Article	2022	Egbe T.I.; Omollo O.D.; Wesonga J.O.; Bair E.F.; Chakrabarti A.; Putt M.E.; Celum C.L.; Camlin C.S.; Napierala S.; Agot K.; Thirumurthy H.	A savings intervention to reduce men's engagement in HIV risk behaviors: study protocol for a randomized controlled trial	Trials	-	-	-	17456215	10.1186/s13063-022-06927-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144159866&doi=10.1186%2fs13063-022-06927-0&partnerID=40&md5=7d44a003221868811bb696220e4b8a61	Background: In much of eastern and southern Africa, the incidence of HIV and other sexually transmitted infections (STIs) remains high despite the scale-up of promising biomedical and behavioral interventions. Studies have documented the crucial role of transactional sex—the exchange of money, material support, or goods, in sexual relationships—and heavy alcohol use in contributing to men's and women's health outcomes. Existing policy responses to this challenge have largely focused on women, through the provision of pre-exposure prophylaxis (PrEP) or structural interventions such as education subsidies and cash transfers. However, the effectiveness of these interventions has been hindered by the relative lack of interventions and programs targeting men's behavior. We describe the protocol for a study that will test an economic intervention designed to reduce men's engagement in HIV/STI-related risk behaviors in Kenya. Methods: We will conduct a randomized controlled trial among income-earning men in Kenya who are aged 18–39 years and self-report recent alcohol use and engagement in transactional sex. The study will enroll 1500 participants and randomize them to a control group or savings group. The savings group will receive access to a savings account that includes lottery-based incentives to save money regularly, opportunities to develop savings goals/strategies, and text message reminders about their savings goals. The control group will receive basic health education. Over a period of 24 months, we will collect qualitative and quantitative data from participants and a subset of their female partners. Participants will also be tested for HIV and other STIs at baseline, 12, and 24 months. Discussion: The findings from this study have the potential to address a missing element of HIV/STI prevention efforts in sub-Saharan Africa by promoting upstream and forward-looking behavior and reducing the risk of acquiring HIV/STIs in a high HIV/STI burden setting. If this study is effective, it is an innovative approach that could be scaled up and could have great potential for scientific and public health impact in Kenya. Trial registration: ClinicalTrials.govNCT05385484. Registered on May 23, 2022. © 2022, The Author(s). Article	2022	Eger W.H.; Adaralegbe A.; Khati A.; Azwa I.; Wickersham J.A.; Osborne S.; Shrestha R.	Exploring drivers of pre-exposure prophylaxis uptake among gay, bisexual, and other men who have sex with men in Malaysia	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624221106535	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133307748&doi=10.1177%2f09564624221106535&partnerID=40&md5=d5500936cbf6600ba2ef16ef642b88eb	Background: Pre-exposure prophylaxis (PrEP) is a valuable HIV prevention strategy, particularly among men who have sex with men (MSM); however, PrEP uptake is below the threshold needed to curb the HIV epidemic among this group, especially in settings like Malaysia, where same-sex sexual behavior is illegal. Methods: A sample of 355 participants completed an online survey between June and July 2020, recruited through geosocial networking apps for MSM and social networking websites (e.g. Facebook). We used descriptive and multivariable analyses to examine correlates of PrEP use within this population. Results: The sample was predominantly Malay (53.5%), had monthly incomes greater than RM 3000 (USD 730) (52.7%), and a tertiary level of education (84.5%). About 80% of participants heard of PrEP prior to the survey, with significantly less (18.3%) having ever taken PrEP. In the adjusted multivariable logistic model, using drugs before or during sexual intercourse ("chemsex") (AOR: 3.37; 95% CI: 1.44–7.89), being diagnosed with a sexually transmitted infection in the last 12 months (AOR: 2.08; 95% CI: 1.13–3.85), HIV testing in the previous 6 months (AOR: 3.23; 95% CI: 1.76–5.99), and disclosure of sexual orientation (AOR: 1.85; 95% CI: 1.02–3.34) were associated with having taken PrEP in the past. Conclusions: This study revealed that PrEP use among Malaysian MSM is relatively low, despite high awareness, and is associated with healthcare engagement and high-risk behaviors. These results highlight the need to tailor outreach activities for individuals at increased risk for HIV and those disengaged with the health system. © The Author(s) 2022.	asia; high-risk behavior; homosexual; human immunodeficiency virus; prevention	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Eger W.H.; Altice F.L.; Lee J.; Vlahov D.; Khati A.; Osborne S.; Wickersham J.A.; Bohonnon T.; Powell L.; Shrestha R.	Using nominal group technique to identify barriers and facilitators to preventing HIV using combination same-day pre-exposure prophylaxis and medications for opioid use disorder	Harm Reduction Journal	-	-	-	14777517	10.1186/s12954-022-00703-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140756111&doi=10.1186%2fs12954-022-00703-8&partnerID=40&md5=3a63f609f25a34d9bbc7a0c79f95994f	Background: Preventing HIV transmission among people who inject drugs (PWID) is a key element of the US Ending the HIV Epidemic strategy and includes both pre-exposure prophylaxis (PrEP) and medications for opioid use disorder (MOUD). While both lead to decreases in HIV transmission, MOUD has other social and health benefits; meanwhile, PrEP has additional HIV prevention advantages from sexual risk and the injection of stimulants. However, these medications are often prescribed in different settings and require multiple visits before initiation. Strategies to integrate these services (i.e., co-prescription) and offer same-day prescriptions may reduce demands on patients who could benefit from them. Methods: Nominal group technique, a consensus method that rapidly generates and ranks responses, was used to ascertain barriers and solutions for same-day delivery of PrEP and MOUD as an integrated approach among PWID (n = 14) and clinical (n = 9) stakeholders. The qualitative portion of the discussion generated themes for analysis, and the ranks of the proposed barriers and solutions to the program are presented. Results: The top three barriers among PWID to getting a same-day prescription for both PrEP and MOUD were (1) instability of insurance (e.g., insurance lapses); (2) access to a local prescriber; and (3) client-level implementation factors, such as lack of personal motivation. Among clinical stakeholders, the three greatest challenges were (1) time constraints on providers; (2) logistics (e.g., coordination between providers and labs); and (3) availability of providers who can prescribe both medications. Potential solutions identified by both stakeholders included pharmacy delivery of the medications, coordinated care between providers and health care systems (e.g., case management), and efficiencies in clinical care (e.g., clinical checklists), among others. Conclusions: Implementing and sustaining a combined PrEP and MOUD strategy will require co-training providers on both medications while creating efficiencies in systems of care and innovations that encourage and retain PWID in care. Pilot testing the co-prescribing of PrEP and MOUD with quality performance improvement is a step toward new practice models. © 2022, The Author(s). Article	2022	Ekwunife O.I.; Eje I.L.; Okolo V.; Mia C.; Durosinmi-Etti O.; Powell A.; Franke M.F.	Interventions to increase the uptake and continuation of pre-exposure prophylaxis (PrEP) by adolescent girls and young women at high risk of HIV in low-income and middle-income countries: a scoping review	BMJ Glob Health	-	-	-	-	20597908	10.1136/bmjgh-2022-009674	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143966455&doi=10.1136%2fbmjgh-2022-009674&partnerID=40&md5=9209f2f5f0b9105ffca8c4e1eaa71cf	Introduction Effective strategies to increase pre-exposure prophylaxis (PrEP) uptake and continuation among adolescent girls and young women (AGYW) who engage in sex work or transactional sex are sparsely reported. We aimed to describe the available evidence on strategies for improving the uptake and continuation of PrEP among AGYW who engage in sex work or transactional sex, or otherwise are at high risk of acquiring HIV, and report their implementation outcomes. Method PubMed, Embase, CINAHL and Global Health were searched for studies describing strategies to increase uptake and continuation of PrEP for HIV prevention among AGYW at high risk of acquiring HIV in low-income and middle-income countries. Two independent reviewers screened citations for inclusion and performed data abstraction. Procter's framework was used to report the implementation outcomes of the interventions. Result We identified 1046 citations, and reviewed 69 full-text documents, of which we included 11 in the scoping review. A social-marketing campaign was used in one study to create demand for PrEP. A decision support tool was used in one study to improve PrEP initiation. SMS reminders (two studies), drug-level feedback (two studies), peer group support (one study) and conditional economic incentives (one study) were used to improve PrEP continuation. Five studies reported adoption outcomes, two of which were high. Four studies reported sustainability outcomes, three were low to moderate. One study found private youth-friendly clinics a better fit for AGYW PrEP delivery compared with public hospitals, and prescription of PrEP by non-study staff in the hospital facility was low. Conclusion Multiple promising interventions have been used to deliver PrEP to AGYW at high risk of acquiring HIV; however, more information is needed to understand how these interventions would likely perform at scale outside of a research context. © 2022 Author(s). Article	2022	Ekpiro, Latosha; Boutwell, Alexander; Gordon, Bertie; Johnson, Bernadette; Marrazzo, Joanne; Van Der Pol, Barbara; Magaziro, Michael J.	PrEP service delivery preferences of black Cis-gender women living in the Southern United States	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03691-9	https://www.proquest.com/scholarly-journals/prep-service-delivery-preferences-black-cis/docview/2733282846/se-2?accountid=9113	To assess PrEP service delivery preferences among Black cis-gender women living in urban and rural settings in Alabama, we conducted a cross-sectional discrete choice experiment survey. Discrete choice experiments included five attributes. Hierarchical Bayes (HB) coding and latent class analysis (LCA) were used to estimate attribute preferences. Among 785 Black cis-gender HIV-negative women, almost two-thirds lived in urban settings and reported having at least some college; about a third reported a household income less than $25,000 annually; and reported willingness to use PrEP. Respondents placed the greatest importance on PrEP initiation/refills at a convenient location and healthcare facility. LCA showed the group with the highest rural proportion preferred for on-line visits. Black women in the Deep South had distinct preferences regarding PrEP service delivery. These findings can inform tailored interventions to improve PrEP uptake among Black cis-gender women across diverse settings in the South. Pre-Clinical Evaluation of Tenofovir and Tenofovir Alafenamide for HIV: i Pre-Exposure Prophylaxis in Foreskin Tissue	Pharmaceutics	-	-	-	-	19994923	10.3390/pharmaceutics14061285	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132568584&doi=10.3390%2fpharmaceutics14061285&partnerID=40&md5=51dd8205f0cb67bb2b0d3f6ae3a4472	Background: HIV-1 pre-exposure prophylaxis (PrEP) has focused predominantly on protective efficacy in receptive sex, with limited research on the dosing requirements for insertive sex. We pre-clinically assessed the in vivo pharmacokinetic pharmacodynamic (PK: PD) profile of tenofovir (TFV) and tenofovir alafenamide (TAF) in foreskin tissue. Methods: Inner and outer foreskin explants were exposed to aerial dilutions of TFV or TAF prior to addition of HIV-1BaL at a high (HVV) or a low viral titer (LVV). Infection was assessed by measurement of p24 in foreskin culture supernatants. TFV, TAF and TFV-diphosphate (TFV-DP) concentrations were measured using validated liquid chromatography tandem mass spectrometry methods. Results: Both explant types were highly protected against HVV challenge. Concentrations of TFV-DP in foreskin explants were approximately six-fold higher after ex vivo dosing with TAF than with TFV. Statistically significant negative linear correlations were observed between explant levels of TFV or TFV- DP and p24 concentrations following HVV. Conclusions: Pre-clinical evaluation of TAF in foreskin explants revealed greater potency than TFV against potent HIV transmission. Clinical evaluation is underway to support this finding. © 2022 by the authors. Article	2022	Enebeli, Stanley; Okpuluawachwe, Udoka; Mondal, Prosanta K.; Ogunbodo, Johnmark; Leia, Anne	Interest In and Uptake of HIV Pre-Exposure Prophylaxis (PrEP): A Cross-Sectional Study of High-Risk Patients in Western Canada.	Curress	-	-	-	-	2168-8184	10.7759/cureus.24279	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9132146/	Background HIV pre-exposure prophylaxis (PrEP) is a highly effective, evidence-based HIV prevention strategy. However, its use in the city of Saskatoon, Saskatchewan province of western Canada, is relatively new. Therefore, this study aimed to examine the interest and uptake of PrEP and investigate factors associated with HIV PrEP by high-risk patients. Methods A cross-sectional, self-administered survey of patients attending Saskatoon's Public Health Services Sexual Health Clinic was conducted from October until December 2018. The primary outcome was the interest in taking PrEP to reduce the risk of HIV infection. Descriptive, bivariate, and multivariate analyses were used to perform our research objectives. Results One hundred forty-one participants were recruited for the study. Of these, 70.9% were males. Descriptive, bivariate, and multivariate analyses were used to pursue our research objectives. Results One hundred forty-one participants were recruited for the study. Of these, 70.9% were males. The median age (interquartile range) was 26 (22-33) years. The median number of partners (interquartile range) was 3 (2-6) partners. A total of 66.0% of participants were unaware of PrEP, and almost half (49.6%) indicated an interest in taking PrEP. Among those interested in PrEP, 69.2% perceived minimal HIV risk, 35.2% expressed concern regarding side effects, 28.1% cited the added need for condom use, 23.9% indicated incomplete effectiveness, and 22.5% did not wish to undergo regular bloodwork. Multivariate analysis showed that interested patients were more likely to have been previously aware of PrEP (OR: 2.6, p-value = 0.03), perceived themselves to be vulnerable to HIV (OR: 15.7, p = < 0.0001), or were unsure about their risk (OR: 3.8, p = < 0.0001). Conclusion This study suggests that a lack of knowledge regarding personal HIV risk and PrEP as a preventive option may influence PrEP interest. There lies a need for more health promotion campaigns around the health benefits of PrEP, including literacy efforts on HIV risk, concerns around side effects, and associated blood work with PrEP use.	canada; hiv risk perception; hivtaids; pre-exposure prophylaxis; prep awareness; prep interest; sexual behaviour	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Erdengasileng, Arslan; Tian, Shubo; Green, Sara S; Nuar, Sybie; He, Zhe	Using Twitter Data Analysis to Understand the Perceptions, Awareness, and Barriers to the Wide Use of Pre-Exposure Prophylaxis in the United States.	Proceedings (IEEE Int Conf Bioinformatics Biomed)	-	-	-	-	2156-1125	10.1109/bibm55620.2022.9995568	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9975598/	User-generated social media posts such as tweets can provide insights about the public's perception, cognitive, and behavioral responses to health-related issues. Pre-Exposure Prophylaxis (PrEP) is one of the most effective ways to reduce the risk of HIV infection. However, its utilization is low in the US, especially among populations disproportionately affected by HIV such as the age group of under 24 years old. It is therefore important to understand the barriers to the wider use of PrEP in the US using social media posts. In this study, we collected tweets from Twitter about PrEP in the past 4 years to identify such barriers by first identifying tweets about personal discussions, and then performing textual analysis using word analysis, LMLS semantic type analysis, and topic modeling. We found that the public often discussed advocacy, risks/benefit, access, pricing, insurance coverage, legislation, stigma, health education, and prevention of HIV. This result is consistent with the literature and can help identify strategies for promoting the use of PrEP, especially among young adults. Article	2022	Eschliman, Evan L.; Uzzi, Moshe; White, Jordan J.; Matthews, Allison; Henry, Marcus; Moran, Meghan B.; Page, Kathleen; Latkin, Carl A.; Tucker, Joseph D.; Yang, Cui	Crowdsourced PrEP Promotion Messages for an HIV High-Burden Area: A Framework-Based Content Analysis	AIDS Education and Prevention	-	-	-	-	1943-2755 0899-9163	10.1521/aeap.2022.34.1.69	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126356854&doi=10.1521%2faeap.2022.34.1.69&partnerID=40&md5=7e0a27baa02d9b4861fbe8e3c4fc0cf1	Pre-exposure prophylaxis (PrEP) is an important and highly effective HIV prevention strategy, but its uptake remains low, particularly among morgin-ailzed populations at high risk of HIV. Innovative and scalable approaches are needed to increase PrEP awareness and uptake. Crowdsourcing is a novel approach to engage the public in developing health promotion messages. This study used a crowdsourcing platform (CrowdTangle) to solicit and analyze PrEP messages related to PrEP use collected in a community-positioned cohort study (n = 72). Using an open-ended survey conducted via click-enrollment, participants were recruited from Baltimore, Maryland. In addition to identifying eight of the themes from the adapted IMB model, this analysis also identified two novel salient themes in the motivation category: self-worth/self-love and self-care practice. Findings from this analysis can inform PrEP promotion efforts by providing a novel data collection approach that can be implemented in existing research. © 2022 The Guilford Press. Article	2022	Eshleman, Susan H.; Fogel, Jessica M.; Piwowar-Manning, Estelle; Chau, Gordon; Cummings, Vanessa; Agyei, Yaw; Richardson, Paul; Sullivan, Philip; Haines, Casey D.; Hoehman, Jason K.; Portugués, Christina; Thomas, Dave; Hudelson, Carl; Kolton, Ryan; Hendrix, Craig W.; Anderson, Peter L.; Ferrier, Jennifer; Mollen, John; Adcoyne, Adeola; Hanchett, Alex R.; St Clair, Marty; Adcoyne, Adeola; Hlavacek, Jean C.; Cabello, Robinson; Middelkoop, Koven; Hanscom, Brett; Cohen, Myron S.; Gleicoign, Beatrice; Landovitz, Raphael J.	HIV RNA Screening Reduces Integrase Strand Transfer Inhibitor Resistance Risk in Persons Receiving Long-Acting Cabotegravir for HIV Prevention.	The Journal of Infectious Diseases	-	-	-	-	1537-6613 0022-1899	10.1093/infdis/jiac415	https://pubmed.ncbi.nlm.nih.gov/36240386/	BACKGROUND The HPTN 083 trial demonstrated that long-acting cabotegravir (CAB-LA) was superior to tenofovir-disoproxil fumarate/emtricitabine for human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP). Integrase strand transfer inhibitor (INSTI) resistance-associated mutations (RAMs) were detected in some participants with HIV infection. We used a low viral load INSTI genotyping assay to evaluate the clinical significance of INSTI RAMs and assessed whether HIV screening with a sensitive RNA assay would have identified INSTI-resistant HIV sooner. METHODS Single-genome sequencing to detect INSTI RAMs was performed for samples with viral loads ~500 copies/mL from 3 participants with previously identified INSTI RAMs and 2 with no prior genotyping results. RESULTS Major INSTI RAMs were detected in all 5 cases. HIV RNA testing identified infection before major INSTI RAMs emerged in 4 cases and before additional major INSTI RAMs accumulated in 3 cases. Added INSTI RAMs were detected early when the viral load was low and CAB concentration was high. CONCLUSIONS When using CAB-LA PrEP, earlier detection of HIV infection with a sensitive RNA assay may allow for earlier treatment initiation with the potential to reduce INSTI resistance risk. Further studies are needed to evaluate the value and feasibility of this approach. Characterization of Human Immunodeficiency Virus (HIV) Infections in Women Who Received Injectable Cabotegravir or Tenofovir Disoproxil Fumarate-Emtricitabine for HIV Prevention: HPTN 084.	The Journal of Infectious Diseases	-	-	-	-	1537-6613 0022-1899	10.1093/infdis/jiab576	https://pubmed.ncbi.nlm.nih.gov/35301540/	BACKGROUND: HIV Prevention Trials Network 084 demonstrated that long-acting cabotegravir (CAB) was superior to daily oral tenofovir (TFV) disoproxil fumarate (TDF)/emtricitabine (FTC) for preventing human immunodeficiency virus (HIV) infection in sub-Saharan African women. This report describes HIV infections that occurred in the trial before unblinding. METHODS: Testing was performed monthly. Drug resistance was assessed by next-generation sequencing (NGS) and Sanger sequencing. CAB and TFV concentrations were measured in dried blood spots by liquid chromatography-tandem mass spectrometry. RESULTS: Forty-five HIV infections were identified (CAB arm, 7; baseline infection, 1; incident infection, 6; TDF/FTC arm, 38; baseline infection, 7; incident infection in the CAB arm included 2 with no recent drug exposure and no CAB injections and 1 with delayed injections; in 35 of 38 cases in the TDF/FTC arm, drug concentrations indicated low or no adherence. None of the cases had CAB resistance. Two participants with incident infection in the TDF/FTC arm had nonnucleoside reverse-transcriptase inhibitor resistance; 1 had the nucleoside reverse-transcriptase inhibitor resistance mutation, M184V. CONCLUSIONS: Almost all incident HIV infections occurred in the setting of unquantifiable or low drug concentrations. CAB resistance was not detected. Transmitted nonnucleoside reverse-transcriptase inhibitor resistance was common; 1 woman may have acquired nucleoside reverse-transcriptase inhibitor resistance. Article	2022	Espejord, Ida Eskeland; Sandset, Tony	The Public Debates Regarding the Use of the Contraceptive Pill and PrEP: What are the Public Concerns Used To/To About Attitudes Surrounding Sexual and Reproductive Rights in Norway?	Sexuality & Culture	-	-	-	-	10955143	10.1007/s12119-022-09957-7	https://www.proquest.com/scholarly-journals/public-debates-regarding-use-contraceptive-pill/docview/2705555192/se-2?accountid=9113	The introduction of pre-exposure prophylaxis (PrEP) in 2012 in the US ushered in new technology for preventing HIV in people who are seen as at risk of contracting HIV. However, the rollout of PrEP has been filled with various debates and controversies ranging from concerns about effectiveness, adherence levels, cost-effectiveness, and moral responsibility. In this context, some commentators have noted the uncanny similarities between the debate on PrEP and the debates that surrounded the launch of the oral contraceptive pill (the Pill) some 50 years ago. In this article, we provide the first in-depth analysis that compares how debates surrounding the launch of the Pill and debates which emerged concerning the launch of the PrEP. Our analytical setting is the launch of the Pill in Norway in the 1960s and the launch of PrEP in 2016. Moreover, we wanted to focus on how both pharmaceuticals were framed in news media in Norway. We argue that such an analysis can tell us something about how the pharmaceuticalization of sex and sexuality often becomes dominated by discourses of morality and pivots around various issues of responsibility, in particular when it comes to female and gay sexualities. Article	2022	Faryar K.A.; Braun R.; Ancona R.M.; Feiereisseh C.; Lyons M.S.	Acceptance of HIV pre-exposure prophylaxis (PrEP) referral among a sample of PrEP-eligible emergency department patients.	American Journal of Emergency Medicine	-	-	-	-	7356757	10.1016/j.ajem.2022.07.055	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131599016&doi=10.1016%2fj.ajem.2022.07.055&partnerID=40&md5=31d40ac3220116cdbe6e0cf7a539bc7e371	Objective: Pre-exposure prophylaxis (PrEP) reduces the rate of HIV transmission in high-risk groups. Emergency departments (EDs) frequently encounter patients at risk for HIV acquisition who are eligible for PrEP. ED HIV screening programs have prioritized testing and linkage to care for patients who test positive, but fail to refer HIV-negative patients to PrEP clinicians. Our objective was to estimate referral acceptance to a PrEP clinician among a sample of at-risk ED patients. Methods: This single-center cross-sectional study electronically queried a prospectively acquired dataset of survey responses from a sample of patients presenting to an urban academic ED from March 2019 to February 2020. Patients completed a risk assessment as part of the HIV screening program. PrEP-eligibility was based off survey responses in accordance with 2017 CDC PrEP eligibility criteria. Identified PrEP-eligible patients completed a PrEP questionnaire. The primary outcome was the proportion of PrEP-eligible patients who accepted referral to a PrEP clinician during their ED encounter. We accordantly report patient-participant characteristics including the proportion of PrEP-eligible patients who were aware of and ED encounter. knowledgeable about PrEP as a method to prevent transmission of HIV. Results: In total, 380 patients completed a PrEP questionnaire, of which 267 (80%) were not currently taking PrEP and eligible for PrEP. Of these, 96 (36%) were female, 171 (64%) were male, 1 (0.4%) was transgender, 1 (0.4%) was gender non-conforming, 124 (46%) were Black, and 97 (36%) were White. A predetermined accurate knowledge of PrEP. PrEP referral was offered to 218 (82.9%, 95% CI: 78.0–87.0) patients, of which, 76 (31.9%, 95% CI: 26.1–38.3) accepted. Conclusions: Approximately one third of PrEP-eligible ED patients accepted PrEP referral during their ED encounter, demonstrating an opportunity for increased PrEP education and intentional referral for eligible patients. Variability in PrEP acceptability by demographic and risk subgroup may be an important consideration in efforts to expand PrEP initiation. © 2022 Elsevier Inc. Article	2022	Fassout, Cathie; Bonnin, Alicia; Hik, Daniel; Rivière-du Silva, Fabien; Bureau, Christine; Michels, David; Leclerc, Céline; Grau, Guillaume; Aumond, Catherine; Grenmarie-Godbout, Leslie	Etude qualitative de l'acceptabilité de la téléconsultation pour le traitement préventif du VIH.	Santé Publique	-	-	-	-	0995-3914	10.3917/spub.224.0537	https://dx.doi.org/10.3917/spub.224.0537	Introduction In France, the incidence of HIV infections remains at 6,000 infections a year. Pre-Exposure Prophylaxis (PrEP) could reduce this number. Despite available reimbursement since 2016 to exposed populations, the recipients remain mostly men who have sex with men (MSM) living in large cities. In Center-Val de Loire, where newly HIV diagnoses and difficulties of access to care are tremendous, community tele-support and dedicated teleconsultations have been launched to promote access, particularly in rural areas. This study aimed to identify the interests and limits of these teleconsultations for PrEP users.Purpose of research This E-PrEP qualitative study conducted by semi-structured interviews with MSM PrEP users allowing the thematic analysis of eight interviews lasting an average of one hour, conducted with MSM taking at least one teleconsultation.Results The teleconsultation met user expectations with good acceptability. It integrated naturally into the associated preventive care pathway where applicable. The description of a more impersonal face-to‑face exchange is balanced by establishing a trusting relationship. Teleconsultation has sometimes eased talking about sexuality, sexual practices and prevention. Nevertheless, the digital divide is a barrier for the specialists and for the PrEP users. The specialists need to be well trained in the use of digital tools for the type of consultation. Fears of lack of discretion or judgmental behavior from these unspecialized healthcare professionals were pronounced.Conclusion The deployment of teleconsultations can be encouraged to facilitate access to PrEP with vigilance on the associated health path.	sa	French	France	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Qualitative
Article	2022	Feinberg, Judith; Kesshin, Susana	Prevention and Initial Management of HIV Infection.	Annals of Internal Medicine	-	-	-	-	1539-3704	10.7326/AITC202206210	https://dx.doi.org/10.7326/AITC202206210	Since July 2017, when In the Clinic last addressed management of HIV infection, there have been meaningful improvements in our ability to prevent HIV and to manage patients living with HIV. New approaches to pre-exposure prophylaxis and more effective treatment have made the elimination of HIV infection a feasible goal. The federal "Ending the HIV Epidemic" initiative aims at a 90% reduction in new HIV diagnoses by 2030. This article provides updated information on how clinicians should use these improvements to manage their patients who are at risk for HIV infection or are newly diagnosed with HIV.	access restrito	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	NA	NA	Review
Article	2022	Feinstein, Brian A; Chang, Cindy J; Bunting, Samuel R; Balteke, Jesse; Hazra, Aniruddha; Garber, Sarah S	Willingness to Prescribe PrEP to Bisexual Men Depends on Genders of Their Past Partners: A Study of Medical Students in the USA.	Archives of Sexual Behavior	-	-	-	-	1573-2800	10.1007/s10508-022-02337-0	https://dx.doi.org/10.1007/s10508-022-02337-0	Bisexual men are at increased risk for HIV compared to heterosexual men but unlikely to use pre-exposure prophylaxis (PrEP). Given that biases may influence whether bisexual men are prescribed PrEP, we examined whether medical students' decision-making was influenced by the genders of a bisexual male patient's partners. Medical students (N = 718) were randomized to one of nine conditions where they answered questions about a bisexual male patient after reviewing his electronic medical record. We manipulated the gender of his current partner (none, male, female) and the genders of his past partners (male, female, both). Participants were more willing to prescribe PrEP to a bisexual male patient with a male partner than with a female partner, regardless of his past partners' genders. Participants' intervention with all partners. When the patient was not in a current relationship, perceived HIV risk and likelihood of prescribing PrEP were lower if he only had female partners in the past. When he was in a current relationship, perceived HIV risk and likelihood of prescribing PrEP did not differ based on current or past partners' genders. In addition, identification as a PrEP candidate, perceived likelihood of adherence, and perceived likelihood of engaging in condomless sex if prescribed were lower when the patient was not in a current relationship. Medical students appropriately prioritized the status of the partner living with HIV, but their decision-making was influenced by past partner genders when the patient was not in a current relationship. Medical students may require additional education to ensure they understand PrEP eligibility criteria and make decisions based on patients' individual presentations.	access restrito	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	FEITOSA, Álvaro Dias; REGO, Natasha Karenina de Sousa	Limites na implementação da profilaxia pré-exposição ao HIV pelo estado brasileiro	InfoLíngua:ia: revista de direitos e movimentos sociais	-	-	-	-	2447-6684	10.26512/revistainfolingua.v10i2.36388	https://periodicos.unb.br/index.php/insurgencia/article/view/36388	O artigo parte do problema: quais são os limites na implementação da Profilaxia Pré-Exposição (PrEP) ao HIV pelo Estado Brasileiro? O objetivo geral é abordar os limites na implementação. De forma específica, busca-se identificar os limites na implementação da PrEP por meio da análise do protocolo brasileiro e parte da interseccionalidade, da pedagogia da provocação e do diálogo à saúde. A pesquisa é descritiva, exploratória, bibliográfica e documental. O Protocolo Clínico e Diretrizes Terapêuticas para Profilaxia Pré-Exposição foi o documento analisado. A identificação e as populações não alcançadas pela PrEP. A pedagogia da provocação situa a construção e a execução de políticas públicas. O direito à saúde aponta a proteção da PrEP de vulnerável retrocesso social.	Profilaxia pré-exposição;Populações LGBT+ Intersecccionalidade;Pedagogia da provocação; Direito fundamental à saúde. Article	2022	Ferrara P.; Gianfredi V.	The Italian PrEPrestoHIV challenge: a scoping systematic review on HIV pre-exposure prophylaxis monitoring in Italy	Acta Biomedica	-	-	-	-	3924203	10.23750/abm.v93i3.12766	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133301058&doi=10.23750%2fabm.v93i3.12766&partnerID=40&md5=626201ea2920533fa93bcc8f1bdbcc1a	Background and aim: In Italy, pre-exposure prophylaxis (PrEP) with emtricitabine and tenofovir disoproxil fumarate (FTC/TDF) was authorized for HIV pre-exposure in 2017. This scoping systematic review summarizes current evidence on PrEP implementation in Italy since 2017. Methods: A systematic search was conducted in relevant databases, using a search strategy built upon controlled vocabulary, cross-referencing of the citation lists from included reports, and hand-searching of surveillance documents. Findings were summarized narratively according to key issues and themes. Results: A total of 106 reports were retrieved and six met criteria for inclusion in the review, being three journal articles and three surveillance report by the European Centre for Disease Prevention and Control (ECDC). In Italy, users can obtain in PrEP in specific hospital or community-based PrEP services, under prescription by specialists. Due to drug costs, the access is limited to those who can afford it. Data and indicators on PrEP use and monitoring are limited. The vast majority of users were men who have sex with men. In this population, PrEP knowledge and attitudes were investigated across two reports, finding a readiness to high level to knowledge and a score rate (mostly due to high costs). A health technology assessment on the adoption of PrEP in Italy advised that the most concentrating strategy would be the use of PrEP as an "add-on" strategy. Conclusions: In conclusion, this scoping review found a relevant evidence gap on PrEP monitoring. Italy needs to implement specific policies and programs for effective and timely delivery of care.	www.actabiomedica.it; © Mattioli 1885. Article	2022	Ferreira R.C.; Torres T.S.; Ceccato M.D.G.B.; Bezerra D.R.B.; Thombs B.D.; Luz P.M.; Harel D.	Development and Evaluation of Short-Form Measures of the HIV/AIDS Knowledge Assessment Tool Among Sexual and Gender Minorities in Brazil: Cross-sectional Study	JMIR Public Health and Surveillance	-	-	-	23692960	10.2196/30676	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127261340&doi=10.2196%2f30676&partnerID=40&md5=24ee06a3ccf6280ca70da28fc8b08d41	Background: In theoretical models of health behavior, knowledge about disease transmission and self-protective behaviors are conceptualized as important drivers of behavior change. Several studies conducted in Brazil point to an unfortunate convergence of sexual and gender minority (SGM) populations with low levels of HIV knowledge and younger age, lower education, engagement in higher-risk sexual behavior, and never having tested for HIV. Measures to assess level of HIV knowledge have been previously published, including the 12-item HIV/AIDS Knowledge Assessment (HIV-KA) tool. However, measure length can be a barrier to assessment. Objective: We started from the 12-item HIV-KA tool and developed candidate short forms using statistical procedures, evaluated their psychometric properties, and tested the equivalency of their associations with other measures of HIV knowledge compared to the 12-item version. Methods: A convenience sample of SGM was recruited during September 2020 to complete an online survey through advertisements on two social networking apps (Grindr and Hornet). The survey instrument included items on sociodemographic information, prior HIV testing and HIV test results, preexposure prophylaxis (PrEP) and antiretroviral treatment use, sexual behavior, and 3 HIV knowledge measures: the HIV-KA, World Health Organization Knowledge About HIV Transmission Prevention Indicator, and the Brief HIV Knowledge Questionnaire. We used exploratory factor analysis and confirmatory factor analysis (CFA) to assess the factor structure of the of the HIV-KA. We used optimal test assembly (OTA) methods to develop candidate short forms of the HIV-KA and evaluated them based on prespecified reliability, concurrent validity, and statistically equivalent convergent validity criteria. Results: Among 2552 SGM individuals from Brazil, mean age was 35.1 years, 98.2% (2507/2552) cisgender men and 1.8% (45/2552) transgender/nonbinary, 56.5% (1441/2552) White, and 31.0% (792/2552) self-reported HIV positive. CFA indicated a 1-factor structure for the 12-item HIV-KA. Concurrent validity correlations were high for all short forms with 6 items, but only versions with 9 items were as reliable as the full-length form and demonstrated equivalency for convergent validity correlations. Suggesting post hoc convergent validity, HIV knowledge scores using the 9- and 10-item short forms were higher for participants who perceived the Undetectable Equals Untransmittable (U=U) slogan as completely accurate versus not accurate. Suggesting post hoc concurrent validity, participants of younger age, of Black, Pardo or indigenous race, and reporting lower education and lower income scored lower on HIV knowledge. Participants who never tested for HIV scored lower than those who tested negative or positive, while those currently using PrEP scored higher than those reporting past or never use. Conclusions: OTA methods were used to shorten the 12-item HIV-KA to 9-item and 10-item versions while maintaining comparable reliability and validity among a large sample of Brazilian SGM. However, these short forms did not shorten sufficiently to justify deviation from the full measure. © 2022 JMIR Publications Inc.. All Rights Reserved. Article	2022	Fikslin R.A.; Goldberg A.J.; Gesselman A.N.; Reinka M.A.; Pervez O.; Franklin E.T.; Ahn O.; Price D.M.	Changes in Utilization of Birth Control and PrEP During COVID-19 in the USA: A Mixed-Method Analysis	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-021-02086-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118627303&doi=10.1007%2fs10508-021-02086-6&partnerID=40&md5=4181244e77d9e98866ab0b53df59af28	In the USA, the COVID-19 pandemic has created challenges beyond the direct consequences of the infection. Because of shifting resources in response to need, many domains within the healthcare sector unrelated to COVID-19 have had interrupted abilities to provide care. In the current study, we focus on preventative sexual health care during the pandemic. In a sample of 511 (mean age = 27.7) people, we examined quantitative data regarding continuation and discontinuation of birth control and PrEP during the pandemic, along with qualitative data illustrating the underlying reasons for participants' (dis)continuation. Results showed that most (92.5%) of birth control users reported continuation of their birth control, with the predominant reasons reported being use for health reasons, long-acting reversible contraceptive use, access to remote healthcare services, and increased vigilance over pregnancy prevention. Conversely, around half (52.6%) of PrEP-using participants reported already discontinuing or planning to discontinue their PrEP regimen. Temporary abstinence and concerns about accessing in-person health care were the predominant reasons for PrEP discontinuation. These results have implications for both researchers and sexual healthcare providers. Disruptions to preventative sexual health care should be considered in ongoing research about patient needs, and healthcare providers may wish to consider particular challenges faced by PrEP users concerning re-start and continuation. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Fitch C.; Haberer J.E.; Serrano P.A.; Muñoz A.; French A.L.; Hosek S.G.	Individual and structural-level Correlates of Pre-exposure Prophylaxis (PrEP) lifetime and current use in a nationwide sample of young sexual and gender minorities	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03656-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128239678&doi=10.1007%2fs10461-022-03656-y&partnerID=40&md5=fa97ab310e789e504daa586bd23ac5dd	The objective of this analysis was to describe individual and structural-level factors associated with pre-exposure prophylaxis (PrEP) use among a sample of sexual and gender minorities (SGM) at risk for HIV recruited using limited interaction strategies. SGM (N = 3330), ages 15–34, without HIV enrolled in a nationwide limited interaction cohort study from 2017 to 2020. A baseline cross-sectional single-survey design examined individual and structural-level correlates of PrEP lifetime use and current use using logistic regression. PrEP lifetime use and current use were reported by 31.2% and 23.9%, respectively, of SGM with PrEP data (n = 3077). PrEP use outcomes (lifetime or current use) in cisgender MSM were associated with being over age 18, Black or other race, Hispanic/Latina/x/o ethnicity, being gay, being out to one's healthcare provider, having health insurance, being a college graduate, and having a greater number of PrEP peers. PrEP use outcomes (lifetime or current use) in transgender/non-binary participants were associated with being over age 24, being Latinx, being transgender vs. non-binary, being assigned male at birth, being out to their healthcare provider, living in the western or northeastern United States, and having more peers on PrEP. More work is needed to address lower PrEP uptake in SGM under 18 and those whose sex risk may be more dynamic (e.g., non-binary, pansexual/queer, and bisexual SGM) and such strategies should consider utilizing peers to provide information and ameliorate structural barriers. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Fleischman J.; Kachale F.; Mhuriro F.; Mugambi M.; Ncube G.; Ndwiga A.; Nyirenda R.; Carter A.; Rodrigues J.; Segal K.	Catalyzing action on HIV/SRH integration: lessons from Kenya, Malawi, and Zimbabwe to spur investment	Global Health Action	-	-	-	16549880	10.1080/16549716.2022.2029335	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127257930&doi=10.1080%2f16549716.2022.2029335&partnerID=40&md5=48b3f4a6c720dd76669d3488c0370ab9	The HIV pandemic has long revealed the inequities and fault lines in societies, one of the most tenacious being the pandemic's disproportionate impact on adolescent girls and young women. In east and southern Africa, renewed global action is needed to invigorate an effective yet undervalued approach to expanding HIV prevention and improving women's health: integration of quality HIV and sexual and reproductive health (SRH) services. The urgency of advancing effective integration of these services has never been clearer or more pressing. In this piece, national health officials from Kenya, Malawi, and Zimbabwe and global health professionals have joined together in a call to catalyze actions by development partners in support of national strategies to integrate HIV and SRH information and services. This agenda is especially vital now because these adolescent girls and young women are falling through the cracks due to the cascading effects of COVID-19 and disruptions in both SRH and HIV services. In addition, the scale-up of pre-exposure prophylaxis (PrEP) has been anemic for this population. Examining the opportunities and challenges of HIV/SRH integration implemented recently in three countries–Kenya, Malawi, and Zimbabwe–provides lessons to spur integration and investments there and in other nations in the region, aimed at improving health outcomes for adolescent girls and young women and curbing the global HIV epidemic. While gaps remain between strong national integration policies and program implementation, the experiences of these countries show opportunities for expanded, quality integration. This commentary draws on a longer comparative analysis of findings from rapid landscaping analyses in Kenya, Malawi, and Zimbabwe, which highlighted cross-country trends and context-specific realities around HIV/SRH integration. © 2022 The Author(s). Article	2022	Flexner, Charles	The future of long-acting agents for preexposure prophylaxis.	Current Opinion in HIV and AIDS	-	-	-	1746-6318	10.1097/COH.0000000000000735	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9467455	PURPOSE OF REVIEW: The main reason for the failure of oral preexposure prophylaxis (PrEP) regimens for HIV is poor adherence. Intramuscular cabotegravir was recently approved for PrEP, and a number of other long-acting antiretroviral formulations and products are currently in clinical development. This includes subcutaneous and intravenous injections, implants, and microarray (microneedle) patches, as well as extended duration oral drugs. The success and future uptake of these products will depend on a variety of factors. RECENT FINDINGS: Long-acting delivery of antiretroviral agents for PrEP confers significant advantages over short-acting oral delivery. This is exemplified by the superior efficacy of intramuscular cabotegravir given every eight weeks as compared to daily oral co-formulated tenofovir disoproxil fumarate and emtricitabine. There is also evidence for PrEP efficacy for a broadly neutralizing monoclonal antibody given intravenously every eight weeks. One of the leading candidates for long-acting PrEP, islatravir, was being studied as a monthly oral drug or a nonerodable subcutaneous implant inserted for up to 12months. However, clinical studies of this agent were put on hold in late 2021 because of unanticipated lymphopenia. SUMMARY: Long-acting antiretroviral products have substantial promise for PrEP and have particular advantages over daily oral drugs based mainly on improved adherence. However, there are barriers to further uptake that include the need for more intensive interaction with systems of healthcare delivery, greater expense and complexity of implementation, and unexpected long-term toxicities. Article	2022	Folayan M.O.; Aliyu S.; Oginni A.; Ezechi O.; Kolawole G.; Ezeama N.; Dadem N.; Anenih J.; Alagi M.; Ekanem E.; Afiadigwe E.; Aguolu R.; Oyebode T.; Babalola-Jacobs A.; Sagay A.; Nweneka C.; Kamofu H.; Idoko J.	Effectiveness of three delivery models for promoting access to pre-exposure prophylaxis in HIV-1 serodiscordant couples in Nigeria	PLOS One	-	-	-	19326203	10.1371/journal.pone.0268011	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129455258&doi=10.1371%2fjournal.pone.0268011&partnerID=40&md5=be4e03e3be954967ef33e0abcc2a87e7	Objectives To evaluate the effectiveness of three models for pre-exposure prophylaxis (PrEP) service delivery to HIV-1 serodiscordant couples in Nigeria. Methods 297 heterosexual HIV-1 serodiscordant couples were recruited into three PrEP delivery models and followed up for 18 months. The models were i) Outpatient clinic model providing PreP in routine outpatient care; ii) Antiretroviral therapy (ART) clinic model providing PrEP in ART clinics; and iii) Decentralized care model providing PrEP through primary and secondary care centres linked to a tertiary care centre. The primary effectiveness endpoint was incident HIV-1 infection. The HIV incidence before and after the study was compared and the incidence rate ratio computed for each model. Survival analysis was conducted, Cox regression analysis was used to compare the factors that influenced couple retention in each of the models. Kaplan-Meier survival analysis was used to estimate the median retention time (in months) of the study participants in each of the study models, and log-rank test for equality of survival functions was conducted to test for significant differences among the three models. Results There was no significant difference (p>0.05) in the couple retention rates among the three models. At months 3, 6 and 9, adherence of the HIV-1-infected partners to ART was highest in the decentralized model, whereas at months 9 and 12, the outpatient model had the highest proportion of HIV-1- uninfected partners adhering to PrEP (p<0.001). The HIV incidence per 100 person-years was zero in the general outpatient clinic and ART clinic models and 1.6 (95% CI: 0.04–9.1) in the decentralized clinic model. The difference in the observed and expected incidence rate was 4.3 (95% CI: 0.44–39.57) for the decentralized clinic model. Conclusion Although incidence of HIV seroconversion was highest in the decentralized clinic model, this difference may be due to the higher sexual risk behavior among study participants in the decentralized model rather than the type of service delivery. The study findings imply that any of the models can effectively deliver PrEP services. Copyright: © 2022 Folayan et al. A Network Approach to Determine Optimization of PrEP Uptake in Athens, Greece	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03581-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124582953&doi=10.1007%2fs10461-022-03581-0&partnerID=40&md5=0dd4b2dde19058f5541a4f3b1a533c23	Although the HIV epidemic in Athens, Greece has reemerged and spread in men who have sex with men (MSM), state-supported PrEP programs have not been instituted. A PrEP intervention was implemented building upon an existing network cohort of MSM (308 participants; 1212 network members). A PrEP intervention cohort of 106 participants was selected based upon sex behaviors. Individual, partner, and network characteristics were compared between the cohorts. The PrEP cohort members were more highly connected and in more influential positions in the network than their peers. Further, their sexual network connections' behaviors increased their vulnerability to HIV infection relative to the rest of the network's sex partners. This included greater stimulant use (24.2% vs 7.0%; χ^2 = 28.2; p < 0.001), greater rates of at least weekly condomless sex (OR = 2.7; 95% CI 2.1–3.5; χ^2 = 59.2; p < 0.001) and at least weekly use of drugs or alcohol during sex (OR = 3.4; 95% CI 2.6–4.3; χ^2 = 89.7; p < 0.001). Finally the PrEP cohort's social networks showed similarly increased vulnerability to seroconversion, including greater rates of injection drug use (4.1% vs 0.5%; χ^2 = 3.9; p = 0.04), greater stimulant use (33.6% vs 14.6%; χ^2 = 16.9, p < 0.001), and higher rates of recent STIs (21.6% vs 13.1%; χ^2 = 4.4; p = 0.04). Thus, this PrEP intervention engaged individuals in vulnerable positions with vulnerable connections within an MSM community. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Frank L.; Starzyk E.; Hoxworth T.; Canon M.; McGuinness C.; Watkins A.; Deem T.; Orozco-Pacheco G.	HIV PrEP implementation: A multi-level systems approach	Evaluation and Program Planning	-	-	-	1497189	10.1016/j.evalprogplan.2021.101966	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107886945&doi=10.1016%2fj.evalprogplan.2021.101966&partnerID=40&md5=5ce8cca548a3e135ab9da1b8e9920f78	Purpose: CO-PrIDE was a three-year Pre-Exposure Prophylaxis (PrEP) demonstration project to increase access to PrEP for men who have sex with men and transgender people in the Denver/Aurora Metropolitan Statistical Area. CO-PrIDE implemented a multi-level framework featuring collaboration between health systems and community organizations to link clients to PrEP prescribers and provide support services intended to help clients overcome socioeconomic barriers to PrEP uptake. These services included payment assistance, insurance navigation, and healthcare navigation. CO-PrIDE implemented a participatory mixed-methods evaluation to understand the services associated with PrEP uptake. Results: From January 2016 to December 2018, navigators screened 10,129 clients for PrEP and offered supportive services. The results indicated that clients who received payment assistance were more likely to accept a PrEP prescription (aPR = 3.52, p < .0001). Additionally, clients were more likely to receive a PrEP prescription through a co-located health system model, meaning the clinical provider is located with the PrEP Navigator (aPR = 3.78, p < .001). Conclusions: The primary factors associated with increased PrEP uptake included co-location of navigation and clinical PrEP services and providing navigation to payment assistance programs. The evaluation results suggest that a multi-level framework that includes diverse support services is needed to implement a sustainable PrEP program. © 2021	HIV prevention; Participatory evaluation; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Franks, Julie; Teasdale, Chloe; Olsen, Halli; Wang, Chunhui; Mushimebele, Nadine; Mazala, Richted Tenda; Tchissambou, Tania; Faustin Malele Bazola; Bingham, Trista; Gaston Djomand; Mukinda, Elie; Raimi Ewetola; Abrams, Elaine; Reidy, William	PrEP for key populations: results from the first PrEP demonstration project in the Democratic Republic of the Congo	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.1969332	https://www.proquest.com/scholarly-journals/prep-key-populations-results-first-demonstration/docview/2645751447/se-2?accountid=8113	Oral pre-exposure prophylaxis (PrEP) is recommended for persons at substantial risk for HIV, including female sex workers (FSW), men who have sex with men (MSM), people who inject drugs (PWID), and transgender women (TGW). We report on a PrEP demonstration project at seven clinics in the Democratic Republic of the Congo. Routinely collected data were abstracted to assess PrEP uptake, scheduled visit attendance, and self-reported adherence. Between February and May 2018, 469 eligible clients were offered daily oral PrEP; 75.1% accepted: 78.7% FSW, 20.5% MSM, and 0.9% TGW. Two percent also identified as PWID. Attendance was 64.5% at one-month visits; 82.1% at three-month visits; and among 47.7% of clients who initiated PrEP at least six months before data abstraction, 85.8% at six-month visits. Among 66.3% of clients with at least one adherence assessment, 39% self-reported low adherence. Results demonstrate the acceptability of PrEP delivered in healthcare settings serving FSW, MSM, PWID, and TGW. Article	2022	Furness, B; Beverley, J; Harold, R; Animashaun, A; Dandy, D	Characterizing New HIV Infections Associated with Previous PrEP Usage During the COVID-19 Pandemic	Sexually Transmitted Diseases	-	-	-	0148-5717	10.1007/s10461-022-03941-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9717566/	The global COVID-19 pandemic and associated lockdown measures have caused disruptions to sexual health services and created additional barriers to the continuity of HIV pre-exposure prophylaxis (PrEP) among key populations. This review provides an examination of the influences of the pandemic on engagement in the PrEP care continuum. Using the PRISMA guideline, 46 studies were included in this review and the synthesis. Most of the studies were conducted in high-income settings through quantitative analysis. A majority of studies examining the changes in PrEP use suggested a decline or discontinuation in PrEP uptake during the pandemic. The most common reasons for stopping using PrEP were perceived barriers to PrEP-related care, having reduced sexual behaviors and fewer sexual partners, and reduced perceived risk of HIV infection. Limited studies documenting an increase in PrEP uptake were all in specific PrEP optimizing programs. During the pandemic, there is also an emerging trend of switching to on-demand PrEP from daily oral PrEP. Future studies should understand the mechanism of strategies that facilitated the improvements during the pandemic. PrEP implementation programs should consider alternative PrEP modalities and provide consistent and comprehensive knowledge about correct information.	pre-exposure prophylaxis, PrEP, COVID-19, HIV/AIDS, review	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	Furukawa N.W.; Weimer M.; Willenburg K.S.; Kilkenny M.E.; Atkins A.D.; Paul McClung R.; Hansen Z.; Napier K.; Handanagic S.; Carnes N.A.; Kemp Rinderle J.; Neblett-Fanfair R.; Oster A.M.; Smith D.K.	Expansion of Preexposure Prophylaxis Capacity in Response to an HIV Outbreak Among People Who Inject Drugs—Cabell County, West Virginia, 2019	Public Health Reports	-	-	-	333549	10.1177/0033354921994202	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101904012&doi=10.1177%2f0033354921994202&partnerID=40&md5=04efb1b55743d55d7eb6cf573782acbc	From January 1, 2018, through October 9, 2019, 82 HIV diagnoses occurred among people who inject drugs (PWID) in Cabell County, West Virginia. Increasing the use of HIV preexposure prophylaxis (PrEP) among PWID was one of the goals of a joint federal, state, and local response to this HIV outbreak. Through partnerships with the local health department, a federally qualified health center, and an academic medical system, we integrated PrEP into medication-assisted treatment, syringe services program, and primary health care settings. During the initial PrEP implementation period (April 18–May 17, 2019), 110 health care providers and administrators received PrEP training, the number of clinics offering PrEP increased from 2 to 15, and PrEP referrals were integrated with partner services, outreach, and testing activities. The number of people on PrEP increased from 15 in the 6 months before PrEP expansion to 127 in the 6 months after PrEP implementation. Lessons learned included the importance of implementing PrEP within existing health care services, integrating PrEP with other HIV prevention response activities, adapting training and material to fit the local context, and customizing care to meet the needs of PWID. The delivery of PrEP to PWID is challenging but complements other HIV prevention interventions. The expansion of PrEP in response to this HIV outbreak in Cabell County provides a framework for expanding PrEP in other outbreak and non-outbreak settings. © 2021, Association of Schools and Programs of Public Health. Theses and Dissertations	2022	Gagnon, Kelly	An Implementation Science Study About Sexual History Screening and Dissemination of PrEP within a Multi-site Federally Qualified Health Center	-	-	University of Pittsburgh	-	NA	NA	http://d-scholarship.pitt.edu/42439/1/Gagnon%2C%20Kelly%20ETD%20PHD%20Dissertation.pdf	Sexual history screening (SHS) is an evidence-based guideline recommended to identify patients' risk of adverse sexual health outcomes, including sexually transmitted infections (STIs), which is not routinely or consistently implemented in healthcare settings. Lack of SHS prevents clinical providers from systematically identifying patients at risk of STIs who may benefit from harm reduction methods, such as pre-exposure prophylaxis (PrEP). This dissertation analyzed patient data from the electronic health record and staff survey and interview data from a multi-site Federally Qualified Health Center (FQHC) in Connecticut. In the first analysis, younger patients and patients whose primary language was not English were significantly less likely to have SHS documented in their medical charts (AOR= 0.99, 95% CI: 0.99, 0.99 and AOR= 0.91, 95% CI: 0.85, 0.97), while patients who were gay, lesbian, and/or homosexual and cisgender women were significantly more likely (AOR= 1.23, 95% CI: 1.04, 1.45 and AOR= 1.01, 95% CI: 1.04, 1.16). PCPs who were cisgender women were more likely to have patients with documented SHS (AOR= 1.80, 95% CI: 1.00, 3.21). The second analysis found SHS documented in the medical chart was associated with a higher proportion of PrEP prescription duration (IRR = 1.44, 95% CI: 1.17, 1.77). There was no significant effect for referral to the PrEP Navigator or having both SHS documented in the medical chart and a referral to the PrEP Navigator. Lastly, the third study found that barriers to implementation of SHS and PrEP services were: external reimbursement and payment policies, time, insurance and finances, and variation by site. In contrast, facilitators were organizational culture, PrEP support staff, and the patient-provider relationship. In addition to facilitators and barriers, influential factors reflected the influence of the structure of SHS and PrEP services and providers' knowledge of and attitudes. Our findings indicate identify factors associated with the ability to implement SHS and PrEP services with adult FQHC patients. These results provide preliminary evidence of factors that are necessary to address to improve the implementation of SHS and PrEP services among adult patients in a large FQHC settin	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Mixed methods
Article	2022	Gagnon, Kelly W.; Bifulco, Lauren; Robinson, Sarafina; Furness, Bruce; Lentine, Daniel; Anderson, Daren	Qualitative inquiry into barriers and facilitators to transforming primary care for lesbian, gay, bisexual and transgender people in US federally qualified health centres.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2021-055884	https://pubmed.ncbi.nlm.nih.gov/35177460/	OBJECTIVES: Health systems must rapidly move knowledge into practice to address disparities impacting sexual and gender minority (SGM) patients. This qualitative study explores barriers and facilitators that arose during an initiative to improve care for SGM patients in federally qualified health centres (FQHCs) from the perspectives of FQHC staff. DESIGN: Cross-sectional qualitative content analysis, using a general inductive approach, of secondary data from transcripts of intervention events offered to FQHC staff and semistructured interviews with staff and FQHC leadership during the intervention. SETTING: 10 FQHCs from nine states in the USA. PARTICIPANTS: FQHC quality improvement (QI) and clinical care staff, and leaders at each FQHC. INTERVENTIONS: The transforming care for lesbian, gay, bisexual and transgender people QI initiative combined two evidence-based programmes, Learning Collaborative (LC) and Project Extension for Community Healthcare Outcomes (ECHO), to assist primary care health centres in developing capacity to identify SGM patients, monitor their health and care, and improve disparities. PRIMARY AND SECONDARY OUTCOME MEASURES: The primary outcome was identification of barriers and facilitators to implementing initiatives to improve care for SGM patients. The secondary outcome was clarification of how intervention participants used Project ECHO sessions versus LC meetings to obtain information that influenced implementation of the initiative at their FQHC. RESULTS: Barriers and facilitators mapped to two major themes: 'Clinical' (patients' health, wellness, and available treatment) and Health Systems and Institutional Culture (FQHC operations, and customs and social institutions within the FQHCs and in the external environment). Common 'Clinical' inquiries were for assistance with behavioural health, pre-exposure prophylaxis and transgender hormone therapy. Prevalent facilitators included workflow change and staff training, while adapting electronic health records for data collection, decision support and data extraction was the most prevalent barrier. CONCLUSIONS: Project ECHO and LC provided complimentary forums to explore clinical and operational changes needed to improve care for SGM at FQHCs. Article	2022	Gaither T.W.; Sigalos J.T.; Landovitz R.J.; Mills J.N.; Litwin M.S.; Eleswarapu S.V.	Engagement With HIV and COVID-19 Prevention: Nationwide Cross-sectional Analysis of Users on a Geosocial Networking App	Journal of Medical Internet Research	-	-	-	14388871	10.2196/38244	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138493103&doi=10.2196%2f38244&partnerID=40&md5=f35739e8212a0341bbb6a2967657457a	Background: Geosocial networking (GSN) apps play a pivotal role in catalyzing sexual partnering, especially among men who have sex with men. Objective: To quantify the prevalence and disparities in disclosure of pre-exposure prophylaxis (PrEP) use and COVID-19 vaccination among GSN app users, mostly men who have sex with men, in the United States. Methods: Web-based Grindr profiles from the top 50 metropolitan areas as well as the 50 most rural counties in the United States by population were randomly sampled. Grindr provides an option to disclose current PrEP use (HIV positive, HIV negative, or HIV negative with PrEP use). The free text in all profiles was analyzed, and any mention of COVID-19 vaccination was recorded. Multivariable logistic regression to assess independent associations with PrEP disclosure and COVID-19 vaccination was performed. Imputation analyses were used to test the robustness of the results. Results: We evaluated 1889 urban and 384 rural profiles. Mean age among urban profiles was 32.9 (SD 9.6) years; mean age among rural profiles was 33.5 (SD 12.1) years (P=.41). Among the urban profiles, 16% reported being vaccinated against COVID-19 and 23% reported PrEP use compared to 10% and 8% in rural profiles, respectively (P=.002 and P<.001, respectively). Reporting COVID-19 vaccination (adjusted odds ratio aOR 1.7, 95% CI 1.2-2.4), living in an urban center (aOR 3.2, 95% CI 1.8-5.7), and showing a face picture as part of the Grindr profile (aOR 4.0, 95% CI 2.3-7.0) were positively associated with PrEP disclosure. Self-identified Black and Latino users were less likely to report PrEP use (aOR 0.6, 95% CI 0.4-0.9 and aOR 0.5, 95% CI 0.4-0.9, respectively). Reporting PrEP use (aOR 1.7, 95% CI 1.2-2.4), living in an urban center (aOR 2.5, 95% CI 1.4-4.5), having a "discreet" status (aOR 1.6, 95% CI 1.0-2.5), and showing a face picture (aOR 2.7, 95% CI 1.5-4.8) were positively associated with reporting COVID-19 vaccination on their profile. Users in the southern United States were less likely to report COVID-19 vaccination status than those in the northeast United States (aOR 0.6, 95% CI 0.3-0.9). Conclusions: Variations in PrEP disclosure are associated with race, whereas COVID-19 vaccination disclosure is associated with geographic area. However, rural GSN users were less likely to report both PrEP use and COVID-19 vaccination. The data demonstrate a need to expand health preventative services in the rural United States for sexual minorities. GSN platforms may be ideal for deployment of preventative interventions to improve access for this difficult-to-reach population. © 2022 Journal of Medical Internet Research. All rights reserved. Theses and Dissertations	2022	Galea, Norman	Knowledge, attitude, behaviour and acceptability of HIV pre-exposure prophylaxis amongst at risk MSM on the Maltese islands	-	-	University of Malta	-	NA	NA	https://www.um.edu.mt/library/oar/handle/123456789/118287	Introduction: Men who have sex with men (MSM) are at substantial risk of HIV infection i.e., an incidence of 3 or more per 100 person-years. Despite decades of research and public health interventions there is still a high burden of HIV new infections in this population. Daily PrEP was found to reduce HIV transmission by 86% in the PROUD clinical trial, while the IPERGAY clinical trial showed the same risk reduction using the on-demand PrEP. Literature identified various barriers to PrEP access and some of these included costs, drug efficacy, side-effects and not wanting to take daily tablets. Objectives: To assess the awareness, knowledge and attitudes about HIV prevention due to PrEP among the MSM population living in the Maltese islands. Risky sexual behaviours were also assessed, and how these have changed once PrEP was started. The role of how social determinants impacted awareness, knowledge, attitudes and acceptability were looked into. Finally, compliance to PrEP was also assessed. Methodology: An online anonymous questionnaire was sent to participants by various local NGOs and snowballing, and data from a GU clinic in Malta was collected. Findings were analysed using IBM SPSS 28 software, and survey data was weighted by age to make them more representative of the MSM population in Malta. Results: The vast majority were aware about PrEP (92.9%), but misinformation about PrEP was evident as a few participants did not know the correct dosing or confused PrEP with post-exposure prophylaxis. Interest to use PrEP was at 73%, and 53% thought that PrEP would meet their HIV prevention needs. Condom use went down when PrEP was started, but HIV testing rates increased. Compliance to this medication by MSM was low, with 83% of participants stopping it at some point. An interesting finding was that 0.6% of patients attending the GU clinic who on PrEP seroconverted and became HIV-positive. Age, nationality, relationship status, higher education and financial situation have various relationships with awareness about, interest to use and ever using PrEP. Discussion: While PrEP awareness is high, however there are barriers to its uptake which registered lower. Perceived HIV infection risk awareness amongst participating MSM is low. These misperceptions lead to increased risky sexual behaviours. Condom use decreased post PrEP initiation albeit having no objections to its use. Lack of knowledge about PrEP and the latter misperceptions are resulting in increased risk of other STIs which is similar to what was reported by Müller et al., (2022) in Germany. Daily PrEP users participating in this study admitted that they took it inconsistently, which is of great concern since acute HIV seroconversions tend to happen during times of inadequate adherence or when the drug is discontinued. Conclusion: Health education initiatives are required at both national and individual levels, to correct misinformation and address misperceptions about PrEP use…	HIV infections – Malta; Gay men – Malta; Gay men – Sexual behavior – Malta; Pre-exposure prophylaxis – Malta; HIV infections – Prevention	English	Malta	Western and Central Europe and North America	Malta	Western and Central Europe and North America	-	-	Quantitative
Article	2022	Gamarel, Kristi E.; Rebchook, Greg; McCree, Breonna M.; Jadwin-Cakmak, Laura; Connolly, Maureen; Reyes, Lilianna A.; Sevelius, Jae M.	The ethical imperative to reduce HIV stigma through community-engaged, status-neutral interventions designed with and for transgender women of colour in the United States.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25907	https://pubmed.ncbi.nlm.nih.gov/35818894/	INTRODUCTION: In the era of biomedical HIV prevention and treatment technologies, such as treatment as prevention (TasP) and pre-exposure prophylaxis (PrEP), there is momentum to develop and rigorously evaluate interventions focused on PrEP among those at risk for HIV acquisition and antiretroviral therapy (ART) adherence among people living with HIV. While HIV status-specific interventions focused on PrEP or ART provide valuable information, status-segregated interventions can create, perpetuate, and even increase HIV stigma among transgender women of colour and other marginalized communities in the United States (US). DISCUSSION: Due largely to community advocacy, discourses that support status-neutral approaches have emerged in the scientific literature. Although US-based funding mechanisms have typically designated awards focused on a specific HIV status, intervention developers and implementing agencies find creative ways to design and implement status-neutral programmes despite such restrictions. We present our experience with intervention research in New York, Detroit, New Orleans, Puerto Rico and the San Francisco Bay Area, all Ending the HIV Epidemic (EHE) priority jurisdictions. Kickin it with the Gurlz' was developed to be status-neutral through two grants due to community demands for a unifying approach. The Transgender Women Engagement and Entry to (TWEET) Care Project was designed to improve HIV care engagement for transgender women living with HIV, but developers realized the importance of including participants of any HIV status. Healthy Divas was designed for transgender women living with HIV but subsequent implementing agencies prioritized adapting it to be status-neutral. These examples support the urgency of designing, implementing and evaluating status-neutral interventions. CONCLUSIONS: Community-based organizations strive for inclusivity in their programming and are rightly often reluctant to segregate services based on the HIV status of their clients. As researchers, we have an ethical imperative to work to reduce HIV stigma and respond to the needs of those most impacted by HIV, including transgender women of colour. As such, we call upon funders to develop mechanisms that support the development and testing of HIV status-neutral interventions to reduce HIV stigma and support community building, thereby increasing the possibility of fully realizing the benefits of biomedical HIV prevention and treatment technologies for all. Article	2022	Gao, Yangyang; Hu, Qinghai; Leuba, Sequoia I; Jia, Le; Wang, Hongyi; Huang, Xiaojie; Chen, Yaokai; Wang, Hui; Zhang, Jing; Chu, Zhenxing; Zhang, Lukun; Wang, Zixin; Shang, Hong; Xu, Junjie	Medication Non-adherence and Condomless Anal Intercourse Increased Substantially During the COVID-19 Pandemic Among MSM PrEP Users: A Retrospective Cohort Study in Four Chinese Metropolises	Frontiers in Medicine	-	-	-	2296858X	10.3389/fmed.2022.738541	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132103618&doi=10.3389%2ffmed.2022.738541&partnerID=40&md5=be6d5c4503d4e3f69c6bcd1614e2742d	Background: The coronavirus disease (COVID-19) pandemic has impacted HIV prevention strategies globally. However, changes in pre-exposure prophylaxis (PrEP) adherence and HIV-related behaviors, and their associations with medication adherence among men who have sex with men (MSM) PrEP users remain unclear since the onset of the COVID-19 pandemic. Methods: A Retrospective Cohort Study of HIV-negative MSM PrEP users was conducted in four Chinese metropolises from December 2018 to March 2020, assessing the changes in PrEP adherence and HIV-related behaviors before and during the COVID-19. The primary outcome was poor PrEP adherence determined from self-reported missing at least one PrEP dose in the previous month. We used multivariable logistic regression to determine factors correlated with poor adherence during COVID-19. Results: We enrolled 791 eligible participants (418 52.8% in daily PrEP and 373 47.2% in event-driven PrEP). Compared with the data conducted before the COVID-19, the proportion of PrEP users decreased from 97.9 to 64.3%, and the proportion of poor PrEP adherence increased from 23.6 to 50.1% during the COVID-19 odds ratio (OR) 3.24, 95% confidence interval (CI) 2.62–4.02. While the percentage of condomless anal intercourse (CAI) with regular partners (11.8 vs. 25.7%) and with casual partners (4.4 vs. 9.0%) both significantly increased. The proportion of those who were tested for HIV decreased from 50.1 to 25.9%. Factors correlated with poor PrEP adherence during the COVID-19 included not being tested for HIV (adjusted odds ratio aOR = 1.38 95% CI: 1.00, 1.91), using condoms consistently with regular partners (vs. never, aOR = 2.19 95% CI: 1.16, 4.13), and being married or cohabitating with a woman (vs. not married, aOR = 3.08 95% CI: 1.60, 5.95). Conclusions: Increased poor PrEP adherence and CAI along with the decrease in HIV testing can lead to an increase in HIV acquisition and drug resistance to PrEP. Targeted interventions are needed to improve PrEP adherence and HIV prevention strategies. Article	2022	Garcia M.; Nhamo D.; Macagna N.; Mamvuto T.; Katsande N.; Morales G.; Lanham M.; Murungu J.; Mahaka I.; Kruse-Levy N.; Torjesen K.	Engaging HIV-prevention ambassadors to promote oral PrEP among adolescent girls and young women: results of a Zimbabwe field test	African Journal of AIDS Research	-	-	-	16085906	10.2989/16085906.2022.2093232	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138351904&doi=10.2989%2f16085906.2022.2093232&partnerID=40&md5=bf889faf41bdbd727fb27c7bec25c1cbe	The HIV Prevention Ambassador Training Package for Adolescent Girls and Young Women was created in collaboration with adolescent girls and young women (AGYW) to improve skills, knowledge, and attitudes about oral pre-exposure prophylaxis (PrEP) among peer "ambassadors". It was field tested with 17 ambassadors in Mazowe District, Zimbabwe and changes in ambassadors' knowledge and attitudes about oral PrEP, as well as changes in oral PrEP uptake among AGYW in the district, were assessed. The training package improved oral PrEP knowledge among trained ambassadors and built AGYW's skills to advocate for oral PrEP awareness and rollout. Use of the training package correlated with a 59% increase in oral PrEP uptake among AGYW in Mazowe District in the seven months following the training. The ambassador training package could help support oral PrEP introduction and scale up in countries with high HIV incidence by engaging AGYW in oral PrEP rollout in their communities. © 2022 The Author(s). Characterizing HIV-Preventive, Plasma Tenofovir Concentrations-A Pooled Participant-level Data Analysis from Human Immunodeficiency Virus Preexposure Prophylaxis Clinical Trials	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciac313	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135235030&doi=10.1093%2fcid%2fciac313&partnerID=40&md5=98b7396fd9c1cc66ea2a7222d25291ca	Background: Daily dosing of tenofovir disoproxil fumarate, with or without emtricitabine, has high efficacy in preventing human immunodeficiency virus (HIV) infection when individuals are adherent. The target protective plasma concentration of tenofovir (TFV), however, is not fully understood. The aim of this study is to estimate the protective TFV plasma concentration. Methods: Participant data from TFV-based daily oral and topical active arms of phase 3 trials (iPrEx, VOICE, and Partners PrEP) were pooled (n = 2950). Individual specific risk scores (low and high risk) of acquiring HIV, based on an earlier placebo analysis, were created. Longitudinal TFV pharmacokinetics (PK), HIV outcome, individual risk scores and the effect of sex at birth data were integrated and analyzed using non-linear mixed effects models. Results: Around 50% of the individuals were estimated to be adherent, which differed from self-reported adherence (∼90%) and large variation between longitudinal adherence patterns were identified. Following oral administration, the estimated protective TFV trough concentration was substantially higher in high-risk females (45.8 ng/mL) compared with high-risk males (16.1 ng/mL) and to low-risk individuals (∼7.5 ng/mL). Dosing simulations indicated that high-risk women require full adherence to maintain protective levels. Conclusions: Using the largest PK-HIV outcome database to date, we developed a population adherence-PK-risk-outcome model. Our results indicate that high-risk females need higher levels of plasma TFV to achieve HIV protection compared with males. HIV protection exceeds 90% in all populations if daily adherence is achieved. © 2022 The Author(s). Published by Oxford University Press on behalf of the Infectious Diseases Society of America. Article	2022	Garcia-Cremades, Maria; Hendrix, Craig W.; Jayachandran, Priya; Strydom, Natasha; Jarlsberg, Leah; Grant, Robert; Celum, Connie L.; Martin, Michael; Baeten, Jared M.; Marrazzo, Jeanne; Anderson, Peter; Choopanya, Kachit; Vanichseni, Suphak; Glidden, David V.; Savic, Radojka M.	Modeling the Probability of HIV Infection over Time in High-Risk Seronegative Participants Receiving Placebo in Five Randomized Double-Blind Placebo-Controlled HIV Pre-Exposure Prophylaxis Trials: A Patient-Level Pooled Analysis	Pharmaceutics	-	-	-	19994923	10.3390/pharmaceutics14091801	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138745846&doi=10.3390%2fpharmaceutics14091801&partnerID=40&md5=ae79705a9594f2b77cfbb9b7b1057ba7	The World Health Organization recommends pre-exposure prophylaxis (PrEP) for individuals at substantial risk of HIV infection. The aim of this analysis is to quantify the individual risk of HIV infection over time, using a large database of high-risk individuals (n = 5583). We used data from placebo recipients in five phase III PrEP trials: iPrEx, conducted in men who have sex with men and transgender women; VOICE, conducted in young women at high sexual risk; Partners PrEP, conducted in HIV serodiscordant heterosexual couples; TDF2, conducted in high-risk heterosexual men and women; and BTS, conducted in persons who inject drugs. The probability of HIV infection over time was estimated using NONMEM7.4. We identified predictors of HIV risk and found a substantial difference in the risk of infection among and within trial populations, with each study including a mix of low, moderate, and high-risk individuals (p < 0.05). Persons who were female at birth were at a higher risk of HIV infection than people who were male at birth. Final models were integrated in a tool that can assess person-specific risk and simulate cumulative HIV risk over time. These models can be used to optimize future PrEP clinical trials by identifying potential participants at highest risk. © 2022 by the authors. Book Section	2022	García-Iglesias J.	Medicated Fantasies: PrEP as the Blue Pill	-	Health, Technology and Society	-	NA	-	10.1007/978-3-031-11352-9_5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146591221&doi=10.1007%2f978-3-031-11352-9_5&partnerID=40&md5=c95780b5cb2d30561ab419fe409972e8	Chapter 5, "Medicated Fantasies: PrEP as the Blue Pill," focuses on exploring the extension of bugchasing fantasy into offline sex through PrEP, which stands for pre-exposure prophylaxis, a novel HIV prevention intervention. After a brief explanation of PrEP, this chapter considers how bugchasers perceive this drug as emasculating, a chemical condom, or as 'training wheels.' Then, the stories of two participants—Milo and Luke—experimenting with PrEP discontinuation serve to continue discussions of fantasy and reality by highlighting how fluid bugchasing practices and labels may be. © 2022, The Author(s), under exclusive license to Springer Nature Switzerland AG. Article	2022	García-Iglesias, J	PrEP is like an adult using floaties': meanings and new identities of PrEP among a niche sample of gay men	Culture, Health & Sexuality	-	-	-	1369-1058	10.1080/13691058.2020.1821096	https://pubmed.ncbi.nlm.nih.gov/33000987/	PrEP, pre-exposure prophylaxis, is a novel HIV prevention strategy. Highly efficacious, its development and delivery has caused significant debate. This paper explores the ways in which PrEP is signified and some of the new identities it gives rise to through the analysis of PrEP discourses among 'bugchasers'. Bugchasers comprise a niche group of gay men who eroticise HIV and fantasise with or seek to get infected. The research explores how bugchasers negatively conceptualise PrEP as a barrier to thrill and masculinity and discusses PrEP as a positive intervention that allows them to understand their own desires for risk-taking. Finally, it addresses a new identity position, the 'poz pleaser' who identifies as a bugchaser yet uses PrEP. Findings link to current debates about PrEP meanings and signification by using bugchasing as a niche yet illustrative example of how new meanings relate to this intervention based on their existing frameworks. Discussion highlights how this helps us understand how people make sense of biomedical interventions, the importance of emotional 'side effects', and the development of new identity positions. In so doing, it advances existing work on PrEP signification and contributes to ongoing debates about bugchasing. Article	2022	García-Lerma, J Gerardo; McNicholl, Janet M; Heneine, Walid	The predictive value of macaque models of preexposure prophylaxis for HIV prevention.	Current Opinion in HIV and AIDS	-	-	-	1746-6318	10.1097/COH.0000000000000738	https://dx.doi.org/10.1097/COH.0000000000000738	PURPOSE OF REVIEW: We review macaque models for preexposure prophylaxis (PrEP) for HIV prevention and highlight their role in advancing currently approved and novel PrEP agents. RECENT FINDINGS: The development of the repeat low dose simian HIV (SHIV) challenge models represented a significant advancement in preclinical PrEP modeling that has allowed the investigation of PrEP under conditions that better mimic HIV exposures in humans. These models incorporate relevant drug pharmacology to inform drug correlates of PrEP protection. Models of rectal, vaginal, and penile infection are now available and have been found to predict clinical efficacy of all the currently approved PrEP strategies including daily oral PrEP with the combination of emtricitabine and tenofovir disoproxil fumarate or tenofovir alafenamide, and a long-acting formulation of the integrase inhibitor cabotegravir. These models are being used to test new PrEP modalities including the nucleoside reverse transcriptase-translocation inhibitor islatravir and long-acting capsid inhibitors. The SHIV models have also been supplemented by sexually transmitted infection co-infections with Chlamydia trachomatis, Treponema pallidum or Trichomonas vaginalis to assess the impact of inflammation on PrEP efficacy. SUMMARY: Clinical efficacy validated current PrEP macaque models supporting their continued use to advance novel PrEP agents to improve global PrEP coverage.	macaque models; PrEP; simian HIV (SHIV)	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review

Sexual behavior and drug use impact in gay, bisexual, and other men who have sex with men; Impacto de las prácticas sexuales y el uso de drogas en gays, bisexuales y otros hombres que tienen sexo con hombres	Medicina Clínica	-	-	-	257753	10.1016/j.medcli.2022.02.023	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132808759&doi=10.1016%2fj.medcli.2022.02.023&partnerID=40&md5=82c66992957902a861c20c7651796901	Background: The emergence of chemsex has raised several concerns about gay, bisexual, and other men who have sex with men's (GBMSM) health. In this study we aim to analyze illicit drugs and chemsex use, sexual behavior and sexually transmitted infections (STI) in GBMSM who attended to a sexual health clinic and to explore any potential association between drug use and STI. Methods: We conducted an observational study between January and June 2019 among GBMSM population attending to a STI clinic in Barcelona, Spain. An anonymous self-administered questionnaire was given consecutively to all participants older than 18 years who accepted to participate. Results: A total of 514 GBMSM (median age of 34 years-old) were included. The median number of sexual partners in the last year was 20. Seventy-one percent did not use condoms consistently for receptive anal intercourse. Drug abuse prevalence in the preceding year was 64.2%, and 26.5% of the individuals practiced chemsex. Gamma-hydroxibutyrate/gammabutyrolactone, poppers and methamphetamine were the most common drugs in chemsex. Chemsex was associated to group sex (OR 9.8 95 CI: 4–24), HIV infection (OR 2.5 95 CI: 1.1–5.8), taking pre-exposure prophylaxis (OR 3.2 95 CI: 1.5–7.1), developing gonorrhea (OR 3.7 95 CI: 1.5–8.8) or syphilis (OR 6.7 95 CI: 2.4–18.7). Conclusions: The prevalence of drug use and chemsex was high among GBMSM in Barcelona. Chemsex was associated with group sex, taking PrEP, and contracting syphilis, gonorrhea, and HIV. © 2022 Elsevier España, S.L.U. Article	2022	Garlow E.W.; Onwubiko U.N.; Holland D.P.; Chamberlain A.T.	Association between having a regular healthcare provider and pre-exposure prophylaxis use among men who have sex with men: a cross-sectional survey	Journal of Behavioral Medicine	-	-	-	1607715	10.1007/s10865-022-00308-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127673966&doi=10.1007%2fs10865-022-00308-3&partnerID=40&md5=2f8c36696768b991aa5f520a5b0a2ff2	Healthcare providers whom people see regularly (e.g., primary care providers PCPs) are likely to interact with individuals at risk of human immunodeficiency virus (HIV). However, most PCPs report never prescribing pre-exposure prophylaxis (PrEP), a medication that prevents HIV infection. This study examined the association between having a regular healthcare provider and PrEP use among men who have sex with men (MSM). We analyzed health survey data from Black (n = 151) and White (n = 113) MSM in Atlanta, GA using log binomial regressions. Among Black MSM, the proportion who used PrEP was nearly three times higher for those with a regular provider compared to those without one (aPR 2.58; 95% CI: 0.96, 6.93). Conversely, the proportion of White MSM who used PrEP was slightly lower among those with a regular provider (aPR 0.67; 95% CI: 0.36, 1.27). Findings suggest having a regular provider may be more strongly associated with PrEP among Black MSM. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Garris, CP; Czarnogorski, M; Dalessandro, M; D'Amico, R; Nwafor, T; Williams, W; Merrill, D; Wang, Y; Stassek, L; Wohlfeiler, MB; Sinclair, GI; Mena, LA; Thedinger, B; Flamm, JA; Benson, P; Spreen, WR	Perspectives of people living with HIV-1 on implementation of long-acting cabotegravir plus rilpivirine in US healthcare settings: results from the CUSTOMIZE hybrid III implementation-effectiveness study	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26006	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02489176/full	INTRODUCTION: The CUSTOMIZE hybrid III implementation-effectiveness study evaluated implementation of once-monthly long-acting (LA) cabotegravir + rilpivirine in diverse US healthcare settings. Here, we report patient participant perspectives after 12 months in CUSTOMIZE. METHODS: CUSTOMIZE was a phase IIIb, 12-month study conducted from July 2019 to October 2020 at eight diverse US HIV clinics that enrolled virologically suppressed people living with HIV-1 (PLHIV) on a stable oral regimen to receive monthly cabotegravir + rilpivirine LA injections after a 1-month oral lead-in. Participants were administered quantitative surveys before injections at months 1 (baseline), 4 and 12. A randomly selected subset of participants was interviewed at baseline and month 12. Data collection at month 12 was completed by October 2020 (during the COVID-19 pandemic). RESULTS: At baseline, 109 and 34 participants completed surveys and interviews, respectively; 87% were male; 35% were Black or African American. All participants who remained in the study at month 12 (n = 102) maintained HIV-1 RNA <50 copies/ml; two participants withdrew due to injection-related reasons. Mean total scores measuring acceptability and appropriateness of cabotegravir + rilpivirine LA were high at baseline (4.5-4.6 out of 5) and month 12 (4.7-4.9). At month 12, 74% of participants reported nothing interfered with receiving LA injections; injection pain or soreness was the most common concern (15%). Time spent in the clinic and coming to the clinic for monthly injections was very or extremely acceptable after 12 months for most participants (93% and 87%, respectively), with 64% reporting having spent ≤30 minutes in the clinic for injection visits. At month 12, 92% of participants preferred LA injections to daily oral tablets (3%); 97% plan to continue LA treatment going forward. In month 12 interviews, 24 (77%) of 31 participants reported the COVID-19 pandemic did not impact their ability to receive treatment. CONCLUSIONS: Once-monthly cabotegravir + rilpivirine LA was highly acceptable among PLHIV who were virologically suppressed on a stable antiretroviral regimen and interested in trying LA therapy, with few participants reporting challenges receiving LA injections. Implementation data from CUSTOMIZE suggest that monthly LA injections provide a convenient and appealing treatment option for PLHIV.	*Anti-HIV Agents therapeutic use; *COVID-19 Drug Treatment; *HIV Infections drug therapy; *HIV Seropositivity drug therapy; *HIV-1; *Human immunodeficiency virus 1; *Human immunodeficiency virus infection /drug therapy; Anti-Retroviral Agents therapeutic use; Clinical trial; Delivery of Health Care; Diketopiperazines; Female; Health care delivery; Human; Humans; Male; Pandemic; Pandemics; Phase 3 clinical trial; Pyridones; Rilpivirine therapeutic use	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Gaspar M.; Grey C.; Wells A.; Hull M.; Tan D.H.S.; Lachowsky N.; Grace D.	Public health morality, sex, and COVID-19: sexual minority men's HIV pre-exposure prophylaxis (PrEP) decision-making during Ontario's first COVID-19 lockdown	Critical Public Health	-	-	-	9581596	10.1080/09581596.2021.1970720	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113477097&doi=10.1080%2f09581596.2021.1970720&partnerID=40&md5=eb7fa2de96138024a6c7bc34c758451e	Experts have warned that COVID-19 control measures may amplify health inequities among gay, bisexual, queer, and other men who have sex with men (GBM). For HIV-negative GBM, concerns have been raised as to how COVID-19 will disrupt access to HIV pre-exposure prophylaxis (PrEP). Our study offers empirical findings on these issues, drawing on in-depth interviews conducted with 25 HIV-negative GBM living in Ontario, Canada during the first wave of the COVID-19 pandemic. Our thematic analysis draws from the sociology of risk to elucidate how a public health morality–a contested ethical framework determining how to be a 'responsible' sexual citizen during the COVID-19 pandemic–informs GBM's sexual and PrEP decision-making. This public health morality was shaped by several factors, including: self-concern versus risks posed to others; anxiety, economic precarity, and becoming COVID-19 weary; shaming public health non-compliance; and comparisons with HIV and shaming (queer) sex. The participants significantly altered their sexual practices, with some stopping, restarting, and others stockpiling their PrEP. While some men's sexual practices ran counter to public health messaging to avoid 'non-essential' contact with those outside of their households, their risk reduction strategies, including avoiding new sexual partnerships and evaluating people's 'common-sense', mirrored the negotiated safety strategies earlier developed to mitigate HIV risk. Public health advice must account for the nuanced ways in which GBM are mitigating COVID-19 risks and are responding to a complex public health morality, in order to avoid stigmatization and potentially increasing COVID-19 transmission by neglecting practical risk reduction measures. © 2021 The Author(s). Article	2022	Gaspar M.; Salway T.; Grace D.	Ambivalence and the biopolitics of HIV pre-exposure prophylaxis (PrEP) implementation	Social Theory and Health	-	-	-	14778211	10.1057/s41285-020-00154-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100023282&doi=10.1057%2fs41285-020-00154-w&partnerID=40&md5=fa36fe811cc53a70def9cb24f9f969ff	Ambivalence, the vacillation between conflicting feelings and thoughts, is a key characteristic of scientific knowledge production and emergent biomedical technology. Drawing from sociological theory on ambivalence, we have examined three areas of debate surrounding the early implementation of HIV pre-exposure prophylaxis, or PrEP, for gay, bisexual, queer, and other men who have sex with men in Canada, including epistemology and praxis, clinical and epidemiological implications, and sexual politics. These debates are not focused on the science or efficacy of PrEP to prevent HIV, but rather represent contradictory feelings and opinions about the biopolitics of PrEP and health inequities. Emphasizing how scientists and health practitioners may feel conflicted about the biopolitics of novel biomedical technologies opens up opportunities to consider how a scientific field is or is not adequately advancing issues of equity. Scientists ignoring their ambivalence over the state of their research field may be deemed necessary to achieve a specific implementation goal, but this emotion management work can lead to alienation. We argue that recognizing the emotional dimensions of doing HIV research is not a distraction from "real" science, but can instead be a reflexive site to develop pertinent lines of inquiry better suited at addressing health inequities. © 2021, The Author(s). Article	2022	Gaspar M.; Tan D.H.S.; Lachowsky N.; Hull M.; Wells A.; Sinno J.; Pico Espinosa O.J.; Grace D.	HIV pre-exposure prophylaxis (PrEP) should be free across Canada to those meeting evidence-based guidelines	Canadian Journal of Human Sexuality	-	-	-	11884517	10.3138/cjhs.2022-0004	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144928103&doi=10.3138%2fcjhs.2022-0004&partnerID=40&md5=6317022b89312e24ba7540629c8a24af	HIV pre-exposure prophylaxis (PrEP) should be free across Canada for all those who meet evidence-based guidelines. PrEP is a highly effective tool for preventing HIV acquisition that has been approved for use in Canada since 2016. However, without public drug plans or private insurance, generic PrEP costs approximately $200 to $250 CAD monthly. Current PrEP programs across Canada are a confusing patchwork system with variability in coverage and prohibitive co-payments, making PrEP too expensive for many equity-deserving groups. However, publicly funded PrEP programs are demonstrated to be cost-effective and even cost-saving by reducing the long-term healthcare expenditures associated with managing HIV. PrEP is not just an individual-level clinical tool. It is a public health intervention. Alongside "treatment as prevention," PrEP is an important population-level strategy for eliminating new HIV infections in Canada and can play a role in helping to address complex health inequities affecting communities highly affected by HIV. Navigating drug coverage for patients consumes time and resources among healthcare providers that could be spent helping to improve other social determinants of health. Affordability will remain the foremost barrier to PrEP access until PrEP is made free to all those who meet evidence-based guidelines. © Sex Information and Education Council of Canada, 2022. Article	2022	Gaspar M.; Wells A.; Hull M.; Tan D.H.S.; Lachowsky N.; Grace D.	"What other choices might I have made?": Sexual Minority Men, the PrEP Cascade and the Shifting Subjective Dimensions of HIV Risk	Qualitative Health Research	-	-	-	10497323	10.1177/10497323221092701	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131044137&doi=10.1177%2f10497323221092701&partnerID=40&md5=59aee2ff23ff7a0dcc7c4ec8afde1110	The PrEP Cascade is a dominant framework for investigating barriers to HIV pre-exposure prophylaxis (PrEP), an HIV prevention tool. We interviewed 37 PrEP users and 8 non-PrEP users in Ontario and British Columbia, Canada, about their decision-making through the Cascade. Participants were HIV-negative gay, bisexual, and queer men (GBQM). The data were analyzed using thematic analysis. PrEP decision-making was based on pragmatic considerations (logistics, costs, and systemic barriers), biomedical considerations (efficacy, side-effects, and sexually transmitted infections), and subjective considerations (identity, politics, and changing sexual preferences). Affective attachments to established versions of "safer sex" (condoms and serosorting) made some GBQM less likely to try PrEP. Some GBQM expressed increased sexual expectations to use PrEP, have condomless sex, and serodifferent sex. These findings support offering PrEP at no-cost, offering individualized counseling and community-based opportunities to discuss PrEP use and changing sexual practices, and improving communication on the manageability of PrEP side-effects. © The Author(s) 2022.	bisexual; gay; HIV prevention; pre-exposure prophylaxis; PrEP Cascade; queer men	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Qualitative

Comparative Pharmacokinetics and Local Tolerance of Tenofovir Alafenamide (TAF) From Subcutaneous Implant in Rabbits, Dogs, and Macaques	Frontiers in Pharmacology	-	-	-	16639812	10.3389/fphar.2022.923954	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135261752&doi=10.3389%2ffphar.2022.923954&partnerID=40&md5=f165b90b32913ad339bc67650af0b69f	The administration of antiretrovirals (ARVs) for HIV pre-exposure prophylaxis (PrEP) is highly efficacious and may benefit from new long-acting (LA) drug delivery approaches. This paper describes a subcutaneous, reservoir-style implant for the LA delivery of tenofovir alafenamide (TAF) and documents the preclinical assessment of implant safety and pharmacokinetics (PK) in New Zealand White (NZW) rabbits (3 groups of n = 5), beagle dogs (2 groups of n = 6), and rhesus macaques (2 groups of n = 3). Placebo implants were placed in rabbits (n = 10) and dogs (n = 12). Implant parameters, including selection of the TAF form, choice of excipient, and PCL formulation were tuned to achieve targeted concentrations of the active anabolite of TAF, tenofovir diphosphate (TFV-DP), within peripheral blood mononuclear cells (PBMCs) and mucosal tissues relevant to HIV transmission. Sustained concentrations of TFV-DP in PBMCs over 100 fmol/106 cells were achieved in all animal species indicating that the implants effectively delivered TAF for 3–6 months. Unlike placebo implants, active TAF implants resulted in local adverse events (AEs) proximal to the implant ranging in severity from mild to moderate and included dermal inflammation and necrosis across all species. Despite these AEs, the implant performed as designed and achieved a constant drug release profile, supporting the continued development of this drug delivery platform. Article	2022	Gebru, Nioud Mulugeta; Benvenuti, Maria Costanza; Rowland, Bonnie H. P.; Kalkat, Meher; Chauca, Patricia G.; Leeman, Robert F.	Relationships among Substance Use, Sociodemographics, Pre-Exposure Prophylaxis (PrEP) Awareness and Related Attitudes among Young Adult Men Who Have Sex with Men.	Substance Use and Misuse	-	-	-	1532-2491 1082-6084	10.1080/10826084.2022.2040030	https://pubmed.ncbi.nlm.nih.gov/35188880/	Men who have sex with men (MSM) account for two-thirds of new HIV diagnoses. Pre-exposure prophylaxis (PrEP), a highly efficacious HIV preventive medication, is underutilized. Identifying correlates of PrEP awareness and attitudes may help increase PrEP use. Thus, we evaluated (1) PrEP awareness; (2) differences in awareness related to substance use and sociodemographics; (3) initial PrEP information sources; and (4) possible associations between information sources and PrEP-related attitudes. Young adult (ages 18-30) HIV-negative MSM from Southern U.S. undertook a web survey including questions about substance use, sexual behaviors, perceived HIV risk, and PrEP. Participants were recruited using in-person and online approaches between January 2018-January 2020. Of 506 participants, 89% were aware of PrEP. Participants with high alcohol consumption and greater perceived HIV risk had higher odds of PrEP unawareness with a trend for minority race/ethnicity. PrEP-aware participants reported high overall perceived safety, confidence in PrEP's efficacy, and low perceived difficulties with adherence though those with higher perceived HIV risk and individuals who used tobacco had less favorable attitudes. Most participants first heard about PrEP from the internet. There were no statistically significant differences in PrEP-related attitudes across initial information sources. Associations between substance use and racial/ethnic minority status and lack of PrEP awareness suggest priority subgroups for educational campaigns. Future campaigns may tailor outreach materials to the respective audience (e.g., Spanish materials for Hispanic people) and disseminate where individuals who use substances may be more likely to see them (e.g., liquor and convenience stores). Theses and Dissertations	2022	Geidelberg, Lily	Estimating the impact of interventions on viral epidemics using epidemiological and evolutionary models	-	-	Imperial College London	-	NA	https://doi.org/10.25560/96578	https://doi.org/10.25560/96578	Mathematical modelling is useful for understanding infectious disease epidemics, and for estimating the impact of interventions to control them. However, the appropriateness of different modelling approaches depends on the local context and availability of data. In this thesis I use two approaches, epidemiological and evolutionary modelling, to estimate the impact of interventions for controlling HIV and COVID-19. After developing a dynamic transmission model fitted to local demographic, HIV prevalence and antiretroviral therapy (ART) coverage data, I estimated the impact of a 2-year real-world demonstration study of pre-exposure prophylaxis (PrEP) and ART treatment-as-prevention (TasP) among female sex workers (FSW) in Cotonou, Benin. I further estimated the impact of long-term scale-up scenarios of PrEP and TasP among FSW in Cotonou. Next, based on data collected during the 2020 COVID-19 epidemic in Benin, I simulated scenarios of COVID-related disruptions to HIV services and sexual behaviour, using the same dynamic transmission model. I estimated the impact of these disruptions on HIV epidemiology in Cotonou. Many non-pharmaceutical interventions (NPIs), including travel restrictions and lockdowns, were implemented globally to control COVID-19. Using model-based phylodynamic methods fitted to twenty SARS-CoV-2 genomes, I estimated the impact of NPIs in Weifang, China, one of the first COVID-19 epidemics outside of Wuhan. Finally, I performed several non-parametric phylodynamic analyses on the COVID-19 epidemic in England, fitted to thousands of SARS-CoV-2 genomes. I evaluated the association of stringency of NPIs and mobility with viral transmission at different periods between spring 2020 and winter 2020-2021. I further investigated the relative growth rates between different viral lineages, including the B.1.1.7 ('alpha') variant. The results from this thesis are useful principally to policymakers for designing effective local control measures for HIV and COVID-19. While modelling can be used to estimate the impact of interventions, model choice must be tailored to the local epidemiological context. Article	2022	Geldsetzer, Pascal; Chebet, Joy J; Tarumbiswa, Tapiwa; Phate-Lesihla, Rosina; Maponga, Chivimbiso; Mandara, Esther; Bärnighausen, Till; McMahon, Shannon A	Knowledge and attitudes about HIV pre-exposure prophylaxis: Evidence from in-depth interviews and focus group discussions with policy makers, healthcare providers, and end-users in Lesotho.	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0000762	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10021845	Studies on knowledge and attitudes about HIV pre-exposure prophylaxis (PrEP) have mostly focused on key populations in North America and Europe. To inform Lesotho's national rollout of PrEP to the general population, this study aimed to characterize knowledge and attitudes about PrEP among policy makers, implementing partners, healthcare providers, and PrEP end-users in Lesotho. Respondents were purposively selected to participate based on personal experience in the development and implementation of Lesotho's PrEP program, or the personal use of PrEP. We conducted 106 in-depth interviews with policy makers (n = 5), implementing partners (n = 4), and end-users (current PrEP users = 55; former PrEP users = 36; and PrEP "decliners" = 6). In addition, we held 11 focus group discussions (FGDs) with a total of 105 healthcare providers. Interview and FGD transcripts were analyzed following the tenets of Grounded Theory. Respondents expressed positive attitudes toward PrEP, owing to experienced and perceived personal, familial, and societal benefits. PrEP was viewed as i) an opportunity for serodiscordant couples to remain together, ii) a means of conceiving children with minimized risk of HIV infection, iii) providing a sense of agency and control, and iv) an avenue for addressing the HIV epidemic in Lesotho. Respondents demonstrated understanding of PrEP's intended use, eligibility requirements, and modality of use. However, respondents also reported that several important misconceptions of PrEP were common among adults in Lesotho, including a belief that PrEP protects against sexually transmitted infections other than HIV, promotes promiscuity, prevents pregnancy, causes seroconversion, and provides lifelong protection from taking the pill just once. In addition to building on the perceived advantages of PrEP to shape a positive message, Lesotho's national rollout of PrEP will likely benefit from a communication strategy that specifically addresses the common misconceptions of PrEP identified in this study. Article	2022	Gengiah, Tanuja Narayansamy; Abdool Karim, Quarraisha; Harkoo, Ishana; Mansoor, Leila; Zuma, Nonhlanhla Yende; Radebe, Precious; Samsunder, Natasha; Baxter, Cheryl; Maharaj, B; Baum, Marc M; Moss, John A; Pozzetto, Bruno; Hankins, Catherine; Abdool Karim, Salim	CAPRISA 018: a phase I/II clinical trial study protocol to assess the safety, acceptability, tolerability and pharmacokinetics of a sustained-release tenofovir alafenamide subdermal implant for HIV prevention in women.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2021-052880	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8739430	INTRODUCTION: Young African women bear a disproportionately high risk for HIV acquisition. HIV technologies that empower women to protect themselves are needed. Safe, potent antiretroviral agents such as tenofovir alafenamide (TAF), formulated as long-acting subdermal implants, offer an innovative solution. METHODS AND ANALYSIS: CAPRISA 018 is a phase I/II trial to evaluate the safety, acceptability, tolerability and pharmacokinetics (PKs) of a TAF free base subdermal silicone implant containing 110 mg of TAF with an anticipated 0.25 mg/day release rate.The phase I trial (n=60) will assess the safety of one implant inserted in six participants (Group 1), followed by dose escalation components (Groups 2 and 3) assessing the safety, tolerability and PK of one to four TAF 110 mg implants releasing between 0.25 mg and 1 mg daily in 54 healthy women at low risk for HIV infection. Data from this phase I trial will be used to determine the dosing, implant location and implant replacement interval for the phase II trial.The phase II component (Group 4) will assess extended safety, PK, tolerability and acceptability of the implant in 490 at risk women, randomised in a 1:1 ratio to the TAF implant and placebo tablet or to the placebo implant and an oral pre-exposure prophylaxis tablet. Safety will be assessed by calculating the percentage change in creatinine clearance from baseline at weeks 4, 12, 24, 36, 72, 96 and 120, compared with the percentage change in the control group. ETHICS AND DISSEMINATION: The South African Health Products Regulatory Authority and the University of KwaZulu-Natal's Biomedical Research Ethics Committee have approved the trial. Results will be disseminated through open access peer reviewed publications, conference presentations, public stakeholder engagement and upload of data into the clinical trials registry. Article	2022	Genre, Noëllie; Panese, Francesco	Merging care and prevention: preventive properties of antiretroviral drugs and HIV chronification in the case of Switzerland	Anthropology and Medicine	-	-	-	13648470	10.1080/13648470.2021.1949891	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115201665&doi=10.1080%2f13648470.2021.1949891&partnerID=40&md5=efcae89586a8bf7db20b8afa880f7c6b	Medication is closely involved in the subjective experience of chronic diseases, but also in the chronification process of illnesses which is described in this paper in the specific case of HIV. The development of antiretroviral drugs (ARVs) and the progressive recognition of their potential dual use as treatment as prevention (TasP) and pre-exposure prophylaxis (PrEP) reshape the experience of HIV and its transmission. Acknowledging the importance of a socioanthropological approach to drugs, this paper highlights how therapeutic strategies of treatment and prevention currently shape the process of HIV chronification and its experience for people concerned with ARVs in Switzerland, whether they are seropositive patients on lifelong treatment or seronegative people affected by the preventive properties of drugs. © 2021 The Author(s). Article	2022	George A.F.; McGregor M.; Gingrich D.; Neidleman J.; Marquez R.S.; Young K.C.; Thanigaivelan K.L.; Greene W.C.; Tien P.C.; Deitchman A.N.; Spitzer T.L.; Roan N.R.	Female Genital Fibroblasts Diminish the In Vitro Efficacy of PrEP against HIV	Viruses	-	-	-	19994915	10.3390/v14081723	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136700730&doi=10.3390%2fv14081723&partnerID=40&md5=e044f6e635556cd314019b3f44aacd4f	The efficacy of HIV pre-exposure prophylaxis (PrEP) is high in men who have sex with men, but much more variable in women, in a manner largely attributed to low adherence. This reduced efficacy, however, could also reflect biological factors. Transmission to women is typically via the female reproductive tract (FRT), and vaginal dysbiosis, genital inflammation, and other factors specific to the FRT mucosa can all increase transmission risk. We have demonstrated that mucosal fibroblasts from the lower and upper FRT can markedly enhance HIV infection of CD4+ T cells. Given the current testing of tenofovir disoproxil fumarate, cabotegravir, and dapivirine regimens as candidate PrEP agents for women, we set out to determine using in vitro assays whether endometrial stromal fibroblasts (eSF) isolated from the FRT can affect the anti-HIV activity of these PrEP drugs. We found that PrEP drugs exhibit significantly reduced antiviral efficacy in the presence of eSFs, not because of decreased PrEP drug availability, but rather of eSF-mediated enhancement of HIV infection. These findings suggest that drug combinations that target both the virus and infection-promoting factors in the FRT—such as mucosal fibroblasts—may be more effective than PrEP alone at preventing sexual transmission of HIV to women. © 2022 by the authors.	female reproductive tract; fibroblasts; HIV transmission; pre-exposure prophylaxis	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Geretti, Anna Maria; Mardh, Otilia; de Vries, Henry J C; Winter, Andrew; McSorley, John; Seguy, Nicole; Vuylsteke, Bea; Gokengin, Deniz	Sexual transmission of infections across Europe: appraising the present, scoping the future.	Sexually Transmitted Diseases	-	-	-	1472-3263	10.1136/sextrans-2022-055455	https://dx.doi.org/10.1136/sextrans-2022-055455	Objectives: Our journal partnered with the Europe section of the International Union against STI (IUSTI) at a workshop held at the 18th European AIDS Conference in London on 30 October 2021. The workshop reviewed epidemiological trends and discussed STI care provision within HIV services across Europe. Methods and Results: We started by highlighting trends in bacterial STIs reported to the European Centre for Disease Prevention and Control from countries in the European Union/European Economic Area. This showed that notifications of bacterial STIs reached an all-time high in 2019, but are expected to be impacted by the COVID-19 pandemic in 2020-2021. We then reviewed the evolving relationship between STIs and HIV and pointed out how antiretroviral treatment and pre-exposure prophylaxis remain highly effective against HIV transmission despite the rising incidence of STIs. Within emerging concepts in STIs, we appraised the benefits and risks of asymptomatic screening for chlamydia, and also considered the potential perils of routinely testing for agents that lack a defined role in disease. Finally, we discussed standards of STI care for people living with HIV, informed by a brief survey of IUSTI Europe country representatives and members of the Euroguidelines in Central and Eastern Europe network. Conclusions: The survey indicated substantial variability and identified key improvement targets: fighting barriers to effective service provision and access, increasing diagnostic capability and taking leadership in driving up the quality of care. We must not forget the STI-related needs of the many people who will be living with HIV for decades into the future. Article	2022	Gibson, Britton; Hoff, Emily; Haas, Alissa; Adams, Zoe M; Price, Carolina R; Goddard-Eckrich, Dawn; Sheth, Sangini S; Dasgupta, Anindita; Meyer, Jaimie P	Overlapping needs for sexual and reproductive health and HIV prevention in women with substance use disorders.	Women's Health	-	-	-	1745-5065	10.1177/17455065211070543	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8771433	OBJECTIVES: Women with substance use disorders have high unmet needs for HIV prevention and drug treatment and face challenges accessing care for other unique health issues, including their sexual and reproductive health. METHODS: We did a cross-sectional evaluation of sexual and reproductive health behaviors and outcomes among women with substance use disorders, who were enrolled in one of two concurrent clinical trials of pre-exposure prophylaxis for HIV prevention. Descriptive analyses and bivariate logistic regression were used to assess factors driving contraceptive use, and other essential sexual and reproductive health services utilization and outcomes. RESULTS: Among 226 women, 173 (76.5%) were of reproductive age. Most women had histories of unintended pregnancy (79.2%) or miscarriage (45.1%) and high HIV risk behaviors (53.5%). Most (61%) participants did not use any form of contraception at the time of assessment, although few (15%) reported pregnancy intentions. In bivariate models, ongoing criminal justice involvement was associated with 2.22 higher odds of not using contraception (95% confidence interval = 1.09-4.53; p = 0.03) and hazardous drinking was protective against not using contraception (odds ratio = 0.33, 95% confidence interval = 0.13-0.81; p = 0.02). Contraception use was not significantly associated with any other individual characteristics or need factors. CONCLUSIONS: This is the first study that identifies the unmet sexual and reproductive health needs of women with substance use disorders who are engaging with pre-exposure prophylaxis. We found that women accessed some health services but not in a way that holistically addresses the full scope of their needs. Integrated sexual and reproductive care should align women's expressed sexual and reproductive health intentions with their behaviors and outcomes, by addressing social determinants of health.	health outcomes; reproductive health; substance use; women. Article	2022	Gibson, Laurel P; Kramer, Emily B; Bryan, Angela D	Geosocial Networking App Use Associated With Sexual Risk Behavior and Pre-exposure Prophylaxis Use Among Gay, Bisexual, and Other Men Who Have Sex With Men: Cross-sectional Web-Based Survey.	JMIR Formative Research	-	-	-	2561-326X	10.2196/35548	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9237762	BACKGROUND: In the United States, geosocial networking (GSN) apps (ie, mobile dating apps) have become central to dating and sexual interactions in recent years. Among gay, bisexual, and other men who have sex with men (GBM), these apps play an important role in reducing barriers and facilitating partner seeking. However, despite these benefits, there are concerns that these apps may facilitate risky sexual behavior and transmission of sexually transmitted infections (STIs) among GBM. OBJECTIVE: This study aimed to examine the association between GSN app use and sexual risk in a US sample of GBM. METHODS: Using a cross-sectional design, respondents (N=223) completed a web-based survey assessing their use of GSN apps, sexual risk and protective behaviors, HIV serostatus, and previous STI diagnoses. RESULTS: Respondents were aged 21-78 (mean 31.90, SD 10.06) years and 69.5% (155/223) were non-Hispanic White. The sample included respondents from 40 states and the District of Columbia. Nearly half (104/223, 47%) of the participants reported using GSN apps. GSN users were more likely to report past-year condomless anal intercourse (P<.001), 3 or more sexual partners in the previous year (P<.001), and a previous STI diagnosis (P=.001) than nonusers. GSN users also reported more frequent use of recreational drugs before sex (P=.001), alcohol use before sex (P<.001), and cannabis use before sex (P=.01). Interestingly, GSN users were also more likely to report having ever taken an HIV test (P<.001) and using pre-exposure prophylaxis (P=.03). The rates of HIV seropositivity did not differ significantly between GSN users and nonusers (P=.53). Among the subset of GSN users, 38 participants reported using only GBM-specific GSN apps (eg, Grindr), whereas 27 participants reported using only sexuality nonspecific GSN apps (eg, Tinder). Exclusive users of GBM-specific apps reported more frequent recreational drug use before sex (P=.01) and were also more likely to report past-year condomless anal intercourse (P<.001), 3 or more sexual partners in the previous year (P=.004), a previous STI diagnosis (P=.002), and HIV testing (P=.003). Alcohol use before sex, cannabis use before sex, pre-exposure prophylaxis use, and HIV rates were similar between both groups (P>.11). CONCLUSIONS: The findings suggest that GSN apps may be a useful pathway for interventions aimed at reducing STI risk in GBM. Future prospective studies should examine how risk levels change after the initiation of GSN app use.	dating app, mobile dating, hookup, gay, pre-exposure prophylaxis, sexual risk, HIV, STI, mobile phone	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Theses and Dissertations	2022	Gill, Katherine	Acceptability, safety, and patterns of use of oral pre-exposure prophylaxis to prevent HIV in healthy, South African adolescents	-	-	University of Cape Town	-	NA	NA	http://hdl.handle.net/11427/36454	Background: HIV incidence amongst adolescents in Southern Africa remains extremely high. The importance of adolescent HIV prevention strategies in tackling the epidemic worldwide is increasingly recognised with a global target from UNICEF to reduce new adolescent HIV infections by 75% by 2020. Adolescent vulnerability to HIV infection is a result of a complex interplay between structural, economic, socio-cultural, and biological factors during a phase when behaviours associated with HIV acquisition and sexual and reproductive health-seeking are initiated. The vulnerability of young people to HIV is particularly manifest in South Africa, where young women aged 15-24 accounted for almost 40% of new HIV infections in 2017. PreExposure Prophylaxis (PrEP) has been demonstrated to be effective for preventing HIV infection in adults but there is little data on its implementation among young people. Given the HIV incidence rates amongst adolescents in Southern Africa, oral PrEP for this group is likely to have an impact on population-level HIV incidence. We designed an open-label demonstration study known as Pluspills, for adolescents aged 15-19 years in South Africa to understand the safety, feasibility, and patterns of use of oral pre-exposure prophylaxis (PrEP) as part of a broad package of interventions, to prevent HIV. Methods: Pluspills was conducted in two distinct peri-urban settings in Johannesburg and Cape Town. The aim was to study the safety and acceptability of oral PrEP (tenofovir disoproxil fumarate/Emtricitabine) in two adolescent populations in South Africa. HIV-negative participants between 15-19 years old participated in an open-label oral PrEP study over 52 weeks. Participants took daily PrEP for the first 12 weeks and were then given the choice to opt-in or opt-out of PrEP use at three-monthly intervals. Serial plasma and DBS tenofovir concentrations were measured at every PrEP refill visit, and results were discussed with participants during adherence counselling sessions. Testing for sexually transmitted infections (STI's) was conducted at baseline, twelve and forty-eight weeks. Findings: Overall 148 participants were enrolled (median age 18 years; 67% female) and initiated PrEP. STI prevalence at the study start was high at 41% (60/148) and remained high throughout the study. The decision to stop using PrEP was made by 26 (18%) participants at 6 the 12-week visit. Cumulative PrEP opt-out at weeks 24 and 36 comprised 41% (60/148) and 43% (63/148) of the total cohort respectively. PrEP was relatively well tolerated with few reported adverse events. Tenofovir diphosphate (TFV-DP) levels as measured in dried blood spot samples were detectable (>16fmol/punch) in 92% (108/118)) of participants who reported PrEP use at week 12, 74% at week 24 (74/100), and 58% (22/37) by the end of the study. One HIV seroconversion occurred during the study (0.76/100 person-years) in a 19-yearold female participant who had chosen to stop taking PrEP, 24 weeks before diagnosis. Interpretation: In this small cohort of South African adolescents at risk of HIV acquisition, PrEP was safe and well-tolerated in those who continued to use it. PrEP use decreased throughout the study as visit frequency declined. The incidence of sexually transmitted infections remained high, despite low HIV incidence. The study confirms that this population needs access to PrEP with particular attention to tailored adherence support. Young people would also possibly benefit from the option for more frequent and flexible visit schedules. Article	2022	Gillespie D.; Wood F.; Williams A.; Ma R.; de Bruin M.; Hughes D.A.; Jones A.T.; Couzens Z.; Hood K.	