcase how recruitment ads informed by Black women could help increase their interest and participation in research. Article	2023	Sophus, Amber I; Mitchell, Jason W; Barroso, Julie; Sales, Jessica McDermott	Factors Associated with Planned Future Use of PrEP in the Next 3 Months and Likelihood to Use PrEP Among Black Cisgender HIV-negative Women in Texas.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-023-04188-9	https://dx.doi.org/10.1007/s10461-023-04188-9	Identifying and then addressing barriers and leveraging facilitators is important to help increase pre-exposure prophylaxis (PrEP) use among Black women vulnerable to HIV acquisition. The present cross-sectional study examined what factors were associated with future plans to use PrEP, and general likelihood to use it among a convenience sample of 152 adult, Black cisgender women from three metropolitan areas in Texas. The final multivariable logistic regression model revealed that relationship stigma (aOR = 0.20, 95% CI: 0.05-0.73, p < 0.05), PrEP anticipated stigma (aOR = 0.29, 95% CI: 0.10-0.78, p < 0.05), perceived discrimination (aOR = 0.40, 95% CI: 0.21-0.78, p < 0.01) and interest in learning more about PrEP (aOR = 5.32, 95% CI: 2.60-10.9, p < 0.001) were associated with future plans to use PrEP. The final multivariable linear regression model with maximum likelihood estimation identified that perceived discrimination (β=-0.24, SE: -0.38 - -0.10, p < 0.01), perceived HIV risk (β = 0.33, SE: 0.18-0.49, p < 0.001), willingness to use PrEP with condoms (β = 1.26, SE: 0.94-1.60, p < 0.001), and comfort communicating about PrEP with a provider (β = 0.23, SE: 0.06-0.41, p < 0.01) were associated with general likelihood to use PrEP. Findings reveal key factors that warrant further attention and examination toward improving PrEP use within this population. Article	2023	Soriano, V; Moreno-Torres, V; de Mendoza, C; Fernández-Montero, JV; Treviño, A; Corral, O; de Jesús, F; Barreiro, P	Pre-exposure prophylaxis of non-HIV viral infections and the role of long-acting antivirals	AIDS Reviews	-	-	-	-	1139-6121	10.24875/AIDSRev.M23000066	https://pubmed.ncbi.nlm.nih.gov/38092029/	Viruses cause a large burden of human infectious diseases. During the past 50 years, antivirals have been developed to treat many pathogenic viruses, including herpesviruses, retroviruses, hepatitis viruses, and influenza. Besides being used as treatment, antivirals have shown efficacy for preventing certain viral infections. Following the success in the HIV field, a renewed interest has emerged on the use of antivirals as prophylaxis for other viruses. The development of formulations with extended half-life has pushed further this consideration in persons at risk for a wide range of viral infections. In this way, long-acting antivirals might behave as "chemovaccines" when classical vaccines do not exist, cannot be recommended, immune responses are suboptimal, escape mutants emerge, and/or immunity wanes. Five main caveats would temper its use, namely, selection of drug resistance, drug interactions, short- and long-term side effects, potential teratogenicity in women of child-bearing age, and high cost. Herein, we discuss the prospects for long-acting antivirals as prophylaxis of human viral infections other than HIV. Article	2023	Soriano, Vicente; Blasco-Fontecilla, Hilario; Gallego, Lucía; Fernández-Montero, José V.; Mendoza, Carmen de; Barreiro, Pablo	Rebound in sexually transmitted infections after the COVID-19 pandemic.	AIDS Reviews	-	-	-	-	1698-6997 1139-6121	10.24875/AIDSRev.23000015	https://pubmed.ncbi.nlm.nih.gov/37879632/	Sexually transmitted infections (STIs) have become the second in the global rating of infectious diseases after respiratory infections. Globally, over 1 million, new STI is diagnosed every day. Although four conditions are the most representative and of obligatory declaration (gonorrhea, syphilis, chlamydia, and human immunodeficiency virus HIV), there are many other prevalent STI, including trichomona, herpes simplex, papillomavirus, and viral hepatitis. Herein, we perform a narrative and retrospective review, analyzing information from public databases from distinct Spanish government institutions. STI significantly declined in Spain during 2020 as a result of lockdown and social isolation measures dictated in response to the COVID-19 pandemic. After releasing restrictions, a major STI rebound occurred in 2021. Increases were 49% for gonorrhea, 45% for HIV, 39% for chlamydia, and 32% for syphilis. Based on nationwide statistics, we build a narrative review of the recent STI surge after COVID-19. In summary, we propose a holistic approach to confront the current re-emergence of STI. On one hand, new innovative medical advances must be implemented, including new rapid tests, novel vaccines, pre-exposure prophylaxis beyond HIV, and long-acting antivirals. On the other hand, information to citizens needs to be reformulated with interventions aimed to build a healthier society, alike it has been undertaken with tobacco, alcohol, diet, and lifestyle. STI determines important sexual, reproductive, and maternal-child health consequences. To promote human well-being or flourishing, the education of adolescents and young adults should be aligned with human ecology. Therefore, it is urgent to address new approaches in sexual health that represent a clear benefit for individual persons and society. In this way, favoring a cultural evolution aimed to delay the age of first sexual intercourse and the avoidance of multiple sex partners should be prioritized. Article	2023	Sousa Á.F.L.; Lima S.V.M.A.; Ribeiro C.J.N.; de Sousa A.R.; Camargo E.L.S.; de Oliveira L.B.; Neto J.C.; Fronteira I.; Mendes I.A.C.	Pre-exposure prophylaxis among Brazilian men who have sex with men: a comparative study between migrants and non-migrants	Frontiers in Public Health	-	-	-	-	22962565	10.3389/fpubh.2023.1198339	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169576418&doi=10.3389%2ffpubh.2023.1198339&partnerID=40&md5=9072967c79a8f627a185acf586502ac8	Introduction: Investigating the use and adherence to pre-exposure prophylaxis (PrEP) in MSM is a global health priority in the fight against HIV. Strategies must be capable of increasing usage and reaching not only the population living in the country but also those who immigrate, who face additional vulnerabilities. Based on this, in this observational, cross-sectional, and analytical study, our aim is to analyze the use of PrEP among Brazilian men who have sex with men, whether they are migrants or not. We aim to highlight preventive opportunities and strategies for the global health scenario. Methods: We utilized a sample of Brazilians living in the country and Brazilian immigrants residing in Portugal, one of the main destinations for Brazilians in recent years. To estimate the prevalence ratio (PR) of PrEP use, we employed the Poisson regression model with robust variance estimation using a covariance matrix. Results: A total of 1,117 Brazilian MSM PrEP users participated in this study, with 788 residing in Brazil and 328 in Portugal. Multivariate analysis was conducted in three stages: overall, and for subgroups of residents in Brazil and immigrants in Portugal. We identified four convergent factors that increased the prevalence of PrEP use in Brazilians regardless of migration status: having two or more casual sexual partners per month, engaging in challenging sexual practices as the receptive partner, disclosing serological status on apps, and being single. Among Brazilians, four unique factors stood out: being in a polyamorous relationship, having sexual relations with unknown casual partners, and having higher levels of education. Discussion: This study highlights the need to implement strategies to strengthen PrEP adherence in Brazil and create international programs that facilitate its usage among populations migrating between these two countries. Adherence to Pre-Exposure Prophylaxis (PrEP) among Men Who Have Sex with Men (MSM) in Portuguese-Speaking Countries	International Journal of Environmental Research and Public Health	-	-	-	-	16617827	10.3390/ijerph20064881	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151332616&doi=10.3390%2fijerph20064881&partnerID=40&md5=c0a159a0a4c7a961cc8dd8fd1129d1d4	Strengthening strategies to improve adherence to the use of pre-exposure prophylaxis (PrEP) in key populations constitutes a global health priority to be achieved across countries, especially in countries that share a high flow of people such as Brazil and Portugal. This study aimed to analyze the factors associated with adherence to PrEP among MSM from two Portuguese-speaking countries, highlighting the opportunities and preventive strategies for the global health scenario. This was a cross-sectional analytical online survey conducted from January 2020 to May 2021 with MSM in Brazil and Portugal. For analysis of the data, the Poisson regression model was used to estimate the prevalence ratio (PR) for developing a model to evaluate the associated factors in both countries in a comparative and isolated way. Adherence to PrEP use corresponded to 19.5% (n = 1682) of the overall sample: 18.3% (n = 970) for Brazil and 21.5% (n = 712) for Portugal. Having more than two sex partners in the last 30 days (aPR: 30.87) and routinely undergoing HIV tests (aPR: 26.21) increased the use of this medication. Being an immigrant (PR: 1.36) and knowing the partner's serological status (PR: 1.28) increased adherence to PrEP in Portugal, whereas, in Brazil, it was being an immigrant (PR: 0.83) and not knowing the serological status (PR: 2.24) that promoted the use of this medication. Our findings reinforce the need to invest in programs and strategies to improve access and adherence to PrEP, especially in key populations. © 2023 by the authors. Article	2023	Sousa Á.F.L.D.; Nunes Ribeiro C.J.; Santos G.R.D.S.; Oliveira L.B.D.; Camargo E.L.S.; Lima S.V.M.A.; Oliveira Sena I.V.D.; Bezerra-Santos M.; Batista O.M.A.; Reis de Sousa A.; Mendes I.A.C.	Intention to use PrEP among men who have sex with men and engage in chemsex: an international descriptive study	Therapeutic Advances in Infectious Disease	-	-	-	-	20499361	10.1177/20499361231206918	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176505890&doi=10.1177%2f20499361231206918&partnerID=40&md5=d34b7fe1bb09faea3d7a694403f6ad01	Background: Pre-exposure prophylaxis (PrEP) is a valuable tool in the response to the HIV epidemic, recommended for groups with a higher risk of HIV infection, such as men who have sex with men (MSM), particularly in the context of high-risk sexual behavior such as chemsex. Purpose: This study aimed to analyze the prevalence and factors associated with the intention to use PrEP among MSM who engage in chemsex in Brazil and Portugal. Methods: This was a cross-sectional study of a secondary dataset from a larger study conducted between January 2020 and May 2021 throughout Brazil and Portugal involving 1852 MSM who engage in chemsex. An initial descriptive analysis was performed to calculate the absolute and relative frequencies of independent variables related to the intention to use PrEP among MSM. A multivariate regression model was developed to identify factors independently associated with the intention to use PrEP. Results: Although a high level of PrEP knowledge (85.75%) was observed among MSM who engage in chemsex, the prevalence of intention to use PrEP was only 59.07%. Five variables were associated with a higher prevalence of intention to use PrEP engaging in double penetration – adjusted prevalence ratio (aPR): 1.56, 95% CI: 1.44–1.69; being assigned female sex at birth – aPR: 1.34, 95% CI: 1.12–1.61; cruising – aPR: 1.21, 95% CI: 1.06–1.38; not using condoms – aPR: 1.20, 95% CI: 1.05–1.36; and being an immigrant – aPR: 1.16; 95% CI: 1.07–1.25, while having knowledge of postexposure prophylaxis (aPR: 0.91; 95% CI: 0.84–0.98), having a casual sexual partner (aPR: 0.86 and 0.85; 95% CI: 0.74–0.99 and 0.74–0.98), and engaging in group sex (aPR: 0.81; 95% CI: 0.73–0.90) were associated with a lower intention to use PrEP. Conclusion: The intention to use PrEP among MSM who engage in chemsex was high, and several factors were associated with this intention. Understanding the factors associated with the intention to use PrEP among MSM practicing chemsex is crucial for developing targeted interventions to increase PrEP uptake in this population. The results of this study suggest that tailored approaches are necessary to promote PrEP use in this population. © The Author(s), 2023.	chemsex; global health; HIV; men who have sex with men; pre-exposure prophylaxis; sexual behavior	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Theses and Dissertations	2023	SOUZA, UELQUER GUEDES DE	ENTRE COMPRIMIDOS E INJEÇÕES VIAJANTES: reflexões sobre o cuidado nas práticas de prevenção à infecção pelo HIV e à aids a partir da Profilaxia Pré-Exposição (PrEP)	-	-	URGS	URGS	-	-	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=13542553	Esta dissertação trata do cuidado nas políticas de prevenção à infecção pelo HIV e à aids. Sustenta-se em uma pesquisa qualitativa exploratória que teve como objetivo principal refletir sobre o cuidado a partir das práticas de uma pesquisa clínica e de algumas práticas sexuais que envolvem a utilização da tecnologia biomédica usualmente conhecida como Profilaxia Pré-Exposição (PrEP). Apresento algumas reflexões sobre a autoetnografia, em especial no que diz respeito às preocupações, limitações e potências que esta metodologia pode oferecer para se considerarem transformações nas teorias e práticas de cuidado utilizadas no campo da prevenção da infecção pelo HIV e da aids que resultam em controle e normatização. Interessam para esta dissertação, os diferentes modos como o cuidado é performado nesse campo, assim como os diferentes efeitos desses processos. Inspirado pela Teoria do Ator-Rede (TAR), me dediquei a "seguir" um fármaco utilizado como PrEP, na rede que aqui denomino Experimental-fármaco-sexual. Em suma, para a TAR tanto humanos como não humanos criam realidades estabelecendo redes de conexões, constituindo-se como atores que mediam associações sociais. Desse modo, a TAR questiona dicotomias como: sujeito e objeto; sociedade e indivíduo; ciência e experiência, advindas das ciências modernas, buscando superá-las. Nesta dissertação, realizei reflexões sobre o cuidado a partir da minha utilização da PrEP e das políticas que culminaram no seu desenvolvimento e descrevo, em especial, o que dela é experimentado socialmente e suas repercussões no campo da prevenção ao HIV. Sem dúvida alguma, a PrEP está reconfigurando as sexualidades de homens gays, produzindo novas formas de relação, desejo e afetividade. Se por um lado, a tecnologia tem provocado certa emancipação dos desejos homoeróticos. Por outro lado, ao se amalgamar a alguns discursos do modelo preventivo brasileiro, ela também regula e disciplina corpos, sexualidades, subjetividades e invisibiliza formas de opressão e privilégios. Article	2023	Spencer H.C.; Babiarz J.; Menza T.W.	Human immunodeficiency virus pre-exposure prophylaxis awareness among people who inject drugs in Portland, Oregon	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624231154302	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151083510&doi=10.1177%2f09564624231154302&partnerID=40&md5=752d94669b326a6e207b0693e481a007	Background: Pre-Exposure Prophylaxis (PrEP) to prevent transmission of human immunodeficiency virus (HIV) among people who inject drugs (PWID) has demonstrated efficacy yet awareness of PrEP among PWID is low. Methods: 2018 National Behavioral Health Survey data from the Portland, Oregon metropolitan statistical area was analyzed with chi-squared tests and generalized linear models to determine correlates of PrEP awareness among PWID. Results: 80% of the sample had at least one indication for PrEP and 15% of the sample was aware of PrEP. Factors associated with higher PrEP awareness were: higher education level (PR = 1.083, CI = 1.018–1.153, p =.012), reporting transactional sex (PR = 1.154, CI = 1.019–1.307, p =.024), and men who have sex with men reporting condomless sex (PR = 1.376, CI = 1.081–1.752, p =.010). Lack of a usual source of care (PR = 0.884, CI = 0.824–0.949, p <.001) was negatively associated with PrEP awareness. Conclusions: Interventions to increase PrEP awareness need to target groups with particularly low awareness and be delivered in settings accessible to PWID. © The Author(s) 2023. Dynamics of Pre-Exposure (PrEP) Eligibility because of Waxing and Waning of HIV Risk in Rakai, Uganda	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000003182	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160316769&doi=10.1097%2fQAI.0000000000003182&partnerID=40&md5=4bb95ea05b140dc6f981ecdec3801aa8	Background:We conducted a retrospective population-based study to describe longitudinal patterns of prevalence, incidence, discontinuation, resumption, and durability of substantial HIV risk behaviors (SHR) for pre-exposure prophylaxis (PrEP) eligibility.Methods:The study was conducted among HIV-negative study participants aged 15-49 years who participated in survey rounds of the Rakai Community Cohort Study between August 2011 and June 2018. Substantial HIV risk was defined based on the Uganda national PrEP eligibility as reporting sexual intercourse with >1 partner of unknown HIV status, nonmarital sex without a condom, having genital ulcers, or having transactional sex. Resumption of SHR meant resuming of SHR after stopping SHR, whereas persistence of SHR meant SHR on >1 consecutive visit. We used generalized estimation equations with log-binomial regression models and robust variance to estimate survey-specific prevalence ratios; Generalized estimation equations with modified Poisson regression models and robust variance to estimate incidence rate ratios for incidence, discontinuation, and resumption of PrEP eligibility.Findings:Incidence of PrEP eligibility increased from 11.4/100 person-years (pys) in the first intersurvey period to 13.9/100 pys (adjusted incidence rate ratios = 1.28; 95%CI = 1.10-1.30) and declined to 12.6/100 pys (adjusted incidence rate ratios = 1.06; 95%CI = 0.98-1.15) in the second and third intersurvey periods, respectively. Discontinuation rates of SHR for PrEP eligibility were stable (ranging 34.9/100 pys-37.3/100 pys; P = 0.207), whereas resumption reduced from 25.0/100 pys to 14.5/100 pys (P < 0.001). PrEP eligibility episodes lasted a median time of 20 months (IQR = 10-51).Interpretation:Pre-exposure prophylaxis should be tailored to the dynamic nature of PrEP eligibility. Preventive-effective adherence should be adopted for assessment of attrition in PrEP programs. © Copyright 2023 The Author(s). Prediction of Sex and the Potential Use of On-Demand PrEP Among Young Men Who Have Sex With Men in the United States	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000003202	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164050982&doi=10.1097%2fQAI.0000000000003202&partnerID=40&md5=00cfb04b0d69506e3334cc4acddf15b1	Background:On-demand dosing of preexposure prophylaxis (PrEP) requires accurate prediction of sex; however, prediction abilities among young men who have sex with men (YMSM) have not been characterized.Setting:A nationally recruited prospective cohort of YMSM ages 16-24 years.Methods:We followed 120 YMSM for 8 weeks using digital daily surveys (DDSs) to measure engagement in and prediction of anal sex over 24 hours, along with condom use and other encounter-level circumstances. Our main outcome, an "unpredicted spontaneous encounter," was defined as an anal sex encounter that occurred without sufficient prior knowledge to (hypothetically) enable protective on-demand PrEP use according to dosing guidelines. We operationalized this outcome as an anal sex encounter for which a participant indicated: (1) on the prior day's DDS that there was a low likelihood of sex occurring in the subsequent 24 hours (unpredicted) and (2) on the current day's DDS that he knew ≤2 hours in advance that the encounter would occur (spontaneous).Results:Approximately one-third of all anal sex encounters during the study period were unpredicted and spontaneous and would not have been protected (hypothetically) by on-demand dosing. More than two-thirds of participants experienced such an encounter and almost three-quarters of all acts were condomless.Conclusions:On-demand PrEP to prevent HIV acquisition may be challenging for many YMSM. Clinical and public health approaches that account for patients' predictive abilities alongside their dosing preferences may help to optimize selection of and adherence to PrEP dosing strategies. © 2023 Lippincott Williams and Wilkins. Article	2023	Stanford K.A.; Almirol E.; Eller D.; Hazra A.; Schneider J.	Routine, Opt-Out, Emergency Department Syphilis Testing Increases HIV Preexposure Prophylaxis Uptake	Sexually Transmitted Diseases	-	-	1485717	10.1097/OLQ.0000000000001774	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152591978&doi=10.1097%2fOLQ.0000000000001774&partnerID=40&md5=886eb2f0f69a2ed3830ae07190 1c5753	Background: Many people vulnerable to HIV do not perceive themselves at risk or consider preexposure prophylaxis (PrEP). This study hypothesizes that syphilis diagnosis through universal, emergency department (ED) screening would increase PrEP uptake. Methods: This prospective cohort study enrolled patients tested for syphilis through ED screening between July 2019 and July 2021. Participants completed a survey about behaviors, HIV and PrEP knowledge, and opinions at the time of enrollment. All were offered PrEP if they met Centers for Disease Control and Prevention guidelines for PrEP use. Information about PrEP use and HIV status was collected 6 months later. Bivariate analysis was used to compare outcomes between groups testing positive versus negative for syphilis. Results: The study enrolled 97 participants, 49 with syphilis and 48 testing negative. Overall, 11 (11.3%) started PrEP, all in the syphilis group, despite 28 (58.3%) in the negative group having indications for PrEP. Participants with syphilis less frequently reported low perceived HIV risk than syphilis-negative participants who reported HIV transmission behaviors (83.7% vs. 92.9%). Participants reporting moderate to high HIV risk perception were significantly more likely to start PrEP (odds ratio, 10.5; 95% confidence interval, 1.41-78.1; P = 0.02). At 6 months, 3 participants remained on PrEP (follow-up data available for 63.5% of PrEP-eligible participants). Conclusions: Syphilis diagnosis was associated with increased perception of HIV risk and increased PrEP initiation. Individuals who otherwise might not seek testing for syphilis because of perceived low risk may be identified through routine screening, thus providing an important opportunity to link more people to HIV prevention and PrEP services. Article	2023	Stansfield S.E.; Heitner J.; Mitchell K.M.; Doyle C.M.; Milwid R.M.; Moore M.; Donnell D.J.; Hanscom B.; Xia Y.; Maheu-Giroux M.; Vijver D.V.D.; Wang H.; Barnabas R.; Boily M.-C.; Dimitrov D.T.	Population-level impact of expanding PrEP coverage by offering long-acting injectable PrEP to MSM in three high-resource settings: a model comparison analysis	Journal of the International AIDS Society	-	-	17582652	10.1002/jia2.26109	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164542239&doi=10.1002%2fjia2.26109&partnerID=40&md5=901da3e454847c4a594a9d8054ecb697	Introduction: Long-acting injectable cabotegravir (CAB-LA) demonstrated superiority to daily tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) for HIV pre-exposure prophylaxis (PrEP) in the HPTN 083/084 trials. We compared the potential impact of expanding PrEP coverage by offering CAB-LA to men who have sex with men (MSM) in Atlanta (US), Montreal (Canada) and the Netherlands, settings with different HIV epidemics. Methods: Three risk-stratified HIV transmission models were independently parameterized and calibrated to local data. In Atlanta, Montreal and the Netherlands, the models, respectively, estimated mean TDF/FTC coverage starting at 29%, 7% and 4% in 2022, and projected HIV incidence per 100 person-years (PY), respectively, decreasing from 2.06 to 1.62, 0.08 to 0.03 and 0.07 to 0.001 by 2042. Expansion of PrEP coverage was simulated by recruiting new CAB-LA users and by switching different proportions of TDF/FTC users to CAB-LA. Population effectiveness and efficiency of PrEP expansions were evaluated over 20 years in comparison to baseline scenarios with TDF/FTC only. Results: Increasing PrEP coverage by 11 percentage points (pp) from 29% to 40% by 2032 was expected to avert a median 36% of new HIV acquisitions in Atlanta. Substantially larger increases (by 33 or 26 pp) in PrEP coverage (to 40% or 30%) were needed to achieve comparable reductions in Montreal and the Netherlands, respectively. A median 17 additional PYs on PrEP were needed to prevent one acquisition in Atlanta with 40% PrEP coverage, compared to 1000+ in Montreal and 4000+ in the Netherlands. Reaching 50% PrEP coverage by 2032 by recruiting CAB-LA users among PrEP-eligible MSM could avert >45% of new HIV acquisitions in all settings. Achieving targeted coverage 5 years earlier increased the impact by 5–10 pp. In the Atlanta model, PrEP expansions achieving 40% and 50% coverage reduced differences in PrEP access between PrEP-indicated White and Black MSM from 23 to 9 pp and 4 pp, respectively. Conclusions: Achieving high PrEP coverage by offering CAB-LA can impact the HIV epidemic substantially if rolled out without delays. These PrEP expansions may be efficient in settings with high HIV incidence (like Atlanta) but not in settings with low HIV incidence (like Montreal and the Netherlands). © 2023 The Authors. Article	2023	Stansfield S.E.; Moore M.; Boily M.-C.; Hughes J.P.; Donnell D.J.; Dimitrov D.T.	Estimating benefits of using on-demand oral prep by MSM: A comparative modeling study of the US and Thailand	EClinicalMedicine	-	-	25895370	10.1016/j.eclinm.2022.101776	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144624445&doi=10.1016%2fj.eclinm.2022.101776&partnerID=40&md5=f738b65e02dae544c9e6f46aa5f38d95	Background: Daily and on-demand pre-exposure prophylaxis (PrEP) are effective at preventing HIV acquisition among men who have sex with men (MSM), but only daily PrEP is approved in the US. On-demand PrEP may improve uptake and adherence. We identify sub-groups of MSM who would benefit from on-demand PrEP and determine effectiveness achieved if individuals used their optimal regimens. Methods: Using data from the HPTN 067 study (study period 2012–2014), we created an individual-based stochastic model of HIV risk in two synthetic MSM populations with parameters separately estimated using data from Harlem, US, and Bangkok, Thailand. Agents were assigned daily and on-demand PrEP for six months each. Two personalized PrEP assignments: optimal, based on improved predicted effectiveness and reduced pill burden, and adherence-based, using daily PrEP adherence, were simulated for another six months. Findings: Simulated on-demand PrEP was optimal for approximately one-third of MSM. It was assigned mainly to those with low daily PrEP adherence (88% (Harlem), 95% (Bangkok) of MSM with daily PrEP adherence <40%). Mean effectiveness was slightly higher in the full synthetic population with optimal PrEP assignment compared to universal daily PrEP. Among MSM for whom on-demand PrEP was optimal, mean effectiveness improved by 18 (Harlem) and 7 percentage points (Bangkok). Comparable predicted effectiveness was achieved if on-demand PrEP was assigned to the population with daily PrEP adherence <50%. There was no advantage in assigning on-demand PrEP by sex act frequency. Interpretation: On-demand PrEP could benefit many MSM by increasing effectiveness or decreasing pill burden with similar effectiveness. On-demand PrEP may be an effective alternative to daily PrEP for individuals with difficulty taking daily PrEP consistently. Results were similar for Harlem and Bangkok, indicating that these conclusions were robust in populations with different overall adherence levels and may inform future public-health policies. Article	2023	Stekler, Joanne D.; Violette, Lauren R.; Niemann, Lisa A.; McMahan, Vanessa M.; Katz, David A.; Chavez, Pollyanna R.; Clark, Hollie A.; Cornelius-Hudson, Andy; McDougal, Sarah J.; Delaney, Kevin P.	Seroconversion, seroreversion, and serowaffling among participants initiating antiretroviral therapy in Project DETECT.	International journal of STD & AIDS	-	-	1758-1052 0956-4624	10.1177/09564624231152929	https://pubmed.ncbi.nlm.nih.gov/36703607/	BACKGROUND: Incomplete HIV seroconversion and seroreversion are increasingly documented by testing and pre-exposure prophylaxis programs more than previously recognized. This analysis reports on incomplete seroconversion and seroreversion by specimen and test type among Project DETECT participants. METHODS: Project DETECT included a longitudinal study of point-of-care tests. Participants were categorized as having "incomplete seroconversion" if all timepoints had ≥1 nonreactive test at study censoring. Among participants with incomplete seroconversion, we defined "seroreversion" as sustained regression to nonreactive for any test following a reactive result. We define "serowaffling" as any reactive result followed by a nonreactive and then reactive result. We used Fisher's exact tests to explore relationships between Fiebig stage at ART initiation and incomplete seroconversion, seroreversion, and serowaffling. RESULTS: Twenty of 1940 Project DETECT participants met criteria for this subset. Ten participants had complete seroconversion after a median of 23 (IQR 16-47) days following initial positive tests. Ten participants had incomplete seroconversion, eight of whom had seroreversion. Incomplete seroconversion with persistent nonreactive tests was seen only with oral fluid (OF). Of eight participants with seroreversion, all experienced seroreversion of OF tests if the test was ever reactive (n = 6); seroreversion occurred in fingerstick and venipuncture tests in two participants. Serowaffling occurred in nine (45%) participants. No associations were seen between Fiebig stage at ART start and complete seroconversion, seroregression, or serowaffling in our sample. CONCLUSIONS: OF tests may be particularly susceptible to providing false-negative results. Seroreversion and incomplete seroconversion among individuals on antiretroviral treatment may represent a growing problem for HIV testing and treatment programs. Article	2023	Sternberg C.A.; Daniel E.V.; Marcelin D.; Chery M.J.; Maddy K.; Richard D.; Thomas T.; Ravix J.; Warner J.; Titus M.; Francois A.; Borick J.; Feaster D.J.; Doblecki-Lewis S.; Jones D.L.; Alcaide M.L.; Dale S.K.	Bon Sante (Good Health): Factors Influencing PrEP Use Among Haitians/Haitian Americans	Journal of Racial and Ethnic Health Disparities	-	-	21973792	10.1007/s40615-023-01834-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177857873&doi=10.1007%2fs40615-023-01834-9&partnerID=40&md5=9cdd117a276be9fe078e982f0c9b6315	Background: The HIV/AIDS epidemic has disproportionately affected Black individuals in the USA, and this health disparity has increased over time. Despite the effectiveness of pre-exposure prophylaxis (PrEP) as a prevention tool for HIV, there are disparities in its use, and uptake of this intervention remains low among racial and ethnic minorities, including Haitians/Haitian Americans. In this study, factors influencing PrEP use among Haitians/Haitian Americans in Miami, FL, are explored to provide necessary data to address disparities. Methods: The research team collaborated with local organizations to recruit 30 individuals (Haitians/Haitian Americans) between February 4 and October 1, 2021, and conducted semi-structured interviews. All interviews were audio-recorded and transcribed, and NVivo® was used to analyze the transcripts for emergent themes. Results: The study sample comprised 30 adults of Haitian descent in Miami, FL (50% female, approximately 67% with a high school education or more, mean age = 43.7 ± 13 years, and 74.2% born in Haiti). Four primary themes emerged from the analysis: (1) limited PrEP awareness, (2) underutilization of PrEP, (3) inadequate discussion of HIV prevention strategies, and (4) PrEP delivery encompassing barriers and facilitators for PrEP delivery and promotion strategies. Conclusion: This study indicated that there is a critical need to increase Haitians/Haitian Americans' knowledge regarding PrEP. Health communication interventions tailored specifically for Haitians/Haitian Americans that target stigma, attitudes toward HIV, and risk perception may be significant in increasing PrEP in this population. © 2023, W. Article	2023	Sterrett-Hong, Emma M; Smith, Adrienne B; Bullock, Nana Ama; Combs, Ryan M; Krigger, Karen; Kerr, Jelani	Post-traumatic stress disorder symptoms and PrEP intentions among Black American young adults at high-risk for HIV.	Ethnicity and Health	-	-	1465-3419	10.1080/13557858.2023.2259639	https://dx.doi.org/10.1080/13557858.2023.2259639	OBJECTIVES: Black Americans bear the greatest burden of HIV, accounting for 43% of new diagnoses. Yet Black Americans also evidence the lowest utilization rates of Pre-Exposure Prophylaxis (PrEP), a highly effective biomedical strategy for preventing HIV infection. Predictors of PrEP acceptance vary; however, little is known about psychological distress, such as post-traumatic stress disorder (PTSD) symptoms, as a predictor. DESIGN: In this cross-sectional study, n = 195 Black Americans, evidencing behaviors found in the research literature to heighten risk for contracting HIV (e.g. sex work, injection drug use) ages 18-29, 55% cisgender women, 39.5% cisgender men, 3% transgender/non-binary, completed audio-computer-assisted self-interviews. RESULTS: Bivariate analyses indicated significant positive associations between PTSD symptoms and PrEP acceptance and self-confidence. In multinomial logistic regression analyses, after controlling for Perceived HIV Risk, participants had a higher likelihood of responding they 'probably would' take PrEP (as opposed to 'definitely would not' take PrEP) if they reported higher levels of PTSD symptoms. Post-hoc analyses revealed a curvilinear relationship between PTSD symptoms and PrEP acceptance with those reporting the highest level of PTSD in the sample having slightly lower PrEP acceptance than those reporting moderately high levels of PTSD. CONCLUSION: Findings are discussed in the context of the negative impacts of high levels of PTSD and potential positive adaptations subsequent to moderate levels of PTSD that could be relevant to advances in HIV prevention efforts. Article	2023	Stocks J.B.; Calvetti S.; Rosso M.T.; Slay L.; Kipke M.; Puentes M.; Hightow-Weidman L.B.	Evaluating the Feasibility and Acceptability of a Digital Pre-Exposure Prophylaxis Navigation and Activation Intervention for Racially and Ethnically Diverse Sexual and Gender Minority Youth (PrEPresent): Protocol for a Pilot Randomized Controlled Trial	JMIR Research Protocols	-	-	19290748	10.2196/50866	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174905704&doi=10.2196%2f50866&partnerID=40&md5=83ca9bd4569ef3c5b8b583fb6484c52b	Background: To end the HIV epidemic by 2030, we must double down on efforts to tailor prevention interventions to both young men who have sex with men and transgender and nonbinary youth. There is an urgent need for interventions that specifically focus on pre-exposure prophylaxis (PrEP) uptake in sexual and gender minority youth (SGMY) populations. There are several factors that impact the ability of SGMY to successfully engage in the HIV prevention continuum, including uptake of PrEP. Patient activation, having the knowledge, skills, and self-efficacy to manage one's health, is an important indicator of willingness and ability to manage one's own health and care autonomously. Patient navigation also plays an important role in helping SGMY access PrEP and PrEP care, as navigators help guide patients through the health care system, set up medical appointments, and get financial, legal, and social support. Objective: This study aims to evaluate the feasibility and acceptability of a digital PrEP navigation and activation intervention among a racially and ethnically diverse sample of SGMY living in the Los Angeles area. Methods: In phase 1, we will conduct formative research to inform the development of PrEPresent using qualitative data from key informant interviews involving PrEP care providers and navigators and working groups with SGMY. In phase 2, we will complete 2 rounds of usability testing of PrEPresent with 8-10 SGMY assessing both the intervention content and mobile health delivery platform to ensure features are usable and content is understood. In phase 3, we will conduct a pilot randomized controlled trial to evaluate the feasibility and acceptability of PrEPresent. We will randomize, 1:1, a racially and ethnically diverse sample of 150 SGMY aged 16-26 years living in the Los Angeles area and follow participants for 6 months. Results: Phase 1 (formative work) was completed in April 2021. Usability testing was completed in December 2021. As of June 2023, 148 participants have been enrolled into the PrEPresent pilot randomized controlled trial (phase 3). Enrollment is expected to be completed in July 2023, with final results anticipated in December 2023. Conclusions: The PrEPresent intervention aims to bridge the gaps in PrEP eligibility and PrEP uptake among racially and ethnically diverse SGMY. By facilitating the delivery of PrEP navigation and focusing on improving patient activation, the PrEPresent intervention has the potential to positively impact the PrEP uptake cascade in the HIV care continuum as well as serve as a model for the tailoring of PrEP interventions based on behavior-based qualifications for PrEP instead of generalized gender-based eligibility. © 2023 American Roentgen Ray Society. Article	2023	Stone J.; Bothma R.; Gomez G.B.; Eakle R.; Mukandavire C.; Subedar H.; Fraser H.; Boily M.-C.; Schwartz S.; Coetzee J.; Otwombe K.; Milovanovic M.; Baral S.; Johnson L.F.; Venter W.D.F.; Rees H.; Vickerman P.	Impact and cost-effectiveness of the national scale-up of HIV pre-exposure prophylaxis among female sex workers in South Africa: a modelling analysis	Journal of the International AIDS Society	-	-	17582652	10.1002/jia2.26063	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148677942&doi=10.1002%2fjia2.26063&partnerID=40&md5=86daf1740d30cc4b07c51814f5630b41	Introduction: In 2016, South Africa (SA) initiated a national programme to scale-up pre-exposure prophylaxis (PrEP) among female sex workers (FSWs), with ~20,000 PrEP initiations among FSWs (~14% of FSW) by 2020. We evaluated the impact and cost-effectiveness of this programme, including future scale-up scenarios and the potential detrimental impact of the COVID-19 pandemic. Methods: A compartmental HIV transmission model for SA was adapted to include PrEP. Using estimates on self-reported PrEP adherence from a national study of FSW (67.7%) and the Treatment and Prevention for FSWs (TAPS) PrEP demonstration study in SA (80.8%), we down-adjusted TAPS estimates for the proportion of FSWs with detectable drug levels (adjusted range: 38.0–70.4%). The model stratified FSW by low (undetectable drug; 0% efficacy) and high adherence (detectable drug; 79.9%; 95% CI: 67.2–87.6% efficacy). FSWs can transition between adherence levels, with lower loss-to-follow-up among highly adherent FSWs (aHR: 0.58; 95% CI: 0.40–0.85; TAPS data). The model was calibrated to monthly data on the national scale-up of PrEP among FSWs over 2016–2020, including reductions in PrEP initiations during 2020. The model projected the impact of the current programme (2016–2020) and the future impact (2021–2040) at current coverage or if initiation and/or retention are doubled. Using published cost data, we assessed the cost-effectiveness (healthcare provider perspective; 3% discount rate; time horizon 2016–2040) of the current PrEP provision. Results: Calibrated to national data, model projections suggest that 2.1% of HIV-negative FSWs were currently on PrEP in 2020, with PrEP preventing 0.45% (95% credibility interval, 0.35–0.57%) of HIV infections among FSWs over 2016–2020 or 605 (444–840) infections overall. Reductions in PrEP initiations in 2020 possibly reduced infections averted by 18.57% (13.99–23.29). PrEP is cost-saving, with $1.42 (1.03–1.99) of ART costs saved per dollar spent on PrEP. Going forward, existing coverage of PrEP will avert 5,635 (3,572–9,036) infections by 2040. However, if PrEP initiation and retention doubles, then PrEP coverage increases to 9.9% (8.7–11.6%) and impact increases 4.3 times with 24,114 (15,308–38,107) infections averted by 2040. Conclusions: Our findings advocate for the expansion of PrEP to FSWs throughout SA to maximize its impact. This should include strategies to optimize retention and should target women in contact with FSW services. © 2023 The Authors. Acceptability and Use of the Dapivirine Vaginal Ring and Daily Oral Pre-exposure Prophylaxis (PrEP) During Breastfeeding in South Africa, Malawi, Zimbabwe, and Uganda	AIDS and Behavior	-	-	10907165	10.1007/s10461-023-04125-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164531628&doi=10.1007%2fs10461-023-04125-w&partnerID=40&md5=1b37f781864704b32dabef8ea628a770	This study examines qualitative acceptability of the dapivirine vaginal ring (DVR) and oral daily pre-exposure prophylaxis (PrEP) among breastfeeding persons participating in Microbicide Trials Network 043/B-PROTECTED, a phase 3B safety and drug detectability study of DVR and oral PrEP in breastfeeding. A subsample of 52 participants were purposively sampled to participate in an in-depth interview (IDI). Breastfeeding participants found both study products to be acceptable, and easy to use. A common motivation for product use was to protect the baby from HIV, although participants' understanding of how the study drug would work to protect their babies was often unclear. While most participants did not report experiencing side effects, fears about side effects were common as both initial worries about how the study products would affect their health and the health of their baby, and increased anxiety that health issues experienced by them, or their baby were from the products. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Gender-Based Violence and Post-traumatic Stress Disorder Symptoms Predict HIV PrEP Uptake and Persistence Failure Among Transgender and Non-binary Persons Participating in a PrEP Demonstration Project in Southern California	AIDS and Behavior	-	-	10907165	10.1007/s10461-022-03807-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137536337&doi=10.1007%2fs10461-022-03807-1&partnerID=40&md5=543560b28273ed7ba7ef25a5d7ab6cde	Gender-based violence (GBV) against transgender and nonbinary (TGNB) persons is a pervasive public health issue. GBV has been linked to mental health problems such as depression and posttraumatic stress disorder (PTSD), as well as risk for HIV seroconversion and HIV treatment nonadherence. However, the impact of GBV on HIV pre-exposure prophylaxis (PrEP) use among TGNB persons has yet to be investigated. In the current study we assessed longitudinal PrEP persistence data from dried blood spots (DBS) collected from 172 racially and ethnically diverse TGNB participants during a 48-week PrEP demonstration project in Southern California from June 2017 to September 2020. Participants were categorized into three levels of PrEP uptake and persistence based on their PrEP levels at the start and end of the study: low–low, high–low, and high–high. Individual-, social-, and structural-level variables were then entered into multinomial logistic regression models to predict levels of PrEP uptake and persistence based on hypotheses informed by syndemic and minority stress theories. The models demonstrated that experience of GBV predicted significantly lower odds of PrEP uptake and persistence and greater PTSD symptoms predicted significantly greater odds of early PrEP discontinuation. Higher levels of coping skills, already being on PrEP at baseline, and being in a steady relationship were associated with greater odds of PrEP uptake and persistence. Implications for future GBV research, advocacy, interventions, and much needed structural changes focused on improving the health and safety of TGNB individuals are discussed. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Storholm E.D.; Klein D.J.; Pedersen E.R.; D'Amico E.J.; Rodriguez A.; Garvey R.; Tucker J.S.	Sociodemographic and Behavioral Risk Correlates of PrEP Interest and Use Among Young Adults Experiencing Homelessness in Los Angeles	AIDS and Behavior	-	-	10907165	10.1007/s10461-023-04144-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85170841184&doi=10.1007%2fs10461-023-04144-7&partnerID=40&md5=849e81798fb411dd9d07af3787a78711	Young adults experiencing homelessness (YAEH) are at elevated risk for HIV compared to their stably housed peers. Preexposure prophylaxis (PrEP) is highly effective at preventing HIV infection, yet YAEH have been largely overlooked in PrEP efforts to date despite YAEH reporting high overall interest in PrEP. We assessed individual, social, and structural variables associated with PrEP interest and use among a sample of 195 YAEH (ages 18–25) recruited from drop-in centers across Los Angeles County who met criteria for HIV risk. In the current sample, though most had heard of PrEP (81.0%), the majority were not interested in taking PrEP (68.2%) and only a minority had used/were using PrEP (11.8%). YAEH who identified as sexual and/or gender minority, reported knowing someone who had used PrEP, or recently accessed sexual health services were more likely to have used and/or reported interest in using PrEP. Those who reported more episodes of heavy drinking were less likely to report having used PrEP. Suggestions are provided for better integrating PrEP-related services into existing behavioral and health service programs for YAEH, as well as leveraging peers and fostering positive social norms to reduce PrEP-related stigma and increase interest and use of PrEP among YAEH. © 2023, The Author(s). Article	2023	Subramanian, Ajan; Huang, Yong; Pinto, Melissa D; Downs, Charles A; Rahmani, Amir M	Using Causal Inference to Estimate the Effect of Pre-Exposure Prophylaxis (PrEP) for HIV Prevention on COVID-19 Mortality.	Annual International Conference of the IEEE Engineering in Medicine and Biology Society	-	-	2694-0604	10.1109/EMBC40787.2023.10340453	https://dx.doi.org/10.1109/EMBC40787.2023.10340453	Traditional machine learning (ML) approaches learn to recognize patterns in the data but fail to go beyond observing associations. Such data-driven methods can lack generalizability when the data is outside the independent and identically distributed (i.i.d) setting. Using causal inference can aid data-driven techniques to go beyond learning spurious associations and frame the data-generating process in a causal lens. We can combine domain expertise and traditional ML techniques to answer causal questions on the data. In this paper, we estimate the causal effect of Pre-Exposure Prophylaxis (PrEP) on mortality in COVID-19 patients from an observational dataset of over 120,000 patients. With the help of medical experts, we hypothesize a causal graph that identifies the causal and non-causal associations, including the list of potential confounding variables. We use estimation techniques such as linear regression, matching, and machine learning (meta-learners) to estimate the causal effect. On average, our estimates show that taking PrEP can result in a 2.1% decrease in the death rate or a total of around 2,540 patients' lives saved in the studied population. HIV pre-exposure prophylaxis and its implementation in the PrEP Impact Trial in England: a pragmatic health technology assessment	The Lancet HIV	-	-	23523018	10.1016/S2352-3018(23)00256-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178177319&doi=10.1016%2fS2352-3018%2823%2900256-4&partnerID=40&md5=91534ed6593dcc7033089db2dfd79da9	Background: HIV pre-exposure prophylaxis (PrEP) is highly effective in preventing HIV acquisition. To enable routine commissioning of PrEP in England, we aimed to establish population need, duration of need, PrEP uptake, and duration of use in attendees of sexual health services (SHS) in England. Methods: The Impact Trial was a prospective, open-label, single-arm, multicentre trial conducted at 157 SHS across England between Oct 13, 2017, and July 12, 2020. Clinicians assessed HIV-negative attendees for their risk of HIV acquisition to identify those who were eligible to participate and receive either daily or event-based oral PrEP (tenofovir disoproxil maleate with emtricitabine), as appropriate. Eligible participants were aged 16 years or older, considered HIV-negative on the day of enrolment, and willing to adhere to the trial procedures. Non-trial attendees are mutually exclusive of trial participants and included SHS attendees who were not recruited to the Impact Trial at any point. They include HIV-negative individuals aged 16 years or older who attended a participating SHS at least once after recruitment at that SHS had begun and before Feb 29, 2020. The main outcomes assessed were PrEP need, uptake, and use, and HIV and sexually transmitted infection (STI) incidence. Data are presented up to Feb 29, 2020, before the introduction of COVID-19 control measures. The study is registered with ClinicalTrials.gov, NCT03253757. Findings: In this analysis, we include 21 356 of 24 268 participants enrolled before Feb 29, 2020. 20 403 participants (95·5%) were men who have sex with men (MSM). Uptake of PrEP among SHS attendees clinically assessed and coded as eligible was 21 292 (57·1%) of 37 289. 18 400 trial participants had at least one post-enrolment visit and a median of 361 days of follow-up (IQR 143–638); 14 039 (75·9%) of these had enough PrEP prescribed to provide protection for 75% of their follow-up time. Among MSM, HIV incidence was 0·13 (95% CI 0·08–0·19) per 100 person-years in trial participants (27 seroconversions) and 0·95 (95% CI 0·88–1·03) per 100 person-years in non-trial attendees (587 seroconversions; proportionate reduction of 86·8%, 95% CI 80·2–91·6). 18 607 bacterial STIs were recorded (incidence 68·1 per 100 person-years in trial participants who were MSM). 4343 (24·4%) MSM participants were diagnosed with two or more STIs, accounting for 14 800 (79·5%) of all 18 607 diagnoses. Interpretation: PrEP need was higher than initially estimated by an expert stakeholder group. The high proportion of follow-up time protected by PrEP suggests that the need for protection persisted throughout trial participation for most participants. HIV incidence among MSM trial participants was low. The large unmet need for PrEP suggests that greater provision is required to maximise the potential of a national programme. The high incidence of bacterial STIs among participants, concentrated within a subgroup of PrEP users, presents an opportunity for tailored STI control measures. Article	2023	Sullivan P.S.; Hall E.; Bradley H.; Sanchez T.; Woodyatt C.R.; Russell E.S.	Estimating HIV Incident Diagnoses Among Men Who Have Sex With Men Eligible for Pre-exposure Prophylaxis but Not Taking It: Protocol and Feasibility Assessment of Data Sources and Methods	JMIR Research Protocols	-	-	19290748	10.2196/42267	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151415036&doi=10.2196%2f42267&partnerID=40&md5=f06fb0488cee332381f22e16ee48d5d8	Background: HIV incidence estimates are published each year for all Ending the HIV Epidemic (EHE) counties, but they are not stratified by the demographic variables highly associated with risk of infection. Regularly updated estimates of HIV incident diagnoses available at local levels are required to monitor the epidemic in the United States over time and could contribute to background incidence rate estimates for alternative clinical trial designs for new HIV prevention products. Objective: We describe methods using existing, robust data sources within areas in the United States to reliably estimate longitudinal HIV incident diagnoses stratified by race and age categories among men who have sex with other men (MSM) eligible for pre-exposure prophylaxis (PrEP) but not taking it. Methods: This is a secondary analysis of existing data sources to develop new estimates of incident HIV diagnoses in MSM. We reviewed past methods used to estimate incident diagnoses and explored opportunities to improve these estimates. We will use existing surveillance data sources and population sizes of HIV PrEP-eligible MSM estimated from population-based data sources (eg, US Census data and pharmaceutical prescription databases) to develop metropolitan statistical area–level estimates of new HIV diagnoses among PrEP-eligible MSM. Required parameters are number of new diagnoses among MSM, estimates of MSM with an indication for PrEP, and prevalent PrEP use including median duration of use; these parameters will be stratified by jurisdiction and age group or race or ethnicity. Preliminary outputs will be available in 2023, and updated estimates will be produced annually thereafter. Results: Data to parameterize new HIV diagnoses among PrEP-eligible MSM are available with varying levels of public availability and timeliness. In early 2023, the most recent available data on new HIV diagnoses were from the 2020 HIV surveillance report, which reports 30,689 new HIV infections in 2020, and 24,724 of them occurred in an MSA with a population of ≥500,000. Updated estimates for PrEP coverage based on commercial pharmacy claims data through February 2023 will be generated. The rate of new HIV diagnoses among MSM can be estimated from new diagnoses within each demographic group (numerator) and the total person-time at risk of diagnosis for each group (denominator) by metropolitan statistical area and year. To estimate time at risk, the person-time of individuals on PrEP or person-time after incident HIV infection but before diagnosis should be removed from stratified population size estimates of the total number of person-years with indications for PrEP. Conclusions: Reliable, serial, cross-sectional estimates for rates of new HIV diagnoses for MSM with PrEP indications can serve as benchmark community estimates of failures of HIV prevention and opportunities to improve services and will support public health epidemic monitoring and alternative clinical trial designs. © Patrick Sean Sullivan, Eric Hall, Heather Bradley, Travis Sanchez, Cory R Woodyatt, Elizabeth S Russell.	clinical trial design; commercial pharmacy data; health monitoring; HIV; HIV epidemic; HIV incidence estimates; men who have sex with men; pre-exposure prophylaxis; public health; surveillance data	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Sun Y.; Lu H.; Ye J.; Li D.; Li G.	Awareness and use of HIV pre-exposure prophylaxis and factors associated with awareness among MSM in Beijing, China	Scientific Reports	-	-	20452322	10.1038/s41598-023-27485-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146191259&doi=10.1038%2fs41598-023-27485-8&partnerID=40&md5=e75434c6ab932ae04636d60b0fe19fb1	Human immunodeficiency virus (HIV) sexual transmission among men who have sex with men (MSM) has increased markedly in Beijing, China in the past decade. Pre-exposure prophylaxis (PrEP) is a highly efficacious biomedical prevention strategy that remarkably reduces HIV-transmission risk. This study examined PrEP awareness among MSM and the factors influencing it. From April to July 2021, respondent-driven sampling was used to conduct a cross-sectional survey among MSM in Beijing, China. Demographic, behavior, and awareness data regarding PrEP were collected. The factors influencing PrEP awareness were assessed using univariate and multivariable logistic regression. In total, 608 eligible responders were included in the study. Among the respondents, 27.9% had PrEP awareness, 3.3% had taken PrEP, and 57.9% expressed interest in receiving PrEP, if required. Greater odds of PrEP awareness were associated with higher education level (adjusted odds ratio aOR 3.525, 95% confidence interval CI 2.013–6.173, P < 0.0001), greater HIV-related knowledge (aOR 3.605, 95% CI 2.229–5.829, P < 0.0001), HIV testing (aOR 2.647, 95% CI 1.463–4.788, P = 0.0013), and sexually transmitted infections (aOR 2.064, 95% CI 1.189–3.584, P = 0.0101). Lower odds of PrEP awareness were associated with higher stigma score (aOR 0.729, 95% CI 0.591–0.897, P = 0.0029). The findings indicate sub-optimal awareness and low utilization of PrEP in Beijing and highlight PrEP inequities among MSM with stigma. Strengthening the training of peer educators in disseminating PrEP knowledge and reducing stigma are critical for improving PrEP awareness. © 2023, The Author(s). Article	2023	Sung, ML; Viera, A; Esserman, D; Tong, G; Davidson, D; Aiudi, S; Bailey, GL; Buchanan, AL; Buchelli, M; Jenkins, M; John, B; Kolakowski, J; Lame, A; Murphy, SM; Porter, E; Simone, L; Paris, M; Rash, CJ; Edelman, EJ	Contingency management and pre-exposure prophylaxis adherence support services (CoMPASS): a hybrid type 1 effectiveness-implementation study to promote HIV risk reduction among people who inject drugs	Contemporary Clinical Trials	-	-	-	10.1016/j.cct.2022.107037	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02503877/full	BACKGROUND: HIV disproportionally affects persons who inject drugs (PWID), but engagement with HIV pre-exposure prophylaxis (PrEP) is low. We describe the rationale and study design for a new study, "Contingency Management and Pre-Exposure Prophylaxis (PrEP) Adherence Support Services (CoMPASS)," a hybrid type 1 effectiveness-implementation trial to promote HIV risk reduction among PWID. METHODS: In four community-based programs in the northeastern United States, PrEP-eligible PWID (target n = 526) are randomized to treatment as usual or Contingency Management (CM) and, as indicated, stepped up to PrEP Adherence Support Services (CoMPASS) over 24 weeks. During CM sessions, participants receive timely tangible rewards for verifiable activities demonstrating 1) PrEP initiation and adherence, and 2) engagement with medications for opioid use disorder (MOUD) and other OUD-related care. Participants who do not have high levels of biomarker-confirmed PrEP adherence at week 12 will be stepped up to receive PrEP Adherence Support Services (PASS) consisting of strengths-based case management over 12 weeks. Interventions are delivered by trained PrEP navigators, staff embedded within the respective sites. The primary outcome is sustained PrEP adherence by dried blood spot testing at 24 weeks. To inform future implementation, we are conducting implementation-focused process evaluations throughout the clinical trial. CONCLUSIONS: Results from this protocol are anticipated to yield novel findings regarding the impact and scalability of CoMPASS to promote HIV prevention among PWID in partnership with community-based organizations. http://ClinicalTrials.gov identifier: NCT04738825.	*Anti-HIV Agents therapeutic use; *Drug Users; *HIV Infections drug therapy, prevention & control; *Human immunodeficiency virus; *Pre-Exposure Prophylaxis methods; *Substance Abuse, Intravenous complications; *injection drug user; *pre-exposure prophylaxis; *risk reduction; Adult; Article; Case management; Controlled study; Dried blood spot testing; Female; Human; Humans; Male; Nonhuman; Organization; Outcome assessment; Randomized controlled trial; Reward; Risk Reduction Behavior; United States	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Swanstrom, Adrienne E; Gorelick, Robert J; Welker, Jorden L; Schmidt, Fabian; Lu, Bing; Wang, Kelly; Rowe, William; Breed, Matthew W; Killoran, Kristin E; Kramer, Joshua A; Donohue, Duncan; Roser, James D; Bieniasz, Paul D; Hatziioannou, Theodora; Pyle, Cathi; Thomas, James A; Trubey, Charles M; Zheng, Jim; Blair, Wade; Yant, Stephen R; Lifson, Jeffrey D; Del Prete, Gregory Q	Long-acting lenacapavir protects macaques against intravenous challenge with simian-tropic HIV.	EBioMedicine	-	-	2352-3964	10.1016/j.ebiom.2023.104764	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10470178	BACKGROUND: Long-acting subcutaneous lenacapavir (LEN), a first-in-class HIV capsid inhibitor approved by the US FDA for the treatment of multidrug-resistant HIV-1 with twice yearly dosing, is under investigation for HIV-1 pre-exposure prophylaxis (PrEP). We previously derived a simian-tropic HIV-1 clone (stHIV-A19) that encodes an HIV-1 capsid and replicates to high titres in pigtail macaques (PTM), resulting in a nonhuman primate model well-suited for evaluating LEN PrEP in vivo. METHODS: Lenacapavir potency against stHIV-A19 in PTM peripheral blood mononuclear cells in vitro was determined and subcutaneous LEN pharmacokinetics were evaluated in naïve PTMs in vivo. To evaluate the protective efficacy of LEN PrEP, naïve PTMs received either a single subcutaneous injection of LEN (25 mg/kg, N = 3) or vehicle (N = 4) 30 days before a high-dose intravenous challenge with stHIV-A19, or 7 daily subcutaneous injections of a 3-drug control PrEP regimen starting 3 days before stHIV-A19 challenge (N = 3). FINDINGS: In vitro, LEN showed potent antiviral activity against stHIV-A19, comparable to its potency against HIV-1. In vivo, subcutaneous LEN displayed sustained plasma drug exposures in PTMs. Following stHIV-A19 challenge, while all vehicle control animals became productively infected, all LEN and 3-drug control PrEP animals were protected from infection. INTERPRETATION: These findings highlight the utility of the stHIV-A19/PTM model and support the clinical development of long-acting LEN for PrEP in humans. Article	2023	Szetela, Bartosz; Łapiński, Łukasz; Giniewicz, Katarzyna	Very High Incidence of Chlamydia trachomatis, Neisseria gonorrhoeae, and Treponema pallidum among Low-Risk MSM in an Outpatient Clinic in Wroclaw, Poland in 2019-2020.	International Journal of Environmental Research and Public Health	-	-	1660-4601 1661-7827	10.3390/ijerph20032582	https://pubmed.ncbi.nlm.nih.gov/36767946/	BACKGROUND: The rise in sexually transmitted infections and chemsex has led to syndemy with HIV, partly due to common routes of transmission and clustered transmissions. Despite this, barriers to STI care and PrEP still remain. We sought to determine whether MSM at low risk for HIV infection were also at low risk for other STIs. METHODS: The study group was tested for HIV, HCV, and Treponema pallidum, as well as had urethral, rectal, and oropharyngeal smears performed for Neisseria gonorrhoeae (NG) and Chlamydia trachomatis (CT) six months apart. The control group was tested once to define the background incidence. RESULTS: Treponema pallidum, CT, and NG prevalence was very high at both time points and was similar to the control group. CT was especially common in the control group (20.58%) and the study group at the rectal site at the second time point (9.37%). NG dominated the oropharyngeal site (15.87%), with urethral site sparing. NG infection was associated with an increased number of partners, not condom use (OR, 1.082 95% CI; 1.009-1.171). Risk behavior did not change between the time points. Treponema pallidum, CT, and NG incidence was exceptionally high (12.5/100PY, 25.39/100PY, 34.92/100PY, respectively; pooled 87.5/100PY) and was comparable to other studies of high-risk MSM. CONCLUSIONS: Despite a lower risk for HIV acquisition, the study group was at a very high risk for other STIs, and this risk remained high throughout the study. Patients and medical professionals should be aware of syphilis, gonorrhea, and chlamydiosis transmission risks, and screening should be performed accordingly. Prophylactic programs need to be updated to specifically include lower-risk individuals. Article	2023	Szyk, Piotr; Czarczynska-Goslinska, Beata; Mlynarczyk, Dariusz T.; Ślusarska, Barbara; Kocki, Tomasz; Ziegler-Borowska, Marta; Goslinski, Tomasz	Polymer-Based Nanoparticles as Drug Delivery Systems for Purines of Established Importance in Medicine.	Nanomaterials	-	-	2079-4991	10.3390/nano13192647	https://www.mdpi.com/2079-4991/13/19/2647#:~:text=The%20most%20significant%20achievements%20of,for%20increased%20efficacy%20of%20adoptively	Many purine derivatives are active pharmaceutical ingredients of significant importance in the therapy of autoimmune diseases, cancers, and viral infections. In many cases, their medical use is limited due to unfavorable physicochemical and pharmacokinetic properties. These problems can be overcome by the preparation of the prodrugs of purines or by combining these compounds with nanoparticles. Herein, we aim to review the scientific progress and perspectives for polymer-based nanoparticles as drug delivery systems for purines. Polymeric nanoparticles turned out to have the potential to augment antiviral and antiproliferative effects of purine derivatives by specific binding to receptors (ASGR1-liver, macrophage mannose receptor), increase in drug retention (in eye, intestines, and vagina), and permeation (intranasal to brain delivery, PEPT1 transport of acyclovir). The most significant achievements of polymer-based nanoparticles as drug delivery systems for purines were found for tenofovir disoproxil in protection against HIV, for acyclovir against HSV, for 6-mercaptopurine in prolongation of mice ALL model life, as well as for 6-thioguanine for increased efficacy of adoptively transferred T cells. Moreover, nanocarriers were able to diminish the toxic effects of acyclovir, didanosine, cladribine, tenofovir, 6-mercaptopurine, and 6-thioguanine.	drug delivery systems; nanoparticles; active pharmaceutical ingredients; pharmaceutical technology; polymers; purines	English	Switzerland	Western and Central Europe and North America	Poland	Western and Central Europe and North America	Poland	Western and Central Europe and North America	Review
Article	2023	Tandon A.; Saseen J.J.; Fink R.M.; Billups S.J.	Primary Care and Infectious Disease Provider Adherence to HIV Pre-exposure Prophylaxis (PrEP) Prescribing and Monitoring Recommendations	AIDS and Behavior	-	-	10907165	10.1007/s10461-023-04154-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169958072&doi=10.1007%2fs10461-023-04154-5&partnerID=40&md5=9fe308096def74df287c5f5a10736311	This study aimed to compare primary care (PC) and infectious diseases (ID) provider adherence to HIV pre-exposure prophylaxis (PrEP) prescribing and monitoring parameters outlined in Centers for Disease Control/Department of Health and Human Services (CDC/DHHS) guidelines. This retrospective cohort analysis from 2017 to 2022 used prescription and laboratory order data to identify patients prescribed PrEP by PC or ID providers. Primary endpoints assessed were adherence to baseline and follow-up HIV monitoring recommendations in the 12 months following the initial PrEP prescription. Secondary endpoints included appropriate PrEP prescription order quantities (≤ 90-day supply), appropriate renal function monitoring, and identification of factors independently associated with follow-up HIV monitoring adherence. Of the 324 eligible patients identified, 112 received PrEP from an ID specialist and 212 from a PC provider. Patients prescribed PrEP from an ID specialist were more likely to have appropriately completed baseline HIV monitoring (OR = 2.56, 95% CI 1.20, 5.47), follow-up HIV monitoring (OR = 1.81, 95% CI 1.08, 3.05), and renal function monitoring (OR = 2.81, 95% CI 1.69, 4.68); The ID group was also more likely to have PrEP prescriptions appropriately authorized for a days' supply of ≤ 90 days (OR = 4.41, 95% CI 2.60, 7.48). Patients receiving PrEP care from ID specialists had better adherence to all assessed PrEP prescribing and monitoring recommendations compared to those receiving care from PC providers. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Tanner M.R.; Zhu W.; Iqbal K.; Dominguez K.L.; Yu L.; Hayes T.D.; Wiener J.; Koenig L.J.; Batey S.; Burgess S.; Elamin F.; Fox A.; Price A.; Wood L.; Hoover K.W.	HIV Pre-exposure Prophylaxis Services for Black and Hispanic or Latino Gay, Bisexual, and Other Men Who Have Sex With Men and Transgender Women in THRIVE, 2015-2020	Journal of Acquired Immune Deficiency Syndromes	-	-	15254135	10.1097/QAI.0000000000003138	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148772366&doi=10.1097%2fQAI.0000000000003138&partnerID=40&md5=ecccd1b004672cecd4895c4d4a799ea4	Background and setting:From 2015 to 2020, the THRIVE project supported 7 US health departments to improve HIV prevention services for Black or African American (Black) and Hispanic or Latino gay, bisexual, and other men who have sex with men (GBM) and transgender women (TGW).Methods:We described services provided in the THRIVE PrEP continuum. Using Poisson regression models, we estimated associations between race or ethnicity and age and PrEP screening, linkage, and prescription. We examined associations between colocation of services and PrEP linkage and prescription for 2 sites.Results:THRIVE served 12,972 GBM without HIV; 37% of PrEP-eligible GBM were prescribed PrEP. THRIVE served 1185 TGW without HIV; 45% of PrEP-eligible TGW were prescribed PrEP. Black and Hispanic or Latino GBM were 29% (RR = 0.71, 95% CI: 0.66-0.77) and 19% (RR = 0.81, 95% CI: 0.75-0.87) less likely, respectively, to be prescribed PrEP than White GBM. GBM aged 18-24 years and 55 years or older were 19% (RR = 0.81, 95% CI: 0.75-0.87) and 22% (RR = 0.78, 95% CI: 0.67-0.9) less likely, respectively, to be prescribed PrEP compared with those aged 35-44 years. Colocated services were associated with a 54% (RR = 1.54, 95% CI: 1.44-1.64) and a 31% (RR = 1.31, 95% CI: 1.19-1.43) greater likelihood of PrEP linkage and prescription, respectively, compared with services at different locations.Conclusions:THRIVE provided PrEP to higher proportions of PrEP-eligible persons than current national estimates; however, PrEP use disparities persist. Colocation of services may be a useful component of jurisdictional strategies to increase PrEP coverage. © 2023 Lippincott Williams and Wilkins. Article	2023	Tao J.; Sosnowy C.; Arnold T.; Kapadia J.; Parent H.; Rogers B.G.; Almonte A.; Chan P.A.	Perspectives of a peer-driven approach to improve pre-exposure prophylaxis and HIV prevention among Black/African American and Hispanic/Latino men who have sex with men	Sexual Health	-	-	14485028	10.1071/SH23072	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169026450&doi=10.1071%2fSH23072&partnerID=40&md5=612634f32c32e2f40d08826298bd1ce3	Background: Black/African American (B/AA) and Hispanic/Latino (H/L) men who have sex with men (MSM) are significantly less likely than white MSM to initiate pre-exposure prophylaxis (PrEP). A peer-driven intervention (PDI) may be an effective approach to addressing this disparity. In this study, we explored community member perspectives of a PDI to promote PrEP uptake among B/AA and H/L MSM. Methods: We conducted semi-structured interviews with B/AA and H/L HIV-negative MSM between August 2018 and October 2019 in Rhode Island, USA. Participants reported their perspectives and recommendations for a PDI. Data from participant responses were thematically analysed. Results: Of 15 MSM, the median age was 25 years (interquartile range: 22, 33). The majority identified as B/AA (53.3%), H/L (66.7%), and having a college education or above (53.3%). Most participants viewed a PDI positively and were willing to learn and promote PrEP among their peers. Participants identified and supported several potential intervention components, such as education about the benefit of PrEP, emphasising prevention-effective dosing, and clarifying no prevention effect towards other sexually transmitted infections. They preferred in-person meetings to electronic communication. Preferred characteristics of peer educators included compassion, good communication skills, and enthusiasm about PrEP. Conclusions: This in-depth qualitative interview suggested that a PDI approach is promising in promoting PrEP uptake, as it could deliver culturally appropriate education and encourage PrEP uptake via peer influence among B/AA and H/L MSM. © 2023 CSIRO. Article	2023	Teitelman A.M.; Tieu H.-V.; Chittamuru D.; Shaw P.A.; Nandi V.; Davis A.; Lipsky R.K.; Darlington C.K.; Fiore D.; Koblin B.A.	A Randomized Controlled Pilot Study of Just4Us, a Counseling and Navigation Intervention to Promote Oral HIV Prophylaxis Uptake Among PrEP-Eligible Cisgender Women	AIDS and Behavior	-	-	10907165	10.1007/s10461-023-04017-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149258456&doi=10.1007%2fs10461-023-04017-z&partnerID=40&md5=75f7162cf639bd31dcd804e2a4bb93f9	HIV pre-exposure prophylaxis (PrEP) uptake among cisgender women in the United States is low. Just4Us, a theory-based counseling and navigation intervention, was evaluated in a pilot randomized controlled trial among PrEP-eligible women (n = 83). The comparison arm was a brief information session. Women completed surveys at baseline, post-intervention, and at three months. In this sample, 79% were Black, and 26% were Latina. This report presents results on preliminary efficacy. At 3 months follow-up, 45% made an appointment to see a provider about PrEP; only 13% received a PrEP prescription. There were no differences in PrEP initiation by study arm (9% Info vs. 11% Just4Us). PrEP knowledge was significantly higher in the Just4Us group at post-intervention. Analysis revealed high PrEP interest with many personal and structural barriers along the PrEP continuum. Just4Us is a promising PrEP uptake intervention for cisgender women. Further research is needed to tailor intervention strategies to multilevel barriers. Article	2023	Temelkovska T.; Moriarty K.; Huerta L.; Perez-Brumer A.; Segura E.; Passaro R.C.; Lake J.E.; Clark J.; Blair C.	Social Networks Play a Complex Role in HIV Prevention Knowledge, Attitudes, Practices, and the Uptake of PrEP Through Transgender Women Communities Centered Around Three "Casas Trans" in Lima, Peru: A Qualitative Study	Journal of the International Association of Physicians in AIDS Care	-	-	23259574	10.1177/23259582231196705	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85172679585&doi=10.1177%2f23259582231196705&partnerID=40&md5=9bda2b03976f7ae210dcd7c5c6539bf7	Transgender women's (TW) social networks may facilitate HIV prevention information dissemination and normative reinforcement. We conducted a qualitative study of social networks among 20 TW affiliated with 3 "casas trans" (houses shared among TW) in Lima, Peru, using diffusion of innovations theory to investigate community-level HIV prevention norms. Participants completed demographic questionnaires, social network interviews, and semistructured in-depth interviews. Median age was 26 and all participants engaged in sex work. Interviews revealed high HIV prevention knowledge and positive attitudes, but low engagement in HIV prevention. Respondents primarily discussed HIV prevention with other TW. Network members' opinions about pre-exposure prophylaxis (PrEP) frequently influenced respondents' personal beliefs, including mistrust of healthcare personnel, concern that PrEP efficacy was unproven, fear of adverse effects, and frustration regarding difficulty accessing PrEP. Patterns of influence in TW networks may be leveraged to improve uptake of HIV prevention tools, including PrEP. © The Author(s) 2023. Article	2023	Teng F.; Sha Y.; Fletcher L.M.; Welsch M.; Burns P.; Tang W.	Barriers to uptake of PrEP across the continuum among transgender women: A global scoping review	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624231152781	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148442505&doi=10.1177%2f09564624231152781&partnerID=40&md5=f403d398065fe10bcd6b21d51614cd2b	Background: Although preexposure prophylaxis (PrEP) has demonstrated high efficacy for HIV prevention, rates of PrEP uptake remain low among the transgender population, especially in transgender women (TGW). We conducted this scoping review to assess and characterize barriers to PrEP use along the PrEP care continuum among TGW. Methods: We conducted this scoping review by searching studies in Embase, PubMed, Scopus, and Web of Science. Eligibility criteria included: reporting a PrEP related quantitative result among TGW; peer-reviewed and published in English between 2010-2021. Results: Globally, high willingness (80%) to use PrEP was found, yet uptake and adherence (35.4%) were low. TGW experiencing hardship, including poverty, incarceration, and substance use, were associated with higher odds of PrEP awareness but lower odds of PrEP use. Structural and social barriers such as stigma, medical mistrust, and perceived racism can be important barriers for PrEP continuation. High social cohesion and hormone replacement therapy were associated with greater odds of awareness. In addition, our study confirmed prior research showing that PrEP does not lower feminizing hormone levels in TGW. Conclusions: Significant demographic factors among TGW that are associated with PrEP engagement. It is imperative to focus on TGW as a population with independent needs, requiring specific PrEP care guidelines and tailored resource allocation, that fully considers individual-, provider-, and community/structural-level barriers and facilitators. The present review also indicates that combining PrEP care with GAHT or broader gender-affirmation care may facilitate PrEP use. © The Author(s) 2023.	continuum of care; global; HIV; preexposure prophylaxis; transgender women	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	China	Asia and the Pacific	Review
Theses and Dissertations	2023	Teng, Fei	Understanding Barriers and Facilitators to Pre-Exposure Prophylaxis (PrEP) Care Continuum among Vulnerable Populations in the United States and China	-	-	University of Mississippi Medical Center	-	na	na	https://www.proquest.com/dissertations-theses/understanding-barriers-facilitators-pre-exposure/docview/2848799333/se-2?accountid=8113	This dissertation evaluates a myriad of structural, geographic, and socio-economic disparities existing among marginalized populations (e.g., TGW, Black MSM and Chinese MSM) at high risk of HIV and utilizes multiple studies to evaluate different levels of barriers along Pre-Exposure Prophylaxis (PrEP) care continuum among those vulnerable populations. Furthermore, this research explore perception of HIV risk among marginalized population (Black MSM and Chinese MSM) aims to provide preliminary data for a future larger-scale intervention study to address low uptake and adherence of PrEP. Promoting health education and behaviors and addressing the systematic stigma can be an important strategy to facilitate improved HIV prevention efforts, HIV care and treatment, and to decrease HIV-related disparities. Article	2023	Terada-Hirashima J.; Mizushima D.; Takano M.; Tokita D.; Oka S.	Efficacy and Safety of Pre-Exposure Prophylaxis to Control HIV and Sexually Transmitted Infection Among Men Who Have Sex With Men: Protocol for a Single-Arm Interventional Study	JMIR Research Protocols	-	-	-	19290748	10.2196/50919	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179117869&doi=10.2196%2f50919&partnerID=40&md5=9ad44a036223a11fa3a96a4b012d4711	Background: Pre-exposure prophylaxis (PrEP) against HIV infection is a new approach that involves the prophylactic use of the anti-HIV drug Truvada (tenofovir disoproxil fumarate TDF and emtricitabine FTC) by people not infected with HIV. Objective: The objective of this investigator-initiated clinical study of PrEP was to evaluate the incidence of HIV and sexually transmitted infection (STI), safety and efficacy of PrEP in PrEP users, and their compliance with PrEP medication. The social, medical, and economic benefits of PrEP in Japan was assessed. Methods: This single-center feasibility study of PrEP was conducted at the National Center for Global Health and Medicine, Tokyo, Japan, where a cohort of men who have sex with men without HIV was established in January 2017. This single-arm interventional study compared the efficacy and safety of PrEP in a single group of men who have sex with men who participated in PrEP cohort studies. For reference, the cohort study participants who did not participate in the PrEP study were included for comparison. Blood samples were collected for storage at baseline and clinic visits at 1, 3, and 6 months after starting PrEP and every 3 months thereafter. The participants were administered with 1 tablet of Truvada once daily as PrEP. They underwent blood and anal swab tests 1 and 3 months after starting PrEP and then HIV and STI infection assessments at 3-month intervals. Blood samples were centrifuged at the AIDS Clinical Center Laboratory. PrEP safety was evaluated by monitoring serum creatinine levels for symptoms of renal function disorders. The primary end point was the incidence of HIV in PrEP users (100 person-years). The secondary end points were the incidence of STI in PrEP users (100 person-years), incidence of adverse events caused by Truvada, frequency of high-risk sexual activity, and adherence to periodic visits and medication. Results: The study protocol was reviewed and approved by the certified review board of the National Center for Global Health and Medicine (NCGM-C-003129-03) on April 20, 2020. Changes to the study plan were submitted for review by the certified review board and approved before implementation. Recruitment was completed on March 28, 2019, and the study was completed (last adult participant and last time point) on March 31, 2021. The data were analyzed, and the main results of the study have been published in a peer-reviewed journal. Conclusions: The findings indicated that PrEP is a highly effective and feasible strategy against HIV infection in terms of prophylactic response, retention, and compliance. Article	2023	Tesema, Naomi; Guillaume, Dominique; Francis, Sherilyn; Paul, Sudeshna; Chandler, Rasheeta	Mobile Phone Apps for HIV Prevention Among College-Aged Black Women in Atlanta: Mixed Methods Study and User-Centered Prototype.	JMIR Formative Research	-	-	-	2561-326X	10.2196/37987	https://pubmed.ncbi.nlm.nih.gov/36821362/	BACKGROUND: Black women in college are disproportionately affected by HIV diagnoses. Mobile apps can facilitate the innovative delivery of accurate HIV and sexual and reproductive health information. However, mobile health interventions are severely underused in this population. OBJECTIVE: We aimed to quantitatively and qualitatively explore the perspectives of college-aged Black women on using a mobile health app for HIV prevention and sexual and reproductive health. The data obtained from Black women were used to design preliminary mobile app wireframes and features. METHODS: This explanatory, sequential mixed methods study took place from 2019 to 2020 and targeted Black women who were enrolled in college or who had recently graduated from college. Convenience sampling was used during the quantitative phase, followed by purposive sampling in the qualitative phase. A cross-sectional web-based survey evaluating the willingness to use a mobile app for HIV prevention was conducted in the quantitative phase. Descriptive statistics were used for all variables. A separate focus group discussion was conducted with Black women in college to expand on the quantitative results. Focus group discussions explored their perceptions on HIV and health content delivered through a mobile app along with potential features that participants desired within the app. Using the data obtained, we selected the primary features for the app prototype. RESULTS: In total, we enrolled 34 participants in the survey, with 6 participating in focus group discussions. Over half of the respondents reported a willingness to use an app that contained pre-exposure prophylaxis content. Women who claimed recent sexual activity reported being more likely to use an app feature that would allow them to order an at-home HIV testing kit than their non-sexually active counterparts. The emerging themes from the focus group session were Black women's health concerns, HIV risk, sources of health information, and preferred app features. The content in our prototype included speaking with a specialist, HIV and pre-exposure prophylaxis information, holistic wellness, and features promoting engagement and retention. CONCLUSIONS: The results of our study guided the design of wireframes for an app prototype targeting HIV prevention in college-aged Black women. The rapid growth of mobile devices in Black communities, coupled with high rates of smartphone ownership among Black youth, makes mobile health interventions a promising strategy for addressing sexual and reproductive health disparities. Participants in our sample were willing to use a culturally appropriate and gender-considerate app for their sexual health needs. Our findings indicate that Black women in college may be excellent candidates for mobile app-based interventions. Article	2023	Tessema, Frazer A.; Barenie, Rachel E.; Avorn, Jerry; Kesselheim, Aaron S.	Federal Funding For Discovery And Development Of Costly HIV Drugs Was Far More Than Previously Estimated.	Health Affairs	-	-	-	1544-5208 0278-2715	10.1377/hlthaff.2022.01134	https://pubmed.ncbi.nlm.nih.gov/37126755/	In July 2012, tenofovir disoproxil fumarate-emtricitabine (TDF-FTC, brand name Truvada) was approved by the Food and Drug Administration (FDA) to prevent HIV infection. To estimate the extent of the US government's direct financial contribution to the discovery and development of Truvada, we identified National Institutes of Health awards using FDA documents, peer-reviewed literature, patent records, court filings, and other publicly available materials. We classified seventy-three federal government awards to eleven researchers as being directly linked to the development and clinical testing of Truvada for prevention therapy, through which the US government spent an estimated $143 million. The substantial public funding raises questions about the high price charged by the drug's manufacturer, which reduced its affordability and limited its accessibility as HIV preventive therapy. Risk Factors Associated with Loss to Follow-up Among Transgender Women Receiving HIV Pre-exposure Prophylaxis in Chiang Mai province, Thailand	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03782-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135471389&doi=10.1007%2fs10461-022-03782-7&partnerID=40&md5=e614256e167c2eb80f277dda16fa74c9	Although HIV pre-exposure prophylaxis (PrEP) is free in Thailand, many transgender women discontinue taking it after initiation. We determined the loss to follow-up (LTFU) rate of transgender women who initiated PrEP at the Mplus Foundation, Chiang Mai, Thailand, and identified associated risk factors using Cox proportional hazard models. Of 235 participants who initiated PrEP, 59 (55%) out of 108 remaining participants had reactive syphilis. The LTFU rate at 6 months was 38% (95% confidence interval CI: 29–48%). Multivariable analysis indicates that LTFU is independently associated with age ≥ 26 years old (adjusted hazard ratio aHR = 2.09; 95% CI: 1.06–4.14) and reactive syphilis (aHR = 1.98; 95% CI:1.01–3.88). Delayed appointment scheduling by the PrEP providers and the syphilis clinic was associated with transgender women having reactive syphilis, and the lockdown policy during the COVID-19 pandemic might have influenced them to discontinue PrEP and their subsequent LTFU. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Tian T.; Fu L.; Lu Z.; Bian J.; Zhou X.; Wang B.; Lin Y.-F.; Zhang Z.; Liu L.; Xi M.; Zhen C.; Dai J.; Zou H.	Changes in HPV prevalence, incidence, and clearance following the use of HIV pre-exposure prophylaxis (PrEP) among MSM in Xinjiang, China: An observational cohort study	Journal of Medical Virology	-	-	-	1466615	10.1002/jmv.29112	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85172221839&doi=10.1002%2fjmv.29112&partnerID=40&md5=40e35874e9c682ffd325f798e64ea124	The association between HIV pre-exposure prophylaxis (PrEP) and the natural history of human papillomavirus (HPV) has not been well documented. Our objective was to evaluate the impact of PrEP on the prevalence, incidence, and clearance of anal HPV among men who have sex with men (MSM). Sexually active, HIV-negative MSM aged 18 years and older in Xinjiang, China since September 1, 2016, were enrolled in an ongoing observational cohort study of HPV. At baseline and every 6 months, an anal swab was taken to test for HPV and a questionnaire on sociodemographic characteristics and sexual behaviors was collected. Those who consented to receive PrEP were enrolled in an open-label PrEP intervention study from November 1, 2019, to June 30, 2021. This study analyzed data from participants present in the HPV cohort between November 1, 2019, and June 30, 2021. We compared the prevalence, incidence, and clearance of anal HPV between men who received PrEP (PrEP users) and those who did not (non-PrEP users), and compared men before and after initiating PrEP. We calculated prevalence ratios (PRs), incidence rate ratios (IRRs), and clearance rate ratios (CRRs) for both comparisons. Of the 870 participants present in the HPV cohort during the period between November 1, 2019, and June 30, 2021, 859 had adequate β-globin for HPV genotype testing and were included in our study. Among them, 429 were PrEP users, while 430 were non-PrEP users. Median age was 32 years (interquartile range IQR: 26–38). Among PrEP users, 217 were tested for anal HPV before PrEP initiation. PrEP users had lower prevalence of HPV 45, 51, and 54 (PRs: 0.27 95% CI: 0.09–0.80, 0.42 0.21–0.85, and 0.41 0.17–0.99, respectively) and lower clearance of HPV 16 (CRR: 0.31 0.10–0.91) compared with non-PrEP users. PrEP users exhibited lower prevalence of HPV 51 (PR: 0.31 0.12–0.84), lower incidence of HPV 6, 11, 16, 39 and 61 (IRRs: 0.34 0.13–0.90, 0.26 0.08–0.87, 0.44 0.21–0.91, 0.21 0.05–0.93, and 0.19 0.04–0.82, respectively), as well as higher clearance of HPV 52 (CRR: 2.17 1.08–4.35) after PrEP initiation. PrEP use may lower the risk of HPV infection among MSM in Xinjiang, China. Our findings further extend the knowledge of the impact of PrEP on sexually transmitted infections. © 2023 Wiley Periodicals LLC. Article	2023	Tieosapjaroen W.; Zhang Y.; Fairley C.K.; Zhang L.; Chow E.P.F.; Phillips T.R.; Schmidt H.-M.; Bavinton B.R.; O'Donnell D.; Mao L.; Grulich A.; Ong J.J.	Improving access to oral pre-exposure prophylaxis for HIV among international migrant populations	The Lancet Public Health	-	-	-	24682667	10.1016/S2468-2667(23)00105-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166006859&doi=10.1016%2fS2468-2667%2823%2900105-6&partnerID=40&md5=bb30b423464461c1dac9f9f96cd304ff	Pre-exposure prophylaxis (PrEP) is recommended for people susceptible to HIV acquisition, and the scale-up of PrEP programmes has contributed to new HIV case reductions at a population level. However, international migrants continue to be disproportionately affected by HIV. Understanding barriers and facilitators to PrEP implementation among international migrants can optimise PrEP use among this population and ultimately reduce HIV incidence worldwide. We reviewed the evidence regarding factors influencing PrEP implementation among international migrants; 19 studies were included. The barriers and facilitators at the individual level were related to knowledge and risk perception of HIV. Cost, provider discriminations, and health system navigation influenced PrEP use at the service level. Positive or negative perception towards LGBT+ identities, HIV, and PrEP users affected PrEP use at the societal level. Most existing PrEP campaigns do not target international migrants; therefore, culturally tailored approaches for people from different backgrounds are warranted. Potentially migration-related and HIV-related discriminatory policies must be reviewed to increase access to HIV prevention services to end HIV transmission at a population level. © 2023 The Author(s). Article	2023	Tordoff, Diana M.; Minalga, Brian; Perry, Nicole Lynn; Gross, Bennie; Khosropour, Christine M.; Glick, Sara N.; Barbee, Lindley A.; Duerr, Ann	Heterogeneity in HIV/Sexually Transmitted Infection Prevalence and Prevention Among the Partners of Transgender and Nonbinary People.	Sexually Transmitted Diseases	-	-	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001796	https://pubmed.ncbi.nlm.nih.gov/36881439/	BACKGROUND: Transgender and nonbinary (TNB) people are diverse in their sexual orientation and partnerships. We describe the epidemiology of HIV/sexually transmitted infection (STI) prevalence and prevention utilization among the partners of TNB people in Washington State. METHODS: We pooled data from five 2017 to 2021 cross-sectional HIV surveillance data sources to generate a large sample of TNB people and cisgender people who had a TNB partner in the past year. We described characteristics of recent partners of trans women, trans men, and nonbinary people and used Poisson regression to assess if having a TNB partner was associated with self-reported HIV/STIs prevalence, testing, and preexposure prophylaxis (PrEP) use. RESULTS: Our analysis included 360 trans women, 316 trans men, 963 nonbinary people, 2896 cis women, and 7540 cis men. Overall, 9% of sexual minority cis men, 13% of sexual minority cis women, and 36% of TNB participants reported having any TNB partners. There was significant heterogeneity in HIV/STI prevalence, testing, and PrEP use among the partners of TNB people by study participant gender and the gender of their sex partners. In regression models, having a TNB partner was associated with a higher likelihood of HIV/STI testing and PrEP use but was not associated with higher HIV prevalence. CONCLUSIONS: We observed significant heterogeneity in HIV/STI prevalence and preventative behaviors among the partners of TNB people. Given that TNB people are diverse in their sexual partnerships, there is a need to better understand individual-, dyad-, and structural-level factors that facilitate HIV/STI prevention across these diverse partnerships. Recent HIV infection and annualized HIV incidence rates among sexual and gender minorities in Brazil and Peru (ImPrEP seroincidence study): a cross-sectional, multicenter study	The Lancet Regional Health - Americas	-	-	-	2667193X	10.1016/j.lana.2023.100642	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178165091&doi=10.1016%2fj.lana.2023.100642&partnerID=40&md5=bbfc723937b8f5f9bf346a0e31fe78ce	Background: HIV incidence estimation is critical for monitoring the HIV epidemic dynamics and the effectiveness of public health prevention interventions. We aimed to identify sexual and gender minorities (SGM) with recent HIV infections, factors associated with recent HIV infection, and to estimate annualised HIV incidence rates. Methods: Cross-sectional multicentre study in HIV testing services in Brazil and Peru (15 cities). Inclusion criteria: 18+ years, SGM assigned male at birth, not using pre-/post-exposure prophylaxis. We identified recent HIV infection using the Maxim HIV-1 LAg-Avidity EIA assay as part of a recent infection testing algorithm (RITA). Annualized HIV incidence was calculated using the UNAIDS/WHO incidence estimator tool. Multivariable logistic regression models were used to estimate factors associated with recent HIV infection. Trial registration: NCT05674682. Findings: From 31-Jan-2021 to 29-May-2022, 6899 individuals participated Brazil: 4586 (66.5%); Peru: 2313 (33.5%); 5946 (86.2%) cisgender men, 751 (10.9%) transgender women and 202 (2.9%) non-binary/gender diverse. Median age was 27 (IQR: 23–34) years. HIV prevalence was 11.4% (N = 784/6899); 137 (2.0%) SGM were identified with recent HIV infection. The overall annualized HIV incidence rate was 3.88% (95% CI: 2.86–4.87); Brazil: 2.62% (95% CI: 1.78–3.43); Peru: 6.69% (95% CI: 4.62–8.69). Participants aged 18–24 years had higher odds of recent HIV infection compared to those aged 30+ years in both countries. Interpretation: Our results highlight the significant burden of HIV epidemic among SGM in large urban centres of Brazil and Peru. Public health policies and interventions to increase access to effective HIV prevention methods such as PrEP are urgently needed in Latin America. Background: Pre-exposure prophylaxis (PrEP) scale-up is urgent to reduce new HIV cases among gay, bisexual, and other men who have sex with men (MSM) in Latin America. Different PrEP modalities may increase PrEP uptake and adherence, especially among young MSM. Objectives: To assess preferences for PrEP modalities among MSM from Brazil, Mexico, and Peru. Design: Cross-sectional web-based study (March–May 2018) targeting MSM through advertisements on Grindr, Hornet, and Facebook. We included MSM aged ⩾ 18 years and who reported HIV-negative status. Methods: We assessed preferences for PrEP modalities with the following question: 'Considering that all following PrEP modalities were available, which one would you prefer considering a scale from 1 to 3 (1 = most preferred): daily oral PrEP, event-driven PrEP (ED-PrEP), and long-acting injectable PrEP'. We assessed factors associated with each most preferred PrEP modality per country using multivariable logistic regression models. Results: A total of 19,457 MSM completed the questionnaire (Brazil: 58%; Mexico: 31%; Peru: 11%); median age was 28 years interquartile range (IQR): 24–34. Overall, injectable PrEP was the most preferred modality 42%; 95% confidence interval (CI): 41–43, followed by daily PrEP (35%; 95% CI: 34–35), and ED-PrEP (23%; 95% CI: 23–24). In multivariable models, preferring injectable PrEP was associated with PrEP awareness in all three countries, while PrEP eligibility only in Brazil. Preferring daily PrEP was associated with younger age and lower income in Brazil and Mexico, and lower education only in Brazil. The odds of preferring ED-PrEP were lower among MSM aware and eligible for PrEP in Brazil and Mexico. Conclusions: Long-acting injectable PrEP was the preferred PrEP modality among MSM in Brazil, Mexico, and Peru, especially those aware and eligible for PrEP. Public health interventions to increase PrEP modalities literacy and availability in Latin America are urgent especially among MSM of young age, lower income, and lower education. Findings: From 31-Jan-2021 to 29-May-2022, 6899 individuals participated Brazil: 4586 (66.5%); Peru: 2313 (33.5%); 5946 (86.2%) cisgender men, 751 (10.9%) transgender women and 202 (2.9%) non-binary/gender diverse. Median age was 27 (IQR: 23-34) years. HIV prevalence was 11.4% (N = 784/6899); 137 (2.0%) SGM were identified with recent HIV infection. The overall annualized HIV incidence rate was 3.88% (95% CI: 2.86-4.87); Brazil: 2.62% (95% CI: 1.78-3.43); Peru: 6.69% (95% CI: 4.62-8.69). Participants aged 18-24 years had higher odds of recent HIV infection compared to those aged 30+ years in both countries. Interpretation: Our results highlight the significant burden of HIV epidemic among SGM in large urban centres of Brazil and Peru. Public health policies and interventions to increase access to effective HIV prevention methods such as PrEP are urgently needed in Latin America. Article	2023	Torres, Thiago Silva; Silva, Mayara Secco Torres; Coutinho, Carolina; Hoagland, Brenda; Jalil, Emilia Moreira; Cardoso, Sandra Wagner; Moreira, Julio; Magalhaes, Monica Avelar; Luz, Paula Mendes; Veloso, Valdilea G.; Grinsztejn, Beatriz	Evaluation of Mpox Knowledge, Stigma, and Willingness to Vaccinate for Mpox: Cross-Sectional Web-Based Survey Among Sexual and Gender Minorities.	