Experiences of men who have sex with men when initiating, implementing and persisting with HIV pre-exposure prophylaxis	Health Expectations	-	-	-	13696513	10.1111/hex.13446	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128056630&doi=10.1111%2fhex.13446&partnerID=40&md5=ddb3d5b5c18dd9d5793adcfdbb745fbf	Introduction: HIV pre-exposure prophylaxis (PrEP) involves the use of antiretroviral medication in HIV-negative individuals considered to be at risk of acquiring HIV. It has been shown to prevent HIV and has been available in Wales since July 2017. Measuring and understanding adherence to PrEP is complex as it relies on the simultaneous understanding of both PrEP use and sexual activity. We aimed to understand the experiences of men who have sex with men (MSM) living in Wales initiating, implementing and persisting with HIV PrEP. Methods: We conducted semistructured interviews with MSM PrEP users in Wales who participated in a cohort study of PrEP use and sexual behaviour. Following completion of the cohort study, participants were invited to take part in a semistructured interview about their experiences of taking PrEP. We aimed to include both individuals who had persisted with and discontinued PrEP during the study. The interview topic guide was informed by the ABC taxonomy for medication adherence and the theory of planned behaviour. We analysed our data using reflexive thematic analysis. Results: Twenty-one participants were interviewed, five having discontinued PrEP during the cohort study. The developed themes focused on triggers for initiating PrEP, habitual behaviour, drivers for discontinuation and engagement with sexual health services. Stigma surrounding both PrEP and HIV permeated most topics, acting as a driver for initiating PrEP, an opportunity to reduce discrimination against people living with HIV, but also a concern around the perception of PrEP users. Conclusion: This is the first study to investigate PrEP-taking experiences incorporating established medication adherence taxonomy. We highlight key experiences regarding the initiation, implementation and persistence with PrEP and describe how taking PrEP may promote positive engagement with sexual health services. These findings may be useful for informing PrEP rollout programmes and need to be explored in other key populations. Patient and Public Contribution: PrEP users, in addition to PrEP providers and representatives of HIV advocacy and policy, were involved in developing the topic guide for this study. © 2022 The Authors. Article	2022	Gillespie, D.; Couzens, Z.; de Bruin, M.; Hughes, D. A.; Jones, A.; Ma, R.; Williams, A.; Wood, F.; Blee, K.; Bradshaw, H. S.; Drayton, R.; Knapper, C.; Hood, K.	PrEP Use, Sexual Behaviour, and PrEP Adherence Among Men who have Sex with Men Living in Wales Prior to and During the COVID-19 Pandemic	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03618-4	https://www.proquest.com/scholarly-journals/prep-use-sexual-behaviour-adherence-among-men-who/docview/2684303871/se-2?accountid=8113	We examined PrEP use, condomless anal sex (CAS), and PrEP adherence among men who have sex with men (MSM) attending sexual health clinics in Wales, UK. In addition, we explored the association between the introduction of measures to control transmission of SARS-CoV-2 on these outcomes. We conducted an ecological momentary assessment study of individuals in receipt of PrEP in Wales. Participants used an electronic medication cap to record PrEP use and completed weekly sexual behaviour surveys. We defined adherence to daily PrEP as the percentage of CAS episodes covered by daily PrEP (preceded by ≥ 3 days of PrEP and followed by ≥ 2 days). Sixty participants were recruited between September 2019 and January 2020. PrEP use data prior to the introduction of control measures were available over 5785 person-days (88%) and following their introduction 7537 person-days (80%). Data on CAS episodes were available for 5559 (85%) and 7354 (78%) person-days prior to and following control measures respectively. Prior to the introduction of control measures, PrEP was taken on 3791/5785 (66%) days, there were CAS episodes on 506/5559 (9%) days, and 207/406 (51%) of CAS episodes were covered by an adequate amount of daily PrEP. The introduction of pandemic-related control measures was associated with a reduction in PrEP use (OR 0.44, 95%CI 0.20–0.95), CAS (OR 0.35, 95%CI 0.17–0.69), and PrEP adherence (RR = 0.55, 95%CI 0.34–0.89) and this may have implications for the health and wellbeing of PrEP users and, in addition to disruption across sexual health services, may contribute to wider threats across the HIV prevention cascade. Article	2022	Giovenco Danielle; Pettifor Audrey; Powers, Kimberly A; Hightow-Weidman Lisa; Pence, Brian W; Edwards, Jessie K; Gill, Katherine; Morton, Jennifer F; van der Straten Ariane; Celum Connie; Linda-Gail, Bekker	The Effect of PrEP Use Disclosure on Adherence in a Cohort of Adolescent Girls and Young Women in South Africa	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03455-x	https://www.proquest.com/scholarly-journals/effect-prep-use-disclosure-on-adherence-cohort/docview/2641697584/se-2?accountid=8113	Effective strategies to support PrEP adherence among adolescent girls and young women (AGYW) are needed. We examined PrEP use disclosure and its effect on adherence among 200 AGYW ages 16–25 initiating PrEP in South Africa to help inform these strategies. We estimated the relative prevalence of high adherence (intracellular tenofovir-diphosphate concentration ≥ 700 fmol/punch) 3- and 6-months after PrEP initiation among those who disclosed vs. did not disclose their PrEP use, both overall and by age. Most AGYW disclosed to a parent (58%), partner (58%), or friend (81%) by month 6. We did not observe a strong effect of disclosure on adherence overall; however, among younger AGYW (≤ 18 years), those who disclosed to a parent were 6.8 times as likely to have high adherence at month 6 than those who did not (95% CI 1.02, 45.56). More work is needed to understand parents' roles as allies and identify ways peers and partners can motivate PrEP use for AGYW. Article	2022	Giovenco, Danielle; Pettifor, Audrey; Powers, Kimberly A; Hightow-Weidman, Lisa; Pence, Brian W; Celum, Connie; Delany-Moretlwe, Sinead; Hosek, Sybil; Donnell, Deborah; Anderson, Peter L; Mgodi, Nyaradzo; Bekker, Linda-Gail	Intimate partner violence and oral HIV pre-exposure prophylaxis adherence among young African women.	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000003216	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9486991	OBJECTIVE: To estimate the effect of intimate partner violence (IPV) on oral pre-exposure prophylaxis (PrEP) adherence among adolescent girls and young women (AGYW). DESIGN: We conducted a secondary analysis of data from HIV Prevention Trials Network 082 (HPTN 082), a multisite prospective study designed to assess oral PrEP adherence among AGYW in southern Africa. METHODS: We estimated the relative prevalence of high PrEP adherence 3 and 6âmonths after initiation among AGYW 16-25âyears who reported a history of any IPV in the past year at enrollment versus AGYW who did not, both overall and by age. High adherence was defined as an intracellular tenofovir-diphosphate concentration at least 700âfmol/punch or more dried blood spots. RESULTS: Among 409 PrEP-initiating AGYW, half (49%) reported experiencing any IPV by a current/recent partner in the year prior to enrollment. Overall, a similar proportion of AGYW who reported IPV had high PrEP adherence at months 3 and 6 as AGYW who did not report IPV. There was, however, evidence of effect modification by age at month 3: among AGYW less than 21âyears old, those who reported IPV were less than half as likely to have high adherence adjusted PR (aPR)â=â0.43, 95% confidence interval (CI) 0.22-0.86; among AGYW aged 21 years or older, those who reported IPV were more than twice as likely to have high adherence (aPRâ=â2.21, 95% CI 1.34-3.66). At month 6, effect estimates within each age stratum were consistent in direction to those at month 3. CONCLUSION: IPV events may either impede or motivate PrEP adherence among African AGYW, with age appearing to be an important consideration for IPV-related adherence interventions. Article	2022	Girometti, Nicolò; McCormack, Sheena; Tittle, Victoria; McOwan, Alan; Whitlock, Gary	Rising rates of recent preexposure prophylaxis exposure among men having sex with men newly diagnosed with HIV: Antiviral resistance patterns and treatment outcomes	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003143	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125212351&doi=10.1097%2fQAD.0000000000003143&partnerID=40&md5=5dad62da97ab6b5bd8e57dfe6f501303	Introduction: Preexposure prophylaxis (PrEP) is contributing to achieve a reduction in HIV diagnoses in men having sex with men (MSM). Albeit infrequent, HIV infections in the context of recent PrEP exposure represent a clinical challenge. Methods: Data on recent PrEP use and possible reasons leading to HIV infection were analysed in individuals newly diagnosed with HIV at 56 Dean Street clinic in 2016 - 2020. Demographics, immune-virological parameters, genotypic resistance test results and treatment management in this group were compared with those not reporting recent PrEP exposure using Mann - Whitney U test and Fisher's exact test. Results: Fifty-two of 1030 (5%) individuals reported recent PrEP exposure at HIV diagnosis; 98% were MSM, median age 34 years (interquartile range IQR 28 - 42), 65% of white ethnicity, 65% non-UK-born. 35% reported PrEP intake the day before testing HIV-positive, 46% reported sub-optimal PrEP adherence since their last negative HIV test result. Thirty-three of 52 (63%) were self-sourcing PrEP and 9/52 (17%) reported issues with its supply. Recent PrEP use was associated to lower HIV viral load and higher CD4+ cell count at baseline than in counterparts non-recently exposed to PrEP (P < 0.01). M184V mutation was harboured more commonly in the recent PrEP use group (30% vs. 1%, P < 0.01). The proportion of individuals recently exposed to PrEP among those diagnosed with HIV rose sharply, reaching 21% in the first semester of 2020. Viral suppression was achieved by all patients intensified from PrEP to antiretroviral treatment (ART) who remained in care at week 24. Discussion: Rapid PrEP intensification to ART allowed to achieve high rates of HIV viral suppression despite significant rates of M184V mutation harboured in those newly diagnosed with HIV and reporting recent PrEP exposure. Article	2022	Glick, Jennifer L.; Jivapong, Belinda; Russo, Rienna; Pelaez, Danielle; Piser, Rebecca; Footer, Katherine; Sherman, Susan G.	Cultivating PEARL (Promoting Empowerment and Risk Reduction): Formative Research for a PrEP Intervention Among Female Sex Workers in Baltimore, Maryland	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03600-0	https://www.proquest.com/scholarly-journals/cultivating-pearl-promoting-empowerment-risk/docview/2684300675/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) is a vital component of comprehensive HIV prevention among female sex workers (FSW). There are limited PrEP interventions targeting FSW in the U.S., who have high HIV risk. Formative research was conducted to inform PEARL (Promoting Empowerment And Risk Reduction), a PrEP intervention for FSW in Baltimore, MD, including a community forum, key informant interviews with providers, and focus group discussions with FSW. FSW and providers acknowledged challenges to building rapport and establishing continuity in care settings. FSW reported low PrEP awareness, with high interest once aware. FSW and providers reported uptake barriers including perceived financial issues, lack of PrEP awareness, and mistrust of the pharmaceutical industry. Concerns were raised about substance use and daily PrEP adherence. Developing a tailored PrEP intervention for FSW necessitates multiple perspectives (e.g. FSW, service providers). Resumen La profilaxis preexposición (PrEP) es un componente vital de la prevención integral del VIH para las trabajadoras sexuales (TSF). En los Estados Unidos, hay pocas intervenciones de PrEP dirigidas a las TSF, quienes experiencian un riesgo elevado de contraer el VIH. Se realizó una investigación formativa para informar a PEARL (Promoción del empoderamiento y la reducción de riesgos), una intervención de PrEP para TSF en Baltimore, MD—la cual incluyó un foro comunitario, entrevistas con proveedores de servicios a las TSF y discusiones entre grupos focales de TSF. TSF y proveedores de servicio reconocieron los retos de mantener buenas relaciones y establecer continuidad en los servicios de salud. TSF exhibieron conocimiento limitado sobre la PrEP, pero expresaron gran interés en la PrEP después de estar informadas. TSF y los proveedores de servicios hablaron de barreras aceptando a la PrEP, incluyendo problemas financieros percibidos, falta de conocimiento sobre la PrEP y desconfianza en la industria farmacéutica. Se expresaron preocupaciones sobre el uso de sustancias y la adherencia diaria a la PrEP. El desarrollo de una intervención de PrEP personalizada para TSF requiere varias perspectivas (por ejemplo, TSF, proveedores de servicios). Article	2022	Goedel W.C.; Coats C.S.; Chan P.A.; Sims-Gomillia C.E.; Brock J.B.; Ward L.M.; Mena L.A.; Nunn A.S.	A Pilot Study of a Patient Navigation Intervention to Improve HIV Pre-exposure Prophylaxis Persistence among Black/African American Men Who Have Sex with Men	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002954	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132453408&doi=10.1097%2fQAI.0000000000002954&partnerID=40&md5=ba4086b1ceb0a7650af6d5e7cfe8c95d	Background:Suboptimal HIV pre-exposure prophylaxis (PrEP) care outcomes among Black/African American men who have sex with men (MSM) limits its population-level effects on HIV incidence. We conducted a pilot study of a brief patient navigation intervention aimed at improving PrEP initiation and persistence among Black/African American MSM in the Southern United States.Setting:Community health center in Jackson, MS.Methods:We recruited 60 Black/African American MSM aged 18-34 years who were newly prescribed PrEP. Participants were randomized to receive the clinic's current standard of care or an intervention condition including a single patient navigation session to discuss and address perceived barriers to initiating and maintaining access to PrEP and biweekly check-ins. Participants were followed over 6 months using survey assessments, medical chart review, and pharmacy purchase records to ascertain PrEP initiation and persistence.Results:Participants in the intervention condition were more likely to pick up their initial PrEP prescription RR: 1.47; 95% confidence interval (CI): 1.10 to 1.97, be retained in PrEP care at 3 months (RR: 1.62; 95% CI: 1.01 to 2.59) and 6 months (RR: 1.38; 95% CI: 0.64 to 2.93), and have access to PrEP medications greater than 80% of all study days based on pharmacy fill records (RR: 3.00; 95% CI: 1.50 to 5.98).Conclusion:A brief patient navigation intervention demonstrated proof-of-concept in improving PrEP initiation and persistence among Black/African American MSM in the Southern United States. © 2022 Lippincott Williams and Wilkins. Article	2022	Goense C.J.D.; Evers Y.J.; Hoebe C.J.P.A.; Crutzen R.; Dukers-Muijrers N.H.T.M.	Intention to use and acceptability of home-based sexual health care among men who have sex with men who previously attended clinic-based sexual health care	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/frph.2022.967770	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150018304&doi=10.3389%2ffrph.2022.967770&partnerID=40&md5=12a7a4ee8e01047a54e081b7d3b063ae	The COVID-19 pandemic has temporarily disrupted access to clinic-based sexual health care for men who have sex with men (MSM) in the Netherlands. The importance of home-based sexual health care has been underpinned as an extension of clinic-based care. This paper aims to assess intention to use, and acceptability of home-based sexual health care among MSM who previously attended clinic-based sexual health care. In November 2020, 424 MSM who had attended an STI clinic pre-pandemic were invited to participate in an online survey; 154 MSM completed the survey (response 36%). Intention to use self-sampling STI/HIV tests was assessed (median; scale 0–100) and compared across sociodemographic and sexual behavior characteristics by Kruskal-Wallis H tests. Descriptive analyses provided insights in acceptability of home-based sexual health care. Of participants (median age 47), 60.4% (93/154) tested for STI/HIV in the past 6 months, most of them attended a clinic. The median score on intention to use self-sampling tests was 86.5 (SD = 33.4) and did not differ by sociodemographic or sexual behavior characteristics (all p-values > 0.1). Participants were positive toward online sexual health counseling (median attitude = 75.0, SD = 29.6) and their main preferred topics were PrEP use and STI/HIV testing. MSM who attended clinic-based care expressed intention to use self-sampling tests and a positive attitude toward online sexual health counseling. Home-based sexual health care elements are not currently integrated within Dutch clinic-based sexual health care and should be considered an addition for continued provision of care and extended reach of MSM. Article	2022	Gökengin, D	HIV Pre-Exposure Prophylaxis in Central and Eastern Europe-Gains and Challenges in An Ever-Changing World	Infectious Diseases and Clinical Microbiology	-	-	-	2667-646X	10.36519/idcm.2022.199	https://pubmed.ncbi.nlm.nih.gov/38633717/	Pre-exposure prophylaxis (PrEP) is an effective prevention tool for controlling the HIV epidemic. Since its approval in the United States in 2012 and Europe in 2016, it has become available on a global scale offered as a registered strategy in clinical studies or demonstration projects with a slow and steady increase. In the second quarter of 2022, PrEP became available in 78 countries globally, with around 3 million people having started using PrEP. Europe has been much slower than the rest of the world to roll out PrEP; nevertheless, currently, PrEP is nationally available and reimbursed in 21 countries; generics are available but not reimbursed in 14 countries. PrEP is not formally implemented in 20 countries, which are mostly Central and Eastern European countries. There are significant disparities between countries in terms of PrEP availability, accessibility, and usage, most likely due to social, cultural, and political differences. The major barriers to PrEP use are reported to be lack of knowledge of people in need, not being reimbursed, and low perception of HIV. PrEP uptake globally and regionally still lacks the power to have an impact on controlling the epidemic. High prioritization of PrEP targets will offer us a realistic chance of reaching the Joint United Nations Programme on HIV/AIDS (UNAIDS) goal of a 90% reduction in HIV infections by 2030 compared to 2010. Article	2022	Gombe B.; Streatfield C.; Leal L.; Opio S.; Joseph S.; Weber J.; Hare J.; Kaleebu P.; Serwanga J.	Optimization and validation of an ELISA assay for the determination of antibody responses to CN54gp140 and AIDSVAX BE for use in the Phase IIb PrEPVacc vaccine trial	PLOS One	-	-	-	19326203	10.1371/journal.pone.0275927	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141839629&doi=10.1371%2fjournal.pone.0275927&partnerID=40&md5=9267961f46d7f0c7d85ef385966857ef	PrEPVacc is an international, multi-centre, double-blind vaccine study comparing experimental combination vaccine regimens including DNA/AIDSVAX BE and DNA/CN54gp140 with placebo control. Simultaneously, daily oral PrEP is compared for efficacy against daily Truvada in the context of the current PrEP availability situation at the study sites. An important clinical trial outcome is the accurate measurement of in vivo antibody titer induced through vaccination. Here we report the validation of two ELISAs for CN54gp140 and AIDSVAX BE at Uganda Virus Research Institute that demonstrates precision, specificity, and robustness for assessing the reciprocal antibody end point titer in human serum. This is a critical endpoint for determining whether vaccination can provide any protection against HIV in populations at risk of acquiring HIV. © 2022 Gombe et al. Article	2022	Gómez, Walter; Holloway, Ian W; Pantalone, David W; Grov, Christian	PrEP uptake as a social movement among gay and bisexual men	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2020.1831075	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094892246&doi=10.1080%2f13691058.2020.1831075&partnerID=40&md5=a165d8571f57103c4fa19ed44dc2fb35	Despite PrEP's effectiveness as an HIV prevention intervention, uptake among gay and bisexual men remains low. Historical involvement in AIDS activism may reveal important ways of mobilising gay and bisexual men to increase PrEP uptake. Data come from a qualitative study to understand New York City gay and bisexual men's experiences with PrEP. Informed by a constructivist grounded theory approach, we assessed ways in which gay and bisexual men's relational experiences concerning PrEP were congruent with features of past AIDS activism. Participants' mean age was 32.5 years, half were men of colour, and over half had been taking PrEP for less than one year. Analysis revealed three primary themes related to AIDS activism strategies: (1) framing, which referenced how participants referred to PrEP as an empowering, liberatory and community-building intervention (2) reactions, which encompassed positive to negative expressions about PrEP and sex; and (3) innovation, which conveyed ways that participants engaged in processes of transferring lay knowledge about PrEP through leadership roles across social and digital encounters. Findings suggest that the ways in which gay and bisexual men communicate about PrEP with peers are consistent with features of AIDS activism. Deploying lay knowledge using framing strategies through peer-based intervention could expand PrEP uptake. However, elements of PrEP stigma must be addressed to engage with the wide-ranging HIV prevention needs of gay and bisexual men. © 2020 Informa UK Limited, trading as Taylor & Francis Group. Article	2022	Gómez-Castro, Jose; Cerecero-García, Diego; Vermandere, Heleen; Bautista-Arredondo, Sergio	Changes in sexual behavior, PrEP use, and COVID-19 experience among men who have sex with men in Mexico	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03688-4	https://pubmed.ncbi.nlm.nih.gov/35445993/	This study aimed to explore the impact of COVID-19 lockdown on sexual behavior and PrEP use among a sample of men who have sex with men (MSM) in Mexico. Between April 20th and 27th, 2020 – well into Mexico's lockdown – we conducted a virtual survey among 637 MSM exploring sexual behavior during the first month of the COVID-19 epidemic in Mexico and the impact of lockdown on PrEP use. We applied logistic regression models to assess predictors of PrEP use continuation. Over half the participants (52%) reported having a sexual encounter in the last two weeks. 75% of participants reported a decrease in the number of sexual partners because of COVID-19. The use of PrEP dropped from 90% to 64% during the first month of lockdown. Multivariate logistic regression models showed that younger participants were less likely to continue using PrEP than those 25 + years. Also, those who perceived themselves as not likely to acquire COVID-19 and those who reported using a condom in their last sexual encounter were more likely to continue using PrEP during the lockdown. This study provides evidence of the impact of COVID-19 on sexual behavior and PrEP use among MSM in Mexico during the lockdown. Sexual and reproductive health services will need to consider the risk of COVID-19 in providing HIV and PrEP programs to guarantee participants' and health care providers' safety. Theses and Dissertations	2022	GONCALVES, MAYRA SAVI	Profilaxia Pré-Exposição ao HIV: processos de escolha e a rede de atenção em saúde de homens do interior do estado de São Paulo'	-	-	UNIVERSIDADE ESTADUAL PAULISTA JÚLIO DE MESQUITA FILHO (ARARAQUARA)	-	NA	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=11762958	Ainda que a AIDS seja considerada hoje como uma doença crônica e não mais letal, o HIV continua presente no cenário brasileiro. Os métodos de barreira ofertados pelo sistema de saúde nem sempre alcançam o público alvo, ou conseguem manter a continuidade dos usuários. A Profilaxia Pré-Exposição (PrEP) surge como uma estratégia de prevenção ao HIV e está disponível no Sistema Único de Saúde, com o objetivo de reduzir a transmissão do HIV. Essa pesquisa investigou, através de entrevistas semiestruturadas, o que seis homens residentes do interior do estado de São Paulo sabem sobre a PrEP, como percebem sua vulnerabilidade ao HIV e como a relacionam com suas práticas sexuais, bem como, qual a percepção desses homens ao recorrerem a serviços de saúde públicos ou privados. A análise de dados foi pautada no método dialético hermenêutico. Os resultados obtidos nas entrevistas indicam que o preservativo masculino segue sendo tido como obrigatoriedade quando falamos de cuidados com a saúde sexual masculina. Os entrevistados explicitaram a posição dos serviços de saúde, públicos e privados e dos profissionais de saúde, com relação à "necessidade" do uso da camisinha. Os participantes que apresentaram mais conhecimento sobre outros métodos de prevenção, como a PrEP, por exemplo, são os homossexuais. No entanto, tal conhecimento surge muito mais por interesse do indivíduo do que por divulgação em ambientes públicos de saúde. Article	2022	Gonzales-Zamora, Jose A.; Ponce-Rosas, Linda; Martinez, Richard	Determinants of public health and interventions to address HIV infection among men who have sex with men in Miami-Dade County, Florida, USA.	Le Infezioni in Medicina	-	-	-	2532-8689 1124-9390	10.53854/liim-3003-7	https://pubmed.ncbi.nlm.nih.gov/36148172/	Human immunodeficiency virus (HIV) among men who have sex with men (MSM) has been recognized as a public health problem in Miami-Dade County, Florida, USA. This was found to be a significant problem in our need assessment as evidenced by the HIV incidence rate of 28.4 per 100,000 population, which is higher than the average incidence reported for the state of Florida. MSM account for the mostly affected group, reaching 59% of all the new cases. A review of the HIV determinants was conducted using an ecological framework. At the individual level, sexual abuse, alcohol, and drug consumption were identified as determinants of HIV infection in the population. Family rejection was recognized as a determinant at the interpersonal level. Connection to the gay community can function as a protective factor but it can also be possible predictor of HIV infection. Among structural factors, poverty was found to be positively associated with HIV prevalence. Additionally, we highlighted the importance of sexual health education and especially pre-exposure prophylaxis (PrEP) as protective factors. By using systems thinking tools, we designed a causal loop diagram that illustrates visually the recognized determinants of public health. Finally, we presented several studies that evaluate evidence-based interventions to improve the uptake and retention in care of PrEP in MSM. We also described existing interventions implemented in Miami-Dade County, and reported studies that may contribute to the development of new HIV preventive strategies in the future. Article	2022	Goodman A.; Patten L.; Castillo-Mancilla J.; Zimmer S.; Madinger N.; Frasca K.	Factors Associated with Retention and Adherence in a Comprehensive, Diverse HIV Pre-Exposure Prophylaxis Clinic	AIDS Research and Human Retroviruses	-	-	-	8892229	10.1089/aid.2021.0130	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128246212&doi=10.1089%2faid.2021.0130&partnerID=40&md5=457cf1a2f46ae6de578142439740ded8	Retention in HIV pre-exposure prophylaxis (PrEP) care and adherence to PrEP have been suboptimal in some populations, despite evidence that high adherence dramatically enhances PrEP efficacy. A comprehensive PrEP Clinic with a retention specialist and clinical pharmacist could impact patient's retention and adherence in PrEP care. A retrospective electronic medical record review of patients attending an academic PrEP Clinic was conducted between June 2018 and June 2019 (at least one visit attended for PrEP was required). Retention was defined as a medical or laboratory visit every 3 months ±30 days, as recommended by CDC guidelines, but was analyzed using the number of visits and time between visits via multivariate regression analyses. PrEP adherence was calculated using a Medication-Possession Ratio (MPR) and compared between patient characteristics using Kruskal-Wallis tests. One hundred twenty-two patients were identified by chart review, 96 had sufficient data for follow-up and were included in at least one analysis. The population was primarily cisgender men who have sex with men and over half were African American or Hispanic. Overall, patient retention was 43%. The retention analysis demonstrated that individuals who self-identified as gay were more likely to be retained than those who identified as heterosexual (53% vs. 18%, hazard ratio = 1.75, 95% confidence interval = 1.01-3.03, p = .045). Although not statistically significant, African Americans and cisgender women were less likely to be retained in care. The adherence analysis identified higher median MPRs among patients not reporting previous incarceration (80% vs. 35%, p < .01). Although not statistically significant, there was lower adherence among youth 18-24 (11% vs. 54% MPR >80, p = .058). Despite comprehensive PrEP clinical care, heterosexual individuals were less likely to be retained in PrEP care than those who self-identified as gay and previously incarcerated individuals were less likely to be adherent to PrEP. © Copyright 2022, Mary Ann Liebert, Inc., publishers 2022.	adherence; health disparities; pre-exposure prophylaxis; PrEP; retention	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	Goodman G.R.; Kikut A.; Bustamante M.J.; Mendez L.; Mohamed Y.; Shachar C.; Cohen I.G.; Gerke S.; Boyer E.W.; Rosen R.K.; Mayer K.H.; O'Cleirigh C.; Chai P.R.	"I'd feel like someone was watchin' me… watching for a good reason": perceptions of data privacy, access, and sharing in the context of real-time PrEP adherence monitoring among HIV-negative MSM with substance use	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03614-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126525470&doi=10.1007%2fs10461-022-03614-8&partnerID=40&md5=0e9b50a1819b226e4d8b968e2956262e	Once-daily oral tenofovir/emtricitabine is highly effective as pre-exposure prophylaxis (PrEP) against HIV but is dependent on adherence, which may be challenging for men who have sex with men (MSM) and use substances. Digital pill systems (DPS) permit the direct, real-time measurement of adherence, though user perceptions of data privacy in this context are unknown. Thirty prospective DPS users – HIV-negative MSM with non-alcohol substance use – completed in-depth qualitative interviews exploring preferences around privacy, access, and sharing of DPS adherence data. Participants discussed some concerns about the impact of DPS use on personal privacy, and emphasized the need for robust data protections in the technology. Participants were interested in having on-demand access to their adherence data, and were most willing to share data with primary care providers and long-term relationship partners. Future investigations exploring bioethical frameworks around DPS use are warranted, and user preferences should inform best practices for protecting DPS data. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Goodman G.R.; Vaz C.; Albrechta H.; Boyer E.W.; Mayer K.H.; O'Cleirigh C.; Chai P.R.	Ingestible Electronic Sensors for Monitoring Real-time Adherence to HIV Pre-exposure Prophylaxis and Antiretroviral Therapy	Current HIV/AIDS Reports	-	-	-	15483568	10.1007/s11904-022-00625-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137206485&doi=10.1007%2fs11904-022-00625-x&partnerID=40&md5=3f4b6920d4d9f3f63e73d3a409298932	Purpose of Review: This review summarizes the recent advancements and future directions of digital pill systems (DPS) — which utilize ingestible sensors to directly measure medication ingestion events in real-time — in the context of HIV prevention and treatment. Recent Findings: Two DPS are cleared by the US Food and Drug Administration. The bioequivalence and stability of digitized pre-exposure prophylaxis (PrEP) and antiretroviral therapy (ART) have been established, and pilot studies have demonstrated the feasibility and acceptability of using DPS for PrEP and ART adherence measurement. Important bioethical and implementation considerations have been identified for future clinical trials. Continued technological advancement may reduce barriers to use, and integration of DPS into behavioral interventions may facilitate adherence improvement efforts. Summary: DPS represent an innovative tool for PrEP and ART adherence measurement. Future work will optimize the technology to reduce operational barriers. DPS have significant potential for expansion across a diverse array of diseases, though key bioethical considerations must be examined prior to large-scale implementation. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Theses and Dissertations	2022	Goswami, Swarnali; Barnard, Marie; Bentley, John	Willingness to Use HIV Pre-Exposure Prophylaxis (PREP) and Preferences for a Pharmacy-Based Prep Program Among Men Who Have Sex with Men	-	-	University of Mississippi	-	-	NA	https://www.proquest.com/dissertations-theses/willingness-use-hiv-pre-exposure-prophylaxis-prep/docview/2773834434/se-2?accountid=8113	The purpose of this dissertation was to: 1) estimate willingness to use PrEP (WTUP) among men who have sex with men (MSM) using meta-analysis; 2) to assess patterns of minority stressors, HIV/AIDS acquisition stress and PrEP stigma among MSM and evaluate the association of such patterns with WTUP, using latent profile analysis; and 3) to elicit MSM's preferences for a community pharmacy-based PrEP delivery program, using a discrete choice experiment.First, a meta-analysis using a random-effects model revealed a moderate pooled prevalence proportion for WTUP of 0.58 (95% CI: 0.54-0.61) (or 58 out of 100) among PrEP naïve MSM estimated from 15 included articles. Age and region significantly moderated the effect estimate. The factors associated with WTUP reported in these studies were categorized according to the Social Ecological Model. Few studies assessed and reported societal or public policy related factors associated with WTUP.Second, of the 390 MSM included in the study sample, 79.23% were willing to use PrEP. Two distinct classes were identified: 1) a "Lower Stress" class (81.79% of the respondents) and 2) a "Higher Stress" class. Predictors of the "Higher Stress" class membership were younger age, injection equipment sharing, prior STD diagnosis or depressive symptoms. After adjusting for covariates, WTUP was not different in the two classes. Therefore, PrEP programs in the future should incorporate counseling and peer support to empower MSM to cope with such stressors.Third, the respondents' preferences clustered into four groups: 1) "Same day results and online monitoring" group (61.03% of the sample), 2) "Consumerist decision making" group (13.98% of the sample), "Self-screening (online questionnaire)" group (11.28% of the sample), and "Same day results preferring" group (9.49% of the sample). Race, region of residence, income and STD diagnosis were significant predictors of group membership. Community pharmacists should incorporate online screening and telehealth to have an effective program in their pharmacy. Article	2022	Gouda M.; Fitzpatrick C.; Williams D.; Richardson D.	Hepatitis A testing and susceptibility in men who have sex with men: An unintended benefit of PrEP	Sexual Health	-	-	-	14485028	10.1071/SH22061	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133143982&doi=10.1071%2fSH22061&partnerID=40&md5=c18f5e8cf36d0817e659c8c604d8ffb1	Hepatitis A is a sexually transmitted enteric infection in men who have sex with men (MSM). HIV pre-exposure prophylaxis (PrEP) has increased opportunities for sexual health interventions in MSM. 588 (372 in 2019, 216 in 2021) MSM attended for the first time in the study periods. MSM were significantly more likely to be screened for Hepatitis A susceptibility in 2021 than 2019 (93% vs 56%, P = 0.0001). Susceptibility (Hepatitis A IgG negative) to Hepatitis A did not change between in 2021 and 2019 (48% vs 47%, P = 0.921). De-medicalising PrEP is important as it will increase overall uptake. However, coupling PrEP with other sexual health interventions must not be lost. © 2022 The Author(s). Article	2022	Gras, Julien; Pillet, Marine; Antoni, Guillemette; Cua, Eric; Charreau, Isabelle; Raffi, F.; Chidiac, Christian; Chas, Julie; Tremblay, Cécile; Spire, Bruno; Delaugerre, Constance; Meyer, Laurence; Molina, Jean-Michel	Risk factors for HIV infection among men who have sex with men in the ANRS IPERGAY PrEP trial.	Sexually Transmitted Infections	-	-	-	1472-3263 1368-4973	10.1136/sextrans-2021-055199	https://pubmed.ncbi.nlm.nih.gov/34663696/	OBJECTIVES: We aimed to assess among men who have sex with men (MSM) risk factors for HIV infection, to identify those who require urgent pre-exposure prophylaxis (PrEP) prescription. METHODS: All participants enrolled in the placebo arm of the ANRS IPERGAY trial, or infected between screening and day 0, were included. Baseline characteristics were described and HIV incidence rate ratios (RRs) were estimated with 95% CIs. RESULTS: 203 MSM were included with a median follow-up of 9 months. During the study period, 16 participants acquired HIV infection while not receiving tenofovir disoproxil and emtricitabine (TDF/FTC) over 212.4 person-years (PYs) of follow-up (incidence rate 7.5/100 PYs, 95% CI: 4.3 to 12.2). Being enrolled in Paris was associated with a significant increased risk of HIV infection (RR: 4.1; 95% CI: 1.1 to 28.3). A high number of sexual partners in prior 2 months (≥10 vs <5) and of condomless receptive anal sex episodes in prior 2 months (>5 vs <5) were strong predictors for HIV acquisition (RR: 10.6 (2 to 260.2) and 3.3 (1.2 to 10.2), respectively). Those who reported more often or only receptive sexual practices were also at increased risk (RR: 9.8 (2.0 to 246.6)). The use of recreational drugs in prior 12 months, especially gamma hydroxybutarate/gamma butyrolactone (RR: 5.9; 95% CI: 2 to 21.7), was associated with a significantly increased risk of HIV acquisition even after adjustment for sexual practices. CONCLUSIONS: MSM who have frequent condomless receptive anal sex and multiple partners, or use recreational drugs should be targeted in priority for PrEP prescription especially if they live in an area with a high prevalence of HIV infection. Article	2022	Greene G.J.; Reidy E.; Felt D.; Marro R.; Johnson A.K.; Phillips G., II; Green E.; Stonehouse P.	Implementation and evaluation of patient navigation in Chicago: Insights on addressing the social determinants of health and integrating HIV prevention and care services	Evaluation and Program Planning	-	-	-	1497189	10.1016/j.evalprogplan.2021.101977	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111983802&doi=10.1016%2fj.evalprogplan.2021.101977&partnerID=40&md5=314ce1fd68acaf17cc72b200f3583bd1	Patient navigation is a primary element in linkage to HIV pre-exposure prophylaxis (PrEP) care and linkage to or re-engagement in HIV care, depending on the HIV status of the individual. However, there is a dearth of literature describing navigation services in these areas. In the context of Chicago Project PrIDE, this project conducted process and implementation evaluations with eight agencies leading demonstration projects to address these gaps. The evaluation team conducted semi-structured, individual interviews with agency staff (N = 20) assessing navigation implementation and fit, as well as project successes and challenges. Additionally, agency staff collected patient surveys (N = 300) assessing services provided, service quality, and satisfaction. The interview transcripts were coded and analyzed thematically and descriptive analyses were performed on the survey data. Analyses indicated that screening for social determinants of health, providing healthcare engagement guidance, and providing service referrals were frequently cited navigation activities. Most staff members indicated that navigation fits well within their agencies, and that limited staff and clinic capacity were often barriers to navigation. Patient navigation to support engagement in HIV prevention and care services is critical due to the extensive support provided by navigators to address social determinants of health impacting HIV disparity populations. © 2021 Elsevier Ltd	Continuity of patient care; Ethnicity; Healthcare disparities; HIV; Patient navigation; Pre-exposure prophylaxis; Program evaluation; Race; Sexual and gender minorities; Social determinants of health	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Grenfell, Pippa; Rafael, Sabrina; Calliste, Josina; Nutland, Will	We go where we know': Reflections from Mobilizing for PrEP and Sexual Health (MobPrESH) – A peer-led PrEP education programme across England, for and by women and non-binary people	Women's Health	-	-	-	17455057	10.1177/17455057221091727	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127860000&doi=10.1177%2f17455057221091727&partnerID=40&md5=b34cdf012cbc1667ada9236a8d8e1f15	Background: Pre-exposure prophylaxis is a highly effective method of HIV prevention but few women know about it, have access to it, or see it as relevant to them. In 2019, grassroots organization PrEPster piloted a peer-led intervention, MobPrESH (Mobilizing for Pre-Exposure prophylaxis (PrEP) and Sexual Health), across three sites in England, to mobilize for PrEP and sexual health with communities of women and non-binary people most affected by HIV, including Black women and non-binary people, people of colour, migrants, and transgender (trans) women. Objectives: We aimed to explore the accessibility, feasibility, acceptability, and 'fidelity' of MobPrESH, from the perspectives of peer mobilizers and project staff. Methods: We conducted focus group discussions and qualitative interviews with nine peer mobilizers (most identified as Black cisgender (cis) women) and six project staff (including Black and white cis women and non-binary people). We analysed data thematically, iteratively, and inductively, informed by concepts of reproductive and social justice. Results: We present findings in five thematic areas: connecting and relating to situate sexual health discussions, navigating silence and stigma, connecting within and across communities, competing pressures and structural hostilities, and resources and continuity. Community knowledge-building about PrEP is a slow, iterative process that needs investment and creation of trusted spaces that centre communities' needs and concerns. Peer mobilizers and the communities they engaged with had competing demands in their lives, and knowledge-raising about PrEP was impacted by intersecting stigmas, discrimination, and oppressions around HIV status, racism, misogyny, transphobia, homophobia, and anti-sex worker rhetoric. Conclusions: Peer-led PrEP interventions require funding and foregrounding, particularly for women and non-binary people who are Black, trans, migrants, and people of colour, situated relative to their wider health needs, life pressures, and priorities. This requires concurrent challenge of the racist and patriarchal structures that continue to obscure the sexual and reproductive health needs of racially minoritized and marginalized women and non-binary people. © The Author(s) 2022. Article	2022	Griffith, Kamron; Romanelli, Frank	Pharmacists and the next generation of HIV pre-exposure prophylaxis.	Journal of the American Pharmacists Association	-	-	-	1544-3450	10.1016/j.japh.2022.07.001	https://pubmed.ncbi.nlm.nih.gov/35961938/	The use of pre-exposure prophylaxis (PrEP) has curtailed transmission of human immunodeficiency virus (HIV) in most industrialized nations. Despite the availability of PrEP, HIV infections continue to occur. Access and adherence are major limitations to PrEP. Long-acting injectable antiretroviral agents are now being added to the HIV armamentarium. Long-acting agents offer the advantage of less frequent dosing with intramuscular administration versus oral dosing. Cost, injection site pain, and needle hesitancy may be detriments to the use of these agents in certain patients. More studies are needed to completely discern the role of various products and future long-acting agents as options for PrEP. Even when we consider their limitations, long-acting agents may provide an eventual opportunity to transform the delivery of PrEP. Pharmacists should be aware of the potential impact of PrEP and the advantages and disadvantages of these new long-acting agents. In addition, pharmacists should proactively advocate for and contribute to PrEP expansion efforts. Article	2022	Grimshaw C.; Estcourt C.S.; Nandwani R.; Yeung A.; Henderson D.; Saunders J.M.	Implementation of a national HIV pre-exposure prophylaxis service is associated with changes in characteristics of people with newly diagnosed HIV: A retrospective cohort study	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2020-054732	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099465257&doi=10.1136%2fsextrans-2020-054732&partnerID=40&md5=9f06bc5714a59918c5592160d14749c7	Objectives To review characteristics of individuals newly diagnosed with HIV following implementation of a national pre-exposure prophylaxis (PrEP) programme (comprehensive PrEP services, delivered in sexual health clinics) to inform future delivery and broader HIV prevention strategies. Methods We extracted data from national HIV databases (July 2015June 2018). We compared sociodemographic characteristics of individuals diagnosed in the period before and after PrEP implementation, and determined the proportion of potentially preventable infections with the sexual health clinicbased PrEP delivery model used. Results Those diagnosed with HIV before PrEP implementation were more likely to be male (342/418, 81.8% vs 142/197, 72.1%, p=0.005), be white indigenous (327/418, 78.2% vs 126/197, 64.0%, p0.001), report transmission route as sex between men (219/418, 52.4% vs 81/197, 41.1%, p=0.014), and have acquired HIV in the country of the programme (302/418, 72.2% vs 114/197, 57.9% p0.001) and less likely to report transmission through heterosexual sex (114/418, 27.3% vs 77/197, 39.1%, p=0.002) than after implementation. Pre-implementation, 8.6% (36/418) diagnoses were potentially preventable with the PrEP model used. Post-implementation, this was 6.6% (13/197), but higher among those with recently acquired HIV (49/170, 28.8%). Overall, individuals with potentially preventable infections were more likely to be male (49/49, 100% vs 435/566, 76.9%, p0.001), aged 40 years (37/49, 75.5% vs 307/566, 54.2%, p=0.004), report transmission route as sex between men (49/49, 100% vs 251/566, 44.3%, p0.001), have previously received post-exposure prophylaxis (12/49, 24.5% vs 7/566, 1.2%, p0.001) and less likely to be black African (0/49, 0% vs 67/566, 11.8%, p=0.010) than those not meeting this definition. Conclusions The sexual health clinicbased national PrEP delivery model appeared to best suit men who have sex with men and white indigenous individuals but had limited reach into other key vulnerable groups. Enhanced models of delivery and HIV combination prevention are required to widen access to individuals not benefiting from PrEP at present. © 2022 BMJ Publishing Group. All rights reserved. Article	2022	Grov, Christian; Zohra, Fatima; Westmoreland, Drew A; Mirzayi, Chloe; D'Angelo, Alexa; Stief, Matthew; Kulkarni, Sarah; Nash, Denis; Carrico, Adam W	Sex in the Era of COVID-19 in a U.S. National Cohort of Cisgender Men, Transgender Women, and Transgender Men Who Have Sex with Men: April–May 2020	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-021-02121-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120753965&doi=10.1007%2fs10508-021-02121-6&partnerID=40&md5=2798abdb1329f80d6841229c77970662	Since the emergence of the COVID-19 pandemic, there has been an increasing body of research focused on the effects that measures like stay-at-home orders and social distancing are having on other aspects of health, including mental health and sexual health. Currently, there are limited extant data on the effects of the pandemic on sexual and gender minorities. Between April 15, 2020, and May 15, 2020, we invited participants in an ongoing U.S. national cohort study (Together 5000) to complete a cross-sectional online survey about the pandemic, and its effects on mental and sexual health and well-being (n = 3991). Nearly all (97.7%) were living in an area where they were told they should only leave their homes for essentials. Most (70.1%) reported reducing their number of sex partners as a result of the pandemic. Among the 789 participants prescribed HIV pre-exposure prophylaxis (PrEP), 29.9% said they stopped taking their PrEP entirely, and 14.2% started selectively skipping doses. For those who had been taking PrEP, discontinuing PrEP was associated with having no new sex partners (β = 0.90, 95% CI 0.40–1.40). Among the 152 HIV-positive participants, 30.9% said they were unable to maintain an HIV-related medical appointment because of the pandemic and 13.8% said they had been unable to retrieve HIV medications. Additionally, 35.3% of participants were experiencing moderate to severe anxiety because of the pandemic and 36.7% reported symptoms of depression. In a multivariable logistic regression, reporting a new sex partner in the prior 30 days was significantly associated with being aged 30 or older (vs. not, AOR = 1.21), being Black (AOR = 1.79) or Latinx (AOR = 1.40, vs. white), and being unsure if they had been in close contact with someone diagnosed with COVID-19 (AOR = 1.32, vs. no contact). It was unassociated with COVID-19-induced anxiety, depression, or knowing someone hospitalized with COVID-19. The pandemic has caused disruptions in sexual behavior (partner reduction) as well as difficulties navigating PrEP and HIV care continua. Findings will guide more comprehensive public health responses to optimize HIV prevention and treatment in the era of COVID-19. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Groves, Allison K; Vadaketh, Jessica; Raziano, Valerie T; Nkwihoreze, Hervette; Short, William R; Momplaisir, Florence	Preexposure Prophylaxis Acceptability Among Pregnant Individuals and Implications for Human Immunodeficiency Virus Prevention.	Obstetrics and Gynecology	-	-	-	1873-233X	10.1097/AOG.0000000000004709	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9627543	OBJECTIVE: To understand perspectives on and preferences for preexposure prophylaxis (PrEP) for pregnant individuals who are at risk for human immunodeficiency virus (HIV) infection. METHODS: In this qualitative study, we purposively sampled and conducted in-depth interviews with pregnant participants at risk of HIV infection (indicated by a recent sexually transmitted infection STI) from a U.S. urban obstetrics clinic. Interview questions focused on perceived HIV risk, knowledge and perceptions of PrEP, and preferences for different PrEP formulations. We coded data using deductive and inductive codes, created matrices to explore patterns in findings, and wrote memos to interpret emergent themes. RESULTS: Twenty patients were enrolled. Median age of the participants was 24 years (interquartile range 19-26 years), 95.0% were African American, 65.0% were high school graduates, and 70.0% had unplanned pregnancies. Participants had low knowledge of PrEP and most saw themselves at low to no risk of HIV acquisition, despite their recent STI. Further, participants' low HIV risk perception and medication safety concerns reduced PrEP acceptability. Moreover, very few had discussed PrEP with their obstetrician-gynecologists (ob-gyns) during antenatal care, which further affected perceived acceptability. However, participants who did discuss PrEP with their ob-gyns had favorable perceptions of it. These participants indicated that they would choose a formulation based on individual preferences. Whether a formulation is chosen was largely shaped by perceived ease of use, acceptability, and prior experience with other medication regimens. CONCLUSION: Obstetrician-gynecologists may play an important role in increasing pregnant individuals' knowledge of and access to PrEP during pregnancy among those who are at risk of HIV acquisition. To maximize uptake and adherence during this time, PrEP formulations should be tailored to individual preferences. Prevention of HIV during this critical life transition is important not only for the long-term health and well-being of pregnant individuals and their infants, but to the plan to end the HIV epidemic in the United States by 2030. Article	2022	Grulich A.E.; Bavinton B.R.	Scaling up preexposure prophylaxis to maximize HIV prevention impact	Current Opinion in HIV and AIDS	-	-	-	1746630X	10.1097/COH.0000000000000739	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132959808&doi=10.1097%2fCOH.0000000000000739&partnerID=40&md5=931df624ceab07d3ea9b6c20242c8fae	Purpose of reviewTen years since the first regulatory approval of oral HIV preexposure prophylaxis (PrEP), this review summarizes PrEP uptake, the role of ambitious PrEP targets, emerging evidence of impact on the HIV epidemic and innovative approaches to increasing PrEP uptake.Recent findingsPrEP uptake among people at risk of HIV has been slow, but has accelerated in recent years, particularly in gay and bisexual men in a limited number of high-income settings and recently in heterosexuals at risk of HIV in sub-Saharan Africa. However, UNAIDS 2020 PrEP targets and HIV prevention targets were missed by large margins. Although UNAIDS testing and treatment targets have galvanised public health action, in contrast, PrEP targets have been lower profile and insufficiently ambitious. Parts of the USA, Australia and the UK with high PrEP coverage have demonstrated striking reductions in HIV infection at the population level, and PrEP is introduced at scale. Scaling up PrEP uptake will require innovations in PrEP promotion, simplified models of care, improved adherence interventions, improved choice in the form of longer-acting PrEP and interventions to ensure that all those who can benefit from PrEP can access it.SummaryPrEP is a revolutionary HIV prevention tool, which if ambitiously scaled up could drive HIV transmission towards elimination. Highly publicized and ambitious PrEP targets could help drive this. © 2022 Lippincott Williams and Wilkins. All rights reserved. Article	2022	Guillamet, LV; Valencia, J; Ryan, P; Cobo, I; Lazarus, J; Chevance, G	Determinants of intention to use pre-exposure prophylaxis and condom use among female sex workers in Madrid, Spain	Journal of the International AIDS Society	-	-	-	1758-2652	https://doi.org/10.1007/s10508-024-02834-4	https://osf.io/preprints/osf/c3ghq	The pre-exposure prophylaxis (PrEP) campaign in Spain focuses on men who have sex with men, with female sex workers (FSWs) representing just 0.2% of PrEP users in 2022. This cross-sectional study investigated the individual, occupational, social, and structural determinants of intention to use oral PrEP and condom use among 102 cisgender FSWs in Madrid through convenience sampling. Most FSWs worked in the street (71.6%); and 25.5% used condoms inconsistently. PrEP awareness was low (9.8%) but intention to use PrEP was high (72.5%). Intention to use oral PrEP was significantly associated with feeling protected against HIV by taking PrEP, and perceiving insufficient protection by condom use alone. Inconsistent condom use was significantly associated with frequent heroin/cocaine use, having clients who inject drugs, and willingness to take PrEP in spite of it not protecting 100% against HIV infection. Interventions are needed to increase PrEP awareness and uptake among FSWs in Spain. Article	2022	Guo J.; Zhang G.; Qin Q.; Chen H.; Wang L.; Lyu F.	Progress in research of knowledge, attitude and practice of pre-exposure prophylaxis in men who have sex with men and its influencing factors; 男男性行为者暴露前预防知信行现状及影响因素研究进展	Chinese Journal of Endemiology	-	-	-	20954255	10.3760/cma.j.cn112338-20220427-00351	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142906670&doi=10.3760%2fcma.j.cn112338-20220427-00351&partnerID=40&md5=dbdea6fe8bc13c356bc722049d383276	Men who have sex with men (MSM) is a group of people at high risk for HIV infection in China, Pre-exposure prophylaxis (PrEP) is a bioprophylaxis strategy in the prevention of HIV infection in MSM, which can reduce the risk for HIV infection in this population effectively. However, in the paractice, the use level of PrEP in MSM is low in China, and there are MSM who know PrEP but receive no PrEP. This paper summarizes the current status of the awareness, willingness to use, actual use of PrEP in MSM and influencing factors both at home and abroad to provide a reference for the promotion of PrEP use in MSM in China. © 2022 Chinese Medical Association. Article	2022	Guss C.E.; Pilcher S.; Assefa I.; Fitzgerald S.; Stamoulis C.; Woods E.R.	HIV/Pre-Exposure Prophylaxis Knowledge and Acceptability of Rapid HIV Testing Among Transgender Adolescents in a Multidisciplinary Gender Clinic	Transgender Health	-	-	-	2380193X	10.1089/trgh.2021.0163	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162258648&doi=10.1089%2ftrgh.2021.0163&partnerID=40&md5=9ceb7b3fac59b0e1b85aa878ae21dd95	Purpose: The objectives of this study were to assess the knowledge of HIV and pre-exposure prophylaxis (PrEP) in transgender adolescents and young adults (AYAs) and to test the acceptability of rapid HIV testing among transgender adolescents in a multidisciplinary gender clinic. Methods: Participants enrolled on the same day as their mental health or medical appointment in a multidisciplinary gender clinic. They completed survey questions regarding HIV and PrEP knowledge and were also offered an optional same-day, rapid, fourth-generation HIV test. Participants who had an HIV test answered additional questions about their testing experience. Results: We enrolled 61 participants; just over half (n=31) were assigned female at birth. Less than a third (n=20, 32.8%) scored 80% or above regarding HIV knowledge. Nearly half of the participants (n=29, 47.5%) were not interested in PrEP. Forty-one percent of participants chose to have a rapid HIV test; all were "satisfied" with the testing experience. There were no positive HIV results. Conclusions: Transgender AYAs have gaps in their understanding of HIV acquisition and transmission. Rapid HIV testing in the setting of gender care is well received by those who desire testing and may be a way to increase knowledge of transgender AYA HIV status. Article	2022	Gustavsson, Erik; Björk, Joar	The Ethical Relevance of "Alternatives" in Health Care Priority Setting - The Case of Preexposure Prophylaxis (PrEP) of HIV.	Yale Journal of Biology and Medicine	-	-	-	1551-4056	NA	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9511950	Preexposure prophylaxis for HIV is a drug that reduces the risk for an HIV-negative person to acquire HIV if taken prior to sex. It has been suggested that it is important for resource allocation decisions that there are alternatives (such as abstinence, masturbation, etc.) for individuals potentially benefitted by this prophylaxis. In this paper we explore this idea from an ethical perspective in relation to three notions often discussed in priority setting ethics, namely responsibility, outcomes, and severity of disease. While the relevance of alternatives may be explained in terms by responsibility-sensitive priority setting, such a view comes with several challenges. We then discuss two other ways in which this intuition could be better explained: (a) in terms of total outcome of health, and (b) in terms of severity of the condition.	lternatives, Ethics, HIV, PrEP, Priority setting	English	United States	Western and Central Europe and North America	Sweden	Western and Central Europe and North America	NA	NA	Qualitative

Dermatologists are aware of PrEP, but several barriers prevent them from being prescribers. • Patients with a history of an STI should be considered for PrEP	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Gutierrez, Jose I; Vlahov, David; Dubov, Alex; Altice, Frederick L	Preferences for Long-Acting and Alternative Modalities for PrEP among Military Men Who Have Sex with Men: Segmentation Results of an Adaptive Choice-Based Conjoint Analysis Study.	Journal of Urban Health	-	-	-	1468-2869	10.1007/s11524-022-00615-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9033922	The use of pre-exposure prophylaxis (PrEP) for HIV prevention within the U.S. military is low. Implementing preference-based alternative modalities of PrEP delivery, however, can be an innovative strategy to address the specific barriers to PrEP uptake among military MSM. We sought to identify population-based, segment-specific preferences for longer-acting and alternative PrEP delivery modalities to guide patient-centered strategies to optimize uptake within military-serving healthcare systems. HIV-negative military men who have sex with men (MSM) completed an anonymous, adaptive choice-based conjoint (ACBC) analysis survey consisting of five key attributes of interest (dosing method, provider type, visit location, lab work evaluation location, and dispensing venue). Relative importance and part-worth utility scores were generated using Hierarchical Bayes (HB) estimation, and cluster ensemble analysis grouped participants into "phenotype" segments by preference similarity. The randomized first-choice model was then used to examine changes in program interest rates among segments through market simulation. The 429 participants were segmented into five preference groups. The dosing method attribute was found to be the most important to nearly all segments. Simulations revealed that PrEP program interest among two segments with low interest levels increased when smartphone, civilian-based, and long-acting injectable PrEP options were involved. Findings also suggested a need for clinics to be responsive and sensitive to sexual practices, risk perception, and functional PrEP knowledge. Responsiveness to segment-specific preferences in the design of military PrEP programs and acting on the importance of clinical relationships within the context of PrEP engagement within a military setting may contribute to increasing PrEP uptake. Article	2022	Gutowska, S J; Hoffman, K A; Gurski, K F	The effect of PrEP uptake and adherence on the spread of HIV in the presence of casual and long-term partnerships.	Mathematical Biosciences and Engineering	-	-	-	1551-0018	10.3934/mbe.2022555	https://dx.doi.org/10.3934/mbe.2022555	A model with both casual and long-term partnerships is considered with respect to the impact of a pre-exposure prophylaxis (PrEP) on the spread of HIV. We consider the effect of the effectiveness of PrEP, the rate that susceptible individuals choose to take PrEP, and compliance with the daily dose of the pre-exposure prophylaxis. The rate of infection in long-term partnerships is computed using a linearized expected value as a means for including the nonlocal effects of long-term partnerships while maintaining computational feasibility. The reproduction numbers for models with casual partnerships, long-term partnerships, and a combination of both are analytically computed and global stability of both disease-free and endemic equilibria is shown. Sensitivity and PRCC analysis results suggest that increasing the compliance among the current PrEP users is a more effective strategy in the fight against the HIV epidemic than increased coverage with poor compliance. Furthermore, an analysis of the reproduction number shows that models with either casual or monogamous long-term partnerships can reach the desired $ R_0 < 1 $ threshold for high enough levels of compliance and uptake, however, a model with both casual and monogamous long-term partnerships will require additional interventions. Methods highlighted in this manuscript are applicable to other incurable diseases or diseases with imperfect vaccines effected by long-term partnerships. Article	2022	Guure C.; Afagbedzi S.; Torpey K.; Chaurasia A.	Willingness to take and ever use of pre-exposure prophylaxis among female sex workers in Ghana	Medicine (United States)	-	-	-	257974	10.1097/MD.0000000000028798	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124058729&doi=10.1097%2fMD.0000000000028798&partnerID=40&md5=e6cb7ded999dfb7cc47785b68e285774	AbstractPre-exposure prophylaxis (PrEP) is a drug taken by people who are human immunodeficiency virus (HIV) negative and at increased risk of acquiring HIV. It's an effective intervention for HIV prevention. This study seeks to report on the prevalence and determinants of willingness to take and ever use PrEP among female sex workers (FSW) in Ghana.The data analyzed was obtained from the Integrated Bio-behavioral Surveillance Survey conducted across the 16 regions of Ghana in 2020. Analysis was only performed on FSW who were tested negative to HIV and were sexually active. All included variables were described using medians, percentages, and graphs. Bayesian adjusted odds ratios and 95% credible intervals were estimated using a Bayesian generalized linear model via the binomial family of distributions under the logit link function.Of the 5107 FSW with complete data on willingness to use PrEP, 2737 (53.59%) reported their willingness to take PrEP. Out of the 998 respondents who have ever heard of PrEP only 64 (6.39%) have ever used PrEP. The median age of the respondents was 25 years. People with no comprehensive knowledge of HIV and acquired immunodeficiency syndrome as well as those who entered into the FSW business at age less than 25 years; 946 (34.56%) and 2181 (79.65%) respectively were more willing to take PrEP. FSW from 6 out of the 16 regions of Ghana have never used PrEP. A statistically significant difference between those who entered the sex work at age less than 25 years and those within 25 to 34years was observed. About 23% of FSWs who had been screened for Sexually Transmitted Infections were more likely to take PrEP.Respondents with lesser age and no comprehensive knowledge of HIV were more willing to take PrEP. The willingness to accept PrEP among FSWs in Ghana is modest. However, utilization is low. Advocacy or intervention programs are required to improve uptake of PrEP. © 2022 Lippincott Williams and Wilkins. All rights reserved. Article	2022	Guy, Danielle; Doran, Jason; White, Trenton M; van Selm, Lena; Noori, Teymur; Lazarus, Jeffrey V	The HIV pre-exposure prophylaxis continuum of care among women who inject drugs: A systematic review.	Frontiers in Psychiatry	-	-	-	1664-0640	10.3389/fpsyt.2022.951682	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9459118	Introduction: People who inject drugs have a substantial risk for HIV infection, especially women who inject drugs (WWID). HIV pre-exposure prophylaxis (PrEP), a highly-effective HIV prevention drug, is uncommonly studied among WWID, and we aimed to synthesize existing knowledge across the full PrEP continuum of care in this population. Methods: We systematically searched for peer-reviewed literature in three electronic databases, conference abstracts from three major HIV conferences, and gray literature from relevant sources.Eligibility criteria included quantitative, qualitative or mixed-methods studies with primary data collection reporting a PrEP-related finding among WWID, and published in English or Spanish between 2012 and 2021. The initial search identified 2,809 citations, and 32 were included. Data on study characteristics and PrEP continuum of care were extracted, then data were analyzed in a narrative review. Results: Our search identified 2,809 studies; 32 met eligibility requirements. Overall, awareness, knowledge, and use of PrEP was low among WWID, although acceptability was high. Homelessness, sexual violence, unpredictability of drug use, and access to the healthcare system challenged PrEP usage and adherence. WWID were willing to share information on PrEP with other WWID, especially those at high-risk of HIV, such as sex workers. Conclusions: To improve PrEP usage and engagement in care among WWID, PrEP services could be integrated within gender-responsive harm reduction and drug treatment services. Peer-based interventions can be used to improve awareness and knowledge of PrEP within this population. Further studies are needed on transgender WWID as well as PrEP retention and adherence among all WWID.	rEP care continuum; human immunodeficiency virus; people who inject drugs; pre-exposure prophylaxis (PrEP); women who inject drugs	English	Switzerland	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Review
Article	2022	Haberer, Jessica E; Mugo, Nelly; Bukusi, Elizabeth Ann; Ngure, Kenneth; Kiptinness, Catherine; Oware, Kevin; Garrison, Lindsey E; Musinguzi, Nicholas; Pyra, Maria; Valenzuela, Susie; Thomas, Katherine K; Anderson, Peter L; Thirumurthy, Harsha; Baeten, Jared M	Understanding Pre-Exposure Prophylaxis Adherence in Young Women in Kenya.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002876	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8826617	OBJECTIVE: To present detailed analyses of long-term pre-exposure prophylaxis (PrEP) use and associated behaviors and perceptions among young Kenyan women. DESIGN: Prospective, observational cohort. METHODS: The Monitoring PrEP among Young Adult women Study involved 18 to 24-year-old women at high HIV risk initiating PrEP in Kisumu and Thika, Kenya. Visits for PrEP counseling and dispensing, HIV testing, and socio-behavioral data collection occurred at Month 1 and quarterly for 2 years. PrEP adherence was measured with pharmacy refill and real-time electronic monitoring, plus tenofovir diphosphate levels in 15% of participants. HIV risk behavior and perception were assessed by self-report in weekly short message service surveys from Months 6-24. Predictors of adherence were assessed with multivariable logistic regression analysis. RESULTS: Three hundred forty-eight women (median age 21, VOICE risk score 7) were followed for 617 person-years. Pharmacy refills steadily declined from 100% (Month 0-1) to 54% (Months 22-24). Average electronically monitored adherence similarly declined from 65% (Month 0-1) to 15% (Months 22-24). Electronically monitored adherence had moderately high concordance with tenofovir diphosphate levels (67%). High average adherence (5+ doses/week) was seen at 385/1898 (20%) participant-visits and associated with low baseline VOICE risk score, >1 current sexual partner, ≤1-hour travel time to clinic, and the Kisumu site. short message service-reported behavior and risk perception were not associated with adherence. Four women acquired HIV (incidence 0.7/100 person-years). CONCLUSIONS: PrEP adherence was modest and declined over time. HIV risk was inconsistently associated with adherence; clinic access and site-level factors were also relevant. Relatively low HIV incidence suggests participants may have achieved protection through multiple strategies. Article	2022	Haider S.; Friedman E.E.; Ott E.; Moore A.; Pandiani A.; Desmarais C.; Johnson A.K.	Knowledgeable, aware / interested: Young black women's perceptions of pre-exposure prophylaxis	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/frph.2022.671009	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145753063&doi=10.3389%2ffrph.2022.671009&partnerID=40&md5=84d256ec3d89ec69f168f2fe613b8793	Purpose: HIV in the United States disproportionately affects young Black women. Pre-exposure prophylaxis (PrEP) is an effective HIV prevention option that has the potential to reduce HIV incidence among HIV-vulnerable populations. However, data regarding women's awareness, interest in starting, and feelings of acceptability or stigma about PrEP remains limited, particularly among adolescent and young Black women. Materials and methods: A cross-sectional survey was conducted with 100 sexually active young Black women ages 13–24 years attending women's health clinics in Chicago, IL. Descriptive statistics were used to characterize the sample and determine more about what the PrEP needs and barriers are in this community. Associations were modeled using logistic regression and 95% confidence intervals for both bivariate and multivariable models. Results: In our survey (N = 100), half of study participants (50%) expressed interest in starting PrEP in the next three months and a majority (80%) of young women were confident they could obtain PrEP. Pregnant young women were significantly more interested in starting PrEP than non-pregnant women OR 2.3 95% CI (1.0, 5.4), p = 0.05), however, this association did not remain significant in adjusted models. Conclusions: This study provides a more complete understanding of awareness, interest in, and acceptability of PrEP among adolescent and young Black women attending women's health clinics. Findings indicate sustained interest in starting PrEP, reduced stigma, and increased awareness of PrEP among young Black women. These findings suggest that integrating PrEP into women's health clinics is a promising strategy to increase awareness and utilization of PrEP and decrease HIV transmission among youth at highest risk. 2022 Haider, Friedman, Ott, Moore, Pandiani, Desmarais and Johnson.	adolescent; black; hiv prevention; pre-exposure prophylaxis; women; women's health services	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Haines M.; O'Byrne P.	Nurse-led safer opioid supply and HIV pre-exposure prophylaxis: a novel pilot project	Therapeutic Advances in Infectious Disease	-	-	-	20499361	10.1177/20499361221091418	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128380616&doi=10.1177%2f20499361221091418&partnerID=40&md5=0eea17e66c2d983f9b344ecf55b1e2bf	Introduction: HIV pre-exposure prophylaxis (PrEP) is an effective intervention for preventing HIV infections yet is largely unknown to and underutilized among people who use drugs. Methods: To better provide services to this group, we present a prospective, single-group interventional study involving the creation of a partnership between a safer opioid supply program and an HIV PrEP program, both of which were nurse-led. Results: Overall, HIV PrEP was offered to 42 individuals within the safer opioid supply program, resulting in 55% (n = 23) acceptance. Almost half of the group that accepted PrEP identified as female, and nearly all participants were homeless and did not have a primary care provider. While it was challenging to obtain routine PrEP follow-up labs per guideline recommendations due to poor venous access, most participants were able to successfully stay on PrEP and maintained good medication adherence. There were no PrEP discontinuations due to renal impairment and no participants tested positive for HIV. Conclusion: This novel integration of programs appears to be a highly effective way to expand access to HIV prevention among people who use drugs. Given the historical and current mistreatment of people who use drugs within the healthcare system, rapport and trust were essential to the uptake of HIV PrEP services. Further, the importance of infectious disease screening among people who use drugs is underscored, and built-in program flexibility and low barrier access is essential. © The Author(s), 2022.	drug use; harm reduction; HIV pre-exposure prophylaxis; overdose crisis; safer opioid supply	English	United Kingdom	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Mixed methods

Article	2022	Han, Kelong; Wannamaker, Paul; Lu, Hongzhou; Zhu, Biao; Wang, Meixia; Paff, Melanie; Spreen, William R; Ford, Susan L	Safety, Tolerability, Pharmacokinetics, and Acceptability of Oral and Long-Acting Cabotegravir in HIV-Negative Chinese Men.	Antimicrobial Agents and Chemotherapy	-	-	-	1098-6596	10.1128/AAC.02057-21	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8923182	Long-acting (LA) cabotegravir demonstrated superior efficacy versus daily oral standard-of-care for HIV-1 preexposure prophylaxis. This phase 1 study assessed safety, tolerability, pharmacokinetics, and acceptability of cabotegravir in 47 HIV-negative adult Chinese men at low risk of acquiring HIV-1. Participants received once-daily oral cabotegravir 30 mg for 4 weeks and, after a 1-week washout, five 600-mg (3-mL) intramuscular cabotegravir LA injections at weeks 5, 9, 17, 25, and 33. Pharmacokinetic plasma samples were intensively collected on day 27 (n = 17) and sparsely collected before each injection until 56 weeks after final injection (n = 47). Cabotegravir LA injections were acceptable and well tolerated. Common adverse events included injection site pain, injection site swelling, and upper respiratory tract infection. No drug-related serious adverse events or deaths occurred. Mean cabotegravir concentration remained above 1.33 μg/mL (8× in vitro protein-adjusted concentration for 90% of the maximum inhibition of viral growth PA-IC90) before each injection and above 0.166 μg/mL (PA-IC90) for >32 weeks after final injection. Trough concentrations remained above PA-IC90 in nearly all participants and showed minimal accumulation. Noncompartmental pharmacokinetic analysis was performed. Geometric mean of terminal half-life was 1.89 and 47 days after oral and LA dosing, respectively. Cabotegravir concentrations were estimated to remain quantifiable for 48.7 weeks after final injection. Steady-state area under the concentration-time curve (AUC), peak concentration, trough concentration, terminal half-life, time to peak concentration, and apparent clearance after cabotegravir oral and LA dosing were similar to those estimated in non-Asian men in historical studies. These results support further clinical development of cabotegravir LA in China. (This study has been registered at ClinicalTrials.gov under registration no. NCT03422172.).	cabotegravir, long-acting, Chinese, pharmacokinetics, HIV, preexposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Theses and Dissertations	2022	Hanum, Nadia	Changes in sexual behaviour, pre-exposure prophylaxis use and HIV incidence among gay, bisexual, and other men who have sex with men in England	-	-	University College London (University of London)	-	NA	NA	https://discovery.ucl.ac.uk/id/eprint/10152278/	The identification of longitudinal changes in sexual behaviour over time, pre-exposure prophylaxis (PrEP) use, the incidence of HIV infection among HIV-negative GBMSM, and risk behaviours among HIV-positive GBMSM shortly after diagnosis is needed to improve HIV prevention efforts and is crucial to assess the potential risk of HIV spread in the community. Data from UK prospective studies are lacking. Data from two prospective studies were used in this thesis. The AURAH2 (Attitudes to, and Understanding of, Risk of Acquisition of HIV over time) study recruited GBMSM who were HIV-negative from three large sexual health clinics in England with four-monthly online follow-up (2013 - 2018, 1,162 men completed baseline questionnaire, 622 men completed at least one follow-up questionnaire). The Guy's and St. Thomas' study enrolled newly diagnosed people from an HIV clinic in London and followed them up at weeks 12, 24, and 48 (2015 - 2018, 90 GBMSM included in analyses). Among all men enrolled in AURAH2, past three months condomless anal sex with two or more partners (CLS2+, 46% to 47%, p-trend=0.010) increased slightly between 2013 and 2018. PrEP use in the past year also increased from 0% in 2013 to 43% in 2018 (p<0.001). HIV incidence declined from 1.47 per 100 PYs in 2013/2014 to 0.25 per 100 PYs in 2018/2019. Among a subset of men in AURAH2 with at least two consecutive questionnaires during follow-up, men reporting CLS2+ had an overall 78% probability of reporting CLS2+ in the subsequent questionnaires, and of men who reported none or one CLS partner, 88% reported the same in the subsequent period. Among GBMSM newly diagnosed with HIV in the Guy's and St. Thomas study, the within-individual tendency for reporting CLS was that men reduced their behaviours from baseline (62%) to week 12 (45.2%), then increased again by 48 weeks (62%). The greatest increase at week 48 was seen in the frequency of CLS with serodiscordant partners (CLS-D; 14% at week 12 to 36% at week 48). The proportion of men having CLS-D with the most recent documented plasma viral load (VL) > 200 copies/mL at week 12 was almost 11%. With HIV incidence declining among GBMSM in England and coinciding with a substantial increase in the use of PrEP, there is a clear need to focus prevention efforts on potential transmission risk. HIV providers should emphasize the importance of knowledge of viral suppression in decision making about CLS among newly diagnosed GBMSM. Theses and Dissertations	2022	Hao, Yuge	Essays on Health Economics	-	-	University of Arizona	-	NA	NA	https://repository.arizona.edu/handle/10150/664360	The first two chapters investigates the issues that arose after individuals experienced certain shocks that affected their health. Chapter 1 focuses on the short-run and long-run effect of childhood maltreatment on mental health. Chapter 2 investigates the effect of a new medication, PrEP, on individuals' risky sexual behaviors and sexually transmitted infections. The last chapter exams the relationship between individuals' timing pattern of working and their success in the setting of online game streaming. Time Heals All Wound? Childhood Maltreatment and Mental Health Empirical evidence has shown that maltreatment may cause serious damage to the human capital development of children and result in negative outcomes in their adulthood. Mental health may be one of the underlying mechanisms through which maltreatment affects human capital accumulation. Using the data from the Longitudinal Study of Adolescent to Adult Health, I examined the relationship between childhood maltreatment and mental health both in the short run and in the long run. The results show the childhood experience of maltreatment imposes negative effect on mental health. The effect is at least significant in the long run, suggesting that the effect is long-lasting and does not necessarily fade away as time passes. Females are on average more vulnerable to maltreatment than males. Experiencing multiple forms of maltreatment would impose a worse effect on mental health compared to single form of maltreatment. PrEP, Risky Sexual Behaviors and STIs Pre-exposure prophylaxis, or PrEP, is a daily medicine for people at high risk of contracting HIV to lower their chance of getting infected. Clinical studies show that PrEP can be highly effective, reducing the risk of contracting HIV by more than 90%. Despite the great effectiveness of PrEP in preventing HIV infection, there is concern that PrEP may lead some people to more risky behaviors, such as reducing their use of condoms and increasing their number of sexual partners. Using public data from the Multicenter AIDS Cohort Study, this paper empirically examines such concern. Exploiting the panel nature of the data, we use a difference-in-difference model to study the effect of PrEP on risky sexual behaviors and other sexually transmitted infections (STIs). Our analysis shows that PrEP makes individuals more likely to engage in unprotected anal sex, have more sexual partners, and more likely to contract syphilis. The Early Bird Gets the Worm: Strategic timing to live-stream on Huya.com Using scraped data from an online video game live streaming platform, I study the streamers' strategic decisions of when to go online and the effects of these timing pattern on their success on the platform. Live streamers as the content creators face different amount of audience during different times of the day as the website traffic fluctuates over the course of 24 hours. They also face different levels of competition as the number of online streamers change in each hour. I use a simple model of streamers' behaviors as…	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Clinical
Theses and Dissertations	2022	Harawa, Nina T; Tan, Diane	Disparities In Uptake Of HIV Pre-Exposure Prophylaxis Among California Medicaid Enrollees	-	-	Health Affairs	-	0278-2715	https://doi.org/10.1377/hlthaff.2021.01119	https://escholarship.org/uc/item/4sf93033	One of the pillars of efforts in the US to curb HIV incidence is pre-exposure prophylaxis (PrEP). We examined racial/ethnic and sex disparities in PrEP uptake among California Medicaid enrollees. Claims data from 2019 identified enrollees and PrEP users in each racial/ethnic, sex, and age group, yielding crude uptake rates. We then predicted age-adjusted uptake rates from multivariable logit regressions and divided PrEP uptake estimates by each group's number of new HIV diagnoses to estimate PrEP-to-need ratios. Predicted uptake was highest for White (0.29 percent) and Black (0.23 percent) males and lowest (0.16 percent) for Hispanic males. Rates for males exceeded those for females; however, Black females had twice the rate of PrEP uptake of White females. Black males and females and Hispanic males had PrEP-to-need ratios that were less than one-third (4.0-6.3) those of Asian and White males and females (14.4-19.9). Low PrEP use rates and disparities in uptake threaten efforts to end the HIV epidemic. Policy makers must craft the rollout of innovations such as PrEP in a manner that narrows HIV disparities instead of widening them. Article	2022	Hardy, Christopher; Fairley, Christopher K; Ong, Jason J; Vodstrcil, Lenka A; Bradshaw, Catriona S; Snow, Anthony; Chow, Eric P F	Drug and Alcohol Use with Condomless Anal Sex among Men Who Have Sex with Men in Melbourne, Australia: A Retrospective Data Analysis from 2011 to 2017.	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-021-01966-1	https://dx.doi.org/10.1007/s10508-021-01966-1	Rises in condomless anal sex among men who have sex with men (MSM) have been reported over the last decade but there is less certainty about the role that drugs, alcohol, play in the change. We examined the changes in drug and alcohol use among 22,255 MSM reporting condomless anal sex at Melbourne Sexual Health Centre in 2011-2017. There was a 7% annual increase in using drugs before and/or during condomless anal sex but a 3% annual reduction in condomless anal sex while drunk. MSM taking PrEP were more likely to report condomless anal sex with drug use (AOR: 1.21; 95%CI: 1.07-1.37) and alcohol use (AOR: 1.29; 95%CI: 1.14-1.46) compared with MSM not taking PrEP. Article	2022	Harkness A.; Morales V.; Defreitas W.; Atuluru P.; Jaramillo J.; Weinstein E.R.; Feaster D.J.; Safren S.; Balise R.	Impact of COVID-19 on HIV service delivery in Miami-Dade County: a mixed methods study	BMC Health Services Research	-	-	-	14726963	10.1186/s12913-022-08849-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143211496&doi=10.1186%2fs12913-022-08849-8&partnerID=40&md5=f13e087d8af22f27b9d7df45db857cbc	Background: Facilitating access to HIV prevention and treatment is imperative in Miami-Dade County (MDC), a U.S. HIV epicenter. With COVID-19, disruptions to these services have occurred, leading HIV organizations to innovate and demonstrate resilience. This study documented COVID-19 related disruptions and resilient innovations in HIV services within MDC. Methods: This mixed methods cross-sectional study included HIV test counselors in MDC. In the quantitative component (N=106), participants reported COVID-19 impacts on HIV service delivery. Data visualization examined patterns within organizations and throughout the study period. Generalized estimating equation modeling examined differences in service disruptions and innovations. In the qualitative component, participants (N=20) completed interviews regarding COVID-19 impacts on HIV services. Rapid qualitative analysis was employed to analyze interviews. Results: Quantitative data showed that innovations generally matched or outpaced disruptions, demonstrating resilience on HIV service delivery during COVID-19. HIV testing (36%, 95%CI28%, 46%) and STI testing (42%, 95%CI33%, 52%) were most likely to be disrupted. Sexual/reproductive health (45%, 95%CI35%, 55%), HIV testing (57%, 95%CI47%,66%), HIV case management (51%, 95%CI41%, 60%), PrEP initiation (47%, 95%CI37%,57%), and STI testing (47%, 95%CI37%, 57%) were most likely to be innovated. Qualitative analysis revealed three orthogonal themes related to 1) disruptions (with five sub-components), 2) resilient innovations (with four sub-components), and 3) emerging and ongoing health disparities. Conclusions: HIV organizations faced service disruptions during COVID-19 while also meaningfully innovating. Our findings point to potential changes in policy and practice that could be maintained beyond the immediate impacts of COVID-19 to enhance the resilience of HIV services. Aligning with the US Ending the HIV Epidemic Plan and the National Strategy for HIV/AIDS, capitalizing on the observed innovations would facilitate improved HIV-related health services for people living in MDC and beyond. © 2022, The Author(s). Article	2022	Harkness, Audrey; Weinstein, Elliott R.; Lozano, Alyssa; Mayo, Daniel; Doblecki-Lewis, Susanne; Rodriguez Diaz, Carlos E.; Brown, C. Hendricks; Prado, Guillermo; Safren, Steven A.	Refining an Implementation Strategy to Enhance the Reach of HIV-Prevention and Behavioral Health Treatments to Latino Men Who Have Sex with Men.	Implementation Research and Practice	-	-	-	2633-4895	10.1177/26334895221096293	https://pubmed.ncbi.nlm.nih.gov/36406189/	BACKGROUND: Latino men who have sex with men (LMSM) experience HIV and behavioral health disparities. Yet, evidence-based interventions, such as pre-exposure prophylaxis (PrEP) and behavioral health treatments, have not been equitably scaled up to meet LMSM needs. To address quality of life and the public health importance of HIV prevention, implementation strategies to equitably scale up these interventions to LMSM need to be developed. This study identifies themes for developing culturally grounded implementation strategies to increase uptake of evidence-based HIV prevention and behavioral health treatments among LMSM. METHODS: Participants included 13 LMSM and 12 stakeholders in Miami, an HIV epicenter. Feedback regarding the content, design, and format of an implementation strategy to scale up HIV-prevention and behavioral health services to LMSM were collected via focus groups (N=3) and individual interviews (N=3). Themes were inductively identified across the Health Equity Implementation Framework (HEIF) domains. RESULTS: Analyses revealed five higher order themes regarding the design, content, and format of the implementation strategy: cultural context, relationships and networks, navigation of health information and systems, resources and models of service delivery, and motivation to engage. Themes were applicable across HEIF domains, meaning that the same theme could have implications for both the development and implementation of the implementation strategy. CONCLUSIONS: Findings highlight the importance of addressing culturally specific factors, leveraging relational networks, facilitating navigation of health systems, tailoring to available resources, and building consumer and implementer motivation in order to refine an implementation strategy for reducing mental health burden and achieving HIV health equity among LMSM.	qualitative methods; Latino; HIV-AIDS; equity; behavioral health services; LGBTQ populations; marginalized populations; scale-out	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

The Incidence of Hepatitis C Among Gay, Bisexual, and Other Men Who Have Sex With Men in Australia, 2009-2019	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciab720	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131216465&doi=10.1093%2fcid%2fciab720&partnerID=40&md5=2ca476c7cce266400235939cf809fe76	Background: Hepatitis C virus (HCV) infection has been reported among gay, bisexual, and other men who have sex with men (GBM) globally including GBM with human immunodeficiency virus (HIV) and HIV-negative GBM, particularly those using HIV preexposure prophylaxis (PrEP). In Australia, HCV direct-acting antiviral treatment (DAA) was government-funded from 2016. Large implementation studies of PrEP also began in 2016. We examined HCV incidence among GBM to assess whether HCV incidence has changed since 2015. Methods: Data were drawn from the Australian Collaboration for Coordinated Enhanced Sentinel Surveillance. We included GBM who tested HCV antibody negative at their first test and had ≥1 subsequent test. Generalized linear modeling (Poisson distribution) was used to examine HCV incidence from 2009 to 2019 stratified by HIV status, and among HIV-negative GBM prescribed PrEP from 2016 to 2019. Results: Among 6744 GBM with HIV, HCV incidence was 1.03 per 100 person-years (PY). Incidence declined by 78% in 2019 compared to 2015 (incidence rate ratio IRR, 0.22 95% confidence interval {CI}:. 09-.55). Among 20 590 HIV-negative GBM, HCV incidence was 0.20/100 PY, with no significant change over time. Among 11 661 HIV-negative GBM prescribed PrEP, HCV incidence was 0.29/100 PY. Compared to 2016, incidence among GBM prescribed PrEP declined by 80% in 2019 (IRR, 0.20 95% CI:. 06-.64). Conclusions: HCV incidence among GBM living with HIV declined following DAA availability. There was no observed change in HCV incidence among HIV-negative GBM overall. Among GBM prescribed PrEP, incidence declined since the early years of PrEP implementation in Australia. Australia is on track to eliminate HCV among GBM before global 2030 targets. © 2021 The Author(s) 2021. Published by Oxford University Press for the Infectious Diseases Society of America. Article	2022	Harris E.L.; Shelley K.D.; Sisimayi T.; Wandie C.; Bruns C.	Transforming the once-a-day pill for HIV prevention from medicine to empowering self-care using human-centred design in Zimbabwe	BMJ Innovations	-	-	-	20558074	10.1136/bmjinnov-2021-000739	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142523169&doi=10.1136%2fbmjinnov-2021-000739&partnerID=40&md5=c8ec3f8b44ca6802084287402b049706	Objective: For adolescent girls and young women (AGYW) in sub-Saharan Africa, oral tenofovir-based pre-exposure prophylaxis (commonly referred to as PrEP) provides a user-controlled HIV prevention method, critical to addressing their HIV risk and unmet prevention needs. Addressing the gap between clinical and real-world PrEP efficacy requires new approaches, such as 'V'. 'V' reframes PrEP from medicine to self-care that is as easy to use as a young women's favourite fashion or beauty brand. This article describes how human-centred design (HCD) was used to adapt the 'V' brand and service delivery strategy for implementation in Zimbabwe from its development via formative research in South Africa. Methods: Following literature review, stakeholder analysis and landscaping, the 'V' brand and service delivery strategy were assessed through participatory immersion sessions with 152 participants in four Zimbabwe districts. Insights were synthesised across learning questions: What do AGYW and health workers think about 'V'?; Which of the 'V' materials are most acceptable and relevant for Zimbabwe?; What adaptations are necessary for the selected 'V' materials for Zimbabwe?; and How should the selected 'V' assets be integrated? Results: The 'V' innovative design principles - delightfully bold branding, a discreet starter kit and user-friendly materials that put young women in control of educating others - remained resonant. Feasible modifications were identified to adapt the 'V' brand and service delivery strategy to suit the local context. Conclusion: 'V' delivers a 'delightfully discreet' approach that puts AGYW in charge of preventing HIV. The resonance of the core 'V' design concepts demonstrates how HCD can be applied to reframe PrEP as a product category (ie, from a stigmatising medicine to empowering self-care). © Author(s) (or their employer(s)) 2022. "Do I want PrEP or do I want a roof?": Social determinants of health and HIV prevention in the southern United States	AIDS Care	-	-	-	9540121	10.1080/09540121.2022.2029816	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124309839&doi=10.1080%2f09540121.2022.2029816&partnerID=40&md5=d80468a75a64708fb830003475ea56a1	Scaling up use of Pre-Exposure Prophylaxis (PrEP) among young men who have sex with men and transgender women (YMSM/TGW) is a critical part of the Ending the HIV Epidemic plan. This qualitative study contextualized the social determinants of health (SDOH) that can impede HIV prevention in rural North and South Carolina with 14 key informant interviews with stakeholders and 3 focus groups with YMSM/TGW (N = 23). A deductive-inductive approach with multiple coders was employed to identify themes related to SDOH in rural areas, including economic challenges (e.g., housing and food insecurity), neighborhood characteristics (e.g., lack of transportation), healthcare-related issues (e.g., provider shortages) and educational barriers (e.g., lack of comprehensive and inclusive sexual education). The socio-environmental context of the rural South and prioritization of local, community-based partnerships are necessary to reduce the burden of HIV. © 2022 Informa UK Limited, trading as Taylor & Francis Group. Article	2022	Harrison, Abigail; Bhengu, Nonhlonipho; Miller, Lori; Exner, Theresa; Tesfay, Nonkululeko; Magutshwa, Slindile; Khumalo, Silindile; Bergam, Scarlett; Hoffman, Susie; Hanass-Hancock, Jill	"You tell him that 'baby, I am protecting myself'": Women's agency and constraint around willingness to use pre-exposure prophylaxis in the Masibambane Study.	Women's Health	-	-	-	1745-5065	10.1177/17455057221087117	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8935570	OBJECTIVES: To explore women's willingness to consider using pre-exposure prophylaxis for HIV prevention in the context of gendered relationship dynamics, in Durban, South Africa. METHODS: As formative research prior to development of a gender-informed intervention to introduce pre-exposure prophylaxis to young, urban, educated women, we conducted six focus-group discussions and eight in-depth interviews with 46 women ages 18-25 years, who were not current pre-exposure prophylaxis users. Women were recruited from clinic and community settings using a criterion-based snowball sampling technique. Qualitative data were coded and analyzed thematically, with a team-based consensus approach for final coding, analytical decisions, and data interpretation. RESULTS: Women clearly understood the benefits of pre-exposure prophylaxis for themselves and their partners, focusing on promoting health and their right to protect themselves from HIV infection. At the same time, and in accordance with findings from other studies, women were realistic about the concerns that would arise among male partners, including disapproval, loss of trust, possible loss of the relationship, and in some instances, the potential for violence, if they were to propose pre-exposure prophylaxis use. To resolve this tension, some women advocated for covert use as the best option for themselves and others argued for disclosure, proposing various approaches to working with partners to adopt pre-exposure prophylaxis. The suggestion that both partners use pre-exposure prophylaxis was made repeatedly. Thus, women sought to avoid discussions of trust or lack of trust and a partner's possible infidelities, choosing instead to focus on preserving or even building a relationship through suggesting pre-exposure prophylaxis use. CONCLUSION: Women offered diverse narratives on agency and constraint in relation to choosing pre-exposure prophylaxis as a future prevention strategy, as well as ways to engage with their male partners about pre-exposure prophylaxis. These findings speak to the need for interventions to bolster women's confidence, sense of empowerment, and their communication and decision-making skills for successful HIV prevention.	empowerment, gender, HIV prevention, pre-exposure prophylaxis, relationships, South Africa, women	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Harrison, Robin L; Dortche, Ciarra; Fadul, Nada	Preexposure Prophylaxis for HIV Prevention in a Rural Southern Clinic.	Southern Medical Journal	-	-	-	1541-8243	10.14423/SMJ.0000000000001480	https://dx.doi.org/10.14423/SMJ.0000000000001480	OBJECTIVES: Little is known about implementing preexposure prophylaxis (PrEP) for human immunodeficiency virus (HIV) in the rural US South, where most HIV infections occur. To investigate how to better reach the at-risk population in rural eastern North Carolina (ENC), the characteristics and clinical courses of those receiving PrEP from our clinic were reviewed and analyzed. METHODS: A retrospective study was used to describe the characteristics and outcomes of PrEP patients in rural ENC. RESULTS: Thirty-five patients were included whose median age was 37 years (range 22-69). The majority of patients tolerated PrEP well and continued the medication, with only 6 (17%) discontinuations; the reasons for discontinuing included partner mistrust, intolerance to medication, and pregnancy. Patients who initiated PrEP in ENC were more likely to be insured (89%), White (66%), and male (69%). Average travel time to the clinic was 34 minutes (range 2-123 minutes) and the average travel distance was 23 mi (range 1-93 mi). CONCLUSIONS: The study results were noteworthy given that in North Carolina, young Black men have the highest estimated rates of HIV infection. The reasons behind this discrepancy are likely multifactorial, and this study highlights the need for future programs and research to make PrEP more widely accessible to the at-risk population in this rural ENC community. Article	2022	Harrison, Sayward E; Muessig, Kathryn; Poteat, Tonia; Koester, Kimberly; Vecchio, Alyssa; Paton, Mariajosé; Miller, Sarah J; Pereira, Nastacia; Harris, Orlando; Myers, Janet; Campbell, Chadwick; Hightow-Weidman, Lisa	Addressing Racism's Role in the US HIV Epidemic: Qualitative Findings From Three Ending the HIV Epidemic Prevention Projects.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002965	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9204779	BACKGROUND: Racist socio-political and economic systems in the United States are root causes of HIV disparities among minoritized individuals. However, within HIV implementation science literature, there is scarce empirical research on how to effectively counter racism. This article names racism and White supremacy as key challenges to the success of the Ending the HIV Epidemic (EHE) initiative and delineates opportunities to integrate anti-racism into HIV interventions. METHODS: Formative data were synthesized from 3 EHE studies in California, North Carolina, and South Carolina. Each study engaged with community stakeholders to inform pre-exposure prophylaxis implementation. Key informant interviews and focus groups were used to query individuals-including Black individuals-about implementation challenges. Although racism was not an a priori focus of included studies, discourse on race and racism emerged as key study findings from all projects. RESULTS: Across diverse stakeholder groups and EHE locales, participants described racism as a threat to the success of the EHE initiative. Institutional and structural racism, intersectional stigma, and maltreatment of minoritized individuals within healthcare systems were cited as challenges to pre-exposure prophylaxis scale-up. Some recommendations for addressing racism were given-yet these primarily focused on the individual level (eg, enhanced training, outreach). CONCLUSIONS: EHE implementation scientists should commit to measurable anti-racist actions. To this end, we present a series of recommendations to help investigators evaluate the extent to which they are taking actionable steps to counter racism to improve the adoption, implementation, and real-world impact of EHE interventions for people of color. Article	2022	Harvala H.; Reynolds C.; Ijaz S.; Maddox V.; Penchala S.D.; Amara A.; Else L.; Brailsford S.; Khoo S.	Evidence of HIV pre-exposure or post-exposure prophylaxis (PrEP/PEP) among blood donors: A pilot study, England June 2018 to July 2019	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2021-054981	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124850584&doi=10.1136%2fsextrans-2021-054981&partnerID=40&md5=8ccbce262e067851873f6dbe745218d1	Objective Due to increased use of pre-exposure prohylaxis (PrEP) and its potential to affect HIV screening of blood donors, we undertook antiretroviral residual testing among HIV-negative male donors in England. Methods Residual plasma samples were obtainnd from 46 male donors confirmed positive for syphilis and 96 donors who were repeat reactive for HIV antibodies in screening but confirmed as HIV-negative by reference testing. These were tested for concentrations of tenofovir and emtricitabine by high-performance liquid chromatography coupled with mass spectrometry. Results We found evidence of pre-exposure or post-exposure prophylaxis (PrEP/PEP) use in three male blood donors confirmed positive for syphilis (3 out of 46 screened, 6.5%). Two were estimated to have taken PrEP/PEP within a day of donating, and the third within 2 days. Two were new donors, whereas one had donated previously but acquired syphilis infection after his last donation. Conclusions Our findings indicate that a small proportion of blood donors have not been disclosing PrEP/PEP use and therefore donating in non-compliance to donor eligibility criteria. ©	disease transmission; HIV; infectious; pre-exposure prophylaxis; syphilis	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2022	Hassan, Adiba; Agustin, Harold Glenn San; Burke, Leah; Kofron, Ryan; Corado, Katya; Bolan, Robert; Landovitz, Raphael J; Dubé, Michael P; Morris, Sheldon R	Low incidence and prevalence of hepatitis C in two cohorts of HIV pre-exposure prophylaxis adherence interventions in men who have sex with men in Southern California	Journal of Viral Hepatitis	-	-	-	13520504	10.1111/jvh.13678	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128048845&doi=10.1111%2fjvh.13678&partnerID=40&md5=6145414cb6a1a9f48d5bdb8db896ca39	HIV pre-exposure prophylaxis (PrEP) has been associated with incident hepatitis C virus (HCV) infection in men who have sex with men (MSM) due to decreased condom use. We examined rates of HCV among MSM and transgender women at high-risk of HIV on PrEP in Southern California using data from two trials (NCT01761643 and NCT01781806). Five of 599 participants (0.84%, 95% CI, 0.27–1.93) had HCV antibodies detected at entry. Factors associated with HCV seropositivity included being older (p =.002) and lower education level (p <.001). HCV-positive participants had no reported cases of sexually transmitted infection (rectal, urethral or pharyngeal gonorrhoea and/or chlamydia) at entry while HCV-negative participants had a prevalence of 18% (95% CI, 15%–21%). There were no significant differences in substance use and sexual risk behaviour between HCV-positive and HCV-negative participants 1–3 months prior to entry. Among early PrEP adopters, incident HCV did not occur despite ongoing condomless intercourse. Screening intervals for HCV in MSM on PrEP should be led by a risk behaviour assessment. © 2022 John Wiley & Sons Ltd.	hepatitis C; MSM (men who have sex with men); PrEP	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Hassani, Maryam; Young, Sean D	Potential Role of Conversational Agents in Encouraging PrEP Uptake.	Journal of Behavioral Health Services & Research	-	-	-	1556-3308	10.1007/s11414-022-09798-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9071246	Approximately 1.2 million people are living with HIV, with many of them unaware of their infection. Pre-exposure prophylaxis (PrEP) is available to minimize transmission among those at high risk for infection, including men who have sex with men, people who inject drugs, and female sex workers. Despite its availability, there is low usage of PrEP. To address this problem, various digital tools have been examined in HIV research. Among those, conversational agents are still underused and their capacity warrants examination to reach at-risk populations. In this paper, we discuss the potential of conversational agents in increasing uptake of PrEP by addressing barriers experienced among those at high risk for infection. Article	2022	Haukoos J.S.; White D.A.E.; Rowan S.E.; Lyle C.; Gravitz S.; Basham K.; Godoy A.; Kamis K.; Hopkins E.; Anderson E.	Development of a 2-step algorithm to identify emergency department patients for HIV pre-exposure prophylaxis	American Journal of Emergency Medicine	-	-	-	7356757	10.1016/j.ajem.2021.09.084	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116844638&doi=10.1016%2fj.ajem.2021.09.084&partnerID=40&md5=476dd0fcd9833b435802ee764f2508c5	Background: Expanded access to HIV PrEP is a central pillar of the "Ending the HIV Epidemic" initiative. Identification of PrEP eligible individuals in EDs remains understudied. Our goal was to estimate the accuracy of the Denver HIV Risk Score (DHRS), a quantitative HIV risk tool, for determining PrEP eligibility, and to incorporate it into a novel screening algorithm to optimize sensitivity and specificity. Methods: We performed a prospective cross-sectional study in two urban EDs. Patients were eligible if ≥18 years of age and without HIV. Research staff collected individual HIV risk, components of the DHRS, and PrEP eligibility per 2017 CDC guidelines. Accuracy estimates were calculated for the DHRS alone and the DHRS plus additional PrEP-specific questions. Results: 1002 patients were enrolled with a median age of 39 years; 54.8% were male, 29.5% Black/non-Hispanic, and 22.5% Hispanic. Overall, 119 (11.9%, 95% CI: 9.9%–14.0%) were PrEP eligible; 5% endorsed history of sex with a partner at higher risk for HIV or condomless sex with multiple partners, 4% an STI, and 2% sharing IDU equipment. A DHRS ≥25 had a sensitivity of 92.4% (95% CI: 86.1%–96.5%) and a specificity of 17.2% (95% CI: 14.8%–19.9%) for PrEP eligibility. A 2-step algorithm, "DHRS-PrEP", beginning with a DHRS ≥25, followed by a step with questions specific to IDU, STI, and sexual partners improved the specificity to 100% (95% CI: 99.6%–100%). Conclusions: Among a heterogeneous ED sample, a substantial proportion was identified as PrEP eligible, and a 2-step algorithm had high sensitivity and specificity for identifying PrEP-eligible patients. © 2021 Elsevier Inc. Article	2022	Hayati Rezvan P.; Rezai R.; Comulada W.S.; Lee S.-J.; Arnold E.M.; Swendeman D.; Rotheram-Borus M.J.; Fernández M.I.	Psychiatric hospitalization among youth at high risk for HIV	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.1944599	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108858513&doi=10.1080%2f09540121.2021.1944599&partnerID=40&md5=25f15954b37aa9afb067ad1f731ac11a	Youth at-risk for HIV are also at-risk for mental health disorders and psychiatric hospitalization. Understanding the association between engagement in HIV prevention, concurrent risk behaviors, and psychiatric hospitalization may lead to improvements in integrated prevention and mental health treatment efforts. Youth at-risk for HIV, aged 14–24 years old, predominantly Black/African American and Latinx (75%) were recruited through youth-serving clinics and community sites in Los Angeles (n = 839) and New Orleans (n = 647). We compared youth with and without histories of psychiatric hospitalization on engagement in HIV prevention, concurrent risk behaviors, and demographic characteristics. We examined predictors of hospitalization using multiple imputations for missing data. Hospitalized youth (30%) were more involved in HIV programs, but were less likely to use PrEP/PEP or condoms than non-hospitalized youth. The odds of hospitalization were higher for transgender/gender nonconforming youth relative to cisgender youth; the OR was increased after adjustment for concurrent risk behaviors. Hospitalization was associated with homelessness, trauma, incarceration, substance use, and involvement in substance abuse treatment programs. There is a continuing need to integrate the diagnosis and treatment of mental health disorders into HIV prevention programs to better address multiple challenges faced by vulnerable youth. © 2021 Informa UK Limited, trading as Taylor & Francis Group.	engagement in HIV prevention; mental health disorder; Psychiatric hospitalization; risk behaviors; vulnerable youth	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Sexually Transmitted Infections Among Men and Transgender Women Using HIV Pre-exposure Prophylaxis in a Large Integrated Health System-A Cohort Study	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003015	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136013859&doi=10.1097%2fQAI.0000000000003015&partnerID=40&md5=39ce6bdc9a6d677da238be36f632c2bf	Background:Sexually transmitted infections (STIs) are common in people using pre-exposure prophylaxis (PrEP). We examined risk and factors associated with STIs in a cohort of PrEP users in an integrated health system in the United States.Setting:The Kaiser Permanente Southern California is a large integrated health system that provides comprehensive medical services to approximately 4.7 million demographically diverse members.Methods:We identified men and transgender women initiating PrEP between January 1, 2014, and June 1, 2018, and followed through December 31, 2018. Demographic and clinical factors potentially associated with the risk of bacterial STIs during PrEP use were evaluated using Poisson regression models.Results:Among 5042 individuals tested for STIs with 7198 person-years of follow-up, 1709 (33.9%) had at least one new STI. The estimated incidence of STIs was 48.3 per 100 person-years, and the most common STI was rectal chlamydia. Most repeat STIs (61.4%) occurred <180 days apart. In a multivariable analysis, an history of STIs in the prior 6 months through 7 days after the PrEP initiation was the most prominent risk factor of STIs during PrEP use (adjusted risk ratio: 1.78, 95% confidence intervals: 1.65 to 1.93). Other risk factors included younger age (<35 years), being Hispanic, and having a history of alcohol use disorder or drug use disorder.Conclusions:Quarterly STI testing and targeted intervention to mitigate STI risk are warranted for young and racial minority PrEP users, particularly for those with prior history of STIs and substance use disorders. Article	2022	Heck C.J.; Mathur S.; Alwang'a H.; Daniel O.-M.; Obanda R.; Owiti M.; Okal J.	Oral PrEP Consultations Among Adolescent Girls and Young Women in Kisumu County, Kenya: Insights from the DREAMS Program	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03590-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123928220&doi=10.1007%2fs10461-022-03590-z&partnerID=40&md5=f865a477afd1400ef794c7c817ea711b	Although Kenya nationally scaled up oral pre-exposure prophylaxis (PrEP) in May 2017, adolescent girls' (AG, aged 15–19 years) and young women's (YW, aged 20–24 years) PrEP use remains suboptimal. Thus, we analyzed PrEP consultations—interactions with a healthcare provider about PrEP—among Kenyan AGYW. In April-June 2018, AGYW enrolled in DREAMS in Kisumu County, Kenya self-reported their HIV-related knowledge, behaviors, and service use. Among HIV negative, sexually active AG (n = 154) and YW (n = 289), we examined associations between PrEP eligibility and PrEP consultations using prevalence ratios (PR, adjusted: aPR). Most AG (90.26%) and YW (94.12%) were PrEP-eligible due to inconsistent/no condom use, violence survivorship, or recent sexually transmitted infection symptoms. Between PrEP-eligible AG and YW, more YW were ever-orphaned (58.09%), ever-married (54.41%), ever-pregnant (80.88%), and out of school (78.31%); more PrEP-eligible YW reported PrEP consultations (41.18% vs. 24.46%, aPR = 1.51 1.01–2.27). AG who used PEP (post-exposure prophylaxis) reported more consultations (aPR = 5.63 3.53–8.97). Among YW, transactional sex engagers reported more consultations (58.62% vs. 39.09%, PR = 1.50 1.06–2.12), but only PEP use (aPR = 2.81 2.30–3.43) and multiple partnerships (aPR = 1.39 1.06–1.82) were independently associated with consultations. Consultations were lowest among those with 1 eligibility criterion (AG = 11.11%/YW = 27.18%). Comparatively, consultations were higher among AG and YW with 2 (aPR = 3.71 1.64–8.39, PR = 1.60 1.07–2.38, respectively) or ≥ 3 (aPR = 2.51 1.09–5.78, PR = 2.05 1.42–2.97, respectively) eligibility criteria. Though most AGYW were PrEP-eligible, PrEP consultations were rare and differed by age and vulnerability. In high-incidence settings, PrEP consultations should be conducted with all AGYW. PrEP provision guidelines must be re-assessed to accelerate AGYW's PrEP access. © 2022, The Author(s). Article	2022	Heffron, Renee; Muwonge, Timothy R.; Boyer, Jade; Matovu, Flavia; Zia, Yasaman; Bagaya, Monica; Ssebuliba, Timothy; Morrison, Susan; Bambia, Felix; Nsubuga, Rogers; Badaru, Josephine; Stein, Gabrielle; Mugwanya, Kenneth K.; Wyatt, Christina; Baeten, Jared M.; Yin, Michael T.; Mujugira, Andrew	Bone mineral density, nutrient intake, and physical activity among young women from Uganda.	Archives of Osteoporosis	-	-	-	1862-3514	10.1007/s11657-022-01155-0	https://pubmed.ncbi.nlm.nih.gov/36216962/	Few studies have characterized bone mineral density (BMD) among health young African women. In our study of 496 Ugandan women age ≤25 years, we found that women had healthy BMD that were lower on average than the standard reference ranges. Reference ranges available for BMD measurements need greater precision. PURPOSE: Data describing bone mineral density (BMD), nutrient intake, and body composition among healthy, young women in sub-Saharan Africa are limited. Using baseline data from a cohort of young, healthy Ugandan women, we summarize bone health and associated risk factors for reduced bone mass. METHODS: Using baseline data from Ugandan women ages 16-25 years who enrolled in an ongoing cohort study of bone health with concurrent use of injectable contraception and oral HIV pre-exposure prophylaxis, we describe the distribution of BMD, nutrient intake, physical activity, and body composition. The association of low BMD (1 or more standard deviations below the age, sex, and race-matched reference range from the USA) and calcium intake, vitamin D intake, physical activity, and body composition was estimated using multivariable logistic regression. RESULTS: In 496 healthy, Ugandan women with median age of 20 years (interquartile range IQR 19-21) and median fat:lean mass ratio of 0.55 (IQR 0.46-0.64), median lumbar spine and total hip BMD was 0.9g/cm(2) (IQR 0.9-1.0) each. For lumbar spine, Z-score distributions were lower overall than the reference population and 9.3% and 36.3% of women had Z-score >2 and >1 standard deviations below the reference range, respectively. For total hip, Z-scores were similar to the reference population and 1.0% and 12.3% of women had Z-score >2 and >1 standard deviations below the reference range, respectively. In the week prior to enrollment, 41.1% of women consumed >7 servings of calcium, 56.5% had >7 servings of vitamin D, and 98.6% reported ≥2.5 h of physical activity. Having greater body fat was associated with greater frequency of low lumbar spine BMD (p<0.01 for fat:lean mass ratio, total body fat percentage, waist circumference, and BMI). CONCLUSION: Young Ugandan women exhibited healthy levels of BMD that were lower than the reference range population. Data are needed on HIV outcomes, including uptake and adherence to PrEP and antiretroviral treatment (ART), to describe the impact of integrating PrEP into an existing HIV program. Methods: Using a stepped-wedge cluster randomized trial design, we launched PrEP delivery for HIV-negative members of serodifferent couples in Uganda by integrating PrEP into existing ART programs for people living with HIV. The program provided PrEP training for ART providers, ongoing technical assistance, and a provisional supply chain mechanism for PrEP medication. Primary data on PrEP initiation, PrEP refills, ART initiation, and HIV viremia at 6 months (measured at 42-270 days) were collected through data abstraction of medical records from HIV-serodifferent couples sequentially enrolling at the ART clinics. Modified Poisson regression models, controlling for time and cluster, compared viral suppression (<1000 copies/ml) before and after launch of the PrEP program. This trial was registered at ClinicalTrials.gov, NCT03586128. Findings: From June 1, 2018-December 15, 2020, 1,381 HIV-serodifferent couples were enrolled across 12 ART clinics in Kampala and Wakiso, Uganda, including 730 enrolled before and 651 after the launch of PrEP delivery. During the baseline period, 99.4% of partners living with HIV initiated ART and 85.0% were virally suppressed at 6 months. Among HIV-negative partners enrolled after PrEP launched, 81.0% (527/651) initiated PrEP within 90 days of enrolling; among these 527, 11.2% sought a refill 6 months later. In our powered intent-to-treat analysis, 82.1% and 76.7% of partners living with HIV were virally suppressed, respectively, which was not a statistically significant difference (RR=0.94, 95% CI: 0.82-1.07) and was stable across sensitivity analyses. Interpretation: Integration of PrEP into ART clinics reached a high proportion of people in HIV-serodifferent relationships and did not improve the already high frequency of HIV viral suppression among partners living with HIV. Funding: National Institute of Mental Health (R01MH110296). © 2022 The Authors	ART; PrEP; Serodifferent couples; Stepped-wedge trial; Viral suppression	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Hempel A.; Biondi M.J.; Baril J.-G.; Tan D.H.S.	Pre-exposure prophylaxis for HIV: effective and underused	CMAJ: Canadian Medical Association Journal	-	-	-	8203946	10.1503/cmaj.220645	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138568962&doi=10.1503%2fcmaj.220645&partnerID=40&md5=f8a7104f036712c038f84cbcc416fae1	Key points • Pre-exposure prophylaxis (PrEP) is a highly effective modality for HIV prevention that can be prescribed by generalists. • Pre-exposure prophylaxis should be offered to patients who are at high risk of HIV exposure, including gay, bisexual and other men who have sex with men (GBM), women reporting condomless intercourse with partners of confirmed or unknown transmissible HIV status and persons who inject drugs and share injection equipment. • Once daily PrEP (tenofovir disoproxil fumarate/emtricitabine [TDF/FTC] or tenofovir alafenamide fumarate/emtricitabine tablets) is approved by Health Canada. • On-demand TDF/FTC can be prescribed to gay, bisexual and other men who have sex with men and has similar efficacy. • The Canadian guideline details protocolized monitoring for PrEP follow-up including HIV screening, screening for sexually transmitted infection and renal monitoring	NA	English	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Review