JMIR Public Health and Surveillance	-	-	-	2369-2960	10.2196/46489	https://publichealth.jmir.org/2023/1/e46489	BACKGROUND: The 2022 multicountry mpox outbreak positioned the condition as a public health emergency of international concern. By May 2023, Brazil ranked second globally in the cumulative number of mpox cases and deaths. The higher incidence of mpox among gay and other men who have sex with men in the current mpox outbreak deepens the stigma and discrimination against sexual and gender minorities (SGM). This might worsen the structural barriers impacting access to health services, which ultimately leads to undertesting and underreporting of cases. There are no data available on mpox knowledge and stigma in Latin America. OBJECTIVE: We aimed to evaluate mpox knowledge, stigma, and willingness to vaccinate for mpox among SGM, and to describe sociodemographic and behavioral characteristics according to self-reported mpox diagnosis. METHODS: A cross-sectional, internet-based survey was conducted in a convenience sample of adults (aged >18 years) living in Brazil recruited through advertisements on dating apps, social media, referral institutions for infectious diseases websites, and mass media (October-November 2022). We compared participants' characteristics according to self-reported mpox diagnosis using chi-square test or Fisher exact test for qualitative variables and Kruskal-Wallis test for quantitative variables. RESULTS: We enrolled 6236 participants: 5685 (91.2%) were cisgender men; 6032 (96.7%) were gay, bisexual, or pansexual; 3877 (62.2%) were White; 4902 (78.7%) had tertiary education; and 4070 (65.2%) reported low or middle income. Most participants (n=5258, 84.4%) agreed or strongly agreed that "LGBTQIA+ individuals are being discriminated and stigmatized due to mpox." Mpox awareness was 96.9% (n=6044), and 5008 (95.1%) were willing to get vaccinated for mpox. Overall, 324 (5.2%) reported an mpox diagnosis. Among these, 318 (98.1%) reported lesions, 178 (56%) local pain, and 316 (99.4%) sought health care. Among participants not reporting a diagnosis, 288 (4.9%) had a suspicious lesion, but only 158 (54.9%) of these had sought health care. Compared to participants with no diagnosis, those reporting an mpox diagnosis were younger (P<.001), reported more sex partners (P<.001), and changes in sexual behavior after mpox onset (P=.002). Moreover, participants diagnosed with mpox reported more frequently being tested for HIV in the prior 3 months (P<.001), living with HIV (P<.001), currently using HIV pre-exposure prophylaxis (P<.001), and previous sexually transmitted infection diagnosis (P<.001). CONCLUSIONS: Our results point to high mpox knowledge and willingness to vaccinate among SGM in Brazil. Participants self-reporting mpox diagnosis more frequently reported to be living with HIV, STI diagnosis, and current pre-exposure prophylaxis use, highlighting the importance of an mpox assessment that includes comprehensive sexual health screenings. Efforts to decrease stigma related to mpox among SGM are necessary to avoid mpox underdiagnosis. Book Section	2023	Torres-Cruz C.; Pérez-Brumer A.	Sex, drugs and biomedical prevention: Rethinking sexual health through PrEP research in Peru and HPV vaccine roll-out in Mexico	-	Routledge Handbook of Sexuality, Gender, Health and Rights: Second Edition	-	9 781003800446	-	10.4324/9781003278405-46	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180022867&doi=10.4324%2f9781003278405-46&partnerID=40&md5=2046e2ccff9fe1bd252bbb187f5bf2bd	Drawing on two distinct ethnographies in Latin America, this chapter considers the social consequences of the biomedicalisation of HIV and HPV prevention strategies in re-defining sexual health. The first case study assesses how access to pre-exposure prophylaxis (PrEP) for HIV prevention in Peru shifted meanings and understandings of sexuality and the importance given to sexual risk in the political economy of global health. The second examines how the introduction of Gardasil's HPV preventive vaccine and associated public policies impacted gender, sex and sexuality in Mexico. While approved for use with all adolescents, the vaccine's promotion to cisgender girls reified dominant narratives about heteronormative cisgender female sexuality and risk. By understanding PrEP research and HPV vaccination as deeply connected to the workings of health systems from the North, we show how biomedical prevention fails to engage with social and political realities concerning sex, sexuality and gender in Latin America. These realities must be understood as both barriers and facilitators to the successful deployment of biomedical prevention but must be understood in the context of history, the local environment, culture and social relations - and how these too have been influenced by the broader political economy of health. © 2024 selection and editorial matter, Peter Aggleton, Rob Cover, Carmen H. Article	2023	Torres-Rueda, Sergio; Terris-Prestholt, Fern; Gafos, Mitzy; Indravudh, Pitchaya Peach; Giddings, Rebecca; Bozzani, Fiammetta; Quaife, Matthew; Ghazaryan, Lusine; Mann, Carlyn; Osborne, Connie; Kavanagh, Matthew; Godfrey-Faussett, Peter; Medley, Graham; Malhotra, Shelly	Health Economics Research on Non-surgical Biomedical HIV Prevention: Identifying Gaps and Proposing a Way Forward.	PharmacoEconomics	-	-	-	1179-2027 1170-7690	10.1007/s40273-022-01231-w	https://pubmed.ncbi.nlm.nih.gov/36905570/	BACKGROUND AND OBJECTIVE: Although HIV prevention science has advanced over the last four decades, evidence suggests that prevention technologies do not always reach their full potential. Critical health economics evidence at appropriate decision-making junctures, particularly early in the development process, could help identify and address potential barriers to the eventual uptake of future HIV prevention products. This paper aims to identify key evidence gaps and propose health economics research priorities for the field of HIV non-surgical biomedical prevention. METHODS: We used a mixed-methods approach with three distinct components: (i) three systematic literature reviews (costs and cost effectiveness, HIV transmission modelling and quantitative preference elicitation) to understand health economics evidence and gaps in the peer-reviewed literature; (ii) an online survey with researchers working in this field to capture gaps in yet-to-be published research (recently completed, ongoing and future); and (iii) a stakeholder meeting with key global and national players in HIV prevention, including experts in product development, health economics research and policy uptake, to uncover further gaps, as well as to elicit views on priorities and recommendations based on (i) and (ii). RESULTS: Gaps in the scope of available health economics evidence were identified. Little research has been carried out on certain key populations (e.g. transgender people and people who inject drugs) and other vulnerable groups (e.g. pregnant people and people who breastfeed). Research is also lacking on preferences of community actors who often influence or enable access to health services among priority populations. Oral pre-exposure prophylaxis, which has been rolled out in many settings, has been studied in depth. However, research on newer promising technologies, such as long-acting pre-exposure prophylaxis formulations, broadly neutralising antibodies and multipurpose prevention technologies, is lacking. Interventions focussing on reducing intravenous and vertical transmission are also understudied. A disproportionate amount of evidence on low- and middle-income countries comes from two countries (South Africa and Kenya); evidence from other countries in sub-Saharan Africa as well as other low- and middle-income countries is needed. Further, data are needed on non-facility-based service delivery modalities, integrated service delivery and ancillary services. Key methodological gaps were also identified. An emphasis on equity and representation of heterogeneous populations was lacking. Research rarely acknowledged the complex and dynamic use of prevention technologies over time. Greater efforts are needed to collect primary data, quantify uncertainty, systematically compare the full range of prevention options available, and validate pilot and modelling data once interventions are scaled up. Clarity on appropriate cost-effectiveness outcome measures and thresholds is also lacking. Lastly, research often fails to reflect policy-relevant questions and approaches. CONCLUSIONS: Despite a large body of health economics evidence on non-surgical biomedical HIV prevention technologies, important gaps in the scope of evidence and methodology remain. To ensure that high-quality research influences key decision-making junctures and facilitates the delivery of prevention products in a way that maximises impact, we make five broad recommendations related to: improved study design, an increased focus on service delivery, greater community and stakeholder engagement, the fostering of an active network of partners across sectors and an enhanced application of research. Article	2023	Townes, Ashley; Gaul, Zaneta; Henny, Kirk D.	Sexual health discussion practices and HIV clinical care provided by primary care providers in the Southeast United States, K-BAP Study (2017-2018).	Family Medicine	-	-	-	1460-2229 0263-2136	10.1093/fampra/cmac081	https://pubmed.ncbi.nlm.nih.gov/35899789/	OBJECTIVE: Research underscores the importance of providers having routine discussions with patients about their sexual health. We examined the occurrences and association of routine sexual health discussion practices and human immunodeficiency virus (HIV) clinical care among primary care providers (PCPs) in areas with high HIV prevalence. METHODS: We analysed data collected between April and August 2017 from an online survey that assessed PCPs knowledge, behaviours, attitudes, and practices of HIV-related care in 6 Southeast US jurisdictions (Atlanta, Baltimore, Baton Rouge, District of Columbia, Miami, and New Orleans). RESULTS: Among PCPs, we found that 39.2% routinely obtained sexual health histories, 78.5% offered HIV testing, and 16.0% ever prescribed preexposure prophylaxis (PrEP). Based on adjusted prevalence ratios (aPRs) and 95% confidence intervals (CIs), the proportion of PCPs who routinely obtained sexual histories was higher among female PCPs (aPR = 1.47, 95% CI 1.04, 2.08), PCPs who had a patient population that was >50% men who have sex with men (MSM) (aPR = 1.94, 95% CI 1.72, 2.18), offered HIV testing (aPR = 3.60, 95% CI 2.23, 5.79), and ever prescribed PrEP (aPR = 1.43, 95% CI 1.06, 1.93). CONCLUSION: Improving patient-provider discussions are needed to reduce HIV-related service barriers for disproportionately affected populations. PRACTICE IMPLICATIONS: Routine discussions can reduce barriers to important HIV prevention and care services and help reduce disparities among patients living in highly prevalent HIV locations. Article	2023	Townes, Ashley; Pyra, Maria; Smith, Dawn K; Babu, Aruna Surendera; Williams, Tiffany; Wiener, Jeffrey; Henny, Kirk D; Schneider, John	PrEP Use and Adherence among Transgender Persons in Chicago, IL (SHIPP Study, 2014-2018, USA).	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03826-y	https://pubmed.ncbi.nlm.nih.gov/36094640/	Few studies investigating daily oral preexposure prophylaxis (PrEP) focus on transgender persons. The Sustainable Health Center Implementation PrEP Pilot (SHIPP) Study included a large observational cohort of transgender persons with implications for PrEP in the United States. We examined data from SHIPP's observational cohort and its Medication Adherence Substudy (MAS) to understand adherence among transgender participants in Chicago, IL. We assessed adherence by the proportion of days covered (PDC) for PrEP medication prescriptions, self-reported interview data, and concentrations of intracellular tenofovir diphosphate (TFV-DP) in dried blood spot (DBS) samples. Between 2014 and 2018, there were 510 transgender participants, 349 (68.4%) transgender women and 152 (29.8%) transgender men. Forty-five of these participants were enrolled in the MAS, 31 (68.9%) transgender women and 9 (20.0%) transgender men. By the 3-month follow up, 100% of MAS participants who completed an interview reported taking 4 or more doses of PrEP in the previous week. At 6, 9, and 12 months, taking 4 or more doses in the past week was reported by 81.0%, 94.1%, and 83.3% of participants, respectively. Results from TFV-DP DBS indicated that fewer participants reached the same level of adherence (4 or more doses/week) at clinical visits compared to self-report and even fewer participants reached this level of adherence based on the calculated PDC. Among participants who remained on PrEP throughout the study, DBS adherence levels declined after the first three months. There remains a critical need to develop strategies to address barriers and interventions that support PrEP adherence among transgender people. Article	2023	Traeger, Michael W.; Mayer, Kenneth H.; Krakower, Douglas S.; Gitin, Sy; Jenness, Samuel M.; Marcus, Julia L.	Potential impact of doxycycline post-exposure prophylaxis prescribing strategies on incidence of bacterial sexually transmitted infections.	Clinical Infectious Diseases	-	-	-	1537-6591 1058-4838	10.1093/cid/ciad488	https://pubmed.ncbi.nlm.nih.gov/37595139/	BACKGROUND: Doxycycline post-exposure prophylaxis (doxyPEP) reduces bacterial sexually transmitted infection (STI) incidence in people with HIV (PWH) or using HIV preexposure prophylaxis (PrEP). Given concerns about widespread antibiotic use, we identified doxyPEP prescribing strategies to minimize use while maximizing impact on STIs. METHODS: We used electronic health records of gay and bisexual men (GBM), transgender women, and non-binary people assigned male sex at birth with ≥2 STI tests (chlamydia, gonorrhea, syphilis) at an LGBTQ-focused health center during 2015-2020. We defined 10 hypothetical doxyPEP prescribing strategies based on PrEP use, HIV status, or STI history. We estimated doxyPEP use and STI diagnoses averted in counterfactual scenarios in which people meeting prescribing criteria received doxyPEP, assuming STI rates during use would have been reduced by clinical trial efficacy estimates. RESULTS: Among 10,546 individuals (94% GBM), rate of any STI was 35.9/100 person-years. Prescribing doxyPEP to all individuals would have averted 71% of STI diagnoses (number needed to treat for one year to avert one STI diagnosis, NNT = 3.9); prescribing to PrEP users/PWH (52%/12% of individuals) would have averted 60% of STI diagnoses (NNT = 2.9). Prescribing doxyPEP for 12 months after STI diagnosis would have reduced the proportion using doxyPEP to 38% and averted 39% of STI diagnoses (NNT = 2.4). Prescribing after concurrent or repeated STIs would have maximized efficiency (lowest NNTs) but prevented fewer STIs. CONCLUSIONS: Prescribing doxyPEP to individuals with STIs, particularly concurrent or repeated STIs, could avert a substantial proportion of all STI diagnoses. The most efficient prescribing strategies are based on STI history rather than HIV status or PrEP use. Article	2023	Traeger, Michael W; Harney, Brendan L; Sacks-Davis, Rachel; van Santen, Daniela K; Cornelisse, Vincent J; Wright, Edwina J; Hellard, Margaret E; Doyle, Joseph S; Stoové, Mark A	Incidence and Prevalence of Hepatitis C Virus Among HIV-Negative Gay and Bisexual Men Using HIV Pre-exposure Prophylaxis (PrEP): A Systematic Review and Meta-analysis.	Open Forum Infectious Diseases	-	-	-	2328-8957	10.1093/ofid/ofad401	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10428087	Background: Gay and bisexual men using HIV pre-exposure prophylaxis (PrEP) are at increased risk for sexually transmissible infections. Hepatitis C virus (HCV) risk among PrEP users is less clear. We explored HCV prevalence and incidence among cohorts of gay and bisexual men using PrEP and sources of heterogeneity across studies. Methods: This was a systematic review and meta-analysis of open-label PrEP studies to April 2022 reporting HCV prevalence at baseline or incidence during follow-up among gay and bisexual men using PrEP. Pooled prevalence and incidence estimates were calculated using random-effects meta-analysis, and subgroup analyses were performed by study- and country-level characteristics, including availability of HCV direct-acting antiviral (DAA) therapy at time of study. Results: Twenty-four studies from 9 countries were included, with a total sample of 24 733 gay and bisexual men. Pooled HCV antibody baseline prevalence was 0.97% (95% CI, 0.63%-1.31%), and pooled HCV RNA baseline prevalence was 0.38% (95% CI, 0.19%-0.56%). Among 19 studies reporting HCV incidence, incidence ranged from 0.0 to 2.93/100 person-years (py); the pooled estimate was 0.83/100py (95% CI, 0.55-1.11). HCV incidence was higher in 12 studies that began follow-up before broad DAA availability (1.27/100py) than in 8 studies that began follow-up after broad DAA availability (0.34/100py) and higher in studies in Europe compared with North America and Australia. Conclusions: Early reports of high HCV incidence among PrEP-using cohorts likely reflect enrollment of individuals based on specific risk-based PrEP eligibility criteria for smaller studies and enrollment before DAA scale-up. In contexts where both DAAs and PrEP have been implemented at scale, studies report lower HCV incidence. PrEP-specific HCV testing guidelines should be guided by local epidemiology. Essay	2023	Traeger, Michael W; Krakower, Douglas S; Mayer, Kenneth H; Marcus, Julia L	Prioritising the values of potential users to promote uptake of HIV pre-exposure prophylaxis.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(23)00171-6	https://dx.doi.org/10.1016/S2352-3018(23)00171-6	Benefits of pre-exposure prophylaxis (PrEP) extend beyond HIV risk reduction. Users report a range of physical, emotional, and social effects, including reduced anxiety, increased intimacy, and greater sexual satisfaction. For some people, these benefits are the primary motivation for using PrEP. To successfully engage in shared decision making about HIV prevention methods, clinicians need to be able to discuss all potential risks and benefits of PrEP. These risks and benefits include not only those related to HIV risk reduction and other clinical outcomes, but also those related to experiences and relationships that people value. However, national and international clinical resources on the provision of PrEP do not include user-reported outcomes that are values-based or reflect positive effects on personal, social, or sexual wellbeing. To better integrate the values of potential users into discussions about PrEP, clinician training programmes and clinical guidelines need to be guided by community-driven frameworks and expanded to include user-reported outcomes of PrEP use, including beneficial effects. Achieving PrEP uptake and equity goals will require an approach to PrEP provision that centres the values and desired experiences of potential users, particularly those from populations with the greatest unmet need for PrEP. Theses and Dissertations	2023	TRAEGER, MICHAEL WILLIAM	Epidemiology and prevention of sexually transmissible infections among gay and bisexual men in the era of HIV pre-exposure prophylaxis.	-	-	Monash University	-	NA	NA	http://hdl.handle.net/10.26180/23657442.v1	HIV pre-exposure prophylaxis (PrEP), the use of antiretroviral medications by people without HIV to reduce their risk of HIV acquisition, is a highly efficacious HIV prevention strategy. In Australia, PrEP was first available through large implementation trials which enrolled more than 20,000 people nationally from 2016, and from 2018 became available through Australia's universal healthcare scheme. PrEP has significantly impacted the sexual and overall wellbeing of gay and bisexual men (GBM) in Australia, leading to increased comfort in condomless sex with partners with HIV and reductions in serosorting. While traditional combination approaches to HIV prevention, including behavioural risk reduction, regular testing, and condom use, also help prevent other sexually transmitted infections (STIs), newer biomedical prevention strategies, such as PrEP and Treatment as Prevention (or Undetectable = Untransmissible) have led to a decoupling of HIV and STI prevention. In Australia, HIV and STI epidemics among GBM are now diverging, with HIV infections steadily declining as STI infections increase. The overarching aims of my PhD were to explore the impact of PrEP implementation in Australia on the epidemiology of non-HIV STIs among GBM and improve understanding of the sexual and healthseeking behaviours of GBM using PrEP, to help guide Australia's response to increasing STIs. This thesis comprises of two literature reviews and five empirical studies. The first two studies are epidemiological analyses of data from the Australian Collaboration for Coordinated Enhanced Sentinel Surveillance (ACCESS), a nation-wide sentinel surveillance system for blood borne viruses and STIs. Representing the largest STI incidence studies of PrEP users (>22,000) and GBM (>100,000) globally, these studies found stabilising trends in chlamydia and gonorrhoea among PrEP users, but high rates of syphilis reinfection across groups of GBM suggesting increasing syphilis transmission between sexual networks of GBM with and without HIV, influenced by changes in PrEP use and serosorting. The fourth study is a latent class analysis of participants from a large Australian PrEP implementation study. This study identified four distinct classes of PrEP users based on their behaviours and attitudes towards STIs and STI prevention. Most PrEP users belonged to two groups distinguished by highly disparate attitudes towards STIs but with similar rates of a recent bacterial STI. Findings suggest that attitudes towards STIs among GBM using PrEP in Australia vary considerably, and likely influence their receptivity to different STI prevention strategies. The final study is a mathematical modelling study based on gonorrhoea transmission among gay and bisexual men in Victoria, Australia. which explored the estimated impact of a hypothetical antimicrobial gel-based intervention for reducing gonorrhoea incidence. The introduction of a moderate-efficacy intervention could have benefits for population-level gonorrhoea prevention, even when the intervention is considerably less efficacious than condoms and uptake contributes to reduced condom use. This thesis provides real-world data on the interplay between widespread PrEP uptake and STI epidemiology, including the interplay between HIV prevention, STI testing, sexual networks, behaviours, and attitudes towards STIs. The thesis provides empiric evidence to inform STI prevention strategies, and novel insights into how these may be targeted to maximise impact in the era of PrEP. These findings can also guide other countries planning to scale up PrEP to effectively plan for and address the impact of PrEP implementation on other STIs. The third study is a systematic review and meta-analysis of studies of hepatitis C among GBM using PrEP. This meta-analysis found that high rates hepatitis C in early PrEP studies were likely reflective of risk-based PrEP eligibility criteria and higher community hepatitis C viraemia at the time of study. Later, larger studies, and studies which occurred in settings where hepatitis C direct-acting antiviral treatments (DAAs) were widely available (such as in Australia), found significantly lower rates of hepatitis C among PrEP users. Findings support the hypothesis that uptake of DAAs among GBM translates to less hepatitis C transmission in PrEP users. Prophylaxis to Prevent HIV Infections (PREP)-2010	-	Top Articles in Primary Care	-	978-303125620-2	-	10.1007/978-3-031-25620-2_31	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171011865&doi=10.1007%2f978-3-031-25620-2_31&partnerID=40&md5=fec0cc2ba7d3276322d276389d219c17	I remember the visit vividly. I had seen the patient for evaluation of lymphadenopathy. A workup revealed only one lab abnormality: the patient had become HIV positive, a new development compared to their last test 2 months prior. What became clear after the fact was that the patient had been in an HIV discordant relationship. The patient had been HIV negative, and their partner had been HIV positive, though the patient only became aware of this discordance shortly before their own diagnosis. It highlighted for me the potential for benefit from PrEP, and the need for uptake by primary care providers. © The Editor(s) (if applicable) and The Author(s), under exclusive license to Springer Nature Switzerland AG 2023. Article	2023	Tran, Hieu Trung; Tsuchiya, Kiyoto; Kawashima, Akira; Watanabe, Koji; Hayashi, Yoshiharu; Ryu, Shoraku; Hamada, Akinobu; Gatanaga, Hiroyuki; Oka, Shinichi	Steady-state pharmacokinetics of plasma tenofovir alafenamide (TAF), tenofovir (TFV) and emtricitabine (FTC), and intracellular TFV-diphosphate and FTC-triphosphate in HIV-1 infected old Japanese patients treated with bictegravir/FTC/TAF.	Global Health & Medicine	-	-	-	-	2434-9194 2434-9186	10.35772/ghm.2023.01060	https://pubmed.ncbi.nlm.nih.gov/37655187/	Emtricitabine (FTC) plus tenofovir alafenamide (TAF) has demonstrated efficacy and safety for pre-exposure prophylaxis (PrEP) to prevent HIV-1 infection. We measured the plasma PK of FTC, tenofovir (TFV), and TAF in a steady-state pharmacokinetic (PK) study of bictegravir/FTC/TAF in HIV-1-infected patients. Furthermore, validated liquid chromatography-tandem mass spectrometry was used to measure intracellular TFV-diphosphate (DP) and FTC-triphosphate (TP), the active metabolites of TFV and FTC, respectively. Plasma and dried blood spot samples were collected from 10 male patients aged ≥ 50 years at various time intervals: 0 (trough), 1, 2, 3, 4, 6, 8, 12, and 24 h after drug administration. The mean ± standard deviation of plasma PK parameters were as follows: The maximum concentrations of TAF, TFV, and FTC were 104.0 ± 72.5, 27.9 ± 5.2, and 3,976.0 ± 683.6 ng/mL, respectively. Additionally, their terminal elimination half-lives were 0.6 ± 0.5, 31.6 ± 10.4, and 6.9 ± 1.4 h, respectively. These results were consistent with previously reported data. The intracellular levels of TFV-DP and FTC-TP varied widely among individuals; however, they remained stable over 24 h in each individual at approximately 1,000-1,500 and 2,000-3,000 fmol/punch, respectively, indicating that plasma concentrations did not affect the intracellular concentrations of their active metabolites. These results demonstrated that measuring intracellular TFV-DP and FTC-TP could be useful for monitoring adherence to PrEP in clients on this regimen.	pre-exposure prophylaxis; dried blood spot; intracellular concentration; liquid chromatography-tandem mass spectrometry; plasma concentration	English	United Kingdom	Western and Central Europe and North America	Japan	Asia and the Pacific	Japan	Asia and the Pacific	Clinical
Article	2023	Tran, Julien; Vlaev, Ivo; Read, Daniel; Schmidtke, Kelly Ann; Chow, Eric P F; Lee, David; Tapa, James; Ong, Jason J	A qualitative evaluation of a Nudgeathon event for the co-design of sexual health campaign images targeting overseas-born men who have sex with men.	Sexual Health	-	-	-	-	1449-8987	10.1071/SH22125	https://dx.doi.org/10.1071/SH22125	BACKGROUND: Additional approaches to HIV prevention and management, such as Nudgeathons, are required to increase access to HIV pre-exposure prophylaxis (PrEP) among overseas-born men who have sex with men (MSM). METHODS: In September 2021, we conducted a 4-h online Nudgeathon, wherein four teams co-designed behaviourally informed adverts to improve PrEP access and uptake for overseas-born MSM. After the Nudgeathon, eight of 17 invited Nudgeathon attendees were interviewed about their experience. We conducted a qualitative content analysis of interview data to highlight participants' experiences of the co-design process. RESULTS: We identified three major themes: (1) what worked well; (2) group dynamics; and (3) improvement and future directions. The Nudgeathon about PrEP was a positive learning experience, with valuable contributions and overall satisfaction with the end-products. The online format was perceived as less costly than if the Nudgeathon was hosted in person, and suitable for participants from different geographical regions. In-person Nudgeathons with international attendees would require costs for flights, accommodation, function room hire and catering. Within groups, sharing personal experiences essential to co-designing concepts. However, less information on how to create nudges and more information before the Nudgeathon was preferred. CONCLUSION: Our evaluation finds that Nudgeathons are fast and efficient in developing potential solutions to complex issues related to HIV prevention. Article	2023	Triplett N.S.; Roberts S.T.; Hartmann M.; Wagner D.; Reddy K.R.; Mathebula F.; Tolley E.E.; Baeten J.M.; Palanee-Phillips T.; Montgomery E.T.	Examining Associations Between Mental Health, IPV Exposure, HIV Risk Behaviors, and PrEP Use in South African Women: An Analysis of Data from the Charisma Study	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03936-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143230945&doi=10.1007%2fs10461-022-03936-7&partnerID=40&md5=8142a85cc318a27ac2f982be02ca9085	Intimate partner violence (IPV) has been associated with poorer mental health outcomes and increased human immunodeficiency virus (HIV) risk behaviors. We examine the relations between IPV, mental health symptomology (defined as psychological distress and alcohol misuse), and engagement in HIV risk behaviors among a sample of South African women who participated in a randomized controlled trial of CHARISMA, an intervention to increase women's agency to use oral pre-exposure prophylaxis (PrEP) safely and consistently as well as mitigate relationship challenges. We also examined the impact of trial participation on women's mental health, as well as the impact of psychological distress on the effectiveness of the CHARISMA intervention. Mental health symptomology and IPV exposure were prevalent and associated with some HIV risk and protective behaviors. Trial participation reduced psychological distress. There was no evidence for mental health symptomology impacting the effectiveness of the CHARISMA intervention. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Tross S.; Spector A.Y.; Ertl M.M.; Berg H.; Turrigiano E.; Hoffman S.	A Qualitative Study of Barriers and Facilitators of PrEP Uptake Among Women in Substance Use Treatment and Syringe Service Programs	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03853-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141046519&doi=10.1007%2fs10461-022-03853-9&partnerID=40&md5=4ff3c47c7dd44c305399c2b9e6940a8b	PrEP is an HIV prevention option that could benefit substance-involved women, a high-risk population with low PrEP uptake. Little is known about their interest in PrEP. This qualitative study used in-depth interviews to examine PrEP willingness, barriers, and facilitators among 16 women in outpatient psychosocial substance use treatment, methadone, and/or harm reduction/syringe programs in NYC. All expressed willingness to use PrEP, but only during periods of perceived risk. Women perceived themselves to be at high risk for HIV when engaging in active substance use and/or transactional sex. They perceived themselves to be at low risk and therefore unmotivated to take PrEP when abstinent from these activities. Paradoxically, a major barrier to using PrEP was anticipated interference from substance use and transactional sex, the very same activities that create a perception of risk. Facilitators of PrEP use included perceptions of it as effortless (as opposed to barrier methods during sex) and effective, safe, and accessible. Other barriers included fear of stigma and doubts about adhering daily. Recommendations for best PrEP implementation practices for substance-involved women included tailored and venue-specific PrEP information and messaging, PrEP discussion with trusted medical providers, and on-site PrEP prescription in substance use treatment and harm reduction programs. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Troutman J.; Robillard A.; Ingram L.A.; Qiao S.; Gaddist B.; Segosebe K.	INDIVIDUAL, SOCIAL, AND STRUCTURAL VULNERABILITY FOR BLACK WOMEN IN THE SOUTH: IMPLICATIONS FOR PrEP	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2023.35.4.290	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166438639&doi=10.1521%2faeap.2023.35.4.290&partnerID=40&md5=b6053c5ed21f12e8e22871acdce491d0	Pre-exposure prophylaxis (PrEP) is an effective biomedical HIV prevention option, yet adoption among Black women, who are disproportionately impacted by HIV, is low. A nuanced understanding of the multi-level factors that contribute to elevated risk is necessary to better contextualize PrEP uptake. Qualitative data from Black women residing in the Southern U.S. who self-screened as HIV-negative, were collected via four focus groups (N = 27) to understand influences on HIV vulnerability and the potential role of PrEP in mitigating risk. Content analysis of transcribed data yielded multiple themes addressing: the pervasiveness of sexual partner sharing; lack of transparency regarding HIV status, disclosure, and testing; and social/cultural influences on HIV risk. Experiences with the health care system and providers were of particular concern. Findings demonstrate support for PrEP in this population and contribute to our understanding of individual, social, and structural factors to better inform PrEP promotion. © 2023 The Guilford Press. Article	2023	Truong, Hong-Ha M; Heylen, Elsa; Kadede, Kevin; Amboka, Sayo; Otieno, Beatrice; Odhiambo, Hanningtone; Odeny, Damaris; Hewa, Marion; Opiyo, Maurice; Opondo, Fidel; Ogolla, David; Guzé, Mary A; Miller, Lara E; Bukusi, Elizabeth A; Cohen, Craig R	HIV Pre-Exposure Prophylaxis (PrEP) Awareness and Use Among Adolescents in Kenya.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000003338	https://dx.doi.org/10.1097/QAI.0000000000003338	Background: HIV pre-exposure prophylaxis (PrEP) is an effective prevention tool; however, use among adolescents is thought to be low. To determine the unmet need and opportunity to expand use, we assessed awareness, prior use, and willingness to take PrEP among Kenyan adolescents. Methods: The Maneno Yetu study recruited a community-based sample of adolescents aged 15–19 years (N = 3061) in Kisumu for a survey using respondent-driven sampling. Results: Overall, 50% of adolescents had heard of PrEP and 2% had used PrEP. Girls were more likely than boys to have heard of PrEP (53.4% vs. 45.1%; P < 0.001) and used PrEP (3.6% vs. 0.3%; P < 0.001). Among participants, 14% engaged in transactional sex and 21% experienced forced sexual contact. PrEP use was higher among adolescents who engaged in transactional sex (4.8% vs. 0.6%; P < 0.001) and experienced forced sexual contact (2.7% vs. 0.7%; P < 0.001) compared with those who did not. Among adolescents with no prior use, 53% were willing to consider using PrEP, although girls were less willing than boys (49.7% vs. 55.9%; P = 0.001). Conclusions: PrEP is an important prevention tool, especially for adolescents whose circumstances potentially expose them to HIV-positive or unknown status sexual partners, yet remains underused, particularly in resource-limited settings. Although many expressed willingness to use PrEP, low awareness and use highlight the need to expand HIV prevention education and services tailored for adolescents. Our finding that boys were more willing to use PrEP suggests campaigns should also be designed to reach male youth to narrow the gender gap and expand uptake in the adolescent population. Article	2023	Truong, Hong-Ha; Guzé, Mary; Kadede, Kevin; Amboka, Sayo; Otieno, Beatrice; Odhiambo, Hanningtone; Odeny, Damaris; Hewa, Marion; Opiyo, Maurice; Opondo, Fidel; Fatch, Robin; Ogolla, David; Miller, Lara; Bushman, Dena; Bukusi, Elizabeth; Cohen, Craig	HIV Infection Among Adolescents Residing in Urban Informal Settlements of Kenya.	AIDS Education and Prevention	-	-	-	-	NA	10.1521/aeap.2023.35.3.225	https://escholarship.org/uc/item/00b214cb	Adolescents comprise approximately 15% of new HIV infections in Kenya. Impoverished living conditions in informal settlements place residents at high risk for HIV infection. We assessed factors associated with HIV infection among adolescents residing in urban informal settlements in Kisumu. We recruited 3,061 adolescent boys and girls aged 15-19. HIV prevalence was 2.5% overall, all newly identified cases were among girls and infection was positively associated with not completing a secondary education (p < .001). Girls who had ever been pregnant (p < .001) or out-of-school without completing a secondary education (p < .001) were more likely to be HIV-positive. Our findings of higher HIV prevalence among adolescent girls who had been pregnant or did not complete secondary school highlight the need to facilitate access to HIV testing, HIV pre-exposure prophylaxis, and sexual and reproductive health services as components of a comprehensive prevention strategy to decrease HIV infections in this priority population. Article	2023	Turpin R.E.; Mandell C.J.; Camp A.D.; Davidson Mhonde R.R.; Dyer T.V.; Mayer K.H.; Liu H.; Coates T.; Boekeloo B.O.	COVID-19, Vaccine Hesitancy, and HIV Pre-exposure Prophylaxis among Black Sexual Minority Men	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000003305	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176509679&doi=10.1097%2fQAI.0000000000003305&partnerID=40&md5=39a014b2711a6fdbcf87bc326bdf0788	Background:The COVID-19 pandemic has created substantial and profound barriers to several forms of health care engagement. For Black sexual minority men, this may include engagement with pre-exposure prophylaxis (PrEP) to prevent HIV infection, with significant implications for HIV disparities. Our study explored how the COVID-19 pandemic affected Black sexual minority men, with a focus on relationships between COVID-19 and PrEP engagement.Setting:We sampled 24 Black sexual minority men attending HIV prevention-related events in the greater D.C. Metropolitan area (D.C., Maryland, Virginia).Methods:We conducted qualitative phone interviews among our sample. Questions were primarily focused on the COVID-19 pandemic and how it affected engagement and considerations of PrEP use. Interviews were transcribed and qualitatively analyzed using the 6 stages of thematic analysis.Results:We identified 3 major themes from our thematic analysis: Changes in the health care system, changes in sexual and relationship contexts, and COVID-19 vaccine hesitancy and misinformation. Relationships between COVID-19 vaccine hesitancy and PrEP hesitancy were especially prevalent, with participants describing that COVID-19 hesitancy can directly deter PrEP use through eroding medical trust further.Conclusions:We identified changes in the health care system, sexual and relationship contexts, and COVID-19 vaccine hesitancy as important issues driven by COVID-19 with significant implications for PrEP use. The COVID-19 pandemic has changed the health care and social landscape in profound ways that affect PrEP access, sexual networks, and associated HIV vulnerability. Future research further exploring relationships between specific pandemic stressors and HIV prevention among Black sexual minority men is recommended. © 2023 Lippincott Williams and Wilkins. Article	2023	Turpin R.E.; Mandell C.J.; Camp A.D.; Davidson Mhonde R.R.; Dyer T.V.; Mayer K.H.; Liu H.; Coates T.; Boekeloo B.O.	Monkeypox-Related Stigma and Vaccine Challenges as a Barrier to HIV Pre-Exposure Prophylaxis among Black Sexual Minority Men	International Journal of Environmental Research and Public Health	-	-	-	-	16617827	10.3390/ijerph20146324	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165940244&doi=10.3390%2fijerph20146324&partnerID=40&md5=e6d6bcd1c4651cb04ac2f0a86b1b33da	Background: The U.S. monkeypox (mpox) outbreak of 2022 was a unique emergent public health crisis disproportionately affecting Black sexual minority men (BSMM). Similar to other stigmas, mpox-related stigma may have adverse effects on BSMM, including deterring HIV prevention such as PrEP. Methods: Our study investigated the experiences and perceptions of BSMM related to mpox, including mpox-associated stigma, and PrEP engagement among BSMM. We conducted qualitative interviews of 24 BSMM attending HIV prevention-related events in the greater D.C. Metropolitan area. In-depth interviews were conducted via phone, and responses to questions specific to the mpox outbreak were analyzed using thematic analysis. Results: We identified three key themes from the analysis: Mpox-related stigma, Mpox vaccine availability concerns, and Mpox vaccine hesitancy. Participants also described relationships between each of these three themes and PrEP use. Mpox stigma was particularly relevant as it is related to sexual stigma and is a deterrent to PrEP use. A sense of health system neglect of BSMM, especially related to low mpox vaccine availability, was also described. Conclusions: We identified mpox stigma and challenges related to mpox vaccination as key themes among BSMM, with implications for PrEP use. Future research exploring medical mistrust among BSMM, particularly related to HIV prevention, is recommended. © 2023 by the authors. Article	2023	Tyler, S; Coleman, H; Ali, A; Nori, A	The role of a specialist HIV pre-exposure prophylaxis pharmacist	Sexually Transmitted Infections	-	-	-	-	1368-4973	10.1136/sextrans-BASHH-2023.108	https://sti.bmj.com/content/99/Suppl_1/A56.1	Abstract Introduction The efficacy of HIV Pre-Exposure Prophylaxis (PrEP) is well established, however success largely depends on reach, access and medication adherence. This review describes the expanding role of a pharmacist within a sexual and reproductive health (SRH) clinic including the benefits of improved quality of care and access to PrEP. Method Data was collected on successful service improvements implemented by a specialist HIV PrEP pharmacist. Results Since being in post from July 2022 the pharmacist alongside members of the MDT has led on the following service improvements:- • Implementation of a streamlined all-day nurse led clinic for routine PrEP through patient group directive sign offs and education and training. This has led to an increase in uptake of PrEP by 30%. • Establishing a weekly virtual complex PrEP MDT clinic to review medical complexities such as side effects and renal impairment. This has allowed us to provide options and nephrology referrals for patients who cannot take NHS PrEP. Over 500 patients which is over 20% of our cohort has been reviewed over a 6-month period. • Creation of an online appointment system for PrEP appointments. • Implementation of a weekly Pharmacist PrEP clinic for training new staff and reviewing complex patients (up to 5 patients/week). • Strategic planning for novel deliveries of PrEP to increase capacity and access for marginalised communities (e.g. via medication lockers and remote pathways). Discussion Pharmacists are experts in medication, adherence counselling, adverse effects and monitoring which are critical to clinically successful and safe PrEP usage. PrEP service leadership by a pharmacist skilled in HIV/SRH with an understanding of contracts and supply chain has proven to be beneficial. Article	2023	Ugarte, Ainoa; de la Mora, Lorena; García, David; Martínez-Rebollar, María; de Lazzari, Elisa; Torres, Berta; Inciarte, Alexy; Ambrosioni, Juan; Chivite, Iván; Solbes, Estela; de Loredo, Nicolás; Del Carlo, Guillermo Federico; González-Cordón, Ana; Blanco, José Luis; Martínez, Esteban; Mallolas, Josep; Laguno, Montserrat	Evolution of Risk Behaviors, Sexually Transmitted Infections and PrEP Care Continuum in a Hospital-Based PrEP Program in Barcelona, Spain: A Descriptive Study of the First 2 Years' Experience.	Infectious Diseases and Therapy	-	-	-	-	2193-8229	10.1007/s40121-022-00733-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9753893	INTRODUCTION: Pre-exposure prophylaxis (PrEP) is effective for HIV prevention, but the PrEP care continuum also involves improving PrEP awareness, uptake, adherence, and retention in care. Users' awareness is often compromised because of vulnerability factors and risk behaviors, such as chemsex practice or specific substance use, which could lead to risk compensation. Correct adherence and retention in care are essential to achieve the full effectiveness of PrEP. This study describes changes in users' risk behaviors and sexually transmitted infections (STIs), as well also PrEP care continuum details. METHODS: This was a descriptive single-center retrospective study including adults at high HIV risk screened between November 2019 and June 2021 in the PrEP program of our hospital. Demographic, behavioral, STI, adherence, and retention in care variables were assessed. Data were collected from medical records and self-report questionnaires. RESULTS: A total of 295 people were included, 94% men and 5% transgender women, with a mean age of 34 years (SD 10) and 10% sex workers. At baseline, 55% disclosed chemsex practice and 3% slamming. During follow-up, condom use for anal intercourse decreased from 41% to 13% (p ≤ 0.0001) and one HIV infection was detected; other risk behaviors and STIs remained stable. Chemsex, group sex, fluid exchange, and condomless anal intercourse were related to STI risk. Adherence was correct in 80% of users, and retention in care was 57%. Discontinuations and loss to follow-up were high, mainly affecting transgender women, sex workers, and people practicing fisting. CONCLUSION: PrEP program implementation in our hospital was adequate, since it allowed, in a population at high HIV risk, overall users' risk behaviors and STIs to remain stable, with only one HIV diagnosis during the follow-up. We should target specific strategies to improve adherence and retention in care, as vulnerable subgroups at higher risk of loss to follow-up are identified. Article	2023	Ung M.; Martin S.; Terris-Prestholt F.; Quaife M.; Tieosapjaroen W.; Phillips T.; Lee D.; Chow E.P.F.; Medland N.; Bavinton B.R.; Pan S.W.; Mao L.; Ong J.J.	Preferences for HIV prevention strategies among newly arrived Asian-born men who have sex with men living in Australia: A discrete choice experiment	Frontiers in Public Health	-	-	-	-	22962565	10.3389/fpubh.2023.1018983	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150861061&doi=10.3389%2ffpubh.2023.1018983&partnerID=40&md5=7928522b4300723f19f76c8bbfbc582e	The HIV epidemic in Australia is changing with higher risk for HIV among newly-arrived Asian-born men who have sex with men (MSM) compared to Australian-born MSM. We evaluated the preferences for HIV prevention strategies among 286 Asian-born MSM living in Australia for <5 years. A latent class analysis uncovered three classes of respondents who were defined by their preferences: "PrEP" (52%), "Consistent condoms" (31%), and "No strategy" (17%). Compared to the "No strategy" class, men in the "PrEP" class were less likely to be a student or ask their partner for their HIV status. Men in the "Consistent condoms" class were more likely to get information about HIV from online, and less likely to ask their partner for their HIV status. Overall, PrEP was the preferred HIV prevention strategy for newly arrived migrants. Removing structural barriers to access PrEP can accelerate progress toward ending HIV transmission. Article	2023	Unigwe, I; Goodin, AJ; Lo-Ciganic, WH; Cook, RL; Park, H	TRAJECTORIES OF ADHERENCE TO PRE-EXPOSURE PROPHYLAXIS (PREP) AND RISK OF HIV INCIDENCE	Value in Health	-	-	-	-	1098-3015	10.1016/j.jval.2023.03.177	https://www.valueinhealthjournal.com/article/S1098-3015(23)00277-2/fulltext?_returnURL=https%3A%2F%2Flinkinghub.elsevier.com%2Fretrieve%2Fpii%2FS1098301523002772%3Fshowall%3Dtrue	Objectives: Pre-exposure prophylaxis (PrEP) is effective in preventing HIV transmission and acquisition. However, poor adherence may limit its efficacy. Thus, we examined the association between adherence trajectories of PrEP and the risk of HIV acquisition among PrEP users. Methods: We conducted a retrospective cohort study, using data from the 2011-2020 MarketScan database of commercially-insured individuals in the U.S. aged 12-64 prescribed $ 30 days of PrEP use (i.e., tenofovirdisoproxil-fumarate with emtricitabine or tenofovir-alafenamide with emtricitabine). To ensure PrEP use, we excluded persons with any diagnosis codes or prescriptions for HIV or hepatitis B virus (HBV) during the year before the first PrEP prescription date and prescriptions (,30 days) for post-exposure prophylaxis use. We used group-based trajectory modeling (GBTM) to identify distinct adherence patterns of PrEP using 15-day proportion of days covered over 1 year, starting from day 31 after PrEP initiation. We examined the association between the adherence trajectories and the risk of HIV acquisition during the GBTM measurement period, using inverse probability treatment weighted (IPTW) Cox proportional hazard models. Results: The study cohort consisted of 20,757 new PrEP users (96% males; 52% aged 18-34 years; 38% from the South). The final GBTM models identified four distinct PrEP adherence trajectories including nonadherent (23% of the cohort), rapidly-declining (12%), gradually-declining (20%), and consistently-adherent (44%) groups, with HIV incidence rates of 73, 38, 59, and 39 per 10,000 person-years, respectively. In IPTW Cox regression models, compared with consistently adherent group, nonadherent group had an increased HIV risk (HR 2.17 [1.06-4.44]). There were no statistically-significant differences in HIV risk between the rapidly-declining (HR 0.92 [0.29-2.93]) or gradually-declining (HR 1.72 [0.79-3.75]) adherence groups and the consistently adherent group. Conclusions: We found an increased risk of HIV among those who were nonadherent with PrEP, suggesting the need for interventions targeting barriers to adherence and PrEP access continuity	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Unigwe, Ikenna F; Cook, Robert L; Janelle, Jennifer W; Park, Haesuk	Trends in Recommended Screening and Monitoring Tests for Users of HIV Pre-Exposure Prophylaxis Before and During the COVID-19 Pandemic.	American Journal of Preventive Medicine	-	-	-	-	2773-0654	10.1016/j.focus.2023.100134	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10546544	Introduction: To ensure the health and safety of persons taking pre-exposure prophylaxis to prevent HIV infection, the 2017 Centers for Disease Control and Prevention guidelines recommended initial and follow-up laboratory testing. We assessed the trends in adherence rates to recommended laboratory testing among pre-exposure prophylaxis users and identified factors associated with HIV testing among pre-exposure prophylaxis users from 2016 to 2020 and also examined rate changes during the COVID-19 pandemic in 2020. Methods: We conducted a retrospective cohort study assessing the rates and trends of recommended laboratory testing among commercially insured pre-exposure prophylaxis users from 2016 to 2020, using the MarketScan database. We examined the proportion of pre-exposure prophylaxis users adhering to the following initial and follow-up laboratory testing: (1) HIV, creatinine clearance, hepatitis B virus, hepatitis C virus, and sexually transmitted infections (chlamydia/gonorrhea and syphilis) within 7 days before pre-exposure prophylaxis initiation; (2) HIV 90 days after initiation; and (3) HIV, creatinine clearance, and sexually transmitted infections 180 days after pre-exposure prophylaxis initiation. We used general linear models to examine trends and multivariable logistic regression to identify predictors of ≥1 HIV test within 180 days after index pre-exposure prophylaxis. Results: We identified 19,581 new pre-exposure prophylaxis users. Most were male (96%) and aged 18-34 years (55%). Adherence rates to recommended testing increased from 2016 through 2019 (e.g., 9.0%-13.6% for all initial screening tests 7 days before initiation, 42.1%-44.6% for HIV testing 90 days after initiation, 33.8%-40.6% for all follow-up tests within 180 days after initiation), but all rates decreased during the COVID-19 pandemic (12.4%, 33.6%, and 31.6%, respectively). Younger age (aged 13-17 years: AOR=0.44, 95% CI=0.28, 0.71) and ages 18-34 years (AOR=0.80, 95% CI=0.74, 0.86) were associated with a significantly lower likelihood of getting an HIV test within 180 days after initiation than ages 35-44 years, and female sex (AOR=0.64, 95% CI=0.55, 0.74) were associated with a significantly lower likelihood than male sex. Pre-exposure prophylaxis users with a history of sexually transmitted infections had a higher likelihood (AOR=1.27, 95% CI=1.16, 1.40) of getting tested than those without. Conclusions: Initial screening and follow-up testing rates were lower than those recommended by the Centers for Disease Control and Prevention. Public health efforts are needed to ensure that patients have access to needed laboratory testing during pandemics or natural disasters and to educate patients and clinicians about the importance of screening and monitoring tests to ensure the safety and health of pre-exposure prophylaxis users. Essay	2023	Valente, Pablo K; Operario, Don; Rusley, Jack; Bauermeister, José A; Biello, Katie B	The need for a health equity framework in next-generation pre-exposure prophylaxis implementation.	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(23)00009-7	https://dx.doi.org/10.1016/S2352-3018(23)00009-7	Pre-exposure prophylaxis (PrEP) is highly effective for prevention of HIV transmission and plays an important role in efforts to end the HIV epidemic within the next decade. However, disparities in access to PrEP might be fuelling disparities in the burden of HIV in the USA. The advent of next-generation PrEP formulations that do not involve daily regimens (eg, long-acting cabotegravir) holds potential to facilitate medication adherence, but if the roll-out of these formulations does not consider disparities in access, HIV disparities might be further widened. On the basis of US epidemiological data and informed by the Theory of Fundamental Causes of Health Disparities, we propose an equity-promoting framework to guide the implementation of daily oral and next-generation PrEP. Multilevel efforts to bolster equity in PrEP care include generating demand for next-generation PrEP formulations among marginalised groups, expanding the availability of health services providing oral and next-generation PrEP, and addressing structural and financial barriers to HIV prevention care. The aim of these strategies is to realise the potential of next-generation PrEP to provide people at high risk with effective options to prevent HIV acquisition, thereby helping to reduce both overall HIV transmission and health disparities in the USA. Article	2023	Valente, Pablo K; Rusley, Jack C; Operario, Don; Biello, Katie B	Readiness to Provide Oral and Injectable PrEP for Sexual and Gender Minority Youth Among Healthcare Providers and Clinics in the U.S. Northeast.	Journal of Adolescent Health	-	-	-	-	1879-1972	10.1016/j.jadohealth.2022.11.246	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10121770	PURPOSE: To examine readiness to provide oral and injectable pre-exposure prophylaxis (PrEP) for sexual and gender minority youth (SGMY) and to explore decision-making for HIV prevention strategies (e.g., condom use, daily and event-driven oral PrEP, and injectable PrEP) among healthcare providers. METHODS: Between February and April 2022, we recruited 31 prescribing providers (M.Ds, D.Os, P.As, and N.Ps) practicing in primary care and specialized clinics in the U.S. Northeast for focus groups or individual interviews. Focus groups and interview transcripts were analyzed using thematic analysis. RESULTS: Most providers specialized in Pediatrics (42%) or Adolescent Medicine (23%) and 58% had previously prescribed PrEP. Main barriers to PrEP readiness were low PrEP knowledge, limited time for visits, and competing clinical priorities. Organizational factors such as routine HIV/STI testing, PrEP-specific electronic health records templates, and specialized staff (e.g., PrEP navigators) promoted PrEP readiness. Providers held positive attitudes toward injectable PrEP to promote adherence among SGMY, yet barriers to implementation of this modality were identified (e.g., patient anxiety about needles, additional staffing needs). Providers described event-driven oral PrEP as an option for SGMY with episodic HIV risk. Assurances of conditional confidentiality, including preventing disclosure of sensitive information through insurance forms, and shared decision-making facilitated conversations about HIV prevention with SGMY. DISCUSSION: Future PrEP implementation efforts for SGMY should consider combined efforts targeting provider knowledge about PrEP modalities (e.g., decision aids) and clinic organizational factors (e.g., routine HIV/STI testing, resources to assist providers and patients in navigating the multiple steps between prescription and adherence to PrEP). Article	2023	van den Elshout, Mark Am; Hoornenborg, Elske; Coyer, Liza; Anderson, Peter L; Davidovich, Udi; de Vries, Henry Jc; Prins, Maria; Schim van der Loeff, Maarten F	Determinants of adherence to daily PrEP measured as intracellular tenofovir diphosphate concentrations over 24 months of follow-up among men who have sex with men.	Sexually Transmitted Diseases	-	-	-	-	1472-3263	10.1136/sextrans-2022-055499	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10359585	OBJECTIVES: Adherence is key to the effectiveness of oral pre-exposure prophylaxis (PrEP) to prevent HIV. Therefore, we aimed to explore factors associated with adherence to daily PrEP (dPrEP). METHODS: Men who have sex with men (MSM) using dPrEP (emtricitabine/tenofovir disoproxil) within the Amsterdam PrEP demonstration project at the Public Health Service of Amsterdam, provided dried blood spots (DBS) 12 and 24 months after PrEP initiation. From DBS, we determined intracellular tenofovir diphosphate (TFV-DP) concentrations to assess adherence; TFV-DP ≥700 fmol/punch was considered adequate. We assessed associations of sociodemographic, clinical and behavioural characteristics with TFV-DP concentrations using multivariable linear regression. RESULTS: Of 263 participants who attended 12-month or 24-month study visits while on dPrEP, 257 (97.7%) provided DBS at one or both visits (492 DBS in total). Median TFV-DP concentration was 1299 (IQR 1021-1627) fmol/punch (12 months: 1332 (1087-1687); 24 months: 1248 (929-1590). Higher TFV-DP concentrations were associated with: older age (p=0.0008), condomless anal sex with a casual partner in 6 months preceding PrEP initiation (+166 fmol/punch; 95% CI 36.5 to 296) and using a mobile application providing visualised feedback on PrEP use and sexual behaviour (+146 fmol/punch; 95% CI 28.1 to 263). Lower TFV-DP concentrations were associated with longer duration of PrEP use (24 vs 12 months; -91.5 fmol/punch; 95% CI -155 to -28.1). Time-updated number of sex partners, diagnosed STIs and chemsex were not associated with TFV-DP concentrations. CONCLUSIONS: Overall, TFV-DP concentrations were high among MSM using dPrEP, indicating excellent adherence. Especially older participants, those who reported condomless anal sex with a casual partner prior to PrEP initiation and those who used an app with visualised feedback showed higher levels of adherence. As TFV-DP concentrations had decreased slightly at 2 years of PrEP use when compared with 1 year, we emphasise the importance of adherence counselling to those who continue using PrEP. Article	2023	Van Dijck, Christophe; Laumen, Jolein Gyonne Elise; de Block, Tessa; Abdellati, Saïd; De Baetselier, Irith; Tsoumanis, Achilleas; Malhotra-Kumar, Surbhi; Manoharan-Basil, Sheeba Santhini; Kenyon, Chris; Xavier, Basil Britto	The oropharynx of men using HIV pre-exposure prophylaxis is enriched with antibiotic resistance genes: A cross-sectional observational metagenomic study.	Journal of Infection	-	-	-	-	1532-2742	10.1016/j.jinf.2023.02.006	https://dx.doi.org/10.1016/j.jinf.2023.02.006	BACKGROUND: Phenotypic studies have found high levels of antimicrobial resistance to cephalosporins, macrolides and fluoroquinolones in commensal Neisseria species in the oropharynx of men who have sex with men (MSM) using HIV pre-exposure prophylaxis (PrEP). These species include Neisseria subflava and Neisseria mucosa. This may represent a risk to pathogens like Neisseria gonorrhoeae which tend to take up antibiotic resistance genes (ARGs) from other bacteria. We aimed to explore to what extent the oropharyngeal resistome of MSM using PrEP differed from the general population. METHODS: We collected oropharyngeal swabs from 32 individuals of the general population and from 64 MSM using PrEP. Thirty-two MSM had consumed antibiotics in the previous six months, whereas none of the other participants had. Samples underwent shotgun metagenomic sequencing. Sequencing reads were mapped against MEGARes 2.0 to estimate ARG abundance. ARG abundance was compared between groups by zero-inflated negative binomial regression. FINDINGS: ARG abundance was significantly lower in the general population than in MSM (ratio 0.41, 95% CI 0.26-0.65). More specifically, this was the case for fluoroquinolones (0.33, 95% CI 0.15-0.69), macrolides (0.37, 95% CI 0.25-0.56), tetracyclines (0.41, 95% CI 0.25-0.69), and multidrug efflux pumps (0.11, 95% CI 0.03-0.33), but not for beta-lactams (1.38, 95% CI 0.73-2.61). There were no significant differences in ARG abundance between MSM who had used antibiotics and those that had not. INTERPRETATION: The resistome of MSM using PrEP is enriched with ARGs, independent of recent antibiotic use. Stewardship campaigns should aim to reduce antibiotic consumption in populations at high risk for STIs. Article	2023	Van Gerwen, OT; Yigit, I; Crockett, KB; Turan, B	The Relationship Between HIV Pre-exposure Prophylaxis Stigma and Treatment Adherence Among Current HIV Pre-exposure Prophylaxis Users in the Southeastern US	AIDS and Behavior	-	-	-	-	1090-7165	10.1007/s10461-022-03883-3	https://pubmed.ncbi.nlm.nih.gov/36209179/	Despite efficacy in HIV prevention, Pre-exposure Prophylaxis (PrEP) is underutilized in the US, especially among populations at highest risk. PrEP-related stigma may play a role. We developed measures of PrEP-related stigma dimensions and PrEP adherence. We administered them to current PrEP users. We hypothesized that PrEP-related stigma would negatively impact PrEP adherence. Questionnaire measures were developed using data from previous qualitative work and existing validated HIV-related stigma measures. The resultant survey was administered to current PrEP users from two Birmingham, Alabama PrEP clinics. Plasma tenofovir disoproxil fumarate levels were collected to measure PrEP adherence. Exploratory factor analyses were performed to determine the factor structure of each PrEP-related stigma dimension (internalized, perceived, experienced, anticipated, disclosure concerns). Separate binary logistic (or linear) regressions were performed to assess associations between PrEP-related stigma dimensions and adherence (treatment adherence self-efficacy, self-reported adherence, and plasma tenofovir levels), adjusting for education, race, and time on PrEP. In 2018, 100 participants completed the survey, with 91 identifying as male and 66 as white. Only internalized stigma was associated with lower self-reported PrEP adherence. Exploratory mediation analyses suggested that the association between all stigma dimensions and self-reported PrEP adherence is mediated by PrEP adherence self-efficacy. No associations were found between any PrEP-related stigma measures and plasma tenofovir levels. Internalized PrEP stigma may reduce PrEP adherence, possibly by reducing PrEP adherence self-efficacy among experienced PrEP users. Further investigation of how stigma dimensions affect PrEP adherence in populations at risk for HIV may shed light on drivers of PrEP underutilization. Article	2023	Van Landeghem E.; Dielen S.; Semaan A.; Rotsaert A.; Vanhamel J.; Masquillier C.; Wouters E.; Wouters K.; Vuylsteke B.; Reyniers T.; Nöstlinger C.	Insights into barriers and facilitators in PrEP uptake and use among migrant men and transwomen who have sex with men in Belgium	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-023-15540-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152978083&doi=10.1186%2fs12889-023-15540-y&partnerID=40&md5=bc369916514a5adab2eabf8a125270b4	Background: PrEP uptake is low among non-Belgian men and transwomen who have sex with men, although the HIV epidemic among men who have sex with men in Belgium is diversifying in terms of nationalities and ethnicity. We lack an in-depth understanding of this gap. Methods: We conducted a qualitative study using a grounded theory approach. The data consists of key informants interviews and in-depth interviews with migrant men or transwomen who have sex with men. Results: We identified four underlying determinants which shape our participants' experiences and contextualize the barriers to PrEP use. These include (1) the intersectional identities of being migrant and men and transwomen who have sex with men, (2) migration related stressors, (3) mental health and (4) socio-economic vulnerability. Identified barriers include: the accessibility of services; availability of information, social resources and providers' attitudes. These barriers influence PrEP acceptance and mediated by individual agency this influences their PrEP uptake. Conclusion: An interplay of several underlying determinants and barriers impacts on PrEP uptake among migrant men and transwomen who have sex with men, illustrating a social gradient in access to PrEP. We need equitable access to the full spectrum of HIV prevention and care for all priority populations, including undocumented migrants. We recommend social and structural conditions that foster exercising these rights, including adapting PrEP service delivery, mental health and social support. © 2023, The Author(s). Article	2023	Van Landeghem, Ella; Arbier, Alida; Pratt, Christian Sydney A; Senga, Mikaza; Scheerder, Gert; Reyniers, Thijs; Hensen, Bernadette; Nöstlinger, Christiana	PrEP Among Sub-Saharan African Diaspora Communities in Belgium - a Participatory Action Research Study.	Journal of Community Health	-	-	-	-	1573-3610	10.1007/s10900-023-01269-7	https://dx.doi.org/10.1007/s10900-023-01269-7	In Belgium, migrants from Sub-Saharan Africa (SSA) accounted for 45% of new heterosexual HIV infections in 2021, while only 1.5% of PrEP starters were of SSA descent. We explored the acceptance of PrEP and barriers towards PrEP uptake and use among SSA migrant and diaspora communities in Belgium using a participatory action research approach. Trained community researchers (CRs), involved in all phases of the study, co-designed and moderated group discussions (GDs) while simultaneously providing information on HIV and PrEP during workshops. Extensive summaries and field notes were analysed using reflexive thematic analysis. CRs were involved in data analysis, interpretation and reporting. We conducted seven GDs with 51 participants. We identified five major themes: (1) Participants had limited PrEP knowledge, which created feelings of surprise and annoyance about not being informed. This was partly explained by (2) the taboo and stigma that surrounds sexuality and HIV, which could shape PrEP acceptance. (3) Participants shared feelings of otherness due to experiences of racism and discrimination, also in relationship to HIV prevention. (4) PrEP was considered a high-threshold prevention tool, because of its perceived side-effects and its specialized service delivery. (5) Despite nuanced opinions about PrEP, all participants agreed that PrEP promotion should be mainstreamed, so everyone can make an informed decision. In conclusion, PrEP seemed acceptable among our participants. Our qualitative study provides insights into the intersecting barriers to accessing HIV services, showing that SSA diaspora communities are 'hardly reached' rather than 'hard to reach' by PrEP promotion messages. Article	2023	Vanbaelen T.; Rotsaert A.; Van Landeghem E.; Nöstlinger C.; Vuylsteke B.; Scheerder G.; Verhoeven V.; Reyniers T.	Non-Consensual Sex and Help-Seeking Behavior Among PrEP Users in Belgium: Findings from an Online Survey	Journal of Sex Research	-	-	-	-	224499	10.1080/00224499.2023.2235330	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165592123&doi=10.1080%2f00224499.2023.2235330&partnerID=40&md5=b39eab686e500955966337c48dc3465e	Non-consensual sex poses a threat not only to sexual health but also to mental and physical health in general. HIV pre-exposure prophylaxis (PrEP) users might be particularly vulnerable to non-consensual sex because of interplaying factors such as mental health disorders, a high number of sex partners, engagement in chemsex, and the widespread use of dating apps. The objectives of this study were to assess the occurrence of non-consensual sex, its associated factors, and related help-seeking behavior among PrEP users. We analyzed data from an online survey among PrEP users in Belgium (09/2020-02/2022). Almost one in five participants (34/187, 18.2%) reported having ever experienced non-consensual sex. The most reported form was having sex against one's will, followed by having been given drugs against one's will, and having had sex without a condom against one's will. The vast majority of those who had experienced non-consensual sex (29/34, 85.3%) did not seek help afterward, mostly due to a lack of perceived need (21/29, 72.4%). Reported barriers to seeking help were shame (6/29, 20.7%) and lack of awareness of help services (3/29, 10.3%). Having experienced non-consensual sex in the past five years was associated with younger age and suicidal ideation in a multivariable logistic regression model. We conclude that addressing barriers to non-consensual sex help services is crucial to maximize their use and minimize the consequences of non-consensual sex experiences. PrEP consultations also represent an opportunity to offer such help given PrEP users are already familiar with these PrEP services and engaged in care. © 2023 The Society for the Scientific Study of Sexuality. Article	2023	Vanbaelen, T; Rotsaert, A; Van Landeghem, E; Nöstlinger, C; Vuylsteke, B; Platteau, T; Herrijgers, C; Reyniers, T	Do pre-exposure prophylaxis (PrEP) users engaging in chemsex experience their participation as problematic and how can they best be supported? Findings from an online survey in Belgium.	Sexual Health	-	-	-	-	1449-8987	10.1071/SH23037	https://dx.doi.org/10.1071/SH23037	BACKGROUND: Chemsex involves the use of psychoactive drugs in a sexual context and is a growing phenomenon among men who have sex with men (MSM) and pre-exposure prophylaxis (PrEP) users. Investigating how its negative consequences can be avoided is important. The objective of this study was to explore the perceived impact of chemsex, the willingness to reduce chemsex activities and associated risks and preferred interventions to do so among PrEP users. METHODS: We analysed data from an online survey among PrEP users in Belgium. Chemsex was assessed in two questionnaires distributed between September 2020 and January 2022. RESULTS: A total of 326 participants completed the baseline questionnaire, and 186 the follow-up questionnaire. About one in three participants (36.5%, 119/326) reported engaging in chemsex, and half of those (49.6%, 59/119) were willing to reduce chemsex-related risks. The most preferred strategies for reducing risks were online support via an app (37.3%, 22/59) and face-to-face counselling with a health care professional (30.5%, 18/59). Among those reporting recent chemsex in the follow-up questionnaire, about one in five (21.9%, 14/64) wanted to reduce or stop chemsex activities. About 23.4% (15/64) also reported experiencing negative consequences of chemsex on their health, social or professional life. CONCLUSION: Our findings show that one in four PrEP users engaging in chemsex experienced negative consequences of these activities and about one in five was willing to reduce or stop chemsex activities. We recommend embedding comprehensive chemsex support in the PrEP package of care and developing novel tools and interventions in order to reach maximum impact.	chemsex, harm reduction, HIV, mental health, MSM, pre-exposure prophylaxis, substance use, support. Essay	2023	Vanhamel J.; Wijstma E.; Deblonde J.; Laga M.; Vuylsteke B.; Nöstlinger C.; Noori T.	Developing evidence-informed indicators to monitor HIV pre-exposure prophylaxis programmes across EU/EEA countries: a multi-stakeholder consensus	Eurosurveillance	-	-	-	1025496X	10.2807/1560-7917.ES.2023.28.23.2200546	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162190892&doi=10.2807%2f1560-7917.ES.2023.28.23.2200546&partnerID=40&md5=be5b4d42d03492e33ba26bce021c93ca	Several countries in the European Union (EU) and European Economic Area (EEA) established and/or scaled up HIV pre-exposure prophylaxis (PrEP) programmes between 2016 and 2023. Data on PrEP programmes' performance and effectiveness in reaching those most in need will be needed to assess regional progress in the roll-out of PrEP. However, there is a lack of commonly defined indicators for routine monitoring to allow for minimum comparability. We propose a harmonised PrEP monitoring approach for the EU/EEA, based on a systematic and evidence-informed consensus-building process involving a broad and multidisciplinary expert panel. We present a set of indicators, structured along relevant steps of an adapted PrEP care continuum, and offer a prioritisation based on the degree of consensus among the expert panel. We distinguish between 'core' indicators deemed essential for any PrEP programme in the EU/EEA, vs 'supplementary' and 'optional' indicators that provide meaningful data, yet where experts evaluated their feasibility for data collection and reporting as very context-dependent. By combining a standardised approach with strategic opportunities for adaptation and complementary research, this monitoring framework will contribute to assess the impact of PrEP on the HIV epidemic in Europe. copyright of the authors or their affiliated institutions, 2023. Article	2023	Vazquez Guillamet, Laia J; Babey, Mary Mah; Njah, Mercy; Blake, Hassanatu; Jasani, Amy; Kyeng, Rahel; Hao, Jiaying; Long, Dustin; Tih, Pius; Turan, Janet M; Khan, Eveline Mboh; Dionne, Jodie	Acceptability, feasibility and potential of an intervention using secret Facebook groups to complement existing HIV prevention strategies among female sex workers in Cameroon, a randomized pilot study.	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2023.2275048	https://dx.doi.org/10.1080/09540121.2023.2275048	This randomized pilot project evaluated an intervention promoting health care literacy around HIV, pre-exposure prophylaxis (PrEP), and stigma reduction using private social media groups that complemented existing HIV prevention services among female sex workers (FSWs) in Cameroon. The intervention was 12 HIV and sexual health videos tailored to FSWs that were released over 8 weeks through a secret Facebook group platform. In-person surveys were administered before, after the intervention, and three months later. No HIV seroconversions were detected; all participants completed follow-up and agreed to recommend the intervention to a coworker. Although the intervention was assessed to be acceptable and feasible to implement, poor internet connectivity was a key barrier. In time-series analysis, the intervention group participants reported improved PrEP interest, PrEP knowledge, and condom use along with reduced PrEP and HIV-related stigma, but no impact on sex-work related stigma or social cohesion. Similar results occurred in the control group. Cross-contamination and small pilot study size might have hindered the ability to detect the differential impact of this intervention. As communications technology increases in Cameroon, it is essential to learn more about FSWs preferences on the use of social media platforms for HIV prevention strategies. Article	2023	Velloza J.; Mujugira A.; Muwonge T.; Boyer J.; Nampewo O.; Badaru J.; Ssebuliba T.; Stalter R.M.; Stein G.; Baeten J.M.; Celum C.; Heffron R.	A novel "HIV salience and Perception" scale is associated with PrEP dispensing and adherence among adolescent girls and young women in Kampala, Uganda	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03762-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133262952&doi=10.1007%2fs10461-022-03762-x&partnerID=40&md5=2e2fbcfccf7754649be6c4f11779ce8c	Low perceived HIV risk is a barrier to effective pre-exposure prophylaxis (PrEP) use among African adolescent girls and young women (AGYW). Single-item risk perception measures are stigmatizing and alienating to AGYW and may not predict PrEP use. There is a need for a tool capturing domains of perceived HIV risk and salience that align with PrEP use among AGYW. This HIV PrEP study was conducted in Kampala, Uganda. We developed and piloted the 9-item "HIV Salience and Perception" (HPS) scale (range: 9–36); higher scores indicate beliefs of higher vulnerability to HIV. We administered the scale to Ugandan AGYW participating in an ongoing cohort study at enrollment, one, three and six months. PrEP dispensing was measured quarterly and adherence was measured daily via Wisepill (high adherence: ≥80% of expected pill bottle openings). We assessed scale performance and used generalized estimating equations to determine associations between scale score and PrEP use. Among 499 AGYW, 54.1% of our sample was ≥ 20 years (range:16–25). The median HPS score was 18 (range:8–33; α = 0.77). Higher score was associated with PrEP dispensing (aRR = 1.07 per point increase; 95% CI = 1.01–1.13; p-value = 0.02) in the overall cohort and among only those ≥ 20 years (aRR = 1.10; 95% CI = 1.03–1.19; p-value = 0.01). We did not observe an association between scale score and PrEP adherence. AGYW scoring higher on a novel HPS scale were more likely to initiate and obtain PrEP refills through 6 months. This scale may capture drivers of PrEP dispensing and could inform PrEP delivery and counseling for AGYW. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Velloza, Jennifer; Roche, Stephanie D; Owidi, Emmah J; Irungu, Elizabeth M; Dollah, Annabell; Kwach, Benn; Thuo, Nicholas B; Morton, Jennifer F; Mugo, Nelly; Bukusi, Elizabeth A; O'Malley, Gabrielle; Ngure, Kenneth; Baeten, Jared M; Mugwanya, Kenneth K	Provider perspectives on service delivery modifications to maintain access to HIV pre-exposure prophylaxis during the COVID-19 pandemic: qualitative results from a PrEP implementation project in Kenya.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26055	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9899492	INTRODUCTION: HIV pre-exposure prophylaxis (PrEP) is an essential prevention strategy being scaled up for priority populations in Kenya, including for HIV serodiscordant couples. The COVID-19 pandemic posed challenges to PrEP rollout. We conducted a qualitative study of PrEP providers to understand how clinics adjusted PrEP delivery during the COVID-19 pandemic. METHODS: Since 2017, the Partners Scale-Up Project has integrated PrEP into 25 HIV clinics in Central and Western Kenya. We conducted qualitative interviews with 40 purposively sampled clinic personnel. We interviewed personnel once during the first pandemic wave (May-Aug 2020) and again after some decline in COVID-19 rates (Nov-Jan 2021). We analysed data using inductive memo-writing and summarized data by themes along the PrEP delivery cascade, guided by the Framework for Reporting Adaptation and Modifications (FRAME). RESULTS: We interviewed 27 clinical officers, five nurses, four health records and information officers, and four counsellors from Central (n = 20) and Western (n = 20) Kenya. About half (n = 19) were female, with a median age of 32 (IQR: 29-34) and 2.3 years of experience delivering PrEP (IQR: 2-3). All participants reported clinic changes in PrEP demand creation and service delivery during the pandemic. Modifications occurred during PrEP implementation and sustainment phases, were partly reactive to the pandemic and also facilitated by interim Ministry of Health guidance on PrEP delivery during COVID, and were made by PrEP delivery teams, clients and clinic managers. Commonly reported modifications included dispensing multiple-month PrEP refills, intensifying phone-based client engagement and collaborating with other HIV clinics to ensure that clients with prolonged stays in other regions could continue to access PrEP. Some clinics also adopted practices to streamline visits, such as within clinical-room PrEP dispensing, pre-packing PrEP and task-shifting. Most providers liked these changes and hoped they would continue after the pandemic subsides. CONCLUSIONS: COVID-19 served as a catalyst for PrEP delivery innovations in Kenya. HIV clinics successfully and rapidly adapted their PrEP demand creation, refill and retention strategies to promote PrEP uptake and effective use. These modified implementation strategies highlight opportunities to streamline the delivery of PrEP, as well as other HIV and chronic care services, and strengthen engagement with populations post-pandemic.	adaptation, COVID-19, HIV, Kenya, pre-exposure prophylaxis, serodiscordant couples	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Velloza, Jennifer; Roche, Stephanie; Concepcion, Tessa; Ortblad, Katrina F.	Advancing considerations of context in the evaluation and implementation of evidence-based biomedical HIV prevention interventions: a review of recent research.	Current Opinion in HIV and AIDS	-	-	-	1746-6318 1746-630X	10.1097/COH.0000000000000768	https://pubmed.ncbi.nlm.nih.gov/36503876/	PURPOSE OF REVIEW: A paradigm shift is needed in how we think about biomedical HIV prevention product effectiveness. Often, we expect randomized trial findings to be generalizable across populations and settings where products will be delivered, without consideration of key contextual drivers that could impact effectiveness. Moreover, researchers and policy-makers generally discount products with varied effect sizes across contexts, rather than explicating the drivers of these differences and using them to inform equitable product choice and delivery. We conducted a review of the recent HIV prevention research to advance considerations of context in choices of when, why, and how to implement biomedical HIV prevention products, with a particular focus on daily oral preexposure prophylaxis (PrEP) and the dapivirine vaginal ring (DPV). RECENT FINDINGS: Findings across recent studies of PrEP and DPV emphasize that products that do not work well in one context might be highly desirable in another. Key contextual drivers of PrEP and DPV effectiveness, use, and implementation include population, health system, cultural, and historical factors. We recommend conceptualization, measurement, and analysis approaches to fully understand the potential impact of context on prevention product delivery. Execution of these approaches has real-world implications for HIV prevention product choice and could prevent the field from dismissing biomedical HIV prevention products based on trial findings alone. SUMMARY: Ending the HIV epidemic will require tailored, person-centered, and equitable approaches to design, implement, and evaluate HIV prevention products which necessitates considerations of context in ongoing research and implementation. Article	2023	Veloso, Valdiléa G; Cáceres, Carlos F; Hoagland, Brenda; Moreira, Ronaldo I; Vega-Ramírez, Hamid; Konda, Kelika A; Leite, Iuri C; Bautista-Arredondo, Sergio; Vinícius de Lacerda, Marcus; Valdez Madruga, José; Farias, Alessandro; Lima, Josué N; Zonta, Ronaldo; Lauria, Lilian; Tamayo, Cesar Vidal Osco; Flores, Hector Javier Salvatierra; Santa Cruz, Yovanna Margot Cabrera; Aguayo, Ricardo Martín Moreno; Cunha, Marcelo; Moreira, Júlio; Makkeda, Alessandra Ramos; Díaz, Steven; Guanira, Juan V; Vermandere, Heleen; Benedetti, Marcos; Ingold, Heather L; Pimenta, M Cristina; Torres, Thiago S; Grinsztejn, Beatriz	Same-day initiation of oral pre-exposure prophylaxis among gay, bisexual, and other cisgender men who have sex with men and transgender women in Brazil, Mexico, and Peru (ImPrEP): a prospective, single-arm, open-label, multicentre implementation study	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(22)00331-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147126094&doi=10.1016%2fS2352-3018%2822%2900331-9&partnerID=40&md5=a6fc6453d715470faa107a60fda6e36a	Background: Although gay, bisexual, and other cisgender men who have sex with men (MSM) and transgender women have the highest HIV burden in Latin America, pre-exposure prophylaxis (PrEP) implementation is poor. We aimed to assess the feasibility of same-day oral PrEP delivery in Brazil, Mexico, and Peru. Methods: Implementation PrEP (ImPrEP) was a prospective, single-arm, open-label, multicentre PrEP implementation study conducted in Brazil (14 sites), Mexico (four sites), and Peru (ten sites). MSM and transgender women were eligible to participate if they were aged 18 years or older, HIV-negative, and reported one or more prespecified criteria. Enrolled participants received same-day initiation of daily oral PrEP (tenofovir disoproxil fumarate 300 mg coformulated with emtricitabine 200 mg). Follow-up visits were scheduled at week 4 and quarterly thereafter. We used logistic regression models to identify factors associated with early loss to follow-up (not returning after enrolment), PrEP adherence (medication possession ratio ≥0·6), and long-term PrEP engagement (attending three or more visits within 52 weeks). This study is registered at the Brazilian Registry of Clinical Trials, U1111-1217-6021. Findings: From Feb 6, 2018, to June 30, 2021, 9896 participants were screened and 9509 were enrolled (Brazil n=3928, Mexico n=3288, and Peru n=2293). 543 (5·7%) participants were transgender women, 8966 (94·3%) were cisgender men, and 2481 (26·1%) were aged 18–24 years. There were 12 185·25 person-years of follow-up. 795 (8·4%) of 9509 participants had early loss to follow-up, 6477 (68·1%) of 9509 were adherent to PrEP, and 5783 (70·3%) of 8225 had long-term PrEP engagement. Transgender women (adjusted odds ratio 1·60, 95% CI 1·20–2·14), participants aged 18–24 years (1·80, 1·49–2·18), and participants with primary education (2·18, 1·29–3·68) had increased odds of early loss to follow-up. Transgender women (0·56, 0·46–0·70), participants aged 18–24 years (0·52, 0·46–0·58), and those with primary education (0·60, 0·40–0·91) had lower odds of PrEP adherence. Transgender women (0·56, 0·45–0·71), participants aged 18–24 years (0·56, 0·49–0·64), and those with secondary education (0·74, 0·68–0·86) had lower odds of long-term PrEP engagement. HIV incidence was 0·85 per 100 person-years (95% CI 0·70–1·03) and was higher for transgender women, participants from Peru, those aged 18–24 years, Black and mixed-race participants, and participants who were non-adherent to PrEP. Interpretation: Same-day oral PrEP is feasible for MSM and transgender women in Latin America. Social and structural determinants of HIV vulnerability need to be addressed to fully achieve the benefits of PrEP. Funding: Unitaid, WHO, and Ministries of Health in Brazil, Mexico, and Peru. Theses and Dissertations	2023	Vera, Melissa RenÃ©e	Enhancing Health Services to Improve Adolescent Engagement in HIV Prevention	-	-	University of Washington	-	NA	NA	http://hdl.handle.net/1773/49827	Introduction: Adolescent girls and young women (AGYW) in Eastern and Southern Africa have high HIV incidence. Pre-exposure prophylaxis (PrEP) once daily oral medication is recommended by the World Health Organization (WHO) as an effective intervention for individuals with risk behaviors associated with HIV acquisition. PrEP initiation is low among AGYW. This dissertation draws from two large studies to explore user experiences of PrEP service delivery for AGYW to determine how to improve quality and tailor services to address AGYW needs: 1) the PrEP Implementation for Young Women and Adolescents Program: Standardized Patient (PrIYA-SP) study, and 2) a pilot study delivering PrEP in retail pharmacies. Methods: PrIYA-SP was a cluster randomized trial based in Kisumu County, Kenya that aimed to improve the quality of PrEP delivery by implementing a standardized patient actor (SP)-led training for providers to enhance communication skills and adherence to national PrEP guidelines. At baseline and after conclusion of the intervention training, unannounced patient actor (USP) "mystery shoppers" presented to clinics portraying AGYW in common PrEP scenarios to assess PrEP delivery. To understand PrEP seeking experiences by the USPs, we added open-ended questions to their quantitative checklist evaluations of PrIYA-SP PrEP providers immediately following their encounters. Debriefings were audio-recorded, transcribed, and analyzed using thematic analysis to identify themes relating to why the USP had a positive or negative experience with the PrEP provider. To understand whether the PrIYA-SP training had impact on real-world AGYW, and not just actors, we utilized facility-level PrEP reporting tools to abstract 26 months (May 2019-June 2021) of data to describe patterns of PrEP initiation among AGYW utilizing PrIYA-SP study facilities. We then conducted linear regression analyses to compare the effect of the intervention on AGYW PrEP initiation between intervention and control sites. Finally, to assess whether non-clinic based locations such as retail pharmacies would be more acceptable to AGYW, we analyzed qualitative data from a pilot study in the same region. In this study, PrEP delivery was piloted at three retail pharmacies. AGYW who were purchasing contraception were offered PrEP by study nurses in the pharmacy. Among AGYW who accepted PrEP, we conducted 41 in-depth interviews (IDIs) one month post-PrEP acceptance. We purposefully recruited equal numbers of AGYW who accepted and ingested PrEP and AGYW who took the pills home but did not swallow them. IDIs were audio-recorded, transcribed, and analyzed using thematic analysis to identify themes about user experiences and acceptability of pharmacy-based PrEP delivery for AGYW. Results: We conducted 91 USP debriefings at 24 clinics and identified three primary influences on PrEP service experiences: 1) Privacy improved likelihood of continuing care, 2) respectful attitudes created a safe environment for USPs, and 3) patient-centered communication improved the experience and…	adolescents; communication; healthcare quality; HIV prevention; pharmacy; PrEP; Nursing;	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Qualitative
Article	2023	Vera, Melissa; Bukusi, Elizabeth; Achieng, Pauline; Aketch, Helen; Araka, Evelyne; Baeten, Jared M; Beima-Sofie, Kristin; John-Stewart, Grace; Kohler, Pamela K; Mugambi, Melissa L; Nyerere, Bernard; Odoyo, Josephine; Omom, Caroline; Omondi, Christine; Ortblad, Katrina F; Pintye, Jillian	"Pharmacies are Everywhere, and You can get it at any Time": Experiences With Pharmacy-Based PrEP Delivery Among Adolescent Girls and Young Women in Kisumu, Kenya.	Journal of the International Association of Providers of AIDS Care	-	-	-	2325-9582	10.1177/23259582231215882	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10676062	INTRODUCTION: Many Kenyan adolescent girls and young women (AGYW) with behaviors associated with HIV acquisition access contraception at retail pharmacies. Offering oral pre-exposure prophylaxis (PrEP) in pharmacies could help reach AGYW with PrEP services. METHODS: We piloted PrEP delivery at 3 retail pharmacies in Kisumu, Kenya. AGYW purchasing contraception were offered PrEP by nurses with remote prescriber oversight. AGYW who accepted were provided with a free 1-month supply. We conducted in-depth interviews with AGYW 30 days postobtaining PrEP. Transcripts were analyzed to explore experiences of AGYW accessing PrEP at pharmacies. RESULTS: We conducted 41 interviews. AGYW preferred pharmacies for accessing PrEP and they were willing to pay for PrEP even if available for free at clinics. Reasons for this preference included accessibility, lack of queues, and medication stockouts, privacy, anonymity, autonomy, and high-quality counseling from our study nurses. CONCLUSIONS: Pharmacies may be an important PrEP access option for this population. Article	2023	Villegas, Natalia; Norris, Anne E.; Cianelli, Rosina; Fernandez-Pineda, Madeline; Toledo, Christine	Infección de Amor (Infectious Love): Development and Acceptability of a Telenovela/Soap Opera Intervention for HIV Prevention For Latinas.	AIDS Education and Prevention	-	-	-	1943-2755 0899-9546	10.1521/aeap.2023.35.6.421	https://pubmed.ncbi.nlm.nih.gov/38096456/	Latinas continue to be disproportionately affected by HIV in the United States. Effective interventions to address HIV-related disparities among Latinas are available; however, they have not achieved widespread dissemination due to implementation challenges for real-world settings. A culturally tailored intervention that increases access to HIV prevention is urgently needed. The objective of this study was to develop a culturally tailored telenovela (i.e., a soap opera) to promote HIV prevention behaviors (condom use; HIV testing; and pre-exposure prophylaxis awareness, access, and use) among Latinas. The study was conducted in community organizations throughout South Florida. A total of 44 Spanish-speaking Latinas, 18-35 years old, and sexually active with a man in the past 6 months participated in the study. The final product was an HIV prevention telenovela that incorporated Latinas' ideas and feedback and was produced as four 10-minute filmed episodes. This study aimed to develop innovative approaches to reduce HIV-related disparities for Latinas. Article	2023	Viriyathorn, Shaheda; Sachdev, Saranya; Suwanwela, Waraporn; Wangbanjongkun, Waritta; Patcharanarumol, Walaiporn; Tangcharoensathien, Viroj	Procedural fairness in benefit package design: inclusion of pre-exposure prophylaxis of HIV in Universal Coverage Scheme in Thailand.	Health Policy and Planning	-	-	-	1460-2237	10.1093/heapol/czad061	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10645053	Since 2002, Thailand's Universal Coverage Scheme (UCS) has adopted a comprehensive benefits package with few exclusions. A positive-list approach has gradually been applied, with pre-exposure prophylaxis (PrEP) of HIV recently being included. Disagreements resulting from competing values and diverging interests necessitate an emphasis on procedural fairness when making any decisions. This qualitative study analyses agenda setting, policy formulation and early implementation of PrEP from a procedural fairness lens. Literature reviews and in-depth interviews with 13 key stakeholders involved in PrEP policy processes were conducted. Civil society organizations (CSOs) and academia piloted PrEP service models and co-produced evidence on programmatic feasibility and outcomes. Through a broad stakeholder representation process, the Department of Disease Control proposed PrEP for inclusion in UCS benefits package in 2017. PrEP was shown to be cost-effective and affordable through rigorous health technology assessment, peer review, use of up-to-date evidence and safe-guards against conflicts of interest. In 2021, Thailand's National Health Security Board decided to include PrEP as a prevention and promotion package, free of charge, for the populations at risk. Favourable conditions for procedural fairness were created by Thailand's legislative provisions that enable responsive governance, notably inclusiveness, transparency, safeguarding public interest and accountable budget allocations; longstanding institutional capacity to generate local evidence; and implementation capacity for realisation of procedural fairness criteria. Multiple stakeholders including CSOs, academia and the government deliberated in the policy process through working groups and sub-committees. However, a key lesson from Thailand's deliberative process concerns a possible 'over interpretation' of conflicts of interest, intended to promote impartial decision-making, which inadvertently limited the voices of key populations represented in the decision processes. Finally, this case study underscores the value of examining the full policy cycle when assessing procedural fairness, since some stages of the process may be more amenable to certain procedural criteria than others. Theses and Dissertations	2023	Vitruk, Olga	PrEP Persistence Among Key Populations in Ukraine: Analysis of Scaled PrEP Program Data from October 2020 through February 2022	-	-	University of Washington	-	NA	NA	http://hdl.handle.net/1773/50399	BackgroundWhile global HIV incidence has rapidly decreased during the last decade, Central and Eastern Europe have experienced a significant rise in new cases annually. Ukraine, located in Eastern Europe, has been one of the most ambitious in the region in implementing programs to combat HIV since 2017, including expanding access to PrEP among key populations starting in 2020. Little is known about persistence on PrEP in subpopulations accessing it in Ukraine. Methods Ukraine's PrEP program was implemented in 40 health care facilities in 11 high-burden regions in Ukraine. We analyzed data from program initiation on October 1, 2020 through February 23, 2022. A Sankey diagram was constructed to visualize times between the first four PrEP visits. We conducted a Kaplan-Meier analysis to estimate persistence time for each key group, stratifying by men who have sex with men (MSM), people who inject drugs (PWID), sex workers (SW), and discordant couples and other people vulnerable to HIV acquisition (DC/Other). We also evaluated whether persistence varied by sex and age using the Kaplan-Meier method. We used a Cox regression, clustering by healthcare facility, to estimate hazard ratios for non-persistence by key group and sex, and adjust for age as a potential confounding factor. Results There were 2,033 clients newly starting PrEP with up to 510 days of observation. 65% of clients were males, with a median age of 35 years IQR=29-42 and 35% were females with a median age of 37 years IQR=31-43. There were 51% DC/Other, 22% MSM, 22% PWID and 5% SW. The number of days between visits varied across clients and visit timepoints. Among clients returning to collect a 2nd PrEP prescription, 81% returned within 1-45 days after their previous visit, and 3% discontinued PrEP and then re-initiated after 106 days or more. Six-month persistence estimates were highest overall among PWID (28.9%; 95% CI: 23.4-35.7%), moderate in comparison among SW (18.5%; 95% CI: 11.1-30.8%) and DC/Other (12.7%; 95% CI: 10.0-16.0%), and dropped to nearly 0 among MSM (0.8%; 95% CI: 0.1-5.8%). Individuals aged 26 and above were slightly more likely to persist on PrEP longer than younger individuals and females were slightly more likely to persist on PrEP than males. PrEP persistence calculated using the Kaplan-Meier method differed significantly by key group and age (p<0.05), but not by sex. In the Cox regression model, compared with the female DC/Other reference group and adjusted for age, female PWID had the lowest risk of PrEP discontinuation (adjusted HR aHR 0.59; 95% CI: 0.31-1.11) while male SW had the highest discontinuation risk (aHR 1.87, 95% CI: 0.57-6.11), although findings were not statistically significant. Conclusion PrEP persistence at 6 months was low with the majority of individuals discontinuing PrEP by 6 months. Further research examining barriers and facilitators of persistence by groups can inform interventions to increase PrEP persistence. Article	2023	Voegele, Pascal; Polenz, Wolf	Prevention and health promotion regarding sexually transmitted infections (STI) among university students in Germany.	Zeitschrift für Gesundheitswissenschaften (Journal of Public Health)	-	-	-	2198-1833	10.1007/s10389-023-01876-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10125854	Aim: University students are sexually active, and the sexual risk behavior of this group is higher than that of the general population. The prevention of sexually transmitted infections (STIs) emphasizes the need for comprehensive knowledge about behaviors for STI protection and the actual realization of these behaviors. Subject and methods: First, an online questionnaire was developed to record the knowledge and realization of STI-protective behaviors among students at Hamburg University of Applied Sciences (HUAS) to conduct quantitative cross-sectional interviews. The sample included 1532 students. Specific aspects of the interview are based on lower response rates. The correlations were then tested by Spearman's rank correlation coefficient and Pearson's chi-squared test. Results: Significant positive correlations were identified between the self-efficacy (SE) and the use of condoms, STI vaccinations, STI tests, and HIV pre-exposure prophylaxis (PrEP). Significant negative correlations were suggested between substance use and the use of condoms and the use of PrEP and the intake of antiretroviral therapy (ART). Significant positive correlations were identified between the knowledge about STI-protective behaviors and the usage of STI-protective vaccinations, STI tests, and ART. Significant positive correlations were identified between the experiences in terms of STIs and the knowledge about STI-protective vaccinations, use of PrEP, and use of ART. Conclusion: Moreover, the results indicate that students with a divergent sexual identity have a higher level of knowledge about STI-protective behaviors. The sexual health of university students should be improved by preventive measures to improve the sexual health of individual students and their social environments. Supplementary Information: The online version contains supplementary material available at 10.1007/s10389-023-01876-7. Article	2023	Vora, Anjali S; Marroquin, Monica; Rosenthal, Susan L; Broker, Paul; Jetelina, Katelyn; Tiro, Jasmin A; Francis, Jenny Kr	Residents and Fellows' Confidence in Prescribing Pre-exposure Prophylaxis (PrEP)	Academic Pediatrics	-	-	-	1876-2867	10.1016/j.acap.2023.02.017	https://dx.doi.org/10.1016/j.acap.2023.02.017	OBJECTIVE: Residents and fellows are often the first health.ßcare providers to discuss sexual health and prevention with adolescents and young adults at academic institutions. This study characterized when learners in Pediatrics, Obstetrics and Gynecology, and Family Medicine believed that one should receive training in pre-exposure prophylaxis (PrEP) and it described confidence in prescribing PrEP. METHODS: Learners at a large, urban, southern academic center completed an online survey about adolescent sexual health services. Measures included whether participants were taught how to prescribe PrEP and how to do so in a confidential manner. Confidence in these two behaviors was measured with a Likert scale and dichotomized for bivariate analysis. RESULTS: Among the 228 respondents (63% response rate), most learners preferred sexual health communication to be emphasized early in medical school and throughout training. Overall, 44% reported being ..únot confident at all..Ñ in prescribing PrEP, and 22% were ..únot confident at all..Ñ in prescribing in a confidential manner. Those who reported ..únot confident at all" in prescribing PrEP were more likely in pediatrics (51%) than family medicine (23%) or obstetrics-gynecology (35%) (P.ß<.ß.01). Those who had been taught how to prescribe were more confident in prescribing PrEP (P.ß..±.ß.01) and prescribing in a confidential manner (P.ß<.ß.01). CONCLUSIONS: Given the continued high rates of new human immunodeficiency virus infections among adolescents, effective communication with patients eligible for PrEP is critical. Future studies should evaluate and inform tailored curricula about the importance of PrEP and build communication skills around confidential prescribing.	adolescent; HIV; medical education; pre-exposure prophylaxis; sexual reproductive health	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Vujcich, Daniel; Reid, Alison; Brown, Graham; Durham, Jo; Guy, Rebecca; Hartley, Lisa; Mao, Limin; Mullens, Amy B.; Roberts, Meagan; Lobo, Roanna	HIV-Related Knowledge and Practices among Asian and African Migrants Living in Australia: Results from a Cross-Sectional Survey and Qualitative Study.	International Journal of Environmental Research and Public Health	-	-	-	1660-4601 1661-7827	10.3390/ijerph20054347	https://www.mdpi.com/1660-4601/20/5/4347	Australian HIV notification rates are higher for people born in Northeast Asia, Southeast Asia and sub-Saharan Africa compared to Australian-born people. The Migrant Blood-Borne Virus and Sexual Health Survey represents the first attempt to build the national evidence base regarding HIV knowledge, risk behaviors and testing among migrants in Australia. To inform survey development, preliminary qualitative research was conducted with a convenience sample of n = 23 migrants. A survey was developed with reference to the qualitative data and existing survey instruments. Non-probability sampling of adults born in Northeast Asia, Southeast Asia and sub-Saharan Africa was undertaken (n = 1489), and descriptive and bivariate analyses of data were conducted. Knowledge of pre-exposure prophylaxis was low (15.59%), and condom use at last sexual encounter was reported by 56.63% of respondents engaging in casual sex, and 51.80% of respondents reported multiple sexual partners. Less than one-third (31.33%) of respondents reported testing for any sexually transmitted infection or blood-borne virus in the previous two years and, of these, less than half (45.95%) tested for HIV. Confusion surrounding HIV testing practices was reported. These findings identify policy interventions and service improvements critically needed to reduce widening disparities regarding HIV in Australia. Article	2023	Vujcich, Daniel; Roberts, Meagan; Selway, Tyler; Nattabi, Barbara	The Application of Systems Thinking to the Prevention and Control of Sexually Transmissible Infections among Adolescents and Adults: A Scoping Review.	International Journal of Environmental Research and Public Health	-	-	-	1660-4601 1661-7827	10.3390/ijerph20095708	https://www.mdpi.com/1660-4601/20/9/5708	Systems thinking is a mechanism for making sense of complex systems that challenge linear explanations of cause-and-effect. While the prevention and control of sexually transmissible infections (STIs) has been identified as an area that may benefit from systems-level analyses, no review on the subject currently exists. The aim of this study is to conduct a scoping review to identify literature in which systems thinking has been applied to the prevention and control of STIs among adolescent and adult populations. Joanna Briggs Institute guidelines for the conduct of scoping reviews were followed. Five databases were searched for English-language studies published after 2011. A total of n = 6102 studies were screened against inclusion criteria and n = 70 were included in the review. The majority of studies (n = 34) were conducted in African nations. Few studies focused on priority sub-populations, and 93% were focused on HIV (n = 65). The most commonly applied systems thinking method was system dynamics modelling (n = 28). The review highlights areas for future research, including the need for more STI systems thinking studies focused on: (1) migrant and Indigenous populations; (2) conditions such as syphilis; and (3) innovations such as pre-exposure prophylaxis and at-home testing for HIV. The need for conceptual clarity around 'systems thinking' is also highlighted. Article	2023	Wagner, Anjuli D; Beima-Sofie, Kristin; Awuor, Mercy; Owade, Winnie; Neary, Jillian; Dettinger, Julia C; Pintye, Jillian; Abuna, Felix; Lagat, Harison; Weiner, Bryan J; Kohler, Pamela; Kinuthia, John; John-Stewart, Grace; O'Malley, Gabrielle	Implementation determinants and strategies in integration of PrEP into maternal and child health and family planning services: experiences of frontline healthcare workers in Kenya.	Frontiers in Public Health	-	-	-	2673-3153	10.3389/frph.2023.1205925	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10548203	Background: Delivery of PrEP to adolescent girls and young women (AGYW) and to pregnant women through maternal and child health (MCH) and family planning (FP) clinics is scaling up in Kenya. Evaluation of implementation challenges and strategies is critical to optimize delivery. Methods: We conducted focus group discussions (FGDs) with healthcare workers (HCWs) in MCH and FP clinics offering PrEP in a large implementation project in Kisumu, Kenya. Discussion guides were based on the Consolidated Framework for Implementation Research (CFIR). FGDs were audio recorded and transcribed. Directed content analysis was used to identify implementation challenges and strategies to overcome them. Results: Fifty HCWs from 26 facilities participated in 8 FGDs. HCWs believed PrEP integration was appropriate because it met the needs of AGYW and pregnant women by providing a female-controlled prevention strategy and aligned with policy priorities of elimination of vertical HIV transmission. They were universally accepting of PrEP provision, especially through MCH clinics, noting the relative advantage of this approach because it: (1) enabled high coverage, (2) harmonized PrEP and MCH visits, and (3) minimized stigma compared to PrEP offered through HIV care clinics. However, HCWs noted implementation challenges affecting feasibility and adoption including: (1) increased workload and documentation burden amid workforce shortages, (2) insufficient health care worker knowledge (3) multiple implementing partners with competing priorities (4) drug and documentation form stockouts. HCWs employed various implementation strategies to overcome challenges, including task shifting from nurses to HIV testing providers, patient flow modifications (e.g., fast-tracking PrEP clients to reduce wait times), PrEP demand generation and myth clarification during health talks, provider education, dedicated PrEP delivery rooms, and coordination with adolescent-friendly services. Additional suggested strategies to improve PrEP integration included community education to increase broader PrEP awareness and enable shorter counseling sessions, and task-shifting data entry and client risk assessments. Conclusions: HCWs were enthusiastic about the appropriateness and acceptability of integrating PrEP services into MCH and FP clinics but noted challenges to adoption and feasibility. Strategies to address challenges focused on improving provider time and space constraints, and increasing provider and client knowledge.	pre-exposure prophylaxis (PrEP), pregnancy, postpartum, adolescent girls and young women (AGYW), implementation science, consolidated framework for implementation research (CFIR), implementation strategies	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Wagner, Gabriel A; Wu, Kuan-Sheng; Anderson, Christy; Burgi, Alina	Predictors of Human Immunodeficiency Virus Pre-Exposure Prophylaxis (PrEP) Uptake in a Sexual Health Clinic With Rapid PrEP Initiation	Open Forum Infectious Diseases	-	-	-	2328-8957	https://doi.org/10.1093/ofid/ofad060	https://escholarship.org/uc/item/2s16d26t	BackgroundImproved pre-exposure prophylaxis (PrEP) uptake is essential for human immunodeficiency virus (HIV) prevention initiatives. Offering PrEP at the time of HIV and sexually transmitted infection (STI) testing can improve uptake. We offered rapid PrEP initiation in a sexual health clinic and assessed predictors of PrEP interest, initiation, linkage, and retention.MethodsBetween November 2018 and February 2020, PrEP-eligible individuals who presented to a sexual health clinic were offered a free 30-day supply of PrEP plus linkage to continued PrEP care. Univariable and multivariable analyses of demographic and HIV risk data were conducted to determine predictors of PrEP uptake.ResultsOf 1259 adults who were eligible for PrEP (99.7% male, 42.7% White, 36.2% Hispanic), 456 were interested in PrEP, 249 initiated PrEP, 209 were linked, and 67 were retained in care. Predictors of PrEP interest included younger age (P < .01), lower monthly income (P = .01), recreational drug use (P = .02), and a greater number of sexual partners (P < .01). Negative predictors of PrEP initiation included lower monthly income (P = .04), testing positive for chlamydia (P = .04), and exchanging money for sex (P = .01). Negative predictors of linkage included self-identifying as Black (P = .03) and testing positive for an STI (P < .01). Having health insurance positively predicted both linkage (P < .01) and retention (P < .03).ConclusionsA minority of PrEP-eligible HIV and STI testers initiated PrEP when offered, suggesting that easy PrEP access in sexual health clinics alone may not improve uptake. Predictors of uptake included established HIV risk factors and markers of higher socioeconomic status, suggesting that those aware of their risk and with the means to utilize health services engaged best with this model. Article	2023	Wairimu, Njeri; Malen, Rachel C; Reedy, Adriana M; Mogere, Peter; Njeru, Irene; Culquichicón, Carlos; McGowan, Maureen; Gao, Fei; Baeten, Jared M; Ngure, Kenneth; Ortblad, Katrina F	Peer PrEP referral + HIV self-test delivery for PrEP initiation among young Kenyan women: study protocol for a hybrid cluster-randomized controlled trial.	Trials	-	-	-	1745-6215	10.1186/s13063-023-07734-x	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10625301	BACKGROUND: Oral HIV pre-exposure prophylaxis (PrEP) for HIV prevention is highly effective, but uptake remains low in Africa, especially among young women who are a priority population for HIV prevention services. HIV self-testing (HIVST) has been proven to increase HIV testing in diverse populations but has been underutilized to support linkage to HIV prevention services. Most young women who initiate PrEP in Africa do so through informal peer referral. We wanted to test a model of formalized peer referral enhanced with HIVST delivery among young Kenyan women. METHODS: The Peer PrEP Trial is a two-arm hybrid effectiveness-implementation cluster-randomized controlled trial being conducted in central Kenya. Eligible participants (i.e., peer providers, n = 80) are women (≥ 16-24 years) refilling or initiating PrEP at public healthcare clinics who can identify at least four peers who could benefit from PrEP and not enrolled in another HIV study. Peer providers will be 1:1 randomized to (1) formal peer PrEP referral + HIVST delivery, where they will be encouraged to refer four peers (i.e., peer clients, ≥ 16-24 years) using educational materials and HIVST kits (two per peer client), or (2) informal peer PrEP referral, where they are encouraged to refer four peer clients using informal word-of-mouth referral. In both arms, peer providers will deliver a standard PrEP referral card with information on nearby public clinics delivering PrEP services. Peer providers will complete surveys at baseline and 3 months; peer clients will complete surveys at 3 months. Our primary outcome is PrEP initiation among peer clients, as reported by peer providers at 3 months. Secondary outcomes include PrEP continuation (any refilling), HIV testing (past 3 months), sexual behaviors (past month), and PrEP adherence (past month) among peer clients, as reported by both peer providers and clients at 3 months. Implementation outcomes will include participants' perceived acceptability, appropriateness, and feasibility of the intervention as well assessments of the intervention's fidelity and cost. DISCUSSION: Evidence from this trial will help us understand how HIVST could support health systems by facilitating linkage to PrEP services among young women who could benefit in Kenya and similar settings. Article	2023	Walcott M.M.; Tieu H.-V.; Tipre M.; Nandi V.; Davis A.; Wu E.; Wheatle M.; Frye V.; Figueroa J.P.	Factors associated with discussing HIV pre-exposure prophylaxis (PrEP) among Jamaican medical providers	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624231201187	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176946603&doi=10.1177%2f09564624231201187&partnerID=40&md5=b3c6d7c58fca9293b6e025907cbf58ad	Background: The Ministry of Health and Wellness of Jamaica has endorsed the use of pre-exposure prophylaxis (PrEP) as an HIV prevention strategy; however, PrEP was not included in the national HIV prevention program in 2021. Methods: A cross-sectional online study involving physicians in Jamaica was conducted in 2021 to describe PrEP awareness, beliefs, attitudes, and practices. The study also assessed individual and social factors associated with discussing PrEP with patients and willingness to prescribe PrEP. Findings: The mean age and standard deviation (SD) of the 69 physicians who completed the survey were 45.5 ± 13.6 years. Most of the participants (80%) reported that they were somewhat familiar with PrEP. PrEP attitude and perceived comfort in prescribing PrEP were moderate among participating physicians, with a mean and SD of 3.9 ± 0.8 and 3.6 ± 0.9 respectively. Six percent of physicians reported that they had prescribed PrEP and 17% had discussed PrEP with their patients in the past year. However, most (90%) reported that they were willing to prescribe PrEP after being informed about it. In the unadjusted model, identifying as Christian (compared to non-Christian) and reporting stronger homophobic beliefs were associated with reduced odds of discussing PrEP with patients. In the multivariable model, only homophobia remained statistically significant (OR, 0.24; 95% CI: 0.07–0.63). Conclusion: The findings suggest that physicians in Jamaica may be willing to prescribe PrEP; however, homophobia is a barrier to discussions, underscoring the need for the Ministry of Health and Wellness to recognize the role that homophobia plays in the national HIV program to further reduce HIV incidence in Jamaica. © The Author(s) 2023. Article	2023	Walsh J.L.; Zarwell M.; John S.A.; Quinn K.G.	Sources of Information about Pre-Exposure Prophylaxis (PrEP) and Associations with PrEP Stigma, Intentions, Provider Discussions, and Use in the United States	Journal of Sex Research	-	-	-	224499	10.1080/00224499.2022.2110208	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136949944&doi=10.1080%2f00224499.2022.2110208&partnerID=40&md5=3e90f0627163aa26dd219560f1cc1777	The amount and type of information individuals receive about HIV pre-exposure prophylaxis (PrEP) may influence PrEP uptake. We surveyed 331 HIV-negative sexual and gender minorities who have sex with men at a Midwestern Pride festival in 2018 (M age = 32, 68% White, 87% cisgender men) to assess sources and perceived tone of PrEP information and associated outcomes. Most participants (88%) had heard about PrEP. The most common sources were the internet (70%), social media (59%), and friends (54%). Messages from health campaigns were perceived as most positive and those from religious institutions as least positive. Sources differed based on demographics. Controlling for indications for PrEP use, those who heard about PrEP from health campaigns and those who heard more positive messages reported lower levels of PrEP stigma, βs = −0.27—0.23, ps <.05. Non-users who heard about PrEP from the internet had stronger intentions to use PrEP, β = 0.28, p < .05. Those who heard about PrEP from sexual partners and health campaigns were more likely to discuss PrEP with providers, PRs = 1.60–1.80, ps <.01. Finally, those who heard about PrEP from friends and partners were more likely to use PrEP, PRs = 2.01–2.24, ps <.05. Leveraging sexual partners, social network members, and health campaigns are promising avenues to advance PrEP implementation. © 2022 The Society for the Scientific Study of Sexuality. Article	2023	Wang G.; Song W.; Rao S.; Heitgerd J.; Mulatu M.S.; Karch D.; Belcher L.	HIV Positivity, Linkage to Medical Care, Interview for Partner Services, and Pre-Exposure Prophylaxis Awareness and Referral among Men Who Have Sex with Men Tested in Non-healthcare Settings in the United States, 2019	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003106	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143645081&doi=10.1097%2fQAI.0000000000003106&partnerID=40&md5=5db0aa8a1191446195cd35055e0be15a	Objectives:Gay, bisexual, and other men who have sex with men (MSM) are disproportionately affected by HIV. This study reports data on HIV testing program outcomes among MSM tested for HIV in non-healthcare settings in the United States.Methods:We analyzed Centers for Disease Control and Prevention's National HIV Prevention Program Monitoring and Evaluation data collected in 2019. Descriptive and multivariate robust Poisson regression analyses were conducted to summarize the patterns of HIV testing program outcomes ie, positivity, linkage to HIV medical care within 30 days of diagnosis, interview for partner services (PS), and pre-exposure prophylaxis (PrEP) awareness and referral by demographic characteristics, HIV prevalence, and testing site type.Results:A total of 123,251 HIV tests were conducted among MSM; of these, 1773 (1.4%) were newly diagnosed with HIV. Among MSM newly diagnosed with HIV, 75% were linked to HIV medical care and 80% were interviewed for PS. Among MSM who tested HIV-negative, 63% were aware of PrEP and 47% of those who were eligible for PrEP were referred to PrEP providers. Referral or linkage to services varied by demographic characteristics or other factors.Conclusions:Linkage to HIV medical care and interview for PS among MSM newly diagnosed with HIV in non-healthcare settings were below national or funding program targets. Most MSM with risk factors for HIV infection were not referred to PrEP providers. Expanded efforts to address barriers to equitable access to services may help improve HIV-related outcomes among MSM and contribute to ending the HIV epidemic in the United States. © 2023 Lippincott Williams and Wilkins. Article	2023	Wang, Bo; Janamnuaysook, Rena; MacDonell, Karen; Rongkavilit, Chokechai; Schieber, Elizabeth; Naar, Sylvie; Phanuphak, Nittaya	Adapting Effective mHealth Interventions to Improve Uptake and Adherence to HIV Pre-Exposure Prophylaxis Among Thai Young Men Who Have Sex With Men: Protocol for a Randomized Controlled Trial.	JMIR Research Protocols	-	-	-	1929-0748	10.2196/46435	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10507518	BACKGROUND: Young men who have sex with men (YMSM) are the fastest-growing HIV-positive population worldwide. Thailand has the highest adult HIV seroprevalence in Asia; over 25% of men having sex with men in Bangkok are HIV positive. Pre-exposure prophylaxis (PrEP) is an efficacious HIV prevention strategy recommended for all at-risk individuals. PrEP is highly effective when taken as prescribed, but PrEP utilization rate has been low, and adherence is often inadequate. OBJECTIVE: We propose to develop and pilot a multicomponent, technology-based intervention to promote motivation to begin PrEP ("uptake") and sustained adherence to PrEP among HIV-negative Thai YMSM. We will adapt an existing 2-session technology-delivered, motivational interviewing-based intervention to focus on PrEP use in YMSM in Thailand. The resulting intervention is called the Motivational Enhancement System for PrEP Uptake and Adherence (MES-PrEP). We will also develop motivational text messaging (MTM) to send two-way motivational messages to promote PrEP use. METHODS: The proposed study includes 3 phases. Phase 1 includes in-depth interviews with HIV-negative Thai YMSM and providers to explore barriers and facilitators of PrEP initiation and adherence, aiming to inform intervention content. Phase 2 consists of adapting and beta-testing MES-PrEP and MTM for functionality and feasibility using a youth advisory board of Thai YMSM. In Phase 3, we will conduct a pilot randomized controlled trial to evaluate the feasibility, acceptability, and preliminary efficacy of MES-PrEP and MTM to increase PrEP uptake and adherence among Thai YMSM. A total of 60 HIV-negative Thai YMSM who have not started PrEP and 60 YMSM who are on PrEP but not adherent to it will be randomized 2:1 to receive MES-PrEP and MTM (n=40) or standard PrEP counseling (n=20). The feasibility and acceptability of the intervention will be assessed through usage patterns and the System Usability Scale. The preliminary impact will be assessed by evaluating the proportion of PrEP initiation and level of adherence to PrEP. Participants will complete the assessments at baseline and at 1-, 3-, and 6-month postintervention. Biomarkers of adherence to PrEP and biomarkers of HIV and sexually transmitted infections will be collected. RESULTS: Recruitment for this study began in January 2022 for phase 1. Qualitative interviews were completed with 30 YMSM and 5 clinical providers in May 2022. Phase 3, the pilot feasibility and acceptability trial, began in July 2023. Upon project completion, we shall have developed a highly innovative mobile health intervention to support YMSM using PrEP, which will be ready for testing in a larger efficacy trial. CONCLUSIONS: This study addresses a critical problem (ie, high HIV incidence and low PrEP use) among Thai YMSM. We are developing 2 potentially synergistic technology-based, theory-driven interventions aimed at maximizing PrEP use. The proposed project has the potential to make significant contributions to advancing HIV prevention research and implementation science. Article	2023	Wang, Haoyi; Molina, Jean-Michel; Dray-Spira, Rosemary; Schmidt, Axel J; Hickson, Ford; van de Vijver, David; Jonas, Kai J	Spatio-temporal changes in pre-exposure prophylaxis uptake among MSM in mainland France between 2016 and 2021: a Bayesian small area approach with MSM population estimation.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26089	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10206410	INTRODUCTION: In France, oral pre-exposure prophylaxis (PrEP) for HIV prevention has been publicly available since 2016, mainly targeting at men who have sex with men (MSM). Reliable and robust estimations of the actual PrEP uptake among MSM on a localized level can provide additional insights to identify and better reach marginalized MSM within current HIV prevention service provision. This study used national pharmaco-epidemiology surveillance data and regional MSM population estimations to model the spatio-temporal distribution of PrEP uptake among MSM in France 2016-2021 to identify marginalized MSM at risk for HIV and increase their PrEP uptake. METHODS: We first applied Bayesian spatial analyses with survey-surveillance-based HIV incidence data as a spatial proxy to estimate the size of (1) regional HIV-negative MSM populations and (2) MSM who could be eligible for PrEP use according to French PrEP guidelines. We then applied Bayesian spatio-temporal ecological regression modelling to estimate the regional prevalence and relative probability of the overall- and new-PrEP uptake from 2016 to 2021 across France. RESULTS: HIV-negative and PrEP-eligible MSM populations vary regionally across France. Île-de-France was estimated to have the highest MSM density compared to other French regions. According to the final spatio-temporal model, the relative probability of overall PrEP uptake was heterogeneous across France but remained stable over time. Urban areas have higher-than-average probabilities of PrEP uptake. The prevalence of PrEP use increased steadily (ranging from 8.8% 95% credible interval 8.5%;9.0% in Nouvelle-Aquitaine to 38.2% 36.5%;39.9% in Centre-Val-de-Loire in 2021). CONCLUSIONS: Our results show that using Bayesian spatial analysis as a novel methodology to estimate the localized HIV-negative MSM population is feasible and applicable. Spatio-temporal models showed that despite the increasing prevalence of PrEP use in all regions, geographical disparities and inequalities of PrEP uptake continued to exist over time. We identified regions that would benefit from greater tailoring and delivery efforts. Based on our findings, public health policies and HIV prevention strategies could be adjusted to better combat HIV infections and to accelerate ending the HIV epidemic. Article	2023	Wang, Runzhi; Fruhauf, Timothee F; Sao, Saumya S; Gingher, Erin L; Martin, Stephen J; Coleman, Jenell S	Clinic-based interventions to increase preexposure prophylaxis awareness and uptake among United States patients attending an obstetrics and gynecology clinic in Baltimore, Maryland.	American Journal of Obstetrics and Gynecology	-	-	-	1097-6868	10.1016/j.ajog.2023.07.046	https://dx.doi.org/10.1016/j.ajog.2023.07.046	BACKGROUND: Cisgender women account for 1 of every 5 new US HIV diagnoses, with most cases (85%) attributed to heterosexual contact. HIV preexposure prophylaxis is an effective prevention strategy; however, preexposure prophylaxis awareness and prescriptions among women are low. OBJECTIVE: This study aimed to increase preexposure prophylaxis counseling and uptake among cisgender women attending obstetrics and gynecology clinics. STUDY DESIGN: The study included 3 obstetrics and gynecology clinics within a single health system in a high HIV prevalence region. There were 3 phases: baseline (the 3-month period before the clinical trial that included provider education and training of a registered nurse about preexposure prophylaxis), clinical trial (the 3-month period during which eligible patients were randomized to an active control or preexposure prophylaxis registered nurse intervention), and maintenance (the 3-month period after the trial ended). Electronic medical record clinical decision support tools were available to both arms during the clinical trial, which included best practice alerts, order sets, progress note templates, and written and video preexposure prophylaxis educational materials for patients. In the intervention arm, a preexposure prophylaxis nurse contacted and counseled patients and was equipped to prescribe preexposure prophylaxis. Moreover, this study evaluated the phases through the "reach, effectiveness, adoption, implementation, and maintenance" framework. The primary outcome of the study was effectiveness (eg, percentage of eligible patients with documented HIV prevention counseling in the electronic medical record or preexposure prophylaxis prescriptions). The secondary outcomes included reach (eg, percentage of best practice alerts that providers acted on or the percentage of eligible patients who spoke with the preexposure prophylaxis registered nurse), adoption (eg, percentage of eligible patients with a best practice alert that triggered or the percentage of eligible patients the preexposure prophylaxis registered nurse attempted to contact), and maintenance (eg, percentage of patients with documented HIV prevention counseling or preexposure prophylaxis prescriptions during the maintenance phase). RESULTS: There were 904 unique patients in all phases with a mean age of 28.8±7.7 years, and 416 patients (46%) were pregnant; moreover, 436 patients were randomized in the clinical trial phase. Concerning reach and adoption, best practice alerts were triggered for 100% of eligible encounters; however, the providers acted on 52% of them. The preexposure prophylaxis nurse attempted to contact every patient and successfully spoke with 81.2% of them in the preexposure prophylaxis registered nurse arm. Concerning effectiveness, there were significantly more patients counseled about preexposure prophylaxis in the preexposure prophylaxis registered nurse group than in the active control group (66.5% vs 12.3%, respectively; P<.001), although preexposure prophylaxis prescriptions were equivalent (P=1.0). Among the subgroup of patients who were counseled about preexposure prophylaxis, 18.5% of patients in the active control arm and 3.4% in the preexposure prophylaxis registered nurse arm were prescribed preexposure prophylaxis (P=.02). Concerning maintenance, clinical decision support tools alone resulted in preexposure prophylaxis counseling of 1.0% of patients during the maintenance phase vs 0.6% of patients during the baseline phase and 11.2% of patients during the clinical trial phase (P<.001). Preexposure prophylaxis prescriptions were not statistically different among the 3 phases (P=.096). CONCLUSION: A preexposure prophylaxis nurse effectively increased HIV prevention discussions but did not lead to more preexposure prophylaxis prescriptions than the preexposure prophylaxis-focused clinical decision support tools used by providers. The decrease in preexposure prophylaxis counseling after the trial phase suggests that persistent interventions are needed to maintain effects.	best practice alerts, cisgender women, clinical decision support tool, electronic medical record, HIV prevention, preexposure prophylaxis, preexposure prophylaxis nurse. Article	2023	Wang, Wenjing; Zhao, Shengnan; Wu, Yaxin; Duan, Wenshan; Li, Sibo; Li, Zhen; Guo, Caiping; Wang, Wen; Zhang, Tong; Wu, Hao; Huang, Xiaojie	Safety and Efficacy of Long-Acting Injectable Agents for HIV-1: Systematic Review and Meta-Analysis.	JMIR Public Health and Surveillance	-	-	-	2369-2960	10.2196/46767	https://publichealth.jmir.org/2023/1/e46767/	BACKGROUND: HIV-1 infection continues to affect global health. Although antiretrovirals can reduce the viral load or prevent HIV-1 infection, current drugs require daily oral use with a high adherence level. Long-acting antiretrovirals (LA-ARVs) significantly improve medication adherence and are essential for HIV-1 prophylaxis and therapy. OBJECTIVE: This study aimed to investigate the safety and efficacy of long-acting cabotegravir (CAB-LA) and long-acting rilpivirine (RPV-LA) in the prevention and treatment of HIV-1 infection. METHODS: PubMed, Embase, and the Cochrane Library were searched for studies from database inception to November 12, 2022. We included studies that reported efficacy and safety data on LA-ARV intervention in people living with HIV and excluded reviews, animal studies, and articles with missing or duplicate data. Virological suppression was defined as plasma viral load <50 copies/mL 6 months after antiviral therapy initiation. We extracted outcomes for analysis and expressed dichotomous data as risk ratios (RRs) and continuous data as mean differences. Depending on the heterogeneity assessment, a fixed- or random-effects model was used for data synthesis. We performed subgroup analyses of the partial safety and efficacy outcomes of CAB-LA+RPV-LA. The protocol was registered with the Open Science Framework. RESULTS: We included 12 trials comprising 10,957 individuals, of which 7 were prevention trials and 5 were treatment trials. CAB-LA and RPV-LA demonstrated safety profiles comparable with those of the placebo in terms of adverse event-related withdrawal. Moreover, the efficacy data showed that CAB-LA had a better effect on HIV-1 prevention than tenofovir disoproxil fumarate-emtricitabine (17/5161, 0.33% vs 75/5129, 1.46%; RR 0.21, 95% CI 0.07-0.61; I(2)=70%). Although CAB-LA+RPV-LA had more drug-related adverse events (556/681, 81.6% vs 37/598, 6.2%; RR 12.50, 95% CI 3.98-39.23; I(2)=85%), a mild or moderate injection site reaction was the most common reaction, and its frequency decreased over time. The efficacy of CAB-LA+RPV-LA was comparable with that of daily oral drugs at 48 and 96 weeks (1302/1424, 91.43% vs 915/993, 92.2%; RR 0.99, 95% CI 0.97-1.02; I(2)=0%), and a high level of virological suppression of 80.9% (186/230) was maintained even after 5 years of LA-ARV use. Similar efficacy outcomes were observed in both treatment-naive and treatment-experienced patients (849/911, 93.2% vs 615/654, 94%; RR 0.99, 95% CI 0.96-1.02; I(2)=0%). According to the questionnaires, more than 85% of people living with HIV favored LA-ARVs. CONCLUSIONS: LA-ARVs showed favorable safety profiles for both the prevention and treatment of HIV-1 infection and were well tolerated. CAB-LA has more satisfactory efficacy than tenofovir disoproxil fumarate-emtricitabine, significantly reducing the rate of HIV-1 infection. CAB-LA+RPV-LA maintains virological suppression for a long time and may be a viable switching strategy with enhanced public health benefits by reducing transmission. However, further trials are required to confirm the efficacy of these drugs.	long-acting cabotegravir (1); CAB-LA (1); long-acting rilpivirine (1); RPV-LA (1); pre-exposure prophylaxis (100); PrEP (60); treatment (313); long-term suppression (1)	English	Canada	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Review
Article	2023	Wang, Xiaomeng; Zhang, Tiantian; Chang, Qinxue; Wang, Chun; Wang, Keyun; Yu, Zeyang; Zhang, Honglu; Huang, Huijie; Song, Desheng; Peixoto, Elissa; Yang, Jie; Li, Changping; Cui, Zhuang; Liu, Yuanyuan; Ma, Jun	The risk of acute and early HIV (AEH) infection among MSM with different behaviour trajectories: an open cohort study in Tianjin, China, 2011-2019.	BMC Infectious Diseases	-	-	-	1471-2334	10.1186/s12879-023-08001-9	https://bmcinfectdis.biomedcentral.com/articles/10.1186/s12879-023-08001-9	BACKGROUND: Acute and early HIV (AEH) infection is characterized by a high viral load and infectivity. Approximately 50% of cases of HIV-1 transmission occur during AEH. Understanding sexual behaviour trajectories would be useful for predicting changes in the risk of HIV acquisition. However, few studies have investigated sexual behaviour trajectories and their association with AEH acquisition. This study identified behaviour trajectories among men who have sex with men (MSM), determined the risk of AEH infection, and compared risk factors between different behaviour trajectories. METHODS: The study was based on an ongoing prospective open cohort of voluntary HIV counselling and testing (VHCT) among MSM in Tianjin, China. From 2011 to 2019, 1974 MSM were recruited. Group-based trajectory modelling (GBTM) was used to identify behaviour trajectories by constructing a sexual risk behaviour score. Logistic regression and generalized estimating equation (GEE) were used to compare the risk of AEH infection and risk factors for different behaviour trajectories. All data analyses were performed using SAS 9.4. RESULTS: The incidence of AEH infection was 1.76/100 person-years, with 64 AEH infections documented in 3633 person-years of follow-up. Three sexual behaviour trajectories were identified: CL (consistently low risk, 35.46%), CH (consistently high risk, 42.71%) and HTL (high to low risk, 21.83%). MSM in the HTL and CH groups had higher AEH infection rates than MSM in the CL group (6.73%, 3.08% and 1.28%, respectively), with ORs of 5.54 (2.60, 11.82) and 2.44 (1.14, 5.25), respectively. MSM aged 30-50 years old and MSM who underwent HIV testing in the last year were more likely to be in the CH group and HTL group. In addition, the HTL group was characterized by a lower likelihood of local registration and a higher likelihood of working as a MSW. CONCLUSION: MSM in the CH group and the HTL group had a higher risk of AEH infection. In the future, VHCT should be performed more often among younger MSM, and HIV counselling should be given the same priority as HIV testing. In addition, VHCT combined with PrEP may have a better preventive impact on MSM with a high risk of AEH infection. Article	2023	Wara, Nafisa J; Mvududu, Rufaro; Marwa, Mary M; Gómez, Laurén; Mashele, Nyiko; Orrell, Catherine; Moucheraud, Corrina; Kinuthia, John; John-Stewart, Grace; Myer, Landon; Hoffman, Risa; Pintye, Jillian; Davey, Dvora L Joseph	Preferences and acceptability for long-acting PrEP agents among pregnant and postpartum women with experience using daily oral PrEP in South Africa and Kenya.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26088	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10206415	INTRODUCTION: Long-acting pre-exposure prophylaxis (PrEP) options could overcome barriers to oral PrEP persistence during pregnancy and postpartum. We evaluated long-acting PrEP preferences among oral PrEP-experienced pregnant and postpartum women in South Africa and Kenya, countries with high PrEP coverage with pending regulatory approvals for long-acting injectable cabotegravir and the dapivirine vaginal ring (approved in South Africa, under review in Kenya). METHODS: From September 2021 to February 2022, we surveyed pregnant and postpartum women enrolled in oral PrEP studies in South Africa and Kenya. We evaluated oral PrEP attitudes and preferences for long-acting PrEP methods in multivariable logistic regression models adjusting for maternal age and country. RESULTS: We surveyed 190 women in South Africa (67% postpartum; median age 27 years IQR = 22-32) and 204 women in Kenya (79% postpartum; median age 29 years IQR = 25-33). Seventy-five percent of participants reported oral PrEP use within the last 30 days. Overall, forty-nine percent of participants reported negative oral PrEP attributes, including side effects (21% South Africa, 30% Kenya) and pill burden (20% South Africa, 25% Kenya). Preferred PrEP attributes included long-acting method, effectiveness, safety while pregnant and breastfeeding, and free medication. Most participants (75%, South Africa and Kenya) preferred a potential long-acting injectable over oral PrEP, most frequently for a longer duration of effectiveness in South Africa (87% South Africa, 42% Kenya) versus discretion in Kenya (5% South Africa, 49% Kenya). Eighty-seven percent of participants preferred oral PrEP over a potential long-acting vaginal ring, mostly due to concern about possible discomfort with vaginal insertion (82% South Africa, 48% Kenya). Significant predictors of long-acting PrEP preference included past use of injectable contraceptive (aOR = 2.48, 95% CI: 1.34, 4.57), disliking at least one oral PrEP attribute (aOR = 1.72, 95% CI: 1.05, 2.80) and preferring infrequent PrEP use (aOR = 1.58, 95% CI: 0.94, 2.65). CONCLUSIONS: Oral PrEP-experienced pregnant and postpartum women expressed a theoretical preference for long-acting injectable PrEP over other modalities, demonstrating potential acceptability among a key population who must be at the forefront of injectable PrEP rollout. Reasons for PrEP preferences differed by country, emphasizing the importance of increasing context-specific options and choice of PrEP modalities for pregnant and postpartum women.	breastfeeding, long-acting, PrEP, pregnancy, Kenya, South Africa	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Wardley, Amelia Margaret; Williams, Henrietta; Coombe, Jacqueline; Caddy, Cassandra; Fairley, Christopher Kincaid; Hocking, Jane Simone	Would men who have sex with men support less frequent screening for asymptomatic chlamydia and gonorrhoea to improve antibiotic stewardship? A qualitative study.	Sexual Health	-	-	-	1449-8987	10.1071/SH22139	https://dx.doi.org/10.1071/SH22139	BACKGROUND: Men who have sex with men (MSM) taking pre-exposure prophylaxis (PrEP) are recommended to have screening for asymptomatic chlamydia and gonorrhoea every 3months with high rates of asymptomatic chlamydia and gonorrhoea detected. However, there is little evidence about the effectiveness of this screening interval and there is increasing concern about antibiotic consumption and its impact on antimicrobial resistance. There have been calls to reconsider this frequent screening for chlamydia and gonorrhoea. We conducted interviews with MSM to assess their attitudes to 3-monthly chlamydia and gonorrhoea screening. METHODS: Individual semi-structured interviews were conducted with MSM living in Victoria, Australia. Participants were aged 20-62years and had been taking PrEP for at least 6months. Interviews were audio-recorded and transcribed, and these data were investigated through reflexive thematic analysis. RESULTS: Thirteen interviews were conducted in August 2021. Participants were hesitant about reducing the screening frequency and reported that testing gave them a sense of security. While MSM recognised antimicrobial resistance was a concern, it did not impact their sexual behaviour, with many participants stating they would rather continue to take antibiotics to treat infections rather than adopt preventative measures such as condom use. Positive attitudes towards screening interval changes are more likely when PrEP patients are informed about the risks and benefits of sexual healthcare recommendations. CONCLUSION: While MSM on PrEP were initially hesitant to changes in screening frequency, changes may be acceptable if transparent communication, presenting the benefits and harms of screening and treatment, was delivered by a trusted healthcare professional. Article	2023	Ware, Norma C; Wyatt, Monique A; Pisarski, Emily E; Nalumansi, Alisaati; Kasiita, Vicent; Kamusiime, Brenda; Nalukwago, Grace K; Thomas, Dorothy; Kibuuka, Joseph; Muwonge, Timothy; Mujugira, Andrew; Heffron, Renee	How Central Ugandan HIV Clinics Adapted During COVID-19 Lockdown Restrictions to Promote Continuous Access to Care: A Qualitative Analysis.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-023-04090-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10235841	We used qualitative data from the Partners PrEP Program (PPP) to address the question: How did Central Ugandan HIV clinics adapt to COVID-19 lockdown restrictions to promote continuous access to HIV care? PPP was a stepped-wedge cluster randomized trial of integrated PrEP and ART delivery for HIV serodifferent couples at Central Ugandan HIV clinics (NCT03586128). Individual interviews with purposefully selected PPP couples (N = 42) and clinicians, coordinators, and counselors providing HIV care (N = 36) were carried out. Sixty-four interviews were completed after lockdown and included questions about accessing and providing ART/PrEP refills during lockdown restrictions. We used an inductive, content-focused approach to analyze these interview data. Barriers to continuous access identified by interviewees included loss of income with increased cost of transport, reduced staff at clinics, and physical distancing at clinics. Interviewees pointed to multi-month refills, visits to clinics "close to home," transport to clinics for providers, and delivery of refills in neighborhoods as factors promoting continuous access to antiretroviral medications. Access barriers appeared somewhat different for ART and PrEP. Fewer resources for community delivery and pre-refill HIV testing requirements were identified as PrEP-specific access challenges. Participants emphasized their success in continuing ART/PrEP adherence during the lockdown, while providers emphasized missed refill visits. These results highlight the contributions of providers and ART/PrEP users to adaptation of HIV services during COVID-19 lockdown restrictions in Uganda. The roles of direct care providers and service users as drivers of adaptation should be recognized in future efforts to conceptualize and investigate health system resiliency. Article	2023	Warren, Mitchell; Nyagah, Wawira; Verde Hashim, Catherine; Rodolph, Michelle; Schaefer, Robin; Schmidt, Heather-Marie A; Baggaley, Rachel	Shaping and coordinating the implementation science agenda for injectable cabotegravir for PrEP: the role of the Biomedical Prevention Implementation Collaborative (BioPIC).	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26094	https://dx.doi.org/10.1002/jia2.26094	INTRODUCTION: Data from two randomized controlled trials (RCTs) showed that injectable cabotegravir (CAB) for pre-exposure prophylaxis (PrEP) was efficacious in reducing HIV acquisition. The US Food and Drug Administration approved CAB for PrEP in December 2021; Australia in August 2022; Zimbabwe in October 2022; South Africa in November 2022; Malawi in March 2023; and regulatory approvals are being sought in additional countries. The World Health Organization (WHO) recommended CAB to be offered to people at substantial risk of HIV in July 2022. However, implementation experience beyond RCTs is limited. As countries consider CAB implementation, questions remain regarding delivery and involvement of populations excluded from the trials. A coordinated approach is needed to ensure these are addressed and CAB can be introduced in low- and middle-income countries in timely, acceptable and effective ways. DISCUSSION: Beginning in 2018, the Biomedical Prevention Implementation Collaborative (BioPIC) convened over 100 global health experts to develop a comprehensive introduction strategy for CAB. Using this roadmap, country landscaping for CAB introduction and lessons from oral PrEP implementation, AVAC and WHO co-convened 50 researchers, donors, implementers and civil society in September 2021 to: (1) identify questions and evidence gaps related to CAB across contexts and partners; (2) define the implementation science agenda; and (3) agree on mechanism(s) for future coordination. As a result, CAB-related questions were identified, including: defining optimal and feasible HIV testing strategies that expand access; delivery models; integration with a range of services, including family planning and antenatal care; and embedding CAB in demand generation for HIV prevention choices. Through convenings and mapping of implementation research, BioPIC identified gaps in populations, geographies and delivery approaches. CONCLUSIONS: The introduction strategy refined by BioPIC lays the groundwork for future HIV prevention products. Ongoing policy and implementation dialogue is critical to accelerate the design of CAB implementation studies that adequately address priority knowledge gaps. Additional long-acting HIV prevention products may be available over the next 5 years, increasing choice, but potentially making delivery and stakeholder engagement more complex. Ongoing coordination with WHO will accelerate the adoption of evidence-based policies and wide-scale implementation, and lessons from BioPIC can inform introduction processes for long-acting HIV prevention products. Theses and Dissertations	2023	Watson, Margaret	Perspectives on the Use of Molecular HIV Data for Public Health	-	-	Georgia Southern University	-	NA	NA	https://digitalcommons.georgiasouthern.edu/etd/2688	Background. Effective HIV treatment and pre-exposure prophylaxis can drastically reduce the risk of acquiring HIV and prevent most future transmission, but these advances are not accessible to many who could most benefit from them. Advances in use of molecular sequence data to inform prevention efforts, paired with supportive interventions, have the potential to identify clusters of rapid HIV transmission and focus prevention resources toward areas of highest need. Although molecular cluster detection has been successfully used in other areas of public health, advocates for people with HIV have raised concerns about the application of this approach because of HIV criminalization, stigma and marginalization, and consent issues. Purpose. The primary purpose of this study was to describe the perspectives of Black and Hispanic/Latino same gender-loving men and genderqueer persons with experience in the field of HIV prevention about molecular HIV cluster detection. Additional goals aim to understand the ethical frameworks underlying these perceptions, and to document participants' suggestions to improve implementation of molecular HIV cluster detection and response. Methods. This qualitative research study gathered information from ten key informants via semi-structured individual interviews, using a standard interview tool, to better understand existing opinions and beliefs in HIV prevention and advocacy communities. Data were coded using an inductive thematic analysis with Dedoose version 9.0. Results. Participants had varied levels of experience with this work, but all understood basic concepts including the potential value of this work to focus HIV prevention to communities with the greatest needs. Participants expressed a variety of perspectives. Concerns included HIV criminalization, stigma and marginalization, and informed consent. Suggestions included increasing transparency through additional community engagement and communication, and addressing HIV criminalization, stigma, and marginalization. Conclusions. Public health agencies need to better understand and address concerns about molecular HIV detection. Increased community engagement and communication around this work can help address issues of perceived lack of transparency and mistrust. Communication should include the rationale for conducting public health surveillance activities in the absence of informed consent, as well as health department data protections and local criminalization policies and practices. Article	2023	Watson, Ryan J; Morgan, Ethan; Sherman, Jessica; Caba, Antonia E; Wheldon, Christopher W; Chan, Philip A; Eaton, Lisa A	Pre-exposure prophylaxis (PrEP) use, anticipated PrEP stigma, and bisexual identity among a Black and Hispanic/Latino sexual and gender diverse sample	Behavioral Medicine	-	-	-	08964289	10.1080/08964289.2022.2048249	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-use-anticipated/docview/2843992910/se-2?accountid=8113	Black and Hispanic/Latino sexual minority men and gender diverse (SMMGD) individuals are disproportionately impacted by the HIV epidemic. Uptake and adherence to pre-exposure prophylaxis (PrEP) is suboptimal among SMMGD Black and Hispanic/Latino individuals, but most research has approached this population as homogenous (e.g., a group operationalized as men who have sex with men). Bisexual men are less likely to disclose their sexual identity and report more mental health problems than their gay counterparts, but there is less attention to the impact of different sexual identities on PrEP use over time. We utilized data from three waves of a national longitudinal study (2020-2021) to characterize Black and Hispanic/Latino SMMGD participants' PrEP use including: 1) PrEP uptake during the study; 2) consistent PrEP use across the study; and 3) discontinuation of PrEP use since study baseline. We found bisexual men were significantly less likely than gay men to be consistent PrEP users and were more likely to discontinue PrEP use over the course of the study. Of the sample who reported PrEP use across surveys, 10% initiated PrEP during the study period, 0% of whom were bisexual. Additionally, bisexual participants reported statistically significantly higher anticipated PrEP stigma relative to gay participants. These findings have implications for HIV prevention interventions. Given the differences in PrEP experiences as a function of sexual identity, researchers and clinicians should consider the disruptive role of stigma (both biphobia and anticipated PrEP stigma) in PrEP care and adherence. Article	2023	Weidlich S.; Schneider J.; Lee M.; Mijočević H.; Graf N.; Protzer U.; Spinner C.; Noe S.	Seroconversion rate of SARS-CoV-2 IgG antibodies and dating behaviour in HIV-PrEP users in a German metropolis during the COVID-19 pandemic	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624231190419	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165366347&doi=10.1177%2f09564624231190419&partnerID=40&md5=6a2fdb6b7f82d3cab81ac6de99007854	Background: At the beginning of the COVID-19 pandemic, when mortality was high, social distance was the only option to prevent transmission of SARS-CoV-2 and prohibit uncontrolled spreading. As the impact of social distancing on sexual behavior was unclear, we aimed to assess the influence of sexual risk behavior on SARS-CoV-2 seroconversion in HIV pre-exposition prophylaxis (PrEP) users after declaration of the pandemic. Methods: Prospective study on SARS-CoV-2 IgG-antibody seroconversion rate over time in men having sex with men (MSM) using PrEP at a single tertiary university hospital in Munich, Germany, during quarterly (Q) routine HIV-PrEP visits over 1 year per participant (May 2020 - September 2021). Seroconversion was defined as at least one positive anti-nucleocapsid (anti-N) SARS-CoV-2 IgG antibody test as surrogate for past infection. In addition, sexually transmitted infections (STIs), personal estimated risk behavior and sexual contacts were assessed. Results: Seroconversion rate during the full observation period was 7.3% (9/124 subjects) by September 2021. Percentage of subjects with symptomatic STIs (T. pallidum, N. gonorrhoeae, C. trachomatis and M. genitalium) was 18.7% in Q3-20, 8.1% in Q4-20, 11.1% in Q1-21, 11.6% in Q2-21 and 9.5% in Q3-21. Perception of subjective threat of SARS-CoV-2 infection and adequacy of preventive measures decreased during the observation period. However, self-reported sex behavior remained stable during the observation period. Conclusions: Our cohort showed low proportion of PrEP-users with anti-N IgG by September 2021, comparable to the local incidence. Sexual behavior in this cohort did not change, despite local recommendations for social distancing. © The Author(s) 2023. Article	2023	Weigel, Gabriela; Theva, Meena; Hardy, Erica; Wagner, Stephen; Brown, Benjamin	Sexual and Reproductive Health Care Visits as a Venue for Preexposure Prophylaxis Service Delivery among Women in the United States: Results from a Nationally Representative Survey	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001805	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175151149&doi=10.1097%2fOLQ.0000000000001805&partnerID=40&md5=b5c890c1aefe10061dd20a6e98d4ba16	Background Preexposure prophylaxis (PrEP) for HIV is disproportionately underprescribed to women. Centers for Disease Control and Prevention guidelines identify a group of women at risk of HIV acquisition who should be offered PrEP, but opportunities remain to improve patient awareness of and provider counseling about PrEP and to expand service delivery of PrEP. Methods Using nationally representative data from the 2017-2019 National Survey of Family Growth, we compared women with (n = 689) and without (n = 5,452) Centers for Disease Control and Prevention indications for PrEP on measures of PrEP awareness, counseling by a provider, and interaction with the health care system. Results Women with PrEP indications were no more likely to report awareness of PrEP (odds ratio OR, 1.03; 95% confidence interval CI, 0.82-1.29) or PrEP counseling by a provider (OR, 1.32; 95% CI, 0.77-2.27), compared with those without PrEP indications. However, women with PrEP indications were more likely than those without to report a birth control visit (OR, 1.82; 95% CI, 1.39-2.38) or an abortion within the last 12 months (OR, 5.93; 95% CI, 1.48-23.73), and to currently use prescription contraception (OR, 1.45; 95% CI, 1.19-1.78). A majority of both groups reported accessing prenatal care within the last 12 months. Conclusions There remains a gap in PrEP awareness and counseling among women at highest risk for HIV acquisition. Sexual and reproductive health visits represent a logical and feasible venue for PrEP provision. Obstetrician-gynecologists and other family planning providers may be able to aid in service delivery innovations by providing PrEP alongside other sexual and reproductive health care. © Lippincott Williams & Wilkins. Article	2023	Weinstein E.R.; Puccinelli M.; Cardenas N.; Safren S.A.; Harkness A.	PrEP to Party: Exploring MSM's PrEP Use and Interest in the Context of Sexually Themed Events	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04225-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177083641&doi=10.1007%2fs10461-023-04225-7&partnerID=40&md5=4d525ffc8b4cc4ff11280bb44d0d9d1b	Sexually themed events present a unique opportunity for scaling up pre-exposure prophylaxis (PrEP) to men who have sex with men (MSM). This study descriptively explored PrEP uptake among MSM who anticipated attending a week-long major South Florida sexually themed event and examined potential facilitators and barriers to PrEP engagement among potential attendees. Of the participating HIV-negative MSM (n = 96), 66.7% were currently taking PrEP. Prior attendance at sexually themed events was significantly associated with current PrEP engagement and almost 75% of HIV-negative MSM not on PrEP reported high interest in taking PrEP if offered for free at future events. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Weir, Brian W; Wirtz, Andrea L; Chemnasiri, Tareerat; Baral, Stefan D; Decker, Michele; Dun, Chen; Hnin Mon, Sandra Hsu; Ungsedhapand, Chaiwat; Dunne, Eileen F; Woodring, Joseph; Pattanasin, Sarika; Sukwicha, Wichuda; Thigpen, Michael C; Varangrat, Anchalee; Warapornmongkholkul, Anchalee; O'Connor, Siobhan; Ngo, Julie P; Qaragholi, Noor; Sisel, Haley I; Truong, Jasmine M; Janyam, Surang; Linjongrat, Danai; Sriplienchan, Somchai; Sirivongrangson, Pachara; Rooney, James F; Sullivan, Patrick; Chua-Intra, Boosbun; Hickey, Andrew C; Beyrer, Chris	High PrEP uptake, adherence, persistence and effectiveness outcomes among young Thai men and transgender women who sell sex in Bangkok and Pattaya, Thailand: findings from the open-label combination HIV prevention effectiveness (COPE) study.	The Lancet Regional Health - Americas	-	-	-	2772-3682	10.1016/j.lana.2023.100217	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10442968	Background: Daily oral pre-exposure prophylaxis (PrEP) is effective in preventing HIV infection, but no study has evaluated combination prevention interventions with PrEP for transgender women (TGW) and men who have sex with men (MSM) who sell sex. Methods: The Combination Prevention Effectiveness (COPE) study was a community-based, non-randomized implementation study in Bangkok and Pattaya, Thailand. Participants were HIV-negative MSM and TGW aged 18-26 years who reported exchanging sex with men in the prior 12 months and who met 2014 U.S. Public Health Service PrEP eligibility criteria. The intervention included quarterly HIV testing, semiannual testing for sexually transmitted infections, provision of condoms with lubricant, and the opportunity to initiate or end daily oral PrEP use at any time during study participation. Participants taking PrEP received monthly adherence counseling and short message service reminders. The primary outcome was HIV incidence rate ratio (IRR) on PrEP vs. not on PrEP. Secondary outcomes were PrEP initiation, PrEP use at 12 months, and PrEP adherence. Findings: From October 2017 to August 2019, 846 participants were enrolled: 531 (62.8%) immediately initiated PrEP; 104 (12.3%) subsequently initiated PrEP, and 211 (24.9%) never initiated PrEP. Among those initiating PrEP within 30 days of enrollment, 85.9% were on PrEP at the 12-months. When taking PrEP, participants reported adherent PrEP use at 94.2% of quarterly assessments. Ten HIV seroconversions occurred without PrEP use (incidence rate IR = 3.42 per 100 person-years PY; 95% CI = 1.64-6.30), while zero cases occurred with PrEP use (IR = 0.0 per 100PY; 95% CI = 0.0-0.62), with IRR = 0.0 (95% CI = 0.0-0.22; p < 0.001). Interpretation: Young Thai MSM and TGW who exchange sex can have high PrEP uptake, persistence and adherence, and low HIV incidence when offered in supportive community-based settings. Funding: U.S. National Institute of Allergy and Infectious Diseases; Centers for Disease Control and Prevention. Article	2023	Weld, Ethel D; McGowan, Ian; Anton, Peter; Fuchs, Edward J; Ho, Ken; Carballo-Dieguez, Alex; Rohan, Lisa C; Giguere, Rebecca; Brand, Rhonda; Edick, Stacey; Bakshi, Rahul P; Parsons, Teresa; Manohar, Madhuri; Seigel, Aaron; Engstrom, Jared; Elliott, Julie; Jacobson, Cindy; Bagia, Christina; Wang, Lin; Al-Khouja, Amer; Hartman, Douglas J; Bumpus, Namandje N; Spiegel, Hans M L; Marzinke, Mark A; Hendrix, Craig W	Tenofovir Douche as HIV Pre-Exposure Prophylaxis for Receptive Anal Intercourse: Safety, Acceptability, Pharmacokinetics, & Pharmacodynamics (DREAM 01).	Journal of Infectious Diseases	-	-	-	1537-6613	10.1093/infdis/jiad535	https://dx.doi.org/10.1093/infdis/jiad535	BACKGROUND: Despite highly effective HIV pre-exposure prophylaxis (PrEP) options, no options provide on-demand, non-systemic, and behaviorally-congruent PrEP that many desire. A tenofovir-medicated rectal douche before receptive anal intercourse (RAI) may provide this option. METHODS: Three tenofovir rectal douches - 220-mg iso-osmolar Product A, 660-mg iso-osmolar Product B, and 660-mg hypo-osmolar Product C - were studied in 21 HIV-negative men who have sex with men. We sampled blood and colorectal tissue to assess safety, acceptability, pharmacokinetics, and pharmacodynamics. RESULTS: The douches had high acceptability without toxicity. Median plasma tenofovir peak concentrations for all products were several-fold below trough concentrations associated with oral tenofovir disoproxil fumarate (TDF). Median colon tissue mucosal mononuclear cell (MMC) tenofovir-diphosphate concentrations exceeded target concentrations from 1-hour through 3-to-7-days after dosing. For 6-7-days after a single Product C dose, MMC tenofovir-diphosphate exceeded concentrations expected with steady-state oral TDF 300-mg on-demand "2-1-1" dosing. Compared to pre-drug baseline, HIV replication after ex vivo colon tissue HIV challenge demonstrated a concentration-response relationship with 1.9 log10 maximal effect. CONCLUSIONS: All three tenofovir douches achieved tissue tenofovir-diphosphate concentrations and colorectal antiviral effect exceeding oral TDF with lower systemic tenofovir. tenofovir douches may provide a single dose, on-demand, behaviorally-congruent PrEP option and warrant continued development. Interpersonal and Community-Level Influences Across the PrEP Cascade Among Young Adult Latinx Men who Have Sex with Men Living in a US-Mexico Border Region: A Qualitative Study	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04185-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173029456&doi=10.1007%2fs10461-023-04185-y&partnerID=40&md5=3de436a49f22e7b978b95a56ab253b21	Latinx men who have sex with men (MSM) are an at-risk population for new HIV diagnoses. Pre-exposure prophylaxis (PrEP) is a suite of biomedical approaches to prevent HIV infection. Latinx MSM are less likely to take PrEP compared to non-Latinx White MSM. This qualitative study identified interpersonal- and community-level barriers and facilitators of PrEP among young adult Latinx MSM. Using stratified purposeful sampling, 27 Latinx men, ages 19–29 years and living in a US-Mexico border region, completed self-report demographic surveys and participated in semi-structured in-depth interviews assessing barriers and facilitators to PrEP. Directed content analysis was used to identify both a priori and emerging themes. Most participants reported that other people, including peers, friends, partners, and health care providers were both supportive and discouraging of PrEP use. Participants' intersectional identities as members of both Latinx and LGBTQ+ (Lesbian, Gay, Bisexual, Transgender, Queer) communities both hindered and facilitated PrEP use. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Wells, Nathanael	U=U, PrEP and the unrealised promise of ending HIV-related stigma.	Sexual Health	-	-	-	1449-8987	10.1071/SH23045	https://dx.doi.org/10.1071/SH23045	There is now widespread consensus that by reducing HIV viral load to undetectable levels, HIV treatment also eliminates the risk of HIV sexual transmission. Advocates have hoped that eliminating the risk of HIV will be accompanied by a reduction of HIV-related stigma. These hopes have yet to be realised and people living with HIV continue to report stigma and sexual rejection. The burden of challenging HIV-related stigma has largely fallen on people living with HIV. It is time for those who are HIV-negative to also take on some of the burden in challenging HIV stigma. Article	2023	Werner R.N.; Schmidt A.J.; Potthoff A.; Spornraft-Ragaller P.; Brockmeyer N.H.	Position statement of the German STI Society on the prophylactic use of doxycycline to prevent STIs (Doxy-PEP, Doxy-PrEP)	JDDG - Journal of the German Society of Dermatology	-	-	-	16100379	10.1111/ddg.15282	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180204185&doi=10.1111%2fddg.15282&partnerID=40&md5=d55823936eb628d2dea981936e9029d3	Over the past two decades, there has been a rise in the incidence of syphilis, particularly among men who have sex with men (MSM). This has sparked interest in studying the prophylactic use of doxycycline to prevent syphilis and other sexually transmitted infections (STIs), commonly referred to as Doxycycline Pre- or Post-Exposure Prophylaxis (Doxy-PrEP, Doxy-PEP). At the same time, demand from potential users for this preventive measure is increasing. Several randomized controlled trials have demonstrated that the prophylactic use of doxycycline in MSM and trans women using HIV pre-exposure prophylaxis (HIV-PrEP) or living with an HIV infection effectively reduces the risk of syphilis and chlamydia infections. At present, however, unresolved questions remain, particularly regarding implications of a broad implementation of prophylactic doxycycline to prevent STIs on tetracycline and other antimicrobial resistance in bacterial STIs, non-STI-related bacterial pathogens, and the microbiome. In response to the increasing demand and the challenge of balancing effectiveness, safety, and the risk of promoting antibiotic resistance, the German STI Society (DSTIG) has issued a position statement, providing specific recommendations regarding potential indications, criteria, and precautions for the use of doxycycline in STI prevention. These recommendations are based on current evidence and expert opinion. © 2023 The Authors. Article	2023	Weser, Veronica; Opara, Ijeoma; Budge, Mariana; Duncan, Lindsay; Fernandes, Claudia-Santi F.; Hussett-Richardson, Sydney; Sands, Brandon; Hieftje, Kimberly	Pilot-testing a Multiplayer HIV and Sexually Transmitted Infection Prevention Video Game Intervention for Black Adolescent Girls: Protocol for a Randomized Controlled Trial.	JMIR Research Protocols	-	-	-	1929-0748	10.2196/43666	https://pubmed.ncbi.nlm.nih.gov/36689272/	BACKGROUND: Black adolescent girls aged between 14 and 19 years are more likely than White girls to be diagnosed with a sexually transmitted infection (STI). As STI diagnosis is associated with an increase in the risk for HIV acquisition, an early intervention specifically tailored to Black adolescent girls is warranted. A web-based video game intervention has the potential to reach this demographic. Because studies of social and behavioral determinants of disease demonstrate the protective role of peer group structures on individual outcomes, a multiplayer game can facilitate opportunities to exchange and evaluate information, learn social norms, develop behavioral skills, and allow peers to influence attitudes and behavior. No prior research has examined the feasibility of a web-based multiplayer game intervention for this population. OBJECTIVE: This study describes the protocol for a randomized controlled trial (RCT) pilot-testing the feasibility, acceptability, and limited efficacy of a multiplayer game-based intervention for increasing HIV and STI testing and condom use in Black adolescent girls. METHODS: We enrolled 79 Black adolescent girls aged 14 to 19 years residing in the United States into a 2-arm parallel RCT. The intervention is a theory-based, community-informed, multiplayer game that can be played with peers on the web using videoconferencing software. The goal of the game is to empower Black adolescent girls to make healthy decisions regarding dating, relationships, and sex, thus reducing HIV and STI infection. Control condition participants received a list of resources after playing a time and attention control game. All study procedures were conducted via the internet. We conveniently sampled Black adolescent girls using web-based advertisements. Study assessments occurred at enrollment, 1 week, 1 month, and 4 months after enrollment. The primary outcome was increased HIV and STI testing by Black adolescent girls. Secondary outcomes include increased condom use, self-efficacy to use condoms, positive attitudes toward condom use, intentions, harm perceptions, HIV and STI and pre-exposure prophylaxis knowledge, positive sexual norms, sexual communication with partners, and reduced incidence of sexual risk behaviors associated with HIV and STI transmission. Secondary outcomes also included assessment of intervention feasibility and acceptability. RESULTS: From February to April 2022, a total of 79 Black adolescent girls were enrolled, with 40 (51%) having been randomized into the intervention condition and 39 (49%) into the control condition. At baseline, participant ages ranged from 14 to 19 (mean 16.4, SD 1.23) years. CONCLUSIONS: Web-accessible game interventions overcome common impediments of face-to-face interventions presenting a unique opportunity to reach Black adolescent girls and improve their sexual health and self-efficacy. Trial data will provide information about the limited efficacy of the intervention and inform future web-based studies and a larger RCT aimed at improving the sexual health of Black adolescent girls. Article	2023	West, Rebecca L.; Freeman, Lily; Pahe, Charlotte; Momanyi, Harmon; Kidiga, Catherine; Malaba, Serah; Ciecielag, Joanna; Ridge, Mary-Clare; Goldwin, Emma; Awsumb, Heather; Sharma, Sunny	Characterising the HIV self-testing market in Kenya: Awareness and usage, barriers and motivators to uptake, and propensity to pay.	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0001776	https://journals.plos.org/globalpublichealth/article?id=10.1371/journal.pgph.0001776	HIVST has a key role in ensuring countries meet their 95-95-95 goals. For HIVST to be sustainable, we should explore sharing costs with users as well as the overall experience. This research explores why a consumer would use HIVST and willingness to pay for HIVST through surveying 1,021 participants 18-35 living in Nairobi or Kisumu who were not diagnosed as HIV positive and who are not currently taking PrEP for HIV. A majority (89.8%) would pay 100 KSH and 64.7% would pay 300 KSH, at higher prices likelihood of paying dropped sharply. Price reduction or subsidization coupled with interventions to address the identified barriers may increase HIVST uptake. We identified 5 distinct groups based on willingness to pay and drivers/ barriers to HIVST uptake. These were created using dimension reduction, hierarchical clustering, and k-means analysis to group respondents. 79% of participants had ever heard of HIVST, and 24% had ever used HIVST. The 5 groups included active users, unlikely users, and three segments interested in HIVST with different barriers: need for HCP support, need for increased privacy/confidentiality, and fear of positive result/disclosure. Article	2023	Westin, Mateus Rodrigues; Martinez, Yuppiel Franmil; Silva, Ana Paula; Greco, Marília; Marques, Lucas Miranda; Campos, Guilherme Barreto; Alves, Matheus de Paula; Mancuzzo, Alessandra; Tupinambás, Unaí; Greco, Dirceu Bartolomeu	Prevalence of syphilis and sexual behavior and practices among adolescents MSM and TrTGW in a Brazilian multi-center cohort for daily use of PrEP	Cadernos de Saúde Pública	-	-	-	1678-4464	10.1590/0102-311xen118721	http://www.scielosp.org/scielo.php?script=sci_arttext&pid=S0102-311X2023000505002	Syphilis has reemerged as a serious public health problem in Brazil and worldwide, disproportionately affecting men who have sex with men (MSM) and travestis and transgender women (TrTGW). Studies on sexually transmitted infections (STI) in adolescents from these key populations are relatively scarce. This is a Brazilian multi-center, cross study with prevalence analysis, using as baseline the PrEP1519 cohort of sexually active MSM and TrTGW adolescents, recruited from April 2019 to December 2020. Analyses were made using the dimensions of vulnerability to STI/HIV and logistic regression models were conducted to estimate the odds ratios of the association between the predictor variables and positive treponemal test for syphilis at the moment of entry in the study. In total, 677 participants were analyzed; participants' median age was 18.9 years (IQR: 18.1-19.5); 70.5% (477) self-declared as black; 70.5% (474), as homosexuals/gays; and 48 (7.1%), as trans women or travestis. The baseline prevalence of syphilis was 21.3%. In the final logistic regression model, higher chance of syphilis was associated with: self-reported episode of STI in the last 12 months (OR = 5.92; 95%CI: 3.74-9.37), sex worker (OR = 3.39; 95%CI: 1.32-8.78), and < 11 years of schooling (OR = 1.76; 95%CI: 1.13-2.74). The prevalence of syphilis among MSM/TrTGW adolescents aged from 15 to 19 years was alarming, much higher than the described for the general population within this age range and associated with vulnerability factors. This reinforces the urgent need to strengthen public health programs to debate about race, gender, sexuality, and prevention. Article	2023	Whelan I.; Strachan S.; Apea V.; Orkin C.; Paparini S.	Barriers and facilitators to HIV pre-exposure prophylaxis for cisgender and transgender women in the UK	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(23)00080-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85163345777&doi=10.1016%2fS2352-3018%2823%2900080-2&partnerID=40&md5=9962884784f0fcd7810c5c6f5fd2bb1a	Uptake of oral HIV pre-exposure prophylaxis (PrEP) among cisgender and transgender women in the UK has been low. In this Review, we explore the barriers and facilitators to PrEP access for these groups, with a focus on health equity. We included 20 studies, including seven abstracts presented at conferences. The study samples were disparate, with minimal overlap between papers. We identified barriers at the individual, interpersonal, and structural levels, including poor awareness and acceptability; stigma, race, and ethnicity; restricted access to PrEP; and exclusion from clinical trials. We found hidden subpopulations of women who could potentially benefit from PrEP, of whom little is known about their PrEP knowledge, preferences, and access due to a lack of UK research. These subpopulations include non-Black African women, transgender women, sex workers, migrant women, women experiencing intimate partner violence, incarcerated women, and women who inject drugs. We highlight opportunities to address these obstacles. Research on the use of PrEP by women in the UK is scarce, and existing research has poor generalisability. Without a better understanding of the needs and preferences of the full spectrum of women who could benefit from PrEP, the UK will not reach zero transmissions by 2030. © 2023 Elsevier Ltd	NA	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review
Article	2023	Whelchel K.; Zuckerman A.D.; DeClercq J.; Choi L.; Kelly S.G.	Optimizing HIV PrEP Persistence: Does Your Pharmacy Matter?	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04091-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160823357&doi=10.1007%2fs10461-023-04091-3&partnerID=40&md5=a074d527a844f5f7a7c263036f80beb0	Persistence to human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) is integral to preventing new HIV infections. Previous studies have shown real-world PrEP persistence is low and insight is needed into PrEP delivery strategies that improve persistence. This single-center, retrospective, cohort study measured persistence in patients filling PrEP through an integrated health-system specialty pharmacy (HSSP) compared to those filling at external pharmacies. The Kaplan–Meier estimates for persistence probability at 6, 12, and 18 months were 0.87 (95% CI 0.79–0.95), 0.75 (95% CI 0.66–0.86), and 0.64 (95% CI 0.53–0.76) for the HSSP cohort compared to 0.65 (95% CI 0.51–0.83), 0.41 (95% CI 0.28–0.62), and 0.32 (95% CI 0.2–0.53), respectively, for the non-HSSP cohort (log-rank p < 0.001, χ12 = 11.2). Cox PH modeling showed that patients using a non-HSSP were 2.7 times more likely to be non-persistent than HSSP patients (HR 2.7, 95% CI 1.6–4.7, p < 0.001, χ12 = 12.61), demonstrating patients were better maintained on PrEP therapy when their prescriptions were filled with the HSSP. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Wheldon, Christopher W; Sykes, Kevin J; Ramaswamy, Megha; Bass, Sarah Bauerle; Collins, Bradley N	Integrating HPV Vaccination Within PrEP care Delivery for Underserved Populations: A Mixed Methods Feasibility Study.	Journal of Community Health	-	-	-	1573-3610	10.1007/s10900-023-01202-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10492896	Human Papillomavirus (HPV) vaccination is effective at preventing anal cancer, which disproportionally impacts gay/bisexual men (GBM) and transgender women (TGW). Vaccine coverage among GBM/TGW is insufficient to reduce anal cancer disparities. Federally qualified health centers (FQHCs) can increase reach and uptake of HPV vaccination by integrating and promoting HPV vaccination in ongoing HIV preventive care (e.g., Pre-exposure Prophylaxis PrEP). The purpose of the current study was to assess the feasibility and potential impact of integrating HPV vaccination with PrEP care. We conducted a mixed methods study of PrEP providers and staff (qualitative interviews, N = 9) and PrEP patients (quantitative survey, N = 88) at an FQHC in Philadelphia, Pennsylvania. Qualitative thematic analysis of PrEP provider/staff interviews was informed by the Exploration, Preparation, Implementation, Sustainment (EPIS) framework to identify and describe barriers and facilitators to HPV vaccination implementation. Quantitative analysis of PrEP patient survey was informed by the Information-Motivation-Behavioral Skills Model. Quantitative interviews resulted in 16 themes related to characteristics of the inner and outer clinic context. Barriers among providers included lack of focus on HPV in PrEP management guidelines, in metrics mandated by funding agencies, and in electronic medical record templates. Lack of anal cancer specific knowledge and motivation was identified in both PrEP patients and providers/staff. Providing HPV vaccination during routine PrEP visits was highly acceptable to both patients and providers. Based on these findings, we recommend several multi-level strategies to increase HPV vaccine uptake among PrEP patients. Article	2023	Whiteley, David; Strongylou, Dimitra; Brown, Sally; Vickerman, Peter; Frankis, Jamie Scott	Hepatitis C testing among three distinct groups of gay, bisexual and other men who have sex with men: a cross-sectional study in the Celtic nations.	Sexually Transmitted Infections	-	-	-	1472-3263 1368-4973	10.1136/sextrans-2023-055758	https://pubmed.ncbi.nlm.nih.gov/37045586/	OBJECTIVE: The hepatitis C virus (HCV) epidemic among gay, bisexual and other men who have sex with men (GBMSM) is associated with sexual and drug-related behaviours. To stem the tide of HCV infection in GBMSM, regular testing leading to early diagnosis and treatment as prevention is vital. This study aimed to evaluate the success of current HCV testing guidelines from the perspective of GBMSM in four Celtic nations. METHODS: Subpopulation analysis of data from the 2020 cross-sectional online SMMASH3 (social media, men who have sex with men, sexual and holistic health) survey was undertaken to examine HCV testing experiences and sexual behaviours among sexually active GBMSM (n=1886) stratified across three groups: HIV-diagnosed GBMSM (n=124); HIV-negative GBMSM using pre-exposure prophylaxis (PrEP) (n=365); and HIV-negative/untested GBMSM not using PrEP (n=1397). RESULTS: Sexual behaviours associated with HCV acquisition were reported by the majority of HIV-diagnosed (76.6%, n=95) and PrEP-using (93.2%, n=340) GBMSM. Reassuringly, recent testing for HCV in these groups was common, with 79.8% (n=99) and 80.5% (n=294) self-reporting HCV screening within the preceding year, respectively, mostly within sexual health settings. While 54.5% (n=762) of HIV-negative/untested GBMSM not using PrEP reported sexual behaviours associated with HCV, 52.0% had not been screened for HCV in the last year, despite almost half (48.0%, n=190) of unscreened men being in contact with sexual health services in the same period. CONCLUSIONS: Sexual behaviours associated with HCV acquisition among HIV-diagnosed and PrEP-using GBMSM are common but complemented by regular HCV testing within sexual health services. Current testing guidelines for these groups appear to be effective and generally well observed. However, behaviour-based HCV testing for HIV-negative/untested GBMSM not using PrEP appears less effective and may undermine efforts to achieve HCV elimination. Accordingly, we need to increase HCV testing for these men in clinical settings and explore ways to screen those who are not in touch with sexual health services. Journal of Racial and Ethnic Health Disparities	-	-	-	2196-8837	10.1007/s40615-021-01209-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9441015	BACKGROUND: Black men who have sex with men (MSM) experience disproportionate rates of HIV infection in the USA, despite being no more likely to engage in sexual risk behaviors than other MSM racial/ethnic groups. HIV pre-exposure prophylaxis (PrEP) has been shown to reduce risk of HIV acquisition; however, rates of PrEP use among Black MSM remain low. Clinical, psychosocial, and structural factors have been shown to impact PrEP use and adherence among Black MSM. Care coordination of HIV prevention services has the potential to improve PrEP use and adherence for Black MSM, as it has been shown to improve HIV-related care outcomes among people living with HIV. METHODS: Client-centered care coordination (C4) is a multi-level intervention designed to address clinical, psychosocial, and structural barriers to HIV prevention services for Black MSM within HPTN 073, a PrEP demonstration project among Black MSM in three cities in the USA. The current study examined the implementation process of C4, specifically investigating the activities, cost, time, and outcomes associated with the C4 intervention. RESULTS: On average, participants engaged in five care coordination encounters. The vast majority of care coordination activities were conducted by counselors, averaging 30 min per encounter. The cost of care coordination was relatively low with a mean cost of $8.70 per client encounter. CONCLUSION: Although client-centered care coordination was initially implemented in well-resourced communities with robust HIV research and service infrastructure, our findings suggest that C4 can be successfully implemented in resource constrained communities. Theses and Dissertations	2023	Wiginton, John Mark; Maksut, Jessica L; Scheim, Ayden I; Zlotorzynska, Maria; Sanchez, Travis H	Intersecting Sexual Behavior and Gender Identity Stigmas Among Transgender Women in the United States: Burden and Associations with Sexual Health	-	-	University of California	-	1090-7165	https://doi.org/10.1007/s10461-023-04028-w	https://escholarship.org/uc/item/10v4b5pf	In the United States, a context of multiple marginalization shapes sexual health disparities experienced by transgender women. Using data from 396 transgender women with negative or unknown HIV status, we performed exploratory factor analysis on responses to gender identity and sexual behavior stigma items and regressed sexual health outcomes on extracted factors via modified Poisson regression with robust variance estimation. Overall, 97.2% of participants endorsed ≥ 1 gender identity stigma; 67.2% endorsed ≥ 1 sexual behavior stigma; and 66.9% endorsed ≥ 1 of each. Extracted factors included gender-identity social stigma, reflecting experiences related to family, fearfulness in public, and verbal harassment (α = 0.68); gender-identity institutional stigma/violence, reflecting experiences related to healthcare, police interactions, and interpersonal violence (α = 0.73); and global sexual behavior stigma, reflecting experiences related to family, friends, and healthcare, as well as police interactions, fearfulness in public, verbal harassment, and interpersonal violence (α = 0.83). Gender-identity social stigma was significantly, positively associated with testing for HIV and testing for sexually transmitted infections. Gender-identity institutional stigma/violence and global sexual behavior stigma were both significantly, positively associated with condomless anal sex, sex work, testing for HIV, testing for sexually transmitted infections, and use of HIV pre-exposure prophylaxis. Stigma-mitigation remains critical to improve quality of life and sexual health for transgender women in the United States. Article	2023	Wijstma E.; Vanhamel J.; Deblonde J.; Nöstlinger C.; Noori T.; Vuylsteke B.; Laga M.	An overview of programmatic indicators to monitor the roll-out of HIV preexposure prophylaxis	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003399	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143564456&doi=10.1097%2fQAD.0000000000003399&partnerID=40&md5=5ebc456c9f6794452154081521778b3e	Preexposure prophylaxis (PrEP) is increasingly implemented in national HIV prevention programmes through routine care. Monitoring will be vital to understand whether programmes succeed in engaging people into using PrEP appropriately, and in reducing the HIV epidemic. Yet, it is currently unclear which indicators are most suited to monitor PrEP programmes' performance. We therefore aimed to identify and map indicators that are currently used or suggested for monitoring PrEP programmes. We conducted a scoping review based on the framework by Arksey and O'Malley. We combined a systematic search in the peer-reviewed literature with hand-searching grey literature documents describing indicators and strategies that are used or suggested for PrEP monitoring. Only literature published after 2012 was included. No geographical restrictions were set. We charted data on indicator definitions, data sources used, reported experiences with monitoring and any relevant contextual factors. Ultimately, 35 peer-reviewed and 14 grey literature records were included. We identified indicators related to preuptake stages of PrEP, uptake and coverage, and programme impact. The indicators most commonly suggested for national-level monitoring were the number of new and current PrEP users, the number of HIV seroconversions among PrEP users and some variably defined indicators related to continuation and discontinuation of PrEP. Despite its perceived high relevance, studies reported several challenges to routinely monitor the population in need of PrEP and track prevention-effective PrEP use. In conclusion, a variety of indicators is currently used or suggested for monitoring PrEP programmes. Implementing proxy measures that track different aspects of PrEP use over time, and making synergies with research more explicit, could be used as strategies to obtain more granular insights into trends revealed by routine monitoring. © 2023 Lippincott Williams and Wilkins. Article	2023	Wilbourn B.; Ogburn D.F.; Safon C.B.; Galvao R.W.; Kershaw T.S.; Willie T.C.; Taggart T.; Caldwell A.; Kaplan C.; Phillips N.; Calabrese S.K.	Preexposure Prophylaxis Implementation in a Reproductive Health Setting: Perspectives From Planned Parenthood Providers and Leaders	Health Promotion Practice	-	-	-	15248399	10.1177/15248399221086616	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129293865&doi=10.1177%2f15248399221086616&partnerID=40&md5=d29951c7f071cba97dae1f65edac8bff	Integrating pregnancy and HIV prevention services would make reproductive health care settings an optimal venue for the promotion and delivery of preexposure prophylaxis (PrEP) to cisgender women. However, these settings have been slow to adopt PrEP. Planned parenthood clinicians and leaders possess critical insight that can help accelerate PrEP implementation in reproductive health care settings and elements of the Consolidated Framework for Implementation Research (i.e., relative priority of the intervention to staff, implementation climate, available resources to implement the intervention, and staff access to knowledge and information about the intervention) can shed light on elements of Planned Parenthood's inner setting that can facilitate PrEP implementation. In this study, individual 60-min interviews were conducted with clinical care team members (n = 10), leadership team members (n = 6), and center managers (n = 2) to explore their perspectives on PrEP implementation and associated training needs. Transcripts were transcribed verbatim and thematically analyzed. Despite having variable PrEP knowledge, participants (100% women, 61% non-Hispanic White) expressed positive attitudes toward implementing PrEP. Barriers and facilitators toward providing PrEP were reported at the structural, provider, and patient levels. Participants desired PrEP training that incorporated culturally competent patient-provider communication. Although participants identified ways that Planned Parenthood uniquely enabled PrEP implementation, barriers must be overcome to optimize promotion and delivery of PrEP to cisgender women. © 2022 Society for Public Health Education.	attitudes; clinical services; HIV; implementation; knowledge; preexposure prophylaxis; women's health	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Theses and Dissertations	2023	Williams, Adam Dale Newman	Understanding the relationship between HIV pre-exposure prophylaxis, sexually transmitted infections, and antimicrobial resistance	-	-	Cardiff University	-	NA	NA	https://orca.cardiff.ac.uk/id/eprint/165851/	HIV pre-exposure prophylaxis (PrEP) prevents the acquisition of HIV. There are concerns around PrEP provision due to risk compensation (RC), a theory that suggests people become less careful when they feel safe. The argument suggests that using PrEP provision could lead to people engaging in higher-risk sexual behaviours, increasing other sexually transmitted infections (STIs), which would exacerbate antimicrobial resistance (AMR) through increased antimicrobial requirements. This PhD explores the influence of PrEP on sexual behaviour among men who have sex with men (MSM) in Wales, with a focus on the impact of the transmission of STIs and AMR. This was achieved using a mixed-methods design with insights from relevant literature. Interviews were conducted with MSM to explore the relationship between PrEP, STIs, and AMR and to gain an understanding of behaviour changes after PrEP adoption. Anonymous sexual health records and AMR data were analysed to identify trends in PrEP and non-PrEP using MSM. The findings from these two studies, within the context of existing literature, informed the development of the conceptual framework, presenting the relationship between the variables. In response to the COVID-19 pandemic, a survey exploring sexual behaviour during lockdown was conducted with input from the interviews. Results show that PrEP has had no statistical effect on STI rates, with rates reducing among most STIs since PrEP's introduction. The data available does not allow a detailed examination of AMR. Qualitative findings indicate a range of behaviours in response to PrEP uptake. A detailed account of RC is presented, identifying how the previous examinations may have been incomplete. COVID-19 restrictions were adhered to at the beginning of the pandemic, but over time, more people engaged in sexual behaviours with others despite social distancing measures still in force. Behaviour change is complicated to measure, but what is known is that behaviour is often stable and change difficult, which RC fails to acknowledge. PrEP provision is necessary to protect all populations at risk of HIV. With STI AMR levels increasing, there is a need for greater focus on the identification and prevention of bacterial STIs. There is a need to change the discourse of concern regarding HIV and other STIs. Essay	2023	Williams, Katie M.; Miller, Nora; Tutegyereize, Lilian; Olisa, Adaobi Lisa; Chakare, Tafadzwa; Jeckonia, Patriciah; Mullick, Saiqa; Atieno, Margaret A.; Nhamo, Definate; Rademacher, Kate H.	Defining principles for a choice-based approach to HIV prevention.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(23)00026-7	https://pubmed.ncbi.nlm.nih.gov/37001965/	The HIV prevention landscape is on the cusp of an unprecedented era of multiple biomedical prevention products available for distribution. Several HIV prevention options, such as oral pre-exposure prophylaxis (PrEP), dapivirine vaginal rings, and injectable cabotegravir for PrEP, are becoming more widely available. Although the future HIV prevention market promises to be rich in options, it would benefit from a core set of principles that uphold choice in all phases of product development, assessment, and introduction. These principles, as presented in this Viewpoint, show the applicability, opportunities, and challenges of choice in different contexts of HIV prevention and provide checkpoints of accountability. By committing to these principles, stakeholders at national and global levels can advance choice across all phases of the HIV prevention market, thereby ensuring that individuals can realise their right to choose when and how to prevent HIV in their own lives. Article	2023	Willie, Tiara C; Phillips, Karlye; Shah, Aashna; Monger, M P H Mauda; Nunn, Amy; Kershaw, Trace; Chan, Philip A; Baral, Stefan D; Mayer, Kenneth H; Adimora, Adaora A; Mena, Leandro A; Stockman, Jamila K	Perspectives on HIV pre-exposure prophylaxis (PrEP) implementation in Mississippi among Black women and clinical staff: Recommendations for clinical trauma-informed programs.	Preventive Medicine Reports	-	-	-	2211-3355	10.1016/j.pmedr.2023.102490	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10728323	Intimate partner violence (IPV) can constraint Black women's ability to prioritize and access Human Immunodeficiency Virus (HIV) pre-exposure prophylaxis (PrEP) services. Recent research has called for the development of trauma-informed PrEP implementation programs to improve the delivery of PrEP to Black cisgender women; however, many PrEP-prescribing settings do not reflect this recommendation. The current study sought to identify key components to develop a trauma-informed PrEP implementation program for Black cisgender women and clinical staff. We conducted focus groups with PrEP-eligible Black cisgender women (February-June 2019), and semi-structured interviews with clinical staff offering HIV prevention and treatment services (October-November 2020) in community healthcare clinics in Mississippi. Seven themes were identified as needed to facilitate integration of trauma-informed approaches into existing PrEP programs, including defining intimate partner violence (IPV), appropriate IPV screening and response, HIV prevention in abusive relationships, staff training needs, and creating supportive clinic environments. PrEP-eligible Black women and clinical staff generally agreed on how to best operationalize IPV screening and response, the importance of trauma-informed staff training, and the need for Black women-specific informational campaigns. However, Black women highlighted the need for providers to discuss HIV prevention in controlling relationships, and to respond to IPV disclosure. HIV pre-exposure prophylaxis has yet to achieve the potential impact observed in trials. Ultimately, realizing the HIV prevention potential of PrEP in the US necessitates centering the perspectives of Black cisgender women and staff to better integrate trauma-informed approaches. Article	2023	Witzel, T. Charles; Nicholls, Emily Jay; McCabe, Leanne; Weatherburn, Peter; McCormack, Sheena; Bonell, Christopher; Gafos, Mitzy; Lampe, Fiona C.; Speakman, Andrew; Dunn, David; Ward, Denise; Phillips, Andrew N.; Pebody, Roger; Gabriel, Michelle M.; Collaco-Moraes, Yolanda; Rodger, Alison J.; Burns, Fiona M.	