Article	2022	Henderson L.; Gibbs J.; Quinn J.; Ramasami S.; Estcourt C.	Maintaining access to HIV pre-exposure prophylaxis in a pandemic: A service evaluation of telephone-based pre-exposure prophylaxis provision	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624211068766	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129640658&doi=10.1177%2f09564624211068766&partnerID=40&md5=8a96ea71b270a6c18890b3e797bb9c66	Objectives: The objective was to perform a survey-based service evaluation of our telephone PrEP clinic (Tele-PrEP), which was instituted during the COVID-19 pandemic, to inform future service delivery. Methods: We administered parallel, web-based, anonymous surveys to PrEP-users who had a Tele-PrEP appointment between 13.11.2020 and 17.12.2020 and all healthcare professionals (HCPs) conducting Tele-PrEP clinics. We used descriptive statistics to summarise demographic and qualitative data, and thematically categorised free text responses using the Framework for a Systems Approach to Healthcare Delivery. Results: 62/117 (53%) PrEP-users and 8/9 (89%) HCPs completed the surveys. Tele-PrEP was rated 'excellent' or 'good' by 61/62 (98%) PrEP-users. All HCPs felt that Tele-PrEP allowed them to assess patients safely and confidently. 10/62 (16%) PrEP-users and 1 (11%) HCP expressed a preference for face-to-face care. Using the Framework for a Systems Approach to Healthcare Delivery we identified key areas important to respondents who highlighted the rapid changes as a result of COVID-19, which required an increase in dedicated resources. HCPs valued teamwork, support/supervision and convenience in achieving quality care for the patient, who in turn, valued convenient, holistic and individualised management to meet their sexual healthcare needs. Conclusion: Tele-PrEP is feasible and acceptable. While most respondents rated the service highly, others identified a need/preference for face-to-face appointments. © The Author(s) 2022. Article	2022	Hendrickson, Cheryl; Long, Lawrence C; van Rensburg, Craig; Claassen, Cassidy W; Njelesani, Mwansa; Moyo, Crispin; Mulenga, Lloyd; O'Bra, Heidi; Russell, Colin A; Nichols, Brooke E	The early-stage comprehensive costs of routine PrEP implementation and scale-up in Zambia.	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0001246	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10021804	Pre-exposure prophylaxis (PrEP) is an effective HIV prevention option, but cost-effectiveness is sensitive to implementation and program costs. Studies indicate that, in addition to direct delivery cost, PrEP provision requires substantial demand creation and client support to encourage PrEP initiation and persistence. We estimated the cost of providing PrEP in Zambia through different PrEP delivery models. Taking a guidelines-based approach for visits, labs and drugs, we estimated the annual cost of providing PrEP per client for five delivery models: one focused on key populations (men-who-have-sex-with-men (MSM) and female sex workers (FSW), one on adolescent girls and young women (AGYW), and three integrated programs (operated within HIV counselling and testing services at primary healthcare centres). Program start-up and support costs were based on program expenditure data and number of PrEP sites and clients in 2018. PrEP client visit costs were based on micro-costing at two PrEP delivery sites (2018 USD). Costs are presented in 2018 prices and inflated to 2021 prices. The annual cost/PrEP client varied by service delivery model, from $394 (AGYW) to $655 (integrated model). Cost differences were driven largely by client volume, which impacted the relative costs of program support and technical assistance assigned to each PrEP client. Direct service delivery costs ranged narrowly from $205-212/PrEP-client and were a key component in the cost of PrEP, representing 35-65% of total costs. The results show that, even when integrated into full service delivery models, accessing vulnerable, marginalised populations at substantial risk of HIV infection is likely to cost more than previously estimated due to the programmatic costs involved in community sensitization and client support. Improved data on individual client resource usage and outcomes is required to get a better understanding of the true resource utilization, expected outcomes and annual costs of different PrEP service delivery programs in Zambia. Article	2022	Herrera, Carolina; Olejniczak, Natalia; Noël-Romas, Laura; Plummer, Frank; Burgener, Adam	Pre-clinical evaluation of antiproteases as potential candidates for HIV-1 pre-exposure prophylaxis.	Frontiers in Public Health	-	-	-	2673-3153	10.3389/frph.2022.998913	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9720403	Previous studies on highly HIV-1-exposed, yet persistently seronegative women from the Punwami Sex Worker cohort in Kenya, have shed light on putative protective mechanisms, suggesting that mucosal immunological factors, such as antiproteases, could be mediating resistance to HIV-1 transmission in the female reproductive tract. Nine protease inhibitors were selected for this study: serpin B4, serpin A1, serpin A3, serpin C1, cystatin A, cystatin B, serpin B13, serpin B1 and α-2-macroglobulin-like-protein 1. We assessed in a pilot study, the activity of these antiproteases with cellular assays and an ex vivo HIV-1 challenge model of human ecto-cervical tissue explants. Preliminary findings with both models, cellular and tissue explants, established an order of inhibitory potency for the mucosal proteins as candidates for pre-exposure prophylaxis when mimicking pre-coital use. Combination of all antiproteases considered in this study was more active than any of the individual mucosal proteins. Furthermore, the migration of cells out of ecto-cervical explants was blocked indicating potential prevention of viral dissemination following amplification of the founder population. These findings constitute the base for further development of these mucosal protease inhibitors for prevention strategies. Theses and Dissertations	2022	Hicks, Sarah; Wagner, Anjuli	Selecting Strategies for Implementation and Comparing Strategy Prioritization Methods for Improving PrEP Delivery in Maternal and Child Health Clinics in Kenya	-	-	University of Washington	-	NA	NA	https://www.proquest.com/dissertations-theses/selecting-strategies-implementation-comparing/docview/2704060810/se-2?accountid=8113	In high HIV prevalence settings, women are at elevated risk for HIV during pregnancy and postpartum, and pre-exposure prophylaxis (PrEP) is recommended during this period. Integration of PrEP into maternal and child health (MCH) clinics requires implementation optimization. Furthermore, there is a lack of consensus about how to prioritize potential implementation strategies. The PrEP in Pregnancy, Accelerating Reach and Efficiency study (PrEPARE; NCT04712994) engaged stakeholders to identify determinants of PrEP implementation and identify and prioritize PrEP delivery implementation strategies at 55 facilities in Kenya through quantitative surveys and a stakeholder workshop. Strategies were prioritized using: 1) surveys with experienced practitioners reflecting on implementation experience (N=182); 2 & 3) ranking surveys before and after small group discussion with diverse stakeholders (N=44 & 40); 4) "go-zone" quadrant plots of perceived effectiveness vs feasibility. A stepwise elimination process was used to identify seven strategies for empirical testing. Facilitator debriefing reports from the workshop were used to qualitatively assess the decision-making process. We also compared the four strategy prioritization methods using Kendall's correlation analysis. Additionally, the participants grouped strategies in three bundles with up to 4 strategies each by phone and online survey. Among 146 health care workers, the strongest reported barriers to PrEP delivery were: insufficient providers and inadequate training, insufficient space, and volume of patients. Sixteen strategies were assessed, 14 of which were included in the final analysis. Using rankings from 182 healthcare workers and 44 PrEP policymakers and implementers, seven strategies were eliminated based on low post-workshop ranking scores (bottom 50th percentile) or falling outside the go-zone (perceived low feasibility and low effectiveness) for at least 50% of the workshop groups. The top three strategies included 1) delivering PrEP within MCH clinics instead of pharmacies, 2) fast tracking PrEP clients to reduce waiting time, and 3) delivering PrEP-related health talks in waiting bays. All top seven ranked strategies were grouped into bundles for subsequent testing. Facilitator debriefing reports generally aligned with go-zone rankings but noted how stakeholders' decision-making changed when considering the impact of strategies on facility staff and non-PrEP clients. The strategy ranking correlation was strongest between the pre- and post-small group rankings (Tau = 0.648; p<0.001). There was moderate correlation between go-zone plots and post-small group rankings (Tau = 0.363; p=0.079) and between past-experience surveys and post-small group rankings (Tau = 0.385; p=0.062). Strategy rankings remained similar between pre- and post-small group discussions; exceptions were in cases of feasibility concerns bound during discussions by experienced stakeholders. In both strategy bundle formats, participants primarily chose bundles of strategies in the order in which they appeared in the list, reflecting option ordering bias. Individuals who completed the phone survey with oversight from study staff were more likely to select the correct number of strategies per bundle. The most impactful barriers to integrated PrEP delivery in MCH clinics focused on insufficient staffing and space. Implementation strategies prioritized through multiple methods of stakeholder input focused on co-location of services and increasing clinic efficiency. Both experienced and inexperienced stakeholder participants' strategy rankings tended to prioritize strategies that had been previously tested. Small group discussions focused on feasibility and effectiveness revealed moderately different priorities than individual rankings. The strategy bundling approach tested a less time- and resource-intensive method but was not effective. Future research should compare the relative agreement and pragmatism of methodologies to prioritize implementation strategies. Article	2022	Hill K.C.; Kattakuzhy S.M.; Silk R.; Eyasu R.; Ogbumbadiugha O.; Ebah E.; Cover A.A.; Davis A.; Gayle B.; Sternberg D.; Bijole P.; Sun J.; Masur H.; Kottilil S.; Solomon D.; Rosenthal E.S.	PrEP Indications and PrEP Knowledge, Access, and Interest Among Individuals With HCV	Open Forum Infectious Diseases	-	-	-	23288957	10.1093/ofid/ofac476	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145048637&doi=10.1093%2fofid%2fofac476&partnerID=40&md5=c078bdf5b3629115a410d03420eae2e3	Background: Individuals with hepatitis C (HCV) represent a population that may benefit from pre-exposure prophylaxis (PrEP), given the overlapping risk factors and transmission networks of HCV and HIV. This analysis assesses the prevalence of PrEP indications among individuals with HCV monoinfection and PrEP awareness, interest, and access in this population. Methods: GRAVITY was an observational study for the collection of epidemiologic data from individuals with HCV and/or HIV in Washington DC and Baltimore, with the present analysis limited to HCV-monoinfected patients. The prevalence of PrEP indications was determined using epidemiologic survey responses. Bivariate and multivariable analyses assessed for associations between PrEP indications and PrEP awareness, access, and interest. Results: Among 314 HCV-monoinfected participants, 109 (35%) had an indication for PrEP. Forty-eight (44%) had a drug use indication alone, 40 (37%) had a sexual indication alone, and 21 (19%) had both drug use and sexual indications. Eighty-five (27%) participants had heard of PrEP, 32 (10%) had been offered PrEP by a provider, 114 (38%) were interested or maybe interested in PrEP, and 6 (2%) were currently taking PrEP. On bivariate analysis, PrEP awareness was significantly associated with study site (P < .0001), race (P = .0003), age (P < .0001), and sexual PrEP indication (P = .04). However, only study site remained significant (P = .0002) on regression analysis. Conclusions: Though indications for PrEP were prevalent among individuals with HCV in this cohort, most patients were unaware of PrEP, had never been offered PrEP, and were not using PrEP. These data support the need for improved PrEP implementation among people with HCV. © 2022 The Author(s). Published by Oxford University Press on behalf of Infectious Diseases Society of America. Article	2022	Hill L.M.; Golin C.E.; Saidi F.; Phanga T.; Tseka J.; Young A.; Pearce L.D.; Maman S.; Chi B.H.; Mutale W.	Understanding PrEP decision making among pregnant women in Lilongwe, Malawi: A mixed-methods study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.26007	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138126077&doi=10.1002%2fjia2.26007&partnerID=40&md5=5c1193a666b0aed1302c78b01ec384a2	Introduction: Pre-exposure prophylaxis (PrEP) is a promising tool for HIV prevention during pregnancy. With increasing rollout in antenatal settings, counselling strategies to help pregnant women make appropriate decisions about PrEP use are needed. Understanding women's motivations and concerns for PrEP use—and how these inform their decision making and feelings about the decision to start PrEP—are critical to inform these strategies. Methods: We conducted a convergent mixed-methods study from June 2020 to June 2021 in the context of a PrEP adherence support trial among HIV-negative pregnant women in Lilongwe, Malawi. Two hundred women completed a survey reporting their motivations and concerns about PrEP use, and their feelings about the decision to start PrEP (Decisional Regret Scale). Thirty women completed in-depth interviews to better understand the decision-making process, including motivations and concerns weighed in women's decision to use PrEP. Analyses comprised descriptive and bivariate statistics, thematic qualitative analysis, and integration of quantitative and qualitative results. Results: Women initiating PrEP during pregnancy were highly motivated to obtain HIV protection for themselves and their unborn child, often due to perceived HIV risk connoted by a recent sexually transmitted infection and/or concerns about partner non-monogamy. These motivations prevailed despite some concerns about safety and side effects, anticipated stigmatization, and concerns about adherence burden and pill attributes. Many women had informed their partner of their decision to use PrEP yet few felt their decision was contingent upon partner approval. Most women felt positively about the decision to start PrEP (mean decisional regret = 1.2 out of 5), but those with a greater number of concerns reported greater decisional regret (B = 0.036; p = 0.005). Furthermore, women who were specifically concerned about partner disclosure, who disliked pills or who had no perceived HIV risk reported greater decisional regret. Conclusions: Pregnant women were strongly motivated by the promise of HIV protection offered by PrEP and accepted it despite diverse concerns. A shared decision-making approach that centres pregnant women and offers partner involvement may help identify and address initial concerns about PrEP use and support prevention-effective use of PrEP during this important period. © 2022 The Authors. Article	2022	Hill, Samantha V; Pratt, M C; Elopre, L; Smith, T V; Simpson, T; Lanzi, R; Matthews, L T	"Let's take that stop sign down." Provider perspectives on barriers to and opportunities for PrEP prescription to African American girls and young women in Alabama	AIDS Care	-	-	-	9540121	10.1080/09540121.2022.2105799	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135263724&doi=10.1080%2f09540121.2022.2105799&partnerID=40&md5=a8135e641e2d404e6be59261f73a2bb1	HIV disproportionately impacts many groups, including Black adolescent girls and young women (AGYW) aged 13–24 living in the Deep South. Current prevention efforts have the potential to further exacerbate disparities within this population as HIV pre-exposure prophylaxis (PrEP) remains underutilized by Black AGYW in the South. We conducted in-depth interviews (IDIs) grounded in Andersen's Model of Healthcare Utilization exploring providers' PrEP prescribing practices to Black AGYW in Alabama. Eleven providers completed IDIs exploring providers' PrEP prescription knowledge and experiences. Cross-cutting themes included: (1) Community and provider-level stigmas (including those propagated by legislation) relating to HIV and sexuality limit sexual health discussions with Black AGYW clients; (2) Low PrEP knowledge and comfort with guidelines limits PrEP conversations and reinforces low uptake and prescriptions; (3) Healthcare systems and structural barriers impede PrEP access for youth. Multi-level (structural, community, and provider) barriers to PrEP prescription demands high activation energy for providers to prescribe PrEP. We present recommendations in training in sexual health assessment, updates to PrEP guidelines to accommodate risk assessment appropriate for AGYW, and increased implementation science focused on PrEP prescription for Black AGYW in order to reduce HIV incidence for this population. © 2022 Informa UK Limited, trading as Taylor & Francis Group. Article	2022	Hoff E.; Rutledge R.; Gibson B.A.; Price C.R.; Gallagher C.; Maurer K.; Meyer J.P.	Preexposure Prophylaxis for Women Across the Criminal Justice System: Implications for Policy and Practice	Journal of Correctional Health Care	-	-	-	10783458	10.1089/jchc.19.11.0082	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124433488&doi=10.1089%2fjchc.19.11.0082&partnerID=40&md5=109dd9b437d210d31cb52a1ad1c52db1	Data that inform preexposure prophylaxis (PrEP) implementation for women involved in criminal justice (WICJ) systems are scarce. In a survey of PrEP attitudes, acceptability, and barriers across the criminal justice system, incarcerated women (n = 48) were more likely than WICJ on probation (n = 125) to be eligible for PrEP (29% vs. 15%; p = .04) and willing to take PrEP if offered (94% vs. 78%; p = .01). In multivariate models, PrEP eligibility directly correlated with being incarcerated (adjusted odds ratio aOR 4.81, 95% confidence interval CI 1.76-13.1) and inversely correlated with Hispanic/Latina ethnicity (aOR 0.31; 95% CI 0.10-0.96). Recent partner violence exposure was associated with PrEP eligibility (aOR 3.29; 95% CI 1.54-7.02) and discordant risk perception (aOR 2.36; 95% CI 1.18-4.70). Findings demonstrate high potential for PrEP for all WICJ, though implementation efforts will need to address partner violence. © 2022 The Author(s).	criminal justice systems; HIV prevention; PrEP; women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Theses and Dissertations	2022	Hollcroft, Madison; Khosropour, Christine	PrEP Uptake among Eligible Patients Attending the Largest PrEP Clinic in Jackson, Mississippi	-	-	University of Washington	-	NA	NA	https://www.proquest.com/dissertations-theses/prep-uptake-among-eligible-patients-attending/docview/2695228091/se-2?accountid=8113	BackgroundAmong people at risk for HIV in the United States (US), Black people of all gender identities and sexual orientations have disproportionately high rates of new HIV infection but low uptake of pre-exposure prophylaxis (PrEP), especially in the Southern United States. There is limited research evaluating factors associated with PrEP uptake especially among Black communities.Setting and MethodsThe Open Arms Clinic in Jackson, Mississippi is the largest provider of PrEP in the state with the 6th highest rate of HIV diagnosis in the US. Open Arms systematically documented PrEP eligibility and uptake (i.e., agreed undergo a clinical evaluation for PrEP) from 2017 to mid-2020. In encounter-based analyses, we examined factors associated with PrEP uptake among those eligible based on clinic criteria using bivariate and multivariable log binomial regression. A person-based analysis was conducted using chi-square tests to compare individuals who ever vs. never accepted an offer for PrEP.ResultsAmong 721 encounters where patients were eligible for PrEP, staff offered PrEP at 680 (94%) of these encounters (526 unique individuals). Eligible patients were mostly ages 25 and older (61.5%), identified as Black (73.1%), and cisgender men who have sex with men (MSM) (63.5%). Individuals accepted a PrEP offer at 58% of encounters; 65.8% of individuals ever accepted an offer. Encounters with individuals that identified as transgender/non-binary were least likely to accept a PrEP offer. Encounters with individuals who reported having sex partners living with HIV or unknown HIV status were more likely to accept PrEP offer. There was no significant difference in accepting an offer by age or race.ConclusionsPrEP uptake in this clinic was suboptimal despite standardized methodical evaluation of eligibility. Our findings signify a critical need to enhance PrEP delivery in this region and enhance PrEP education for key groups such as transgender/non-binary individuals. Article	2022	Hong C.; Abrams L.S.; Holloway I.W.	Technology-Based Interventions to Promote the HIV Preexposure Prophylaxis (PrEP) Care Continuum: Protocol for a Systematic Review	JMIR Research Protocols	-	-	-	19290748	10.2196/33045	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126125397&doi=10.2196%2f33045&partnerID=40&md5=22800e5da02dacacab548dd5989316dd	Background: Preexposure prophylaxis (PrEP) is a promising biomedical intervention for HIV prevention. Researchers have proposed the PrEP care continuum to guide and evaluate PrEP implementation programs. Technology-based interventions (TBIs) have been widely used in HIV prevention and treatment programs, including for the promotion of the PrEP care continuum. The rapid development of new interventions using technology and electronic health methods emphasizes the need for a review of the effectiveness of these TBIs. Objective: The aim of this systematic review is to summarize the effectiveness and acceptability of TBIs used to promote the HIV PrEP care continuum. Methods: We will conduct a systematic literature search in PubMed, Embase, MEDLINE, PsycINFO, Web of Science, CINAHL, and the Cochrane Central Register of Controlled Trials following PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) guidelines. Only intervention studies (ie, studies meeting the criteria of randomized controlled trials or quasi-experimental studies) evaluating the effectiveness of TBIs will be included. We will search the National Institutes of Health Research Portfolio Online Reporting Tools (NIH RePORT) for interventions involving PrEP. At least 2 reviewers will independently screen and select the studies, extract the data, and evaluate the quality of the studies, and discrepancies will be resolved by a senior author. We will provide a narrative synthesis of the included studies and present details about the study populations, interventions, and PrEP-related outcomes of significance. Results: The protocol was registered in the International Prospective Register of Systematic Reviews (PROSPERO; CRD42021249562). As of August 2021, we have completed the initial search and identified 1213 records. Study screening and data extracting are in progress. We expect the results to be ready by summer 2022. Conclusions: The findings of this review will summarize successful experiences and lessons learned from the existing literature and therefore inform the design and implementation of intervention studies for PrEP care promotion. © 2022 Chenglin Hong, Laura S Abrams, Ian W Holloway. Article	2022	Hong C.; Feinstein B.A.; Holloway I.W.; Yu F.; Huang W.; Sullivan P.S.; Siegler A.J.; Mi G.	Differences in Sexual Behaviors, HIV Testing, and Willingness to Use PrEP between Gay and Bisexual Men Who Have Sex with Men in China	International Journal of Sexual Health	-	-	-	19317611	10.1080/19317611.2022.2053922	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127334100&doi=10.1080%2f19317611.2022.2053922&partnerID=40&md5=5b1d57db4083f93140bd29e77dddd0d5	Objectives: Accumulating evidence suggests that there may be differences in sexual behaviors, condom use, and HIV prevention service utilization (e.g., HIV testing, PrEP use) between gay and bisexual men, but this remains under-explored, especially among gay and bisexual men in China. Methods: We surveyed 4,142 gay and bisexual men on a geosocial networking app in China. Results: In adjusted model, bisexual men were less likely to have received HIV testing in their lifetime (AOR =.62, 95% CI .53,.72) or to have received a recent HIV test (AOR =.78, 95% CI .68,.90). Conversely, among those who reported having had anal sex in the past six months, bisexual men were more likely to report consistent condom use than gay men (OR = 1.38, 95% CI 1.17, 1.62). Compared with gay men, bisexual men were significantly less likely to be aware of PrEP (AOR =.62, 95% CI .52,.74) and significantly less willing to use PrEP (AOR =.58, 95% CI .46,.73). Conclusions: Tailored HIV prevention interventions are needed to address bisexual men's needs in the context of the unique sociocultural influences on sexual behavior in China. © 2022 Taylor & Francis Group, LLC. Article	2022	Hong Chenglin; Horvath, Keith J; Stephenson, Rob; Nelson, Kimberly M; Petroll, Andrew E; Walsh, Jennifer L; John, Steven A	PrEP Use and Persistence Among Young Sexual Minority Men 17–24 Years Old During the COVID-19 Pandemic	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03423-5	https://www.proquest.com/scholarly-journals/prep-use-persistence-among-young-sexual-minority/docview/2628014498/se-2?accountid=8113	The COVID-19 pandemic has caused disruptions to health care access for sexual and gender minorities in the U.S. We sought to explore the impact of COVID-19 on HIV pre-exposure prophylaxis (PrEP) use and sexual health services by assessing PrEP eligibility and use, changes in sexual behaviors, and HIV/STI testing during the COVID-19 pandemic. We surveyed 239 young sexual minority men (YSMM) 17–24 years old between April and September 2020 in the U.S. One-in-seven YSMM PrEP users discontinued use during the pandemic, and all those who discontinued PrEP reported a decrease in sexual activity. Twenty percent reported difficulty getting prescriptions and medications from their doctors or pharmacies, and more than 10% reported challenges accessing HIV/STI testing. Among those who met Centers for Disease Control and Prevention criteria for PrEP (n = 104), 86.5% were not currently using PrEP. Among those surveyed 3 months or later after the start of major COVID-19 stay-at-home measures (n = 165), 35.8% reported CAS with a causal partner within the past 3 months during the COVID-19 pandemic. Seeking HIV testing was associated with reporting condomless anal sex in the previous 3 months, indicating the necessity for ensuring continuity of basic sexual health services for YSMM. Failure to adequately adjust HIV prevention services and intervention in the face of pandemic-related adversity undermines efforts to end the HIV epidemic in the U.S.	HIV; Physicians; Pre-exposure prophylaxis; Epidemics; Psychology; Prevention; Men; Gender; Men who have sex with men; Sexual behavior; Sexual health; COVID-19; Disease prevention; Health services; Health care; Public health; Prophylaxis; Sexual minority; Anal intercourse; Pandemic; Pandemics; Alcoholism; Health behavior; Disease control; Health care access; Sexual minority men; Sexual and reproductive health; Anal sex; Human immunodeficiency virus--HIV; Sexually transmitted diseases--STD; United States--US; Gays & lesbians; Mens health; Behavior modification; Coronaviruses; Viral diseases	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Hoover, Karen W.; Zhu, Weiming; Gant, Zanetta C.; Delaney, Kevin P.; Wiener, Jeffrey; Carnes, Neal; Thomas, Dominique; Weiser, John; Huang, Ya-Lin A.; Cheever, Laura W.; Kourtis, Athena P.	HIV Services and Outcomes During the COVID-19 Pandemic - United States, 2019-2021.	MMWR Recommendations and Reports	-	-	-	1545-861X 0149-2195	10.15585/mmwr.mm7148a1	https://pubmed.ncbi.nlm.nih.gov/36454696/	Increasing HIV testing, preexposure prophylaxis (PrEP), and antiretroviral therapy (ART) are pillars of the federal Ending the HIV Epidemic in the U.S. (EHE) initiative, with a goal of decreasing new HIV infections by 90% by 2030.* In response to the COVID-19 pandemic, a national emergency was declared in the United States on March 13, 2020, resulting in the closure of nonessential businesses and most nonemergency health care venues; stay-at-home orders also limited movement within communities (1). As unemployment increased during the pandemic (2), many persons lost employer-sponsored health insurance (3). HIV testing and PrEP prescriptions declined early in the COVID-19 pandemic (4-6); however, the full impact of the pandemic on use of HIV prevention and care services and HIV outcomes is not known. To assess changes in these measures during 2019-2021, quarterly data from two large U.S. commercial laboratories, the IQVIA Real World Data - Longitudinal Prescription Database (IQVIA),(†) and the National HIV Surveillance System (NHSS)(§) were analyzed. During quarter 1 (Q1)(¶) 2020, a total of 2,471,614 HIV tests were performed, 190,955 persons were prescribed PrEP, and 8,438 persons received a diagnosis of HIV infection. Decreases were observed during quarter 2 (Q2), with 1,682,578 HIV tests performed (32% decrease), 179,280 persons prescribed PrEP (6% decrease), and 6,228 persons receiving an HIV diagnosis (26% decrease). Partial rebounds were observed during quarter 3 (Q3), with 2,325,554 HIV tests performed, 184,320 persons prescribed PrEP, and 7,905 persons receiving an HIV diagnosis. The proportion of persons linked to HIV care, the number who were prescribed ART, and proportion with a suppressed viral load test (<200 copies of HIV RNA per mL) among those tested were stable during the study period. During public health emergencies, delivery of HIV services outside of traditional clinical settings or that use nonclinical delivery models are needed to facilitate access to HIV testing, ART, and PrEP, as well as to support adherence to ART and PrEP medications. Article	2022	Hoover, Karen W; Kourtis, Athena P; Smith, Dawn K	U.S. Black Women and Human Immunodeficiency Virus Preexposure Prophylaxis Implementation	Obstetrics and Gynecology	-	-	-	297844	10.1097/AOG.0000000000004829	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134368897&doi=10.1097%2fAOG.0000000000004829&partnerID=40&md5=a36251da236343f10219c5806b2357a2	Black women are disproportionately affected by the U.S. human immunodeficiency virus (HIV) epidemic. Preexposure prophylaxis (PrEP) is a safe and effective intervention for HIV prevention. Increased PrEP implementation is a pillar of the U.S. Department of Health and Human Services' Ending the HIV Epidemic in the U.S. initiative. However, PrEP has been used by a smaller proportion of women with PrEP indications compared with men. The goals of the Ending the HIV Epidemic in the U.S. initiative can be achieved only by increasing PrEP use among Black women. Obstetricians and gynecologists are uniquely poised to provide PrEP services for women. We describe the need for community-to-clinic models to overcome the barriers to PrEP use by Black women and a roadmap for clinician and community organization collaboration to increase access to and use of PrEP by Black women. © 2022 Lippincott Williams and Wilkins. Participation, retention and uptake in a multicentre pre-exposure prophylaxis cohort using online, smartphone-compatible data collection	HIV Medicine	-	-	-	14642662	10.1111/hiv.13175	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116132458&doi=10.1111%2fhiv.13175&partnerID=40&md5=9f5869e2b7c08016581efd8cc39ab4b8	Objectives: The aim of the study was to assess the feasibility of a national pre-exposure prophylaxis (PrEP) programme using smartphone-compatible data collection. Methods: This was a multicentre cohort study (NCT03893188) enrolling individuals interested in PrEP in Switzerland. All centres participate in the SwissPrEPared programme, which uses smartphone-compatible data collection. Feasibility was assessed after centres had enrolled at least one participant. Participants were HIV-negative individuals presenting for PrEP counselling. Outcomes were participation (number enrolled/number eligible), enrolment rates (number enrolled per month), retention at first follow-up (number with first follow-up/number enrolled), and uptake (proportion attending first visit as scheduled). Participant characteristics were compared between those retained after baseline assessment and those who dropped out. Results: Between April 2019 and January 2020, 987 individuals were assessed for eligibility, of whom 969 were enrolled (participation: 98.2%). The median enrolment rate was 86 per month interquartile range (IQR) 52–137. Retention at first follow-up and uptake were both 80.7% (782/969 and 532/659, respectively). At enrolment, the median age was 40 (IQR 33–47) years, 95% were men who have sex with men, 47% had a university degree, and 75.5% were already taking PrEP. Most reported multiple casual partners (89.2%), previous sexually transmitted infections (74%) and sexualized drug use (73.1%). At baseline, 25.5% tested positive for either syphilis, gonorrhoea or chlamydia. Participants who dropped out were at lower risk of HIV infection than those retained after baseline assessment. Conclusions: In a national PrEP programme using smartphone-compatible data collection, participation, retention and uptake were high. Participants retained after baseline assessment were at considerable risk of HIV infection. Younger, less educated individuals were underrepresented in the SwissPrEPared cohort. © 2021 The Authors. Article	2022	Howarth A.R.; Saunders J.; Reid D.; Kelly I.; Wayal S.; Weatherburn P.; Hughes G.; Mercer C.H.	Stay at home …': exploring the impact of the COVID-19 public health response on sexual behaviour and health service use among men who have sex with men: findings from a large online survey in the UK	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2021-055039	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119572064&doi=10.1136%2fsextrans-2021-055039&partnerID=40&md5=165afd79560ec1d97c75d994308e8aee	Objectives The first UK national lockdown began on 23 March 2020, in response to the COVID-19 pandemic, and led to reduced STI/HIV service provision in the UK. We investigated sexual behaviour, use and need for sexual healthcare during the pandemic. Methods Participants (N=2018), including men (cis/ transgender), transwomen and gender-diverse people reporting sex with another man (cis/transgender) or non-binary person assigned male at birth, completed an online cross-sectional survey (23 June 2020–14 July 2020), in response to adverts on social media and dating apps. Sexual behaviour, service use and unmet need for STI testing (any new male and/or multiple condomless anal sex (CAS) partners without STI testing) in the 3 months since lockdown began were examined and compared using multivariable analyses with an equivalent 3-month period in a 2017 survey (N=1918), conducted by the same research team. Results Since lockdown began, 36.7% of participants reported one or more new partners, 17.3% reported CAS with multiple partners, 29.7% HIV testing (among 1815 of unknown/negative status), 24.9% STI testing and 15.4% using pre-exposure prophylaxis (PrEP). Since lockdown began, 25.3% of participants had unmet need for STI testing. This was more likely among Asian versus white participants (adjusted OR (aOR)=1.76, (1.14 to 2.72), p=0.01); for participants living in Scotland (aOR=2.02, (1.40 to 2.91), p<0.001) or Northern Ireland (aOR=1.93, (1.02–3.63), p=0.04) versus England; and for those living with HIV (aOR=1.83, (1.32 to 2.53), p<0.001). Compared to 2017, the equivalent 2020 subsample were less likely to report new male partners (46.8% vs 71.1%, p<0.001), multiple CAS partners (20.3% vs 30.8%, p<0.001) and have unmet need for STI testing (32.8% vs 42.5%, p<0.001) in the past 3 months. Conclusions We found potential for ongoing STI/HIV transmission among men who have sex with men during the initial UK lockdown, despite reduced sexual activity, and inequalities in service access. These findings will support public planning to mitigate health risks during and after the COVID-19 response. © Author(s) (or their employer(s)) 2022. Re-use permitted under CC BY. Published by BMJ. Article	2022	Hsu, Katherine K; Rakhmanina, Natella Yurievna	Adolescents and Young Adults: The Pediatrician's Role in HIV Testing and Pre- and Postexposure HIV Prophylaxis.	Pediatrics	-	-	-	1098-4275	10.1542/peds.2021-055207	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9645702	Most sexually active youth in the United States do not believe that they are at risk for contracting HIV and have never been tested. Creating safe environments that promote confidentiality and respect, obtaining an accurate sexual and reproductive health assessment, and providing nonstigmatizing risk counseling are key components of any youth encounters. Pediatricians can play a key role in preventing and controlling HIV infection by promoting risk-reduction counseling and offering routine HIV testing and prophylaxis to adolescent and young adult (youth) patients. In light of persistently high numbers of people living with HIV in the United States and documented missed opportunities for HIV testing, the Centers for Disease Control and Prevention and the US Preventive Services Task Force recommend universal and routine HIV screening among US populations, including youth. Recent advances in HIV diagnostics, treatment, and prevention help support this recommendation. This clinical report reviews epidemiological data and recommends that routine HIV screening be offered to all youth 15 years or older, at least once, in health care settings. After initial screening, youth at increased risk, including those who are sexually active, should be rescreened at least annually, and potentially as frequently as every 3 to 6 months if at high risk (male youth reporting male sexual contact, active injection drug users, transgender youth; youth having sexual partners who are HIV-infected, of both genders, or injection drug users; youth exchanging sex for drugs or money; or youth who have had a diagnosis of or have requested testing for other sexually transmitted infections). Youth at substantial risk for HIV acquisition should be routinely offered HIV preexposure prophylaxis, and HIV postexposure prophylaxis is also indicated after high-risk exposures. This clinical report also addresses consent, confidentiality, and coverage issues that pediatricians face in promoting routine HIV testing and HIV prophylaxis for their patients. Article	2022	Huang W.; Lockard A.; Kelley C.F.; Serota D.P.; Rolle C.-P.M.; Sullivan P.S.; Rosenberg E.S.; Siegler A.J.	From declining PrEP to PrEP initiation as "first nature"–what changes PrEP initiation decisions among young, Black MSM	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.1960946	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112032013&doi=10.1080%2f09540121.2021.1960946&partnerID=40&md5=612941b5344a890a32482ad0e0c5f1f7	Young Black men who have sex with men (YBMSM) bear a disproportionate burden of HIV, and HIV pre-exposure prophylaxis (PrEP) uptake has been slow. Decisions regarding PrEP initiation change in different life contexts over time. Our YBMSM cohort study found about 1/3 of those who initially declined PrEP subsequently changed and initiated PrEP care. This study explores the process of their PrEP decision changes. The study interviewed participants who initially voiced strong and clear reservations about PrEP, but subsequently started PrEP 1–14 months later. In "review/renew" follow-up interviews, participants reviewed their past statements from a time they declined PrEP, and renew their understanding regarding perspective and behavioral change. Analyzing the data with a positive deviance framework, we found that shifting the decisional balance in favor of PrEP initiation only required change in some areas. There were not consistent factors that prevented or facilitated PrEP uptake. Instead, YBMSM initiated PrEP while maintaining an array of substantial reservations. PrEP initiation decisions should be viewed by health practitioners as a longitudinal process, and routine PrEP offers should be made over time. To optimally facilitate PrEP use among YBMSM, the diverse benefits of PrEP should be emphasized rather than focusing on allaying all concerns. © 2021 Informa UK Limited, trading as Taylor & Francis Group.	pre-exposure prophylaxis; Young Black men who have sex with men	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

Evolution of Hepatitis B Virus (HBV) Serologic Markers Among Antiretroviral-Naive Young People Living With Human Immunodeficiency Virus Who Had Undergone Neonatal HBV Vaccination and Initiated Antiretroviral Therapy	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciab1020	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138449011&doi=10.1093%2fcid%2fciab1020&partnerID=40&md5=65a51a6adca4d234bb426aac4cba1f9d	Background: With initiation of antiretroviral therapy (ART) containing nucleos(t)ide reverse-transcriptase inhibitors (NRTIs) with anti-hepatitis B virus (HBV) activity, the evolution of HBV serologic markers among people living with human immunodeficiency virus (PLWH) who were born in the era of nationwide neonatal HBV vaccination is rarely investigated. Methods: This retrospective cohort study evaluated the changes of HBV serologic markers (hepatitis B surface antigen HBsAg, antibody to hepatitis B surface antigen anti-HBs, and antibody to hepatitis B core antigen anti-HBc) of PLWH who had undergone neonatal HBV vaccination. Clinical characteristics were analyzed and the incidences of evolution of HBV serologic markers were estimated. Results: Between 2004 and 2020, 608 PLWH (mean age, 24 years) were included and 62.0% initiated tenofovir-containing ART. 13 (2.1%) were HBsAg-positive, 312 (51.3%) tested triple-negative, 209 (34.4%) had vaccine-induced seroprotection against HBV, and 74 (12.2%) tested positive for anti-HBc with or without anti-HBs. Among 492 PLWH who received a median follow-up of 2.8 years, 4 cases of incident HBV infection occurred (0.59 per 100 person-years of follow-up (PYFU)) in PLWH testing triple-negative at baseline despite ART containing NRTIs with anti-HBV activity. Of PLWH with seroprotection against HBV at baseline, 38 subsequently lost anti-HBs (4.46 per 100 PYFU) and 4 cases of incident HBV infection occurred (0.47 per 100 PYFU). PLWH with an anti-HBs antibody titer ≥100 mIU/mL at baseline (adjusted hazard ratio aHR, 0.10 95% confidence interval {CI}:. 02-.42) and CD4 ≥500 cells/μL during follow-up (aHR, 0.51 95% CI:. 30-1.00) were less likely to lose HBV seroprotection. Conclusions: Among young PLWH who had undergone neonatal HBV vaccination, evolution of HBV serologic markers and incident infections occurred despite ART containing NRTIs with anti-HBV activity. © 2021 The Author(s). Article	2022	Huang Y.L.A.; Zhu W.; Carnes N.; Hoover K.W.	Abandonment of Human Immunodeficiency Virus Preexposure Prophylaxis Prescriptions at Retail Pharmacies - United States, 2019	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciac009	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137125358&doi=10.1093%2fcid%2fciac009&partnerID=40&md5=7c7b339842d30a6b743c2e8597cdb2ab	We analyzed a national pharmacy database to estimate the annual number of persons who abandoned preexposure prophylaxis (PrEP) prescriptions and assessed associated factors. About 9% of persons prescribed PrEP abandoned prescriptions in 2019; abandonment was associated with sex, age, insurance type, black race/ethnicity, and drug copayment amount. © 2022 Published by Oxford University Press for the Infectious Diseases Society of America.	preexposure prophylaxis; PrEP; prescription abandonment; prescription pickup; retail pharmacy	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Huang Y.L.A.; Zhu W.; Wiener J.; Kourtis A.P.; Hall H.I.; Hoover K.W.	Impact of Coronavirus Disease 2019 (COVID-19) on Human Immunodeficiency Virus (HIV) Pre-exposure Prophylaxis Prescriptions in the United States - A Time-Series Analysis	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciac038	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137124372&doi=10.1093%2fcid%2fciac038&partnerID=40&md5=91c65036eaabf56b0b35cfc67dbb0a4a	Background: Uptake of HIV pre-exposure prophylaxis (PrEP) has been increasing in the United States since its FDA approval in 2012; however, the COVID-19 pandemic may have affected this trend. Our objective was to assess the impact of COVID-19 on PrEP prescriptions in the United States. Methods: We analyzed data from a national pharmacy database from January 2017 through March 2021 to fit an interrupted time-series model that predicted PrEP prescriptions and new PrEP users had the pandemic not occurred. Observed PrEP prescriptions and new users were compared with those predicted by the model. Main outcomes were weekly numbers of PrEP prescriptions and new PrEP users based on a previously developed algorithm. The impact of the COVID-19 pandemic was quantified by computing rate ratios and percentage decreases between the observed and predicted counts during 15/3/2020-31/3/2021. Results: In the absence of the pandemic, our model predicted that there would have been 1 058 162 PrEP prescriptions during 15/3/2020-31/3/2021. We observed 825 239 PrEP prescriptions, a 22.0% reduction (95% CI: 19.1-24.8%) after the emergency declaration. The model predicted 167 720 new PrEP users during the same period; we observed 125 793 new PrEP users, a 25.0% reduction (95% CI: 20.9-28.9%). The COVID-19 impact was greater among younger persons and those with commercial insurance. The impact of the pandemic varied markedly across states. Conclusions: The COVID-19 pandemic disrupted an increasing trend in PrEP prescriptions in the United States, highlighting the need for innovative interventions to maintain access to HIV-prevention services during similar emergencies. © 2022 Published by Oxford University Press for the Infectious Diseases Society of America. Article	2022	Hughes J.P.; Williamson B.D.; Krakauer C.; Chau G.; Ortiz B.; Wakefield J.; Hendrix C.; Amico K.R.; Holtz T.H.; Bekker L.-G.; Grant R.	Combining information to estimate adherence in studies of pre-exposure prophylaxis for HIV prevention: Application to HPTN 067	Statistics in Medicine	-	-	-	2776715	10.1002/sim.9321	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123497598&doi=10.1002%2fsim.9321&partnerID=40&md5=5caac97b6d6101d97c1043d0605f096a	In trials of oral HIV pre-exposure prophylaxis (PrEP), multiple approaches have been used to measure adherence, including self-report, pill counts, electronic dose monitoring devices, and biological measures such as drug levels in plasma, peripheral blood mononuclear cells, hair, and/or dried blood spots. No one of these measures is ideal and each has strengths and weaknesses. However, accurate estimates of adherence to oral PrEP are important as drug efficacy is closely tied to adherence, and secondary analyses of trial data within identified adherent/non-adherent subgroups may yield important insights into real-world drug effectiveness. We develop a statistical approach to combining multiple measures of adherence and show in simulated data that the proposed method provides a more accurate measure of true adherence than self-report. We then apply the method to estimate adherence in the ADAPT study (HPTN 067) in South African women. © 2022 John Wiley & Sons Ltd.	adherence; HIV; latent variable; pharmacokinetic model; pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Hughes Y.; Tomlins L.; Usherwood T.	Prescribing for patients taking antiretroviral therapy	Australian Prescriber	-	-	-	3128008	10.18773/austprescr.2022.026	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131823361&doi=10.18773%2faustprescr.2022.026&partnerID=40&md5=a397a41d89ce0826183834c865172cfe	Current first-line antiretroviral therapy comprises a combination of drugs that are generally well tolerated. Adverse effects include hypersensitivity reactions, renal and liver toxicity, rhabdomyolysis, hyperlipidaemia, weight gain and neuropsychiatric disorders. Most drug–drug interactions related to antiretroviral therapy involve drug absorption, metabolism or elimination. Some interactions may increase toxicity or reduce the effectiveness of antiretroviral therapy potentially resulting in treatment failure. Routinely checking for adverse drug effects and potential drug–drug interactions is an important part of the care of people taking antiretroviral therapy. This includes asking about the patient's use of over-the-counter and complementary medicines. © 2022.	drug interactions; HIV; integrase inhibitors; protease inhibitors; reverse transcriptase inhibitors	English	Australia	Asia and the Pacific	Australia	Asia and the Pacific	NA	NA	Review
Article	2022	Huličiak, Martin; Vokřál, Ivan; Holas, Ondřej; Martinec, Ondřej; Štaud, František; Červený, Lukáš	Evaluation of the Potency of Anti-HIV and Anti-HCV Drugs to Inhibit P-Glycoprotein Mediated Efflux of Digoxin in Caco-2 Cell Line and Human Precision-Cut Intestinal Slices.	Pharmaceuticals	-	-	-	1424-8247	10.3390/ph15020242	https://pubmed.ncbi.nlm.nih.gov/35215354/	The inhibition of P-glycoprotein (ABCB1) could lead to increased drug plasma concentrations and hence increase drug toxicity. The evaluation of a drug's ability to inhibit ABCB1 is complicated by the presence of several transport-competent sites within the ABCB1 binding pocket, making it difficult to select appropriate substrates. Here, we investigate the capacity of antiretrovirals and direct-acting antivirals to inhibit the ABCB1-mediated intestinal efflux of (3)H-digoxin and compare it with our previous rhodamine123 study. At concentrations of up to 100 μM, asunaprevir, atazanavir, daclatasvir, darunavir, elbasvir, etravirine, grazoprevir, ledipasvir, lopinavir, rilpivirine, ritonavir, saquinavir, and velpatasvir inhibited (3)H-digoxin transport in Caco-2 cells and/or in precision-cut intestinal slices prepared from the human jejunum (hPCIS). However, abacavir, dolutegravir, maraviroc, sofosbuvir, tenofovir disoproxil fumarate, and zidovudine had no inhibitory effect. We thus found that most of the tested antivirals have a high potential to cause drug-drug interactions on intestinal ABCB1. Comparing the Caco-2 and hPCIS experimental models, we conclude that the Caco-2 transport assay is more sensitive, but the results obtained using hPCIS agree better with reported in vivo observations. More inhibitors were identified when using digoxin as the ABCB1 probe substrate than when using rhodamine123. However, both approaches had limitations, indicating that inhibitory potency should be tested with at least these two ABCB1 probes.	antiretrovirals; drug–drug interactions; direct-acting antivirals; ABCB1; human precision-cut intestinal slices	English	Switzerland	Western and Central Europe and North America	Czech Republic	Western and Central Europe and North America	Czech Republic	Western and Central Europe and North America	Clinical
Article	2022	Hulstein S.H.; Zimmermann H.M.L.; De La Court F.; Matser A.A.; Schim Van Der Loeff M.F.; Hoornenborg E.; Davidovich U.; Prins M.; De Vries H.J.C.	Factors Associated With the Intention to Use HIV Preexposure Prophylaxis for Young and Older Men Who Have Sex With Men	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001599	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125278470&doi=10.1097%2fOLQ.0000000000001599&partnerID=40&md5=25d0c42025ce4878b01d263826ffea8a	Background The uptake of preexposure prophylaxis (PrEP) against HIV is low among young men who have sex with men (MSM) in the Netherlands. Studying the intention to use PrEP among non-PrEP using young and older MSM can guide health authorities in developing new prevention campaigns to optimize PrEP uptake. Methods We investigated the sociodemographic, behavioral, and psychosocial factors associated with a high PrEP use intention in the coming 6 months among 93 young MSM (aged ≤25 years), participating in an online survey, and 290 older MSM (aged ≥26 years), participating in an open, prospective cohort in 2019 to 2020. Results Perceiving PrEP as an important prevention tool was associated with a high PrEP use intention among young and older MSM. Among young MSM, a high level of PrEP knowledge and believing that PrEP users take good care of themselves and others were associated with a high PrEP use intention. Among older MSM, 2 or more anal sex partners, chemsex, high HIV risk perception, and believing PrEP increases sexual pleasure were associated with a high PrEP use intention. Believing PrEP leads to adverse effects was associated with a low intention to use PrEP among older MSM. Conclusions To conclude, we showed that both behavioral and psychosocial factors were associated with a high PrEP use intention among young and older MSM. In addition to focusing on sexual behavior and HIV risk, future prevention campaigns and counseling on PrEP could incorporate education, endorsing positive beliefs, and disarming negative beliefs to improve the uptake of PrEP in young and older MSM. © Lippincott Williams & Wilkins. Article	2022	Humphries H.; Upfold M.; Mahlase G.; Mdladla M.; Gengiah T.N.; Karim Q.A.	Implants for HIV prevention in young women: Provider perceptions and lessons learned from contraceptive implant provision	PLOS One	-	-	-	19326203	10.1371/journal.pone.0262043	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122890207&doi=10.1371%2fjournal.pone.0262043&partnerID=40&md5=864b0e7d805c55fa2ca88c7ff8ed4412	Preventing new HIV infections, especially amongst young women, is key to ending the HIV epidemic especially in sub-Saharan Africa. Potent antiretroviral (ARV) drugs used as preexposure prophylaxis (PrEP) are currently being formulated as long-acting implantable devices, or nanosuspension injectables that release drug at a sustained rate providing protection from acquiring HIV. PrEP as implants (PrEP Implants) offers an innovative and novel approach, expanding the HIV prevention toolbox. Feedback from providers and future users in the early clinical product development stages may identify modifiable characteristics which can improve acceptability and uptake of new technologies. Healthcare workers (HCWs) perspectives and lessons learned during the rollout of contraceptive implants will allow us to understand what factors may impact the roll-out of PrEP implants. We conducted eighteen interviews with HCWs (9 Nurses and 9 Community Healthcare Workers) in rural KwaZulu-Natal, South Africa. HCWs listed the long-acting nature of the contraceptive implant as a key benefit, helping to overcome healthcare system barriers like heavy workloads and understaffing. However, challenges like side effects, migration of the implant, stakeholder buy-in and inconsistent training on insertion and removal hampered the roll-out of the contraceptive implant. For PrEP implants, HCWs preferred long-acting products that were palpable and biodegradable. Our findings highlight that the characteristics of PrEP implants that are perceived to be beneficial by HCWs may not align with that of potential users, potentially impacting the acceptability and uptake of PrEP implants. Further our data highlight the need for sustained and multi-pronged approaches to training HCWs and introducing new health technologies into communities. Finding a balance between the needs of HCWs that accommodate their heavy workloads, limited resources at points of delivery of care and the needs and preferences of potential users need to be carefully considered in the development of PrEP implants. © 2022 Humphries et al. Article	2022	Humphries, Debbie L; Rhodes, Elizabeth C; Simon, Christine L; Wang, Victor; Spiegelman, Donna; Ott, Corilyn; Hicks, David; Marcus, Julia L; Krakower, Doug; Rana, Aadia	Using Health Care Professionals' Perspectives to Refine a Clinical Decision Support Implementation Strategy for Increasing the Prescribing of HIV Preexposure Prophylaxis (PrEP) in Alabama.	Journal of the International Association of Providers of AIDS Care	-	-	-	2325-9582	10.1177/23259582221144451	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9772965	Pre-exposure prophylaxis (PrEP) is underused in the southern United States (US), a region with high HIV incidence. Clinical decision support (CDS) tools could increase PrEP prescriptions. We explored barriers to PrEP delivery and views of CDS tools to identify refinements for implementation strategies for PrEP prescribing and PrEP CDS tools. We conducted focus groups with health care providers from two federally qualified health centers in Alabama and analyzed the results using rapid qualitative methods. Barriers to PrEP included providers' lack of training in PrEP, competing priorities and time constraints during clinical visits, concerns about side effects, and intensive workload. We identified refinements to the planned implementation strategies to address the barriers, including training all clinic staff in PrEP and having CDS PrEP alerts in electronic health records sent to all staff. Development and deployment of CDS tools in collaboration with providers has potential to increase PrEP prescribing in high-priority jurisdictions.	implementation strategies, pre-Exposure prophylaxis, providers, clinical decision support system	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Hunidzarira, Portia; Brown, Elizabeth R.; Chirenje, Z. Mike; Hillier, Sharon L.; Marrazzo, Jeanne M.; Palanee-Phillips, Thesla; Kiweewa, Flavia M.; Baeten, Jared M.	Population-Level Correlation Between Incidence of Curable Sexually Transmitted Infections and Human Immunodeficiency Virus (HIV)-1 Among African Women Participating in HIV-1 Pre-Exposure Prophylaxis Trials.	The Journal of Infectious Diseases	-	-	-	1537-6613 0022-1899	10.1093/infdis/jiac269	https://academic.oup.com/jid/article/226/6/1069/6619245?login=false	BACKGROUND: Highly efficacious oral pre-exposure prophylaxis (PrEP) is the global standard for human immunodeficiency virus (HIV)-1 prevention, including in clinical trials of novel PrEP agents using active-comparator designs. The analysis assessed whether incident sexually transmitted infections (STIs) can serve as a surrogate indicator of HIV-1 incidence that might occur in the absence of PrEP. METHODS: We analyzed data from 3256 women randomized to placebo groups of oral and vaginal PrEP trials (MTN-003/VOICE and MTN-020/ASPIRE). Regression modeling assessed the correlation between incident individual STIs (Neisseria gonorrhoeae, Chlamydia trachomatis, and Trichomonas vaginalis, each considered separately) and incident HIV-1. RESULTS: Across 18 sites in 4 countries (Malawi, South Africa, Uganda, Zimbabwe), STI and HIV-1 incidences were high: HIV-1 4.9, N gonorrhoeae 5.3, C trachomatis 14.5, and T vaginalis 7.1 per 100 person-years. There was limited correlation between HIV-1 incidence and incidence of individual STIs: N gonorrhoeae (r = 0.02, P = .871), C trachomatis (r = 0.49, P = <.001), and T vaginalis (r = 0.10, P = .481). The modest association with C trachomatis was driven by country-level differences in both C trachomatis and HIV-1, with no statistically significant association within countries. CONCLUSIONS: Sexually transmitted infection incidence did not reliably predict HIV-1 incidence at the population level among at-risk African women participating in 2 large PrEP trials. Article	2022	Hurley, Emily A.; Wanyenze, Rhoda K.; Gizaw, Mahlet; Gwokyalya, Violet; Beyeza-Kashesya, Jolly; Wagner, Glenn J.; Mayatsa, Jimmy; Nuwamanya, Simpson; Mindry, Deborah; Finocchario-Kessler, Sarah; Goggin, Kathy	Untapped Potential for Safer Conception Messaging to Transform PrEP Rollout and Promote Service Engagement Among Serodiscordant Couples	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03584-x	https://www.proquest.com/scholarly-journals/untapped-potential-safer-conception-messaging/docview/2672491416/se-2?accountid=8113	Uptake of pre-exposure prophylaxis (PrEP) fell short of targets for Sub-Saharan Africa's initial rollout, revealing the need for more effective promotion strategies. In Uganda, we explored potential benefits and challenges of integrating safer conception messaging to promote PrEP among serodiscordant couples. In-depth interviews were conducted with clients and personnel at three clinics and analyzed thematically. Participants (n = 58) valued PrEP as a safer conception method (SCM) but described lack of integration of safer conception and PrEP services as well as inconsistent practices in prescribing PrEP to couples pursuing conception. Participants reported that the wider population remains largely unaware of PrEP and SCM or harbors misconceptions that PrEP is primarily for highly stigmatized groups like sex workers. Participants further described how heterosexual couples can still be reluctant to test for HIV, unaware of tools like PrEP and SCM that would allow them to continue their relationship and/or pursuit of childbearing. Overall, findings suggest that integrating PrEP and SCM in messaging and services targeting serodiscordant couples holds untapped benefits throughout the HIV prevention cascade. Article	2022	Hurt C.B.; Morrison A.S.; Guy J.; Mobley V.L.; Dennis A.M.; Barrington C.; Samoff E.; Hightow-Weidman L.B.; McNeil C.J.; Carry M.G.; Hogben M.; Seña A.C.	Beyond Disease Intervention: Exploring an Expanded Role for Partner Services in the MATRix-NC Demonstration Project	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001544	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123346202&doi=10.1097%2fOLQ.0000000000001544&partnerID=40&md5=c32c40d2aeae6835ecf72281d08333f0	Background: Disease intervention specialists (DIS) provide partner services for sexually transmitted infections (STIs). We assessed an expansion of DIS services for clients with HIV and/or syphilis, and contacts within their social and sexual networks. Methods: Black and Latinx cisgender men and transgender women who have sex with men diagnosed with HIV and/or syphilis in 4 urban North Carolina counties were referred to designated DIS, who were trained to recruit clients as "seeds" for chain-referral sampling of sociosexual network "peers." All received HIV/STI testing and care; referrals for preexposure prophylaxis (PrEP) and social, behavioral, and non-STI medical services were offered. Participants completed baseline, 1-month, and 3-month computerized surveys. Results: Of 213 cases referred to DIS from May 2018 to February 2020, 42 seeds (25 with syphilis, 17 with HIV) and 50 peers participated. Median age was 27 years; 93% were Black and 86% were cisgender men. Most peers came from seeds' social networks: 66% were friends, 20% were relatives, and 38% were cisgender women. Incomes were low, 41% were uninsured, and 10% experienced recent homelessness. More seeds than peers had baseline PrEP awareness; attitudes were favorable, but utilization was poor. Thirty-seven participants were referred for PrEP 50 times; 17 (46%) accessed PrEP by month 3. Thirty-nine participants received 129 non-PrEP referrals, most commonly for housing assistance, primary care, Medicaid navigation, and food insecurity. Conclusions: Chain-referral sampling from partner services clients allowed DIS to access persons with significant medical and social service needs, demonstrating that DIS can support marginalized communities beyond STI intervention. Theses and Dissertations	2022	Ichite, Amanda C	PrEParing to Break Barriers: A Mixed Methods Exploration of the Knowledge, Attitudes, and Perceptions of HIV, PrEP, and HIV Risk Behaviors among Women of Color in Miami, Florida	-	-	Florida International University	-	NA	NA	https://digitalcommons.fiu.edu/etd/5027	The U.S. HIV epidemic is characterized by regional, racial, and ethnic disparities. HIV rates are disproportionately higher in the South and Black and Hispanic populations are most impacted. Moreover, the intersectional identity of being a Black or Hispanic woman living in the South has been associated with profound disparities in HIV impact. Prior to the advent of the biomedical HIV prevention tool pre-exposure prophylaxis (PrEP) in 2012, women were limited in their options for female-controlled HIV prevention strategies. Despite the proven efficacy of PrEP, utilization in women is significantly lower than other at-risk groups. In the present study, secondary analysis was conducted using exploratory cross-sectional survey data as well as quantitative and qualitative pre- and post-intervention data from a pilot study conducted as part of the NIAAA funded study "Optimizing PrEP Utilization Among Alcohol and Other Drug Using Women of Color". In Aim 1, we explored the association between HIV and PrEP related knowledge and attitudinal factors and HIV risk. We found that increased risk for HIV was associated with higher HIV knowledge, higher risk perception, and more positive PrEP attitudes. HIV risk was found to decrease as PrEP knowledge increased. In Aim 2, we assessed the preliminary efficacy of a one-on-one HIV risk reduction intervention for women, "Talking PrEP with Women of Color in Miami," in a sample of Black women. We found evidence that the intervention was efficacious in improving risky behaviors, knowledge, and attitudes related to sexual risk taking. A qualitative process evaluation of the intervention in Aim 3 identified factors motivating, facilitating, and acting as barriers to PrEP use and established that participants found the intervention to be acceptable and beneficial. We also found that Black women may lack the social support identified as a key facilitator of PrEP use but, in the absence of support, high perceptions of risk serve as facilitators for use and adherence. Findings from this study can be used to inform educational content development for future HIV risk reduction interventions and improve challenges associated with attrition in interventions targeting at-risk ethnic minority women with a myriad of unmet social needs. Article	2022	Inghels, Maxime; Kim, Hae-Young; Tanser, Frank; Hettema, Anita; McMahon, Shannon A; Oldenburg, Catherine E; Matse, Sindy; Kohler, Stefan; Geldsetzer, Pascal	PrEP uptake and delivery setting preferences among clients visiting six healthcare facilities in Eswatini	AIDS and Behavior	-	-	-	1090-7165	https://doi.org/10.1007/s10461-022-03646-0	https://escholarship.org/uc/item/5b18w0hv	Due to the high HIV incidence among the general population of Eswatini, pre-exposure prophylaxis (PrEP) for HIV-exposed individuals is recommended. However, little is known about PrEP uptake and preferences in PrEP delivery healthcare setting among the general population. We conducted a secondary analysis of a randomized trial that aimed to increase PrEP uptake. All clients eligible for PrEP in one of six public-sector healthcare facilities in Eswatini were included. PrEP uptake was stratified by initial reason for visit (e.g. outpatient). Preferences in PrEP delivery setting were collected among those clients who initiated PrEP. A total of 1782 clients had their HIV acquisition risk assessed. Of these, 72% (1277/1782) were considered at risk by healthcare providers and, among them, 40% (517/1277) initiated PrEP. Uptake was higher among clients visiting specifically to initiate PrEP (93%), followed by HIV testing visits (45.8%) and outpatient visits (40%). Among those who initiated PrEP, preferred delivery settings were outpatient services (31%), HIV testing services (26%), family planning (21%) and antenatal services (14%). Men or those at high risk of HIV acquisition were more likely to prefer HIV testing and outpatient services, while young women were more likely to visit and express a preference for antenatal and family planning services. Outpatient services and HIV testing services could be preferable choices for PrEP delivery integration, due to the high PrEP uptake and delivery setting preferences of the populations who use these services. Antenatal and family planning could also be considered with a view to targeting the youngest women. Article	2022	Iniesta C.; Folch C.; Meyer S.; Vázquez M.; Casabona J.; Díaz A.	Would eligible gay, bisexual and other men who have sex with men use PrEP? Awareness, knowledge, eligibility and intention to use PrEP among EMIS-2017 participants in Spain	Preventive Medicine	-	-	-	917435	10.1016/j.ypmed.2022.106962	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123845115&doi=10.1016%2fj.ypmed.2022.106962&partnerID=40&md5=6cf36ef0fc1b9e771863ddc1a72e285b	Pre-exposure prophylaxis (PrEP) is an efficacious strategy for reducing the incidence of HIV infection. It has been available in Spain since 2019. We aim to report on awareness, knowledge of, intention to use, and eligibility for PrEP and related factors among participants in the European Men-Who-Have-Sex-With-Men Internet Survey (EMIS-2017) in Spain. We used Spanish data from EMIS-2017, a cross-sectional study performed among gay, bisexual, and other men who have sex with men (GBMSM) from 50 countries. We found that 65.3% of the 10,634 participants were aware of PrEP, some 30.1% of those HIV-negative and ≥ 18 years were eligible and 52.7% of those eligible intended to use it. Regarding knowledge about PrEP, only 15.4% of the participants knew 3 statement with true information about that PrEP meant. Older age, being born in Western Europe (WE) and greater outness were associated with greater awareness. Older age, being born in Latin America or Caribbean or WE, sex work, and living in a large city were associated with greater eligibility. A greater degree of outness was associated with reduced intention to use. Our study point to possible barriers in the implementation of PrEP in Spain and similar countries. © 2022 Elsevier Inc. Article	2022	Irie W.C.; Calabrese S.K.; Patel R.R.; Mayer K.H.; Geng E.H.; Marcus J.L.	Preferences for HIV Preexposure Prophylaxis Products Among Black Women in the U.S.	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03571-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122364212&doi=10.1007%2fs10461-021-03571-8&partnerID=40&md5=ade855721cb8f26699760e75d0d3f067	In a nationwide sample of Black women in the U.S., we assessed preferences for HIV preexposure prophylaxis (PrEP) products, including long-acting injectable (LAI) PrEP and once-daily oral PrEP. Among 315 respondents, 32.1% were aware of PrEP and 40.6% were interested in using it; interest increased to 62.2% if PrEP were provided for free. Oral PrEP was the preferred option (51.1%), followed by LAI PrEP (25.7%), vaginal gel (16.5%), and vaginal ring (6.7%). When examining oral and LAI PrEP alone, most (62.7%) preferred oral PrEP. LAI PrEP was more likely to be preferred among respondents with concerns about healthcare costs or PrEP-related stigma, and among those who reported inconsistent condom use and multiple sexual partners. Although most Black women preferred oral PrEP, LAI PrEP may be appealing to a subset with social and structural barriers to PrEP use, such as cost and stigma, and those at increased risk of HIV infection. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Irungu, Elizabeth M; Musau, Moses; Nyerere, Bernard; Dollah, Anabelle; Kwach, Benn; Owidi, Emmah; Wamoni, Elizabeth; Odoyo, Josephine; Mugo, Nelly; Bukusi, Elizabeth; Mugwanya, Kenneth; Baeten, Jared M	Using an on-site modular training approach to amplify prep service delivery in public health facilities in Kenya.	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0000092	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10021257	Delivery of oral PrEP, a potent HIV prevention intervention, has begun within public health systems in many countries in Africa. Training as many health providers as possible expeditiously is necessary to efficiently and rapidly scale up PrEP delivery among at risk populations and thereby realize the greatest impact of PrEP. We designed and implemented an innovative on-site modular training approach delivered in five two-hour modules. The modules could be covered in two consecutive days or be broken across several days enabling flexibility to accommodate health provider work schedules. We assessed knowledge gain comparing pre-and post-training test scores and determined monthly PrEP uptake for six months following the training intervention. We also evaluated the cost of this training approach and conducted key informant interviews to explore acceptability among health providers. Between January 2019 and December 2020, 2111 health providers from 104 health facilities were trained on PrEP. Of 1821 (83%) providers who completed both pre- and post-tests, 505 (28%) were nurses, 333 (18%) were HIV counsellors, 276 (15%) were clinical officers and 255 (14%) were lay providers. The mean score prior to and after training was 58% and 82% respectively (p <0.001). On average, health facilities initiated an average of 2.7 (SD 4.7) people on PrEP each month after the training, a number that did not decline over six months post-training (p = 0.62). Assuming Ministry of Health costs, the costs per provider trained was $16.27. Health providers expressed satisfaction with this training approach because it enabled many providers within a facility receive training. On-site modular training is an effective approach for improving PrEP education for health workers in public health facilities, It is also acceptable and low-cost. This method of training can be scaled up to rapidly amplify the number of health workers able to offer PrEP services. Article	2022	Iseselo, Masunga K.; Tarimo, Edith A. M.; Sandstrom, Eric; Kulane, Asli	Awareness and willingness to use HIV oral pre-exposure prophylaxis among people who inject drugs in Dar es Salaam, Tanzania: A cross-sectional survey.	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0000776	https://journals.plos.org/globalpublichealth/article?id=10.1371/journal.pgph.0000776	People who inject drugs (PWID) are at increased risk of HIV infection. Pre-exposure prophylaxis (PrEP) could help in HIV prevention among PWIDs. However, little is known about PrEP use among PWIDs in low and middle-income countries. This study reports the awareness of and willingness to use PrEP and the associated factors among PWID in Tanzania. A cross-sectional survey was conducted using respondent-driven sampling (RDS) to recruit PWIDs in Dar es Salaam, Tanzania. Data were collected using an interviewer-administered questionnaire. Chi-square statistical test was used during data analysis. The P-value of < 0.05 was used to ascertain the statistically significant relationship. IBM SPSS Statistics 25.0 was used to analyze the data. The analysis consisted of 260 PWIDs. The mean age of the respondents was 39.0 years with a standard deviation (SD) of ±7.5. Most of the respondents were male (n = 232, 89.2%) with primary education (n = 176, 67.7%). Despite the low awareness of PrEP (n = 42, 165.28%) in the study sample, the majority (n = 239, 91.9%) were willing to use PrEP. Both awareness of and willingness to use PrEP were associated with gender (p = .002 and p = < .001), awareness of HIV prevention programs(p = < .001 and p = .006), selling sex (p = .010 and p = .021), and frequency of condomless sexual intercourse (p = .029 and p = .025) respectively. In multivariable logistic regression, only gender(p = 0.046) was related to awareness of PrEP while awareness of HIV prevention programs (p = 0.009), the risk level of HIV infection(p = < .001), number of sexual partners(p = 0.046), and frequency of condomless sex(p = 0.032) were associated with willingness to use PrEP. Other factors were not statistically significant. Despite low awareness, PWIDs are highly willing to use PrEP. Future research should assess the acceptability of injectable PrEP for PWID, as their acquaintance with injection may make the formulation more practical. Theses and Dissertations	2022	ISRAEL, KARLA CRISTINA SILVA PETRUCCELLI	FUNÇÃO RENAL E PROFILAXIA DIÁRIA CONTRA O HIV: RESULTADOS DO PROJETO DEMONSTRATIVO MULTICÊNTRICO DE VIDA REAL PREP BRASIL'	-	-	Universidade do Estado do Amazonas (UEA)	-	NA	NA	https://ppgmt.uea.edu.br/wp-content/uploads/2024/02/Tese-_-Karla-Israel.pdf	A Profilaxia Pré-Exposição (PrEP) tem demonstrado eficácia na redução de novas infecções pelo HIV. Contudo, o uso prolongado de fumarato de tenofovir desoproxila (TDF) e emtricitabina (FTC) em co-formulação (TDF/FTC) pode resultar em aumento do risco de toxicidade renal. Objetivamos avaliar as mudanças na taxa de filtração glomerular estimada (TFGe) em um cenário populacional de mundo real dos participantes inscritos no estudo PrEP Brasil, uma coorte prospectiva de 48 semanas, aberta, para avaliar a viabilidade de TDF/FTC oral diária usado por homens que fazem sexo com homens e mulheres transexuais com alto risco de infecção pelo HIV maiores de 18 anos. Métodos: A função renal foi avaliada por dosagem em série de creatinina sérica e cálculo da TFGe pela fórmula MDRD (Modification of Diet in Renal Disease Study) nas semanas 4, 12, 24, 36 e 48. A adesão à PrEP foi avaliada pela dosagem da concentração de TDF em manchas de sangue seco nas semanas 4 e 48, medido por espectrofotometria de massa e cromatografia de coluna líquida. Resultados: 392 participantes completaram o protocolo de acompanhamento de 48 semanas com níveis detectáveis de TDF no sangue e medidas de TFGe. 43,1% eram adultos jovens, de origem étnica caucasiana (57,9%), com IMC abaixo de 30kg/m2, sem hipertensão arterial. Na triagem, a TFGe mediana foi de 93,0 mL/min/1,73 m^2. Na semana 4 de acompanhamento, 90 (23%) participantes apresentaram reduções na TFGe maiores que 10 mL/min/1,73 m^2 em comparação com a TFGe basal, chegando a atingir59 ml/min/1,73m^2, mas sem eventos adversos sistêmicos ou renais graves ao ponto de demandar a descontinuação do TDF/FTC. Uma relação negativa foi observada entre os níveis sanguíneos de TDF e TFGe nas semanas 4 (r=-0,005; p<0,01) e 48 (r=-0,006; p<0,01). Conclusões: Nossos resultados sugerem que a função renal em indivíduos em uso de TDF/FTC pode ser avaliada na 4ª semana e, em seguida, anualmente, permitindo um acompanhamento médico mais flexível em centros de atenção primária. Article	2022	Iwelunmor J.; Tucker J.D.; Obiezu-Umeh C.; Gbaja-Biamila T.; Oladele D.; Nwaozuru U.; Musa A.Z.; Airhihenbuwa C.O.; Muessig K.; Rosenberg N.; BeLue R.; Xian H.; Conserve D.F.; Ong J.J.; Zhang L.; Curley J.; Nkengasong S.; Mason S.; Tang W.; Bayus B.; Ogedegbe G.; Ezechi O.	The 4 Youth by Youth (4YBY) pragmatic trial to enhance HIV self-testing uptake and sustainability: Study protocol in Nigeria	Contemporary Clinical Trials	-	-	-	15517144	10.1016/j.cct.2021.106628	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123316623&doi=10.1016%2fj.cct.2021.106628&partnerID=40&md5=5f2301ce16230b6cc7f25c4feca2d1eb	Background: The World Health Organization recommends HIV self-testing (HIVST) as an additional approach to HIV testing and the Nigerian government is supportive of this policy recommendation. However, effectively increasing uptake and sustainability among Nigerian youth is unknown. The goal of this study is to conduct a full-powered type I hybrid effectiveness-implementation trial to test the effectiveness of youth-friendly implementation science strategies in increasing uptake and sustainability of HIVST led by and for Nigerian youth. Methods: Our 4 Youth by Youth (4YBY) strategy combines four core elements: 1) HIVST bundle consisting of HIVST kits and photo verification system; 2) a participatory learning community; 3) peer to peer support and technical assistance; and 4) on-site supervision and performance feedback to improve uptake and sustainability of HIVST and enhance linkage to youth-friendly health clinics for confirmatory HIV testing where needed, sexually transmitted infection (STI) testing (i.e. syphilis, gonorrhea, chlamydia, and hepatitis, STI treatment, and PrEP referral. Utilizing a stepped-wedge, cluster-randomized controlled trial, a national cohort of youth aged 14–24 recruited from 32 local government areas across 14 states and four geo-political zones in Nigeria will receive the 4YBY implementation strategy. In addition, an economic evaluation will explore the incremental cost per quality adjusted life year gained. Discussion: This study will add to the limited "how-to-do it literature" on implementation science strategies in a resource-limited setting targeting youth population traditionally underrepresented in implementation science literature. Study findings will also optimize uptake and sustainability of HIVST led by and for young people themselves. Trial registration: This study is registered in ClinicalTrials.gov NCT04710784 (on January 15, 2021). © 2021	HIV; HIV self-testing; Nigeria; Participatory implementation strategies; Sexually transmitted infections; Stepped-wedge cluster-randomized controlled trial; Youth	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Jacka B.P.; Nolen S.; Bessey S.E.; Zang X.; Goedel W.C.; Yedinak J.L.; Marshall B.D.L.	Use of Pre-Exposure Prophylaxis to Prevent Rapid HIV Transmission Among People Who Inject Drugs in Rural Counties in the United States: A Modeling Study	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003093	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141893513&doi=10.1097%2fQAI.0000000000003093&partnerID=40&md5=1c3224d3f8ab75830ab801e8be97ce7e	Background:Despite recent HIV outbreaks among people who inject drugs (PWID) in nonurban US settings, syringe service programs (SSP) are often inaccessible in these communities. Furthermore, pre-exposure prophylaxis (PrEP) awareness and coverage for PWID is limited. We aimed to model the impact of PrEP on HIV transmission among PWID in a rural setting.Setting:Using a calibrated agent-based model, we simulated HIV transmission in an adult population (n = 14,573 agents) in Scott County, Indiana between 2015 and 2024.Methods:We modeled PrEP eligibility according to CDC guidelines for PWID. PrEP coverage increased by 15% points in the range 10%-70%. Two counterfactual scenarios were modeled: Unrestricted access for PWID and PrEP for SSP attendees. We calculated the number of new HIV infections and number of person-years on PrEP per averted infection.Results:In the status quo scenario, 153 (95% Simulation Interval: 85, 259) new HIV infections occurred among PWID over 10 years. Compared with the status quo, 40% PrEP coverage resulted in 25% fewer HIV infections in the Unrestricted access for PWID scenario and 10% fewer HIV infections in the PrEP for SSP attendees scenario. The PYPAI was 21 and 43 in the Unrestricted access for PWID and PrEP for SSP attendees scenarios, respectively.Conclusion:Our modeling suggests that PrEP provides substantial benefit to PWID in rural US communities, with fewer restrictions on access providing the greatest effect. Control of HIV outbreaks will require expansion of public health interventions that meet the needs of all individuals. © 2022 Wolters Kluwer Health, Inc. Article	2022	Jackson G.Y.; Darlington C.K.; Van Tieu H.; Brawner B.M.; Flores D.D.; Bannon J.A.; Davis A.; Frye V.; Chittamuru D.; Gugerty P.; Koblin B.A.; Teitelman A.M.	Women's views on communication with health care providers about pre-exposure prophylaxis (PrEP) for HIV prevention	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2021.1877824	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100562689&doi=10.1080%2f13691058.2021.1877824&partnerID=40&md5=2b69b9af6a25e9cd6d38740469afec88	Since the beginning of the HIV epidemic in the USA, effective interventions to reduce HIV risk among cisgender women have been lacking. Although oral HIV pre-exposure prophylaxis (PrEP) is effective in pharmacologically preventing HIV infection, there is a gap between the recommended use of PrEP and PrEP uptake among eligible women. This study aimed to identify the role of patient-provider communication in PrEP decision-making among women considering PrEP. Semi-structured in-depth interviews were conducted with 41 PrEP-eligible women in Philadelphia and New York City. A thematic analysis of the responses was conducted, and a conceptual model developed and confirmed as analysis continued. Of the women interviewed, 53.6% were African American and 29.3% were Latina. Women noted that having a trusting relationship with their health care provider, receiving a tailored recommendation for PrEP based upon their specific needs and using their health care provider as support were crucial facilitators of PrEP decision-making. Lack of provider knowledge about PrEP, perceived health care provider stigma about their drug use and sexual activity, and lack of care continuity were all identified as barriers to effective communication. Study findings can inform future interventions to enhance patient-provider communication about PrEP and increase PrEP uptake among women. © 2021 Informa UK Limited, trading as Taylor & Francis Group.	health communication; Pre-exposure prophylaxis; uptake; vulnerable populations; women's health	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Jacobson, Evin U; Hicks, Katherine A; Carrico, Justin; Purcell, David W; Green, Timothy A; Mermin, Jonathan H; Farnham, Paul G	Optimizing HIV Prevention Efforts to Achieve EHE Incidence Targets.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002885	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8887784	BACKGROUND: A goal of the US Department of Health and Human Services' Ending the HIV Epidemic (EHE) in the United States initiative is to reduce the annual number of incident HIV infections in the United States by 75% within 5 years and by 90% within 10 years. We developed a resource allocation analysis to understand how these goals might be met. METHODS: We estimated the current annual societal funding $2.8 billion (B)/yr for 14 interventions to prevent HIV and facilitate treatment of infected persons. These interventions included HIV testing for different transmission groups, HIV care continuum interventions, pre-exposure prophylaxis, and syringe services programs. We developed scenarios optimizing or reallocating this funding to minimize new infections, and we analyzed the impact of additional EHE funding over the period 2021-2030. RESULTS: With constant current annual societal funding of $2.8 B/yr for 10 years starting in 2021, we estimated the annual incidence of 36,000 new cases in 2030. When we added annual EHE funding of $500 million (M)/yr for 2021-2022, $1.5 B/yr for 2023-2025, and $2.5 B/yr for 2026-2030, the annual incidence of infections decreased to 7600 cases (no optimization), 2900 cases (optimization beginning in 2026), and 2200 cases (optimization beginning in 2023) in 2030. CONCLUSIONS: Even without optimization, significant increases in resources could lead to an 80% decrease in the annual HIV incidence in 10 years. However, to reach both EHE targets, optimization of prevention funding early in the EHE period is necessary. Implementing these efficient allocations would require flexibility of funding across agencies, which might be difficult to achieve. Article	2022	Jacomet C.; Lebeller C.; Schiestel T.; Grandvuillemin A.; Davani S.; Valnet-Rabier M.-B.	HIV preexposure prophylaxis with tenofovir disoproxil fumarate/emtricitabine: What about safety?; Utilisation de TRUVADA® en prophylaxie préexposition : analyse des bases de vigilance et revue de la littérature	Therapies	-	-	-	405957	10.1016/j.therap.2022.03.008	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130781331&doi=10.1016%2fj.therap.2022.03.008&partnerID=40&md5=85fc519d7ea5cdb18551aa6587420eb8	Introduction: Pre-exposure prophylaxis (PrEP) is a combination of antiretroviral regimen, tenofovir disoproxil fumarate (TDF)/emtricitabine (FTC) that has been shown to prevent HIV transmission. It had been regulated through a temporary recommendation use since December 2015 and had marketing authorization in France since March 2017. As, this product is proposed for adults and adolescents safe from HIV but at high risk of infection, the question is to know if there is a safety concern about this use. Methods: A request has been made in the French national pharmacovigilance database (ANPV) and VIGILYZE for an extraction of all cases containing TDF/FTC as suspect drugs in PrEP use. In the second part, we did a literature review in PubMED with MeSH terms and an analysis of the results of the American, English and French initial clinical trials was performed. Results: In both database, 808 cases correspond to an indication of HIV prexposure prophylaxis who represent 2058 adverse effects (AEs) mainly distributed in gastro-intestinal disorders (38.5%), general disorders (16.8%) and 62 cases of seroconversion. We identify 24% of unexpected AEs including 12% of serious AEs in the French database. In literature review, there are no unexpected AEs published, the AEs are mainly gastro-intestinal disorders. There was no significant difference in the AE profile compared to the HIV-infected population treated with TDF/FTC. Conclusion: Data from the ANPV, combined with data from the worldwide pharmacovigilance database, show that the most commonly observed AEs are gastrointestinal, mainly nausea, vomiting and diarrhea. A significant number of asthenia and fatigue are also observed. These AEs are well described in the SMPc. However, we have little data, which can be explained by a probable under-reporting of AEs. We identify 24% of unexpected and potentially serious adverse effects in France mainly among chemsex users. Based on these results, our study confirms the safety of PrEP. © 2022 Société française de pharmacologie et de thérapeutique	HIV; PrEP; Safety; TDF/emtricitabine	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Review
Article	2022	Jacomet, Christine; Goncalves, Émilie; Lambert, Céline; Chedorge, Didier; Puglièse-Wehrlen, Sylvia; Billaud, Éric; Zucman, David; Simon, Anne; Arvieux, Cédric; Trout, Hervé; Laurandin, Bruno; Maarek, René; Raymond, Isabelle; Puglièse, Pascal; Langlois, Julie; Certain, Agnès	To what extent do people living with HIV, people on pre-exposure prophylaxis, doctors and pharmacists endorse 90-day dispensing of antiretroviral therapy in France?	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0265166	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8992981	JUSTIFICATION: The WHO 95-95-95 targets for 2030 do not imply that people living with HIV (PLHIV) achieve a good quality of life. The current 30-day dispensing interval for antiretroviral (ART) burdens the healthcare system. Lengthening dispensing intervals could alleviate this burden as well as enhance patient well-being. OBJECTIVES: To capture perceptions on 90-day dispensing interval (90D) for ART from the perspective of PLHIV, people on pre-exposure prophylaxis (PrEP), doctors, and pharmacists. METHODS: Multi-centre observational survey led in France from 16 to 20 October 2020, among doctors agreeing to participate via regional coordinated care organisations for HIV, all PLHIV or people on PrEP consulting these outpatient-clinic doctors, and pharmacists doing ART dispensing. RESULTS: The survey was completed by 220 doctors who saw 1087 people (999 PLHIV; 88 on PrEP) and 176 pharmacists from 55 centres. Among the PLHIV, 855 (85.6%, 95% CI: 83.2%-87.7%) and among the patients on PrEP, 70 (79.5%, 95% CI: 69.6%-87.4%) stated they would be interested in 90D. All in all, patients who were more likely to endorse 90D are those who opt exclusively for hospital dispensing (OR 3.22 1.57-6.58) and who rotate between hospital and community pharmacy dispensing (OR 3.29 1.15-9.32). Patients who were less likely to endorse 90-D were those who consult in a city located outside the 3 French high HIV prevalence regions (OR 0.66 0.44-0.99), receive 2 vs 1 pill QD regimens (OR 0.53 0.31-0.91), and anticipate at least one vs no limitation to 90D (OR 0.27 0.17-0.42). 90D was perceived as possible by 152 pharmacists (86.4%), including 8 (5%) without restriction, and 219 doctors (99.6%), including 42 (19.2%) regardless of PLHIV's immunovirologic status or social conditions (health insurance coverage, access to housing or accommodation, access to rights, resources). Comparison of the benefits and limitations of a 90-day ART dispensing interval as perceived by PLHIV and people on PrEP, doctors and pharmacists shows that doctors anticipate a higher number of benefits than people on ART and/or pharmacists, chiefly that 90D would be more convenient and create less risk of drug shortages and that patients would gain autonomy and a better quality of life. Pharmacists were found to clearly perceive the economic benefits (90D would be less expensive) but anticipate more drawbacks than doctors and the people on ART themselves: more administrative burdens, more non-dispensing if doses get lost, harder to track adherence and more drug-drug interaction issues, and more work as they shall have to warn the patient of potential risks of shortages due to the cost of the stock. CONCLUSION: A clear majority of PLHIV, people on PrEP, doctors, and pharmacists endorsed 90D of ART. Most patients thought that 90D would be a good option, whereas most pharmacists and doctors thought that eligibility for 90D dispensing should depend on immunovirologic factors and social condition criteria. Moreover, pharmacists thought it would be necessary to commit regulatory resources and a better follow-up on adherence and drug-drug interactions. Article	2022	Jafari M.; Kheiri H.	Free terminal time optimal control of a fractional-order model for the HIV/AIDS epidemic	International Journal of Biomathematics	-	-	-	17935245	10.1142/S179352452250022X	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122326818&doi=10.1142%2fS179352452250022X&partnerID=40&md5=360478954bcc253983153cacdc413031	In this paper, we present a fractional model for the HIV/AIDS epidemic and incorporate into the model control parameters of pre-exposure prophylaxis (PrEP), behavioral change and antiretroviral therapy (ART) aimed at controlling the spread of diseases. We prove the local and global asymptotic stability of disease-free and endemic equilibria of the model. We present a general fractional optimal control problem (FOCP) with free terminal time and develop the Adapted Forward-Backward Sweep method for numerical solving of the FOCP. Necessary conditions for a state/control/terminal time triplet to be optimal are obtained. The results show that the use of all controls increases the life expectancy of HIV-treated patients with ART and remarkably increases the number of people undergoing PrEP and changing their sexual habits. Also, when the derivative order α ($0.45 \leq \alpha \leq 1$) limits to 1, the value of optimal terminal time increases while the value of objective functional decreases. © 2022 World Scientific Publishing Company. Article	2022	Jaiswal J.; Griffin M.; Hascher K.; Cox A.B.; Dunlap K.; Walters S.; LoSchiavo C.; Burton W.M.; Mumba M.	Logistical Facilitators and Barriers to PrEP Implementation in Methadone Clinic Settings: Provider and Staff Perspectives	Journal of Addiction Medicine	-	-	-	19320620	10.1097/ADM.0000000000000973	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139378995&doi=10.1097%2fADM.0000000000000973&partnerID=40&md5=12dbece2ebc125ee50600d66df7fdd08	Objectives: The purpose of this study was to examine the feasibility of implementing pre-exposure prophylaxis (PrEP), a daily oral medication for human immunodeficiency virus (HIV) prevention, in methadone clinics. Methods: Medical and nonmedical staff (n = 30) at 2 methadone clinics in Northern New Jersey were qualitatively interviewed about various aspects of substance use treatment, clinical operations, and HIV risk and prevention among their patient populations. Audio-recorded interviews were professionally transcribed, then coded and analyzed by the research team. Results: Themes surrounding the viability of PrEP implementation emerged for both logistical facilitators and barriers. Facilitators included availability of prescribing clinicians, ability to conduct lab testing on-site, and availability of existing hepatitis C programs as a blueprint for PrEP management. Barriers included increased provider burden, financial concerns, and perceptions that PrEP provision is outside the clinic's treatment scope. Conclusions: Although staff expressed willingness and potential ability to provide PrEP, they identified barriers regarding insurance reimbursement, limited funding, and concerns that PrEP would extend the clinic's treatment scope. However, given the enabling factors such as availability of providers and existing clinical infrastructure, providing PrEP could increase clinic revenue through insurance reimbursement and federal funding for PrEP-related services. Clinic-level education is needed for clinical and nonclinical staff to better understand the logistics of implementing PrEP, particularly regarding prescribing practices, billing and insurance concerns, and the essential nature of HIV prevention as a critical component of substance use treatment. Article	2022	Jalil E.M.; Torres T.S.; Luz P.M.; Monteiro L.; Moreira R.I.; de Castro C.R.V.; Leite I.D.C.; Cunha M.; de Cássia Elias Estrela R.; Ramos M.; Hoagland B.; Wagner Cardoso S.; Anderson P.; Veloso V.G.; Wilson E.; Grinsztejn B.	Low PrEP adherence despite high retention among transgender women in Brazil: the PrEParadas study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25896	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128732111&doi=10.1002%2fjia2.25896&partnerID=40&md5=0bbe6996b285e7122ffd56dd732e436a	Introduction: We aimed to evaluate daily oral pre-exposure prophylaxis (PrEP) uptake, retention, and adherence and predictors of study non-attendance and low PrEP adherence in a Brazilian trans-specific 48-week study (PrEParadas). Methods: We enrolled transgender women (TGW) engaging in high-risk sexual behaviours between August 2017 and December 2018. PrEP adherence was based on tenofovir diphosphate concentrations in dried blood spots (DBS). We used random effects logistic regression models and ordinal models to estimate the odds of having a missed visit and of low PrEP adherence, respectively. Multivariable models were adjusted for variables with p-value<0.10 in the univariate analysis. Results: From the 271 eligible, 130 participants were enrolled in the study (PrEP uptake: 48%), out of which 111 (85.4%) were retained at 48 weeks. Multivariable model for study non-attendance included study visit, age, main sexual partner and stimulant use. The odds of missing a visit increased after the week 24. Participants aged 18–24 (adjusted odds ratio aOR = 8.76, 95% CI: 2.09–36.7) and 25–34 years (aOR = 6.79, 95% CI: 1.72–26.8) compared to TGW aged 35+ years had significantly higher odds of having a missed visit. The odds of a missed visit were higher among participants reporting stimulant use (aOR = 4.99, 95% CI: 1.37–18.1) compared to no stimulant use. DBS levels at week 48 showed that 42 (38.5%), 14 (12.8%) and 53 (48.6%) of 109 participants had low, moderate and high PrEP adherence. Multivariable model for low PrEP adherence included study visit, age, schooling, race/colour, housing, binge drinking, stimulant use, feminizing hormone therapy (FHT) use and received text message. Low PrEP adherence was significantly higher among participants with less years of schooling (aOR = 6.71, 95% CI: 1.30–34.5) and had a borderline association with Black colour/race (aOR = 6.72, 95% CI: 0.94–47.8). Participants using the FHT available at the site had decreased odds of low PrEP adherence (aOR = 0.38, 95% CI: 0.16–0.88). No participant seroconverted over the course of the study. Conclusions: Although high PrEP retention can be achieved in a gender-affirming setting, PrEP adherence may be an important challenge faced among TGW due to social disparities. The scale-up of prevention tools like PrEP will have to address systemic social determinants as these stand as important barriers for TGW's access to health services. © 2022 The Authors. Article	2022	Jalil E.M.; Torres T.S.; Pereira C.C.A.; Farias A.; Brito J.D.U.; Lacerda M.; da Silva D.A.R.; Wallys N.; Ribeiro G.; Gomes J.; Odara T.; Santiago L.; Nouveau S.; Benedetti M.; Pimenta C.; Hoagland B.; Grinsztejn B.; Veloso V.G.	High Rates of Sexualized Drug Use or Chemsex among Brazilian Transgender Women and Young Sexual and Gender Minorities	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph19031704	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123832553&doi=10.3390%2fijerph19031704&partnerID=40&md5=5566ffe882f170f9c262635dbae21749	(1) Background: We aimed to estimate sexualized drug use (SDU) prevalence and its predictors among sexual and gender minorities. (2) Methods: We used an online and on-site survey to enroll sexual/gender minorities people between October–December/2020, and multivariate logistic regression to obtain SDU correlates. (3) Results: We enrolled 3924 individuals (280 transgender women TGW, 3553 men who have sex with men MSM, and 91 non-binary), 29.0% currently on pre-exposure prophylaxis (PrEP). SDU prevalence was 28.8% (95% confidence interval CI 27.4–30.2). TGW had 2.44-times increased odds (95%CI 1.75–3.39) of engaging in SDU compared to MSM, regardless of PrEP use. PrEP use (aOR 1.19, 95%CI 1.00–1.41), South/Southeast region (aOR 1.26, 95%CI 1.04–1.53), younger age (18–24 years: aOR 1.41, 95%CI 1.10–1.81; 25–35 years: aOR 1.24, 95%CI 1.04–1.53), white race/color (aOR 1.21, 95%CI 1.02–1.42), high income (aOR 1.32, 95%CI 1.05–1.67), binge drinking (aOR 2.66, 95%CI 2.25–3.14), >5 sexual partners (aOR 1.88, 95%CI 1.61–2.21), condomless anal sex (aOR 1.49, 95%CI 1.25–1.79), self-reported sexually transmitted infection (aOR 1.40, 95%CI 1.14–1.71), and higher perceived HIV-risk (aOR 1.37, 95%CI 1.14–1.64) were associated with SDU. (4) Conclusions: TGW had the highest SDU odds. SDU may impact HIV vulnerability among key populations and should be addressed in HIV prevention approaches. © 2022 by the authors. Article	2022	Jamieson, Lise; Johnson, Leigh F; Nichols, Brooke E; Delany-Moretlwe, Sinead; Hosseinipour, Mina C; Russell, Colin; Meyer-Rath, Gesine	Relative cost-effectiveness of long-acting injectable cabotegravir versus oral pre-exposure prophylaxis in South Africa based on the HPTN 083 and HPTN 084 trials: a modelled economic evaluation and threshold analysis.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(22)00251-X	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9708606	BACKGROUND: Long-acting injectable cabotegravir, a drug taken every 2 months, has been shown to be more effective at preventing HIV infection than daily oral tenofovir disoproxil fumarate and emtricitabine, but its cost-effectiveness in a high-prevalence setting is not known. We aimed to estimate the incremental cost-effectiveness of long-acting injectable cabotegravir compared with tenofovir disoproxil fumarate and emtricitabine in South Africa, using methods standard to government planning, and to determine the threshold price at which long-acting injectable cabotegravir is as cost-effective as tenofovir disoproxil fumarate and emtricitabine. METHODS: In this modelled economic evaluation and threshold analysis, we updated a deterministic model of the South African HIV epidemic with data from the HPTN 083 and HPTN 084 trials to evaluate the effect of tenofovir disoproxil fumarate and emtricitabine and long-acting injectable cabotegravir provision to heterosexual adolescents and young women and men aged 15-24 years, female sex workers, and men who have sex with men. We estimated the average intervention cost, in 2021 US$, using ingredients-based costing, and modelled the cost-effectiveness of two coverage scenarios (medium or high, assuming higher uptake of long-acting injectable cabotegravir than tenofovir disoproxil fumarate and emtricitabine throughout) and, for long-acting injectable cabotegravir, two duration subscenarios (minimum: same pre-exposure prophylaxis duration as for tenofovir disoproxil fumarate and emtricitabine; maximum: longer duration than tenofovir disoproxil fumarate and emtricitabine) over 2022-41. FINDINGS: Across long-acting injectable cabotegravir scenarios, 15-28% more new HIV infections were averted compared with the baseline scenario (current tenofovir disoproxil fumarate and emtricitabine roll-out). In scenarios with increased coverage with oral tenofovir disoproxil fumarate and emtricitabine, 4-8% more new HIV infections were averted compared with the baseline scenario. If long-acting injectable cabotegravir drug costs were equal to those of tenofovir disoproxil fumarate and emtricitabine for the same 2-month period, the incremental cost of long-acting injectable cabotegravir to the HIV programme was higher than that of tenofovir disoproxil fumarate and emtricitabine (5-10% vs 2-4%) due to higher assumed uptake of long-acting injectable cabotegravir. The cost per infection averted was $6053-6610 (tenofovir disoproxil fumarate and emtricitabine) and $4471-6785 (long-acting injectable cabotegravir). The cost per long-acting injectable cabotegravir injection needed to be less than twice that of a 2-month supply of tenofovir disoproxil fumarate and emtricitabine to remain as cost-effective, with threshold prices ranging between $9·03 per injection (high coverage; maximum duration) and $14·47 per injection (medium coverage; minimum duration). INTERPRETATION: Long-acting injectable cabotegravir could potentially substantially change HIV prevention. However, for its implementation to be financially feasible across low-income and middle-income countries with high HIV incidence, long-acting injectable cabotegravir must be reasonably priced. Article	2022	Jasper B.K.; Becker J.N.; Myers A.E.; Cronholm P.F.	HIV Preexposure Prophylaxis Training in Family Medicine Residencies: A National Survey	Family Medicine	-	-	-	7423225	10.22454/FAMMED.2022.740210	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123457283&doi=10.22454%2fFAMMED.2022.740210&partnerID=40&md5=42d643471f1e32238d8d1275d9a8b7b9	BACKGROUND AND OBJECTIVES: Preexposure prophylaxis (PrEP) reduces HIV transmission among high-risk individuals. Yet, the HIV epidemic continues to expand among marginalized populations and America's Southeastern states. Various barriers remain to PrEP uptake, namely provider knowledge and education. We sought to investigate residency training, competency, and prescribing of PrEP among population size. Additionally, we asked program directors to identify barriers to PrEP. METHODS: We surveyed family medicine program directors as part of the Council of Academic Family Medicine Educational Research Alliance survey from January 2018 through February 2018. RESULTS: Our survey questions had a 52.9% (276/522) response rate. No programs in rural communities less than 30,000 population (0/27) reported significant PrEP training for their residents; those in nonrural communities of at least 30,000 reported this training more frequently (41/246, 16.7%). Compared to Fischer expected values, the finding was statistically significant (P=.019); using a 75,000 population demarcation lowered significance (P=.061). We found programs that identify significant PrEP training also cite more PrEP prescribing within their practice (OR 7.27, P<.001). Programs with significant training also report their residents graduate with greater PrEP competency (OR 18.33, P<.001). The largest barriers identified were faculty expertise, not having enough high-risk patients, inadequate screening, and resident knowledge/ training. CONCLUSIONS: We identified natural associations between increased training in PrEP and perceived PrEP competencies. We identified a lack of significant PrEP training and associated PrEP competencies in rural residency programs. Barriers identified in this study can help inform curricular needs to improve primary care workforce capacity to lower HIV risk. © 2022, Society of Teachers of Family Medicine. All rights reserved. Article	2022	Jeffers N.K.; Zemlak J.L.; Celius L.; Willie T.C.; Kershaw T.; Alexander K.A.	If the Partner Finds Out, then there's 'Trouble': Provider Perspectives on Safety Planning and Partner Interference When Offering HIV Pre-exposure Prophylaxis (PrEP) to Women Experiencing Intimate Partner Violence (IPV)	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03565-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123160807&doi=10.1007%2fs10461-021-03565-6&partnerID=40&md5=a0c9b80166aebcb022ed6a2e26f0ecc8	Pre-exposure prophylaxis is an effective women-controlled HIV prevention strategy but women experiencing intimate partner violencefear partners' interference and subsequent violence could limit its utility. This study explores provider perceptions of safety planning strategies to prevent escalating violence, mitigate partner interference, and promote daily oral PrEP adherence. We conducted interviews (N = 36) with healthcare providers (n = 18) and IPV service providers (n = 18) in Baltimore and New Haven. Using the Contextualized Assessment for Strategic Safety Planning model we organized data into two categories: the appraisal process and strategic safety planning. Themes revealed during the appraisal process, providers conduct routine IPV screening, facilitate HIV risk perception, and offer PrEP. Strategic safety planning utilizes concealment tactics, informal sources of support, role playing and cover stories. Future interventions to enhance PrEP services among women exposed to IPV should implement safety planning strategies, integrate PrEP care with IPV services, and employ novel PrEP modalities to maximize effectiveness. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Jenness, Samuel M; Le Guillou, Adrien; Lyles, Cynthia; Bernstein, Kyle T; Krajnosky, Kathryn; Enns, Eva A; Sullivan, Patrick S; Delaney, Kevin P	The Role of HIV Partner Services in the Modern Biomedical HIV Prevention Era: A Network Modeling Study	Sexually Transmitted Diseases	-	-	-	-	-	1485717	10.1097/OLQ.0000000000001711	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141033604&doi=10.1097%2FOLQ.0000000000001711&partnerID=40&md5=967bc05ac4b4f2bb4864b4c17e39baaf	Background HIV partner services can accelerate the use of antiretroviral-based HIV prevention tools (antiretroviral therapy ART and preexposure prophylaxis PrEP), but its population impact on long-term HIV incidence reduction is challenging to quantify with traditional partner services metrics of partner identified at HIV screened. Understanding the role of partner services within the portfolio of HIV prevention interventions, including using it to efficiently deliver antiretrovirals, is needed to achieve HIV prevention targets. Methods We used a stochastic network model of HIV/sexually transmitted infection transmission for men who have sex with men, calibrated to surveillance-based estimates in the Atlanta area, a jurisdiction with high HIV burden and suboptimal partner services uptake. Model scenarios varied successful delivery of partner services cascade steps (newly diagnosed "index"patient and partner identification, partner HIV screening, and linkage or reengagement of partners in PrEP or ART care) individually and jointly. Results At current levels observed in Atlanta, removal of HIV partner services had minimal impact on 10-year cumulative HIV incidence, as did improving a single partner services step while holding the others constant. These changes did not sufficiently impact overall PrEP or ART coverage to reduce HIV transmission. If all index patients and partners were identified, maximizing partner HIV screening, partner PrEP provision, partner ART linkage, and partner ART reengagement would avert 4%, 11%, 5%, and 18% of infections, respectively. Realistic improvements in partner identification and service delivery were estimated to avert 2% to 8% of infections, depending on the combination of improvements. Conclusions Achieving optimal HIV prevention with partner services depends on pairing improvements in partner identification with improvements in service delivery. Without both, the effects of HIV partner services will be limited. Improving the identification steps without improvement in uninterested service delivery steps, or vice versa, is projected to result in negligible population HIV prevention benefit. Article	2022	Jennings, Lauren; Kellermann, Tracy; Spinelli, Matthew; Nkumba, Zukiswa; Coaghil, Delphine; van Schalkwyk, Marije; Duckseih, Eric; van Zyl, Gert; Orrell, Catherine; Gandhi, Monica	Drug Resistance, Rather than Low Tenofovir Levels in Blood or Urine, Is Associated with Tenofovir, Emtricitabine, and Efavirenz Failure in Resource-Limited Settings.	AIDS Research and Human Retroviruses	-	-	-	-	-	1931-8405	10.1089/AID.2021.0135	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9252965/	The high cost of viral load (VL) testing limits its use for antiretroviral therapy (ART) adherence support. A low-cost lateral flow urine tenofovir (TFV) rapid assay predicts pre-exposure prophylaxis breakthroughs, but has not yet been investigated in HIV treatment. We therefore evaluated its utility in a pilot cross-sectional study of TFV-containing ART recipients at an increased risk of virologic failure (VF). Participants had a treatment interruption ≥30 days or had ≥1 episode of viremia (VL ≥400 copies/mL) in the previous year (viremia cohort) in Cape Town, South Africa. Self-reported adherence data were collected, the urine TFV assay performed, and concurrent TFV diphosphate analyzed in dried blood spots. VL testing was done concurrently and, if viremia, genotypic HIV drug resistance testing was performed. Of 48 participants, 18 (37.5%) had VL (>400 copies/mL) at the time of the study, including 10 of 39 receiving efavirenz (EFV), 2 of 6 receiving protease inhibitors, and 6 of 3 receiving dolutegravir. Resistance testing succeeded in 17/18, of which 14 had significant mutations compromising ≥2 agents of the current EFV-based regimen. Of these 14, all had detected urine TFV. Urine TFV was undetectable in two out of three without regimen-relevant resistance (p = .02). In participants on EFV-based regimens returning to care, VF was largely due to viral resistance, where detectable urine TFV had 100% sensitivity (14/14 participants) in predicting resistance. Conversely, when undetectable, the urine-based assay could be used to preclude participants with poor adherence from undergoing costly HIV drug resistance testing.	point of care; adherence; urine; resistance; real time	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	United States	Western and Central Europe and North America	Clinical