Understanding experiences of potential harm among MSM (cis and trans) using HIV self-testing in the SELPHI randomised controlled trial in England and Wales: a mixed-methods study.	Sexually Transmitted Infections	-	-	-	1472-3263 1368-4973	10.1136/sextrans-2023-055840	https://pubmed.ncbi.nlm.nih.gov/37607814/	BACKGROUND: The potential of HIV self-testing (HIVST) to cause harm is a concern hindering widespread implementation. The aim of this paper is to understand the relationship between HIVST and harm in SELPHI (An HIV Self-testing Public Health Intervention), the largest randomised trial of HIVST in a high-income country to date. METHODS: 10 111 cis and trans men who have sex with men (MSM) recruited online (geolocation social/sexual networking apps, social media), aged 16+, reporting previous anal sex and resident in England or Wales were first randomised 60/40 to baseline HIVST (baseline testing, BT) or not (no baseline testing, nBT) (randomisation A). BT participants reporting negative baseline test, sexual risk at 3 months and interest in further HIVST were randomised to three-monthly HIVST (repeat testing, RT) or not (no repeat testing, nRT) (randomisation B). All received an exit survey collecting data on harms (to relationships, well-being, false results or being pressured/persuaded to test). Nine participants reporting harm were interviewed in-depth about their experiences in an exploratory substudy; qualitative data were analysed narratively. RESULTS: Baseline: predominantly cis MSM, 90% white, 88% gay, 47% university educated and 7% current/former pre-exposure prophylaxis (PrEP) users. Final survey response rate was: nBT=26% (1056/4062), BT=45% (1674/3741), nRT=41% (471/1147), RT=50% (581/1161).Harms were rare and reported by 4% (n=138/3691) in exit surveys, with an additional two false positive results captured in other study surveys. 1% reported harm to relationships and to well-being in BT, nRT and RT combined. In all arms combined, being pressured or persuaded to test was reported by 1% (n=54/3678) and false positive results in 0.7% (n=34/4665).Qualitative analysis revealed harms arose from the kit itself (technological harms), the intervention (intervention harms) or from the social context of the participant (socially emergent harms). Intervention and socially emergent harms did not reduce HIVST acceptability, whereas technological harms did. DISCUSSION: HIVST harms were rare but strategies to link individuals experiencing harms with psychosocial support should be considered for HIVST scale-up. TRIAL REGISTRATION NUMBER: ISRCTN20312003. Article	2023	Wolfe, Hill L.; Drainoni, Mari-Lynn; Klasko-Foster, Lynne; Fix, Gemmae M.; Siegel, Jennifer; Mimiaga, Matthew J.; Reisner, Sari L.; Hughto, Jaclyn M. W.	Structural Equation Modeling of Stigma and HIV Prevention Clinical Services Among Transgender and Gender Diverse Adults: The Mediating Role of Substance Use and HIV Sexual Risk.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003144	https://pubmed.ncbi.nlm.nih.gov/36515898/	BACKGROUND: Transgender and gender diverse (TGD) adults experience high levels of stigma that contributes to elevated substance use and HIV sexual risk behaviors. Despite higher burdens of substance use and HIV compared to cisgender adults, TGD individuals may be less likely to engage in health care to avoid further discrimination. SETTING: This analysis included 529 TGD adults in Massachusetts and Rhode Island who were HIV negative or had an unknown HIV serostatus and were purposively sampled between March and August 2019. METHODS: We used structural equation modeling to test whether substance use, HIV sexual risk behaviors (ie, condom use, sex work, and multiple partners), and receiving gender-affirming hormone therapy mediate any observed association between TGD-related stigma and utilization of HIV prevention clinical services (ie, HIV prevention programs, PrEP use, and HIV testing). RESULTS: Substance use and HIV sexual risk mediated the relationship between TGD-related stigma and utilization of HIV prevention clinical services (β = 0.08; 95% CI = 0.05, 0.17; P = 0.03 and β = 0.26; 95% CI = 0.14 to 0.37; P < 0.001). Having a hormone therapy prescription was not a mediator between TGD-related stigma and HIV prevention clinical services. CONCLUSIONS: Future interventions that aim to improve HIV prevention clinical services among TGD adults should consider the impact of TGD-related stigma on participants' substance use and sexual risk behaviors. These efforts require that health care organizations and community organizations make a deliberate investment in the reach and success of interventions and programs. Article	2023	Wray, Tyler B; Chan, Philip A; Kahler, Christopher W; Ocean, Erik M S; Nittas, Vasileios	Pilot Randomized Controlled Trial of Game Plan for PrEP: A Brief, Web and Text Message Intervention to Help Sexual Minority Men Adhere to PrEP and Reduce Their Alcohol Use.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-023-04223-9	https://dx.doi.org/10.1007/s10461-023-04223-9	Suboptimal adherence to oral PrEP medications, particularly among younger sexual minority men (SMM), continues to be a key barrier to achieving more substantial declines in new HIV infections. Although variety of interventions, including web and text-message-based applications, have successfully addressed PrEP adherence, very few have addressed the potential influence of alcohol. This pilot study explored whether the Game Plan for PrEP, a brief, web-based and text messaging intervention, helped promote PrEP persistence and adherence and reduced condomless sex and alcohol use. Seventy-three heavy-drinking SMM on PrEP were recruited online from states with Ending the HIV Epidemic jurisdictions and randomly assigned 1:1 to receive either the Game Plan for PrEP intervention or an attention-matched control. We collected online surveys assessing primary outcomes at one, three, and six months post-enrollment. As secondary outcomes, we also collected dried blood spot samples at baseline, three, and six months to analyze for biomarkers of PrEP and alcohol use. Our results showed that the odds of stopping PrEP or experiencing a clinically meaningful lapse in PrEP adherence (≥ 4 consecutive missed doses) were not different across the two conditions. We also did not find evidence of any differences in condomless sex or drinking outcomes across conditions, although participants in both conditions reported drinking less often over time. These findings were consistent across both self-reported outcomes and biomarkers. Overall, we did not find evidence that our brief, web and text messaging intervention encouraged more optimal PrEP coverage or moderate their alcohol use. Article	2023	Wu P.; Ahmed S.; Wang X.; Wang H.	PrEP Intervention in the Mitigation of HIV/AIDS Epidemics in China via a Data-Validated Age-Structured Model	Bulletin of Mathematical Biology	-	-	-	928240	10.1007/s11538-023-01145-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152244339&doi=10.1007%2fs11538-023-01145-4&partnerID=40&md5=a63e9b6cd30ddcf41a926acf00889819	Antiretroviral-based pre-exposure prophylaxis (PrEP) treatment offers a new opportunity for protecting humans against HIV and disrupting current HIV prevention systems. However, implementing this preventive measure has been difficult due to its high cost. In this paper, we propose an age-structured model that incorporates infection ages, HAART (highly active antiretroviral therapy), and PrEP intervention. We investigate the qualitative behavior of the model and find a threshold parameter (the basic reproduction number) that determines the asymptotic stability of equilibria. We validate the model and estimate the parameters by confronting the actual HIV/AIDS data from 2004 to 2018 in China using MCMC (Markov Chain Monte Carlo) method. Furthermore, we investigate the PrEP intervention strategy by using incremental cost-effectiveness and average cost-effectiveness. Our work suggests that PrEP intervention based on the infection characteristics of different age groups can be an effective strategy to eradicate HIV/AIDS epidemics in China. © 2023, The Author(s), under exclusive licence to Society for Mathematical Biology. Article	2023	Wyatt M.A.; Pisarski E.E.; Kriel Y.; Smith P.M.; Mathenjwa M.; Jaggernath M.; Smit J.A.; Matthews L.T.; Ware N.C.	Influences on PrEP Uptake and Adherence Among South African Women During Periconception and Pregnancy: A Qualitative Analysis	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03757-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133208262&doi=10.1007%2fs10461-022-03757-8&partnerID=40&md5=8d4fc5b857156bfda4b5fd1364fe80dd	Pre-exposure prophylaxis (PrEP) is highly effective for HIV prevention, yet PrEP delivery to women in periconception and pregnancy has lagged. We report qualitative research from a study evaluating PrEP use as part of safer conception care for 330 South African women. Fifty-two semi-structured interviews were conducted with 25 study participants to identify influences on PrEP adherence. Influences were: (1) changing proximity to male partners; (2) COVID-19 lockdown; (3) mobile lifestyle; (4) PrEP-related stigma; (5) disclosure of PrEP use; and (6) pregnancy and motherhood. Data also revealed important contextual information shaping adherence influences for women, including: (a) not living with partners, (b) partners as drivers of pregnancy intention, and (c) feeling at high risk for HIV. Disclosure of PrEP use, addressing stigma, strategies for traveling with pills, and counseling on prevention effective adherence are promising components of PrEP-inclusive HIV prevention interventions for South African women who are pregnant or planning pregnancy. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Xavier Hall C.D.; Bundy C.; Foran J.E.; Newcomb M.E.; Carrillo H.; Watkins-Hayes C.; Mustanski B.	Identifying Strategies for Improving Pre-exposure Prophylaxis Adherence: Perspectives from a Sample of Highly Adherent Young Men Who have Sex with Men	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03785-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135261380&doi=10.1007%2fs10461-022-03785-4&partnerID=40&md5=882eaabd8f3b0b06565be54c4f2aa8b	Most research on pre-exposure prophylaxis (PrEP) adherence and persistence uses a deficit-based approach to identify negative influences on PrEP adherence; however, an alternative set of approaches (such as resilience, asset-based, and positive variation) may identify equally important positive influences on PrEP adherence. Thus, the current study presents qualitative perspectives of PrEP adherence strategies from a sample of adherent YMSM. PrEP-using YMSM living in the Chicago area from a larger cohort study were recruited into a 90-day diary study that measured sexual health behaviors including PrEP use. A subset (n = 28) were then recruited for in-depth interviews between April and September 2020 covering topics of PrEP use and adherence. Thematic analysis was used to interpret patterns within the data. The analytic sample (n = 19) consistently reported high levels of adherence. Adherence strategies were organized into three broader categories: psychological (e.g. mindfulness, pill auditing), technical/instrumental (e.g. automated reminders, pill organizers), and social strategies (e.g. checking in with friends, or getting suggestions from friends). The majority of participants described using multiple strategies and changing strategies to respond to barriers to adherence. Other themes that were related to adherence included having a daily medication history and a generally positive outlook toward the PrEP regimen. Those who had medication histories were able to draw from experience to develop strategies for PrEP adherence. Findings suggest the need for pre-emptive counseling for PrEP-initiators on the use of multiple strategies, how to prepare for PrEP adherence, to adapt to challenges, and to adopt a range of potential strategies for adherence. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Xavier, Julia; Ward, Maranda C; Corr, Patrick G; Kalita, Nikhil; McDonald, Paige	Identifying the barriers and facilitators to culturally responsive HIV and PrEP screening for racial, ethnic, sexual, and gender minoritized patients: A scoping review protocol.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0281173	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10208460	INTRODUCTION: While mainstream messaging about human immunodeficiency virus (HIV) disparities continues to highlight individual risk-taking behavior among historically marginalized groups, including racial, ethnic, sexual, and gender minoritized patients, the effect of structural factors and social determinants of health (SDOH) on morbidity and mortality remain underestimated. Systemic barriers, including a failure of adequate and acceptable screening, play a significant role in the disparate rates of disease. Primary care practitioner (PCP) competency in culturally responsive screening practices is key to reducing the impact of structural factors on HIV rates and outcomes. To address this issue, a scoping review will be performed to inform the development of a training series and social marketing campaign to improve the competency of PCPs in this area. OBJECTIVES: This scoping review aims to analyze what recent literature identify as facilitators and barriers of culturally responsive HIV and pre-exposure prophylaxis (PrEP) screening practices for historically marginalized populations, specifically racial, ethnic, sexual, and gender minoritized groups. A secondary aim is to identify themes and gaps in the literature to help guide future opportunities for research. METHODS: This scoping review will be performed following the framework set forth by Arksey and O'Malley and the Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for scoping reviews (PRISMA-ScR). Relevant studies between the years 2019-2022 will be identified using a rigorous search strategy across four databases: MEDLINE (via PubMed), Scopus, Cochrane (CENTRAL; via Wiley), and CINAHL (via EBSCO), using Boolean and Medical Subject Headings (MeSH) search terms. Studies will be uploaded to the data extraction tool Covidence to remove duplicates and perform a title/abstract screening, followed by a full-text screening and data extraction. RESULTS: Data will be extracted and analyzed for themes related to culturally responsive HIV and PrEP screening practices in clinical encounters with the identified target populations. Results will be reported according to PRISMA-ScR guidelines. DISCUSSION: To our knowledge, this is the first study to use scoping methods to investigate barriers and facilitators to culturally responsive HIV and PrEP screening practices for racial, ethnic, sexual, and gender minoritized populations. The limitations of this study include the analysis restrictions of a scoping review and the timeframe of this review. We anticipate that this study's findings will interest PCPs, public health professionals, community activists, patient populations, and researchers interested in culturally responsive care. The results of this scoping review will inform a practitioner-level intervention that will support culturally sensitive quality improvement of HIV-related prevention and care for patients from minoritized groups. Additionally, the themes and gaps found during analysis will guide future avenues of research related to this topic. Article	2023	Xia D.; Su X.; Liu G.; Ren X.; Wang J.; Li G.; Chen J.; Xu C.; Lu H.	HIV infection rate, high-risk behavior and pre-exposure prophylaxis/post-exposure prophylaxis in men who have sex with men in Beijing; 北京市男男性行为者 HIV 新发感染率与高危行为及接受暴露前后预防用药服务情况调查	Chinese Journal of Endemiology	-	-	-	2546450	10.3760/cma.j.cn112338-20230308-00133	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175251411&doi=10.3760%2fcma.j.cn112338-20230308-00133&partnerID=40&md5=00317e5a082f9a368d4202b03a7bd0eb	Objective To understand the incidence of HIV infection, high risk behaviors and pre-exposure prophylaxis/post-exposure prophylaxis (PrEP/PEP) utilization in men who have sex with men (MSM) in Beijing. Methods Sample size was estimated to be 1 227 persons and 207 person year respectively in the survey and the cohort by using Epi Info 7.0 software. Using convenient sampling method, MSM were recruited by using Wechat app. Questionnaire was completed online to collect the information about demographic characteristics, high risk behavior, and utilization of PrEP/PEP of the MSM. MSM collected dry blood spot (DBS) samples by themselves, and mailed the DBS samples to laboratory for HIV nucleic acid testing. Open cohort was established and those with HIV negative nucleic acid testing results were followed up. Non-conditional binary logistic regression method was used to identify the associated factors for high risk anal sex in the last month and having multiple homosexual partners in the last month. Results A total of 1 147 MSM were recruited, and follow up for 236 person years was conducted in 956 MSM with negative HIV nucleic acid testing results. The detection rate of new HIV infection was 1.3 per 100 person-years (3/236). During the last month, the proportions of consistent condom use in anal sex and oral sex were 50.7% (238/469) and 4.9% (23/469). In the MSM, 5.9% (43/723) had sex with HIV positive partners in the last month. 9.8% (103/1 049) used PrEP, and 8.7% (91/1 049) used PEP. The proportion of consistent condom use in PrEP and PEP were 34.3% (24/70) and 72.2% (39/54) respectively. Logistic regression analysis revealed that compared with those who used no PrEP/PEP, those who used PrEP/PEP were more likely to have unprotected anal sex in the last month (aOR=3.16, 95%CI: 1.45-7.18), and more likely to have multiple homosexual partners in the last month (aOR=2.64, 95%CI: 1.19-6.30), and compared with those who used no Rush Popper or drugs in the last month, those who used Rush Popper or drugs in the last month were more likely to have unprotected anal sex in the last month (aOR=2.34, 95%CI: 1.67-3.30), and more likely to have multiple homosexual partners (aOR=2.42, 95%CI: 1.76-3.33). Conclusions It is necessary to strengthen the health education to promote condom use and introduce the harm of drug use in MSM. In PrEP and PEP services, it is still necessary to suggest consistent condom use for MSM. © 2023 Authors. All rights reserved. Article	2023	Xiaonan Z.; Ke Y.; Xiangdong Y.; Jinhai L.; Na Z.; Guoyong W.; Meizhen L.; Wei M.	Acceptance of pre-exposure prophylaxis and post-exposure prophylaxis against HIV and related factors in men who have sex with men in Shandong Province; 山东省男男性行为人群 HIV 暴露前后预防用药情况及相关因素分析	Chinese Journal of Endemiology	-	-	-	2546450	10.3760/cma.j.cn112338-20230202-00052	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175318690&doi=10.3760%2fcma.j.cn112338-20230202-00052&partnerID=40&md5=7e59d0680363a92c81b53a4041d2a2ab	Objectives To understand the use of pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) and related factors in men who have sex with men (MSM) in Shandong Province, and provide reference for the promotion of PrEP and PEP in MSM. Methods From April to July in 2022, MSM were recruited from 7 sentinel surveillance sites in Shandong Province for a questionnaire survey, and the sample size of each city site was 400. The information about sociodemographic characteristics, sexual behaviors, the uses of PrEP and PEP and others were collected from the MSM, and blood samples were collected from them for HIV and syphilis testing. Results A total of 2 815 MSM were investigated, the majority of them were aged less than 30 years (55.7%, 1 569/2 815), unmarried (68.6%, 1 931/2 815) and had education background of college and above (56.5%, 1 590/2 815). Only 9.2% (258/2 815) had used PrEP and 10.8% (305/2 815) had used PEP. Multivariate logistic regression showed that factors associated with high likelihood of PrEP use in MSM included age ≤30 years (aOR=4.04, 95%CI:1.25-13.01), self-perceived lower risk of HIV infection (aOR=1.76, 95%CI: 1.16-2.68), group sex and commercial sex in the past six months (aOR=1.51, 95%CI: 1.10-2.09; aOR=1.69, 95%CI: 1.16-2.47), new-type drug use (aOR=1.53, 95%CI: 1.11-2.11), receiving peer education (aOR=1.56, 95%CI: 1.03-2.37), other people using PrEP (aOR= 3.29, 95%CI: 2.48-4.36), and being HIV negative (aOR=8.40, 95%CI: 1.12-63.12). Factor associated with low likelihood of PrEP use in MSM was anal sex with casual partner (aOR=0.67, 95%CI: 0.49-0.90). Factors associated with high likelihood of PEP use in MSM included age under 50 years (≤30 years old: aOR=2.41, 95%CI: 1.02-5.69; 31-49 years old: aOR=3.33, 95%CI: 1.42-7.85), no self-perceived risk for HIV infection (aOR=1.87, 95%CI:1.12-3.11), group sex in the past six months (aOR=1.68, 95%CI: 1.23-2.29), new-type drug use (aOR=3.86, 95%CI: 2.94-5.07) and receiving no peer education (aOR=1.54, 95%CI: 1.12-2.12). Conclusions In Shandong, a higher proportion of MSM used PrEP and PEP. Peer education and self-perceived HIV infection risk education should be strengthened to increase the rates of PrEP and PEP use in MSM. © 2023 Authors. All rights reserved. Article	2023	Xu, Qing; McMann, Tiana; Godinez, Hector; Nali, Matthew C; Li, Jiawei; Cai, Mingxiang; Merenda, Christine; Lee, Christine; Araojo, Richardae; Mackey, Tim K	Impact of COVID-19 on HIV Prevention Access: A Multi-platform Social Media Infodemiology Study.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03922-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9734820	This study seeks to identify and characterize key barriers associated with PrEP therapy as self-reported by users on social media platforms. We used data mining and unsupervised machine learning approaches to collect and analyze COVID-19 and PrEP-related posts from three social media platforms including Twitter, Reddit, and Instagram. Predominant themes detected by unsupervised machine learning and manual annotation included users expressing uncertainty about PrEP treatment adherence due to COVID-19, challenges related to accessibility of clinics, concerns about PrEP costs and insurance coverage, perceived lower HIV risk leading to lack of adherence, and misinformation about PrEP use for COVID-19 prevention. Article	2023	Yacout H.; Smith B.L.; Foster S.; Lora M.; Niles-Carnes L.V.; Zheng Z.; Kundu S.; Cantos V.D.	Pre-exposure prophylaxis adherence and discontinuation at an urban pre-exposure prophylaxis program in Atlanta, Georgia	Journal of the American College of Clinical Pharmacy	-	-	-	25749870	10.1002/jac5.1792	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85159169976&doi=10.1002%2fjac5.1792&partnerID=40&md5=9dc4b9efbb19ff4de9b37ee744f4f9a5	Oral pre-exposure prophylaxis (PrEP) effectiveness is directly correlated with medication adherence. Grady Health System (GHS) developed a PrEP program to optimize PrEP uptake in Atlanta, Georgia. The purpose of this study is to determine PrEP medication adherence and its associated factors during the first 18 months of the program's implementation. A single-center, retrospective chart review was conducted on patients enrolled in a PrEP program in Atlanta, Georgia, between June 1, 2018 and February 29, 2020, who received more than one PrEP prescription. The primary outcome was mean adherence to PrEP, using the medication possession ratio (MPR). This study included 154 primarily young patients (mean 34 years of age), Black (70.8%), uninsured (59.1%), and cisgender men (62.3%). Mean PrEP adherence was 89.2%; 77.3% of patients had an MPR ≥ 80% (high adherence). Of all patients, 71 (46%) met PrEP discontinuation criteria. This PrEP program demonstrated high levels of PrEP adherence with discontinuation rates similar to other PrEP programs nationwide, despite a higher index of social vulnerability in the area. Future areas of research include identifying the specific program-related factors that may optimize PrEP adherence in areas with high indices of social vulnerability. © 2023 Pharmacotherapy Publications, Inc. Article	2023	Yamanis, Thespina Nina J.; Mulawa, Marta I.; Kilonzo, Mrema Noel; Maman, Suzanne; Singh, Basant; Kajula, Lusajo	Reaching Out-of-school Adolescent Girls and Young Women at Risk for HIV Through Their Social Networks.	AIDS and Behavior	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04168-z	https://pubmed.ncbi.nlm.nih.gov/37725236/	Out-of-school adolescent girls/young women (AGYW) in Africa are at increased risk for HIV and are underserved by HIV prevention interventions. Identifying social networks of out-of-school AGYW may be a strategic approach for reaching them. A sequential mixed methods study design was used. The PLACE (Priorities for Local AIDS Control Efforts) methodology, implemented in one ward of Dar es Salaam, Tanzania, identified 69 networks of AGYW. We randomly selected 28 networks and conducted surveys and network assessments with 80.9% (n = 310) of the members. On average, the networks consisted of 13.7 members, and had a density of 0.65 and a transitivity of 0.80, indicating high cohesion. The networks were mostly female (92%). On average, 67% of network membership were AGYW aged 15-24 years, of whom 70% were out-of-school and 67% were sexually active. Among sexually active AGYW aged 15-24, self-reported HIV seropositivity was 12.2%. We then conducted focus group discussions with 6 purposively selected networks. AGYW described their networks as sources of support and advice. Social norms supported AGYW engaging in transactional sex to alleviate life's hardships; it was the easiest way to earn income without "sweating". AGYW discussed IPV as a common experience, and social norms stigmatized AGYWs' use of condoms. AGYW were largely unaware of pre-exposure prophylaxis. The self-reported HIV prevalence rates of this cohort were higher than national averages, suggesting we tapped into high-risk networks. Social norms promoted transactional and unprotected sex. Social networks are an acceptable channel for HIV prevention intervention delivery to out-of-school AGYW. Article	2023	Yang X.; Zhang J.; Cai R.; Liang C.; Olatosi B.; Weissman S.; Li X.	Computational phenotyping with the All of Us Research Program: identifying underrepresented people with HIV or at risk of HIV	JAMIA Open	-	-	-	25742531	10.1093/jamiaopen/ooad071	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169910427&doi=10.1093%2fjamiaopen%2fooad071&partnerID=40&md5=cba1981a0fb0b1e10658ddbb055dc39c	Objective: This study aims to identify the people living with HIV (PWH) and pre-exposure prophylaxis (PrEP) users in the All of Us (AoU) database by integrating information from both electronic health record (EHR)-and self-reported survey data. Methods: We identified PWH and PrEP users if they met the inclusion criterion by conditions, lab measurements, or medications related to HIV in EHR data or confirmed questions in the Survey data. Results: We evaluated the latest data release through July 1, 2022 in AoU. Through computational phenotyping, we identified 4575 confirmed and 3092 probable adult PWH and 564 PrEP users. PWH was most identified by a combination of medications and conditions (3324, 43.4%) and drug exposure alone (2191, 28.6%), then less commonly by survey data alone (608, 7.9%) and lab alone (81, 1.1%). Discussion and conclusion: Our methods serve as an overall framework for other researchers using AoU data for conducting HIV-related research. © The Author(s) 2023. Article	2023	Yang, Cui; Reyes, Dominick; Henry, Marcus; Walker, Lonnie; Moran, Meghan; Mathews, Allison; Page, Kathleen; Latkin, Carl; Tucker, Joseph D; McCulloh, Ian	A Neuro-Influence Experiment to Evaluate the Persuasiveness of Pre-Exposure Prophylaxis Promotion Messages Among Men Who Have Sex With Men: Protocol for a Randomized Controlled Trial.	JMIR Research Protocols	-	-	-	1929-0748	10.2196/52546	https://dx.doi.org/10.2196/52546	BACKGROUND: Pre-exposure prophylaxis (PrEP) is recommended by the US Centers for Disease Control and Prevention, but behavioral factors limit uptake, especially among men who have sex with men. A better understanding of how humans cognitively process information may inform health message development to promote PrEP uptake. OBJECTIVE: This paper is informed by the neuroscience of persuasion and influence and describes the protocol of a neuro-influence experiment using functional near-infrared spectroscopy (fNIRS) to evaluate the persuasiveness of PrEP promotion messages among men who have sex with men in Baltimore, Maryland. METHODS: We will conduct a randomized controlled trial using fNIRS to measure brain activation among 60 participants viewing PrEP promotion messages either developed through a crowdsourcing open contest implemented by the study team or developed with a traditional social marketing approach. We will evaluate the effectiveness of PrEP promotion messages by assessing brain activation in the regions associated with persuasion and changes in PrEP willingness, behavioral intention, initiation, and action between the 2 groups. RESULTS: This study is funded by the National Institutes of Health (National Institute of Mental Health: R34MH116725). Participant recruitment and data collection were completed in October 2023. The first results are expected to be submitted for publication in 2024. CONCLUSIONS: In addition to providing insight into the effectiveness of PrEP promotion messages, this study will examine the feasibility, acceptability, and utility of neuroimaging techniques to evaluate PrEP promotion messages for high-risk men who have sex with men. The findings can also demonstrate the utility of fNIRS as a tool for preproduct testing of health campaigns and enable the public health community to deliver more effective messages to improve health outcomes. Article	2023	Yang, Lanbo; Cambou, Mary Catherine; Nielsen-Saines, Karin	The End Is in Sight: Current Strategies for the Elimination of HIV Vertical Transmission.	Current HIV/AIDS Reports	-	-	-	1548-3576	10.1007/s11904-023-00655-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10239317	PURPOSE OF REVIEW: The goal of this review is to highlight and interpret recent trends and developments in the diagnosis, treatment, and prevention of HIV vertical transmission from a clinical perspective. RECENT FINDINGS: Universal third-trimester retesting and partner testing may better identify incident HIV among pregnant patients and result in early initiation of antiretroviral therapy to prevent vertical transmission. The proven safety and efficacy of integrase inhibitors such as dolutegravir may be particularly useful in suppressing viremia in pregnant persons who present late for ART treatment. Pre-exposure prophylaxis (PrEP) during pregnancy may play a role in preventing HIV acquisition; however, its role in preventing vertical transmission is difficult to elucidate. Substantial progress has been made in recent years to eliminate HIV perinatal transmission. Future research hinges upon a multipronged approach to improving HIV detection, risk-stratified treatment strategies, and prevention of primary HIV infection among pregnant persons. Article	2023	Yeager S.; Serrano V.B.; Paltin D.; Fisher A.; Karris M.; Aarons G.A.; Rangel A.; Flynn R.; Bolan R.; Moore D.J.; Montoya J.L.	QUALITATIVE EXAMINATION OF THE IMPACT OF THE COVID-19 PANDEMIC ON ACCESS AND ADHERENCE TO PRE-EXPOSURE PROPHYLAXIS (PREP) AMONG SEXUAL AND GENDER MINORITIES	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2023.35.4.255	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166397572&doi=10.1521%2faeap.2023.35.4.255&partnerID=40&md5=2a573ef5f22b118e81b246af0d64adb9	During the COVID-19 pandemic, pre-exposure prophylaxis (PrEP) access and adherence decreased nationwide. This study examined pandemic-related disruptions to PrEP access and adherence among clients of a health center (Center) in Los Angeles, California. Clients (n = 25) and Center per-sonnel (n = 11) completed qualitative interviews from March to July 2021. Although the Center provided options for remote PrEP care (i.e., telehealth, STI self-testing kits, and prescription delivery), clients experienced difficulty navigating services or lacked equipment for telehealth. More than half (n = 13) of clients discontinued PrEP during COVID-19 due to decreased sexual partners, relocation, or insurance status changes. Among those who continued PrEP, the majority reported no change in adherence, while a minority reported worsening adherence due to distractions/forgetting, prescription refill issues, lack of insurance coverage, and fear of complet-ing in-person visits. Findings highlight the challenges of navigating PrEP services during COVID-19 and suggest PrEP services enhancement to adapt to crisis events. © 2023 The Guilford Press.	adherence; COVID-19; pre-exposure prophylaxis (PrEP); PrEP access; qualitative research	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Yellin H.; Levy M.E.; Magnus M.; Kuo I.; Siegel M.	HIV Risk Perception, Willingness to Use PrEP, and PrEP Uptake Among Young Men who have Sex with Men in Washington, DC	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-023-04008-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148439636&doi=10.1007%2fs10461-023-04008-0&partnerID=40&md5=79380e7ae632a5a12cad23894691a8cf	Low HIV risk perception is a barrier to PrEP uptake, but few studies have examined risk perception and PrEP uptake among young men who have sex with men (YMSM). We performed a secondary analysis of data collected in 2016 from YMSM ages 16–25 in the Washington, DC metropolitan area who participated in a cross-sectional online survey that aimed to identify strategies for engaging YMSM in PrEP services. Of 188 participants, 115 (61%) were considered eligible for PrEP. Among PrEP-eligible participants who had never used PrEP, 53%, 71%, and 100% with low, moderate, and high risk perception, respectively, were willing to use PrEP (Fisher's exact test p = 0.01). Odds of PrEP willingness were greater among those with moderate/high versus low risk perception (adjusted odds ratio OR = 5.62, 95% CI = 1.73–18.34). HIV risk perception was not significantly associated with self-reported PrEP use. These findings suggest the importance of risk perception as a correlate of willingness to use PrEP, which is a key step in existing frameworks of PrEP uptake. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Yeo T.E.D.	Reconciling intimacy and safety: a qualitative systematic review of HIV pre-exposure prophylaxis implementation among gay and bisexual men	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2023.2270004	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174425273&doi=10.1080%2f13691058.2023.2270004&partnerID=40&md5=99016c5d4d37dffc5c9d8e293fa3eebf	This review synthesises qualitative research on pre-exposure prophylaxis (PrEP) uptake by sexual minority men to provide an overarching conceptualisation of the implementation processes involved. Twenty-four studies—comprising 734 participants from USA, UK, France, Canada, and Taiwan—were synthesised using thematic synthesis. The synthesis elucidates the dual significance of PrEP uptake: (1) risk management: reinforcing relational circumstances, and rebalancing safety and risk; and (2) sexual empowerment: reclaiming health and sexuality and refocusing on sexual fulfillment and intimacy. Overall, the findings show how gay and bisexual men use PrEP to reconcile their antagonistic desires for intimacy and safety by recalibrating protection and reimagining intimacy. This review conceptualises the essence of users' experiences of PrEP implementation as reconciliation work—the labour and agency in making and remaking practices to manage discontinuities and incongruities—about the new HIV prevention modality. The concept of reconciliation work illustrates how using PrEP influences users' practices, which in turn, shape the meanings of PrEP use within the community. This work engenders contingent transformations and outcomes beyond HIV protection, encompassing the broader aspects of health and sexuality. Findings support the adoption of more holistic and empowering approaches to sexual health promotion and intervention. © 2023 The Author(s). Article	2023	Yeung, Anna; Lisk, Ryan; Rana, Jayoti; Guiang, Charlie B.; Bacon, Jean; Brunetta, Jason; Gilbert, Mark; Gesink, Dionne; Grewal, Ramandip; Kwag, Michael; Logie, Carmen H.; Mitterni, Leo; Shahin, Rita; Tan, Darrell Hs; Burchell, Ann N.	Community and Health Care Provider Preferences for Bacterial Sexually Transmitted Infection Testing Interventions for Gay, Bisexual, and Other Men Who Have Sex With Men: e-Delphi Study.	Journal of Medical Internet Research	-	-	1438-8871 1439-4456	10.2196/40477	https://www.jmir.org/2023/1/e40477/	BACKGROUND: Canadian clinical guidelines recommend at least annual and up to quarterly bacterial sexually transmitted infection (STI) testing among sexually active gay, bisexual, and other men who have sex with men (GBM). However, testing rates are suboptimal. Innovative solutions are needed to close the gap because there is currently limited knowledge on how best to approach this issue. OBJECTIVE: Our aim was to build consensus regarding interventions with the greatest potential for improving local STI testing services for GBM communities in Toronto, Ontario, Canada, using a web-based e-Delphi process. METHODS: The e-Delphi method involves using a panel format to conduct successive rounds of prioritization, with feedback between rounds, to determine priorities among groups. We recruited experts separately from the community (GBM who sought or underwent STI testing in the preceding 18 months; conducted between October 2019 and November 2019) and health care providers (those who offered STI testing to GBM in the past 12 months; conducted between February 2020 and May 2020). The experts prioritized 6 to 8 potential interventions on a 7-point Likert scale ranging from definitely not a priority to definitely a priority over 3 survey rounds and ranked their top 3 interventions. Consensus was defined as ≥60% within a ±1 response point. Summaries of responses were provided in successive rounds. We reported the percentage of a priority (encompassing somewhat a priority, a priority, and definitely a priority responses) at the end of the final round of the survey. RESULTS: Of the community experts (CEs), 84% (43/51) completed all rounds; 19% (8/43) were living with HIV; 37% (16/43) were HIV negative and on pre-exposure prophylaxis; and 42% (18/43) were HIV negative and not on pre-exposure prophylaxis. We reached consensus on 6 interventions: client reminders (41/43, 95%), express testing (38/43, 88%), routine testing (36/43, 84%), an online booking app (36/43, 84%), online-based testing (33/43, 77%), and nurse-led testing (31/43, 72%). The CEs favored convenient interventions that also maintain a relationship with their provider. Of the provider experts (PEs), 77% (37/48) completed all rounds; 59% (22/37) were physicians. Consensus was reached on the same 6 interventions (range 25/37, 68%, to 39/39, 100%) but not for provider alerts (7/37, 19%) and provider audit and feedback (6/37, 16%). Express testing, online-based testing, and nurse-led testing were prioritized by >95% (>37/39) of the PEs by the end of round 2 because of streamlined processes and decreased need to see a provider. CONCLUSIONS: Both panels were enthusiastic about innovations that make STI testing more efficient, with express testing rating highly in both the prioritizations and top 3 rankings. However, CEs preferred convenient interventions that involved their provider, whereas PEs favored interventions that prioritized patient independence and reduced patient-provider time. Article	2023	Young A.M.; Saidi F.; Phanga T.; Tseka J.; Bula A.; Mmodzi P.; Pearce L.D.; Maman S.; Golin C.E.; Mutale W.; Chi B.H.; Hill L.M.	Male partners' support and influence on pregnant women's oral PrEP use and adherence in Malawi	Frontiers in Reproductive Health	-	-	26733153	10.3389/frph.2023.1206075	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85168520195&doi=10.3389%2ffrph.2023.1206075&partnerID=40&md5=2468072d7c94a233c7962ff3791ec0d9	Introduction: Daily oral pre-exposure prophylaxis (PrEP) is a safe and effective HIV prevention method for pregnant and postpartum women, but adherence barriers exist. Understanding the role of male partners in supporting PrEP use may inform strategies to support PrEP adherence among pregnant and breastfeeding women. Methods: To understand male partners' involvement in women's use of PrEP, we conducted in-depth interviews with pregnant women in Lilongwe, Malawi who had recently decided to use PrEP (n = 30) and their male partners (n = 20) in the context of a PrEP adherence trial. Women were purposively recruited to ensure variation in their partners' HIV status. Interviews were conducted in Chichewa using a semistructured guide. We followed a thematic approach to analyze the interview data. Results: Most male partners were receptive to women using PrEP during pregnancy because it eased their fears of the woman and baby acquiring HIV. Men often played a key role in women's PrEP adherence by providing daily reminders and encouragement to adhere to their medication. The majority of women appreciated this support from the men as it lessened the burden of remembering to take their medications daily on their own and aided their adherence. However, several women who lacked male partner support spoke of wanting their partners to be more involved. Many men living with HIV found the mutual support beneficial for their antiretroviral therapy adherence, while men without HIV or with status unknown appreciated knowing that the family was protected. While most men were open to women continuing PrEP beyond the current study, some would only support it if women were still at risk for acquiring HIV. Conclusion: In this study, male partners were strongly motivated to support the PrEP adherence of their female partners as a way of ensuring that the pregnant women and unborn babies were protected against HIV. Promoting disclosure and tangible support that arises organically among men may be helpful, but programs to enhance this support and identify ways to support women who do not receive support from their partners or do not wish to disclose their PrEP use to partners may be needed. 2023 Young, Saidi, Phanga, Tseka, Bula, Mmodzi, Pearce, Maman, Golin, Mutale, Chi and Hill. Article	2023	Young A.M.P.; Reddy P.; Gonzalez A.M.; Arlandson M.E.; Patel A.; Premkumar A.	Predictors of Preexposure Prophylaxis Eligibility among Pregnant People with Opioid Use Disorder	American Journal of Perinatology	-	-	7351631	10.1055/s-0043-1776350	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175826244&doi=10.1055%2fs-0043-1776350&partnerID=40&md5=49a14007b0b34209fac0b777e4fa484c	Objective We seek to evaluate risk factors for eligibility for preexposure prophylaxis (PrEP) among pregnant people with opioid use disorder (OUD). Study Design This is a single-site retrospective cohort study of pregnant people admitted for management of OUD at an urban, tertiary care center from 2013 to 2022. PrEP eligibility was defined based on (1) modified American College of Obstetricians and Gynecologists' (ACOG) 2014 criteria: diagnosis of a sexually transmitted infection (STI), engagement in transactional sex work, intravenous drug use (IVDU), or incarceration and (2) modified 2021 Centers for Disease Control (CDC) criteria: diagnosis of bacterial STI (e.g., gonorrhea or syphilis) or transactional sex work. Risk factors associated with PrEP eligibility were evaluated using chi- square or Fischer's exact tests for categorical variables and t -tests or Wilcoxon rank-sum tests for continuous variables. Multivariable regression was used to control for confounding covariates, defined as p < 0.10 on bivariate analysis. p < 0.05 was used to indicate statistical significance. Results A total of 132 individuals met inclusion criteria, of whom 101 (76.5%) were deemed eligible for PrEP by meeting one or more modified 2014 ACOG criteria: 42 (31.8%) were incarcerated or had one or more STIs, while 30 (22.7%) endorsed engaging in transactional sex work and 68 (58.6%) endorsed IVDU. Using modified 2021 CDC criteria, 37 (28%) met PrEP eligibility, with 12 (9.1%) diagnosed specifically with a bacterial STI and 30 (22.7%) engaging in transactional sex work. Only comorbid psychiatric illness was associated with an increased risk for PrEP eligibility based on 2014 criteria, which persisted after controlling for maternal race/ethnicity (aRR 1.52, 95% confidence interval CI 1.24-1.86), and 2021 criteria, which persisted after controlling for nulliparity (aRR 2.12, 95% CI 1.30-3.57). Conclusion A significant number of pregnant people with OUD meet one or more criteria for PrEP, with comorbid psychiatric conditions increasing the risk of meeting criteria. Key Points Comorbid psychiatric illness is significantly associated with high risk of PrEP eligibility. A large proportion of pregnant individuals with active OUD meet criteria for PrEP prescribing. Risk-based screening algorithms for PrEP eligibility have limitations. © 2023 Thieme Medical Publishers, Inc.. All rights reserved. Article	2023	Young I.; Boydell N.	Don't lose it on the bus!': Casting the normative biosexual citizen in early Scottish pre-exposure prophylaxis provision	Sociology of Health and Illness	-	-	1419889	10.1111/1467-9566.13632	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150731774&doi=10.1111%2f1467-9566.13632&partnerID=40&md5=74cd75e5b121f92568cf9fdd6d25cc82	The introduction of HIV pre-exposure prophylaxis (PrEP) raises important questions around how new biotechnologies are negotiated within contemporary settings and how they can shape the moral governance of biocitizens, or as we explore, biosexual citizens. This article draws on qualitative interviews and focus groups to consider how the normative biosexual citizen was cast at the start of provision in Scotland by clinical and community practitioners. Our findings show how practitioners navigated ideas around who was deserving of support and access to PrEP in the context of limited resources, interpreted what legitimate risk narratives might look like for different groups and translated particular gendered, sexualised and racialised risk profiles in the context of PrEP provision. This draws attention to how normative biosexual citizenship was not determined through meeting a set of clinical criteria and adhering to a prophylaxis regime but cast through ongoing negotiations with clinical and community practitioners in relation to normative ideas of essential care, constrained resources, risk narratives and gendered and racialised bodies. Our research indicates how access to PrEP will continue to demand particular enactments of normative biosexual citizenship that may well be at odds with the experiences and needs of communities affected by HIV. © 2023 The Authors. Article	2023	Young I.C.; Massud I.; Cottrell M.L.; Shrivastava R.; Maturavongsadit P.; Prasher A.; Wong-Sam A.; Dinh C.; Edwards T.; Mrotz V.; Mitchell J.; Seixas J.N.; Pallerla A.; Thorson A.; Schauer A.; Sykes C.; De la Cruz G.; Montgomery S.A.; Kashuba A.D.M.; Heneine W.; Dobard C.W.; Kovarova M.; Garcia J.V.; García-Lerma J.G.; Benhabbour S.R.	Ultra-long-acting in-situ forming implants with cabotegravir protect female macaques against rectal SHIV infection	Nature Communications	-	-	20411723	10.1038/s41467-023-36330-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147785989&doi=10.1038%2fs41467-023-36330-5&partnerID=40&md5=f74aa215ddd4cd3825789344736fd836	Ultra-long-acting delivery platforms for HIV pre-exposure prophylaxis (PrEP) may increase adherence and maximize public health benefit. We report on an injectable, biodegradable, and removable in-situ forming implant (ISFI) that is administered subcutaneously and can release the integrase inhibitor cabotegravir (CAB) above protective benchmarks for more than 6 months. CAB ISFIs are well-tolerated in female mice and female macaques showing no signs of toxicity or chronic inflammation. In macaques, median plasma CAB concentrations exceed established PrEP protection benchmarks within 3 weeks and confer complete protection against repeated rectal SHIV challenges. Implant removal via a small incision in 2 macaques at week 12 results in a 7- to 48-fold decrease in plasma CAB levels within 72 hours. Modeling to translate CAB ISFI dosing suggests that a 3 mL injection would exceed protective benchmarks in humans for over 5 months post administration. Our results support the clinical advancement of CAB ISFIs for ultra-long-acting PrEP in humans. © 2023, The Author(s). Article	2023	Young, Alinda M; Mancuso, Noah; Atujuna, Millicent; Tenza, Siyanda; Chitukuta, Miria; Kemigisha, Doreen; Ngure, Kenneth; van der Straten, Ariane; Garcia, Morgan; Szydlo, Danny; Soto-Torres, Lydia; Roberts, Sarah T	Adolescent Girls and Young Women's Experiences with Disclosing Oral PrEP or Dapivirine Vaginal Ring Use: a Multi-Country Qualitative Analysis.	AIDS and Behavior	-	-	1573-3254	10.1007/s10461-023-04109-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10598125	Effective use of oral pre-exposure prophylaxis (PrEP) has been low among adolescent girls and young women (AGYW) in Eastern and Southern Africa, partly due to stigma and opposition from key influencers. Understanding AGYW's experiences of disclosure of different PrEP modalities to key influencers may inform strategies to motivate uptake and adherence. We analyzed qualitative in-depth interviews and focus group discussions data from 119 participants in the MTN-034/REACH (Reversing the Epidemic in Africa with Choices in HIV Prevention) study of oral PrEP and the dapivirine vaginal ring (ring) to explore AGYW's disclosure experiences. We found that AGYW disclosure experiences varied across influencers and product type. The ring was disclosed less often to most influencers, except partners, because it was discreet. Oral PrEP was disclosed more often, because pills were more common and to avoid HIV stigma given that oral PrEP resembled HIV treatment. Ultimately, disclosure typically led most key influencers to support product use through reminders and encouragement. While disclosure yielded positive support from influencers, further community awareness of both PrEP products is essential to reduce potential opposition and perceived stigma.Clinical Trial Number: NCT03593655. Article	2023	Zamantakis, Alithia; Li, Dennis H.; Benbow, Nanette; Smith, Justin D.; Mustanski, Brian	Determinants of Pre-exposure Prophylaxis (PrEP) Implementation in Transgender Populations: A Qualitative Scoping Review	AIDS and Behavior	-	-	10907165	10.1007/s10461-022-03943-8	https://www.proquest.com/scholarly-journals/determinants-pre-exposure-prophylaxis-prep/docview/2805736507/se-2?accountid=8113	We conducted a scoping review of contextual factors impeding uptake and adherence to pre-exposure prophylaxis in transgender communities as an in-depth analysis of the transgender population within a previously published systematic review. Using a machine learning screening process, title and abstract screening, and full-text review, the initial systematic review identified 353 articles for analysis. These articles were peer-reviewed, implementation-related studies of PrEP in the U.S. published after 2000. Twenty-two articles were identified in this search as transgender related. An additional eleven articles were identified through citations of these twenty-two articles, resulting in thirty-three articles in the current analysis. These thirty-three articles were qualitatively coded in NVivo using adapted constructs from the Consolidated Framework for Implementation Research as individual codes. Codes were thematically assessed. We point to barriers of implementing PrEP, including lack of intentional dissemination efforts and patience assistance, structural factors, including sex work, racism, and access to gender affirming health care, and lack of provider training. Finally, over 60% of articles lumped cisgender men who have sex with men with trans women. Such articles included sub-samples of transgender individuals that were not representative. We point to areas of growth for the field in this regard.Resumo alternativo:ResumenEn este revisión de alcance, examinamos los factores contextuales que impiden la adopción y el cumplimiento de la profilaxis previa a la exposición en las comunidades transgénero. Este revisión sistemática se formó a partir de una revisión sistemática más grande. Utilizando un proceso de selección de aprendizaje automático, filtración de los títulos y examines, y revision del texto complete, el primer revisión sistemática identificó 353 artículos por el analisis. Estes artículos fueron estudios revisados por pares, relacionados con la implementación de la PrEP en los EE.UU. publicados despues de 2000. Veintidós artículos se identificaron en esta b?squeda como relacionados con personas transgénero. Se identificaron once artículos adicionales a través de citas de estos veintidós artículos, lo que resultó en treinta y tres artículos en el análisis actual. Estos treinta y tres artículos fueron codificados cualitativamente en NVivo utilizando construcciones adaptadas del Marco Consolidado para la Investigación de Implementación (CFIR) como códigos individuales. Los códigos fueron evaluados temáticamente. Señalamos las barreras de la implementación de la PrEP, como la falta de esfuerzos intencionales de difusión y asistencia al paciente, las barreras estructurales como el trabajo sexual, el racismo, y el acceso a la salud de afirmación de género, y la falta del entrenamiento de los doctores. Finalmente, más de sesenta por ciento de los artículos tuvieron submuestras de personas transgénero que no eran representativas. Se?alamos áreas de crecimiento para el campo en este sentido. Article	2023	Zamudio-Haas, Sophia; Koester, Kim; Venegas, Luz; Salinas, Ariana; Herrera, Cinthya; Gutierrez-Mock, Luis; Welborn, Layla; Deutsch, Madeline B.; Sevelius, Jae	"Entre Nosotras:" a qualitative study of a peer-led PrEP project for transgender latinas.	BMC Health Services Research	-	-	1472-6963	10.1186/s12913-023-09707-x	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10510224	BACKGROUND: Uptake of HIV pre-exposure prophylaxis (PrEP) remains low among transgender people as compared to other subgroups, despite high rates of HIV acquisition. In California, Latinx people comprise 40% of the population and Latina transgender women experience some of the highest burden of HIV of any subgroup, indicating a critical need for appropriate services. With funding from the California HIV/AIDS Research Programs, this academic-community partnership developed, implemented, and evaluated a PrEP project that co-located HIV services with gender affirming care in a Federally Qualified Heath Center (FQHC). Trans and Latinx staff led intervention adaptation and activities. METHODS: This paper engages qualitative methods to describe how a PrEP demonstration project- Triunfo- successfully engaged Spanish-speaking transgender Latinas in services. We conducted 13 in-depth interviews with project participants and five interviews with providers and clinic staff. Interviews were conducted in Spanish or English. We conducted six months of ethnographic observation of intervention activities and recorded field notes. We conducted thematic analysis. RESULTS: Beneficial elements of the intervention centered around three intertwined themes: creating trusted space, providing comprehensive patient navigation, and offering social support "entre nosotras" ("between us women/girls"). The combination of these factors contributed to the intervention's success supporting participants to initiate and persist on PrEP, many of whom had previously never received healthcare. Participants shared past experiences with transphobia and concerns around discrimination in a healthcare setting. Developing trust proved foundational to making participants feel welcome and "en casa/ at home" in the healthcare setting, which began from the moment participants entered the clinic and continued throughout their interactions with staff and providers. A gender affirming, bilingual clinician and peer health educators (PHE) played a critical part in intervention development, participant recruitment, and patient navigation. CONCLUSIONS: Our research adds nuance to the existing literature on peer support services and navigation by profiling the multifaceted roles that PHE served for participants. PHE proved instrumental to empowering participants to overcome structural and other barriers to healthcare, successfully engaging a group who previously avoided healthcare in clinical settings. Article	2023	Zang, Xiao; Piske, Micah; Humphrey, Lia; Enns, Benjamin; Sui, Yi; Marshall, Brandon D L; Goedel, William C; Feaster, Daniel J; Metsch, Lisa R; Sullivan, Patrick S; Tookes, Hansel E; Nosyk, Bohdan	Estimating the epidemiological impact of reaching the objectives of the Florida integrated HIV prevention and care plan in Miami-Dade County.	The Lancet Regional Health - Americas	-	-	2667-193X	10.1016/j.lana.2023.100623	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10624567	Background: The US Ending the HIV Epidemic (EHE) initiative aims to reduce national HIV incidence 90% by 2030 and to address the disproportionate burden of HIV among different racial/ethnic populations. Florida's state-wide 2022-2026 Integrated HIV Prevention and Care Plan outlines objectives for reaching EHE goals. In Miami-Dade County, we determined the epidemiological impact of achieving the integrated plan's objectives individually and jointly. Methods: We adapted an HIV transmission model calibrated to Miami-Dade County adjusting access to HIV testing, pre-exposure prophylaxis (PrEP) and antiretroviral treatment to model the effects of each objective between 2022 and 2030. We compared two service scale-up approaches: (a) scale-up proportionally to existing racial/ethnic group access levels, and (b) scale-up according to new diagnoses across racial/ethnic groups (equity-oriented). We estimated reductions in new HIV infections by each objective and approach, compared to the EHE's incidence reduction target. Findings: The single most influential strategy was reducing new HIV diagnoses in Hispanic/Latinx men who have sex with men through increased PrEP uptake, resulting in 907/2444 (37.1%) fewer annual new HIV infections in 2030. Achieving all objectives jointly would result in 1537/2444 (62.9%) and 1553/2444 (63.5%) fewer annual new HIV infections with the proportional and equity-oriented approaches, respectively. Interpretation: Achieving the goals of Florida's integrated care plan would significantly reduce HIV incidence in Miami-Dade County; however, further efforts are required to achieve EHE targets. Structural changes in service delivery and a focus on effective implementation of available interventions to address racial/ethnic disparities will be crucial to ending the HIV epidemic. Funding: This work was supported by the National Institutes of Health/National Institute on Drug Abuse grant no. R01-DA041747. Article	2023	Zapata J.P.; zamantakis A.; Queiroz A.A.F.L.N.	Identification of Determinants and Implementation Strategies to Increase Long-Acting Injectable PrEP for HIV Prevention Among Latino Men Who Have Sex with Men (MSM)	Journal of Racial and Ethnic Health Disparities	-	-	21973792	10.1007/s40615-023-01678-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162943036&doi=10.1007%2fs40615-023-01678-3&partnerID=40&md5=7dc6f83d084cbd7329a2a9f45078db44	Background: Latino men who have sex with men (LMSM) are disproportionally affected by HIV infections in the USA. The uptake rate of pre-exposure prophylaxis (PrEP) for HIV prevention has remained low among LMSM. Long-acting injectable PrEP (LAI-PrEP) may have the potential to improve structural, behavioral, and cognitive barriers to adherence. Given the potential benefits of LAI-PrEP and the limited data with this population, the aim of our study was to explore experiences and attitudes of LAI-PrEP among LMSM and identify implementation barriers compared to the standard oral presentation, align proposed implementation strategies, and propose outcomes to monitor and assess impact. Methods: In this qualitative study, guided by the Consolidated Framework for Implementation Research, we explored health care providers perspectives on facilitators and barriers to LAI-PrEP implementation strategies for LMSM. Interviews were recorded, transcribed, and analyzed using thematic content analysis. Results: Fear of immigration policies, ability to conceal PrEP medication, health insurance coverage, health information fatigue, lack of culturally adapted information, and provider's lack of knowledge were among the main barriers to LAI-PrEP. Most providers discussed the need for adapted and/or tailored training materials for and suggested designing marketing materials and specific clinical recommendations for LAI-PrEP. Conclusion: In order to ensure an effective adaptation process that encompasses local and national goals of HIV prevention, future interventions should be designed in a way that incorporates culturally relevant information for LMSM. This study provides an implementation research logic model to guide future studies. © 2023, W. Montague Cobb-NMA Health Institute. Article	2023	Zapata, Juan Pablo; Avila, Andres Alvarado; Hurtado, Manuel; de St Aubin, Ed; Rodriguez-Diaz, Carlos E; Robles, Gabriel	Stakeholders' Perspectives About Cultural Strategies to Support PrEP for Latino Sexual Minority Men.	AIDS Education and Prevention	-	-	1943-2755	10.1521/aeap.2023.35.3.185	https://dx.doi.org/10.1521/aeap.2023.35.3.185	Compared with non-Latino White sexual minority men, Latino sexual minority men (LSMM) have lower engagement with HIV pre-exposure prophylaxis (PrEP) and likelihood of discussing PrEP with a health care provider. The overall goal of the current study was to collect data from community stakeholders to inform the integration of culturally relevant factors into an empirically supported PrEP prevention program. Between December 2020 and August 2021, 18 interviews were conducted with 18 stakeholders with experience delivering health and social services. Themes identified are: (1) stakeholders' perspectives of new HIV infections among LSMM; (2) stakeholders' perspectives of general cultural variables; and (3) the development of culturally tailored programs. Our findings demonstrate how culturally competent stakeholders can leverage their established rapport and trust to reduce the negative effects of machismo and/or homophobia in the Latinx community to promote HIV prevention. Article	2023	Zapata, Juan Pablo; Hirshfield, Sabina; Nelson, Kimberly; Horvath, Keith; John, Steven A	Preferred Characteristics for mHealth Interventions Among Young Sexual Minoritized Men to Support HIV Testing and PrEP Decision-Making: Focus Group Study.	JMIR Formative Research	-	-	2561-326X	10.2196/51103	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10616747	BACKGROUND: Epidemiological trends in the United States have shown an increase in HIV cases among young sexual minoritized men. Using mobile health (mHealth), which refers to health services and information delivered or enhanced through the internet and related technologies, is a crucial strategy to address HIV disparities. However, despite its potential, the practical implementation of mHealth remains limited. Additionally, it is important to consider that young individuals may become accustomed to, distracted from, or lose interest in these apps, highlighting the need for regular updates and monitoring of relevant content. OBJECTIVE: In this study, we sought to highlight the voices of young sexual minoritized men aged 17-24 years and explored preferred mHealth intervention characteristics and willingness to adopt these technologies among a diverse, nationwide sample of young sexual minoritized men. METHODS: From April to September 2020, we recruited participants through web-based platforms such as social media and geosocial networking apps for men. These individuals were invited to participate in synchronous web-based focus group discussions centered around topics pertaining to HIV testing and prevention and their preferences for mHealth technologies. RESULTS: A total of 41 young sexual minoritized men, aged between 17 and 24 years, participated in 9 focus group discussions spanning April to September 2020, with 3-7 participants in each group. The findings shed light on three key insights regarding young sexual minoritized men's preferences: (1) the need for personalized and representative content, (2) a preference for mobile and web-based simulation of prevention scenarios, and (3) a preference for digital software with individually tailored content. As expected, preference for mHealth apps was high, which supports the potential and need to develop or adapt interventions that use smartphones as a platform for engaging young sexual minoritized men in HIV prevention. This study expands on previous research in multiple meaningful ways, delving into the use and perceptions of mHealth information amid the COVID-19 pandemic. This study also highlighted the importance of streamlined access to health care providers, especially in light of the barriers faced by young people during the COVID-19 pandemic. In terms of presentation and navigation, participants favored a user-friendly design that was easy to use and appropriate for their age, which was effectively addressed through the implementation of web-based simulations. CONCLUSIONS: Ultimately, this study provides valuable insight into the preferences of young sexual minoritized men when it comes to mHealth interventions and highlights the need for further research in order to develop effective and tailored HIV prevention tools. A future direction for researchers is to evaluate how best to address participants' desire for personalized content within mHealth apps. Additionally, as technology rapidly evolves, there is a need to re-assess the effectiveness of web-based simulations, particularly those that are used in HIV prevention.	mobile health, eHealth, minority health, male adolescents, HIV prevention, sexual health, support, HIV testing, prevention, decision-making, men, sexual minority men, youth, adolescent, mobile simulation, virtual simulation, user-friendly, design, implementation, mobile phone	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

Article	2023	Zarwell M.; Patton A.; Gunn L.H.; Benziger A.; Witt B.; Robinson P.A.; Terrell D.F.	PrEP awareness, willingness, and likelihood to use future HIV prevention methods among undergraduate college students in an ending the HIV epidemic jurisdiction	Journal of American College Health	-	-	7448481	10.1080/07448481.2023.2232885	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165400403&doi=10.1080%2f07448481.2023.2232885&partnerID=40&md5=2d7bb8d623b14acfb63875d789e0b0a6	Objective: Identify factors associated with PrEP awareness, willingness, and future prevention modalities among undergraduate college students. Participants: Undergraduates (N = 701) were recruited from a private university, a public research university, and a private historically Black college and university for an online survey. Methods: Upon multiple imputations, a multivariate logistic model, a multivariate multinomial model, and independent multivariate ordinal logistic models were used to calculate Rubin's rules-pooled adjusted odds ratios for PrEP awareness, willingness, and future HIV prevention methods. Results: Only 33.4% of students had heard of and 32.4% were willing to take PrEP. PrEP willingness was higher among sexual minority students compared to heterosexual/straight students (OR = 1.65; 95% CI: 1.03–2.63); p =.036). The likelihood to take a future vaccine or antibody prophylaxis treatment was higher than the likelihood to take injectable PrEP or implants. Conclusions: Interventions to increase PrEP uptake and willingness among undergraduates should emphasize equity in HIV education and include future prevention modalities. © 2023 Taylor & Francis Group, LLC. Article	2023	Zarwell, Meagan; Witt, Brian; Marin-Cespedes, Sebastian; Gorman, Brianna; Kumtap, Makshwar U; Hoff, Rhoen; Rysbayeva, Ainella; Jha, Prashant; Boehm, Elsa L; Harihar, Sweta; Issel, L Michele; Robinson, Patrick	Uptake and Discontinuation of Pre-Exposure Prophylaxis Among Uninsured Transgender and Cisgender Women: A Public-Private Partnership Model in North Carolina.	AIDS Patient Care and STDs	-	-	1557-7449	10.1089/apc.2023.0147	https://dx.doi.org/10.1089/apc.2023.0147	HIV pre-exposure prophylaxis (PrEP) remains underutilized among cis and trans women. The PrEP Initiative Program (PIP) is a novel public-private partnership implemented at 12 local clinics in North Carolina. PIP provides HIV/sexually transmitted infection (STI) testing and clinical and laboratory monitoring for PrEP to uninsured/underinsured clients. We sought to understand service-related differences among both cis and trans women enrolled in PIP, including STIs diagnoses, clinic type, sources of referral, services needed, and reasons for PrEP discontinuation. The Kaplan-Meier curves display retention on PrEP over the duration of the program. Since 2018, 142 women (cis n = 113; trans n = 29) enrolled, and 136 started PrEP. The majority were ages 25-34 years (31.7%) or 18-24 years (29.6%), Black (57.8%) or Latinx (24.7%). Approximately 20.6% of recipients reported at least one STI while enrolled. Overall, trans women requested fewer services than cis women. After accounting for the amount of time each patient was taking PrEP, there were higher rates of trans women diagnosed with syphilis than cis women. Rates of persons with other STIs were not notably different between trans and cis women. Clinic access varied by gender: 69% of trans women were enrolled at only one site. Trans women were retained significantly longer: The Kaplan-Meier adjusted median time to discontinuation was 560 and 238 days for trans and cis women, respectively. PIP successfully reached historically marginalized and uninsured cis and trans women who may benefit from PrEP. Further investigations into factors contributing to recruitment and retention of women in HIV prevention programs are needed. Article	2023	Zdun, Beata; Reiter, Tamara; Kroutil, Wolfgang; Borowiecki, Pawel	Chemoenzymatic Synthesis of Tenofovir.	The Journal of Organic Chemistry	-	-	1520-6904 0022-3263	10.1021/acs.joc.3c01005	https://pubs.acs.org/doi/10.1021/acs.joc.3c01005	We report on novel chemoenzymatic routes toward tenofovir using low-cost starting materials and commercial or homemade enzyme preparations as biocatalysts. The biocatalytic key step was accomplished either via stereoselective reduction using an alcohol dehydrogenase or via kinetic resolution using a lipase. By employing a suspension of immobilized lipase from Burkholderia cepacia (Amano PS-IM) in a mixture of vinyl acetate and toluene, the desired (R)-ester (99% ee) was obtained on a 500 mg scale (60 mM) in 47% yield. Alternatively, stereoselective reduction of 1-(6-chloro-9H-purin-9-yl) propan-2-one (84 mg, 100 mM) catalyzed by lyophilized E. coli cells harboring recombinant alcohol dehydrogenase (ADH) from Lactobacillus kefir (E. coli/Lk-ADH Prince) allowed one to reach quantitative conversion, 86% yield and excellent optical purity (>99% ee) of the corresponding (R)-alcohol. The key (R)-intermediate was transformed into tenofovir through "one-pot" aminolysis-hydrolysis of (R)-acetate in NH(3)-saturated methanol, alkylation of the resulting (R)-alcohol with tosylated diethyl(hydroxymethyl) phosphonate, and bromotrimethylsilane (TMSBr)-mediated cleavage of the formed phosphonate ester into the free phosphonic acid. The elaborated enzymatic strategy could be applicable in the asymmetric synthesis of tenofovir prodrug derivatives, including 5'-disoproxil fumarate (TDF, Viread) and 5'-alafenamide (TAF, Vemlidy). The molecular basis of the stereoselectivity of the employed ADHs was revealed by molecular docking studies. Article	2023	Zeballos D.; Magno L.; Soares F.; Filho M.E.; Amorim L.; Pinto J.A., Jr.; Greco D.; Grangeiro A.; Dourado I.	Oral Pre-Exposure Prophylaxis for HIV Discontinuation in a Large Cohort of Adolescent Men Who Have Sex With Men and Transgender Women in Brazil	Journal of Adolescent Health	-	-	1054139X	10.1016/j.jadohealth.2023.08.005	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175531562&doi=10.1016%2fj.jadohealth.2023.08.005&partnerID=40&md5=2eb41ce5285b67bdc3e29401f2fe0a6f	Purpose: This study aimed to describe pre-exposure prophylaxis (PrEP) for HIV discontinuation in adolescent men who have sex with men (aMSM) and adolescent transgender women (aTGW) and to identify factors associated with discontinuation. Methods: The PrEP1519 study included a cohort of aMSM and aTGW aged 15–19 years old, and it was conducted in three large Brazilian capital cities. For this analysis, we included adolescents who initiated PrEP. PrEP discontinuation was defined as no possession of PrEP pills for >90 days. Kaplan-Meier curves were used to analyze the probabilities of discontinuation, and survival distributions stratified by covariates were compared using log-rank or Wilcoxon tests. Cox regression models were used to estimate the adjusted hazard ratio (aHR) with a 95% confidence interval (95% CI). Results: We included 908 adolescents, 829 (91.30%) aMSM and 79 (8.70%) aTGW, most of whom were 18–19 years (80.29%). The incidence rate of discontinuation was 75.6 per 100 person-years. The probability of discontinuation was 52.61% in the first year. The multivariate analysis demonstrated that the aTGW (aHR = 1.63; 95% CI: 1.02–1.64) and adolescents with a medium (aHR = 1.29; 95% CI: 1.02–1.64) or low (aHR = 1.65; 95% CI: 1.29–2.12) perceived risk of HIV infection had an increased risk of discontinuation, whereas the adolescents with a partner living with HIV had a lower risk of discontinuation (aHR = 0.57; 95% CI: 0.35–0.91). Discussion: Adolescents with a high risk for discontinuation may need additional support that emphasizes the value of PrEP as a tool for HIV prevention because PrEP discontinuation was associated with a disconnect between HIV risk perception and HIV prevention. © 2023 Society for Adolescent Health and Medicine	Adolescents; Discontinuation; HIV prevention; PrEP	English	United States	Western and Central Europe and North America	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Quantitative
Article	2023	Zeglin, Alissa; Lazebnik, Rina	Teaching About Contraception: Adolescent Attitudes Surrounding Sexual Education.	Open Access Journal of Contraception	-	-	1179-1527	10.2147/OAJC.S402443	https://pubmed.ncbi.nlm.nih.gov/38059115/	PURPOSE: Adolescent pregnancy remains an important public health issue in the United States as it has profound health consequences for both mother and child. Evidence shows that improved contraception use is a critical factor in decreasing rates of adolescent pregnancy. In order to provide effective and engaging contraception education, it is important to understand adolescents' attitudes, questions, and misconceptions around the topic and its delivery. METHODS: Two searches were conducted using PubMed. Articles were limited to those published in the last 10 years that were written in English. The first search was completed using the search terms "Adolescent attitudes on sex education in the United States", and resulted in 688 articles. The second search was completed using the search terms "Adolescent attitudes on contraception in the United States", and resulted in 840 articles. Articles including contraception but focusing more on HIV, pre-exposure prophylaxis (PrEP), LGBTQ+ health and practices, human papillomavirus (HPV) vaccination, and studies completed in other countries were excluded. Remaining articles were screened by the authors for inclusion, and articles were included if they addressed information on adolescent attitudes on both contraception for pregnancy prevention and sex education, including education by schools, community organizations, the media, peers, parents, and physicians. A total of 56 articles were included in the review. RESULTS: The overwhelming theme that emerged from the review is that adolescents prefer comprehensive sex education in a safe space that allows for exploration and questioning. Adolescents want to ask their parents questions about sexual health without fear of punishment, and they desire the opportunity to learn from their physicians in a confidential environment. CONCLUSION: The foundation of effective sex education is a non-judgmental, confidential, and safe space where adolescents can ask questions. There are multiple resources that adolescents use to gather information and establish their preferences and attitudes.	media; parents; access to contraception; confidential; non-judgmental; pregnancy prevention	English	New Zealand	Asia and the Pacific	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Zewdie, Kidist; Kiweewa, Flavia M; Ssebuliba, Timothy; Morrison, Susan A; Muwonge, Timothy R; Boyer, Jade; Bambia, Felix; Badaru, Josephine; Stein, Gabrielle; Mugwanya, Kenneth K; Wyatt, Christina; Yin, Michael T; Mujugira, Andrew; Heffron, Renee	The effect of daily oral PrEP use during pregnancy on bone mineral density among adolescent girls and young women in Uganda.	Frontiers in Public Health	-	-	2673-3153	10.3389/frph.2023.1240990	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10801233	Introduction: Oral pre-exposure prophylaxis (PrEP) is recommended during pregnancy for at-risk cisgender women. Pregnancy is known to impede bone growth and tenofovir-based PrEP may also yield detrimental changes to bone health. Thus, we evaluated the effect of PrEP use during pregnancy on bone mineral density (BMD). Methods: We used data from a cohort of women who were sexually active, HIV-negative, ages 16-25 years, initiating DMPA or choosing condoms for contraception and enrolled in the Kampala Women's Bone Study. Women were followed quarterly with rapid testing for HIV and pregnancy, PrEP dispensation, and adherence counseling. Those who became pregnant were counseled on PrEP use during pregnancy per national guidelines. BMD of the neck of the hip, total hip, and lumbar spine was measured using dual-energy x-ray absorptiometry at baseline and annually. We compared the mean percent change in BMD from baseline to month 24. Results: Among 499 women enrolled in the study, 105 pregnancies occurred in 90 women. At enrollment, the median age was 20 years (IQR: 19-21) and 89% initiated PrEP. During pregnancy, 67% of women continued using PrEP and PrEP was dispensed in 64% of visits. BMD declined significantly in women using PrEP during pregnancy compared to women who were not pregnant nor used PrEP: relative BMD change was -2.26% (95% CI: -4.63 to 0.11, p = 0.06) in the femoral neck, -2.57% (95% CI: -4.48 to -0.66, p = 0.01) in total hip, -3.06% (95% CI: -5.49 to -0.63, p = 0.001) lumbar spine. There was no significant difference in BMD loss when comparing PrEP-exposed pregnant women to pregnant women who never used PrEP. Women who became pregnant were less likely to continue PrEP at subsequent study visits than women who did not become pregnant (adjOR: 0.25, 95% CI: 0.16-0.37, p < 0.001). Based on pill counts, there was a 62% reduction in the odds of high PrEP adherence during pregnancy (adjOR = 0.38, 95% CI: 0.27-0.58, p < 0.001). Conclusion: Women who used PrEP during pregnancy experienced a similar reduction in BMD as pregnant women with no PrEP exposure, indicating that BMD loss in PrEP-using pregnant women is largely driven by pregnancy and not PrEP.	bone mineral density, oral PrEP, young women and adolescent girls, HIV prevention, Uganda	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2023	Zhai Y.; Isadore K.M.; Parker L.; Sandberg J.	Responding to the HIV Health Literacy Needs of Clients in Substance Use Treatment: The Role of Universal PrEP Education in HIV Health and Prevention	International Journal of Environmental Research and Public Health	-	-	16617827	10.3390/ijerph20196893	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173709583&doi=10.3390%2fijerph20196893&partnerID=40&md5=5637b377553237e74cf01c37de4cd72c	Health literacy, particularly HIV health literacy, is a key social determinant of health and can be significantly improved through targeted health education. This paper explores the often-overlooked potential of pre-exposure prophylaxis (PrEP) education as a powerful tool to enhance HIV health literacy among people with substance use disorders (PWSUD), a population notably susceptible to HIV. Given the syndemic interplay of substance use disorders (SUDs) and HIV, health professionals, especially substance use counselors, are uniquely positioned to bolster HIV health literacy and positively influence health outcomes. This article offers a brief introduction to PrEP, delineates potential barriers and facilitators to its use and education, and proposes strategies for effective PrEP education, implementation, and adherence. By equipping substance use counselors with essential knowledge and skills, we aim to encourage and promote the integration of PrEP education into substance use treatment. The overarching objective is to empower counselors to proactively engage in HIV prevention efforts, thereby fulfilling pressing health literacy needs and contributing to improved health outcomes among PWSUD. © 2023 by the authors.	counselors; HIV prevention; pre-exposure prophylaxis (PrEP) education; PrEP health literacy; substance use disorders	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Zhang G.; Yang X.; Kang W.; Liu T.; Cheng L.; Qu M.; Wang X.; Tang H.	Pre-exposure prophylaxis uptake for high-risk men who have sex with men in China: a multi-city cross-sectional survey	AIDS Research and Therapy	-	-	17426405	10.1186/s12981-023-00528-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160904225&doi=10.1186%2fs12981-023-00528-w&partnerID=40&md5=001ff62d1ae0d69d2aab1ae2ac0768e0	Background: Pre-exposure prophylaxis (PrEP) is a proven biomedical strategy to prevent HIV transmission among men who have sex with men (MSM). Despite oral PrEP is safe and effective in MSM, the use of PrEP has been discouraging, especially in high-risk MSM. And there are no relevant studies showing the use of PrEP in high-risk MSM. The purpose of this study was to get the rate of PrEP use and the factors influencing PrEP use among high-risk MSM. Methods: A cross-sectional study was conducted through an electronic questionnaire on the "i guardian Platform", and "snowballing" method was used to recruit MSM in six cities in China, including Beijing, Shenzhen, Chengdu, Chongqing, Tianjin and Nanjing in China, from January to April 2021. Univariate and multivariate logistic regression analysis were used to analyze the factors associated with the use of PrEP among high-risk MSM who had heard about PrEP. Results: Among the 1865 high-risk MSM who had heard of PrEP, the rates of those who were willing to use PrEP, had knowledge awareness of PrEP, and had used PrEP were 96.7%, 24.7%, and 22.4%, respectively. Multivariate logistic regression analysis of PrEP use in high-risk MSM showed that more PrEP was used by those who were 26 years or older (OR = 1.86, 95%CI 1.17 ~ 2.99), had master degree or above (OR = 2.37, 95% CI 1.21 ~ 4.72), had unstable work (OR = 1.86, 95% CI 1.16 ~ 2.96), had tested five or more HIV times in the past year (OR = 3.09, 95% CI 1.65 ~ 6.04), had consulted PrEP (OR = 22.05, 95% CI 14.87 ~ 33.91) and had PrEP knowledge awareness (OR = 1.90, 95% CI 1.41 ~ 2.55) (P < 0.05). Conclusions: The rate of PrEP use in high-risk MSM was relatively low. PrEP was used more by high-risk MSM with unstable jobs, higher education, frequent HIV testing, and PrEP counseling. Public education on PrEP for MSM should continue to be enhanced to help them use PrEP in a timely and accurate manner. © 2023, The Author(s). Article	2023	Zhang L.; Iannuzzi S.; Chaturvedula A.; Irungu E.; Haberer J.E.; Hendrix C.W.; von Kleist M.	Model-based predictions of protective HIV pre-exposure prophylaxis adherence levels in cisgender women	Nature Medicine	-	-	10788956	10.1038/s41591-023-02615-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176438594&doi=10.1038%2fs41591-023-02615-x&partnerID=40&md5=9bed09b108c74b3d8207de4a4af4b4ef	Most human immunodeficiency virus (HIV) infections occur in cisgender women in resource-limited settings. In women, self-protection with emtricitabine/tenofovir disoproxil fumarate pre-exposure prophylaxis (FTC/TDF-PrEP) constitutes a major pillar of HIV prevention. However, clinical trials in women had inconsistent outcomes, sparking uncertainty about adherence requirements and reluctance in evaluating on-demand regimens. We analyzed data from published FTC/TDF-PrEP trials to establish efficacy ranges in cisgender women. In a 'bottom-up' approach, we modeled hypotheses in the context of risk-group-specific, adherence–efficacy profiles and challenged those hypotheses with clinical data. We found that different clinical outcomes were related to the proportion of women taking the product, allowing coherent interpretation of the data. Our analysis showed that 90% protection was achieved when women took some product. We found that hypotheses of putative male/female differences were either not impactful or statistically inconsistent with clinical data. We propose that differing clinical outcomes could arise from pill-taking behavior rather than biological factors driving specific adherence requirements in cisgender women. © 2023, The Author(s). Article	2023	Zhang, L; Rosen, JG; Cooper, L; Olatunde, PF; Pelaez, D; Sherman, SG; Park, JN; Glick, JL	Interrogating perceived relevance and feasibility of HIV pre-exposure prophylaxis: A novel model of PrEP acceptability among cisgender women who inject drugs	SSM Qualitative Research in Health	-	-	2667-3215	10.1016/j.ssmqr.2023.100337	https://www.sciencedirect.com/science/article/pii/S266732152300121X	Introduction: Uptake of daily oral HIV pre-exposure prophylaxis (PrEP) remains low among cisgender women who inject drugs (WWID) in the U.S., who experience elevated sexual- and injection-mediated HIV exposure risks. While anticipated barriers to PrEP uptake have been explored, further work is needed to situate PrEP acceptability (i.e., PrEP interest and willingness) within the context of WWID's lives and the HIV risk environment.Methods: We conducted semi-structured, in-depth interviews (N = 27) with cisgender WWID in Baltimore, Maryland, between April-September 2021. Interviews explored women's daily survival needs, substance use practices, healthcare experiences, HIV risk perception, and PrEP perspectives. Thematic analysis revealed complex dimensions of WWID's health perspectives and HIV risk conceptualization, from which a Psychosocial Model of PrEP Acceptability and a novel construct of 'perceived PrEP relevance' were developed using a grounded theory approach.Results: In our Psychosocial Model of PrEP Acceptability, anticipated PrEP feasibility and perceived PrEP relevance shape women's interest in and willingness to initiate PrEP. Attending to PrEP-related healthcare tasks (e. g., medical appointments, bloodwork) and managing a daily medication regimen were anticipated as feasible but would likely be de-prioritized relative to women's competing substance-related and survival needs. Women's perceptions of both their locus of HIV risk and sufficiency of existing HIV prevention practices determined their perceived PrEP relevance. PrEP was least relevant for women perceiving their prevention practices as sufficient to mitigate self-controlled HIV risk and most relevant for women perceiving their prevention practices as insufficient to mitigate environmentally shaped HIV risk.Conclusions: Our models demonstrate how PrEP acceptability is influenced by WWID's lived experiences and complex risk conceptualization. Effective multilevel interventions to enhance PrEP engagement should support women's competing needs, affirm women's existing prevention strategies, and address the harms of the HIV risk environment. Article	2023	Zhang, Lanxin; Iannuzzi, Sara; Chaturvedula, Ayyappa; Haberer, Jessica E; Hendrix, Craig W; von Kleist, Max	Synthesis of protective oral PrEP adherence levels in cisgender women using convergent clinical- and bottom-up modeling.	Research Square	-	-	NA	10.21203/rs.3.rs-2772765/v1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10153398	Globally, most HIV infections occur in heterosexual women in resource-limited settings. In these settings, female self-protection with generic emtricitabine/tenofovir disoproxil fumarate pre-exposure prophylaxis (FTC/TDF-PrEP) may constitute a major pillar of the HIV prevention portfolio. However, clinical trials in women had inconsistent outcomes, sparking uncertainty regarding risk-group specific adherence requirements and causing reluctance in testing and recommending on-demand regimen in women. We analyzed all FTC/TDF-PrEP trials to establish PrEP efficacy ranges in women. In a 'bottom-up' approach, we modeled hypotheses corroborating risk-group specific adherence-efficacy profiles. Finally, we used the clinical efficacy ranges to (in-)validate hypotheses. We found that different clinical outcomes could solely be explained by the proportion of enrolled participants not taking the product, allowing, for the first time, to unify clinical observations. This analysis showed that 90% protection was achieved, when women took some of the product. Using 'bottom-up' modelling, we found that hypotheses of putative male/female differences were either irrelevant, or statistically inconsistent with clinical data. Furthermore, our multiscale modelling indicated that 90% protection was achieved if oral FTC/TDF was taken at least twice weekly.	viral dynamics, infection, pre-exposure prophylaxis, HIV, mathematical model, adherence	English	United States	Western and Central Europe and North America	Germany	Western and Central Europe and North America	Germany	Western and Central Europe and North America	Clinical