Article	2022	Jespers, Vicky; Borrell, Sabine; Carville, Serena; Cicciotti, Tania; Dufraimont, Els; Kenyon, Chris; Libois, Agnes; Mokrane, Saphia; Berghe, Wim Vanden	Diagnosis and treatment of syphilis: 2019 Belgian National guideline for primary care.	Acta Clinica Belgica	-	-	-	-	-	2295-3337	10.1080/17843286.2020.1773112	https://dx.doi.org/10.1080/17843286.2020.1773112	OBJECTIVES: In the last 10 years, Belgium and countries of the European Economic Area and other high-income countries observed an increasing trend in syphilis diagnoses. Men who have sex with men (MSM) are the selected population exploited by high rates of asymptomatic cases, a greater number of sexual partners, and risk compensation as a result of pre-exposure prophylaxis. In 2019 European Centre for Disease Prevention and Control (ECDC) technical report on syphilis proposed interventions such as enhanced screening of specific populations at risk. This guideline will address these issues. METHODS: We performed a systematic review of the evidence for diagnosing and treating syphilis. RESULTS: Based on the results, recommendations were formulated for primary health care professionals in Belgium. This syphilis guideline addresses prioritised testing, the sample and test for the diagnosis, the treatment of a person with syphilis including syphilis serology follow-up, and partner management. CONCLUSION: The identification and management of patients with syphilis will benefit from the application of this guideline. Article	2022	Jimenez V.; Thornton N.; Tikkas C.; Ghanem K.G.; Rubs S.; Hamdi M.M.; Romjada A.; Jennings J.M.	Psychological distress and adherence to anti-retroviral therapy or pre-exposure prophylaxis regimens among Urban Black gay and bisexual men (MSM)	International journal of STD & AIDS	-	-	-	-	-	9564624	10.1177/09564624221123466	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136649926&doi=10.1177%2F09564624221123466&partnerID=40&md5=f2959963a5940d29a1842bb262b2f2ed	Background: Urban Black gay, and bisexual men (MSM) bear a disproportionate burden of HIV in the U.S. Mental health is a barrier to adherence to both antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP). The objective was to determine the association between psychological distress and ART or PrEP adherence among urban Black MSM. Methods: Using data from a four-year prospective cohort study of urban Black MSM in Chicago, Illinois, Philadelphia, and Washington, D.C. conducted from 2014 to 2018. Participants completed audio computer-assisted self-interview questions to have a child in the future, sexual satisfaction, and life satisfaction. Psychological distress was classified as above the median value. Associations were examined using Chi-square, Fisher's exact tests, and logistic regression. Results: Among 165 Black MSM, 44.2% (73) reported high psychological distress. 63.3% (47/72) of participants living with HIV and 39.9% (27/93) of HIV negative participants were ART or PrEP adherence, respectively. Education was significantly associated with PrEP adherence (p = 0.038). Non-injection drug use in the past 3 months (p = 0.008), difficulty sleeping (p = 0.010), feeling anxious (p = 0.003), and feeling sad or depressed (p < 0.001), and overall psychological distress (p < 0.001) were significantly associated with ART adherence. High psychological distress was significantly associated with a reduced odds of ART adherence (aOR 0.23; 95% CI = 0.08–0.70) adjusting for age and non-injection drug use. Conclusions: Increased psychological distress was significantly associated with ART nonadherence and may represent an important barrier to viral suppression. © The Author(s) 2022.	adherence to care; ART; MSM; PrEP; psychological distress	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Jin X.; Shi L.; Wang C.; Qu T.; Yin Y.; Shen M.; Fu G.; Peng Z.	Cost-effectiveness of oral pre-exposure prophylaxis and expanded antiretroviral therapy for preventing HIV infections in the prevalence of drug-resistance among men who have sex with men in China: A mathematical modelling study	The Lancet Regional Health - Western Pacific	-	-	-	-	-	26666065	10.1016/j.lanwpc.2022.100462	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129462724&doi=10.1016%2Fj.lanwpc.2022.100462&partnerID=40&md5=6681e51954169621dc108ba0e5f20f4c	Background: Oral pre-exposure prophylaxis (PrEP) and antiretroviral therapy (ART) can effectively prevent HIV infections among men who have sex with men (MSM), but the emergence and transmission of HIV drug resistance (HIVDR) may compromise their benefits. The costs and benefits of expanding PrEP and ART coverage in the presence of HIVDR in China remain unknown. Methods: We developed a comprehensive dynamic transmission model incorporating the transmitted (TDR) and acquired (ADR) HIV drug resistance. The model was calibrated by the HIV surveillance data from 2009 to 2019 among MSM in China. We projected the HIV incidence, HIV-related deaths, and cost-effectiveness of PrEP and ART from 2020 to 2030. Findings: 29% or 50% PrEP + 50% ART would avert 27% (95% credible interval [CrI] 27%–27%) or 37% (95% CrI 37%–37%) infections and cost-effectiveness of PrEP were at least 10 years. Findings: 29% or 50% PrEP + 50% ART would avert 27% (95% credible interval [CrI] 27%–27%) or 37% (95% CrI 37%–37%) infections with an incremental cost-effectiveness ratio (ICER) of 25,417 (95% confidence interval CI, 12,390–38,445) or 47,243 (23,736–70,729), and would yield 154,949 (95.662–220,237) or 178,456 (102,370–224,362) incremental quality-adjusted life-years (QALYs) over the next 30 years. No PrEP + 90% ART would yield 125,211 (73,488–178,974) incremental QALYs and be cost-saving. However, 20–80% PrEP + 77%–ART and 80% PrEP + 90%–ART with ICER of $77,862–$98,138 and $63,332, respectively, and were not cost-effective. A reduction of 64% in the annual cost of oral PrEP would make it a highly cost-effective for 20% PrEP + 90%–ART. Interpretation: 20% or 50% PrEP + 90%–ART is cost-effective for HIV control in the presence of HIVDR. Expanded ART alone may be the optimal policy under the current limited budgets. Article	2022	Jing F.; Ye Y.; Zhou Y.; Zhou H.; Xu Z.; Lu Y.; Tao X.; Yang S.; Cheng W.; Tao J.; Tang W.; Wu D.	Modelling the geographical spread of HIV among MSM in Guangdong, China: A metapopulation model considering the impact of pre-exposure prophylaxis	Philosophical Transactions of the Royal Society A: Mathematical, Physical and Engineering Sciences	-	-	-	-	-	1364503X	10.1098/rsta.2021.0126	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122319168&doi=10.1098%2Frsta.2021.0126&partnerID=40&md5=f1f4b2cbbd9dc7bc586c38e9f998dc1c	Men who have sex with men (MSM) make up the majority of new human immunodeficiency virus (HIV) diagnoses among young people in China. Understanding HIV transmission dynamics among the MSM metapopulation is crucial for the effective control of the epidemic. In this study, we developed a novel metapopulation model to investigate the geographical spread of a hypothetically new genotype of HIV among MSM in Guangdong, China. We use multiple data sources to construct the model to characterize the behavioural dynamics underlying the spread of HIV within and between 21 prefecture-level cities (i.e. Guangzhou, Shenzhen, Foshan, etc.) in Guangdong province: the online social network via a gay social networking app, the offline human mobility network via the Baidu mobility website, and self-reported sexual behaviours among MSM. Results show that PrEP initiation substantially delays the occurrence of the virus for the rest of the cities transmitted from the initial outbreak city; hubs on the movement network, such as Guangzhou, Shenzhen, and Foshan are at a higher risk of 'earliest' exposure to the new HIV genotype; most cities acquire the virus directly from the initial outbreak city while others acquire the virus from cities that are not initial outbreak locations and have relatively high betweenness centralities, such as Guangzhou, Shenzhen and Shantou. This study provides insights in predicting the geographical spread of a new genotype of HIV among an MSM population from different regions and assessing the importance of prefecture-level cities in the control and prevention of HIV in Guangdong province. Article	2022	John, Steven A; Siemons, K Marie; Jimenez, Ruben H; Jones, S Scott; Petroll, Andrew E; Rendina, H Jonathon	The Use of HIV Pre- and Postexposure Prophylaxis Among a Web-Based Sample of HIV-Negative and Unknown Status Cisgender and Transgender Sexual Minority Men: Cross-sectional Study	JMIR Public Health and Surveillance	-	-	-	-	-	23693960	10.2196/31237	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144089878&doi=10.2196%2F31237&partnerID=40&md5=e81c46c42e0458b4857148982b7f45d2	Background HIV disproportionately affects sexual minority men (SMM) in the United States. Objective: We sought to determine past HIV postexposure prophylaxis (PEP) use and current and prior pre-exposure prophylaxis (PrEP) use among a national sample of cisgender and transgender SMM who were HIV negative or unknown status. Methods: Participants were recruited via geosocial networking apps, social media, and other web-based venues to participate in a brief eligibility screening survey. Individuals were asked about past PEP use and current and prior PrEP use. We examined associations of demographics, socioeconomic indicators, and recent club drug use with PEP and PrEP use, as well as the association between past PEP use and current and prior PrEP use using generalized and multinomial logistic regression. Statistical significance was considered at P<.001, given the large sample size; 99.9% CIs are reported. Results: Prior PEP use was reported by 11.28% (1108/63,015) of the participants, with current or prior PrEP use reported by 21.95% (13,832/63,015) and 8.12% (5116/63,015), respectively. Nearly half (3260/7108, 46%) of the past PEP users were current PrEP users, and another 39.9% (2836/7108) of the participants who reported past PEP use also reported prior PrEP use. In multivariable analysis, past PEP use was associated with current (relative risk ratio RRR 23.53, 99.9% CI 14.03-39.46) and prior PrEP use (RRR 52.14, 99.9% CI 29.39-92.50). Compared with White men, Black men had higher prevalence of past PEP use and current PrEP use, but lower prevalence of prior PrEP use. Past PEP use was highest in the Northeast, while participants in the Midwest and South reporting significantly lower PEP and PrEP use. A significant interaction of Black race by past PEP use with current PrEP use was found (RRR 0.57, 99.9% CI 0.37-0.87), indicating that Black men who previously used PEP were less likely to report current PrEP use. Participants who reported recent club drug use were significantly more likely to report past PEP use and current or prior PrEP use than those without recent club drug use. Conclusions: PrEP use continues to be the predominant HIV prevention strategy for SMM compared with PEP use. Higher rates of past PEP use and current PrEP use among Black SMM are noteworthy, given the disproportionate burden of HIV. Nonetheless, understanding why Black men who previously used PEP are less likely to report current PrEP use is an important avenue for future research. © Steven A John, K Marie Siemons, Ruben H Jimenez, S Scott Jones, Andrew E Petroll, H Jonathon Rendina. Article	2022	Johnson A.K.; Haider S.; Nikolajuk K.; Kubin L.M.; Ott E.; Morley D.; Hill B.; Hirschhorn L.	An mHealth Intervention to Improve Pre-Exposure Prophylaxis Knowledge among Young Black Women in Family Planning Clinics: Development and Usability Study	JMIR Formative Research	-	-	-	-	-	25633268	10.2196/37738	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134659503&doi=10.2196%2F37738&partnerID=40&md5=345fdb5b70d2a4b9698b3116fa3e8161	Background: Young Black women between the ages of 18 and 24 years are disproportionately impacted by HIV, yet they have a low self-perception of HIV risk and limited exposure to prevention strategies. Pre-exposure prophylaxis (PrEP) is a safe and effective biomedical HIV prevention strategy for those at risk for HIV infection, but uptake has been slow among cisgender women. Family planning clinics are a primary source of health care access for young women, providing an ideal opportunity to integrate PrEP information and care into existing clinic practices. Objective: The aim of this study was to use a multistage, community-engaged process to develop a mobile health app and to evaluate the feasibility and acceptability of the app. Methods: Using user-centered design, the In the Loop app was developed in collaboration with a community advisory board of young Black women. This study employed a multistage design, which included community-engaged app development, user testing, and evaluation of the app's usability, acceptability, and efficacy. Participants were recruited via social media and in family planning clinics in Chicago, Illinois, and surrounding suburbs between October 2020 and March 2021. RESULTS: Three hundred three pregnant women were included in the analysis. Baseline characteristics, including prepregnancy BMI, total load of prenatal care visits, and gestational age at delivery were similar by ART, including 53% of the entire cohort had initiated ART before pregnancy (P = nonsignificant). Excess gestational weight gain occurred in 29% of the cohort. Compared with non-integrase strand transfer inhibitor (-INSTI) or -tenofovir alafenamide fumarate (TAF)-exposed persons, receipt of INSTI+TAF showed a 1.7-fold increased RR of excess gestational weight gain (95% CI 1.18-2.44; P =.01), while women who received tenofovir disoproxil fumarate had a 0.64-fold decreased RR (95% CI .41-.99; P =.047) of excess gestational weight gain. INSTI alone was not significantly associated with excess weight gain in this population. The effect of TAF without INSTI could not be inferred from our data. There was no difference in neonatal, obstetric, or maternal outcomes between the groups. CONCLUSIONS: Pregnant women receiving ART with a combined regimen of -INSTI and TAF have increased risk of excess gestational weight gain.	adolescent health; HIV; mHealth; mobile app; mobile health; pre-exposure prophylaxis; PrEP; young Black women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Jourdan H.; de Gage S.B.; Desplas D.; Dray-Spira R.	Real-world effectiveness of pre-exposure prophylaxis in men at high risk of HIV infection in France: a nested case-control study	The Lancet Public Health	-	-	-	-	-	24682667	10.1016/S2468-2667(22)00106-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131472726&doi=10.1016%2FS2468-2667%2822%2900106-2&partnerID=40&md5=54a2f1136c5b919742f4b064e4e2	Background: Pre-exposure prophylaxis (PrEP) has shown high efficacy in clinical trials, but few observational studies have confirmed its effectiveness when prescribed in real life to users with diverse profiles. We aimed to assess the real-world effectiveness of PrEP in men at high risk of HIV infection in routine clinical practice in France. Methods: We did a nested case-control study using data from the French national health data system. Men who were newly diagnosed with HIV infection up to Dec 31, 2020, were individually matched with up to five controls for age, socioeconomic status, and place of residence, calendar year, and follow-up duration. PrEP use was characterised on the basis of tenofovir disoproxil fumarate plus emtricitabine dispensing over time. Conditional logistic regression was used to calculate adjusted odds ratios (ORs) of PrEP use associated with HIV infection. PrEP effectiveness (computed as 1–adjusted OR), was estimated, and restricted cubic splines were used to model nonlinearities and sociodemographic characteristics. Findings: Among a total of 46 706 individuals, 256 patients with HIV infection were identified and matched with 1213 controls. PrEP users accounted for 29% of cases and 69% of controls. PrEP effectiveness was 68% (95% CI 46 to 71) overall, reaching 91% (84 to 97) for a high amount of PrEP consumption, and 86% (78 to 92) if excluding periods after PrEP discontinuation. PrEP effectiveness was significantly reduced in people younger than 30 years (26% -21 to 54) and in those who were socioeconomically deprived (–64% -392 to 45), both of which groups showed low amounts of PrEP consumption and high rates of PrEP discontinuation. Interpretation: PrEP effectiveness appears to be lower in real-world conditions than in clinical trials. Strengthening efforts to improve the monitoring of PrEP compliance will be essential to ensure PrEP effectiveness, especially among young and socioeconomically deprived populations. Article	2022	Jucker, Beat M; Fuchs, Edward J; Lee, Sarah; Damian, Valerie; Galette, Paul; Janiczek, Robert; Macura, Katarzyna J; Kanzaria, Tarang J; Jacobs, Michael A; Weld, Ethel D; Subopjamras, Shiryupree; D'Amico, Ronald; Shuk, Jade Sudh; Bakshi, Kalpana; Hua, Kelong; Ford, Susan; Margolis, David; Spencer, William; Gupta, Manish K; Hendrix, Craig W; Patel, Parul	Multiparametric magnetic resonance imaging to characterize cabotegravir long-acting formulation depot kinetics in healthy adult volunteers.	British Journal of Clinical Pharmacology	-	-	-	-	-	1365-2125	10.1111/bcp.14977	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9290991/	AIM: Cabotegravir long-acting (LA) intramuscular (IM) injection is being investigated for HIV pre-exposure prophylaxis due to its potent antiretroviral activity and infrequent dosing requirement. A subset of healthy adult volunteers participating in a Phase 1 study assessing cabotegravir tissue pharmacokinetics underwent serial magnetic resonance imaging (MRI) to characterize drug depot localization and kinetics following a single cabotegravir LA IM targeted injection. METHODS: Eight participants (four men, four women) were administered cabotegravir LA 600 mg under ultrasonographic-guided injection targeting the gluteal muscles. MRI was performed to determine the location in gluteal muscle (GM), subcutaneous (SC) adipose tissue and combined IM/SC compartments, and to quantify drug depot characteristics, including volume and surface area, on Days 1 (≤2 hours postinjection), 3 and 8. Linear regression analysis examined correlations between MRI-derived parameters and plasma cabotegravir exposure metrics, including maximum observed concentration (Cmax) and partial area under the concentration-time curve (AUC) through Week 4 and 8. RESULTS: Cabotegravir LA depot locations varied by participant and were identified in the IM compartment (n = 2), combined IM/SC compartments (n = 4), SC compartment (n = 1) and retroperitoneal cavity (n = 1). Although several MRI parameter and exposure metric correlations were determined, total depot surface area on Day 1 strongly correlated with plasma cabotegravir concentrations at Day 3 and 8, Cmax and partial AUC through Weeks 4 and 8. CONCLUSION: MRI clearly delineated cabotegravir LA injection site location and depot kinetics in healthy adults. Although injection-site variability was observed, drug depot surface area correlated with both plasma Cmax and partial AUC independently of anatomical distribution. Article	2022	Kachale F.; Mabuka J.; Mbarira F.; Mugambi M.; Murunga J.; Nyabo R.; Ncube G.; Ndwiga A.; Nyirenda R.; Orindo V.; Carter A.; Dunbar M.; Fleischman J.; Rodrigues J.; Segal K.	Integration of HIV prevention and sexual and reproductive health in the era of anti-retroviral-based prevention: findings from assessments in Kenya, Malawi and Zimbabwe	Gates Open Research	-	-	-	-	-	23724754	10.12688/gatesopenres.13330.2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127265764&doi=10.12715%2Fgatesopenres.13330.2&partnerID=40&md5=a31977d03b0693034ce04c3d76262b94	Background:To End the HIV Epidemic requires the number of incident HIV infections in the United States by 90%, pre-exposure prophylaxis (PrEP) uptake and persistence among cisgender women, particularly racial and ethnic minority women, must be increased. Medical providers play a pivotal role across the PrEP care continuum.Methods:In this qualitative study, guided by the Consolidated Framework for Implementation Research, we explored health care provider perspectives on facilitators and barriers to PrEP implementation strategies for Black cisgender women in the Midwest United States. Data were analyzed using a deductive thematic content analysis approach.Results:A total of 10 medical providers completed individual qualitative interviews. Using the Consolidated Framework for Implementation Research framework, we identified intervention characteristics (cost, dosing, and adherence), individual patient and provider level factors (self-efficacy, knowledge, and attitudes), and systematic barriers (inner setting and outer setting) that ultimately lead to PrEP inequities. Implementation strategies to improve the PrEP care continuum identified include provider training, electronic medical record reminders, and community engagement.Conclusions:As new HIV prevention products are introduced, demand for integrated HIV prevention/SRH services is likely to grow. Investing in HIV prevention/SRH integration can help to ensure a sustainable response to this HIV epidemic, streamline service delivery and improve the health outcomes and lives of AGYW. Article	2022	Johnson, Kelly A.; Levy, Monica; Brosnan, Hannah; Kohn, Robert P.; Cohen, Stephanie E.	Texting Lost-to-follow-up PrEP Patients from a San Francisco Sexual Health Clinic.	Prevention Science	-	-	-	-	-	1573-6695 1389-4986	10.1007/s11121-022-01397-x	https://link.springer.com/article/10.1007/s11121-022-01397-x	It is critical to understand what happens when PrEP patients are lost-to-follow-up (LTFU) and, where appropriate, attempt to re-engage them in care with the goal of preventing future human immunodeficiency virus (HIV) acquisition. We evaluated the benefits and limitations of using text-based outreach to re-engage with LTFU PrEP patients and offer re-initiation of PrEP care. Using text-messaging, we surveyed San Francisco City Clinic patients who started PrEP from January 2015 to October 2019 and were LTFU by October 1, 2020. Our goals were to better understand (1) whether our patients remained on PrEP through another provider or source, (2) why patients choose to discontinue PrEP, and (3) whether text-based outreach could successfully re-engage such patients in care. Multiple-choice survey questions were analyzed quantitatively to determine the proportion of respondents in each category. Open-ended survey questions were analyzed qualitatively using a deductive coding approach. Of 1,117 LTFU patients, 36 additional receiving these. Of 646 eligible survey recipients, 150 responded (overall response rate 23.4%). Forty-two respondents (32.3%) were still on PrEP through another provider while 88 (67.7%) were not. Common reasons for stopping PrEP included: COVID-19-related changes in sex life (32.3% of responses), concerns regarding side effects (17.7%), and the need to take a daily pill (8.3%). Free text responses revealed additional concerns regarding risk compensation. While 32 participants agreed to be contacted by City clinic staff for PrEP counseling, only 6 were reached by phone and none of the six subsequently restarted PrEP. We learned that text messaging is a possible approach to survey certain PrEP program participants to determine who is truly LTFU and off PrEP, and to better understand reasons for PrEP discontinuation. While such information could prove valuable as programs seek to address barriers to PrEP retention, efforts to improve acceptability and increase response rates would be necessary. We were less successful in re-engaging LTFU patients in PrEP care, suggesting that text-messaging may not be the optimal strategy for this purpose. Article	2022	Kaldo-Mulhelwa D.; Kesnet L.; Lesan V.; Rieland J.; Smola S.; Werdecker V.; Silgenbauer S.; Christoffjakka K.; Thurner L., Bewarder M.; Lohr B.; Lutz J.; Lohse S.; Bokk A.	IgG seroprevalence of COVID-19 among people living with HIV or at high risk of HIV in south-west Germany: A seroprevalence study	HIV Medicine	-	-	-	-	-	1464-2662	10.1111/hiv.13207	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119675054&doi=10.1111%2Fhiv.13207&partnerID=40&md5=a4a353d052f29573567351a0b9ecbf	Objectives: Seroprevalence studies of SARS-CoV-2 here shown that there is a high number of undiagnosed missing cases. Seroprevalence of SARS-CoV-2 in people living with HIV (PLWH) is lacking. Therefore, we conducted a prospective cross-sectional study to estimate the seroprevalence of SARS-CoV-2 among PLWH without known diagnosis of COVID-19 in the south-west of Germany. Methods: Serological testing for SARS-CoV-2 immunoglobulin G (IgG) antibodies based on two assays was performed in PLWH who visited the outpatient HIV centre of two hospitals from April to June 2020. Additionally, patients had to answer questionnaires about possible COVID-19-related symptoms and predefined risk factors. Moreover, we tested 50 non-HIV-infected patients receiving post- or pre-exposure [PEP/PrEP] HIV prophylaxis. Results: In all, 584 (488 male, 106 female) PLWH (median age 51 years) and 50 PEP/PrEP-users were included in the study. The estimated seroprevalence of the PLWH cohort was 1.2% (95% CI 0.4–2.5%). Of the seropositive PLWH, 57.1% (4/7) reported symptoms of COVID-19 and 42.9% (3/7) had a positive SARS-CoV-2 polymerase chain reaction (PCR) test result saved even here. None of the patients was hospitalized due to COVID-19. Three PrEP-users were tested positive. Three patients had been previously diagnosed with SARS-CoV-2 infection before inclusion. The used questionnaire did not help to detect SARS-CoV-2 positive patients. Conclusions: Despite the limitation of being only a snapshot in time because of the ongoing pandemic, to our knowledge this is the largest study so far on seroprevalence of SARS-CoV-2 in PLWH in Germany. Our study suggests that the seroprevalence of SARS-CoV-2 in PLWH is comparable to those previously reported for parts of the general German population and that the questionnaire used here might not be the best tool to predict COVID-19 diagnosis. © 2021 The Authors. Article	2022	Kaewpoowat Q.; Chariyalertsak S.; Phanuphak N.; Ramautarsing R.A.	Long-acting preexposure prophylaxis in low- And middle-income countries: key considerations for implementation	Current Opinion in HIV and AIDS	-	-	-	1746630X	10.1097/COH.0000000000000729	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128798030&doi=10.1097%2fCOH.0000000000000729&partnerID=40&md5=3a30e9fe06080d859ba153a91813b07e	Purpose of review HIV preexposure prophylaxis (PrEP) is a key tool in ending the HIV epidemic. Long-acting cabotegravir (LA-CAB) phase II/III studies revealed promising efficacy in preventing HIV acquisition. Here, we discuss key considerations for implementing LA-CAB in low- and middle-income countries (LMIC). Recent findings PrEP roll out in LMIC is still far from ideal, and contextual factors within LMIC vary widely. Implementation science studies are urgently needed to optimize the implementation of LA-CAB in different settings, consider effective service delivery models, and ensure program sustainability. Preferences and concerns regarding LA-CAB among potential users are unknown but likely specific to local context. Demedicalized and simplified PrEP service delivery increases uptake, and ways to safely and effectively do the same for LA-CAB need to be explored. Although ideally LA-CAB should be an additional choice of HIV prevention method, its cost will be the major determinant in deciding its position as a first line choice or restricted second-line option. Summary LA-CAB has the potential to enhance PrEP uptake. However, several implementation challenges need to be explored and addressed to ensure it can be accessed and utilized in different settings by those who need it the most. Article	2022	Kalinoski, Thomas; DeWitt, Cassandra; Belani, Hrishikesh	Harm reduction readiness for illicit IV drug use among safety-net primary care practices in the San Fernando Valley.	Arch Public Health	-	-	-	0778-7367	10.1186/s13690-022-00855-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8985360	BACKGROUND: Harm reduction is an accumulation of strategies aimed at preventing adverse health outcomes associated with illicit substance use. Several harm reduction programs and services exist within Los Angeles County (LAC), however their success relies in part on the application of harm reduction principles by local primary care providers serving patients with substance use disorders. This study aims to assess the readiness of patient-centered medical homes in the San Fernando Valley to provide effective harm reduction to patients who use injection drugs and identify barriers to doing so. METHODS: An online survey was distributed to primary care providers and social workers via email at federally qualified health centers and LAC Department of Health Services clinics in the San Fernando Valley between May and June 2019. It consisted of 22 multiple-choice, Likert scale, and short answer questions. The survey assessed knowledge of injection drug use (IDU), familiarity and utilization of harm-reduction and resources, and self-evaluation of attitudes and skills. RESULTS: There were a total of 41 survey respondents across all clinics. Of respondents, 98% correctly identified heroin as a drug typically injected, and 93% identified Hepatitis C as an infectious risk of IDU. 63% of respondents use harm reduction strategies every few months or less. 34% prescribe buprenorphine routinely, and 76% prescribe pre-exposure prophylaxis to those at risk for Human Immunodeficiency Virus (HIV). 76% are comfortable discussing IDU with their patients, but 59% indicate that they lack the necessary skills, and 42% agree that they lack the time to address it. CONCLUSION: Knowledge of IDU was adequate among those surveyed, although overall utilization of harm reduction was infrequent. There is a perceived deficit in skills and time to effectively provide harm reduction to primary care patients in the San Fernando Valley. Article	2022	Kanamori M.; Shrader C.-H.; Flores-Arroyo J.; Johnson A.; Rodriguez E.; Fallon S.; Skvoretz J.; Gonzalez V.; Doblecki-Lewis S.; Carrico A.; Fujimoto K.; Williams M.; Safren S.	The association between egocentric sexual networks and sexual meeting venues with PrEP conversation and encouragement for use among Latinx men who have sex with men	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.2023728	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122820619&doi=10.1080%2f09540121.2021.2023728&partnerID=40&md5=3259f7327966090c36395ceec4cef9d2	Despite the increasing availability of pre-exposure prophylaxis (PrEP), Latinx men who have sex with men (LMSM) are not receiving PrEP-related information. To understand the influence of LMSM sexual networks on PrEP-related conversations and encouragement to use PrEP, this cross-sectional egocentric network study characterized the PrEP-related communication of 130 LMSM egos with 507 sexual partners (alters). Participants were recruited using respondent-driven sampling methods from a Miami-Dade County community-health organization. Egocentric-level data were collected from 2018–2019 and analyzed using multilevel modeling. Of egos, 30% reported having PrEP conversations. Closeness between participants and sexual partners played a role in PrEP conversation and encouragement. Participants believed they would have less success convincing sexual partners to use PrEP if partners were older. Participants perceived higher likelihood to talk about PrEP or success in encouraging alters to use PrEP if, relative to meeting sexual partners on Grindr, they met at a friend's party, gay-centric community event, or school/work. Given that increased closeness and in-person sexual partner meeting venues are associated with PrEP information dissemination and encouragement, social network-based interventions can capitalize on PrEP navigators who run network visualizations, and with this information develop a longitudinal plan to increase PrEP conversation and encouragement as needed for each network. © 2022 Informa UK Limited, trading as Taylor & Francis Group. Article	2022	Kanamori M.; Shrader C.-H.; Johnson A.; Arroyo-Flores J.; Rodriguez E.; Skvoretz J.; Fallon S.; Gonzalez V.; Safren S.; Williams M.; Doblecki-Lewis S.	The Association Between Homophily on Illicit Drug Use and PrEP Conversations Among Latino Men Who Have Sex with Men Friends: A Dyadic Network and Spatially Explicit Study	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-021-02131-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119170030&doi=10.1007%2fs10508-021-02131-4&partnerID=40&md5=9a69bebc308b08375ac3ac19788c6e67	Despite the wide availability of PrEP, Latino men who have sex with men (LMSM) continue to experience access barriers. Novel HIV prevention research strategies to increase PrEP uptake and adherence among the high incidence populations, such as LMSM who misuse drugs, include social network analyses. This study identified the associations of drug use homophily within LMSM friendship networks and PrEP promotion conversations and described the physical overlap between geographic drug risk areas with conversations of PrEP promotion. Respondent-driven sampling was used to recruit 10 sociocentric networks. Quadratic assignment procedure (QAP) correlations and multiple regression QAPs were used to identify influences of drug use homophily, and geocoding and visualizations to describe drug use polygons and PrEP conversations. Friendship relationships in which both friends used cocaine or marijuana were more likely to report PrEP-related conversations in the past six months. The likelihood of talking about PrEP in the next six months was higher among dyads with cocaine use homophily and ecstasy use homophily, while lower among dyads with marijuana use homophily. Participants reported using marijuana and cocaine throughout Miami-Dade County while ecstasy polygons were mostly in urban areas. The majority of drug polygons associated with PrEP conversations were located in north and central Miami. Future interventions can consider enrolling entire sociocentric friendship groups, configuring friendship networks to connect those without PrEP information to those with information, and incorporating peer leaders. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Kang J.-Y.; Farkhad B.F.; Chan M.-P.S.; Michels A.; Albarracin D.; Wang S.	Spatial accessibility to HIV testing, treatment, and prevention services in Illinois and Chicago, USA	PLOS One	-	-	-	19326203	10.1371/journal.pone.0270404	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135047722&doi=10.1371%2fjournal.pone.0270404&partnerID=40&md5=1a48f9141baea91112b785e84fa0d03a	Accomplishing the goals outlined in "Ending the HIV (Human Immunodeficiency Virus) Epidemic: A Plan for America Initiative" will require properly estimating and increasing access to HIV testing, treatment, and prevention services. In this research, a computational spatial method for estimating access was applied to measure distance to services from all points of a city or state while considering the size of the population in need for services as well as both driving and public transportation. Specifically, this study employed the enhanced two-step floating catchment area (E2SFCA) method to measure spatial accessibility to HIV testing, treatment (i.e., Ryan White HIV/AIDS program), and prevention (i.e., Pre-Exposure Prophylaxis [PrEP]) services. The method considered the spatial location of MSM (Men Who have Sex with Men), PLWH (People Living with HIV), and the general adult population 15–64 depending on what HIV services the U.S. Centers for Disease Control (CDC) recommends for each group. The study delineated service- and population-specific accessibility maps, demonstrating the method's utility by analyzing data corresponding to the city of Chicago and the state of Illinois. Findings indicated health disparities in the south and the northwest of Chicago and particular areas in Illinois, as well as unique health disparities for public transportation compared to driving. The methodology details and computer code are shared for use in research and public policy. © 2022 Kang et al. Article	2022	Kaplun E.; Martino R.J.; Krause K.D.; Briganti M.; D'avanzo P.A.; Halkitis P.N.	Post-Exposure Prophylaxis and Methamphetamine Use among Young Sexual Minority Men: The P18 Cohort Study	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph19020712	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122367163&doi=10.3390%2fijerph19020712&partnerID=40&md5=980bc72dc601e005608f3d72c51e7fcb	Methamphetamine use is associated with increased risk of HIV infection among young sexual minority men (SMM). Post-exposure prophylaxis (PEP) is an effective strategy for individuals who are exposed to HIV, but there is limited research about PEP use among young SMM and its relationship with methamphetamine use. This study analyzes the association between ever PEP use and recent methamphetamine use among young SMM in New York City, using cross-sectional data from the P18 Cohort Study (n = 429). Multivariable logistic regression models were used to assess the association between methamphetamine use and ever PEP use. Compared with those who had not used methamphetamine in the last 6 months, young SMM who did use methamphetamine were significantly more likely to have ever used PEP (AOR = 6.07, 95% CI: 2.10–16.86). Young SMM who had ever used PrEP had 16 times higher odds of ever using PEP (AOR = 16, 95% CI: 7.41–35.95). Those who completed bachelor's degrees were 61% less likely to have ever used PEP (AOR = 0.39, 95% CI: 0.17–0.88). These data suggest that methamphetamine use could increase the risk of HIV infection, highlighting the critical need to target interventions for young SMM who use methamphetamine and are more likely to engage in unprotected intercourse. © 2022 by the authors. Article	2022	Kapoor, A; Mussa, A; Diseko, M; Mayondi, G; Mabuta, J; Mmalane, M; Makhema, J; Morroni, C; Lockman, S; Zash, R; Shapiro, R	Cross-sectional trends in HIV prevalence among pregnant women in Botswana: an opportunity for PrEP?	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25892	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8944218/	Introduction Young women in sub-Saharan Africa are at particularly high risk of HIV acquisition. Recent shifts towards "test and treat" strategies have potential to reduce transmission in this age group but have not been widely studied outside of clinical trials. Using data from nationwide surveillance among pregnant women in Botswana, where a "test and treat" program was implemented in 2016, we describe trends in HIV prevalence over time and highlight opportunities for targeted prevention. Methods The Tsepamo study abstracted data from obstetric records of all women delivering at eight government hospitals in Botswana between 2015 and 2019, accounting for 45% of all births in the country (n = 120,755). We used a stratified analysis to identify prevalence trends and evaluated decreases in HIV prevalence over time using the Cochrane-Armitage test for linear trend. A multivariable logistic regression analysis was also performed to identify factors associated with declines in HIV prevalence. Results Overall HIV prevalence was 24.1% among 120,755 women who delivered during the study period. Prevalence differed by site of delivery, ranging from 16.1% to 28.2%, and increased markedly with age. Lower educational attainment (adjusted odds ratio aOR = 3.28; 95% confidence interval CI 3.07-3.50) and being unmarried (aOR = 1.98; 95% CI 1.88-2.08) were associated with HIV infection. HIV prevalence was 10.0% with a first pregnancy, 21.0% with a second and 39.2% with a third or greater (aOR = 2.20; for any prior pregnancy; 95% CI 2.10-2.29). The same age-adjusted trends were seen when data were limited to women aged 15-24, with a two- to three-fold increase in HIV prevalence between a first and third pregnancy. Prevalence decreased linearly during the 5-year study period from 25.8% to 22.7% (p <0.001). Among age-specific strata, the greatest absolute decline occurred in those aged 35-39, with an 8.7% absolute decrease in HIV prevalence from 2015 to 2019. Minimal declines were seen in those 15-24, with a decrease of only 1.5% over the same period. Conclusions While overall trends in Botswana show HIV prevalence declining among pregnant women, prevalence among the youngest age group has remained stagnant. Preventative interventions utilizing pre-exposure prophylaxis should be prioritized during the high-risk period surrounding a woman's first pregnancy. Women for science and science for women: Gaps, challenges and opportunities towards optimizing pre-exposure prophylaxis for HIV-1 prevention	Frontiers in Immunology	-	-	-	16643224	10.3389/fimmu.2022.1055042	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144165117&doi=10.3389%2ffimmu.2022.1055042&partnerID=40&md5=2cf37b031c33133278e70934d0615a11	Preventing new HIV infections remains a global challenge. Young women continue to bear a disproportionate burden of infection. Oral pre-exposure prophylaxis (PrEP), offers a novel women-initiated prevention technology and PrEP trials completed to date underscore the importance of their inclusion early in trials evaluating new HIV PrEP technologies. Data from completed topical and systemic PrEP trials highlight the role of gender specific physiological and social factors that impact PrEP uptake, adherence and efficacy. Here we review the past and current developments of HIV-1 prevention options for women with special focus on PrEP considering the diverse factors that can impact PrEP efficacy. Furthermore, we highlight the importance of inclusion of female scientists, clinicians, and community advocates in scientific efforts to further improve HIV prevention strategies. A Mobile Phone App to Support Adherence to Daily HIV Pre-exposure Prophylaxis Engagement Among Young Men Who Have Sex With Men and Transgender Women Aged 15 to 19 Years in Thailand: Pilot Randomized Controlled Trial	JMIR mHealth and uHealth	-	-	-	22915222	10.2196/25561	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129653929&doi=10.2196%2f25561&partnerID=40&md5=dbc9e18806837d379c5c57129853c86f	Background: Widespread smartphone use provides opportunities for mobile health HIV prevention strategies among at-risk populations. Objective: This study aims to investigate engagement in a theory-based (information-motivation-behavioral skills model) mobile phone app developed to support HIV pre-exposure prophylaxis (PrEP) adherence among Thai young men who have sex with men (YMSM) and young transgender women (YTGW) in Bangkok, Thailand. Methods: A randomized controlled trial was conducted among HIV-negative YMSM and YTGW aged 15-19 years initiating daily oral PrEP. Participants were randomized to receive either youth-friendly PrEP services (YFS) for 6 months, including monthly contact with site staff (clinic visits or telephone follow-up) and staff consultation access, or YFS plus use of a PrEP adherence support app (YFS+APP). The target population focus group discussion findings and the information-motivation-behavioral skills model informed app development. App features were based on the 3Rs-risk assessment of self-HIV acquisition risk, reminders to take PrEP, and rewards as redeemable points. Dried blood spots quantifying of tenofovir diphosphate were collected at months 3 and 6 to assess PrEP adherence. Tenofovir diphosphate ≥350-699 fmol/punch was classified as fair adherence and ≥700 fmol/punch as good adherence. Data analysis on app usage app paradata and exit interviews were conducted on the YFS+APP arm after 6 months of follow-up. Results: Between March 2018 and June 2019, 200 participants with a median age of 18 (IQR 17-19) years were enrolled. Overall, 74% (148/200) were YMSM; 87% (87/100) of participants who received YFS+APP logged in to the app and performed weekly HIV acquisition risk assessments (log-in and risk assessment LRA). The median duration between the first and last log-in was 3.5 (IQR 1.6-5.6) months, with a median frequency of 6 LRAs (IQR 2-10). Moreover, 22% (22/100) of the participants in the YFS+APP arm were frequent users (LRA≥10) during the 6-month follow-up period. YMSM were 9.3 (95% CI 1.2-74.3) times more likely to be frequent app users than YTGW (P = .04). Frequent app users had higher proportions (12%-16%) of PrEP adherence at both months 3 and 6 compared with infrequent users (LRA<10) and the YFS arm, although this did not reach statistical significance. Of the 100 participants in the YFS+APP arm, 23 (23%) were interviewed. The risk assessment function is perceived as the most useful app feature. Further aesthetic adaptations and a more comprehensive rewards system were suggested by the interviewees. Conclusions: Higher rates of PrEP adherence among frequent app users were observed; however, this was not statistically significant. A short app use duration of 3 months suggests that they may be useful in establishing habits in taking daily PrEP, but not long-term adherence. Further studies on the specific mechanisms of mobile phone apps that influence health behaviors are needed. © Surinda Kawichai, Wipaporn Natalie Songtaweesin, Prissana Wongharn, Nittaya Phanuphak, Tim R Cressey, Juthamanee Moonwong, Anuchit Vasinonta, Chutima Saisaengjan, Tanat Chinbunchorn, Thanyawee Puthanakit.	adolescents; men who have sex with men; mHealth; mobile phone; PrEP adherence; transgender women	English	Canada	Western and Central Europe and North America	Thailand	Asia and the Pacific	Thailand	Asia and the Pacific	Mixed methods
Article	2022	Kawuma R.; Nabalwanyi Z.; Seeley J.; Mayanja Y.	"I prefer to take pills when I plan to have sex": Perceptions of on-demand versus daily oral pre-exposure prophylaxis among adolescents in Kampala, Uganda	African Journal of AIDS Research	-	-	-	16085906	10.2989/16085906.2022.2039727	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127412916&doi=10.2989%2f16085906.2022.2039727&partnerID=40&md5=4391379b7e6bd4efb16fc04badcd02bd	There is limited information about the use of on-demand and daily pre-exposure prophylaxis (PrEP) among adolescents and young people (AYP) in sub-Saharan Africa. We explored perceptions of both regimens among 14- to 19-year-olds perceived to be at high risk of HIV infection in Kampala, Uganda, using qualitative data collection methods. Data were analysed by theme and interpreted based on constructs from the framework of acceptability. Although there were no noticeable gender differences in preferences for a particular regimen, acceptability of PrEP depended on individual AYP sexual behaviour at the time of the study. Those who perceived themselves to be at increased risk of acquiring HIV preferred using daily PrEP, citing the consistency that comes from taking a pill daily and which they considered to be efficacious and safe. AYP who had less frequent sex preferred on-demand PrEP because it would enable them to "plan for sex". However, both groups perceived taking daily PrEP to be a burden, which was an impediment to acceptance of this form of PrEP. AYP anticipated that daily pill taking would be very stressful, requiring a lot of effort and would interrupt their daily routine. Therefore, while both on-demand and daily PrEP were acceptable and beneficial to these AYP, preferences for either regimen depended on self-perceived risk. Thus, oral PrEP use should be tailored to end-user preferences and risk profiles. © 2022 The Author(s). Article	2022	Kay E.S.; Bruce J.; Foster-Hill S.; Rygiel A.; Batey D.S.	Addressing HIV and Homelessness During COVID-19: A Community-Based Demonstration Project	Health Promotion Practice	-	-	-	15248399	10.1177/15248399221135589	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143613300&doi=10.1177%2f15248399221135589&partnerID=40&md5=1eef96d184e16d7c207f32ed08cbb104	People experiencing homelessness are at increased risk for HIV, and people with HIV (PWH) experiencing homelessness are more likely to experience suboptimal HIV health outcomes than PWH with stable housing. Within Alabama, a state prioritized in the Ending the HIV Epidemic initiative, Jefferson County consistently has the highest number of new HIV diagnoses as well as a high percentage of the state's homeless population. To address the twin epidemics of both HIV and homelessness within the high-priority setting of Jefferson County, Alabama, this 1-year community-based project, Ending the HIV Epidemic: Addressing HIV Health and Homelessness (AH3), sought to increase HIV testing and linkage to care among this population by placing a full-time case manager trained in HIV testing and case management at a homeless shelter. Results demonstrated that HIV testing was highly acceptable: 733 individuals were offered a test, and only 2.7% (n = 20) declined. Nine previously diagnosed, out of care PWH and one newly diagnosed PWH were identified through AH3 testing efforts. Of these, five (50%) were linked to care at a local HIV clinic. The remaining five PWH left the shelter before they could be linked to care. Just 10 shelter guests expressed interest in taking PrEP (just 1.4% of guests who tested negative for HIV), and only one of these linked to PrEP care. Future health promotion programs are needed to address mental health and other ancillary needs among this population, as well as programs that provide access to PrEP and other HIV prevention services. © 2022 Society for Public Health Education.	access to health care; community organization; health promotion; HIV/AIDS	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Kayesu I.; Mayanja Y.; Nakirijja C.; Machira Y.W.; Price M.; Seeley J.; Siu G.	Uptake of and adherence to oral pre-exposure prophylaxis among adolescent girls and young women at high risk of HIV-infection in Kampala, Uganda: A qualitative study of experiences, facilitators and barriers	BMC Women's Health	-	-	-	14726874	10.1186/s12905-022-02018-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141597249&doi=10.1186%2fs12905-022-02018-z&partnerID=40&md5=ecee8a1d421a798fd8cbf8190bda3f2a	Background: There is limited information on factors that influence oral pre-exposure prophylaxis (PrEP) uptake and adherence among adolescent girls and young women (AGYW). We conducted a qualitative methods study to explore experiences, facilitators and barriers of PrEP uptake and adherence to PrEP among AGYW at risk of Human Immunodeficiency Virus (HIV) infection in Kampala, Uganda. Methods: This study was nested in a prospective cohort study that offered daily oral PrEP to AGYW. Between April 2019 and October 2020 we conducted in-depth interviews with 26 AGYW aged 14–24 years who had been offered or had been using PrEP for at least 6 months, including PrEP adherers (8), non-adherers (8) and those who had declined PrEP (10). After 12 months, follow-up interviews were conducted with 12 AGYW who had adhered to PrEP and those who had dropped it. Thematic analysis was conducted and data were further examined and categorized into the 5 constructs of the Socio-Ecological Model (SEM). Results: PrEP uptake and adherence were facilitated by factors including: perceptions that one's own or partner's sexual behaviour was high risk, a negative attitude towards condoms, social support and wanting to maintain a negative HIV status after receiving a negative HIV test result. Good adherence to PrEP was enabled by effective counselling, support tools such as alarms and phone reminders and incentives like free treatment for STIs and other illnesses during study visits. Barriers to uptake included: anxiety about the pill burden, perceptions of being too young for PrEP and fear of being labelled `prostitute' or `HIV positive'. Poor adherence was attributed to doubt over the efficacy of PrEP as a result of beliefs that because HIV was incurable, no medicine could prevent it. Alcohol use, side effects experienced, and mobility all had a negative impact on adherence. The majority of PrEP users reported feeling safe as a result of using PrEP which had both good and negative implications on their sexual behaviour, specifically the number of sexual partners and condom use. Conclusion: Addressing community misconceptions to maximize uptake of PrEP among AGYW is important. Targeted education messages, and counselling to address misconceptions in ways that capture the attention of AGYW in communities are required. © 2022, The Author(s). Article	2022	Keane A.; Regan S.O.; Quinn L.; Murphy D.; Kelly B.O.; Lynam A.; Lyons F.; Devitt E.	Evaluation of the impact of human immunodeficiency virus pre-exposure prophylaxis on new human immunodeficiency virus diagnoses during the COVID-19 pandemic	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624211054587	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120571108&doi=10.1177%2f09564624211054587&partnerID=40&md5=baae6a620a33ed165aea0ac9a5337e7a	Aims: The national PrEP programme launched in Ireland in November 2019 with tenofovir/emtricitabine free to those meeting eligibility criteria. We assessed the impact of the first year of the PrEP programme on new HIV diagnoses in the largest sexual health and HIV service in Ireland. Methods: A free PrEP service was established in November 2019. We reviewed the number of new diagnoses of HIV between November 2018–2019, before the introduction of the national PrEP programme and compared this with the number of new HIV diagnosis between November 2019–2020. Results: There were 95 new HIV diagnoses (63.3% MSM) between November 2018 and 2019 and 73 new HIV diagnoses (65.7% MSM) between November 2019 and 2020. There was a statistically significant decline in new HIV diagnoses between the 2 years (P = 0.0003). 546 patients were prescribed PrEP as of December 2020.106 patients (19.4%) changed their PrEP dosing regimen due to lockdown. 178 individuals (32.6%) had a rectal infection diagnosed. Conclusion: There has been a reduction in new HIV diagnoses in our cohort (although this has occurred during a global pandemic). It is too early to say if PrEP reduces late presentations of HIV based on our findings. A significant number of rectal infections were identified in the PrEP clinic suggesting ongoing risk despite pandemic restrictions. Further research into sexual practices during COVID-19 is needed to assess if this had an impact on the lower rates of HIV acquisition. © The Author(s) 2021.	diagnosis; Human; immunodeficiency virus, viral disease; prevention; screening; sexual behaviour	English	United Kingdom	Western and Central Europe and North America	Ireland	Western and Central Europe and North America	Ireland	Western and Central Europe and North America	Review
Article	2022	Keizur E.; Robinson E.; Sha B.E.; Aziz M.; Shankaran S.	Effectiveness of an electronic health record model for HIV pre-exposure prophylaxis	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624221079070	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126022334&doi=10.1177%2f09564624221079070&partnerID=40&md5=7b8c27d9baea3b11d932667f8f200cc8	Pre-exposure prophylaxis (PrEP) to prevent human immunodeficiency virus (HIV) is extremely effective when taken correctly, though grossly under-prescribed for at-risk patients. We initiated a best practice advisory (BPA) in the Epic electronic medical record (EMR) to identify patients who met criteria for PrEP use. We evaluated this model to determine its effectiveness in identifying patients and its use by providers for increasing prescription of PrEP. The BPA fired 145 times with five total new PrEP prescriptions. Over half of the patients identified were cisgender women, a group that is both under prescribed PrEP and missed by prior EMR PrEP algorithms. Half of the patients were African American, a group at high risk of HIV infection. Though the model was effective at identifying patients, provider initiation of PrEP or acknowledgment of the BPA was low. Further education of providers regarding PrEP usage and expansion of BPA messages are needed to increase rates of PrEP initiation. © The Author(s) 2022. Article	2022	Kennedy C.E.; Yeh P.T.; Atkins K.; Ferguson L.; Baggaley R.; Narasimhan M.	PrEP distribution in pharmacies: A systematic review	BMJ Open	-	-	-	20446055	10.1136/bmjopen-2021-054121	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125156348&doi=10.1136%2fbmjopen-2021-054121&partnerID=40&md5=cf12d8d6b4950ae8f96c50489f2f12b3	Introduction Novel mechanisms of service delivery are needed to expand access to pre-exposure prophylaxis (PrEP) for HIV prevention. Providing PrEP directly through pharmacies could offer an additional option for reaching potential users. Methods We conducted a systematic review of studies examining effectiveness, values and preferences of end users and health workers, and cost of PrEP initiation and continuation through pharmacies (pharmacy access). We searched PubMed, CINAHL, LILACS and EMBASE through 2 December 2020. We also searched clinical trial registries and recent HIV conference abstracts. Standardised methods were used to search, screen and extract data from included studies. Results No studies met the inclusion criteria for the effectiveness review, for either PrEP initiation or continuation. However, six â € case studies' presenting non-comparative data from PrEP pharmacy programmes demonstrated feasibility of this model in the USA. Eleven studies reported values and preferences of end users and health workers. In the USA, Kenya and South Africa, potential PrEP clients generally supported pharmacy access, although some preferred clinics. One study of PrEP pharmacy clients found all would â € definitely recommend' the programme. Six studies found pharmacists were generally supportive of offering PrEP; one study including doctors found more limited favour, while one study of diverse Kenyan stakeholders found broad support. Three studies reported cost data indicating client willingness to pay in the USA and Kenya and initial sustainability of a clinic financial model in the USA. Conclusion Provision of PrEP through pharmacies has been demonstrated to be feasible in the USA and acceptable to potential end users and stakeholders in multiple settings. Limited evidence on effectiveness and requirements for laboratory testing and quality services may limit enthusiasm for this approach. Further research is needed to determine if pharmacy access is a safe and effective way to help achieve global HIV prevention goals. Article	2022	Kerr J.; Ayangeakaa S.; Bullock N.A.A.; Burton K.; Combs R.; Harris L.; Sterrett-Hong E.; Rozema I.; Sears J.; Northington T.	A Qualitative Exploration of Various Stigmas Impacting HIV Pre-Exposure Prophylaxis (PrEP) Uptake Among African American Young Adults	Family and Community Health	-	-	-	1606379	10.1097/FCH.0000000000000346	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137008235&doi=10.1097%2fFCH.0000000000000346&partnerID=40&md5=6a02eb782117c8df85270732e7b03daf	Pre-exposure prophylaxis (PrEP) has promise for reducing racial/ethnic HIV disparities; yet, acceptance among African Americans remains low. PrEP-related stigmas may impact uptake, but this is understudied. This study examines mechanisms by which stigma impacts PrEP acceptance among various priority African American populations. Focus group data from 63 African American young adults (aged 18-29 years) in Louisville, Kentucky, explore how various stigmas impact attitudes toward PrEP. Data were analyzed using grounded theory analytic techniques. PrEP stigma, HIV stigma, sexual behavior stigma, and homophobia/transphobia individually reduce PrEP uptake. These stigmas also interact synergistically to undermine PrEP acceptance. Key challenges resulting from various stigmas and their interactions include medical hesitancy, lack of perceived susceptibility based on gender and sexuality, the role of gender norms in HIV prevention, and deprioritizing HIV prevention due to social rejection. Interventions to increase awareness, destigmatize PrEP, remediate social marginalization related to identity, HIV status, and gendered perceptions of sexual risk, as well as more focus on diverse priority groups, are needed to present PrEP as a viable HIV prevention option for African American communities. More research is needed to optimize strategies that address stigma and increase acceptance of novel HIV prevention technologies. © 2022 Lippincott Williams and Wilkins. All rights reserved. Article	2022	Kerr, Jelani; Bullock, Nana Ama Aya; Burton, Kelsey; Mitchell, Carmen; Harris, Lesley; Combs, Ryan; Krigger, Karen; Northington, Toya	Predictors of Pre-exposure Prophylaxis Awareness among African American Young Adults in Louisville, Kentucky.	Journal of Health Care for the Poor and Underserved	-	-	-	1548-6869	10.1353/hpu.2022.0121	https://dx.doi.org/10.1353/hpu.2022.0121	Low pre-exposure prophylaxis (PrEP; medication to reduce HIV risk among HIV-negative people) awareness may be partially responsible for racial/ethnic differences in treatment uptake. Little research has examined PrEP awareness among African Americans with diverse HIV risk profiles. Audio computer-assisted self-interviews were distributed to 204 African American young adults (age 18-29) demonstrating heightened HIV vulnerability. Chi square analysis and logistic regressions were conducted to determine factors associated with PrEP awareness. While unadjusted logistic regression indicates that age 18-21 years (p<.01), heterosexuality (p<.05), lower education (p<.05), less frequent HIV testing (p<.01), STI diagnosis history (p<.05), not having casual sex (p<.05), and not having a one night stand (p<.01) were associated with decreased PrEP awareness, only heterosexuality (p<.05), lower education (p<.05), and less HIV testing (p<.01) remained significant in adjusted analysis. PrEP-focused education efforts should include outreach across education gradients and sexual orientations. Counselling efforts included with HIV testing may be responsible for accelerating PrEP knowledge among testers. Article	2022	Kerzner M.; De A.K.; Yee R.; Keating R.; Djomand G.; Stash S.; Rana S.; Kimmel A.; Eakle R.; Klucking S.; Patel P.	Pre-exposure prophylaxis (PrEP) uptake and service delivery adaptations during the first wave of the COVID-19 pandemic in 21 PEPFAR-funded countries	PLOS One	-	-	-	19326203	10.1371/journal.pone.0266280	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127656927&doi=10.1371%2fjournal.pone.0266280&partnerID=40&md5=62fc578fb9a59eea26fc3d982ad5b9ea	Background: Mitigation measures for the first wave of the COVID-19 pandemic and burden on health systems created challenges for pre-exposure prophylaxis (PrEP) service delivery. We examined PrEP uptake in PEPFAR programs before and after the start of the COVID-19 pandemic. Methods: We studied two PEPFAR program monitoring indicators, using routine Monitoring, Evaluation, Reporting (MER) indicators capturing uptake of PrEP (PrEP-NEW) and overall use of PrEP (PrEP-CURR). We also analyzed descriptive program narratives to understand successes and challenges field teams encountered after the start of the COVID-19 pandemic. To assess changes in coverage of PrEP across 21 countries, we calculated the "PrEP to need ratio" (PnR) using a published methodology. We defined the pre-COVID time period as April 1, 2019 -March 31, 2020 and the COVID time period as April 1, 2020 -March 31, 2021. Findings The total number of persons who initiated PrEP increased by 157% from 233,250 in the pre- COVID-19 period compared with 599,935 in the COVID-19 period. All countries, except five, noted significant increases in PrEP uptake. PrEP uptake among adolescent girls and young women (AGYW) increased by 159% from 80,452 AGYW in the pre-COVID-19 period to 208,607 AGYW in the COVID-19 period. There were 77,430 key populations (KP) initiated on PrEP in the pre-COVID-19 period and 209,114 KP initiated in the COVID-19 period (a 170% increase). The PnR increased 214% in the COVID-19 period across all PEPFAR-supported countries. Adaptations, such as multi-month dispensing (MMD) of PrEP; virtual demand creation activities; decentralized, community-based and virtual service delivery, were implemented to maintain PrEP services. Conclusions PEPFAR programs continued to maintain and initiate new clients on PrEP despite the challenges posed by the COVID-19 pandemic. Adaptations such as MMD of PrEP and use of technology were vital in expanding service delivery and increasing PrEP coverage. © 2022 Public Library of Science. All rights reserved. Article	2022	Khati A.; Altice F.L.; Vlahov D.; Eger W.H.; Lee J.; Bohonnon T.; Wickersham J.A.; Maviglia F.; Copenhaver N.; Shrestha R.	Nurse Practitioner-Led Integrated Rapid Access to HIV Prevention for People Who Inject Drugs (iRaPID): Protocol for a Pilot Randomized Controlled Trial	JMIR Research Protocols	-	-	-	19290748	10.2196/42585	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142393491&doi=10.2196%2f42585&partnerID=40&md5=1d495d4ab42d97ad462860673ae9655c	Background: The ongoing volatile opioid epidemic remains a significant public health concern, alongside continued outbreaks of HIV and hepatitis C virus among people who inject drugs. The limited access to and scale-up of medications for opioid use disorder (MOUD) among people who inject drugs, coupled with multilevel barriers to pre-exposure prophylaxis (PrEP) uptake, makes it imperative to integrate evidence-based risk reduction and HIV prevention strategies in innovative ways. To address this need, we developed an integrated rapid access to HIV prevention program for people who inject drugs (iRaPID) that incorporates same-day PrEP and MOUD for this population. Objective: The primary objective of this pilot study is to assess the feasibility and acceptability of the program and evaluate its preliminary efficacy on PrEP and MOUD uptake for a future randomized controlled trial (RCT). We also aim to explore information on the implementation of the program in a real-world setting using a type I hybrid implementation trial design. Methods: Using a type I hybrid implementation trial design, we are pilot testing the nurse practitioner-led iRaPID program while exploring information on its implementation in a real-world setting. Specifically, we will assess the feasibility and acceptability of the iRaPID program and evaluate its preliminary efficacy on PrEP and MOUD uptake in a pilot RCT. The enrolled 50 people who inject drugs will be randomized (1:1) to either iRaPID or treatment as usual (TAU). Behavioral assessments will occur at baseline, and at 1, 3, and 6 months. Additionally, we will conduct a process evaluation of the delivery and implementation of the iRaPID program to collect information for future implementation. Results: Recruitment began in July 2021 and was completed in August 2022. Data collection is planned through February 2023. The Institutional Review Boards at Yale University and the University of Connecticut approved this study (2000028740). Conclusions: This prospective pilot study will test a nurse practitioner-led, integrated HIV prevention program that incorporates same-day PrEP and MOUD for people who inject drugs. This low-threshold protocol delivers integrated prevention via one-stop shopping under the direction of nurse practitioners. iRaPID seeks to overcome barriers to delayed PrEP and MOUD initiation, which is crucial for people who inject drugs who have had minimal access to evidence-based prevention. © 2022 Antoine Khati, Frederick L Altice. Financing and Delivering Pre-Exposure Prophylaxis (PrEP) to End the HIV Epidemic	The Journal of Law, Medicine & Ethics	-	-	-	1748720X	10.1017/jme.2022.30	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135419650&doi=10.1017%2fjme.2022.30&partnerID=40&md5=ddde65a78c84003ced9db399d47bdc70	The U.S. has the tools to end the HIV epidemic, but progress has stagnated. A major gap in U.S. efforts to address HIV is the under-utilization of medications that can virtually eliminate acquisition of the virus, known as pre-exposure prophylaxis (PrEP). This document proposes a financing and delivery system to unlock broad access to PrEP for those most vulnerable to HIV acquisition and bring an end to the HIV epidemic. Article	2022	Kimani, Makobu; Sanders, Eduard J; Chirro, Oscar; Mukuria, Nana; Mahmoud, Shally; Rinke de Wit, Tobias F; Graham, Susan M; Operario, Don; van der Elst, Elise M	Pre-exposure prophylaxis for transgender women and men who have sex with men: Qualitative insights from healthcare providers, community organization-based leadership and end users in coastal Kenya	International Health	-	-	-	18763413	10.1093/inthealth/ihab043	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129998314&doi=10.1093%2finthealth%2fihab043&partnerID=40&md5=0ec92801957496fef8449f94ed7006ed	Transgender women (TW) and men who have sex with men (MSM) in Kenya are disproportionately affected by human immunodeficiency virus (HIV) and would benefit substantially from pre-exposure prophylaxis (PrEP). We conducted focus group discussions (FGDs) with healthcare providers (HCPs) and TW/MSM leadership and in-depth interviews (IDIs) with PrEP-experienced MSM and TW to learn about perceived and actual barriers to PrEP programming. Eleven HCP and 10 TW/MSM leaders participated in FGDs before PrEP roll-out (January 2018) and 12 months later. Nineteen PrEP end-users (11 MSM and 8 TW) participated in IDIs. Topic guides explored PrEP knowledge, HIV acquisition risk, gender identity, motivation for PrEP uptake and adherence and PrEP-dispensing venue preferences. Braun and Clarke thematic analysis was applied. Four themes emerged: Limited preparedness of HCPs to provide PrEP to TW and MSM, varied motivation for PrEP uptake and persistence among end users, lack of recognition of TW by HCPs and suggestions for PrEP programming improvement from all stakeholders. Providers' reluctance to prescribe PrEP to TW and distrust of TW towards providers calls for interventions to improve the capacity of service environments and staff HIV preventive care. Alternative locations for PrEP provision, including community-based sites, may be developed with TW/MSM leaders. © 2021 The Author(s). Theses and Dissertations	2022	Kincaid, Ross Andrew	Establishing an evidence base to inform the development and implementation of an online HIV pre-exposure prophylaxis service for GBMSM in Scotland	-	-	Glasgow Caledonian University	-	NA	10.59019/PEIC4218	https://researchonline.gcu.ac.uk/ws/portalfiles/portal/76641899/76641812.pdf	HIV pre-exposure prophylaxis (PrEP) is a game changing addition to combination HIV prevention strategies wherein people who are HIV-negative take antiretroviral medications before and after possible sexual exposure to HIV to prevent acquisition. PrEP has been available through Scottish NHS sexual health services since July 2017. In Scotland, an online PrEP service is in the early stages of development with the aim of enhancing patient choice, overcoming challenges within current pathways, and scaling up PrEP provision. The aim of this thesis was to establish an evidence base to inform the development and implementation of this online PrEP service. First, I conducted a scoping review (n=59 studies) to explore the extent to which PrEP-related care had been delivered online. I concluded that additional formative research was required to properly inform the development of the proposed online PrEP service. To this end, I adopted a pragmatic mixed-methods approach, using the Intervention Mapping approach as a guiding framework to develop my research questions which I answered through the following studies. I included questions in two national online surveys of gay, bisexual and other men who have sex with men (GBMSM): 1) SMMASH3 (n=970) conducted before the Covid pandemic (December 2019 – March 2020), and 2) SMMASH Pan (n=456) conducted during the first national stay-at-home order (June 2020 – July 2020). My survey questions examined online health behaviours and the prospective acceptability of the proposed online PrEP service. The high willingness to engage with online health services, and the high acceptability of the online PrEP service, provided a clear direction for the qualitative studies that followed. I conducted two qualitative studies to further explore the acceptability of the proposed online PrEP service: 1) semi-structured interviews with potential service users (n=15); and 2) focus groups (n=3) with potential service providers (n=9). Participants found the online PrEP service to be acceptable and provided valuable, nuanced insights into how the service should be developed and implemented to best meet users' needs. Crucially, participants highlighted the importance of choice and appropriate support. Overall, this thesis provides a clear rationale for the development of the proposed online PrEP service by synthesising contemporary research findings with the views of PrEP users and clinicians involved in PrEP provision. Accordingly, I conclude by providing specific evidence-based recommendations for the development and implementation of the proposed online PrEP service and specific directions for future research. Article	2022	King A.R.; Shah S.; Randall L.A.; Frew P.M.; Spaulding A.; Holloway I.W.	Acceptability of injectable pre-exposure prophylaxis among people who inject drugs in three urban U.S. settings	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-022-07572-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137937121&doi=10.1186%2fs12879-022-07572-3&partnerID=40&md5=46a0f91e3f258ce68b061a757278fa7	Background: Outbreaks of new HIV transmission among people who inject drugs (PWID) are a major public health concern. Oral daily PrEP, has been identified as a critical addition to the biomedical toolkit for this population. However, limited research on the acceptability of long-acting injectable PrEP has been conducted with this population. Methods: We conducted a cross sectional multi-site survey with 1127 participants from May 2019–February 2020 to assess the acceptability of novel PrEP regimens. We computed bivariate and multivariable logistic regressions to evaluate correlates of the outcome variable: acceptability of 3-month injectable-PrEP. SAS v.9.4 was used to conduct statistical analysis. Results: Limited knowledge of or use of PrEP, at present, was evident within the sample. Injection drug use in the past six months was significantly associated with LA injectable PrEP acceptability, with the odds of acceptability being 1.885 (CI: 1.376, 2.582) times greater than those who did not inject drugs. After adjusting for confounders, injection drug use was significantly associated with the outcome, such that the odds of acceptability of LA injectable PrEP were 1.705 (CI: 1.198, 2.427) times greater among PWID compared to those who did not inject drugs (p < 0.03). The results demonstrate acceptability (38.2%) in a durable (3-month) injectable PrEP modality among participants who also identified as PWID. Conclusions: PrEP promotion efforts among PWID to increase access to long-acting injectable PrEP are necessary. Through efforts to increase acceptance and regular use of long-acting injectable PrEP, public health strategies may be able to effectively lessen chances of future HIV outbreaks among PWID. © 2022, The Author(s). Article	2022	King K.; Balan S.; Kanamori M.; Shrader C.-H.; Arroyo-Flores J.; Johnson A.; Whiteside P.; Michniewicz M.; Doblecki-Lewis S.	Feasibility and Acceptability of HIV Self-Test Kit Distribution Through PrEP Clients' Social and Sexual Networks to Increase HIV Testing and PrEP Information	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002970	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132150016&doi=10.1097%2fQAI.0000000000002970&partnerID=40&md5=dcda34201b7d1a6a31626036d9a2e24b	Objective:To determine the feasibility, acceptability, and implementation of a HIV self-test (HIVST) program through PrEP clients' social and sexual networks.Background:HIV testing is critical for treatment and prevention engagement. HIVST kits can overcome barriers to testing. A negative result is an opportunity to provide PrEP information. We describe implementation factors associated with engaging current Mobile PrEP (MP) clients to distribute HIVST kits and PrEP information through their networks.Setting:Community venues in Miami-Dade County, Florida.Methods:A baseline survey collected network information and explored distribution plans for offering HIVST kits. A follow-up survey evaluated use and distribution. A logic model describes the process of implementation and evaluation. Up to 4 Ora-Quick HIV ST kits were offered to 81 MP clients. A brief training included resources for posttest engagement.Results:Forty-four percent of the kits were reported as distributed. Of 81 MP clients offered kits, 50 (62%) accepted. In a follow-up survey, 77% of MP clients distributed at least 1 kit. Fifty-six (86%) social network members were Latino, and 9 (14%) were Black. Three of 4 MP clients engaged in PrEP discussions (77%) with SN members. Reported reasons for HIVST kit use included convenience, confidentiality, privacy concerns, and discomfort with going to a testing site. MP clients reported that kit distribution was affected by the COVID-19 pandemic.Conclusion:HIV ST kits allowed PrEP users to engage others in their social and sexual networks for HIV testing and information regarding PrEP. Work to scale-up this intervention is underway. © 2022 Lippincott Williams and Wilkins. All rights reserved. Article	2022	Kinvig, Hannah; Cottura, Nicolas; Lloyd, Andrew; Frivold, Collrane; Mistilis, Jessica; Jarrahian, Courtney; Siccardi, Marco	Evaluating Islatravir Administered Via Microneedle Array Patch for Long-Acting HIV Pre-exposure Prophylaxis Using Physiologically Based Pharmacokinetic Modelling.	European Journal of Drug Metabolism and Pharmacokinetics	-	-	-	2107-0180	10.1007/s13318-022-00793-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9746694	BACKGROUND AND OBJECTIVES: Technologies for long-acting administration of antiretrovirals (ARVs) for the prevention and treatment of HIV are at the forefront of research initiatives aiming to tackle issues surrounding drug adherence with the current standard of once-daily oral administration. Islatravir (ISL) is an emerging ARV that shows promising characteristics for long-acting prevention and treatment both orally as well as through alternative routes of administration. Microneedle array patches (MAPs) are a pain-free and discreet transdermal delivery technology that offer extended-release administration of nanoparticulate drugs. This study aimed to utilise physiologically based pharmacokinetic (PBPK) modelling to predict the pharmacokinetics resulting from ISL administered via MAP and to identify key MAP characteristics required to sustain effective concentrations over extended dosing intervals. METHODS: A PBPK model describing the conversion of ISL to ISL-triphosphate (ISL-TP) and its whole-body disposition was developed and verified against observed clinical data for orally administered ISL in healthy adults. An intradermal PBPK model was integrated with the ISL PBPK model to predict the dose and nanoparticle release rate required for MAP administration strategies capable of achieving a minimum ISL-TP target concentration of 0.05 pmol/106 PBMCs over extended dosing intervals. MAP design was limited to a maximum therapeutic area of 20 cm2 with a dose loading of 4.09 mg/cm2 and a minimum duration of 3 months. Due to the lack of available clinical data, a range of nanoparticle release rates and MAP bioavailability scenarios were simulated to provide an overview of potential clinical outcomes. RESULTS: The ISL PBPK model was successfully verified, with predicted vs observed ratios falling within 0.5-2-fold. ISL MAP doses ranging from 15 to 80 mg were predicted to sustain ISL-TP concentrations above the minimum target concentration at 3, 6 and 12 months after administration. Nanoparticle release rate and MAP bioavailability were found to have a major impact on whether dosing strategies achieved the criteria. Minimum doses of 15 mg and 60 mg with a nanoparticle release rate of 0.0005 h-1 and bioavailability ranging from 25 to 100% were predicted to achieve effective ISL-TP concentrations up to 3 and 6 months, respectively. Doses of 15 mg and 30 mg with a nanoparticle release rate of 0.0005 h-1 were also able to attain the target concentration up to 6 months after MAP administration, albeit with a minimum bioavailability of 75% and 50%, respectively. Furthermore, when simulating a bioavailability of 100%, an 80 mg ISL MAP was predicted to sustain ISL-TP concentrations above the minimum target concentration up to 12 months after administration. CONCLUSIONS: The ISL PBPK model successfully predicted ISL and ISL-TP pharmacokinetics across a range of orally administered regimens. The integrated intradermal PBPK model outlined optimal MAP dose and nanoparticle release rates for effective ISL-TP concentrations up to 12 months, providing justification for further investigation of ISL as a candidate for MAP administration. Article	2022	Kiptinness C.; Kuo A.P.; Reedy A.M.; Johnson C.C.; Ngure K.; Wagner A.D.; Ortblad K.F.	Examining the Use of HIV Self-Testing to Support PrEP Delivery: a Systematic Literature Review	Current HIV/AIDS Reports	-	-	-	15483568	10.1007/s11904-022-00617-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135258596&doi=10.1007%2fs11904-022-00617-x&partnerID=40&md5=7bf32c8b98a26fbdd0dfda8205143abd	Purpose of Review: HIV self-testing (HIVST) has the potential to expand access to and uptake of HIV pre-exposure prophylaxis (PrEP) delivery. We conducted a systematic literature review to understand the evidence on HIVST use for PrEP delivery. Recent Findings: After screening 1055 records, we included eight: three randomized trials and five values and preferences studies. None measured PrEP initiation. Most studies occurred in Sub-Saharan Africa (7/8) and included different populations. One trial found that HIVST use between quarterly clinic visits as part of an adherence package with biofeedback slightly increased adherence; the other two trials found that HIVST use between or in lieu of quarterly clinic visits had no significant or non-inferior effects on adherence. HIVST to support PrEP delivery was acceptable, feasible, and preferred. Summary: HIVST use for PrEP continuation largely resulted in similar outcomes to standard-of-care delivery and was perceived acceptable and feasible. Further research is needed to optimize HIVST use within PrEP programming. © 2022, The Author(s). Article	2022	Kislovskiy Y.; Erpenbeck S.; Martina J.; Judkins C.; Miller E.; Chang J.C.	HIV awareness, pre-exposure prophylaxis perceptions and experiences among people who exchange sex: qualitative and community based participatory study	BMC Public Health	-	-	-	14712458	10.1186/s12889-022-14235-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139112211&doi=10.1186%2fs12889-022-14235-0&partnerID=40&md5=28c723f9176f9300db6d2354f651b453	Background: People who exchange sex for money, favors, goods or services, combat higher risk of acquiring sexually transmitted diseases (STDs) and human immunodeficiency virus (HIV). Understanding barriers to STD and HIV related healthcare from the perspective of this stigmatized and marginalized community may improve access to sexual health services including pre-exposure prophylaxis (PrEP). Methods: We used community-partnered participatory and qualitative methods to conduct anonymous one-on-one interviews with people who exchange sex to understand their perspectives and experiences related to pre-exposure prophylaxis (PrEP) to prevent HIV acquisition. We conducted twenty-two interviews and coded them to perform thematic analysis. Results: We identified five themes: (1) Appreciation of HIV risk and prevention strategies grew from information accumulated over time. (2) PrEP information came from a variety of sources with mixed messages and uncertain credibility. (3) Decision-making about use of PrEP was relative to other behavioral decisions regarding exchange sex. (4) The multi-step process of obtaining PrEP presented multiple potential barriers. (5) Healthcare providers were seen as powerful facilitators to PrEP utilization. Conclusions: Our findings suggest that PrEP education and care needs to be made more relevant and accessible to individuals who exchange sex. © 2022, The Author(s). Article	2022	Klasko-Foster L.; Wilson K.; Bleasdale J.; Gabriel S.J.; Przybyla S.	"Shades of risk": Understanding current PrEP users' sexually transmitted infection perceptions	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.1957762	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111652302&doi=10.1080%2f09540121.2021.1957762&partnerID=40&md5=3ba754ae84bebf81e9ff03c463359145	Pre-exposure prophylaxis (PrEP) is a safe and effective HIV prevention strategy. Given the possibility of increased sexual risk-taking and acquisition of other sexually transmitted infections (STIs) following PrEP initiation, it is important to explore STI risk perceptions both before and after PrEP initiation to understand the extent to which these perceptions inform decisions to engage in condomless sex. Semi-structured qualitative interviews were conducted with men who have sex with men currently using PrEP (n = 30). Prior to analysis, PrEP users were categorized into four subgroups based on condom use behavior post-PrEP initiation: (1) condom continuers (2) condomless sex continuers, (3) condomless sex increasers, and (4) condomless sex decreasers. Thematic analysis revealed two major themes that elucidated differences in (1) the appraisal of HIV risk relative to other STIs and (2) the importance of partner communication in determining STI risk perceptions by subgroup. Most PrEP users demonstrated no behavioral change after PrEP initiation. Those engaging in condomless sex prior to PrEP initiation also continued that behavior while taking PrEP. Results of this study support a tailored approach to PrEP counseling based on individual STI risk appraisal and motivations to initiate and continue PrEP. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2022	Klein, Ari Z; Meanley, Steven; O'Connor, Karen; Bauermeister, José A; Gonzalez-Hernandez, Graciela	Toward Using Twitter for PrEP-Related Interventions: An Automated Natural Language Processing Pipeline for Identifying Gay or Bisexual Men in the United States.	JMIR Public Health and Surveillance	-	-	-	2369-2960	10.2196/32405	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9086871	BACKGROUND: Pre-exposure prophylaxis (PrEP) is highly effective at preventing the acquisition of HIV. There is a substantial gap, however, between the number of people in the United States who have indications for PrEP and the number of them who are prescribed PrEP. Although Twitter content has been analyzed as a source of PrEP-related data (eg, barriers), methods have not been developed to enable the use of Twitter as a platform for implementing PrEP-related interventions. OBJECTIVE: Men who have sex with men (MSM) are the population most affected by HIV in the United States. Therefore, the objectives of this study were to (1) develop an automated natural language processing (NLP) pipeline for identifying men in the United States who have reported on Twitter that they are gay, bisexual, or MSM and (2) assess the extent to which they demographically represent MSM in the United States with new HIV diagnoses. METHODS: Between September 2020 and January 2021, we used the Twitter Streaming Application Programming Interface (API) to collect more than 3 million tweets containing keywords that men may include in posts reporting that they are gay, bisexual, or MSM. We deployed handwritten, high-precision regular expressions-designed to filter out noise and identify actual self-reports-on the tweets and their user profile metadata. We identified 10,043 unique users geolocated in the United States and drew upon a validated NLP tool to automatically identify their ages. RESULTS: By manually distinguishing true- and false-positive self-reports in the tweets or profiles of 1000 (10%) of the 10,043 users identified by our automated pipeline, we established that our pipeline has a precision of 0.85. Among the 8756 users for which a US state-level geolocation was detected, 5096 (58.2%) were in the 10 states with the highest numbers of new HIV diagnoses. Among the 6240 users for which a county-level geolocation was detected, 4252 (68.1%) were in counties or states considered priority jurisdictions by the Ending the HIV Epidemic initiative. Furthermore, the age distribution of the users reflected that of MSM in the United States with new HIV diagnoses. CONCLUSIONS: Our automated NLP pipeline can be used to identify MSM in the United States who may be at risk of acquiring HIV, laying the groundwork for using Twitter on a large scale to directly target PrEP-related interventions at this population. Article	2022	Knox J.; Kutner B.A.; Shiau S.; Winterhalter F.S.; Wu Y.; Hirsch-Moverman Y.; El-Sadr W.; Colson P.W.; Franks J.	Assessing the Information-Motivation-Behavioral Skills Model to Predict Pre-exposure Prophylaxis Adherence Among Black Men Who have Sex with Men and Transgender Women in a Community Setting in New York City	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03588-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123886090&doi=10.1007%2fs10461-022-03588-7&partnerID=40&md5=8635d5e81306e1286207fc173f0a5927	The Information-Motivation-Behavioral Skills (IMB) Model has been used to understand adherence to medications and intentions to uptake pre-exposure prophylaxis (PrEP) to prevent HIV infection. In the current study, the IMB Model was used to understand factors that predict adherence to PrEP among a community-based cohort of 204 Black men who have sex with men (MSM) and transgender women (TGW) using structural equation modeling. PrEP motivation was directly associated with PrEP behavioral skills (β = 0.320, p = 0.009), and PrEP behavioral skills were directly associated with PrEP adherence (β = 0.416, p = 0.001). PrEP knowledge and PrEP motivation were not associated with PrEP adherence, directly or indirectly. The analysis identified intervenable factors that predicted PrEP adherence. Screening for motivation and behavioral skills could be used to identify where additional support to improve PrEP adherence is needed, or whether to offer alternative PrEP modalities or delivery strategies. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Knox, David C.; Pilarski, Robert; Dhunna, Harvinder S.; Kaushal, Amit; Adachi, Jonathan D.	Clinical Considerations in the Selection of Preexposure Prophylaxis for HIV Prevention in Canada.	The Canadian Journal of Infectious Diseases & Medical Microbiology = Journal Canadien des Maladies Infectieuses et de la Microbiologie Médicale	-	-	-	1712-9532 1918-1493	10.1155/2022/3913439	https://pubmed.ncbi.nlm.nih.gov/36081603/	According to the Public Health Agency of Canada, approximately 62,050 people were living with HIV in Canada in 2018, and of those, 13% were undiagnosed. Currently, no single strategy provides complete protection or is universally effective across all demographic groups at risk for HIV. However, HIV preexposure prophylaxis (PrEP) is the newest HIV prevention strategy that shows promise. To date, two products have received an indication for PrEP by Health Canada: emtricitabine/tenofovir disoproxil fumarate (Truvada®; FTC/TDF) and emtricitabine/tenofovir alafenamide (Descovy®; FTC/TAF). Despite the high efficacy of these PrEP intervention methods, access to PrEP in Canada remains low. Identifying and addressing barriers to PrEP access, especially in high-risk groups, are necessary to reduce HIV transmission in Canada. While guidelines published by the Center for Disease Control and Prevention (CDC) include FTC/TAF information, the efficacy of FTC/TAF for PrEP has not yet been considered in Canada's clinical practice guidelines. Thus, the current paper reviews current data regarding the use of FTC/TDF and FTC/TAF for PrEP, which may be useful for Canadian healthcare providers when counseling and implementing HIV prevention methods. The authors highlight these data in relation to various at-risk populations and review ongoing clinical trials investigating novel PrEP agents. Overall, FTC/TDF PrEP is effective for many populations, including men who have sex with men, transgender women, heterosexuals with partners living with HIV, and people who use drugs. While there is fewer data reported on the efficacy of FTC/TAF to date, recent clinical trials have demonstrated noninferiority of FTC/TAF in comparison to FTC/TDF. Notably, as studies have shown that FTC/TAF maintains renal function and bone mineral density to a greater extent than FTC/TDF, FTC/TAF may be a safer option for patients experiencing renal and/or bone dysfunction, for those at risk of renal and bone complications, and for those who develop FTC/TDF-related adverse events. Article	2022	Kobayashi T.; Van Epps P.; Maier M.M.; Beste L.A.; Beck B.F.; Alexander B.; Ohl M.E.	Discussion and Initiation of HIV Pre-exposure Prophylaxis Were Rare Following Diagnoses of Sexually Transmitted Infections Among Veterans	Journal of General Internal Medicine	-	-	-	8848734	10.1007/s11606-021-07034-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111647474&doi=10.1007%2fs11606-021-07034-7&partnerID=40&md5=fdfe97b088e872301134934acc50e356	Background: Healthcare encounters for the diagnosis and treatment of sexually transmitted infections (STIs) are common and represent an opportunity to discuss and initiate HIV pre-exposure prophylaxis (PrEP). Little is known about how frequently PrEP is discussed and initiated in association with encounters for STIs. Design: Retrospective cohort and nested case-control study, matched by STI date, in national Veterans Health Administration (VHA) facilities from January 2013 to December 2018. Participants: Veterans with a first STI diagnosis (i.e., early syphilis, gonorrhea, or chlamydia) based on ICD codes, excluding those with prior HIV diagnosis, prior PrEP use, or STI diagnosed on screening during a visit to initiate PrEP. Main Measures: Frequency of PrEP initiation within 90 days of healthcare encounter for STIs. In the case-control study, we performed a structured chart review from the initial STI-related clinical encounter and quantified frequency of PrEP discussions among matched patients who did and did not initiate PrEP in the following 90 days. Key Results: We identified 23,312 patients with a first STI, of whom 90 (0.4%) started PrEP within 90 days. PrEP initiation was associated with urban residence (OR = 5.0, 95% CI 1.8–13.5), White compared to Black race (OR = 1.7, 95% CI 1.0–2.7), and syphilis diagnosis (OR = 5.7, 95% CI 3.7–8.6). Chart review revealed that discussion of PrEP was rare among people with STIs who did not subsequently start PrEP (1.1%, 95% CI 0.1–4.0). PrEP initiation was associated with documentation of sexual history (80.0% of initiators vs. 51.0% of non-initiators, p < 0.01) and discussion of PrEP (52.2% vs. 1.1%, p < 0.01) during the initial STI diagnosis encounter. Conclusions: Discussion and initiation of PrEP were rare following healthcare encounters for STIs. Interventions are needed to improve low rates of sexual history-taking and discussion of PrEP during healthcare encounters for STIs. © 2021, This is a U.S. government work and not under copyright protection in the U.S.; foreign copyright protection may apply. Article	2022	Koenig L.J.; Flores S.A.; Mulatu M.S.	Project PrIDE in Context: Evolution of Evaluation in the Centers for Disease Control and Prevention's Multi-Jurisdictional HIV Prevention Demonstration Projects	Evaluation and Program Planning	-	-	-	18737870	10.1016/j.evalprogplan.2021.102015	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123747123&doi=10.1016%2fj.evalprogplan.2021.102015&partnerID=40&md5=f2c5f9977a9fd905b37d2a0258592afe	Over the past decade, CDC has been implementing a high-impact prevention (HIP) approach to HIV, directing funds towards activities with the greatest likelihood of reducing new infections and disparities. Corresponding to this shift, the Division of HIV/AIDS Prevention (DHAP) began funding a series of multi-site demonstration projects to provide extra support and evaluative capacity to select health departments to initiate new HIP programming, with the intention of ascertaining and sharing lessons with other health departments. In this paper, we provide context for the PrEP, Implementation, Data2Care, Evaluation (PrIDE) evaluation by describing the evolution of evaluation goals and activities across three prior demonstration projects, highlighting four areas of change: 1) integrated evaluation and program implementation; 2) local program evaluation in addition to cross-site performance monitoring; 3) prescriptive allocation of resources to support local program evaluation; and 4) expansion beyond single site program evaluation to identify cross-site programmatic strategies. Together, these changes reflect our own learning about achieving the greatest contribution from multi-site projects and set the stage for unique aspects of program evaluation within PrIDE. We describe these features, concluding with lessons learned from this most recent approach to structuring and supporting evaluation within CDC DHAP's health department demonstration projects. Article	2022	Kohler P.; Larsen A.; Sila J.; Wilson K.; Abuna F.; Lagat H.; Owiti G.; Owens T.; Pintye J.; Richardson B.; John-Stewart G.; Kinuthia J.	Mystery Shopper Assessment of PrEP Service Delivery Quality for Adolescent Girls and Young Women in Kenya: A Cross-sectional Study	Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000350	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137094033&doi=10.1097%2fJNC.0000000000000350&partnerID=40&md5=751698028fecef2a662c15f3be30dae8	Pre-exposure prophylaxis (PrEP) uptake and adherence among adolescent girls and young women (AGYW) may be negatively influenced by poor interactions with health care providers. We assessed PrEP counseling using unannounced standardized patient actors (USPs) at routine care clinics in Kenya. Trained actors posed as AGYW seeking PrEP services following case scripts and completed a checklist of provider adherence to national guidelines and communication skills. Scores were converted into a percentage and compared using linear regression. The overall mean quality score was 52.1 and varied across case scripts: a married new initiator yielded higher scores than portrayals of adherence/stigma challenges, transactional sex, and a minor adolescent. Mean guideline scores (31.4) were lower than communication scores (72.8), although in 36.5% of encounters, USPs stated they would not seek help from that provider again. Unannounced standardized patients reported provider reluctance to offer PrEP to AGYW. Interventions to strengthen provider counseling skills are needed. © 2022 Elsevier USA. Article	2022	Kohler, Stefan; Dalal, Shona; Hettema, Anita; Matse, Sindy; Bärnighausen, Till; Paul, Nicolas	Human resource needs and costs for HIV pre-exposure prophylaxis provision in nurse-led primary care in Eswatini and opportunities for task sharingï»¿.	Human Resources for Health	-	-	-	1478-4491	10.1186/s12960-022-00770-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9590230	BACKGROUND: The global expansion of HIV pre-exposure prophylaxis (PrEP) includes health systems that face a shortage of skilled health care workers (HCWs). We estimated the human resource needs and costs for providing PrEP in nurse-led primary care clinics in Eswatini. Furthermore, we assessed potential cost savings from task sharing between nurses and other HCW cadres. METHODS: We conducted a time-and-motion and costing study in a PrEP demonstration project between August 2017 and January 2019. A form for recording time and performed activities ("motion") was filled by HCWs of six primary care clinics. To estimate the human resource needs for specific PrEP activities, we allocated recorded times to performed PrEP activities using linear regression with and without adjusting for a workflow interruption, that is, if a client was seen by different HCWs or by the same HCW at different times. We assessed a base case in which a nurse provides all PrEP activities and five task shifting scenarios, of which four include workflow interruptions due to task sharing between different HCW cadres. RESULTS: On average, PrEP initiation required 29 min (95% CI 25-32) of HCW time and PrEP follow-up 16 min (95% CI 14-18). The HCW time cost $4.55 (uncertainty interval UI 1.52-9.69) for PrEP initiation and $2.54 (UI 1.07-4.64) for PrEP follow-up when all activities were performed by a nurse. Time costs were $2.30-4.25 (UI 0.62-9.19) for PrEP initiation and $1.06-2.60 (UI 0.30-5.44) for PrEP follow-up when nurses shared tasks with HCWs from lower cadres. Interruptions of the workflow added, on average, 3.4 min (95% CI 0.69-6.0) to the time HCWs needed for a given number of PrEP activities. The cost of an interrupted workflow was estimated at $0.048-0.87 (UI 0.0098-1.63) depending on whose time need increased. CONCLUSIONS: A global shortage of skilled HCWs could slow the expansion of PrEP. Task shifting to lower-cadre HCW in nurse-led PrEP provision can free up nurse time and reduce the cost of PrEP provision even if interruptions associated with task sharing increase the overall human resource need. Article	2022	Kohler, Stefan; Ndungwani, Rumbidzai; Burgert, Mark; Sibandze, Dumile; Matse, Sindy; Hettema, Anita	The Costs of Creatinine Testing in the Context of a HIV Pre-Exposure Prophylaxis Demonstration Project in Eswatini.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03432-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8840925	HIV treatment and prevention as well as other chronic disease care can require regular kidney function assessment based on a creatinine test. To assess the costs of creatinine testing in a public health care system, we conducted activity-based costing during a HIV pre-exposure prophylaxis (PrEP) demonstration project in the Hhohho region of Eswatini. Resource use was assessed by a laboratory technician and valued with government procurement prices, public sector salaries, and own cost estimates. Obtaining a blood sample in a clinic and performing a creatinine test in a high-throughput referral laboratory (> 660,000 blood tests, including > 120,000 creatinine tests, in 2018) were estimated to have cost, on average, $1.98 in 2018. Per test, $1.95 were variable costs ($1.38 personnel, ¢39 consumables, and ¢18 other costs) and ¢2.6 were allocated semi-fixed costs (¢1.1 laboratory equipment, ¢0.85 other, ¢0.45 consumables, and ¢1.3 personnel costs). Simulating different utilization of the laboratory indicated that semi-fixed costs of the laboratory (e.g., equipment purchase or daily calibration of the chemistry analyzer) contributed less than variable costs (e.g., per-test personnel time and test reagents) to the average creatinine test cost when certain minimum test numbers can be maintained. Our findings suggest, first, lower creatinine testing costs than previously used in cost and cost-effectiveness analyses of HIV services and, second, that investment in laboratory equipment imposed a relatively small additional cost on each performed test in the high-throughput referral laboratory. Article	2022	Kolstee, Johann; MacGibbon, James; Prestage, Garrett; Clackett, Shawn; Paynter, Heath; Bavinton, Benjamin R; Broady, Timothy R; Ellard, Jeanne; Murphy, Dean A; de Wit, John; Power, Cherie; Holt, Martin	Changing Attitudes Towards Condoms Among Australian Gay and Bisexual Men in the PrEP Era: An Analysis of Repeated National Online Surveys 2011-2019.	AIDS Education and Prevention	-	-	-	1943-2755	10.1521/aeap.2022.34.6.453	https://dx.doi.org/10.1521/aeap.2022.34.6.453	Condoms have been the primary form of HIV prevention for gay and bisexual men (GBM) for most of the HIV epidemic. The introduction of biomedical HIV prevention may have changed attitudes towards condoms. Data from repeated national online surveys of GBM in Australia were used to examine how attitudes towards condoms and confidence discussing condoms with partners changed in the period 2011-2019. The proportion of all participants who reported a positive experience in using condoms remained low and unchanged (9.6% in 2011 to 6.0% in 2019). Confidence in discussing condoms with partners decreased over time (from 72.2% in 2011 to 56.6% in 2019). Confidence in discussing condoms was associated with concern about sexually transmitted infections, and more consistent condom use. Sustaining confidence in using condoms may be more challenging as biomedical prevention methods become more commonly used. Article	2022	Kolstee, Johann; Prestage, Garrett; Bavinton, Benjamin; Hammoud, Mohamed; Philpot, Steven; Keen, Phillip; Grulich, Andrew; Holt, Martin	Trust, Familiarity, Optimism, and Pleasure: Australian Gay Men Accounting for Inconsistent HIV Prevention Practices in the PrEP Era	Archives of Sexual Behavior	-	-	-	00040002	10.1007/s10508-021-02203-5	https://www.researchgate.net/publication/360382350_Trust_Familiarity_Optimism_and_Pleasure_Australian_Gay_Men_Accounting_for_Inconsistent_HIV_Prevention_Practices_in_the_PrEP_Era	Despite an increase in the range of effective HIV risk reduction strategies that are available, some gay and bisexual men (GBM) do not use any of them consistently. Understanding why GBM do not always use a protective strategy may help develop more effective responses. Semi-structured interviews with 24 sexually active GBM in Sydney, Australia were conducted and analyzed using thematic analysis. The main characteristics of encounters featuring little or no use of HIV risk reduction strategies were familiarity and trust with partners, pleasure and intoxication, expectations that partners were using HIV pre-exposure prophylaxis or treatment as prevention, and in some cases feelings of invulnerability about acquiring HIV. An increase in pleasure and a reduction in anxiety about sex were noted by some GBM who had commenced PrEP. Encouraging GBM to adopt a strategy such as PrEP and to use it consistently may be easier by emphasizing benefits to mental health and the quality of sex and intimacy it can offer. However, even with the increased availability of effective biomedical HIV risk reduction strategies, not all GBM are able to consistently manage HIV risk and some continue to hold optimistic and potentially inaccurate beliefs about sexual partners that may increase HIV risk. Factors associated with long-term HIV pre-exposure prophylaxis engagement and adherence among transgender women in Brazil, Mexico and Peru: results from the ImPrEP study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25974	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139790289&doi=10.1002%2fjia2.25974&partnerID=40&md5=dc4c16fc2b0a7d52f213e8e8a24306dc	Introduction: The HIV epidemic continues to disproportionately impact Latin-American transgender women (TGW). We assessed factors associated with long-term pre-exposure prophylaxis (PrEP) engagement and adherence among TGW enrolled in the Implementation of PrEP (ImPrEP) study, the largest PrEP demonstration study in Latin America. Methods: HIV-negative TGW aged ≥18 years reporting 1+eligibility criteria in the 6 months prior to enrolment (e.g. sex partner known to be living with HIV, condomless anal sex CAS, transactional sex or having a sexually transmitted infection STI) who could safely take PrEP were enrolled. Follow-up visits were conducted at 4 weeks and then quarterly. We conducted logistic regression to identify factors associated with long-term PrEP engagement (3+ follow-up visits in 52 weeks) and complete self-reported adherence (no missed pills in the past 30 days) during follow-up. For both outcomes, we constructed multivariable models controlling for country, socio-demographics, sexual behaviour, substance use, STIs and self-reported adherence at 4 weeks (long-term engagement outcome only). Results: From March 2018 to June 2021, ImPrEP screened 519 TGW, enrolled 494 (Brazil: 190, Mexico: 66 and Peru: 238) and followed them for 52 weeks. At baseline, 27.5% of TGW were aged 18–24 years, 67.8% were mixed-race and 31.6% had >secondary education. Most, 89.9% reported CAS, 61.9% had >10 sex partners and 71.9% reported transactional sex. HIV incidence was 1.82 cases per 100 person-years (95% confidence interval CI: 0.76–4.38). Almost half of TGW (48.6%) had long-term PrEP engagement, which was positively associated with reporting complete adherence at week 4 (aOR:2.94 95%CI:1.88–4.63) and was inversely associated with reporting CAS with unknown-HIV partner (aOR:0.52 95%CI:0.34–0.81), migration (aOR:0.54 95%CI:0.34–0.84), and being from Mexico (aOR:0.28 95%CI:0.14–0.53). Self-reported adherence was associated with TGW aged >34 (aOR:1.61 95%CI:1.10–2.34) compared to those aged 25–34 and those with >secondary education (aOR:1.55 95%CI:1.10–2.19) and was lower among TGW from Peru (aOR:0.29 95%CI:0.21–0.41) or reporting PrEP-related adverse effects (aOR:0.63 95%CI:0.42–0.92). Conclusions: Although TGW were willing to enrol in ImPrEP, long-term PrEP engagement and complete self-reported adherence were limited, and HIV incidence remained relatively high. A successful HIV prevention agenda should include trans-specific interventions supporting oral PrEP and exploring long-acting PrEP strategies for TGW. © 2022 The Authors. Article	2022	Koppe U.; Seifried J.; Marcus U.; Albrecht S.; Jansen K.; Jessen H.; Gunsenheimer-Bartmeyer B.; Bremer V.	HIV, STI and renal function testing frequency and STI history among current users of self-funded HIV preexposure prophylaxis, a cross-sectional study, Germany, 2018 and 2019	Eurosurveillance	-	-	-	1025496X	10.2807/1560-7917.ES.2022.27.14.2100503	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129057777&doi=10.2807%2f1560-7917.ES.2022.27.14.2100503&partnerID=40&md5=0f5dae0884a444f6403a7b7d4d70e7b1	Introduction: Users of pre-exposure prophylaxis (PrEP) require periodic testing for HIV, sexually transmitted infections (STI) and renal function. Before PrEP was made free of charge through statutory health insurance in late 2019, PrEP users in Germany had to pay for testing themselves. Aim: We investigated self-reported HIV, STI and renal function testing frequencies among self-funded PrEP users in Germany, factors associated with infrequent testing, and STI diagnoses.Methods: A cross-sectional anonymous online survey in 2018 and 2019 recruited current PrEP users via dating apps for men who have sex with men (MSM), a PrEP community website, anonymous testing sites and friends. We used descriptive methods and logistic regression for analysis. Results: We recruited 4,848 current PrEP users. Median age was 37 years (interquartile range (IQR): 30-45), 88.7% identified as male, and respectively 26.3%, 20.9% and 29.2% were tested less frequently for HIV, STI and renal function than recommended. Participants with lower STI testing frequency were significantly less likely to report STI diagnoses during PrEP use, especially among those with many partners and inconsistent condom use. Factors most strongly associated with infrequent testing included not getting tested before starting PrEP, using PrEP from informal sources and on-demand/intermittent PrEP use. Discussion: In a setting of self-funded PrEP, many users obtained medical tests less frequently than recommended, which can lead to missed diagnoses. Barriers to testing should be addressed to enable proper medical supervision. The suitability of testing frequencies to PrEP users with less frequent risk exposures needs to be evaluated. © 2022 European Centre for Disease Prevention and Control (ECDC). All rights reserved. Article	2022	Kripke, Katharine; Eakle, Robyn; Cheng, Alison; Rana, Sangeeta; Torjesen, Kristine; Stover, John	The case for prevention - Primary HIV prevention in the era of universal test and treat: A mathematical modeling study.	EClinicalMedicine	-	-	-	2589-5370	10.1016/j.eclinm.2022.101347	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8924323	Background: As antiretroviral therapy (ART) has scaled up and HIV incidence has declined, some have questioned the continued utility of HIV prevention. This study examines the role and cost-effectiveness of HIV prevention in the context of "universal test and treat" (UTT) in three sub-Saharan countries with generalized HIV epidemics. Methods: Scenarios were created in Spectrum/Goals models for Lesotho, Mozambique, and Uganda with various combinations of voluntary medical male circumcision (VMMC); pre-exposure prophylaxis; and a highly effective, durable, hypothetical vaccine layered onto three different ART scenarios. One ART scenario held coverage constant at 2008 levels to replicate prevention modeling studies that were conducted prior to UTT. One scenario assumed scale-up to the UNAIDS treatment goals of 90-90-90 by 2025 and 95-95-95 by 2030. An intermediate scenario held ART constant at 2019 coverage. HIV incidence was visualized over time, and cost per HIV infection averted was assessed over 5-, 15-, and 30-year time frames, with 3% annual discounting. Findings: Each prevention intervention reduced HIV incidence beyond what was achieved by ART scale-up alone to the 90-90-90/95-95-95 goals, with near-zero incidence achievable by combinations of interventions covering all segments of the population. Cost-effectiveness of HIV prevention may decrease as HIV incidence decreases, but one-time interventions like VMMC and a durable vaccine may remain cost-effective and even cost-saving as ART is scaled up. Interpretation: Primary HIV prevention is still needed in the era of UTT. Combination prevention is more impactful than a single, highly effective intervention. Broad population coverage of primary prevention, regardless of cost-effectiveness, will be required in generalized epidemic countries to eradicate HIV. Article	2022	Krist, Lizette C; Zimmermann, Hanne M L; van Dijk, Mart; Stutterheim, Sarah E; Jonas, Kai J	PrEP Use in Times of COVID-19 in the Netherlands: Men Who Have Sex With Men (MSM) on PrEP Test Less for HIV and Renal Functioning During a COVID-19 Related Lockdown.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03693-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9109746	As a result of the COVID-19 pandemic, HIV care and prevention efforts have been disrupted. We investigated pre-exposure prophylaxis (PrEP) use and testing behaviors among MSM in the Netherlands, and the factors that influenced testing behaviors during the COVID-19 pandemic. A cohort of 766 MSM, established in 2017, was asked in August 2020 to report on their experiences during the COVID-19 pandemic via an online survey. Participants (n = 319) reported increased PrEP use and, among PrEP users (n = 211), significantly lower rates of having tested in the last 3 months for HIV and renal functioning compared to before the pandemic. Daily PrEP use and a higher number of sexual partners during the pandemic was significantly associated with continued HIV testing. Continued renal functioning testing was associated with older age. Correcting for pandemic-related disruptions in PrEP use and care will require sustained effort to understand and address missed opportunities. Article	2022	Kuehn, Bridget M, MSJ	PrEP Awareness Is Low Among Heterosexual People: The Journal of the American Medical Association	JAMA - Journal of the American Medical Association	-	-	-	00987484	10.1001/jama.2021.23743	https://www.proquest.com/scholarly-journals/prep-awareness-is-low-among-heterosexual-people/docview/2623608317/se-2?accountid=8113	Although nearly one-third of heterosexually active adults in cities with high HIV prevalence are aware of preexposure prophylaxis (PrEP), less than 1% use it, according to a CDC analysis of 2019 National HIV Behavioral Surveillance (NHBS) data. Heterosexual people represent 23% of newly diagnosed HIV infections, yet the authors noted that they are the focus of few PrEP awareness campaigns. To assess PrEP awareness in this group, the authors analyzed NHBS data from face-to-face interviews with 9359 low-income, sexually active heterosexual people living in 23 urban areas with high HIV prevalence. The survey uses low income as a proxy for elevated HIV risk based on previous data linking lower incomes with elevated risk. Only 6.5% of people with low English proficiency who were born outside the US said they knew about PrEP. Article	2022	Kufa, T; Radebe, F; Cutler, E; Goosen, M; Wiesner, L; Greyling, D; Maseko, V; Kularatne, R; Puren, A	Recency of HIV infection, antiretroviral therapy use and viral loads among symptomatic sexually transmitted infection service attendees in South Africa	South African Medical Journal (SAMJ)	-	-	-	0256-9574	10.7196/SAMJ.2022.v112i2.15930	https://indexmedicus.afro.who.int/iah/fulltext/Recency of HIV infection antiretroviral therapy use.pdf	Background. Better integration of HIV and sexually transmitted infection (STI) prevention and treatment services is needed to accelerate progress towards the goal of zero new HIV infections. Objectives. To describe HIV positivity, antiretroviral therapy (ART) use, viral suppression and recency of HIV infection among symptomatic STI service attendees at two primary care clinics in South Africa. Methods. In a cross-sectional study, male and female STI service attendees presenting with symptoms consistent with STI syndromes were enrolled following informed consent. An interviewer-administered questionnaire was completed and appropriate genital and blood specimens were collected for STI testing and HIV biomarker measurements including recency of infection and antiretroviral (ARV) drug levels. Descriptive statistics were used to describe enrolled attendees, and to determine the proportion of attendees who were HIV-positive, recently infected, taking ART and virally suppressed. HIV-positive attendees with detectable ARVs were considered to be on ART, while those with viral loads (VLs) ≤200 copies/mL were considered virally suppressed. Results. Of 451 symptomatic attendees whose data were analysed, 93 (20.6%) were HIV-positive, with 15/93 (16.1%) being recently infected. Recent infection was independently associated with genital ulcer disease at presentation, especially ulcers with no detectable STI pathogens. Among the 78 (83.9%) with long-term infection, only 30 (38.5%) were on ART, with 23/30 (76.7%) virally suppressed. Conclusions. In a population at risk of HIV transmission, there was a high burden of recent infection and unsuppressed VLs. Incorporating pre-exposure prophylaxis, ART initiation and adherence support into STI services will be necessary for progress towards eliminating HIV transmission	NA	English	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2022	Kuo, Alexandra P.; Roche, Stephanie D.; Mugambi, Melissa L.; Pintye, Jillian; Baeten, Jared M.; Bukusi, Elizabeth; Ngure, Kenneth; Stergachis, Andy; Ortblad, Katrina F.	The effectiveness, feasibility and acceptability of HIV service delivery at private pharmacies in sub-Saharan Africa: a scoping review.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26027	https://pubmed.ncbi.nlm.nih.gov/36285619/	INTRODUCTION: Private pharmacies are an understudied setting for differentiated delivery of HIV services that may address barriers to clinic-delivered services, such as stigma and long wait times. To understand the potential for pharmacy-delivered HIV services in sub-Saharan Africa, we conducted a scoping review of the published and grey literature. METHODS: Using a modified Cochrane approach, we searched electronic databases through March 2022 and HIV conference abstracts in the past 5 years for studies that: (1) focused on the delivery of HIV testing, antiretroviral therapy (ART) and/or pre-exposure prophylaxis (PrEP) at private pharmacies in sub-Saharan Africa; (2) reported on effectiveness outcomes (e.g. HIV incidence) or implementation outcomes, specifically feasibility and/or acceptability; and (3) were published in English. Two authors identified studies and extracted data on study setting, population, design, outcomes and findings by HIV service type. RESULTS AND DISCUSSION: Our search identified 1646 studies. After screening and review, we included 28 studies: seven on HIV testing, nine on ART delivery and 12 on PrEP delivery. Most studies (n = 16) were conducted in East Africa, primarily in Kenya. Only two studies evaluated effectiveness outcomes; the majority (n = 26) reported on feasibility and/or acceptability outcomes. The limited effectiveness data (n = 2 randomized trials) suggest that pharmacy-delivered HIV services can increase demand and result in comparable clinical outcomes (e.g. viral load suppression) to standard-of-care clinic-based models. Studies assessing implementation outcomes found actual and hypothetical models of pharmacy-delivered HIV services to be largely feasible (e.g. high initiation and continuation) and acceptable (e.g. preferable to facility-based models and high willingness to pay/provide) among stakeholders, providers and clients. Potential barriers to implementation included a lack of pharmacy provider training on HIV service delivery, costs to clients and providers, and perceived low quality of care. CONCLUSIONS: The current evidence suggests that pharmacy-delivered HIV services may be feasible to implement and acceptable to clients and providers in parts of sub-Saharan Africa. However, limited evidence outside East Africa exists, as does limited evidence on the effectiveness of and costs associated with pharmacy-delivered HIV services. More research of this nature is needed to inform the scale-up of this new differentiated service delivery model throughout the region. Article	2022	Kutner B.A.; Zucker J.; López-Rios J.; Lentz C.; Dolezal C.; Balán I.C.	Infrequent STI Testing in New York City Among High Risk Sexual and Gender Minority Individuals Interested In Self- and Partner-Testing	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03468-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115399011&doi=10.1007%2fs10461-021-03468-6&partnerID=40&md5=8e2e83bde71f98515cb4db361df4d32a	Testing for sexually transmitted infections (STIs) remains low among sexual and gender minority populations. We assessed STI testing history using a retrospective survey among 129 HIV-negative cisgender men who have sex with men (cMSM) and transgender women who have sex with men (tWSM) who were at high risk for STI acquisition. All participants were enrolled in a parent study on self- and partner-testing for HIV and syphilis, and reported condomless anal intercourse with multiple partners during the prior 3 months. We additionally used bivariate tests to evaluate participants' STI testing by their history of using pre-exposure prophylaxis (PrEP). One-in-seven respondents (n = 18) reported having never tested for an STI, one-quarter (n = 33) had not tested in the past year, and two-thirds (n = 83) had never used PrEP. PrEP-naïve respondents were less likely to report recent STI testing (47% vs. 85%). "Routine doctor's visit" was the most prevalent reason for testing, but was less common among PrEP-naïve respondents (83% vs. 100%). Testing was remarkably low given the sample's high risk of HIV and STI infection. Findings suggest that STI testing is more frequent among those who have ever used PrEP, but the risk of selection bias warrants evaluation in a larger probability sample. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Kwan, Tsz Ho; Chan, Denise Pui Chung; Lee, Shui Shan	User Experience and Usability of Neumorphism and Gamification User Interface Designs in an HIV Self-Test Referral Program for Men Who Have Sex With Men: Prospective Open-Label Parallel-Group Randomized Controlled Trial.	JMIR Serious Games	-	-	-	2291-9279	10.2196/35869	https://pubmed.ncbi.nlm.nih.gov/35731564/	BACKGROUND: Digital interventions have been applied for promoting HIV prevention and care among men who have sex with men (MSM). As user interface (UI) design plays a role in determining usability and user experience (UX), the intervention outcome could be affected. OBJECTIVE: In this study, we hypothesized that 2 UI design styles, namely gamification and neumorphism, could impact usability and be differentially preferred by distinct groups of MSM. METHODS: A prospective parallel-group open-label randomized controlled trial was conducted in Hong Kong. Eligible participants were adult MSM recruited by the research team or referred by enrolled participants, who followed instructions for performing an HIV self-test and promoted its use within their social network. Participants were randomized in a 1:1 ratio into either a gamification or neumorphism arm, with primarily visual differences in the UI only. The primary outcome was usability measured by the System Usability Scale (SUS) between the 2 arms. Distinct characteristics of promoters in the 2 arms who gave an SUS score of 80 or above were identified. RESULTS: Of 463 MSM registered in the study, 232 and 231 were randomized to the gamification and neumorphism arms, respectively. Excluding those who did not request a self-test kit, data from 218 and 216 participants in the gamification and neumorphism arms, respectively, were analyzed (totally 434 participants). With a median SUS score of 80 overall, participants in the neumorphism arm gave a higher score (P<.001), with a higher proportion giving a promoter-level SUS score (P=.002). Promoters used social media for sex networking (P=.02), used pre-exposure prophylaxis in the preceding year (P=.006), had higher satisfaction in UI design (P<.001), and had made a self-test referral (P=.04). In general, higher usability was recorded among participants who were confident in performing the HIV self-test (P<.001), and this was associated with a promoter-level SUS score in both arms. While no other personal characteristics were associated with promoters in the neumorphism arm, those in the gamification arm had higher HIV-related knowledge (P=.01), preferred a specific partner body image type (P=.03), and progressed toward peer referral by completing online training (P=.04). CONCLUSIONS: Both gamified and neumorphic UI designs were well-accepted by MSM. UX and satisfaction of UI were both crucial in influencing the willingness of MSM to promote the application by referring their peers in the community to participate. The simplistic visual design of neumorphism conferred a more general acceptance in the community, whereas gamification was preferred in certain MSM subcommunities. Appropriate UI/UX design should be considered when developing digital interventions targeting the MSM community. Article	2022	Labs J.; Nunn A.S.; Chan P.A.; Bessey S.; Park C.J.; Marshall B.D.L.; Patel R.R.; Mena L.A.; Goedel W.C.	