Article	2024	Brogan A.J.; Davis A.E.; Mellott C.E.; Fraysse J.; Metzner A.A.; Oglesby A.K.	Cost-effectiveness of Cabotegravir Long-Acting for HIV Pre-exposure Prophylaxis in the United States	PharmacoEconomics	-	-	-	-	11707690	10.1007/s40273-023-01342-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182977022&doi=10.1007%2fs40273-023-01342-y&partnerID=40&md5=9c3c1af4c0769e61c493a3bfb09d730b	Objective: Cabotegravir long-acting (CAB–LA) administered every 2 months was approved in the USA as pre-exposure prophylaxis (PrEP) for individuals at risk of acquiring human immunodeficiency virus (HIV)-1 infection based on the HIV Prevention Trials Network (HPTN) 083 and HPTN 084 clinical trials, which demonstrated superior reduction in HIV-1 acquisition compared with daily oral emtricitabine/tenofovir disoproxil fumarate (FTC/TDF) in men who have sex with men (MSM), transgender women (TGW), and cisgender women. A decision-analytic model was developed to assess the lifetime cost-effectiveness of initiating CAB–LA versus generic oral FTC/TDF for HIV PrEP in the USA from a healthcare sector perspective. Methods: PrEP-eligible adults entered the Markov model receiving CAB–LA or FTC/TDF and could continue initial PrEP, transition to a second PrEP option, or discontinue PrEP over time. Efficacy was taken from the HPTN 083 and HPTN 084 clinical trials. Individuals who acquired HIV-1 infection incurred lifetime HIV-related costs, could transmit HIV onwards, and could develop PrEP-related resistance mutations. Input parameter values were obtained from public and published sources. Model outcomes were discounted at 3%. Results: The model estimated that the CAB–LA pathway prevented 4.5 more primary and secondary HIV-1 infections per 100 PrEP users than the oral PrEP pathway, which yielded 0.2 fewer quality-adjusted life-years (QALYs) lost per person. Additional per-person lifetime costs were $9476 (2022 US dollars), resulting in an incremental cost-effectiveness ratio of $46,843 per QALY gained. Results remained consistent in sensitivity and scenario analyses, including in underserved populations with low oral PrEP usage. Conclusions: Our analysis suggests that initiating CAB–LA for PrEP is cost-effective versus generic daily oral FTC/TDF for individuals at risk of acquiring HIV-1 infection. © 2024, The Author(s).	cabotegravircobicistat plus darunavircobicistat plus darunavir plus emtricitabine plus tenofovir alafenamidedolutegravir	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2024	Bunge, Katherine; Balkus, Jennifer E; Fairlie, Lee; Mayo, Ashley J; Nakabiito, Clemensia; Mgodi, Nyaradzo; Gadama, Luis; Matrimbira, Moleen; Chappell, Catherine Anne; Piper, Jeanna; Chakhtoura, Nahida; Szydlo, Daniel W; Richardson, Barbra; Hillier, Sharon L	DELIVER: A Safety Study of a Dapivirine Vaginal Ring and Oral PrEP for the Prevention of HIV During Pregnancy.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000003312	https://dx.doi.org/10.1097/QAI.0000000000003312	BACKGROUND: Pregnancy represents a period of high HIV acquisition risk. Safety data for the monthly dapivirine vaginal ring (DVR) during pregnancy are limited. Here, we report data from the first 2 cohorts of pregnant participants in MTN-042/DELIVER, a phase 3b, randomized, open-label safety trial of DVR and oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC). MTN-042 is being conducted in 3 cohorts beginning with later gestational ages when risks of drug exposure are less. METHODS: Eligible pregnant individuals aged 18-40 years in Malawi, South Africa, Uganda, and Zimbabwe were randomized 2:1 to monthly DVR or daily TDF/FTC. Participants in cohort 1 initiated product use between 36 weeks 0 days (36 0/7 weeks) and 37 6/7 weeks gestation; participants in cohort 2 initiated product use between 30 0/7 and 35 6/7 weeks gestation. All participants continued product use until delivery or 41 6/7 weeks gestation. Pregnancy outcomes and complications were assessed and summarized using descriptive statistics and compared with local background rates obtained through a separate chart review. RESULTS: One-hundred and fifty participants were enrolled into cohort 1 with 101 randomized to DVR and 49 to TDF/FTC. One-hundred and fifty-seven participants were enrolled into cohort 2 with 106 randomized to DVR and 51 to TDF/FTC. In both cohorts, pregnancy complications were rare and similar to local background rates. CONCLUSION: In this first study of a long-acting HIV prevention agent in pregnancy, adverse pregnancy outcomes and complications were uncommon when DVR and TDF/FTC were used in the third trimester of pregnancy, suggesting a favorable safety profile for both prevention products. Article	2024	Burgan K.; McCollum C.G.; Guzman A.; Penney B.; Hill S.V.; Kudroff K.; Thorn S.; Burton T.; Turner K.; Mugavero M.J.; Rana A.; Elopre L.	A mixed methods evaluation assessing the feasibility of implementing a PrEP data dashboard in the Southeastern United States	BMC Health Services Research	-	-	-	-	14726963	10.1186/s12913-023-10451-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182627049&doi=10.1186%2fs12913-023-10451-5&partnerID=40&md5=4ac29838b5e2980793c21122b28c953d	Background: Alabama is one of seven priority states for the National Ending the HIV Epidemic Initiative due to a disproportionate burden of rural infections. To reverse growing infection rates, the state must increase its focus on prevention efforts, including novel strategies. One such approach is to utilize dashboards that visualize real-time data on the pre-exposure prophylaxis (PrEP) care continuum to assist in prioritizing evidence-based preventative care for those most vulnerable for HIV infection. Methods: We conducted a mixed methods evaluation to ascertain stakeholders' perceptions on the acceptability, feasibility, appropriateness, and usability of a PrEP care continuum dashboard, as well as gain insight on ways to improve the activities necessary to sustain it. Clinicians, administrators, and data personnel from participating sites in Alabama completed surveys (n = 9) and participated in key informant interviews (n = 10) to better understand their experiences with the prototype data dashboard and to share feedback on how it can be modified to best fit their needs. Results: Surveys and interviews revealed that all participants find the pilot data dashboard to be an acceptable, feasible, and appropriate intervention for clinic use. Overall, stakeholders find the pilot dashboard to be usable and helpful in administrative efforts, such as report and grant writing; however, additional refining is needed in order to reduce burden and optimize usefulness. Participants voiced concerns about their site's abilities to sustain the dashboard, including the lack of systematized PrEP protocols and limited funds and staff time dedicated to PrEP data collection, cleaning, and upload. Conclusion: Study participants from clinics providing HIV prevention services, including PrEP, in Alabama voiced interest in sustaining and refining a data dashboard that tracks clients across the PrEP care continuum. Despite viewing the platform itself as an acceptable, feasible, and appropriate intervention, participants agreed that efforts need to be focused on standardizing PrEP data collection protocols in order to ensure consistent, accurate data capture and that limited funds and staff time are barriers to the sustained implementation of the dashboard in practice. © 2024, The Author(s). Article	2024	Caoimhe C.; Spate J.; Day S.	Improving awareness and uptake of pre-exposure HIV prophylaxis amongst service users accessing Sexual Health London, a regional online postal sexually transmitted infection testing health service	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624241231630	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184160584&doi=10.1177%2f09564624241231630&partnerID=40&md5=fe11f2013ec0edf7eda7c65f31918c60	Background: The UK pledged commitment to the global strategy of zero new HIV infections and HIV-related deaths by 2030. PrEP was commissioned in England in 2020 and is fundamental to achieving these targets, yet awareness and uptake are suboptimal in certain populations. Method: Sexual Health London (SHL) incorporated questions on its e-triage questionnaire estimating need for PrEP amongst online service users. Two types of signposting messaging were shown to users directing them to more detailed online content: PrEP-discussion (potential need) and PrEP-eligible (assumed need). The effectiveness of this signposting was evaluated by reviewing demographics and triage responses in returning users. Results: 426,149 SHL users requested STI screening between 1.7.21-31.10.22. 16% (69,867/426,149) and 32.2% (137,489/426,149) of individuals received PrEP-eligible and PrEP-discussion signposting. The PrEP-eligible cohort were: 41.0% gay/bisexual or other men who have sex with men (GBMSM), 16.3% heterosexual males, 33.1% heterosexual females, and 60.6% were of white ethnicity. The PrEP-discussion cohort were: 9.3% GBMSM, 34.3% heterosexual males, 45.5% heterosexual females and 63.7% of white ethnicity. 50.4% (35,190/69,867) and 41.3% (56,808/137,489) of the PrEP-eligible and PrEP discussion cohorts ordered a subsequent SHL STI testing kit, during which 10.0% (3510/35,190) and 5.9% (3364/56,808) reported taking PrEP. Of those who denied taking PrEP, 59% (18,702/31,680) and 61.0% (32,559/53,444) triggered PrEP signposting again. 95.4% of PrEP starters were GBMSM (6562/6874) and 1.4% (97/6874) heterosexual males/females. Conclusion: The e-service demonstrated feasibility in estimating PrEP need and signposting service users. Up to 16% of returning users subsequently commenced PrEP. This highlights significant missed opportunities for the remaining online users, who continue to report HIV acquisition risk(s). Further efforts regionally/nationally to optimise uptake of PrEP, particularly among under-represented groups are warranted. © The Author(s) 2024. Article	2024	Cespedes, Michelle S.; Das, Moupali; Yager, Jenna; Prins, Maria; Krznaric, Ivanka; de Jong, Jan; Xiao, Deqing; Shao, Yongwu; Wong, Pamela; Kintu, Alexander; Carter, Christoph; Hoornenborg, Elske; Ruane, Peter; Phoenix, John; Younis, Islam; Halperin, Jason	Gender Affirming Hormones Do Not Affect the Exposure and Efficacy of F/TDF or F/TAF for HIV Preexposure Prophylaxis: A Subgroup Analysis from the DISCOVER Trial.	Transgender Health	-	-	-	-	2688-4887 2380-193X	10.1089/trgh.2022.0048	https://www.liebertpub.com/doi/full/10.1089/trgh.2022.0048	PURPOSE: Transgender women are disproportionately affected by HIV and are underutilizing preexposure prophylaxis (PrEP). The lower uptake of PrEP by transgender women may be, in part, owing to the perception that taking PrEP may lower the efficacy of gender-affirming hormone therapy (GAHT) or to provider concerns that GAHT may lower the efficacy of PrEP. METHODS: DISCOVER was a randomized, double-blind, noninferiority trial comparing emtricitabine (FTC, F) and tenofovir alafenamide (F/TAF) versus emtricitabine and tenofovir disoproxil fumarate (F/TDF) as PrEP among transgender women and cisgender men who have sex with men (MSM). This nested substudy of the DISCOVER trial compared the exposure of the active intracellular metabolites of FTC and tenofovir (TFV), FTC triphosphate (FTC-TP) and TFV diphosphate (TFV-DP), in peripheral blood mononuclear cells (PBMC) among transgender women receiving GAHT versus MSM within the F/TAF and F/TDF groups. RESULTS: Our results demonstrate that TFV-DP and FTC-TP levels in PBMC were comparable between transgender women on GAHT and MSM receiving F/TAF, and between transgender women on GAHT and MSM receiving F/TDF. TFV-DP concentrations remained above the EC(90) of 40 fmol/10(6) cells across all groups. No clinically significant drug-drug interactions of GAHT were observed with either F/TAF or F/TDF in this subanalysis. CONCLUSIONS: These findings are consistent with the clinical pharmacology of GAHT, FTC, TDF, and TAF reported in previous studies, and support the continued use of F/TAF and F/TDF for PrEP in transgender women. Article	2024	Chambers, Laura C.; Tapia, Kenneth A.; Srinivasan, Sujatha; Proll, Sean; Morgan, Jennifer L.; Hoffman, Noah G.; Lowens, M. Sylvan; Glick, Sara N.; Khosropour, Christine M.; Golden, Matthew R.; Hughes, James P.; Manhart, Lisa E.; Fredricks, David N.	The Relationship Between Insertive Oral and Anal Sex and Select Measures of the Composition of the Urethral Microbiota Among Men Who Have Sex With Men.	Sexually Transmitted Diseases	-	-	-	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001959	https://journals.lww.com/stdjournal/abstract/2024/06000/the_relationship_between_insertive_oral_and_anal.5.aspx	BACKGROUND: Sexual behavior may influence the composition of the male urethral microbiota, but this hypothesis has not been tested in longitudinal studies of men who have sex with men (MSM). METHODS: From 12/2014-7/2018, we enrolled MSM with non-gonococcal urethritis (NGU) attending a sexual health clinic. Men attended five in-clinic visits at 3-week intervals, collected weekly urine specimens at home, and reported daily antibiotics and sexual activity on weekly diaries. We applied broad-range 16S rRNA gene sequencing to urine. We used generalized estimating equations to estimate the association between urethral sexual exposures in the prior 7 days (insertive oral sex IOS only, condomless insertive anal intercourse CIAI only, IOS with CIAI IOS + CIAI, or none) and Shannon index, number of species (observed, oral indicator, and rectal indicator), and specific taxa, adjusting for recent antibiotics, age, race/ethnicity, HIV, and pre-exposure prophylaxis. RESULTS: Ninety-six of 108 MSM with NGU attended ≥1 follow-up visit. They contributed 1,140 person-weeks of behavioral data and 1,006 urine specimens. Compared to those with no urethral sexual exposures, those with IOS only had higher Shannon index (P = 0.03) but similar number of species and presence of specific taxa considered, adjusting for confounders; the exception was an association with Haemophilus parainfluenzae. CIAI only was not associated with measured aspects of the urethral microbiota. IOS + CIAI was only associated with presence of H. parainfluenzae and Haemophilus. CONCLUSIONS: Among MSM after NGU, IOS and CIAI did not appear to have a substantial influence on measured aspects of the composition of the urethral microbiota. Article	2024	Chan K.; Mitchell M.M.; Casselle E.; Bender A.A.	Facilitators and Barriers to PrEP Acceptability and Initiation Among Opioid Treatment Program Patients and Staff	AIDS Education and Prevention	-	-	-	-	19432755	10.1521/aeap.2024.36.1.60	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85185109434&doi=10.1521%2faeap.2024.36.1.60&partnerID=40&md5=084d21e53b6ad5ddac172ee3a972f89c	The Centers for Disease Control and Prevention recommends PrEP (pre-exposure prophylaxis) for people who use drugs, yet uptake remains low. This study explores the acceptability and potential uptake of PrEP among participants in an opioid treatment program (OTP). We conducted 26 in-depth, semistructured interviews with staff and patients at an OTP in Baltimore, Maryland. Overall, participants felt that providing PrEP within the program would be beneficial, but they noted competing priorities among populations engaging in high-risk behaviors and lack of willingness among groups with lower risk behaviors. Participants reported several barriers to PrEP use among people who use drugs and who use medications for opioid use, including cost, competing priorities, stigma, and misconceptions about who should use PrEP. Facilitators to PrEP use were described as health benefits, trusted relationships with providers, and existing resources in the opioid treatment program. Practitioners should consider addressing barriers to access and stigma within an OTP setting for HIV prevention tools. Article	2024	Chazuka Z.; Madubueze C.E.; Mathebula D.	Modelling and analysis of an HIV model with control strategies and cost-effectiveness	Results in Control and Optimization	-	-	-	-	26667207	10.1016/j.rico.2023.100355	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180058942&doi=10.1016%2fj.rico.2023.100355&partnerID=40&md5=6bf058942f3c23ba11f0a4128831be26	The Human Immunodeficiency Virus (HIV) remains a significant public health concern, despite global efforts to reduce new infections and increase access to antiretroviral treatment. While pre-exposure prophylaxis (PrEP) has shown promise in reducing new infections, its overall effectiveness is hindered by challenges in adherence. In this paper, a novel model was proposed. The basic properties of the model were established and the reproduction number for the model without control was computed. We conducted a sensitivity analysis to highlight the need for optimal control analysis and hence proposed an optimal control model that incorporates PrEP, condom use, and antiretroviral treatment to capture the dynamics of HIV transmission. The existence of the optimal control was mathematically proven and Pontryagin's maximum principle was employed to establish the necessary optimal control conditions. Utilizing demographic and epidemiological parameters specific to South Africa, we conducted numerical simulations. The results demonstrate the community-level benefits of implementing a combination of control measures for HIV reduction. Additionally, a cost-effectiveness analysis was performed to determine the most effective and economically viable control strategies. We anticipate that the findings from this analysis will provide valuable insights for policymakers in designing effective HIV control programmes. © 2023 The Author(s)	Adherence; Cost-effectiveness; Optimal control; Pontryagin's maximum principle; Pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2024	Chazuka Z.; Mudimu E.; Mathebula D.	Stability and bifurcation analysis of an HIV model with pre-exposure prophylaxis and treatment interventions	Scientific African	-	-	-	-	24682276	10.1016/j.sciaf.2023.e01979	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177817172&doi=10.1016%2fj.sciaf.2023.e01979&partnerID=40&md5=5789f7a41be429ab553228835f42236f	Oral pre-exposure prophylaxis (PrEP) is a highly effective method of HIV prevention. However, despite its effectiveness, the use of PrEP is not without challenges. These challenges include issues such as adherence, societal stigma, as well as accessibility and cost. PrEP effectiveness measures the drug's performance in the real world while efficacy measures the degree to which PrEP inhibits HIV infection and its transmission. In this paper, we address the problem of reduced effectiveness of PrEP, primarily due to non-adherence, and the impact on the dynamics of HIV infection. The study aims to determine the critical threshold of PrEP effectiveness required to avoid the occurrence of a backward bifurcation. The conditions for a stable infection-free equilibrium are stated. Through a rigorous analysis of the proposed mathematical model using Castillo-Chavez and Song's bifurcation theorem, it was found that backward bifurcation occurs when PrEP effectiveness falls below 100%. In contrast, if the effectiveness is 100%, which implies full adherence to PrEP, the model undergoes forward bifurcation. The existence of a backward bifurcation bears significant consequences, most notably the co-existence of the infection-free equilibrium and the endemic equilibrium. Under these circumstances, the eradication of HIV within a particular community becomes very difficult. The results of the numerical analysis demonstrate the important role of proper adherence in augmenting the effectiveness of PrEP and, consequently, curbing HIV transmission within communities. Nevertheless, intensive efforts are required to boost adherence to PrEP. Therefore, other HIV control measures need to be promoted to further reduce transmission. © 2023 The Author(s)	Backward bifurcation; PrEP adherence; PrEP effectiveness; PrEP efficacy; Sensitivity analysis; Treatment interventions	English	Netherlands	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2024	Cheah, Min Hui; Gan, Yan Nee; Altice, Frederick L; Wickersham, Jeffrey A; Shrestha, Roman; Salleh, Nur Afiqah Mohd; Ng, Kee Seong; Azwa, Iskandar; Balakrishnan, Vimala; Kamarulzaman, Adeeba; Ni, Zhao	Testing the Feasibility and Acceptability of Using an Artificial Intelligence Chatbot to Promote HIV Testing and Pre-Exposure Prophylaxis in Malaysia: Mixed Methods Study.	JMIR Human Factors	-	-	-	-	2292-9495	10.2196/52055	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10858413	BACKGROUND: The HIV epidemic continues to grow fastest among men who have sex with men (MSM) in Malaysia in the presence of stigma and discrimination. Engaging MSM on the internet using chatbots supported through artificial intelligence (AI) can potentially help HIV prevention efforts. We previously identified the benefits, limitations, and preferred features of HIV prevention AI chatbots and developed an AI chatbot prototype that is now tested for feasibility and acceptability. OBJECTIVE: This study aims to test the feasibility and acceptability of an AI chatbot in promoting the uptake of HIV testing and pre-exposure prophylaxis (PrEP) in MSM. METHODS: We conducted beta testing with 14 MSM from February to April 2022 using Zoom (Zoom Video Communications, Inc). Beta testing involved 3 steps: a 45-minute human-chatbot interaction using the think-aloud method, a 35-minute semistructured interview, and a 10-minute web-based survey. The first 2 steps were recorded, transcribed verbatim, and analyzed using the Unified Theory of Acceptance and Use of Technology. Emerging themes from the qualitative data were mapped on the 4 domains of the Unified Theory of Acceptance and Use of Technology: performance expectancy, effort expectancy, facilitating conditions, and social influence. RESULTS: Most participants (13/14, 93%) perceived the chatbot to be useful because it provided comprehensive information on HIV testing and PrEP (performance expectancy). All participants indicated that the chatbot was easy to use because of its simple, straightforward design and quick, friendly responses (effort expectancy). Moreover, 93% (13/14) of the participants rated the overall chatbot quality as high, and all participants perceived the chatbot as a helpful tool and would refer it to others. Approximately 79% (11/14) of the participants agreed they would continue using the chatbot. They suggested adding a local language (ie, Bahasa Malaysia) to customize the chatbot to the Malaysian context (facilitating condition) and suggested that the chatbot should also incorporate more information on mental health, HIV risk assessment, and consequences of HIV. In terms of social influence, all participants perceived the chatbot as helpful in avoiding stigma-inducing interactions and thus could increase the frequency of HIV testing and PrEP uptake among MSM. CONCLUSIONS: The current AI chatbot is feasible and acceptable to promote the uptake of HIV testing and PrEP. To ensure the successful implementation and dissemination of AI chatbots in Malaysia, they should be customized to communicate in Bahasa Malaysia and upgraded to provide other HIV-related information to improve usability, such as mental health support, risk assessment for sexually transmitted infections, AIDS treatment, and the consequences of contracting HIV.	artificial intelligence; acceptability; chatbot; feasibility; HIV prevention; HIV testing; men who have sex with men; MSM; mobile health; mHealth; preexposure prophylaxis; PrEP; mobile phone	English	Canada	Western and Central Europe and North America	Malaysia	Asia and the Pacific	United States	Western and Central Europe and North America	Mixed methods
Article	2024	Chen S.; Zhu Y.-Y.; Chu Z.-X.; Zhou H.; Liu M.; Jiang Y.-J.; Hu Q.-H.	Trajectories of anxiety and depression among Chinese men who have sex with men on pre-exposure prophylaxis: a group-based trajectory model approach	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-024-17854-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184092203&doi=10.1186%2fs12889-024-17854-x&partnerID=40&md5=0644b85a3e513d90061695ffefa5441b	Background: Anxiety and depression can influence adherence to Pre-exposure Prophylaxis (PrEP). However, there is limited research on the temporal dynamics of anxiety and depression among men who have sex with men (MSM) using PrEP. Methods: From December 2018 to November 2020, we administered the Hospital Anxiety and Depression Scale (HADS) to participants in the China Real-World Oral Intake of PrEP (CROPrEP) to measure their anxiety and depression levels. The group-based trajectory model (GBTM) depicted the dynamic changes of anxiety and depression scores over time. Results: A total of 1023 MSM were included, with 4523 follow-up assessments. The GBTM categorized the trajectories into three distinct patterns: consistently low (54.8% for anxiety, 60.7% for depression), consistently moderate (39.3% for anxiety, 31.4% for depression), and high but bell-shaped (5.9% for anxiety, 7.9% for depression). Higher anxiety levels were associated with being aged 18–30 years old, earning less than US$619 per month, female-identifying, adopting the bottom sexual role with men, and having two or more anal sex partners in the past three months; similarly, higher depression levels correlated with a monthly income under US$619, female-identifying, sexual behavior as bottom and a positive syphilis at baseline. PrEP adherence was notably lower in the high but bell-shaped anxiety and depression group compared to the other groups, particularly at the 12th-month follow-up. Conclusions: Close monitoring of anxiety and depression levels in MSM on PrEP is crucial. Provision of targeted mental health support is essential to enhance PrEP effectiveness. © The Author(s) 2024. Article	2024	Chen, Yen-Ju; Lin, Yu-Chen; Wu, Meng-Tien; Kuo, Jenn-Yuan; Wang, Chun-Hsiang	Prevention of Viral Hepatitis and HIV Infection among People Who Inject Drugs: A Systematic Review and Meta-Analysis.	Viruses	-	-	-	-	1999-4915	10.3390/v16010142	https://pubmed.ncbi.nlm.nih.gov/38257842/	This study aimed to explore the current evidence on preventing blood-borne virus infections among people who inject drugs (PWID). We conducted a comprehensive search across three databases (PubMed, Embase, Cochrane Library) for relevant articles published in English between 2014 and 2023. We followed the Preferred Reporting Items for Systematic Reviews and Meta Analysis (PRISMA) guidelines, assessed the quality of the paper using the revised Cochrane Risk of Bias Tool (ROB 2), and conducted a meta-analysis using RevMan 5.3. Completing the harm reduction program (HRP) participation and receiving all three vaccine doses resulted in a 28% reduction in the risk of HBV infection (OR: 0.72, 95% CI: 0.37-1.42). Various interventions increased the willingness of PWIDs to undergo HCV treatment (OR: 5.91, 95% CI: 2.46-14.24) and promoted treatment adherence (OR: 15.04, 95% CI: 2.80-80.61). Taking PrEP, participating in HRP, and modifying risky behaviors were associated with a 33% reduction in the risk of HIV infection (OR: 0.67, 95% CI: 0.61-0.74). Conducting referrals, providing counseling, and implementing antiretroviral therapy resulted in a 44% reduction in the risk of viral transmission (OR: 0.56, 95% CI: 0.47-0.66). Co-infection may potentially compromise effectiveness, so it is important to consider drug resistance. Article	2024	Cheung, Doug H.; Samoh, Nattharat; Jonas, Kai; Lim, Sin How; Kongjareon, Yamol; Guadamuz, Thomas E.	Partying in Thailand: Never testing among MSM who attend sexualized (drug) parties.	Sexually Transmitted Diseases	-	-	-	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001937	https://pubmed.ncbi.nlm.nih.gov/38301623/	BACKGROUND: HIV testing for Thai MSM is suboptimal, which undermines their linkage to care and subsequent HIV preexposure prophylaxis (PrEP) uptake. METHODS: We analyzed a cross-sectional survey conducted in 2021 among Thai MSM who attended any private sex parties or circuit parties in the past 3 years ("sexualized parties"). RESULTS: Of the 424 men included in our analysis, 47.6% had been recently tested for HIV in the past 1 year, 30.2% had not recently been tested, and 22.2% had never been tested. In our multivariable analysis, relative to participants who had recently tested for HIV, those who have never tested were more likely to have lower education or to live outside of Bangkok, and to have attended both circuit and private sex parties (vs. private sex party only) but were less likely to report any STI diagnosis or to have heard of PrEP. Participants who had an HIV test more than a year ago were more likely to have attended both circuit and private sex parties (vs. private sex parties only) but were less likely to have any STI diagnoses, meet sexual partners online, or have heard of PrEP. Rates of condomless anal sex and willingness to use PrEP were similar across groups. CONCLUSION: Despite the high rates of sexual risk-taking, sexualized party attendees reported suboptimal HIV testing uptake. The joint promotion of HIV testing and PrEP is warranted - especially on-premise HIV testing at circuit parties and outreach at online platforms to reach sexualized party attendees.	acesso restrito	English	United States	Western and Central Europe and North America	Thailand	Asia and the Pacific	Thailand	Asia and the Pacific	Quantitative
Article	2024	Chevalier, Joshua M.; Hansen, Megan A.; Coskun, Elif; Sy, Karla Therese L.; Drakes, Janeen; Dowling, Stephanie; Williams, Amanda; Jenkins, Sarah; Amole, Carolyn; Haimbe, Prudence; Mpasela, Felton; Shakwelele, Hilda; Nichols, Brooke E.	Cost-effectiveness of intervention combinations towards the elimination of vertical transmission of HIV in limited-resource settings: a mathematical modelling study.	The Lancet Global Health	-	-	-	-	2214-109X	10.1016/S2214-109X(23)00588-0	https://www.thelancet.com/journals/langlo/article/PIIS2214-109X(23)00588-0/fulltext	BACKGROUND: Since 2000, there has been a substantial global reduction in the vertical transmission of HIV. Despite effective interventions, gaps still remain in progress towards elimination in many low-income and middle-income countries. We developed a mathematical model to determine the most cost-effective combinations of interventions to prevent vertical transmission. METHODS: We developed a 12-month Markov model to follow a cohort of women of childbearing age (aged 15-49 years) in Zambia (n=1 107 255) who were either pregnant, in delivery, or breastfeeding; the population included in the model reflects the estimated number of pregnant women in Zambia from the 2018 Zambia Demographic and Health Survey. The model incorporated nine interventions: infant prophylaxis; three different HIV retesting schedule options; oral pre-exposure prophylaxis; maternal peer-support groups; regimen shift; tracing of loss to follow-up; and point-of-care viral load testing. We analysed incident HIV infections among mothers and infants, intervention costs, and evaluated 190 scenarios of different combinations of interventions to calculate the incremental cost-effectiveness ratios (ICERs) over 1 year. FINDINGS: Three interventions with the greatest reduction in vertical transmission, individually, were support groups for 80% of those in need (35% reduction in infant infections), HIV retesting schedules (6·5% reduction), and infant prophylaxis (4·5% reduction). Of all 190 scenarios evaluated, eight were on the cost-effectiveness frontier (ie, were considered to be cost-effective); all eight included increasing infant prophylaxis, regimen shift, and use of support groups. Excluding the highest-cost scenarios, for a 1-22% increase in total budget, 23-43% of infant infections could be prevented, producing ICERs between US$244 and $16 242. INTERPRETATION: Using the interventions modelled, it is possible to reduce vertical transmission and to cost-effectively prevent up to 1734 infant HIV infections (43% reduction) in Zambia over a period of 1 year. To optimise their effect, these interventions must be scaled with fidelity. Future work is needed to incorporate evidence on additional innovative interventions and HIV risk factors, and to apply the model to other country contexts to support targeted implementation and resource use. Article	2024	Cianelli, Rosina; De Santis, Joseph P; De Oliveira, Giovanna C; Castro, Jose G; Iriarte, Evelyn; Baeza, María José; Thomas, Sophia O; Villegas, Natalia; Peragallo-Montano, Nilda	Feasibility and acceptability of SEPA+PrEP: An HIV prevention intervention to increase PrEP knowledge, initiation, and persistence among cisgender heterosexual Hispanic women.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0296080	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10760780	The HIV epidemic disproportionately affects Hispanics in the U.S., with Hispanic women (HW) accounting for 18% of new HIV diagnoses in 2019 despite comprising only 16% of the female population. The imbalance of power related to cultural values and HW's lack of knowledge and low perception of risk for HIV interferes with prevention efforts (e.g., condom use, HIV testing, and Pre-Exposure Prophylaxis PrEP). It is estimated that in 2019, only 10% of women in the U.S. who could benefit from PrEP were given prescriptions for it. This number is estimated to be significantly lower among HW. PrEP is highly effective for preventing HIV, reducing the risk of acquiring HIV from sexual activity by about 99%. To respond to this need, we developed SEPA+PrEP, a biobehavioral HIV prevention intervention that adapted and integrated SEPA (Salud/Health, Educación/Education, Prevención/Prevention, Autocuidado/Self-Care), an empirically validated behavioral HIV prevention intervention, with the evidence-based biomedical strategy of PrEP. This study aimed to investigate the feasibility and acceptability of SEPA+PrEP among cisgender heterosexual Hispanic women (HW). We used a mixed methods approach to gather data from 44 HW living in the City of Homestead and its surrounding communities in Miami-Dade County, Florida. None of the participants knew about PrEP prior to participating in the study, and the majority (70.5%, n = 23) had not used condoms when engaging in vaginal sex during the previous three months. Overall, study results suggest that SEPA+PrEP is an acceptable and feasible intervention to prevent HIV among HW, with a focus on PrEP knowledge, initiation, and maintenance.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2024	Clement, Meredith E.; Perry, Brian; McKenna, Kevin; Beckford, Jeremy; Davenport, Tamachia; Murray, Erica; Magee, Veronica; Bickham, Jacquelyn N.; Siren, Julia; Smith, Amy; Lillis, Rebecca; Corneli, Amy	Identifying Implementation Strategies to Enhance HIV Pre-Exposure Prophylaxis Uptake Among Black Cisgender Women in New Orleans, Louisiana.	AIDS Patient Care and STDs	-	-	-	-	1557-7449 1087-2914	10.1089/apc.2023.0300	https://pubmed.ncbi.nlm.nih.gov/38471093/	There is an unmet need for HIV prevention among Black cisgender women. From January to November 2020, we conducted formative research to develop locally informed implementation strategies to enhance pre-exposure prophylaxis (PrEP) uptake among Black cisgender women in New Orleans, Louisiana. Following an iterative process, we conducted in-depth interviews (IDIs) with Black women who were not taking PrEP and used those findings to inform IDIs with Black women taking PrEP. We asked about PrEP awareness, social support, PrEP-related norms, medical mistrust, motivation to take PrEP, and potential implementation strategies. Data were analyzed using applied thematic analysis. We established the Black Women and PrEP (BWAP) Task Force-a diverse group of 25 Black female community representatives who reviewed the IDI findings and identified strategies to address these determinants of PrEP uptake. We interviewed 12 Black women who were not taking PrEP and 13 Black women who were taking PrEP. Two main PrEP uptake barriers were identified from the IDI findings and Task Force discussions. First, Black women do not know of other Black women taking PrEP. Women perceived PrEP as a drug for gay men. Most said that testimonials from Black women taking PrEP would make its use more relatable. Second, Black women are not frequently offered PrEP by their providers. Many preferred accessing PrEP through women's health providers. The Task Force identified two strategies to address these barriers: a social media campaign for women and an educational initiative to train providers to discuss and prescribe PrEP. These implementation strategies require further study. Article	2024	Cocohoba J.; Tweedie L.; Frank M.; McElya B.; Witt E.	Legislation expanding pharmacist scope of practice to furnish Human Immunodeficiency Virus pre-exposure prophylaxis: A content analysis	Journal of the American College of Clinical Pharmacy	-	-	-	-	25749870	10.1002/jac5.1906	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179978739&doi=10.1002%2fjac5.1906&partnerID=40&md5=a431a6e04ebc6322cf616ff2ac6590cf	Introduction: Approximately 1.2 million persons in the United States have indications for human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) yet utilization remains low. Alternative models for PrEP access, such as community pharmacy programs where pharmacists may prescribe and dispense HIV PrEP medications, may help improve rates of utilization. Individual states have begun to pass laws governing expanded pharmacist practice for provision of PrEP. Methods: An internet search was conducted from January 2022 to June 2023 to identify United States legislative bills which support the independent provision of PrEP by pharmacists. A content analysis was conducted of the bill text to conceptualize key components, compare these across states, and hypothesize implications for implementation and pharmacy practice. Results: Twelve states (Arkansas, California, Colorado, Nevada, Utah, New Mexico, Virginia, Oregon, Illinois, Maine, Rhode Island, and Connecticut) with legislation supporting pharmacist-furnished HIV PrEP were identified. Content analysis revealed differences in required pharmacist training, conditions for furnishing PrEP, total amount of PrEP permitted for dispensing, and discussions of pharmacist-provided laboratory testing and reimbursement. Conclusion: Pharmacist-furnished PrEP is rapidly gaining support as a means to expand access to HIV prevention tools. State-to-state differences in legislation will have an impact on implementation and scalability of these models. It will be important to observe states that were early adopters of this type of legislation and who experienced challenges in implementing such programs in order to refine the new legislation being presented in other states. © 2023 The Authors. Article	2024	Coleman, A; Maslen, B; Foster, R	Inequities in PrEP use according to Medicare status in a publicly funded sexual health clinic; a retrospective analysis	Sexual Health	-	-	-	-	1448-5028	10.1071/SH23141	https://pubmed.ncbi.nlm.nih.gov/38382053/	New HIV diagnoses continue to disproportionately affect overseas-born men who have sex with men (MSM). A retrospective study of all pre-exposure prophylaxis (PrEP)-eligible MSM attending Sydney Sexual Health Centre for the first time in 2021 analysed self-reported PrEP-use, PrEP prescribed at the initial consult, and PrEP taken during 2021 using binomial logistic regression models. A total of 1367 clients were included in the analysis, 716 (52.4%) were born overseas and 414 (57.8%) were Medicare-ineligible. Medicare-ineligible clients were less likely to be on PrEP at initial visit (OR 0.45, 95% CI 0.26-0.77). This study suggests inequities in PrEP access and/or awareness in Medicare-ineligible MSM in Australia. Article	2024	Cooper, Spring C; Santella, Anthony J; Caines, Matthew; Rojanaworarit, Chanapong; Hernandez, Alex	Impact of participation as a peer change agent on peer change agents themselves: a quantitative study of a peer-led, social media-based PrEP promotion intervention.	Health Education Research	-	-	-	-	1465-3648	10.1093/her/cyad042	https://dx.doi.org/10.1093/her/cyad042	Despite the adoption of pre-exposure prophylaxis (PrEP) as a crucial HIV intervention, uptake remains suboptimal among men who have sex with men, a sexual minority group, due to barriers like cost and stigma. Peer change agents (PCAs) disseminate PrEP information within their social networks. This study explores the reciprocal effects of an online community-based participatory intervention on PCAs, focusing on their transformed PrEP uptake perceptions-leadership efficacy, social network dynamics, attitudes, perceived benefits and barriers and self-efficacy. Leveraging insights from the PrEP Chicago Study, our research addresses a key gap in community-based participatory interventions for PrEP uptake: the transformative experiences and perception shifts of PCAs involved in these interventions. We engaged 20 men who have sex with men, aged 18-45, as PCAs in a one-group pretest-posttest design intervention, which disseminated PrEP communications within their preferred online networks. We utilized the PrEP Chicago Study's 45 Likert items, tailored to reveal the PCAs' transformative potential. Data on PrEP uptake perceptions, sociodemographics and social media use were captured and analyzed using the Wilcoxon matched-pairs signed-rank test, a nonparametric method. PCAs demonstrated significant changes in their PrEP uptake perceptions, including leadership capacity, social network dynamics, attitudes toward PrEP, perceived benefits, barriers and self-efficacy. Our intervention highlights the reciprocal transformation PCAs undergo when disseminating PrEP information. This study adds a new dimension to community-based PrEP interventions and underscores the need for continued refinement of peer-led strategies to optimize the transformative potential of PCAs.	hivattitudeperceptionself efficacycommunitysocial mediapre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods

Clinical and epidemiological features of mpox in a Brazilian reference center for HIV and sexually transmitted infections: A cross-sectional study	International Journal of Infectious Diseases: Regions	-	-	-	-	27727076	10.1016/j.ijregi.2023.11.017	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182419419&doi=10.1016%2fj.ijregi.2023.11.017&partnerID=40&md5=b7aa1274bda448540dd06120687274d1	Background: The 2022 mpox outbreak has affected disproportionately people living with HIV (PLWH) and pre-exposure prophylaxis (PrEP) users. Methods: We conducted a cross-sectional study to evaluate factors associated with laboratory diagnosis of mpox among suspected cases, and access differences between PrEP users and PLWH with confirmed diagnostic. Results: 394 mpox suspected cases were analyzed, 309 (78.4%) confirmed. Most patients were PLWH (54.4%) and 99 (32%) PrEP users. Mpox cases were likely to be between 25 and 39 years old (aOR=2.8; p=0.042), men who have sex with men/bisexual or transgender women (aOR=17.2; p< 0.001) and to have fever (aOR=4.7; p< 0.001), adenomegaly (aOR=7.2; p< 0.001) and multiple vesicular lesions (aOR=4.2; p< 0.001). Comparing PrEP users to PLWH with confirmed mpox, PrEP users had lesions predominantly with exclusive genital involvement (p=0.016); while PLWH had higher extragenital involvement (p=0.018). Conclusions: PrEP users and PLWHA were the main epidemiological groups in our cohort. Recognizing the differences between vulnerable populations can contribute to the development public policies to control mpox in settings with reduced access to vaccines © 2023 The Authors	na	English	United Kingdom	Western and Central Europe and North America	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Clinical
Article	2024	Cox S.N.; Wu L.; Wittenauer R.; Clark S.; Roberts D.A.; Nwogu I.B.; Vitruk O.; Kuo A.P.; Johnson C.; Jamil M.S.; Sands A.; Schaefer R.; Kisia C.; Baggaley R.; Stekler J.D.; Akullian A.; Sharma M.	Impact of HIV self-testing for oral pre-exposure prophylaxis scale-up on drug resistance and HIV outcomes in western Kenya: a modelling study	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(23)00268-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184259873&doi=10.1016%2fS2352-3018%2823%2900268-0&partnerID=40&md5=bf4c62aaa2eb96da2518513815 5c7e4c	Background: Community-based oral pre-exposure prophylaxis (PrEP) provision has the potential to expand PrEP coverage. HIV self-testing can facilitate PrEP community-based delivery but might have lower sensitivity than facility-based HIV testing, potentially leading to inappropriate PrEP use among people with HIV and subsequent development of drug resistance. We aimed to evaluate the impact of HIV self-testing use for PrEP scale-up. Methods: We parameterised an agent-based network model, EMOD-HIV, to simulate generic tenofovir disoproxil fumarate and emtricitabine PrEP scale-up in western Kenya using four testing scenarios: provider-administered nucleic acid testing, provider-administered rapid diagnostic tests detecting antibodies, blood-based HIV self-testing, or oral fluid HIV self-testing. Scenarios were compared with a no PrEP counterfactual. Individuals aged 18–49 years with one or more heterosexual partners who screened HIV-negative were eligible for PrEP. We assessed the cost and health impact of rapid PrEP scale-up with high coverage over 20 years, and the budget impact over 5 years, using various HIV testing modalities. Findings: PrEP coverage of 29% was projected to avert approximately 54% of HIV infections and 17% of HIV-related deaths among adults aged 18–49 years over 20 years; health impacts were similar across HIV testing modalities used to deliver PrEP. The percentage of HIV infections with PrEP-associated nucleoside reverse transcriptase inhibitor (NRTI) drug resistance was 0·6% (95% uncertainty intervals 0·4–0·9) in the blood HIV self-testing scenario and 0·8% (0·6–1·0) in the oral HIV self-testing scenario, compared with 0·3% (0·2–0·3) in the antibody rapid diagnostic testing scenario and 0·2% (0·1–0·2) in the nucleic acid testing scenario. Accounting for background NRTI resistance, we found similarly low proportions of drug resistance across scenarios. The budget impact of implementing PrEP using HIV self-testing and provider-administered rapid diagnostic tests were similar, while nucleic acid testing was approximately 50% more costly. Interpretation: Scaling up PrEP using HIV self-testing has similar health impacts, costs, and low risk of drug resistance as provider-administered rapid diagnostic tests. Policy makers should consider leveraging HIV self-testing to expand PrEP access among those at HIV risk. Article	2024	D'Avanzo P.; Shourya S.; Brin M.; Kaw S.; Kay E.; Batey D.S.; Radix A.; Belkind U.; Tanner M.; Galindo C.A.; Ferrara S.; Ott C.; Ozoria Ramirez S.; Schnall R.	Identifying Key Factors to PrEP Initiation and Persistence Among YMSM Through Focus Groups and Surveys in Two High-Priority Settings	AIDS Education and Prevention	-	-	-	-	19432755	10.1521/aeap.2024.36.1.33	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85185098575&doi=10.1521%2faeap.2024.36.1.33&partnerID=40&md5=64b5c882db7cc681031d720c15969933	Cisgender men are diagnosed with HIV at a rate four times greater than cisgender women, with 71% of infections attributed to male-male sexual contact. Despite expanding accessibility, pre-exposure prophylaxis (PrEP) for HIV prevention is initiated by only 30% of people with PrEP indications. Five focus groups with 42 young men who have sex with men from New York and Alabama were conducted to identify key factors to PrEP initiation and persistence. Thirty focus group participants completed a survey on demographics, PrEP choices and health care attitudes. Findings suggest provider competency significantly influences PrEP use due to stigmatization in medical settings. Participants noted benefits of PrEP including HIV protection and sexual empowerment, yet barriers like cost and side effects were prevalent. Our findings outline barriers and facilitators to PrEP use among young men who have sex with men in two high priority settings that will inform PrEP care updates in participating clinics.	focus groups; HIV; PrEP; young men who have sex with men	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2024	Davey, Dvora Joseph; Nyemba D.C.; Mvududu R.; Mashele N.; Johnson L.; Bekker L.-G.; Dean S.S.; Bheemraj K.; Coates T.J.; Myer L.	Pregnancy outcomes following self-reported and objective-measured exposure to oral preexposure prophylaxis in South Africa	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000003729	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179486138&doi=10.1097%2fQAD.0000000000003729&partnerID=40&md5=98e02a9532f13fa50c3ef9b681b4b6d0	Objective:To compare pregnancy outcomes using self-reported and objective levels of intracellular tenofovir diphosphate (TFV-DP) in pregnant women using preexposure prophylaxis (PrEP).Design:We enrolled pregnant women >15 years without HIV at first antenatal care visit in an observational cohort study to compare pregnancy outcomes by PrEP use.Methods:Exposure defined as: any PrEP use tenofovir disoproxil and emtricitabine (TDF/FTC) prescription + reported taking PrEP, or objectively-measured TFV-DP in dried blood spots in PrEP-using pregnant women. The primary outcome was a composite of pregnancy loss, preterm birth (<37weeks), low birthweight (<2500g), small for gestational age (SGA ≤ tenth percentile), or neonatal death. Multivariable logistic regression models evaluated individual and composite adverse outcomes by self-reported or objectively measured PrEP use adjusting for age, gestational age, gravidity and socio-economic status.Results:Between August 19 and February 23, we followed 1195 pregnant women and ascertained 1145 pregnancy outcomes (96%); 72% (n=826) reported taking PrEP while pregnant, 16% did not take PrEP (n=178), 12% were unconfirmed (n=141). Overall, 94.5% (n=1082) had singleton live births with a median birthweight of 3.2kg interquartile range (IQR)=2.9-3.5, with no difference in pregnancy loss between self-reported PrEP exposed vs. unexposed 4.0 vs. 5.6%; adjusted odds ratio (aOR)=0.65, 95% confidence interval (CI)=0.32-1.47. Composite adverse outcomes did not differ by reported PrEP use (20% for both groups; aOR=1.07, 95% CI=0.71-1.63). Comparing objective PrEP use (any TFV-DP vs. no TFV-DP or not on PrEP), adverse outcomes did not differ (aOR=0.64, 95% CI=0.39-1.04), nor did other outcomes including preterm birth nor SGA.Conclusions:Pregnancy outcomes did not differ by PrEP exposure (self-reported or objective), suggesting real-world efficacy that TDF/FTC as PrEP is safe in pregnancy. © 2024 Lippincott Williams and Wilkins. Article	2024	Dawit R.; Predmore Z.; Raifman J.; Chan P.A.; Skinner A.; Napoleon S.; Zanowick-Marr A.; Le Brazidec D.; Almonte A.; Dean L.T.	Identifying HIV PrEP Attributes to Increase PrEP Use Among Different Groups of Gay, Bisexual, and Other Men Who Have Sex with Men: A Latent Class Analysis of a Discrete Choice Experiment	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04131-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165263690&doi=10.1007%2fs10461-023-04131-y&partnerID=40&md5=8341f9056bec81e3a7b5e09500f53fd0	Daily pre-exposure prophylaxis (PrEP) is highly effective at preventing HIV among gay, bisexual, and other men who have sex with men (GBMSM), although uptake remains suboptimal. By identifying the features of PrEP that appeal to various subgroups of GBMSM, this study aimed to improve PrEP uptake by examining preferences for PrEP use. Adults ≥ 18 years old in six New England states completed an online discrete choice experiment survey. A latent class analysis (LCA) was conducted to identify groups of GBMSM based on four attributes of choices for PrEP (cost, time, side effects, and mode of administration). Multinominal logistic regression was conducted to compare the association between sociodemographic and behavioral characteristics and class memberships. Data from 675 GBMSM were analyzed. A 3-Class model was selected as the best fit model. Class 1 (47.7% of individuals) was identified as having "no specific preferences". Class 2 (18.5% of individuals) were "Cost- and time-conscious" and were significantly more likely to be older, have prior sexually transmitted infection (STI) testing, have low household income, private insurance, and have extreme concerns about HIV risk than those with no specific preference (Class 1). Finally, Class 3 (34.1% of individuals) were "Side effects-conscious" and were more likely to have low income, private insurance, and have moderate and extreme concerns about HIV risk than those with no specific preference (Class 1). Findings indicate that outreach to GBMSM who have never used PrEP should emphasize low cost and short travel times to increase potential PrEP use. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2024	de la Mora, Lorena; Mallolas, Josep; Ambrosioni, Juan	Epidemiology, treatment and prognosis of HIV infection in 2024: A practical review.	Medicina Clínica	-	-	-	-	1578-8989 0025-7753	10.1016/j.medcli.2023.12.007	https://www.sciencedirect.com/science/article/abs/pii/S2387020624002006	In recent years, the epidemiology and prognosis of HIV infection have undergone significant changes thanks to the recommendation of antiretroviral therapy (ART) for all infected persons, the development of more effective and better tolerated drugs, and preventive measures such as pre-exposure prophylaxis (PrEP). The evolution of ART, now with simple oral and injectable options, has also contributed to improvements in comprehensive HIV treatment and care. With early diagnosis and early initiation of ART, the life expectancy of people with HIV has reached the same as the general population. However, many people with HIV remain undiagnosed or are diagnosed late, and some population groups experience greater vulnerability, affecting individual and collective health. In this review we review the current epidemiology, treatment and prognosis of HIV infection. Article	2024	Dean L.T.; Nunn A.S.; Chang H.-Y.; Bakre S.; Goedel W.C.; Dawit R.; Saberi P.; Chan P.A.; Doshi J.A.	Estimating The Impact Of Out-Of-Pocket Cost Changes On Abandonment Of HIV Pre-Exposure Prophylaxis	Health Affairs	-	-	-	-	2782715	10.1377/hlthaff.2023.00808	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181997579&doi=10.1377%2fhlthaff.2023.00808&partnerID=40&md5=b22532e0c9f83278201b9a00bcf1a447	Oral HIV pre-exposure prophylaxis (PrEP) is highly effective for preventing HIV. Several different developments in the US either threaten to increase or promise to decrease PrEP out-of-pocket costs and access in the coming years. In a sample of 58,529 people with a new insurer-approved PrEP prescription, we estimated risk-adjusted percentages of patients who abandoned (did not fill) their initial prescription across six out-of-pocket cost categories. We then simulated the percentage of patients who would abandon PrEP under hypothetical changes to out-of-pocket costs, ranging from $0 to more than $500. PrEP abandonment rates of 5.5 percent at $0 rose to 42.6 percent at more than $500; even a small increase from $0 to $10 doubled the rate of abandonment. Conversely, abandonment rates that were 48.0 percent with out-of-pocket costs of more than $500 dropped to 7.3 percent when those costs were cut to $0. HIV diagnoses were three times higher among patients who abandoned PrEP prescriptions than among those who filled them. These results imply that recent legal challenges to the provision of PrEP with no cost sharing could substantially increase PrEP abandonment and HIV rates, upending progress on the HIV/AIDS epidemic. © 2024, Project HOPE. Article	2024	Devlin, Samantha A; Johnson, Amy K; Stanford, Kimberly A; Haider, Sadia; Ridgway, Jessica P	"There hasn't been a push to identify patients in the emergency department"-Staff perspectives on automated identification of candidates for pre-exposure prophylaxis (PrEP): A qualitative study	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0300540	https://pubmed.ncbi.nlm.nih.gov/38483939/	Automated algorithms for identifying potential pre-exposure prophylaxis (PrEP) candidates are effective among men, yet often fail to detect cisgender women (hereafter referred to as "women") who would most benefit from PrEP. The emergency department (ED) is an opportune setting for implementing automated identification of PrEP candidates, but there are logistical and practical challenges at the individual, provider, and system level. In this study, we aimed to understand existing processes for identifying PrEP candidates and to explore determinants for incorporating automated identification of PrEP candidates within the ED, with specific considerations for ciswomen, through a focus group and individual interviews with ED staff. From May to July 2021, we conducted semi-structured qualitative interviews with 4 physicians and a focus group with 4 patient advocates working in a high-volume ED in Chicago. Transcripts were coded using Dedoose software and analyzed for common themes. In our exploratory study, we found three major themes: 1) Limited PrEP knowledge among ED staff, particularly regarding its use in women; 2) The ED does not have a standardized process for assessing HIV risk; and 3) Perspectives on and barriers/facilitators to utilizing an automated algorithm for identifying ideal PrEP candidates. Overall, ED staff had minimal understanding of the need for PrEP among women. However, participants recognized the utility of an electronic medical record (EMR)-based automated algorithm to identify PrEP candidates in the ED. Facilitators to an automated algorithm included organizational support/staff buy-in, patient trust, and dedicated support staff for follow-up/referral to PrEP care. Barriers reported by participants included time constraints, hesitancy among providers to prescribe PrEP due to follow-up concerns, and potential biases or oversight resulting from missing or inaccurate information within the EMR. Further research is needed to determine the feasibility and acceptability of an EMR-based predictive HIV risk algorithm within the ED setting. Article	2024	Di Ciaccio M.; Villes V.; Delabre R.M.; Alain T.; Morel S.; Michels D.; Schmidt A.J.; Velter A.; Rojas Castro D.	When awareness is not a barrier to PrEP uptake among men who have sex with men who are eligible for PrEP in France	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2023.2268887	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176109643&doi=10.1080%2f09540121.2023.2268887&partnerID=40&md5=a87848a5d0b1f26af0fc6942875a4e46	Despite PrEP being available and free of charge in France, a gap remains between the estimated number of men who have sex with men (MSM) with high-risk exposure to HIV and the number of MSM PrEP users. The objective of this study is to identify factors associated with non-intention to use PrEP among PrEP-eligible and PrEP-aware MSM in France, "non-intenders". European MSM Internet Survey (EMIS)-2017 was a cross-sectional survey conducted among MSM concerning their HIV prevention needs. Logistic regression models were used to identify factors associated with "non-intenders". Compared to PrEP users, factors associated with non-intention to use PrEP were; age (aOR95%CI = 3.802.21;6.53); not being vaccinated against hepatitis B (2.201.45;3.34); self-efficacy (1.841.29;2.60); lower knowledge about on-demand PrEP (11.487.35;17.87) and daily PrEP (2.581.27;5.25); not having a PrEP discussion at a hospital (12.398.90;17.27) or at a community service/drop-in (4.933.48;6.97); living in a department with few PrEP access points (1.701.10;2.63). On-demand PrEP may meet the prevention needs of "non-intenders" who have lower HIV risk perception. Increasing communication from health providers and community health workers to all MSM is needed. © 2023 The Author(s). Published by Informa UK Limited, trading as Taylor & Francis Group. Article	2024	Dillon F.R.; Ertl M.M.; Eklund A.C.; Westbrook J.; Balek G.; Algarin A.; Martin J.; Sánchez F.J.; Ebersole R.	Sexual Identity Development and Social Ecological Facilitators and Barriers of PrEP Uptake and Adherence Among Latinx Men Who Have Sex with Men	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-023-02776-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182235152&doi=10.1007%2fs10508-023-02776-3&partnerID=40&md5=34767eabee4e1ead6fd8b0e161d9c589	Latinx gay, bisexual, and other men who have sex with men (LMSM) report lower pre-exposure prophylaxis (PrEP) use than their white, non-Latinx counterparts. We hypothesize that this disparity is partially attributable to social ecological factors that can be addressed via prevention interventions. In this retrospective study, we first examined data from 253 LMSM to determine whether theorized associations existed between acquisition of a PrEP prescription (uptake) in relation to several social ecological factors based on a conceptual framework of determinants of access to and uptake of PrEP for LMSM. We also explored relations between frequency of PrEP use (adherence) and social ecological factors with a subsample of 33 LMSM who had initiated PrEP 12 months prior to assessment. In this study, individual-level factors from this framework included age and socioeconomic status. Perceived access to medical care represented both individual- and community-level determinants of PrEP uptake and adherence. Interpersonal-level factors were social support and relationship status. Structural/cultural-level factors were sexual identity development status, the masculinity norm of heterosexual self-presentation, traditional Latinx masculine gender role beliefs of machismo and caballerismo, racial identity, and immigration status. Results indicated that older men and those who endorsed the synthesis/integration status of sexual identity development were more likely to acquire a PrEP prescription during their lifetime in comparison to peers. PrEP adherence was linked with being older, reporting higher socioeconomic status, reporting more appraisal social support, self-identifying as white-Latinx, being U.S.-born, and endorsing less sexual identity uncertainty and more heterosexual self-presentation. Results specify modifiable factors that may inform tailored, community-based prevention efforts to increase PrEP use and decrease existing HIV/AIDS disparities among LMSM. © 2024, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2024	Downer, Goulda A.; Cunningham, Suzanne Randolph; Ramsey, Lauren M.; Ellick, Kecia L.; Bailey, Denise	Increasing provider awareness of PrEP on HBCU campuses and beyond: A case study of the HBCU HIV prevention project (H2P).	Journal of the National Medical Association	-	-	-	-	1943-4693 0027-9684	10.1016/j.jnma.2024.01.011	https://www.sciencedirect.com/science/article/abs/pii/S0027968424000117	BACKGROUND: The HBCU-HIV Prevention Project (H2P) is a culturally-tailored, targeted intervention at Historically Black Colleges and Universities (HBCUs) aimed at training health care providers as key players in reducing HIV infections and improving healthcare outcomes among HBCU students. METHODS: A cross-sectional purposive sample of health care providers at HBCU campuses and invited health care professionals from partnering organizations in their surrounding communities participated in an 11-module series on the CDC's evidence-based HIV prevention strategy for high-risk individuals, pre-exposure prophylaxis (PrEP). The intervention was aimed at increasing provider awareness and knowledge about PrEP and the importance of HIV testing and counseling as well as promoting provider intentions to use PrEP (initiating discussions with students and prescribing). Pre- and post-module quizzes served as awareness and knowledge assessments and providers also received online surveys about their intentions and uses of PrEP at 30 and 60 days post-training. RESULTS: Both on-campus and off-campus providers showed trending gains in awareness and knowledge for information in all modules. The off-campus providers appear to be more willing to use the information for initiating discussions and prescribing PrEP; however, HBCU providers also expressed similar intentions, although at lower rates. CONCLUSIONS: The project successfully increased provider awareness of pre-exposure prophylaxis (PrEP), effective HIV testing, and strategies for reducing HIV infection among HBCU college students. Findings highlight the project's impact on enhancing provider training and the potential of this impact on addressing HIV disparities among African Americans on HBCU campuses and their surrounding communities. The success of the H2P Project provides valuable insights for future interventions, reinforcing the importance of targeted, systems-level approaches in mitigating health disparities among marginalized populations. Implications are also drawn as to the potential for expanding such provider-level interventions to address other health conditions and informing policy development in African American communities. Article	2024	Dumchev K.; Kornilova M.; Makarenko O.; Antoniak S.; Liulchuk M.; Cottrell M.L.; Varetska O.; Morozova O.	Low daily oral PrEP adherence and low validity of self-report in a randomized trial among PWID in Ukraine	International Journal of Drug Policy	-	-	-	-	9553959	10.1016/j.drugpo.2023.104284	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179099779&doi=10.1016%2fj.drugpo.2023.104284&partnerID=40&md5=831b61fe6df8f2c267cf727c07f1b233	Background: The efficacy of daily oral pre-exposure prophylaxis (PrEP) in preventing HIV transmission among people who inject drugs (PWID) was demonstrated over a decade ago. However, only a few studies among PWID have since measured PrEP adherence using laboratory markers. Methods: In this trial, we randomized recently injecting PWID in Kyiv, Ukraine, to receive daily oral TDF/FTC with or without SMS reminders. Enrollment and PrEP initiation took place at an HIV clinic. Subsequent visits at months 1, 3, and 6 were conducted at a community harm reduction center and included a structured interview, adherence counseling, PrEP dispensing, and dried blood spot collection. PrEP adherence was assessed using standard self-reported measures and TDF/FTC biomarkers. Results: A total of 199 PWID (99 SMS, 100 No-SMS) were enrolled, of whom 24 % were women, with a median age of 37. At month 6, 79.4 % (158/199) of participants were retained, with 84 % (133/158) reporting opioid injection and 20 % (31/158) reporting stimulant injection in the past 30 days. 77 % (122/158) reported taking >95 % of PrEP doses in the past month, and 87 % reported taking the last dose within 2 days. Tenofovir diphosphate was detected in 17 % (28/158) of participants, and emtricitabine triphosphate was detected in 25 % (40/158). Only 3 % (5/158) had metabolite levels indicative of consistent PrEP uptake at 4+ doses per week. There was no association between the SMS intervention and TDF/FTC metabolite detection. Conclusion: Adherence to daily oral PrEP among actively injecting PWID, without daily supervision or incentives, was extremely low, despite supportive counseling and SMS reminders. We also observed a high rate of discordance between self-report and classification by a validated biomarker of adherence. Given the scarcity of evidence and emerging data suggesting low oral PrEP adherence among PWID, additional implementation studies with TDF/FTC biomarkers are needed to study whether a sufficient level of adherence to daily PrEP is attainable among PWID, especially as long-acting injectable PrEP offers a promising alternative. © 2023	FTCtp; Pre-exposure prophylaxis; PrEP adherence; PWID; TFVdp	English	United Kingdom	Western and Central Europe and North America	Ukraine	Eastern Europe and Central Asia	Ukraine	Eastern Europe and Central Asia	Clinical
Article	2024	Eger W.H.; Bazzi A.R.; Valasek C.J.; Vera C.F.; Harvey-Vera A.; Artamonova I.; Rangel M.G.; Strathdee S.A.; Pines H.A.	Long-acting Injectable PrEP Interest and General PrEP Awareness among People who Inject Drugs in the San Diego-Tijuana Border Metroplex	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-024-04285-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184165399&doi=10.1007%2fs10461-024-04285-3&partnerID=40&md5=47a99c040df0114ada9dbe606e7c142d	Long-acting injectable HIV pre-exposure prophylaxis (LAI-PrEP) could help overcome multilevel challenges to HIV prevention for people who inject drugs (PWID), including those in the binational San Diego-Tijuana metroplex. Yet, general PrEP awareness and interest in LAI-PrEP remain underexplored among PWID. From 2020 to 2021, 562 HIV-negative PWID in San Diego and Tijuana completed surveys assessing general PrEP awareness and interest in oral and LAI-PrEP. Modified Poisson regression examined factors associated with general PrEP awareness. Multinomial logistic regression assessed factors associated with interest in both oral and LAI-PrEP, oral PrEP only, LAI-PrEP only, or neither. General PrEP awareness was low (18%) and associated with experiencing unsheltered homelessness (adjusted prevalence ratio APR = 1.50, 95% confidence interval CI: 0.96–2.33), past 6-month fentanyl injection (APR = 1.53, 95% CI: 1.04–2.25), and transactional sex (APR = 1.71, 95% CI: 1.06–2.76). Interest in oral PrEP only was most common (44%), followed by LAI-PrEP only (25%) and neither (16%). Compared to the odds of being interested in LAI-PrEP only, the odds of being interested in oral PrEP only were lower among those who were stopped by police (AOR = 0.38, 95% CI: 0.22–0.65), reported past 6-month fentanyl injection (AOR = 0.33, 95% CI: 0.20–0.56), polydrug use (AOR = 0.48, 95% CI: 0.27–0.86), injecting multiple times daily (AOR = 0.26, 95% CI: 0.14–0.46), receptive syringe use (AOR = 0.30, 95% CI: 0.19–0.49), and higher perceived HIV risk (AOR = 0.24, 95% CI: 0.15–0.39). Interest in LAI-PrEP was more common among PWID reporting social and structural factors that could interfere with oral PrEP adherence, suggesting LAI-PrEP implementation could increase PrEP coverage among those most vulnerable to HIV. © The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature 2024. Article	2024	Felker-Kantor E.; Greener L.R.; Mabaso S.; Kruger W.; Hasen N.; Khosla A.; Malone S.	Understanding Oral PrEP Interest, Uptake, Persistence, and Experience of Use Among Heterosexual Men in Johannesburg, South Africa: An Exploratory Pilot Study	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04246-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85180182932&doi=10.1007%2fs10461-023-04246-2&partnerID=40&md5=7f01ea96c603716f1dc760076fb0ae46	South Africa's PrEP programming has primarily focused on men who have sex with men and other key populations through dedicated clinical and outreach services. However, data shows that the pool of men vulnerable to contracting HIV extends beyond this group, including men who have sex only with women and who do not identify as gay. The aim of this pilot study was to assess acceptability of PrEP among this subset of men who are at risk of HIV acquisition in South Africa and to describe the demographic and behavioral characteristics of male PrEP users as well as their experience of PrEP use. We employed a mixed-methods study design consisting of in-depth interviews and quantitative analysis of routine clinic data collected between September 2021 and February 2022 from 10 private health facilities. Men who enrolled in the study and initiated PrEP had low consistent condom use and nearly three quarters reported more than one sexual partner in the past three months. Despite minimal follow-up support, PrEP persistence was relatively high and similar to other populations. 57% of men returned for their 1-month visit, 40% returned for their 4-month visit, and 16% returned for their 7-month visit. The greatest barriers to ongoing use were the need to take a daily pill and low perceived HIV risk. To improve uptake and continuation, programs should increase awareness of PrEP, leverage trusted sources to build credibility, make access more convenient, and accommodate flexible use through event-driven PrEP. © The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature 2023. Article	2024	Flynn S.; Adamo M.; Kochanska M.; Garcia-Grossman I.	Initiating pre-exposure prophylaxis in the inpatient setting: A quality improvement project	BMJ Open Quality	-	-	-	-	23996641	10.1136/bmjoq-2023-002416	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182956937&doi=10.1136%2fbmjoq-2023-002416&partnerID=40&md5=884115ef59fdffde1955f0db4e6fa631	Many patients who are at high risk of HIV transmission do not receive pre-exposure prophylaxis (PrEP). HIV risk counselling and PrEP initiation have historically been limited to outpatient settings. Here we describe a novel quality improvement project at San Francisco's main safety-net hospital designed to incorporate universal screening for active HIV risk factors and PrEP initiation into standard inpatient care. Interventions included education sessions and dissemination of clinical materials to increase providers' knowledge and comfort with HIV risk screening, prevention counselling and prescribing PrEP. We implemented new workflows on the inpatient medicine service to encourage providers to universally screen all patients at the time of admission and initiate PrEP for appropriate patients during their hospitalisation. Over the first 9 months of the initiative, 14 inpatients were started on PrEP during their admission. As PrEP was initiated in particularly vulnerable patients, using inpatient admissions to engage at-risk patients in HIV prevention may help to reduce disparities in HIV outcomes. © Author(s) (or their employer(s)) 2024. Article	2024	Fordjuoh, Judy; Dolezal, Curtis; Bhengu, Nonhlonipho; Harrison, Abigail D.; Exner, Theresa M.; Hanass-Hancock, Jill; Hoffman, Susie	Peer-to-Peer Chain Recruitment for Enrolling Young South African Women into an HIV Pre-exposure Prophylaxis (PrEP) Intervention Study: How Did It Perform?	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04256-0	https://link.springer.com/article/10.1007/s10461-023-04256-0#citeas	Peer-to-peer chain recruitment has been used for descriptive studies, but few intervention studies have employed it. We used this method to enroll sexually active women ages 18 to 25 into an online Pre-Exposure Prophylaxis (PrEP) information and motivation intervention pilot in eThekwini (Durban), South Africa. Seeds (N = 16) were recruited by study staff and randomized to Masibambane, Ladies Chat, a Gender-Enhanced group-based WhatsApp Workshop (GE), or Individual-Access (IA), a control condition that provided participants with online information/motivation materials only. Each seed could recruit up to three women to participate in the same study condition, with an incentive for each enrolled woman; participants in subsequent waves could choose to recruit or not. We evaluated if peer-to-peer recruitment was self-sustaining and resulted in enrolling women who, in subsequent waves, had less contact with the health care system and less knowledge about PrEP than the initial seeds. Over three recruitment waves beyond the seeds, 84 women were recruited. Almost 90% of women became recruiters, with each recruiting on average 1.90 women and 1.26 eligible enrolled women. The approach was successful at reaching women with less education but not women with less health system contact and PrEP knowledge across waves. IA participants had a slightly higher, though non-significantly different, percentage of individuals who became Peer Health Advocates (PHAs) than GE participants and, on average, they recruited slightly more women who enrolled. Our findings demonstrated that peer-to-peer recruitment is a feasible and self-sustaining way to recruit SA young women into a PrEP intervention study. Article	2024	Forsythe, Steven; Kioko, Urbanus; Mahiane, Guy; Glaubius, Robert; Musau, Abednego; Gichangi, Anthony; Reed, Jason; Were, Daniel	Estimating the costs and perceived benefits of oral pre-exposure prophylaxis (PrEP) delivery in ten counties of Kenya: a costing and a contingent valuation study.	Frontiers in Reproductive Health	-	-	-	-	2673-3153	10.3389/frph.2024.1278764	https://www.frontiersin.org/journals/reproductive-health/articles/10.3389/frph.2024.1278764/full	BACKGROUND: Kenya included oral PrEP in the national guidelines as part of combination HIV prevention, and subsequently began providing PrEP to individuals who are at elevated risk of HIV infection in 2017. However, as scale-up continued, there was a recognized gap in knowledge on the cost of delivering oral PrEP. This gap limited the ability of the Government of Kenya to budget for its PrEP scale-up and to evaluate PrEP relative to other HIV prevention strategies. The following study calculated the actual costs of oral PrEP scale-up as it was being delivered in ten counties in Kenya. This costing also allowed for a comparison of various models of service delivery in different geographic regions from the perspective of service providers in Kenya. In addition, the analysis was also conducted to understand factors that indicate why some individuals place a greater value on PrEP than others, using a contingent valuation technique. METHODS: Data collection was completed between November 2017 and September 2018. Costing data was collected from 44 Kenyan health facilities, consisting of 23 public facilities, 5 private facilities and 16 drop-in centers (DICEs) through a cross-sectional survey in ten counties. Financial and programmatic data were collected from financial and asset records and through interviewer administered questionnaires. The costs associated with PrEP provision were calculated using an ingredients-based costing approach which involved identification and costing of all the economic inputs (both direct and indirect) used in PrEP service delivery. In addition, a contingent valuation study was conducted at the same 44 facilities to understand factors that reveal why some individuals place a greater value on PrEP than others. Interviews were conducted with 2,258 individuals (1,940 current PrEP clients and 318 non-PrEP clients). A contingent valuation method using a "payment card approach" was used to determine the maximum willingness to pay (WTP) of respondents regarding obtaining access to oral PrEP services. RESULTS: The weighted cost of providing PrEP was $253 per person per year, ranging from $217 at health centers to $283 at dispensaries. Drop-in centers (DICEs), which served about two-thirds of the client volume at surveyed facilities, had a unit cost of $276. The unit cost was highest for facilities targeting MSM ($355), while it was lowest for those targeting FSW ($248). The unit cost for facilities targeting AGYW was $323 per person per year. The largest percentage of costs were attributable to personnel (58.5%), followed by the cost of drugs, which represented 25% of all costs. The median WTP for PrEP was $2 per month (mean was $4.07 per month). This covers only one-third of the medication (approximately $6 per month) and less than 10% of the full cost of delivering PrEP ($21 per month). A sizable proportion of current clients (27%) were unwilling to pay anything for PrEP. Certain populations put a higher value on PrEP services, including: FSW and MSM, Muslims, individuals with higher education, persons between the ages of 20 and 35, and households with a higher income and expenditures. DISCUSSION: This is the most recent and comprehensive study on the cost of PrEP delivery in Kenya. These results will be used in determining resource requirements and for resource mobilization to facilitate sustainable PrEP scale-up in Kenya and beyond. This contingent valuation study does have important implications for Kenya's PrEP program. First, it indicates that some populations are more motivated to adopt oral PrEP, as indicated by their higher WTP for the service. MSM and FSW, for example, placed a higher value on PrEP than AGYW. Higher educated individuals, in turn, put a much higher value on PrEP than those with less education (which may also reflect the higher "ability to pay" among those with more education). This suggests that any attempt to increase demand or improve PrEP continuation should consider these differences in client populations. Cost recovery from existing PrEP clients would have potentially negative consequences for uptake and continuation. Article	2024	Fraser, Doug; Holt, Martin; Ong, Jason J.; Bourne, Christopher; Chan, Curtis; Grulich, Andrew E.; Bavinton, Benjamin R.	A proposal for a simplified measure of HIV preexposure prophylaxis prevention-effective adherence in self-report questionnaires.	AIDS	-	-	-	-	1473-5571 0269-9370	10.1097/QAD.0000000000003823	https://pubmed.ncbi.nlm.nih.gov/38482908/	Evaluating HIV preexposure prophylaxis (PrEP) use and HIV risk events concurrently remains challenging. We developed a single question method for measuring prevention-effective adherence with PrEP in self-report questionnaires. In a questionnaire completed by 409 gay and bisexual men, 46% reported condomless anal sex that was not covered by their own PrEP use, and this was more common among younger, lower-income participants. Refining this questionnaire item could improve measurement of prevention-effective adherence. Article	2024	Friedland, Barbara A.; Mgodi, Nyaradzo M.; Palanee-Phillips, Thesla; Mathur, Sanyukta; Plagianos, Marlena G.; Bruce, Irene V.; Lansiaux, Maud; Murombedzi, Caroline; Musara, Petina; Dandadzi, Adlight; Reddy, Krishnaveni; Ndlovu, Nkosiphile; Zulu, Sihle K.; Shale, Lerato R.; Zieman, Brady; Haddad, Lisa B.	Assessing the acceptability of, adherence to and preference for a dual prevention pill (DPP) for HIV and pregnancy prevention compared to oral pre-exposure prophylaxis (PrEP) and oral contraception taken separately: protocols for two randomised, controlled, cross-over studies in South Africa and Zimbabwe.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2023-075381	https://bmjopen.bmj.com/content/14/3/e075381	INTRODUCTION: Oral pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention method; however, uptake and persistence have been low among southern African women. A dual prevention pill (DPP) that combines PrEP with oral contraception (OC) may increase PrEP use and better meet women's sexual and reproductive health needs. We will gauge the DPP's acceptability in two cross-over clinical trials. METHODS AND ANALYSIS: PC952 (Zimbabwe) and PC953 (South Africa) will compare acceptability, adherence and preference for an over-encapsulated DPP versus PrEP and OCs taken separately. HIV-negative, non-pregnant cisgender females in Johannesburg, South Africa (n=96, 16-40 years) and Harare, Zimbabwe (n=30, 16-24 years) will be randomised 1:1 to the order of regimens-DPP or two separate tablets-each used for three 28-day cycles, followed by a 6-month choice period in South Africa. Monthly clinic visits include HIV and pregnancy testing; safety assessments and risk reduction and adherence counselling. We will assess adherence (monthly) based on tenofovir diphosphate drug levels in dried blood spots and by self-report. We will evaluate acceptability (monthly) and preference (end of cross-over) via computer-assisted self-interviewing and in-depth interviews with a subset of participants. Data collection started in September 2022 and ended in January 2024. ETHICS AND DISSEMINATION: PC952 was approved by the Ministry of Health and Child Care, Medical Research Council, Research Council and Medicines Control Authority of Zimbabwe; the Chitungwiza City Health Ethics Committee; and the Joint Research Ethics Committee for the University of Zimbabwe Faculty of Medicine and Health Sciences and Parirenyatwa Group of Hospitals. PC953 was approved by the South African Health Products Regulatory Authority and the University of the Witwatersrand's Human Research Ethics Committee. The Population Council IRB approved both studies. We will disseminate results in open-access journals, clinical trials registries, and at local and international meetings and conferences. Article	2024	Gebru, Nioud Mulugeta; James, Tyler G.; Ahn, Seungjun; Cheong, JeeWon; Berry, Meredith S.; Cook, Robert L.; Leeman, Robert F.	A Behavioral Economic Examination of Sexual Behaviors in the Era of Pre-exposure Prophylaxis via Explanatory Sequential Mixed Methods.	Archives of Sexual Behavior	-	-	-	-	1573-2800 0004-0002	10.1007/s10508-024-02822-8	https://pubmed.ncbi.nlm.nih.gov/38472604/	Pre-exposure prophylaxis (PrEP) use may be associated with condom use decisions. The current investigation examined sexual decision-making in the context of PrEP among young adult men who have sex with men (MSM) between 18 and 30 years old, using an explanatory sequential mixed methods design. For the quantitative aim, 99 MSM currently taking PrEP (i.e., PrEP-experienced) and 140 MSM not currently taking PrEP (i.e., PrEP-naive) completed an online survey, including the Sexual Delay Discounting Task (SDDT), which captures likelihood of condom use. For the qualitative aim, 15 people from each group were interviewed about their (1) conceptualizations of risky sex and (2) ways they manage their sexual risk. Participants were, on average, 25.69 years old (SD = 3.07) and 64% White. Results from the quantitative aim revealed, controlling for covariates, PrEP-experienced participants exhibited significantly lower likelihood of (1) using an immediately available condom and (2) waiting for a delayed condom (i.e., sexual delay discounting) compared to PrEP-naive participants. Qualitative themes explaining what young adult MSM consider to be risky sex included: (1) any sex as risky sex, (2) risky sex as "sex without a conversation," and (3) risky sex as sex with risk for physical harm. Themes on ways young adult MSM manage sexual risk were classified as proactive, reactive, and passive. Results suggest that PrEP use is related to condom use decisions. Taken together, quantitative differences in sexual delay discounting, but qualitatively similar conceptualizations and management of risky sex, suggest that the SDDT may be a useful tool in sex research to capture processes (i.e., delay discounting) underlying sexual decision-making that may be missed by traditional self-reports. Implications of results, including potentially providing (good quality) condoms with every PrEP prescription, and future research topics are discussed. Article	2024	Gebru, Nioud Mulugeta; Strickland, Justin C.; Reed, Derek D.; Kahler, Christopher W.; Leeman, Robert F.	Use of preexposure prophylaxis and condom purchasing decisions.	Journal of the Experimental Analysis of Behavior	-	-	-	-	1938-3711 0022-5002	10.1002/jeab.905	https://pubmed.ncbi.nlm.nih.gov/38356347/	Preexposure prophylaxis (PrEP) prevents human immunodeficiency virus (HIV) but not other sexually transmitted infections (STIs). Men who have sex with men (MSM) who take PrEP tend to report reduced condom use, but little is known about the underlying mechanisms. For this study, MSM who take PrEP (i.e., PrEP experienced; n = 88) and MSM who do not (i.e., PrEP naïve; n = 113) completed an online study, including the condom purchase task (CoPT). The CoPT assesses decisions to purchase condoms across escalating prices (range: free-$55) for sex with different types of hypothetical partners: those least likely to have an STD (least STD) and those that participants most want to have sex with (most want sex with). When condoms were free, PrEP-experienced MSM had a lower rate of condom purchasing than did PrEP-naïve MSM. For both partner types, PrEP-experienced MSM reached a price break point (i.e., would not buy condoms) at a lower price than did PrEP-naïve participants. For the most-want-sex-with partner at the price at which participants elected not to buy condoms, only 23% of PrEP-experienced MSM chose to abstain from sex when not purchasing condoms versus 53% among PrEP-naïve MSM. Similar patterns were observed for the least-STD partner. The results support the potential utility of the CoPT in identifying behavioral mechanisms related to condom use and PrEP. Article	2024	Goense, H; Dukers-Muijrers, N; Evers, Y; Hoebe, CJPA	Newly diagnosed HIV and use of HIV-PrEP among migrant MSM attending STI clinics in the Netherlands, a retrospective cohort study	Sexually Transmitted Diseases	-	-	-	-	0148-5717	10.3389/fpubh.2023.1196958	https://pubmed.ncbi.nlm.nih.gov/37404283/	Introduction: The World Health Organization recommends HIV-PrEP for all people at risk for HIV infection, which includes men who have sex with men (MSM). Substantial part of new HIV diagnoses in the Netherlands are in non-western born MSM. This study evaluated new HIV diagnoses and reported PrEP use among non-western born MSM and compared it to western-born MSM. To inform public health efforts in the context of equitable PrEP access, we further assessed sociodemographic factors related to higher HIV risk and lower PrEP use among non-western born MSM. Methods: Surveillance data of consultations among MSM in all Dutch STI-clinics (2016-2021) were analyzed. STI-clinics provide PrEP via the national pilot-program since August 2019. In non-western born MSM (born in Eastern-Europe/Latin-America/Asia/Africa/Dutch-Antilles/Suriname), sociodemographic factors were evaluated for association with HIV (by multivariable generalized estimating equations) and reported PrEP use in the past 3 months (by multivariable logistic regression; restricted to an at-risk for HIV person-level data-subset from August 2019). Results: New HIV infections were diagnosed among 1.1% (493/44,394) of non-western born MSM-consultations (vs. 0.4% among western-born MSM, 742/210,450). Low education (aOR: 2.2, 95%CI: 1.7-2.7, vs. high education) and age under 25 years (aOR: 1.4, 95%CI: 1.1-1.8, vs. age above 35 years) were associated with new HIV diagnoses. PrEP use in the past 3 months was 40.7% in non-western born MSM (1,711/4,207; 34.9% among western-born MSM, 6,089/17,458). PrEP use was lower among non-western born MSM aged under 25 years (aOR: 0.3, 95%CI: 0.2-0.4), living in less urban areas (aOR: 0.7, 95%CI: 0.6-0.8), and having low education level (aOR: 0.6, 95%CI: 0.5-0.7). Conclusion: Our study confirmed that non-western born MSM are an important key population in HIV prevention. Access to HIV prevention, including HIV-PrEP, should be further optimized to all non-western born MSM at risk for HIV, and specifically to those who are younger, live in less urban areas, and have a low education level. Article	2024	Gómez, Walter; Gomez, Anu Manchikanti; Solis, Sheilalyn; Dimonte, Cheryl; Organista, Kurt C.	Provider Perspectives on Multi-level Barriers and Facilitators to PrEP Access Among Latinx Sexual and Gender Minorities.	Journal of Racial and Ethnic Health Disparities	-	-	-	-	2196-8837	10.1007/s40615-024-01948-8	https://pubmed.ncbi.nlm.nih.gov/38381327/	Although pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention intervention, inequities in access remain among Latinx sexual and gender minorities (LSGM). There is also a gap in the PrEP literature regarding providers' perspective on access inequities. This qualitative case study sought to explore barriers and facilitators to PrEP engagement in a community-based integrated health center primarily serving Latinx populations in Northern California. We conducted in-depth, semi-structured interviews with providers (9/15) involved in PrEP services and engaged in a constructivist grounded theory analysis consisting of memoing, coding, and identifying salient themes. Three participants worked as medical providers, three as outreach staff, and one each in planning, education, and research. The analysis surfaced four themes: geopolitical differences, culture as barrier, clinic as context, and patient strengths and needs. Participants referenced a lack of resources to promote PrEP, as well as the difficulties of working within an institution that still struggles with cultural and organizational mores that deprioritize sexual health. Another barrier is related to sexual health being positioned outside of patients' immediate needs owing to structural barriers, including poverty, documentation status, and education. Participants, however, observed that peer-based models, which emboldened their decision-making processes, were conducive to better access to PrEP, as well as allowing them to build stronger community ties. These data underscore the need for interventions to help reduce sexual stigma, promote peer support, and ameliorate structural barriers to sexual healthcare among LSGM. Article	2024	Goodman, Georgia R; Carnes, T Chris; Albrechta, Hannah; Alpert, Pamela; Hokayem, Joanne; Goldfine, Charlotte; Lee, Jasper S; Boyer, Edward W; Rosen, Rochelle; Mayer, Kenneth H; O'Cleirigh, Conall; Chai, Peter R	Real-World Implementation Challenges Associated with a Digital Pill System to Measure Adherence to HIV Pre-Exposure Prophylaxis from Two Studies of Men Who Have Sex With Men.	Proc Annu Hawaii Int Conf Syst Sci	-	-	-	-	1530-1605	NA	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10783042	Once-daily oral pre-exposure prophylaxis (PrEP) is highly effective for HIV prevention, but its efficacy is dependent on adherence, which can be challenging for men who have sex with men (MSM) with substance use. Digital pill systems (DPS) represent a novel tool for directly measuring adherence through ingestible radiofrequency sensors that confirm ingestions in real-time. We examined operational challenges across two studies involving DPS to measure PrEP adherence. While most participants successfully operated the system, a number of technological and sociobehavioral challenges requiring intervention were identified across both studies. Technological issues were both system- and participant-related, and were primarily addressed with technical updates and participant re-education, while sociobehavioral issues, including health and housing changes and issues with technology access, warranted innovative solutions. Future research leveraging DPS technology should develop robust supportive infrastructure and mitigation procedures to promptly identify and resolve operational issues to optimize the potential benefits of DPS use. Article	2024	Goodman-Meza, David; Shoptaw, Steven; Hanscom, Brett; Smith, Laramie R.; Andrew, Philip; Kuo, Irene; Lake, Jordan E.; Metzger, David; Morrison, Ellen A. B.; Cummings, Melissa; Fogel, Jessica M.; Richardson, Paul; Harris, Jayla; Heitner, Jesse; Stansfield, Sarah; El-Bassel, Nabila	Delivering integrated strategies from a mobile unit to address the intertwining epidemics of HIV and addiction in people who inject drugs: the HPTN 094 randomized controlled trial protocol (the INTEGRA Study).	Trials	-	-	-	-	1745-6215	10.1186/s13063-023-07899-5	https://pubmed.ncbi.nlm.nih.gov/38360750/	BACKGROUND: Persons with opioid use disorders who inject drugs (PWID) in the United States (US) face multiple and intertwining health risks. These include interference with consistent access, linkage, and retention to health care including medication for opioid use disorder (MOUD), HIV prevention using pre-exposure prophylaxis (PrEP), and testing and treatment for sexually transmitted infections (STIs). Most services, when available, including those that address substance misuse, HIV prevention, and STIs, are often provided in multiple locations that may be difficult to access, which further challenges sustained health for PWID. HPTN 094 (INTEGRA) is a study designed to test the efficacy of an integrated, "whole-person" strategy that provides integrated HIV prevention including antiretroviral therapy (ART), PrEP, MOUD, and STI testing and treatment from a mobile health delivery unit ("mobile unit") with peer navigation compared to peer navigation alone to access these services at brick and mortar locations. METHODS: HPTN 094 (INTEGRA) is a two-arm, randomized controlled trial in 5 US cities where approximately 400 PWID without HIV are assigned either to an experimental condition that delivers 26 weeks of "one-stop" integrated health services combined with peer navigation and delivered in a mobile unit or to an active control condition using peer navigation only for 26 weeks to the same set of services delivered in community settings. The primary outcomes include being alive and retained in MOUD and PrEP at 26 weeks post-randomization. Secondary outcomes measure the durability of intervention effects at 52 weeks following randomization. DISCUSSION: This trial responds to a need for evidence on using a "whole-person" strategy for delivering integrated HIV prevention and substance use treatment, while testing the use of a mobile unit that meets out-of-treatment PWID wherever they might be and links them to care systems and/or harm reduction services. Findings will be important in guiding policy for engaging PWID in HIV prevention or care, substance use treatment, and STI testing and treatment by addressing the intertwined epidemics of addiction and HIV among those who have many physical and geographic barriers to access care. Article	2024	Goodreau, Steven M.; Barry, Michael P.; Hamilton, Deven T.; Williams, Austin M.; Wang, Li Yan; Sanchez, Travis H.; Katz, David A.; Delaney, Kevin P.	Behavior Change Among HIV-Negative Men Who Have Sex with Men Not Using PrEP in the United States.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-024-04281-7	https://pubmed.ncbi.nlm.nih.gov/38411799/	This study measures changes in condomless anal sex (CAS) among HIV-negative men who have sex with men (MSM) who are not taking pre-exposure prophylaxis (PrEP). It considers the 2014-2019 cycles of the American Men's Internet Survey, a serial, cross-sectional web-based survey of US cisgender MSM aged ≥ 15 years, in which ~ 10% of each year's sample is drawn from the previous year. Among those surveyed for 2 years who remained HIV-negative and off PrEP, reports of having any CAS and of CAS partner number were compared across years. We disaggregated by partner HIV status, and considered demographic predictors. The overall population saw a significant 2.2 percentage-point (pp) increase in reports of any CAS year-over-year. Sub-populations with the largest year-on-year increases were 15-24-year-olds (5.0-pp) and Hispanic respondents (5.1-pp), with interaction (young Hispanic respondents = 12.8-pp). On the relative scale, these numbers correspond to 3.2%, 7.2%, 7.3% and 18.7%, respectively. Absolute increases were concentrated among partners reported as HIV-negative. Multivariable analyses for CAS initiation found effects concentrated among Hispanic and White youth and residents of fringe counties of large metropolitan areas. CAS partner number increases were similarly predicted by Hispanic identity and young age. Although condom use remains more common than PrEP use, increasing CAS among MSM not on PrEP suggests potential new HIV transmission pathways. Concentration of increases among 18-24-year-old MSM portends future increases in the proportion of newly diagnosed HIV that occur among youth. Concentration among young Hispanic MSM will likely expand existing disparities. Although reducing barriers to PrEP remains vital, condom promotion for MSM remains a key public health practice and appears to be missing key audiences. LGBTQ+-inclusive sex education is one avenue for enhancing these efforts. Article	2024	Gordon J.; Wongsomboon V.; Alvarado Avila A.; Lorenzo J.; Mustanski B.; Macapagal K.	Experiences of Successful PrEP Uptake Among Adolescent Sexual Minority Men in the United States: A Qualitative Exploration	AIDS Education and Prevention	-	-	-	-	19432755	10.1521/aeap.2024.36.1.1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85185150519&doi=10.1521%2faeap.2024.36.1.1&partnerID=40&md5=843b8401508837e064278ead22de9c8a	Male adolescent sexual minorities are at elevated risk of HIV acquisition yet demonstrate low rates of PrEP uptake. Understanding the experiences of adolescents who have successfully accessed PrEP may inform ways to best support adolescents seeking PrEP. Adolescent sexual minorities (N = 100) who reported utilizing PrEP responded to open-ended items asking about their initial PrEP experiences and advice for others. Qualitative analysis suggested that adolescents' ability to access PrEP is influenced by managing parental involvement and seeking culturally competent health care providers. Additionally, they reported how the benefits and drawbacks of taking PrEP played a role in their PrEP use. Findings suggest that educational PrEP interventions targeted at this population could improve uptake by incorporating discussions on side effects and mental health benefits associated with PrEP use. Structural interventions are warranted that improve adolescents' ability to seek sexual health care independently and make room for parental involvement when adolescents could benefit from their support.	adolescence; HIV; PrEP; PrEP uptake; qualitative; sexual and gender minorities	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2024	Guo, Yan; Westmoreland, Drew A.; D'Angelo, Alexa B.; Mirzayi, Chloe; Dearolf, Michelle; Ray, Meredith; Carneiro, Pedro B.; Pantalone, David W.; Carrico, Adam W.; Patel, Viraj V.; Golub, Sarit A.; Hirshfield, Sabina; Hoover, Donald R.; Nash, Denis; Grov, Christian	PrEP Uptake and Methamphetamine Use Patterns in a 4-Year U.S. National Prospective Cohort Study of Sexual and Gender Minority People, 2017-2022.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-024-04306-1	https://pubmed.ncbi.nlm.nih.gov/38436807/	Methamphetamine use is on the rise among sexual and gender minority people who have sex with men (SGMSM), escalating their HIV risk. Despite pre-exposure prophylaxis (PrEP) being an effective biomedical HIV prevention tool, its uptake in relation to methamphetamine use patterns in SGMSM has not been studied. In a U.S. cohort study from 2017 to 2022, 6,253 HIV-negative SGMSM indicated for but not using PrEP were followed for four years. Methamphetamine use was categorized (i.e., newly initiated, persistently used, never used, used but quit), and PrEP uptake assessed using generalized estimating equation (GEE), adjusted for attrition. Participants had a median age of 29, with 51.9% White, 11.1% Black, 24.5% Latinx, and 12.5% other races/ethnicities. Over the four years, PrEP use increased from 16.3 to 27.2%. GEE models identified risk factors including housing instability and food insecurity. In contrast, older age, health insurance, clinical indications, and prior PrEP use increased uptake. Notably, Latinx participants were more likely to use PrEP than Whites. Regarding methamphetamine use, those who newly initiated it were more likely to use PrEP compared to non-users. However, those who quit methamphetamine and those who persistently used it had PrEP usage rates comparable to those of non-users. Though PrEP uptake increased, it remained low in SGMSM. Methamphetamine use was associated with PrEP uptake. Healthcare providers should assess methamphetamine use for harm reduction. Prioritizing younger, uninsured SGMSM and addressing basic needs can enhance PrEP uptake and reduce HIV vulnerabilities. Article	2024	Guo, Yan; Westmoreland, Drew A.; D'Angelo, Alexa; Mirzayi, Chloe; Dearolf, Michelle; Carneiro, Pedro B.; Ray, Meredith; Pantalone, David W.; Carrico, Adam W.; Patel, Viraj V.; Golub, Sarit A.; Hirshfield, Sabina; Hoover, Donald; Nash, Denis; Grov, Christian	PrEP Discontinuation In A US National Cohort Of Sexual And Gender Minority Populations, 2017-22.	Health Affairs	-	-	-	-	1544-5208 0278-2715	10.1377/hlthaff.2023.00867	https://pubmed.ncbi.nlm.nih.gov/38437609/	In the US, sexual and gender minority populations are disproportionately affected by HIV. Pre-exposure prophylaxis (PrEP) is a key prevention method, but its effectiveness relies on consistent usage. Our four-year national cohort study explored PrEP discontinuation among sexual and gender minority people who initiated PrEP. We found a high annual rate of discontinuation (35-40 percent) after PrEP initiation. Multivariable analysis with 6,410 person-years identified housing instability and prior history of PrEP discontinuation as predictors of discontinuation. Conversely, older age, clinical indication for PrEP, and having health insurance were associated with ongoing PrEP use. To promote sustained PrEP use, strategies should focus on supporting those at high risk for discontinuation, such as younger people, those without stable housing or health insurance, and prior PrEP discontinuers. Article	2024	Gupta, Amit K.; Lyons, Brody; Hunter, Ian; Arnold, Barbra; Gilbert, Mark; Hoang, Linda; Malleson, Sarah; Ryan, Venessa; Romney, Marc G.; Severini, Alberto; Jason Wong, M. D.; Grennan, Troy	The resurgence of lymphogranuloma venereum (LGV): changing presentation of LGV in the era of HIV pre-exposure prophylaxis (PrEP), 2004-2022.	Sexually Transmitted Diseases	-	-	-	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001944	https://pubmed.ncbi.nlm.nih.gov/38299874/	BACKGROUND: Before the early 2000s, the sexually transmitted infection lymphogranuloma venereum (LGV) was rare in high-income countries. Initially, most cases in these countries were among symptomatic men who have sex with men (MSM) living with HIV. In the context of widespread HIV pre-exposure prophylaxis (PrEP), LGV's epidemiology may be changing. We aim to characterize the epidemiology and clinical presentation of LGV in the PrEP era. METHODS: A retrospective chart review was performed on all LGV cases occurring between 11/2004-10/2022 in British Columbia (BC), Canada. Cases were stratified by having occurred before (2004-2017) or after widespread PrEP availability in BC (2018-2022). Annual rates and test positivity percentages were calculated. Bivariate logistic regression was performed to identify drivers of asymptomatic infection in the PrEP era. RESULTS: Among 545 cases identified, 205 (37.6%) occurred pre-PrEP and 340 (62.4%) occurred during the PrEP era. Most cases were among MSM (97.2%). The estimated rate of LGV has doubled from 2018 to 2022, reaching 1,535.2 cases per 100,000 PrEP users. Most PrEP-era cases were among HIV-negative individuals (65.3%), particularly those on PrEP (72.6%). Cases in the PrEP era were often asymptomatic compared to pre-PrEP (38.6% vs. 19.3%; p < 0.001). PrEP users were more likely to experience asymptomatic infection compared to HIV-negative PrEP non-users (odds ratio 2.07, 95% confidence interval 1.07, 3.99). CONCLUSION: In context of increased asymptomatic testing, LGV may be increasing in BC. Most infections now occur among HIV-negative MSM. A high proportion of infections are asymptomatic. Article	2024	Haberer, Jessica E.; Oware, Kevin; Juma, Lawrence; Nyerere, Bernard; Momanyi, Vincent; Odoyo, Josephine; Garrison, Lindsey; Bhagat, Julita; Musinguzi, Nicholas; Baeten, Jared M.; Siegler, Aaron; Bukusi, Elizabeth A.	My Way: development and preliminary evaluation of a novel delivery system for PrEP and other sexual health needs of young women in Western Kenya.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26217	https://pubmed.ncbi.nlm.nih.gov/38379132/	INTRODUCTION: Young women in sub-Saharan Africa are a priority population for HIV prevention, yet challenges with adherence and persistence to HIV pre-exposure prophylaxis (PrEP) are common. This study involved the development and pilot testing of My Way-a novel delivery system for PrEP and co-packaged sexual health services. METHODS: My Way was developed in Kisumu, Kenya through a user-centred design process (2020). The intervention involves peer-delivery and support for HIV testing and PrEP use, self-collected vaginal swabs for sexually transmitted infection (STI) testing, pregnancy testing, oral contraceptive pills, self-injectable medroxyprogesterone and/or condoms. My Way was assessed among 16- to 24-year-old sexually active women in a randomized controlled trial versus standard of care (SoC; 2021-2022). Use of PrEP and other sexual health services were tracked at 1, 3 and 6 months for feasibility. Acceptability was determined by questionnaire. The effect of the intervention on tenofovir diphosphate (TFV-DP) levels was assessed by chi-square test (primary outcome); other predictors were explored with regression analysis. RESULTS: Among 150 women, the median age was 22 years and the median number of sexual partners was 2. Moderate/severe depression was common (41.3%). In the intervention arm, peers made 88% (198/225) of possible kit deliveries (177 with PrEP) and 49 STIs were diagnosed. In the SoC arm, 24% (55/225) of expected clinic visits occurred (53 with PrEP); no STI testing was performed. TVF-DP was detected in 16 participants at 6 months: 16% (12/75) in the intervention arm versus 5% (4/75) in the SoC arm (p = 0.03). Persistence among those with ongoing HIV prevention needs (i.e. prevention-effective persistence) was 18% (12/67) versus 7% (4/56; p = 0.08). No women acquired HIV. The intervention was significantly associated with detectable TFV-DP (OR 3.5, 1.1-11.4; p = 0.04); moderate/severe depression trended towards an association with TFV-DP (OR 0.2, 0.03-1.6; p = 0.13). CONCLUSIONS: My Way is a promising delivery system for PrEP and other sexual health services among young women in Western Kenya. We found high feasibility and acceptability. PrEP use was modest, but higher with My Way compared to SoC. Long-acting PrEP formulations may overcome important barriers to PrEP use and should be explored in combination with the My Way delivery model. Article	2024	Hartmann M.; Nyblade L.; Otticha S.; Marton T.; Agot K.; Roberts S.T.	The development of a conceptual framework on PrEP stigma among adolescent girls and young women in sub-Saharan Africa	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.26213	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85185264001&doi=10.1002%2fjia2.26213&partnerID=40&md5=8852ed0231db8811fe1be4c031429281	Introduction: Stigma is a well-known barrier to HIV testing and treatment and is an emerging barrier to pre-exposure prophylaxis (PrEP) use. To guide future research, measurement and interventions, we developed a conceptual framework for PrEP stigma among adolescent girls and young women (AGYW) in sub-Saharan Africa, a priority population for PrEP. Methods: A literature review, expert consultations and focus group discussions (FGDs) were conducted to adapt the Health Stigma and Discrimination Framework, describing the stigmatization process nested within the socio-ecological framework. We reviewed all articles on PrEP stigma and on HIV, contraceptive or sexuality stigma among AGYW from 2009 to 2019. Expert consultations were conducted with 10 stigma or PrEP researchers and two Kenyan youth advisory boards to revise the framework. Finally, FGDs were conducted with AGYW PrEP users (4 FGDs; n = 20) and key influencers (14 FGDs; n = 72) in Kenya with the help of a Youth Research Team who aided in FGD conduct and results interpretation. Results from each phase were reviewed and the framework was updated to incorporate new and divergent findings. This was validated against an updated literature search from 2020 to 2023. Results: The conceptual framework identifies potential drivers, facilitators and manifestations of PrEP stigma, its outcomes and health impacts, and relevant intersecting stigmas. The main findings include: (1) PrEP stigma is driven by HIV, gender and sexuality stigmas, and low PrEP community awareness. (2) Stigma is facilitated by factors at multiple levels: policy (e.g. targeting of PrEP to high-risk populations), health systems (e.g. youth-friendly service availability), community (e.g. social capital) and individual (e.g. empowerment). (3) Similar to other stigmas, manifestations include labelling, violence and shame. (4) PrEP stigma results in decreased access to and acceptability of PrEP, limited social support and community resistance, which can impact mental health and decrease PrEP uptake and adherence. (5) Stigma may engender resilience by motivating AGYW to think of PrEP as an exercise in personal agency. Conclusions: Our PrEP stigma conceptual framework highlights potential intervention targets at multiple levels in the stigmatization process. Its adoption would enable researchers to develop standardized measures and compare stigma across timepoints and populations as well as design and evaluate interventions. © 2024 The Authors. Article	2024	Hascher, Kevin; Jaiswal, Jessica; LoSchiavo, Caleb; Ezell, Jerel; Duffalo, Danika; Greene, Richard E.; Cox, Amanda; Burton, Wanda M.; Griffin, Marybec; John, Tejossy; Grin, Benjamin; Halkitis, Perry N.	Lack of Informed and Affirming Healthcare for Sexual Minority Men: A Call for Patient-Centered Care.	Journal of General Internal Medicine	-	-	-	-	1525-1497 0884-8734	10.1007/s11606-024-08635-8	https://pubmed.ncbi.nlm.nih.gov/38308157/	BACKGROUND: Sexual minority men (SMM) face severe health inequities alongside negative experiences that drive avoidance of medical care. Understanding how SMM experience healthcare is paramount to improving this population's health. Patient-centered care, which emphasizes mutual respect and collaboration between patients and providers, may alleviate the disparaging effects of the homophobia that SMM face in healthcare settings. OBJECTIVE: To explore how SMM perceive their experiences with healthcare providers and how care can most effectively meet their needs. DESIGN: Semi-structured qualitative interviews focused on healthcare experiences, pre-exposure prophylaxis (PrEP), and HIV-related beliefs were conducted between July and November 2018. PARTICIPANTS: The study included a sample of 43 young adult SMM (ages 25-27), representing diverse socioeconomic, racial, and ethnic backgrounds, in New York City. APPROACH: Researchers utilized a multiphase, systematic coding method to identify salient themes in the interview transcripts. KEY RESULTS: Analyses revealed three main themes: (1) SMM perceived that their clinicians often lack adequate skills and knowledge required to provide care that considers participants' identities and behaviors; (2) SMM desired patient-centered care as a way to regain agency and actively participate in making decisions about their health; and (3) SMM felt that patient-centered care was more common with providers who were LGBTQ-affirming, including many who felt that this was especially true for LGBTQ-identified providers. CONCLUSIONS: SMM expressed a clear and strong desire for patient-centered approaches to care, often informed by experiences with healthcare providers who were unable to adequately meet their needs. However, widespread adoption of patient-centered care will require improving education and training for clinicians, with a focus on LGBTQ-specific clinical care and cultural humility. Through centering patients' preferences and experiences in the construction of care, patient-centered care can reduce health inequities among SMM and empower healthcare utilization in a population burdened by historic and ongoing stigmatization. Article	2024	Hatch, Mary A.; Laschober, Tanja C.; Paschen-Wolff, Margaret; Ertl, Melissa M.; Nelson, C. Mindy; Wright, Lynette; Lancaster, Chloe; Feaster, Daniel J.; Forrest, David; Hankey, Colby; Monger, Mauda; Fegley, Joshua P.; Irving, Rhonda; Young, Cynthia; Rose, Juliana; Spector, Anya; Dresser, Lauren; Moran, Landhing; Jelstrom, Eve; Tross, Susan	PrEP for people who use opioids: A NIDA clinical trials network survey study in Southern U.S. cities where HIV incidence is high.	Drug and Alcohol Dependence	-	-	-	-	1879-0046 0376-8716	10.1016/j.drugalcdep.2024.111133	https://pubmed.ncbi.nlm.nih.gov/38447393/	BACKGROUND: People who use opioids (PWUO) are at increased risk for HIV. Pre-exposure prophylaxis (PrEP) is effective but underutilized as HIV prevention among PWUO. This study examined predictors of willingness to take daily oral PrEP and long-acting injectable (LAI) PrEP among PWUO across eight Southern urban cities with high HIV incidence. METHODS: HIV-negative PWUO (N = 308) seeking services in community-based programs participated in this cross-sectional survey study. Measures included demographics, sexual risk behavior, substance use frequency, and awareness of and willingness to take oral and injectable PrEP. Data were analyzed using mixed-effects models. RESULTS: Willingness to take daily oral and LAI PrEP was moderately high (69.16% and 62.02%, respectively). Half had heard of PrEP, but only 4% had ever taken it. Only education and condomless vaginal sex predicted willingness to take oral PrEP. Only education predicted willingness to take LAI PrEP. Polysubstance use was prevalent, with substantial proportions of PWUO reporting frequent use of injection drugs (opioids or stimulants, 79.5%), non-injection opioids (73.3%), non-injection stimulants (71.1%), cannabis (62.6%), and hazardous drinking (29.6%). About 20% reported past-year condomless anal sex, and one-third reported past-year condomless vaginal sex. CONCLUSIONS: PWUO in this study were amenable to PrEP, particularly in light of education and condomless vaginal sex. Careful consideration for matching PrEP messaging to the PWUO audience is needed. PrEP promotion should expand beyond men who have sex with men to include groups such as these predominantly heterosexual, polysubstance-using PWUO with HIV risk who were open to both formulations of PrEP. Article	2024	Herrera, M. C.; Johnson, J.; Lim, S.; Morales, K. H.; Wilson, J. Deanna; Hadland, S. E.; Metzger, D.; Wood, S.; Dowshen, N.	Co-delivery of HIV pre-exposure prophylaxis (PrEP) and HIV testing among publicly insured adolescents and young adults (AYA) receiving medication for opioid use disorder (MOUD).	Drug and Alcohol Dependence	-	-	-	-	1879-0046 0376-8716	10.1016/j.drugalcdep.2024.111132	https://pubmed.ncbi.nlm.nih.gov/38387256/	BACKGROUND: Low rates of HIV pre-exposure prophylaxis (PrEP) prescribing contribute to the disproportionate burden of HIV in the United States. Among adolescent and young adults (AYA) with opioid use disorder, HIV testing and PrEP co-prescription rates are poorly characterized. METHODS: We performed a retrospective analysis involving deidentified data from Philadelphia's Medicaid beneficiaries ages 16-29 years who were prescribed medication for opioid use disorder (MOUD) from 2015 to 2020 and continuously Medicaid-enrolled for ≥6 months prior to that prescription. After identifying the presence of a qualifying diagnosis signifying a PrEP indication, we examined the outcome of appropriate PrEP co-prescriptions and HIV testing using generalized estimating equations (GEE) modeling. RESULTS: We identified 795 AYA Medicaid beneficiaries with 1269 qualified treatment episodes. We calculated a PrEP prescribing rate of 29.47 per 1000 person-years among AYA receiving MOUD. The HIV testing rate was 63.47 per 1000 person-years among AYA receiving MOUD. GEE modeling revealed that individuals receiving methadone were more likely (aOR=2.62, 95% CI=1.06-6.49) to receive HIV testing within 6 months after a PrEP-qualifying diagnosis compared to those receiving other MOUD medications. Those who only saw outpatient behavioral health providers were less likely (aOR=0.48, 95% CI=0.24-0.99) to have received an HIV test within 6 months after the PrEP-qualifying diagnosis compared to those receiving inpatient behavioral health services. CONCLUSIONS: Co-prescription of PrEP and HIV testing among AYA receiving MOUD was rare in this large urban publicly insured population. Interventions are needed to increase HIV prevention services for this key population of AYA at risk for HIV infection. Article	2024	Hovaguimian F.; Kouyos R.D.; Kusejko K.; Schmidt A.J.; Tarr P.E.; Bernasconi E.; Braun D.L.; Calmy A.; Notter J.; Stoeckle M.; Surial B.; Christinet V.; Darling K.E.A.; Depmeier C.; Läuchli S.; Reinacher M.; Rasi M.; Nicca D.; Bruggmann P.; Haerry D.; Bize R.; Low N.; Vock F.; El Amari E.B.; Böni J.; Bosshard P.P.; Fehr J.S.; Hampel B.	Incidence of sexually transmitted infections and association with behavioural factors: Time-to-event analysis of a large pre-exposure prophylaxis (PrEP) cohort	HIV Medicine	-	-	-	-	14642662	10.1111/hiv.13543	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173454223&doi=10.1111%2fhiv.13543&partnerID=40&md5=713672f930070ac0eda82214830f28d7	Objectives: Our objective was to obtain long-term data on the incidence of sexually transmitted infections (STIs) and their association with behavioural factors after widespread pre-exposure prophylaxis (PrEP) implementation. Methods: This was a time-to-event analysis of a national PrEP cohort in Switzerland (SwissPrEPared study). Participants were people without HIV interested in taking PrEP with at least two STI screening visits. Primary outcomes were incidence rate of gonorrhoea, chlamydia, and syphilis. The association between behavioural factors and STI diagnosis was expressed using hazard ratios. We adjusted for testing frequency and calendar year. Results: This analysis included 3907 participants enrolled between April 2019 and April 2022, yielding 3815.7 person-years of follow-up for gonorrhoea (15 134 screenings), 3802.5 for chlamydia (15 141 screenings), and 3858.6 for syphilis (15 001 screenings). The median age was 39 years (interquartile range IQR 32–47), 93.8% (n = 3664) identified as men who have sex with men (MSM). The incidence was 22.8 (95% confidence interval CI 21.3–24.4) per 100 person-years for gonorrhoea, 26.3 (95% CI 24.7–28.0) for chlamydia, and 4.4 (95% CI 3.8–5.1) for syphilis. Yearly incidence rates decreased between 2019 (all bacterial STIs: 81.6; 95% CI 59.1–109.9) and 2022 (all bacterial STIs: 49.8; 95% CI 44.6–55.3). Participants reporting chemsex substance use were at higher risk of incident STIs, as were those reporting multiple sexual partners. Younger age was associated with a higher risk of gonorrhoea and chlamydia. Conclusions: Incidence rates of bacterial STIs decreased over time. Young MSM, those with multiple partners, and those using chemsex substances were at increased risk of STIs. © 2023 The Authors. Article	2024	Hu J.; Kang W.; Guo J.; Xu J.; Lyu F.; Zhang G.	Analysis of HIV drug prophylaxis services cascade in healthcare workers: a cross-sectional study in China	BMC Infectious Diseases	-	-	-	-	14712334	10.1186/s12879-023-08873-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181255435&doi=10.1186%2fs12879-023-08873-x&partnerID=40&md5=ca96dea3754e6413b251c8a943889983	Background: Human immunodeficiency virus (HIV) drug prophylaxis, including post-exposure prophylaxis (PEP) and pre-exposure prophylaxis (PrEP), has not yet been generally recognized and accepted by the whole society in China, and the utilization coverage among high-risk populations is low. Healthcare workers (HCWs) are important to the promotion and implementation of HIV drug prophylaxis strategy. This study analyzed the HIV drug prophylaxis services cascade (knowledge, attitude, and service) in HCWs, and explored the correlations between PEP and PrEP. Methods: A cross-sectional study was conducted among 1066 HCWs in 20 designated hospitals for HIV antiretroviral therapy in 20 cities in China. We collected information on participants' essential characteristics, HIV drug prophylaxis services cascade (knowledge, attitude, and service) and so on. The Chi-square test was used to analyse whether the differences and correlations between categorical variables were statistically significant, and Pearson contingency coefficient was used to analyze the strength of correlations. Multivariable logistic regression was used to analyse associated factors. Results: Among these stages of HIV drug prophylaxis services cascade, a high percentage of 1066 participants had knowledge of HIV drug prophylaxis (PEP: 78.2%, PrEP: 80.0%). Of them, almost all had supportive attitudes towards HIV drug prophylaxis (PEP: 99.6%, PrEP: 98.6%). Only about half of them would provide HIV drug prophylaxis services (PEP: 53.5%, PrEP: 48.5%). There were positive correlations between knowledge of PEP and PrEP (r = 0.292), between attitudes toward PEP and PrEP (r = 0.325), and between provision of PEP services and PrEP services (r = 0.555) in HCWs. Conclusions: There was a positive correlation between PEP and PrEP in HCWs. At the stage of providing HIV drug prophylaxis services, training, advocacy and education for HCWs, should be targeted and also combine PEP and PrEP to maximize the effects, so as to improve the enthusiasm of HCWs to provide HIV drug prophylaxis services. © 2023, The Author(s). Article	2024	Huang Y.-L.A.; Radix A.; Zhu W.; Kimball A.A.; Olansky E.J.; Hoover K.W.	HIV Testing and Preexposure Prophylaxis Prescriptions Among U.S. Commercially Insured Transgender Men and Women, 2014 to 2021	Annals of Internal Medicine	-	-	-	-	34819	10.7326/M23-2073	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182608328&doi=10.7326%2fM23-2073&partnerID=40&md5=a210af9293c1c53af26ed7097483f668	Background: Transgender persons are disproportionately affected by HIV, but preexposure prophylaxis (PrEP) use has been low in this population. Clinical encounters for gender-affirming hormone therapy (GAHT) provide opportunities for HIV prevention. Objective: To estimate the number of commercially insured transgender women (TGW) and transgender men (TGM) in the United States and their use of HIV prevention services. Design: Retrospective analysis of secondary data. Setting: Merative MarketScan commercial databases from 2014 to 2021. Participants: TGW and TGM, defined as those with transgender-related diagnoses and prescriptions for feminizing or masculinizing GAHT. Measurements: HIV testing and PrEP use. Results: A substantially increasing trend was observed in the prevalence of transgender-related diagnosis codes from 2014 to 2021 and in the proportion of persons who used GAHT. The increases were driven by persons aged 18 to 34 years. In 2021, among 10 613 TGW with a test for or a diagnosis of a sexually transmitted infection (STI) in the previous 12 months, 61.1% had an HIV test; among those, 20.2% were prescribed PrEP. Among 4184 TGM with STI risk, 48.3% had an HIV test; among those, 10.2% were prescribed PrEP. The prevalence of TGW and TGM who had a test for or a diagnosis of an STI, had an HIV test, and were prescribed PrEP increased substantially from 2014 to 2021. Limitation: The findings represent only persons with commercial health insurance who sought health care services for GAHT. Conclusion: It is important to identify transgender persons to monitor their receipt of HIV prevention services. Encounters for GAHT provide opportunities to offer HIV prevention and other prevention services. Many HIV prevention opportunities were likely missed at clinical encounters for GAHT. © 2023 American College of Physicians. Article	2024	Hudrudchai S.; Suwanwong C.; Prasittichok P.; Mohan K.P.; Janeaim N.	Pre-exposure Prophylaxis Adherence Among Men Who Have Sex With Men: A Systematic Review and Meta-analysis	Journal of Preventive Medicine and Public Health	-	-	-	-	19758375	10.3961/jpmph.23.345	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184833076&doi=10.3961%2fjpmph.23.345&partnerID=40&md5=d24bc5284a0dfc6bd6bea395357a2f04	Objectives: The effectiveness and efficiency of pre-exposure prophylaxis (PrEP) in reducing the transmission of human immunodeficiency virus (HIV) among men who have sex with men (MSM) relies on how widely it is adopted and adhered to, particularly among high-risk groups of MSM. The meta-analysis aimed to collect and analyze existing evidence on various factors related to PrEP adherence in MSM, including demographic characteristics, sexual behaviors, substance use, and psychosocial factors. Methods: The meta-analysis followed the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines. The search included articles published between January 2018 and December 2022, obtained from the PubMed, ScienceDirect, and Scopus databases. The studies that were included in the analysis reported the proportion of MSM who demonstrated adherence to PrEP and underwent quality appraisal using the Newcastle-Ottawa Scale. Results: Of the 268 studies initially identified, only 12 met the inclusion criteria and were included in the final meta-analysis. The findings indicated that education (odds ratio OR, 1.64; 95% confidence interval CI, 1.12 to 2.40), number of sexual partners (OR, 1.16; 95% CI, 1.02 to 1.31), engaging in sexual activities with an human immunodeficiency virus-positive partner (OR, 1.59; 95% CI, 1.16 to 2.26), substance use (OR, 0.83; 95% CI, 0.70 to 0.99), and lower levels of depression (OR, 0.55; 95% CI, 0.37 to 0.82) were associated with higher rates of PrEP adherence among MSM. Conclusions: Despite these findings, further research is necessary to investigate PrEP adherence more comprehensively. The findings of this meta-analysis can be utilized to inform interventions aimed at improving PrEP adherence among MSM and provide directions for future research in this area. Article	2024	Hutchings, Danielle A; Larson, Brent K; Guindi, Maha; Waters, Kevin M	Markedly increased duodenal villous surface apoptosis in patients taking pre-exposure prophylaxis (PrEP) against human immunodeficiency virus.	Histopathology	-	-	-	-	1365-2559	10.1111/his.15137	https://dx.doi.org/10.1111/his.15137	AIMS: Pre-exposure prophylaxis (PrEP) consists of combination antiretroviral therapy and is increasingly utilized to prevent human immunodeficiency virus (HIV) in high-risk populations. Two index cases noted during routine care showed markedly increased duodenal villous surface apoptosis in patients on PrEP. We sought to examine the prevalence of this finding and identify any clinicopathologic correlations. METHODS: Gastrointestinal biopsy specimens from 23 male patients aged 18-40 years taking PrEP and 23 control patients were reviewed. Patients with HIV, inflammatory gastrointestinal diseases, and celiac disease were excluded. Apoptoses were counted on surface epithelium and deep crypts. The highest apoptotic body count per tissue fragment was recorded. Clusters were defined as groups of ≥5 apoptoses. Apoptotic counts between patients taking PrEP and controls were compared using t-tests. RESULTS: In PrEP patients, the median age was 35 years (range 25-40) and 83% (19/23) were white. The control patients were demographically similar (median age: 32 years range 23-40; 70% 16/23 white). Duodenal apoptosis in villous surface epithelium was increased in PrEP patients, with 14/23 (60.9%) patients having ≥10 surface apoptoses compared to 2/23 (8.7%) controls (P = 2.1 × 10-3) and 14/23 (61%) having clusters compared to 3/23 (13%) controls (P = 2.0 × 10-3). There was no significant association between increased surface apoptosis or clusters and clinical symptoms or duration of PrEP use. CONCLUSION: Markedly increased villous surface apoptosis, particularly in clusters, is often seen in the duodenum of patients taking PrEP. Although the mechanism and significance are unknown, knowledge of this peculiar finding may prevent unnecessary additional testing. Article	2024	Hutchins, Freddie; Drey, Nicholas	Influences affecting decision-making regarding use of pre-exposure prophylaxis among black men who have sex with men in the USA: a systematic review and meta-synthesis.	Sexually Transmitted Diseases	-	-	-	-	1472-3263	10.1136/sextrans-2023-055861	https://dx.doi.org/10.1136/sextrans-2023-055861	AIM: To systematically identify, evaluate, and synthesise qualitative research examining positive and negative influences affecting decision-making behaviour among black men who have sex with men (BMSM) in the USA regarding use of pre-exposure prophylaxis (PrEP). BACKGROUND: Used correctly, PrEP is highly efficacious in preventing HIV infection and is available via healthcare services throughout the USA. BMSM are a key target population for HIV prevention services, however their engagement with these services is low. With potential barriers to access ranging from systemic to personal, a phenomenological perspective on the influences affecting individuals' decision-making is essential, helping to better understand the needs of this target population and guide development and delivery of more effective future policy and intervention services. DESIGN: Qualitative meta-synthesis with meta-aggregation. DATA SOURCES: The electronic databases Medline, CINAHL, APA PsycInfo, Embase and Ovid Emcare were comprehensively searched from inception to 21 January 2022. REVIEW METHODS: Systematic identification, quality assessment and synthesis of existing qualitative research according to protocols of meta-aggregation. This included identifying salient study findings and corroborating illustrations from the data, sorting like findings into descriptive themed categories and developing transformative synthesised statements from aggregate appraisal of category findings. RESULTS: Seventeen studies met the inclusion criteria and were assessed to be of acceptable quality. Synthesis of study data yielded 30 categories grouped under five themes: Stigma, Discrimination, Mistrust, PrEP positivity and PrEP negativity. Twelve synthesised statements were produced to provide a summary of the results and suggest improvements to the delivery of future PrEP services and interventions. CONCLUSION: A more targeted approach focused on advocacy and ambassadorship outside of clinical settings may be more influential in positive decision-making regarding use of PrEP in BMSM populations than relying on traditional outreach methods via institutions and their representatives where stigma, mistrust and structural inequalities perpetuate. Article	2024	Huynh, Katie; Kahwaji, Chadi I.	HIV Testing.	StatPearls	-	-	-	-	NA	NA	https://www.ncbi.nlm.nih.gov/books/NBK482145/	An estimated 15% of patients living with HIV in the United States (US) are unaware of their status. HIV testing needs to be incorporated into every level of the healthcare system to diagnose HIV as early as possible. It is estimated that 40% of new infections of HIV are transmitted by those who are not aware of their HIV diagnosis. Early detection reduces the complications of HIV infection and decreases the risk of transmission. Who to Screen HIV testing should be considered at every clinical visit across specialties. All healthcare providers should be aware of the screening recommendations. All patients between 13 and 75 years of age should be routinely screened for HIV. One-time testing is sufficient for most patients except in specific populations. Those needing more frequent testing are men who have sex with men, especially between 13 and 24 years of age; those who inject drugs; those who have sex in exchange for money or food; those who have sex with partners of unknown HIV status; and those who have partners who are known to be HIV positive, inject drugs or are bisexual. Patients should be screened for HIV if they present with signs and symptoms of HIV. A constellation of nonspecific symptoms, such as fever, sore throat, or rash, may present as acute retroviral syndrome 2 to 4 weeks after HIV transmission. Patients should be screened if they report possible HIV exposure, regardless of symptoms. This includes all patients requesting sexually transmitted infections testing, those with occupational needle stick or significant mucous membrane exposures, as well as suspected or known sexual or percutaneous exposures, such as patients sharing needles for substance use. Patients with possible exposure need repeated testing during the 4 to 6 months following exposure. These patients also should be considered for occupational or nonoccupational post-exposure prophylaxis (PEP). Guidelines for prescribed PEP can be found at https://www.cdc.gov/hiv/basics/pep.html. Patients who are seeking pre-exposure prophylaxis (PrEP) also should be screened for HIV before starting therapy as well as every 3 months after beginning treatment with PrEP. PrEP treatment is currently emtricitabine/tenofovir once a day. If emtricitabine/tenofovir is used as PrEP in an individual who has converted to HIV, there is a risk that the virus will develop resistance, further complicating the treatment. Women who are pregnant need to be screened early in pregnancy. Article	2024	Irie W.C.; Calabrese S.K.; Mayer K.H.; Geng E.H.; Blackstock O.; Marcus J.L.	Social and structural factors associated with interest in HIV preexposure prophylaxis among Black women in the United States	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2023.2299338	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181441428&doi=10.1080%2f09540121.2023.2299338&partnerID=40&md5=f748b7048d69a5dd44e0ba4550f23315	In a nationwide sample of cisgender Black women in the US, we assessed the associations between social and structural factors and interest in using HIV preexposure prophylaxis (PrEP). Among 315 respondents, 62.2% were interested in PrEP if it were provided for free. Positive social norms surrounding PrEP, including injunctive norms (perceived social acceptability of PrEP use) and descriptive norms (perceived commonality of PrEP use), were positively associated with interest in using PrEP. Concerns about HIV infection, recently visiting a health care provider, and comfort discussing PrEP with a provider were also positively associated with interest in using PrEP. Anticipating PrEP disapproval from others was negatively associated with interest in PrEP. Although PrEP can promote autonomy and personal discretion, Black women's PrEP-related decisions occur in a complex social environment. Black women may benefit from interventions to promote positive norms and attitudes surrounding PrEP at the community level and empower them in discussions with their providers about PrEP. © 2024 Informa UK Limited, trading as Taylor & Francis Group. Article	2024	Irie W.C.; Croston M.A.; Mahone A.	The Impact of Providers as Health Discussants on Black Women's Interest in PrEP for HIV Prevention	Journal of the International Association of Physicians in AIDS Care	-	-	-	-	23259574	10.1177/23259582231225278	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181667755&doi=10.1177%2f23259582231225278&partnerID=40&md5=0774f88cb70348a723eb8852cd5a2dce	This study sought to examine the role of providers as health discussants (HD) on interest in preexposure prophylaxis for HIV prevention in a national sample of adult Black cisgender women (N = 315). Health discussant networks, a type of social network, may be influential in HIV prevention efforts. These networks, often composed of individuals' families, have improved health utilization outcomes in other disciplines. However, health discussants in HIV prevention are understudied, especially when considering providers as network members. We conducted a cross-sectional online survey and collected socio-demographic information, sexual history, HIV concerns, PrEP attitudes, healthcare utilization, mistrust, social support, and HD information. We used descriptive statistics and logistic regression to analyze data. Associations between PrEP interest and variables were examined. We found that older, partnered, who had recent healthcare visits or health insurance were more likely to involve healthcare providers as discussants. Anticipated PrEP stigma decreased provider involvement. Among participants listing providers as discussants, there was a greater likelihood of interest in using PrEP. Our findings indicate that healthcare provider support and social factors are crucial in promoting PrEP engagement among Black women. Integrating social dynamics and positive provider-patient interactions is essential for successful PrEP implementation. © The Author(s) 2024. Article	2024	Irie W.C.; Mahone A.; Johnson B.; Marrazzo J.; Mugavero M.J.; Van Der Pol B.; Elopre L.	"Just the Stigma Associated with PrEP Makes You Feel Like It's HIV Itself": Exploring PrEP Stigma, Skepticism, and Medical Mistrust Among Black Cisgender Women in Urban and Rural Counties in the U.S. Deep South	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-023-02769-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181873112&doi=10.1007%2fs10508-023-02769-2&partnerID=40&md5=d409eb8399fc2bddb1f8968d1aa245b3	Despite its effectiveness in HIV prevention, PrEP use among Black women is suboptimal. Notably in the Deep South, Black women have the lowest PrEP uptake rates among all US regions. To increase PrEP engagement, research suggests the implementation of structural and social interventions particular to the needs of Black women. The state of Alabama is of priority to federal HIV prevention initiatives; therefore, this study conducted focus groups among 47 cis-gender Black women in rural and urban Alabama counties, with the highest statewide HIV incidence rates, to understand perceptions of PrEP and decision-making processes. Deductive coding analysis was conducted and themes were finalized based on consensus among the two coders. Four themes were identified. Findings show stigma undergirds Alabaman Black women's decisions to engage in PrEP care. Moreover, women reported stigma stifled community-level education about PrEP. Despite these experiences, education was regarded as a strategy to decrease stigma and PrEP skepticism, the latter of which emerged as a prominent theme. Medical mistrust and healthcare engagement were the other emergent themes influencing participation in PrEP care. To ensure PrEP efforts meet the needs of Black cisgender women in Alabama counties, interventions must address longstanding stigma, increase educational initiatives, and ensure interventions consider women's experiences with medical mistrust and health care engagement. © 2024, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2024	Janamnuaysook, Rena; Guo, Yan; Yu, Yeon Jung; Phanuphak, Nittaya; Kawichai, Surinda; MacDonell, Karen; Jupimai, Thidarat; Rongkavilit, Chokechai; Wang, Bo	Lived experiences with pre-exposure prophylaxis uptake and adherence among transgender women in Thailand: a qualitative study.	Sexual Health	-	-	-	-	1449-8987	10.1071/SH23102	https://dx.doi.org/10.1071/SH23102	BACKGROUND: Transgender women (TGW) are disproportionately affected by HIV, and HIV prevalence among TGW in Thailand has been increasing. Although oral daily pre-exposure prophylaxis (PrEP) is effective for HIV prevention, PrEP uptake and persistence among TGW have been low. This study aimed to provide a deeper understanding of TGW's experiences with PrEP uptake and adherence, and to identify major barriers to PrEP use to inform intervention adaptation. METHODS: We interviewed 20 young TGW (six non-PrEP users, eight adherent, six non-adherent) and 10 health care providers from two HIV clinics in Bangkok, Thailand, in 2022. We focused on understanding challenges to PrEP use in this population using an interview guide based on a theoretical model of behaviour change and thematic content analysis. RESULTS: Thematic analysis identified major barriers to and facilitators of PrEP uptake and adherence. Barriers to PrEP initiation included low self-perceived HIV risk, concern about potential side-effects, patient burdens such as frequent HIV testing for prescription refills and social stigma against PrEP. Barriers to adherence included side-effects, inconvenient access to health services (especially during COVID-19 lockdowns), forgetfulness resulting from busy schedules and low self-perceived HIV risk. TGW also reported health care providers' stigma against PrEP users deterred them from seeking further PrEP services. TGW identified major facilitators of PrEP initiation, including awareness about the benefits of PrEP, concern about risks of HIV and supportive social networks of PrEP users. As to PrEP regimens, most TGW participants reported a clear preference for long-lasting, injectable PrEP over daily oral PrEP. TGW and health care providers largely agreed on barriers and facilitators of PrEP use, but they differed in perceptions of HIV risk. CONCLUSIONS: The results highlighted challenges and opportunities to improve the delivery of PrEP, as well as other sexually transmissible infection and mental health services, especially among TGW. Thus, there is an urgent need for developing effective intervention programs that could raise PrEP awareness and knowledge, reduce PrEP stigma, and improve PrEP delivery systems among TGW in Thailand.	adherence, barriers, facilitators, HIV prevention, in-depth interview, pre-exposure prophylaxis, PrEP uptake, Thailand, transgender women. Frontiers in Public Health	-	-	-	-	2296-2565	10.3389/fpubh.2024.1298297	https://www.frontiersin.org/journals/public-health/articles/10.3389/fpubh.2024.1298297/full	HIV/AIDS is still a major worldwide health concern, and Indonesia is making efforts to mitigate its effects. Antiretroviral therapy (ARV), which aims to decrease viral replication, boost immunological function, and lengthen the lifespans of persons living with HIV/AIDS, is the cornerstone of Indonesia's strategy. The availability of ARV has significantly increased, yet problems including stigma and the requirement for regular medication adherence still exist. To address the broader needs of those affected by HIV/AIDS, Indonesia lays a major focus on comprehensive care, which includes mental health and social support, in addition to ARV. Data show that, despite progress, there is still a stigma surrounding HIV/AIDS, which affects patient outcomes and access to care. With vigorous research into cutting-edge antiretroviral medications and treatment techniques, Indonesia has a thriving future therapeutic landscape. The goals of these programs are to increase treatment effectiveness, decrease side effects, and increase access to cutting-edge treatments. Preventive methods, such as PrEP (pre-exposure prophylaxis), are making progress, and efforts to find a cure are gaining prominence. Notably, HIV/AIDS management plan of Indonesia heavily relies on natural remedies. Patient care incorporates traditional Indonesian medicine, such as jamu and several herbal medicines. Although there is little scientific proof to support the effectiveness of these herbal remedies, complementary and alternative therapies frequently employ them to manage symptoms and promote general wellness. In terms of the 95-95-95 targets, Indonesia is making an effort to comply with these international goals by seeking to diagnose 95% of HIV-positive individuals, provide sustained ARV to 95% of those diagnosed, and achieve viral suppression in 95% of ARV recipients. Although there are gaps in reaching these aims, progress is being made, in part because of the aforementioned challenges. In summary, Indonesia employs a multimodal approach to HIV/AIDS management, including traditional herbal cures, continuous research into cutting-edge treatments, and conventional ARV. In order to enhance overall health outcomes and create a healthier society, the future of HIV/AIDS treatment in Indonesia is concentrated on expanding therapeutic alternatives, reaching the 95-95-95 targets, decreasing stigma, and improving access to care. Article	2024	Johnson, Leigh F.; Myer, Landon; Jamieson, Lise; Meyer-Rath, Gesine; Delany-Moretlwe, Sinead; Joseph Davey, Dvora	The potential benefits of long-acting injectable cabotegravir in pregnant and breastfeeding women and their infants.	AIDS	-	-	-	-	1473-5571 0269-9370	10.1097/QAD.0000000000003803	https://pubmed.ncbi.nlm.nih.gov/38016171/	BACKGROUND: Pregnant and breastfeeding women (PBW) in sub-Saharan Africa have high HIV incidence rates and associated risk of vertical transmission to their infants. Oral preexposure prophylaxis (PrEP) and injectable PrEP (long-acting cabotegravir, or CAB-LA) can potentially reduce this HIV transmission, but population-level impacts are uncertain. METHODS: We extended a previously developed model of HIV and PrEP in South Africa to allow for variable PrEP duration and preference in PBW. We considered three potential scenarios for PrEP provision to PBW: oral PrEP only, CAB-LA only, and allowing oral/CAB-LA choice, with uptake and retention assumptions informed by South African data, each compared with a 'base' scenario without PrEP for PBW. RESULTS: Without PrEP for PBW, the model estimates 1.31 million new infections will occur between 2025 and 2035 in South African adults and children, including 100000 in PBW, 16800 in infants at/before birth, and 35200 in children through breastmilk. In the oral PrEP-only scenario, these numbers would reduce by 1.2% (95% CI: 0.7-1.7%), 8.6% (4.8-12.9%), 4.0% (2.1-5.8%), and 5.3% (3.0-8.2%) respectively. In the CAB-LA-only scenario, the corresponding reductions would be 6.1% (2.9-9.6%), 41.2% (19.8-65.0%), 12.6% (6.0-19.4%), and 29.5% (13.9-46.8%), respectively, and in the oral/CAB-LA choice scenario, similar reductions would be achieved 5.6% (3.4-8.0%), 39% (23.4-55.9%), 12.4% (7.4-16.8%) and 27.6% (16.5-39.9%) respectively. CONCLUSION: CAB-LA has the potential to be substantially more effective than oral PrEP in preventing HIV acquisition in PBW and vertical transmission, and can also modestly reduce HIV incidence at a population level. Article	2024	Johnson, Ragan; Conley, Cherie; Jeter, Elizabeth; Randolph, Schenita D	PrEP-aring stylists: Development of a stylist educational workshop to increase PrEP awareness and knowledge among Black women in the US south	Public Health Nursing	-	-	-	-	7371209	10.1111/phn.13253	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171335289&doi=10.1111%2fphn.13253&partnerID=40&md5=52f8ec973369340fe1b2668f46007e33	Background: Black cis-gender women are disparately affected by HIV and require prioritization in prevention efforts, including pre-exposure prophylaxis (PrEP). Preparing trusted community leaders such as salon stylists as health-based opinion leaders may be promising to increasing awareness, knowledge, and uptake of PrEP among Black women. We sought to develop training and better understand stylists who may participate in a salon-based PrEP intervention for Black women. Methods: A community-research partnership designed a stylist training workshop for stylists with a majority Black women clientele. A two-session workshop focused on HIV knowledge, HIV prevention including PrEP, and the role of an opinion leader to influence community social and health norms. An exploratory research design and analysis was conducted to examine stylists and opinion leader roles. Conclusions: Stylists showed a high level of knowledge and willingness to serve as an opinion leader in their salons and with their communities. Stylists also verified medical mistrust in the healthcare system that makes community-based interventions attractive. This article discusses how the training was piloted and accepted by stylists. © 2023 Wiley Periodicals LLC.	community-engaged interventions; HIV prevention; PrEP; salon-based intervention; training	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2024	Kalu, Ngozi; Ross, Michael W.; Taegtmeyer, Miriam; Spicer, Neil; Adebajo, Sylvia; Owolabi, Rotimi; Lamontagne, Erik; Howell, Sean; Neuman, Melissa	Is Internalised Homonegativity associated with HIV testing and HIV risk behaviours of men who have sex with men: a multilevel cross-sectional study of sub-Saharan African countries.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2023-074791	https://pubmed.ncbi.nlm.nih.gov/38286695/	OBJECTIVES: This study assessed the associations of Internalised Homonegativity (IH) with HIV testing and risk behaviours of adult men who have sex with men (MSM) in sub-Saharan Africa (SSA) and effect modification by the legal climate. DESIGN: We used data from the cross-sectional 2019 Global Lesbian, Gay, Bisexual, Transgender and Intersex (LGBTI+) Internet survey study. SETTING AND PARTICIPANTS: Overall, the 2019 Global LGBTI Internet Survey collected data from 46 SSA countries. In this secondary analysis, we included data from 3191 MSM in 44 SSA countries as there were no eligible MSM responses in the 2 countries excluded. OUTCOME MEASURES: Our response variables were self-reported binary indicators of ever tested for HIV, recently tested in the past 6 months (from those who reported ever testing), transactional sex (paying for and being paid for sex in the past 12 months), and unprotected anal sex (that is without a condom or pre-exposure prohylaxis (PrEP)) with a non-steady partner (in the past 3 months). RESULTS: Our findings showed high levels of IH (range 1-7) in MSM across SSA (mean (SD)=5.3 (1.36)). We found that MSM with higher IH levels were more likely to have ever (adjusted OR (aOR) 1.18, 95% CI 1.03 to 1.35) and recently tested (aOR 1.19, 95% CI 1.07 to 1.32) but no evidence of an association with paying for sex (aOR 1.00, 95% CI 0.89 to 1.12), selling sex (aOR 1.06, 95% CI 0.95 to 1.20) and unprotected sex (aOR 0.99, 95% CI 0.89 to 1.09). However, we observed that a favourable legal climate modifies the associations of IH and paying for sex (aOR 0.75, 95% CI 0.60 to 0.94). Increasing levels of IH had a negative association with paying for sex in countries where same-sex relationships are legal. We found no associations of IH with unprotected anal sex in the population surveyed. CONCLUSIONS: We confirm that IH is widespread across SSA but in countries that legalise same-sex relationships, MSM were less likely to engage in transactional sex compared with those in countries where homosexuality is criminalised. Article	2024	Kalwicz D.A.; Rao S.; Modrakovic D.X.; Zea M.C.; Dovidio J.F.; Eaton L.A.; Holt M.; MacGibbon J.; Zaheer M.A.; Garner A.; Calabrese S.K.	The Implications of PrEP Use, Condom Use, and Partner Viral Load Status for Openness to Serodifferent Partnering Among US Sexual Minority Men (SMM)	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04241-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184455131&doi=10.1007%2fs10461-023-04241-7&partnerID=40&md5=dec39475ea33b0e80eff15da5e4c6560	PrEP has been reported to facilitate openness to serodifferent sexual partnerships among sexual minority men (SMM). However, other aspects of a sexual scenario likely come into play, including whether or not condoms are used and whether or not the partner living with HIV has an undetectable viral load. This online survey study evaluated the association between PrEP status and openness to serodifferent partnering, as well as the effects of various sexual scenario variables (condom use and partner's viral load) among 268 HIV-negative SMM in the US. Each participant reported their PrEP status and rated their openness to serodifferent partnering in four sexual scenarios, which varied by condom use (with/without) and partner viral load status (detectable/undetectable). Analyses of covariance (ANCOVAs) were conducted to assess differences in openness to serodifferent partnering by PrEP status in each scenario, adjusting for background characteristics. A two-way repeated measures ANCOVA and a three-way mixed factorial ANCOVA, including PrEP status as a between-subjects variable, were also performed to assess the effects of condom use and partner viral load status on openness. Across all scenarios, current PrEP users expressed significantly greater openness to serodifferent partnering compared to participants who had never used PrEP. Current PrEP users were also more likely than former PrEP users to consider partnering with someone with an undetectable viral load without using condoms. Both PrEP users and PrEP-inexperienced individuals had greater openness to serodifferent partnering with a partner having an undetectable (vs. detectable) viral load, which was magnified by condom use among the latter. © The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature 2024. Article	2024	Kamadjou A.; Decock A.; Huleux T.; Depreux A.; Aissi E.; Landre L.; Baclet V.; Viget N.; Valette M.; Robineau O.; Meybeck A.	Impact of the COVID-19 pandemic on sexual behaviour and welfare of HIV preexposure prophylaxis users: a mixed-method study	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2023.2206100	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85158866646&doi=10.1080%2f09540121.2023.2206100&partnerID=40&md5=379a6abe9174715f2b5003f4bcca13d3	COVID-19 pandemic can affect people using HIV preexposure prophylaxis (PrEP). To assess its consequences on PrEP users' sexual behaviour and welfare, we conducted a mixed-method study. A self-administered questionnaire was given to PrEP users during scheduled consultation in Tourcoing Hospital from February to May 2021. In addition, a qualitative study included 14 participants who took part in semi-structured in-depth interviews (IDIs). Ninety-four PrEP users completed the questionnaire. During lockdown, 62% of participants continued PrEP. After lockdown release, the average number of sexual intercourses and partners increased from 6 ± 12 to 13 ± 17 intercourses/month (p < 0.001) and from 3 ± 11 to 11 ± 34 partners/month (p < 0.001). Similarly, the proportion of PrEP users who engaged in group sex, sex with alcohol or chemsex increased respectively from 28% to 55% (p < 0.001), 28% to 45% (p < 0.001) and 28% to 38% (p < 0.001). Analysis of IDIs revealed emotional deprivation and sexual frustration during the lockdown. After its release, frequent clandestine chemsex parties and curfew forcing overnight stay increased fears of intimate violence and overdoses. In conclusion, PrEP users reduced their sexual activity during the lockdown. Its release led to an increase in sexual risk-taking. Social distancing measures could favour medical and social harm of sexual risk-taking. © 2023 Informa UK Limited, trading as Taylor & Francis Group.	chemsex; COVID-19; HIV; intimate violence; PrEP; sexual risk-taking; STI	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Mixed methods
Article	2024	Kamitani, Emiko; Peng, Yinan; Hopkins, David; Higa, Darrel H.; Mullins, Mary M.	A Community Guide Systematic Review: Digital HIV Pre-Exposure Prophylaxis Interventions.	American Journal of Preventive Medicine	-	-	-	-	1873-2607 0749-3797	10.1016/j.amepre.2024.02.009	https://www.sciencedirect.com/science/article/abs/pii/S0749379724000631	INTRODUCTION: HIV preexposure prophylaxis (PrEP) is highly effective when taken as prescribed. Digital health adherence interventions have been identified as effective for improving antiretroviral therapy adherence among people with HIV, but limited evidence exists for PrEP adherence interventions among people without HIV. The purpose of this Community Guide systematic review was to present the characteristics and effectiveness of digital PrEP adherence interventions. METHODS: The author searched the CDC HIV Prevention Research Synthesis cumulative database for digital health interventions with PrEP adherence outcomes published in peer-reviewed journals from 2000 to 2022. Studies with comparison arms or pre-post data evaluating interventions in high-income countries were included. Two reviewers independently screened citations, extracted data, conducted risk of bias assessment, and resolved discrepancies through discussion. Summary effect estimates were calculated using median and interquartile interval. RESULTS: Nine studies were included and all focused on gay, bisexual, and other men who have sex with men. Eight studies were U.S.-based while the other was conducted in the Netherlands. Five were randomized control trials and four were pre-/post studies. All studies showed improved adherence in the intervention arms compared with comparison groups or preintervention data. One study also reported improvement in PrEP care retention. DISCUSSION: Digital health adherence interventions with different strategies to improve PrEP and HIV-related outcomes were identified. The small number of studies identified is a limitation. Findings from this review served as the basis for the Community Preventive Services Task Force recommendation to use these interventions to increase PrEP adherence to prevent HIV infection. Article	2024	Kamusiime, Brenda; Beima-Sofie, Kristin; Chhun, Nok; Nalumansi, Alisaati; Nalukwago, Grace Kakoola; Kasiita, Vicent; Twesige, Chris Collins; Kansiime, Ritah; Muwonge, Timothy R.; Kyambadde, Peter; Kadama, Herbert; Mudiope, Peter; Glick, Sara; Lambdin, Barrot; Mujugira, Andrew; Heffron, Renee	"Take services to the people": strategies to optimize uptake of PrEP and harm reduction services among people who inject drugs in Uganda.	Addiction Science & Clinical Practice	-	-	-	-	1940-0640 1940-0632	10.1186/s13722-024-00444-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10893723/	BACKGROUND: People who inject drugs (PWID) are at increased risk of HIV acquisition and often encounter barriers to accessing healthcare services. Uganda has high HIV prevalence among PWID and lacks integrated pre-exposure prophylaxis (PrEP) and harm reduction services. Understanding PWID experiences accessing and using harm reduction services and PrEP will inform strategies to optimize integration that align with PWID needs and priorities. METHODS: Between May 2021 and March 2023, we conducted semi-structured interviews with PWID in Kampala, Uganda. We recruited participants with and without previous experience accessing harm reduction services and/or PrEP using purposive and snowball sampling. Interviews were audio recorded, translated, and transcribed. We used thematic analysis to characterize motivations for uptake of harm reduction and HIV prevention services, and strategies to optimize delivery of needle and syringe programs (NSP), medications for opioid use disorder (MOUD), and PrEP. RESULTS: We conducted interviews with 41 PWID. Most participants were relatively aware of their personal HIV risk and accurately identified situations that increased risk, including sharing needles and engaging in transactional sex. Despite risk awareness, participants described engaging in known HIV risk behaviors to satisfy immediate drug use needs. All reported knowledge of harm reduction services, especially distribution of sterile needles and syringes, and many reported having experience with MOUD. Participants who had accessed MOUD followed two primary trajectories; limited resources and relationships with other PWID caused them to discontinue treatment while desire to regain something they believed was lost to their drug use motivated them to continue. Overall, PrEP knowledge among participants was limited and few reported ever taking PrEP. However, participants supported integrating PrEP into harm reduction service delivery and advocated for changes in how these services are accessed. Stigma experienced in healthcare facilities and challenges acquiring money for transportation presented barriers to accessing current facility-based harm reduction and HIV prevention services. CONCLUSIONS: Meeting the HIV prevention needs of PWID in Uganda will require lowering barriers to access, including integrated delivery of PrEP and harm reduction services and bringing services directly to communities. Additional training in providing patient-centered care for healthcare providers may improve uptake of facility-based services. Article	2024	Kanny, Dafna; Lee, Kathryn; Olansky, Evelyn; Robbins, Taylor; Trujillo, Lindsay; Finlayson, Teresa; Morris, Elana; Agnew-Brune, Christine; Cha, Susan; Chapin-Bardales, Johanna; Wejnert, Cyprian	Overview and Methodology of the National HIV Behavioral Surveillance Among Transgender Women - Seven Urban Areas, United States, 2019-2020.	MMWR Recommendations and Reports	-	-	-	-	2380-8942 2380-8950	10.15585/mmwr.su7301a1	https://www.cdc.gov/mmwr/volumes/73/su/su7301a1.htm	Transgender women, especially transgender women of color, are disproportionately affected by HIV. However, no surveillance system collects data on HIV risk factors among this population. To address this gap, CDC developed a surveillance system entitled National HIV Behavioral Surveillance Among Transgender Women (NHBS-Trans) to assess behavioral and contextual data through systematic biobehavioral surveillance to monitor behavioral risk factors, prevention usage, and HIV prevalence among transgender women. NHBS-Trans used respondent-driven sampling in seven urban areas in the United States. Trained interviewers used a standardized, anonymous questionnaire to collect information on HIV-related behavioral risk factors, HIV testing, and use of prevention services. Each of the seven participating project areas recruited approximately 200 eligible transgender women and offered anonymous HIV testing. Overall, in the seven project areas, 1,757 participants completed the eligibility screener for NHBS-Trans during 2019-2020; of these, 6.6% were seeds (i.e., a limited number of initial participants who were chosen by referrals from persons and community-based organizations who knew or were part of the local population of transgender women). A total of 1,637 (93.2%) participants were eligible, consented, and completed the interview. Of these, 1,624 (99.2%) agreed to HIV testing. Of the total 1,637 participants, 29 participants did not report identity of woman or transgender woman, resulting in a final sample of 1,608 transgender women. NHBS-Trans project area staff members (n = 14) reported that the survey was timely and addressed a critical need for HIV surveillance in a population that is often overlooked. The MMWR supplement includes this overview report on NHBS-Trans, which describes the methods (history, participant eligibility criteria, questionnaire, data collection, and HIV testing) as well as evaluation of project implementation and the performance of the questionnaire content, specifically the acceptability for transgender women. The other NHBS-Trans reports in the supplement include information on pre-exposure prophylaxis use, psychosocial syndemic conditions and condomless anal intercourse, nonprescription hormone use, homelessness, discrimination and the association between employment discrimination and health care access and use, and social support and the association between certain types of violence and harassment (gender-based verbal and physical abuse or harassment, physical intimate partner abuse or harassment, and sexual violence) and suicidal ideation. NHBS-Trans provides important data related to the goals of the Ending the HIV Epidemic in the U.S. initiative. Findings from NHBS-Trans can help guide community leaders, clinicians, and public health officials in improving access to and use of HIV prevention and treatment services by transgender women. Article	2024	Kebede, Samuel; Brazier, Ellen; Freeman, Aimee M.; Muwonge, Timothy R.; Choi, Jun Yong; de Waal, Renee; Poda, Armel; Cesar, Carina; Munyaneza, Athanase; Kasozi, Charles; Pasayan, Mark Kristoffer U.; Althoff, Keri N.; Shongo, Alisho; Low, Nicola; Ekouevi, Didier; Veloso, Valdiléa G.; Ross, Jonathan	Preexposure prophylaxis availability among health facilities participating in the global International epidemiology Databases to Evaluate AIDS (IeDEA) consortium.	AIDS	-	-	-	-	1473-5571 0269-9370	10.1097/QAD.0000000000003824	https://pubmed.ncbi.nlm.nih.gov/38133656/	BACKGROUND: While recognized as a key HIV prevention strategy, preexposure prophylaxis (PrEP) availability and accessibility are not well documented globally. We aimed to describe PrEP drug registration status and the availability of PrEP services across HIV care sites participating in the International epidemiology Databases to Evaluate AIDS (IeDEA) research consortium. METHODS: We used country-level PrEP drug registration status from the AIDS Vaccine Advocacy Coalition and data from IeDEA surveys conducted in 2014, 2017 and 2020 among participating HIV clinics in seven global regions. We used descriptive statistics to assess PrEP availability across IeDEA sites serving adult patients in 2020 and examined trends in PrEP availability among sites that responded to all three surveys. RESULTS: Of 199 sites that completed the 2020 survey, PrEP was available in 161 (81%). PrEP availability was highest at sites in North America (29/30; 97%) and East Africa (70/74; 95%) and lowest at sites in Central (10/20; 50%) and West Africa (1/6; 17%). PrEP availability was higher among sites in countries where PrEP was officially registered (146/161; 91%) than where it was not (14/32; 44%). Availability was higher at health centers (109/120; 90%) and district hospitals (14/16; 88%) compared to regional/teaching hospitals (36/63). Among the 94 sites that responded to all three surveys, PrEP availability increased from 47% in 2014 to 60% in 2017 and 76% in 2020. CONCLUSION: PrEP availability has substantially increased since 2014 and is now available at most IeDEA sites. However, PrEP service provision varies markedly across global regions. Article	2024	Keddem S.; Frye V.; Davis A.; Koblin B.A.; Tieu H.; Lipsky R.K.; Nandi V.; Teitelman A.M.	The Moderating Effects of HIV Relevant Factors on the Relationship Between Intimate Partner Violence and Intention to Start HIV Pre-exposure Prophylaxis (PrEP) Among Cisgender Women	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-024-02812-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85185125404&doi=10.1007%2fs10508-024-02812-w&partnerID=40&md5=85f74e6a90c59eeb3ed5449b064cbe89	Intimate partner violence (IPV) and HIV are serious and related public health problems that detrimentally impact women's health. Because women who experience IPV are more likely to acquire HIV, it is critical to promote HIV prevention strategies, such as HIV pre-exposure prophylaxis (PrEP), that increase autonomy. This study of cisgender women eligible for HIV PrEP took place between 2017 and 2019 in Philadelphia and New York City. This study aimed to examine the relationship between four types of IPV (control, psychological, physical, sexual) and intention to start PrEP among PrEP-eligible cisgender women and assess the extent to which HIV relevant factors moderated the association between IPV experience and intention to start PrEP. In this sample of PrEP-eligible women (n = 214), 68.7% indicated intention to start PrEP in the next 3 months. Ethnicity was strongly associated with intention to start PrEP, with Hispanic women having the highest odds of intending to start PrEP in the next 3 months. Having a controlling partner significantly predicted intention to start PrEP. Women with more than one sex partner and a controlling partner had higher odds of intending to start PrEP as compared with those who had one or no partners and had no IPV control. These findings point to a need for patient-centered interventions that address the need for safety and autonomy among cisgender, PrEP-eligible women. © This is a U.S. Government work and not under copyright protection in the US; foreign copyright protection may apply 2024. Article	2024	Keddem, Shimrit; Thatipelli, Sneha; Caceres, Omaris; Roder, Navid; Momplaisir, Florence; Cronholm, Peter	Barriers and Facilitators to Long-Acting Injectable HIV Pre-Exposure Prophylaxis Implementation in Primary Care Since Its Approval in the United States.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003370	https://journals.lww.com/jaids/abstract/2024/04010/barriers_and_facilitators_to_long_acting.9.aspx	BACKGROUND: HIV pre-exposure prophylaxis (PrEP) is a highly effective method to mitigate the HIV epidemic, but uptake of PrEP has been slow and is associated with racial and gender disparities. Oral PrEP requires high levels of adherence to be effective, which may disadvantage certain high-risk groups. The first injectable HIV PrEP, a drug given every 2 months rather than as a daily pill, was approved by the US Food & Drug Administration in December 2021. SETTING: A Family Medicine practice in a single health organization in the United States (November 2022 to February 2023). METHODS: We conducted interviews with patients and key stakeholders to characterize factors affecting long-acting injectable (LAI) PrEP implementation. Data collection and analysis were guided by the Consolidated Framework for Implementation Research. Interviews were transcribed and analyzed using guided content analysis. RESULTS: Twenty-five patients (n = 13) and practice stakeholders (n = 12) were interviewed. Overall, stakeholders described a very low uptake of LAI PrEP. Barriers to LAI PrEP included a lack of awareness, insurance and access issues, a lack of streamlined workflow, and a trust in pills over injectables. Facilitators to LAI PrEP implementation included the absence of a pill burden, a culture of shared decision making, and pharmacy support. CONCLUSIONS: Although uptake has been slow, we have identified several promising strategies for improving rollout and implementation of LAI PrEP. Approaches that can bolster rollout of LAI PrEP include having an interdisciplinary care team that is supported by PrEP navigators and pharmacists and are informed by a patient-centered model of care to increase patient engagement and trust. Article	2024	Kelly J.A.; Walsh J.L.; DiFranceisco W.J.; Amirkhanian Y.A.; Quinn K.; Brown K.D.; Pearson B.; Foster J.; Rosado A.N.; McAuliffe T.L.	AIDSImpact special issue: factors associated with PrEP use in a community sample of African American men who have sex with men (MSM) and transgender women (TGW) in the United States Midwest	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2024.2308743	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184274894&doi=10.1080%2f09540121.2024.2308743&partnerID=40&md5=42b1267e1ebcafd8812f7c7ac0107cf9	Black sexual minority men who have sex with men (MSM) in the United States are at disparate risk for contracting HIV infection, but pre-exposure prophylaxis (PrEP) use is suboptimal. Social network methods were used to recruit a community sample of racial minority MSM and transgender women (TGW) in two Midwestern US cities. 250 PrEP-eligible (HIV-negative) participants completed measures assessing current and intended PrEP use; demographic characteristics; PrEP knowledge, attitudes, norms, stigma, and self-efficacy; and structural barriers to PrEP. Multivariate analyses established predictors of current and intended PrEP use. Only 12% of participants reported currently using PrEP, which was associated with greater PrEP knowledge and not having a main partner, with trends for greater PrEP use by younger participants and those with partners living with HIV. Among participants not currently on PrEP, strength of PrEP use intentions was associated with higher PrEP knowledge, PrEP descriptive social norms, and PrEP use self-efficacy. This study is among few to directly compare Black who have adopted PrEP with those who have not. Its findings underscore the potential benefits of employing social network approaches for strengthening PrEP use peer norms, increasing PrEP knowledge and self-efficacy, and optimizing PrEP uptake among racial minority MSM and TGW. © 2024 The Author(s). Article	2024	Kerbler M.K.; Isaacs C.; Eatmon C.; Reid J.; Davis K.W.	Impact of an HIV pre-exposure prophylaxis dashboard on veteran PrEP enrollment	Journal of the American Pharmacists Association	-	-	-	-	15443191	10.1016/j.japh.2024.01.002	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184076506&doi=10.1016%2fj.japh.2024.01.002&partnerID=40&md5=f0621c6cee5ca89afb6fe38dc8311524	Background: Pre-exposure prophylaxis (PrEP) is highly effective at reducing the risk of human immunodeficiency virus (HIV) acquisition in at-risk individuals; however, it is largely underutilized. The Veterans Health Administration has created an HIV PrEP dashboard to identify at-risk veterans in attempt to increase PrEP enrollment. Objective: This study aimed to determine whether the use of an HIV PrEP dashboard would prove effective at increasing PrEP enrollment at a single facility. Methods: This was a single-center quality improvement project. Three pharmacists used the HIV PrEP dashboard and retrospective chart review to identify eligible patients for PrEP. A multimodal process of contacting patients was conducted. The primary objective was to evaluate the number of patients who enrolled in PrEP during the study period. Secondary objectives included evaluating the ability of the HIV PrEP dashboard to identify eligible patients, identify effective strategies to target PrEP enrollment, and compare those patients who accepted with those who declined PrEP to evaluate barriers to enrollment. Results: Of the 94 patients reviewed, 26 patients (27.7%) were found eligible for PrEP. Of the eligible patients, 3 patients (11.5%) were enrolled, and 7 patients (26.9%) declined PrEP. The others were lost to follow-up (9 of 26, 34.6%), had no action taken on a chart note to provider (6 of 26, 23.1%), or did not have a primary care provider assigned at the local facility (1 of 26, 3.9%). The 3 patients who were successfully enrolled in PrEP were all contacted and prescribed PrEP through the infectious diseases (ID) clinic. There were no statistically significant differences between the cohorts of patients who accepted and declined PrEP. Conclusions: The use of an HIV PrEP dashboard aided in identifying eligible patients for PrEP. Enrollment through the ID clinic was the most successful modality. Further research is needed to characterize barriers to PrEP uptake and to develop strategies to increase prescribing from non-ID providers. © 2024	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2024	Kerr J.; Combs R.; Sterrett-Hong E.; Harris L.; Northington T.; Krigger K.; Parker K.	Evaluation of a community-informed multimedia intervention to increase PrEP awareness and intention among African American young adults	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2023.2297739	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184734751&doi=10.1080%2f09540121.2023.2297739&partnerID=40&md5=1d213c321eb0646aa93192d9484b54b7	Despite the benefits of pre-exposure prophylaxis (PrEP) in preventing HIV and its potential for reducing racial/ethnic HIV inequities, PrEP remains underutilized among African Americans who may benefit from it. Factors of PrEP uptake include awareness and acceptability of this prevention strategy among this group, yet few community-informed interventions have been developed and evaluated to address these challenges. Thus, this study evaluates the effectiveness of a community-informed, six-month multimedia campaign (print, digital media, internet radio, social media) for African American young adults (age 18–29) in Louisville, Kentucky to increase PrEP awareness and PrEP use intentions. Pretest surveys, posttest surveys, and digital analytic metrics were used to determine campaign effectiveness. Logistic regressions indicate increased PrEP awareness over time (p ≤ 0.0001) and greater PrEP intention among participants reporting greater campaign affinity (p ≤ 0.05). Campaign digital analytic performance was similar to or exceeded that of industry competitors (e.g., healthcare organizations). Findings indicate that a community-informed multimedia campaign increased PrEP use intentions among those exhibiting greater campaign affinity (the extent to which participants report a favorable view of the campaign) and demonstrated similar or greater effectiveness in digital elements as industry competitors at a cost-effective price. Future studies should incorporate community-engaged approaches in developing health communication products for greater PrEP acceptability and efficiency. Article	2024	King, Hope; Thornton, Nicole; Evans, Kimberly N.; Tadfor, Yomi; German, Danielle; Flynn, Colin; Jennings, Jacky; Fields, Errol L.	Factors Associated with the Awareness of and Willingness to Use HIV Pre-exposure Prophylaxis Among Gay, Bisexual, and Other Men Who Have Sex with Men, Baltimore, MD, 2017-2019.	Journal of Racial and Ethnic Health Disparities	-	-	-	-	2196-8837	10.1007/s40615-024-01954-w	https://pubmed.ncbi.nlm.nih.gov/38436888/	Pre-exposure prophylaxis (PrEP) is an effective tool in protecting persons from acquiring HIV infection through sex or injection drug use. However, awareness and willingness to use PrEP among Black gay, bisexual, and other men who have sex with men (BMSM) remain suboptimal compared to White MSM (WMSM) in the United States. Our aims were to (1) assess the factors associated with PrEP awareness and willingness to use PrEP among MSM and (2) compare the PrEP perceptions among BMSM versus non-Black MSM. Data were drawn from two cross-sectional behavioral surveys in Baltimore, MD: Behavioral Surveillance Research (BESURE) conducted in 2017, and Safe Spaces 4 Sexual Health (SS4SH), conducted in 2018 and 2019. Descriptive statistics were used to summarize the study population. We used Poisson regression models to identify variables associated with awareness of PrEP and willingness to use PrEP. PrEP perceptions were assessed via 13 items scored on a 5-point Likert scale. Finally, we conducted a post-hoc exploratory bivariate analysis of the relationship between PrEP perception and willingness to use PrEP, stratified by race/ethnicity. A total of 261 MSM participated in this study. Many of the participants were aware of PrEP (75.1%). Factors associated with greater PrEP awareness included having greater than a high school education (aRR 1.22, 95% CI 1.04, 1.43); and earning more than $25,000 annually (aRR 1.24, 95% CI 1.08, 1.42). Participants who had received money in exchange for sex one or more times were less likely to be aware of PrEP (aRR 0.59, 95% CI 0.36, 0.95). More than half of the participants were willing to use PrEP (55.3%). In bivariate and multivariable analyses, demographic or behavioral characteristics were not significantly associated with willingness to use PrEP. Higher agreement with the following statements was associated with lower willingness to use PrEP: "Having to take a pill every day is difficult" (RR 0.89, 95% CI 0.82-0.97) and, "I am concerned about the side effects of PrEP" (RR 0.89, 95% CI 0.82-0.96), and "PrEP is for people who have riskier sex lives than I do" (RR 0.86, 95% CI 0.78-0.95). Conversely, higher willingness to use PrEP was associated with comfortable having sex without a condom (RR 1.11, 95% CI 1.02-1.21), less anxious about sex (RR 1.12, 95% CI 1.02-1.24), and my friends think that I should take PrEP (RR 1.19, 95% CI 1.07-1.32). We found BMSM compared to non-Black MSM had higher mean scores related to taking a daily pill (p = 0.041), concerns about side effects (p = 0.012), concerns about people thinking they had HIV (p = 0.001), concerns about the financial costs of PrEP (p = 0.038) and caution when dealing with healthcare organizations/medical mistrust (p = 0.019). Perceptions with a statistically significant lower score among BMSM versus non-Black MSM included statements such as, comfortable having sex without a condom (p = 0.003) and less anxious about sex (p < 0.001). We conclude HIV prevention strategies, programs, and interventions should be cognizant of PrEP perceptions that facilitate or hinder PrEP uptake in Baltimore City, MD. Article	2024	Kinsale, Talisa S.; Cottrell, Mackenzie L.; Li, Linying; Brand, Rhonda; Gatto, Greg; Luecke, Ellen; Norton, Chasity; Krovi, Archana; Dumond, Julie B.; Rao, Gauri; Yeshwante, Shekhar; Van Horne, Brian; Van Der Straten, Ariane; Kashuba, Angela D. M.; Johnson, Leah M.	Pharmacokinetic Modeling to Guide Preclinical Development of an Islatravir-Eluting Reservoir-Style Biodegradable Implant for Long-Acting HIV PrEP.	Pharmaceutics	-	-	-	-	1999-4923	10.3390/pharmaceutics16020201	https://pubmed.ncbi.nlm.nih.gov/38399255/	Long-acting injectable cabotegravir is more effective than daily oral PrEP at preventing HIV transmission due to improved adherence, but requires bi-monthly large-volume intramuscular injections. Subcutaneous (SC) contraceptive implants can be formulated with antiretrovirals for extended-duration HIV PrEP. Islatravir (ISL) is a first-in-class, investigational antiretroviral with pharmacologic properties well-suited for implant delivery. We performed preclinical studies for the development of a reservoir-style, poly(ε-caprolactone) ISL-eluting implant by conducting a single-dose SC ISL dose-ranging pharmacokinetic (PK) study of 0.1, 0.3, and 1 mg/kg in adult Wistar rats. Non-compartmental analysis was conducted, and dose proportionality assessed for ISL plasma and intracellular islatravir-triphosphate (ISL-tp). Population PK models estimated ISL's unit impulse response to deconvolve ISL-implant in vivo absorption rate (mg/day) and cumulative mass (mg) from published rat plasma PK (n = 10). Drug release was interpreted using four kinetic models. Dose proportionality was affirmed for ISL and ISL-tp. A first-order, two-compartment model fitted the SC ISL bolus data. Mean (SD) absorption rate from 0 to 154 days was 0.072 ± 0.024 mg/day, and cumulative mass at 154 days was 8.67 ± 3.22 mg. ISL absorption was well-described by zero-order (r(2) = 0.95) and Ritger-Peppas (r(2) = 0.98). Our zero-order ISL-release poly(ε-caprolactone) implant is projected to achieve clinical PK above ISL-tp's PrEP efficacy threshold. Continued development for HIV PrEP applications is warranted.	antiretroviral agents; HIV prevention; preexposure prophylaxis; long-acting implant; islatravir; extended-duration	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2024	Kohli, Manik; Reeves, Iain; Waters, Laura	Homophobia in the provision of sexual health care in the UK.	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(23)00302-8	https://pubmed.ncbi.nlm.nih.gov/38218200/	Decision making in the provision of health care is influenced by not only scientific evidence but also by the systems in which decisions are made. We consider national decisions made in the UK related to sexually transmitted infection prevention in gay, bisexual, and other men who have sex with men (GBMSM), with three specific examples-HIV pre-exposure prophylaxis, mpox (formerly known as monkeypox) vaccination, and doxycycline prophylaxis. We suggest that entrenched societal and political homophobia results in unacceptable delays and limitations to accessing highly effective interventions and that these delays result in harm from preventable transmissions of HIV, mpox, and syphilis. GBMSM have been affected disproportionately by HIV, mpox, and bacterial sexually transmitted infections, and there is an ongoing unmet need for effective prevention. Denying access to public health interventions that meet these needs is unethical. Article	2024	Kota, Krishna Kiran; Gelaude, Deborah; Carnes, Neal; Schoua-Glusberg, Alisú; Frew, Paula M.; Randall, Laura; Gale, Bryan; Betley, Valerie; Mansergh, Gordon	Low Self-Perceived Need for PrEP and Behavioral Indications of MSM Who Recently Refused Daily PrEP: A Mixed Methods Study in Three U.S. Cities.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-024-04276-4	https://pubmed.ncbi.nlm.nih.gov/38457051/	Pre-exposure prophylaxis (PrEP) reduces sexual risk for HIV transmission by 99% when used appropriately, but remains underutilized among gay, bisexual, and other men who have sex with men (MSM). In this mixed-method study, we describe reasons for PrEP refusal associated with low self-perceived need for PrEP among MSM who recently declined daily oral PrEP when offered by a provider. Data are from a quantitative behavioral survey of MSM (N = 93) living in Atlanta, Chicago, and Raleigh-Durham, who also either responded to an in-depth interview (n = 51) or participated in one of 12 focus groups (n = 42). Themes of low self-perceived need for PrEP were: low self-perceived risk for HIV acquisition (33% of respondents); confidence in remaining HIV-negative (35%); using condoms (81%); limiting number of partners and choosing partners carefully (48%); asking partners about their HIV status before having sex (45%); engaging in safer sexual positions or oral sex (28%); being in a monogamous relationship or exclusivity with one partner (26%); and regular HIV testing (18%). Low self-perceived risk for HIV acquisition and high confidence in other prevention strategies were important factors related to low self-perceived need in MSM refusing daily oral PrEP when offered. Providers should continue to discuss the benefits of PrEP as a safe and highly effective option for HIV prevention. Article	2024	Laban, Muteebwa; Nakku, Edith Joloba; Nangendo, Joan; Muramuzi, Dan; Akello, Faith; Bakeera, Sabrina Kitaka; Semitala, Fred Collins; Semeere, Aggrey S; Karamagi, Charles	Acceptability of short message service reminders as the support tool for PrEP adherence among young women in Mukono district, Uganda.	PLOS Global Public Health	-	-	-	-	2767-3375	10.1371/journal.pgph.0002492	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10760663	Adolescent girls and young women (AGYW) have a disproportionately high incidence of HIV compared to males of the same age in Uganda. AGYW are a priority sub-group for daily oral Pre-Exposure Prophylaxis (PrEP), but their adherence has consistently remained low. Short Message Service (SMS) reminders could improve adherence to PrEP in AGYW. However, there is paucity of literature about acceptability of SMS reminders among AGYW using PrEP. We assessed the level of acceptability of SMS reminders as a PrEP adherence support tool and the associated factors, among AGYW in Mukono district, Central Uganda. We consecutively enrolled AGYW using PrEP in Mukono district in a cross sectional study. A structured pre-tested questionnaire was administered to participants by three trained research assistants. Data were analyzed in STATA 17.0; continuous variables were summarized using median and interquartile range (IQR) while categorical variables were summarized using frequencies and percentages. Acceptability of SMS was defined as willingness to accept SMS reminders to support PrEP adherence and was assessed using the seven constructs of the theoretical framework of acceptability. The relationship between the outcome and independent variables was assessed using a modified Poisson regression with robust standard errors. During the month of August 2022, 142 AGYW with median age 22 years (IQR; 18, 24) of whom 80.3% owned a personal mobile phone were assessed. SMS reminders were highly acceptable 90.9%, 95% Confidence Interval (CI) 84.9, 95.0. Rural residence was negatively associated with acceptability of SMS reminders (aPR: 0.92, 95% CI (0.84, 0.99)) and having belief that SMS cannot breach individual's privacy (aPR: 1.40, 95% CI (1.07, 1.84)) was positively associated with acceptability of SMS reminders. The acceptability of SMS reminders was high in this sub-population. SMS reminder can be leveraged to support AGYW to adhere to PrEP but should be designed in a way that maintains confidentiality, and supports AGYW living in rural settings. Article	2024	Lee, Jane J.; Kerani, Roxanne P.; Robles, Gabriel; Sanchez, Travis H.; Katz, David A.	Reasons for Migration and Their Associations with HIV Risk and Prevention Among Cisgender Sexual Minority Men: A Latent Class Analysis.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04204-y	https://pubmed.ncbi.nlm.nih.gov/37812273/	The immigrant population in the United States (U.S.) is rapidly growing; yet there is limited knowledge about how reasons for migrating to the U.S. are associated with HIV prevention behaviors. Using data from the American Men's Internet Survey (2018-2020), we performed a Latent Class Analysis (LCA) to identify patterns in reasons for migration among cisgender gay, bisexual, and other sexual minority men (SMM) who born outside the U.S. We used multivariable logistic regression controlling for demographic characteristics to assess class associations with the following in the past 12 months: condomless anal sex (CAS), illicit drug use, marijuana use, HIV testing, and PrEP use. LCA identified six distinct patterns in reasons for migration among the sample (n = 1,657): (1) Family and friends (14%); (2) Financial (17%); (3) Personal freedom related to being gay (10%); (4) Pursuit of opportunities while living openly as SMM (12%); (5) Educational purposes (18%); (6) Not my decision (29%). While HIV testing (range = 57.6-65.4%) and PrEP use (range = 15.6-21.4%) did not vary by class (p > .05 for all), CAS and illicit drug use were significantly different (p < .05). SMM who migrated to pursue opportunities while living openly and whose reasons were not their decision had greater odds of CAS than SMM who migrated for educational purposes (aOR:1.72, 95% confidence interval 95%CI:1.15-2.59; 1.57, 1.13-2.19, respectively). Reasons for migration among SMM were associated with behaviors that can increase HIV risk, but not testing or PrEP. Push and pull factors related to migration should be considered when developing behavioral HIV interventions for immigrant SMM. Article	2024	Lepik, Katherine J.; Hunt, Olivia L.; Bacani, Nic; Wang, Lu; Harris, Marianne; Toy, Junine; McLinden, Taylor; Sereda, Paul; Akagi, Linda J.; Ready, Erin; Montaner, Julio Sg; Barrios, Rolando	Adverse drug reactions attributed to generic substitution of antiretroviral medications among HIV treatment and pre-exposure prophylaxis clients in British Columbia, Canada.	Antiviral Therapy	-	-	-	-	2040-2058 1359-6535	10.1177/13596535241233128	https://pubmed.ncbi.nlm.nih.gov/38375582/	BACKGROUND: In British Columbia, antiretrovirals (ARVs) for HIV treatment (HIV-Tx) and pre-exposure prophylaxis (PrEP) are free-of-charge through publicly-funded Drug Treatment Programs (DTPs). When available, less costly generics are substituted for brand-name ARVs. We describe the incidence and type of product substitution issue (PSI) adverse drug reactions (ADRs) attributed to generic ARVs. METHODS: Cohorts included DTP clients ≥19 years who received generic ARVs for HIV-Tx (abacavir-lamivudine, emtricitabine-tenofovir DF, efavirenz-emtricitabine-tenofovir DF, atazanavir or darunavir between 01 Jun 2017 and 30 Jun 2022) or PrEP (emtricitabine-tenofovir DF, 01 Apr 2018 to 30 Jun 2022). Demographic, ARV and ADR data were extracted from DTP databases and summarized by descriptive statistics. PSI incidence was calculated for each product during the year following brand-to-generic and generic-to-generic transitions (first-year-post-rollout), and compared between generic versions using generalized estimating equations. For context, incidence of any ARV product-related ADR was calculated in the same 1-year periods. RESULTS: During first-year-post-rollout periods, 5339 HIV-Tx (83% male, median age 52 years) and 8095 PrEP (99% male, median 33 years) clients received generic ARVs, and reported 78 and 23 generic PSIs, respectively. PSI incidence was <1% for most generic ARVs, with mild-moderate symptoms including gastrointestinal upset, headache, dizziness, fatigue/malaise and skin rash. In HIV-Tx clients, the efavirenz-containing product had higher PSI incidence than other ARVs (2.2%, p = .004), due to more neuropsychiatric adverse reactions. Any ADR incidence was stable across measurement periods, and generic PSIs represented less than one third of all product-related ADRs. CONCLUSIONS: Generic substitution of antiretrovirals for HIV-Tx and PrEP were well tolerated, with ≤2% incidence of mild-moderate PSI ADRs. Article	2024	Li L.X.; Lin J.S.; Tackett S.; Bertram A.; Sisson S.D.; Rastegar D.; Berkenblit G.	Knowledge of Pre- and Postexposure Prophylaxis for HIV Prevention Among Internal Medicine Residents in the United States	AIDS Education and Prevention	-	-	-	-	19432755	10.1521/aeap.2024.36.1.48	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85185146020&doi=10.1521%2faeap.2024.36.1.48&partnerID=40&md5=bac7d9e112351625b451b4171af73fd5	Prescription rates of pre-exposure prophylaxis (PrEP) have remained low among noninfectious disease providers in the United States despite almost a decade since their introduction. For future primary care doctors, residency is the optimal time to build practice patterns around HIV prevention. We assessed baseline knowledge of PrEP in specific pre- and post-exposure prophylaxis content areas among internal medicine trainees who completed the Physician Education and Assessment Center HIV learning module between 2013 to 2020 (N = 12,060). Resident baseline PrEP knowledge was universally low; despite rising awareness of antiretroviral therapy for PrEP in successive years following the nadir of 41% in 2014, still only 56% of residents affirmed this means of HIV prevention by 2020. Knowledge remained limited regardless of academic year, local HIV prevalence, or training program type. Online module completion increased competence across all content areas. There is still a deficit in HIV prevention knowledge across U.S. internal medicine residents, suggesting insufficient education and exposure to HIV-related care. Article	2024	Lim, Sahnah; Mantsios, Andrea; Braithwaite, Ronald S.; Pitts, Robert	A secondary gendered analysis of interviews with Latina cisgender women indicated for HIV pre-exposure prophylaxis.	AIDS Care	-	-	-	-	1360-0451 0954-0121	10.1080/09540121.2024.2325070	https://pubmed.ncbi.nlm.nih.gov/38466205/	HIV infections disproportionately impact Latinx populations in the United States, yet oral pre-exposure prophylaxis (PrEP) uptake is low. This study was a secondary gendered analysis of interviews with Latina cisgender women (n = 20) recruited from an urban safety net hospital inNew York City between August 2019 and October 2022. All women were indicated for PrEP by the provider. In-depth interviews were conducted with participants in English and Spanish and asked about social determinants of health, sexual partnerships and behaviors, and PrEP-specific enablers and barriers. Secondary thematic content analysis was conducted to identify gender-related factors influencing PrEP uptake. The following themes emerged from the data:structural factors (e.g., employment), partner-related factors, low sexual health knowledge, and resilience and empowerment. Partner-related factors were the most salient; partner infidelity served as reasons for initiating PrEP. Despite being constrained by low power in relationships, women made empowered choices to initiate PrEP and protect themselves. Findings indicated that the impact of gender inequity was an important factor in Latina women's PrEP decision making, pointing to a need to address partner-driven HIV risk, imbalance of power in relationships, and gender norms. Article	2024	Liu Y.; Siddiqi K.A.; Cho H.; Park H.; Prosperi M.; Cook R.L.	Demographics, Trends, and Clinical Characteristics of HIV Pre-Exposure Prophylaxis Recipients and People Newly Diagnosed with HIV from Large Electronic Health Records in Florida	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2023.0220	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182545082&doi=10.1089%2fapc.2023.0220&partnerID=40&md5=10b4cdf075eead1a764946d86d30edb8	Florida is one of the HIV epicenters with high incidence and marked sociodemographic disparities. We analyzed a decade of statewide electronic health record/claims data—OneFlorida+—to identify and characterize pre-exposure prophylaxis (PrEP) recipients and newly diagnosed HIV cases in Florida. Refined computable phenotype algorithms were applied and a total of 2186 PrEP recipients and 7305 new HIV diagnoses were identified between January 2013 and April 2021. We examined patients' sociodemographic characteristics, stratified by self-reported sex, along with both frequency-driven and expert-selected descriptions of clinical conditions documented within 12 months before the first PrEP use or HIV diagnosis. PrEP utilization rate increased in both sexes; higher rates were observed among males with sex differences widening in recent years. HIV incidence peaked in 2016 and then decreased with minimal sex differences observed. Clinical characteristics were similar between the PrEP and new HIV diagnosis cohorts, characterized by a low prevalence of sexually transmitted infections (STIs) and a high prevalence of mental health and substance use conditions. Study limitations include the overrepresentation of Medicaid recipients, with over 96% of female PrEP users on Medicaid, and the inclusion of those engaged in regular health care. Although PrEP uptake increased in Florida, and HIV incidence decreased, sex disparity among PrEP recipients remained. Screening efforts beyond individuals with documented prior STI and high-risk behavior, especially for females, including integration of mental health care with HIV counseling and testing, are crucial to further equalize PrEP access and improve HIV prevention programs. © 2024 Mary Ann Liebert Inc.. Article	2024	Liu, Albert Y.; Gundacker, Holly; Richardson, Barbra; Chen, Beatrice A.; Hoesley, Craig; van der Straten, Ariane; Brown, Amanda; Beamer, May; Robinson, Jennifer; Jacobson, Cindy E.; Scheckter, Rachel; Bunge, Katherine; Schwartz, Jill; Thurman, Andrea; Piper, Jeanna M.; Marzinke, Mark A.	Phase 1 randomized pharmacokinetic and safety study of a 90-day tenofovir vaginal ring in the United States.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26223	https://pubmed.ncbi.nlm.nih.gov/38444118/	INTRODUCTION: Tenofovir-based oral pre-exposure prophylaxis is currently approved for HIV prevention; however, adherence in women has been low. A vaginal gel containing tenofovir (TFV) demonstrated partial protection to HIV but protection was not confirmed in additional studies. Vaginal rings offer user-controlled long-acting HIV prevention that could overcome adherence and protection challenges. TFV may also help prevent herpes simplex virus type 2 acquisition when delivered intravaginally. We evaluated the pharmacokinetics, safety, adherence and acceptability of a 90-day TFV ring. METHODS: Between January and June 2019, Microbicide Trials Network (MTN)-038 enrolled 49 HIV-negative participants into a phase 1, randomized (2:1) trial comparing a 90-day ring containing 1.4 grams (g) TFV to a placebo ring. TFV concentrations were quantified in plasma, cervicovaginal fluid (CVF), rectal fluid and cervical tissue, and TFV-diphosphate (TFV-DP) in cervical tissue. Used rings were analysed for residual TFV. Safety was assessed by adverse events (AEs); acceptability and adherence by self-report. RESULTS: Mean age was 29.5; 46 identified as cisgender-female and three gender non-conforming. There were no differences in the proportion of participants with grade ≥2 genitourinary AEs in the TFV versus placebo arms (p = 0.41); no grade ≥3 AEs were reported. Geometric mean TFV concentrations increased through day 34 in CVF/rectal fluid and day 59 in plasma, but declined across compartments by day 91. Geometric mean TFV-DP tissue concentrations exceeded the 1000 fmol/mg target through day 56, but fell to 456 fmol/mg at day 91. Among 32 rings returned at the end of the study, 13 had no or low (<0.1 g) residual TFV. Residual TFV did not differ by socio-demographics, sexual activity, Nugent Score or vaginal microbiota. Most participants reported being fully adherent to ring use: 85% and 81% in the TFV and placebo arms, respectively (p = 1.00). A majority of participants reported liking the ring (median 8 on a 10-point Likert scale) and reported a high likelihood of using the ring in the future, if effective (median 9). CONCLUSIONS: The 90-day TFV ring was well-tolerated, acceptable and exceeded target cervical tissue concentrations through day 56, but declined thereafter. Additional studies are needed to characterize the higher release from TFV rings in some participants and the optimal duration of use. Article	2024	Lozano A.; Weinstein E.R.; Fernandez A.; Bainter S.; Atuluru P.; Hurtado A.; Morales V.; Prado G.; Safren S.A.; Harkness A.	Refining Multilevel Barrier and Facilitator Measures for HIV Testing and PrEP Among Latino Sexual Minority Men	American Journal of Health Promotion	-	-	-	-	8901171	10.1177/08901171231198430	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85170102649&doi=10.1177%2f08901171231198430&partnerID=40&md5=1686e10b69f9c3a13357df2e8e4ded75	Purpose: The purpose of this study is to refine and establish measures of multilevel barriers and facilitators to HIV testing and PrEP for Latino sexual minority men (LSMM). Design: Cross-sectional measure validation. Setting: Participants from Miami, FL. Subjects: 290 LSMM from the DÍMELO study. Measures: Based on prior qualitative work, we developed two measures that evaluated multiple determinants (i.e., barriers and facilitators) to (1) HIV testing and (2) PrEP use. Analysis: All measures included in this analysis assessed a set of theoretically distinct barriers and facilitators. We performed 11 exploratory factor analyses (EFA) to assess the dimensionality of theoretical groupings of items informed by prior qualitative work, including: knowledge, perceived need and benefit, mistrust and concerns, stigma and normalization, cultural competence, navigation support, provider demeanor, clinic and medical system issues, privacy concerns, cost, and language and immigration barriers. Based on EFA results, we conducted two confirmatory factor analyses (CFA), one for each measure. Results: Within each measure, the 11 EFAs extracted 10 barrier factors and 7 facilitator factors. The CFAs for HIV testing and PrEP measures were consistent, such that all models retained the structures identified in the EFAs. Conclusion: Findings support the use of these measures with LSMM. These measures can inform multilevel implementation strategies for health promotion professionals to scale up and disseminate HIV prevention services to LSMM. © The Author(s) 2023. Article	2024	Ma J.; Owens C.; Valadez-Tapia S.; Brooks J.J.; Pickett J.; Walter N.; Macapagal K.	Adult Stakeholders' Perspectives on the Content, Design, and Dissemination of Sexual and Gender Minority Adolescent-Centered PrEP Campaigns	Sexuality Research & Social Policy	-	-	-	-	18689884	10.1007/s13178-023-00826-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160754877&doi=10.1007%2fs13178-023-00826-y&partnerID=40&md5=7fc6203dc7d7d8c5433c684a875611a5	Introduction: This qualitative study examined the perspectives of sexual and gender minority (SGM) teen-focused HIV pre-exposure prophylaxis (PrEP) social marketing campaigns among Chicago-area adults who work with or parent SGM teens. Methods: Thirty adults (M age = 37.5 years; 53.3% racial/ethnic minority) participated in online interviews from March to June 2021. Questions elicited their preferences for the design, content, and dissemination of SGM teen-centered PrEP campaigns. Transcripts were analyzed through inductive content analysis. Results: Participants discussed benefits (e.g., cultivate awareness of HIV prevention, destigmatize sex, encourage PrEP conversations) and concerns (e.g., PrEP's safety, access to PrEP) about teen-centered PrEP campaigns. Adults emphasized that teen-centered PrEP campaigns should appeal to adolescents, regardless of SGM identity, as the teens they knew prioritized inclusivity. At the same time, campaigns were recommended to be tailored enough to resonate with SGM teens and others disproportionately affected by HIV. Participants also suggested including clear instructions and calls to action and testimonials from other SGM teens. Finally, respondents recommended online and offline spaces for the delivery of such campaigns, like social media, youth-serving organizations, and public transportation. Conclusions: These findings lay the groundwork for designing teen-centered PrEP campaigns in Chicago and may guide similar campaigns in other jurisdictions. Adults in SGM teens' lives may use these findings to optimize teens' access to PrEP. Policy Implications: Policymakers and public health professionals can work together to make adolescents more aware of sexual health services like PrEP and where they can be accessed via social marketing campaigns. This may ultimately narrow adolescent health disparities. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2024	Ma, Emily C.; Rogers, Brooke G.; Chan, Philip A.; Toma, Emily; Almonte, Alexi; Napoleon, Siena; Galipeau, Drew; Ahluwalia, Jasjit S.; Murphy, Matthew	Characterizing Interest in and Uptake of Preexposure Prophylaxis for HIV Prevention Among Men in a US State Correctional System.	Sexually Transmitted Diseases	-	-	-	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001912	https://pubmed.ncbi.nlm.nih.gov/38412463/	BACKGROUND: People experiencing incarceration are disproportionately impacted by HIV and are potential candidates for HIV preexposure prophylaxis (PrEP). We explored factors associated with PrEP interest and PrEP uptake and described barriers to PrEP uptake among incarcerated men in a state correctional system. METHODS: From September 2019 to July 2022, incarcerated men at the Rhode Island Department of Corrections were screened for PrEP eligibility and referred to a PrEP initiation study. We used bivariate analyses and multivariable logistic regression models to explore factors associated with PrEP interest and uptake in the screening sample. RESULTS: Of the men screened and determined to be eligible for PrEP, approximately half (50%) were interested in taking PrEP. Individuals identifying as men who have sex with men (adjusted odds ratio, 4.46; 95% confidence interval, 1.86-11.4) and having multiple female sex partners (adjusted odds ratio, 2.98; 95% confidence interval, 1.47-6.27) were more likely to express interest in PrEP (interested/not interested) than those not reporting these behavioral factors. Preexposure prophylaxis uptake (yes/no) was 38%. Lack of PrEP interest, low self-perceived risk of HIV acquisition, and unpredictable lengths of incarceration were the most frequently encountered barriers to PrEP uptake. CONCLUSIONS: Men reporting sexual transmission behaviors were more interested in PrEP and had higher uptake than other men. Preexposure prophylaxis interest and HIV risk factors were both moderately high, which suggests that men experiencing incarceration should be screened for and offered PrEP as part of standard clinical care. Study findings have important implications for research and practice to adapt PrEP care to correctional systems. Article	2024	Makusha T.; Gittings L.	