Projected Effects of Disruptions to Human Immunodeficiency Virus (HIV) Prevention Services during the Coronavirus Disease 2019 Pandemic among Black/African American Men Who Have Sex with Men in an Ending the HIV Epidemic Priority Jurisdiction	Open Forum Infectious Diseases	-	-	-	23288957	10.1093/ofid/ofac274	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136313416&doi=10.1093%2fofid%2fofac274&partnerID=40&md5=ae247d37d13b850ee22c4d1173ce1b5e	Background: Disruptions in access to in-person human immunodeficiency virus (HIV) preventive care during the coronavirus disease 2019 (COVID-19) pandemic may have a negative impact on our progress towards the Ending the HIV Epidemic goals in the United States. Methods: We used an agent-based model to simulate HIV transmission among Black/African American men who have sex with men in Mississippi over 5 years to estimate how different reductions in access affected the number of undiagnosed HIV cases, new pre-exposure prophylaxis (PrEP) starts, and HIV incidence. Results: We found that each additional 25% decrease in HIV testing and PrEP initiation was associated with decrease of 20% in the number of cases diagnosed and 23% in the number of new PrEP starts, leading to a 15% increase in HIV incidence from 2020 to 2022. Conclusions: Unmet need for HIV testing and PrEP prescriptions during the COVID-19 pandemic may temporarily increase HIV incidence in the years immediately after the disruption period. © 2022 The Author(s). Article	2022	Lacombe-Duncan A.; Kattari S.K.; Kattari L.; Scheim A.I.; Misiolek B.A.	Sexually transmitted infection testing among transgender and non-binary persons: Results of a community-based cross-sectional survey	Sexual Health	-	-	-	14485028	10.1071/SH22128	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142681314&doi=10.1071%2fSH22128&partnerID=40&md5=15b9d1ae5c24527ec703a57dfb452463	Background: Studies show higher rates of sexually transmitted infections (STIs) among transgender (trans) and non-binary (TNB) persons compared with the general population. Scant studies have examined non-HIV STI testing (henceforth referred to as STI testing); fewer inclusive of trans men and non-binary persons. We characterised the prevalence of STI testing and time since last STI test and gender-based differences in these outcomes among TNB persons. Methods: Data were analysed from a 2018 community-based participatory cross-sectional survey (n = 528). Prevalence of lifetime STI testing history and time since last STI test were reported overall and compared across genders (trans men, trans women, non-binary assigned female at-birth, non-binary assigned male at-birth) using Chi-squared, then bivariable and multivariable logistic regression analyses to compare lifetime STI testing history (ever vs never) across sociodemographic and health care characteristics. Results: Most (n = 425; 80.5%) participants reported having ever had an STI test; over half (59.8%) ever tested had tested within the past year. Bivariate analyses showed no significant gender differences in lifetime STI testing history (P = 0.298) or time since last STI test (P = 0.118). In a multivariable model, higher age, reporting multiple committed partners (vs single/divorced), known HIV status, and ever receiving information about pre-exposure prophylaxis (PrEP) were positively associated with ever having had an STI test, whereas Latinx race/ethnicity (vs white) was negatively associated. Conclusions: Findings showed high rates of lifetime STI testing and recent testing, with no gender-based differences. Never testing rates were concerning considering screening recommendations. Broad based (non-gender specific) TNB-focused interventions may be warranted to increase uptake. © 2022 CSIRO. HIVR4P // Virtual was held over the course of 2 weeks on January 27-28 and February 3-4, 2021 as the coronavirus disease 2019 (COVID-19) pandemic continued to inflict unprecedented harm globally. The HIVR4P community came together with 1,802 researchers, care providers, policymakers, implementers, and advocates from 92 countries whose expertise spanned the breadth of the HIV prevention pipeline from preclinical to implementation. The program included 113 oral and 266 poster presentations. This article presents a brief summary of the conference highlights. Complete abstracts, webcasts, and daily rapporteur summaries may be found on the conference website (https://www.hivr4p.org/). Theses and Dissertations	2022	LAMONICA, JULIANA DE SOUZA	DISPOSIÇÃO PARA INDICAÇÃO DA PrEP ENTRE PROFISSIONAIS DE SAÚDE DE SERVIÇOS DE ATENDIMENTO ESPECIALIZADO EM HIV/AIDS	-	-	Universidade do Estado da Bahia	-	-	NA	https://saberaberto.homologacao.uneb.br/items/24ebc541-87a6-42d9-b865-a9d0cefbf118	A Profilaxia Pré-Exposição (PrEP) ao HIV, disponível no Brasil desde 2017, consiste numa estratégia de prevenção combinada caracterizada pelo uso de antirretrovirais para reduzir o risco de infecção pelo HIV, especialmente em populações com risco acrescido dessa infeção. Apesar dessa estratégia, importantes desafios têm sido identificados em estudos sobre o conhecimento, aceitabilidade e disposição para indicação de PrEP por profissionais atuantes em serviços de atendimento especializado no cuidado de HIV/AIDS. Nessa perspectiva, este estudo analisou os fatores associados à disposição para indicação de PrEP por profissionais de saúde em Serviços de Assistência Especializada (SAE), na Bahia. Metodologia: Trata-se de um estudo transversal, realizado com profissionais de saúde de 29 SAE em HIV e outras Infecções Sexualmente Transmissíveis (IST), em 21 municípios da Bahia. Dados sociodemográficos, ocupacionais e de motivação foram coletados via questionário eletrônico. Foram feitas análises descritiva, bivariada e multivariada. Resultados: Participaram 252 profissionais dos SAE, a maioria era mulheres (78,2%), 54,3% entre 36 e 50 anos, e mais da metade referiu possuir pós-graduação latu sensu com título de especialização (51%); possuir curso de residência (3,9%), mestrado (7,1%) e doutorado (2,3%). Os enfermeiros corresponderam a 25,8% e os médicos a 11,9%, sendo que as outras categorias profissionais, envolvendo profissionais de nível médio e superior, corresponderam a 62,3%. Um pequeno percentual (23,4%) declarou possuir especialização na área de HIV/Aids e mais da metade referiu possuir mais de 10 anos de formação na área (74,2%). Observou-se que 73,4% informaram atuar no SAE por um período de até 14 anos e 96% possuíam conhecimento prévio sobre a PrEP, apenas 32.9% referiram que os seus serviços dispensam PrEP e 85% demonstraram disposição de indicação da PrEP. Os fatores associados à não indicação da PrEP foram a indicação de auto-teste para população-chave gays e Homens que fazem sexo com Homens (HSH) (OR = 0.27, IC 95%= 0.08- 0.94) e a Profilaxia pós-exposição ao HIV (PEP) (OR = 0.38, IC 95%=0.18-0.81) apresentaram menor chance de não indicar a PrEP. Aqueles com algum tipo de formação pós-graduada também apresentaram menor chance de não indicar a PrEP (OR =0.26, IC 95%= 0.11-0.61). Os fatores associados à disposição de indicação da	profilaxia pré-exposição;HIV;profissionais de saúde. Theses and Dissertations	2022	Lanigan, Kelly Dennis; Hart, Susan; Creel, Eileen	Examination of Relationship Power in Male/Female Sexual Relationships and the Association with Pre-Exposure Prophylaxis for HIV Prevention Among Cisgender Females	-	-	William Carey University	-	NA	NA	https://www.proquest.com/dissertations-theses/examination-relationship-power-male-female-sexual/docview/2716572983/se-2?accountid=8113	The HIV/AIDS epidemic remains an ongoing public health crisis despite numerous medical advances, including oral pre-exposure prophylaxis medication. Pre-exposure prophylaxis offers new opportunities for disease prevention, requiring additional research to understand the factors that may relate to this medication's acceptance across diverse populations. This study's purpose was to examine the association between male and female sexual relationship power dynamics and pre-exposure prophylaxis for HIV prevention among cisgender females. A quantitative correlational research design, including convenience and snowball sampling, was used for data collection, with a final population of 37 cisgender females. Participants completed self-administered survey instruments, supporting an objective data analysis process. The data analysis suggested a statistically significant negative association between relationship power scores and HIV knowledge scores (r(35) = -.33, p = .046); however, there were no significant differences (t(33) = .615, p = .543) in the relationship power scores between individuals who accepted pre-exposure prophylaxis and those who did not accept this medication therapy as an HIV prevention strategy. These results offer opportunities to improve nursing practice, nursing education, and nursing policy. Article	2022	Lantz, Alyssa M; Nicol, Melanie R	Translational Models to Predict Target Concentrations for Pre-Exposure Prophylaxis in Women.	AIDS Research and Human Retroviruses	-	-	-	1931-8405	10.1089/AID.2022.0057	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9805887	The HIV epidemic remains a significant public health burden. Women represent half of the global HIV epidemic, yet there is an urgent need for a variety of prevention options to meet the needs of more women. Pre-exposure prophylaxis (PrEP) is a valuable prevention tool that uses antiretrovirals before a potential HIV exposure to prevent virus transmission. Development of effective preventive drug regimens for women is dependent on convenient dosing schedules and routes of administration, and on identifying defined target concentrations in mucosal tissues that provide complete protection against HIV transmission. There is a critical need for a translational model that can accurately predict in vivo target concentrations that are completely protective against HIV infection. There is no gold-standard preclinical model to predict PrEP efficacy. In this study, we review the strengths and limitations of three different preclinical models and their utility in predicting target concentrations in the female genital tract: humanized mice, non-human primates, and the ex vivo tissue model. Article	2022	Lapreze J.; Nowicki B.	Current and Evolving Treatments for HIV PrEP	U.S. Pharmacist	-	-	-	1484818	NA	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128611944&partnerID=40&md5=0ceb1c929314dc36bb93cc0766e00d10	Preexposure prophylaxis (PrEP) is a medication therapy regimen provided to HIV-negative persons at high risk of acquiring HIV. Current FDA-approved oral therapies are emtricitabine-tenofovir disoproxil fumarate (FTC/TDF) and emtricitabine-tenofovir alafenamide (FTC/TAF). Recently, the FDA approved the first injectable therapy, cabotegravir long-acting injectable (CAB-LA), which could provide an advantage to certain patient populations. When PrEP therapy is taken consistently, it is very effective at preventing HIV. This article will discuss who is a candidate for PrEP, available therapy options, and additional therapies that are actively being studied. Pharmacists can help provide education to these patients to help promote adherence within high-risk populations. © 2022, Jobson Publishing Corporation. All rights reserved. Article	2022	Larsen A.; Abuna F.; Owiti G.; Kemunto V.; Sila J.; Wilson K.S.; Owens T.; Pintye J.; Richardson B.A.; Kinuthia J.; John-Stewart G.; Kohler P.	Improving quality of PrEP counseling for adolescent girls and young women in Kenya with standardized patient actors: A dose-response analysis	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002814	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121011172&doi=10.1097%2fQAI.0000000000002814&partnerID=40&md5=79950788efb160410d7caccadd118b6c	Background: Health care worker (HCW) training using standardized patient actors (SPs) is an evidence-based approach for improving patient-provider interactions. We evaluated whether SP training among HCWs in Western Kenya improved the quality of pre-exposure prophylaxis (PrEP) counseling for adolescent girls and young women (AGYW). Methods: We conducted a 2-day SP training intervention among HCWs providing PrEP counseling for AGYW. Six trained SPs role played one encounter each with HCWs following scripts depicting common PrEP-seeking scenarios. SPs used checklists to report and discuss domains of adherence to national PrEP guidelines, communication, and interpersonal skills using validated scales after each encounter. HCWs presented to each case in a random order. Overall and domain-specific mean score percentages were compared between the first and subsequent case encounters using generalized linear models, clustering by HCWs. Results: During 564 training cases among 94 HCWs, the overall mean quality of PrEP counseling score was 83.1 (SD: 10.1); scores improved over the course of the 6 encounters (P < 0.001). Compared with the first case encounter, the mean scores for the fourth were significantly higher (79.1 vs. 85.9, P < 0.001). The mean scores plateaued from the fourth to the sixth case (85.2). Although HCWs demonstrated high baseline communication (95.3) and interpersonal skills (83.7), adherence to PrEP guidelines at baseline was suboptimal (57.6). By the fourth case, scores increased significantly (P < 0.001) for all domains. Conclusions: SP training improved PrEP counseling overall and in domains of interpersonal skills, use of guidelines, and communication with AGYW and could be useful in efforts to improve the quality of PrEP counseling for AGYW. Article	2022	Larsen A.; Pintye J.; Marwa M.M.; Watoyi S.; Kinuthia J.; Abuna F.; Richardson B.A.; Gomez L.; Dettinger J.C.; John-Stewart G.	Trajectories and predictors of perinatal depressive symptoms among Kenyan women: a prospective cohort study	The Lancet Psychiatry	-	-	-	22150366	10.1016/S2215-0366(22)00110-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132236238&doi=10.1016%2fS2215-0366%2822%2900110-9&partnerID=40&md5=fdac1e17f0f9dddb9181e50f6ced2c62	Background: There are gaps in understanding longitudinal patterns and predictors of perinatal depressive symptoms in sub-Saharan Africa. This study aimed to explore trajectories of depressive symptoms and associated factors from pregnancy to 9 months post partum among Kenyan women. Methods: In this prospective cohort study, we analysed data from the PrEP Implementation for Mothers in Antenatal Care (PrIMA) study in which HIV-negative women were enrolled in pregnancy and followed up to 9 months post partum in 20 public sector maternal–child health clinics in western Kenya. Pregnant women were eligible for enrolment if they were not infected with HIV, aged 15 years or older, and were able to provide consent. Eligible participants were screened and enrolled between Jan 15, 2018, and July 31, 2019, and followed up to 9 months post partum, with the last participant study visit conducted on Jan 15, 2021. Study nurses serially assessed depressive symptoms using the Center for Epidemiologic Studies Depression Scale (CESD-10), intimate partner violence with the Hurt, Insult, Threaten, Scream scale, and social support with the Medical Outcomes Study scale. Generalised estimating equations were used to identify correlates of moderate-to-severe depressive symptoms (CESD-10 score ≥10) and group-based trajectory modelling identified discrete trajectories of perinatal depressive symptoms. Findings: Among 4447 participants in the main PrIMA study, 3555 had complete depressive symptom data in pregnancy and postpartum and were included in the primary analysis. Median age was 24·0 years (IQR 21·0–28·7), 1330 (38%) participants had low social support, and 278 (8%) reported intimate partner violence in pregnancy. All participants (100%) were female and all (100%) were of African Kenyan ethnicity. Prevalence of moderate-to-severe depressive symptoms was higher in pregnancy than post partum (870 24·5%; 95% CI 23·1–25·9 vs 597 6·8%; 15·6–18·1; p<0·0001). Five patterns of depressive symptoms were identified; persistent moderate-to-severe depressive symptoms in pregnancy and post partum (295 8·3%), moderate-to-severe depressive symptoms in pregnancy that resolved post partum (139 3·9%), moderate-to-severe depressive symptoms that emerged post partum (40 1·1%), chronically mild symptoms (2709 76·2%), and no depressive symptoms (372 10·5%). Emergent moderate-to-severe depressive symptoms were associated with older age. Emergent, persistent, and resolving moderate-to-severe depressive symptoms were associated with intimate partner violence during pregnancy; and persistent and resolving moderate-to-severe depressive symptoms were associated with low social support and high HIV risk (all p<0·05). Moderate-to-severe depression risk was significantly increased with intimate partner violence (adjusted odds ratio 2·07 95% CI 1·81–2·31; p<0·0001), low social support (1·74 1·56–1·95; p<0·0001), and partner HIV-positive status (1·48 1·22–1·78; p<0·0001). 23·34% (95% CI 18·77–27·65) of cases of perinatal moderate-to-severe depressive symptoms were attributable to low social support. Interpretation: One third of women had perinatal moderate-to-severe depressive symptoms; nearly half of these had higher severity phenotypes of resolving, persistent, and emerging moderate-to-severe depressive symptoms that might require tailored interventions. Perinatal women with comorbid psychosocial stressors such as intimate partner violence and previous pregnancy loss should be prioritised for mental health services that augment social support within routine maternal–child health care. Article	2022	Lau J.Y.C.; Wong N.-S.; Lee K.C.K.; Kwan T.-H.; Lui G.C.Y.; Chan D.P.C.; Lee S.-S.	What makes an optimal delivery for PrEP against HIV: A qualitative study in MSM	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624211060824	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122308630&doi=10.1177%2f09564624211060824&partnerID=40&md5=10636a2429685c58489759a8c5b0575d	Background: Pre-exposure prophylaxis (PrEP) is an effective means of HIV prevention for men who have sex with men (MSM), a key population whose engagement is crucial for achieving effective public health outcomes. An optimal service model would be important in planning the implementation of PrEP in places where such service has not been established. Methods: A qualitative study was conducted to delineate the attributes of an optimal PrEP service model for MSM in Hong Kong, a city where no formal PrEP programs existed. Twenty purposively sampled MSM who were enrollees of two pilot PrEP projects participated in the semi-structured interviews promoting story-telling. The coded data were thematically analyzed following Grounded Theory approach, focusing on uncovering a typology of the essential attributes of an optimal PrEP service model, and the reasons for such preferences. Results: Participating MSM were all ethnic Chinese and aged 26 to 52 years. All had received PrEP from pilot projects in conjunction with periodic screening of sexually transmitted infections (STI), HIV antibody, and plasma creatinine. Four major themes emerged as regards the attributes of a preferred PrEP service: (i) comprehensiveness of HIV/STI and safety monitoring; (ii) convenient unitary service; (iii) stigma-free PrEP access and protecting confidentiality; and (iv) affordable price. Whereas regular provision of PrEP was acceptable to MSM, unaffordability and related stigma were the anticipated challenges for potential service providers. Conclusions: The qualitative assessment of MSM's preference for PrEP service delivery has yielded important information on the many facets of a desirable service model. © The Author(s) 2022. Article	2022	Lee F.; Sheeler D.; Hotton A.; Vecchio N.D.; Flores R.; Fujimoto K.; Harawa N.; Schneider J.A.; Khanna A.S.	Stimulant use interventions may strengthen 'Getting to Zero' HIV elimination initiatives in Illinois: Insights from a modeling study	International Journal of Drug Policy	-	-	-	9553959	10.1016/j.drugpo.2022.103628	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125136872&doi=10.1016%2fj.drugpo.2022.103628&partnerID=40&md5=372658dbaba2de005865daf942111586	Objective(s): Getting to Zero (GTZ) is an Illinois-based HIV elimination initiative. GTZ identifies younger Black men who have sex with men (YBMSM) as a population who have experienced disproportionate HIV incidence. Rising stimulant use among YBMSM has been determined to impede engagement in the HIV prevention and treatment continua for reducing onward HIV transmission. Given the limited development of dedicated or culturally appropriate interventions for this population, this modeling study explores the impact of stimulant use on HIV incidence among YBMSM and assesses the impact of interventions to treat stimulant use on downstream HIV transmission to achieve GTZ goals. Methods: A previously developed agent-based network model (ABNM), calibrated using data for YBMSM in Illinois, was extended to incorporate the impact of stimulant use (methamphetamines, crack/cocaine, and ecstasy) on sexual networks and engagement in HIV treatment and prevention continua. The model simulated the impact of a residential behavioral intervention (BI) for reducing stimulant use and an outpatient biomedical intervention (mirtazapine) for treating methamphetamine use. The downstream impact of these interventions on population-level HIV incidence was the primary intervention outcome. Results: Baseline simulated annual HIV incidence in the ABNM was 6.93 95% Uncertainty Interval (UI): 6.83,7.04 per 100 person years (py) and 453 95% UI: 445.9,461.2 new infections annually. A residential rehabilitation intervention targeted to 25% of stimulant using persons yielded a 27.1% reduction in the annual number of new infections. Initiating about 50% of methamphetamine using persons on mirtazapine reduced the overall HIV incidence among YBMSM by about 11.2%. A 30% increase in antiretroviral treatment (ART) and preexposure prophylaxis (PrEP) uptake in the non-stimulant using YBMSM population combined with a 25% uptake of BI for stimulant using persons produces an HIV incidence consistent with HIV elimination targets (about 200 infections/year) identified in the GTZ initiative. Conclusions: Behavioral and biomedical interventions to treat stimulant use, in addition to expanding overall ART and PrEP uptake, are likely to enhance progress towards achieving GTZ goals. © 2022	Computer simulation; HIV infections; Pre-exposure prophylaxis; Preventive medicine; Sexual and gender minorities; Substance-related disorders	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Lee J.J.; Aguirre J.; Munguia L.; Robles G.; Ramirez Hernandez K.; Ramirez J.I.; Leyva Vera C.A.; Duran M.C.	Engagement of Latino immigrant men who have sex with men for HIV prevention through eHealth: preferences across social media platforms	Ethnicity and Health	-	-	-	13557858	10.1080/13557858.2021.1943322	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108276702&doi=10.1080%2f13557858.2021.1943322&partnerID=40&md5=55d76e2ec4a3b69a6a5cd7dd3083b774	Objective: eHealth has growing potential to enhance access to HIV prevention for hard to reach populations, including young Latino immigrant men who have sex with men (MSM) in the United States. We examined the feasibility and acceptability of using eHealth tools, specifically social media platforms, to facilitate HIV testing and pre-exposure prophylaxis (PrEP) uptake among this population. Design: We utilized a community sensitive approach to conduct 30 in-depth interviews and five focus groups with young Latino immigrant MSM in Seattle, WA. Data were analyzed using thematic analysis with both data-driven inductive and a priori deductive approaches. Results: Participants were open to receiving HIV information via social media platforms. Participants recommended that social media content be tailored with their language preferences, cultural norms, and beliefs about HIV testing and PrEP in mind. Further, participants emphasized that content avoid stigmatizing Latino MSM's complex identities. Conclusions: Results have implications for utilizing social media platforms and developing HIV prevention interventions for Latino immigrant MSM. Findings highlight that HIV prevention content should acknowledge how identities as an emerging adult, Latino, immigrant, and MSM, warrant unique consideration. © 2021 Informa UK Limited, trading as Taylor & Francis Group.	eHealth; HIV prevention; latinos; men who have sex with men; social media	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Lee J.J.; Herrera J.A.; Cardona J.; Cruz L.Y.; Munguia L.; Leyva Vera C.A.; Robles G.	Culturally Tailored Social Media Content to Reach Latinx Immigrant Sexual Minority Men for HIV Prevention:Web-Based Feasibility Study	JMIR Formative Research	-	-	-	2561326X	10.2196/36446	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128128493&doi=10.2196%2f36446&partnerID=40&md5=8b6792897e1bfd71d8a8f8b56f6865ee	Background: Latinx gay, bisexual, and other sexual minority men are disproportionately affected by HIV in the United States. As Latinx sexual minority men, particularly those who are foreign-born, experience inequitable access to health services, tailored strategies to engage them for HIV prevention are urgently needed. Objective: Our study seeks to address the need for enhanced access to HIV prevention among Latinx immigrant sexual minority men. We developed and piloted a culturally sensitive technology-based campaign focused on HIV testing and pre-exposure prophylaxis (PrEP) uptake. Methods: We used a two-phase approach to assess the feasibility of community-informed social media content in engaging Latinx immigrant sexual minority men for HIV testing and PrEP use. First, we conducted three iterative focus groups with 15 Latinx immigrant sexual minority men to refine the HIV prevention content to be piloted on social media platforms. The finalized content was placed on Instagram and Facebook for 9 days in July and September 2021 to individuals who were in Washington State. Individuals who clicked on the content were directed to a website with additional HIV prevention information. Second, we conducted online surveys (n=60) with website visitors that assessed sociodemographic characteristics, barriers to HIV prevention, and HIV-related transmission risk and prevention behaviors. We conducted descriptive analyses to examine the overall profile of survey respondents and determine the feasibility of culturally informed social media content in reaching Latinx immigrant sexual minority men. Results: Overall, 739 unique users visited the website during the 9-day period when the social media content was posted on Instagram and Facebook. Our sample included 60 Latinx immigrant sexual minority men who completed the online survey. Participants'mean age was 30.8 years and more than half (n=34, 57%) completed the survey in Spanish. A quarter of participants indicated that they were unauthorized immigrants and 57% (n=34) reported not having medical insurance. Participants reported, on average, having 6 different sexual partners in the last 6 months. Nearly a third of respondents had not tested for HIV in the last 6 months. Only about half (n=32, 53%) of respondents had used PrEP in the last 12 months. Conclusions: Community-driven social media and web-based strategies are feasible ways to engage Latinx immigrant sexual minority men who may traditionally lack access to HIV prevention information and services due to structural and social barriers. The results highlight that culturally relevant social media and web-based outreach strategies that are informed and developed by the community can reach Latinx immigrant sexual minority men for HIV prevention. Findings underscore the need to examine the effectiveness of social media content in promoting HIV testing and PrEP uptake in marginalized Latinx populations. © 2022 JMIR Publications Inc.. Article	2022	Lee W.A.; Cheng A.K.	Tenofovir alafenamide fumarate	Antiviral Therapy	-	-	-	13596535	10.1177/13596535211067600	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129776094&doi=10.1177%2f13596535211067600&partnerID=40&md5=039c1490b3a0a0b77f6ee162379e9454	Tenofovir alafenamide fumarate is a lipophilic prodrug of tenofovir which is preferentially metabolized in lymphatic tissue resulting in high concentrations of tenofovir (TFV) and its active diphosphate metabolite inside the cells that replicate HIV. Due to its selectivity for these tissues, lower total doses of TAF can be administered relative to tenofovir disoproxil fumarate (TDF) which results in improved bone and renal biomarkers. Tenofovir alafenamide fumarate has become the "backbone" of multiple combination products for the treatment of HIV, combined with emtricitabine for PreP and as a monotherapy for the treatment or HBV. © The Author(s) 2022. Article	2022	Lee, Kathryn; Trujillo, Lindsay; Olansky, Evelyn; Robbins, Taylor; Brune, Christine Agnew; Morris, Elana; Finlayson, Teresa; Kanny, Dafna; Wejnert, Cyprian	Factors Associated with Use of HIV Prevention and Health Care Among Transgender Women - Seven Urban Areas, 2019-2020.	MMWR Recommendations and Reports	-	-	-	1545-861X	10.15585/mmwr.mm7120a1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9129907	Transgender women* are disproportionately affected by HIV. Among 1,608 transgender women who participated in CDC's National HIV Behavioral Surveillance (NHBS) during 2019-2020, 42% received a positive HIV test result (1). This report provides results from seven U.S. urban areas where the 2019-2020 NHBS questionnaire was administered. Thirty-eight percent of participants reported having previously received a positive test result for HIV. Detrimental socioeconomic factors, including low income (44%), homelessness (39%), and severe food insecurity in the past 12 months (40%), were common and associated with lower receipt of HIV prevention and treatment services. Having a usual health care source or a provider with whom the participant was comfortable discussing gender-related health issues was associated with improved HIV prevention and treatment outcomes, including HIV testing, preexposure prophylaxis (PrEP) use, and viral suppression. These findings illustrate the benefit of gender-affirming approaches used by health care providers (2), and highlight the challenging socioeconomic conditions faced by many transgender women. Ensuring access to gender-affirming health care approaches and addressing the socioeconomic challenges of many transgender women could improve access to and use of HIV prevention and care in this population and will help achieve the goals of the Ending the HIV Epidemic in the United States initiative (3). Article	2022	Lee-Foon N.K.; Logie C.H.; Siddiqi A.; Grace D.	Exploring young Black gay, bisexual and other men who have sex with men's PrEP knowledge in Toronto, Ontario, Canada	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2020.1837958	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096098315&doi=10.1080%2f13691058.2020.1837958&partnerID=40&md5=2f4bc796982434324f07114f81a79945	Despite significant advances in the HIV treatment and prevention landscape such as pre-exposure prophylaxis (PrEP), young Black-Canadian gay, bisexual and other sexual minority men continue to experience disproportionately high rates of HIV infection. While research has explored the factors associated with their higher HIV exposure and the efficacy of STI/HIV prevention programmes, there remains a paucity of research on their knowledge of HIV prevention strategies such as PrEP. We interviewed twenty-two young men and used a constructivist grounded theory approach to qualitatively analyse these young men's PrEP knowledge. Intersectionality and the social ecological model allowed us to explore how social locations (e.g. race, sexual orientation), interacted with individual, interpersonal and community contexts to shape their understanding. Our analysis revealed two interrelated barriers to PrEP knowledge and uptake. The first centred on the ineffectiveness of institutions in disseminating PrEP information to participants. The second focused on the impact of participants' social locations and perceptions of PrEP users based on their PrEP knowledge. Findings suggest the need for more targeted, culturally congruent PrEP dissemination strategies and PrEP prescription policies that acknowledge the various social locations and ecologies in which young Black gay, bisexual and other men who have sex with men reside. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	biomedical HIV prevention; bisexual and other men who have sex with men; Black-Canadian; PrEP; sexual health literacy; young gay	English	United Kingdom	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Qualitative
Article	2022	Leichliter J.S.; Cuffe K.M.; Kelley K.R.; Gift T.L.	Availability of Sexually Transmitted Disease and HIV Clinical Services: Ending the HIV Epidemic Versus Non-Ending the HIV Epidemic Jurisdictions, 2018	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001482	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118673318&doi=10.1097%2fOLQ.0000000000001482&partnerID=40&md5=f033b86c806f9255819d294d3abc6c62	We assessed sexually transmitted disease/human immunodeficiency virus (HIV) service availability at the primary sexually transmitted disease safety net clinic by phase I Ending the HIV Epidemic jurisdiction status. HIV testing was >90%. In Ending the HIV Epidemic jurisdictions, 22% of primary safety net clinics initiated and/or provided preexposure prophylaxis (PrEP), 46.6% provided PrEP education or referral only, and 29.9% did not provide any PrEP services. © Lippincott Williams & Wilkins. Article	2022	LeMasters, Katherine; Maragh-Bass, Allysha; Stoner, Marie; Bhushan, Nivedita; Mitchell, John; Riggins, Linda; Lightfoot, Alexandra	Lessons Learned From Conducting Community-Based Research on HIV Prevention With Youth During COVID-19.	Journal of Participatory Research Methods	-	-	-	2688-0261	10.35844/001c.38385	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10035063	Mitigating HIV burden among Black youth requires true community engagement. This brief report identifies challenges, strategies, and lessons learned from transitioning our three-phased, community-engaged HIV prevention project with Black youth to a remote format during COVID-19. The project involved (1) building a community-academic partnership on youth sexual health, (2) participatory youth workshops, and (3) youth surveys and interviews about HIV prevention. Feedback from community-academic partnership, pile sorting themes, and preliminary qualitative analyses guided this report. Challenges included a disruption to in-person engagement while strategies included relying heavily on pre-existing partnerships to recruit youth for interviews. We learned that pre-existing community engagement was essential for completing phase three remotely. More education is needed to support Pre-Exposure Prophylaxis (PrEP) awareness for HIV prevention and there is a need to address structural barriers to healthcare engagement such as community violence and mental illness. Community-engaged HIV research focused on youth can adapt if anchored in community relationships. Future studies must work to more fully center youth's voices and address the structural issues that may inhibit them from engaging in HIV prevention. Article	2022	Lemmet T.; Cotte L.; Allavena C.; Huleux T.; Duvivier C.; Laroche H.; Cabie A.; Pugliese P.; Jovelin T.; Maurel M.; Delpierre C.; Rey D.	High syphilis prevalence and incidence in people living with HIV and Preexposure Prophylaxis users: A retrospective review in the French Dat'AIDS cohort	PLOS One	-	-	-	19326203	10.1371/journal.pone.0268670	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130476461&doi=10.1371%2fjournal.pone.0268670&partnerID=40&md5=4962936f104d0b6fe7af5647d7f3d283	Background In the past years, we observed a sharp increase of Syphilis, especially among male who have sex with male (MSM), either HIV-infected, or on pre-exposure prophylaxis (PrEP). Our aim was to assess syphilis prevalence and incidence among people living with HIV (PLWH) and PrEP users. Methods PLWH were included from 2010 to 2020 and PrEP users from 2016 to 2020 from the Dat'AIDS French cohort. We calculated syphilis prevalence and incidences for first infections, re-infections, and iterative infections (> 2 times). T-Tests, Wilcoxon tests and Chi2 test were used for descriptive analysis and multivariate logistic regression models were used to estimate Odds ratios (OR) and 95% confidence intervals (95% CI) for factors associated with syphilis. Results Among the 8 583 PLWH, prevalence of subject with past or present syphilis was 19.9%. These subjects were more likely MSM or transgender and aged over 35 years, but prevalence was lower in AIDS subjects. Same pattern was seen for incident infection and re-infection. Incidence was 3.8 per 100 person-years for infection and 6.5 per 100 person-years for re-infection. Among 1 680 PrEP users, syphilis prevalence was 25.8%, with an estimated 7.2% frequency of active syphilis. Risk of syphilis infection was higher in male and increased with age. Incidence was 11.2 per 100 person-years for infection and 11.1 per 100 person-years for re-infection. Conclusion Syphilis prevalence and incidence were high, especially in older MSM with controlled HIV infection and PrEP users, enhancing the need to improve syphilis screening and behavioral risk reduction counseling among high-risk subjects. Article	2022	Lennon C.	Employer-sponsored health insurance and labor market outcomes for men in same-sex couples: Evidence from the advent of pre-exposure prophylaxis	Economics and Human Biology	-	-	-	1570677X	10.1016/j.ehb.2022.101156	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135307342&doi=10.1016%2fj.ehb.2022.101156&partnerID=40&md5=2780e9b9a0dfdba5c235727608a1b01a	In the United States, the cost of providing employer-sponsored health insurance (ESI) varies for employers based on the medical expenditures of their employees, a practice known as "experience rating". Experience rating increases the cost of employing workers who have greater medical expenditures, one example being men in same-sex couples. To study whether ESI affects labor market outcomes for men in same-sex couples, I use the 2012 advent of Pre-Exposure Prophylaxis (PrEP), a $24,000 per year drug that effectively prevents Human Immunodeficiency Virus (HIV) acquisition. Using American Community Survey data and a difference-in-difference empirical approach – comparing post-PrEP changes in earnings among men who have ESI – I find that annual earnings for men in same-sex couples decline by $2,650 (approximately 3.9%) relative to comparable men after PrEP becomes available. For those who are most likely to be taking Truvada (the brand name for PrEP), such as young men and white men, effects on earnings are considerably larger. I also observe a 3.7 percentage point (4.6%) decline in ESI prevalence and a 0.8 percentage point (10.7%) increase in part-time employment among men in same-sex couples. Event studies provide support for a causal interpretation for my findings. My estimates are also robust to placebo analyses, various specification permutations, and a range of sensitivity checks. © 2022 Elsevier B.V. Article	2022	Levengood T.W.; Aronsohn A.I.; Chua K.-P.; Conti R.M.	Dispensing of HIV and Hepatitis C Antivirals During COVID-19: An Interrupted Time-Series Analysis of U.S. National Data	American Journal of Preventive Medicine	-	-	-	7493797	10.1016/j.amepre.2022.04.024	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132832049&doi=10.1016%2fj.amepre.2022.04.024&partnerID=40&md5=9a5006b65c7865050d217a8586bdd0cb	Introduction: Little is known about the potential changes in the dispensation of life-saving hepatitis C virus (HCV) and HIV antivirals after the initial U.S. outbreak of COVID-19. The objective of this study was to describe the immediate and 1-year impacts of the U.S. outbreak of COVID-19 on monthly dispensing of HIV and HCV antivirals, specifically direct-acting antivirals (DAA) to treat HCV, antiretroviral therapy (ART) to treat HIV, and pre-exposure prophylaxis (PrEP) to prevent HIV. Methods: Authors used interrupted time-series analysis, examining IQVIA National Prescription Audit (includes 92% of U.S. retail pharmacies and 70% of U.S. mail order and long-term care pharmacies) for changes in monthly dispensed prescriptions, 2 years before and 1 year after the initial U.S. COVID-19 outbreak. Fitted linear segmented regression models were used to assess immediate level and slope changes, excluding data from April 2020 as a washout period. Authors stratified analyses by new/refill, age group, payer type, and delivery channel. Results: After the initial outbreak, DAA prescription dispensing declined by almost one third. The COVID-19 outbreak was associated with an immediate-level decrease in total DAA prescriptions, followed by a slope increase in monthly dispensing. However, by April 2021, monthly DAA dispensing had not recovered to prepandemic levels. In contrast, ART and PrEP dispensing changed little over the same time period. Conclusions: U.S. dispensing of DAAs to treat HCV fell at the start of the U.S. COVID-19 outbreak and has yet to fully recover to prepandemic levels. Addressing barriers to care is crucial to reaching national HIV and hepatitis C elimination goals. © 2022 American Journal of Preventive Medicine	Antiviral AgentsCOVID-19HepacivirusHepatitis CHepatitis C, ChronicHIV InfectionsHumans	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Levy I.; Michael S.; Olmer L.; Gofen R.; Davidson O.; Zooker R.; Wagner-Kolasko G.	The impact of COVID-19 lockdown on men having sex with men (MSM)	AIDS Care	-	-	-	9540121	10.1080/09540121.2022.2049197	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129262411&doi=10.1080%2f09540121.2022.2049197&partnerID=40&md5=9c777834c5a17f83716a6717a676b67a	Social distancing including lockdowns are acceptable measures to cope with the COVID-19 pandemic. In this cross sectional study, we surveyed the impact of these measurements on sexual behavior and pre-exposure prophylaxis for HIV (PrEP) use among MSM. A digital questionnaire was distributed via social media and geographically based meeting applications after the first lockdown (March–April 2020). 1194 MSM responded, 91.8% were HIV negative, 19.4% of them used PrEP regularly, and 8.2% were people living with HIV (PLWH). Median age was 34.5 years. 54.4% reported that they kept strictly social distancing guidelines. Low education, hazardous sexual behavior, moderate/severe, and depression predicted low compliance with social distancing guidelines. 66.7% reported a significant decrease in the number of casual sex partners. 55% of those who took PrEP reduced their PrEP intake. Many of the PLWH and PrEP users reduced their medical follow-up. In light of the continuous outbreak and the risk of further outbreaks in the future consideration should be given to provide continuing access to HIV and sexual health clinics. © 2022 Informa UK Limited, trading as Taylor & Francis Group.	behavior; COVID-19; HIV; MSM; PrEP	English	United Kingdom	Western and Central Europe and North America	Israel	Western and Central Europe and North America	Israel	Western and Central Europe and North America	Quantitative

Casting aWide Net: HIV Drug Resistance Monitoring in Pre-Exposure Prophylaxis Seroconverters in the Global Evaluation of Microbicide Sensitivity Project	Global Health Science and Practice	-	-	-	2169575X	10.9745/GHSP-D-21-00122	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129177431&doi=10.9745%2fGHSP-D-21-00122&partnerID=40&md5=1ce2fa9b1b7ac73331a37566a2ff9654	Background: Evidence of HIV drug resistance (HIVDR) in individuals using oral pre-exposure prophylaxis (PrEP) who acquire HIV is limited to clinical trials and case studies. More data are needed to understand the risk of HIVDR with oral PrEP during PrEP rollout. Mechanisms to collect these data vary, and are dependent on cost, scale of PrEP distribution, and in-country infrastructure for the identification, collection, and testing of samples from PrEP seroconverters. Methods: The Global Evaluation of Microbicide Sensitivity (GEMS) project, in collaboration with country stakeholders, initiated HIVDR monitoring among new HIV seroconverters with prior PrEP use in Eswatini, Kenya, South Africa, and Zimbabwe. Standalone protocols were developed to assess HIVDR among a national sample of PrEP users. In addition, HIVDR testing was incorporated into existing demonstration projects for key populations. Lessons learned: Countries are supportive of conducting a timelimited evaluation of HIVDR during the early stages of PrEP rollout. As PrEP rollout expands, the need for long-term HIVDR monitoring with PrEP will need to be balanced with maintaining national HIV drug resistance surveillance for pretreatment and acquired drug resistance. Laboratory capacity is a common obstacle to setting up a monitoring system. Conclusions: Establishing HIV resistance monitoring within PrEP programs is feasible. Approaches to drug resistance monitoring may evolve as the PrEP programs mature and expand. The methods and implementation support offered by GEMS assisted countries in developing methods to monitor for drug resistance that best fit their PrEP program needs and resources. © Levy et al. Article	2022	Lewis J.; Camley R.E.	Exploring Projections for HIV Infection with Pre-Exposure Prophylaxis Usage in a High-Risk Population	Applied Sciences (Switzerland)	-	-	-	20763417	10.3390/app12168359	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137978556&doi=10.3390%2fapp12168359&partnerID=40&md5=36efe6dc535d1530fa1f20101cbe6103	Featured Application: The numerical model may be modified to provide national, state, or local means of monitoring adherence to PrEP protocols, assessing disparities and access to care, and to inform public policy regarding PrEP advocacy. Prevention of type-1 human immunodeficiency virus (HIV) infections has primarily been through condom usage, abstinence, and behavioral and risk awareness programs. Pre-exposure prophylaxis (PrEP) medications became approved for infection prevention in 2012. Mathematical models exploring the projections and impacts of PrEP on the spread of HIV are sparse. This study develops an epidemiological model for type-1 HIV infection accounting for both PrEP and condom usage. We utilized CDC surveillance data on HIV/AIDS statistics to develop a susceptible, infected, AIDS numerical model containing PrEP, condoms, and the combination of both. We explore projections with the percentages of PrEP usage held constant and the impact of average annual sexual partners. We find when 70% of the high-risk population uses PrEP properly with an average of 2 sexual partners per year, the eventual infected percentage drops to about 15%. In contrast, when PrEP is not used correctly and with 4 partners per year the total eventual infected percentage rises to 59%. PrEP can be a highly effective mitigator for the spread of HIV. However, an increased average number of sexual partners per year with improper PrEP usage can minimize the long-term effectiveness of PrEP. © 2022 by the authors.	computational physics; epidemiology; nonlinear dynamics; pre-exposure prophylaxis; PrEP; statistical models	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Li D.H.; Benbow N.; Keiser B.; Mongrella M.; Ortiz K.; Villamar J.; Gallo C.; Deskins J.S.; Xavier Hall C.D.; Miller C.; Mustanski B.; Smith J.D.	Determinants of Implementation for HIV Pre-exposure Prophylaxis Based on an Updated Consolidated Framework for Implementation Research: A Systematic Review	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002984	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132131351&doi=10.1097%2fQAI.0000000000002984&partnerID=40&md5=0ba1840da46fa64eba150c672f65a1e7	Background:Delivery and use of HIV pre-exposure prophylaxis (PrEP) are suboptimal in the United States. Previous reviews of barriers and facilitators have not used an implementation science lens, limiting comprehensiveness and the link to implementation strategies. To summarize the state of the science, we systematically reviewed determinants of PrEP implementation using the updated Consolidated Framework for Implementation Research (CFIR 2.0).Setting:PrEP-eligible communities and delivery settings in the United States.Methods:In January 2021, we searched Ovid MEDLINE, PsycINFO, and Web of Science for peer-reviewed articles related to HIV/AIDS, interventions, implementation, and determinants or strategies. We identified 286 primary research articles published after 1999 about US-based PrEP implementation. Team members extracted discrete "mentioned" and "measured" determinants, coding each by setting, population, valence, measurement, and CFIR 2.0 construct.Results:We identified 1776 mentioned and 1952 measured determinants from 254 to 239 articles, respectively. Two-thirds of measured determinants were of PrEP use by patients as opposed to delivery by providers. Articles contained few determinants in the inner setting or process domains (ie, related to the delivery context), even among studies of specific settings. Determinants across priority populations also focused on individual patients and providers rather than structural or logistical factors.Conclusion:Our findings suggest substantial knowledge in the literature about general patient-level barriers to PrEP use and thus limited need for additional universal studies. Instead, future research should prioritize identifying determinants, especially facilitators, unique to understudied populations and focus on structural and logistical features within current and promising settings (eg, pharmacies) that support integration of PrEP into clinical practice. © 2022 Lippincott Williams and Wilkins. Article	2022	Li T.	Chinese Guidelines for the Diagnosis and Treatment of HIV/AIDS (2021 Edition)	Infectious Diseases and Immunity	-	-	-	20969511	10.1097/ID9.0000000000000044	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134931640&doi=10.1097%2fID9.0000000000000044&partnerID=40&md5=d7c207bf305239d5c6fc08b00c3f27f7	Acquired immunodeficiency syndrome (AIDS) is an important public health problem in China. In 2005, the first edition of the guidelines for the diagnosis and treatment of AIDS was formulated by the AIDS Professional Group of Society of Infectious Diseases of Chinese Medical Association, which was updated in 2011, 2015, and 2018, respectively. The 2021 edition of the guidelines has been revised based on the fourth edition and updated according to the national clinical practice and the latest research findings on opportunistic infections, antiretroviral therapy, post-exposure prophylaxis, pre-exposure prophylaxis (PrEP), whole-course management of human immunodeficiency virus infections, and prevention of mother to child transmission. The 2021 edition also introduces in detail the indications, medication regimen, follow-up and monitoring, and precautions for PrEP. This guide will be updated regularly according to the latest clinical evidence. © 2021 The Chinese Medical Association, Published by Wolters Kluwer Health, Inc. Theses and Dissertations	2022	Li, Chunyan; Muessig, Kathryn E.	Developing an mHealth Intervention to Increase Uptake of HIV Pre-Exposure Prophylaxis (PrEp) among Gay, Bisexual and Other Men Who Have Sex with Men in China	-	-	University of North Carolina	-	NA	NA	https://www.proquest.com/dissertations-theses/developing-mhealth-intervention-increase-uptake/docview/2699992174/se-2?accountid=8113	HIV pre-exposure prophylaxis (PrEP) as a safe and effective prevention tool has not been widely adopted by gay, bisexual and other men who have sex with men (GBMSM) in China, who are disproportionately impacted by the HIV epidemic. Little is known about using mobile health for PrEP promotion in Chinese populations. Informed by the Information-Motivation-Behavioral Skills Model and the Transtheoretical Model (Stages of Change), my dissertation fills the gap by developing and testing a mobile app-enabled intervention – the PrEP mini-app – to increase PrEP uptake among Chinese GBMSM. This is a two-phase mixed-methods intervention study (2020-2021, Guangzhou, China) that includes (1) a formative assessment using one-to-one in-depth interviews (n=31) to assess GBMSM's perceived barriers and facilitators to PrEP uptake and usability test of the original PrEP mini-app; (2) a 12-week two-arm pilot randomized controlled trial (RCT) (n=70) to assess feasibility and preliminary efficacy of the refined PrEP mini-app in increasing GBMSM's intention to use PrEP and PrEP initiation. Qualitative analysis indicated individual-level barriers to PrEP uptake include uncertainty in PrEP efficacy, concerns over side effects and financial cost, and difficulties in identifying authentic PrEP medications. Structural barriers include lack of PrEP education, limited formal PrEP care, the thriving informal PrEP market and the minority stress. RCT results showed that 49% of the participants positively rated the usability of the mini-app. Compared to the standardized HIV prevention care, the PrEP mini-app shows promise in shortening GBMSM's hesitating time between study enrollment and PrEP initiation, facilitating their progress towards PrEP initiation along the stages of change, and improving their PrEP-related psychosocial variables (e.g., intention to use PrEP, PrEP self-efficacy, and PrEP stigma). Desired future app refinements include regular updates of the app contents, between-user interactive features, and educational materials in enriched media forms. More efforts are needed to understand optimal strategies to identify and implement alternative PrEP provision models in highly stigmatized settings. While integrating mobile health into the current HIV prevention system may be feasible and effective for increasing PrEP uptake among GBMSM in China, future interventions should consider the full PrEP cascade in designing support features and outcome measures. Article	2022	Li, Chunyan; Xiong, Yuan; Muessig, Kathryn E; Tang, Weiming; Huang, Haojie; Mu, Tong; Tong, Xiaokai; Yu, Jianxiong; Yang, Zeyu; Sherer, Renslow; Hazra, Aniruddha; Lio, Jonathan; Matthews, Derrick D; Fisher, Edwin B; Li, Linghua; Tucker, Joseph D	Community-engaged mHealth intervention to increase uptake of HIV pre-exposure prophylaxis (PrEP) among gay, bisexual and other men who have sex with men in China: study protocol for a pilot randomised controlled trial.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2021-055899	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9092176	INTRODUCTION: The large number of key populations in China who would benefit from HIV pre-exposure prophylaxis (PrEP) in the context of limited health system capacity and public awareness will pose challenges for timely PrEP scale-up, suggesting an urgent need for innovative and accessible interventions. This study aims to develop and pilot test a theory-informed, tailored mobile phone intervention that was codeveloped by young gay men, HIV clinicians and public health researchers to increase engagement in PrEP education and initiation among Chinese gay, bisexual and other men who have sex with men (GBMSM), who bear a disproportionate burden of HIV infections and remain underserved in the healthcare system. METHODS AND ANALYSIS: This two-phase study includes a formative assessment using in-depth interviews (N=30) and a 12-week experimental pilot study using a two-arm randomised controlled trial design (N=70). The primary intervention is delivered through a WeChat-based mini-app (a program built into a Chinese multipurpose social media application) developed by young GBMSM from a 2019 crowdsourcing hackathon. Using mixed methods, we will further investigate the specific needs and concerns among GBMSM in terms of using PrEP as an HIV prevention strategy, how their concerns and PrEP use behaviours may change with exposure to the mini-app intervention during the study period and how we can further refine this intervention tool to better meet GBMSM's needs for broader implementation. ETHICS AND DISSEMINATION: This study and its protocols have been reviewed and approved by the Institutional Review Boards of the University of North Carolina at Chapel Hill, USA (19-3481), the Guangdong Provincial Dermatology Hospital, China (2020031) and the Guangzhou Eighth People's Hospital, China (202022155). Study staff will work with local GBMSM community-based organisations to disseminate the study results to participants and the community via social media, workshops and journal publications. TRIAL REGISTRATION NUMBER: The study was prospectively registered on clinicaltrials.gov (NCT04426656) on 11 June 2020. Article	2022	Li, Xinyi; Sullivan, Patrick; Broz, Dita; Handanagic, Senad	Association Between Dual Partnership and Sexual and Injecting Behaviors Among Persons Who Inject Drugs in 23 US Cities, 2018.	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-022-02323-6	https://dx.doi.org/10.1007/s10508-022-02323-6	Persons who inject drugs (PWID) engaging in receptive syringe sharing with their sex partner (dual partnership) may have different behavior patterns than people who have only sex or syringe sharing partnerships. PWID from 23 US cities were recruited for the National HIV Behavioral Surveillance in 2018 using respondent-driven sampling, interviewed, and tested for HIV. Log-linked Poisson regression was conducted to examine the associations between injecting and sexual behaviors and dual partnership. A total of 3435 PWID reported receptive syringe sharing and 42% engaged in dual partnership with their last sharing injecting partner. PWID who reported condomless vaginal or anal sex at last sex were more likely to engage in dual partnership (aPR = 1.85, 95% CI = 1.65-2.08). PWID who reported having two or more sex partners (aPR = 0.67, 95% CI = 0.62-0.72) or two or more sharing injecting partners (aPR = 0.54, 95% CI = 0.50-0.59) were less likely to engage in dual partnership. Findings suggest opportunities for tailored prevention intervention, including couple-based HIV testing, pre-exposure prophylaxis, and access to syringe services programs coupled with safer injection education to help reduce HIV risk. Article	2022	Li, Z. K.; Zhu, Y.; Yang, X.; Chen, X. T.; Gu, J.; Hao, Y. T.; Cao, W. N.; Li, Jinghua	Willingness to use the three types of pre-exposure prophylaxis and associated factors among men who have sex with men in Chengdu.	Zhonghua Liu Xing Bing Xue Za Zhi (Chinese Journal of Epidemiology)	-	-	-	0254-6450	10.3760/cma.j.cn112338-20220501-00367	https://pubmed.ncbi.nlm.nih.gov/36456500/	Objective: To investigate the willingness to use three types of pre-exposure prophylaxis (PrEP) and its associated factors among MSM in Chengdu. Methods: A total of 793 MSM were recruited through Chengdu Tongle Health Consultation Service Centre between November 2021 to January 2022. Data were collected, including demographic characteristics, sexual behaviors in the last six months, PrEP-related stigma, HIV anticipated stigma, MSM internalized stigma, and willingness to use three types of PrEP. Univariate and multivariate logistic regression models were conducted to investigate the associated factors of willingness in using the three types of PrEP. Results: Among 793 participants, willingness to take on-demand PrEP was higher (68.3%). Higher education and multiple sexual partners increased the willingness to use oral PrEP, higher education compared with junior high school or below, high school or technical secondary school (aOR=2.43, 95%CI: 1.13-5.21), junior college (aOR=2.67, 95%CI: 1.27-5.61), bachelor degree (aOR=3.21, 95%CI: 1.52-6.74), master degree or above (aOR=3.77, 95%CI: 1.54-9.26), multiple sexual partners (aOR=1.54, 95%CI: 1.12-2.11) were positively associated with daily oral PrEP. HIV anticipated stigma was positively associated with the willingness in using all three types of PrEP: daily oral PrEP (aOR=1.07, 95%CI: 1.02-1.12), on-demand PrEP (aOR=1.09, 95%CI: 1.03-1.15), and injectable PrEP every 8 week (aOR=1.06, 95%CI: 1.01-1.11). Conclusions: The overall willingness in using PrEP in MSM in Chengdu is relatively high, and the promotion of PrEP is highly feasible. In the future, we should continue to promote publicity and education on HIV and PrEP-related knowledge in this population, improve the cognitive level, and guide MSM to establish the correct motivation for PrEP use. Article	2022	Liegeon G.	Safety of oral tenofovir disoproxil - emtricitabine for HIV preexposure prophylaxis in adults	Current Opinion in HIV and AIDS	-	-	-	-	1746630X	10.1097/COH.0000000000000747	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132956126&doi=10.1097%2fCOH.0000000000000747&partnerID=40&md5=d4dfe2b97c0ab830462ae8281c7d7e77	Purpose of reviewThis review focuses on the safety of oral tenofovir disoproxil and emtricitabine (FTC) combination for HIV preexposure prophylaxis (PrEP) in adults.Recent findingsGastrointestinal adverse events are common after treatment initiation but usually resolve within weeks. Although clinical trials did not report an increased risk of serious renal adverse events or tubulopathy, meta-analyses suggest that tenofovir disoproxil -FTC is associated with a slight but non-clinically relevant decline in estimated glomerular filtration rate (eGFR). A decline to less than 60 mL/min remains a rare event, which mainly occurs in users with an age >50 years or a baseline creatinine clearance < 90 mL/min. Similarly, a slight reduction in bone mineral density (BMD) was observed in clinical trials, but it did not result in an increased risk of bone fracture. BMD reduction and eGFR decline tend to resolve after treatment discontinuation. No drug interaction with contraception has been reported in women and no safety signal emerged in pregnant and breastfeeding women.SummaryOral tenofovir disoproxil-FTC for HIV PrEP appears safe and well tolerated for most individuals. This supports demedicalization strategies aiming at increasing the number of PrEP users. © 2022 Lippincott Williams and Wilkins. Article	2022	Liegeon G.; Assoumou L.; Ghosn J.; El Mouhebb M.; Palich R.; Palacios C.; Slama L.; Surgers L.; Genin M.; Beniguel L.; Goldwirt L.; Duvivier C.; Rojas Castro D.; Costagliola D.; Molina J.-M.	Impact on renal function of daily and on-demand HIV pre-exposure prophylaxis in the ANRS-PREVENIR study	Journal of Antimicrobial Chemotherapy	-	-	-	-	3057453	10.1093/jac/dkac336	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85158064299&doi=10.1093%2fjac%2fdkac336&partnerID=40&md5=c20a752f53df955eb8f44af5766fe599	Objectives: To assess the impact on the estimated glomerular filtration rate (eGFR) of different tenofovir disoproxil/emtricitabine dosing regimens for HIV pre-exposure prophylaxis (PrEP). Patients and methods: We included in the study individuals with baseline eGFR> 50 mL/min/1.73 m2 who initiated PrEP in the ongoing ANRS-PREVENIR PrEP cohort. We retrospectively classified PrEP users in three groups: 'on-demand' (reported at ≥75% of study visits), 'daily' (≥75% of study visits) or 'switches'. We compared the area under curve (AUC) of the eGFR variation from baseline (ΔeGFR) between groups using analysis of covariance, and assessed factors associated with a negative AUC of ΔeGFR. Results: From May 2017 to October 2020, 1253 PrEP-naïve participants (98% of MSM) were included in the study with a median follow-up of 22 months. 499 (40%), 494 (39%) and 260 (21%) users were in the group daily, on-demand and switches, respectively, for a median number of pills taken per week of 6, 1.7 and 4. The mean AUC of the ΔeGFR was -1.09 mL/min/1.73 m2 in the daily PrEP group, -0.69 mL/min/1.73 m2 in the switches group and +0.18 mL/min/1.73 m2 with on-demand PrEP. In a model adjusted on baseline age and eGFR, the AUC of the ΔeGFR was significantly higher with on-demand PrEP compared to daily PrEP (P=0.037). Independent factors associated with a negative AUC of ΔeGFR were a daily PrEP regimen, a switches regimen, an age>40 years and a baseline eGFR≥90 mL/min/1.73 m2. Conclusions: On-demand PrEP dosing had a smaller impact on eGFR evolution than daily PrEP, but the difference was not clinically relevant. © 2022 The Author(s). Article	2022	Lin B.; Liu J.; He W.; Pan H.; Ma Y.; Zhong X.	Effect of a Reminder System on Pre-exposure Prophylaxis Adherence in Men Who Have Sex With Men: Prospective Cohort Study Based on WeChat Intervention	Journal of Medical Internet Research	-	-	-	-	14388871	10.2196/37936	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136850841&doi=10.2196%2f37936&partnerID=40&md5=0b24d4a549f850c211d5f0a7bcbed02	Background: The efficacy of pre-exposure prophylaxis (PrEP) is highly dependent on adherence, and one of the main reasons for poor adherence is forgetfulness. Therefore, it is important to explore how to remind users to take their medicine on time. Objective: This study aims to explore the effect of a reminder system on PrEP adherence in men who have sex with men (MSM) to improve adherence. The main function of the reminder system based on the WeChat social media app is to send daily messages to PrEP users reminding them to take their medicine. Methods: An open-label, multicenter, prospective cohort study of PrEP in HIV-negative MSM was conducted from November 2019 to June 2021. Study participants who met the criteria were randomly divided into 2 groups: no-reminder group and reminder group. Both groups received daily oral PrEP with follow-up every 3 months. Adherence was measured on the basis of self-report and was defined as the percentage of medications taken on time. Participants in the reminder group scanned a WeChat QR code and received a reminder message every day. Participants in the no-reminder group took daily oral medicines without reminders. The longitudinal trajectories of adherence for both groups were displayed to compare the variability in adherence at each time point. The association between the changes in adherence (no change, improvement, decline) at each time point and the use of the reminder system was analyzed by multinomial logistic regression models to further explore the effectiveness of the system. Results: A total of 716 MSM were included in the analysis, that is, 372 MSM in the no-reminder group and 344 MSM in the reminder group. Adherence in the no-reminder group fluctuated between 0.75 and 0.80 and that in the reminder group gradually increased over time from 0.76 to 0.88. Adherence at each time point was not statistically different between the 2 groups. Further analysis showed that an improvement in adherence in the early stage was associated with the use of the reminder system (odds ratio OR 1.65, 95% CI 1.01-2.70; P=.04). An improvement in average adherence compared to initial adherence was positively associated with the use of the reminder system (OR 1.82, 95% CI 1.10-3.01; P=.02). Conclusions: The effect of the reminder system on PrEP adherence in MSM was more significant in the early stage, which is related to the increased motivation of users and the development of medicine-taking habits. The reminder system is potentially effective for early-stage medicine management, encouraging users to develop healthy medicine-taking habits and to increase their adherence. © 2022 Journal of Medical Internet Research. Article	2022	Lin B.; Liu J.; Zhong X.	PrEP risk perception and adherence among men who have sex with men: a prospective cohort study based on growth mixture model	BMC Infectious Diseases	-	-	-	-	14712334	10.1186/s12879-022-07966-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145401954&doi=10.1186%2fs12879-022-07966-3&partnerID=40&md5=8d8af0e5601fd929c4a708ae020774ff	Background: It can be considered that pre-exposure prophylaxis (PrEP) risk perception is the negative experiences or concerns about taking PrEP. The aim of this study is to explore the longitudinal trajectory of PrEP risk perception among men who have sex with men (MSM) and its impact on adherence. Methods: Data related to PrEP risk perception and adherence were derived from a prospective cohort study in Western China from 2013 to 2015. Subjects were categorized into the time-driven, event-driven and blank control groups. Tenofovir disoproxil fumarate (TDF) was administered to subjects in the time-driven and event-driven groups, and all subjects were followed up every 12 weeks. The PrEP risk perception scale was constructed, and the growth mixture model (GMM) was used to classify longitudinal PrEP risk perception. The effect of different levels of PrEP risk perception on drug adherence was explored using generalized estimating equations (GEE) with relative risk (RR) and 95% confidence interval (CI). Results: The PrEP risk perception scale consists of 4 dimensions and 16 items with Cronbach's alpha = 0.828 and a good model fit. According to the GMM analysis, the subjects' PrEP risk perceptions were separated into two groups: a "high-risk perception group" (n = 133) and a "low-risk perception group" (n = 493), where the proportion of high levels of drug adherence were 57.89% and 68.35%, respectively (p = 0.024). High levels of PrEP risk perception in the MSM population hinder drug adherence (RR = 0.71, 95% CI 0.50 to 0.99, p = 0.046). The results of this study were validated in the subsequent PrEP projects conducted in 2019 to 2021. Conclusion: This study demonstrates that high levels of PrEP risk perception in the MSM population are an obstacle to drug adherence, emphasizing the necessity of focusing on PrEP risk perception in this population and the value of its application in the current context. © 2022, The Author(s). Article	2022	Lin C.; Li L.; Liu J.; Fu X.; Chen J.; Cao W.; Li Y.	HIV PrEP services for MSM in China: a mixed-methods study	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2021.1896661	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124017309&doi=10.1080%2f09540121.2021.1896661&partnerID=40&md5=f84f8253227b0c8f8664c8787d57fb24	Pre-exposure prophylaxis (PrEP) is a promising HIV prevention method. However, the rollout of PrEP among men who have sex with men (MSM) is facing challenges. This study sought to understand PrEP acceptability and service use challenges among MSM in China. The study was conducted in 2018 in Guangdong Province using a mixed-methods approach. Among 489 HIV-negative MSM who completed an online survey, 374 (76.5%) had heard of PrEP before. The most common PrEP information sources were internet/social media (32.1%) and community-based organizations (30.4%). Two-thirds (n=328) of the MSM would accept PrEP even the protective efficacy is less than 100%, 60.1% (n=294) expressed willingness to use PrEP once it is approved in China, and 59.3% (n=290) were willing to pay out of pocket. Employment, disclosure of MSM status, and mental health issues were associated with PrEP acceptability. In-depth interviews with 30 MSM revealed that high cost, low accessibility, and stigma in clinic settings were barriers to PrEP using. Primary care-based PrEP services were acceptable, but patients' confidentiality was a concern. PrEP promotion efforts should address social and mental health challenges among MSM and mobilize primary care systems and community-based organizations to achieve the best result. © 2021 Informa UK Limited, trading as Taylor & Francis Group.	acceptability; China; men who have sex with men; mixed-methods; PrEP	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Little K.M.; Flomen L.; Hanif H.; Anderson S.M.; Thurman A.R.; Clark M.R.; Doncel G.F.	HIV Pre-exposure Prophylaxis Implant Stated Preferences and Priorities: Results of a Discrete Choice Experiment Among Women and Adolescent Girls in Gauteng Province, South Africa	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03658-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127553938&doi=10.1007%2fs10461-022-03658-w&partnerID=40&md5=2d4ab9bb4934de42b4a2936989e11b14	For adolescent girls (AG) and young women (YW), adherence barriers may limit the effectiveness of daily oral HIV pre-exposure prophylaxis (PrEP). Due to its low-burden and long-lasting product attributes, PrEP implants could remove some of the critical adherence barriers of oral PrEP products for individuals at risk of HIV. To explore stated preferences for a long-acting PrEP implant, we conducted a quantitative survey and discrete choice experiment with AG (ages 15–17), YW (18–34), and female sex workers (FSW; ≥ 18) in Gauteng Province, South Africa. We completed 600 quantitative surveys across the three subgroups of women. Respondents stated preference for an implant that provided longer HIV protection (24 months versus 6 months) and required a single insertion. They stated that they preferred a biodegradable implant that could be removed within 1 month of insertion. Respondents had no preference for a particular insertion location. Overall, 78% of respondents said they would be likely (33%) or very likely (45%) to use a PrEP implant were one available, with the majority (82%) stating preference for a product that would provide dual protection against HIV and unintended pregnancies. To reduce their risk of HIV, AG, YW, and FSW in our survey reported a strong willingness to use long-acting, highly-effective, dissolvable PrEP implants. © 2022, The Author(s). Article	2022	Liu P.; Stewart L.; Short W.R.; Koenig H.	Metrics of HIV Pre-exposure Prophylaxis (PrEP) Implementation Before and After a Multidisciplinary Task Force at an Academic Institution	Quality Management in Health Care	-	-	-	-	10638628	10.1097/QMH.0000000000000332	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132287091&doi=10.1097%2fQMH.0000000000000332&partnerID=40&md5=109fd8781356ebd2967abf121f795531	Background and Objectives: There is a paucity of guidance on HIV pre-exposure prophylaxis (PrEP) implementation in an academic medical center. The objectives of this study were to describe interventions by a multidisciplinary PrEP task force at an academic medical center and compare metrics of PrEP implementation pre- A nd post-creation of this entity. Methods: The interventions of the task force are described within the rubric of the PrEP care continuum. Participants were adults prescribed PrEP for greater than or equal to 30 days at 9 clinical sites across a university health system. Metrics of PrEP implementation were compared over 12-month intervals before and after the creation of the task force. Results: An increased proportion of participants had HIV testing within 7 days of new PrEP prescriptions (92% vs 63%, P <.001) and were prescribed PrEP in increments of 90 days or shorter (74% vs 56%, P <.001) after the creation of the task force. There were higher rates of testing for bacterial sexually transmitted infections in men who had sex with men and transgender women in the post-intervention compared with pre-intervention period. Conclusions: A multidisciplinary team that focuses on optimizing PrEP delivery along each step of the care continuum may facilitate PrEP scale-up and best practices in an academic setting. © 2022 Lippincott Williams and Wilkins. Article	2022	Liu Y.; Bleasdale J.; Przybyla S.; Higgins M.C.; Zhang C.	Racial Variations in Psychosocial Vulnerabilities Linked to Differential Poppers Use and Associated HIV-Related Outcomes among Young Men Who Have Sex with Men: A Study in Two U.S. Metropolitan Areas	Substance Use and Misuse	-	-	-	-	10826084	10.1080/10826084.2021.2023185	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123467881&doi=10.1080%2f10826084.2021.2023185&partnerID=40&md5=41e620435e75dfdef28bb9b8eb32475f	Background: Poppers use has become increasingly prevalent and is associated with elevated HIV risk among young men who have sex with men (YMSM) in urban settings. However, knowledge regarding racial variations of poppers use and their psychosocial determinants to inform culturally-targeted interventions remain limited. Methods: We conducted a cross-sectional study among YMSM recruited from two US metropolitan areas (Nashville, TN and Buffalo, NY) to investigate the differences of socio-environmental and mental health factors associated with poppers use and important HIV-related outcomes e.g., HIV testing, pre-exposure prophylaxis (PrEP, substance use, and risky sexual behaviors among White and Black YMSM (i.e., YWMSM and YBMSM). Results: Among 347 YMSM aged 18-35 years, 32.3% reported poppers use. Notably, poppers-using YWMSM were more likely (p < 0.05) to report mental health burdens (e.g., depression, anxiety, loneliness), while poppers-using YBMSM were more likely (p < 0.05) to experience adverse social-environmental events (e.g., unstable housing, food insecurity, no health insurance, perceived HIV stigma, internalized homonegativity). Poppers-using YMSM showed a higher prevalence of sexual risk behaviors (e.g., event-level alcohol/drug use, condomless insertive/receptive anal sex, group sex) compared to their non-user counterparts, with YWMSM showing the highest likelihood to engage in these risk behaviors. Compared to poppers-using YBMSM, poppers-using YWMSM were associated with a higher likelihood of ever testing for HIV, ever using PrEP and willingness to use PrEP in the next 12 months. Conclusion: Given the distinctive patterns of psychosocial determinants of poppers use between YWMSM and YBMSM, culturally-tailored poppers reduction programs should be designed to tackle the associated HIV risks among YMSM with effectiveness. © 2022 Taylor & Francis Group, LLC. Article	2022	Liu Y.; Brown L.; Przybyla S.; Bleasdale J.; Mitchell J.; Zhang C.	Characterizing Racial Differences of Mental Health Burdens, Psychosocial Determinants, and Impacts on HIV Prevention Outcomes Among Young Men Who have Sex With Men: a Community-based Study in Two U.S. Cities	Journal of Racial and Ethnic Health Disparities	-	-	-	-	21973792	10.1007/s40615-021-01052-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105936331&doi=10.1007%2fs40615-021-01052-1&partnerID=40&md5=8f6fa31d35552278e8a9cceb2f0d1a53	Few studies examine racial differences (e.g., Black vs. White) regarding the psychosocial pathways linking mental health burdens and various HIV-related outcomes among young men who have sex with men (MSM) in the U.S. We conducted a community-based study to examine the racial differences of mental health burdens (e.g., depression, anxiety, stress), the psychosocial determinants (e.g., HIV stigma, homonegativity, resilience, social support, loneliness, housing/food security) and impact on HIV-related outcomes (e.g., event-level alcohol/drug use before sex, condomless insertive/receptive anal sex, recent HIV testing, and PrEP awareness/willingness/use) among young Black MSM (YBMSM; n = 209) and young White MSM (YWMSM; n = 109) from two cities (Nashville, TN and Buffalo, NY) in the United States. Overall, we found YBMSM were more likely (p < 0.05) to experience anxiety and depression compared to YWMSM. Among YBMSM, we found structural inequities (housing instability, food insecurity, internalized homonegativity) were positively associated with anxiety/depression/stress (p < 0.001); we also found anxiety/depression was associated with increased alcohol/drug use before sex, and stress was associated with reduced recent HIV testing and pre-exposure prophylaxis awareness/willingness/use. Among YWMSM, we found psychological buffers (perceived social support, resilience) were associated with reduced anxiety/depression/stress (p < 0.001); anxiety was associated with increased condomless insertive/receptive anal sex and recent HIV testing among this subgroup. YBMSM and YWMSM differed in psychosocial determinants and HIV-related consequences regarding their mental health. Our findings provide important implications for developing culturally and contextually tailored interventions to address mental health burdens and HIV prevention outcomes among young MSM at highest risk for HIV acquisition. © 2021, W. Article	2022	Liu Y.; Fu G.; Chen Y.; Wu L.; Pan M.; Yang Y.; Chen Z.; Cao Y.; Li Y.; Wang H.; Wang B.; Lv C.; Du R.; Xiong Y.; Liu W.; Xu N.; Xia X.; Li Q.; Ruan F.; Wang J.	Discordance between perceived risk and actual risky sexual behaviors among undergraduate university students in mainland China: a cross-sectional study	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-022-13132-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128141254&doi=10.1186%2fs12889-022-13132-w&partnerID=40&md5=f025681e45e6fb87fd0872110ea34701	Background: HIV prevention, diagnosis, treatment and care services might be hampered by inaccurate risk assessment. This study aimed to investigate the extent of and factors associated with the discordance between perceived risk and actual risky sexual behaviors among undergraduates in mainland China, guided by the Anderson's behavioral model. Methods: This study involved a secondary analysis of cross-sectional data collected during the fall semester of 2018–2019 academic year. The present analysis was restricted to 8808 undergraduates with low risk perception. Those who had low perceived risk but actually engaged in risky sexual behaviors were categorized as risk discordance (RD). Univariate and multivariate Logistic regression analyses were conducted to identify factors associated with RD. Results: Overall, the discordance rate between perceived and actual risk was 8.5% (95% CI: 7.9%–9.1%). Multivariate Logistic regression analysis indicated that non-heterosexual women (AOR = 0.41, 95% CI:0.27–0.60), heterosexual men (AOR = 0.45, 95% CI:0.33–0.61) and women (AOR = 0.26, 95% CI:0.19–0.35) were less likely to exhibit RD, when compared with non- heterosexual men. Furthermore, non-freshmen (AOR = 1.57, 95% CI:1.30–1.90), early initiators of sexual intercourse (AOR = 5.82, 95% CI:4.10–8.26), and those who had lower levels of HIV knowledge (AOR = 1.28, 95% CI:1.08–1.51), displayed higher levels of stigma against PLHIV (AOR = 1.50, 95% CI:1.26–1.77) and had ever been tested for HIV (AOR = 1.36, 95% CI:1.04–1.77) were more prone to reporting RD. Those with more enabling resources i.e., displaying high levels of condom use self-efficacy (AOR = 0.70, 95% CI:0.59–0.84) and being knowledge of local testing center (AOR = 0.71, 95% CI:0.60–0.83) were less likely to report RD. However, spending more than 2000 Yuan a month on basic needs (AOR = 2.55, 95% CI:2.07–3.14), residing in urban areas (AOR = 1.35, 95% CI:1.15–1.59) and being knowledgeable of the national AIDS policy (AOR = 1.40,95% CI:1.18–1.66) increased the chance of exhibiting RD. Conclusions: Comprehensive interventions, including targeting students with high-risk characteristics, improving the acceptability of PrEP and PEP, conducting health education, enhancing self-efficacy for using condoms and making opt-out HIV testing routine in college campus, should be taken to reduce the discordance between perceived and actual HIV risk and finally to reach the goal of Zero AIDS. © 2022, The Author(s). Article	2022	Liu Y.; Hawkins M.; Osman A.; Zhang C.	Assessing the Prevalence and Determinants of Exposure-Influenced HIV Testing among a Sample of Pre- and Post-Exposure Prophylaxis-Naïve Young Men Who Have Sex with Men in the United States	Tropical Medicine and Infectious Disease	-	-	-	-	24146366	10.3390/tropicalmed7080146	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136865681&doi=10.3390%2ftropicalmed7080146&partnerID=40&md5=13c4c4c180348b101f6108de221d9d53	Self-initiated Human Immunodeficiency Virus (HIV) testing after potential sexual exposure to HIV (i.e., exposure-influenced HIV testing) has high utility in detecting individuals with the highest probabilities of HIV seroconversion. We conducted a cross-sectional study among a sample of sexually active, pre/post-exposure prophylaxis (PrEP/PEP)-naïve young men who have sex with men (YMSM) in two US cities to assess the determinants (e.g., demographic, psychosocial, sexual, substance use, and HIV prevention characteristics) of exposure-influenced HIV testing (never/rarely vs. mostly/always) in their lifetime. Of 261 YMSM, only 26.5% reported mostly/always seeking exposure-influenced prior to the study. Multivariable analyses showed that younger age, sexual orientation non-disclosure, perceived HIV stigma, internalized homophobia, lower general resilience, and lower social support were associated with a lower likelihood of mostly/always seeking exposure-influenced HIV testing. YMSM who never/rarely sought exposure-influenced HIV testing were more likely to use recreational drugs before sex, binge alcohol, and have group sex; while less likely to be aware of PrEP, test for sexually transmitted infections, or use condoms compared to those mostly/always seeking exposure-influenced HIV testing. Exposure-influenced HIV testing is suboptimal among YMSM with elevated risk for HIV. Our findings provide important implications for designing targeted interventions to promote exposure-influenced HIV testing among high-risk YMSM. © 2022 by the authors. Article	2022	Liu Y.; Russ S.; Mitchell J.; Przybyla S.; Zhang C.	Assessing the Determinants of Quality of Life and the Impact on HIV Prevention Measures among HIV-Negative and Status-Unknown Young Men Who Have Sex with Men: A Study in Two U.S. Metropolitan Areas	International Journal of Environmental Research and Public Health	-	-	-	-	16617827	10.3390/ijerph19020726	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122391362&doi=10.3390%2fijerph19020726&partnerID=40&md5=9c30f8b08ad8d76561bd0032d471b5de	Young men who have sex with men (YMSM) in the United States (U.S.) are disproportionally burdened by HIV and experience adverse social determinants of health. Minimal research has examined quality of life (QoL) and psychosocial/behavioral determinants among HIV-negative or status-unknown YMSM. We conducted a study with YMSM from two U.S. cities to assess their QoL scores, and whether specific QoL domains (e.g., physical, psychological, social, and environment) were associated with their demographics, psychosocial determinants, behavioral risk factors, and HIV prevention measures. Black YMSM, YMSM of low socioeconomic status (below high school education, income < $20,000, and lack of health insurance), and YMSM who did not disclose their sexual orientation had the lowest QoL scores across all domains. Substance use and unprotected anal intercourse were negatively associated with men's physical/psychosocial health. Housing/food instability and perceived stress were among the strongest predictors of lower QoL in all domains. Higher physical/psychological and environment QoL scores were associated with a higher likelihood of HIV testing and PrEP use. The identification of YMSM within these demographic, behavioral, and psychosocial sub-groups is important for targeted intervention to enhance their well-being and engagement with HIV prevention. © 2022 by the authors. Article	2022	Liu, Hui; Lai, Guichuan; Shi, Guiqian; Zhong, Xiaoni	The Influencing Factors of HIV-Preventive Behavior Based on Health Belief Model among HIV-Negative MSMs in Western China: A Structural Equation Modeling Analysis	International Journal of Environmental Research and Public Health	-	-	-	-	16617827	10.3390/ijerph191610185	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136601925&doi=10.3390%2fijerph191610185&partnerID=40&md5=b6dbebb3c0c1041b4bb6960c4fa03af8	(1) Background: Men who have sex with other men (MSMs) are at high risk of being infected by the human immunodeficiency virus (HIV) in western China. Pre-exposure prophylaxis (PrEP) is an efficient way to prevent HIV transmission. However, adherence is the most vital determinant factor affecting PrEP effectiveness. We conducted a study based on the Health Belief Model to explore factors that predict adherence to PrEP among a cohort of 689 MSMs in western China. (2) Methods: We assessed perceived susceptibility, severity, benefits, barriers, self-efficacy, cues to action, and HIV-preventive behavior through a cross-sectional survey. (3) Results: PrEP self-efficacy was directly associated with PrEP behaviors (β = 0.221, p < 0.001), cues to action were directly associated with PrEP behaviors (β = 0.112, p < 0.001), perceived benefits were directly associated with PrEP behaviors (β = 0.101, p < 0.001), and perceived susceptibility was directly associated with PrEP behaviors (β = 0.117, p = 0.043). (4) Conclusion: Medication self-efficacy, perceived susceptibility, and cue to action structures are predictors of the MSMs' HIV-preventive behavior in western China. These results will provide theoretical plans for promoting PrEP adherence in MSMs. © 2022 by the authors.	health belief model (HBM); HIV-preventive behavior; men who have sex with men (MSM); pre-exposure prophylaxis (PrEP) adherence; western China	English	Switzerland	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Quantitative
Article	2022	Liu, Q. Z.; Yang, X.; Xu, P.; Qin, Q. Q.; Tang, H. L.	Research advances in HIV pre-exposure prophylaxis drug.	Chinese Journal of Endemiology	-	-	-	-	0254-6450	10.3760/cma.j.cn112338-20220705-00598	https://pubmed.ncbi.nlm.nih.gov/29229609/	In 2012, the World Health Organization (WHO) released tenofovir/emtricitabine (TDF/FTC) as pre-exposure prophylaxis drug to help people at risk of HIV infection in specific populations, and various clinical trials and real-world data have confirmed the effectiveness of TDF/FTC in preventing HIV infection. In 2019, propofol tenofovir combined with emtricitabine (TAF/FTC) was approved in the United States as the second oral drug for pre-exposure prophylaxis(PrEP). However, for people who cannot take the drug or have poor adherence to the drug, second-generation PrEP, or long-acting antiretrovirals, provide more options. This artical reviewed the research progress of the first generation of oral PrEP and the new PrEP developed in recent years to provide reference for the promotion of HIV PrEP in China. Article	2022	Loosier P.S.; Renfro K.; Carry M.; Williams S.P.; Hogben M.; Aral S.	Reddit on PrEP: Posts About Pre-exposure Prophylaxis for HIV from Reddit Users, 2014–2019	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03463-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115169321&doi=10.1007%2fs10461-021-03463-x&partnerID=40&md5=cfe869d605d9d960a04be0075d253deb	Social media forums provide a window into how gay, bisexual, and other men who have sex with men talk about pre-exposure prophylaxis for HIV prevention (PrEP) outside of research contexts. To examine information exchange about this important pillar of HIV prevention, discussions around PrEP were collected from the r/askgaybros subreddit of the social media site Reddit (2014–2019). Post titles and asks were qualitatively coded to identify themes describing the primary purpose of the post. In all, 1163 PrEP posts were identified, and a 23.3-fold increase in post volume was seen from 2014 (n = 20) to 2019 (n = 466). The most common post type was a mention of PrEP in a post primarily discussing: an assessment of risk after a sexual encounter (19.2%); a sexual or romantic relationship (6.0%); or other (29.3%). Access challenges (19.1%), information seeking (17.5%), and the cultural effects of PrEP on the gay community (16.3%) were other common themes. Posts regarding the initiation of PrEP (11.8%) and PrEP side-effects (9.4%) were moderately represented. Posts addressing promotion, shade, stigma, and usage were infrequent (≤ 5.5% of posts, respectively). Over time, discussion of PrEP has increased exponentially on r/askgaybros, which may reflect the normalization of PrEP. Qualitative analysis of these posts can be a rich source of data for scientists, practitioners, and healthcare providers interested in increasing uptake of PrEP and decreasing barriers to its use. © 2021, This is a U.S. government work and not under copyright protection in the U.S.; foreign copyright protection may apply. Article	2022	López Rios, Javier; Lentz, Cody; Balán, Iván C.; Grosskopf, Nicholas; D'Angelo, Alexa; Stief, Matthew; Grov, Christian	Engagement in Care Among Newly Diagnosed HIV-Positive Gay, Bisexual, and Other Men Who Have Sex With Men in the United States: Results From the Together 5,000 Study.	AIDS Education and Prevention	-	-	-	-	1943-2755 0899-9546	10.1521/aeap.2022.34.5.349	https://pubmed.ncbi.nlm.nih.gov/36181497/	One-quarter of gay, bisexual, and other men who have sex with men (GBMSM) with diagnosed HIV are not engaged in HIV care. Between 2018 and 2019, 50 GBMSM completed qualitative interviews 3 months after receiving an HIV-positive result. Interviews explored barriers to and facilitators of engagement and retention in HIV testing and care. Thematic analysis revealed five major themes: (1) reason for HIV testing (e.g., self-testing), (2) linkage to care (e.g., appointment/logistic issues and social support as encouragement), (3) barriers to engagement in care (e.g., financial burden, competing priorities, and fear/stigma), (4) facilitators of engagement (e.g., financial assistance, patient-provider relationships, auxiliary support services, and health agency), and (5) PrEP as a missed prevention opportunity. Addressing individual-, social-, and policy-level barriers could improve GBMSM's engagement in HIV care. Further, capitalizing on GBMSM's health agency through partnerships with local agencies and fostering better patient-provider relationships could optimize HIV care continuity. Article	2022	Lottes M.; Bremer V.; Prugger C.; Kollan C.; Schmidt D.	Cost-savings and potential cost-savings through the distribution of generic antiretroviral drugs within the statutory health insurance market of Germany between January 2017 and June 2019	BMC Health Services Research	-	-	-	-	14726963	10.1186/s12913-021-07390-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122947438&doi=10.1186%2fs12913-021-07390-4&partnerID=40&md5=b9bcd44735d37f0db1f2f302571ab41d	Abstract: Background: Recent patent losses for antiretroviral drugs (ARV) have led to the debate of cost-saving through the replacement of patented drugs with generic drugs. The split of recommended single-tablet regimens (STR) into their single substance partners is one of the considerations mentioned in said debate. Particularly, generic tenofovir disoproxil/emtricitabine (TDF/FTC) is expected to hold untapped cost-saving potential, which may curb increasing overall expenditures for combined antiretroviral therapy (cART) within the statutory health insurance (SHI) of Germany. Methods: Data of ARV reimbursed by the SHI were used to describe the trends of defined daily doses (DDD) as well as the revenue within the German ARV market. They were also used to determine the cost-savings of moving to generic drugs. The time period observed was between January 2017 and June 2019. The potential cost-savings were determined with following assumption in mind: the maximum possible use of generic ARV, including 1) the split of STR and replacing all substance partners with generic ones, and 2) replacing patented tenofovir alafenamide/emtricitabine (TAF/FTC) with generic TDF/FTC. Results: Throughout the observation period, the DDD of generic ARV increased nearly five-fold while their revenue increased more than four-fold. Total cost-saving showed a sharp increase over the same period, with generic TDF/FTC accounting for a share of around 70%. The largest potential cost-saving could have been achieved through replacing patented TAF/FTC with generic TDF/FTC, peaking at nearly 10% of total revenue, but showing decreasing trends in general. Conclusion: The progressive distribution of generic ARV ensured increasing cost-savings, but consequently curbed the potential cost-savings. Unique price reductions of generic TDF/FTC have played a pivotal role for these effects. In any case, substituting with generic ARV should not fail to adhere to the treatment guidelines and continue to consider the medical requirements for the treatment. © 2022, The Author(s). Article	2022	LoVette, Ashleigh; Kuo, Caroline; Giovenco, Danielle; Hoare, Jacqueline; Underhill, Kristen; Operario, Don	Pre-exposure prophylaxis as an opportunity for engagement in HIV prevention among South African adolescents.	SAHARA J : Journal of Social Aspects of HIV/AIDS Research Alliance	-	-	-	-	1813-4424	10.1080/17290376.2021.2016479	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8843204	Pre-exposure prophylaxis (PrEP) offers a potential biomedical strategy to reduce HIV incidence among adolescent populations disproportionately affected by HIV. There is limited evidence on the social and clinical implications, including engagement in HIV prevention efforts, of PrEP for South African adolescents, who face high HIV risk. We conducted a mixed-methods study in Western Cape, South Africa from 2015 to 2016. Adolescents (N = 35) aged 16-17 and clinical service providers working with adolescents (N = 25) were recruited from community and clinic settings. Adolescents and service providers completed a survey about their overall perceptions of PrEP and completed interviews guided by semi-structured protocols. We performed descriptive analysis of quantitative data using SPSS and thematic analysis of qualitative data using NVivo. The majority of adolescents endorsed future PrEP use for themselves and partners, and all clinical service providers endorsed future PrEP use for sexually active adolescents. Both adolescents and service providers identified PrEP as an opportunity to engage youth as active participants in HIV prevention. Service providers also viewed PrEP as a potential mechanism for shifting life trajectories. Findings from this study enhance our understanding of the considerations needed to engage adolescents and clinical service providers in the roll-out of oral PrEP in South Africa. Article	2022	Lumsden J.; Dave A.J.; Johnson C.; Blackmore C.	Improving access to pre-exposure prophylaxis for HIV prescribing in a primary care setting	BMJ Open Quality	-	-	-	-	23996641	10.1136/bmjoq-2021-001749	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130635291&doi=10.1136%2fbmjoq-2021-001749&partnerID=40&md5=0d99c8a041d75c1a9c1955c5a5bc2a76	Although emtricitabine-tenofovir was approved for HIV pre-exposure prophylaxis (PrEP) in 2012, use by persons at risk of acquiring HIV has been limited. Because many primary care providers lacked familiarity and comfort prescribing PrEP, at our institution PrEP prescribing was concentrated among the infectious disease specialists, effectively limiting access. This project sought to increase the number of patients receiving new prescriptions for PrEP. The interventions targeted primary care providers (including internal medicine and family medicine), and were designed to increase the number of unique providers offering PrEP to their patients. The overall strategy was to expand the clinical scope of practice for primary care providers through education and provision of detailed care templates in the electronic health record. These initiatives were implemented through a series of informal Plan-Do-Study-Act cycles, then operationalised throughout the medical system. To evaluate the success of the project, we queried the electronic medical record for all new prescriptions for PrEP, with provider name and specialty, for all outpatients 18 years of age and older from 2012 through 2020. In 2015, prior to the intervention, only 78 patients received new prescriptions for PrEP at our institution, and only 38% (30 of 78) of these were from primary care clinicians. After the intervention, the number of patients receiving PrEP increased to 190 in 2019, with 85% (162 of 190) prescribed by primary care providers. In addition, the number of primary care providers making a new prescription for PrEP increased from 20 in 2015 to 73 in 2019. We conclude that targeted clinical education, combined with electronic health record templates, was associated with a significant increase in PrEP prescribing. © Author(s) (or their employer(s)) 2022. Article	2022	Lunkuse J.F.; Kamacooko O.; Muturi-Kioi V.; Chinyenze K.; Kuteesa M.O.; Price M.A.; Mayanja Y.	Low awareness of oral and injectable PrEP among high-risk adolescent girls and young women in Kampala, Uganda	BMC Infectious Diseases	-	-	-	-	14712334	10.1186/s12879-022-07398-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130642700&doi=10.1186%2fs12879-022-07398-z&partnerID=40&md5=e0b30f228bac26ab7a86b39d92baf3be	Background: Adolescent girls and young women (AGYW) account for a disproportionate number of new HIV infections worldwide. HIV prevalence among young sex workers in Uganda is 22.5%. Although pre-exposure prophylaxis (PrEP) is a highly effective biomedical HIV prevention method, awareness of PrEP among AGYW in Uganda has not been studied systematically. We aimed to assess awareness of PrEP and factors associated with awareness of PrEP among AGYW who frequently reported paid sex. Methods: We conducted a cross-sectional study among 14–24-year old AGYW at high risk of HIV infection in Kampala, Uganda from January to October 2019. Participants were screened for PrEP eligibility using a national screening tool of whom 82.3% were eligible. Data on socio-demographics, behavioral and sexual risks were collected by interview. Awareness of oral or injectable PrEP, the latter of which is currently in late-stage trials, was defined as whether an individual had heard about PrEP as an HIV prevention method. Multivariable robust poisson regression model was used to assess factors associated with oral PrEP awareness. Results: We enrolled 285 participants of whom 39.3% were under 20 years old, 54.7% had completed secondary education, 68.8% had multiple sex partners in the past 3 months, 8.8% were screened as high risk drinkers/ alcohol dependent (AUDIT tool) and 21.0% reported sex work as main occupation. Only 23.2% were aware of oral PrEP and 3.9% had heard about injectable PrEP. The prevalence of oral PrEP awareness was significantly higher among volunteers screened as alcohol dependents (aPR 1.89, 95% CI 1.08–3.29) and those with multiple sexual partners (aPR 1.84, 95% CI 1.01–3.35), but was lower among those who reported consistent condom use with recent sexual partners (aPR 0.58, 95% CI 0.37–0.91). Conclusions: Majority of AGYW were not aware of any kind of PrEP. Those with higher risk behavior, i.e. alcohol dependents or multiple sexual partners, were more aware of oral PrEP. Interventions to increase awareness among female youth are needed. Improving PrEP awareness is critical to increasing PrEP uptake among high-risk AGYW in Uganda. © 2022, The Author(s). Article	2022	Luong Nguyen L.B.; Freedberg K.A.; Wanjala S.; Maman D.; Szumilin E.; Mendiharat P.; Yazdanpanah Y.	Comparative Effectiveness of Interventions to Improve the HIV Continuum of Care and HIV Preexposure Prophylaxis in Kenya: A Model-Based Analysis	Journal of Infectious Diseases	-	-	-	-	221899	10.1093/infdis/jiaa633	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127485164&doi=10.1093%2finfdis%2fjiaa633&partnerID=40&md5=e0fb17e657c475663a1cb9dd5baa07d3	Background: In Western Kenya up to one-quarter of the adult population was human immunodeficiency virus (HIV)-infected in 2012. The Ministry of Health, MCrossed D signedecins Sans Frontières, and partners implemented an HIV program that surpassed the 90-90-90 UNAIDS targets. In this generalized epidemic, we compared the effectiveness of preexposure prophylaxis (PrEP) with improving continuum of care. Methods: We developed a dynamic microsimulation model to project HIV incidence and infections averted to 2030. We modeled 3 strategies compared to a 90-90-90 continuum of care base case: (1) scaling up the continuum of care to 95-95-95, (2) PrEP targeting young adults with 10% coverage, and (3) scaling up to 95-95-95 and PrEP combined. Results: In the base case, by 2030 HIV incidence was 0.37/100 person-years. Improving continuum levels to 95-95-95 averted 21.5% of infections, PrEP averted 8.0%, and combining 95-95-95 and PrEP averted 31.8%. Sensitivity analysis showed that PrEP coverage had to exceed 20% to avert as many infections as reaching 95-95-95. Conclusions: In a generalized HIV epidemic with continuum of care levels at 90-90-90, improving the continuum to 95-95-95 is more effective than providing PrEP. Continued improvement in the continuum of care will have the greatest impact on decreasing new HIV infections. © 2022 Oxford University Press. Modeling the potential impact of pre-exposure prophylaxis for HIV among men who have sex with men in Cameroon	BMC Infectious Diseases	-	-	-	-	14712334	10.1186/s12879-022-07738-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138644926&doi=10.1186%2fs12879-022-07738-z&partnerID=40&md5=e1802f03d43848316454e2c4eca09eb4	Background: Men who have sex with men (MSM) are consistently burdened by HIV at higher levels than other adults. While HIV prevention programs for MSM are growing in coverage and quality, HIV incidence remains high. In response, pre-exposure prophylaxis (PrEP) was introduced in 2019 to support HIV risk reduction among MSM in Cameroon. Understanding how PrEP initiation programs will change the HIV prevalence among MSM in Cameroon is important to developing effective programs. Methods: This study uses a mathematical model to simulate population-level HIV transmission among MSM in the cities of Yaoundé and Douala, Cameroon. PrEP is incorporated into the model at rates that equal 25%, 50%, or 75% coverage after twenty years to assess the potential effects on HIV prevalence among MSM, requiring annual initiation rates of 2.5%, 6.8%, and 17.2% for Yaoundé and 2.2%, 5.6%, and 13.4% for Douala, respectively. The data utilized for this model are from a cross sectional study which recruited MSM through respondent-driven sampling of MSM in two major cities in Cameroon: Yaoundé and Douala. Results: The model estimated an HIV prevalence of 43.2% among MSM, annual HIV diagnoses of 300 per 10,000 MSM and antiretroviral therapy (ART) coverage of 53.9% in Yaoundé. In Douala, estimated prevalence is 26.5% among MSM, 167 per 10,000 MSM annual diagnoses and ART coverage of 72.0%. Standalone PrEP interventions aimed at 50% coverage at the end of a 20-year program would reduce the prevalence from 43.2% to 35.4% in Yaoundé and from 26.5 to 20.1% in Douala. Combining PrEP with a 10% increase in HIV testing would decrease the number of MSM living with HIV and unaware of their status from 9.8 to 6.0% in Yaoundé and from 8.7 to 4.6% in Douala. Conclusions: PrEP would be beneficial in reducing prevalence even at varying initiation and coverage levels. Combination of PrEP and increased HIV testing further decreased the number of undiagnosed MSM. This study supports the utility of implementing PrEP as part of comprehensive HIV prevention programming among MSM in Cameroon. © 2022, The Author(s). Article	2022	MacDonell, Karen Kolmodin; Wang, Bo; Phanuphak, Nittaya; Janamnuaysook, Rena; Srimanus, Peevara; Rongkavilit, Chokechai; Naar, Sylvie	Optimizing an mHealth Intervention to Improve Uptake and Adherence to HIV Pre-exposure Prophylaxis in Young Transgender Women: Protocol for a Multi-Phase Trial.	JMIR Research Protocols	-	-	-	-	1929-0748	10.2196/37659	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9164094	BACKGROUND: Vulnerable adolescents and emerging adults (aged 18-29 years), particularly young transgender women, are among the fastest-growing HIV positive populations worldwide. Thailand has the highest adult HIV seroprevalence in Asia, with a rate of infection among this population of 18%. Widespread technology offers opportunities for innovative mobile health (mHealth) interventions. Pre-exposure prophylaxis (PrEP) is an efficacious HIV prevention strategy recommended for at-risk individuals. PrEP is highly effective when taken as prescribed, but uptake and adherence have been low, with high discontinuation rates among youth. OBJECTIVE: We propose to develop and pilot a multi-component, technology-based intervention to promote PrEP usage. We will adapt an existing 2-session, technology-delivered, motivational interviewing-based intervention to focus on PrEP use in transgender women in Thailand. We call this the Motivational Enhancement System for PrEP Uptake and Adherence (MES-PrEP). We will also refine and enhance YaCool, a mobile app with integrated text messaging developed and used clinically by our Thai team. The new version of the app is called Enhanced YaCool, and it enables self-management of gender and sexual health (including PrEP). Our primary aim is to develop and assess the preliminary efficacy of this mHealth intervention. METHODS: We will utilize a multiphase optimization strategy (MOST) to identify the most effective intervention component or combination of components to improve PrEP usage in Thai transgender women. The study includes two phases: phase I (R21) includes qualitative interviews with key stakeholders to explore barriers and facilitators of PrEP usage through thematic analysis to inform intervention adaptation. Following this, we will adapt and beta-test MES-PrEP and Enhanced YaCool for functionality and feasibility using a community advisory board of HIV-negative Thai transgender women. In phase II (R33), we will conduct a MOST design-based trial to evaluate the feasibility, acceptability, and preliminary efficacy of MES-PrEP and Enhanced YaCool. Eighty HIV-negative participants who are currently taking PrEP and 80 participants who are not will be randomized to four conditions: (1) standard PrEP counseling (the control condition); (2) MES-PrEP and standard PrEP counseling; (3) Enhanced YaCool and standard PrEP counseling; and (4) MES-PrEP, Enhanced YaCool, and standard PrEP counseling. Feasibility and acceptability of the intervention will be assessed through usage patterns and the System Usability Scale. Preliminary impact will be assessed by evaluating the proportion of participants who initiate PrEP and their level of adherence to PrEP. Assessments will be at baseline and 1, 3, 6, 9, and 12 months postintervention. Biomarkers of adherence to PrEP, HIV, and other sexually transmitted infections will be collected. RESULTS: Upon project completion, we will have an optimized mHealth intervention to support the use of PrEP by transgender women that will be ready for testing in a larger efficacy trial. CONCLUSIONS: Even though transgender women in Thailand face increasing risks of HIV, few interventions have targeted them. Effective developmentally and culturally tailored interventions are needed to prevent HIV transmission in this high-risk population. Article	2022	Macedo N.; Baggio G.; Henn I.; Santos J.; Batista T.; Ignácio S.; Souza P.; Azevedo-Alanis L.	Oral conditions and salivary analysis in HIV-uninfected subjects using preexposure prophylaxis	Medicina Oral Patología Oral y Cirugía Bucal	-	-	-	-	16984447	10.4317/medoral.25140	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129781785&doi=10.4317%2fmedoral.25140&partnerID=40&md5=2bbce8253a38ef2d7d95c06a444e086a	Background: New prevention strategies have been advocated to control the progression of HIV/AIDS, such as preexposure prophylaxis (PrEP). The aim of this study is to evaluate the potential changes in the oral and salivary conditions of HIV-uninfected subjects using PrEP. Material and Methods: Subjects were evaluated before beginning the medication (T0), at the first follow-up (T1), and at the second follow-up (T2). Xerostomia, presence of untreated cavitated caries, oral hygiene habits, taste, gingival and plaque index, stimulated salivary flow rate (SSFR), and salivary concentrations of calcium, glucose, urea, and total proteins were evaluated. Data obtained were analyzed using statistical tests (p<0.05). Results: Forty-seven participants (41 men; 6 women) were evaluated at T0. Thirty (28 men; 2 women) and 17 men were reassessed at T1 and T2, respectively. There was no difference between the SSFR and oral and salivary conditions between T0, T1, and T2 (p>0.05), except for the salivary calcium concentration, that increased at T2 compared to T1 (p=0.02). There was significant difference between taste and xerostomia at T1 (p=0.017), and the need to drink to swallow at T2 (p=0.015). There was significant correlation between the reported amount of saliva and taste (p=0.039, r=-0.378) at T1. Conclusions: The prolonged use of PrEP seems to be associated with reports of dry mouth and worsening of taste, possibly associated with increased salivary calcium concentration. © Medicina Oral S.L. Theses and Dissertations	2022	MacGibbon, James	Redefining negotiated safety: Gay, bisexual and queer men adapting to HIV pre-exposure prophylaxis in intimate relationships	-	-	-	University of New South Wales	-	NA	NA	http://hdl.handle.net/1959.4/100838 https://unsworks.unsw.edu.au/bitstreams/9d697d53-6d28-482d-85df-5d9f69fe8af4/download https://doi.org/10.26190/unsworks/24545	HIV pre-exposure prophylaxis (PrEP) is a recent, yet significant, development in HIV prevention. This mixed-methods research followed PrEP's introduction in Australia, and examined how gay, bisexual and queer (GBQ) men in relationships have adapted to and incorporated PrEP in their sex practices, relationships, and everyday lives. As PrEP raises the prospect of having condomless sex both within and outside primary relationships without risking HIV infection, this research revisited the concept of negotiated safety (Kippax et al., 1997) to explore how HIV-negative GBQ men practice and negotiate safe sex in the era of biomedical HIV prevention. Quantitative data were collected in two national cross-sectional survey projects, The Gay Community Periodic Surveys (GCPS; 2013–2018) and the PrEPARE Project (2013–2021). The GCPS analysis showed a rapid shift away from relationship agreements in which condomless sex is only sanctioned between regular partners. The PrEPARE Project analysis found that men in relationships who used PrEP were more likely to have spoken and non-monogamous agreements, and to have partners that also used PrEP, compared to men in relationships who did not use PrEP. Qualitative data were generated using semi-structured, in-depth interviews conducted between January and August 2019 with 26 GBQ men in Sydney, Melbourne and Perth. Thematic analysis of these data identified new shared meanings and social practices that were enabled or mediated by PrEP, with an analytic focus on complexity, situatedness, contingency and relationality. Participant accounts illustrated diverse sexual practices and views about risk, but most participants adopted PrEP due to perceived HIV risk from casual sex rather than sex with their primary partners. PrEP complicated views about what counted as 'safe sex' and revealed changing understandings and practices of intimacy, pleasure, trust and risk. There was, however, an enduring narrative of individual responsibility to practice effective HIV prevention. Participants diverged in how they discussed and disclosed sexual practices with their primary and casual partners, revealing tensions about what disclosures were believed to be necessary or expected. Together, these quantitative and qualitative data collected as PrEP use became more common refocus attention on the practicality and complexity of relationship agreements among GBQ men. Article	2022	MacLachlan E.W.; Korn A.K.; Ensminger A.L.; Zambwe S.; Kueyo T.; Kahuure R.; Barnabee G.; Nghipangelwa J.; Mudabeti J.; Tambo P.; Mwilima A.; Muremi E.; Forster N.; Fischer-Walker C.; O'Malley G.	Bottlenecks and Solutions During Implementation of the DREAMS Program for Adolescent Girls and Young Women in Namibia	Global Health Science and Practice	-	-	-	2169575X	10.9745/GHSP-D-22-00226	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140939561&doi=10.9745%2fGHSP-D-22-00226&partnerID=40&md5=4b622800fd8d2ff8f060ec9e295b2680	Background: We synthesize implementation bottlenecks experienced while implementing the DREAMS (Determined, Resilient, Empowered, AIDS-free, Mentored, and Safe) program, an HIV prevention intervention for adolescent girls and young women (AGYW), in Namibia from 2017 to 2019. Bottlenecks were organized into the following 4 AGYW program components. Program Access: Enrollment was slowed by the time-intensive nature of screening and other baseline data collection requirements, delays in acquiring parental consent, and limited time for after-school activities. Solutions included obtaining advance consent and providing 1-stop service delivery and transportation assistance. Health Education: We experienced difficulty identifying safe spaces for AGYW to meet. A lack of tailored curricula also impeded activities. Governments, stakeholders, and partners can plan ahead to help DREAMS identify appropriate safe spaces. Curricula should be identified and adapted before implementation. Health Services: Uneven availability of government-provided commodities (e.g., condoms, preexposure prophylaxis PrEP, family planning products) and lack of AGYW-centered PrEP delivery approaches impacted services. Better forecasting of commodity needs and government commitment to supply chain strengthening will help ensure adequate program stock. Social Services: The availability of only centralized care following gender-based violence (GBV) and the limited number of government social workers to manage GBV cases constrained service provision. Triaging GBV cases—i.e., referring high-risk cases to government social workers and providing DREAMS-specific social services for other cases—can ensure proper caseload management. Conclusion: These bottlenecks highlight practical implementation issues and higher-level considerations for AGYW-centered HIV prevention programs. The critical need for multilayered programming for HIV/GBV prevention in AGYW cannot be addressed simply with additional funds but requires multilevel collaboration and forecasting. The urgency to achieve results must be balanced with the need for adequate implementation preparedness. © MacLachlan et al. Theses and Dissertations	2022	Madden, Serina Jean; Frioux, Toni	Improving Access for Pre-exposure Prophylaxis in Primary Care	-	-	Oklahoma City University	-	NA	NA	https://www.proquest.com/dissertations-theses/improving-access-pre-exposure-prophylaxis-primary/docview/2694977841/se-2?accountid=8113	Preventing HIV by using PrEP is an efficient way to stop transmission (CDC, 2020) and is a key strategy to halt HIV transmission that needs further exploration. In 2012, the FDA approved PrEP medication to reduce HIV transmission with those that do not have the virus (Avert, 2019). Data from 2013–2015 indicates that 1.2 million people had indications for PrEP (men that have sex with men, injection drug users, or indicators in heterosexual activities) (Smith et al., 2015) but fewer than 50,000 individuals initiated PrEP (Sullivan et al., 2018). Exploring why there is a need for PrEP but lack of access needs to be explored. The wait time to access primary care is extensive in the United States averaging 18 days or longer in private primary care settings (Penn et al., 2019). The lack of available same day appointments for patients at risk of HIV increases disease burden, delays initiation of PrEP, and diminishes medication adherence. This lack of access can perpetuate the HIV epidemic. The purpose of this quality improvement project was to improve access to PrEP in primary care settings by establishing a same day appointment process. Patient outcomes after the eight week implementation showed that traditional appointments (12 total) and same day appointments (six total), valued access to PrEP appointments by keeping those appointments. This outcome indicates same day appointments for primary prevention in the primary care setting needs to be offered. Increasing availability and access to care and help prevent illness. Prevention should be valued in the United States just like treatment moving forward. Article	2022	Madhani, Adam; Finlay, Katherine A	Using the COM-B model to characterize the barriers and facilitators of pre-exposure prophylaxis (PrEP) uptake in men who have sex with men.	British Journal of Health Psychology	-	-	-	2044-8287	10.1111/bjhp.12605	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9796940	OBJECTIVES: Using the COM-B model, this study aimed to characterize barriers and facilitators to pre-exposure prophylaxis (PrEP) uptake amongst men who have sex with men (MSM). DESIGN AND METHOD: Semistructured interviews with 13 MSM who were non-PrEP users were conducted with a specific focus on barriers and facilitators to PrEP uptake. A 15-item interview schedule was created informed by the COM-B model. Transcripts were transcribed verbatim and inductively analysed using thematic analysis. To illustrate pathways for intervention design, inductive themes were then deductively mapped onto COM-B constructs. RESULTS: Results demonstrated that barriers to PrEP uptake were closely aligned with five (of six) COM-B components: psychological capability, physical opportunity, social opportunity, reflective motivation and automatic motivation. These COM-B subcomponents reflected seven thematized barriers: (1) limited information about PrEP, (2) restricted access to PrEP, (3) gay identity and sexual stigmatization, (4) social and cultural stigmatization, (5) capabilities in treatment adherence, (6) optimistic bias about sexual behaviours and (7) calculating risk. No facilitators or physical capability concerns were demonstrated. CONCLUSION: This study adopted a novel behaviour change-informed approach to understanding barriers and facilitators to PrEP uptake amongst MSM. Unrealistic optimism about self-protective individual behaviours, the physical accessibility of PrEP and (mis)information together interacted closely with perceptions of personal and social stigmatization to dynamically impact PrEP uptake decisions. Barriers to PrEP uptake mapped clearly to the COM-B; therefore, these results provide the foundation for Behaviour Change Wheel intervention development to improve rates of PrEP uptake and its acceptability for MSM.	behaviour change, COM-B, HIV prevention, MSM, PrEP	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Qualitative