The path towards an HIV-free generation: engaging adolescent boys and young men (ABYM) in sub-Saharan Africa from lessons learned and future directions	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2024.2307391	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85183399552&doi=10.1080%2f09540121.2024.2307391&partnerID=40&md5=f40995e32435358618a09e3bcc5a5cb1	This paper highlights the pressing need to address the HIV epidemic among adolescent boys and young men (ABYM) in sub-Saharan Africa. Despite progress in HIV prevention, ABYM still experience low diagnosis rates, treatment adherence, and linkage to care. The paper emphasizes ABYM's vulnerability due to societal norms, limited healthcare access, and economic pressures. It calls for gender-responsive interventions, including comprehensive sexual education, youth-friendly health services, community engagement, and targeted outreach. Comprehensive sexual education is pivotal in HIV prevention for ABYM, providing them with age-appropriate sexual health knowledge and safer sexual practices to reduce HIV incidence. Harmful masculine norms must be countered to promote respectful relationships, benefiting boys, men, and their partners. Inadequate access to youth-friendly health services hampers HIV prevention. Establishing spaces with confidential, non-judgmental care offering testing, counselling, circumcision, and provision of pre-exposure prophylaxis (PrEP) is essential, especially considering ABYM's unique clinic experiences. Engaging communities, leaders, educators, and peers combats stigma and discrimination. ABYM's input in intervention design, targeted outreach, and innovative technology enhances effectiveness of HIV prevention programmes. Economic factors should also be addressed. Comprehensive multi-sectoral interventions, including conditional cash transfers, effective for AGYW, could benefit ABYM. Addressing structural factors alongside behaviour change and social support is key. © 2024 The Author(s). Published by Informa UK Limited, trading as Taylor & Francis Group. Article	2024	Marrazzo, Jeanne; Tao, Li; Becker, Marissa; Leech, Ashley A.; Taylor, Allan W.; Ussery, Faith; Kiragu, Michael; Reza-Paul, Sushena; Myers, Janet; Bekker, Linda-Gail; Yang, Juan; Carter, Christoph; de Boer, Melanie; Das, Moupali; Baeten, Jared M.; Celum, Connie	HIV Preexposure Prophylaxis With Emtricitabine and Tenofovir Disoproxil Fumarate Among Cisgender Women.	JAMA - Journal of the American Medical Association	-	-	-	-	1538-3598 0098-7484	10.1001/jama.2024.0464	https://pubmed.ncbi.nlm.nih.gov/38427359/	IMPORTANCE: Emtricitabine and tenofovir disoproxil fumarate (F/TDF) for HIV preexposure prophylaxis (PrEP) is highly effective in cisgender men who have sex with men (MSM) when adherence is high (>4 doses/week). Real-world effectiveness and adherence with F/TDF for PrEP in cisgender women is less well characterized. OBJECTIVE: To characterize the effectiveness of F/TDF for PrEP and its relationship with adherence in cisgender women. DESIGN, SETTING, AND PARTICIPANTS: Data were pooled from 11 F/TDF PrEP postapproval studies conducted in 6 countries that included 6296 cisgender women aged 15 to 69 years conducted from 2012 to 2020. HIV incidence was evaluated according to adherence level measured objectively (tenofovir diphosphate concentration in dried blood spots or tenofovir concentration in plasma; n = 288) and subjectively (electronic pill cap monitoring, pill counts, self-report, and study-reported adherence scale; n = 2954) using group-based trajectory modeling. EXPOSURES: F/TDF prescribed orally once a day. HIV incidence was analyzed in subgroups based on adherence trajectory. MAIN OUTCOMES AND MEASURES: HIV incidence. RESULTS: Of the 6296 participants, 46% were from Kenya, 28% were from South Africa, 21% were from India, 2.9% were from Uganda, 1.6% were from Botswana, and 0.8% were from the US. The mean (SD) age at PrEP initiation across all studies was 25 (7) years, with 61% of participants being younger than 25 years. The overall HIV incidence was 0.72 per 100 person-years (95% CI, 0.51-1.01; 32 incident HIV diagnoses among 6296 participants). Four distinct groups of adherence trajectories were identified: consistently daily (7 doses/week), consistently high (4-6 doses/week), high but declining (from a mean of 4-6 doses/week and then declining), and consistently low (less than 2 doses/week). None of the 498 women with consistently daily adherence acquired HIV. Only 1 of the 658 women with consistently high adherence acquired HIV (incidence rate, 0.13/100 person-years 95% CI, 0.02-0.92). The incidence rate was 0.49 per 100 person-years (95% CI, 0.22-1.08) in the high but declining adherence group (n = 1166) and 1.27 per 100 person-years (95% CI, 0.53-3.04) in the consistently low adherence group (n = 632). CONCLUSIONS AND RELEVANCE: In a pooled analysis of 11 postapproval studies of F/TDF for PrEP among cisgender women, overall HIV incidence was 0.72 per 100 person-years; individuals with consistently daily or consistently high adherence (4-6 doses/week) to PrEP experienced very low HIV incidence. Article	2024	May, Sarah B.; Giordano, Thomas P.; Gottlieb, Assaf	Generalizable pipeline for constructing HIV risk prediction models across electronic health record systems.	Journal of the American Medical Informatics Association	-	-	-	-	1527-974X 1067-5027	10.1093/jamia/ocad217	https://pubmed.ncbi.nlm.nih.gov/37990631/	OBJECTIVE: The HIV epidemic remains a significant public health issue in the United States. HIV risk prediction models could be beneficial for reducing HIV transmission by helping clinicians identify patients at high risk for infection and refer them for testing. This would facilitate initiation on treatment for those unaware of their status and pre-exposure prophylaxis for those uninfected but at high risk. Existing HIV risk prediction algorithms rely on manual construction of features and are limited in their application across diverse electronic health record systems. Furthermore, the accuracy of these models in predicting HIV in females has thus far been limited. MATERIALS AND METHODS: We devised a pipeline for automatic construction of prediction models based on automatic feature engineering to predict HIV risk and tested our pipeline on a local electronic health records system and a national claims data. We also compared the performance of general models to female-specific models. RESULTS: Our models obtain similarly good performance on both health record datasets despite difference in represented populations and data availability (AUC = 0.87). Furthermore, our general models obtain good performance on females but are also improved by constructing female-specific models (AUC between 0.81 and 0.86 across datasets). DISCUSSION AND CONCLUSIONS: We demonstrated that flexible construction of prediction models performs well on HIV risk prediction across diverse health records systems and perform as well in predicting HIV risk in females, making deployment of such models into existing health care systems tangible. Article	2024	McCauley, Peter S.; Morgan, Ethan; Caba, Antonia E.; Renley, Benton M.; Eaton, Lisa A.; Watson, Ryan J.	Perceptions of bias in HIV prevention services, happiness with social support, and anticipated PrEP stigma among Black and Latine/x sexual and gender diverse individuals.	AIDS Care	-	-	-	-	1360-0451 0954-0121	10.1080/09540121.2024.2326126	https://pubmed.ncbi.nlm.nih.gov/38451740/	Although pre-exposure prophylaxis (PrEP) is a highly effective preventive treatment for HIV, anticipated PrEP stigma can hinder uptake. Perceptions of bias in HIV prevention and evaluations (e.g., happiness) tied to social support among Black and Latine/x sexual and gender diverse (SGD) individuals could be important correlates of anticipated PrEP stigma. To further this line of inquiry, a national sample of 872 Black and Latine/x SGD individuals who had and had never taken PrEP (M(age) = 25.1, SD = 2.8) reported how they perceived HIV prevention and how happy they were with their social support. Multivariable linear regressions revealed that greater perceptions of bias in HIV prevention services were associated with higher anticipated PrEP stigma among Black and Latine/x SGD individuals who have never taken PrEP. Greater happiness with friend support was associated with lower PrEP stigma, whereas greater happiness with family support was associated with higher PrEP stigma among individuals who have taken PrEP. Findings highlight the need for PrEP and HIV interventions to address the intersectional stigma attached to prevention and for researchers to understand how evaluations of social support may contribute to stigma among Black and Latine/x SGD individuals. Article	2024	McCormick C.D.; Sullivan P.S.; Qato D.M.; Crawford S.Y.; Schumock G.T.; Lee T.A.	Adherence and persistence of HIV pre-exposure prophylaxis use in the United States	Pharmacoepidemiology and Drug Safety	-	-	-	-	10538569	10.1002/pds.5729	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85177217399&doi=10.1002%2fpds.5729&partnerID=40&md5=67ecbb7336a68ae5504cd9888b4a4a11	Purpose: To describe medication adherence and persistence of HIV PrEP overall and compare between sex and age groups of commercially insured individuals in the United States. Methods: We conducted a national retrospective cohort study of the Merative MarketScan Claims Database from 2011 to 2019 to describe adherence and persistence of PrEP overall and compared between sex and age groups. High adherence was defined as ≥80% of proportion of days covered and persistence was measured in days from initiation to the first day of a 60-day treatment gap. Results: A total of 29 689 new PrEP users identified. Overall adherence was high (81.9%; 95% confidence interval CI: 81.5%–82.3%). Females were more adherent than males (adjusted odds ratio aOR 1.87; 95% CI: 1.50–2.34), while those ≥45-years were less adherent than individuals <45-years (aOR 0.87: 95% CI: 0.81–0.93). More than half of individuals discontinued therapy within the first year (median 238.0 days; interquartile range 99.0–507.0 days). Females were less persistent than males (hazard ratio HR 1.49; 95% CI: 1.34–1.65), and people ≥45-years old were more persistent (i.e., lower risk of discontinuation) than those <45-years (HR 0.43; 95% CI: 0.33–0.55). Conclusions: These findings show adherence to daily PrEP is high among commercially insured individuals but the majority still discontinue in the first year. Future research should investigate what factors influence PrEP discontinuation among this population and ways to reduce barriers to therapy maintenance to ensure the population-level benefits of PrEP treatment. © 2023 The Authors. Article	2024	Mehtani, Nicky J.; Strough, Alix; Strieff, Sarah; Zevin, Barry; Eveland, Joanna; Riley, Elise D.; Gandhi, Monica	Feasibility of Implementing a Low-Barrier Long-Acting Injectable Antiretroviral Program for HIV Treatment & Prevention for People Experiencing Homelessness.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003396	https://pubmed.ncbi.nlm.nih.gov/38346426/	BACKGROUND: Long-acting (LA) antiretrovirals may provide meaningful benefit to people who use drugs and people experiencing homelessness (PEH) who face disproportionate structural and psychosocial barriers in adhering to daily oral HIV antiretroviral therapy (ART) or pre-exposure prophylaxis (PrEP), but their use in these populations has not been studied. SETTING: The Maria X. Martinez Health Resource Center is a low-barrier (e.g., no appointment) community-based clinic serving San Francisco PEH. METHODS: A multidisciplinary care model with robust monitoring and outreach support was developed to provide LA-ART and LA-PrEP to eligible patients experiencing difficulties adhering to oral antiretrovirals. Feasibility was assessed by evaluating rates of HIV viremia and on-time injections among patients receiving LA antiretrovirals over the first 24 months of program implementation. RESULTS: Between November 2021 and November 2023, 33 patients initiated LA-ART or LA-PrEP (median age, 37 years; 27% transgender/non-binary; 73% non-White; 27% street homeless; 52% sheltered homeless; 30% with opioid use disorder; 82% with methamphetamine use disorder). Among 18 patients with HIV, 14 initiated LA-ART injections with detectable viremia (median CD4 count, 340 cells/mm3; mean log10 viral load, 3.53; standard deviation SD, 1.62), eight had never previously been virally suppressed, and all but one achieved or maintained virologic suppression (mean, 9.67 months; SD, 8.30). Among 15 LA-PrEP patients, all remained HIV-negative (mean, 4.73 months; SD, 2.89). Of 224 injections administered total, 8% were delayed >7 days. DISCUSSION: The implementation of LA antiretrovirals is feasible in low-barrier, highly supportive clinical settings serving vulnerable PEH. Expansion of such programs will be critical to Ending the HIV Epidemic. Article	2024	Mohareb, Amir M.; Kouamé, Menan Gérard; Nouaman, Marcellin; Kim, Arthur Y.; Larmarange, Joseph; Neilan, Anne M.; Lacombe, Karine; Freedberg, Kenneth A.; Boyd, Anders; Coffie, Patrick; Hyle, Emily P.	What does the scale-up of long-acting HIV pre-exposure prophylaxis mean for the global hepatitis B epidemic?	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26218	https://shs.hal.science/ANRS_12381_PRINCESSE/hal-04491666v1	INTRODUCTION: The HIV and hepatitis B virus (HBV) epidemics are interconnected with shared routes of transmission and specific antiviral drugs that are effective against both viruses. Nearly, 300 million people around the world live with chronic HBV, many of whom are from priority populations who could benefit from HIV prevention services. Oral pre-exposure prophylaxis (PrEP) for HIV has implications in the prevention and treatment of HBV infection, but many people at increased risk of HIV acquisition may instead prefer long-acting formulations of PrEP, which are currently not active against HBV. DISCUSSION: People at increased risk for HIV acquisition may also be at risk for or already be living with HBV infection. Oral PrEP with tenofovir is effective in preventing both HIV and HBV, and tenofovir is also the recommended treatment for chronic HBV infection. Although implementation of oral PrEP has been challenging in sub-Saharan Africa, investments in its scale-up could secondarily reduce the clinical impact of HBV. Long-acting PrEP, including injectable medicines and implantable rings, may overcome some of the implementation challenges associated with oral PrEP, such as daily pill burden, adherence challenges and stigma; however, current formulations of long-acting PrEP do not have activity against HBV replication. Ideally, PrEP programmes would offer both oral and long-acting formulations with HBV screening to optimize HIV prevention services and HBV prevention and care, when appropriate. People who are not immune to HBV would benefit from being vaccinated against HBV before initiating long-acting PrEP. People who remain non-immune to HBV despite vaccination may benefit from being offered oral, tenofovir-based PrEP given its potential for HBV PrEP. People using PrEP and living with HBV who are not linked to dedicated HBV care would also benefit from laboratory monitoring at PrEP sites to ensure safety when using and after stopping tenofovir. PrEP programmes are ideal venues to offer HBV screening, HBV vaccination for people who are non-immune and treatment with tenofovir-based PrEP for people with indications for HBV therapy. CONCLUSIONS: Long-acting PrEP holds promise for reducing HIV incidence, but its implications for the HBV epidemic, particularly in sub-Saharan Africa, should not be overlooked. Article	2024	Moreno-García S.; Belza M.J.; Iniesta C.; González-Recio P.; Palma D.; Sordo L.; Pulido J.; Guerras J.M.	Daily use of HIV pre-exposure prophylaxis among gay, bisexual and other men who have sex with men in Spain: Prevalence and associated factors; El uso diario de la profilaxis preexposición para el VIH en hombres gais, bisexuales y otros hombres que tienen sexo con hombres en España: prevalencia y factores asociados	Medicina Clinica	-	-	-	-	257753	10.1016/j.medcli.2023.08.002	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173363709&doi=10.1016%2fj.medcli.2023.08.002&partnerID=40&md5=23ba495144bd0873305bd700279a426e	Objective: We aim to estimate the prevalence of daily HIV pre-exposure prophylaxis (PrEP) use 6 months after public funding approval in Spain and identify associated factors in a national sample of gay, bisexual and other men who have sex with men (GBMSM). Material and methods: We analysed 4692 HIV-undiagnosed GBMSM men recruited via an online questionnaire distributed nationally via gay contact apps and websites between May and July 2020. We estimated the proportion of participants using daily PrEP and identified associated factors using Poisson regression with robust variance. Results: Daily PrEP use was reported by 2.8% (95% CI 2.3-3.3) of all participants. Daily PrEP use was independently associated with being recruited into community programmes, being older than 30 years, living in a large city, living with men, having condomless anal intercourse with more than 10 sexual partners, using drugs for sex, especially chemsex drugs, and being diagnosed with a sexually transmitted infection. Conclusion: Six months after PrEP was approved in Spain, the prevalence of daily use is low in a national sample of GBMSM men. There is a need to promote access, demand and interest in PrEP, especially among young GBMSM men, those living in small and medium-sized cities, and those who hide their relationships with other men. © 2023 Elsevier España, S.L.U. Article	2024	Moyo, Perez Livias; Nunu, Wilfred Njabulo	Exploring Barriers and Facilitators That Influence Uptake of Oral Pre-Exposure Prophylaxis Among Men Who Have Sex With Men in Bulawayo, Zimbabwe: Key Stakeholder's Perspectives.	American Journal of Men's Health	-	-	-	-	1557-9891	10.1177/15579883231223377	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10771743	The world has been on the path to ending HIV and AIDS as a global threat by 2030; despite these efforts, the rate of new HIV infections among men who have sex with men remains very high. This study sought to explore the perceptions of key stakeholders on the potential barriers and facilitators of pre-exposure prophylaxis use among this key population. An exploratory, descriptive (through interviews) qualitative study was conducted on 10 key informants who were purposively selected and snowballed based on their knowledge and experience toward pre-exposure prophylaxis programming among men who have sex with men. The interviews were recorded, transcribed verbatim, coded, and thematically analyzed on MAXQDA. Stated barriers were stigma, lack of information, wrong messaging around pre-exposure prophylaxis, hearing negative things about the pills, the burden of taking pills daily, negative attitudes from health care providers, non-friendly health care facilities, pre-exposure prophylaxis not being affordable, and lack of flexibility and privacy from public hospitals. Identified facilitators were correct messaging on pre-exposure prophylaxis, long-lasting injectable pre-exposure prophylaxis, improved packaging, de-stigmatization, more friendly facilities, differentiated service approach, community groups, engagement, and partnership. To address these barriers and leverage the facilitators, it is imperative to have accessible, affordable services, non-judgmental health care providers, and peer support networks to empower men who have sex with men to make informed decisions regarding their sexual and reproductive health. Continued efforts to remove barriers and promote facilitators are crucial for maximizing the potential of pre-exposure prophylaxis as an effective HIV prevention tool among this population.	men who have sex with men, pre-exposure prophylaxis, uptake, barriers, facilitators, HIV and AIDS	English	United States	Western and Central Europe and North America	Zimbabwe	Eastern and Southern Africa	Zimbabwe	Eastern and Southern Africa	Qualitative
Article	2024	Mshenga, Mansour Maulid; Tang, Weiming	A call for change: addressing the implementation strategy using pre exposure Prophylaxis for combating the escalating HIV crisis in Zanzibar's key populations.	AIDS Research and Therapy	-	-	-	-	1742-6405	10.1186/s12981-024-00597-5	https://pubmed.ncbi.nlm.nih.gov/38336684/	The Integrated Bio-Behavioural Surveillance Survey of 2022-2023 among key populations report from Zanzibar has been released. The prevalence of HIV is estimated to be 21.1%, 11.4%, and 9.3% among Female Sex Workers, Men who have Sex with Men, and People Who Injected Drugs, respectively. This has prompted a closer examination of the factors contributing to this trend, with a particular focus on the low coverage of Pre-Exposure Prophylaxis in these key populations. The current prevalence reported in December 2023 signals a critical turning point that necessitates a reevaluation of the barriers and facilitators of Pre Exposure Prophylaxis intervention to combat the epidemic. It is imperative to acknowledge the severity of the situation and take decisive action to prevent further spread of the virus in the Isles. Article	2024	Mthimkhulu, Nqaba; Chidumwa, Glory; Kutywayo, Alison; Mataboge, Paballo; Martin, Catherine E; Kwatsha, Khanyiswa; Makalela, Nthabiseng; Mazibuko, Mbali; Butler, Vusile; Mullick, Saiqa	Factors influencing the uptake of a mono-PrEP implant for the prevention of HIV: Males' perspectives from three South African provinces.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0296341	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10760848	INTRODUCTION: Oral pre-exposure prophylaxis (PrEP) is an effective HIV prevention method; however, males over 15 years face challenges with its effective use. Long-acting prevention products could address barriers to effective PrEP use. This study aimed to estimate the potential uptake of a mono-PrEP implant and the factors influencing uptake among males in South Africa. The study also examined messaging and demand creation tactics that males perceive will improve HIV prevention uptake. METHODS: We conducted a mixed methods study comprising participatory workshops and a self-administered survey among 142 PrEP-eligible males (18-40 years) in three provinces (Gauteng, Eastern Cape, and Kwa-Zulu Natal) in South Africa from July to November 2022. Logistic regression was used to assess the relationship between the potential uptake of a hypothetical, non-biodegradable mono-PrEP implant and socioeconomic and behavioural factors. Workshop data were analysed using content analysis. RESULTS: The top three HIV prevention products that males would consider using were the monthly pill (74.6%), the mono-PrEP implant (62.7%), and event-driven oral PrEP (59.2%). If one prevention option was available, 31.7% of participants stated that they would use the monthly oral pill, 28.2% would use the six-monthly injection, and 19.7% the mono-PrEP implant. Four key themes were noted as influential to potential mono-PrEP uptake: "Health Over Everything", "Mono-PrEP Implant Concerns", "Potential Disclosure of Mono-PrEP Use", and "Information Distribution Channels". Participants preferred social and mainstream media as information distribution channels to receive information on HIV prevention services, including the mono-PrEP implant. CONCLUSION: In this study among predominantly heterosexual men in South Africa, there was interest in long-acting HIV prevention methods but concerns about the mono-PrEP implant. A comprehensive and participatory introduction will be needed for the implant, to improve acceptability and address potential concerns. Demand-creation strategies utilising social media and health campaigns should be considered to engage and reach males. Article	2024	Mulwa, Sarah; Baker, Venetia; Cawood, Cherie; Khanyile, David; O'Donnell, Dominique; Sarrassat, Sophie; Cousens, Simon; Birdthistle, Isolde	Evaluating the Intensity of Exposure to MTV Shuga, an Edutainment Program for HIV Prevention: Cross-Sectional Study in Eastern Cape, South Africa.	JMIR Formative Research	-	-	-	-	2561-326X	10.2196/44111	https://pubmed.ncbi.nlm.nih.gov/38349729/	BACKGROUND: MTV Shuga is an edutainment campaign designed to equip young people with knowledge, motivation, and informed choices to protect themselves from HIV infection. From 2019 to 2020, a total of 10 episodes of a new dramatic series, MTV Shuga "Down South 2" (DS2), were broadcast via television and the internet, alongside complementary media activities. OBJECTIVE: This study aims to investigate whether the intensity of DS2 exposure was linked with positive HIV prevention outcomes in a setting with high HIV prevalence and relatively low levels of HIV testing. METHODS: We analyzed data from a web-based survey of participants aged 15 to 24 years in South Africa in 2020. The survey was promoted via social media platforms of schools, universities, and communities in Eastern Cape, South Africa. The primary exposure of interest was the intensity of exposure to DS2, measured by the number of episodes of DS2 watched on the television or the internet or listened to on the radio (out of 10 episodes). Individuals who had not watched or listened to any DS2 episode were classified according to other MTV Shuga content that they had accessed. We estimated associations between the intensity of DS2 exposure and HIV-related outcomes, including knowledge of HIV status, awareness of HIV self-testing (HIVST) and pre-exposure prophylaxis (PrEP), uptake of HIVST, and demand for HIVST and PrEP, adjusting for potential confounders using multivariable logistic regression. RESULTS: Among the 3431 survey participants, 827 (24.1%) were exposed to DS2. Specifically, 18.1% (622/3431) watched or listened to only 1 DS2 episode, and 2.4% (82/3431), 1.7% (58/3431), and 1.8% (62/3431) watched or listened to 2 to 4, 5 to 7, and 8 to 10 DS2 episodes, respectively. Increasing the exposure to DS2 was associated with improvements in most outcomes. Exposure to multiple episodes (eg, 2-4, 5-7, and 8-10) was associated with successively higher odds of knowing one's HIV status, awareness of PrEP and HIVST, and uptake of HIVST compared with no MTV Shuga exposure, albeit with statistical uncertainty around some estimates. The interest in using HIVST or PrEP was high overall (>80%), with no measurable differences by DS2 intensity. CONCLUSIONS: We found evidence consistent with a dose-response relationship between MTV Shuga DS2 exposure and outcomes, including knowledge of HIV status, awareness and uptake of HIVST, and awareness of PrEP among young people in Eastern Cape. This indicates that greater engagement with a youth-focused edutainment campaign can improve HIV testing and prevention options in a setting and population with high need. However, only a few participants accessed multiple DS2 episodes despite its availability on multiple media platforms. We conclude that there is potential to benefit more young people by increasing access to and interest in the show. Article	2024	Murphy M.; Rogers B.G.; Ames E.; Galipeau D.; Uber J.; Napoleon S.; Brinkley-Rubinstein L.; Toma E.; Byrne S.; Teitelman A.M.; Berk J.; Chan P.A.; Ramsey S.	Implementing Preexposure Prophylaxis for HIV Prevention in a Statewide Correctional System in the United States	Public Health Reports	-	-	-	-	333549	10.1177/00333549231186576	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165588052&doi=10.1177%2f00333549231186576&partnerID=40&md5=2cf404835056f26397c589de09ed0153	HIV disproportionately affects populations experiencing incarceration. Preexposure prophylaxis (PrEP) is an effective approach to preventing HIV acquisition among populations at increased risk of acquiring HIV. Yet few, if any, efforts have been made to offer PrEP in correctional settings. Beginning in November 2019, the Rhode Island Department of Corrections (RIDOC) implemented a systemwide PrEP initiation program with linkage to PrEP care in the community upon reentry. Incarcerated individuals identified as being potentially at increased risk of HIV acquisition during standard clinical screenings and medical care were referred to a PrEP care provider for potential PrEP initiation. Of the 309 people who met with a PrEP care provider, 35% (n = 109; 88 men, 21 women) agreed to initiate PrEP while incarcerated. Clinical testing and evaluation were completed for 82% (n = 89; 69 men, 20 women) of those who agreed to initiate PrEP. Of those, 54% (n = 48; 29 men, 19 women) completed the necessary clinical evaluation to initiate PrEP, were determined to be appropriate candidates for PrEP use, and had the medication delivered to a RIDOC facility for initiation. Only 8 people (4 men, 4 women) were successfully linked to a PrEP care provider in the community after release. The RIDOC experience demonstrates notable levels of PrEP interest and moderate levels of PrEP uptake among this population. However, PrEP engagement in care after release and persistence in taking PrEP when in the community were relatively poor, indicating a need to better understand approaches to overcoming barriers to PrEP care in this unique setting. © 2023, Association of Schools and Programs of Public Health.	corrections; HIV; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2024	Nagai, Henry; Ankomah, Augustine; Fuseini, Kamil; Adiibokah, Edward; Semahegn, Agumasie; Tagoe, Henry	HIV Pre-Exposure Prophylaxis Uptake Among High-Risk Population in Sub-Saharan Africa: A Systematic Review and Meta-Analysis.	AIDS Patient Care and STDs	-	-	-	-	1557-7449 1087-2914	10.1089/apc.2023.0117	https://pubmed.ncbi.nlm.nih.gov/38381951/	Globally, 38.4 million people are affected by the human immunodeficiency virus (HIV) pandemic, and more than 2.5 million new HIV infections occur yearly. HIV pre-exposure prophylaxis (PrEP) has been widely recognized as a potential way to prevent new infections among risk population. There is a paucity of abridged evidence on the level and barriers to PrEP service uptake in sub-Saharan Africa (SSA). Therefore, we conducted a systematic review to synthesize existing evidence on PrEP uptake in SSA. Relevant studies were searched from major databases (PubMed and PsychInfo) and direct Google Scholar. Data were extracted and recorded using a pilot-tested template. Methodological rigor, heterogeneity and publication bias of studies were assessed to minimize the inclusion of erroneous findings. A random effect model was used for the meta-analysis followed by narrative metasynthesis. The protocol of this systematic review has been by registered PROSPERO (ID: CRD42022308855). A total of 1830 studies were retrieved, and 30 studies met inclusion criteria of the systematic review. People who heard about PrEP ranged from 23% to 98%. The pooled prevalence of willingness to use PrEP was 64.2% (95% confidence interval: 55.5-72.0). Fear of side effect, stigma, nonreceptive attitude, cost of pills, low awareness about PrEP, perceived reason about the effectiveness of PrEP, and lack of friendly services were the common barriers to PrEP uptake in Africa. In conclusion, comprehensive knowledge and willingness to use PrEP were low in SSA. The barriers to low PrEP service uptake are avoidable through comprehensive awareness creation and availing essential services to key population in Africa. Expanding educational messages to key population using friendly approaches and more accessible platforms, engaging stakeholders, and integrating PrEP service with routine health care are important to foster HIV prevention and control in the future. Article	2024	Nakiganda, Lydia Jacenta; Bavinton, Benjamin R; Poynten, Isobel Mary; Serwadda, David; Bazaale, Jeremiah Mulamba; Grulich, Andrew E	Sexual pleasure and HIV-related worry in female sex workers on oral pre-exposure prophylaxis in south-western Uganda.	Sexual Health	-	-	-	-	1449-8987	10.1071/SH23056	https://dx.doi.org/10.1071/SH23056	BACKGROUND: Female sex workers (FSWs) contribute disproportionately to HIV transmission in Uganda, and pre-exposure prophylaxis (PrEP) is effective in preventing HIV among cisgender women. Psychological factors are important for PrEP uptake, but few studies have examined psychosocial changes due to PrEP use in Uganda. METHODS: In 2021, we recruited 524 FSWs in three Trans-African Highway towns and four fishing communities in south-western Uganda. We conducted structured interviews among women who were attending routine PrEP follow-up visits in six health units. Bivariable and multivariable modified regression using a robust covariance matrix estimator were used to identify factors associated with experiencing increased sexual pleasure and less worry about HIV because of PrEP. RESULTS: Overall, 80.9% participants reported that sex was more pleasurable because of taking PrEP. There were statistical trends for sex being more pleasurable when taking PrEP or when having condomless sex with casual paying partners (aPR=1.19, 95% CI=1.07-1.32, P=0.001). Almost three-quarters of the participants (76.3%) were less worried about getting HIV because of PrEP. Condomless sex with casual paying partners (aPR=1.17, 95% CI=1.05-1.31, P=0.032, P=0.003) and being On PrEP for the past 1-2years (aPR=1.18, 95% CI=1.00-1.38, P=0.032) was significantly associated with HIV-related worry (aPR=1.17, 95% CI=1.05-1.31, P=0.032, P=0.003)Conclusions:We found a positive impact of PrEP in Ugandan FSWs on two key psychosocial dimensions: (1) more pleasurable sex; and (2) less worry about acquiring HIV. Interventions aiming to increase PrEP uptake may find it useful to focus on psychosocial dimensions. Article	2024	Nardell, Maria Francesca; Govathson, Caroline; Mngadi-Ncube, Sithabile; Ngcobo, Nkosinathi; Letswalo, Daniel; Lurie, Mark; Miot, Jacqui; Long, Lawrence; Katz, Ingrid Theresa; Pascoe, Sophie	Migrant men and HIV care engagement in Johannesburg, South Africa.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-024-17833-2	https://pubmed.ncbi.nlm.nih.gov/38347453/	BACKGROUND: South Africa (SA) has one of the highest rates of migration on the continent, largely comprised of men seeking labor opportunities in urban centers. Migrant men are at risk for challenges engaging in HIV care. However, rates of HIV and patterns of healthcare engagement among migrant men in urban Johannesburg are poorly understood. METHODS: We analyzed data from 150 adult men (≥ 18 years) recruited in 10/2020-11/2020 at one of five sites in Johannesburg, Gauteng Province, SA where migrants typically gather for work, shelter, transit, or leisure: a factory, building materials store, homeless shelter, taxi rank, and public park. Participants were surveyed to assess migration factors (e.g., birth location, residency status), self-reported HIV status, and use and knowledge of HIV and general health services. Proportions were calculated with descriptive statistics. Associations between migration factors and health outcomes were examined with Fisher exact tests and logistic regression models. Internal migrants, who travel within the country, were defined as South African men born outside Gauteng Province. International migrants were defined as men born outside SA. RESULTS: Two fifths (60/150, 40%) of participants were internal migrants and one fifth (33/150, 22%) were international migrants. More internal migrants reported living with HIV than non-migrants (20% vs 6%, p = 0.042), though in a multi-variate analysis controlling for age, being an internal migrant was not a significant predictor of self-reported HIV positive status. Over 90% all participants had undergone an HIV test in their lifetime. Less than 20% of all participants had heard of pre-exposure prophylaxis (PrEP), with only 12% international migrants having familiarity with PrEP. Over twice as many individuals without permanent residency or citizenship reported "never visiting a health facility," as compared to citizens/permanent residents (28.6% vs. 10.6%, p = 0.073). CONCLUSIONS: Our study revealed a high proportion of migrants within our community-based sample of men and demonstrated a need for HIV and other healthcare services that effectively reach migrants in Johannesburg. Future research is warranted to further disaggregate this heterogenous population by different dimensions of mobility and to understand how to design HIV programs in ways that will address migrants' challenges. Article	2024	Nardell, Maria Francesca; Govathson-Mandimika, Caroline; Garnier, Salomé; Watts, Ashley; Babalola, Dolapo; Ngcobo, Nkosinathi; Long, Lawrence; Lurie, Mark N.; Miot, Jacqui; Pascoe, Sophie; Katz, Ingrid T.	"Emotional stress is more detrimental than the virus itself": A qualitative study to understand HIV testing and pre-exposure prophylaxis (PrEP) use among internal migrant men in South Africa.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26225	https://pubmed.ncbi.nlm.nih.gov/38462755/	INTRODUCTION: South Africa has one of the highest rates of internal migration on the continent, largely comprised of men seeking labour in urban centres. South African men who move within the country (internal migrants) are at higher risk than non-migrant men of acquiring HIV yet are less likely to test or use pre-exposure prophylaxis (PrEP). However, little is known about the mechanisms that link internal migration and challenges engaging in HIV services. METHODS: We recruited 30 internal migrant men (born outside Gauteng Province) during August 2022 for in-depth qualitative interviews at two sites in Johannesburg (Gauteng) where migrants may gather, a factories workplace and a homeless shelter. Interviewers used open-ended questions, based in the Theory of Triadic Influence, to explore experiences and challenges with HIV testing and/or PrEP. A mixed deductive inductive content analytic approach was used to review data and explain why participants may or may not use these services. RESULTS: Migrant men come to Johannesburg to find work, but unreliable income, daily stress and time constraints limit their availability to seek health services. While awareness of HIV testing is high, the fear of a positive diagnosis often overshadows the benefits. In addition, many men lack knowledge about the opportunity for PrEP should they test negative, though they express interest in the medication after learning about it. Additionally, these men struggle with adjusting to urban life, lack of social support and fear of potential stigma. Finally, the necessity to prioritize work combined with long wait times at clinics further restricts their access to HIV services. Despite these challenges, Johannesburg also presents opportunities for HIV services for migrant men, such as greater anonymity and availability of HIV information and services in the city as compared to their rural homes of origin. CONCLUSIONS: Bringing HIV services to migrant men at community sites may ease the burden of accessing these services. Including PrEP counselling and services alongside HIV testing may further encourage men to test, particularly if integrated into counselling for livelihood and coping strategies, as well as support for navigating health services in Johannesburg. Article	2024	Ngumbau, Nancy M.; Neary, Jillian; Wagner, Anjuli D.; Abuna, Felix; Ochieng, Ben; Dettinger, Julia C.; Gómez, Laurén; Marwa, Mary M.; Watoyi, Salphine; Nzove, Emmaculate; Pintye, Jillian; Baeten, Jared M.; Kinuthia, John; John-Stewart, Grace	Cofactors of Partner HIV Self-testing and Oral PrEP Acceptance Among Pregnant Women at High Risk of HIV in Kenya.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003355	https://pubmed.ncbi.nlm.nih.gov/38408215/#:~:text=Compared%20with%20women%20who%20accepted,other%20partners%3B%20and%20(3)	BACKGROUND: Oral pre-exposure prophylaxis (PrEP) and male partner HIV self-testing (HIVST) is being scaled up within antenatal clinics. Few data are available on how co-distribution influences acceptance of both interventions. METHODS: We used data from the PrEP Implementation of Mothers in Antenatal Care (NCT03070600) trial in Kenya. Women included in this analysis were determined to be at high risk of HIV and offered oral PrEP and partner HIVST. Characteristics were compared between women who chose: (1) PrEP and HIVST, (2) HIVST-alone, (3) PrEP-alone, or (4) declined both (reference), excluding women who had partners known to be living with HIV. RESULTS: Among 911 women, median age was 24 years, 87.3% were married, 43.9% perceived themselves to be at high risk of HIV and 13.0% had history of intimate partner violence (IPV). Overall, 68.9% accepted HIVST and 18.4% accepted PrEP, with 54.7% accepting HIVST-alone, 4.2% PrEP-alone, and 14.3% both HIVST and PrEP. Of women accepting HIVST, partner HIV testing increased from 20% to 82% and awareness of partner HIV status increased from 4.7% to 82.0% between pregnancy and 9 months postpartum (P < 0.001). Compared with women who accepted neither, choosing: (1) HIVST-alone was associated with being married, higher level of education, and residing with partner; (2) PrEP-alone was associated with lower social support, IPV, not residing with partner, longer time living with partner, and suspicion of other partners; and (3) PrEP and HIVST was associated with being married, IPV, and suspicion that partner had other partners. CONCLUSIONS: Understanding factors associated with accepting HIVST and PrEP can inform HIV prevention programs for pregnant women. CLINICAL TRIAL NUMBER: NCT03070600. Article	2024	Nguyen, Van Thi Thuy; Dat, Vu Quoc; Truc, Huynh Minh; Nguyen Anh Thu, Pham; Linh, Doan Thi Thuy; Johnson, Cheryl; Baggaley, Rachel Clare; Phan, Huong Thi Thu	Preference and retention of daily and event-driven pre-exposure prophylaxis for HIV prevention: a prospective cohort in Can Tho city, Viet Nam.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2023-075976	https://bmjopen.bmj.com/content/14/2/e075976	OBJECTIVE: Pre-exposure prophylaxis (PrEP) was introduced in Viet Nam in 2017, but data on oral PrEP preference and effective use beyond 3 months are limited. We aimed to evaluate PrEP preferences for PrEP, factors influencing uptake, choice and effective use, as well as barriers to PrEP. METHODS: This is a prospective cohort study in Can Tho, Viet Nam. Participants who were eligible for PrEP and provided informed consent were interviewed at baseline on demographic information, willingness to pay, reasons for choosing their PrEP regimen and the anticipated difficulties in taking PrEP and followed up at 3 months, 6 months and 12 months after PrEP initiation. FINDINGS: Between May 2020 and April 2021, 926 individuals at substantial risk for HIV initiated PrEP. Of whom 673 (72.7%) choose daily PrEP and 253 (27.3%) choose event-driven (ED)-PrEP. The majority of participants were men (92.7%) and only 6.8% were transgender women. Median participant age was 24 years (IQR 20-28) and 84.7% reported as exclusively same-sex relationship. The three most common reasons for choosing daily PrEP were effectiveness (24.3%) and unplanning for sex (22.9%). Those opting for ED-PrEP also cited effectiveness (22.7%), as well as convenience (18.0%) and easier effective use (12.0%). Only 7.8% of PrEP users indicated they were unwilling to pay for PrEP and 76.4% would be willing to pay if PrEP were less than US$15 per month. The proportion of user effectively using PrEP at 12 months was 43.1% and 99.2% in daily PrEP and ED-PrEP users, respectively. CONCLUSIONS: ED-PrEP was preferred by more than a quarter of 23.5% of the participants and there was little concern about potential adverse events. High rates of effective use were reported by ED-PrEP users. Future research to inform implementation of PrEP in Viet Nam is needed to develop ways of measuring adherence to ED-PrEP more accurately and to understand and address difficulties in taking daily PrEP use. Article	2024	Nieuwenburg, S. A.; Bruisten, S. M.; Heijman, T.; Vermeulen, W.; van Dam, A. P.; Schim van der Loeff, M. F.; de Vries, H. J. C.	Use of home-based self-collected dried blood spots to test for syphilis, HIV, hepatitis C and B virus infections and measuring creatinine concentration.	Sexually Transmitted Diseases	-	-	-	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001941	https://pubmed.ncbi.nlm.nih.gov/38430511/	INTRODUCTION: Home-based self-collected dried blood spot (DBS) sampling could simplify sexual health and pre-exposure prophylaxis (PrEP) care and reduce sexually transmitted infections (STI) clinic visits for men who have sex with men (MSM). We compared the performance of DBS to venipuncture collected blood samples to test four STIs and creatinine concentration. METHODS: We invited MSM clients of the Amsterdam STI clinic to participate. Routinely collected peripheral blood was tested for syphilis treponemal antibody (CLIA), HIV (HIV Ag/Ab), HCV (antibodies), HBV (HBsAg) and creatinine concentration. Participants received a home kit for DBS sampling, a return envelope and a questionnaire to evaluate the acceptability, feasibility and usability of DBS, measured on 5-point Likert scales, 1 representing complete disagreement and 5 complete agreement. We assessed sensitivity and specificity of DBS versus peripheral blood-based testing. RESULTS: In 2020-21 we included 410 participants; 211 (51.5%) returned a completed DBS card, 117 (28.5%) returned a partially filled card and 82 (20%) did not return a card. The sensitivity for syphilis was 90.8% and the specificity 84.3%. For both HIV Ag/Ab and HBsAg the sensitivity and specificity were 100.0%. The sensitivity for HCV antibody was 80.0% and the specificity 99.2%. The DBS creatinine concentration was a mean of 5.3 µmol/L higher than in venipuncture obtained plasma. Participants' median willingness to take a future DBS was 4 IQR 3 - 5. DISCUSSION: DBS may be an acceptable method among MSM for STI testing and creatinine follow-up during PrEP use. However collecting enough blood on DBS cards was a challenge, and sensitivities for syphilis and HCV serology were too low. Article	2024	Ntinga, Xolani; Isehunwa, Oluwaseyi O.; Msimango, Lindani I.; Smith, Patricia M.; Matthews, Lynn T.; Van Heerden, Alastair	Perceptions of Pre-exposure Prophylaxis (PrEP) for HIV prevention among men living with HIV in the context of reproductive goals in South Africa: a qualitative study.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-024-18118-4	https://pubmed.ncbi.nlm.nih.gov/38389039/	BACKGROUND: Pre-exposure Prophylaxis (PrEP) and Treatment as Prevention (TasP) are effective strategies to prevent HIV transmission within serodifferent couples. However, limited usage of PrEP, knowledge and interest has been amongst the barriers for men, alongside testing and treatment adherence. We explored the perceptions of PrEP for HIV prevention with Men living with HIV (MWH) who have reproductive goals, to understand awareness and experiences related to PrEP use in the context of HIV prevention with their partners. METHODS: We undertook a qualitative study with 25 MWH aged 18 to 65 between April and September 2021 in South Africa. Potential participants were screened for eligibility and scheduled to participate in telephonic interviews. Interviews were audio recorded, transcribed, translated and thematically analysed. RESULTS: Themes were organized into opportunities and barriers that men with HIV articulate as important for using PrEP to meet individual, couple, and community reproductive goals. At the individual level, some men were willing to discuss PrEP with their partners to protect their partners and babies from acquiring HIV. Lack of knowledge about PrEP among men was a potential barrier to promoting PrEP among their female partners. At the couple level, PrEP use was seen as a way to strengthen relationships between partners, signifying care, trust, and protection and was seen as a tool to help serodifferent couples meet their reproductive goals safely. At the community level, PrEP was viewed as a tool to promote HIV testing and prevention efforts, especially among men, but participants emphasized the need for more education and awareness. CONCLUSION: Despite PrEP implementation in South Africa, awareness of PrEP among men with HIV in rural areas remains low. Engaging MWH to support their partners in accessing PrEP could be an innovative strategy to promote HIV prevention. Additionally, providing men with comprehensive reproductive health information can empower them to make more informed decisions, adopt safer sexual practices, and challenge societal norms and stigmas around HIV. Article	2024	Nydegger L.A.; Kidane H.; Benitez S.; Yuan M.; Claborn K.R.	A Qualitative Exploration of PrEP Interests, Barriers, and Interventions Among Black and Latina Cisgender Women in the U.S.	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-023-02712-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85173732995&doi=10.1007%2fs10508-023-02712-5&partnerID=40&md5=b471d144d7c7bf38c63793d78f5e4cbf	Black and Latina cisgender women (BLCW) are disproportionally affected by HIV, particularly in the southern U.S. In Austin, Texas, Black women contract HIV 18.4 times more and Latinas 2.6 times more compared to White women. Pre-exposure prophylaxis (PrEP) is a medication that prevents contracting HIV; however, PrEP adoption among women is low. The current qualitative study aimed to explore PrEP awareness, interest, preferred PrEP administration methods, barriers to PrEP adoption, and future programs to increase PrEP adoption and adherence among BLCW. A total of 18 BLCW at high risk for HIV were enrolled. Participants completed 3 semi-structured interviews across 3 months. Interviews were transcribed verbatim, coded, and analyzed using thematic content analysis. Results demonstrated that BLCW had low PrEP awareness, high initial PrEP interest, and were interested in a long-acting injectable form of PrEP. Barriers to PrEP adoption included concerns regarding side effects, concerns about adherence to the currently available daily pill, and difficulty with insurance. Participants proposed different ideas for interventions, including support groups, education, community-level programs, and structural interventions. Future studies should focus on increasing PrEP awareness and HIV risk, consider alternative forms of PrEP, educate providers and medical staff on PrEP, and consider tailored interventions to reduce HIV risk among BLCW. Article	2024	O'Bryan, Gillian; Chirairo, Harugumi; Munyayi, Farai; Ensminger, Alison; Barnabee, Gena; Dzinotyiweyi, Edington; Mwandingi, Leonard; Ashipala, Laimi; Forster, Norbert; O'Malley, Gabrielle; Golden, Matthew	Assisted Partner Notification Services in Namibia: Comparison of Case-Finding in Persons With New and Previously Diagnosed Human Immunodeficiency Virus, and Success as a Platform for PrEP Referral.	Sexually Transmitted Diseases	-	-	-	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001922	https://pubmed.ncbi.nlm.nih.gov/38412468/	BACKGROUND: Assisted partner notification services (APS) are widely implemented throughout sub-Saharan Africa. The effectiveness of APS among persons with previously diagnosed human immunodeficiency virus (HIV) infection is uncertain, and there are few published data on the success of integrating referrals for HIV preexposure prophylaxis (PrEP) into APS. METHODS: Staff in 22 Namibian Ministry of Health and Social Service clinics offered APS to persons newly and previously diagnosed with HIV (index cases ICs) between October 2019 and June 2021. Counselors used a structured interview guide to elicit ICs' sex partners and biological children and assisted ICs in arranging testing of contacts. Contacts testing HIV-positive were linked to HIV services and those 14 years or older testing negative were offered PrEP. The primary outcome was the case-finding index (contacts testing HIV-positive ÷ ICs receiving APS). RESULTS: Staff provided APS to 1222 (78%) of 1557 newly diagnosed ICs eliciting 1155 sex partners and 649 biological children. Among 280 previously diagnosed ICs, 279 sex partners and 158 biological children were elicited. The case-finding index was higher among ICs with newly diagnosed HIV compared with previously diagnosed HIV (0.14 vs 0.09, P = 0.46), though this difference was not statistically significant. Most sex partners testing HIV-negative were initiated on PrEP (67% in sex partners from newly diagnosed ICs; 74% in sex partners from previously diagnosed ICs). CONCLUSIONS: Assisted partner notification services successfully identified sex partners and biological children with undiagnosed HIV infection when provided to both newly and previously diagnosed ICs. Integration of referral to PrEP resulted in many HIV-negative partners initiating PrEP. Article	2024	Ogello, Vallery A.; Rono, Bernard Kipkoech; Ngure, Kenneth; Sedah, Eric; Thuo, Nicholas B.; Musinguzi, Nicholas; Baeten, Jared M.; Bukusi, Elizabeth A.; Mugo, Nelly R.; Haberer, Jessica E.	Acceptability and feasibility of long-term, real-time electronic adherence monitoring of HIV pre-exposure prophylaxis (PrEP) use among young women in Kenya: A mixed methods study.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0299168	https://pubmed.ncbi.nlm.nih.gov/38451884/	Real-time electronic adherence monitoring involves "smart" pill boxes that record and monitor openings as a proxy for pill taking and may be useful in understanding and supporting PrEP use; however, acceptability and/or feasibility for PrEP users is uncertain. We sought to understand the experiences of using a real-time electronic adherence monitor for PrEP delivery among young women in Kisumu and Thika, Kenya. We used the Wisepill device to monitor PrEP use among 18-24-year-old women for two years. Half of the participants were randomized to also receive SMS adherence reminders (daily or as needed for missed doses). We assessed acceptability quantitatively and qualitatively according to the four constructs of Unified Theory of Acceptance and Use of Technology (UTAUT): performance expectancy, effort expectancy, social influence, and facilitating conditions. We assessed feasibility by monitor functionality during periods of PrEP use. We analyzed quantitative data descriptively and compared by site and over time; qualitative data were analyzed inductively and deductively. The median age was 21 years (IQR 19-22), median education was 12 years (IQR 10-13), 182 (53%) had disclosed PrEP use, and 55 (16%) reported recent intimate partner violence. Most participants reported high levels of usefulness and high interest in using the monitor with few problems or worries reported throughout follow-up. Feasibility was high overall with some differences by site (96% functional monitor days in Kisumu vs 88% in Thika). Few monitors were reported lost (N = 29; 8%) or dysfunctional (N = 11; 3%). In qualitative interviews, electronic monitoring was perceived as useful because it supported privacy, confidentiality, easy storage, and PrEP adherence. Effort was generally considered low. Participants expressed some concern for stigma from monitor and/or PrEP use. Facilitating conditions involved the monitor size, color, and battery life. Overall, real-time electronic adherence monitoring was a highly acceptable and feasible approach to understand PrEP adherence among young women in a sub-Saharan African setting. Article	2024	Olakunde B.O.; Folala-Anoemuah Y.; Ujam C.; Ndukwe C.D.; Olaifa Y.; Yahaya H.B.; Bello H.; Ogundipe A.	Awareness and uptake of oral pre-exposure prophylaxis among adolescent and young key populations in Nigeria: a secondary data analysis of the 2020 Integrated Biological & Behavioural Surveillance Survey	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2023.2254547	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85170566446&doi=10.1080%2f09540121.2023.2254547&partnerID=40&md5=61423711c16deb6b696df82c51ac66ea	Oral pre-exposure prophylaxis (PrEP) is a critical intervention for HIV prevention among key populations (KP) in Nigeria. However, little is known about its coverage among adolescent and young key populations (AYKP). Using the 2020 Integrated Biological & Behavioural Surveillance Survey conducted among KP, including female sex workers (FSW), men who have sex with men (MSM), people who inject drugs (PWID), and transgender people (TG), we assessed the awareness and uptake of PrEP among AYKP (15-24 years) in Nigeria. We performed weighted descriptive statistics and logistic regression analyses. Of the 6882 AYKP included in this study, 36.1% were aware of PrEP, ranging from 47.9% in MSM to 19.8% in FSW. Compared with FSW, MSM (aOR = 3.7, 95%CI = 3.22–4.35) and TG (aOR = 2.6, 95%CI = 2.18–2.98) had significant higher odds of PrEP awareness. Among those aware of PrEP, 24.5% had ever taken PrEP. The uptake of PrEP varied by KP group: TG (28.1%), MSM (25.3%), PWID (18.0%), and FSW (14.4%). MSM (aOR = 2.6, 95%CI = 1.72–4.07) and TG (aOR = 2.7, 95%CI = 1.71–4.14) had significant higher odds of PrEP uptake relative to FSW. The awareness and uptake of PrEP among AYKP in Nigeria is low. This calls for more awareness creation about PrEP addressing the barriers that limit its uptake. © 2023 Informa UK Limited, trading as Taylor & Francis Group. Article	2024	Oliveri C.; Eang R.; Ségéral O.; Mora M.; Puth L.; Prom S.; Mosnier E.; Ouk V.; Spire B.; Saphonn V.; Fiorentino M.	"AIDSImpact Special Issue"–High PrEP acceptability and need for tailored implementation in Cambodian key populations: results from a qualitative assessment	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2024.2308029	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184439779&doi=10.1080%2f09540121.2024.2308029&partnerID=40&md5=069bb9797120dcf43ace9fa3c694e754	The HIV epidemics in Cambodia is concentrated in key populations (KPs). Pre-exposure prophylaxis (PrEP) has been officially approved in the country since 2019. However, its use may still be controversial after a PrEP clinical trial was interrupted in Cambodia after being deemed unethical in 2004. In this context, it was necessary to evaluate PrEP acceptability and administration preferences of KPs in Cambodia, with a view to increasing roll-out and uptake. We conducted a qualitative study in 2022 comprising six focus groups and four semi-structured individual interviews with transgender women, men who have sex with men, male entertainment workers, venue-based female entertainment workers (FEW), street-based FEW, and PrEP users who participated in a PrEP pilot study that started in 2019. Overall, KPs positively perceived PrEP, with some reservations. They preferred daily, community-based PrEP to event-driven, hospital-based PrEP, and highlighted that injectable PrEP would be a potential option if it became available in Cambodia. We recommend (i) proposing different PrEP regimens and PrEP delivery-models to broaden PrEP acceptability and adherence in Cambodia (ii) increasing the number of community-based organisations and improving the services they offer, (iii) rolling out injectable PrEP when it becomes officially available, and (iv) improving PrEP side effects information. © 2024 The Author(s). Article	2024	Paudel, Kiran; Bhandari, Prashamsa; Gautam, Kamal; Wickersham, Jeffrey A.; Ha, Toan; Banik, Swagata; Shrestha, Roman	Mediating role of food insecurity in the relationship between perceived MSM related stigma and depressive symptoms among men who have sex with men in Nepal.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0296097	https://pubmed.ncbi.nlm.nih.gov/38166131/	BACKGROUND: Previous studies have indicated the association between stigma and depressive symptoms among frequently stigmatized groups, such as men who have sex with men (MSM). While this association has been suggested in the literature, there is a dearth of evidence that examines whether food insecurity statistically mediates the relationship between stigma and depressive symptoms. METHODS: This cross-sectional study conducted between October and December 2022 among a sample of 250 MSM in Kathmandu, Nepal, recruited through respondent-driven sampling. An unadjusted model including the exposure (stigma), mediator (food insecurity), and outcome variables (depressive symptoms) and an adjusted model that controlled for sociodemographic, behavioral, and health-related confounders were used. Bootstrapping was utilized to estimate the coefficients of these effects and the corresponding 95% confidence intervals. Via bootstrap approach, we find out the mediating role of food insecurity in the association between stigma and depressive symptoms. RESULTS: Depressive symptoms, stigma, and food insecurity were 19.6%, 24.4%, and 29.2%, respectively, among MSM. Food insecurity was associated with higher age (b = 0.094; 95% CI = 0.039, 0.150) and monthly income (b = -1.806; 95% CI = -2.622, -0.985). Depressive symptoms were associated with condom-less sex in past six months (b = -1.638; 95% CI = -3.041, -0.092). Stigma was associated with higher age (b = 0.196; 95% CI = 0.084, 0.323) and PrEP uptake (b = 2.905; 95% CI = 0.659, 5.248). Food insecurity statistically mediated 20.6% of the indirect effect of stigma in depressive symptoms. CONCLUSION: Our findings show that food insecurity affects the relationship between stigma and depressive symptoms in this population. Reducing food insecurity and addressing the stigma surrounding sexual orientation should be a priority when addressing mental health concerns among MSM in Nepal and other resource-limited countries with similar socio-cultural settings. Article	2024	Perez-Urbano, India; Dilraj, Athmanundh; Pitsi, Annah; Hlongwane, Naomi; Abdelatif, Nada; Dietrich, Janan; Ahmed, Khatija	Strategies to Close the PrEP Uptake Gap Among Transgender People and Men Who Have Sex with Men in Tshwane, South Africa: Perspectives from the Community.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-024-04300-7	https://pubmed.ncbi.nlm.nih.gov/38427124/	HIV Pre-exposure Prophylaxis (PrEP) uptake among transgender (TG) people and gay men and other men who have sex with men (MSM) remains low, despite South Africa being the first African country to approve PrEP. This mixed-methods study used a two-phase explanatory sequential design: (1) quantitative analysis of cross-sectional surveys followed by (2) qualitative in-depth interviews. This study explored facilitators and barriers to PrEP uptake to identify strategies to increase utilization in these key populations. We conducted 202 cross-sectional surveys and 20 in-depth interviews between July 2021 and March 2022 in Soshanguve, Tshwane, Gauteng. Quantitative data were analysed using univariate logistic regression; thematic analysis was performed for qualitative data. Findings show high willingness to use PrEP but low PrEP uptake. We outline strategies to facilitate PrEP use: (1) demystify daily PrEP by deploying community-engaged PrEP education campaigns; (2) capitalize on existing peer networks; and (3) expand accessible and culturally responsive PrEP service delivery models. We provide feasible recommendations to close the PrEP uptake gap in these key populations in South Africa. Article	2024	Pesola F.; Smith K.M.; Phillips-Waller A.; Przulj D.; Griffiths C.; Walton R.; McRobbie H.; Coleman T.; Lewis S.; Whitemore R.; Clark M.; Ussher M.; Sinclair L.; Seager E.; Cooper S.; Bauld L.; Naughton F.; Sasieni P.; Manyonda I.; Hajek P.	Safety of e-cigarettes and nicotine patches as stop-smoking aids in pregnancy: Secondary analysis of the Pregnancy Trial of E-cigarettes and Patches (PREP) randomized controlled trial	Addiction	-	-	-	-	9652140	10.1111/add.16422	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182496809&doi=10.1111%2fadd.16422&partnerID=40&md5=336747a31e1685cd04b74e5d2f15cd4f	Aims: The aim of this study was to examine the safety of e-cigarettes (EC) and nicotine patches (NRT) when used to help pregnant smokers quit. Design: A recent trial of EC versus NRT reported safety outcomes in the randomized arms. We conducted a further analysis based on product use. Setting: Twenty-three hospitals in England and a stop-smoking service in Scotland took part. Participants: The participants comprised 1140 pregnant smokers. Interventions: We compared women using and not using EC and NRT regularly during pregnancy. Measurements: Measurements included nicotine intake compared with baseline, birth weight, other pregnancy outcomes, adverse events, maternal respiratory symptoms and relapse in early abstainers. Findings: Use of EC was more common than use of NRT (47.3% vs 21.6%, P < 0.001). Women who stopped smoking (abstainers) and used EC at the end-of-pregnancy (EOP) reduced their salivary cotinine by 45% 49.3 ng/ml, 95% confidence interval (CI) = −79.8 to −10. Only one abstainer used NRT at EOP. In dual users, cotinine increased by 19% (24 ng/ml, 95% CI = 3.5–68). In women reporting a reduction of at least 50% in cigarette consumption, cotinine levels increased by 10% in those using nicotine products and by 9% in those who did not. Birth weights in dual users and exclusive smokers were the same (3.1 kg). Birth weight in abstainers using either nicotine product was higher than in smokers 3.3 kg, standard deviation (SD) = 0.7 versus 3.1 kg, SD = 0.6; difference = 0.15 kg, 95% CI = 0.05–0.25) and not different from abstainers not using nicotine products (3.1 kg, SD = 0.8). Abstainers and smokers using nicotine products had no worse pregnancy outcomes or more adverse events than abstainers and smokers not using them. EC users reported more improvements than non-users in cough adjusted relative risk (aRR) = 0.59, 95% CI = 0.37–0.93 and phlegm (aRR = 0.53, 95% CI = 0.31–0.92), controlling for smoking status. EC or NRT use had no association with relapse. Conclusions: Regular use of e-cigarettes or nicotine patches by pregnant smokers does not appear to be associated with any adverse outcomes. © 2024 The Authors. Article	2024	Pinto, Rogério M.; Hall, Evan; Im, Vitalis; Lee, Carol A.; Ethan Park, Sunggeun	Disruptions to HIV services due to the COVID pandemic in the USA: a state-level stakeholder perspective.	BMC Health Services Research	-	-	-	-	1472-6963	10.1186/s12913-024-10609-9	https://bmchealthservres.biomedcentral.com/articles/10.1186/s12913-024-10609-9	BACKGROUND: The United States envisions a 90% reduction in HIV infections by 2030. However, the COVID-19 pandemic disrupted the HIV continuum and disproportionately affected access to social and health services for people at the highest vulnerability. This study shows how stakeholders in the State of Michigan handled disruptions and their key recommendations. As a case study, this study adds to the literature about preparedness for future pandemics. METHODS: We interviewed 33 statewide Michigan HIV/AIDS Council members-practitioners, researchers, and community representatives, guiding service planning, improvement, and resource allocations, measuring group cohesiveness using a tested scale. We measured group cohesiveness as a proxy for how individual opinions reflected those of the Council as a group. We used qualitative questions to assess: (1) how the COVID-19 pandemic disrupted HIV prevention; (2) how disruptions were handled; and (3) recommendation to help address disruptions now and in the future. Using thematic analysis, we coded the interviews. RESULTS: We found a high degree of cohesiveness. Participants agreed that the pandemic disrupted HIV prevention services (e.g., HIV testing, PrEP education, referrals to primary care, etcetera) offered by community organizations, hospital clinics, and health departments across the state. In response, they developed online and curbside services to maintain HIV services, abate social isolation, and address structural issues like lack of food and public transportation. We organized results in four categories: (1) HIV service disruptions (e.g., "Housing for women and children who are fleeing a legal situation"); (2) Responses to disruptions (e.g., "Some of them, we would say, hey, weather permitting, we'll come out to your car"); (3) Minoritized groups disproportionately affected (e.g., "Especially in my community, to get people if there's ever a vaccine, Black people are going to be the last people to take it"); and (4) Recommendations (below). CONCLUSIONS: The pandemic unsettled and further exacerbated every aspect of HIV service provision. The main recommendation was to overhaul communication systems between government and organizations offering HIV services to mitigate disruptions and improve the chances of achieving a 90% reduction. Article	2024	Pitchford, Kayla; Shangani, Sylvia; Dawson, Charlotte; Masa, Rainier; Heron, Kristin	Community Health Care Providers' Perspectives on Human Immunodeficiency Virus Pre-Exposure Prophylaxis Use Among Black Women in Eastern Virginia.	AIDS Patient Care and STDs	-	-	-	-	1557-7449 1087-2914	10.1089/apc.2023.0199	https://pubmed.ncbi.nlm.nih.gov/38471092/	The most at-risk population among women for human immunodeficiency virus (HIV) diagnosis in the United States are Black women, accounting for 61% of all new HIV cases. Pre-exposure prophylaxis (PrEP) is a safe and effective HIV prevention method for people at risk of HIV acquisition. Although disproportionately affected by HIV, Black women's knowledge, perceived benefits, and uptake of PrEP remain low. The socioecological model (SEM) may be useful for understanding why there is a low uptake of PrEP among Black women. The current study used the SEM to explore provider perspectives on the barriers and facilitators of PrEP uptake among Black women in Eastern Virginia. Semistructured interviews were conducted with a total sample of 15 community health care providers. Barriers of PrEP uptake at the societal (e.g., PrEP advertisements focus on gay men), community/organizational (e.g., time constraints in the workplace), interpersonal (e.g., perceived monogamy), and individual (e.g., unmet basic needs) levels were identified. Providers also identified facilitators of PrEP uptake at the societal (e.g., PrEP advertisements that target women), community/organizational (e.g., PrEP education), interpersonal (e.g., HIV-positive partner), and individual (e.g., PrEP awareness and perceived susceptibility to HIV) levels. These findings highlight unique barriers to accessing and taking PrEP for Black women in the United States, and potential factors that could facilitate PrEP use. Both barriers and facilitators may be important targets for interventions to improve PrEP uptake. Future research focused on improving PrEP uptake among Black women in the United States should consider multi-level interventions that target barriers and facilitators to reduce rates of HIV infections. Article	2024	Pravosud, Vira; Ballard, April M.; Holloway, Ian W.; Young, April M.	Latent Class Analysis of Online Platforms for Partner-Seeking and Sexual Behaviors Among Men Who Have Sex with Men from Central Kentucky.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04210-0	https://pubmed.ncbi.nlm.nih.gov/37824036/	Little is known whether engagement in sexual behaviors associated with potential HIV risks differs by subgroups of men who have sex with men (MSM), who are distinct regarding patterns of use of online tools for partner-seeking. Using latent class analysis, we revealed four classes of app-using MSM (n = 181, 18-34 y.o., 82.4% identified as White and non-Hispanic) residing in Central Kentucky: the Grindr/Tinder class; the Poly App Use class of MSM-oriented apps; the General Social Media class, and the Bumble class. Unadjusted penalized logistic regressions showed associations of the Poly App Use class with increased numbers of receptive anal sex partners and reporting condomless receptive anal sex. Adjusting for other covariates, poly app users versus others were more likely to be older (25-34 vs. 18-24, AOR = 3.81, 95%CI = 1.70-9.03), to report past six-month illicit drug use (AOR = 2.93, 95%CI = 1.25-7.43) and to have ever used pre-exposure prophylaxis (AOR = 2.79, 95%CI = 1.10-7.12). Poly app users had behavior profiles associated with an elevated HIV risk and also reported HIV-related protective behaviors likely indicating increased risk awareness among this class. Our findings warrant differentiation of behavior profiles by patterns of app use and suggest not to generalize sexual behaviors associated with potential HIV risks to all app-using MSM. Article	2024	Punchihewa, T Minushika; Wiles, Janine; Saxton, Peter J W	More than prevention: early adoption of HIV pre-exposure prophylaxis (PrEP) by gay and bisexual men in New Zealand	Culture, Health & Sexuality	-	-	-	-	13691058	10.1080/13691058.2023.2195474	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152914856&doi=10.1080%2f13691058.2023.2195474&partnerID=40&md5=0d0949026df5d25eed802958443af9a6	Pre-exposure prophylaxis (PrEP) minimises HIV risk and New Zealand was one of the first countries to publicly fund PrEP in 2018. However, no studies have explored in-depth the experience and meaning of living 'on PrEP' among individuals at elevated risk of HIV, such as gay and bisexual men. This qualitative study builds on findings from the NZPrEP demonstration project of early PrEP-adopting gay and bisexual men in Auckland, New Zealand. We interviewed 10 of the 150 NZPrEP participants using an ethnicity equity quota (five European ethnicities and five non-European ethnicities). A phenomenologically-inspired thematic analysis was conducted. We identified three themes. The first, Trusting in the Pill, focuses on the relationship between PrEP and its user, while the second theme, A Liberation of Sorts, details the freedom PrEP offered men, sexually, mentally and socially. The final theme, Reframing Risk, explores the risk perceptions and the conflicting discourses surrounding gay and bisexual men using PrEP. This first qualitative study in New Zealand about the experiences of PrEP early-adopters suggests that the role of PrEP extends well beyond HIV prevention and, for many, involves redefining safe sex even in a country with historically high levels of condom promotion and low HIV incidence. © 2023 The Author(s). Article	2024	Rager, Theresa L.; Tzilos Wernette, Golfo; Coleman, Jenell S.; Schechter, Nicole; Mmeje, Okeoma	"PrEPping" women's healthcare providers: motivational interviewing to support ending the HIV epidemic.	American Journal of Obstetrics and Gynecology	-	-	-	-	1097-6868 0002-9378	10.1016/j.ajog.2024.01.019	https://pubmed.ncbi.nlm.nih.gov/38290644/	In 2018, cisgender women accounted for nearly 20% of new HIV infections, with women of color disproportionately affected. HIV pre-exposure prophylaxis uptake, adherence, and persistence are paramount to ending the HIV epidemic, but current strategies to promote it have not improved uptake among women. Alternatively, pre-exposure prophylaxis marketing and implementation have traditionally targeted men who have sex with men and transwomen. Women feel most comfortable turning to their primary care and reproductive health providers for HIV and pre-exposure prophylaxis counseling, but prescribing is the lowest among these providers. Thus, reframing pre-exposure prophylaxis counseling and education strategies is crucial to better engage providers and patients. Motivational interviewing is a person-centered counseling style for eliciting behavior change. Providers use 4 core skills-open-ended questions, affirmation, reflective listening, and summarizing-to empower individuals for behavior change, such as pre-exposure prophylaxis use. Motivational interviewing is brief, individualized, and effective in increasing pre-exposure prophylaxis uptake, regardless of patients' readiness to change. Primary care and reproductive health providers can employ motivational interviewing approaches with pre-exposure prophylaxis counseling to increase uptake among cisgender women and end the HIV epidemic. Intradermal delivery of the antiretroviral drugs cabotegravir and rilpivirine by dissolving microarray patches: Investigation of lymphatic uptake	Journal of Controlled Release	-	-	-	-	1683659	10.1016/j.jconrel.2024.01.010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182506494&doi=10.1016%2fj.jconrel.2024.01.010&partnerID=40&md5=910f4e4f8ceba53cb8f9fbb0adce8dca	The lymphatic system possesses the main viral replication sites in the body following viral infection. Unfortunately, current antiretroviral agents penetrate the lymph nodes insufficiently when administered orally and, therefore, cannot access the lymphatic system sufficiently to interrupt this viral replication. For this reason, novel drug delivery systems aimed at enhancing the lymphatic uptake of antiretroviral drugs are highly desirable. Dissolving polymeric microarray patches (MAPs) may help to target the lymph intradermally. MAPs are intradermal drug delivery systems used to deliver many types of compounds. The present work describes a novel work investigating the lymphatic uptake of two anti-HIV drugs: cabotegravir (CAB) and rilpivirine (RPV) when delivered intradermally using dissolving MAPs containing nanocrystals of both drugs. Maps were formulated using NCs obtained by solvent-free milling technique. The polymers used to prepare the NCs of both drugs were PVA 10 Kda and PVP 58 Kda. Both NCs were submitted to the lyophilization process and reconstituted with deionized water to form the first layer of drug casting. Backing layers were developed for short application times and effective skin deposition. In vivo biodistribution profiles of RPV and CAB after MAP skin application were investigated and compared with the commercial intramuscular injection using rats. After a single application of RPV MAPs, a higher concentration of RPV was delivered to the axillary lymph nodes (AL) (Cmax 2466 ng/g – Tmax 3 days) when compared with RPV IM injection (18 ng/g - Tmax 1 day), while CAB MAPs delivered slightly lower amounts of drug to the AL (5808 ng/g in 3 days) when compared with CAB IM injection (9225 ng/g in 10 days). However, CAB MAPs delivered 7726 ng/g (Tmax 7 days) to the external lumbar lymph nodes, which was statistically equivalent to IM delivery (Cmax 8282 ng/g - Tmax 7 days). This work provides strong evidence that MAPs were able to enhance the delivery of CAB and RPV to the lymphatic system compared to the IM delivery route. © 2023	Antiretroviral; Cabotegravir; HIV; Intradermal delivery; Lymph-targeted; Lymphatic distribution; Nanocrystals; PrEP; Rilpivirine	English	Netherlands	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2024	Ratcliffe, Judith; Paer, Jeffrey; Quigee, Daniela; Carnevale, Caroline; Richards, Paul; Lasota, Elijah; Dandan, Nadine; Scherer, Matthew; Gordon, Peter; Cohall, Alwyn; Sobieszczyk, Magdalena; Zucker, Jason	Examining Patient Preferences for Express, Telemedicine, and Standard Visits in a Sexual Health Clinic in New York City. Article	2024	Rhodes S.D.; Alonzo J.; Mann-Jackson L.; Aviles L.R.; Tanner A.E.; Galindo C.A.; Bessler P.A.; Courtenay-Quirk C.; Garcia M.; Sucaldito A.D.; Smart B.D.; Goldenberg T.; Reboussin B.A.	Preexposure Prophylaxis Uptake Among Spanish-Speaking Transgender Women: A Randomized Controlled Trial in North and South Carolina, 2019-2022	American Journal of Public Health	-	-	-	-	15410048	10.2105/AJPH.2023.307444	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85179648775&doi=10.2105%2fAJPH.2023.307444&partnerID=40&md5=d2f927798046a4da4618fae5ff5b3596	Objectives. To evaluate Chicas Creando Acceso a la Salud (Girls Creating Access to Health; ChiCAS), a Spanish-language, small-group intervention designed to increase preexposure prophylaxis (PrEP) use, consistent condom use, and medically supervised gender-affirming hormone therapy use among Spanish-speaking transgender Latinas who have sex with men. Methods. Participants were 144 HIV-negative Spanish-speaking transgender Latinas, aged 18 to 59 years, living in North and South Carolina. From July 2019 to July 2021, we screened, recruited, and randomized them to the 2-session ChiCAS intervention or the delayed-intervention waitlist control. Participants completed assessments at baseline and 6-month follow-up. Follow-up retention was 94.4%. Results. At follow-up, relative to control participants, ChiCAS participants reported increased PrEP use (adjusted odds ratio AOR = 4.64; 95% confidence interval CI = 1.57, 13.7; P < .006). However, ChiCAS participants did not report increased use of condoms or medically supervised gender-affirming hormone therapy. ChiCAS participants reported increases in knowledge of HIV (P < .001), sexually transmitted infections (P < .001), and gender-affirming hormone therapy (P = .01); PrEP awareness (P < .001), knowledge (P < .001), and readiness (P < .001); condom use skills (P < .001); and community attachment (P = .001). Conclusions. The ChiCAS intervention was efficacious in increasing PrEP use among Spanish-speaking, transgender Latinas in this trial. Article	2024	Rivera, Adovich S.; Pak, Katherine; Mefford, Matthew T.; Hechter, Rulin C.	Changes in Glomerular Filtration Rate After Switching From Tenofovir Disoproxil Fumarate to Tenofovir Alafenamide Fumarate for Human Immunodeficiency Virus Preexposure Prophylaxis.	Open Forum Infectious Diseases	-	-	-	-	2328-8957	10.1093/ofid/ofad695	https://academic.oup.com/ofid/article/11/2/ofad695/7503592	BACKGROUND: Tenofovir alafenamide fumarate (TAF) was promoted as a safer alternative to tenofovir disoproxil fumarate (TDF) for human immunodeficiency virus oral preexposure prophylaxis (PrEP). It is unknown if switching from TDF to TAF translates to improved renal function. We used electronic health record (EHR) data to assess changes in creatinine-estimated glomerular filtration rate (eGFR) after switching from TDF to TAF. METHODS: We conducted a retrospective cohort study using EHR data from Kaiser Permanente Southern California. We identified individuals who switched from TDF to TAF between October 2019 and May 2022 and used time-varying propensity score matching to identify controls who were on TDF ("nonswitchers"). We then used Bayesian longitudinal modeling to compare differences in eGFR between switching and nonswitching scenarios. RESULTS: Among 5246 eligible individuals, we included 118 TDF to TAF switchers and 114 nonswitchers. Compared to nonswitchers, switchers had older age of starting TDF but similar body weights at index date. A higher proportion of switchers were White, on Medicare or Medicaid, and had dyslipidemia at index date. Switching to TAF was associated with a higher eGFR compared to staying on TDF in 3-15 months post-switch, but the differences were not statistically significant (eg, month 9 difference: 1.27 95% credible interval, -1.35 to 3.89). While most of the estimated changes showed eGFR increase associated with switching, most were <2 eGFR units. Sensitivity analyses to address missingness or nonadherence showed similar results. CONCLUSIONS: Switching from TDF to TAF for PrEP was associated with a nonsignificant increase in eGFR. Findings need to be confirmed using larger cohorts.	tenofovir alafenamide; HIV; preexposure prophylaxis; renal function	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2024	Roche, Stephanie D.; Ekwunife, Obinna I.; Mendonca, Rouella; Kwach, Benn; Omollo, Victor; Zhang, Shengruo; Ongwen, Patricia; Hattery, David; Smedinghoff, Sam; Morris, Sarah; Were, Daniel; Rech, Dino; Bukusi, Elizabeth A.; Ortblad, Katrina F.	Measuring the performance of computer vision artificial intelligence to interpret images of HIV self-testing results.	Frontiers in Public Health	-	-	-	-	2296-2565	10.3389/fpubh.2024.1334881	https://www.frontiersin.org/journals/public-health/articles/10.3389/fpubh.2024.1334881/full	INTRODUCTION: HIV self-testing (HIVST) is highly sensitive and specific, addresses known barriers to HIV testing (such as stigma), and is recommended by the World Health Organization as a testing option for the delivery of HIV pre-exposure prophylaxis (PrEP). Nevertheless, HIVST remains underutilized as a diagnostic tool in community-based, differentiated HIV service delivery models, possibly due to concerns about result misinterpretation, which could lead to inadvertent onward transmission of HIV, delays in antiretroviral therapy (ART) initiation, and incorrect initiation on PrEP. Ensuring that HIVST results are accurately interpreted for correct clinical decisions will be critical to maximizing HIVST's potential. Early evidence from a few small pilot studies suggests that artificial intelligence (AI) computer vision and machine learning could potentially assist with this task. As part of a broader study that task-shifted HIV testing to a new setting and cadre of healthcare provider (pharmaceutical technologists at private pharmacies) in Kenya, we sought to understand how well AI technology performed at interpreting HIVST results. METHODS: At 20 private pharmacies in Kisumu, Kenya, we offered free blood-based HIVST to clients ≥18 years purchasing products indicative of sexual activity (e.g., condoms). Trained pharmacy providers assisted clients with HIVST (as needed), photographed the completed HIVST, and uploaded the photo to a web-based platform. In real time, each self-test was interpreted independently by the (1) client and (2) pharmacy provider, with the HIVST images subsequently interpreted by (3) an AI algorithm (trained on lab-captured images of HIVST results) and (4) an expert panel of three HIVST readers. Using the expert panel's determination as the ground truth, we calculated the sensitivity, specificity, positive predictive value (PPV), and negative predictive value (NPV) for HIVST result interpretation for the AI algorithm as well as for pharmacy clients and providers, for comparison. RESULTS: From March to June 2022, we screened 1,691 pharmacy clients and enrolled 1,500 in the study. All clients completed HIVST. Among 854 clients whose HIVST images were of sufficient quality to be interpretable by the AI algorithm, 63% (540/854) were female, median age was 26 years (interquartile range: 22-31), and 39% (335/855) reported casual sexual partners. The expert panel identified 94.9% (808/854) of HIVST images as HIV-negative, 5.1% (44/854) as HIV-positive, and 0.2% (2/854) as indeterminant. The AI algorithm demonstrated perfect sensitivity (100%), perfect NPV (100%), and 98.8% specificity, and 81.5% PPV (81.5%) due to seven false-positive results. By comparison, pharmacy clients and providers demonstrated lower sensitivity (93.2% and 97.7% respectively) and NPV (99.6% and 99.9% respectively) but perfect specificity (100%) and perfect PPV (100%). CONCLUSIONS: AI computer vision technology shows promise as a tool for providing additional quality assurance of HIV testing, particularly for catching Type II error (false-negative test interpretations) committed by human end-users. We discuss possible use cases for this technology to support differentiated HIV service delivery and identify areas for future research that is needed to assess the potential impacts-both positive and negative-of deploying this technology in real-world HIV service delivery settings. Article	2024	Rodriguez, Edda; Boga, Devina J.; Shrader, Cho Hee; Arroyo-Flores, Juan; Rosas, Yesenia; Kanamori, Mariano	PROGRESO-II: Developing Culturally Tailored Materials for a Social Network-Based Intervention to Promote HIV Pre-Exposure Prophylaxis Initiation Among Latina Seasonal Farmworkers.	AIDS Patient Care and STDs	-	-	-	-	1557-7449 1087-2914	10.1089/apc.2023.0228	https://pubmed.ncbi.nlm.nih.gov/38471094/	Latina Seasonal Farmworkers (LSFW) in South Florida are a community affected by human immunodeficiency virus (HIV) due to cultural barriers, stigma, and lack of awareness of pre-exposure prophylaxis (PrEP). Building on the PROGRESO study, this study sought to: (1) develop and pre-test scientifically supported and culturally tailored PrEP materials for PROGRESO and (2) assess the acceptability of these PrEP materials by LSFW who use alcohol and/or drugs. PrEP messages were selected based on a literature review, feedback from experts working on PrEP programs, and recommendations from a four-member scientific expert panel through a two-level Delphi method. A culturally tailored PrEP presentation was developed and presented to sixteen LSFW, who engaged in four focus groups. Materials were modified based on participants' suggestions. Thematic analysis was used to assess the acceptability and usability of these materials in the LSFW community. Participants responded positively to the PrEP messages and understood their importance for Latinx communities. Participants felt empowered and comfortable enough with the information to distribute the messages to partners, children, and friends with the aid of a physical pamphlet or flyer. A strong cultural context of familialismo and confianza was present in comments made by our participants. This study has the potential to increase LSFW's PrEP awareness and initiation. Future studies may implement a hybrid-interview approach, allowing individuals to self-select into a virtual or in-person focus group. Such flexibility may increase participation and discussion by allowing participants to attend in a format they are most comfortable with, as noted by participants in this study. Article	2024	Rotsaert A.; Vanhamel J.; Vanbaelen T.; Vuylsteke B.; van der Loeff M.S.; Hensen B.; Kielmann K.; Callens S.; Reyniers T.	HIV Pre-exposure Prophylaxis (PrEP) Care in Belgium: A mixed-methods Study on PrEP Users' Experiences and Service Delivery Preferences	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-023-04232-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178204111&doi=10.1007%2fs10461-023-04232-8&partnerID=40&md5=b2319247f34d3cbd9ef9ce3df16d00ef	In Belgium, HIV pre-exposure prophylaxis (PrEP) services are mainly provided through specialised HIV clinics. To optimise PrEP uptake and retention in care, we require insights into users' perspectives on PrEP care. We aimed to elicit experiences with, and preferences for, PrEP service delivery among PrEP users in Belgium, including willingness to involve their family physician (FP) in PrEP care. We adopted a sequential mixed-methods design. We used a web-based longitudinal study among 326 PrEP users that consisted of two questionnaires at six-month intervals, and complemented this with 21 semi-structured interviews (September 2020-January 2022). We conducted descriptive analyses and logistic regression to examine factors associated with willingness to involve their FP in PrEP care. Interviews were analysed using thematic analysis. Survey respondents reported high satisfaction with care received in HIV clinics median score 9 (IQR 8–10), 10='very satisfied'. Interviews revealed the importance of regular HIV/STI screening, and the expertise and stigma-free environment of HIV clinics. Yet, they also contextualised service delivery barriers reported in the questionnaire, including the burden of cost and challenges integrating PrEP visits into their private and professional lives. Although 63.8% (n = 208/326) of baseline respondents preferred attending an HIV clinic for PrEP follow-up, 51.9% (n = 108/208) of participants in the follow-up questionnaire reported to be willing to have their FP involved in PrEP care. Participants reporting trust in FPs' PrEP and sexual health expertise, or who didn't feel judged by their FP, were more likely to be willing to involve them in PrEP care. Therefore, we recommend a differentiated PrEP service delivery approach, including involving FPs, to make PrEP care more client-centred. © The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature 2023. Article	2024	Sadeghi Y.; Nelson P.; Sullivan A.; Allen V.; Hasso M.; Liu J.; Tran V.; Tan D.H.S.	Can laboratory HIV and infectious syphilis data inform future pre-exposure prophylaxis use in women in Ontario, Canada?	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2023-055985	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184510495&doi=10.1136%2fsextrans-2023-055985&partnerID=40&md5=fc32c8a8ddb92876595667359b658c15	Objectives: Infectious syphilis has been proposed as an indication for HIV pre-exposure prophylaxis (PrEP) in women. We explored how many women experienced HIV seroconversion after being diagnosed with syphilis in Ontario between 20 April 2010 and 31 December 2021. Methods: Through deterministic linkage of laboratory data at the Public Health Ontario laboratory, which conducts the vast majority of syphilis and HIV testing in Ontario, we quantified the number of females with positive syphilis diagnoses who subsequently exhibited HIV seroconversion between April 2010 and December 2021. New HIV cases were identified by diagnostic serology or HIV viral load test result of ≥20 copies/mL at least 60 days after the positive syphilis test. We report aggregate numbers of women with new laboratory evidence of HIV infection after their first positive syphilis test. Results: Among 7957 women with positive syphilis tests during the study period, 6554 (82.4%) had linkable HIV serology tests and 133 (1.7%) ever tested HIV positive. With further linkage to viral load data, the number of women who ever had laboratory evidence of HIV infection increased to 184 (2.3%). However, when restricting to women whose first positive HIV test or HIV viral load occurred after their first positive syphilis test, this number decreased to 34 (0.4%). The median (IQR) time between the positive syphilis test and the first laboratory evidence of HIV was 551 (IQR=226-1159) days. Conclusion: Although it is clinically appropriate to recommend HIV PrEP to women with syphilis, Ontario surveillance data suggest that the population-level impact of this strategy on the HIV epidemic in Ontario would have been modest during this 11-year period. Future studies should explore additional ways of prioritising women for PrEP. © Author(s) (or their employer(s)) 2024. Re-use permitted under CC BY-NC. No commercial re-use. Article	2024	Sánchez, David; Ferrer, Josep; Giménez, Estela; Torres, Ignacio; Carretero, Diego; Alcaraz, María Jesús; Castaño, María Jesús; Navarro, David; Albert, Eliseo	Genotypic study of Chlamydia trachomatis for lymphogranuloma venereum diagnosis in rectal specimens from men who have sex with men: a cost-effectiveness analysis.	BMC Infectious Diseases	-	-	-	-	1471-2334	10.1186/s12879-024-09185-4	https://bmcinfectdis.biomedcentral.com/articles/10.1186/s12879-024-09185-4	PURPOSE: The significant proportion of asymptomatic patients and the scarcity of genotypic analysis of lymphogranuloma venereum (LGV), mainly among men who have sex with men (MSM), triggers a high incidence of underdiagnosed patients, highlighting the importance of determining the most appropriate strategy for LGV diagnosis, at both clinical and economical levels. MATERIALS AND METHODS: We conducted L1-L3 serovar detection by molecular biology in stored Chlamydia trachomatis-positive samples from MSM patients with HIV, another STI or belonging to a Pre-exposure prophylaxis program, to make a cost effectiveness study of four diagnostic strategies with a clinical, molecular, or mixed approach. RESULTS: A total of 85 exudates were analyzed: 35urethral (31 symptomatic/4 positive) and 50 rectal (22 symptomatic/25 positive), 70/85 belonging to MSM with associated risk factors. The average cost per patient was €77.09 and €159.55 for clinical (Strategy I) and molecular (Strategy IV) strategies respectively. For molecular diagnosis by genotyping of all rectal exudate samples previously positive for CT (Strategy II), the cost was €123.84. For molecular diagnosis by genotyping of rectal and/or urethral exudate samples from all symptomatic patients (proctitis or urethritis) with a previous positive result for CT (Strategy III), the cost was €129.39. The effectiveness ratios were 0.80, 0.95, 0.91, and 1.00 for each strategy respectively. The smallest ICER was €311.67 for Strategy II compared to Strategy I. CONCLUSIONS: With 30% asymptomatic patients, the most cost-effective strategy was based on genotyping all rectal exudates. With less restrictive selection criteria, thus increasing the number of patients with negative results, the most sensitive strategies tend to be the most cost-effective, but with a high incremental cost-effectiveness ratio. Article	2024	Santos, Glenn-Milo; Hernandez, Christopher; Lam, Eric; Hern, Jaclyn; Rowe, Christopher	Racial/Ethnic Disparities in Club Drug Use, Situational Club Drug Use during Sex, and Sexual Risk Behaviors among Alcohol-Using Men Who Have Sex with Men (MSM) in San Francisco.	Substance Use and Misuse	-	-	-	-	1532-2491	10.1080/10826084.2024.2310480	https://www.tandfonline.com/doi/full/10.1080/10826084.2024.2310480	BACKGROUND: Club drug use-including 3,4-Methylenedioxymethamphetamine, ketamine, crack/cocaine, hallucinogens, gamma hydroxybutyrate, volatile nitrites, and methamphetamine-has been linked to sexual risk behaviors among MSM. Few studies examine how the use of club drugs and the association between club drug use during sex and sexual risk may differ by race/ethnicity. METHODS: Using data from a cross-sectional study among alcohol-using MSM in San Francisco (n = 252), we examined the associations between the interaction of race/ethnicity and club drug use during sex, and the following behavioral outcomes: any condomless anal intercourse (CAI), insertive CAI, receptive CAI, and any serodiscordant sex in the past six months. All models controlled for income, HIV status, relationship status, age, and current use of a biomedical HIV prevention tool (i.e., Pre-Exposure Prophylaxis PrEP or antiretroviral therapy). RESULTS: There were significant racial differences in club drug use (p < 0.001) and club drug use during sex (p = 0.01). Asian/Pacific Islander (API) and Latino participants reported using club drugs the most at 78.8% and 79%, respectively. Among users of club drugs, club drug use during sex was most common among Black (100%), and Latino MSM (93%). Significant interactions between race/ethnicity and club drug use during sex were observed for CAI (p = 0.02), insertive CAI (p = 0.01), and receptive CAI (p = 0.01). API participants who used club drug during sex had higher odds of reporting CAI (aOR = 15.27, CI = 1.50-155.34), insertive CAI (aOR = 21.11, CI = 2.04-218.10), and receptive CAI (aOR = 21.11, CI = 2.04-218.10). CONCLUSIONS: Given the differing rates of club drug use during sex by race/ethnicity and the role race/ethnicity plays in modifying the relationships between club drug use during sex and sexual risk behaviors, culturally-tailored interventions may be needed to address the needs of ethnically-diverse, club drug-using MSM. Article	2024	Schäfer, Guido; Lübke, Rabea; Degen, Olaf; Mader, Maria; Scheiter, Robin; Wolski, Annika; Addo, Marylyn M.; Schulze Zur Wiesch, Julian; Pischke, Sven	Lack of evidence of acute HEV infections as a sexually transmitted disease: Data from a German cohort of PrEP users.	The Brazilian Journal of Infectious Diseases	-	-	-	-	1678-4391 1413-8670	10.1016/j.bjid.2024.103720	https://www.scielo.br/j/bjid/a/4YXKd9bxV8k6qVCy7QmDQ8n/abstract/?lang=en	BACKGROUND: While the sexual transmissibility of HAV in MSM has been extensively described, the potential for sexual transmission of HEV has not been definitively established. Although HEV has been detected in the ejaculate of chronically infected men, studies among MSM PrEP users in France did not observe an elevated anti-HEV seroprevalence as an indicator of increased exposure risk by sexual intercourse. PATIENTS AND METHODS: A total of 111 unselected PrEP users and 111 age- and sex-matched blood donors were tested for anti-HEV IgG, IgM and HEV (PCR). Of the participants 79/111 (71 %) responded to a questionnaire covering topics as sexual preferences, previous sexually transmitted diseases, profession, food consumption, and pet ownership. RESULTS: The anti-HEV IgG seroprevalence in PrEP users (22 %) did not differ significantly from the rate in controls (17 %). While one PrEP user and three controls tested positive for anti-HEV IgM, all PrEP users and controls tested PCR negative. CONCLUSION: In immunocompetent individuals with frequent changes of sexual partners, the epidemiology of Hepatitis E Virus does not significantly involve the sexual transmission route. Article	2024	Schnarrs, Phillip W.; Zuñiga, Julie; Benitez, Gabrielle; Fliedner, Paul; Norwood, Aliza; Croll, Madeleine; Oviedo, Liany D. Serrano; Buchorn, Jacey; Oeffinger, John; Lane, Rocky; Schelling, Emmett; Pham, Gin; Pate, TreShaun; Arnold, Elizabeth M.	