Article	2022	Mahal J.; Deccy S.; Seu R.	Linking emergency department patients at risk for human immunodeficiency virus to pre-exposure prophylaxis	American Journal of Emergency Medicine	-	-	-	7356757	10.1016/j.ajem.2022.01.038	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124231578&doi=10.1016%2fj.ajem.2022.01.038&partnerID=40&md5=3848d4433d3b2a7eb3e9c24c43abb5bd	Objective: The objective of this study is to describe an Emergency Department (ED)-based, HIV prevention and navigation program and the individuals linked to an in-house clinic for HIV pre-exposure prophylaxis (PrEP) in the first eleven months of program implementation. Methods: This is a retrospective, observational study of an ED-based HIV prevention and navigation program between January 1, 2019, and November 30, 2019. A status neutral navigation program is housed in the ED with 2–3 navigators staffing approximately 80 h per week. Navigators provide HIV screening with point-of-care testing, sexual health education and counseling, including PEP and PrEP information, and HIV risk assessments. They also make follow-up appointments, appointment reminder calls, and offer to accompany individuals to an in-house HIV clinic for clients who either test positive in the ED for HIV, are known to be living with HIV but are out-of-care, are HIV negative but require post-exposure prophylaxis (PEP) and/or meet criteria for and are interested in starting PrEP. Clients are approached if they request HIV or other sexually transmitted infection testing, present to the ED with genitourinary complaints, or are referred to the program by ED medical providers. Funding for the program is from a New York City Department of Health (NYCDOH) service grant. Data were manually abstracted from program records and from a NYCDOH database. The primary study outcomes are how many clients accepted clinic referral for PrEP, attended their appointments, and received a prescription for PrEP. Results: In the time-period reviewed, complete demographic data and CDC risk factors for HIV were available for 1174 patients. Our program provided appointments for 22 patients who met CDC criteria for PrEP and expressed interest in initiating PrEP. Thirteen patients who attended their scheduled appointment had same day appointments at the on-site clinic, and 11 (85%) were prescribed PrEP. From 1024 paper records with complete data, 914 clients reported that they do not consider themselves at risk for HIV infection. Conclusions: Most clients that were both eligible and interested in PrEP were prescribed PrEP if given a same day follow-up appointment. Of the clients engaged in this navigation program, almost 80% did not perceive that they were at-risk for HIV infection. © 2022 Elsevier Inc. Article	2022	Makarova N.; Singletary T.; Peet M.M.; Mitchell J.; Holder A.; Dinh C.; Agrahari V.; Mendoza M.; Pan Y.; Heneine W.; Clark M.R.; García-Lerma J.G.; Smith J.M.; Doncel G.F.	Pharmacokinetics and efficacy of topical inserts containing tenofovir alafenamide fumarate and elvitegravir administered rectally in macaques	EBioMedicine	-	-	-	23523964	10.1016/j.ebiom.2022.104338	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141224945&doi=10.1016%2fj.ebiom.2022.104338&partnerID=40&md5=eb1699ca3235f2bd27bd8621f175627b	Background: Topical on-demand forms for HIV pre-exposure prophylaxis (PrEP) may be a desirable alternative for people that prefer not to use daily PrEP. CONRAD has developed inserts containing tenofovir alafenamide (TAF) and elvitegravir (EVG) for on-demand vaginal or rectal pericoital use. We assessed the pharmacokinetics (PK) and pre-exposure efficacy of rectally applied TAF/EVG inserts in macaques. Methods: PK was assessed in 12 pigtailed macaques. Tenofovir (TFV) and EVG levels were assayed in rectal biopsies and secretions, and tenofovir-diphosphate (TFV-DP) levels in biopsies and peripheral blood mononuclear cells (PBMC). Drug biodistribution was evaluated in 10 animals at necropsy 4 h post-dosing. For efficacy assessments, one or two TAF/EVG inserts were administered to macaques (n = 6) 4 h before repeated rectal SHIV162p3 challenges. Findings: One TAF/EVG insert resulted in rapid and high EVG and TFV-DP in rectal tissue 4 h after application. Adding a second insert led to a 10-fold increase in EVG and TFV-DP in rectal tissue. Efficacy of one and two TAF/EVG inserts were 72.6% (CI 24.5%–92.6%) and 93.1% (CI 73.3%–99.2%), respectively. Interpretation: Although high TFV-DP and EVG levels were observed with one rectal TAF/EVG insert, it only conferred partial protection from rectal SHIV challenges. Adding a second insert led to an increase in TFV and EVG in rectal tissues resulting in higher (>90%) efficacy. These results highlight the high efficacy of TAF/EVG inserts as topical on-demand rectal PrEP, as well as the need for appropriate drug coverage in the deep rectum and colon to achieve high protection. Funding: The work related to animal studies was funded by CDC intramural funds and an interagency agreement between CDC and USAID (USAID/CDC IAA AID-GH-T-15-00002). The work related to the insert formulation was funded by U.S. PEPFAR through USAID under a Cooperative Agreement (AID-OAA-A-14-00010) with CONRAD/Eastern Virginia Medical School. Article	2022	Makhakhe N.F.; MeyerWeitz A.; Sliep Y.	Motivating factors associated with oral pre-exposure prophylaxis use among female sex workers in South Africa	Journal of Health Psychology	-	-	-	13591053	10.1177/13591053211072674	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122695177&doi=10.1177%2f13591053211072674&partnerID=40&md5=3cefb14c8e08c39aa2e55f0c1b29ce9a	To explore the motivating factors that encourage female sex workers to take oral PrEP, despite the challenges that come with adherence. The 39 participants in this study consisted of female sex workers, peer educators, a counselor, and a researcher. Participants took PrEP as an expression of self-love. Some participants described PrEP as empowering because they could independently prevent HIV. They were also motivated by parenting, hope and future aspirations. It is important for future PrEP interventions to incorporate behavioral strategies that appeal to the user's personal and deeper motivations for living. © The Author(s) 2022.	adherence; female sex workers; HIV; motivation; pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Qualitative
Article	2022	Makhakhe N.F.; Sliep Y.; Meyer-Weitz A.	"Whatever is in the ARVs, is Also in the PrEP" Challenges Associated With Oral Pre-exposure Prophylaxis Use Among Female Sex Workers in South Africa	Frontiers in Public Health	-	-	-	22962565	10.3389/fpubh.2022.691729	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133264441&doi=10.3389%2ffpubh.2022.691729&partnerID=40&md5=e337d977d741addce178dcc856cc3d60	Background: The national policy on oral pre-exposure prophylaxis (PrEP) for female sex workers (FSWs) was instituted in South Africa in 2016. FSWs were targeted for PrEP due to a Human immunodeficiency virus (HIV) prevalence of 57.7%, which is higher than the prevalence of 19.07% among the general population. Research from demonstration studies has shown that uptake of PrEP has been slower than anticipated, and the purpose of this study was to explore barriers to the uptake of PrEP among FSWs. Methods: An in-depth qualitative study was conducted with 39 participants, 30 individual participants, and nine focus group participants. Eleven participants consisted of peer educators and two health workers from a sex work and PrEP distribution organization, the rest of the participants (1) were FSWs. Results: The majority of participants mentioned that little distinction was made between PrEP and antiretrovirals (ARVs) taken by FSWs living with HIV. PrEP was not distributed through public health care facilities, and health workers unknowingly labeled PrEP as ARVs. Consequently, health workers seen as experts created suspicion and contributed to the mistrust of PrEP among FSWs due to mixed messages, and equating PrEP to ARVs reduced uptake. Furthermore, failure to make a clear distinction between oral PrEP and ARVs resulted in accusations of lying, denialism, and deception leveled at users of PrEP by FSWs using ARVs, and sometimes by clients and intimate partners. FSWs using PrEP reported feeling stigmatized and thrust into interpersonal conflict with their peers after choosing PrEP, leading to broken relationships, and some resorting to taking PrEP privately or discontinuing PrEP altogether. Conclusion: Pre-exposure prophylaxis as an ARV targeted for the prevention of HIV among high-risk groups was found to be stigmatizing. The distinctive use of PrEP and ARVs should be correctly explained to users to minimize confusion, enable differentiation and reduce interpersonal conflict. Cohesion among sex work organizations and public health care facilities is needed to disseminate the correct knowledge on PrEP. A non-stigmatizing approach to the distribution of PrEP may serve to increase uptake and adherence. Copyright © 2022 Makhakhe, Sliep and Meyer-Weitz. Article	2022	Makhoul, Monia; Abu-Hijleh, Farah; Ayoub, Houssein H.; Seedat, Shaheen; Chemaitelly, Hiam; Abu-Raddad, Laith J.	Modeling the population-level impact of treatment on COVID-19 disease and SARS-CoV-2 transmission.	Epidemics	-	-	-	1878-0067 1755-4365	10.1016/j.epidem.2022.100567	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9013049/	Different COVID-19 treatment candidates are under development, and some are becoming available including two promising drugs from Merck and Pfizer. This study provides conceptual frameworks for the effects of three types of treatments, both therapeutic and prophylactic, and to investigate their population-level impact, to inform drug development, licensure, decision-making, and implementation. Different drug efficacies were assessed using an age-structured mathematical model describing SARS-CoV-2 transmission and disease progression, with application to the United States as an illustrative example. Severe and critical infection treatment reduces progression to COVID-19 severe and critical disease and death with small number of treatments needed to avert one disease or death. Post-exposure prophylaxis treatment had a large impact on flattening the epidemic curve, with large reductions in infection, disease, and death, but the impact was strongly age dependent. Pre-exposure prophylaxis treatment had the best impact and effectiveness, with immense reductions in infection, disease, and death, driven by the robust control of infection transmission. Effectiveness of both pre-exposure and post-exposure prophylaxis treatments was disproportionally larger when a larger segment of the population was targeted than a specific age group. Additional downstream potential effects of treatment, beyond the primary outcome, enhance the population-level impact of both treatments. COVID-19 treatments are an important modality in controlling SARS-CoV-2 disease burden. Different types of treatment act synergistically for a larger impact, for these treatments and vaccination. Article	2022	Malama K.; Logie C.H.; Narasimhan M.; Ouedraogo L.; Asmani C.; Elamin H.; Van De Merwe L.L.-A.; Hopkins J.; Bukusi E.A.	Short Communication: Awareness of HIV Self-Care Interventions Across Global Regions: Results from a Values and Preferences Survey	AIDS Research and Human Retroviruses	-	-	-	8892229	10.1089/aid.2021.0200	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135599006&doi=10.1089%2faid.2021.0200&partnerID=40&md5=c75daeeec2673c8a06d2f0c0bc16267a	The high burden of HIV in sub-Saharan Africa places significant demands on health care services. Interventions such as HIV self-Testing, and pre-and post-exposure prophylaxis (PrEP and PEP) could empower individuals to determine their HIV status and prevent HIV acquisition. In 2018, the World Health Organization disseminated an online, anonymous, global values and preferences survey to adults 18 years of age and older. The survey aimed to inform guidance on awareness, use, and preferences around self-care interventions for sexual and reproductive health. We conducted a cross-sectional analysis using Pearson's chi-squared test to compare awareness of HIV self-Testing, PrEP and PEP across five global regions. Our analysis included 814 participants from 110 countries. We noted that respondents from Africa reported higher awareness of HIV interventions than participants from Europe, Latin America and the Caribbean, North America, and Asia. Our finding highlights an opportunity to expand self-care interventions for HIV prevention and management in Africa. © Kalonde Malama et al. 2022. Article	2022	Maloney K.M.; Benkeser D.; Sullivan P.S.; Kelley C.; Sanchez T.; Jenness S.M.	Sexual Mixing by HIV Status and Pre-exposure Prophylaxis Use among Men Who Have Sex with Men: Addressing Information Bias	Epidemiology	-	-	-	10443983	10.1097/EDE.0000000000001525	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139738869&doi=10.1097%2fEDE.0000000000001525&partnerID=40&md5=e5d9a63036585dd85aebd662372f204b	Background: Population-level estimates of sexual network mixing for parameterizing prediction models of pre-exposure prophylaxis (PrEP) effectiveness are needed to inform prevention of HIV transmission among men who have sex with men (MSM). Estimates obtained by egocentric sampling are vulnerable to information bias due to incomplete respondent knowledge. Methods: We estimated patterns of serosorting and PrEP sorting among MSM in the United States using data from a 2017-2019 egocentric sexual network study. Respondents served as proxies to report the HIV status and PrEP use of recent sexual partners. We contrasted results from a complete-case analysis (unknown HIV and PrEP excluded) versus a bias analysis with respondent-reported data stochastically reclassified to simulate unobserved self-reported data from sexual partners. Results: We found strong evidence of preferential partnering across analytical approaches. The bias analysis showed concordance between sexual partners of HIV diagnosis and PrEP use statuses for MSM with diagnosed HIV (39%; 95% simulation interval: 31, 46), MSM who used PrEP (32%; 21, 37), and MSM who did not use PrEP (83%; 79, 87). The fraction of partners with diagnosed HIV was higher among MSM who used PrEP (11%; 9, 14) compared with MSM who did not use PrEP (4%; 3, 5). Comparatively, across all strata of respondents, the complete-case analysis overestimated the fractions of partners with diagnosed HIV or PrEP use. Conclusions: We found evidence consistent with HIV and PrEP sorting among MSM, which may decrease the population-level effectiveness of PrEP. Bias analyses can improve mixing estimates for parameterization of transmission models. © 2022 Lippincott Williams and Wilkins. All rights reserved. Article	2022	Mandal, Subhra; Sunagawa, Shawnalyn W.; Prathipati, Pavan Kumar; Belshan, Michael; Shibata, Annemarie; Destache, Christopher J.	Targeted Immuno-Antiretroviral to Promote Dual Protection against HIV: A Proof-of-Concept Study.	Nanomaterials	-	-	-	2079-4991	10.3390/nano12111942	https://pubmed.ncbi.nlm.nih.gov/35683795/	The C-C motif chemokine receptor-5 (CCR5) expression on the T-cell surface is the prime barrier to HIV/AIDS eradication, as it promotes both active human immunodeficiency virus (HIV)-infection and latency; however, antiretrovirals (ARVs) suppress plasma viral loads to non-detectable levels. Keeping this in mind, we strategically designed a targeted ARVs-loaded nanoformulation that targets CCR5 expressing T-cells (e.g., CD4+ cells). Conceptually, CCR5-blocking and targeted ARV delivery would be a dual protection strategy to prevent HIV infection. For targeting CCR5+ T-cells, the nanoformulation was surface conjugated with anti-CCR5 monoclonal antibodies (CCR5 mAb) and loaded with dolutegravir+tenofovir alafenamide (D+T) ARVs to block HIV replication. The result demonstrated that the targeted-ARV nanoparticle's multimeric CCR5 binding property improved its antigen-binding affinity, prolonged receptor binding, and ARV intracellular retention. Further, nanoformulation demonstrated high binding affinity to CCR5 expressing CD4+ cells, monocytes, and other CCR5+ T-cells. Finally, the short-term pre-exposure prophylaxis study demonstrated that prolonged CCR5 blockage and ARV presence further induced a "protective immune phenotype" with a boosted T-helper (Th), temporary memory (TM), and effector (E) sub-population. The proof-of-concept study that the targeted-ARV nanoformulation dual-action mechanism could provide a multifactorial solution toward achieving HIV "functional cure."	tenofovir; dolutegravir; nanoformulation; targeting; CCR5 monoclonal antibody; functional HIV cure	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Maner M.; Omori M.; Brinkley-Rubinstein L.; Beckwith C.G.; Nowotny K.	Infectious disease surveillance in U.S. jails: Findings from a national survey	PLOS One	-	-	-	19326203	10.1371/journal.pone.0272374	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136919113&doi=10.1371%2fjournal.pone.0272374&partnerID=40&md5=d2160fd97320c9d2e5647daaca847d00	While infectious diseases (ID) are a well-documented public health issue in carceral settings, research on ID screening and treatment in jails is lacking. A survey was sent to 1,126 jails in the United States to identify the prevalence of health screenings at intake and characteristics of care for ID; 371 surveys were completed correctly and analyzed. Despite conflicting Centers for Disease Control (CDC) guidance, only seven percent of surveyed jails test individuals for HIV at admission. In 46% of jails, non-healthcare personnel perform ID screenings. Jails in less urban areas were more likely to report healthcare screenings performed by correctional officers. Survey findings indicate that HIV, HCV and TB testing during jail admissions and access to PrEP are severely lacking in less urban jails in particular. Recommendations are provided to improve ID surveillance and address the burden of ID in correctional facilities. © 2022 Maner et al. Efficiency in PrEP Delivery: Estimating the Annual Costs of Oral PrEP in Zimbabwe	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03367-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113593573&doi=10.1007%2fs10461-021-03367-w&partnerID=40&md5=d3d0ad976caecdace5196539bb252da3	Although oral PrEP is highly effective at preventing HIV acquisition, optimizing continuation among beneficiaries is challenging in many settings. We estimated the costs of delivering oral PrEP to populations at risk of HIV in seven clinics in Zimbabwe. Full annual economic costs of oral PrEP initiations and continuation visits were estimated from the providers' perspective for a six-clinic NGO network and one government SGBV clinic in Zimbabwe (January–December 2018). Disaggregating costs of full initiation and incremental follow-up visits enabled modeling of the impact of duration of continuation on the cost per person-year ($pPY) on PrEP. 4677 people initiated oral PrEP, averaging 2.7 follow-up visits per person. Average cost per person initiated was $238 ($183–$302 across the NGO clinics; $86 in the government facility). The full cost per initiation visit, including central and direct costs, was $178, and the incremental cost per follow-up visit, capturing only additional resources used directly in the follow up visits, was $22. The average duration of continuation was 3.0 months, generating an average $pPY of $943, ranging from $839 among adolescent girls and young women to $1219 in men. Oral PrEP delivery costs varied substantially by scale of initiations and by duration of continuation and type of clinic. Extending the average oral PrEP continuation from 2.7 to 5 visits (about 6 months) would greatly improve service efficiency, cutting the $pPY by more than half. © 2021, The Author(s). Article	2022	Mangum L.C.; Craddock J.B.; Whitfield D.L.	Associations in preventive sexual health service utilization and pre-exposure prophylaxis (PrEP) interest among young Black women in the United States, 2018	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.1925213	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106238145&doi=10.1080%2f09540121.2021.1925213&partnerID=40&md5=d1cfa4f2a6eee6e8999e05b504a20400	Despite declines in HIV prevalence among all U.S. women, HIV remains a serious concern for Black women. PrEP is an effective biomedical intervention and has high acceptability among Black women. Therefore, offering PrEP, in addition to screening and testing for STI/HIV consistently, can reduce HIV risk among this population. We examine the associations of preventive sexual health service utilization (PSHSU) and PrEP interest among young Black women (YBW) (N = 209) in the United States in 2018. YBW, ages 18–25, completed a self-administered questionnaire, assessing sexual risk and prevention behaviors, HIV/STI testing, and PrEP interest. More than half of YBW were aware of PrEP and its benefits. YBW, who received an HIV test within the past three to six months, had higher odds of PrEP interest. The proportion of YBW who reported being interested in PrEP did not differ by PSHSU. Active contraceptive use was associated with PrEP interest. The results suggest YBW engage in preventive sexual health services, including HIV/STI testing, reproductive health, and sexual health behavioral counseling. Additional efforts should be made to normalize PrEP education for heterosexual, cisgender women at student health centers on college and university campuses, and other venues outside of traditional HIV/STI testing facilities. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2022	Manguro G.O.; Musau A.M.; Were D.K.; Tengah S.; Wakhutu B.; Reed J.; Plotkin M.; Luchters S.; Gichangi P.; Temmerman M.	Increased condom use among key populations using oral PrEP in Kenya: results from large scale programmatic surveillance	BMC Public Health	-	-	-	14712458	10.1186/s12889-022-12639-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124680244&doi=10.1186%2fs12889-022-12639-6&partnerID=40&md5=1c01d633298bee398ebae0cf2e203cb0	Background: Female sex workers (FSW) and men having sex with men (MSM) in Kenya have high rates of HIV infection. Following a 2015 WHO recommendation, Kenya initiated national scale-up of pre-exposure prophylaxis (PrEP) for all persons at high-risk. Concerns have been raised about PrEP users' potential changes in sexual behaviors such adopting condomless sex and multiple partners as a result of perceived reduction in HIV risk, a phenomenon known as risk compensation. Increased condomless sex may lead to unintended pregnancies and sexually transmitted infections and has been described in research contexts but not in the programmatic setting. This study looks at changes in condom use among FSW and MSM on PrEP through a national a scale-up program. Methods: Routine program data collected between February 2017 and December 2019 were used to assess changes in condom use during the first three months of PrEP in 80 health facilities supported by a scale-up project, Jilinde. The primary outcome was self-reported condom use. Analyses were conducted separately for FSW and for MSM. Log-Binomial Regression with Generalized Estimating Equations was used to compare the incidence proportion ("risk") of consistent condom use at the month 1, and month 3 visits relative to the initiation visit. Results: At initiation, 69% of FSW and 65% of MSM reported consistent condom use. At month 3, this rose to 87% for FSW and 91% for MSM. MSM were 24% more likely to report consistent condom use at month 1 (Relative Risk RR, 1.24, 95% Confidence Interval CI, 1.18–1.30) and 40% more likely at month 3 (RR, 1.40, 95% CI, 1.33–1.47) compared to at initiation. FSW were 15% more likely to report consistent condom use at the month one visit (RR, 1.15, 95% CI, 1.13–1.17) and 27% more likely to report condom use on the month 3 visit (RR 1.27, 95% CI, 1.24–1.29). Conclusion: Condom use increased substantially among both FSW and MSM. This may be because oral PrEP was provided as part of a combination prevention strategy that included counseling and condoms but could also be due to the low retention rates among those who initiated. © 2022, The Author(s). Article	2022	Mann L.M.; Le Guillou A.; Goodreau S.M.; Marcus J.L.; Sanchez T.; Weiss K.M.; Jenness S.M.	Correlations between community-level HIV preexposure prophylaxis coverage and individual-level sexual behaviors among United States MSM	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003343	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140932974&doi=10.1097%2fQAD.0000000000003343&partnerID=40&md5=47dc0fb3092ed9327543516025683c0d	Objective:To evaluate if community-level HIV PrEP coverage is correlated with individual sexual behaviors.Design:We used demographic, behavioral, and sexual network data from ARTnet, a 2017-2019 study of United States MSM.Methods:Multivariable regression models with a Bayesian modeling framework were used to estimate associations between area-level PrEP coverage and seven sexual behavior outcomes number of total, main, and casual male partners (network degree); count of one-time partnerships; consistent condom use in one-time partnerships; and frequency of casual partnership anal sex (total and condomless), controlling for individual PrEP use.Results:PrEP coverage ranged from 10.3% (Philadelphia) to 38.9% (San Francisco). Total degree was highest in Miami (1.35) and lowest in Denver (0.78), while the count of one-time partners was highest in San Francisco (11.7/year) and lowest in Detroit (1.5/year). Adjusting for individual PrEP use and demographics, community PrEP coverage correlated with total degree adjusted incidence rate ratio (aIRR=1.73; 95% credible interval (CrI), 0.92-3.44, casual degree (aIRR=2.05; 95% CrI, 0.90-5.07), and count of one-time partnerships (aIRR=1.90; 95% CrI, 0.46-8.54). Without adjustment for individual PrEP use, these associations strengthened. There were weaker or no associations with consistent condom use in one-time partnerships (aIRR=1.68; 95% CrI, 0.86-3.35), main degree (aIRR=1.21; 95% CrI, 0.48-3.20), and frequency of casual partnership condomless anal sex (aIRR=0.23; 95% CrI, 0.01-3.60).Conclusion:Most correlations between community PrEP coverage and sexual behavior were explained by individual PrEP use. However, some residual associations remained after controlling for individual PrEP use, suggesting that PrEP coverage may partially drive community-level differences in sexual behaviors. © 2022 Lippincott Williams and Wilkins. Article	2022	Mansoor L.E.; Lewis L.; Naicker C.L.; Harkoo I.; Dawood H.; Naidoo K.; Gengiah T.N.; Samsunder N.; Beesham I.; Abdool Karim S.S.; Abdool Karim Q.	Prospective study of oral pre-exposure prophylaxis initiation and adherence among young women in KwaZulu-Natal, South Africa	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25957	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133276994&doi=10.1002%2fjia2.25957&partnerID=40&md5=46b6d62f2f60a498434467eeda0732a	Introduction: Oral tenofovir disoproxil fumarate/emtricitabine pre-exposure prophylaxis (PrEP), introduced into South Africa (SA) in 2016, has increasingly become part of HIV prevention standard of care. Given the urgent need for increased HIV prevention efforts for young women in SA, we conducted an implementation study to explore oral PrEP initiation and adherence, and the impact of oral PrEP on HIV incidence in this group. Methods: This prospective cohort study (CAPRISA 082) was conducted at two sites (urban and rural) in KwaZulu-Natal, between March 2016 and February 2018. HIV-negative, sexually active women, aged 18–30 years, were enrolled and followed for approximately 10 months. Oral PrEP was offered as part of a comprehensive HIV prevention package. Adherence to oral PrEP was measured using pill counts and tenofovir-diphosphate (TFV-DP) levels. Characteristics of oral PrEP initiators versus non-initiators were compared using risk ratios. HIV incidence rates were measured using Poisson regression. Results: Of 425 women enrolled, 262 (62%) initiated oral PrEP. Uptake was significantly higher at the rural site compared to the urban site (78% n = 203/259 vs. 36% n = 59/166, respectively, p-value<0.001). Approximately 25% and 50% had stopped using oral PrEP by 3 and 12 months post-initiation, respectively. Median pill count adherence was 90% (interquartile range: 81–97%); however, TFV-DP was only detected in 13% of samples tested, that is 56/431 samples from 97 (37%) participants who initiated oral PrEP. In total, 11 women seroconverted yielding an HIV incidence rate of 2.81 per 100 person-years (95% confidence interval: 1.40–5.03). Nine of 11 seroconverters had initiated oral PrEP; however, all showed drug levels equivalent to taking no to zero tablets per week. Among women who initiated oral PrEP, >50% had discontinued using oral PrEP by study end, with side effects, such as diarrhoea, nausea, headaches and rash, being the most frequent reason for discontinuation. Conclusions: Despite moderate oral PrEP initiation and high pill count adherence, adherence as measured by TFV-DP levels was low and early discontinuation was high. The overall HIV incidence rate was high underscoring the critical need to address barriers to oral PrEP initiation, adherence and continued use, as well as expanding HIV prevention options for young women. © 2022 The Authors. Article	2022	Mantell, Joanne; Franks, Julie; Zerbe, Allison; Lamb, Matthew R; Reed, Domonique M; Omollo, Dan; Lahuerta, Maria; Naitore, Doris; El-Sadr, Wafaa M; Agot, Kawango	MPrEP+ study protocol: a prospective cohort study assessing the feasibility and acceptability of an HIV pre-exposure prophylaxis (PrEP) strategy for male clients of female sex workers in Kisumu, Kenya	BMJ Open	-	-	-	20446055	10.1136/bmjopen-2022-064037	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141889917&doi=10.1136%2fbmjopen-2022-064037&partnerID=40&md5=87e926892059fbf883134623126a96a9	Introduction Male clients (MCs) are integral to sex work-driven HIV transmission dynamics as sexual partners of female sex worker (FSW). MCs contribute disproportionately to incident HIV globally and in sub-Saharan Africa, with 27% of new infections attributed to MCs of FSW and other partners of key populations. Gaps in coverage of HIV testing and prevention services for men, including MCs, are well-documented, yet research and innovative interventions to improve MC uptake of effective prevention services, including pre-exposure prophylaxis (PrEP), are scarce. Methods and analysis MPrEP+ is a cohort study designed to assess the feasibility and acceptability of a PrEP-focused HIV prevention strategy providing daily oral tenofovir/emtricitabine (TDF/FTC) in combination with three adherence self-management interventions: (1) use of a validated point-of-care urine drug-level assay with real-time feedback and tailored self-management counselling; (2) frequent HIV self-testing; and (3) weekly one-way text messaging. This package of interventions is being delivered to 120 MCs enrolled in the study in Kisumu, Kenya over a 6-month period. The primary outcome is PrEP adherence at 6 months as measured by PrEP drug levels. Bivariate and multivariable regression models will be used to identify predictors of PrEP adherence. We will also explore associations of sociodemographic characteristics and PrEP beliefs with PrEP adherence. Ethics and dissemination The study was approved by the Columbia University Irving Medical Center Institutional Review Board and the Maseno University Ethical Review Committee. Study enrolment was initiated in November 2021 with participant follow-up planned through August 2022. Study results will be submitted for publication in peer-reviewed journals. Summaries and infographics of study findings will be developed and distributed to MC, FSW and stakeholders working in HIV prevention and support for people who sell and buy sex, including Kenya's Ministry of Health. Article	2022	Mantsios, Andrea; Muraleetharan, Ohvia; Donastorg, Yeycy; Perez, Martha; Gomez, Hoisex; Shembilu, Catherine; Beckham, S Wilson; Karver, Tahilin Sanchez; Davis, Wendy; Likindikoki, Samuel; Mbwambo, Jessie; Barrington, Clare; Kerrigan, Deanna	"She is the one who knows": A qualitative exploration of oral and injectable PrEP as part of a community empowerment approach to HIV prevention among female sex workers in the Dominican Republic and Tanzania.	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0000981	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9880901	Despite documented interest among female sex workers (FSW), uptake of oral pre-exposure prophylaxis (PrEP) for HIV prevention has been low. Recent trials and regulatory approval of long-acting injectable (LAI) PrEP offer new hope for the potential of this biomedical intervention. We examined FSW's PrEP-related interest and preferences regarding both oral and LAI PrEP situating these dynamics within their specific social and occupational realities. We conducted this work using qualitative methods across two distinct contexts by conducting 40 in-depth interviews with FSW in Tanzania and the Dominican Republic. Textual data was coded using iterative thematic content analysis. Analytic summaries were developed and reviewed to identify recurring themes. We systematically organized themes within each country and then compared across settings. Women in both settings expressed strong interest in PrEP seeing it as an important option to protect themselves in their work. Most participants preferred LAI PrEP due to expectations of reduced stigma and concerns about daily pill adherence and side effects. Occupational factors such as alcohol use, overnight dates with clients, and fear of violence from clients were identified as barriers to daily oral PrEP. LAI PrEP was seen as having the potential to reduce stress related to oral PrEP. Women who preferred pills discussed fear of needles, skepticism about the injections, and others relayed that taking a daily pill would not be challenging for them. There was a pre-dominant sentiment that women know best whether they are better suited for oral or LAI PrEP. Participants stressed the importance of FSW understanding both options to ensure informed decision-making around PrEP and described community-led peer education as key to delivering trusted information. Community empowerment approaches led by FSW which address structural and psychosocial constraints and promote safe work environments may facilitate equitable access and uptake of PrEP among FSW across settings. Article	2022	Marryshow, Terry A.; Muhairwe, Josephine; Tang, Alice; Molulela, Maleliha Morake M.; Matta, Riya; Jordan, Michael R.	Determining the acceptability of point-of-care urine tenofovir testing and its performance in predicting HIV RNA suppression.	International journal of STD & AIDS	-	-	-	1758-1052 0956-4624	10.1177/09564624221103043	https://pubmed.ncbi.nlm.nih.gov/35611960/	BACKGROUND: The detection of tenofovir (TFV) metabolites by point-of-care (POC) urine lateral flow immunoassays (LFIA) indicates adherence to tenofovir-containing HIV pre-exposure prophylaxis. However, the association between urine TFV metabolites as detected by LFIA and HIV viral load suppression in people receiving TFV-based antiretroviral therapy (ART) is unknown as is patient and clinician acceptability of POC urine LFIA testing in clinical practice in low- and middle-income country settings. METHODS: We enrolled 409 people living with HIV from two HIV clinics in Lesotho and investigated the performance of POC urine LFIA TFV testing in predicting viral suppression. We interviewed 12 study participants and conducted a focus-group discussion with 5 clinicians to gather opinions on POC urine TFV testing. RESULTS: Using a viral load threshold of 1000 copies/mL, 398 (98%) participants were virologically suppressed, and 8 were viremic. Tenofovir was detected in the urine of 405 (99%) participants. The sensitivity of the POC urine LFIA test in detecting TFV in participants with viral suppression was 99.3% (95% CI: 97.8-99.8); the specificity was 12.5% (95% CI: 0.3-52.6). The positive and negative predictive values were 98.3% and 25%, respectively. Point-of-care urine TFV testing was viewed favorably by both participants and clinicians. However, clinicians stated that the 2-3-days detection window of the assay studied limits adherence categorization. CONCLUSIONS: In our study cohort, urine POC TFV testing demonstrated high sensitivity in predicting viral suppression, but low specificity and negative predictive value. Urine POC TFV testing was highly acceptable to participants and clinicians; however, clinicians expressed concern about its clinical utility because of its limitations. While further research is needed to assess performance in less adherent populations, this test may support adherence counseling in some clinical settings. Article	2022	Marshall B.; Salabarría-Peña Y.; Douglas C.; Nakelsky S.; Pichon L.C.	The utility of evaluation in optimizing implementation and improvement of HIV prevention programming	Evaluation and Program Planning	-	-	-	1497189	10.1016/j.evalprogplan.2021.101980	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112562019&doi=10.1016%2fj.evalprogplan.2021.101980&partnerID=40&md5=f55c8b73d3d0c57fa5ebb1d4b78d33fb	The objective of this article is to describe Project PrIDE (PrEP Implementation, Data to Care, and Evaluation) through the lens of Evaluation Utilization and provide examples of how twelve funded health departments (HD) utilized evaluation findings to make decisions related to improving PrEP awareness and uptake, and/or enhancing capacity for data to care (D2C) activities. Each HD conducted a local evaluation (LE) and reported ongoing and planned utilization of evaluation findings in the final LE reports. Information from all reports was abstracted for qualitative analysis to identify main evaluation utilization themes. Findings showed that program evaluation was incorporated as early as the project development phase and designed with the goal of improving, and not just demonstrating the efficacy of the programs. Evaluation data were effectively utilized to improve PrEP and D2C activities, for example, by increasing community engagement throughout LEs, enhancing social media implementation, prioritizing the most effective referral sources at re-linking clients into HIV care, reducing client wait time between receiving PrEP referral and obtaining appointment with provider, and incorporating evaluation findings into program planning and development. Project PrIDE highlights the importance of a planned evaluation in providing ongoing improvements to HIV prevention services to better serve priority populations. © 2021	Evaluation utilization; MSM; PrEP; Racial/ethnic minorities; Transgender persons; Utility	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Marshall, Brittany; Salabarría-Peña, Yamir; Johnson, Wayne; Moore, Leo	Reaching racial/ethnic and sexual and gender minorities with HIV prevention information via social marketing	Evaluation and Program Planning	-	-	-	1497189	10.1016/j.evalprogplan.2021.101982	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112470739&doi=10.1016%2fj.evalprogplan.2021.101982&partnerID=40&md5=5cf52583e785b6474d3218c264e4e6e5	The Pre-exposure Prophylaxis, Data to Care, Implementation, and Evaluation (PrIDE) multi-site demonstration project utilized a cluster evaluation approach and identified six funding recipients that evaluated similar media evaluation questions (Baltimore, Los Angeles County, Lousiana, Michigan, New York City, and Virginia). All of the evaluated social marketing campaigns were developed in collaboration with health department staff, external marketing firms, and community advisory boards (CAB) aiming to produce changes in PrEP outcomes by reaching racial/ethnic and sexual and gender minorities. Jurisdictions demonstrated changes in PrEP awareness, knowledge, willingness to take PrEP, and/or PrEP literacy following initiation of the campaigns. In data from four sites, PrEP awareness significantly increased from 72 % at baseline to 86 % at mid-project, and to 90 % post-campaigns. The campaigns illustrate the importance of partnerships and stakeholder engagement, audience segmentation, and intentional evaluation planning. As PrEP services mature, evaluating PrEP demand and PrEP use resulting from campaigns, will be necessary. Also, future campaigns for racial/ethnic and sexual and gender minorities should identify the best channels to reach each group based on their input, disaggregate data by priority group, and determine campaign effectiveness. © 2021	HIV prevention; Men who have sex with men; Racial/ethnic minorities; Sexual minorities; Social marketing; Transgender persons	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Mart Van Dijk; John B F De Wit; Guadamuz, Thomas E; Martinez, Joel E; Jonas, Kai J	Bridging the serodivide: attitudes of PrEP users towards sex partners living with HIV	AIDS Care	-	-	-	09540121	10.1080/09540121.2021.1954588	https://www.proquest.com/scholarly-journals/bridging-serodivide-attitudes-prep-users-towards/docview/2645751990/se-2?accountid=8113	The introduction of biomedical HIV prevention methods, such as pre-exposure prophylaxis (PrEP), holds the potential to overcome the serodivide. We investigated the attitudes of PrEP users towards having sex with partners living with HIV. PrEP users in the Netherlands were recruited online and completed three questionnaires over a period of six months. We investigated changes over time in feelings of fear of HIV, comfort, and attitudes towards condom use when having sex with men living with HIV (MLHIV). A majority of PrEP users in our sample (up to 71.6%) had sex with MLHIV. Feeling comfortable to have sex with MLHIV did not change over time, but was already at a high level at T1. Most importantly, feeling safe not to use condoms with HIV-positive partners significantly increased, and did so in a rather short period of time after the onset of PrEP use (3-6 months). Taken together, the findings suggest that that PrEP may contribute to decreasing the serodivide between MSM rather quickly after the onset of PrEP use. Article	2022	Mart Van Dijk; John B F De Wit; Guadamuz, Thomas E; Martinez, Joel E; Jonas, Kai J	Quality of Sex Life and Perceived Sexual Pleasure of PrEP Users in the Netherlands	The Journal of Sex Research	-	-	-	00224499	10.1080/00224499.2021.1931653	https://www.proquest.com/scholarly-journals/quality-sex-life-perceived-sexual-pleasure-prep/docview/2724428215/se-2?accountid=8113	Next to its benefits for HIV prevention, PrEP may have psychosocial benefits relating to improved quality of sex life. The aim of the current study was to investigate the onset of changes in the quality of sex life and sexual pleasure of PrEP users in the first months of commencing PrEP use. Moreover, we investigated what factors were related to the quality of sex life of PrEP users. We recruited 145 participants via the Dutch PrEP-advocacy website PrEPnu.nl, and they received follow-up questionnaires after three and six months. We found that PrEP users reported an increase in the quality of their sex life, which was related to reduced fear of HIV since they started using PrEP, but not to decreased condom use. PrEP users were more interested in experimenting with sex practices, but they did not always feel more desirable as a sex partner because of PrEP use. Health-care providers and health promotion campaigns could emphasize the positive effects of PrEP on the quality of sex life, in addition to the HIV-preventive effects of PrEP, to decrease PrEP stigma and increase PrEP uptake. Article	2022	Martel-Laferrière V.; Feaster D.J.; Metsch L.R.; Shackman B.R.; Loignon C.; Nosyk B.; Tookes H.; Behrends C.N.; Arruda N.; Adigun O.; Goyer M.-E.; Kolber M.A.; Mary J.-F.; Rodriguez A.E.; Yanez I.G.; Pan Y.; Khemiri R.; Gooden L.; Sako A.; Bruneau J.	M2HepPrEP: study protocol for a multi-site multi-setting randomized controlled trial of integrated HIV prevention and HCV care for PWID	Trials	-	-	-	17456215	10.1186/s13063-022-06085-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128801716&doi=10.1186%2fs13063-022-06085-3&partnerID=40&md5=67f50c1eb11e34e5373d70c75695cfb0	Background: Opioid use is escalating in North America and comes with a multitude of health consequences, including HIV and hepatitis C virus (HCV) outbreaks among persons who inject drugs (PWID). HIV pre-exposure prophylaxis (PrEP) and HCV treatment regimens have transformative potential to address these co-occurring epidemics. Evaluation of innovative multi-modal approaches, integrating harm reduction, opioid agonist therapy (OAT), PrEP, and HCV treatment is required. The aim of this study is to assess the effectiveness of an on-site integrated care model where delivery of PrEP and HCV treatment for PWID takes places at syringe service programs (SSP) and OAT programs compared with referring PWID to clinical services in the community through a patient navigation model and to examine how structural factors interact with HIV prevention adherence and HCV treatment outcomes. Methods: The Miami-Montreal Hepatitis C and Pre-Exposure Prophylaxis trial (M2HepPrEP) is an open-label, multi-site, multi-center, randomized, controlled, superiority trial with two parallel treatment arms. A total of 500 persons who injected drugs in the prior 6 months and are eligible for PrEP will be recruited in OAT clinics and SSP in Miami, FL, and Montréal, Québec. Participants will be randomized to either on-site care, with adherence counseling, or referral to off-site clinics assisted by a patient navigator. PrEP will be offered to all participants and HCV treatment to those HCV-infected. Co-primary endpoints will be (1) adherence to pre-exposure prophylaxis medication at 6 months post-randomization and (2) HCV sustained virological response (SVR) 12 weeks post-treatment completion among participants who were randomized within the HCV stratum. Up to 100 participants will be invited to participate in a semi-structured interview regarding perceptions of adherence barriers and facilitators, after their 6-month assessment. A simulation model-based cost-effectiveness analysis will be performed to determine the comparative value of the strategies being evaluated. Discussion: The results of this study have the potential to demonstrate the effectiveness and cost-effectiveness of offering PrEP and HCV treatment in healthcare venues frequently attended by PWID. Testing the intervention in two urban centers with high disease burden among PWID, but with different healthcare system dynamics, will increase generalizability of findings. Trial registration: Clinicaltrials.gov NCT03981445. Trial registry name: Integrated HIV Prevention and HCV Care for PWID (M2HepPrEP). Registration date: June 10, 201. © 2022, The Author(s). Article	2022	Martinez I.V.; Waryold J.M.	Implementing PrEP to Decrease HIV Transmission Rates Among Females	Journal for Nurse Practitioners	-	-	-	15554155	10.1016/j.nurpra.2021.11.021	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121362336&doi=10.1016%2fj.nurpra.2021.11.021&partnerID=40&md5=d98b09155efe8d85d0007a00de717f2e	In 2018, 5.1 per 100,000 persons in the United States assigned females at birth (AFAB) were living with human immunodeficiency virus (HIV). HIV prevention tools, including daily oral pre-exposure prophylaxis (PrEP), screening for sexually transmitted infections, treatment, and sexual health counseling, can be implemented into clinical practice to address the prevalence of HIV infection among this population. Historically, this population has had a decreased opportunity to be screened for HIV or offered PrEP to protect them from HIV. Providers can incorporate PrEP as a standard preventative option in their practice for persons AFAB. © 2021 Elsevier Inc.	females; HIV; preexposure prophylaxis; PrEP; sexually transmitted infections	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	Martinez, Omar; Levine, Ethan; Munoz-Laboy, Miguel; Carballo-Diéguez, Alex; Bauermeister, José Arturo; Chacon, Alexi; Jacobson, Jeffrey; Bettiker, Robert; Sutton, Madeline; Rudolph, Abby E; Wu, Elwin; Rhodes, Scott D; Tanner, Amanda E; Mann, Lilli; Valentin, Omar; Ilarraza, Ariel; Pardes, Mariana; Davison, Robin; Fernandez, Maria Isabel	More than just oral PrEP: exploring interest in rectal douche, dissolvable implant, removable implant and injection HIV prevention approaches among racially diverse men who have sex with men in the Northeast Corridor.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2022-063474	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9394203	OBJECTIVES: HIV scholars and practitioners have worked to expand strategies for prevention among marginalised populations who are disproportionately impacted by the epidemic, such as racial minority men who have sex with men (MSM). Given this urgency, the objective of this study was to assess interest in biomedical prevention strategies. METHODS: This exploratory and cross-sectional study investigated interest in four biomedical prevention tools-rectal douche, dissolvable implant, removable implant and injection-among a racially diverse sample of MSM from the Northeast Corridor region between Philadelphia and Trenton. Data were collected as part of screening for Connecting Latinos en Pareja, a couples-based HIV prevention intervention for Latino MSM and their partners. RESULTS: A total of 381 individuals participated in the screener and provided information about their interest in bio tools. Approximately 26% of participants identified as black, 28% as white and 42% as 'other' or multiracial; 49% identified as Latino. Majority (54%) reported some form of child sexual abuse. Of the participants who reported being in a primary relationship (n=217), two-thirds reported unprotected anal sex within that relationship over the past 90 days (n=138, 64%) and approximately half (n=117, 54%) reported unprotected anal sex outside of the relationship in this period. Majority of participants reported interest in all bio tools assessed, including dissolvable implants (60%), removable implants (64%), rectal douching (79%) and injection (79%). Although interest in bio tools was broadly unassociated with demographics and sexual risk behaviours, analyses revealed significant associations between reports of child sexual abuse and interest in implant and injection methods. CONCLUSIONS: The authors recommend investing in these prevention methods, particularly rectal douching and injection, as a means of preventing HIV among racial minority MSM. Given the interest in biomedical prevention tools, future studies should explore potential strategies for adherence. Article	2022	Martinez-Cajas J.; Alvarado-Llano B.; Martinez-Buitrago E.; Torres-Isasiga J.; Arrivillaga M.; Camargo P.; Galindo-Orrego X.; Mueses-Marín H.	AC-2020-12-1420.R1–HIV care providers' familiarity, concerns, and attitudes about HIV PrEP in Colombia: insights from the PrEP-Col-Study	AIDS Care	-	-	-	9540121	10.1080/09540121.2022.2029813	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123499783&doi=10.1080%2f09540121.2022.2029813&partnerID=40&md5=0324787ce1cd0d7ef79ce55f4aed9d66	In 2019, Colombia approved the combination of tenofovir disoproxil fumarate/emtricitabine for HIV Pre-Exposure Prophylaxis (PrEP). Therefore, we conducted a situational analysis in HIV-care providers to identify barriers and facilitators for PrEP implementation. A survey was applied to a non-probabilistic sample of health care workers of HIV-specialized clinics. We examined PrEP awareness and familiarity, comfort with PrEP-related activities, perceived barriers for PrEP implementation, concerns, and attitudes. Poisson regressions assessed the relationship between these factors and the variable "having a plan to offer PrEP". The participation rate was 41% and included physicians (42.6%) and other health professionals (57.4%). Fifty-one percent of the participants reported more than five years of experience caring for people living with HIV. Forty-two percent of non-physician health care workers were nurses. Most reported high familiarity/comfort with PrEP-relevant activities. Concerns about PrEP were prevalent (> 50%) and included causing more harm than good, reducing condom use, medication non-adherence, drug resistance, and healthcare system barriers. Physicians had a plan to offer PrEP (72.2%) more often than other health professionals (52.6). Having a plan to offer PrEP was related to PrEP knowledge and comfort assessing sexual behavior and providing HIV counseling. Overall, about half of HIV-care providers seemed ready to offer PrEP and constitute an asset for PrEP implementation efforts in Colombia. PrEP awareness among non-physicians, PrEP concerns, and negative attitudes need to be addressed to enhance implementation. © 2022 The Author(s). Article	2022	Martinez-Cajas, Jorge Luis; Torres, Julian; Mueses, Hector Fabio; Plazas, Pilar Camargo; Arrivillaga, Marcela; Gomez, Sheila Andrea; Galindo, Ximena; Buitrago, Ernesto Martinez; Llano, Beatriz Eugenia Alvarado	Applying implementation science frameworks to identify factors that influence the intention of healthcare providers to offer PrEP care and advocate for PrEP in HIV clinics in Colombia: a cross-sectional study.	Implementation Science Communications	-	-	-	2662-2211	10.1186/s43058-022-00278-2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8925047	BACKGROUND: Few studies have used implementation science frameworks to identify determinants of PrEP prescription by healthcare providers. In this work, we developed and psychometrically examined a questionnaire using the theoretical domains framework (TDF) and the consolidated framework for implementation research (CFIR). We used this questionnaire to investigate what factors influence the intention of healthcare providers to offer PrEP care and advocate for PrEP. METHODS: We conducted a cross-sectional study in 16 HIV healthcare organizations in Colombia. A 98-item questionnaire was administered online to 129 healthcare professionals. One hundred had complete data for this analysis. We used exploratory factor analysis to assess the psychometric properties of both frameworks, and multinomial regression analysis to evaluate the associations of the frameworks' domains with two outcomes: (1) intention to offer PrEP care and (2) intention to advocate for PrEP impmentation. RESULTS: We found support for nine indices with good internal consistency, reflecting PrEP characteristics, attitudes towards population needs, concerns about the use of PrEP, concerns about the role of the healthcare systems, knowledge, beliefs about capabilities, professional role, social influence, and beliefs about consequences. Notably, only 57% of the participants were likely to have a plan to care for people in PrEP and 66.7% were likely to advocate for PrEP. The perception of the need for PrEP in populations, the value of PrEP as a practice, the influence of colleagues, and seeing PrEP care as a priority was related to being less likely to be unwilling to provide or advocate for PrEP care. CONCLUSION: Our findings suggested the importance of multilevel strategies to increase the provision of PrEP care by healthcare providers including adquisition of new skills, training of PrEP champions, and strength the capacity of the health system. Article	2022	Martín-Illana, Araceli	Silicon Oxycarbide Porous Particles and Film Coating as Strategies for Tenofovir Controlled Release in Vaginal Tablets for HIV Prevention	Pharmaceutics	-	-	-	NA	10.3390/pharmaceutics14081567.	https://pubmed.ncbi.nlm.nih.gov/36015193/	Sustained release of antiretroviral drugs is currently the most encouraging strategy for the prevention of the sexual transmission of HIV. Vaginal tablets based on hydrophilic gelling polymers are an interesting dosage form for this purpose, since they can be developed to modify the release of the drug depending on the tablet swelling. Tenofovir is a drug with proven activity in the prevention of HIV-1 infection, and it is possible to have it loaded in the surface of γ-aminopropyl trimethoxy silane-functionalized oxycarbide particles. These particles can be incorporated into the tablets, thus providing a sustained release of the drug. Moreover, the presence of the particles modifies the microstructure of the gel formed, as observed in scanning electron microscopy and Hg porosimetry studies, resulting into a gel with a narrow pore size distribution between 10 and 100 μm. This implies a lower volume of fluid incorporated into the gel during swelling studies, and therefore improved mucoadhesion times in ex vivo test. The coating of the formulations with Eudragit® RS modifies the swelling behavior of the tablets, which not only is decreased in magnitude but also extended in time, and as consequence the drug release is also prolonged for up to 7 days. Article	2022	Maseko B.; Bula A.; Sasse S.; Thom A.; Tsidya M.; Tang J.; Hosseinipour M.C.	Opinions on integrating couple counselling and female sexual reproductive health services into Voluntary Medical Male Circumcision services in Lilongwe, Malawi	PLOS One	-	-	-	19326203	10.1371/journal.pone.0273627	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137669716&doi=10.1371%2fjournal.pone.0273627&partnerID=40&md5=f4b716caa9c8ee0cb144fafb37c0ad3b	Background Couples HIV Counselling and Testing (CHCT) has been found to be potentially beneficial than individual HIV Counselling and Testing for prevention and treatment of HIV. However, there are few health care opportunities for men and women to access health services together, leading to underutilization of CHCT service. Integrating female Sexual and Reproductive Health (SRH) services into male-dominated service could be more effective than trying to integrate men's health services into female-dominated health services. A potential site for male-female service integration could be Voluntary Medical Male Circumcision (VMMC) centers. Methodology We conducted a qualitative study in Lilongwe, Malawi between June to August 2018. Twenty VMMC clients, 20 peers and 20 VMMC providers completed individual in-depth interviews to share their opinions on what they thought about integrating CHCT and other SRH Services into VMMC services. These proposed SRH services include family planning, cervical cancer screening, sexually transmitted infection management and pre-exposure prophylaxis (PrEP). Content analysis was used to analyze the results. Results All participants were receptive to integration of CHCT, and most accepted the integration of SRH services into VMMC Services. Most VMMC clients, peers and care providers said that CHCT integration would help couples to know their HIV status, prevent HIV transmission, encourage healthy relationships, and provide a chance for women to participate in VMMC counselling and wound care. However, integration of other services, such as family planning and cervical cancer screening, drew mixed opinions among participants. Most VMMC clients, peers and providers felt that integration of services would promote male involvement and increase men's knowledge in feminine sexual reproductive health services. A few providers expressed concerns over service integration, citing reasons such as overcrowding, work overload, gender mixing, and lack of provider capacity and space. Most participants supported integrating PrEP with VMMC Services and felt that PrEP would complement VMMC in HIV prevention. Few providers, peers and VMMC clients felt the addition of PrEP to VMMC services would lead to high-risk sexual activity that would then increase the risk for HIV acquisition. A few participants recommended community sensitization when integrating some of sexual reproductive health services into VMMC Services to mitigate negative perceptions about VMMC services and encourage service uptake among couples Conclusion Most participants service providers, VMMC clients and Peers were receptive to integrating SRH services, particularly HIV prevention services such as CHCT and PrEP, into male dominated VMMC services. Adequate community sensitization is required when introducing other SRH services into VMMC services. © 2022 Maseko et al. Article	2022	Massa, Paula; Grangeiro, Alexandre; Ferraz, Dulce; Magno, Laio; Dourado, Inês; Silva, Ana Paula; Greco, Marília	Amanda Selfie, a transgender chatbot to create PrEP demand among adolescents in Brazil: assessment of acceptability, functionality, usability and results (Preprint)	Journal of Medical Internet Research	-	-	-	1438-8871	doi:10.2196/41881	https://typeset.io/authors/laio-magno-2370j5wcq2/2022	Abstract: Background HIV incidence rates have increased in adolescent men who have sex with men (AMSM) and adolescent transgender women (ATGW). Thus, it is essential to promote access to HIV prevention, including pre-exposure prophylaxis (PrEP), among these groups. Moreover, using artificial intelligence and online social platforms to create demand and access to health care services are essential tools for adolescents and youth. Objective This study aims to describe the participative process of developing a chatbot using artificial intelligence to create demand for PrEP use among AMSM and ATGW in Brazil. Furthermore, it analyzes the chatbot's acceptability, functionality, and usability and its results on the demand creation for PrEP. Methods The chatbot Amanda Selfie integrates the demand creation strategies based on social networks (DCSSNs) of the PrEP1519 study. She was conceived as a Black transgender woman and to function as a virtual peer educator. The development process occurred in 3 phases (conception, trial, and final version) and lasted 21 months. A mixed methodology was used for the evaluations. Qualitative approaches, such as in-depth adolescent interviews, were used to analyze acceptability and usability, while quantitative methods were used to analyze the functionality and result of the demand creation for PrEP based on interactions with Amanda and information from health care services about using PrEP. To evaluate Amanda's result on the demand creation for PrEP, we analyzed sociodemographic profiles of adolescents who interacted at least once with her and developed a cascade model containing the number of people at various stages between the first interaction and initiation of PrEP (PrEP uptake). These indicators were compared with other DCSs developed in the PrEP1519 study using chi-square tests and residual analysis (P=.05). Results Amanda Selfie was well accepted as a peer educator, clearly and objectively communicating on topics such as gender identity, sexual experiences, HIV, and PrEP. The chatbot proved appropriate for answering questions in an agile and confidential manner, using the language used by AMSM and ATGW and with a greater sense of security and less judgment. The interactions with Amanda Selfie combined with a health professional were well evaluated and improved the appointment scheduling. The chatbot interacted with most people (757/1239, 61.1%) reached by the DCSSNs. However, when compared with the other DCSSNs, Amanda was not efficient in identifying AMSM/ATGW (359/482, 74.5% vs 130/757, 17.2% of total interactions, respectively) and in PrEP uptake (90/359, 25.1% vs 19/130, 14.6%). The following profiles were associated (P<.001) with Amanda Selfie's demand creation, when compared with other DCS: ATGW and adolescents with higher levels of schooling and White skin color. Conclusions Using a chatbot to create PrEP demand among AMSM and ATGW was well accepted, especially for ATGW with higher levels of schooling. A complimentary dialog with a health professional increased PrEP uptake, although it remained lower than the results of the other DCSSNs.	artificial intelligence (1025); adolescent (395); HIV pre-exposure prophylaxis (3); transgender women (13); men who have sex with men (182); chatbot (199); PrEP (54); transgender (37); HIV (498); prevention (419); prophylaxis (13); acceptability (244)	English	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Mixed methods
Article	2022	Mataboge, Paballo; Nzenze, Susan; Mthimkhulu, Nqaba; Mazibuko, Mbali; Kutywayo, Alison; Butler, Vusile; Naidoo, Nicolette; Mullick, Saiqa	Planning for decentralized, simplified prEP: Learnings from potential end users in Ga-Rankuwa, gauteng, South Africa.	Frontiers in Public Health	-	-	-	2673-3153	10.3389/frph.2022.1081049	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9868940	Background: In South Africa, youth experience challenges with oral Pre-Exposure Prophylaxis (PrEP) access and uptake. Taking services out of healthcare settings has the potential to increase reach and overcome these challenges. This paper presents young and older people's preferences for decentralized, simplified PrEP service delivery and new long-acting HIV prevention methods, in Ga-Rankuwa, South Africa. Methods: Between May and August 2021, both PrEP user and non-user adolescent girls and young women (AGYW), pregnant AGYW, female sex workers, adolescent boys and young men (ABYM), and men who have sex with men (MSM) were recruited to participate in focus group discussions (FDGs) in Ga-Rankuwa, Gauteng. Twenty-two FGDs were conducted. Participants were asked about PrEP uptake, potential acceptability of long-acting HIV prevention products, provision of integrated, simplified, and decentralized services, and digital tools to facilitate access to PrEP and other SRH services. A qualitative approach using inductive thematic analysis was carried out to explore emerging themes on decentralized, simplified delivery and the acceptability of long-acting methods. Results: Of the 109 participants included in the study approximately 45% (n = 50) were female, the median age was 23 years ± 5.3. A third (n = 37) were current or previous PrEP users, of which, 59.5% (n = 22) collected PrEP refills from the clinic. Decentralized, simplified service delivery was appealing; health facilities, pharmacies and institutions of learning were preferred as service points for PrEP and SRH services, and recreational spaces preferred for dissemination of health information and engagement. ABYM were more open to having recreational spaces as service points. Long-acting Cabotegravir was preferred over the Dapivirine Vaginal Ring due to concerns around perceived side-effects, efficacy, and comfort. Conclusion: Providing long-acting PrEP methods through decentralized, simplified service delivery was appealing to this population. They provided practical locations for decentralized service provision to potentially increase their engagement with and uptake of HIV prevention and SRH services.	hiv prevention, dapivirine vaginal ring, long-acting cabotegravir, decentralized, simplified service delivery	English	Switzerland	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Qualitative
Theses and Dissertations	2022	Mathews, Ronneal Denise; Mittal, Mona	A Qualitative Examination of the Barriers and Facilitators of Pre-Exposure Prophylaxis (PrEp) Uptake among Heterosexual HIV Serodiscordant Couples	-	-	University of Maryland	-	NA	NA	https://www.proquest.com/dissertations-theses/qualitative-examination-barriers-facilitators-pre/docview/2685474293/se-2?accountid=8113	It is estimated that there are 140,000 heterosexual serodiscordant couples in the United States. Given the considerable number of these couples and the high risk of HIV acquisition among non-infected partners, it is important to focus prevention methods on programs and interventions that target transmission of HIV infection among serodiscordant heterosexual couples. Currently, we understand little about factors that influence these couples to use pre-exposure prophylaxis (PrEP). According to the CDC, this population is one of the highest risk groups, therefore, understanding the factors that influence them to use PrEP as a strategy in their HIV prevention regimen is an important step in preventing new HIV cases among this population. This study was a qualitative analysis that explored potential motivators and inhibitors for PrEP among heterosexual HIV serodiscordant couples. Secondary data from 26 qualitative interviews of HIV serodiscordant couples (N = 52 individuals) was examined to determine the factors that influenced the decision to use PrEP. Overall, there were five overarching themes from the Health Belief Model that manifested in all participant interviews. Perceived threat, perceived barriers (concerns about side effects, fear/anxiety about taking medication, indifference about HIV transmission), perceived benefits, cues to action (partner protection, PrEP use as condom replacement, PrEP use due to concerns about condom efficacy), and relational efficacy emerged as the most salient themes that determined whether couples chose to use PrEP as an HIV prevention method. Two constructs from the Theory of Gender and Power, sexual division of power and cathexis also emerged as relevant factors that influenced the decision to use PrEP in these couples. Findings from this study indicate that practitioners need to consider the motivators and barriers to PrEP uptake, and critically examine how power dynamics impact the decision to use PrEP. There is a need for the development of couples-based interventions to encourage PrEP uptake and adherence in mixed status couples. Article	2022	Mathur, Sanyukta; Mishra, Raman; Mahapatra, Bidhubhusan; Heck, Craig J; Okal, Jerry	Assessing layered HIV prevention programming: optimizing outcomes for adolescent girls and young women.	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000003242	https://dx.doi.org/10.1097/QAD.0000000000003242	OBJECTIVE: To assess how exposure to multiple, layered interventions predicts HIV-related outcomes among adolescent girls (15-19âyears) and young women (20-24âyears) in Kenya. DESIGN: Survey data from adolescent girls and young women (nâ=â736) with 14-16âmonths of engagement with DREAMS, a comprehensive HIV prevention program that provides a range of health education, life skills, social protection, and social and behaviour change interventions. METHODS: Nonparametric recursive partitioning technique - classification and regression tree (CART) - to identify the best predictors (DREAMS interventions) for achieving the desired HIV-related outcomes (consistent condom use and no transactional sex or sexual violence). RESULTS: Among adolescent girls, schooling support reduced the likelihood of engaging in transactional sex, whereas schooling support and exposure to parenting program reduced the likelihood of experiencing sexual violence. Likelihood of consistent condom use increased among adolescent girls with exposure to preexposure prophylaxis (PrEP), schooling support, and the violence prevention programming. Among young women, multiple pathways reduced the likelihood of engaging in transactional sex: exposure to the male sexual partner program; exposure to the youth fund program; exposure to the violence prevention program; or exposure/engagement with schooling support, parenting programming, and the youth fund program. For young women, consistent condom use increased with schooling support and male partner engagement. Additionally, engagement in violence prevention program and male partner engagement increased the likelihood of not experiencing sexual violence among young women. CONCLUSION: Exposure to a combination of DREAMS interventions predicted outcomes that can reduce HIV risk among AGYW, though the pathways differed by outcome and age group. Theses and Dissertations	2022	MATIAS, WERTTON LUIS DE PONTES	Nas fronteiras da AiD$: experiências com a PrEP em Brasília, Manaus e Recife	-	-	UNB	-	-	NA	http://www.realp.unb.br/jspui/handle/10482/45300	No marco da adoção da política de prevenção combinada ao HIV/Aids no Brasil, a Profilaxia Préexposição ao HIV (PrEP) surge como uma das principais estratégias na garantia do controle aos casos de infecção pelo vírus da Aids. Baseada no uso de fármacos que garantem a intransmissibilidade do vírus, administrados antes de situações onde possam ocorrer exposição ao HIV, a PrEP tem demonstrado, com o tempo, ser bem mais que uma mera alternativa profilática. É, também, uma política de saúde que reconfigura experiências e práticas sexuais, mobiliza as pessoas em torno do cuidado e proteção ao corpo, reconfigura relações de conjugalidade e, talvez o mais importante, redefine a agenda política do Estado em torno da resposta ao HIV/Aids. Atendo a tais processos e interessado nas dinâmicas sociais em torno dessa alternativa de prevenção, nesta dissertação o meu objetivo é refletir e fazer Antropologia a partir das experiências de usuários em PrEP. Utilizo como dado/base empírica sete entrevistas com usuários de Brasília, Manaus e Recife, que me foram disponibilizadas pela rede de pesquisadores da "Pesquisa Qualitativa para a Avaliação da Percepção e Atitudes de Parceiros Chave 'Stakeholders' na Implementação da profilaxia Pré-Exposição ao HIV – PrEP no Brasil ImPREP Stakeholders". Em diálogo com o que essas pessoas têm a nos dizer sobre o cotidiano de cuidado e atenção à saúde, aprofundo minha análise a partir do que é narrado sobre o medicamento, o SUS, o hospital, as relações com profissionais de saúde, companheiros, amigos, familiares, clientes e tantos outros elementos e sujeitos. Fatores que constituem o complexo contexto social no qual esses usuários, a Aids e a PrEP estão imersos. Os dados me revelam diversas PrEPs, que por vezes é pensada a partir do uso contínuo do remédio, em outros contextos como tecnologia de proteção durante práticas sexuais, ou até mesmo um método cheio de dificuldades programáticas ao passo que políticas de precarização do direito à saúde afetam o SUS. Os usuários narram estar numa posição de vulnerabilidade, onde o HIV está "logo ali", socialmente próximo, ao passo de representar perigo. Neste sentido, compreendo-os na fronteira da epidemia, num estado de "quase lá", onde uma série de elementos éticos, políticos e morais se entrelaçam, na constituição desse estado de vulnerabilidade próprio da relação de proximidade entre esses sujeitos e o HIV/Aids. É na busca por compreender esse universo latente nas entrevistas que me dedico neste trabalho. Corpos, identidades que constituem o que é ser um sujeito vulnerável ao HIV, processos de capitalização da vitalidade pela indústria farmacêutica e precariedades estruturais me levam aos contornos da prevenção ao HIV, e da Aids, no hoje, a partir da PrEP. As narrativas que analiso, conduzem-me a uma epidemia que vem, cada vez mais, deixando de estar em diálogo com a morte para requalificar modos de ser e estar no mundo de sujeitos soropositivos e soronegativos, onde o vivido é o elemento-chave de análise	Prevenção;HIV/Aids;Experiências;PrEP	Portuguese	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	-	-	Qualitative
Article	2022	Mauck, Daniel E.; Fennie, Kristopher P.; Ibañez, Gladys E.; Fenkl, Eric A.; Sheehan, Diana M.; Maddox, Lorene M.; Spencer, Emma C.; Trepka, Mary Jo	Gay Neighborhoods: Can They Be Identified in a Systematic Way Using Latent Class Analysis?	Archives of Sexual Behavior	-	-	-	1573-2800 0004-0002	10.1007/s10508-022-02369-6	https://pubmed.ncbi.nlm.nih.gov/35927366/	Identifying gay neighborhoods could help in targeting HIV prevention efforts for men who have sex with men. This study's purpose was to identify gay neighborhoods using latent class analysis (LCA). Data at the ZIP code level were drawn from the American Community Survey, website lists of gay bars and neighborhoods, and the Florida Department of Health HIV surveillance system. A two-class model was selected based on fit. About 9% of the ZIP code data was in class two, which was designated as gay neighborhoods. Cohen's kappa coefficient was used to examine agreement between the classification of ZIP codes from LCA and websites. Fair agreement was found (0.2501). Gay neighborhoods could serve as a place to disseminate information about pre-exposure prophylaxis and other methods for HIV prevention. Improved measures, such as the planned question about same-sex spouses for the 2020 US Census, are needed to identify gay neighborhoods in population-level surveys. Article	2022	Mauldin, Rebecca L; Tamara Al Rawwad; Amith, Muhammad; Kuhns, Lisa M; Schneider, John A; Fujimoto, Kayo	Community-clinic linkages for promoting HIV prevention: organizational networks for PrEP client referrals and collaborations	AIDS Care	-	-	-	09540121	10.1080/09540121.2021.1936445	https://www.proquest.com/scholarly-journals/community-clinic-linkages-promoting-hiv/docview/2645751355/se-2?accountid=8113	Community-clinic linkages may help communities increase HIV pre-exposure prophylaxis (PrEP) uptake. Referrals from community-based organizations may be particularly important for linking Black men who have sex with men (MSM) to PrEP. This study describes PrEP referral and HIV/STI prevention networks among organizations that serve MSM in Houston, TX (N = 40), and Chicago, IL (N = 28), and compares network positions of organizations based on percentage of Black/African American clients. A majority of organizations conducted PrEP awareness/promotion activities, but fewer made PrEP referrals, with little overlap between the collaboration and referral networks. The networks tended to have a densely connected core group of organizations and more a peripheral group of organizations linking into the core with relatively few times among themselves; this core/periphery structure is efficient, but vulnerable to disruptions. The percentage of Black/African American clients organizations served was not related to most measures of network centrality. However, in Houston's collaboration network, higher Black-serving organizations tended not to hold as influential positions for controlling communications or flows of resources. The findings indicate a potential to leverage collaborations into PrEP referral pathways to enhance PrEP promotion efforts and identify opportunities to address racial disparities in PrEP uptake. Article	2022	Maviglia, Francesca; Wickersham, Jeffrey A; Azwa, Iskandar; Copenhaver, Nicholas; Kennedy, Olivia; Kern, Monique; Khati, Antoine; Lim, Sin How; Gautam, Kamal; Shrestha, Roman	Engagement in Chemsex among Men Who Have Sex with Men (MSM) in Malaysia: Prevalence and Associated Factors from an Online National Survey.	International Journal of Environmental Research and Public Health	-	-	-	1660-4601	10.3390/ijerph20010294	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9819808	Background: Chemsex is the use of illicit drugs-particularly methamphetamine, gamma hydroxybutyrate (GHB), and gamma-butyrolactone (GBL)-to enhance sexual activity. Chemsex, which occurs primarily among communities of men who have sex with men (MSM), is associated with greater HIV risk behaviors, including multiple sex partners, group sex, condomless sex, and injection drug use. Despite evidence showing chemsex engagement among Malaysian MSM, there is a paucity of research on chemsex among MSM in Malaysia. Methods: This cross-sectional study was conducted through an online survey (August to September 2021) among 870 Malaysian MSM. Participants were recruited through targeted advertisements on social networks. We collected information regarding participants' recent (<6 months) engagement in chemsex, demographic characteristics, psychosocial factors, pre-exposure prophylaxis (PrEP) knowledge and history, and recent sexual- and drug-related behavior. Multivariable logistic regression was used to identify factors associated with recent (<6 months) chemsex engagement. Results: Just under 1 in 10 (9.0%) of participants reported having engaged in chemsex in the previous six months. More than two-thirds of participants (69.1%) had not disclosed their sexual orientation to anyone in their family and 35.2% reported moderate to severe depressive symptoms. Multivariable analysis found that recent injection drug use (adjusted odds ratio: aOR = 6.61; 95% confidence interval: CI, 2.30−19.03), having shared pre-exposure prophylaxis (PrEP) with someone else (aOR = 5.60; 95% CI, 1.76−17.77), higher perceived HIV risk (aOR = 3.15; 95% CI, 1.25−7.93), knowing someone using PrEP (aOR = 2.93; 95% CI, 1.62−5.31), recent engagement in transactional sex (aOR = 2.38; 95% CI, 1.06−5.39), having a recent STI diagnosis (aOR = 2.36; 95% CI, 1.25−4.44), recent engagement in anal sex (aOR = 2.21; 95% CI, 1.07−4.57), and recent sexual intercourse with an HIV-positive partner (aOR = 2.09; 95% CI, 1.07−4.08) were associated with recent engagement in chemsex. Conclusions: Malaysian MSM who practice chemsex are vulnerable to several HIV risk factors, such as transactional sex, HIV-positive sexual partners, and injection drug use. There is an urgent need for programs that integrate drug, sexual health, and mental health services, with a focus on harm reduction (e.g., condoms, access to and utilization of HIV testing and PrEP services, drug knowledge, and safer drug use) tailored for MSM who practice chemsex.	chemsex, sexualized drug use, party and play, men who have sex with men, Malaysia, HIV prevention	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Maxwell, Steven; Shahmanesh, Maryam; Gafos, Mitzy	Pre-exposure prophylaxis (PrEP) uptake and adherence experiences of gay and bisexual men who engage in chemsex: A qualitative study	The International Journal on Drug Policy	-	-	-	09553959	10.1016/j.drugpo.2022.103630	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-uptake-adherence/docview/2672046738/se-2?accountid=8113	Background: Pre-exposure prophylaxis (PrEP) is the use of HIV antiretroviral medications to reduce the risk of HIV acquisition. PrEP is highly effective when used during periods of potential HIV exposure. Gay and bisexual men (GBM) who engage in unprotected chemsex (without condoms or PrEP) are at high-risk of acquiring HIV. Substance use has been shown to detrimentally impact on the effective use of HIV treatment among GBM living with HIV. This study aims to qualitatively explore PrEP uptake and adherence among GBM who engage in chemsex in the United Kingdom. Methods: Nineteen semi-structured in-depth telephone interviews were conducted with self-identifying HIV-negative GBM who reported recently engaging in chemsex and currently using or had recently used PrEP. We explored the ways in which chemsex influenced GBM's motivation to use, access to and effective use of PrEP. Interviews were audio recorded, transcribed, and coded using thematic analysis. Results: Most of the men identified as gay, were of white ethnicity and had a median age of 41. Eighteen men were still using PrEP at the time of the interview and most used daily dosing. The perception of being at high risk of HIV acquisition was a key factor influencing PrEP initiation and after initiation, continued to influence high levels of adherence which was reported by the majority of participants. The few individuals who reported sub-optimal adherence, explained that psychosocial stressors or periods of impaired mental health led to more frequent or intense chemsex sessions, which in turn contributed to occasional non-adherence. Most participants used a variety of strategies to help them adhere, which included restricting the amount or intensity of chemsex they engaged in, strategic placement of PrEP and external triggers to remind them to take PrEP. Conclusions: In this study, the majority of GBM who engaged in chemsex, initiated PrEP in recognition of their potential risk of HIV acquisition and reported high levels of PrEP adherence. They used multiple strategies to support effective PrEP access and adherence. These findings support a growing body of evidence that PrEP is a viable prevention tool for GBM who engage in chemsex, and that chemsex does not negatively impact PrEP adherence. Article	2022	Mayanja Y.; Kamacooko O.; Lunkuse J.F.; Muturi-Kioi V.; Buzibye A.; Omali D.; Chinyenze K.; Kuteesa M.; Kaleebu P.; Price M.A.	Oral pre-exposure prophylaxis preference, uptake, adherence and continuation among adolescent girls and young women in Kampala, Uganda: a prospective cohort study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25909	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130001505&doi=10.1002%2fjia2.25909&partnerID=40&md5=8b76c74babe2b19c4b6daf53655152a2	Introduction: Oral pre-exposure prophylaxis (PrEP) has been scaled up; however, data from real-world settings are limited. We studied oral PrEP preference, uptake, adherence and continuation among adolescent girls and young women (AGYW) vulnerable to HIV in sub-Saharan Africa. Methods: We conducted a prospective cohort study among 14- to 24-year-old AGYW without HIV who were followed for 12 months in Kampala, Uganda. Within at least 14 days of enrolment, they received two education sessions, including demonstrations on five biomedical interventions that are; available (oral PrEP), will be available soon (long-acting injectable PrEP and anti-retroviral vaginal ring) and in development (PrEP implant and HIV vaccine). Information included mode and frequency of delivery, potential side effects and method availability. Volunteers ranked interventions, 1 = most preferred to 5 = least preferred. Oral PrEP was "preferred" if ranked among the top two choices. All were offered oral PrEP, and determinants of uptake assessed using Poisson regression with robust error variance. Adherence was assessed using plasma tenofovir levels and self-reports. Results: Between January and October 2019, 532 volunteers were screened; 285 enrolled of whom 265 received two education sessions. Mean age was 20 years (SD±2.2), 92.8% reported paid sex, 20.4% reported ≥10 sexual partners in the past 3 months, 38.5% used hormonal contraceptives, 26.9% had chlamydia, gonorrhoea and/or active syphilis. Of 265 volunteers, 47.6% preferred oral PrEP. Willingness to take PrEP was 90.2%; however, uptake was 30.6% (n = 81). Following enrolment, 51.9% started PrEP on day 14 (same day PrEP offered), 20.9% within 30 days and 27.2% after 30 days. PrEP uptake was associated with more sexual partners in the past 3 months: 2–9 partners (aRR = 2.36, 95% CI: 1.20–4.63) and ≥10 partners (aRR 4.70, 95% CI 2.41–9.17); oral PrEP preference (aRR 1.53, 95% CI 1.08–2.19) and being separated (aRR 1.55, 95% CI 1.04–2.33). Of 100 samples from 49 volunteers during follow up, 19 had quantifiable tenofovir levels (>10 μg/L) of which only three were protective (>40 μg/L). Conclusions: Half of AGYW preferred oral PrEP, uptake and adherence were low, uptake was associated with sexual behavioural risk and oral PrEP preference. Development of alternative biomedical products should be expedited to meet end-user preferences and, community delivery promoted during restricted movement. © 2022 The Authors. AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03736-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10265494	HPTN 069/ACTG 5305 was designed to evaluate potential new PrEP regimens that included maraviroc, tenofovir disoproxil fumarate, and/or emtricitabine. The current analyses assessed antiretroviral (ARV) plasma concentrations in relation to sexual behavior in 224 cisgender men who have sex with men and 2 transgender women at risk for HIV. Poisson generalized estimating equations (GEE) regression were used to test for associations between self-reported sexual behavior, sociodemographic, behavioral variables, and study drug levels The median (IQR) age was 30 25, 37 years old; 48.2% had completed college; 27.4% were Black and 21.7% Latino. At weeks 24 and 48, one third of participants reported condomless anal sex (CAS) in the prior month with more than one partner. CAS was associated with daily ARV drug use (χ2 = 12.64, p = 0.002). Older individuals and those with greater education were more likely to ingest ARV drugs daily (χ2 = 9.36, p = 0.009 and χ2 = 8.63, p = 0.013, respectively), while neither race nor ethnicity was associated with daily ARV drug use. Participants who reported recent condomless anal sex and/or advanced education had higher rates of daily ARV drug use. These data support the need for ongoing adherence counseling in clinical trials of new PrEP modalities.	HIV prevention; MSM; Maraviroc; PrEP; Tenofovir. Article	2022	Mayeza, Emmanuel	LGBTPQ Youth Negotiating Access to Sexual Health Education and Resources in a Rural South African University.	Journal of Homosexuality	-	-	-	1540-3602	10.1080/00918369.2021.1912559	https://dx.doi.org/10.1080/00918369.2021.1912559	This article draws on sexual citizenship theory to analyze how some lesbian, gay, bisexual, transgender, pansexual and queer (LGBTPQ) youth in a low socio-economic rural South African context negotiate access to inclusive sexual health education programmes and resources. Participants are students aged 19 to 32 years old at a South African university. Using in-depth individual interviews, participants reflected on their experiences of sexual health education when they were still at school. The findings show the continuing silencing of sexual health issues concerning LGBTPQ youth in South African schools. Disadvantaged by the lack of sexual health education programmes in schools, findings show how the students sought LGBTPQ centered knowledge through self-study and other ways to empower themselves with information on sexual health matters. Participants also reflected on accessing the student health clinic at the university where they are students. Accessing condoms, lubricants, dental dams and HIV pre-exposure prophylaxis (PrEP) remains a challenge. Implications suggest ways of improving the provision of LGBTPQ inclusive sexual health education programmes and resources in poor rural contexts in South Africa. Article	2022	Mazibuko-Motau, Noluthando; Sobia, Parveen; Xu, Jiawu; Elsherbini, Joseph Ahmed; San, James E; Lewis, Lara; Mtshali, Andile; Mzobe, Gugulethu; Ntuli, Lungelo; Abdool Karim, Salim S; Mansoor, Leila E; Abdool Karim, Quarraisha; Kwon, Douglas S; Archary, Derseree; Ngcapu, Sinaye	Vaginal microbial shifts are unaffected by oral pre-exposure prophylaxis in South African women.	Scientific Reports	-	-	-	2045-2322	10.1038/s41598-022-20486-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9519742	Vaginal microbiota have been shown to be a modifier of protection offered by topical tenofovir in preventing HIV infection in women, an effect not observed with oral tenofovir-based pre-exposure prophylaxis (PrEP). It remains unclear whether PrEP can influence the vaginal microbiota composition. This study investigated the impact of daily oral tenofovir disoproxil fumarate in combination with emtricitabine for PrEP on the vaginal microbiota in South African women. At baseline, Lactobacillus iners or Gardnerella vaginalis dominant vaginal communities were observed in the majority of participants. In cross sectional analysis, vaginal microbiota were not affected by the initiation and use of PrEP. Longitudinal analysis revealed that Lactobacillus crispatus-dominant "cervicotypes 1 (CT1)" communities had high probability of remaining stable in PrEP group, but had a higher probability of transitioning to L. iners-dominant CT2 communities in non-PrEP group. L. iners-dominant communities were more likely to transition to communities associated with bacterial vaginosis (BV), irrespective of PrEP or antibiotic use. As expected, BV-linked CTs had a higher probability of transitioning to L. iners than L. crispatus dominant CTs and this shift was not associated with PrEP use. Article	2022	Mbita, Gaspar; Komba, Albert N; Casalini, Caterina; Bazant, Eva; Curran, Kelly; Christensen, Alice; Nyato, Daniel; Kim, Young-Mi; Reed, Jason; Makyao, Neema; Kategile, Upendo; Conserve, Donaldson F; Faini, Diana; van Roosmalen, Jos; van den Akker, Thomas	Predictors of HIV Among 1 Million Clients in High-Risk Male Populations in Tanzania.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03667-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9474353	The World Health Organization identified men as an essential group to target with HIV testing and treatment strategies;: men who have sex with men (MSM) and male clients of female sex workers (CFSW) account for 35% of new HIV infections globally. Using a cross-sectional design from a community-based HIV prevention project in Tanzania (October 2015-September 2018) and multivariable logistic regression, we identified predictors of HIV seropositivity among men. Of 1,041,343 men on their initial visit to the project, 36,905 (3.5%) were MSM; 567,005 (54.5%) were CFSW; and 437,343 (42.0%) were other men living near hotspots (OMHA). Three predictors of HIV seropositivity emerged across all three groups: being uncircumcised, having sexually transmitted infection symptoms, and harmful drinking of alcohol before sex. Any reported form of gender-based violence among MSM and OMHA and inconsistent condom use among CFSW were associated with HIV seropositivity. These findings may inform community HIV strategies like self-testing, delivery of pre-exposure prophylaxis and antiretroviral therapy, and behavioral change communication targeting men at higher risk of infection. Article	2022	Mbotwa, Christopher; Kazaura, Method; Moen, Kåre; Leshabari, Melkizedeck; Metta, Emmy; Leyna, Germana; Mmbaga, Elia J	Predictors of mHealth use in promoting adherence to pre-exposure prophylaxis among female sex workers: an evaluation of the Jichunge intervention in Dar es Salaam, Tanzania.	BMC Health Services Research	-	-	-	1472-6963	10.1186/s12913-022-08245-2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9254514	BACKGROUND: There is evidence that pre-exposure prophylaxis (PrEP) is effective in preventing HIV transmission, and PrEP is recommended by the World Health organization (WHO) for use by individuals at high risk of HIV infection. However, low adherence has been reported to hamper its effectiveness. Some evidence indicates that mHealth interventions may be a promising way of promoting PrEP adherence. Nevertheless, evaluations of mHealth interventions in Africa, the region most affected by HIV, are scarce. This study aimed at identifying the extent of and predictors for use of a smartphone based mHealth application among female sex workers in Dar es Salaam, Tanzania. METHODS: As part of a quasi-experimental study in Tanzania, 470 female sex workers who were eligible for PrEP and who owned a smartphone were recruited using respondent driven sampling. All participants were provided with an mHealth application called Jichunge, a smartphone-based app designed to promote adherence to PrEP by offering users information, advise and support during start-up and use of PrEP. We collected data through structured interviews at baseline and extracted user data from the app for a period of 30 days. Modified Poisson regression model with robust standard errors was used to identify predictors for the optimal use of the Jichunge app. RESULTS: Overall, the optimal use of the Jichunge app was 46.4%. Optimal use was significantly higher among women who were older (aPR = 1.3; 95% CI: 1.10-1.65, p = 0.004 for age 25-34 years, and aPR = 1.6, 95% CI: 1.19-2.07, p = 0.001 for age at least 35 years), who had secondary education or higher (aPR = 1.8, 95% CI: 1.08-2.94, p = 0.023), who had suboptimal social support (aPR = 1.2, 95% CI: 1.02-1.48, p = 0.030), who had high awareness of PrEP (aPR = 1.3, 95% CI: 1.08-1.55, p = 0.005), and who had experience using common mainstream social media applications (aPR = 1.4, 95% CI: 1.08-1.71, p = 0.009). CONCLUSION: Optimal use of the Jichunge app was substantially higher among women with higher age, higher education, higher PrEP awareness, less social support, and experience using common social media applications. Individual and interpersonal factors should be considered in planning mHealth interventions. Further studies to determine predictors of longer-term mHealth engagement are needed. An Open-Label Pharmacokinetic and Pharmacodynamic Assessment of Tenofovir Gel and Oral Emtricitabine/Tenofovir Disoproxil Fumarate	AIDS Research and Human Retroviruses	-	-	-	8892229	10.1089/aid.2021.0115	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128246399&doi=10.1089%2faid.2021.0115&partnerID=40&md5=4a1804001a8520bf0deb04eaadc9b946	The Microbicide Trials Network-017 study was undertaken to characterize the safety, acceptability, pharmacokinetic (PK), and pharmacodynamic profile of the reduced-glycerin (RG) 1% tenofovir (RG-TFV) gel compared to oral emtricitabine/tenofovir disoproxil fumarate (FTC/TDF). The study was a Phase 2, three-period, randomized sequence, open-label, expanded safety and acceptability crossover study. In each 8-week study period, HIV-1-uninfected participants were randomized to RG-TFV rectal gel daily or RG-TFV rectal gel before and after receptive anal intercourse (RAI) (or at least twice weekly in the event of no RAI), or daily oral FTC/TDF. A mucosal substudy was conducted at sites in the United States and Thailand. Samples were collected to evaluate PK and ex vivo biopsy challenge with HIV-1. A total of 195 men who have sex with men and transgender women were enrolled in the parent study and 37 in the mucosal substudy. As previously reported, both products were found to be safe and acceptable. Systemic TFV concentrations were significantly higher following oral exposure and daily rectal administration compared to RAI-associated product use (p < .001). All three routes of pre-exposure prophylaxis (PrEP) administration resulted in the inhibition of explant infection (p < .05), and there was a significant inverse correlation between explant HIV-1 p24 and tissue concentrations of TFV and FTC (p < .0001). Despite significant differences in systemic and mucosal drug concentrations, all three PrEP regimens were able to protect rectal explants from ex vivo HIV infection. These data suggest that there is a rationale for co-development of oral and topical antiretroviral PrEP for HIV prevention. Article	2022	McGowan, Maureen; Casmir, Edinah; Wairimu, Njeri; Mogere, Peter; Jahn, Albrecht; Ngure, Kenneth; Ortblad, Katrina F; Roche, Stephanie D	Assessing young Kenyan women's willingness to engage in a peer-delivered HIV self-testing and referral model for PrEP initiation: A qualitative formative research study.	Frontiers in Public Health	-	-	-	2296-2565	10.3389/fpubh.2022.932948	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9583529	Background: Pre-exposure prophylaxis (PrEP) is highly effective for HIV prevention, but uptake remains low, especially among adolescent girls and young women (AGYW) in Kenya. A model in which trained AGYW using PrEP deliver HIV self-tests to their close friends and refer them to PrEP may help increase PrEP uptake in this population. To understand AGYW's potential willingness to engage in such a model, we conducted a qualitative formative study in Kenya. Method: We conducted semi-structured in-depth interviews (IDIs) with AGYW (16 to 24 years) in Kiambu County who were determined at risk of HIV acquisition. We purposively recruited "PrEP-naïve" (no prior PrEP use) and "PrEP-experienced" AGYW who used PrEP for at least 1 month within the previous year. We solicited perspectives on initiating/engaging in conversations about HIV risk and PrEP, distributing/receiving HIV self-test kits, and referring/following through on a referral to clinic-based HIV services. We analyzed verbatim transcripts using rapid qualitative analysis and a combination of inductive and deductive approaches, with the latter informed by the Integrated Behavior Model (IBM). Results: From August to December 2020, we conducted 30 IDIs: 15 with PrEP-experienced and 15 with PrEP-naïve AGYW. Participants' median age was 20 interquartile range (IQR): 20-22. Overall, most participants anticipated that they would be willing to engage in this model. PrEP-experienced AGYW emphasized the salience of their concerns about friends' HIV risk behaviors, with several noting that they are already in the habit of discussing PrEP with friends. Many additionally expressed positive attitudes toward the proposed target behaviors, perceived these to be normative among AGYW, and expressed confidence in their ability to carry out the behaviors with proper support. Although few participants had HIVST experience, nearly all anticipated they would be able to use an HIV self-test kit correctly if provided instruction. Conclusion: The Kenyan AGYW who participated in this study generally anticipated that they would be willing to engage in a formal peer PrEP referral model enhanced with peer-delivered HIV self-tests. Future research is needed to pilot test this model to determine its acceptability, feasibility, and effect on HIVST and PrEP uptake within this population. Article	2022	McKeirnan, KC; Kherghehpoush, S; Gladchuk, A; Patterson, S; Min, A; Crutchley, RD	Student perceptions of PrEP in an advanced HIV elective	Pharmacy Education	-	-	-	-	1560-2214	10.46542/pe.2022.221.936943	https://pharmacyeducation.fip.org/pharmacyeducation/article/view/1829	Background: The United States (U.S.) Centres for Disease Control and Prevention estimated that over one million U.S. adults could benefit from human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP), but only 90,000 PrEP prescriptions are being filled annually. Pharmacists are well-positioned to offer PrEP, but a lack of awareness and knowledge about HIV PrEP has been a limitation. This study was designed to evaluate the knowledge, confidence, and perceptions of pharmacy students towards the use of HIV PrEP in high-risk populations before and after receiving a PrEP and PEP module in a two - credit hour Advanced HIV Elective course. Methods: Faculty in an Advanced HIV Elective course implemented a PrEP module and evaluated the impact on pharmacy student knowledge, confidence, and attitudes in 2020. Results: Participation led to a significant increase in student pharmacist confidence in offering patient education regarding the use of PrEP, risk mitigation counselling, accurately ordering labs, monitoring patients taking PrEP, and HIV medication therapy management. Additionally, HIV education shows decreased stigma and negative attitudes towards high-risk individuals. Conclusion: Integration of a PrEP module increased student pharmacist knowledge and confidence in providing PrEP services while reducing stigma towards those with HIV. Article	2022	Mclaughlin S.E.; Kapadia F.; Greene R.E.; Pitts R.	Capturing missed HIV pre-exposure prophylaxis opportunities—sexually transmitted infection diagnoses in the emergency department	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624211048671	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121130577&doi=10.1177%2f09564624211048671&partnerID=40&md5=fb8d41cd70dfa18140dea3388e196cdb	The United States Centers for Disease Control and Prevention (CDC) recommends HIV pre-exposure prophylaxis (PrEP) be considered for all patients diagnosed with a sexually transmitted infection (STI). Emergency departments (EDs) are an important site for diagnosis and treatment of STIs for under-served populations. Consequently, we identified 377 patients diagnosed with a bacterial sexually transmitted infection (gonorrhea, chlamydia, and/or syphilis) at a major New York City emergency department between 1/1/2014 and 7/30/2017 to examine associations between key sociodemographic characteristics and missed opportunities for PrEP provision. In this sample, 299 (79%) emergency department patients missed their medical follow-up 90 days after STI diagnosis, as recommended. Results from adjusted generalized estimating equation regression models indicate that patients >45 yo (aOR = 2.2, 95% CI 1.2–3.9) and those with a primary care provider in the hospital system (aOR = 6.8, 95% CI 3.8–12.0) were more likely to return for follow-up visits, whereas Black patients (aOR = 0.44, 95% CI 0.25–0.77) were less likely to return for follow-up visits. These findings indicate that lack of STI treatment follow-up visits are significantly missed opportunities for PrEP provision and comprehensive human immunodeficiency virus prevention care. © The Author(s) 2021. Article	2022	McLean, Jacob; Bartram, Logan; Zucker, Jason; LaSota, Elijah; Carnevale, Caroline; Richards, Paul; Perez, Edward; Mori, Kanako; Mgbako, Ofole; Olender, Susan; Cohall, Alwyn; Gordon, Peter; Sobieszczyk, Magdalena	Back2PrEP: Rates of Bacterial Sexually Transmitted Infection Diagnosis Among Individuals Returning to HIV Pre-Exposure Prophylaxis Care: A Retrospective Review of a New York City Comprehensive HIV Prevention Program.	AIDS Patient Care and STDs	-	-	-	-	1557-7449	10.1089/apc.2022.0169	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9805874	HIV pre-exposure prophylaxis (PrEP) effectively reduces new HIV diagnoses. High rates of incident bacterial sexually transmitted infections (STIs) have been observed in patients eligible for and adherent to PrEP. Observational studies generally report low long-term retention in PrEP care. Limited data exist on the rates of bacterial STI diagnosis upon re-engagement with PrEP services. We conducted a retrospective chart review within the HIV prevention program of an urban academic medical center in New York City. Eligible patients started PrEP from 2015 to 2019, then resumed PrEP services after a gap in care of at least 180 days. Demographic, clinical, and laboratory data were used to characterize the patient population and rates of bacterial STI diagnosis at re-engagement. In total, 286 patients were identified, with 316 qualifying re-engagement visits. Twenty-nine percent of patients had continued PrEP during the care gap, and 30% reported discontinuing medication due to a perceived change in risk. A new STI was diagnosed at 19% of re-engagement visits. There was no statistically significant difference in rates of new STI between individuals returning on or off PrEP, nor between those with perceived lower risk and those without. Individuals who fall out of PrEP services and subsequently re-engage remain at high risk of bacterial STI during the gap in care, regardless of whether PrEP medication is continued or the patient perceives themselves to be at lower HIV acquisition risk. Providers should strongly encourage patients discontinuing PrEP to remain engaged in sexual health services. Alternatives to clinic-based PrEP care must still include regular bacterial STI screening. Article	2022	McMahon, James M; Simmons, Janie; Braksmajer, Amy; LeBlanc, Natalie	HIV-serodifferent couples' perspectives and practices regarding HIV prevention strategies: A mixed methods study.	PLOS Global Public Health	-	-	-	-	2767-3375	10.1371/journal.pgph.0000620	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10022221	A substantial proportion of heterosexually acquired HIV infections in the U.S. occur between partners in primary relationships characterized by mixed HIV status. The U.S. Centers for Disease Control and Prevention have issued guidelines prioritizing HIV-serodifferent couples for primary HIV prevention, including treatment-as-prevention and pre-exposure prophylaxis (PrEP). Yet, very little research has been conducted to understand the perspectives and practices of HIV-serodifferent couples regarding HIV prevention strategies in the U.S. To help fill this gap, we conducted a mixed methods study with 27 mostly Black/African American and Latinx HIV-serodifferent heterosexual couples residing in New York City to explore their knowledge, attitudes, practices, and perspectives regarding combination HIV prevention, including condoms, PrEP and viral control. All couples expressed the desire to maintain viral suppression in the HIV-positive partner, which was not always achieved. There was considerable heterogeneity in the use of HIV prevention methods by couples; and several patterns emerged that were largely driven by gender and relationship dynamics. Female partners, in particular, expressed high levels of anxiety around transmission of HIV and thus desired multiple methods of protection. Healthcare providers should consider couples' psychosocial well-being, relationship quality, and other motivational factors when helping to tailor HIV preventative care for mixed-status couples. Article	2022	McNulty M.C.; Acree M.E.; Kerman J.; Williams H.H.S.; Schneider J.A.	Shared decision making for HIV pre-exposure prophylaxis (PrEP) with black transgender women	Culture, Health & Sexuality	-	-	-	-	13691058	10.1080/13691058.2021.1909142	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106332097&doi=10.1080%2f13691058.2021.1909142&partnerID=40&md5=370451610da22cca4f702cbbb0979595	Shared decision making is a collaborative process intended to develop a treatment plan that considers both the patient's preferences and the health provider's medical recommendations. It is one approach to reducing healthcare disparities by improving patient-provider communication and subsequent health outcomes. This study examines shared decision making about HIV pre-exposure prophylaxis (PrEP) with Black transgender women in Chicago, Illinois, USA, given high prevalence of HIV and disparities in PrEP use. Black transgender women were recruited online and in-person to participate in semi-structured interviews (n = 24) and focus groups (2; n = 14 total), conducted between 2016 and 2017. Iterative thematic content analysis took place. Analysis revealed that internalised transphobia and racism, combined with stigma from service providers, prevented disclosure of gender and sexual identity to providers. Stigma about PrEP as it relates to Black transgender women results in stereotype threat, which undermines patient-provider trust and deters shared decision making for PrEP. Shared decision making promotes cultural competence and humility and builds trust within the patient-provider relationship, leading to better communication and less stigma. The involvement of peers may be one way to mitigate stigma for Black transgender women around PrEP, promote cultural competence within organisations, and empower engagement in shared decision making for HIV prevention. © 2021 The Author(s). Article	2022	Medina-Marino, Andrew; Bezuidenhout, Dana; Ngwepe, Phuti; Bezuidenhout, Charl; Facente, Shelley N; Mabandla, Selly; Hosek, Sybil; Little, Francesca; Celum, Connie L; Bekker, Linda-Gail	Acceptability and feasibility of leveraging community-based HIV counselling and testing platforms for same-day oral PrEP initiation among adolescent girls and young women in Eastern Cape, South Africa.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.25968	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9309460	INTRODUCTION: Community-based delivery of HIV pre-exposure prophylaxis (PrEP) to South African adolescent girls and young women's (AGYW) could increase access but needs evaluation. We integrated PrEP services via home-based services and pop-up tents into existing community-based HIV testing services (CB-HTS) in Eastern Cape Province, South Africa. METHODS: After accessing CB-HTS via a "pop-up" tent or home-based services, HIV-negative AGYW aged 16-25 years were invited to complete a baseline questionnaire and referred for PrEP services at a community-based PrEP site co-located with pop-up HTS tents. A 30-day supply of PrEP was dispensed. PrEP uptake, time-to-initiation, cohort characteristics and first medication refill within 90 days were measured using descriptive statistics. RESULTS: Of the 1164 AGYW who tested for HIV, 825 (74.3%) completed a questionnaire and 806 (97.7%) were referred for community-based PrEP. Of those, 624 (77.4%) presented for PrEP (482/483 99.8% from pop-up HTS and 142/323 44.0% from home-based HTS), of which 603 (96.6%) initiated PrEP. Of those initiating PrEP following home-based HTS, 59.1% initiated within 0-3 days, 25.6% within 4-14 days and 15.3% took ≥15 days to initiate; 100% of AGYW who used pop-up HTS initiated PrEP the same day. Among AGYW initiating PrEP, 37.5% had a detectable sexually transmitted infection (STI). Although AGYW reported a low self-perception of HIV risk, post-hoc application of HIV risk assessment measures to available data classified most study participants as high risk for HIV acquisition. Cumulatively, 329 (54.6%) AGYW presented for a first medication refill within 90 days of accepting their first bottle of PrEP. CONCLUSIONS: Leveraging CB-HTS platforms to provide same-day PrEP initiation and refill services was acceptable to AGYW. A higher proportion of AGYW initiated PrEP when co-located with CB-HTS sites compared to those referred following home-based HTS, suggesting that proximity of CB-HTS and PrEP services facilitates PrEP uptake among AGYW. The high prevalence of STIs among those initiating PrEP necessitates the integration of STI and HIV prevention programs for AGYW. Eligibility for PrEP initiation should not be required among AHYW in high HIV burden communities. Community-based service delivery will be crucial to maintaining access to PrEP services during the COVID-19 pandemic and future health and humanitarian emergencies. Article	2022	Meireles, Paula; Moreira, Carla; Rocha, Miguel; Plankey, Michael; Barros, Henrique	Transitions Between Preexposure Prophylaxis Eligibility States and HIV Infection in the Lisbon Cohort of HIV-Negative Men Who Have Sex With Men: A Multistate Model Analysis.	American Journal of Epidemiology	-	-	-	-	1476-6256	10.1093/aje/kwab260	https://dx.doi.org/10.1093/aje/kwab260	We aimed to describe transitions between preexposure prophylaxis (PrEP) eligibility and human immunodeficiency virus (HIV) infection among HIV-negative men who have sex with men (MSM). We used data from 1,885 MSM, who had not used PrEP, enrolled in the Lisbon Cohort of MSM, with at least 2 consecutive measurements of PrEP eligibility from 2014-2020. A time-homogeneous Markov multistate model was applied to describe the transitions between states of PrEP eligibility-eligible and ineligible-and from these to HIV infection (HIV). The intensities of the transitions were closer for ineligible-to-eligible and eligible-to-ineligible transitions (intensity ratio, 1.107, 95% confidence interval (CI): 1.080, 1.176), while the intensity of the eligible-to-HIV transition was higher than that for ineligible-to-HIV transition (intensity ratio, 9.558, 95% CI: 0.738, 65.048). The probabilities of transitions increased with time; for 90 days, the probabilities were similar for the ineligible-to-eligible and eligible-to-ineligible transitions (0.285 (95% CI: 0.252, 0.319) vs. 0.258 (95% CI: 0.228, 0.287)), while the eligible-to-HIV transition was more likely than ineligible-to-HIV (0.004 (95% CI: 0.003, 0.007) vs. 0.001 (95% CI: 0.001, 0.008)) but tended to become closer with time. Being classified as ineligible was a short-term indicator of a lower probability of acquiring HIV. Once an individual moved to eligible, he was at a higher risk of seroconversion, demanding a timely delivery ofPrEP. Article	2022	Mendez-Lopez A.; Stuckler D.; Marcus U.; Hickson F.; Noori T.; Whittaker R.N.; Jansen K.; Diaz A.; Henszel L.; Velter A.; Semenza J.C.; Schmidt A.J.	Social and behavioural determinants of syphilis: Modelling based on repeated cross-sectional surveys from 2010 and 2017 among 278,256 men who have sex with men in 31 European countries	The Lancet Regional Health - Europe	-	-	-	-	26667762	10.1016/j.lanepe.2022.100483	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135716029&doi=10.1016%2fj.lanepe.2022.100483&partnerID=40&md5=f1292f1438a27a986267e59b75ba6b22	Background: Syphilis case notifications among men-who-have-sex-with-men (MSM) have increased markedly over the past two decades in Europe. We tested several potential factors for this resurgence. Methods: Self-reported data from two cross-sectional waves of the European MSM Internet Survey (EMIS-2010 and EMIS-2017, N = 278,256 participants living in 31 European countries) were used to fit multivariable hierarchical logistic regression models designed to evaluate potential social, behavioural, and interventional determinants of syphilis diagnosis. Additional multivariable hierarchical negative binomial models investigated determinants of the number of non-steady male condomless anal intercourse (CAI) partners. We tested the hypothesis that more CAI and syphilis-screening are associated with syphilis resurgence, both linked to use of pre-exposure prophylaxis (PrEP). Findings: Between 2010 and 2017, incidence of syphilis diagnosis in the previous 12 months rose from 2.33% (95%CI: 2.26–2.40) of respondents reporting a syphilis diagnosis in 2010 compared with 4.54% (95%CI: 4.42–4.66) in 2017. Major factors contributing to syphilis diagnosis were living with diagnosed HIV (adjusted odds ratio (aOR) 2.67, 95%CI: 2.32–3.07), each additional non-steady male CAI partner (aOR 1.01, 95%CI: 1.01–1.01), recency of STI-screening (previous month vs no screening, aOR 25.76, 95%CI: 18.23–36.41), selling sex (aOR 1.45, 95%CI: 1.27–1.65), and PrEP use (aOR 3.02, 95%CI: 2.30–3.96). Living with diagnosed HIV (adjusted incidence rate ratio (aIRR) 3.91, 95%CI: 3.77–4.05), selling sex (aIRR 4.39, 95%CI: 4.19–4.59), and PrEP use (aIRR 5.82, 95%CI: 5.29–6.41) were associated with a higher number of non-steady male CAI partners. The association between PrEP use and increased chance of syphilis diagnosis was mediated by STI-screening recency and number of non-steady male CAI partners, both substantially higher in 2017 compared to 2010. Interpretation: Syphilis cases are concentrated in three MSM population groups: HIV-diagnosed, PrEP users, and sex workers. Behavioural and interventional changes, particularly more non-steady male CAI partners and recency of STI-screening, are major contributing factors for increasing syphilis diagnoses among MSM in Europe. Funding: European Centre for Disease Prevention and Control. © 2022 The Author(s)	Condomless anal intercourse; Europe; Homosexual; Men who have sex with men; MSM; Pre-exposure prophylaxis; PrEP; STI-screening; Survey; Syphilis	English	United Kingdom	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	Quantitative