Intention to Use Different Formulations of Longer Acting HIV Pre-Exposure Prophylaxis Among Transgender and Gender Expansive Individuals: The Roles of Social Vulnerability and Medical Mistrust.	AIDS Patient Care and STDs	-	-	-	-	1557-7449 1087-2914	10.1089/apc.2023.0211	https://pubmed.ncbi.nlm.nih.gov/38381948/	In 2012, the Federal Drug Administration approved daily oral pre-exposure prophylaxis (PrEP) for HIV prevention in adults. Longer acting injectable PrEP (LA PrEP) has been approved and other formulations are in development. A successful LA PrEP rollout requires examining potential facilitators and barriers to PrEP uptake. Given that transgender and gender expansive (TGE) individuals experience more social vulnerability and higher levels of medical mistrust compared to other populations, examining the role of these two factors in LA PrEP uptake is important. This study, PrEP for ALL, is a community-based participatory research project in Texas that engaged TGE community members and organizational partners through a community advisory board. In total, 482 TGE individuals were recruited and responded to all relevant questions in an online survey, including their intentions to use three formulations: a monthly oral pill, a bimonthly intramuscular injection, and an annual subdermal implant. Multiple regression analysis was used to examine the influence of social vulnerability and medical mistrust on intention to use each LA PrEP formulation adjusting for other relevant factors. Findings suggest that individuals with higher levels of social vulnerability had greater intentions to use the monthly oral pill (β = 0.12, p = 0.009), the bimonthly intramuscular injection (β = 0.18, p < 0.001), and annual subdermal implant (β = 0.17, p < 0.001), whereas medical mistrust reduced intentions to use the bimonthly intramuscular injection (β = -0.18, p < 0.001) and annual subdermal implant (β = -0.11, p = 0.021). Improvements in gender-affirming clinical care are needed along with LA PrEP formulations that allow for greater autonomy and reduced clinical contact. Article	2024	Sciannameo, S; Zalazar, V; Spadaccini, L; Duarte, M; Cahn, P; Aristegui, I; Sued, O	Preference for long-acting injectable for ART and PrEP among people with and without HIV: a cross-sectional study in Argentina	Therapeutic Advances in Infectious Disease	-	-	-	-	2049-9361	10.1177/20499361241228341	https://pubmed.ncbi.nlm.nih.gov/38380160/	Background: Little is known about the preferences for antiretroviral therapy (ART) administration methods, such as oral daily pills or long-acting injectable (LAI) options, as well as preferences for pre-exposure prophylaxis (PrEP) administration methods among people without HIV in Latin America.Objectives: This study aimed to assess the preferences for ART administration methods among people with HIV and PrEP methods among those without HIV, as well as to examine the correlations and reasons for these preferences.Design: We conducted a cross-sectional web-based questionnaire between April and July 2021, using social media accounts of a HIV non-governmental organization. The questionnaire was open to all adults living in Argentina, irrespective of their sexual orientation or gender identity.Methods: The questionnaire included questions on substance use, depression, chronic treatment, previous experiences with injectable medication, and HIV status. Those with HIV answered questions about ART adherence and their preferences for ART methods, while those without HIV were asked about condom use, awareness of PrEP, and their preferences for PrEP methods.Results: Out of 1676 respondents, 804 had HIV, and 872 did not. Among those with HIV, 91.5% expressed a high preference for LAI-ART, with significantly higher preferences among participants with higher educational levels, cisgender gay, bisexual, and queer men, younger individuals, and those with prior injectable medication experience. Among those without HIV, 68% preferred LAI-PrEP, and this preference was positively associated with previous positive experiences with injectable medication.Conclusion: The strong preference for LAI-ART suggests the potential for improved adherence and well-being among people with HIV. Additionally, the preference for LAI-PrEP among those without HIV emphasizes the importance of considering this option for HIV prevention strategies. This study highlights the need to offer diverse methods for ART and prevention to accommodate different preferences and improve health care outcomes in Latin America. Article	2024	Scott, Kristal; Faryar, Kiran A.; Patil, Nirav; Gripshover, Barbara; Hammond, Christopher; Purohit, Maulik; Schmotzer, Christine; Suleman-Civis, Leyya; Niforatos, Joshua; Avery, Ann; Yax, Justin	Evaluation of an emergency department opt-out provider-driven HIV and syphilis screening and linkage-to-care program.	The American Journal of Emergency Medicine	-	-	-	-	1532-8171 0735-6757	10.1016/j.ajem.2023.12.029	https://pubmed.ncbi.nlm.nih.gov/38163414/	OBJECTIVE: While the effectiveness of emergency departments (ED) in screening for HIV and syphilis is understood, less is known about dual screening programs. We aim to evaluate the impact of an opt-out provider-initiated HIV and syphilis program on screening, diagnosis, and linkage to care outcomes. METHODS: We performed a retrospective review of patients screened pre (2014-2017) and post (2017-2021) program implementation. Primary outcomes include HIV and syphilis screening, incidence of positive tests, and proportion of patients linked to care. Secondary outcomes included pre-exposure prophylaxis (PrEP) referral and successful linkage rates for HIV-negative syphilis-positive patients. RESULTS: Pre-implementation, 882 HIV tests were performed, of which 22 (2.49%) were new cases and 18 (81.82%) were linked to care; 754 syphilis tests were performed, of which 33 (4.38%) were active infections and 30 (90.91%) were treated. No eligible patients received PrEP referral. Post-implementation, 12,999 HIV tests were performed, of which 73 (0.56%) were new cases and 55 (75.34%) were linked to care; 10,885 syphilis tests were performed, of which 216 (1.98%) were active infections and 188 (87.04%) were treated. 25 (9.09%) eligible patients were referred for PrEP, and four (16.0%) attended their appointment. CONCLUSIONS: Post-implementation, there was a 1373.81% and 1343.63% increase in screening, and a 231.82% and 554.55% increase in positive cases of HIV and syphilis, respectively. Dual screening programs can be successfully implemented within the existing ED framework to increase screening and early detection for HIV and syphilis. Article	2024	Sensalire, Simon; Nkolo, Abel; Ssali, Juliana Nabwire; Muhire, Martin; Muhwezi, Augustin; Kadama, Herbert	Applying a Three-Tier Approach to Address Gaps in Oral Pre-Exposure Prophylaxis Uptake and Continuity in Uganda: A Mixed Methods Approach.	Global Health Science and Practice	-	-	-	-	2169-575X	10.9745/GHSP-D-23-00229	https://www.ghspjournal.org/content/12/2/e2300229	BACKGROUND: We describe a 3-tier approach involving a gap analysis, root cause analysis, and pre-exposure prophylaxis (PrEP) collaborative to understand the gap and identify and address the main barriers to oral PrEP uptake and continuity in Uganda. METHODS: We used a mixed methods design with retrospective, cross-sectional, and prospective components. The gap analysis involved descriptive analysis of PrEP uptake and continuity. The RCA identified the main barriers to initiation and continuity on PrEP among 1,334 clients who declined to start PrEP and 1,266 who missed their appointment but were at risk. The PrEP collaborative tested changes mapped onto specific barriers to optimize the PrEP clinical service delivery. A trend analysis of routinely collected data of the PrEP cascade determined significant shifts and trends in PrEP uptake and continuity. RESULTS: Only 60% of the high-risk population eligible for PrEP were enrolled, while fewer than 30% of the cumulative number of PrEP users were refilled each quarter. Uncertainty and fear of side effects, perceptions about the harmfulness of the medication, perceived inability to adhere to PrEP, and stigma were the main reasons why clients rejected PrEP. Lack of access to the facility, side effects, pill burden, stigma, perceived low-risk exposure to HIV, and preference of staying at work as opposed to picking up refills affected continuity on PrEP. The collaborative registered statistically significant shifts in PrEP enrollment from 64% to 89% and continuity from 51% to 78% between July 21 and November 22 following the collaborative intervention. CONCLUSIONS: We recommend using a 3-tier approach for other similar implementation contexts to strengthen PrEP programming, given the marked statistical shift in PrEP uptake and continuity. This begins with understanding the gap and barriers to use among clients, followed by mapping interventions to specific barriers through a quality improvement collaborative. Article	2024	Sewak A.; Lodi S.; Li X.; Shu D.; Wen L.; Mayer K.H.; Krakower D.S.; Young J.G.; Marcus J.L.	Causal Effects of Stochastic PrEP Interventions on HIV Incidence Among Men Who Have Sex With Men	American Journal of Epidemiology	-	-	-	-	29262	10.1093/aje/kwad097	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181852743&doi=10.1093%2faje%2fkwad097&partnerID=40&md5=638602a455abede31535d6ef252d7b4c	Antiretroviral preexposure prophylaxis (PrEP) is highly effective in preventing human immunodeficiency virus (HIV) infection, but uptake has been limited and inequitable. Although interventions to increase PrEP uptake are being evaluated in clinical trials among men who have sex with men (MSM), those trials cannot evaluate effects on HIV incidence. Estimates from observational studies of the causal effects of PrEP-uptake interventions on HIV incidence can inform decisions about intervention scale-up. We used longitudinal electronic health record data from HIV-negative MSM accessing care at Fenway Health, a community health center in Boston, Massachusetts, from January 2012 through February 2018, with 2 years of follow-up. We considered stochastic interventions that increased the chance of initiating PrEP in several high-priority subgroups. We estimated the effects of these interventions on population-level HIV incidence using a novel inverse-probability weighted estimator of the generalized g-formula, adjusting for baseline and time-varying confounders. Our results suggest that even modest increases in PrEP initiation in high-priority subgroups of MSM could meaningfully reduce HIV incidence in the overall population of MSM. Interventions tailored to Black and Latino MSM should be prioritized to maximize equity and impact. © The Author(s) 2023. Article	2024	Shankaran, Shivanjali; Friedman, Eleanor E.; Devlin, Samantha; Kishen, Ekta; Mason, Joseph A.; Sha, Beverly E.; Payne, Darjai; Sinchek, Katherine; Smiley, Natali; York, Sloane; Ridgway, Jessica P.	Assessing Patient Acceptance of an Automated Algorithm to Identify Ciswomen for HIV Pre-Exposure Prophylaxis.	Journal of Women's Health	-	-	-	-	1931-843X 1540-9996	10.1089/jwh.2023.0491	https://pubmed.ncbi.nlm.nih.gov/38335447/	The use of HIV pre-exposure prophylaxis (PrEP) in cisgender women (ciswomen) lags far behind their need. Data elements from the electronic medical record (EMR), including diagnosis of a sexually transmitted infection (STI), can be incorporated into automated algorithms for identifying clients who are most vulnerable to HIV and would benefit from PrEP. However, it is unknown how women feel about the use of such technology. In this study, we assessed women's attitudes and opinions about an automated EMR-based HIV risk algorithm and determined if their perspectives varied by level of HIV risk. Respondents were identified using best practice alerts or referral to a clinic for STI symptoms from January to December 2021 in Chicago, IL. Participants were asked about HIV risk factors, their self-perceived HIV risk, and their thoughts regarding an algorithm to identify ciswomen who could benefit from PrEP. Most of the 112 women who completed the survey (85%) thought they were at low risk for HIV, despite high rates of STI diagnoses. The majority were comfortable with the use of this algorithm, but their comfort level dropped when asked about the algorithm identifying them specifically. Ciswomen had mixed feelings about the use of an automated HIV risk algorithm, citing it as a potentially helpful and empowering tool for women, yet raising concerns about invasion of privacy and potential racial bias. Clinics must balance the benefits of using an EMR-based algorithm for ciswomen with their concerns about privacy and bias to improve PrEP uptake among particularly vulnerable women. Article	2024	Sharma I.; Hill A.	Global HIV Incidence Analysis and Implications for Affordability Using Long-Acting Cabotegravir Versus Continuous and Event-Driven Oral Preexposure Prophylaxis	Clinical Infectious Diseases	-	-	-	-	15376591	10.1093/cid/ciad537	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85185396701&doi=10.1093%2fcid%2fciad537&partnerID=40&md5=56889d4b9501531ecc3234e1a85687eb	BACKGROUND: The HIV Prevention Trials Network (HPTN) 083/084 trials showed up to 88% increased efficacy of long-acting cabotegravir (CAB-LA) versus continuous oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC). However, CAB-LA's high price limits the number of people who can be treated within fixed prevention budgets. Global human immunodeficiency virus (HIV) prevention budgets are highly limited, with TDF/FTC widely available as a low-cost generic. In randomized clinical trials, event-driven TDF/FTC has shown similar preventive efficacy to continuous TDF/FTC. METHODS: A systematic review of global HIV incidence studies was conducted. Weighted incidence was calculated in each at-risk population. HIV infection rates were evaluated for 5 prevention strategies, with additional HIV testing, education, and service access costs assumed for each ($18 per person per year). Assumed efficacies were 90% (continuous CAB-LA), 60% (continuous TDF/FTC), and 60% (event-driven TDF/FTC). Using weighted incidence and an assumed 100 000 target population, annual HIV infection rates by population were calculated for each prevention strategy. RESULTS: Ninety-eight studies in 5 230 189 individuals were included. Incidence per 100 person-years ranged from 0.03 (blood donors) to 3.82 (people who inject drugs). Using the number needed to treat to benefit for each strategy, a mean incidence of 2.6 per 100 person-years in at-risk populations, and a 100 000 target population, current-price continuous CAB-LA cost $949 487 per HIV infection successfully prevented, followed by target-price CAB-LA ($11 453), continuous TDF/FTC ($4231), and event-driven TDF/FTC ($1923). CONCLUSIONS: High prices of CAB-LA limit numbers treatable within fixed budgets. Low-cost event-driven TDF/FTC consistently prevents the most HIV infections within fixed budgets. © The Author(s) 2023. Article	2024	Siegel, Karolynn; Cabán, María; Brown-Bradley, Courtney J.; Schrimshaw, Eric W.	Condomless Anal Sex Between Male Sex Workers and Clients in the Age of Hookup Apps.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04216-8	https://pubmed.ncbi.nlm.nih.gov/38036795/	Among men who have sex with men (MSM), those who also engage in the exchange of sex for money, drugs, shelter or other material goods (i.e., male sex workers-MSWs) have been found to have higher rates of condomless anal sex (CAS), HIV, and STIs than MSM who do not engage in exchange sex. To gain a better understanding of the factors that influence MSWs' engagement in CAS with male clients, we analyzed qualitative interview data from a diverse sample of 141 MSWs from 8 U.S. cities who met clients primarily through hookup or dating apps/websites and who reported having condomless anal sex with at least one of their exchange sex partners in the prior three months. While high client demand and financial incentives were the most frequently mentioned reasons for engaging in CAS with clients, other factors including drug and alcohol use, attraction to the client, the heat of the moment, concerns about sexual performance, and reliance on pre-exposure prophylaxis (PrEP) were also important. Participants who engaged in CAS generally felt that due to client characteristics or mitigating steps they had taken themselves, their chance of acquiring HIV/STIs was acceptably low. Hookup or dating apps/websites have provided an additional and increasingly popular venue for exchange sex to be arranged. These platforms also offer an opportunity for HIV/STI prevention through interventions and tailored messages delivered through these venues that address the motivations, misconceptions and/or situational factors that may lead to CAS. Article	2024	Silva, Keyser Rogerio Oliveira; Ferreira, Rayane Cupolillo; Coelho, Lara E.; Veloso, Valdilea G.; Grinsztejn, Beatriz; Torres, Thiago S.; Luz, Paula M.	Knowledge of HIV transmission, prevention strategies and U= U among adult sexual and gender minorities in Brazil.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26220	https://pubmed.ncbi.nlm.nih.gov/38379186/	INTRODUCTION: Although strong scientific evidence of the efficacy and effectiveness of treatment-as-prevention (TasP) is available, full endorsement of the "Undetectable = Untransmittable" (U = U) and "non-risk" messages could be improved. Increasing knowledge about HIV transmission, prevention and treatment is a critical component of care efforts. The study assessed knowledge of HIV transmission and prevention strategies, and the perceived accuracy of the slogan. U = U among sexual and gender minorities (SGM) in Brazil. METHODS: Cross-sectional web-based survey targeting adult SGM living in Brazil (2022–2023) recruited on social media and dating apps. We used the 12-item HIV Knowledge Assessment (HIV-KA) questionnaire to assess HIV knowledge; three items of which address pre-exposure prophylaxis (PrEP), post-exposure prophylaxis and TasP. Perceived accuracy of the U = U slogan was assessed with the question: "With regards to HIV-positive individuals transmitting HIV through sexual contact, how accurate do you believe the slogan U = U is?". We a priori grouped the study population into three mutually exclusive groups: people living with HIV (PLHIV), HIV negative and HIV unknown. We used logistic regression models to assess factors associated with high HIV knowledge and perception of the U = U as completely accurate. RESULTS: Of 50,222 individuals accessing the questionnaire, 23,981 were included: 5071 (21.0%) PLHIV, 17,257 (71.7%) HIV-negative and 1653 (6.9%) HIV- unknown. The proportion of participants with high knowledge was significantly higher for PLHIV and HIV negative (48.3% and 45.5%, respectively) compared to 26.1% of HIV- unknown. More PLHIV perceived U= U as completely accurate (80.4%), compared to 60.0% of HIV negative and 42.2% of HIV- unknown. In the multivariable analysis, PLHIV (aOR 1.15, 95% CI 1.05–1.26) and HIV negative (aOR 1.10, 95% CI 1.01–1.19) were more likely to have high knowledge than HIV- unknown. Among HIV-negative participants, PrEP awareness and use were associated with higher knowledge and accurate perception of the U= U slogan. CONCLUSIONS: Our findings show that HIV knowledge and perceived accuracy of U= U are strongly correlated, that knowledge differs according to HIV status, and that poor socio-economic is linked to poor knowledge among SGM from Brazil. Educational strategies regarding TasP, U= U and zero risk targeting socio-economically vulnerable populations are urgent in Brazil. Article	2024	Siregar A.Y.M.; Jowita M.N.; Hardiawan D.; Akbar A.; Bachman Z.H.; Haekal M.D.F.; Marwah Y.S.; Putri T.A.; Rakhmat F.F.; Pohan M.N.; Handayani M.; Budiarty T.I.; Afriana N.; Prabowo B.R.; Wuaksana R.	Cost of implementing HIV pre-exposure prophylaxis at community-based clinics in Indonesia	Tropical Medicine and International Health	-	-	-	-	13602276	10.1111/tmi.13946	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85178152066&doi=10.1111%2Ftmi.13946&partnerID=40&md5=ac7ba40c40ae02bd8094da2121d9f4bf	Introduction: Currently, Indonesia still has one of the highest rates of new HIV/AIDS infections among countries in Asia and the Pacific region. The WHO has recommended pre-exposure prophylaxis (PrEP) as an additional HIV epidemic prevention step, which has been applied globally and related to the reduction in the number of HIV cases. However, information on the cost of implementing PrEP is rarely available in developing countries, especially in Southeast Asia. Designing a cost-effective approach to scale up PrEP and to estimate the potential budget impact requires information on the cost of implementing PrEP. This study aims to estimate the cost of implementing PrEP at community-based clinics in Indonesia. Methods: We collected healthcare and non-healthcare/client costs from nine community-based clinics in various classifications in Indonesia. The healthcare costs included data on resource utilisation and costs to deliver PrEP, divided into recurrent and capital costs using a discount rate of 3%. Non-healthcare costs included out-of-pocket costs (e.g., transportation, meals) and productivity loss by clients and accompanying person(s) in accessing PrEP. On average, we interviewed 27 clients/clinic. Results: The annual cost per client was US$ 1,756.26 (95% CI: 1,704.69–1,807.83). The largest proportion of the cost was for PrEP medication (US$ 1,656.00), followed by clinical monitoring at approximately 87% of the cost. The cost of PrEP amounts to US $282,756.40/year, covering 882 clients. The non-healthcare cost per visit at all sites never reaches more than 10% of the average monthly household expenditure. Conclusions: The cost of providing PrEP per person is approximately US $365 and is 39% lower than the annual cost of ART per person. Lowering the cost of PrEP ARV drugs would reduce the cost. Scaling up PrEP should recognise this cost structure and strive to reach economies of scale as the intervention gains more clients while simultaneously controlling new HIV infections. © 2023 John Wiley & Sons Ltd.	cost analysis; HIV; HIV test; Indonesia; PrEP	English	United Kingdom	Western and Central Europe and North America	Indonesia	Asia and the Pacific	Indonesia	Asia and the Pacific	Mixed methods
Article	2024	Spinelli, Matthew; Gandhi, Monica	Point-of-care urine tenofovir monitoring of adherence to drive interventions for HIV treatment and prevention.	Expert Review of Molecular Diagnostics	-	-	-	-	1744-8352 1473-7159	10.1080/14737159.2024.2312122	https://pubmed.ncbi.nlm.nih.gov/38353417/	INTRODUCTION: Although effective antiretroviral and pre-exposure prophylaxis/PrEP regimens are available globally, adherence challenges persist. Objective measures of adherence can both measure adherence accurately and can be used to drive interventions. As the transmission dynamics of HIV have changed, urine tenofovir testing using a lateral flow assay, is now available. AREAS COVERED: This review examines the ability of pharmacologic metrics of adherence to predict HIV and PrEP clinical outcomes and the past use of pharmacologic metrics of adherence as tools to drive adherence interventions. The authors also review the past and present data regarding point-of-care urine tenofovir testing and its potential role in HIV treatment and prevention. Finally, the authors look to the impact of point-of-care adherence interventions on HIV and PrEP clinical outcomes, gives promising results of the pilot studies summarized here. Method implementation-effectiveness studies will be needed to examine optimal approaches to incorporating point-of-care testing into routine clinical care delivery, including in guiding resistance testing, adherence counseling, and delivery of other evidence-based adherence interventions. Given the ability of point-of-care tenofovir testing to be implemented in settings where viral load testing is not available, and at more frequent intervals due to its low cost, urine-based tenofovir assays have the potential to be highly scalable in diverse clinical settings. Article	2024	Starks, Tyrel J.; Kyes, Kory; Cuebillasco, Juan; Parker, Joyelle N.; Kahle, Eric; Stephenson, Rob; Cain, Demetria	Comparing Repeated (Annual) Couples HIV Testing and Counseling to Individual HIV Testing and Counseling Among Male Couples at High Risk of HIV Infection: Protocol for a Randomized Control Trial	JMIR Research Protocols	-	-	-	-	1929-0748	10.2196/53823	https://pubmed.ncbi.nlm.nih.gov/38349737/	BACKGROUND: Couples HIV testing and counseling (CHTC) is now a standard of care prevention strategy recommended by the Centers for Disease Control and Prevention for sexual minority men (SMM) in relationships. Despite standard recommendations that couples complete CHTC every 6-12 months, no study has empirically evaluated the effects associated with CHTC retesting. OBJECTIVE: This study aims to understand the benefits associated with continued dyadic engagement in the HIV prevention continuum through routine CHTC retesting, which is of particular importance for emerging-adult SMM in relationships who use drugs. METHODS: Eligible couples for this CHTC retesting trial must already be enrolled in the 4Us trial, where they completed a CHTC session after their baseline survey. The purpose of the original 4Us trial was to test the efficacy of 2 intervention components for CHTC: a communication skills training video and a substance use module. Couples were eligible for the original 4Us trial if they were between the ages of 18 and 29 years, identified as SMM, were in a main relationship with another SMM partner for at least 3 months, and reported at least 1 episode of heavy drinking, sex while high, or sex while drunk in the past 90 days. Couples were ineligible for the original 4Us trial if they were HIV seropositive or seronegative, report use of at least 1 drug (cannabis, cocaine or crack, crystal methamphetamine, ketamine, gamma-hydroxybutyrate/gamma-butyrolactone, erectile dysfunction/sexual enhancement medications [eg, sildenafil, tadalafil, vardenafil], poppers [eg, amyl nitrite or isobutyl nitrite], opioids [eg, heroin, fentanyl, oxycodone, hydrocodone, methadone, buprenorphine, morphine, opium, and nitrates) use, and engage in condomless anal sex (CAS) acts with a casual partner or have a main partner who is nonmonogamous or serodiscordant. Those who complete the 4Us 12-month follow-up and remain in a relationship with the same partner are eligible for the CHTC retesting trial and will be offered the opportunity to participate in this CHTC retesting trial. These consenting are randomized to either CHTC retesting or individual HIV testing. Follow-up assessments are conducted 3 and 6 months after randomization to evaluate the effects of repeat CHTC on 2 primary outcomes: (1) CAS with a casual partner in the absence of preexposure prophylaxis (PrEP), and (2) CAS with a seroconcordant main partner who is not virally suppressed or concomitant CAS between main and casual partners in the absence of PrEP. RESULTS: The CHTC retesting trial launched in January 2023, and enrollment is ongoing. As of February 2024, the study had enrolled 106 eligible participants (n=53 couples). CONCLUSIONS: Findings from this CHTC retesting trial will help determine whether dyads who receive additional HIV testing services—individual HIV testing for SMM in relationships. The identification of results of this test will inform CHTC retesting guidance. TRIAL REGISTRATION: ClinicalTrials.gov NCT05833074; https://www.clinicaltrials.gov/study/NCT05833074. Article	2024	Starks, Tyrel J.; Sumrock, Steven; Lopez, David; Bradford-Rogers, Jesse; Marmus, Jonathan; Cain, Demetria	Testing the Effectiveness of a Motivational Interviewing Intervention to Reduce HIV Risk and Drug Use in Young Sexual Minority Men in a Community-Based Organization Setting.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04191-0	https://pubmed.ncbi.nlm.nih.gov/37803244/	Youngor sexual-minority men (YSMM) remain at high risk for HIV infection and substance use increases this risk. This study evaluated the effectiveness of a (4-session) motivational interviewing (MI) intervention to reduce substance use and sexual risk taking when delivered at two community-based organizations (CBOs) in the New York City metropolitan area. Participants were 229 YSMM aged 15–29 who reported recent sexual/HIV transmission risk and substance use. Overall, 86% of the sample identified as a racial or ethnic minority. Within each CBO, participants were randomized to receive either the MI intervention or enhanced treatment as usual (an HIV testing session plus PrEP information and referrals to CBO service). Contrary to hypotheses, results provided no indication that the MI intervention was associated with reductions in substance use (alcohol, cannabis, or other illicit drug use) or sexual risk taking or current PrEP use. Results are discussed in terms of challenges in real-world intervention implementation, study enrollment, and the COVID-19 pandemic. Article	2024	Stewart, Jessica; Ruiz-Mercado, Gloriuse; Sperring, Heather; Parris, Cassandra M.; Assoumou, Sabrina A.; Taylor, Jessica L.	Addressing Unmet PrEP Needs in Women: Impact of a Laboratory-Driven Protocol at an Urban, Essential Hospital.	Open Forum Infectious Diseases	-	-	-	-	2328-8957	10.1093/ofid/ofae056	https://pubmed.ncbi.nlm.nih.gov/38466498/	BACKGROUND HIV pre-exposure prophylaxis (PrEP) uptake in women remains low. We developed a laboratory result-driven protocol to link women with a positive bacterial sexually transmitted infection (STI) to HIV PrEP at an urban safety-net hospital. METHODS: Electronic health records of women with positive chlamydia, gonorrhea, and/or syphilis tests were accessed, and those eligible for PrEP were referred for direct or primary care provider-driven outreach. We assessed the proportion of women with STIs who received PrEP offers, acceptance, and prescriptions before (July 1, 2018-December 31, 2019) and after (January 1, 2021-June 30, 2022) implementation of the protocol. We used logistic regression to assess the association between the protocol and PrEP prescription, adjusting for age, race/ethnicity, and insurance. RESULTS: The proportion of women who received PrEP offers increased from 7.4% to 17.4% (P < .001). After multivariable adjustment, only the implementation period was associated with PrEP offers (odds ratio [OR], 2.49; 95% CI, 1.68-3.68). In subgroup analyses, PrEP offers increased significantly among non-Hispanic Black (OR, 2.75; 95% CI, 1.65-4.58) and Hispanic (OR, 3.16; 95% CI, 1.77-5.64, 11) women but not among non-Hispanic White women (OR, 1.49; 95% CI, 0.55-4.05). Significant changes in PrEP acceptance and prescriptions were not observed during the sample overall. CONCLUSIONS A laboratory result-driven protocol was associated with a significant increase in PrEP offers to Black and Hispanic women with STI. These results provide concrete suggestions for health systems seeking to increase PrEP access and equity among women. Article	2024	Storbeck E.D.; Ogunbajo A.; Nacht C.L.; Opale C.; Horvath K.J.; Lyman P.; Flynn R.; Reback C.J.; Blumenthal J.; Moore D.J.; Bolan R.; Morris S.	Facilitators of PrEP Persistence among Black and Latinx Transgender Women in a PrEP Demonstration Project in Southern California	Behavioral Medicine	-	-	-	-	8964289	10.1080/08964289.2022.2105766	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135919968&doi=10.1080%2F08964289.2022.2105766&partnerID=40&md5=e9ec67c1243458f59bb22c2f7a905ad2	Black and Latinx transgender women in the United States (U.S.) are at disproportionately high risk for HIV. Although HIV pre-exposure prophylaxis (PrEP) reduces the risk of HIV infection, uptake and persistence (i.e., ability to continue taking PrEP over time) can be a challenge for Black and Latinx transgender women due to myriad social and structural forces. In this qualitative study, we present unique data on the facilitators of PrEP persistence from Black and Latinx transgender women who initiated PrEP and exhibited varying levels of persistence during a demonstration project in Southern California. PrEP persistence was assessed by collecting quantitative intracellular tenofovir-diphosphate (TFV-DP) levels on dried blood spot (DBS) samples collected at weeks 12 and 48. Informed by the socioecological framework, we conducted in-depth interviews with participants (= 20) who had TFV-DP levels indicating adherence to PrEP at week 12 but not at week 48. Facilitators of PrEP persistence included having high individual-level HIV risk perception, feeling empowered to take PrEP, and reporting having improved peace of mind and mental health because of taking PrEP. Interpersonal-community-level facilitators included feeling motivation to prevent HIV in the community, motivation to prevent HIV in the context of sex work, and having high community-level risk perception. Structural-level facilitators included having positive experiences in affirming healthcare settings and having PrEP visits combined with other gender-related healthcare visits. Interventions aiming to increase PrEP uptake and persistence among Black and Latinx transgender women in the U.S. should harness the multiple levels of support exhibited by those who were able to start and persist on PrEP in the face of the myriad social and structural barriers. © 2022 Taylor & Francis Group, LLC.	health equity; HIV prevention; medication adherence; PrEP persistence; Transgender women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2024	Strong S.H.; Oldfield B.J.; van den Berg J.J.; Cole C.A.; Biegacki E.; Ogbuagu O.; Virata M.; Chan P.A.; Edelman E.J.	Perspectives on unhealthy alcohol use among men who have sex with men prescribed HIV pre-exposure prophylaxis: A qualitative study	Preventive Medicine Reports	-	-	-	-	22113355	10.1016/j.pmedr.2023.102553	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85181092968&doi=10.1016%2Fj.pmedr.2023.102553&partnerID=40&md5=67cb7b97f3b1d05fa0b4a3c9bbb02	Unhealthy alcohol use is a common, often unaddressed behavior associated with increased risk for acquisition of HIV and may also be associated with decreased adherence to oral pre-exposure prophylaxis (PrEP) among gay, bisexual, and other men who have sex with men (MSM) living in the United States. To inform future alcohol-reduction interventions among individuals engaging in PrEP care, we sought to explore perceptions of unhealthy alcohol use among MSM prescribed PrEP. We conducted semi-structured interviews with 15 MSM without HIV who were prescribed PrEP and screened positive for unhealthy alcohol use with AUDIT-C [4] and were receiving care in Providence, Rhode Island or New Haven, Connecticut. Interviews were coded and analyzed using thematic analysis. Three themes emerged: 1) Consequences of fluctuations in drinking 2) Alcohol use negatively impacts health and relationships; and 3) Desire for a multimodal approach to treatment of unhealthy alcohol use. Our findings support the need to raise awareness of potential alcohol-related harms, address the spectrum of unhealthy alcohol use among MSM prescribed PrEP, and the acceptability and preferences for alcohol reduction interventions within PrEP programs. © 2023 The Authors	Alcohol; HIV; Men who have sex with men; PrEP; Qualitative research	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2024	Sutten Coats, Cassandra; Goold, William C.; Sims-Gomillia, Courtney E.; Arnold, Trisha L.; Wirtes-Jones, Ina; Buck, Byron; Chen, Philip A.; Mena, Leandro A.; Nunn, Amy S.	"Make it more than a pill, make it an experience of health" results from an open pilot intervention to retain young African American men who have sex with men in PrEP care.	AIDS Care	-	-	-	-	1360-0451 0954-0121	10.1080/09540121.2021.2221422	https://pubmed.ncbi.nlm.nih.gov/37331017/	Uptake and retention in clinical care for pre-exposure prophylaxis (PrEP) is suboptimal, particularly among young African American men who have sex with men (MSM) in the Deep South. We conducted a pilot intervention, Uptake and Retention Intervention for Sustained Engagement (URISE), to improve PrEP care among young African American MSM. Using a human-centered design process to center in fashion, friendship, and fitness to design a rich recommendations for the PrEP persistence intervention. We developed an intervention based on recommendations in Phase I, and in Phase II, we implemented and evaluated the intervention enrolled in an open pilot. Eight participants completed Phase II study activities, including a single intervention session, phone call check-ins, and four assessments (Months 0, 1, 3, and 6). Exit interviews demonstrated a high level of acceptability and satisfaction with the intervention. These formative data demonstrate the initial promise of a novel intervention to improve PrEP persistence among young African American MSM. Article	2024	Takalani, Funanani; Kumar, Pradeep; Kondiah, Patric P. D.; Choonara, Yahya E.	Co-emulsified Aliginate-Eudragit Nanoparticles: Potential Carriers for Localized and Time-defined Release of Tenofovir in the Female Genital Tract.	AAPS PharmSciTech	-	-	-	-	1530-9932	10.1208/s12249-023-02723-4	https://pubmed.ncbi.nlm.nih.gov/38200167/	This research aimed to explore the possibilities of Eudragit S100 (ES100) and sodium alginate as carriers for tenofovir disoproxil fumarate (TDF) in the female genital tract. Alginate and alginate-ES100 nanoparticles were prepared using the ionic gelation and emulsion/gelation coalescence/gelation methods, respectively. The nanocarriers were tested using morphological, physicochemical, in vitro drug release, and cytotoxicity analyses. In SEM and TEM images, the presence of spherical and uniformly distributed nanoparticles was revealed. The FTIR spectrum showed that alginate and calcium chloride interacted to ionic bonds linking divalent calcium ions and the -COO- of alginate groups. Alginate and ES100 interacted via the ester C=O amide stretching. The results obtained from XRD and DSC, on the other hand, revealed a favorable interaction between alginate-sodium alginate and ES100 polymers, as evidenced by the crystallization peaks observed. Under experimental design analysis and optimization, overall size distribution profiles ranged from 134.9 to 228.0 nm, while zeta potential results showed stable nanoparticles (-17.8 to -34.4 MV). The optimal formulation exhibited a maximum cumulative in vitro release of 72% (pH 4.2) up to 96 h. The cytotoxicity tests revealed the safety of TDF-loaded nanoparticles on vaginal epithelial cells at concentrations of 0.025 mg/mL, 0.5 mg/mL, and 1 mg/mL for 72 h. These results indicated that alginate-ES100 nanoparticles have the potential to preserve and sustain the release of the TDF drug in the FGT. The future goal is to develop a low-dose non-toxic microbicide that can be administered long term in the vagina in order to both pregnant and non-pregnant HIV patients. Article	2024	Tadesse, Bineyam T.; Leyden, Wendy A.; Lea, Alexandra N.; Lee, Catherine; Donnelly, Michelle C.; Koskower, Douglas S.; Lee, Kristine; Liu, Vincent X.; Marcus, John L.; Silverberg, Michael J.	Using Electronic Health Records to Improve HIV Preexposure Prophylaxis Care: A Randomized Trial.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003376	https://pubmed.ncbi.nlm.nih.gov/38412047/	BACKGROUND: Preexposure prophylaxis (PrEP) use remains limited and inequitable, and strategies are needed to improve PrEP provision in primary care. METHODS: We conducted a cluster randomized trial at Kaiser Permanente, San Francisco, to evaluate the effectiveness of a clinical-decision support intervention guided by an electronic health record (EHR)-based HIV risk prediction model to improve PrEP provision. Primary care providers (PCPs) were randomized to receive care or intervention, with PCPs who provided care to patients with high HIV risk (PCPs in the intervention arm) receiving an EHR-based staff message with prompts to discuss HIV prevention and PrEP before upcoming in-person or video visits with patients whose predicted 1-year HIV risk was above a prespecified threshold. This study outcome was initiation of PrEP care within 90 days, defined as PrEP discussions, referrals, or prescription fills. RESULTS: Our one hundred twenty-one PCPs had 5051 appointments with eligible patients (2580 usual care; 2471 intervention). There was a nonsignificant increase in initiation of PrEP care in the intervention arm (6.0% vs 4.5%, HR 1.32, 95% CI 0.84 to 2.1). There was a significant increase in discussions, referrals, or prescriptions for PrEP (11.4% vs 6.8%, HR 1.69, 95% CI 1.09 to 2.63) and in non-HIV providers (P-interaction <0.001). CONCLUSION: An EHR-based intervention guided by an HIV risk prediction model substantially increased initiation of PrEP care among patients of PCPs who also care for people with HIV. Higher-intensity interventions may be needed to improve PrEP provision among PCPs less familiar with PrEP and HIV care. Article	2024	Thomas, Dorothy; Nakabugo, Lydiane; Nambi, Florence; Kibuuka, Joseph; Mwongo, Timothy R; Fretz, Erika; Thomas, Katherine K; Simoni, Jane M; Montgomery, Elizabeth T; Ware, Norma; Wyatt, Monique A; Katz, Ingrid T; Kadama, Herbert; Mugagga, Andrew; Hoffow, Renee	Intimate Partner Violence and Adherence to PrEP and ART Among Ugandan HIV Serodiscordant Couples.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000003368	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10898593/	BACKGROUND: Intimate partner violence (IPV) is associated with increased risk of HIV acquisition and reduced engagement in HIV care. There is limited understanding of the ways in which IPV exposure and other relationship relationship dynamics may influence adherence to antiretroviral treatment (ART) and pre-exposure prophylaxis (PrEP) for individuals in antenatal, HIV serodifferent partnerships. METHODS: We used binomial generalized linear mixed-effect regression models to evaluate the association between IPV exposure and ART/PrEP adherence among members of serodifferent couples in Uganda. Secondarily, we assessed the interaction between relationship power/closeness and ART/PrEP adherence. RESULTS: We enrolled and followed both partners in 82 serodifferent couples for 6 months. The partner living with HIV was female in 68% of couples. IPV exposure was associated with low ART adherence (15% vs. 2% in quarters with no IPV; odds ratio: 4.78, 95% confidence interval: 1.40 to 16.32). Similarly, IPV exposure was associated with low PrEP adherence (11% vs. 0%; odds ratio: 5.00, 95% confidence interval: 1.00 to 25.00). Participants were less likely to have poor PrEP and ART adherence with those with low relationship power/closeness (20% vs. 30%; odds ratio: 0.57, 95% confidence interval: 0.36 to 0.90). We observed an association between lower relationship power/closeness and ART adherence. CONCLUSIONS: We found that IPV exposure was associated with low adherence to ART and that relationship power/closeness was associated with good adherence to PrEP. These findings underscore the importance of addressing IPV and relationship power in ART/PrEP adherence for individuals in HIV serodiscordant couples. Article	2024	Thomasson S.E.; van Schreeb S.; Kirkby N.S.; Pinholt M.; Lebech A.-M.; Kronborg G.; Engsig F.N.	Prospective screening for monkeypox infection among users of HIV pre-exposure prophylaxis in Denmark	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624231223764	https://pubmed.ncbi.nlm.nih.gov/38183662/	Introduction: During the 2022 outbreak of mpox (previously called monkeypox), which primarily affected Gay, Bisexual, and other Men who have Sex with Men (GBMSM), testing was mainly limited to individuals with symptoms of infection. Although sporadic cases of mpox continue to be diagnosed in Denmark, the feasibility of screening asymptomatic high-risk populations, such as those using HIV pre-exposure prophylaxis (PrEP), is still unknown. Methods: During the autumn of 2022, a rectal swab PCR was included in the routine sexually transmitted infections (STI) screening for PrEP users. Results: The screening included 224 asymptomatic men with a median age of 36.5 years. One patient (0.4%) tested positive for mpox. Ten (4.5%) and nine (4.0%) had chlamydia and gonorrhea, respectively. Discussion: Our study demonstrates that screening for mpox is feasible in two Danish PrEP clinics. © The Author(s) 2024.	asymptomatic; HIV pre-exposure prophylaxis; Monkeypox; pre-exposure prophylaxis; screening; vaccination; vaccine	English	United Kingdom	Western and Central Europe and North America	Denmark	Western and Central Europe and North America	Denmark	Western and Central Europe and North America	Clinical
Article	2024	Thornhill, John Patrick; Fox, Julie; Martin, Genevieve Elizabeth; Hall, Rebecca; Lwanga, Julianne; Lewis, Heather; Brown, Helen; Robinson, Nicola; Kuldanek, Kristen; Kulnich, Sabine; Nwokolo, Nneka; Whitlock, Gary; Fidler, Sarah; Frater, John	Rapid antiretroviral therapy in primary HIV-1 infection enhances immune recovery	AIDS	-	-	-	-	1473-5571 0269-9370	10.1097/QAD.0000000000003825	https://pubmed.ncbi.nlm.nih.gov/38133660/?-icid=entrez%3A%20Link%20to%20datasets%20or%20related%20publications&-ncbi_phrase=%20%20or%20%20	OBJECTIVE: We present findings from a large cohort of individuals treated during primary HIV infection (PHI) and examine the impact of time from HIV-1 acquisition to antiretroviral therapy (ART) initiation on clinical outcomes. We also examine the temporal changes in the demographics of individuals presenting with PHI to inform HIV-1 prevention strategies. METHODS: Individuals who fulfilled the criteria for PHI and started ART within 1 year of HIV-1 acquisition between 2009 and 2015 were included. Clinical, laboratory, and demographic data were collected at baseline and follow-up visits. Data were analyzed using Cox proportional hazards models. RESULTS: Of 1,148 individuals with PHI, 1,024 (89%) were male, 1,004 (87%) were men who have sex with men, 1,006 (88%) were White, and 1,004 (88%) were UK born. Between 2009 and 2015, the proportion of PHI cases who were UK born declined from 94% to 79% (P < 0.001), whereas the proportion who were Black increased from 3% to 10% (P = 0.001). Among participants, 1,006 (88%) started ART during PHI (median 3.6 months). At PHI, the median age was 33 years, 4% were women, 19% were Black, and 84% were MSM. The proportion of UK born individuals was 47% in 2009–2013, compared with 29% in 2013–2020. There was an association between earlier ART initiation after PHI diagnosis and increased immune recovery; each day that ART was delayed was associated with a lower likelihood of achieving a CD4 > cell-count more than 500 cells/μl hazard ratio 0.99 (95% confidence interval, 95% CI 0.98–0.99), P = 0.02) and CD4/CD8 more than 1.0 hazard ratio 0.98 (95% CI 0.97–0.99). CONCLUSION: Early initiation of ART at PHI diagnosis is associated with enhanced immune recovery, providing further evidence to support immediate ART in the context of PHI. Non-UK-born MSM accounts for an increasing proportion of those with primary infection; UK HIV-1 prevention strategies should better target this group. Article	2024	Waldron, Elizabeth M.; Goodman, Georgia R.; Rivas, Alexa M.; Ott, Carolyn; Blyler, Abigail; McDonald, Victoria W.; Campbell, Marquetta; Underwood, Eric; Bonner, Aharai; Wise, Jenni M.; Elopre, Latesha; Kudroff, Kachina; Krakower, Douglas; Sherr, Kenneth; Kempf, Mirjam-Colette; Pearce, Christina	Perceptions of and preferences for PrEP use among African American women and providers in the U.S. South: a qualitative study.	Psychology & Health	-	-	-	-	1476-8321 0887-0446	10.1080/08870446.2024.2322079	https://pubmed.ncbi.nlm.nih.gov/38441083/	OBJECTIVE: Although there has been an increase in PrEP use among AA women in the U.S. South, disparities still exist. This study aimed to explore perceptions, attitudes, and implementation preferences surrounding PrEP use for AA women in the U.S. South. METHODS AND MEASURES: This study team conducted qualitative interviews with AA cisgender women clients, (n = 21) and their providers (n = 20) in Federally Qualified Health Centers and HIV clinics in Alabama. The research team employed directed qualitative content analysis to analyze interview data. RESULTS: Five themes emerged: a) inconsistent access to PrEP and PrEP knowledge, b) need for improving low PrEP awareness, c) managing hesitancy to prescribe or use PrEP, d) perceived HIV vulnerability and inherent stigma, and e) normalizing PrEP as part of routine sexual healthcare to increase uptake and maintenance. Interviews revealed an openness towards PrEP as an HIV prevention strategy for AA, cisgender women in Alabama. CONCLUSION: Improving PrEP uptake and maintenance among AA women in the U.S. South must go beyond increasing awareness to improving PrEP access and trust through mobility of AA women's PrEP use and incorporating PrEP education and services into routine sexual healthcare. Article	2024	Wallach, Sara; Saito, Suzue; Nawagatha-Birdsworska, Harriet; Dube, Leslie; Lamb, Matthew R.	Synthetic Controls for Implementation Science: Opportunities for HIV Program Evaluation Using Routinely Collected Data.	Current HIV/AIDS Reports	-	-	-	-	1548-3576 1548-3568	10.1007/s11904-024-00695-z	https://pubmed.ncbi.nlm.nih.gov/38478352/	PURPOSE OF REVIEW: HIV service delivery programs are some of the largest-funded public health programs in the world. Timely, efficient evaluation of these programs can be enhanced with methodologies designed to estimate the effects of policy. We propose using the synthetic control method (SCM) as an implementation science tool to evaluate these HIV programs. RECENT FINDINGS: The SCM is a quasi-experimental approach that estimates the effect of a policy change by comparing outcomes in a single unit exposed to the policy change to outcomes in a weighted average of unexposed units. Implementation science HIV interventions that could be evaluated using the SCM include programs that aim to improve HIV testing, linkage, and retention in care; pre-exposure prophylaxis (PrEP); voluntary medical male circumcision; and programs that address social and structural drivers of HIV. The SCM can be used to estimate the effects of a public health intervention targeting HIV health facilities with high numbers of recent infections on trends in pre-exposure prophylaxis (PrEP) enrollment. This tool case demonstrates SCMs feasibility for effectiveness evaluations of site-level HIV interventions. HIV programs collecting longitudinal, routine service delivery data for many facilities, with only some receiving a time-specified intervention, are well-suited for evaluation using SCM. Article	2024	Wan Z.; Shi M.; Gong Y.; Lucci M.; Li J.; Zhou J.; Yang X.-L.; Lelli M.; He X.; Mao J.	Multitasking Pharmacophores Support Cabotegravir-Based Long-Acting HIV Pre-Exposure Prophylaxis (PrEP)	Molecules	-	-	-	-	14203049	10.3390/molecules29020376	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85183335649&doi=10.3390%2fmolecules29020376&partnerID=40&md5=3b253248e92b8e4f5fe62a18eb69090e	Cabotegravir is an integrase strand transfer inhibitor (INSTI) for HIV treatment and prevention. Cabotegravir-based long-acting pre-exposure prophylaxis (PrEP) presents an emerging paradigm for infectious disease control. In this scheme, a combination of a high efficacy and low solubility of anti-infection drugs permits the establishment of a pharmaceutical firewall in HIV-vulnerable groups over a long period. Although the structure-activity-relationship (SAR) of cabotegravir as an INSTI is known, the structural determinants of its low solubility have not been identified. In this work, we have integrated multiple experimental and computational methods, namely X-ray diffraction, solid-state NMR (SSNMR) spectroscopy, solution NMR spectroscopy, automated fragmentation (AF)-QM/MM and density functional theory (DFT) calculations, to address this question. The molecular organization of cabotegravir in crystal lattice has been determined. The combination of very-fast magic-angle-sample-spinning (VF MAS) SSNMR and solution NMR, as supported by AF-QM/MM and DFT calculations, permits the identification of structural factors that contribute to the low aqueous solubility of cabotegravir. Our study reveals the multitasking nature of pharmacophores in cabotegravir, which controls the drug solubility and, meanwhile, the biological activity. By unraveling these function-defining molecular features, our work could inspire further development of long-acting HIV PrEP drugs. © 2024 by the authors. Article	2024	Wang L.; Muwonge T.R.; Simoni J.M.; Nambi F.; Nakabugo L.; Kibuuka J.; Thomas D.; Katz I.T.; Feutz E.; Thomas K.K.; Ware N.C.; Wyatt M.A.; Kadama H.; Mujugira A.; Heffron R.	Behavioral Modeling and its Association with PrEP and ART Use in Ugandan HIV-Serodifferent Couples	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-024-04286-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85185119907&doi=10.1007%2fs10461-024-04286-2&partnerID=40&md5=17cc43b1f28978b28e67c2107b0be4ec	Integrating Pre-Exposure Prophylaxis (PrEP) delivery into Antiretroviral Therapy (ART) programs bridges the Human Immunodeficiency Virus (HIV) prevention gap for HIV-serodifferent couples prior to the partner living with HIV achieving viral suppression. Behavioral modeling is one mechanism that could explain health-related behavior among couples, including those using antiretroviral medications, but few tools exist to measure the extent to which behavior is modeled. Using a longitudinal observational design nested within a cluster randomized trial, this study examined the factor structure and assessed the internal consistency of a novel 24-item, four-point Likert-type scale to measure behavioral modeling and the association of behavioral modeling with medication-taking behaviors among heterosexual, cis-gender HIV-serodifferent couples. In 149 couples enrolled for research, a five-factor model provided the best statistical and conceptual fit, including attention to partner behavior, collective action, role modeling, motivation, and relationship quality. Behavioral modeling was associated with medication-taking behaviors among members of serodifferent couples. Partner modeling of ART/PrEP taking could be an important target for assessment and intervention in HIV prevention programs for HIV serodifferent couples. © The Author(s) 2024. Article	2024	Warus J.; Hidalgo M.A.; Belzer M.; Olson-Kennedy J.	Acute HIV Diagnosis After Initiation of Pre-exposure Prophylaxis in a Young Adult Patient: A Case Report	Journal of Adolescent Health	-	-	-	-	1054139X	10.1016/j.jadohealth.2023.07.013	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85171194680&doi=10.1016%2fj.jadohealth.2023.07.013&partnerID=40&md5=e6ae9f55460c8654ac6bc001147d33a6	Oral pre-exposure prophylaxis (PrEP) in the prevention of human immunodeficiency virus (HIV) infection is highly effective, yet the majority of sexually active adolescents and young adults (AYAs) at highest risk for HIV infection, particularly AYA males who have sex with males, have not been prescribed this medication. Provider hesitancy in prescribing PrEP to at-risk AYA patients is often associated with concerns about patient nonadherence and its effect on inducing HIV medication resistance. This case report has two aims. First, to outline the clinical course for an AYA patient prescribed PrEP for 3 months and then found to have HIV with an M184V resistance mutation and subsequently started on HIV treatment. And second, to illustrate how the benefits of PrEP initiation outweigh its risks by presenting clinical data on resistance patterns to PrEP medications. The patient eventually achieved viral suppression within 5 months of starting HIV treatment which has been sustained up to 2 years. This case illustrates that M184V resistance mutations, although rarely associated with PrEP, are unlikely to impact options for HIV treatment. Providers should recommend and prescribe oral PrEP to AYA patients at risk for HIV infection without concern for nonadherence leading to HIV medication resistance. © 2023 Society for Adolescent Health and Medicine	Adolescent; Medication adherence; Primary prevention; Sexual and gender minorities; Sexual health	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2024	Warzywoda, Sarah; Dyda, Amalie; Fitzgerald, Lisa; Mullens, Amy; Debattista, Joseph; Durham, Jo; Gu, Zhihong; Wenham, Kathryn; Ariana, Armin; Gilks, Charles F.; Bell, Sara F. E.; Dean, Judith A.	A cross-sectional investigation of the factors associated with awareness of PEP and PrEP among Queensland university students.	Australian and New Zealand Journal of Public Health	-	-	-	-	1753-6405 1326-0200	10.1016/j.anzjph.2024.100136	https://pubmed.ncbi.nlm.nih.gov/38432178/	OBJECTIVE: University creates unique social environments for many young people that can result in behaviour changes that can impact sexual health-related risks and facilitate transmission of HIV. Little is known about HIV knowledge, risk, and awareness of pre-exposure prophylaxis/post-exposure prophylaxis (PrEP/PEP) among Australian university students. METHODS: A 2019 online survey distributed through Queensland universities, using active recruitment/snowball sampling. Descriptive and logistical regression analysis investigated HIV knowledge/risk and PrEP/PEP awareness. RESULTS: Of the 4,291 responses, 60.4% were 20-29 years old, 57.0% identified as heterosexual, and 31.8% were born-overseas. Mean HIV knowledge score was 9.8/12. HIV risk scores were higher among men-who-have-sex-with-men (MSM) (mean=5.2/40) compared to all other sexual behaviours (mean=3.1/40). Logistic regression indicated PrEP and PEP awareness was associated with older age (p<0.05), being non-binary/gender-diverse (p<0.05), and MSM (p<0.05). Lower odds of PrEP awareness were associated with international student status (p<0.05). CONCLUSION: This study highlights the need for future health promotion targeting younger Australians at risk of HIV to increase uptake of PrEP/PEP, particularly among overseas-born young people and those ineligible for appropriate health care in Australia. IMPLICATIONS FOR PUBLIC HEALTH: Addressing these gaps will improve sexual health outcomes for young Australians at risk of HIV and work towards virtual elimination of HIV transmission in Australia. Article	2024	Watson D.L.; Listerud L.; Drab R.A.; Lin W.Y.; Momplaisir F.M.; Bauermeister J.A.	HIV pre-exposure prophylaxis programme preferences among sexually active HIV-negative transgender and gender diverse adults in the United States: a conjoint analysis	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.26211	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85184514102&doi=10.1002%2fjia2.26211&partnerID=40&md5=166d329a3f5cfc6f4df9a857bdc0c9c3	Introduction: Current implementation efforts have failed to achieve equitable HIV pre-exposure prophylaxis (PrEP) provision for transgender and gender-diverse (trans) populations. We conducted a choice-based conjoint analysis to measure preferences for key attributes of hypothetical PrEP delivery programmes among a diverse online sample predominantly comprised of transmasculine and nonbinary individuals in the United States. Methods: Between April 2022 and June 2022, a national online survey with an embedded conjoint analysis experiment was conducted among 304 trans individuals aged ≥18 years in the United States to assess five PrEP programme attributes: out-of-pocket cost; dispensing venue; frequency of visits for PrEP-related care; travel time to PrEP provider; and ability to bundle PrEP-related care with gender-affirming hormone therapy services. Participants responded to five questions, each of which presented two PrEP programme scenarios and one opt-out option per question and selected their preferred programme in each question. We used hierarchical Bayes estimation and multinomial logistic regression to measure part-worth utility scores for the total sample and by respondents' PrEP status. Results: The median age was 24 years (range 18–56); 75% were assigned female sex at birth; 54% identified as transmasculine; 32% as nonbinary; 14% as transfeminine. Out-of-pocket cost had the highest attribute importance score (44.3%), followed by the ability to bundle with gender-affirming hormone therapy services (18.7%). Minimal cost-sharing ($0 out-of-pocket cost) most positively influenced the attribute importance of cost (average conjoint part-worth utility coefficient of 2.5 95% CI 2.4–2.6). PrEP-experienced respondents preferred PrEP delivery in primary care settings (relative utility score 4.7); however, PrEP-naïve respondents preferred pharmacies (relative utility score 5.1). Conclusions: Participants preferred programmes that offered PrEP services without cost-sharing and bundled with gender-affirming hormone therapy services. Bolstering federal regulations to cover PrEP services and prioritizing programmes to expand low-barrier PrEP provision are critical to achieving equitable PrEP provision. Community-engaged implementation research conducted by and in close collaboration with trans community stakeholders and researchers are needed to streamline the design of patient-centred PrEP programmes and develop implementation strategies that are salient to the diverse sexual health needs of trans patients. © 2024 The Authors. Article	2024	Weinstein, Elliott R.; Broos, Hannah C.; Lozano, Alyssa; Jones, Megan A.; Serrano, Lorenzo Pla; Harkness, Audrey	Longitudinal predictors of post-exposure prophylaxis awareness among latino sexual minority men in South Florida.	Journal of Behavioral Medicine	-	-	-	-	1573-3521 0160-7715	10.1007/s10865-024-00466-6	https://pubmed.ncbi.nlm.nih.gov/38409554/	Biomedical tools for HIV prevention such as post-exposure prophylaxis (PEP) continue to be underutilized by subgroups experiencing significant HIV inequities. Specifically, factors associated with both PEP awareness and uptake both cross-sectionally and longitudinally are under-researched, despite PEP being a part of the United States' Plan for Ending the HIV Epidemic. The current study examined longitudinal predictors of PEP awareness among Latino sexual minority men (LSMM) living in South Florida. This current study (N = 290) employed hierarchal linear modeling across three timepoints (baseline, 4-months, 8-months) to assess within-person and between-person effects over time for several psychosocial and structural factors. Most participants (67.5%) reported little to no awareness of PEP at baseline with general PEP awareness growing slightly across the study (60.5% reporting little to no awareness of PEP at 8 months). Results of the final conditional model suggest significant within-person effects of PrEP knowledge (p = 0.02) and PrEP self-efficacy (p < 0.001), as well as a significant positive between-person effect of PrEP knowledge (p < 0.01) on PEP awareness. Between-person HIV knowledge was also a significant predictor in this model (p = 0.01). This longitudinal analysis of LSMM's PEP awareness indicates that more must be done to increase PEP awareness among this subgroup. Future studies should explore how to build on existing interventions focused on HIV and PrEP knowledge and PrEP self-efficacy to incorporate information about PEP to increase the reach of this effective biomedical HIV prevention tool. Article	2024	Weld, Ethel D.; Ogasawara, Ken; Fuchs, Edward J.; Louissaint, Nicolette; Caffo, Brian; Hendrix, Craig W.	Mapping Colorectal Distribution of Cell-free and Cell-associated HIV Surrogates Following Simulated Anal Intercourse to Aid Rectal Microbicide Development.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000003401	https://pubmed.ncbi.nlm.nih.gov/38346420/	BACKGROUND: Anal sex remains the greatest HIV transmission risk for men who have sex with men and carries substantial population attributable risk among women. Despite a growing array of HIV pre-exposure prophylaxis (PrEP) options, rectal microbicides remain desirable as on demand, non-systemic PrEP. Rectal microbicide product development for PrEP requires understanding the spatiotemporal distribution of HIV infectious elements in the rectosigmoid to optimize formulation development. SETTING: Outpatient setting with healthy research participants. METHODS: Six healthy men underwent simulated receptive anal sex with an artificial phallus fitted with a triple lumen catheter in the urethral position. To simulate ejaculation of HIV-infected semen, autologous seminal plasma laden with autologous blood lymphocytes from apheresis labeled with 111Indium-oxine (cell-associated) and 99mTechnetium-sulfur colloid (cell-free) as HIV surrogates were injected into the rectal lumen through the phallic urethra. Spatiotemporal distribution of each radioisotope was assessed using SPECT/CT over eight hours. Analysis of radiolabel distribution used a flexible principal curve algorithm to quantitatively estimate rectal lumen distribution. RESULTS: Cell-free and cell-associated HIV surrogates distributed to a maximal distance of 15 and 16 cm, respectively, from the anorectal junction (~19 and ~20 cm from the anal verge), with a maximal signal intensity located 6 and 7 cm, respectively. There were no significant differences in any distribution parameters between cell-free and cell-associated HIV surrogate. CONCLUSIONS: Cell-free and cell-associated HIV surrogate distribution in the rectosigmoid can be quantified with spatiotemporal pharmacokinetic methods. These results describe the ideal luminal target distribution to guide rectal microbicide development. Article	2024	Wiginton J.M.; Murray S.M.; Anderson B.J.; Sey K.; Ma Y.; Flynn C.P.; German D.; Higgins E.; Menza T.W.; Orellana E.R.; Sanz S.; Hasan N.A.; Al-Tayyib A.; Kienzle J.; Shields G.; Lopez Z.; Wermuth P.; Baral S.D.	Sexual Behavior Stigma Among Cisgender Gay, Bisexual, and Other Men Who Have Sex With Men in Nine NHBS Cities Across the United States: Burden and Associations With PrEP Continuum and HIV Care Continuum Outcomes	Stigma and Health	-	-	-	-	23766972	10.1037/sah0000495	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85183744271&doi=10.1037%2fsah0000495&partnerID=40&md5=54ebcc209351af37d4c2c7f9c38eabd7	In the United States, sexuality-based stigma continues to undermine HIV prevention and care efforts. We assessed sexual behavior stigma burden across family, health care, and social domains and determined associations with HIV-related outcomes among cisgender gay, bisexual, and other men who have sex with men (MSM) in nine United States metropolitan statistical areas. MSM (N = 4,086) recruited at places of MSM social congregation via venue-based, time-sampling procedures completed a survey on sexual behavior stigma, preexposure prophylaxis (PrEP) continuum and HIV care continuum outcomes, sociodemographic characteristics, and other measures. We calculated prevalence and overall mean stigma subscale scores (range: 0.00–1.00) and used logistic and mixed-effects logistic regression to determine stigma-HIV outcome associations. Most participants identified as gay, were employed, and were from West Coast cities; roughly 40% were non-Hispanic White, aged 25–34 years, and had completed some college. One in five were living with HIV. Family stigma (prevalence = 47.5%; M = 0.36) was associated with greater odds of health care engagement, PrEP awareness, and PrEP use among HIV-negative MSM. Anticipated health care stigma (prevalence = 14.5%; M = 0.11) was associated with lower odds of health care engagement, current antiretroviral treatment (ART) use, and viral load undetectability among MSM living with HIV. General social stigma (prevalence = 49.9%; M = 0.20) was associated with greater odds of PrEP awareness and use among HIV-negative MSM and lower odds of current ART use among MSM living with HIV. Targeted stigma-mitigation in family, health care, and other social contexts remains paramount to ending the HIV epidemic in the United States. © 2024 American Psychological Association	HIV care continuum; men who have sex with men; preexposure prophylaxis continuum; sexual behavior stigma; stigma prevalence	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2024	Wong, Christina Misa; Munthali, Tendai; Mangunje, Featherstone G; Katoka, Mercy L; Burke, Holly M; Musonda, Bupe; Musonda, Musonda; Todd, Catherine S	Creating allies: qualitative exploration of young women's preferences for PrEP methods and parents' role in PrEP uptake and user support in urban and rural Zambia.	BMC Women's Health	-	-	-	-	1472-6874	10.1186/s12905-024-02913-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10809647	BACKGROUND: Zambian adolescent girls and young women (AGYW) have high HIV incidence and face barriers to the use of pre-exposure prophylaxis (PrEP). Parental support improves PrEP use and adherence in some settings, but negative parental attitudes toward HIV prevention may inhibit engagement with AGYW. We explored perceptions of future PrEP methods among AGYW and parents and parent-youth engagement on HIV prevention and PrEP use. METHODS: We conducted a qualitative descriptive study among AGYW and parents of AGYW in five provinces in Zambia in September-October 2021. We conducted 10 focus group discussions (FGDs) and four in-depth interviews (IDIs) with AGYW participants (n = 87) and seven FGDs and four IDIs among parents of AGYW (n = 62). All FGDs and IDIs were audio-recorded, transcribed verbatim, and analyzed to identify qualitative themes. RESULTS: Most AGYW participants preferred the discreet nature and longer duration of injectable PrEP compared to the PrEP ring and oral PrEP. Many AGYWs reported inability to disclose PrEP use to their parents due to lack of parental support based on cultural taboos against premarital sex. Nevertheless, AGYW participants said they would like to talk to their parents about PrEP so their parents could support their use. Many parents also described difficulties discussing PrEP with their daughters because of cultural and religious beliefs about abstinence from sex before marriage. However, parents acknowledged that the threat of HIV is real and said they need PrEP knowledge and guidance on speaking with their children about HIV prevention and PrEP. CONCLUSIONS: Although many parents are currently not playing a role in daughters' decisions about PrEP use, both parents and AGYW are willing to engage with each other on HIV prevention issues. To foster parent-child engagement, HIV prevention programs should not only provide information about PrEP but also address social norms that impede discussion of HIV prevention and equip both parents and AGYW with skills and support for such conversations. Community sensitization is also needed as new PrEP products are introduced, to create an enabling environment for parent-child engagement by increasing awareness, countering misconceptions, and reducing stigma. Article	2024	Wyatt, Gail E; Norwood-Scott, Enricka; Cooley-Strickland, Michele; Zhang, Muyu; Smith, Amber; Jordan, Wilbert; Liu, Honghu; Hamilton, Alison B	Increasing Urban African American Women's Readiness for Pre-exposure Prophylaxis: A Pilot Study of the Women Prepping for PrEp Plus Program (WP3+).	Women's Health Issues	-	-	-	-	1878-4321	10.1016/j.whi.2023.11.001	https://dx.doi.org/10.1016/j.whi.2023.11.001	BACKGROUND: African American women are disproportionately at risk for HIV infection. To increase women's readiness to consider taking pre-exposure prophylaxis (PrEP), we conducted a pilot study of Women Prepping for PrEP Plus (WP3+). Adapted from an evidence-based HIV risk reduction intervention for African American couples who are HIV-serodiscordant, WP3+ is a group-based culturally congruent program designed for African American women without HIV. METHODS: Women were screened for eligibility; if eligible, they were invited to participate in the four-session WP3+ group. Participants completed surveys at baseline (n = 47) and post-implementation (n = 28); surveys assessed demographics, HIV and PrEP knowledge, depression and posttraumatic stress (PTS) symptoms, substance use, sexual risk behaviors, health care-related discrimination, and social support. In a process evaluation, a subset of women completed qualitative interviews at baseline (n = 35) and post-implementation (n = 18); the interviews were designed to converge with (e.g., on HIV and PrEP knowledge) and expand upon (e.g., unmeasured perceived impacts of WP3+) quantitative measures. To triangulate with the quantitative data, deductive qualitative analysis concentrated on women's knowledge and awareness of PrEP and HIV, their relationship dynamics and challenges, and their considerations (e.g., barriers, facilitators) related to taking PrEP; inductive analysis focused on women's experiences in the intervention. RESULTS: Participants in the WP3+ intervention reported: improved proportion of condom use in the past 90 days (p < .01) and in a typical week (p < .05); reduced PTS symptoms (p < .05); increased HIV knowledge (p < .0001) and awareness of PrEP (p < .001); and greater consideration of using PrEP (p < .001). In interviews, participants expressed not only increased knowledge but also appreciation for learning how to protect themselves against HIV, communicate with their partners, and take charge of their health, and they expressed greater receptiveness to using PrEP as a result of the knowledge and skills they gained. CONCLUSIONS: The WP3+ pilot study demonstrated preliminary efficacy and acceptability as an HIV-prevention program for African American women. A controlled trial is needed to confirm its efficacy for increasing PrEP use among African American women. Article	2024	Wyatt, Monique A.; Pisarski, Emily E.; Nalumansi, Alisaati; Kasiita, Vicent; Kamusiime, Brenda; Nalukwago, Grace K.; Thomas, Dorothy; Muwonge, Timothy R.; Mujugira, Andrew; Heffron, Renee; Ware, Norma C.	How PrEP delivery was integrated into public ART clinics in central Uganda: A qualitative analysis of implementation processes.	PLOS Global Public Health	-	-	-	-	2767-3375	10.1371/journal.pgph.0002916	https://journals.plos.org/globalpublichealth/article?id=10.1371/journal.pgph.0002916	Tailored delivery strategies are important for optimizing the benefit and overall reach of PrEP in sub-Saharan Africa. An integrated approach of delivering time-limited PrEP in combination with ART to serodifferent couples encourages PrEP use in the HIV-negative partner as a bridge to sustained ART use. Although PrEP has been delivered in ART clinics for many years, the processes involved in integrating PrEP into ART services are not well understood. The Partners PrEP Program was a stepped-wedge cluster randomized trial of integrated PrEP and ART delivery for HIV serodifferent couples in 12 public health facilities in central Uganda (Clinicaltrials.gov NCT03586128). Using qualitative data, we identified and characterized key implementation processes that explain how PrEP delivery was integrated into existing ART services in the Partners PrEP Program. In-depth interviews were conducted with a purposefully-selected sub-sample of 83 members of 42 participating serodifferent couples, and with 36 health care providers implementing integrated delivery. High quality training, technical supervision, and teamwork were identified as key processes supporting providers to implement PrEP delivery. Interest in the PrEP program was promoted through the numerous ways health care providers made integrated ART and PrEP meaningful for serodifferent couples, including tailored counseling messages, efforts to build confidence in integrated delivery, and strategies to create demand for PrEP. Couples in the qualitative sample responded positively to providers' efforts to promote the integrated strategy. HIV-negative partners initiated PrEP to preserve their relationships, which inspired their partners living with HIV to recommit to ART adherence. Lack of disclosure among couples and poor retention on PrEP were identified as barriers to implementation of the PrEP program. A greater emphasis on understanding the meaning of PrEP for users and its contribution to implementation promises to strengthen future research on PrEP scale up in sub-Saharan Africa. Article	2024	Wyllie T.J.S.; Brown J.L.; Meisman A.; Bayyari N.; Mangeot C.; Sun Q.; Mullins T.L.K.	Attitudes and Intentions toward Use of HIV Pre-Exposure Prophylaxis (PrEP) among Adults Receiving Treatment for Opioid Use	Substance Use and Misuse	-	-	-	-	10826084	10.1080/10826084.2023.2275556	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175947726&doi=10.1080%2f10826084.2023.2275556&partnerID=40&md5=223c4fa1a92b373605b8b4896db903ab	Background: Although pre-exposure prophylaxis (PrEP) prevents HIV, little is known about PrEP awareness and factors associated with intention to take PrEP among people with opioid use disorder (OUD). Methods: HIV-negative adults recruited from an outpatient treatment program in Cincinnati, Ohio completed self-administered surveys. Items derived from literature and health behavioral theory included demographics, sexual and drug use behaviors, HIV prevention practices, PrEP knowledge, and attitudes toward PrEP. Primary outcomes were 1) intention to ask a clinician about PrEP and 2) intention to accept PrEP if recommended by a clinician. Outcomes were dichotomized into higher vs. lower intention for analyses in logistic regression models. Results: Among 198 participants, 60.3% reported past injection drug use. Among 58 participants (29.3%) meeting criteria for PrEP, 24% were aware of PrEP, 15.5% had discussed it with a clinician, and 5% had taken it. Factors associated with intention to ask a clinician about PrEP included being somewhat confident about consistent condom use (p < 0.01), motivation to comply with normative beliefs (p < 0.01), and reporting that PrEP fits very well (p < 0.01) and is easy to fit (p < 0.01) into current prevention practices. Factors associated with intention to accept PrEP if recommended by a clinician included motivation to comply with normative beliefs (p < 0.01) and PrEP being easy to fit into current prevention practices (p < 0.01). Conclusion: Among participants meeting indications for PrEP, only 24% were aware of it and few had taken it. Interventions that normalize PrEP and target incorporating PrEP into current prevention practices may improve uptake among individuals with OUD. © 2023 Taylor & Francis Group, LLC.	attitudes; HIV prevention; opioid use disorder; Pre-exposure prophylaxis; substance use; survey	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2024	Yin, Zhuoheng; Tan, Rayner Kay Jin; Tucker, Joseph D; Li, Quanmin; Sherer, Renslow; Li, Linghua; Tang, Weiming	Acute facial neuralgia related to initiation of emtricitabine/tenofovir for HIV PrEP: a report of two cases in a PrEP demonstration trial.	Sexual Health	-	-	-	-	1449-8987	10.1071/SH23129	https://dx.doi.org/10.1071/SH23129	BACKGROUND: Emtricitabine (FTC) and tenofovir disoproxil fumarate (TDF) fixed-dose combination (FTC/TDF) is generally well-tolerated, although treatment-related adverse events have been reported. METHODS: We report two cases of persons using FTC/TDF PrEP who had acute neuralgia in a Chinese PrEP demonstration trial. RESULTS: Neurological symptoms subsided upon treatment discontinuation. Symptoms were reported as similar to one case's previous experiences with dolutegravir (DTG)+FTC+tenofovir alafenamide (TAF) (for PEP), leading to permanent discontinuation of PrEP. CONCLUSION: Acute facial neuralgia appears to be a rare idiosyncratic adverse event to FTC/TDF. Article	2024	Yu, Simin; Bavinton, Benjamin R.; Chan, Curtis; MacGibbon, James; Mao, Limin; Vujcich, Daniel; Broady, Timothy R.; Holt, Martin	Assessing HIV risk and the social and behavioural characteristics of gay and bisexual men who have recently migrated to Australia: an analysis of national, behavioural surveillance data 2019-2021.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26204	https://onlinelibrary.wiley.com/doi/10.1002/jia2.26204	INTRODUCTION: Overseas-born gay and bisexual men (GBM) are overrepresented in HIV diagnoses in Australia. We assessed social and sexual behaviours, and the use of HIV prevention and testing, by region of birth and length of residence in Australia. We sought to identify similarities and differences between recently arrived and non-recently arrived GBM from non-English-speaking countries to improve targeting and engagement with HIV testing and prevention. METHODS: Data were collected in national repeated, behavioural surveillance surveys conducted across Australia during 2019-2021. Logistic regression was used to identify factors that differentiated between recently arrived (<2 years) and non-recently arrived (≥2 years in Australia) GBM from non-English-speaking countries. RESULTS: Among 24,707 participants in 2019-21, 2811 (11.4%) were from high-income English-speaking countries, 714 (2.9%) were recently arrived overseas-born GBM and 3833 (15.5%) were non-recently arrived migrants. Recently arrived GBM were most likely to be born in Asia (36.1%) and Europe (21.1%). Compared with non-recently arrived GBM, recently arrived GBM from non-English-speaking countries were younger (aOR = 0.95, 95% CI = 0.94-0.96, p<0.001), more likely to be students (aOR = 1.43, 95% CI = 1.11-1.85, p = 0.005), less likely to be in full-time employment (aOR = 0.56, 95% CI = 0.46-0.69, p <0.001), more likely to report consistent condom use (aOR = 1.30, 95% CI = 1.01-1.66, p = 0.039), but had lower awareness (aOR = 0.62, 95% CI = 0.48-0.80, p<0.001) and use of pre-exposure prophylaxis (PrEP) (22.8%, vs. 32.3%, χ(2) (1, 4185) = 23.78, p<0.001), and similar levels of casual sex with a risk of HIV acquisition or transmission (aOR = 1.29, 95% CI = 0.98-1.69, p = 0.066). Recently arrived GBM reported similar levels of lifetime HIV testing (aOR = 0.97, 95% CI = 0.54-1.74, p = 0.915) and recent HIV testing (OR = 1.03, 95% CI = 0.86-1.22, p = 0.779), but were much less likely to have tested at general practitioners (aOR = 0.53, 95% CI = 0.41-0.68, p<0.001) and more likely to report testing at hospitals (aOR = 3.35, 95% CI = 2.53-4.43, p<0.001), at home (aOR = 2.85, 95% CI = 1.63-4.99, p<0.001), or community-based services (aOR = 1.36, 95% CI = 1.01-1.84, p = 0.043). CONCLUSIONS: Recently arrived GBM from non-English-speaking countries reported similar levels of risk of HIV acquisition to longer-term residents in Australia, but lower levels of PrEP awareness and use, and more reliance on HIV testing services which are free or low cost. It is necessary to enhance access to HIV testing and prevention among recently arrived GBM in Australia. Article	2024	Zewdie, Kidist Belay; Ngure, Kenneth; Mwangi, Margaret; Mwangi, Dominic; Maina, Simon; Etyang, Lydia; Maina, Gakuo; Ogello, Vallery; Owidi, Emmah; Mugo, Nelly R.; Baeten, Jared M.; Mugwanya, Kenneth K.	Effect of differentiated direct-to-pharmacy PrEP refill visits supported with client HIV self-testing on clinic visit time and early PrEP continuation.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26222	https://onlinelibrary.wiley.com/doi/full/10.1002/jia2.26222	INTRODUCTION: Delivery of oral pre-exposure prophylaxis (PrEP) is being scaled up in Africa, but clinic-level barriers including lengthy clinic visits may threaten client continuation on PrEP. METHODS: Between January 2020 and January 2022, we conducted a quasi-experimental evaluation of differentiated direct-to-pharmacy PrEP refill visits at four public health HIV clinics in Kenya. Two clinics implemented the intervention package, which included direct-to-pharmacy for PrEP refill, client HIV self-testing (HIVST), client navigator, and pharmacist-led rapid risk assessment and dispensing. Two other clinics with comparable size and client volume served as contemporaneous controls with the usual clinic flow. PrEP continuation was evaluated by visit attendance and pharmacy refill records, and time and motion studies were conducted to determine time spent in the clinics. Dried blood spots were collected to test for tenofovir-diphosphate (TFV-DP) at random visits. We used logistic regression to assess the intervention effect on PrEP continuation and the Wilcoxon rank sum test to assess the effect on clinic time. RESULTS: Overall, 746 clients were enrolled, 366 at control clinics (76 during pre-implementation and 290 during implementation phase), and 380 at direct-to-pharmacy clinics (116 during pre-implementation and 264 during implementation phase). Prior to implementation, the intervention and control clinics were comparable on client characteristics (female: 51% vs. 47%; median age: 33 vs. 33 years) and PrEP continuation (35% vs. 37% at 1 month, and 37% vs. 39% at 3 months). The intervention reduced total time spent at the clinic by 35% (median of 51 minutes at control vs. 33 minutes at intervention clinics; p<0.001), while time spent on HIV testing (20 vs. 20 minutes; p = 0.50) and pharmacy (8 vs. 8 minutes; p = 0.8) was unchanged. PrEP continuation was higher at intervention versus the control clinics: 45% versus 33% at month 1, 34% versus 25% at month 3 and 23% versus 16% at month 6. TFV-DP was detected in 85% (61/72) of samples, similar by the study group (83% vs. 85%). CONCLUSIONS: A client-centred PrEP delivery approach with direct-to-pharmacy PrEP refill visits plus client HIVST significantly reduced clinic visit time by more than one-third and improved PrEP continuation in public health HIV clinics in Kenya. Article	2024	Zhang, Xinhong; Li, Jianwei; Tang, Gan; Wang, Ziwei; Guo, Qian; Guo, Qisheng; Qin, Qirong; Fan, Yinguang	The prevalence and factors of willingness to accept circumcision among MSM in Maanshan City, China.	AIDS Care	-	-	-	-	1360-0451 0954-0121	10.1080/09540121.2023.2299664	https://www.tandfonline.com/doi/full/10.1080/09540121.2023.2299664	To investigate the prevalence of male circumcision and the willingness to undergo male circumcision and influencing factors among MSM in Maanshan City, we conducted a cross-sectional study from June 2016 to December 2019. Respondent-driven sampling (RDS) was used to recruit participants. Influential factors of willingness to accept circumcision were identified by a multivariable logistic regression model. The multivariable logistic regression model revealed that five variables were independent influential factors for willingness to participate. The factors include that used condoms during last anal intercourse (OR = 1.87, 95% CI:1.03-3.41, P = 0.04), sex with female sex partners (OR = 0.499, 95% CI:0.298-0.860, P = 0.012, level of education (junior college: OR = 0.413, 95% CI:0.200-0.854, P = 0.017; bachelor's degree or higher: OR = 0.442, 95% CI:0.208-0.938, P = 0.033), condom use during oral sex in the last six months (OR = 4.20, 95% CI:1.47-12.0, P = 0.007) and level of knowledge of PrEP (OR = 5.09, 95% CI:1.39-18.7, P = 0.014). Given the willingness of MSM to accept circumcision was low in China, establishing a proper understanding of circumcision is essential if it is to be used as a strategy to prevent HIV infection among MSM. Therefore, publicity and education on the operation should be strengthened to increase the willingness to undergo male circumcision. Article	2024	Zhao, Rui; Fairley, Christopher K; Cook, Alex R; Phanuphak, Nittaya; He, Shiyi; Tieosapjaroen, Warittha; Chow, Eric P F; Phillips, Tiffany R; Jin Tan, Rayner Kay; Wei, Yuhang; Shen, Mingwang; Zhuang, Guihua; Ong, Jason J; Zhang, Lei	Optimising HIV pre-exposure prophylaxis and testing strategies in men who have sex with men in Australia, Thailand, and China: a modelling study and cost-effectiveness analysis	The Lancet Global Health	-	-	-	-	2214109X	10.1016/S2214-109X(23)00536-3	https://pubmed.ncbi.nlm.nih.gov/38245115/	Background: Men who have sex with men (MSM) in the Asia-Pacific region have a disproportionately high burden of HIV infection compared with the general population. Although pre-exposure prophylaxis (PrEP) for HIV is highly effective at preventing new HIV infections, the cost-effectiveness of PrEP for MSM in different countries in the Asia-Pacific region with varying PrEP coverage and HIV testing frequencies remains unstudied. We aimed to analyse the economic and health benefits of long-acting injectable cabotegravir (CAB-LA) compared with oral PrEP in high-income countries and low-income and middle-income countries within the Asia-Pacific region. Methods: We developed a decision-analytic Markov model to evaluate the population impact and cost-effectiveness of PrEP scale-up among MSM in Australia, Thailand, and China. We assumed a static cohort of 100 000 MSM aged 18 years or older who were at risk of HIV infection, with a monthly cycle length over a 40-year time period. We evaluated hypothetical scenarios with universal PrEP coverage of 80% among 100 000 suitable MSM in each country. We modelled oral PrEP and CAB-LA for MSM with diverse HIV testing frequency strategies. We adopted the health-care system's perspective with a 3% annual discount rate. We calculated the incremental cost-effectiveness ratio (ICER), measured as additional cost per quality-adjusted life-year (QALY) gained, to compare different strategies with the status quo in each country. All costs were reported in 2021 US$. We also performed one-way, two-way, and probabilistic sensitivity analyses to assess the robustness of our findings. Findings: Compared with the status quo in each country, expanding oral PrEP to 80% of suitable MSM would avert 8·1% of new HIV infections in Australia, 14·5% in Thailand, and 26·4% in China in a 40-year period. Expanding oral PrEP use with 6-monthly HIV testing for both PrEP and non-PrEP users was cost-saving for Australia. Similarly, expanding oral PrEP use remained the most cost-effective strategy in both Thailand and China, but optimal testing frequency varied, with annual testing in Thailand (ICER $4707 per QALY gained) and 3-monthly testing in China (ICER $16 926 per QALY gained) for both PrEP and non-PrEP users. We also found that replacing oral PrEP with CAB-LA for MSM could avert more new HIV infections (12·8% in Australia, 27·6% in Thailand, and 32·8% in China), but implementing CAB-LA was not cost-effective due to its high cost. The cost of CAB-LA would need to be reduced by 50–90% and be used as a complementary strategy to oral PrEP to be cost-effective in these countries. Interpretation: Expanding oral PrEP use for MSM, with country-specific testing frequency, is cost-effective in Australia, Thailand, and China. Due to the high cost, CAB-LA is currently not affordable as a single-use strategy but might be offered as an additional option to oral PrEP. Article	2024	Zheng C.; Qiu Y.; Liu S.; Liu L.; Li J.; Wu Z.; Wang Y.	Survey on awareness, level of willingness to use, and influencing factors of HIV/AIDS pre-exposure prophylaxis among men who have sex with men in Shijiazhuang	Journal of Medical Pest Control	-	-	-	-	10036245	10.7629/yxdwfz202401012	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182683039&doi=10.7629%2fyxdwfz202401012&partnerID=40&md5=3abbc2207103c16355f70e375ab49c70	Objective To investigate the cognition, level of willingness to use, and related influencing factors of HIV/AIDS pre-exposure prophylaxis (PrEP) among men who have sex with men (MSM) in Shijiazhuang City from February to March 2022. Methods The cross-sectional study design and convenience sampling were used to study. MSM groups were selected from a voluntary counselling clinic, a social welfare organization, and an internet community in Shijiazhuang City for a questionnaire survey. Chi-square test and multivariate logistic regression analysis methods were used to explore the relevant factors affecting the awareness and willingness to use PrEP among the MSM population. Results A total of 258 valid questionnaires were obtained, of which 73. 2% of respondents had heard of PrEP and 72. 5% said they would be willing to use PrEP medicine. However, only 7. 7% of respondents had used or were using PrEP services. Multivariate logistic regression analysis showed that respondents who didn't know how to access PrEP (OR = 3. 452, 95% CI: 1. 507-7. 786) and with a fear of AIDS (OR = 2. 084, 95% CI: 1. 054-4. 118) had a relatively high willingness to use PrEP. However, sexual roles as others (OR = 0. 218, 95% CI: 0. 049-0. 971),worried about the potential stigmatization caused by access to PrEP (OR = 0. 233,95%CI:0. 110-0. 496),and the perception that it might be financially burdensome (OR = 0. 474, 95% CI: 0. 238-0. 942) or might be an impediments influence to use PrEP. Conclusion The overall MSM population in Shijiazhuang has a high level of cognition and willingness to use PrEP,but there are a number of factors affecting the utilization rate. Therefore,we need to take multiple measures to promote PrEP and provide convenient and accessible services to convert PrEP use intention into utilization rate. © 2024, Editorial Department of Medical Pest Control. Article	2024	Zia Y.; Etyang L.; Nyerere B.; Nyamwaro C.; Mogaka F.; Mwangi M.; June L.; Njiru R.; Mokoyo J.; Kimani S.; Thomas K.K.; Ngure K.; Wanyama I.; Bukusi E.; Mugo N.; Heffron R.	Structural influences on delivery and use of oral HIV PrEP among adolescent girls and young women seeking post abortion care in Kenya	EClinicalMedicine	-	-	-	-	25895370	10.1016/j.eclinm.2023.102416	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85182369691&doi=10.1016%2fj.eclinm.2023.102416&partnerID=40&md5=2ea11ccd67b7c9cef44933b4e67a8356	Background: Adolescent girls and young women (AGYW) in East and southern Africa experience a disproportionate burden of HIV incidence. Integrating HIV pre-exposure prophylaxis (PrEP) within existing programs is a key component of addressing this disparity. Methods: We evaluated an oral PrEP program integrated into post-abortion care (PAC) in Kenya from March 2021 to November 2022. Technical advisors trained staff at PAC clinics on PrEP delivery, abstracted program data from each clinic, and collected data on structural characteristics. Utilizing a modified Poisson regression, we estimated the effect of structural factors on the probability of PrEP offer and uptake. Findings: We abstracted data on 6877 AGYW, aged 15–30 years, across 14 PAC clinics. PrEP offers were made to 57.4% of PAC clients and 14.1% initiated PrEP. Offers were associated with an increased probability at clinics that had consistent supply of PrEP (relative risk (RR):1.81, 95% CI: 1.1–2.95), inconsistent HIV testing commodities (RR: 1.89, 95% CI: 1.29–2.78), had all providers trained (RR: 1.65, 95% CI: 1.01, 2.68), and were public (RR: 1.89, 95% CI: 1.29–2.78). These same factors were associated with PrEP uptake: consistent supply of PrEP (RR: 2.71, 95% CI: 1.44–5.09), inconsistent HIV testing commodities (RR: 2.55, 95% CI: 1.39–4.67), all providers trained (RR: 2.61, 95% CI: 1.38–4.92), and were public (RR: 2.55, 95% CI: 1.39–4.67). Interpretation: Greater success with integration of HIV prevention into reproductive health services will likely require investments in systems, such as human resources and PrEP and HIV testing commodities, to create stable availability and ensure consistent access. Article	2024	Zia, Yasaman; Etyang, Lydia; Mwangi, Margaret; Njiru, Roy; Mogaka, Felix; June, Lavender; Njeru, Irene; Makoyo, Job; Kimani, Susan; Ngure, Kenneth; Wanyama, Inviolata; Bukusi, Elizabeth; Nyerere, Bernard; Nyamwaro, Cyprian; Mugo, Nelly; Heffron, Renee	The Effect of Stigma on Family Planning and HIV Pre-exposure Prophylaxis Decisions of Young Women Accessing Post-Abortion Care in Kenya.	AIDS and Behavior	-	-	-	-	1573-3254 1090-7165	10.1007/s10461-024-04274-6	https://pubmed.ncbi.nlm.nih.gov/38451448/	Adolescent girls and young women (AGYW) in Eastern and Southern Africa face parallel epidemics of unintended pregnancy and HIV. Their sexual health decisions are often dominated by intersecting stigmas. In an implementation science project integrating delivery of daily, oral pre-exposure prophylaxis (PrEP) for HIV prevention into 14 post-abortion care (PAC) clinics in Kenya, we enrolled a subset of PrEP initiating AGYW (aged 15 to 30 years) into a research cohort. Utilizing log binomial models, we estimated the effect of PrEP stigma on PrEP continuation (measured via self-report and urine assay for tenofovir) and abortion stigma on contraceptive initiation. Between April 2022 and February 2023, 401 AGYW were enrolled after initiating PrEP through their PAC provider, of which 120 (29.9%) initiated highly-effective contraception. Overall, abortion and PrEP stigmas were high in this cohort. Abortion stigma was more prevalent among those that were adolescents, unmarried, and reported social harm. Among 114 AGYW returning for the month 1 follow-up visit, 83.5% reported continuing PrEP and 52.5% had tenofovir detected. In this subset, higher levels of PrEP stigma were significantly associated with greater likelihood of PrEP adherence, but not PrEP continuation. For abortion stigma, greater scores in the subdomain of isolation were significantly associated with greater likelihood of initiating a highly-effective contraception, while greater scores in the subdomain of community condemnation were significantly associated with reduced likelihood of initiating a highly-effective contraception. Given the burden of stigma documented by our work, PAC settings are a pivotal space to integrate stigma-informed counseling and to empower young women to optimize contraceptive and PrEP decisions. Article	2024	Zinsli, Kaitlin; Means, Arianna Rubin; Barbee, Lindley A.; Rodriguez, Evelyn Manley; Kerani, Roxanne P.	A participatory approach to identifying gaps in and recommendations for STI and PrEP clinical services in Pierce County, Washington.	Sexually Transmitted Diseases	-	-	-	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001961	https://pubmed.ncbi.nlm.nih.gov/38403301/	BACKGROUND: Pierce County, Washington has a high burden of sexually transmitted infections (STI) relative to Washington State and the United States. We used a participatory approach to identify gaps in STI and PrEP service provision in Pierce County and generate recommendations to address these gaps. METHODS: In collaboration with the Tacoma-Pierce County Health Department (TPCHD), we conducted 14 key informant interviews with local STI/PrEP providers from varied clinical settings. Using rapid qualitative analysis, we identified key gaps and strengths in service provision. Local, state and national HIV/STI subject matter experts (SMEs) prioritized the gaps and recommendations to address them via an online survey. RESULTS: The primary six gaps ranked by SMEs (N = 32) in order of importance included: 1) inadequate availability of STI and PrEP services, 2) lack of awareness of STI and PrEP services, 3) need for free/low cost STI and PrEP care, 4) need for stronger relationships among providers and TPCHD, 5) reduced accessibility related to geographically distributed population and centralized services, and 6) frequent referrals pose a service barrier. SMEs prioritized recommendations for each gap as follows: 1) create an STI specialty clinic, 2) implement an STI/PrEP service availability outreach campaign, 3) strengthen referral relationships between TPCHD and free/low-cost providers, 4) develop a provider support network, 5) create a mobile STI clinic, and 6) develop an STI specialty clinic. CONCLUSIONS: STI specialty clinics were prioritized by SMEs to improve access to STI and PrEP care in Pierce County, and to serve as a resource for local providers.