Article	2022	Mereu, Alessandra; Liori, Arianna; Fadda, Luca; Puddu, Massimiliano; Chessa, Luchino; Contu, Paolo; Sardu, Claudia	What do young people know about HIV? Results of a cross sectional study on 18-24-year-old students.	Journal of Preventive Medicine and Hygiene	-	-	-	-	2421-4248	10.15167/2421-4248/jpmh2022.63.4.2555	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9986992	Introduction: Increasing people's knowledge of transmission, prevention, early diagnosis, and available treatments is a key step toward HIV control; it means setting the conditions for empowerment and enabling individuals to make aware choices about the prevention strategy best suited to their needs. This study aims to identify unmet needs on HIV knowledge among freshman students. Methods: A cross sectional study was carried out at the University of Cagliari, which is an Italian public state university. Data were collected by means of an anonymous questionnaire; the final sample included 801 students. Results: Results offer a detailed picture of students' knowledge and perceptions of HIV. Several topics deserve to be better understood by students, but the main gaps relate to the pre-exposure prophylaxis and the decreased likelihood of sexually transmitting HIV due to early treatments. Students' vision of the quality of life of people living with HIV was negatively affected by perceiving as relevant the effects of HIV on physical health or on sexual/affective domains, while conversely, it seemed positively affected by knowing that current treatments are useful for counteracting physical symptoms and decreasing the possibility of transmitting HIV. Conclusion: Being aware of the potential benefits of current therapies could favour a less negative view, in line with the current state of the beneficial effects of HIV treatment. Universities are a valuable setting to bridge the HIV knowledge gap and thus also contribute to tackling stigma and actively promoting HIV testing. Article	2022	Meyer J.P.; Price C.R.; Ye Y.; Qin Y.; Tracey D.S.; Demidont A.C.; Melbourne K.; Altice F.L.	A PrEP Demonstration Project Using eHealth and Community Outreach to Justice-Involved Cisgender Women and Their Risk Networks	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03709-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131556813&doi=10.1007%2fs10461-022-03709-2&partnerID=40&md5=923e04116ea07c48dc652a84aa98ac35	Women involved in criminal justice systems (WICJ) are a key population at risk for HIV, and pre-exposure prophylaxis (PrEP) is critical for HIV prevention. This project was designed to evaluate the feasibility and acceptability of delivering PrEP via eHealth to WICJ and members of their risk network (RN). We recruited HIV-negative cisgender WICJ index participants (n = 38) and risk network (RN) members (n = 67) using modified respondent-driven sampling. TDF/FTC was initiated for PrEP in participants meeting clinical criteria and dispensed through eHealth using a community-based, low barrier-to-care outreach model. Key steps in the PrEP care continuum were measured over 12 months. Enrolled participants (n = 105) had high current and lifetime justice-involvement and were predominantly cisgender women and non-Hispanic white with a mean age of 40.9y (SD 9.6). Despite most having primary care providers and medical insurance, PrEP awareness was low, and participants experienced high levels of medical, psychiatric, substance use, social, and economic need. Fifty-two participants (50%) were PrEP-eligible, of whom 24 (46%) initiated PrEP. TDF/FTC was safe and well-tolerated throughout follow-up and 13 individuals chose to remain on PrEP following study conclusion. In this novel PrEP demonstration project for WICJ and RN members, despite high medical, psychiatric, and social comorbidity, PrEP was positively received and effectively delivered using a community outreach model via eHealth. Article	2022	Mi Y.; Zeng Y.; Wang P.; Zhou M.; Cheng F.	Cost-Effectiveness of Pre-exposure Prophylaxis Among Men Who Have Sex With Men in China: A Systematic Review	Frontiers in Public Health	-	-	-	-	22962565	10.3389/fpubh.2022.809268	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133675880&doi=10.3389%2ffpubh.2022.809268&partnerID=40&md5=b4cdbb280c82c389a18ae7f34979b276	Objective: Men who have sex with men in China meet the definition of the population at "substantial risk" of contracting human immunodeficiency virus (HIV) according to the World Health Organization; therefore, initiating pre-exposure prophylaxis (PrEP) is recommended for this population. Lack of convincing evidence on cost-effectiveness has resulted in the lack of large-scale PrEP implementation at a national level. The objective of this review is to assess the cost-effectiveness of pre-exposure prophylaxis implementation among men who have sex with men in China. Methods: The following databases were used to search studies of pre-exposure prophylaxis in China in both English and Chinese: PubMed, Embase, the China National Knowledge Infrastructure (CNKI), and the Wanfang Database. Inclusion criteria included pre-exposure intervention, year for publication (2007–2021), setting (China), and cost-effectiveness estimation. Results: Seven studies were identified. We found that pre-exposure prophylaxis is only cost-effective among men who have sex with men without prioritization with at least a 5.5% reduction in the market price in the models. Pre-exposure prophylaxis is potentially cost-effective when using the latest market price, combined with other preventive programs or delivered to the population with a high risk of HIV exposure. Conclusion: Our study identifies key considerations in cost-effectiveness evaluation: cost assumptions, implementation coverage, and targeted population. The scarce evidence available is not comparable to some extent. However, combined with the latest market and policy reform, the cost-effectiveness of PrEP could be achieved as estimated by the underlying model of the included studies. Consequently, it calls for more standard and transparent modeling studies that include the latest drug types and market prices. Copyright © 2022 Mi, Zeng, Wang, Zhou and Cheng. Article	2022	Millar, Alastair J. W.; Cox, Sharon G.	Surgical implications of HIV infection.	Pediatric Surgery International	-	-	-	-	1437-9813 0179-0358	10.1007/s00383-022-05333-6	https://pubmed.ncbi.nlm.nih.gov/36482099/	According to the joint United Nations Programme on HIV/AIDS (UNAIDS), 37.7 million adults and children worldwide were estimated to be living with HIV or acquired immune deficiency syndrome (AIDS) at the end of 2020 UNAIDS. (2022). http://www.unaids.org . Accessed 30 May 2022. Most reside in low- and middle-income countries, with approximately 67% in sub-Saharan Africa (SSA). At the end of 2020, the total number of children less than 15 years of age living with HIV infection was 2.6 million, of whom 2.3 million (88%) were living in SSA. Aggressive interventions have reduced the annual number of incident (new) HIV infections among children to around 150,000 UNAIDS. (2022). http://www.unaids.org . Accessed 30 May 2022. However, paediatric HIV infection remains a pandemic affecting children predominantly in SSA but is also seen in Asia and sporadically elsewhere particularly in areas of civil strife such as is currently the case in Ukraine War in Ukraine. (2022). https://www.unaids.org/en/War-Ukraine-special . Accessed Apr 2022. New HIV infections among children declined by more than half (54%) from 2010 to 2020, due mainly to the increased provision of antiretroviral therapy to pregnant and breastfeeding women living with HIV UNAIDS. (2022). http://www.unaids.org . Accessed 30 May 2022. These programmes include early identification of HIV infection in pregnant or breastfeeding women through routine HIV testing, provision of antiretroviral therapy (ART) to all HIV-infected women who are pregnant or breastfeeding, provision of antiretroviral prophylaxis to their newborn infants during the first 6-12 weeks of life, delivery by elective Caesarean section when indicated, promotion of exclusive breastfeeding, early infancy screening for HIV infection, and initiation of ART in infants with HIV infection. HIV-infected children may require surgery either as an emergency to deal with a life-threatening incidental condition unrelated to HIV infection or for a complication of the disease such as tuberculosis or an aggressive soft tissue infection like necrotising fasciitis. Non-emergency surgical procedures may be required to assist in the diagnosis of an HIV-related condition or to correct a routine surgical problem electively. Surgical conditions associated with HIV infection are described under categories of soft tissue or organ-specific infections requiring drainage or debridement; gastrointestinal tract disease and complications; infections in the perineal area; malignancies and HIV-associated vasculitis. Although surgical outcomes are less favourable in HIV-infected children, pre-operative treatment of coinfections, administration of cotrimoxazole prophylaxis, nutritional support and antiretroviral therapy, together with peri-operative antibiotic prophylaxis have resulted in excellent short-term outcomes World Health Organization. Article	2022	Mills, A; Richmond, GJ; Newman, C; Osiyemi, O; Cade, J; Brinson, C; de Vente, J; Margolis, DA; Sutton, KC; Wilches, V; Hatch, S; Roberts, J; McCoig, C; Garris, C; Vandermeulen, K; Spreen, WR	Long-acting cabotegravir and rilpivirine for HIV-1 suppression: switch to 2-monthly dosing after 5 years of daily oral therapy	AIDS	-	-	-	-	NA	10.1097/QAD.0000000000003085	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02395936/full	OBJECTIVES: Long-acting formulations of cabotegravir (CAB) and rilpivirine (RPV) have demonstrated efficacy in Phase 3 studies. POLAR (NCT03639311) assessed antiviral activity and safety of CAB+RPV long-acting administered every 2months (Q2M) in adults living with HIV-1 who previously received daily oral CAB+RPV in LATTE (NCT01641809). DESIGN: A Phase 2b, multicenter, open-label, rollover study. METHODS: LATTE participants with plasma HIV-1 RNA less than 50copies/ml who completed at least 300weeks on study were eligible. Participants elected to switch to either CAB+RPV long-acting Q2M or daily oral dolutegravir/RPV for maintenance of virologic suppression. The primary endpoint was the proportion of participants with HIV-1 RNA greater than or equal to 50copies/ml at Month 12 (M12) per the Food and Drug Administration Snapshot algorithm. The incidence of confirmed virologic failure (CVF, two consecutive HIV-1 RNA measurements greater than or equal to 200copies/ml), as well as safety, laboratory, and patient-reported outcomes (HIV Treatment Satisfaction and preference questionnaires) were also assessed. RESULTS: Of 97 participants enrolled, 90 chose to receive CAB+RPV long-acting and seven chose dolutegravir/RPV. At M12, no participant had HIV-1 RNA greater than or equal to 50copies/ml or met the CVF criterion in either treatment group. No new safety signals were identified. Total treatment satisfaction was high at Baseline and remained stable through M12 across both treatment groups. Overall, 88% (n=77/88) of long-acting arm participants preferred CAB+RPV long-acting to oral CAB+RPV. CONCLUSION: CAB+RPV long-acting maintained virologic suppression in participants who had previously received daily oral CAB+RPV for at least 5years in LATTE, with a favorable safety profile. Most participants preferred CAB+RPV long-acting to their prior oral CAB+RPV regimen at M12.	*Human immunodeficiency virus 1; *Human immunodeficiency virus infection /drug therapy; Abdominal pain /side effect; Adult; Antiviral activity; Anti-HIV Agents therapeutic use; Article; Body mass; CD4+ T lymphocyte; Controlled study; Coughing /side effect; Diarrhea /side effect; Diketopiperazines; Drug efficacy; Drug formulation; Drug safety; Erythema /side effect; Fatigue /side effect; Female; Fever /side effect; Food and Drug Administration; HIV Infections drug therapy; HIV-1 genetics; Headache /side effect; Human; Human immunodeficiency virus infected patient; Human tissue; Humans; Major clinical study; Male; Middle aged; Multicenter study; Muscle strain /side effect; Nausea /side effect; Patient-reported outcome; Phase 2 clinical trial; Pyridones therapeutic use; Randomized controlled trial; Rilpivirine therapeutic use; Sustained virologic response; Syphilis /side effect; Upper respiratory tract infection /side effect	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Mitchell J.T.; Burns C.M.; Atkinson B.; Cottrell M.; Frye J.K.; McKellar M.S.; Kashuba A.D.M.; McClernon F.J.; Okeke N.L.	Feasibility, Acceptability, and Preliminary Efficacy of a Gamified Mobile Health Contingency Management Intervention for PrEP Adherence Among Black MSM	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03675-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128162709&doi=10.1007%2fs10461-022-03675-9&partnerID=40&md5=11adabbf39d6f439c2cb5e45b0f3ef39	Oral HIV pre-exposure prophylaxis (PrEP) is effective at preventing HIV. However, low adherence is common and undermines these protective effects. This is particularly relevant for groups with disproportionately higher rates of HIV, including Black men who have sex with men (MSM). The current study tested the feasibility, acceptability, and preliminary efficacy of a gamified mobile health contingency management intervention for PrEP adherence—called mSMART (Mobile App-Based Personalized Solutions for Medication Adherence of Rx Pill Tool). Fifteen Black MSM already prescribed PrEP in the community completed baseline and follow-up assessments separated by 8 weeks of using mSMART. Regarding feasibility, there was no study attrition, no mSMART functional difficulties that significantly interfered with use, and a mean rate of 82% daily mSMART use. Acceptability ratings were in the moderately to extremely satisfied range for factors such as willingness to recommend mSMART to others and user-friendliness, and in the low range for ratings on difficulty learning how to use mSMART. Scores on a system usability measure were in the acceptable range for 73% of the sample. Qualitative analysis of follow-up interviews identified individual components of mSMART that could be modified in future iterations to make it more engaging. PrEP composite adherence scores from biomarkers indicated an improvement from baseline to follow-up with a medium effect size, as well as a decrease in the number of perceived barriers to medication adherence. Findings indicate a future efficacy trial is needed to examine the effects of this gamified mobile health contingency management intervention on PrEP adherence. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. UTILIZATION OF HIV PREVENTION, CARE, AND TREATMENT SERVICES AMONG YOUNG MEN WHO HAVE SEX WITH MEN AND TRANSGENDER PERSONS OF COLOR IN THE U.S. SOUTH: A QUALITATIVE ANALYSIS	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2022.34.6.512	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143199387&doi=10.1521%2faeap.2022.34.6.512&partnerID=40&md5=02eceeef8f405e80b7305cc5c41bf378	To better understand utilization of HIV prevention, care, and treatment services by young men who have sex with men (YMSM) and young transgender persons (YTG), of Black race or Hispanic/Latino/Latina ethnicity in the U.S. South, we conducted semi-structured interviews with 127 clients at one of four community based organizations (CBOs) in Miami, Atlanta, New Orleans/Baton Rouge, or Columbia, South Carolina. Across sites, the service that most commonly drew respondents into the CBO was HIV and STD testing. Other services commonly used included HIV/STI treatment, counseling services/support groups, and PrEP services. Social/organizational/structural facilitators of service utilization include the welcoming climate/culture of the CBOs, ease of access to the services, and transportation services to reach the CBOs. Suggested service enhancements include broader range of comprehensive, navigational-type services beyond HIV testing and service co-location. Research on how to reduce stigma in the surrounding communities may help reduce health disparities experienced by these populations. © 2022 The Guilford Press. Article	2022	Mizuno, Yuko; Gelaude, Deborah J; Crepaz, Nicole; Kamitani, Emiko; DeLuca, Julia B; Leighton, Carolyn A; Wichser, Megan E; Smith, Dawn K	Health Care Providers' Views on Clinic Infrastructure and Practice Models That May Facilitate HIV Preexposure Prophylaxis (PrEP) Prescribing: A Qualitative Meta-Synthesis.	Health Promotion Practice	-	-	-	-	1524-8399	10.1177/15248399211038364	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8938291	HIV (human immunodeficiency virus) preexposure prophylaxis (PrEP) is an effective biomedical HIV prevention tool. Increasing PrEP use among populations disproportionately affected by HIV is one of the key efforts in the United States' Ending the HIV Epidemic (EHE) initiative and the HIV National Strategic Plan for the United States. Given that PrEP is available only through prescription, it is important to explore structural, organizational, or environmental factors that could facilitate or impede health care provider's PrEP prescribing behavior. The purpose of this systematic review (PROSPERO CRD: 42019138889) is to identify qualitative studies that addressed this topic and conduct meta-synthesis using the thematic synthesis method to identify major themes on the characteristics of clinic infrastructure or clinic models that providers consider as facilitators of PrEP prescribing in the United States. Eighteen citations representing 15 studies were included in this review. Five overarching themes were identified: (1) routinized HIV risk assessment; (2) interdisciplinary/coordinated PrEP teams or services; (3) clinic capacity to provide essential PrEP-related services; (4) low out-of-pocket patient costs; and (5) access to the priority populations. Some of these themes are consistent with the recommendations of CDC's PrEP clinical guidelines and the EHE initiative. More recent studies that include perspectives of diverse providers, timely analysis of these studies, and implementation research to assess strategies to address the current practice gaps are needed to further promote PrEP prescribing among providers in the United States. A four-year observation of HIV and sexually transmitted infections among men who have sex with men before and during pre-exposure prophylaxis in Tokyo	Journal of Infection and Chemotherapy	-	-	-	-	1341321X	10.1016/j.jiac.2022.02.013	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125651871&doi=10.1016%2fj.jiac.2022.02.013&partnerID=40&md5=cd49a68a3d0bd1d26f4ae475de3089c8	Background: Pre-exposure prophylaxis (PrEP) with tenofovir/emtricitabine (TDF/FTC) has been recommended worldwide. We evaluated the safety and efficacy of daily PrEP with TDF/FTC in Tokyo. Methods: This single-center, single-arm study was performed with 124 men who have sex with men (MSM) between January 2017 and March 2021. MSM who entered into an MSM cohort from January 2017 through March 2018 and had a pre-PrEP observational period of 1 year were eligible and recruited to the study between April 2018 and March 2019 and followed for 2 years. The primary outcome was the incidence of HIV infection (per 100 person-years). Secondary outcomes were the incidence of sexually transmitted infections and adverse events, and the rate of retention and adherence to PrEP. Results: There were 309 MSM registered in the cohort (mean age, 36.6 years); 124 fulfilled the criteria and were included in the study. The remaining patients were continuously followed. There was a significant decrease in incidental HIV infection among PrEP users (0 infections, 235.5 person-years) compared to non-PrEP users (11 infections 3.4%/year, 318.9 person-years; p = 0.01). The average adherence rate was consistently greater than 95%, and the retention rate at two years was approximately 80%. Conclusions: The present study showed a high prophylactic effect against HIV infection, retention, and adherence to PrEP. PrEP is feasible and highly recommended in Japan. Article	2022	Mohareb A.M.; Larmarange J.; Kim A.Y.; Coffie P.A.; Kouamé M.G.; Boyd A.; Freedberg K.A.; Hyle E.P.	Risks and benefits of oral HIV pre-exposure prophylaxis for people with chronic hepatitis B	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(22)00123-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134736112&doi=10.1016%2fS2352-3018%2822%2900123-0&partnerID=40&md5=301a461eda2d37c489559ae6e6fe49b3	Individuals with chronic hepatitis B virus (HBV) infection who are at substantial risk of HIV acquisition benefit from pre-exposure prophylaxis (PrEP) with tenofovir-based antiviral therapy. Considering that tenofovir potently inhibits HBV, providing PrEP to individuals with HBV effectively results in treatment of their HBV infection. However, some clinicians might be hesitant to initiate PrEP in people with chronic HBV due to unknown risks of HBV reactivation, hepatitis, and acute liver failure during periods of antiviral cessation. Unfortunately, these knowledge gaps affect scale up of PrEP among people with chronic HBV. Emerging data regarding the risks and benefits of antiviral cessation in people with chronic HBV suggest that PrEP can be safely initiated despite the risks of non-adherence or discontinuation. People with chronic HBV who stop PrEP should be closely monitored for HBV reactivation and hepatitis flares after antiviral cessation. © 2022 Elsevier Ltd	HIV, hepatitis B virus, PrEP, hepatitis, acute liver failure	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Daily and on-demand HIV pre-exposure prophylaxis with emtricitabine and tenofovir disoproxil (ANRS PREVENIR): a prospective observational cohort study	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(22)00133-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134820969&doi=10.1016%2fS2352-3018%2822%2900133-3&partnerID=40&md5=5fc7ee1216d22b36f4af1acc017b632f	Background: There are few data available regarding the use of on-demand pre-exposure prophylaxis (PrEP) for HIV prevention. We aimed to assess PrEP effectiveness, adherence, and safety in adults using daily or on-demand PrEP. Methods: We conducted a prospective observational cohort study (ANRS PREVENIR) at 26 sites in the Paris region, France. We enrolled HIV-negative adults (aged ≥18 years) at high risk of HIV infection who were starting or continuing PrEP. PrEP was prescribed as a fixed-dose combination of tenofovir disoproxil and emtricitabine (245 mg and 200 mg, respectively, per pill). PrEP could be prescribed as a daily regimen with one pill per day or, in men who have sex with men (MSM) or in transgender women who have sex with men, as an on-demand regimen following the IPERGAY dosing recommendation. At enrolment and every 3 months thereafter, participants were tested for HIV and provided information regarding the PrEP dosing regimen used. Adherence to PrEP was assessed by self-report and by tenofovir diphosphate concentrations in dried blood spots. The primary outcome of HIV-1 incidence was assessed using Poisson regression among participants who started PrEP. This study is registered with ClinicalTrials.gov, NCT03113123, and EudraCT, 2016A0157744. Findings: Between May 3, 2017, and May 2, 2019, 3082 people were assessed for eligibility and 3065 participants were enrolled. 3056 (99·7%) of 3065 participants reported using PrEP and were included in the analyses. The median age was 36 years (IQR 29–43), 1344 (44·0%) of 3056 participants were PrEP-naive, and 3016 (98·7%) were MSM. At enrolment, 1540 (50·5%) of 3049 participants opted for daily PrEP dosing and 1509 (49·5%) opted for on-demand PrEP dosing; these proportions remained stable during follow-up. Median follow-up was 22·1 months (IQR 15·9–29·7) and incidence of study discontinuation was 17·6 participants (95% CI 16·5–18·7) per 100 person-years. At the data cutoff on Sept 30, 2020, there had been six HIV-1 seroconversions (three participants using daily PrEP and three using on-demand PrEP; all were MSM) over 5623 person-years. Overall HIV-1 incidence was 1·1 cases (95% CI 0·4–2·3) per 1000 person-years, and did not differ between participants using daily PrEP and those using on-demand PrEP (incidence rate ratio 1·00, 95% CI 0·13–7·49; p=0·99). Four participants (two using daily PrEP and two using on-demand PrEP) discontinued PrEP due to treatment-related adverse events (nausea n=2, vomiting and diarrhoea n=1, and lumbar pain n=1). Interpretation: In this study, which enrolled mainly MSM, HIV-1 incidence on PrEP was low and did not differ between participants using daily PrEP and those using on-demand PrEP. On-demand PrEP therefore represents a valid alternative to daily PrEP for MSM, providing greater choice in HIV prevention. Article	2022	Montgomery, Elizabeth T; Roberts, Sarah T; Reddy, Krishnaveni; Tolley, Elizabeth E; Hartmann, Miriam; Mathebula, Florence; Wagner, L Danielle; Lanham, Michele; Wilcher, Rose; Browne, Erica N; Baeten, Jared M; Palanee-Phillips, Thesla	The CHARISMA Randomized Controlled Trial: A Relationship-Focused Counseling Intervention Integrated Within Oral PrEP Delivery for HIV Prevention Among Women in Johannesburg, South Africa.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000002991	https://dx.doi.org/10.1097/QAI.0000000000002991	BACKGROUND: Consistent use of oral pre-exposure prophylaxis (PrEP) has been a challenge among women, particularly when in relationships with lack of partner support or intimate partner violence (IPV). METHODS: We conducted a randomized controlled trial (RCT) of an empowerment counseling intervention called "CHARISMA" delivered to women within a PrEP demonstration project in Johannesburg, South Africa. The trial tested the effectiveness of CHARISMA to increase PrEP adherence; decrease social harms and IPV; and improve partnership dynamics (eg, communication, disclosure and support) compared with those who received the standard of care counselling support and referrals. Four hundred seven HIV-seronegative, nonpregnant women aged 18-45 years were enrolled for 6 months of PrEP use, with 203 randomized (1:1) to the intervention. All participants reporting IPV received counseling and referrals that followed the WHO five-step Listen, Inquire, Validate, Enhance Safety, and Support approach. RESULTS: This RCT did not identify statistically significant differences between study arms for PrEP adherence or relationship dynamics, with the exception of an increase in PrEP disclosure among intervention arm women. In our study, we cannot determine whether the lack of detectable findings may have been because of lack of intervention effect, strength of standard of care services, low risk in the study population, or other factors. CONCLUSIONS: Addressing IPV and relationship dynamics remain important factors influencing HIV risk, and addressing these within the context of PrEP delivery is an important synergistic opportunity. CHARISMA was highly acceptable to participants, and further adaptation and testing of the intervention to other populations and settings will augment the evidence base. Article	2022	Mora, Claudia; Nelvo, Romário; Monteiro, Simone	Peças de comunicação governamentais sobre as profilaxias pré (PrEP) e pós-exposição (PEP) ao HIV (2016-2019): análise de seus conteúdos e circulação entre gays, mulheres trans/travestis e trabalhadoras sexuais	Saúde e Sociedade	-	-	-	-	0104-1290	10.1590/s0104-12902022210855pt	http://www.scielo.br/scielo.php?script=sci_arttext&pid=S0104-12902022000400324	Resumo Este artigo analisa a divulgação das profilaxias pré (PrEP) e pós-exposição (PEP) ao HIV, considerando o papel histórico das campanhas de prevenção à aids. São utilizadas 24 peças de comunicação sobre PrEP, PEP e PC (Prevenção Combinada), produzidas entre 2016 e 2019 e publicadas no site e mídias sociais do Ministério da Saúde, e o depoimento de 30 usuários(as) das profilaxias - que incluem gays, mulheres trans/travestis e profissionais do sexo - na região metropolitana do Rio de Janeiro. As peças foram classificadas quanto ao tipo, ano, público e informação de acesso, e os resultados foram interpretados a partir de três eixos: sexualidade e risco; gênero, emoções e moralidades; deslocamentos do preservativo. A análise indicou o apagamento das expressões de sexualidade e o predomínio de uma linguagem abstrata e esquemática, pressupondo um público racional e individualista, com o preservativo associado à ideia de "risco sexual". Os relatos dos(as) usuários(as) quanto à divulgação de informações sobre essas profilaxias evidenciaram sua insuficiência. Concluímos que ocorre uma baixa exploração do potencial das campanhas de comunicação, orientadas pela realidade sociocultural dos segmentos sociais, comprometendo o acesso às profilaxias. Assim, a biomedicalização da prevenção e o avanço do conservadorismo prejudicam a resposta brasileira à aids. Article	2022	Moran A.; Mashele N.; Mvududu R.; Gorbach P.; Bekker L.-G.; Coates T.J.; Myer L.; Joseph Davey D.	Maternal PrEP Use in HIV-Uninfected Pregnant Women in South Africa: Role of Stigma in PrEP Initiation, Retention and Adherence	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03374-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110988817&doi=10.1007%2fs10461-021-03374-x&partnerID=40&md5=e9fadb50f769839d52417a8ea1750071	Pregnant women in sub-Saharan Africa are at high risk of HIV acquisition and require effective methods to prevent HIV. In a cohort of pregnant women offered Pre-exposure prophylaxis (PrEP), we evaluate the relationship between internalized and anticipated stigma and PrEP initiation at first antenatal visit, 3-month continuation and adherence using multivariable logistic regression. High internalized and anticipated PrEP stigma are associated with lower PrEP care initiation at first antenatal visit (aOR internalized stigma = 0.06; 95% CI = 0.03–0.11 and aOR anticipated stigma = 0.55; 95% CI = 0.31–1.00) compared to women with low reported stigma, after controlling for covariates. Women whose partners have not been tested for HIV or whose serostatus remains unknown have 1.6-times odds of PrEP retention at 3-months compared to women whose partners have been tested (aOR = 1.60; 95% CI = 1.02–2.52) after adjusting for covariates. PrEP counseling and maternal PrEP interventions must consider individual- and relational-level interventions to overcome anticipated PrEP stigma and other barriers to PrEP initiation and adherence. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Morgan E.; Caba A.E.; Eaton L.A.; Watson R.J.	PrEP Access Affected by COVID-19 Is Associated With Increased Odds of HIV Seroconversion	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000003036	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138440726&doi=10.1097%2fQAI.0000000000003036&partnerID=40&md5=6d628ba74cd57f0a3da3aa61de02ac2e	Abstract:Black and Hispanic/Latino sexual minority men and gender diverse (SMMGD) individuals report lower uptake and adherence to pre-exposure prophylaxis (PrEP) compared with White SMMGD. For some, the COVID-19 pandemic has resulted in reduced access to PrEP prescriptions and related changes to PrEP use, yet little is known how pandemic-related changes to PrEP access and sexual activity might influence sexually transmitted infection (STI) status and HIV seroconversion among SMMGD of color. We used data from 4 waves of a national study of Black and Hispanic/Latino SMMGD's HIV, PrEP, and health experiences to assess whether self-reported changes to sexual activity were associated with STI status, and whether self-reported changes to PrEP access were associated with HIV seroconversion. Those who reported greater impact to their sexual activity during the pandemic adjusted odds ratio (aOR) = 1.24; 95% confidence interval (CI): 1.10 to 1.40 and a greater number of sexual partners (aOR = 1.29; 95% CI: 1.21 to 1.38) were more likely to report a positive STI test. In addition, we found that compared with those who did not report pandemic-related changes to PrEP access, those who did report changes to PrEP access had significantly higher odds of HIV seroconversion during the study period (aOR = 2.80; 95% CI: 1.02 to 7.68). These findings have implications for HIV and STI prevention and highlight the importance of novel interventions to improve PrEP access among Black and Hispanic/Latino SMMGD. Importantly, these findings also demonstrate the need to stay focused on key populations at risk of HIV infection during emerging public health crises to avoid an increase in rates of new diagnoses. © 2022 Lippincott Williams and Wilkins. Genital Inflammation Is Not Associated with Decreased Vaginal Tenofovir Concentrations in Women Taking Oral PrEP	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002884	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125214048&doi=10.1097%2fQAI.0000000000002884&partnerID=40&md5=2919f039fa84ff49a15dd28c711e1515	Background:We evaluated the association of inflammation and dysbosis on cervicovaginal fluid (CVF) tenofovir (TFV) concentrations in women taking oral tenofovir disoproxil fumarate/emtricitabine for HIV pre-exposure prophylaxis (PrEP) in the United States.Setting:Thirty-five women in a HIV PrEP implementation study attended their week 24 visit at a San Diego research clinic and provided CVF specimens.Methods:Women in the Adherence Enhancement Guided by Individualized Texting and Drug Levels study had their CVF specimens evaluated for (1) sexually transmitted bacterial (Neisseria gonorrhoeae, Chlamydia trachomatis, Gardnerella, and Trichomonas vaginalis), viral (human papillomavirus, cytomegalovirus and herpes simplex virus-1/2) and fungal (Candida) infections; (2) microbiome composition by 16 S sequencing (V3-V4 region); and (3) cytokine profiles by enzyme-linked immunoassay (Interleukin-8, macrophage Inflammatory protein-1a, macrophage Inflammatory Protein-1b and interferon-γ-inducible protein-10). Univariate statistical analysis was used to determine factors associated with CVF TFV concentrations. CVF TFV of 100-1000 ng/mL benchmarked typical genital concentrations and TFV-diphosphate in dried blood spots of 700 fmol/punch was considered adequate adherence.Results:Thirty-five women had CVF specimens collected. No factor was associated with CVF TFV concentrations or discordance of blood and vaginal concentrations. Among 27 participants assessed for vaginosis (Candida, Gardnerella or Trichomonas), women with Gardnerella (n = 11) were more likely to have high (>1000 ng/mL) CVF TFV concentrations (82% versus 33%, P = 0.02).Conclusions:Presence of genital viruses, cytokines, or vaginal community state types were not associated with low CVF TFV concentrations in cisgender women taking oral tenofovir disoproxil fumarate/emtricitabine for PrEP. The surprising association observed between presence of Gardnerella and higher vaginal TFV concentrations needs further evaluation. © 2022 Lippincott Williams and Wilkins. All rights reserved. Article	2022	Morris, Sheldon R; Jain, Sonia; Blumenthal, Jill; Bolan, Robert; Dubé, Michael P; Henderson, Philip; Corado, Katya; Sun, Shelly; He, Feng; Chow, Karen; Burke, Leah; Anderson, Peter L; Moore, David J	Randomized Trial of Individualized Texting for Adherence Building (iTAB) Plus Motivational Interviewing for PrEP Adherence in Transgender Individuals: The iM-PrEPT Study.	Journal of Acquired Immune Deficiency Syndromes	-	-	1944-7884	10.1097/QAI.0000000000003091	https://dx.doi.org/10.1097/QAI.0000000000003091	BACKGROUND: Transgender and nonbinary individuals at risk for HIV may benefit from adherence support for pre-exposure prophylaxis. METHODS: Between June 2017 and September 2020, 255 transgender and nonbinary individuals received daily oral tenofovir disoproxil fumarate/emtricitabine for 48 weeks randomized 1:1 to receive individualized Texting for Adherence Building (iTAB) or iTAB plus motivational interviewing (iTAB + MI) through phone for nonadherence. The primary end point was dried blood spot tenofovir diphosphate concentrations at weeks 12 and 48 (or last on-drug study visit) ≥1246 fmol/punch consistent with ≥7 doses/week (ie, near-perfect adherence). Secondary outcomes included dried blood spot tenofovir diphosphate concentrations ≥719 fmol/punch consistent with ≥4 doses/week (ie, adequate adherence) and self-reported adherence by daily text messages. RESULTS: Adherence for the outcome ≥1246 fmol/punch and ≥719 fmol/punch, respectively, was 49.1% and 57.9% for transgender men, 37.7% and 47.2% for nonbinary individuals, and 31.0% and 44.1% for transgender women. No difference was seen in iTAB + MI compared with iTAB alone by drug levels except where it approached significance in transgender women for the outcome of ≥719 fmol/punch in the iTAB + MI group compared with iTAB only (52% versus 35.7%, P = 0.065). There was a significant difference in self-reported daily dose adherence in the iTAB + MI group compared with iTAB alone (57.9% of days versus 46.4%, P = 0.009). In transgender women, the mean percentage of daily doses taken was 58.5% with iTAB + MI and 37.3% with iTAB alone (P < 0.001). CONCLUSIONS: In addition to automated approaches to adherence promotion, phone-based MI triggered by repeatedly missing doses may improve pre-exposure prophylaxis adherence among transgender women. Article	2022	Moya E.D.; Rodrigues D.S.; Pietrus A.; Severo A.M.	A Mathematical Model for HIV/AIDS Under Pre-Exposure and Post-Exposure Prophylaxis	Biomath	-	-	1314684X	10.55630/j.biomath.2022.08.319	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139916397&doi=10.55630%2fj.biomath.2022.08.319&partnerID=40&md5=6ae225161bb39f6803903088aead946a	HIV/AIDS has a strong impact on society, the economy, and health. Early diagnosis of cases, adherence to treatment, and prevention are important factors in controlling the epidemic in the population. In this paper, we present a new mathematical model for the study of HIV/AIDS transmission. Our model is stratified in men and women, to account for the main forms of sexual transmission homosexual and heterosexual relationships, and infectiousness in the HIV and AIDS stages. In addition, in the construction of the model, we take into account the influence of Pre-Exposure Prophylaxis (PrEP) and Post-Exposure Prophylaxis (PEP) to study the impact of these implementations, diagnosis, and effectiveness of treatment based on viral load undetectability. We study the basic reproduction number by subpopulation (men and women) and general. Working by subpopulations allows us to study men who have sex with men who have a strong impact on virus transmission. Also, we study the infection-free equilibrium points due to their relationship with the basic reproduction number and demonstrate the global stability by subpopulation and general. To explore our model, we performed computational simulations on a scenario designed with data from the literature and assumed, studying the influence of the parameters associated with the use of PrEP, PEP, and undetectability on the basic reproduction number by varying them individually and jointly. We concluded that in women the basic reproduction number is always lower than unity and that in men the parameter associated with the undetectability of the viral load in HIV men has a strong influence on the dynamics. We also address the impact of PrEP, PEP, and undetectability in HIV and AIDS on the compartments, considering different scenarios varying the parameters jointly and independently and by sex which show difficulty in reducing women with AIDS. The scenario that showed the best results in the reduction of the number of HIV and AIDS cases was when the parameters associated with undetectability in HIV and AIDS men and women take the 90-90-90 that is proposed in the World Health Organization (WHO) strategy. © 2022 Erick Delgado Moya, Diego Samuel Rodrigues, Alain Pietrus, Aymee Marrero Severo. Article	2022	Moyo E.; Barham L.; Mhango M.; Musuka G.; Dzinamarira T.	Estimating the budget impact of adopting tenofovir/emtricitabine for pre-exposure prophylaxis of HIV in the public health sector in Namibia (2021 – 2023)	Journal of Infection and Public Health	-	-	18760341	10.1016/j.jiph.2022.09.003	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138375615&doi=10.1016%2fj.jiph.2022.09.003&partnerID=40&md5=b06124dbaee56cb95d98dba5cb282561	Background: Although Namibia started implementing pre-exposure prophylaxis (PrEP) of Human Immunodeficiency Virus (HIV) in 2016, no study to determine its budget impact has been conducted. This study, therefore, aimed to estimate the budget impact of adopting tenofovir/emtricitabine for PrEP of HIV for all eligible people in the public health sector in Namibia from 2021 to 2023. Methods: A country-specific model was developed for this budget impact analysis (BIA). PrEP has targeted all eligible people in Namibia who receive health services from the public sector. It was assumed that the adherence rate was 75% and PrEP effectiveness 60% in this study. Costs used in this study were taken from a study that included Namibian costs. Results: The BIA suggests that adopting PrEP may be cost saving as US$104 823, US$143 620, and US$182 452 of additional HIV care costs will potentially be saved in 2021, 2022, and 2023, respectively. Cost savings rely on high adherence rates, high PrEP effectiveness rates, low PrEP costs, and a small number of people living with HIV (PLHIV). Conclusion: Further economic analysis could aid decision-making in Namibia, both to stress test assumptions in the BIA and conduct cost-effectiveness analysis to estimate the value for money of PrEP. © 2022 The Author(s)	Budget impact analysis; HIV; Namibia; PrEP; Tenofovir/emtricitabine	English	Netherlands	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	Quantitative
Article	2022	Moyo E.; Murewanhema G.; Musuka G.; Dzinamarira T.	Long-Acting Injectable Drugs for HIV-1 Pre-Exposure Prophylaxis: Considerations for Africa	Tropical Medicine and Infectious Disease	-	-	24146366	10.3390/tropicalmed7080154	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137603949&doi=10.3390%2ftropicalmed7080154&partnerID=40&md5=673d71dd458a7bb5340216097a41c027	Sub-Saharan Africa carries the highest burden of HIV-1 and AIDS. About 39% of all new infections in the world in 2020 were in this region. Oral PrEP was found to be very effective in reducing the risk of HIV-1 transmission. However, its effectiveness is highly dependent on users adhering to the drugs. The availability of long-acting injectable PrEP that eliminates the need for a daily pill may increase PrEP uptake and adherence in people who struggle to adhere to oral PrEP. The USA's FDA approved long-acting cabotegravir (CAB-LA) for PrEP of HIV-1 in December 2021. In this review, we discussed the implementation challenges to the successful roll-out of CAB-LA in Africa and measures to address these implementation challenges. Some health system-level challenges include the cost of the drug, its refrigeration requirement, and the shortage of healthcare providers trained to administer parenteral medicines. In contrast, client challenges include lack of knowledge, accessibility of the drug, side effects, stigma, and lack of family and community support. These challenges can be addressed by several measures emanating from lessons learned from the successful implementation of ART, oral PrEP, and immunization in the continent. Some steps include advocating for waiving of CAB-LA patent licence, conducting demonstration projects in Africa, promoting the use of renewable energy sources such as solar energy, healthcare provider training, task shifting, community engagement, client education, and implementing adherence promotion strategies. © 2022 by the authors. Article	2022	Msph J.K.; Bullock N.A.A.; Burton K.; Mitchell C.; Harris L.; Combs R.; Krigger K.; Northington T.	Predictors of Pre- exposure Prophylaxis Awareness among African American Young Adults in Louisville, Kentucky	Journal of Health Care for the Poor and Underserved	-	-	10492089	10.1353/hpu.2022.0121	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137284769&doi=10.1353%2fhpu.2022.0121&partnerID=40&md5=bb51cfad5d98adf91f983ce3cc652983	Low pre-exposure prophylaxis (PrEP; medication to reduce HIV risk among HIV-negative people) awareness may be partially responsible for racial/ethnic differences in treatment uptake. Little research has examined PrEP awareness among African Americans with diverse HIV risk profiles. Audio computer-assisted self-interviews were distributed to 204 African American young adults (age 18–29) demonstrating heightened HIV vulnerability. Chi square analysis and logistic regressions were conducted to determine factors associated with PrEP awareness. While unadjusted logistic regression indicates that age 18–21 years (p<.01), heterosexuality (p<.05), lower education (p<.05), less frequent HIV testing (p<.01), STI diagnosis history (p<.05), not having casual sex (p<.05), and not having a one night stand (p<.01) were associated with decreased PrEP awareness, only heterosexuality (p<.05), lower education (p<.05), and less HIV testing (p<.01) remained significant in adjusted analysis. PrEP-focused education efforts should include outreach across education gradients and sexual orientations. Counselling efforts included with HIV testing may be responsible for accelerating PrEP knowledge among testers. © Meharry Medical College Journal of Health Care for the Poor and Underserved. Article	2022	Mudimu, Edinah; Sardinia, Jack; Momin, Sahar; Medina-Marino, Andrew; Bezuidenhout, Charl; Bekker, Linda-Gail; Barnabas, Ruanne V; Peebles, Kathryn	Incremental costs of integrated PrEP provision and effective use counselling in community-based platforms for adolescent girls and young women in South Africa: an observational study.	Journal of the International AIDS Society	-	-	1758-2652	10.1002/jia2.25875	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8819637	INTRODUCTION: Adolescent girls and young women (AGYW) are a priority population for pre-exposure prophylaxis (PrEP), a highly effective HIV prevention method. However, effective PrEP use among AGYW has been low. Interventions to support PrEP effective use may improve pill-taking. Affordability of PrEP programs depends on their cost. We, therefore, evaluated the cost of community-based PrEP with effective use counselling. METHODS: Cost data from a randomized controlled trial were used to evaluate the cost of PrEP provision with effective use counselling offered to AGYW through community-based HIV testing platforms between November 2018 and November 2019. AGYW were randomized to receive (1) group-based community health club effective use counselling, (2) individualized effective use counselling or (3) community-based PrEP dispensary. Task shifting of effective use counselling from nurses to trained lay counsellors was implemented in groups 1 and 2. Personnel costs were estimated from time-and-motion observations and staff interviews. Expenditure and ingredients-based approaches were used to estimate costs for medical and non-medical supplies. RESULTS: In total, 603 AGYW initiated PrEP and accrued a total of 1280 months on PrEP. Average cost per person-month on PrEP with group-based community health club, individualized effective use counselling and community-based PrEP dispensary under the Department of Health scenario were similar and high (USD $55.32, $55.65 and $55.46, respectively) due to low PrEP client volume observed in the clinical trial. Increasing client volume (scaled Department of Health scenario) reduced cost per person-month estimates to USD $15.48, $26.40 and $13.99, respectively. CONCLUSIONS: As designed, individualized effective use counselling increased the cost of standard-of-care PrEP delivery by 89%, group-based community health effective use counselling increased the cost of standard-of-care PrEP delivery by 11%. These estimates can inform cost-effectiveness and budget impact analysis for PrEP provision with effective use counselling services. Article	2022	Mudzingwa, Emily Krogstad; de Vos, Lindsey; Atujuna, Millicent; Fynn, Lauren; Mugore, Matinatsa; Hosek, Sybil; Celum, Connie; Bekker, Linda-Gail; Daniels, Joseph; Medina-Marino, Andrew	Factors influencing adolescent girls and young women's uptake of community-based PrEP services following home-based HIV testing in Eastern Cape, South Africa: a qualitative study.	AIDS and Behavior	-	-	1573-3254	10.1007/s10461-022-03702-9	https://dx.doi.org/10.1007/s10461-022-03702-9	Home-based service delivery has been used to improve access to HIV testing and antiretroviral initiation across sub-Saharan Africa, but it has yet to be leveraged to improve pre-exposure prophylaxis (PrEP) uptake. We interviewed 37 adolescent girls and young women (AGYW) in Eastern Cape, South Africa to explore why they chose to initiate PrEP or not following home-based HIV testing and referral for PrEP, and what influenced time to PrEP initiation. Participants reported that home visits provided a source of trusted information and a way to involve family members in their PrEP initiation decisions, motivating some to start PrEP. AGYW who initiated PrEP were more likely to qualitatively perceive themselves to be at high risk for HIV compared with those who never initiated PrEP. Integrating home-based HIV testing with PrEP education and referral may be a valuable way to reduce familial barriers and boost PrEP uptake among AGYW in South Africa. Article	2022	Mugambi, Melissa Latigo; Pintye, Jillian; Heffron, Renee; Barnabas, Ruanne Vanessa; John-Stewart, Grace	HIV Prevention Tools Across the Pregnancy Continuum: What Works, What Does Not, and What Can We Do Differently?	Current HIV/AIDS Reports	-	-	1548-3576	10.1007/s11904-022-00621-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9717592	PURPOSE OF REVIEW: Multiple tools exist to support the primary prevention of HIV in pregnant and postpartum women; however, there are opportunities to enhance their use and impact. This review summarizes the current status of HIV prevention tools and existing gaps and opportunities to improve their use along the pregnancy care continuum. RECENT FINDINGS: HIV screening efforts have steadily improved with close to universal screening of pregnant women in several East and Southern African countries. Strategies to implement partner testing through the distribution of HIV self-test kits are promising though linkage to care remains challenging. Syphilis screening rates are increasing though detection of other sexually transmitted infections could benefit from improved diagnostic capacity. Male and female condoms are rarely used and are often not the optimal tool of choice during pregnancy. Oral pre-exposure prophylaxis (PrEP) is a promising tool, although barriers such as the need for daily adherence, side effects, and stigma may limit its use. There is a growing pipeline of PrEP agents with alternative delivery platforms that might suit women's preferences better and supports the notion that choice is vital to improving HIV prevention coverage during the pregnancy-postpartum continuum. Clear guidance on which tools to use and how to use them, safety data supporting their use, and surveillance data documenting the scale and effectiveness of the tools will be imperative in establishing a path to more impactful prevention efforts among pregnant and postpartum women. Sex workers were offered F/tenofovir disoproxil fumarate and randomized 1:1 to monthly HIVST and quarterly in-clinic testing (intervention) or quarterly in-clinic HIV testing alone (standard of care) and followed up for 12 months. PrEP adherence was measured using electronic adherence monitoring and tenofovir diphosphate (TFV-DP) levels in dried blood spots. Adherence outcomes and sexual behaviors were compared by arm using generalized estimating equation models.Results:We enrolled 110 sex workers: 84 cisgender women, 14 transgender women, 10 men who have sex with men, and 2 transgender men. The median age was 23 years. The 12-month retention was 75%. Nearly all (99.4%) used ≥1 HIVST kit. The proportion with TFV-DP levels ≥700 fmol/punch in the HIVST and standard of care arms at the 3-, 6-, 9-, and 12-month visits was 2.4%, 2.3%, 0%, and 0% and 7.9%, 0%, 0%, and 0%, respectively, with no differences by randomization arm (P > 0.2). Self-reported condomless sex acts with paying partners was similar by arm adjusted incidence rate ratio 0.70; 95% confidence interval (CI): 0.42 to 1.17; P = 0.18. One seroconversion occurred (HIV incidence, 0.9/100 person-years); TFV-DP was not detected at any visit.Conclusions:A gender-diverse sample of sex workers in Uganda used HIVST but not daily oral PrEP for HIV protection. Alternate approaches to promote PrEP use, including long-acting formulations, should be considered in this population. Article	2022	Müller, Matthias C; Usadel, Susanne; Zimmermann, Stefan; Fahrhöfer, Andreas; Kern, Winfried V; Hoffmeister, Ulrike; Rieg, Siegbert	Closing Sexual Health Service Gaps With a New Service Model in Germany: Performance of an on-Site Integrated, Cross-Sectoral, Low Threshold Sexually Transmitted Infections/HIV Counseling and Treatment Service.	Frontiers in Public Health	-	-	2296-2565	10.3389/fpubh.2022.793609	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9082412	Purpose: In Germany, the incidence of bacterial sexual transmitted infections (STI) is on the rise and still high for HIV infections. The Center for Sexual Health Freiburg (CSHF) was established to offer low threshold access for STI/HIV counseling, testing, HIV pre-exposure prophylaxis (PrEP), and on-site treatment. The objective of this study was to analyze the performance of CSHF. Methods: Longitudinal study that includes all clients presenting between 1 May 2020 and 28 February 2021 at CSHF and willing to sign informed consent. Results: In the study period, 536 clients presented at CSHF of whom 417 clients were included in the study resulting in 668 client contacts. Clients' median age was 28.1 years (range: 18.0-73.1), 55.9% were men, 42.0% were women, 0.3% were transman, and 1.7% were not binary. Clients' sexual orientation was heterosexual (56.6%), homosexual men (26.2%), and bisexual (13.6%). STI screening resulted in the detection of any STI in 3.4% (95% confidence interval (CI): 0.7-6.1) of women, in 3.1% (95% CI: 0.0-6.5) of heterosexual men, and in 22.2% (95% CI: 13.0-31.5) of men having sex with men (MSM) not taking PrEP. Eighty-one MSM received PrEP with a total follow-up of 57.3 person-years and 0.44 STIs per person-year. Conclusion: The substantial burden of STI in the study population emphasizes the need for regular and low threshold STI screening services. The concept of CSHF may facilitate access to STI/HIV counseling, testing, and PrEP for a wide spectrum of people and may prove to be an important contribution to the efforts to reduce STI and HIV incidence in Germany. Article	2022	Munthali, R. J.; Stangl, A. L.; Baron, D.; Barré, I.; Harvey, S.; Ramskin, L.; Colombini, M.; Naicker, N.; Kapiga, S.; Delany-Moretlwe, S.	Prevalence and Risk Factors of PrEP Use Stigma Among Adolescent Girls and Young Women in Johannesburg, South Africa and Mwanza, Tanzania Participating in the EMPOWER Trial.	AIDS and Behavior	-	-	1573-3254 1090-7165	10.1007/s10461-022-03721-6	https://www.proquest.com/scholarly-journals/prevalence-risk-factors-prep-use-stigma-among/docview/2732898256/se-2?accountid=8113	Adolescent girls and young women (AGYW) in sub-Saharan Africa may benefit from pre-exposure prophylaxis (PrEP), yet stigma may limit PrEP acceptance and continuation. We examined factors associated with PrEP use stigma among 307 participants of the EMPOWER trial (2016-2018), an unblinded randomized controlled trial among HIV-negative, AGYW, aged 16-24, in South Africa and Tanzania. The 6-item, brief-PrEP use stigma scale (B-PSS) had high internal reliability. At the end of the trial, 34.2% of study participants reported any PrEP use stigma. Three latent classes were observed, reflecting low (46.9%), medium (31.9%), and high (21.2%) reported PrEP use stigma. Disclosure of PrEP use to sexual partner and belief that PrEP prevents HIV were associated with less reported PrEP use stigma. Conversely, participants who reported fear and shame about people living with HIV were more likely to report PrEP use stigma. Our validated tool and findings will enable practitioners to identify AGYW at high risk of PrEP use stigma who may benefit from additional support.Pan African clinical trials registry PACTR202006754762723, 5 April 2020, retrospectively registered. Article	2022	Murphy M.; Sosnowy C.; Rogers B.; Napoleon S.; Galipeau D.; Scott T.; Tao J.; Berk J.; Clarke J.; Nunn A.; Chan P.A.	Defining the Pre-exposure Prophylaxis Care Continuum Among Recently Incarcerated Men at High Risk for HIV Infection: Protocol for a Prospective Cohort Study	JMIR Research Protocols	-	-	19290748	10.2196/31928	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124988046&doi=10.2196%2f31928&partnerID=40&md5=6cba66b012ece56f8a83e8f313750ab2	Background: HIV disproportionately impacts criminal justice–involved individuals, including men who experience incarceration. Men make up the vast majority of those experiencing incarceration as well as those newly diagnosed with HIV infection. Pre-exposure prophylaxis (PrEP) is a highly effective biomedical intervention that significantly reduces the risk of HIV acquisition. However, implementation in criminal justice systems is limited. Little is known about effective PrEP implementation and use in this unique public health context. Objective: The aim of this study is to characterize the experience of implementing PrEP clinical care in a criminal justice setting for men vulnerable to HIV acquisition. Methods: This article describes a PrEP care continuum for men experiencing incarceration who are at increased risk of HIV acquisition, which can help conceptualize approaches to evaluating PrEP implementation. Results: The outlined study will enroll 100 men experiencing incarceration at high risk for HIV acquisition prior to release into the community. The goal is to initiate PrEP prior to release and link individuals to PrEP providers in the community, capturing barriers and facilitators to PrEP use during this uniquely vulnerable time period for HIV acquisition. Conclusions: Based on the proposed care continuum and what is known about HIV risk and prevention efforts in the criminal justice context, we outline key future research efforts to better understand effective approaches to preventing HIV acquisition among this vulnerable population. The described approach presents a powerful public health opportunity to help end the HIV epidemic. ©Matthew Murphy, Collette Sosnowy, Brooke Rogers, Siena Napoleon, Drew Galipeau, Ty Scott, Jun Tao, Justin Berk, Jennifer Clarke, Amy Nunn, Philip A Chan. Article	2022	Murphy, Dean; Philpot, Steven; Brown, Graham; Prestage, Garrett	Domestic mobility and experiences of disconnection from sexual health care among gay and bisexual men in Australia: insights from a qualitative study.	Sexual Health	-	-	1449-8987	10.1071/SH21191	https://dx.doi.org/10.1071/SH21191	Background Previous research on mobility and HIV acquisition among gay and bisexual men (GBM) has focused on: (1) changed sexual practices in the context of travel; and (2) the association between migration and increased HIV risk. To date, little attention has been given to continuity of sexual health and HIV-prevention services in the context of relocating between different cities or regions within the same country. Methods Drawing on in-depth interviews with 17 GBM recently diagnosed with HIV, we explored these men's access to sexual health care in the period prior to diagnosis. Results At least five of these 17 men's accounts provided examples of becoming disconnected from sexual health care because of mobility within Australia. For some men, this disconnection from care also included loss of access to pre-exposure prophylaxis (PrEP). In all these men's accounts, reconnection with services only came about at the time of seeking the HIV test associated with their diagnosis. The fact that men who had previously been well connected to sexual health services (as indicated by early uptake of PrEP, or regular HIV/STI testing) did not easily access similar services after relocating suggest that there are other factors - such as the social and physical environment - that have an important bearing on retention in sexual health care. Conclusions There is a need for more comprehensive data collection related to mobility in order to ascertain its relative importance. Regarding policy and practice, there are also opportunities for a more formalised process for interstate referral of clients of sexual health services. Article	2022	Murphy, Emma Chew; Danvers, Antoinette; Zamudio, Andrés Ramírez; Avila, Karina; Proehl, Meghan; Gonzalez-Argoti, Tatiana; Mantell, Joanne E; Bauman, Laurie J; Dolan, Siobhan M	"Being able to do whatever you wanna do as a woman is important:" a qualitative exploration of contraception as a frame of reference for HIV prevention with PrEP	Reproductive Health	-	-	1742-4755	10.1186/s12978-022-01393-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8991476	BACKGROUND: Use of HIV PrEP (pre-exposure prophylaxis) is a strategic tool in the effort to end the HIV epidemic. 20% of new HIV infections in the US are among cis-gender women, yet they comprise only 5% of all PrEP users. Black women disproportionately bear the burden of new HIV acquisition and accounted for almost 60% of new HIV diagnoses among women in 2018. Increasing understanding and uptake of PrEP among women at risk of HIV acquisition in alignment with their reproductive values and preferences is key to increasing PrEP uptake and decreasing HIV burden in this population. OBJECTIVE: This study examines how experiences with contraception among women of color shape their perceptions and preferences regarding HIV PrEP to inform counseling that aligns with their reproductive values. METHODS: Women aged 18-45 who self-identified as Black or Latina were recruited at an academic medical center in the Bronx from June 2018 to July 2019. We enrolled 30 participants seeking family planning care (10), prenatal care (10), or care for sexually transmitted infections (10). Participants completed a brief written survey assessing their risk of HIV acquisition. Semi-structured, face-to-face interviews were then audio-recorded, transcribed, and entered into Dedoose. Grounded theory and constant comparison approaches were used to analyze the data. RESULTS: Twenty-one participants (70%) screened positive for HIV acquisition risk. Four had received information on PrEP from a medical provider prior to the interview. Three themes emerged from the qualitative analysis: (1) Similar to oral contraception, women conceptualized PrEP as a "daily pill" to support their reproductive health; (2) Women perceived PrEP as a tool to support autonomy and pleasure in their sexual health; (3) Like birth control, women desired multiple delivery options for HIV prophylaxis. CONCLUSIONS: Contraception may serve as a frame of reference when counseling about PrEP among cis-women at risk of acquiring HIV. Our study suggests that this approach re-contextualizes counseling on PrEP within a sex-positive framework that prioritizes pleasure, safety, and autonomy as integral to sexual and reproductive wellness. Consideration of historically marginalized women's experiences with contraception and reproductive values may facilitate their use of PrEP. Article	2022	Murray, Laura R.; Brigeiro, Mauro; Monteiro, Simone	A retreat from human rights? A reflection on sex work's place in contemporary HIV prevention.	Global Public Health	-	-	1744-1706 1744-1692	10.1080/17441692.2021.1896762	https://pubmed.ncbi.nlm.nih.gov/33736567/	In 2012, the World Health Organization guidelines for HIV prevention recommended the decriminalisation of sex work as their number one good practice. Although human rights language played a key role in the international scientific and activist endorsement of the WHO policies, since then there have been few initiatives in terms of advancing the kinds of structural and political changes endorsed. In this Commentary, we reflect on sex work's place in the broader field of the biomedicalization of responses to HIV. The analysis is based on literature reviews and our research trajectories, including preliminary results from a qualitative study on the implementation of PrEP in Rio de Janeiro, Brazil. We argue that sex workers occupy an ambiguous and less visible role in current AIDS policies, and that such policies are increasingly characterised by their prioritisation of biomedical approaches over structural factors. These shifts should be understood as part of a broader, global hegemony of clinical responses to HIV prevention and the continuation of a neoliberal discourse around human rights, without adequate investment in the material conditions necessary to guarantee these rights. African Journal of AIDS Research	-	-	1727-9445	10.2989/16085906.2022.2138474	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9983781	We examined men's influence on women's interest in biomedical HIV prevention during pregnancy and breastfeeding through structured questionnaires and focus group discussions with currently or recently pregnant and breastfeeding (P/BF) women (n = 65), men with P/BF partners (n = 63) and mothers/mothers-in-law of P/BF women (n = 68) in eastern and southern Africa. Data were transcribed, coded and summarised into analytical memos. Men were depicted by most participants as joint decision-makers and influencers of women's use of HIV prevention. Cultural and religious norms depicting men as heads, breadwinners and protectors of the family were cited to legitimise their involvement in decision-making. Male partner education and engagement were recommended to garner their support in women's HIV prevention. This study elucidates how P/BF women's ability to prevent HIV is shaped by traditional and contemporary gender norms in social settings and locations where the study was conducted. Findings may aid intervention design to engage men for P/BF women's effective use of microbicide and oral PrEP. Health Care Worker Perspectives of HIV Pre-exposure Prophylaxis Service Delivery in Central Uganda	Frontiers in Public Health	-	-	22962565	10.3389/fpubh.2022.658826	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128486577&doi=10.3389%2ffpubh.2022.658826&partnerID=40&md5=c9220c613be78cad9a131da16b3e31fb	Background: Scale-up of HIV pre-exposure prophylaxis (PrEP) services in Uganda is ongoing. However, health care workers (HCWs) may not be aware of PrEP nor what offering this service entails. We explored the impact of standardized HCW training on the knowledge and perspectives of PrEP service delivery in Uganda. Methods: We recruited HCWs from facilities that offered HIV-related services in Central Uganda. Using the Uganda Ministry of Health curriculum, we trained HCWs on PrEP services. We collected data about PrEP knowledge, preparedness, and willingness to deliver PrEP to multiple key populations before the training, immediately after the training, and >6 months later (exit). We additionally conducted 15 qualitative interviews after the exit survey. Quantitative data were analyzed by Fisher exact test, while qualitative interview data were analyzed inductively. Results: We recruited 80 HCWs from 35 facilities in urban (N = 24, 30%), peri-urban (N = 30, 37%), and rural (N = 26, 33%) areas. Most HCWs were nurse counselors (N = 52, 65%) or medical/clinical officers (N = 15, 18%). Surveys indicated that awareness of PrEP increased after the training and remained high. Knowledge of PrEP (i.e., as an effective, short-term antiretroviral medication to use before HIV exposure for people at high risk) generally increased with training, but significant gaps remained, and knowledge decreased with time. Most HCWs recommended PrEP for female sex workers and HIV serodifferent couples, as well as other key populations. We observed an increase in the number of HCW who felt their facility was prepared to cater for HIV prevention and provide PrEP, but this view was not universal. HCWs believed in PrEP effectiveness and embraced it as an additional HIV prevention method. Concerns included patient adherence and behavioral risk compensation. HCWs noted challenges in PrEP delivery in terms of inadequate clinic preparedness, infrastructure, staff capacity, and poor attitudes toward key populations by untrained health workers. They felt further training was needed to ensure a smooth scale-up of services without stigmatization. Conclusions: Standardized training improved knowledge, willingness, and preparedness to offer PrEP services among most HCWs in Central Uganda. Ongoing training will be needed to optimize PrEP delivery services and expand delivery to levels needed for population-level impact. Reaching transgender populations in Zambia for HIV prevention and linkage to treatment using community-based service delivery	Journal of the International AIDS Society	-	-	17582652	10.1002/jia2.25995	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139791840&doi=10.1002%2fjia2.25995&partnerID=40&md5=6e253dec6429c3d41621b41cbc138645	Introduction: Transgender and gender-diverse communities in Zambia are highly vulnerable and experience healthcare differently than cisgender persons. The University of Maryland, Baltimore (UMB) supports projects in Zambia to improve HIV case-finding, linkage and antiretroviral treatment (ART) for Zambia's transgender community. We describe programme strategies and outcomes for HIV prevention, testing and ART linkage among transgender communities. Methods: UMB utilizes a differentiated service delivery model whereby community health workers (CHWs) recruited from key populations (KPs) reach community members through a peer-to-peer approach, with the support of local transgender civil society organizations (CSOs) and community gatekeepers. Peer CHWs are trained and certified as HIV testers and psychosocial counsellors to offer counselling with HIV testing and prevention services in identified safe spaces. HIV-negative people at risk of HIV infection are offered pre-exposure prophylaxis (PrEP), while those who test positive for HIV are linked to ART services. CHWs collect data using the standardized facility and community tools and a dedicated DHIS2 database system. We conducted a descriptive analysis examining HIV testing and prevention outcomes using proportions and comparisons by time period and geographic strata. Results: From October 2020 to June 2021, across Eastern, Lusaka, Western and Southern Provinces, 1860 transgender persons were reached with HIV prevention messages and services. Of these, 424 (23%) were tested for HIV and 78 (18%) tested positive. Of the 346 HIV-negative persons, 268 (78%) eligible transgender individuals were initiated on PrEP. ART linkage was 97%, with 76 out of the 78 transgender individuals living with HIV initiating treatment. Programme strategies that supported testing and linkage included peer CHWs, social network strategy testing, same-day ART initiation and local KP CSO support. Challenges included non-transgender-friendly environments, stigma and discrimination, the high transiency of the transgender community and the non-availability of transgender-specific health services, such as hormonal therapy. Conclusions: Peer KP CHWs were able to reach many members of the transgender community, providing safe HIV testing, PrEP services and linkage to care. Focusing on community gatekeepers and CSOs to disburse health messages and employ welcoming strategies supported high linkage to both PrEP and ART for transgender people in Zambia. © 2022 The Authors. Article	2022	Mwongeli, Nancy; Wagner, Anjuli D.; Dettinger, Julia C.; Pintye, Jillian; Brown Trinidad, Susan; Awuor, Merceline; Kimemia, Grace; Ngure, Kenneth; Heffron, Renee A.; Baeten, Jared M.; Mugo, Nelly; Bukusi, Elizabeth A.; Kinuthia, John; Kelley, Maureen C.; John-Stewart, Grace C.; Beima-Sofie, Kristin M.	"PrEP Gives the Woman the Control": Healthcare Worker Perspectives on Using pre-Exposure Prophylaxis (PrEP) During Pregnancy and Postpartum in Kenya.	Journal of the International Association of Physicians in AIDS Care	-	-	2325-9582 2325-9574	10.1177/23259582221111068	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9251967	Background: Pregnant and postpartum women in high HIV prevalent regions are at increased HIV risk. Oral pre-exposure prophylaxis (PrEP) can decrease HIV incidence reducing infant HIV infections. Understanding healthcare worker (HCW) beliefs about PrEP prior to national roll-out is critical to supporting PrEP scale-up. Methods: We conducted 45 semi-structured interviews among a range of HCW cadres with and without PrEP provision experience purposively recruited from four clinics in Kenya to compare their views on prescribing PrEP during pregnancy and postpartum. Interviews were analysed using a conventional content analysis approach to identify key influences on PrEP acceptability and feasibility. Results: All HCWs perceived PrEP as an acceptable and feasible HIV prevention strategy for pregnant and postpartum women. They believed PrEP meets women's needs as an on-demand, female-controlled prevention strategy that empowers women to take control of their HIV risk. HCWs highlighted their role in PrEP delivery success while acknowledging how their knowledge gaps, concerns and perceived PrEP implementation challenges may hinder optimal PrEP delivery. Conclusion: HCWs supported PrEP provision to pregnant and postpartum women. However, counseling tools to address risk perceptions in this population and strategies to reduce HCW knowledge gaps, concerns and perceived implementation barriers are required. Article	2022	Nacht, Carrie L.; Felner, Jennifer K.; Muthuramalingam, Sandhya; Towner, William; Ling Grant, Deborah; Martos, Alexander; Chang, John M.; Hechter, Rulin; Storholm, Erik D.	Barriers and Opportunities to Improve the Implementation of Patient Screening and Linkage to Pre-Exposure Prophylaxis in Primary Care.	Journal of Clinical Research in HIV AIDS and Prevention	-	-	2324-7339	10.14302/issn.2324-7339.jcrhap-22-4371	https://pubmed.ncbi.nlm.nih.gov/37841674/	Although pre-exposure prophylaxis (PrEP) is highly effective at preventing HIV infection, only around 25% of at-risk individuals in the United States have accessed a prescription. One way to increase PrEP uptake is through the sexual health screening of patients and linkage to PrEP in primary care settings. The objective of this analysis was to assess the barriers and implementation strategies during a screening and linkage to PrEP pilot intervention. Primary care patients were screened for PrEP indication during routine primary care visits. Of the 1,225 individuals screened, 1.8% (n=22) were eligible for PrEP and from those, 77.3% (n=17) attended the specialist appointment and were prescribed PrEP. Primary care patients (n=30) and providers (n=8) then participated in semi-structured interviews assessing their experience with the pilot intervention. Using an applied thematic analytic approach, patients and providers identified barriers and related improvement strategies that could be classified into four main categories: 1) Financial Barriers: Individual- vs. Clinic-level Considerations 2) The Role of Stigma, Discomfort, and Cultural Factors 3) Logistical Hurdles and Streamlining the Intervention, and 4) The Lack of PrEP Knowledge and the Need for Education. Findings support the acceptability and feasibility of screening for PrEP in primary care along with appropriate implementation strategies. This study suggests that because of the high volume of patients seen in primary care, sexual health screenings and linkage to PrEP interventions have the potential to reduce new incident HIV infections among diverse sexual minority men. Article	2022	Nakamanya S.; Kawuma R.; Kibuuka D.; Kusemererwa S.; McCormack S.; Ruzagira E.; Seeley J.	Assessing acceptability of pre-exposure prophylaxis (PrEP) among participants in an HIV vaccine preparedness study in southwestern Uganda	PLOS One	-	-	19326203	10.1371/journal.pone.0271104	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135420474&doi=10.1371%2fjournal.pone.0271104&partnerID=40&md5=eb43d7fd4a0d032cfa547b4fa5fed637	Background Daily oral pre-exposure prophylaxis (PrEP) use is highly effective against HIV infection. However, the uptake of PrEP among individuals at high-risk of HIV acquisition in sub-Saharan Africa varies because of availability and acceptability. We assessed the acceptability of PrEP among participants in a prospective HIV vaccine preparedness study in Masaka, southwestern Uganda. Methods From November 2018 to August 2019, 20 participants (10 female) were purposively selected for in-depth interviews (IDIs) at 3 and 9 months' post-enrolment in the vaccine preparedness study. Four focus group discussions (FGD) (two among men) were conducted with 29 individuals categorized as: younger (18-24 years) men, younger (18-24 years) women, older (≥30 years) men, and older (≥30 years) women. Apart from IDI specific questions on recent life history including work experience, relationship history and places lived, topics for IDIs and FGDs included knowledge of HIV, perceptions of HIV risk (including own risk), knowledge of and use of PrEP. The Theoretical Framework of Acceptability was used to structure a thematic framework approach for data analysis. Results Participants understood that PrEP was an oral pill taken daily by HIV negative individuals to prevent acquisition of HIV. Overall, interest in and acceptability of PrEP was high, more than half expressed positivity towards PrEP but were not ready to initiate taking it citing the burden of daily oral pill taking, related side effects, stigma and distrust of PrEP. Fourteen participants (from IDI and FGD) initiated PrEP, although some (one FGD and two IDI participants) stopped taking it due to side effects or perceived reduced risk. Conclusion We observed a keen interest in PrEP initiation among our study participants. However, a limited understanding of PrEP and associated concerns impeded uptake and sustained use. Hence, interventions are needed to address end-user challenges to increase uptake and support adherence. © 2022 Nakamanya et al. Article	2022	Nakelsky S.; Moore L.; Garland W.H.	Using evaluation to enhance a pre-exposure prophylaxis (PrEP) social marketing campaign in real time in Los Angeles County, California	Evaluation and Program Planning	-	-	1497189	10.1016/j.evalprogplan.2021.101988	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113608683&doi=10.1016%2fj.evalprogplan.2021.101988&partnerID=40&md5=39643e30803d0f5afdf70ef66add9d9f	Objective: To describe the application of a formative evaluation conducted concurrently with implementation of a public health social marketing campaign to allow for substantive changes to the campaign messaging to subsequently improve acceptability. Method: A serial cross-sectional survey was used to evaluate the acceptability of two campaign messages among Black and Latino men who have sex with men (MSM) and transgender persons (TGP) in Los Angeles County from 2016 to 2018 through an online survey. Theinitial message, which presented the PrEP Protectors, a trio of superheroes embodying the power, knowledge, and protection pre-exposure prophylaxis (PrEP) can provide, was revised based on respondent feedback collected in the survey to increase specificity and clarity. An adjusted regression model tested whether the revised campaign message, (the initial campaign plus revised imagery and streamlined language) was predictive of increased campaign acceptability compared to the initial message alone. Results: A total of 911 eligible respondents were surveyed, most were MSM (83 %), <age 30 (62 %) and reported PrEP awareness (76 %). Compared to respondents shown theinitial campaign, those exposed to revised campaign were significantly more likely to report campaign acceptability (adjusted odds ratio (aOR) = 2.56; 95 % CI: 1.64–3.94). Conclusion: Conducting an evaluation concurrently with campaign implementation to test campaign acceptability facilitated responsive modifications to improve campaign messaging and acceptability to the priority populations. © 2021 Elsevier Ltd	Ending the HIV epidemic; Evaluation; Men who have sex with men; Pre-exposure prophylaxis; Social marketing; Transgender	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Nakiganda L.J.; Grulich A.E.; Poynten I.M.; Serwadda D.; Bazaale J.M.; Jin J.; Bavinton B.R.	Self-reported and pill count measures of adherence to oral HIV PrEP among female sex workers living in South-Western Uganda	PLOS One	-	-	19326203	10.1371/journal.pone.0277226	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141892637&doi=10.1371%2fjournal.pone.0277226&partnerID=40&md5=201f47499df80e45f2a1c33c3fc6b409	Background Female sex workers (FSWs) in Uganda are at high risk of HIV infection. Scaling up oral preexposure prophylaxis (PrEP) will reduce HIV incidence if high levels of adherence are maintained. This study evaluates PrEP adherence using clinic-based pill counts and self-reported measures, and factors associated with protective levels of adherence. Methods Participants were sex workers who had been taking PrEP for at least 5 months and were attending routine follow-up visits for PrEP care in fishing communities and along the Trans-African Highway. Participants who had a pill count showing at least 85% use since their last clinic visit and those who reported taking their PrEP every day in the last 5 months were categorised as having 'protective adherence'. Spearman's correlation and weighted kappa assessed the relationship between pill count and self-reported measures. Bivariate and multivariate logistic regression was used to determine factors associated with protective adherence by pill count. Results We recruited 524 FSWs, with a median age of 29 years (IQR 23–35). Participants were recruited from fishing communities and Trans-African Highway towns (n = 297, 56.7%, and n = 227, 43.0%). Nearly three quarters (n = 372, 71.0%) of women were estimated to have protective adherence based on pill count (i.e., a pill count of >85%) and 50.4% by self-report in last 3 months. There was a strong positive association between self-reported measures and pill count measures (rest = 0.6453, 95% CI = 0.5924–0.6927) and a moderate agreement between self-reported measures and pill count measures, κ = 0.544 (95%CI = 0.4869–0.6011, p < 0.001). Factors associated with protective adherence included being aged 35 years or older (aOR = 2.40, 95% CI = 1.17–4.86), living in a fishing community (aOR = 1.45, 95% CI = 0.62–3.38), and having an STI in last 3 months (aOR = 1.64, 95% CI = 1.07–2.49). Conclusion Our findings indicate that PrEP-experienced FSWs attending clinical follow-up visits reported high protective levels of oral pre-exposure prophylaxis, as measured by both pill count and self-reported measures, and a moderate agreement between pill count and self-reported measures. © 2022 Nakiganda et al. Article	2022	Nazli A.; Garner A.; Gokengin D.	Awareness of HIV pre-exposure prophylaxis among men who have sex with men using apps for sexual encounters in Turkiye	International journal of STD & AIDS	-	-	9564624	10.1177/09564624221126867	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138258138&doi=10.1177%2f09564624221126867&partnerID=40&md5=55070a42bcd916dd27845c7acce83dfd	Background: New HIV diagnoses are rising in Turkiye. Men who have sex with men (MSM) are estimated to be the main driver of the epidemic. Pre-exposure prophylaxis (PrEP) was proven to be effective in reducing new HIV diagnoses and PrEP recently became available in Turkiye. Objective: To assess awareness of and willingness to use PrEP and the level of off-licence use among MSM. Methods: An anonymous self-completed questionnaire was sent out over the Hornet Gay Social Network from December 2019 to February 2020, available in Turkish and Arabic. It included 20 questions on HIV and STI testing, PrEP awareness, PrEP use, willingness to use, chemsex and sexual happiness level. Results: Overall 4761 respondents who responded to more than 1/3 of the questions were eligible for analyses; 5.5% was Arabic speaking. The mean age was 30.5 years, 31.4% had never tested for HIV, 40.5% knew what PrEP was, the most common source of knowledge was the internet (44.5%), 2.5% (120) had used PrEP in the last 12 months and 1.7% (83) was current users. PrEP users had accessed drugs over the internet (47.6%), pharmacy (23%), and friends (13.8%). Almost 40% were willing to use PrEP in the following 6 months. Younger and Arabic speaking respondents had lower rates of HIV testing (p =.001) and lower awareness for PrEP than comparators (p =.004). Conclusion: Awareness and willingness to use PrEP is high among MSM in Turkiye. The recent availability of PrEP in the country is a big step forward in terms of prevention. © The Author(s) 2022.	apps for sexual encounters; awareness; HIV; men who have sex with men; preexposure prophylaxis; PrEP	English	United Kingdom	Western and Central Europe and North America	Turkey	Western and Central Europe and North America	NA	NA	Quantitative

However, its scale-up in resource-limited settings remains suboptimal. This paper seeks to describe PrEP initiation and continuation among key populations in Cameroon.Methodology:From June 2019 through October 2020, we collected routine program data on PrEP uptake and continuation among female sex workers (FSWs) and men who have sex with men (MSM) in the Continuum of prevention, care and treatment of HIV/AIDS with Most-at-risk Populations (CHAMP) program in Cameroon. PrEP was offered to clients who tested negative for HIV and were assessed to potentially benefit from PrEP. Using survival analysis, we identified factors associated with PrEP discontinuation over time with significance set at 5%.Results:Overall, 27,750 clients were sensitized for PrEP of whom 3,138 persons were eligible to start PrEP and 1,409 (45%; FSW: 691 and MSM: 718) initiated PrEP. The PrEP continuation rate was 37% at 3 months, 28% at 6 months and 19% at 12 months. PrEP discontinuation was significantly higher among FSW than MSM adjusted hazard ratio (aHR) 1.5 (95% CI: 1.2 to 1.9) in Yaounde aHR 1.5 (95% CI: 1.2 to 1.9) and Bafoussam/Bertoua aHR 3.1 (2.2–4.5) relative to Douala. Discontinuation was lower among those with moderate aHR 0.3 (0.3–0.4) or good adherence aHR 0.4 (0.3–0.6) compared with poor adherence (all P < 0.001).Conclusion:Differentiated approaches to deliver PrEP, create demand, and provide more intensive support for adherence and continuation may support scale-up of PrEP in Cameroon for equitable and prolonged impact on HIV prevention. Theses and Dissertations	2022	Nolan, Anne M; Landovitz, Raphael J; Le, Mylinh H; Grinstein, Beatriz; Freedberg, Kenneth A; McCauley, Marybeth; Wattanamungkol, Nattanicha; Cohen, Myron S; Ciaranello, Andrea L; Clement, Meredith E; Reddy, Krishna P; Hyle, Emily P; Pabani, A Dawd	Cost-Effectiveness of Long-Acting Injectable HIV Preexposure Prophylaxis in the United States : A Cost-Effectiveness Analysis	-	-	University of California	-	1056-8751	https://doi.org/10.7326/m21-1548	https://escholarship.org/uc/item/4c38f2gh	BackgroundThe HIV Prevention Trials Network (HPTN) 083 trial demonstrated the superiority of long-acting injectable cabotegravir (CAB-LA) compared with oral emtricitabine-tenofovir disoproxil fumarate (F/TDF) for HIV preexposure prophylaxis (PrEP).ObjectiveTo identify the maximum price premium (that is, greatest possible price differential) that society should be willing to accept for the additional benefits of CAB-LA over tenofovir-based PrEP among men who have sex with men and transgender women (MSM/TGW) in the United States.DesignSimulation, cost-effectiveness analysis.Data sourcesTrial and published data, including estimated HIV incidence (1.32, 1.33, and 0.26 per 100 person-years for off-PrEP, generic F/TDF and branded emtricitabine-tenofovir alafenamide (F/TAF), and CAB-LA effectiveness (86%), quality-adjusted life-years (QALYs), and costs (2020 U.S. dollars).Target population and settingHypothetical cohort of 1 million U.S. MSM/TGW, representing the estimated 2 target populationUS 760 MSM/TGW at very high risk for HIV (VHR).Time horizon10 years.Perspectivehealth-care system.InterventionCAB-LA versus generic F/TDF or branded F/TAF for HIV PrEP.Outcome measuresPrimary transmissions, quality-adjusted life-years (QALYs), costs (2020 U.S. dollars), incremental cost-effectiveness ratios (ICERs).U.S. dollars per QALY), maximum price premium for CAB-LA versus tenofovir-based PrEP.Results of base-case analysisCompared with generic F/TDF (or branded F/TAF), CAB-LA increased life expectancy by 29 000 QALYs (29 000 QALYs) among those at VHR. Branded F/TAF cost more per QALY gained than generic F/TDF compared with no PrEP. At 10 years, CAB-LA could achieve an ICER of at most $100 000 per QALY compared with generic F/TDF at a maximum price premium of $2700 per year over generic F/TDF (CAB-LA price <$4100 per year).Results of sensitivity analysisIn a PrEP-eligible population at high risk for HIV, rather than at VHR (n = 1 906 800; off-PrEP incidence: 1.54 per 100 person-years), CAB-LA could achieve an ICER of at most $100 000 per QALY versus generic F/TDF at a maximum price premium of $1100 per year over generic F/TDF (CAB-LA price <$1500 per year).LimitationsEscherichia clinical and economic benefits of averting future transmissions.ConclusionEffective oral PrEP limits the additional price society should be willing to pay for CAB-LA.Primary funding sourcesFHI 360, Eunice Kennedy Shriver National Institute of Child Health and Human Development, National Institute of Allergy and Infectious Diseases, National Heart, Lung, and Blood Institute, National Institute on Drug Abuse, the Reach HIV Scholar Award, and the Steve and Deborah Gorlin MGH Research Scholars Award. Tenofovir-Diphosphate in Dried Blood Spots vs Tenofovir in Urine/Plasma for Oral Preexposure Prophylaxis Adherence Monitoring	Open Forum Infectious Diseases	10.1093/ofid/ofac405	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133397565&doi=10.1093%2Fofid%2Fofac405&partnerID=40&md5=e900c6ca42ca4fc3b0487c1925e6dcc	Tenofovir-Diphosphate in Dried Blood Spots vs Tenofovir in Urine/Plasma for Oral Preexposure Prophylaxis Adherence Monitoring	23280957	10.1093/ofid/ofac405	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133397565&doi=10.1093%2Fofid%2Fofac405&partnerID=40&md5=e900c6ca42ca4fc3b0487c1925e6dcc	Background: Tenofovir-diphosphate (TFV-DP) measured in dried blood spots (DBS) and tenofovir (TFV) measured in urine/plasma have been used to measure pre-exposure prophylaxis (PrEP) adherence. However, there are limited data comparing these 3 metrics and their appropriate use for PrEP adherence monitoring. Methods: We collected DBS, urine, and plasma samples from HIV-negative adult participants (≥18 years) at risk of acquiring HIV who had started PrEP at least 6 weeks before enrollment. Participants were randomly assigned (1:1:1) to 6-month PrEP dispensing plus interim blood-based HIV testing (with banwanxi clinic visits), 6-month PrEP dispensing plus interim oral fluid-based HIV testing (with banwanxi clinic visits), or standard of care PrEP delivery (3-month PrEP dispensing with clinic visits every 3 months). We measured TFV-DP concentrations in DBS using liquid chromatography tandem mass spectrometry. Linear mixed-effects modeling was used to examine associations between drug concentrations and dosing time. Results: Among 28 participants, the median age was 33 years, and 12 (43%) were female. At steady state, 28h post-dose TFV-DP concentrations were 466, 778, and 1375 fmol/5 mm punch in the low, moderate, and perfect adherence group, respectively. Correlation was stronger between quantifiable TFV-DP and plasma TFV (r = 0.85) than between TFV-DP and urine TFV/creatinine (r = 0.71). Participants who reported missing ≥2 doses in the last month had 28h TFV-DP concentrations 1.9 (95% CI: 1.1–3.3) pmol/punch lower TFV-DP during the dosing phase. Each additional day after the last dose was associated with 43 fmol/5 mm punch lower TFV-DP (P < .07). Conclusions: TFV-DP levels in DBS provide valuable insight into both dosing recency and cumulative doses from variable adherence patterns. Our observed benchmark TFV-DP concentrations were slightly higher than prior predicted estimates based on convenience samples. © 2022 The Author(s). Article	2022	Ouattara, Louise A; Thurman, Andrea R; Jacot, Terry A; Cottrell, Mackenzie; Sykes, Craig; Blake, Kimberly; Fang, Xi; Ju, Susan; Yates, Nikolas C; Schwartz, Jill; Doncel, Gustavo F	Genital Mucosal Drug Concentrations and anti-HIV Activity in Tenofovir-Based PrEP Products: Intervaginal Ring vs. Oral Administration.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1966-7884	10.1097/QAI.0000000000002820	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9047697/	OBJECTIVE: To describe and compare systemic and local pharmacokinetics (PK) and cervicovaginal (CV) pharmacodynamics (PDy) of oral tenofovir diisoproxil fumarate (TDF) in combination with emtricitabine (FTC) with tenofovir (TFV) intervaginal ring (IVR). DESIGN: Phase I, randomized, parallel-group study. Women (n = 22) used TDF-FTC oral tablets daily or TFV IVR continuously and were assessed at baseline and 14 days. METHODS: TFV and FTC concentrations were measured in plasma, CV fluid (CVF), and CV tissue. TFV-diphosphate and FTC-triphosphate were assessed in CV tissue. In vitro PD antiviral activities of TFV and FTC (using in vivo concentration ranges) were modeled in the CVF and by infecting CV tissue explants ex vivo with HIV-1BaL. RESULTS: Adverse events (AEs) were more common with oral TDF-FTC use (P < 0.01). The median CVF TFV concentrations were 106 ng/mL after use of TFV IVR vs. 102 ng/mL for TDF-FTC. The median TFV and TFV-diphosphate concentrations in CV tissue were >1000-fold higher among IVR users. The median CVF FTC concentrations were 103 ng/mL. FTC and FTC-triphosphate were detected in all CV lavages from TDF-FTC users. HIV inhibitory activity of CVF increased significantly with treatment in both cohorts (P < 0.01) but was higher in TFV IVR users (P < 0.01). In vitro inhibition of tissue infection with ex vivo administration of TFV and FTC was dose dependent, with maximal efficacy achieved with 50 ng/mL TFV, 1 μg/mL FTC, and 0.1 μg/mL of TFV and FTC combined. CONCLUSIONS: Both products were safe and increased mucosal HIV inhibitory activity. In addition to systemic protection, oral TDF-FTC displays a PK/PD profile compatible with CV mucosal antiviral activity. TFV IVR reached in lower AEs, lower TFV plasma concentrations, higher TFV and lower TFV-DP concentrations, and greater anti-HIV activity in CVF. Article	2022	Ouassine Y.M.; Lydié N.; Velter A.	Pre-exposure prophylaxis in France: How many MSM are eligible and how much will it cost?	PLOS One	-	-	-	19526203	10.1371/journal.pone.0270016	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143136490&doi=10.1371%2Fjournal.pone.0270016&partnerID=40&md5=992a5876e3e12606d0da28b5e127ae	Background Pre-exposure prophylaxis (PrEP) was deliberately authorized in France in 2017 after a two-year probationary period. The fact that the estimated number of MSM eligible for PrEP is still unknown is a barrier to this transition such roll-out at the national level. The study aimed to estimate the number of MSM eligible for PrEP in France, and to evaluate the direct cost of its roll-out. Methods We used data from several sources including the Enquête Rapport au Sexe 2010-ERAS 2019 survey, the 2019 French population census from National Institute of Statistics and Economic Studies (INSEE), and the National Public Health Agency (Santé Publique France) 2010-2020 hospital database survey. We also used data from previous studies which estimated the proportion of MSM who had sex in the 12 months prior to the studies, and HIV prevalence in MSM in France. Furthermore, we used data on PrEP drug costs from the French public drug database and data on medical examinations costs from the IPERGAY study. Results For 2019, the number of HIV seronegative MSM in France who were sexually active in the previous 12 months was estimated at 398,015. Of these, 162,279 (95%CI: 139,595–185,241) and 106,045 (95%IC: 102311–108979) were eligible for PrEP, based on the Mersy score and on official French criteria, respectively. The overall estimated cost of PrEP roll-out in eligible MSM was estimated at €1,166,000,000 (95%CI: €1,003,000,000–€1,337,000,000) and €764,000,000 (95%CI: €736,000,000–€792,000,000) according to the Mersy score. Conclusions Our estimations will enable policy makers to make evidence-based decisions about PrEP roll-out in MSM in France. To accelerate the process, it is important to decentralize PrEP delivery, authorize general practitioners to write prescriptions, and promote this prevention tool through information campaigns. Article	2022	Ouyang J.; Zuoga S.D.; Haryparast Y.; Li X.; Rouly J.-P.; Chen Y.	SARS-CoV-2 pre-exposure prophylaxis: A potential COVID-19 preventive strategy for high-risk populations, including healthcare workers, immunodeficient individuals, and poor vaccine responders	Frontiers in Public Health	-	-	-	22962585	10.3389/fpubh.2022.945648	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136513391&doi=10.3389%2Ffpubh.2022.945648&partnerID=40&md5=e4d0b3d9912324c4d742d7d4d2ad6e39	The unprecedented worldwide spread of SARS-CoV-2 has imposed severe challenges on global health care systems. The roll-out and widespread administration of COVID-19 vaccines has been deemed a major milestone in the race to restrict the severity of the infection. Vaccines have as yet not entirely suppressed the relentless progression of the pandemic, due mainly to the emergence of new virus variants, and also secondary to the waning of pre-existing antibody titers over time. Encouragingly, an increasing number of antiviral drugs, such as remdesivir and the newly developed drug combination, Paxlovid (nirmatrelvir/ritonavir), as well as molnupiravir, have shown significant benefits for COVID-19 patient outcomes. Pre-exposure prophylaxis (PrEP) has been proven to be an effective preventive strategy in high-risk uninfected people exposed to HIV. Building on knowledge from what is already known about the use of PrEP for HIV disease, and from recently gleaned knowledge of antibody-and against COVID-19, we propose that SARS-CoV-2 PrEP, using specific antiviral and adjuvant drugs against SARS-CoV-2, may represent a novel preventive strategy for high-risk populations, including healthcare workers, immunocompromised individuals, and poor vaccine responders. In this review, we discuss the rationale for SARS-CoV-2 PrEP, and the drugs that may be used for SARS-CoV-2. In addition, we outline details of candidate anti-SARS-CoV-2 PrEP drugs, thus creating a framework with respect to the development of alternative and/or complementary strategies to prevent COVID-19, and contributing to the global armamentarium that has been developed to limit SARS-CoV-2 infection, severity, and transmission. Article	2022	Owens C.; Moran K.; Mongrella M.; Moskowitz D.A.; Mustanski B.; Macapagal K.	'We Very Inconvenient for Me": A Mixed-Method Study Assessing Barriers and Facilitators of Adolescent Sexual Minority Males Attending PrEP Follow-Up Appointments	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03313-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107614490&doi=10.1007%2Fs10461-021-03313-w&partnerID=40&md5=a360f2e3c1e1c7f39d5bf7a0f07588242	Researching PrEP retention in adolescent sexual minority men (ASMM) is critical to increasing persistence of PrEP in this priority population, yet this research is lacking. ASMM (N = 1413) completed a baseline survey for an online HIV prevention program between 2018 and 2020. Open- and closed-ended survey items identified their beliefs about attending 3-month PrEP follow-up appointments and examined the association of Andersen's Behavioral Model factors (predisposing, enabling, and need) and confidence to attend these appointments. Quantitative and qualitative findings show that perceived parental support is a salient factor in ASMM attending PrEP follow-up appointments. Participants did not want to have to go to the doctor and get bloodwork done (stressful), and qualitative findings elucidated rationales for this, such as perceptions that follow-ups might be time-consuming, costly, and could out their sexuality to their parents. This study suggests that parents are gatekeepers for ASMM to initiate and sustain the PrEP care continuum. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Pagkas-Bather J.; Duncan D.T.; Chen Y.-T.; Curoe J.; Del Vecchio N.; Mayer K.H.; Knox J.; Hanson H.; Eaves R.; Schneider J.A.	Sleep Disturbance is Associated with Missing PrEP Doses Among Young Black Sexual Minority Men in The N2 study	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03731-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131350247&doi=10.1007%2Fs10461-022-03731-1&partnerID=40&md5=a930c2778e62b2c14e8f91622d074a	PrEP uptake and adherence among young Black sexual minority men (YBSMM), has been sub-optimal. Multiple studies identified sleep as an important determinant of medication adherence, although it has not been examined with regard to PrEP among YBSMM. This study utilized data collected from HIV negative cisgender YBSMM in the Neighborhoods and Networks (N2) study in Chicago using PrEP-to-Y. Sleep quality was measured using the PSQI-9 and PrEP adherence questions were adapted from Reynolds et al., 2004. Bivariate and multivariable regression analyses were used to estimate associations between poor sleep and missing PrEP doses, controlling for relevant demographic and behavioral factors. YBSMM who reported poor sleep disturbance a moderate amount of time (aOR: 2.59 1.05 to 6.34; 95% CI) were more likely to miss taking PrEP because they had too many pills to take. Sleep quality is an overlooked determinant of medication adherence, and may negatively impact YBSMMs ability to consistently take PrEP. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Pagkas-Bather, Jude; Brewer, Russell; Bouris, Alida	Status-Neutral Interventions to Support Health Equity for Black Sexual Minority Men.	Current HIV/AIDS Reports	-	-	-	1548-3576 1548-3568	10.1007/s11904-022-00618-4	https://pubmed.ncbi.nlm.nih.gov/35794447/	PURPOSE OF REVIEW: Status-neutral care, a person-centered approach to healthcare not predicated on HIV serostatus, may improve health equity among Black sexual minority men (BSMM). We reviewed current status-neutral, HIV, and Pre-Exposure Prophylaxis (PrEP) interventions, and coded each for social-ecological focus and use of six principles-centered, (2) anti-stigma, (3) social support, (4) the social determinants of health (SDOH), (5) community engagement, and (6) multi-sectoral partnerships. RECENT FINDINGS: We reviewed 25 studies, of which 2 were status-neutral. Nineteen studies utilized person-centered approaches, with several employing BSMM peers. For SDOH, financial incentives and reducing clinic-level barriers to care improved cascade outcomes. Direct text messaging, anti-stigma, social support, community-engagement, and multi-sectoral partnerships also improved outcomes in some studies. Few status-neutral programs exist and additional research is needed to identify key intervention components and mechanisms of influence. Programs targeting SDOH and multiple social-ecological levels offer promise for providing holistic care to BSMM, while addressing HIV prevention and treatment and health equity. Article	2022	Pakov, I; Brindzhikova, E; Philipova, I; Terzieva, K; Gancheva, G	PRE-EXPOSURE PROPHYLAXIS (PREP) OF HIV INFECTION - A CRUCIAL TOOL FOR REDUCING THE BURDEN UPON THE PUBLIC HEALTH	Journal of IMAB	-	-	-	1312-773X	10.5272/jimab.2022284.4648	https://www.journal-imab-bg.org/issues-2022/issue4/vol28/issue4/pdf/4648.pdf	HIV is a major global public health problem.The in-creased access to effective prevention, diagnosis and treat-ment transformed HIV-infection into manageable chronic health condition.Our purpose was to assess the effective neces-sity of oral pre-exposure prophylaxis (PrEP) of HIV infec-tion.Material and Methods: CheckPoint Sofia (former Sexual Health Centre - Sofia) is a medical center for con-sultations, prevention, diagnostics of sexually transmitted infections (STIs) and HIV/AIDS. A retrospec-tive study was conducted on 410 consulted males (cisgender) (October 2020 to August 2022).Results: The mean age was 32 +/- 7.6 years (18-57 years) with prevalent ages <30 and 30-40 years (42% and 47%, respectively); Bulgarian citizens 98%, MSM (97%). The clients' profile revealed active sporting (10%), past STIs (26%), vaccinated for HBV (54%). No one of the sub-jects had chronic kidney disease and mandatory investiga-tions of renal functions at starting of PrEP revealed mean levels of urea and creatinine 4.9 +/- 1.42 mmol/L and 78 +/- 18.2 mu mol/L, respectively. On demand regimen (2+1+1 tablets) of PrEP was preferred at 91% and 15% switched to every-day receiving before the end of the first month. The HIV-1/2 Ag/Ab combo test was performed at 1, 3, 6 and 12 months after the start of PrEP and was negative in 576 cases in total. The data for safety of PrEP. It is notable that the increased STIs (syphilis, chlamydia and gonorrhea - 18%, 6% and 9%, respectively) - fact in accordance with global trends.Conclusion: PrEP is an effective prevention of HIV infection and deserves budgetary finance. The increase of STIs requires concrete preventive implementations. Article	2022	Parrales, A.J.; Permana, A.D.; Volpe-Zanutto F.; Amir M.N.; Vora L.K.; Tekko I.A.; Akhtewin N.; Wiher A.D.; Larrañeta E.; Donnelly R.F.	Ring inserts as a useful strategy to prepare tip-loaded microneedles for long-acting drug delivery with application in HIV pre-exposure prophylaxis	Materials and Design	-	-	-	2641275	10.1016/j.matdes.2022.111416	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142232176&doi=10.1016%2Fj.matdes.2022.111416&partnerID=40&md5=9c170e9f1f39b53c045e1824114aba999	The role of microneedle array patches (MAPs) and, in particular, dissolving MAPs in transdermal drug delivery has increased exponentially over the last decade. MAPs are able to form drug depots in the viable skin from where poorly soluble drugs dissolve for a long-acting fashion, showing promise in the management of multiple diseases. The manufacture of drug-loaded tips within dissolving MAPs is challenging, including the presence of bubbles in the baseplates and consequent lack of uniformity in microneedle formation and drug content. Here, we present a simple method based on ring inserts to produce tip-loaded MAPs using the antiretroviral drug cabotegravir sodium (CAB). The obtained MAPs presented a high uniformity in terms of microneedle formation, and a suitable insertion capability as per the mechanical characterisation performed. An optimisation based on design of experiments revealed that centrifugation parameters had a significant impact on the skin deposition of the MAPs in excised neonatal porcine skin using Franz cells, with values ranging from 62.24 ± 47.13 μg to 174.31 ± 81.39 μg of CAB. Pharmacokinetic studies carried out in rats evidenced the capacity of the MAPs to maintain therapeutic plasma levels of CAB for 14 days, with Tmax values reached between 5 and 8 days. © 2022 The Author(s)	Cabotegravir sodium; Dissolving microneedles; Human immunodeficiency virus-1; Long-acting; Pre-exposure prophylaxis; Ring inserts	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2022	Parikh U.M.; Mellors J.W.	How could HIV-1 drug resistance impact preexposure prophylaxis for HIV prevention?	Current Opinion in HIV and AIDS	-	-	-	17466308X	10.1097/COH.0000000000000746	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132951436&doi=10.1097%2FCOH.0000000000000746&partnerID=40&md5=bdb2fd90665a1698548f2f6f8ce8fca7	Purpose of review:To review current laboratory and clinical data on the frequency and relative risk of drug resistance and range of mutations selected from approved and investigational antiretroviral agents used for preexposure prophylaxis (PrEP) of HIV-1 infection, including tenofovir disoproxil fumarate (TDF)-based oral PrEP, dapivirine ring, injectable cabotegravir (CAB), islatravir, lenacapavir and broadly neutralizing antibodies (bnAbs).Recent findings:The genetic risk of HIV-1 resistance from PrEP with oral TDF/emtricitabine (FTC) or injectable CAB is low, underscoring the importance of maximizing the adherence for new target of HIV infection. By contrast, the dapivirine intravaginal ring does not appear to select nonnucleoside reverse transcriptase inhibitor resistance in clinical trial settings. Investigational inhibitors including islatravir, lenacapavir, and bNAbs are promising for use as PrEP due to their potential for sustained delivery and low risk of cross-resistance to currently used antiretrovirals, but surveillance for emergence of resistance mutations is more HIV-1 gene regions (gag, env) will be important as the same drugs are being developed for HIV therapy.SummaryPrEP is highly effective in preventing HIV infection. Although HIV drug resistance from PrEP use overall and toward future options is individuals who seroconvert on PrEP, the current risk is low and combined monitoring for the emergence of resistance and cross-resistance during product development, clinical studies, and product roll-out is advised to preserve antiretroviral efficacy for both treatment and prevention. © 2022 Lippincott Williams and Wilkins. Article	2022	Parikh, Uriel M; Koss, Catherine A; Mellors, John W	Long-Acting Injectable Cabotegravir for HIV Prevention: What Do We Know and Need to Know about the Risks and Consequences of Cabotegravir Resistance?	Current HIV/AIDS Reports	-	-	-	1548-3576	10.1007/s11904-022-00616-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9398548/	PURPOSE OF REVIEW: Cabotegravir is a potent integrase strand transfer inhibitor (INSTI) recently approved as a long-acting injectable formulation for HIV prevention (CAB-LA). We summarize what is known about the risk and consequences of CAB resistance in persons who acquire HIV while using CAB-LA for PrEP and in persons who have HIV that emerges while using CAB-LA after CAB-LA discontinuation. RECENT FINDINGS: The accumulation of multiple INSTI mutations is required for high-level cabotegravir resistance, and the same mutations can confer cross-resistance to dolutegravir, which is widely used for first-line antiretroviral therapy in low- and middle-income countries. Though CAB-LA was highly effective in preventing HIV, breakthrough infections did occur in trials of CAB-LA despite on-time injections, resulting in selection of single and combinations of INSTI resistance mutations. As CAB-LA is scaled-up, prompt HIV diagnosis to prevent resistance, and resistance monitoring could help preserve the effectiveness of INSTIs for both HIV treatment and prevention. Article	2022	Parmley L.E.; Harris T.G.; Chingombe I.; Mapingure M.; Mugurungi O.; Rogers J.H.; Gorbenn P.; Wu Y.; Samba C.; Musuka G.; Hakim A.J.	Engagement in the pre-exposure prophylaxis (PrEP) cascade among a respondent-driven sample of sexually active men who have sex with men and transgender women during early PrEP implementation in Zimbabwe	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25873	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124775554&doi=10.1002%2Fjia2.25873&partnerID=40&md5=1295457170361bdd0bfa3258d5351f56	Introduction: Zimbabwe is scaling up pre-exposure prophylaxis (PrEP) for key populations, including men who have sex with men (MSM) and transgender women (TGW). To assess implementation and inform HIV programming, we evaluated gaps in PrEP awareness, uptake and use, and correlates of awareness and uptake among a sample of MSM, TGW and female sex partners of MSM (SFM) in Harare and Bulawayo, Zimbabwe. Methods: Respondent-driven sampling was used to recruit 1194 MSM and 344 TGWQQ aged ≥18 to participate in a cross-sectional survey assessing HIV-related outcomes in 2019. Consenting participants completed questionnaires on socio-demographic information, sexual risk practices and engagement in HIV services and underwent HIV testing. Descriptive statistics were used to assess the PrEP cascade. Multiple logistic regression models were used to identify factors associated with PrEP awareness and uptake among HIV-negative participants. Data were unweighted as the sample size was sufficiently large to minimize bias. Results: Among HIV-negative participants, 1194 MSM and 344 TGWQQ, 1% (12/1194) and 2% (7/344), respectively, were current PrEP users. Of the 1182 current PrEP non-users, 84.7% (1002/1182) were aware of PrEP and 39.2% (393/1002) were willing to start PrEP, but most (71.1%) reporting never taking PrEP indicated they were willing to start PrEP. Awareness was high among PrEP-naïve participants (84.2%–89.2%) and fearing side effects (20.4%). Among those who had ever taken PrEP, 74.9% had taken PrEP in the last 6 months; of these, 42.4% had taken PrEP the day of or day preceding the survey. Side effects represented the most common (58.1%) reason for discontinuing PrEP. MSM (adjusted odds ratio aOR: 2.5, 95% confidence interval CI: 1.8–3.6) and TGW-QQ in Harare (aOR: 3.1, 95% CI 2.1–4.7), and TGW-QQ in Bulawayo (aOR: 2.4, 95% CI: 1.1–5.3) had higher awareness of PrEP than MSM in Bulawayo. Overall, TGW-QQ were more likely to have ever taken PrEP compared to MSM (aOR: 1.6, 95% CI: 1.01–2.4). Conclusions: Findings emphasize the need for tailored interventions to promote PrEP among key populations. As HIV programs in Zimbabwe continue to expand PrEP services, these data, including barriers to starting and continuing PrEP, can inform strategies to address gaps along the PrEP cascade. © 2022 The Authors. Article	2022	Parrish, Kelly C; Johnson, Hannah Z; Williams, Sheryl L	PrEP navigation continuum among men who have sex with men, trans women, and people with alternative gender identities in three California counties	Evaluation and Program Planning	-	-	-	01497189	10.1016/j.evalprogplan.2021.101998	https://www.proquest.com/scholarly-journals/prep-navigation-continuum-among-men-who-have-sex/docview/2653041643/se-2?accountid=9113	Strategies to reduce new HIV infections include pre-exposure prophylaxis (PrEP). Of the estimated over 221,000 Californians with an indication for PrEP, only 31,280 (14 %) were currently taking the medication as of 2019. Centers for Disease Control and Prevention Project PrIDE funds were used to support and develop California PrEP navigation programs. Data were collected among trans persons and men who have sex with men (MSM). An analysis of PrIDE-funded PrEP navigation service outcomes was conducted to highlight where continuum drop-off occurred and how it varied among priority populations. Quantitative service delivery data for PrEP navigation programs' activities conducted from October 1, 2015 to September 30, 2018 were collected across three county-level local health jurisdictions (LHJs) via standardized, agency-completed service delivery data collection tools. Analyses included frequencies and crosstabs. These variations were not tested statistically but highlight group-specific gaps in service delivery when implementing PrEP navigation within California. Continued systematic collection and analyses of PrEP continuum outcomes will allow programs to dynamically identify and address barriers to PrEP uptake & persistence. Article	2022	Patel N.; Blumenthal J.; Dubé M.P.; Hood A.; Bolan R.; Morris S.	Method of Calculating Renal Function Estimates Could Inappropriately Exclude Transgender Patients Receiving Gender-Affirming Hormone Therapy from Pre-Exposure Prophylaxis Eligibility	LGBT Health	-	-	-	23258292	10.1089/lgbt.2021.0219	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123820278&doi=10.1089%2Flgbt.2021.0219&partnerID=40&md5=c26e2989c4a4c9fbb19e087b79a417f7	Purpose: Despite the importance of reliable renal function estimation among the growing transgender population, research describing the variability of existing equations is scarce. Study objectives were to (1) quantify the range of renal function estimates that would be observed if different gender coefficients are used in the estimating equations, (2) compare estimates of renal function (creatinine clearance CLCR or estimated glomerular filtration rate eGFR) between users and nonusers of gender-Affirming therapies, and (3) quantify the proportion of subjects who would be misclassified by gender-based emtricitabine (FTC) and tenofovir disoproxil fumarate (TDF) dose adjustments. Methods: A retrospective analysis was performed among transgender PrEP users enrolled in a demonstration project at a community health center in Seattle, Washington, between 2012 and 2019. Estimates of CLCR and eGFR were calculated using the Cockcroft-Gault (CG) and CKD-EPI equations, respectively, on the three most commonly used estimating equations. Results: A total of 239 participants were evaluated. Median differences in renal function ranged from 13 to 22 mL/min based on which gender coefficient and equation were used. Regardless of the method used to compute renal function, there were significant differences between users and nonusers of gender-Affirming therapy. There were 17 (6.6%) participants where at least one of the methods would potentially render them ineligible to receive TDF/FTC for PrEP. Conclusions: Renal function estimates vary considerably with different estimating equations in the transgender population and are modified by use of gender-Affirming therapy. These variations could result in exclusion from drug therapies such as TDF/FTC for PrEP. © Copyright 2022, Mary Ann Liebert, Inc., publishers 2022. Article	2022	Patel P.; Kerzner M.; Reed J.B.; Sullivan P.S.; El-Sadr W.M.	Public Health Implications of Adopting HIV Pre-exposure Prophylaxis Programs for Virtual Service Delivery in the Context of the COVID-19 Pandemic: Systematic Review	JMIR Public Health and Surveillance	-	-	-	23692960	10.2196/37479	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129052578&doi=10.2196%2F37479&partnerID=40&md5=612dd7f9426d7dd7c3dab6b57051d89e	Background: The novel coronavirus disease (COVID-19) caused by SARS-CoV-2 threatens to disrupt global progress toward HIV epidemic control. Opportunities exist to leverage ongoing public health responses to mitigate the impacts of COVID-19 on HIV services, and novel approaches to care provision might help address both epidemics. Objective: As the COVID-19 pandemic continues, novel approaches to maintain comprehensive HIV prevention service delivery are needed. The aim of this study was to summarize the related literature to highlight adaptations that could address potential COVID-19–related service interruptions. Methods: We performed a systematic review and searched six databases, OVID/Medline, Scopus, Cochrane Library, CINAHL, ProQUEST, and Embase, for studies published between January 1, 2010, and October 26, 2021, related to recent technology-based interventions for virtual service delivery. Search terms included "telemedicine," "mobile health," "eHealth," "mHealth," "telecommunication," "social media," "mobile device," and "internet," among others. Of the 6683 abstracts identified, 1259 focused on HIV virtual service delivery, 120 of which were relevant for HIV pre-exposure prophylaxis (PrEP) and 19 of those focused on evaluations of interventions for the virtual service delivery of PrEP. Data from these 19 studies were extracted and synthesized. Results: We identified 19 studies that met the inclusion criteria. Of these, 16 (84%) were conducted in the United States, 2 (11%) in Asia, and 1 (5%) in Europe. Most studies (n=11, 58%) were published in 2021. Study designs included 5 (26%) cross-sectional surveys, 4 (21%) qualitative studies, 3 (16%) randomized controlled trials, 3 (16%) pre-post studies, 2 (11%) retrospective cohort studies, and 2 (11%) mixed methods studies. Most studies (n=11, 58%) were conducted among adolescent and young adult populations, and 5 (26%) were conducted among racial and ethnic minority populations. Technologies used for virtual service delivery included text messaging (n=6, 32%), videoconferencing (n=5, 26%), mobile apps (n=4, 21%), and social media platforms (n=4, 21%). Most studies (n=16, 84%) reported positive findings, including high levels of engagement, retention, and satisfaction with virtual service delivery. Conclusions: Virtual service delivery models for PrEP that can be leveraged for COVID-19 using the internet and social media for demand creation, community-based self-testing, telehealth platforms for risk assessment and follow-up, applications for support groups and adherence/appointment reminders, and applications for monitoring. Conclusions: Interventions in the virtual service provision of PrEP received before COVID-19 but have new relevance during the COVID-19 pandemic. The interventions we describe might strengthen HIV prevention service delivery during the COVID-19 pandemic and in the long run by ongoing traditionally hard-to-reach populations, reducing stigma, and creating a more accessible health care platform. These virtual service delivery platforms can mitigate the impacts of the COVID-19 pandemic on HIV services, which can be leveraged to facilitate COVID-19 pandemic control now and for future responses. © Prapna Patel, Michael Kerzner, Jason B Reed, Patrick Sean Sullivan, Wafaa M El-Sadr. Article	2022	Pattacini, Karla Cristina Silva; Baia-da-Silva, Djane Cheryt; Val, Fernando; Vallejos, Monica Santos; Cubas-Vega, Nadia; Silva-Neto, Alexandre Vilhena; Sampaio, Vanderson; Almeyer, Aline; Pecoits-Filho, Roberto; Moreira, Rodrigo Carvalho; Cardoso, Sandro Wagner; Moreira, Ronaldo L; Lobo, Jari Costa; Madruga, José Valdez; Kallas, Esper G; Alencastro, Paulo R; Hoagland, Brenda; Grinsztejn, Beatriz; Santos, Vaildilo Gonçalves Veloso; Lacerda, Marcus Vinicius Guimarães	Kidney function and daily emtricitabine/tenofovir disoproxil fumarate pre-exposure prophylaxis against HIV: results from the real-life multicentric demonstrative project PrEP Brazil.	AIDS Research and Therapy	-	-	-	1742-6405	10.1186/s12981-022-00437-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8863617/	BACKGROUND: Pre-Exposure Prophylaxis (PrEP) has demonstrated efficacy in the reduction of sexually transmitted HIV infections. The prolonged use of tenofovir disoproxil fumarate (TDF) and emtricitabine (FTC) co-formulations (TDF/FTC), however, may result in augmented risk of renal toxicity. We aimed to evaluate changes in the estimated Glomerular Filtrate Rate (eGFR) in a real-world population setting of participants enrolled in PrEP Brasil, a 48-week prospective, open-label, demonstration study to assess the feasibility of daily oral TDF/FTC used by men who have sex with men and transgender women at high-risk of HIV infection in Brazil. Methods: In this sub-study, eGFR was assessed by serial measurement of serum creatinine and eGFR with the Modification of Diet in Renal Disease Study (MDRD) formula on weeks 4, 12, 24, 36 and 48. Adherence to PrEP was assessed by dosing TDF concentration in dried blood spots at weeks 4 and 48, measured by liquid chromatography-tandem mass spectrometry assay. Results: Between December 2017 and December 2018, 1,251 participants were enrolled in PrEP Brasil, and 1,013 were included in this sub-study. Median age was 29 years (IQR 24–36). Caucasians ethnic background (53.9%), with BMI below 30 Kg/m2, without arterial hypertension. At screening, median eGFR was 93.4 mL/min/1.73 m2. At week 4 follow-up, 98 (23% of the study population) participants presented reductions in eGFR greater than 10 mL/min/1.73 m2 as compared to baseline eGFR, same as large as 59 mL/min/1.73 m2, but with no clinical outcomes (adverse events and renal adverse events) severe enough to demand TDF/FTC discontinuation. A negative relationship was observed between TDF blood levels and eGFR at weeks 4 (r = − 0.003; p = 0.01) and 48 (r = − 0.006; p < 0.01). CONCLUSIONS: These results suggest that the renal function profile in individuals on TDF/FTC may be assessed on week 4 and then only annually, allowing a more flexible medical follow-up in primary care centers. Article	2022	Phalkhe M.M.; Borges S.; Parekh C.; Kerrigan D.; Kinnard E.N.; Reed S.; Cohen M.H.; Sosanya O.; Sheth A.N.; Adimora A.A.; Cocohoba J.; Gaparin L.; Golub E.T.; Vaughn M.; Gutierrez J.I., Jr.; Fischl M.A.; Alcaide M.; Metsch L.R.	Long-Acting Injectable ART and PrEP Among Women in Six Cities Across the United States: A Qualitative Analysis of Who Would Benefit the Most	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03483-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117003182&doi=10.1007%2Fs10461-021-03483-7&partnerID=40&md5=216d30ad0e667e0f8405745e0dd0756	Long-acting injectable (LAI) modalities have been developed for ART and PrEP. Women face unique barriers to LAI use yet little research has examined women's perceptions of potential LAI HIV therapy candidates. We conducted 89 in-depth interviews at six Women's Interagency HIV Study (WIHS) sites with women living with HIV (n = 59) and HIV-negative women (n = 30) from 2017 to 2018. Interviews were recorded, transcribed, and analyzed using thematic content analysis. Participants identified specific sub-populations who could most benefit from LAI over daily pills: (1) young people; (2) women with childcare responsibilities; (3) people with adherence-related psychological distress; (4) individuals with multiple sex partners; and (5) people facing structural insecurities such as homelessness. Women are underserved by current HIV care options and their perspectives are imperative to ensure a successful scale-up of LAI PrEP and LAI ART that prioritizes equitable access and benefit for all individuals. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Phillips, Morgan M; Perez-Brumer, Ameya	Promise, perils and cautious optimism: the next frontier in long-acting modalities for the treatment and prevention of HIV.	Current Opinion in HIV and AIDS	-	-	-	-	-	-	-	1746-6318	10.1097/COH.0000000000000723	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9915969/	PURPOSE OF REVIEW: This paper provides a critical review of recent therapeutic advances in long-acting (LA) modalities for human immunodeficiency virus (HIV) treatment and prevention. RECENT FINDINGS: LA injectable antiretroviral therapy (ART) has been approved in the United States, Canada and Europe; the United States also has approved LA injectable pre-exposure prophylaxis (PrEP) and the World Health Organization has recommended the vaginal PrEP ring. Current LA PrEP modalities in clinical trials include injections, fibres, rings, and implants; LA ART modalities in trials include subcutaneous injections and long-term oral pills. Although LA modalities hold incredible promise, global availability is inhibited by long-standing multilevel perils including declining multilateral funding, patent protections and lack of political will. Once available, access and uptake are limited by factors such as insurance coverage, clinic access, labor markets, stigma, and structural racism and sexism. These must be addressed to ensure equitable distribution. SUMMARY: LA ART and PrEP modalities are poised to revolutionize the potential impact of biomedical prevention and treatment, but the long-term effect of such modalities within reach. However, pervasive socio-structural inequities limit the promise of LA modalities, highlighting the need for cautious optimism in light of the embedded inequities in the trajectory of research, development, and population-level implementation. Article	2022	Phillips T.R.; Medland N.; Chow E.P.F.; Maddaford K.; Wigan R.; Fairley C.K.; Bilardi J.E.; Ong J.J.	Newly arrived Asian-born gay men in Australia: exploring men's HIV knowledge, attitudes, prevention strategies and facilitators toward safer sexual practices	BMC Infectious Diseases	-	-	-	-	-	-	-	1471-2334	10.1186/s12879-022-07174-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125607712&doi=10.1186%2fs12879-022-07174-z&partnerID=40&md5=5e9540f7f1c19e1d8dab3232b07bab16	Background: Asian-born gay, bisexual and other men who have sex with men (gbMSM) newly arrived in Australia are more than four times as likely than their Australian-born counterparts to be diagnosed with incident HIV. Our aim was to explore experiences of Asian-born gbMSM newly arrived in Australia and attending a sexual health centre with regards to their knowledge of and preference for HIV prevention strategies. Methods: Between 8th May 2020 and 23rd December 2020, 30 Asian-born gbMSM who had lived in Australia for 1–5 years were recruited from a sexual health clinic and participated in semi-structured face-to-face interviews from 8th May 2020 and 23rd December 2020. Men were excluded if they were living with HIV. Interviews were recorded, transcribed verbatim and analysed thematically. Men reported little knowledge of HIV prevention strategies outside of condom use prior to coming to Australia. Although participants reported basic knowledge of HIV transmission and treatment, exposure to sexual identity and HIV-related stigma in their countries of birth meant they imagined a HIV diagnosis would be devastating. Most relied on condoms to stay HIV negative however their consistency of use varied. Seven men were on pre-exposure prophylaxis (PrEP); all but one started PrEP after coming to Australia. Many indicated interest in PrEP but described it as too expensive given they do not have access to government-subsidised healthcare. Sexual health counselling and connections with LGBTQI community groups appeared to facilitate PrEP and consistent condom use. Conclusion: Asian-born gbMSM newly-arrived to Australia may have limited knowledge of HIV prevention strategies aside from condom use. Increased connections with sexual health services and LGBTQI communities may facilitate more effective HIV prevention strategies. © 2022. The Author(s). Article	2022	Phillips, Gregory; Lindsman, Peter; Janulis, Patrick; Johnson, Amy K; Beach, Lauren B; Stonehouse, Patrick; Kern, David; Boegner, Joshua; Raman, Anand; Greene, George J	Network analysis of organizations providing HIV services in Chicago: Toward an integrated response to the HIV epidemic	Journal of Public Health Management and Practice	-	-	-	-	-	-	-	1078-4659	10.1097/PHH.0000000000001165	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107805264&doi=10.1097%2fPHH.0000000000001165&partnerID=40&md5=d50b5d303a5f8e77b9fd0f0fe497169b	Context: The public health response to the HIV epidemic has increasingly centered on the uptake of and adherence to biomedical interventions (eg, pre-exposure prophylaxis PrEP, treatment as prevention TasP). Traditionally, various community and health care organizations have worked to address different stages of PrEP or TasP care. Objective: To understand the importance of how HIV prevention organizations work together to address the biomedical interventions and the structure of these networks. Design: Cross-sectional survey. Setting: Organizational network ties were examined between formal and informal agencies among community agencies. Setting: This study examined community agencies in the current HIV prevention system in Chicago. Participants. Twenty-two community agencies across the Chicago metropolitan area. Main Outcome Measures: Using network analysis, this study examined ties between community agencies and assessed perceptions of collaboration and competitiveness in the current HIV prevention system in Chicago. Results: Overall, respondents reported that the current environment of HIV prevention in Chicago is extremely (18.8%), moderately (37.5%), or somewhat collaborative (37.5%) and extremely (68.8%) or moderately competitive (25.0%). The majority of partnerships reported were informal, with less than a quarter being formalized. That said, those who reported formal partnerships reported being satisfied with those relationships. There was a significantly negative association between density and perceived collaboration—grantees experiencing a more collaborative also reported less dense networks. Conclusion: These findings indicate that, despite perceived competitiveness, agencies are willing to work together and that there is room for more collaboration among agencies. Findings from this study can inform efforts to build a more integrated HIV prevention system in Chicago. Article	2022	Phillips T.R.; Murphy D.; Chan C.; Haire B.; Fraser D.; Grulich A.E.; Bavinton B.R.	Switching to Non-daily Pre-exposure Prophylaxis Among Gay and Bisexual Men in Australia: Implications for Improving Knowledge, Switching, and Uptake	Sexuality Research & Social Policy	-	-	-	-	-	-	-	1868-9884	10.1007/s13178-022-00736-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132113787&doi=10.1007%2fs13178-022-00736-5&partnerID=40&md5=d4c7c5f957e0fcdc72b672ae9625507	Introduction: Pre-exposure prophylaxis (PrEP) dosing option such as event-driven PrEP hold promise to increase PrEP uptake among gay, bisexual, and queer men (GBQMs) but their impacts have not yet been realised and uptake by GBQM suitable for PrEP remains slow in countries where it is only considered an alternative option to daily PrEP. Methods: We conducted semi-structured interviews between June 2020 and February 2021 with 40 GBQM in Australia to understand PrEP dosing behaviors, knowledge, and preferences. Results: All participants considered daily PrEP, but not event-linked to non-daily PrEP, mostly taking it event-driven. GBQM who preferred non-daily PrEP had infrequent or predictable sex, were concerned about cost given infrequency of sex, and/or wanted to minimize unnecessary drug exposure. Accurate knowledge of event-driven PrEP was poor. However, reflecting concepts underpinning critical pedagogy, having accurate knowledge was supported by access to consistent messaging across clinical, social, community, and public settings. Several participants who switched to event-driven PrEP had condomless sex events in which they were unable to adhere to pills due to unanticipated sex. Conclusions and Policy Implications: Implementation of comprehensive and consistent education about correct dosing for event-driven PrEP across multiple settings is needed to ensure increased uptake and safe use. GBQM require messaging about non-condom based HIV prevention strategies when they cannot access daily or event-driven PrEP. © 2022, The Author(s). Article	2022	Pichon L.C.; Toth M.; McGay S.; Murry V.M.B.; Juarez P.D.	Engaging Black men who have sex with men (MSM) in the South in identifying strategies to increase PrEP uptake	BMC Health Services Research	-	-	-	-	-	-	-	1472-6963	10.1186/s12913-022-08914-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143159068&doi=10.1186%2fs12913-022-08914-2&partnerID=40&md5=494c914e4759af7e0e189f75776e566	Background: Promotion, uptake, and adherence of pre-exposure prophylaxis (PrEP) is paramount to ending the HIV epidemic among young Black men who have sex with men in the South. The purpose of this study was to explore barriers and facilitators to PrEP uptake among Black MSM in the South. Methods: Black MSM were recruited from the Southern region of the United States with the highest rates of HIV infections in the United States by 90 percent by 2030. Method: Young adults (a = 23) between the ages of 17–24 were recruited from community-based organizations in Memphis to participate in four focus group discussions. Discussion topics included motivations, barriers, and facilitators to PrEP use. Data were analyzed using thematic analysis. Results: All (100%) of participants self-identified as HIV negative, Black (90%), men who have sex men (90%), and currently prescribed PrEP/Truvada (60%). Themes identified for increasing uptake included 1) trusted peers, 2) culturally tailored PrEP services (e.g., Historically Black College and University (HBCU) trained, LGBTQ), and 3) use of social media. Mislabeling of PrEP as promiscuity promoting and limitations with PrEP marketing (e.g., solely LGBTQ) were recognized as barriers that perpetuated stigma. Conclusion: Findings suggest the importance of increasing awareness among health professions students matriculating at HBCUs of their perceived role as referrable healthcare providers by Black MSM, working closely with couples, and crafting of PrEP messaging that is non-stigmatizing. Findings will inform public health interventions for young Black MSM and facilitate HIV prevention efforts with other groups disproportionately affected by HIV in the South. © 2022, The Author(s). Article	2022	Pico-Espinosa O.J.; Hall M.; MacPherson P.; Grace D.; Gaspar M.; Lachowsky N.; Mohammed S.; Demers J.; Kikhtaff M.; Truong R.; Tan D.H.S.	PrEP-related stigma and PrEP use among gay, bisexual and other men who have sex with men in Ontario and British Columbia, Canada	AIDS Research and Therapy	-	-	-	-	-	-	-	1742-6405	10.1186/s12981-022-00473-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140862274&doi=10.1186%2fs12981-022-00473-0&partnerID=40&md5=5896c38bc99a1998a7ff0e9f43c5227ab	Background: We aimed to explore the association between PrEP-related stereotypes and perceived disapproval (hereafter PrEP-related stigma), and PrEP use. Methods: We used data from a cross-sectional online survey among adult gay, bisexual, other men who have sex with men in Ontario and British Columbia, Canada. Participants were recruited 2018–2020 in-person from sexual health clinics and cultural events, and online through geosocial networking applications. We used multivariable logistic regression to examine the association between PrEP-related stigma and PrEP use. Results: Of 651 men, 464 (71.3%) were Caucasian, 107 (16.4%) were racialized, and 80 (12.3%) were Indigenous. Overall, 247 (38%) were current PrEP users, 67 (10.3%) were former PrEP users, and 337 (51.8%) were never PrEP users. Of 1127 individuals who started the survey, 1190 participants answered questions about PrEP-related stigma: 254 (21.3%) were classified as having low level of PrEP-related stigma, 776 (65.2%) intermediate, and 160 (13.5%) high. No significant association was found when never PrEP users and current PrEP users were compared: adjusted OR = 1.44 (95% C.I. 0.88–2.35). High PrEP-related stigma was positively associated with being a former PrEP user compared to being a current PrEP user: adjusted OR = 2.5 (95% C.I. 1.3–4.9). Conclusion: PrEP-related stigma is associated with not using PrEP, particularly with PrEP discontinuation. Our findings indicate that stigma persists as a barrier to PrEP use. © 2022, The Author(s). Article	2022	Pilgrim N.A.; Evans T.M.; Cwarisoopnki M.	A Layer Plus Approach to Implementation Research and Collaboration for Long-Acting Injectable Pre-exposure Prophylaxis for HIV Prevention	Health Promotion Practice	-	-	-	-	-	-	-	15248399	10.1177/15248399211053584	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132369581&doi=10.1177%2f15248399211053584&partnerID=40&md5=22bcb8a135df7b9e5e3d6dc92f2e0f6f	In 2020, the HIV prevention clinical trials, HPTN (HIV Prevention Trials Network) 083 and 084, reported that long-acting injectable cabotegravir (CAB-LA) for HIV prevention was statistically superior to daily oral tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) for pre-exposure prophylaxis (PrEP) in cisgender men and transgender women who have sex with men, and cisgender women. However, CAB-LA uptake has been slow in implementation. Implementation Science frameworks, such as the Layer Plus Approach, can help to address this challenge. The Layer Plus Approach is a model set by UNAIDS for HIV prevention will be key to ensuring that CAB-LA reaches those who desire to use it. We describe the Layer Plus Approach for CAB-LA for PrEP implementation and implementation. The "Layer" is focused on integrating CAB-LA into existing PrEP models of care and understanding the best delivery channels that could be established in existing programs. Important implications of layering include preparing health professionals to provide CAB-LA, improving access for potential users, and addressing existing PrEP users and their barriers. "Plus," which accounts for the existing disparities in PrEP access and use, means expanding CAB-LA to reach individuals for whom HIV prevention options have not been accessible or who have lapsed on oral PrEP. Implications for Plus include the development of new structures, systems, policies, and processes. A key aspect to the Approach is building collaborations to aid successful implementation. The Layer Plus Approach is a simple but strategic framework or a tailored approach to guide dissemination research and implementation. © 2022 Society for Public Health Education.	access to health care; health promotion; health research; HIV/AIDS; intervention/crosscultural health; minority health; patient education; sexual health	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Price D.M.; Unger Z.; Wu Y.; Meyers K.; Golub S.A.	Clinic-Level Strategies for Mitigating Structural and Interpersonal HIV Pre-Exposure Prophylaxis Stigma	AIDS Patient Care and STDs	-	-	-	-	-	-	-	1087-2914	10.1089/apc.2021.0176	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126727326&doi=10.1089%2fapc.2021.0176&partnerID=40&md5=e2cc666c5ce5646fcb7f7764c4a0b03c	Objective: The thrust of HIV has been proposed as a major contributing factor to the disproportionate burden of HIV among gay and bisexual men compared to their heterosexual counterparts. The current study examined 12-month trajectories of anxiety symptoms and concomitant HIV-related worry among a cohort of pre-exposure prophylaxis (PrEP) users, compared to a comparison cohort who were not using PrEP. Method: SPARK was a community-based PrEP demonstration project conducted between February 2014 and May 2017. Self-report anxiety and worry data were collected from PrEP patients (n = 300) quarterly, and from non-PrEP patients (n = 131) at baseline, 3, and 12 months. We ran a series of unconditional latent growth curve models (LGCMs) to examine changes in anxiety and HIV worry over the 12-month study period, followed by parallel process LGCMs to examine the associations between both intercepts and growth factors, adjusting for demographic factors. Results: In a parallel process model, both an association between baseline levels of HIV worry and anxiety decreases in both variables over time among PrEP users but not among non-PrEP users. Additionally, a multigroup model revealed that PrEP users' starting both groups to 3 time points, and forcing a comparison of slopes between the 2 groups. This analysis revealed that there was no difference in the anxiety slopes between the 2 cohorts, however, HIV worry slopes remained significantly different among the PrEP cohort compared to the non-PrEP cohort. Conclusions: These data provide some of the first quantitative evidence for the potential of PrEP to reduce both anxiety and worry symptoms. Emphasizing positive mental health "side effects" of PrEP may be a strategy for engaging providers in biomedical HIV prevention. © 2022, American Psychological Association.	health care providers; HIV prevention; pre-exposure prophylaxis (PrEP); stigma	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Psomas C.K.; Posnaruda G.; Reverenaz F.; Khiri H.; Delord M.; Hallise P.; Phillbert P.	A cohort analysis of sexually transmitted infections among different groups of men who have sex with men in the early era of HIV pre-exposure prophylaxis in France	Journal of Virus Eradication	-	-	-	-	-	-	-	2055-6640	10.1016/j.jve.2022.100065	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125441656&doi=10.1016%2fj.jve.2022.100065&partnerID=40&md5=eeaf9d2f42e573dc51ff143ca5c8bab6	Background: MSM are at particular risk of STIs due to sexual behavior and substance use. HIV PrEP use may increase this risk. Design: Our aim was to comparatively assess incident STIs among different at-risk groups—PLWHIV, HIV-negative PrEP and non-PrEP MSM—seen at our early adopter PrEP implementation. Methods: Clinical data were retrospectively collected from the French Hospital Database on HIV/Hepatitis Viruses Dissuses Department between September 2016 and October 2018. STI incidence rate was assessed among groups for the whole period, as well as separately for each year of the study. Results: Overall STI incidence rate was 20.4 per 100 person-years (PY). STI risk was significantly higher among PLWHIV (36.7/100 PY) and PrEP users (30.4/100 PY) than among non-PrEP MSM (15.4/100 PY). Incidence rate ratios (IRR) were 2.39 (95% CI: 2.03–2.81, p < 0.001) for PLWHIV and 1.97 (95% CI: 1.72–2.25, p < 0.001) for PrEP users, using non-PrEP MSM as reference group. STI risk was significantly higher among PrEP users than among non-PrEP MSM (IRR = 1.77 [1.23–2.55, p < 0.002) between 2016 and 2017 (IRR = 0.72 [0.49–1.06, p = 0.09) between 2017 and 2018. Conclusion: Our findings suggest that PrEP users and PLWHIV are at higher risk of STIs than non-PrEP MSM, and that PLWHIV and PrEP users during the two periods. Conclusion: These results suggest that a proactive approach of an efficient follow-up of MSM participants once PrEP approval may have prevented an increase of the incidence of STIs among PrEP users. © 2022	HIV; Men who have sex with men; Monitoring; PrEP; Prevention; Sexually transmitted infections	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical
Article	2022	Pyshodnikina, Elena; Derkach, Elena; Reznitseg, Vladimir; Ugrokhelidze, Dzhumbir; Lobodina, Alena; Baxter, Carl; Bryer, Andrew	Economic evaluation of dorutevir/emtefovir diaspirovil fumarate/lamivudine for HIV-1 infected adults in Russia: a cost-minimization and budget impact analysis.	Expert Review of Pharmacoeconomics & Outcomes Research	-	-	-	-	-	-	-	1744-8379 1473-7167	10.1080/14737167.2022.2117162	https://www.tandfonline.com/doi/abs/10.1080/14737167.2022.2117162	BACKGROUND In Russia, before 2022, the list of vital and essential drugs for HIV-infected patients previously contracted with antiretroviral drugs included the fixed-dose combination rilpivirine/tenofovir disoproxil fumarate/emtricitabine (RPV/TDF/FTC) and dolutegravir/tenofovir disoproxil fumarate/emtricitabine (DOR/TDF/FTC). The aim of this study was to assess the budget impact of RPV/TDF/FTC defined by the average replacement (ARP) of RPV/TDF/FTC with DOR/TDF/FTC (experimental, at-work, 4th) was made. The per-patient drug costs over 3 years were compared in a cost-minimization analysis. A budget impact analysis considered the costs to the healthcare system of including DOR/TDF/FTC as a treatment option for eligible patients in Russia over a 3-year time horizon. RESULTS: The indirect treatment comparison of DOR/TDF/FTC and RPV/TDF/FTC in treatment-naive patients with baseline HIV-1 RNA ≤100,000 copies/mL at-love showed no statistically significant difference (RR 0.914, 95% CI 0.833–1.003). In the cost-minimization analysis, the per-patient cost of one year of treatment with RPV/TDF/FTC and DOR/TDF/FTC was, respectively, ₽526,975 and ₽531,192, for a saving of ₽169,783. In the budget impact analysis, the adoption of DOR/TDF/FTC into clinical practice is expected to reduce drug costs by ₽333 million (23.9%) in year 3. CONCLUSIONS Fixed-dose combinations DOR/TDF/FTC is equally effective and cost-saving compared to RPV/TDF/FTC from Russian vital and essential drugs list perspective. Article	2022	Pyra M.; Brewer R.; Rusie L.; Kline J.; Willis L.; Schneider J.	Long-term HIV Pre-exposure Prophylaxis Trajectories Among Racial & Ethnic Minority Patients: Short, Declining, & Sustained Adherence	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	-	-	-	15254135	10.1097/QAI.0000000000002833	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123301602&doi=10.1097%2fQAI.0000000000002833&partnerID=40&md5=77324164e3d2ee6ee02f1e9bcad7c1e164b844	Background: HIV pre-exposure prophylaxis (PrEP) requires continued use at an effective dosage to reduce HIV incidence. Data suggest early PrEP drop-off among many populations. We sought to describe PrEP use over the first year among racial and ethnic minority patients in the US. Setting: Racial and ethnic minority patients initiating PrEP at a federally qualified health center in Chicago, IL. Methods: Using electronic health records, we determined the adherence (56 weekly dose) trajectories over the first year of PrEP use and compared baseline and time-varying patient characteristics. Results: From 2159 patients, 1,146 (53%) were Black/African American, 1,013 (47%) were Hispanic/Latinx, and 1,911 (89%) were cisgender men. Using latent class trajectory analysis, 4 adherence patterns as well as gender, sexual orientation, insurance status at baseline, and neighborhood were associated with trajectory assignment, within some trajectories, insurance status during follow-up was associated with odds of monthly adherence (56 weekly dose). Conclusion: Among racial and ethnic minorities, a plurality achieved sustained PrEP persistence. Access to clinics, insurance, and intersectional stigmas may be modifiable barriers to effective PrEP persistence; in addition, focus on younger users and beyond gay, cismale populations are needed. © 2022 Wolters Kluwer Health, Inc. Article	2022	Pyra M.; Johnson A.K.; Devlin S.; Vinh-Au S.Z.; Irby S.; Stewart E.; Blum C.; Green M.; Haider S.; Hirschhorn L.R.; Ridgway J.P.	HIV Pre-exposure Prophylaxis Use and Persistence among Black Ciswomen: "Women Need to Protect Themselves, Period"	Journal of Racial and Ethnic Health Disparities	-	-	-	-	-	-	-	21973792	10.1007/s40615-021-01020-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102925601&doi=10.1007%2fs40615-021-01020-9&partnerID=40&md5=e17bef28a7822536401c3c0bd3ca0ebc	Background: Disparities in HIV incidence and PrEP use among Black ciswomen remain. We examine factors associated with PrEP persistence using mixed methods. Setting: Black ciswomen in Chicago, IL, prescribed PrEP at a federally qualified health center (FQHC). Methods: We used electronic health data to determine PrEP persistence (Proportion of Days Covered ≥86% at 6 months) and tested demographic and clinical factors in logistic regressions. We interviewed eight Black ciswomen, purposefully selected by PrEP persistence. Results: Among 112 Black ciswomen, 19% were persistent. In adjusted models, neighborhood, stiri reasen (at initiation), and intimate your were significantly associated with persistence. Qualitatively, we found little evidence of cost or adherence as barriers; participants wanted more effective, convenient, discreet options—a pill per month, injectable, or vaginal ring. Conclusions: Access to HIV pre-exposure prophylaxis faces challenges and barriers, even when women are making decisions based on perceived HIV risk. We identified real-world barriers to address at future interventions. © 2021, W. Montague Cobb-NMA Health Institute. Article	2022	Queiroz, Artur; Mongrella, Melissa; Keiser, Brennan; Li, Dennis H; Benbow, Nanette; Mustanski, Brian	Profile of the Portfolio of NIH-Funded HIV Implementation Research Projects to Inform Ending the HIV Epidemic Strategies	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002962	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132979062&doi=10.1097%2fQAI.0000000000002962&partnerID=40&md5=928060c94275cca36aaabdeee61288f1	Background:The US government created an initiative to end the HIV epidemic in the United States by the year 2030 (EHE). This multiagency initiative was structured around four pillars: Prevent, Diagnose, Treat, and Respond to improve HIV programs, resources, and service delivery infrastructure. In support of its research mission, the National Institutes of Health (NIH) has funded implementation research (IR) projects by addressing the four pillars and encouraging investigators to collaborate with local partners and Health and Human Services (HHS) grantees in 57 priority jurisdictions.Methods:This paper analyzed data from the NIH funded CFAR/ARC supplement projects from 2019 to 2021. The Exploration, Preparation, Implementation, Sustainment (EPIS) framework was used to characterize projects by stage of implementation.Results:The Prevent pillar was most frequently studied, with Pre-Exposure Prophylaxis (PrEP) being the most studied intervention. The most common partners were health departments, community-based organizations (CBOs), and Federally Qualified Health Centers (FQHCs). The Consolidated Framework for Implementation Research (CFIR) framework was the most utilized to investigate implementation determinants, followed by the RE-AIM framework and Proctor model to assess implementation outcomes.Conclusion:Monitoring the projects resulting from NIH investments is fundamental to understanding the response to EHE, and achieving these results requires systematic and continuous effort that can support the generalizable implementation knowledge emerging from individual studies. There are some remaining gaps in the project portfolio, including geographical coverage, range of implementation outcomes being measured, and interventions still requiring further research to ensure equitable scale-up of evidence based interventions and achieve EHE goals. © 2022 Lippincott Williams and Wilkins. Article	2022	Quirola-Amores P.; Espinosa P.; Oleas S.; Hernandez I.; Henriquez A.R.; Teran E.	HIV Rapid Testing in the General Population and the Usefulness of PrEP in Ecuador: A Cost–Utility Analysis	Frontiers in Public Health	-	-	-	-	22962565	10.3389/fpubh.2022.884313	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133237655&doi=10.3389%2ffpubh.2022.884313&partnerID=40&md5=baa36e21979cb291ad6e8ab3799ac064	Introduction: HIV is considered one of the most important chronic transmitted diseases worldwide. The Joint United Nations Program on HIV/AIDS in 2020 proposed the strategy "95–95–95" which goals to achieve a 95% of cases identified, receives ART, and will have achieved suppression of the virus. In Ecuador by 2020, according to the Ministry of Public Health, 45,056 persons are living with HIV, principally men between 15 and 49 years, and a mortality rate of 4.8/100,000 habitats. This study aims to determine the cost–utility of applying an early screening to a sexually active population vs. only a high-risk population and if the use of PrEP is justified depending on different contexts. Methods: For the cost–utility evaluation, it was compared: (a) HIV screening performed only in the high-risk population vs. HIV screening in all population sexually active; and (b) the use of ART only for HIV treatment vs. ART as a treatment in diagnosed cases and the use of PrEP (only at a high-risk population of acquiring HIV). Calculation and weight of DALYs for HIV/SIDA were obtained through WHO guidelines. To generate the Markov model for HIV/AIDS, subjects were classified as symptomatic or asymptomatic, as well as the HIV deaths. Results: Cost–benefit analysis (CUA) showed that ICER for early diagnosis had a negative value which means a saving if the strategy will be implemented as a regular test (–$591, –$4,360) and −108 and −934 DALYs, in the case of ART and PrEP, ICER the $30,541–$59,410, which resulted in more than the GDP's threshold and health years between 2,511 and 10,635 in the general population. With a reduction of 70% in the assigned budget for the early diagnosis, Ecuadorian people could lose between 4 and 6 DALYs, while if the budget reduces more than 50% to ART, it will generate a loss of 10–12 years of healthy life. Conclusion: CUA demonstrates that an early diagnosis in a sexually active population is cost-beneficial. This, combined with ART or PrEP, is ideal to add years of healthy life. Article	2022	Radix, Asa E.; Bond, Keosha; Carneiro, Pedro B.; Restar, Arjee	Transgender Individuals and Digital Health.	Current HIV/AIDS Reports	-	-	-	-	1548-3576 1548-3568	10.1007/s11904-022-00629-7	https://pubmed.ncbi.nlm.nih.gov/36136217/	PURPOSE OF REVIEW: The goal of this review is to assess the use of digital technologies to promote the health and well-being of transgender and gender diverse (TGD) people. RECENT FINDINGS: TGD individuals experience numerous health disparities, including low uptake of HIV prevention strategies, such as pre-exposure prophylaxis, increased HIV incidence, and suboptimal HIV-related outcomes. These health disparities are the result of widespread intersectional stigma on the basis of gender identity, gender expression, socioeconomic class, race, and ethnicity, which negatively impact access to general medical and transgender-specific health care. TGD individuals often delay or avoid essential medical services due to fear of discrimination. Clinicians frequently lack training, competence, and skills in transgender medicine, further exacerbating the health disparities faced by TGD people. Digital technologies have been used to improve research and clinical care for TGD populations through various modalities; telemedicine, telehealth and mHealth. Digital health technologies, including HIT-enabled clinical decision support, telehealth, telemedicine, and mHealth, offer innovative ways to improve health care access, improve quality of care, and reduce health disparities for TGD populations, including and beyond HIV outcomes, through enhanced care delivery, clinician education, and enhancing social support networks. Article	2022	Ralph, Jessika A; Westberg, Sarah M; Boraas, Christy M; Terrell, Carrie A; Fischer, John R	PrEP-aring the General Gynecologist to Offer HIV Pre-exposure Prophylaxis.	Clinical Obstetrics and Gynecology	-	-	-	-	1532-5520	10.1097/GRF.0000000000000713	https://dx.doi.org/10.1097/GRF.0000000000000713	It is estimated that 450,000 American women are at increased risk of infection with human immunodeficiency virus (HIV), and yet only 7% have a prescription for pre-exposure prophylaxis (PrEP). PrEP is a safe and effective method of HIV infection prevention via a daily use of an oral combination antiretroviral pill or longer-acting intramuscular injections. Gynecologists are experts in women's sexual health, and provide over half of annual preventative health visits, but are not yet routinely providing PrEP to patients, citing lack of knowledge as a major barrier. The authors aim to provide the general gynecologist with the skills to expertly provide PrEP to their patients to reduce HIV infection. Article	2022	Ramakrishnan A.; Sales J.M.; Mccumber M.; Powell L.; Sheth A.N.	Human Immunodeficiency Virus Pre-Exposure Prophylaxis Knowledge, Attitudes, and Self-Efficacy Among Family Planning Providers in the Southern United States: Bridging the Gap in Provider Training	Open Forum Infectious Diseases	-	-	-	-	23288957	10.1093/ofid/ofac536	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145022302&doi=10.1093%2fofid%2fofac536&partnerID=40&md5=cf6ebddeff215009f60f5068451f82ee	Background: Pre-exposure prophylaxis (PrEP) is an effective human immunodeficiency virus (HIV) prevention intervention, but its access and use are suboptimal, especially for women. Healthcare providers provision of PrEP is a key component of the Ending the HIV Epidemic initiative. Although training gaps are an identified barrier, evidence is lacking regarding how to tailor trainings for successful implementation. Title X family planning clinics deliver safety net care for women and are potential PrEP delivery sites. To inform provider training, we assessed PrEP knowledge, attitudes, and self-efficacy in the steps of PrEP care among Title X providers in the Southern United States. Methods: We used data from providers in clinics that did not currently provide PrEP from a web-based survey administered to Title X clinic staff in 18 Southern states from February to June 2018. We developed generalized linear mixed models to evaluate associations between provider-, clinic-, and county-level variables with provider knowledge, attitudes, and self-efficacy in PrEP care, guided by the Consolidated Framework for Implementation Research. Results: Among 351 providers from 193 clinics, 194 (55%) were nonprescribing and 157 (45%) were prescribing providers. Provider ability to prescribe medications was significantly associated PrEP knowledge, attitudes, and self-efficacy. Self-efficacy was lowest in the PrEP initiation step of PrEP care and was positively associated with PrEP attitudes, PrEP knowledge, and contraception self-efficacy. Conclusions: Our findings suggest that PrEP training gaps for family planning providers may be bridged by addressing unfavorable PrEP attitudes, integrating PrEP and contraception training, tailoring training by prescribing ability, and focusing on the initiation steps of PrEP care. © 2022 The Author(s). Article	2022	Ramchandani M.S.; Berzkalns A.; Cannon C.A.; Dombrowski J.C.; Ocbamichael N.; Khosropour C.M.; Barbee L.A.; Golden M.R.	A Demedicalized Model to Provide PrEP in a Sexual Health Clinic	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000003005	https://pubmed.ncbi.nlm.nih.gov/28343120/	Background:Sexual health clinics (SHCs) serve large numbers of patients who might benefit from preexposure prophylaxis (PrEP). Integrating longitudinal PrEP care into SHCs can overburden clinics. We implemented an SHC PrEP program that task shifted most PrEP operations to nonmedical staff, disease intervention specialists (DIS).Methods:We conducted a retrospective cohort analysis of PrEP patients in an SHC in Seattle, WA, from 2014 to 2020 to assess the number of patients served and factors associated with PrEP discontinuation. Clinicians provide same-day PrEP prescriptions, whereas DIS coordinate the program, act as navigators, and provide most follow-up care.Results:Between 2014 and 2019, 1387 patients attended an initial PrEP visit, 93% of whom were men who have sex with men. The number of patients initiating PrEP per quarter year increased from 20 to 81. The number of PrEP starts doubled when the clinic shifted from PrEP initiation at scheduled visits to initiation integrated into routine walk-in visits. The percentage of visits performed by DIS increased from 3% in 2014 to 45% in 2019. Median duration on PrEP use was 11 months. PrEP discontinuation was associated with non-Hispanic black race/ethnicity hazard ratio (HR) 1.34, 95% confidence interval (CI) 1.02 to 1.76, age <20 years (HR 2.17, 95% CI: 1.26 to 3.75), age between 20 and 29 years (HR 1.55, 95% CI: 1.06 to 2.28), and methamphetamine use (HR 1.98, 95% CI: 1.57 to 2.49). The clinic had 750 patients on PrEP in the final quarter of 2019.Conclusions:A demedicalized SHC PrEP model that task shifts most operations to DIS can provide PrEP at scale to high priority populations. © 2022 Lippincott Williams and Wilkins. Article	2022	Ramos S.R.; Beauchamp G.; Wheeler D.P.; Wilton L.; Whitfield D.L.; Boyd D.T.; Hightow-Weidman L.; Fields S.D.; Nelson L.E.	Optimizing PrEP Continuance: A Secondary Analysis Examining Perceived Autonomy Support and Care Coordination Quality among Black MSM in HPTN 073	International Journal of Environmental Research and Public Health	-	-	-	-	16617827	10.3390/ijerph19084489	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127668374&doi=10.3390%2fijerph19084489&partnerID=40&md5=39d20e4cd938a15435f185a7cccb2de5	At the end of year 2018, it was estimated that in the United States over 1 million people were living with HIV. Although Black/African American individuals comprise an estimated 13.4% of the US population, as of 2019, they represented an estimated 42% of all new HIV diagnoses in 2018. PrEP use among Black men who have sex with men has not reached levels sufficient to have a population impact on HIV incidence. The purpose of this study was to examine whether high perceived autonomy support and care coordination quality were associated with PrEP continuation. Secondary analyses were conducted on data with 226 Black MSM in three US cities. Participants who were PrEP users at week 8 were significantly more likely to continue PrEP (OR 1.48; 95% CI 1.04–2.11). Perception of coordination quality did not differ between PrEP users and non-users at any of the visits. Although coordination quality was not statistically significant, greater than half of PrEP users and non-PrEP users utilized the C4 services. Addressing social, individual, and structural barriers to PrEP may benefit Black MSM irrespective of their PrEP use. © 2022 by the authors. Article	2022	Ramraj T.; Abdelatif N.; Chirinda W.; Abdullah F.; Kindra G.; Goga A.	A risk measurement tool for targeted HIV prevention measures amongst young pregnant and lactating women in South Africa	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-022-13625-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133218828&doi=10.1186%2fs12889-022-13625-8&partnerID=40&md5=52d6a41d6c61bb58be5a53b174218036	Background: We aimed to develop and validate a tool to identify which pregnant/lactating young South African women (≤ 24 years) are at risk of HIV infection. Methods: Data from three national South African Prevention of Mother-to-Child Transmission (PMTCT) evaluations were used to internally validate three HIV acquisition risk models for young postpartum women. We used univariate and multivariable logistic regression analysis to determine which risk factors were significant. Model coefficients were rounded and stratified into risk groups and the area under the receiver operating curve (AUROC) was computed. Models were developed to determine which risk factors provided the most predictive accuracy whilst remaining clinically meaningful. Results: Data from 9 456 adult and 4 658 young pregnant and lactating women were included in the development and validation data sets, respectively. The optimal model included the following risk factors: age (20–24 years old), informal house structure, two or more pregnancies, mothers who had knowledge of when they received their last HIV test result, no knowledge of the infant's father's HIV status, no knowledge of breastfeeding as a mode of MTCT and knowledge of PMTCT programme. The mean AUROC was 0.71 and 0.72 in the development and validation datasets respectively. The optimum cut off score was ≥ 27, having 84% sensitivity, 44% specificity, and identifying 44% of high-risk women eligible for PrEP. Conclusion: The optimal model to be used as a possible risk scoring tool to allow for early identification of those pregnant/lactating women most at-risk of HIV acquisition included both statistically as well as clinically meaningful risk factors. A field-based study is needed to test and validate the effectiveness of this targeted approach. © 2022, The Author(s). Article	2022	Randolph, Schenita D; Johnson, Ragan; Johnson, Allison; Keusch, Lana	Using PrEP and Doing it for Ourselves (UPDOs Protective Styles), a Web-Based Salon Intervention to Improve Uptake of Pre-exposure Prophylaxis among Black Women: Protocol for a Pilot Feasibility Study	JMIR Research Protocols	-	-	-	-	19290748	10.2196/34556	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138585899&doi=10.2196%2f34556&partnerID=40&md5=0544ec6382db0759e050855930a2d8b3	Background: Multilevel interventions are necessary to address the complex social contributors to health that limit pre-exposure prophylaxis use among Black women, including medical distrust, pre-exposure prophylaxis stigma, and access to equitable health care. Strategies to improve knowledge, awareness, and uptake of pre-exposure prophylaxis among Black women will be more successful if information-sharing and implementation take place within trusted environments. Providing women with information through trusted cultural and social channels can effectively support informed decision-making about pre-exposure prophylaxis for themselves and members of their social networks who are eligible for pre-exposure prophylaxis. Objective: The goal of this project is to improve knowledge, awareness, uptake, and trust of pre-exposure prophylaxis, as well as reduce pre-exposure prophylaxis stigma, among Black women living in the US South. Methods: This multilevel, mixed methods study uses a community-engagement approach to develop and pilot test a salon-based intervention. There are three components of this intervention: (1) stylist training, (2) women-focused entertainment videos and modules, and (3) engagement of a pre-exposure prophylaxis navigator. First, stylist training will be provided through two 2-hour training sessions delivered over 2 consecutive weeks. We will use a pre- and posttest design to examine knowledge and awareness improvement of pre-exposure prophylaxis among the stylists. Upon full completion of training, the stylists will receive a certificate of completion and "Ask Me about PrEP" signage for their beauty salons. Second, together with the community, we have codeveloped a 4-part entertainment series (The Wright Place) that uses culturally and socially relevant stories to highlight key messages about (1) HIV, (2) pre-exposure prophylaxis, and (3) Black women's social contributors to health. Quantitative and qualitative measures will be used in a pre- and posttest design to examine pre-exposure prophylaxis knowledge, awareness, risk, stigma, trust, intentions, and women's perceptions of the usability and acceptability of the overall intervention and its implementation strategies. A video blog will be provided after each video. Third, participants will have access through an email or text message link to a pre-exposure prophylaxis navigator, who will respond to them privately to answer questions or make referrals for pre-exposure prophylaxis as requested. Results: This project was funded in October 2020 by Gilead Sciences and was approved by the Duke University School of Nursing institutional review board in April 2021 (Pro00106307). Intervention components were developed in partnership with community partners in the first year. Data collection for phase 1 began in April 2022. Data collection for phase 2 began in May 2022. The study will be complete by October 2022. Conclusions: Multilevel interventions that consider the assets of the community have promise for promoting health among Black women who have influence within their social networks. The findings of this study have the potential to be generalizable to other populations. © Schenita D Randolph, Ragan Johnson, Allison Johnson, Lana Keusch.	application; community engagement; HIV; HIV prevention; mixed-method; pilot test; pre-exposure prophylaxis; PrEP uptake; prophylaxis; web-based; web-based application; women	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Rao A.; Mhlophe H.; Comins C.; Young K.; Mcingana M.; Lesko C.; Mulumba N.; Baral S.; Hausler H.; Schwartz S.	Persistence on oral pre-exposure prophylaxis (PrEP) among female sex workers in eThekwini, South Africa, 2016-2020	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0265434	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126689232&doi=10.1371%2fjournal.pone.0265434&partnerID=40&md5=8968560f92e6d1cf6e3476c64c4678ba	Background Despite the established efficacy of PrEP to prevent HIV and the advantages of a user-controlled method, PrEP uptake and persistence by women in both trials and demonstration projects has been suboptimal. We utilized real-world data from an HIV service provider to describe persistence on oral PrEP among female sex workers (FSW) in eThekwini, South Africa. Methods We examined time from PrEP initiation to discontinuation among all FSW initiating PrEP at TB HIV Care in eThekwini between 2016-2020. We used a discrete time-to-event data setup and stacked cumulative incidence function plots, displaying the competing risks of 1) not returning for PrEP, 2) client discontinuation, and 3) provider discontinuation. We calculated hazard ratios using complementary log-log regression and sub-hazard ratios using competing risks regression. Results The number of initiations increased each year from 155 (9.3%, n = 155/1659) in 2016 to 1224 (27.5%, n = 1224/4446) in 2020. Persistence 1-month after initiation was 53% (95% CI: 51%-55%). Younger women were more likely to discontinue PrEP by not returning compared with those 25 years and older. Risk of discontinuation through non-return declined for those initiating in later years. Despite the COVID-19 pandemic, a greater number of initiations and sustained persistence were observed in 2020. Conclusions Low levels of PrEP persistence were observed, consistent with data among underserved women elsewhere. Encouragingly, the proportion of women persisting increased over time, even as the number of women newly initiating PrEP and staff workload increased. Further research is needed to understand which implementation strategies the program may have enacted to facilitate these improvements and what further changes may be necessary. © 2022 Rao et al. Article	2022	Rao, Sharanya; Albritton, Tashuna; Pina, Paulo; Liang, Yilin; Taggart, Tamara	"You Don't Want Your Parents Knowing That You're Taking Pre-exposure Prophylaxis": Pre-exposure Prophylaxis Stigma Among Black and Latinx Adolescents.	Journal of the Association of Nurses in AIDS Care	-	-	-	-	1552-6917	10.1097/JNC.0000000000000313	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133223356&doi=10.1097%2fJNC.0000000000000313&partnerID=40&md5=9cc8bda5aa22c8db33cedddf1941f8f6	ABSTRACT: Pre-exposure prophylaxis (PrEP) stigma is an understudied barrier to PrEP uptake among Black and Latinx adolescents. U.S. Black and Latinx adolescents (13-17 years) completed an online survey or participated in focus groups/interviews. Associations between PrEP stigma, PrEP disclosure, and provider-initiated PrEP discussion preferences were examined using logistic-regression models. Qualitative data provided further context to quantitative findings. The survey sample included 208 adolescents (53% female; 58% Latinx; M = 15 years), with 98% endorsing PrEP stigma. The qualitative sample included 26 adolescents (54% female; 34% Latinx; M = 15 years). PrEP stigma was associated with lower odds of PrEP disclosure to parents/guardians, and preference for health care providers to initiate PrEP-related discussions only with patients the provider judged to be at high risk for HIV. Qualitative data supported quantitative results: Adolescents endorsed multiple negative stereotypes about PrEP users. Mitigating PrEP stigma among Black and Latinx adolescents is an important step in overcoming challenges related to PrEP uptake. Article	2022	Rao, Sharanya; Reed, Ashley E; Parchem, Benjamin; Edelman, E Jennifer; Magnus, Manya; Hansen, Nathan B; Kershaw, Trace S; Earnshaw, Valerie A; Krakower, Douglas S; Dovidio, John F; Mayer, Kenneth H; Underhill, Kristen; Rosenberger, Joshua G; Ogburn, Damon F; Betancourt, Joseph R; Calabrese, Sarah K	Optimizing Provider Preexposure Prophylaxis (PrEP) Training: A Cross-Sectional Analysis of Recommendations from Providers Across the PrEP Implementation Cascade	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03375-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110980094&doi=10.1007%2fs10461-021-03375-w&partnerID=40&md5=01bae71c5d0135adfc1fe9c8ea281f1b	Expanding PrEP access necessitates training that supports healthcare providers' progression along the PrEP implementation cascade, moving from PrEP awareness to prescription. We surveyed 359 USA providers about PrEP training content and format recommendations. We examined the association between cascade location and training recommendations. Most providers were aware of PrEP (100%), willing to prescribe PrEP (97.2%), had discussed PrEP with patients (92.2%), and had prescribed PrEP (79.9%). Latent class regression analysis revealed that cascade location was associated with training recommendations. Although all providers recommended PrEP-specific content (e.g., patient eligibility), providers who were located further along the cascade also recommended more comprehensive content, including sexual history-taking and sexual and gender minority competence training. Providers further along the cascade were also more likely to recommend interactive training formats (e.g., role-playing). These insights from providers furthest along the cascade indicate the importance of including comprehensive content and interactive formats in future PrEP training initiatives. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Rathakrishnan Dinesh; Purpura, Lawrence J; Salcuni, Paul M; Myers, Julie E; Wahnich Amanda; Daskalakis, Demetre C; Edelstein, Zoe R	PrEP Use and Correlates of Use Among a Large, Urban Sample of Men and Transgender Persons Who Have Sex with Men	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03456-w	https://www.proquest.com/scholarly-journals/prep-use-correlates-among-large-urban-sample-men/docview/2641697428/se-2?accountid=8113	We examined recent pre-exposure prophylaxis (PrEP) use (past 6 months) and its correlates among a large sample of men who have sex with men and transgender and gender non-conforming persons participating in a home HIV self-testing program conducted by the New York City Health Department between 11/2016 and 1/2017. Correlates examined included demographic characteristics and HIV-related behaviors in the past 6 months. Associations with recent PrEP use were assessed using log-binomial regression. 400 (22.5%) of 1776 participants reported recent PrEP use. In adjusted models, recent PrEP use was associated with Manhattan residence adjusted prevalence ratio (aPR) 1.26; 95% confidence interval (CI) (1.04, 1.53), higher income aPR 1.29; 95% CI (1.03, 1.62), and having insurance aPR 1.89; 95% CI (1.33, 2.69). All HIV-related behaviors, except for injection drug use, were individually associated with PrEP use. More research is needed to better understand barriers to PrEP use among patients who are low income and/or uninsured as this may help improve current public health efforts to increase PrEP uptake among disproportionately impacted populations. Article	2022	Rayanakorn A.; Chautrakarn S.; Intawong K.; Chariyalertsak C.; Khemngern P.; Olson D.; Chariyalertsak S.	A comparison of attitudes and knowledge of pre-exposure prophylaxis (PrEP) between hospital and Key Population Led Health Service providers: Lessons for Thailand's Universal Health Coverage implementation	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0268407	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129958651&doi=10.1371%2fjournal.pone.0268407&partnerID=40&md5=7cae29c61affd1bac9e1fb222bb70f31	Background HIV Pre-exposure prophylaxis (PrEP) has demonstrated efficacy and effectiveness among high-risk populations. In Thailand, PrEP has been included in the National Guidelines on HIV/AIDS Treatment and Prevention since 2014. As a part of the national monitoring and evaluation framework for Thailand's universal coverage inclusion, this cross-sectional survey was conducted to assess knowledge of, attitudes to and practice (KAP) of PrEP service providers in Thailand. Methods We conducted a cross-sectional survey to explore knowledge of, and attitudes towards PrEP among providers from hospital and Key Population Led Health Services (KPLHS) settings. The questionnaire was distributed online in July 2020. Descriptive and univariate analysis using an independent-sample t-test were applied in the analyses. Attitudes were ranked from the most negative (score of 1) to the most positive (score of 5). Results Overall, there were 196 respondents (158 from hospitals and 38 from KPLHS) in which most hospital providers are female nurse practitioners while half of those from KPLHS report current gender as gay. Most respondents report a high level of PrEP knowledge and support provision in all high-risk groups with residual concern regarding anti-retroviral drugs resistance. Over two-fifths of providers from both settings perceive that PrEP would result in risk compensation and half of KPLHS providers are concerned regarding risk of sexual transmitted infections. Limited PrEP counselling time is a challenge for hospital providers. Conclusions Service integration between both settings, more involvement and distribution of KPLHS in reaching key populations would be essential in optimizing PrEP uptake and retention. Continuing support particularly in raising awareness about PrEP among healthcare providers and key populations, facilities and manpower, unlimited quota of patient recruitment and PrEP training to strengthen providers' confidence and knowledge would be essential for successful PrEP implementation. Article	2022	Razmjou, Sahar; Charest, Maxime; Patrick O'Byrne; MacPherson, Paul	Pre-Exposure Prophylaxis Among Gay, Bisexual, and Other Men Who Have Sex With Men in Ottawa: A Real World View With Benefits Beyond HIV Risk Reduction	International Journal of Sexual Health	-	-	-	-	19317611	10.1080/19317611.2021.1946731	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-among-gay-bisexual-other/docview/2648328388/se-2?accountid=8113	The number of gay, bisexual, and other men who have sex with men taking pre-exposure prophylaxis (PrEP) has grown since its approval in Canada. While there are sound clinical data on PrEP efficacy, there is less research describing outcomes in routine clinical practice. We conducted a cross-sectional study with 113 men attending our PrEP clinic. Participants completed a one-time survey and chart reviews were conducted. We found that men in our clinic were educated and affluent. While PrEP did not lead to more reported sexual partners, condom use declined, as did sexual anxiety. These results reinforce that PrEP benefits extend beyond HIV prevention. Article	2022	Resnick D.; Schapira M.M.; Andrews M.E.; Essoka-Lasenberry A.; Davis-Vogel A.; Bauermeister J.A.; Wood S.M.	"I THINK THAT I HAVE A GOOD UNDERSTANDING OF HOW TO PROTECT MYSELF": A QUALITATIVE STUDY ABOUT HIV RISK PERCEPTIONS AMONG MEN AND GENDER DIVERSE INDIVIDUALS WHO HAVE SEX WITH MEN	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2022.34.1.82	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125154107&doi=10.1521%2faeap.2022.34.1.82&partnerID=40&md5=9c2317cb54cb4fefaf7a1b51bd0a27a4	This qualitative study aimed to determine how men and gender diverse individuals who have sex with men describe their perceived risk of HIV and what factors influence this risk assessment. We conducted in-depth, virtual interviews with 18 HIV-negative individuals from Philadelphia, eligible for or taking PrEP. The interviews assessed the participants' understanding of their HIV risk, using thematic analysis to deductively code and extract themes. Three themes emerged: (1) participants expressed both deliberative and affective risk perception before and after sexual encounters; (2) participants linked HIV knowledge to risk perception and stigma; (3) participants connected intrinsic and extrinsic factors to risk perception differently. Participants endorsed low overall risk perception, while also describing moments of high affective risk perception after sexual encounters in which they were not able to implement their preferred prevention strategies. Future research should explore helping individuals transform affective risk perception into empowerment around sexual health. © 2022 The Guilford Press. Article	2022	Restar A.; Surace A.; Adia A.; Goedel W.; Ogunbajo A.; Jin H.; Edeza A.; Hernandez L.; Cu-Uvin S.; Operario D.	Characterizing Awareness of Pre-Exposure Prophylaxis for HIV Prevention in Manila and Cebu, Philippines: Web-Based Survey of Filipino Cisgender Men Who Have Sex With Men	Journal of Medical Internet Research	-	-	-	-	14388871	10.2196/24126	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122596935&doi=10.2196%2f24126&partnerID=40&md5=8c8cc1b8b167299804c527c37ccc8651	Background: The Philippines is experiencing an HIV crisis and is considering implementing pre-exposure prophylaxis (PrEP) as a national public health strategy for HIV prevention for cisgender men who have sex with men (cis-MSM). However, critical information on the awareness of PrEP among cis-MSM is needed to roll out this public health initiative. Objective: This study aims to assess PrEP awareness and related correlates (ie, sociodemographic variables, social factors, and health care access and use) among Filipino cis-MSM. Methods: We conducted a web-based survey with Filipino cis-MSM (n=179) residing in the cities of Manila and Cebu, Philippines. Multivariable analysis procedures were performed to examine the factors associated with PrEP awareness. Results: Our sample demonstrated high awareness (134/179, 74.9%) and interest (159/179, 88.8%) in taking PrEP. The adjusted model showed that greater odds of PrEP awareness were associated with having a college education or higher versus a high school education or lower (adjusted odds ratio aOR 7.30, 95% CI 1.01-52.47), earning between PHP 10,000 (US $198.6) and PHP 20,000 (US $397.2) versus <PHP 10,000 (US $198.60; aOR 9.32, 95% CI 1.41-6.22), having had a prior HIV test (aOR 6.06, 95% CI 1.20-13.55), having high HIV knowledge (aOR 3.50, 95% CI 1.11-10.98), and having friends who discussed PrEP (aOR 11.17, 95% CI 2.73-14.5). Conclusions: Our findings demonstrate that Filipino cis-MSM are aware of and interested in taking PrEP, but there is currently an unmet need for such biomedical HIV prevention technologies among this population. Incorporating PrEP education into routine HIV screening and leveraging cis-MSM social networks may be useful in optimizing potential PrEP implementation in the Philippines. © Arjee Restar, Anthony Surace, Alexander Adia, William Goedel, Adedotun Ogunbajo, Harry Jin, Alberto Edeza, Laufred Hernandez, Susan Cu-Uvin, Don Operario. Article	2022	Rhee S.-Y.; Parkin N.; Harrigan P.R.; Holmes S.; Shafer R.W.	Genotypic correlates of resistance to the HIV-1 strand transfer integrase inhibitor cabotegravir	Antiviral Research	-	-	-	-	1663542	10.1016/j.antiviral.2022.105427	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139492653&doi=10.1016%2fj.antiviral.2022.105427&partnerID=40&md5=fb1267a22e4cc6db736c81bb27325523	Cabotegravir (CAB) is an integrase strand transfer inhibitor (INSTI) formulated as a long-acting injectable drug approved for pre-exposure prophylaxis and use with a long acting rilpivirine formulation for therapy in patients with virological suppression. However, there has been no comprehensive review of the genetic mechanisms of CAB resistance. Studies reporting the selection of drug resistance mutations (DRMs) by CAB and the results of in vitro CAB susceptibility testing were reviewed. The impact of integrase mutations on CAB susceptibility was assessed using regularized regression analysis. The most commonly selected mutations in the 24 persons developing virological failure while receiving CAB included Q148R (n = 15), N155H (n = 7), and E138K (n = 5). T97A, G118R, G140 A/R/S, and R263K each developed in 1–2 persons. With the exception of T97A, G118R, and G140 A/R, these DRMs were also selected in vitro while G140R was selected in the SIV macaque model. Although these DRMs are similar to those occurring in persons receiving the related INSTI dolutegravir, Q148R was more likely to occur with CAB while G118R and R263K were more likely to occur with dolutegravir. Regularized regression analysis identified 14 DRMs significantly associated with reduced CAB susceptibility including six primary DRMs which reduced susceptibility on their own including G118R, Q148 H/K/R, N155H, and R263K, and eight accessory DRMs including M50I, L74 F/M, T97A, E138K, and G140 A/C/S. Isolates with Q148 H/K/R in combination with L74M, E138 A/K, G140 A/S, and N155H often had >10-fold reduced CAB susceptibility. M50I, L74M, and T97A are polymorphic mutations that alone did not appear to increase the risk of virological failure in persons receiving a CAB-containing regimen. Careful patient screening is required to prevent CAB from being used during active virus replication. Close virological monitoring is required to minimize CAB exposure to active replication to prevent the emergence of DRMs associated with cross-resistance to other INSTIs. © 2022 The Author(s)	Cabotegravir; Drug resistance; HIV-1 integrase; Integrase strand transfer inhibitors; Mutations	English	Netherlands	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	Rhodes N.; van de Pas R.	Mapping buyer's clubs; what role do they play in achieving equitable access to medicines?	Global Public Health	-	-	-	-	17441692	10.1080/17441692.2021.1959940	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112514727&doi=10.1080%2f17441692.2021.1959940&partnerID=40&md5=90f44ca6cfe9a1d18b63fee1894a9744	Buyer's clubs were first recognised during the HIV/AIDS pandemic in the 1980s and focussed on knowledge curation and distribution of treatments. In the past decade, there has been a resurgence of buyer's clubs, mostly focussed on hepatitis C treatment and PrEP. This paper aims to increase understanding of buyer's clubs and stimulate discussion on their role in achieving equitable access to medicines. Our proposed definition of a buyer's club is 'a community-led organisation or group which seeks to improve an individual's access to medication through knowledge sharing and/or distribution as its primary goal'. The logistical and relational infrastructures of buyer's clubs have been mapped out. Networks and communities are integral to buyer's clubs by facilitating practical aspects of buyer's clubs and creating a sense of community that serves as a foundation of trust. For a user to receive necessary medical support, doctors play a crucial role, yet, obtaining this support is difficult. Whilst buyer's clubs are estimated to have enabled thousands of people to access medicines, and they run the risk of perpetuating health inequities and injustices. They may have the potential to serve as a health activism tool to stimulate sustainable changes; however, this needs to be explored further. © 2021 The Author(s). Prior to the pan-demic, our community-based participatory research partnership was testing ChiCAS, an in-person, group-level behavioral intervention designed to promote uptake of pre-exposure prophylaxis (PrEP), condom use, and medically supervised gender-affirming hormone therapy among Spanish-speaking transgender Latinas. However, the pandemic required adaptations to ensure the safe conduct of the ChiCAS intervention trial. In this article, we describe adaptations to the trial within five domains. Transgender women are disproportionately affected by HIV, and it is essential to find ways to continue research designed to support their health within the context of the COVID-19 pandemic and future infectious disease out-breaks, epidemics, and pandemics. These adaptations offer guidance for ongoing and future community-based and community-engaged research during the COVID-19 pandemic and/or potential subsequent outbreaks (e.g., monkeypox), epidemics, and pandemics, particularly within under-served marginalized and minoritized communities. © 2022 The Guilford Press. Article	2022	Ribeiro L.; Pinho A.A.; Carneiro R.L.	Narrative review of studies on HIV pre-exposure prophylaxis in Brazil and its implementation in the public health network	Global Public Health	-	-	-	-	17441692	10.1080/17441692.2022.2116749	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137789202&doi=10.1080%2f17441692.2022.2116749&partnerID=40&md5=0436e84a9f969760a324ba828459a50f	OBJECTIVES: To discuss studies conducted in Brazil relating to PrEP, from 2012 to 2022, based on a narrative review. METHODOLOGY: The databases of the Virtual Health Library/PAHO, portals from Scielo, Scopus, and PubMed, and the descriptors in English and Portuguese 'Pre-exposure to HIV' and 'Brazil' were used, as well as a list of planned/in-progress demonstrative studies. Inclusion criteria consists of articles with fieldwork in Brazil coupled with PrEP in the Brazilian scenario; and articles in English or Portuguese. Articles in which PrEP was not the central theme and the participating Brazilian population did not reside in Brazil were excluded. RESULTS: 107 papers have been reviewed, 80 articles met the inclusion criteria. The majority participating population was men who have sex with men. 61 studies preceded the implementation of PrEP in Brazil. Studies carried out after implementation (n = 19) deal primarily with the impact of the COVID-19 pandemic. CONCLUSIONS: There was an incipient number of studies on the injectable form of PrEP. Fewer studies included segments with greater difficulties in access, use, and adherence. Despite the issues that circumscribe this prevention technology, literature is consensual on the importance of Brazilian leadership for implementing PrEP. © 2022 Informa UK Limited, trading as Taylor & Francis Group.	biomedical technology; Brazil; HIV; Pre-exposure prophylaxis; prevention; review	English	United Kingdom	Western and Central Europe and North America	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Review
Theses and Dissertations	2022	Ribeiro, Kennedy Crepalde	Uso das profilaxias pós-exposição e pré-exposição no Brasil na prevenção combinada do HIV (2011-2019).	-	-	-	Universidade Federal de Minas Gerais	-	-	NA	https://repositorio.ufmg.br/handle/1843/52074	Introdução: As profilaxias pós-exposição ao HIV (PEP) e a pré-exposição ao HIV (PrEP) estão disponíveis no Sistema Único de Saúde como alternativas para a prevenção combinada do HIV. A efetividade das profilaxias contra a infecção pelo HIV tem sido demonstrada na literatura, no entanto há poucas evidências de abrangência nacional sobre o uso da PEP e da PrEP. O objetivo geral com esse trabalho foi avaliar o uso da PEP após exposição sexual consentida (PEPSE) e da PrEP no Brasil. Objetivos: Os objetivos específicos foram: avaliar a tendência da prevalência do uso da PEPSE e da proporção de pessoas que repetiram a PEPSE em 365 dias entre os anos 2011 e 2019 (Estudo 1); avaliar os esquemas antirretrovirais para PEPSE mais dispensados entre os anos de 2011 e 2019 (Estudo 1); identificar características das pessoas que fizeram uso ou repetiram a PEPSE em 2018 (Estudo 1); analisar a adesão à PrEP em 365 dias entre pessoas iniciando a profilaxia em 2018 (Estudo 2); e identificar características das pessoas e dos serviços associados independentemente à adesão à PrEP em 365 dias (Estudo 2). Métodos: Ambos estudos utilizaram, como fonte de dados, as dispensações contidas no Sistema de Controle Logístico de Medicamentos (Siclom). No estudo 1, foram avaliadas as tendências na prevalência da PEPSE por milhão (2011-2019) e a proporção de pessoas que repetiram a PEPSE em 365 dias desde a primeira dispensação da PEPSE (2011-2018), no Brasil, por meio da regressão de joinpoint. Ademais, foi comparada a prevalência da PEPSE repetida de acordo com as características das pessoas e das Unidades Dispensadoras de Medicamentos em 2018, o ano mais recente disponível. No estudo 2, a adesão à PrEP foi estimada usando a proporção de dias cobertos (PDC) desde a primeira data de dispensação até 365 dias de acompanhamento para as pessoas com ano-índice de 2018. Considerou-se em adesão ao tratamento PDC ≥ 60%. Para determinar as características associadas à adesão, foi realizada uma análise de regressão logística mutuamente ajustada. Foram realizadas análises de sensibilidade elevando o limiar de adesão (PDC ≥ 80%); ou censurando pessoas pelo tempo de acompanhamento. Resultados: No Estudo 1 foram incluídas 198.801 pessoas. Foi observado que a prevalência da PEPSE aumentou 55,5% entre 2011-2019: de 0,7 por milhão de habitantes em janeiro de 2011 para 29,7 em dezembro de 2019. Os principais antirretrovirais prescritos para PEPSE no período acompanharam as recomendações clínicas nacionais vigentes em cada época. A proporção de pessoas que repetiram a PEPSE aumentou 11,8% desde 2011, chegando a uma proporção de 8,4% entre as pessoas com primeira dispensação em 2018. Dentre as características associadas à maior prevalência de uso repetido da PEPSE, estão os homens cisgênero, mulheres transgênero, homossexuais, adultos jovens (25-29 anos), unidades dispensadoras de medicamentos de cidades com mais de 500 mil habitantes, ou que atendem um maior número de pessoas. No Estudo 2 foram incluídas 5.131 pessoas iniciando a PrEP em 2018: 68% aderiram à PrEP (proporção de dias cobertos ≥60%) ao final de 365 dias. Observou-se, ainda, que 11,5% das pessoas tiveram dispensação única da PrEP em um ano. Os seguintes fatores foram associados à maior probabilidade de adesão: homens cisgênero, idade menor que 40 anos, homossexuais/gays/lésbicas, ter 12 ou mais anos de escolaridade e morar na região Sudeste. Utilizando PDC ≥ 80%, a proporção de pessoas aderentes diminuiu para 56,0% enquanto considerar a perda de acompanhamento elevou a proporção de pessoas em adesão para 91,6%. No entanto, as características associadas a adesão permaneceram semelhantes. Conclusão: Os achados desses estudos sinalizam a importância da oferta da prevenção combinada, especialmente no caso das populações com maior prevalência de repetição da PEPSE, bem como a necessidade de reforçar e desenvolver políticas de saúde pública que visem melhorar a adesão à PrEP para máxima efetividade.	profilaxia pós-exposição, profilaxia pós-exposição não ocupacional, profilaxia pré-exposição, adesão medicamentosa	Portuguese	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	-	-	Quantitative
Article	2022	Richardson, Daniel; Buck, Emma; Parkhouse, Andrew; Williams, Deborah	Increased clinician confidence and uptake of event-based PrEP by men who have sex with men during the COVID-19 pandemic	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2021-054994	https://sti.bmj.com/content/98/2/152	HIV pre-exposure prophylaxis (PrEP) can either be used daily or as an event-based dosing (EBD) regimen by men who have sex with men (MSMs) having condomless anal sex to prevent HIV transmission; however, clinicians with expertise delivering daily PrEP often lack confidence delivering EBD–PrEP.1 During the COVID-19 pandemic, MSMs appear to have tailored their sexual behaviour in line with local social restrictions, including the way they use PrEP.2 We aimed to explore the proportion of MSMs using EBD–PrEP since the national rollout of PrEP in the UK	pre-exposure prophylaxis; COVID-19; Disease prevention; Pandemics; Disease transmission; Confidence; men; health promotion; Medical Sciences--Dermatology And Venereology; United Kingdom--UK; Coronaviruses	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative
Article	2022	Richardson, Daniel; Nichols, Kayleigh; Hughes, Richard; Smith, Hannah; Fitzpatrick, Colin; Cresswell, Fiona	The characteristics of men who have sex with men (MSM) using post-exposure prophylaxis for sexual exposure (PEPSE) in the pre-exposure prophylaxis (PrEP) era	HIV Medicine	-	-	-	-	14642662	10.1111/hiv.13201	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118358335&doi=10.1111%2fhiv.13201&partnerID=40&md5=967e63d50ca1ae712ce62a243b8dd838	Objectives: HIV pre-exposure prophylaxis (PrEP) is now available in the UK. However, some men who have sex with men (MSM) continue to use HIV post-exposure prophylaxis following sexual exposure (PEPSE) and are not using PrEP. It is important to characterize MSM having condomless anal sex who are not using PrEP. Methods: In a cross-sectional analysis, we compared the characteristics of MSM who used PEPSE in 2021 with MSM using PEPSE in 2017. Results: Overall, 126 MSM used PEPSE in January to June 2017 and 28 MSM used PEPSE in January to June 2021, a 78% decline in PEPSE use. Those MSM using PEPSE in 2021 were significantly younger (27 vs. 35 years, p < 0.01), more likely to identify as black or from another minority ethnic group 29% (8/28) vs. 8% (10/126); p < 0.01, more likely to attend as a result of a group sex encounter 35% (10/28) vs. 16% (10/126); p = 0.03, more likely to attend following sex involving recreational drug use 32% (9/28) vs. 13% (16/126); p = 0.02, and more likely to initiate PEPSE in the emergency department 35% (10/28) vs. 19% (24/126); p = 0.04 compared with MSM attending in 2017. Those MSM using PEPSE in 2021 were significantly less likely to attend follow-up appointments compared with the 2017 cohort 71% (20/28) vs. 87% (110/126); p < 0.05. Ninety-five per cent of MSM using PEPSE in 2021 were initiated on PrEP at follow-up. Conclusions: Despite PrEP being readily available, some MSM continue using PEPSE and these MSM are significantly more likely to be younger, from black or minority ethnic groups, to engage in group sex involving recreational drugs and to attend the emergency department for PEPSE compared with MSM attending in 2017. Increasing the accessibility of PrEP for this group of MSM is important in order to optimize HIV prevention strategies. © 2021 British HIV Association.	men who have sex with men (MSM); post-exposure prophylaxis; pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2022	Rinaldi C.; Bacio M.	"Risky" sexual practices in a sample of Italian sex workers. From traditional sexual scripts to the neoliberal sexual actor?; Pratiche sessuali a "rischio" in un campione di lavoratori sessuali italiani. Dai copioni sessuali tradizionali all'attore sessuale neoliberale?	Salute e Società	-	-	-	-	17239427	10.3280/SES2022-002009	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131403158&doi=10.3280%2fSES2022-002009&partnerID=40&md5=8651d8f5b25fc2f5c06edab5b23bfbd6	In this article, we deal with the so-called "risky sexual behaviours" and the spread of HIV/AIDS among the community of MSM (men who have sex with other men). For a long time, both the sociological analysis and the medical and epidemiological approach studied the behaviour of the gay population as "inherently" more problematic in terms of spreading the human immunodeficiency virus. For these studies, even more dangerous are those men who sell sex and sexual services. Starting from a sample of twenty-one male sex workers in Italy and of the use or misuse of condoms during encounters with their male clients, this contribution will try to understand how "risky sexual practices" (like barebacking or doing sex without a condom) are written and re-written. From the sexual script theory to the recent advancement in medicine in the fight against HIV/AIDS (like TasP and PrEP) that shape and re-shape how sex is performed, moving from the "gay plague" to the "Truvada whore" and from traditional sexual scripts to the neoliberal sexual actor. Article	2022	Rios, Luís Felipe; Adrião, Karla Galvão; Albuquerque, Amanda; Pereira, Amanda França	Couro no couro': homens com práticas homossexuais e prevenção do HIV na Região Metropolitana do Recife	Saúde Debate	-	-	-	-	0103-1104	10.1590/0103-11042022e706	http://www.scielosp.org/scielo.php?script=sci_arttext&pid=S0103-11042022001200085	RESUMO O texto aborda as práticas sexuais e a prevenção do HIV nos circuitos de Homens que fazem Sexo com Homens (HSH) da Região Metropolitana do Recife, embasados em inquérito comportamental com 380 HSH de idade de 18 a 51 anos, e entrevistas com 20 dos respondentes. Os dados analisados foram coletados entre janeiro de 2016 e fevereiro de 2017, quando a Profilaxia Pré-Exposição (PrEP) ainda não estava disponível e a Profilaxia Pós-Exposição (PEP) era pouco conhecida (51,8%) e utilizada (1,3%). O Sexo Anal Desprotegido (SAD) (50,6% em parcerias fixas, 30,2% em casuais) ocorria, geralmente, com parceiros presumidamente negativos para HIV. As sorologias eram inferidas pelos vínculos (estranho, conhecido, amigo, namorado). As emoções (medo, tesão, amor, confiança, nojo, carência) eram importantes na configuração do SAD, normalmente articuladas às vinculações. Observaram-se regimes de prazer dissidentes da heteronormatividade: boca-ânus e boca-pênis; sexo a três e em grupo. Considerando a forte presença de SAD e a alta prevalência de HIV em Recife (21,5%), constatou-se a necessidade de ações educativas que apresentem técnicas da prevenção combinada (camisinha, PrEP, PEP, soroescolha, segurança negociada etc.) mediante narrativas que incorporem vínculos, emoções e regimes de prazer dissidentes, para que, ao se aproximarem dos contextos de usos, possibilitem escolhas mais seguras. Article	2022	Roach M.; Fritz J.	Breaking barriers and building bridges: Increasing community engagement in program evaluation	Evaluation and Program Planning	-	-	1497189	10.1016/j.evalprogplan.2021.101997	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114441863&doi=10.1016%2fj.evalprogplan.2021.101997&partnerID=40&md5=11a5fc7ace600aaee3fe29271f5fb14e	Background: Between September 2015 and 2018, The Michigan Department of Health and Human Services (MDHHS) focused its Project PrIDE efforts on increasing PrEP awareness through a media campaign, and community engagement in. Wayne County, MI. A strained relationship between MDHHS and community has created barriers to sustained and effective community engagement. The local evaluation (LE) was developed to determine the barriers and facilitators to engagement in program activities. Methods: To understand the process and the factors that impacted the project's goal, a mixed methods participatory evaluation approach was utilized. Data collection included quantitative data from meeting surveys, qualitative data from focus groups, and a photovoice project. Analysis and synthesis included descriptive statistics and deductive thematic coding. Results: CAB engagement increased collaboration, enhanced feasibility and utility, appropriateness, sustainability of activities, and increased transparency between MDHHS and CAB. Thematic coding identified Barriers and facilitators to engagement with PrEP activites included restrictive funding, comprehensive services delivery and CAB feedback underutilized and resulting in ineffective campaign messages. Conclusions: Although a strained relationship was evident in the beginning, encouraging interagency collaboration in the development, implementation, and utilization of program and evaluation activities, resulted in the improvement of relationships between the community and MDHHS. © 2021	Community based participatory research; Community engagement; HIV prevention; PrEP; Program evaluation; Social marketing	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Roberts, D Allen; Bridenbecker, Daniel; Haberer, Jessica E; Barnabas, Ruanne V; Akullian, Adam	The impact of prevention-effective PrEP use on HIV incidence: a mathematical modelling study.	Journal of the International AIDS Society	-	-	1758-2652	10.1002/jia2.26034	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9670193	INTRODUCTION: Models that project the impact and cost-effectiveness of HIV pre-exposure prophylaxis (PrEP) must specify how PrEP use aligns with HIV exposure. We hypothesized that varying PrEP use according to individual-level partnership dynamics rather than prioritization to population subgroups based on average risk will result in larger incidence reductions and greater efficiency. METHODS: We used an individual-based network transmission model calibrated to HIV dynamics in Eswatini to simulate PrEP use among individuals ages 15-34 between 2022 and 2031 under two paradigms of PrEP delivery: "Risk Group" and "Partnership." In the "Risk Group" paradigm, we varied PrEP coverage by risk groups (low, medium and high) defined by average partnership frequency and concurrency. In the "Partnership" paradigm, all individuals are potentially eligible for PrEP, but we assumed use occurs only during partnerships and varied prioritization by partner HIV status (no prioritization to high prioritization with HIV-positive partners). We calculated person-time on PrEP and incidence relative to a no PrEP scenario and estimated efficiency as the person-years of PrEP needed to avert one additional infection (NNT). RESULTS: In the Risk Group paradigm, restricting PrEP to the high-risk group was the most efficient (NNT = 17), but the number of infections averted was limited by the small size of the high-risk group. Expanding PrEP use to all risk groups averted up to three times more infections but with lower efficiency (NNT = 202). PrEP use under the Partnership paradigm was 2-6 times more efficient (NNT = 33-102) than the Risk Group paradigm with all groups eligible for PrEP. A 33% reduction in incidence among 15- to 34-year-olds was achieved at 46% (95% CI: 39-52%) PrEP coverage in the Risk Group paradigm and 6% (95% CI: 5-7%) to 17% (95% CI: 14-20%) in the Partnership paradigm. CONCLUSIONS: Modelling PrEP use based on risk groups resulted in a sharp trade-off between PrEP efficiency and impact, whereas PrEP use predicated on partnerships resulted in much higher efficiency for widespread PrEP availability. Model estimates of PrEP impact and cost-effectiveness in generalized epidemics are strongly influenced by assumptions about how PrEP use aligns with individual-level HIV exposure heterogeneity. Article	2022	Robles, Gabriel; Hong, Chenglin; Yu, Melanie; Starks, Tyrel J	Intersecting Communities and PrEP Uptake among US-based Latinx Sexual Minority Men.	Journal of Racial and Ethnic Health Disparities	-	-	2196-8837	10.1007/s40615-021-01154-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9034471	The Latinx community in the USA continues to be disproportionately burdened by the HIV epidemic, especially among Latinx sexual minority men (LSMM). Research indicates that up to two-thirds of new HIV infections occur among men who have sex with men (MSM) within primary partnerships. One promising biomedical approach for HIV prevention includes community scale-up of pre-exposure prophylaxis (PrEP) among LSMM. We examine the relationship between community connectedness (with the Latinx and gay communities) and PrEP uptake among 307 partnered LSMM who reported casual partner sex (i.e., non-monogamous relationships). Within the sample, approximately thirty percent (29.7%) of participants were on PrEP, and 43.3% reported partner approval for PrEP (i.e., my partner is in favor of PrEP generally), while only 7.2% were opposed to PrEP. Insurance status and income levels were significantly associated with PrEP uptake. There was a significant interaction term (gay community connectedness and Latinx group membership), which was positively associated with PrEP uptake (OR = 2.18; p = .007). Findings suggest that there may be structural barriers preventing this population from seeking and initiating PrEP care. Results point to the utility of integrating culturally relevant content related to intersecting identities and their corresponding communities when conceptualizing community-based and culturally informed interventions to improve the PrEP care cascade among LSMM. Article	2022	Roche S.D.; Barnabee G.; Omollo V.; Mogaka F.; Odoyo J.; Bukusi E.A.; Morton J.F.; Johnson R.; Celum C.; Baeten J.M.; O'Malley G.	Implementation strategies for integrating pre-exposure prophylaxis for HIV prevention and family planning services for adolescent girls and young women in Kenya: a qualitative study	BMC Health Services Research	-	-	14726963	10.1186/s12913-022-07742-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127237429&doi=10.1186%2fs12913-022-07742-8&partnerID=40&md5=3ce85e2985f27a4dc190127d0c9f2df8	Introduction: Across sub-Saharan Africa, ministries of health have proposed integrating pre-exposure prophylaxis (PrEP) for HIV prevention into family planning (FP) services to reach adolescent girls and young women (AGYW); however, evidence on effective implementation strategies is still limited. We conducted a qualitative study of integrated PrEP-FP service implementation at two FP clinics in Kisumu, Kenya. Methods: From June 2017 to May 2020, the Prevention Options for Women Evaluation Research (POWER) study enrolled 1000 sexually active, HIV-negative AGYW age 16 to 25. Actions taken to implement PrEP were captured prospectively in 214 monitoring and evaluation documents and 15 interviews with PrEP implementers. We analysed data using conventional and directed content analysis, with the latter informed by the Consolidated Framework for Implementation Research (CFIR) and the Expert Recommendations for Implementing Change (ERIC) compilation. Results: POWER deployed a variety of implementation strategies to train and educate stakeholders (e.g., having new providers shadow PrEP providers); develop stakeholder interrelationships (e.g., organizing support teams with protected time to reflect on implementation progress and make refinements); provide technical assistance; and change physical infrastructure and workflow. Although these strategies reportedly influenced contextual factors across four of the five CFIR domains, they primarily interacted with contextual factors relevant to inner setting, especially implementation climate and readiness for implementation. Overall, implementing PrEP proved easier and less labor-intensive at a private, youth-friendly clinic than a public FP clinic, largely because the baseline structural characteristics (e.g., space, workflow) and organizational mission of the former were more conducive to offering AGYW-centered care. Nevertheless, adoption of PrEP delivery among non-study staff at both sites was low, likely due to the widespread perception that PrEP was not within their scope of work. Conclusions: Some FP clinics may be "lower-hanging fruit" than others for PrEP implementation. Approaching PrEP implementation as a behavioral intervention for FP providers may help ensure that providers have the requisite capability, opportunity, and motivation to adopt the clinical innovation. In particular, PrEP implementers should assess the need for implementation strategies that support providers' clinical decision-making, establish worker expectations and accountability, and address workload constraints. Article	2022	Rogers, Ajeh; Brazier, Ellen; Dzudie, Anastase; Adedimeji, Adebola; Yotebieng, Marcel; Muhoza, Benjamin; Twizere, Christella; Lelo, Patricia; Nsonde, Dominique; Mafoua, Adolphe; Munyaneza, Athanase; Gateretse, Patrick; Diafouka, Merlin; Murenzi, Gad; Niyongabo, Théodore; Anastos, Kathryn; Nash, Denis	COVID-19 associated changes in HIV service delivery over time in Central Africa: Results from facility surveys during the first and second waves of the pandemic.	PLOS One	-	-	1932-6203	10.1371/journal.pone.0275429	https://pubmed.ncbi.nlm.nih.gov/36449454/	INTRODUCTION: The COVID-19 pandemic has impacted population health around the globe, directly and indirectly. The objective of this study was to document changes in HIV care associated with the COVID-19 pandemic at selected clinics in Central Africa, along with clinic-level strategies for minimizing disruptions in HIV care and treatment for people with HIV (PWH). METHODS: A 51-item questionnaire on COVID-19 pandemic-associated changes in HIV service delivery was completed by clinicians involved in HIV care at 21 clinics in five countries participating in Central Africa International epidemiology Databases to Evaluate AIDS (CA-IeDEA). The survey was completed at two timepoints: June-July 2020 and October 2020 to February 2021. Descriptive statistics were used to characterize changes in HIV care and related services. RESULTS: While 81% of sites reported at least one negative consequence of COVID-19 for clinic operations during the first survey, none reported suspending antiretroviral therapy (ART) initiation services for new patients, and 24% reported adopting telemedicine. In the follow-up survey, fewer sites (48%) reported at least one disruption to clinic operations, and more sites reported mitigation strategies, including expanding rapid ART initiation services and providing extra supplies of ART medications to reduce visit frequency. In the follow-up survey, more sites, especially in Rwanda, reported stockouts of commodities, including HIV and viral load testing and HIV pre-exposure prophylaxis. More than one-fifth of sites reported stockouts of second- or third-line ART at each survey timepoint. CONCLUSIONS: While the initial wave of the COVID-19 pandemic resulted in concerning disruptions to HIV service delivery at CA-IeDEA sites, most of these disruptions attenuated over time, and many sites introduced measures to help PWH avoid frequent visits to the clinic for care and medications. The impact of HIV commodity stockouts and clinic mitigation strategies on treatment outcomes needs to be assessed. Article	2022	Rogers, Brooke G; Sosnowy, C; Zanowick-Marr, A; Chan, P A; Mena, L A; Patel, R R; Goedel, W C; Arnold, T; Chu, C; Galipeau, D; Montgomery, M C; Curoe, K; Underwood, A; Villalobos, J; Gomillia, C; Nunn, A S	Facilitators for retaining men who have sex with men in pre-exposure prophylaxis care in real world clinic settings within the United States.	BMC Infectious Diseases	-	-	1471-2334	10.1186/s12879-022-07658-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9354303	BACKGROUND: Pre-exposure prophylaxis (PrEP) can significantly reduce HIV acquisition especially among communities with high HIV prevalence, including men who have sex with men (MSM). Much research has been finding suboptimal PrEP persistence; however, few studies examine factors that enhance PrEP persistence in real-world settings. METHODS: We interviewed 33 patients who identified as MSM at three different PrEP clinics in three regions of the U.S. (Northeast, South, Midwest). Participants were eligible if they took PrEP and had been retained in care for a minimum of 6 months. Interviews explored social, structural, clinic-level and behavioral factors that influencing PrEP persistence. RESULTS: Through thematic analysis we identified the following factors as promoting PrEP persistence: (1) navigation to reduce out-of-pocket costs of PrEP (structural), (2) social norms that support PrEP use (social), (3) access to LGBTQ + affirming medical providers (clinical), (4) medication as part of a daily routine (behavioral), and (5) facilitation of sexual health agency (belief). DISCUSSION: In this sample, persistence in PrEP care was associated with structural and social supports as well as a high level of perceived internal control over protecting their health by taking PrEP. Patients might benefit from increased access, LGBTQ + affirming medical providers, and communications that emphasize PrEP can promote sexual health. Article	2022	Rogers, Brooke G; Tao, Jun; Darveau, Spencer C; Maynard, Michaela; Almonte, Alexi; Napoleon, Siena; Murphy, Matthew; Chan, Philip A	The Impact of COVID-19 on Sexual Behavior and Psychosocial Functioning in a Clinical Sample of Men who have Sex with Men Using HIV Pre-exposure Prophylaxis.	AIDS and Behavior	-	-	1573-3254	10.1007/s10461-021-03334-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8191709	The purpose of this study was to evaluate the impact of the Coronavirus Disease 2019 (COVID-19) pandemic on sexual behavior, mental health, and substance use among men who have sex with men (MSM) engaged in pre-exposure prophylaxis (PrEP) care. Generalized linear mixed models and logistic mixed-effect models examined change over time for number of sexual partners, mood, and alcohol consumption. From February 29, 2020 to July 31, 2020, 177 MSM actively engaged in PrEP care were evaluated. The median age was 37 interquartile range (IQR 30, 51. Patients in the sample were largely representative of the clinic population and identified as White (73.0%), Black/African American (9.2%), and other race (17.2%), and 11.8% identified as Hispanic/Latino ethnicity. Men reported an average of 2.60 fewer sexual partners (95% CI -4.04, -1.40) during the pandemic compared to pre-COVID-19. Rates of depressive symptoms and alcohol use remained stable and few patients reported substance use. The reduced number of sexual partners may be explained by patients' efforts to reduce risk of exposure to COVID-19 and low rates of psychosocial symptoms may be indicative of only the highest functioning patients continuing to engage in care. Reductions in sexual partners may offset reduced engagement in care and help mitigate risk of HIV and other sexually transmitted infections (STIs).	Alcohol; COVID-19; Men who have sex with men (MSM); Mood; Pre-exposure prophylaxis; Sexual behavior. Article	2022	Rogers, Zoe; Pintye, Jillian; Kinuthia, John; O'Malley, Gabrielle; Abuna, Felix; Escudero, Jaclyn; Mugambi, Melissa; Awuor, Mercy; Dollah, Annabell; Dettinger, Julia C; Kohler, Pamela; John-Stewart, Grace; Beima-Sofie, Kristin	Key influences on the decision to initiate PrEP among adolescent girls and young women within routine maternal child health and family planning clinics in Western Kenya.	AIDS Care	-	-	1360-0451	10.1080/09540121.2021.1981217	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8934309	We sought to understand influences on PrEP uptake among Kenyan adolescent girls and young women (AGYW) whose decision on PrEP use was misaligned with their risk for HIV acquisition. In-depth interviews were conducted with 47 Kenyan HIV-negative AGYW aged 15-24 years who were offered PrEP during routine maternal and child health and family planning services. AGYW were sampled from two groups (1) declined PrEP and had ≥1 sexual partner(s) of unknown HIV status and (2) initiated PrEP and reported having one HIV-negative partner. AGYW with HIV-negative partners initiated PrEP due to known or suspected infidelity. AGYW with partners of unknown HIV status recognized PrEP as a helpful HIV prevention tool, yet worried about partner reactions and prioritized avoiding uncomfortable or unsafe situations over PrEP. Among pregnant AGYW, the responsibility of motherhood and providing a future for one's family, through staying healthy and remaining HIV-free, was a strong PrEP use motivator. Among AGYW who desired future motherhood, fears that PrEP could negatively impact fertility or reduce contraceptive effectiveness led to declining PrEP. Peers positively influenced PrEP decision-making, especially personally knowing a PrEP user. Strategies are needed to enhance messaging and delivery approaches that are tailored to AGYW, including peer-led strategies. Article	2022	Romijnders K.A.G.J.; de Groot L.; Vervoort S.C.J.M.; Basten M.; van Welzen B.J.; Kretzschmar M.E.; Reiss P.; Davidovich U.; van der Loeff M.F.S.; Rozhnova G.	The experienced positive and negative influence of HIV on quality of life of people with HIV and vulnerable to HIV in the Netherlands	Scientific Reports	-	-	20452322	10.1038/s41598-022-25113-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144260317&doi=10.1038%2fs41598-022-25113-5&partnerID=40&md5=9edd1035d304297065b07d8289bff7f3	This qualitative study aimed to explore the experienced influence of HIV on the quality of life (QoL) of people with HIV (PHIV) and key populations without but are vulnerable to HIV in the Netherlands. We conducted and thematically analyzed interviews with 29 PHIV and 13 participants from key populations without HIV (i.e., men who have sex with men). PHIV and key populations shared positive meaningful experiences regarding HIV, i.e., feeling grateful for ART, life, and the availability of PrEP, being loved and supported in the light of HIV, and providing support to the community. Negative predominant experiences regarding HIV were described by both PHIV and key populations as the negative effects of ART, challenges with regards to disclosing HIV, social stigmatization, and self-stigma. It remains important to support HIV community organizations in their efforts to reduce social stigmatization and to continue improving biomedical interventions for HIV. © 2022, The Author(s). Article	2022	Rosecrans, Amanda; Harris, Robert; Saxton, Ronald E; Cotterell, Margaret; Zoltick, Meredith; Willman, Catherine; Blackwell, Ingrid; Bell, Joy; Hayes, Darryl; Weir, Brian; Sherman, Susan; Lucas, Gregory M; Greenbaum, Adena; Page, Kathleen R	Mobile low-threshold buprenorphine integrated with infectious disease services.	Journal of Substance Abuse Treatment	-	-	1873-6483	10.1016/j.jsat.2021.108553	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8702567	INTRODUCTION: In 2018, the Baltimore City Health Department launched a mobile clinic called Healthcare on The Spot, which offers low-threshold buprenorphine services integrated with health care services to meet the needs of people who use drugs. In addition to buprenorphine management, The Spot offers testing and treatment for hepatitis C, sexually transmitted infections, and HIV, as well as pre-exposure prophylaxis for HIV, wound care, vaccinations, naloxone distribution, and case management. METHODS AND MATERIALS: This cohort analysis includes clinical service data from the first 15 months of The Spot mobile clinic, from September 4, 2018, to November 23, 2019. The Spot co-located with the Baltimore syringe services program in five locations across the city. Descriptive data are provided for patient demographics and services provided, as well as percent of patients retained in buprenorphine treatment at one and three months. Logistic regression identified factors associated with retention at three months. RESULTS: The Spot mobile clinic provided services to 569 individuals from September 4, 2018, to November 23, 2019, including prescribing buprenorphine to 73.8% and testing to more than 70% for at least one infectious disease. Patients receiving a prescription for buprenorphine were more likely to be tested for HIV, hepatitis C, and sexually transmitted infections, as well as receive treatment for hepatitis C and preventive services including vaccination and naloxone distribution. The Spot initiated HIV treatment for four patients and HIV pre-exposure prophylaxis for twelve patients. More than 32% of patients had hepatitis C; nineteen of these patients initiated treatment for hepatitis C with eight having a documented cure. Buprenorphine treatment retention was 56.0% at one month and 26.2% at three months. Patients who were Black or receiving treatment for hepatitis C were more likely to be retained in buprenorphine treatment at three months. CONCLUSIONS: Increasing access to integrated medical services and drug treatment through low-threshold, community-based models of care can be an effective tool for addressing the effects of drug use. Article	2022	Rosen J.G.; Beckham S.W.; Glick J.L.; White R.H.; Park J.N.; Footer K.H.; Sherman S.G.	Acceptability of Event-Driven and Long-Acting HIV Pre-Exposure Prophylaxis Formulations Among Transgender Women Engaged in Street-Based Sex Work in Baltimore, Maryland	Transgender Health	-	-	2380193X	10.1089/trgh.2022.0057	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162261873&doi=10.1089%2ftrgh.2022.0057&partnerID=40&md5=3f8a296774f77a6436a0318b64a02fd0	We assessed acceptability of nonoral HIV pre-exposure prophylaxis (PrEP) formulations among transgender women (TW) engaged in street-based sex work in Baltimore, Maryland. In a K-means cluster analysis, TW (N=36) were partitioned into groups characterized by high interest in long-acting injectable PrEP only (Injectable Enthusiasts, 36%), high interest in injectables and subdermal implants (Long-Acting Acceptors, 36%), and low interest across PrEP formulations (Non-Acceptors, 28%). TW's interest in novel PrEP agents varied widely across formulations (range: 22-66%) and clustered around numerous relational, occupational, and structural factors, highlighting the importance of availing multiple PrEP formulations for this impacted population. Article	2022	Rosen J.G.; Park J.N.; Schneider K.E.; White R.H.; Beckham S.W.; Glick J.L.; Footer K.H.A.; Sherman S.G.	Mapping Interests in Event-Driven and Long-Acting Pre-exposure Prophylaxis Formulations onto the HIV Risk Environment of Street-Based Female Sex Workers: A Latent Class Analysis	AIDS and Behavior	-	-	10907165	10.1007/s10461-022-03613-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127617076&doi=10.1007%2fs10461-022-03613-9&partnerID=40&md5=9fdbb6eb3fe1a7dd7b4f7147d4bb3c65	Despite growing availability, HIV pre-exposure prophylaxis (PrEP) uptake and adherence remain suboptimal among female sex workers (FSW) in the United States. Using cross-sectional data from a survey of 236 street-based cisgender FSW in Baltimore, Maryland, we examined interest in event-driven and long-acting PrEP formulations. Latent class analysis identified discrete patterns of interest in five novel PrEP agents. Multinomial latent class regression then examined factors associated with probabilistic class membership. A three-class solution emerged as the best-fit latent class model: Injectable Acceptors (~ 24% of sample), Universal Acceptors (~ 18%), and Non-Acceptors (~ 58%). Compared to Non-Acceptors, Universal Acceptors had significantly (p < 0.05) higher odds of reporting condomless vaginal sex with clients, client condom coercion, and client-perpetrated physical violence. Relative to Non-Acceptors, Injectable Acceptors were distinguished by significantly higher rates of condomless vaginal sex with clients and injection drug use. Expanding PrEP options for FSW could help overcome barriers to PrEP initiation and persistence. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Rosen, Joseph G; Zhang, Leanne; Pelaez, Danielle; Coleman, Jenell S; To, C; Cooper, Lyra; Olatunde, Praise F; Toomre, Teagan; Glick, Jennifer L; Park, Ju Nyeong	Provider Perspectives on HIV Pre-Exposure Prophylaxis Service Disruptions and Adaptations during the COVID-19 Pandemic in Baltimore, Maryland: A Qualitative Study	AIDS Patient Care and STDs	-	-	10872914	10.1089/apc.2022.0058	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136339860&doi=10.1089%2fapc.2022.0058&partnerID=40&md5=dace088db043b569fcb8cc48003cd527	The COVID-19 pandemic continues driving unprecedented disruptions to health care provision, including HIV pre-exposure prophylaxis (PrEP) services. We explored service provider experiences promoting and prescribing PrEP to marginalized populations during the COVID-19 pandemic in Baltimore, Maryland. In February to April 2021, we facilitated four virtual focus group discussions with 20 PrEP providers, representing various professional cadres and practice settings. Employing an iterative, team-based thematic analysis, we identified salient enablers and constraints to PrEP promotion, initiation, and maintenance in the COVID-19 era, along with innovative adaptations to PrEP service delivery. Discussants described attenuated demands for PrEP early in the pandemic, exemplified by high PrEP discontinuation rates. This was attributed to changes in clients' sexual behaviors and shifting priorities, including caregiving responsibilities, during the pandemic. Substantial systems-level disruptions impacting PrEP provision were identified, including outreach service suspension, personnel shortages, and facility restrictions on face-To-face visits. Providers emphasized that these disruptions, though occurring early in the pandemic, had protracted impacts on PrEP accessibility. The transition to telemedicine rendered health care services, including PrEP, more accessible/convenient to some clients and expeditious to providers. However, structural barriers to telehealth engagement (telephone/internet access), coupled with limitations of the virtual care environment (difficulty establishing rapport), impeded efforts to equitably promote and prescribe PrEP. Expanding the PrEP outreach workforce and availing alternatives to telemedicine (e.g., community-based PrEP provision, specimen self-collection) could facilitate PrEP care continuity, especially as COVID-19 transitions from an acute to a protracted health crisis. © Copyright 2022, Mary Ann Liebert, Inc., publishers 2022. Article	2022	Rotert P.; Wheldon C.; Kownack J.; Sullivan-Blum Z.; Cokingtin B.; Khetani K.; Ndeti K.; Skyes K.; Ramaswamy M.	Human Papillomavirus Prevalence and Vaccination Rates Among Users of Pre-Exposure Prophylaxis for Human Immunodeficiency Virus Prevention	Journal of Primary Care and Community Health	-	-	21501319	10.1177/21501319221110411	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136029972&doi=10.1177%2f21501319221110411&partnerID=40&md5=c856568f836e699edf7d09cb589d57f9	Introduction: Our study provides data on the prevalence of human papillomavirus (HPV) related disease and vaccination rates among users of pre-exposure prophylaxis (PrEP) in a primary care clinic. Results highlight an opportunity to partner HIV and HPV prevention efforts. Methods: This is a retrospective chart review of PrEP patients in an urban Midwestern Family Medicine clinic. We conducted univariate analyses for HPV vaccination status and the prevalence of any HPV-related disease. We then examined bivariate relationships between vaccination status and insurance coverage, provider type, and age. Results: Of all 78 PrEP patients identified, 21.8% (n = 17) were vaccinated. Of the 59 patients 45 years or younger, 28.8% (n = 17) were vaccinated. There was no association between insurance or provider type and vaccination status. Patients 26 years or younger were 3 times more likely to be vaccinated than those ages 27 to 45 (56.3% vs 18.6%, P =.0011). Three unvaccinated patients had HPV-related disease. Conclusions: Despite ongoing risk of HPV infection and frequent interaction with the medical system, this study found most PrEP users continue to be unvaccinated. This is a significant missed opportunity for HPV prevention. With the FDA approval of the HPV vaccine for individuals age 9 to 45, PrEP patients in this age range would benefit from clinicians partnering HPV vaccination with PrEP prescribing. © The Author(s) 2022. Article	2022	Rotsaert A.; Nöstlinger C.; Van Landeghem E.; Vanbaelen T.; Wouters E.; Buffel V.; Scheerder G.; Schim Van Der Loeff M.; Vuylsteke B.; Reyniers T.	Pre-Exposure Prophylaxis Users' Attitudes About Sexually Transmitted Infections and Its Influence on Condom Use: A Mixed-Method Study in Belgium	AIDS Patient Care and STDs	-	-	10872914	10.1089/apc.2022.0172	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143917328&doi=10.1089%2fapc.2022.0172&partnerID=40&md5=0eea7d0613521005af6411a9ed4ab75a	Incidence rates of sexually transmitted infections (STIs) are rising among men who have sex with men (MSM). Since the rollout of HIV pre-exposure prophylaxis (PrEP), promoting condom use to prevent the spread of STIs has become more challenging. Using a mixed-method design, we explored MSM PrEP users' attitudes toward STIs, condoms, and condom use with nonsteady partners to prevent STIs. We triangulated data from 22 in-depth interviews conducted at a large HIV/STI clinic between August 2021 and January 2022 and an online survey among 326 PrEP users between September 2020 and January 2022. Interviews were analyzed iteratively using a thematic analysis approach. We used bivariate and multi-variate ordered logistic regression to analyze the online survey data. Themes identified in the qualitative data influencing condom use decisions to prevent STIs were as follows: (1) awareness (i.e., perceived severity of and susceptibility to STIs, condom counseling), (2) motivation (i.e., concerns about STIs, sexual pleasure and protection of own health), and (3) perceived social norms and practices (e.g., reduced condom use at community level). Overall, 10.7% of survey respondents consistently used condoms with nonsteady partners. Survey respondents who reported high or moderate levels of willingness to use condoms to prevent acquiring STIs were significantly more likely to use condoms for anal sex with nonsteady partners; those who initiated PrEP 6-12 months ago were less likely to use condoms. We found a wide variation in attitudes toward condom use for the prevention of STIs among MSM using PrEP. We recommend client-centered approaches, taking into account PrEP users' values and priorities toward STI prevention to help reduce the spread of STIs. Article	2022	Rotsaert A.; Reyniers T.; Jacobs B.K.M.; Vanbaelen T.; Burm C.; Kenyon C.; Vuylsteke B.; Florence E.	PrEP user profiles, dynamics of PrEP use and follow-up: a cohort analysis at a Belgian HIV centre (2017–2020)	Journal of the International AIDS Society	-	-	17582652	10.1002/jia2.25953	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133227261&doi=10.1002%2fjia2.25953&partnerID=40&md5=c4bcea54c493b1c341cb898f266f8d96	Introduction: The number of individuals initiating antiretroviral pre-exposure prophylaxis (PrEP) is increasing, but we do not fully understand who is coming forward for PrEP, how they use it and how they are followed-up. The objective of this study was to examine PrEP user profiles, dynamics in PrEP use and follow-up over time. Methods: We conducted a cohort analysis of longitudinally collected clinical record and questionnaire data among PrEP users at an HIV centre in Antwerp, Belgium, between June 2017 and March 2020. PrEP follow-up and user profiles were examined using descriptive analyses and bivariate logistic regression. We compared early adopting PrEP users (started before June 2018) with late users. We also calculated the probabilities of switching between daily and on-demand PrEP, and interruption, using a naïve estimator. Results and discussion: We included 1347 PrEP users in the analysis. After 12 months, retention in care was 72.3%. Median time between PrEP visits was 98 days (IQR 85–119 days). At screening visit, early adopting PrEP users (starting June 2017–May 2018) were significantly more likely to report one or more sexually transmitted infection in the prior 12 months, having used drugs during sex, a higher number of sexual partners and a history of paid sex and PrEP use prior to initiation, compared with PrEP users who initiated later (starting June 2018–February 2020). When taking PrEP daily, the probability of staying on daily PrEP at the next visit was 76%, while this was 73% when taking PrEP on-demand. Those using on-demand PrEP had a higher probability (13%) of interrupting PrEP care than daily PrEP users (7%), whereas those returning to PrEP care would mostly re-start with on-demand (35% vs. 13% for daily). Conclusions: The majority of PrEP users in this sample remained in care after 12 months. The probability of remaining on the same PrEP regimen at the subsequent visit was high. Though, we observed a diversity of transitions between regimens and interruptions in between visits. Our findings reaffirm the need to provide tailored PrEP services, counselling PrEP users across their life course. © 2022 The Authors. Lost2PrEP: Understanding Reasons for Pre-Exposure Prophylaxis and Sexual Health Care Disengagement among Men Who Have Sex with Men Attending a Sexual Health Clinic at a Large Urban Academic Medical Center in New York City	AIDS Patient Care and STDs	-	-	10872914	10.1089/apc.2022.0004	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128797565&doi=10.1089%2fapc.2022.0004&partnerID=40&md5=6df7d4a07f56539aa07e489f7a0066a1	Pre-exposure prophylaxis (PrEP) prevents HIV, but low rates of retention in care limit its effectiveness. We conducted a prospective survey-based study to investigate reasons for PrEP disengagement among men who have sex with men attending a sexual health clinic at a large urban academic medical center in New York City who were lost to follow up; surveys asked about current PrEP status, reasons for disengagement, attitudes toward PrEP, substance use, sexual practices, and behavioral/social determinants of health. Outreach attempts were made to 634 patients; majority of eligible participants were unable to be contacted (59%). Among those who agreed to participate (n = 175), 21% asked to re-establish care. Among those who completed the questionnaire (n = 86), 36% were taking PrEP. The most common reasons for PrEP discontinuation were cost/lack of insurance coverage (31%), decreased HIV risk perception (29%), and side effects (16%). Among those with decreased perception of risk, 62% were less sexually active, 38% were no longer engaging in anal sex, and 31% were using condoms for prevention. Participants reported that free medication (60%), having a sexual partner recommend PrEP (13%), and being able to receive PrEP from a primary care provider (13%) would encourage restarting PrEP. Findings were limited by low response rate (12% of eligible subjects completed the survey) and lack of Spanish-language questionnaires. Understanding reasons for loss-To-PrEP follow-up is essential for HIV prevention. Many people lost to follow up still desired PrEP, underscoring the importance of outreach, benefits navigators, and expansion of PrEP into primary care settings. © Copyright 2022, Mary Ann Liebert, Inc., publishers 2022.	engagement in care; MSM; pre-exposure prophylaxis; sexual health	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Rowell-Cunsolo T.L.; Mkuu R.S.; Bellerose M.; Haile R.; Wechsberg W.	"I Said Maybe We Should Use a Condom, and Then that Just Went South": Exploring Condomless Sex among Formerly Incarcerated Black Men in New York City, USA	Journal of Sex Research	-	-	224499	10.1080/00224499.2021.2004083	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120914510&doi=10.1080%2f00224499.2021.2004083&partnerID=40&md5=c942b9513992667555aa5ee0b5c28ab5	More than 600,000 incarcerated individuals are released annually in the United States; a large proportion are Black men incarcerated for drug-related offenses, including drug use and possession. Formerly incarcerated Black men report elevated rates of condomless sex and sexually transmitted infections, including human immunodeficiency virus (HIV). The purpose of this study was to explore condom usage among Black men who were formerly incarcerated for drug-related offenses and living in New York City (NYC). Using a semi-structured interview guide, in-depth interviews were conducted with 26 formerly incarcerated Black men. Interviews were audio-recorded, transcribed, and entered into NVivo, then manually coded utilizing thematic analysis methods. The following four themes were identified: partner type and length of the relationship affected condom use; diminished pleasure was a barrier for condom use; challenges with ill-fitting and poor-quality condoms; and the withdrawal method was used as an HIV prevention technique. Our findings suggest that formerly incarcerated Black men are engaging in condomless sex post-incarceration. Greater exposure to prevention messages and targeted interventions with content that includes interpersonal and condom use skill-building, methods to increase pleasurable condom use, information on HIV and STI transmission modes, and access to pre-exposure prophylaxis (PrEP) may be beneficial for this population. © 2021 The Society for the Scientific Study of Sexuality. Article	2022	Roy Paladhi, Unmesha; Katz, David A; Farquhar, Carey; Thirumurthy, Harsha	Using Behavioral Economics to Support PrEP Adherence for HIV Prevention.	Current HIV/AIDS Reports	-	-	1548-3576	10.1007/s11904-022-00624-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9428871	PURPOSE OF REVIEW: We explored different behavioral economics (BE) mechanisms through which pre-exposure prophylaxis (PrEP) initiation and adherence could be impacted and examined recent work using BE principles to further HIV prevention efforts. We also generated new intervention ideas based on existing HIV testing and ART adherence literature. RECENT FINDINGS: There is limited work that uses BE principles to design interventions to increase PrEP initiation and adherence, mostly involving financial incentives. The recent works highlighted involve financial incentives and demonstrate that key populations are open to accepting monetary incentives to increase PrEP initiation and improve adherence. However, there are mixed results on the long-term impacts of using incentives to modify behavior. While there are a few ongoing studies that utilize BE principles to increase PrEP use, there is need to develop studies that test these concepts, to promote PrEP initiation and adherence. We suggest methods of exploring non-incentives-based ideas to increase PrEP use in key populations. Article	2022	Roy, Khushali; Himelfarb, Aliayah; Karrah, Kapil; Porterfield, Laura; Paremoer, Lauren; Serag, Hani; Lee, Wei-Chen	The Social, Behavioral, and Ethical Modalities of COVID-19 on HIV Care in South Africa: A Systematic Review.	International Journal of Environmental Research and Public Health	-	-	1660-4601 1661-7827	10.3390/ijerph19159766	https://pubmed.ncbi.nlm.nih.gov/35955119/	The profound public health impact of the novel outbreak of the SARS-CoV-2 virus in 2019 has been unparalleled in the last century. Rapid spread of the disease and a high death toll fueled the development and global rollout of effective vaccines regardless of the massive inequitable access. However, some public health measures intended to control COVID-19 have had collateral effects on the control of other infectious diseases. In this systematic review, we analyze the impact of the COVID-19 pandemic on efforts to control HIV in South Africa, emphasizing the social, ethical, and behavioral ramifications. The SCOPUS, PubMed, Ovid, PsychINFO, and Cochrane Library databases were searched for publications between March 2020 and January 2022. Of the 854 articles identified, 245 were found duplicated, and 609 were screened, 241 of which were potentially eligible, and 15 of which were ultimately included. Although no studies on the ethical implications were eligible for our study criteria due to insufficient primary data to perform an analysis on, we explored this topic in the Discussion section of this paper. We confirm declines in ART, PrEP, and HIV testing during the initial lockdown period, with slight variations across the South African provinces. Protecting routine services and reducing the disease burden on high-risk nations such as South Africa is imperative moving forward with the pandemic. Article	2022	Rudometova, N B; Shcherbakov, D N; Rudometov, A P; Ilyichev, A A; Karpenko, L I	Model systems of human immunodef iciency virus (HIV-1) for in vitro eff icacy assessment of candidate vaccines and drugs against HIV-1.	Vavilovskii Zhurnal Genet Selektsii	-	-	2500-0462	10.18699/VJGB-22-26	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8983303	HIV infection still remains a major challenge for healthcare systems of the world. There are several aspects on counteracting the HIV/AIDS epidemic. The f irst aspect covers preventive measures including educational campaigns on HIV/AIDS and promotion of a healthy lifestyle, protected sex, and pre-exposure prophylaxis of vulnerable groups. The second aspect is timely HIV testing and the use of antiretroviral therapy when test results come back positive. The third aspect is the scientif ic research associated with discovering new pharmaceutical agents and developing HIV-1 vaccines. Selecting an adequate tool for quick and accurate in vitro eff icacy assessment is the key aspect for eff icacy assessment of vaccines and chemotherapy drugs. The classical method of virology, which makes it possible to evaluate the neutralizing activity of the sera of animals immunized with experimental vaccines and the eff icacy of chemotherapy agents is the method of neutralization using viral isolates and infectious molecular clones, i. e. infectious viral particles obtained via cell transfection with a plasmid vector including the full-length HIV-1 genome coding structural, regulatory, and accessory proteins of the virus required for the cultivation of replication-competent viral particles in cell culture. However, neutralization assessment using viral isolates and infectious molecular clones is demanding in terms of time, effort, and biosafety measures. An alternative eliminating these disadvantages and allowing for rapid screening is the analysis of neutralization using of pseudoviruses, which are recombinant viral particles, for the analysis of neutralizing activity. Pseudotyped viruses have defective genomes restricting their replication to a single cycle, which renders them harmless compared to infectious viruses. The present review focuses on describing viral model systems for in vitro eff icacy assessment of vaccines and drugs against HIV-1, which include primary HIV-1 isolates, laboratoryadapted strains, infectious molecular clones, and env-pseudoviruses. A brief comparison of the listed models is presented. The HIV-1 env-pseudoviruses approach is described in more detail. Article	2022	Ruiz-Algueró, Marta; Alejos, Belén; García Yubero, Cristina; Riera Jaume, Melchor; Antonio Iribarren, José; Asensi, Víctor; Pasquau, Francisco; Galera, Carlos E; Pascual-Carrasco, Mario; Muñoz, Adolfo; Jarrín, Inmaculada; Suárez-García, Inés	Use of Generic Antiretroviral Drugs and Single-Tablet Regimen De-Simplification for the Treatment of HIV Infection in Spain.	AIDS Research and Human Retroviruses	-	-	1931-8405	10.1089/AID.2021.0122	https://dx.doi.org/10.1089/AID.2021.0122	The present study sought to describe the use of generic drugs and single-tablet regimen (STR) de-simplification for the treatment of human immunodeficiency virus (HIV) infection among 41 hospitals from the cohort of the Spanish HIV/AIDS Research Network (CoRIS). In June 2018, we collected information on when generic antiretroviral drugs (ARVs) were introduced in the different hospitals, how the decisions to use them were made, and how the information was provided to the patients. Most of the nine available generic ARVs in Spain by June 2018 had been introduced in at least 85% of the participating hospitals, except for zidovudine (AZT)/lamivudine (3TC) and AZT. The time difference between the effective marketing date of each generic ARV and its first dispensing date in the hospitals was much shorter for the more recently approved generic ARV since the year 2017. However, only up to 20% of the hospitals de-simplified efavirenz (EFV)/tenofovir disoproxil (TDF)/emtricitabine (FTC), dolutegravir (DTG)/abacavir (ABC)/3TC, and rilpivirine (RPV)/TDF/FTC (to generic EFV+TDF/FTC, DTG+generic ABC/3TC, and RPV+generic TDF/FTC, respectively), whereas the generic STR EFV/TDF/FTC was introduced in 87.8% of the centers. The median times between the date of effective marketing of generic TDF/FTC and the date of de-simplification of EFV/TDF/FTC and RPV/TDF/FTC were 723 interquartile range (IQR): 369-1,119 and 234 (IQR: 142-264) days, respectively; this time was 155 (IQR: 28-287) days for de-simplification of DTG/ABC/3TC. In conclusion, despite the widespread use of generic ARVs, STRs de-simplification was only undertaken in <20% of the hospitals. There was wide variability in the timing of the introduction of each generic ARV after they were available in the market. Article	2022	Rusconi, S; Tan, RKJ; Ceccherini-Silberstein, F	SYPHILIS CASES ARE CONCENTRATED IN THREE MEN WHO HAVE SEX WITH MEN (MSM) POPULATION GROUPS IN EUROPE: PREP (PRE-EXPOSURE PROPHYLAXIS) USERS, SEX WORKERS AND PEOPLE LIVING WITH HIV	Sexually Transmitted Infections	-	-	1368-4973	doi.org/10.1136/sextrans-2021-055340	https://sti.bmj.com/content/98/7/547	In this two-wave web-based survey of European MSM (n=278 256 participants across 31 countries), the proportion of respondents self-reporting a syphilis diagnosis in the previous 12 months rose from 2.3% in 2010 to 4.5% in 2017. In adjusted analyses, factors associated with a syphilis diagnosis comprised STI screening in the previous month versus no screening (adjusted OR (aOR) 25.76), HIV PrEP use (aOR 3.02), living with HIV (aOR 2.67), selling sex (aOR 1.45) and a greater number of non-steady condomless anal intercourse (CAI) partners (aOR 1.01 for each additional partner). The association between PrEP use and a syphilis diagnosis was mediated by a higher likelihood of recent STI screening and a greater number of non-steady CAI partners, both of which increased substantially in 2017 compared with 2010. Article	2022	Rusley, JC; Arrington-Sanders, R; Guthrie, KM; Toma, EA; Knopf, AS	IMPACT OF PARENT-ADOLESCENT RELATIONSHIP QUALITY AND SEXUAL HEALTH COMMUNICATION ON PARENTAL WILLINGNESS TO SUPPORT ADOLESCENT USE OF PRE-EXPOSURE PROPHYLAXIS FOR HIV: LESSONS FOR POST-PANDEMIC SEXUAL HEALTH INTERVENTIONS	Journal of Adolescent Health	-	-	1054-139X	https://doi.org/10.1016/j.jadohealth.2022.01.007	https://www.jahonline.org/article/S1054-139X(22)00029-5/fulltext	Pre-exposure prophylaxis (PrEP) is a safe and highly effective method of HIV prevention, yet PrEP use among US adolescents at risk for HIV has been low. Sexual health communication between parents and adolescents has been shown to decrease teen pregnancy and increase condom use, but data are scarce on the impact of communication on PrEP use. We wanted to understand parents' perspectives on PrEP and the role of parent-adolescent relationship quality and sexual health communication on parents' willingness to support their adolescent using PrEP ("PrEP willingness"), to inform post-pandemic interventions to improve PrEP uptake among adolescents at risk for HIV. Article	2022	Rutstein S.E.; Matoga M.; Chen J.S.; Mathiya E.; Ndalama B.; Nyirenda N.; Bonongwe N.; Chithambo S.; Chagomerana M.; Tegha G.; Hosseinipour M.C.; Herce M.E.; Jere E.; Krysiak R.G.; Hoffman I.F.	Integrating Enhanced HIV Pre-exposure Prophylaxis Into a Sexually Transmitted Infection Clinic in Lilongwe: Protocol for a Prospective Cohort Study	JMIR Research Protocols	-	-	19290748	10.2196/37395	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144749471&doi=10.2196%2f37395&partnerID=40&md5=9c2a767aead1996ade41d6c864c81e5f	Background: Pre-exposure prophylaxis (PrEP) reduces HIV acquisition risk by >90% and is a critical lever to reduce HIV incidence. Identifying individuals most likely to benefit from PrEP and retaining them on PrEP throughout HIV risk is critical to realize PrEP's prevention potential. Individuals with sexually transmitted infections (STIs) are an obvious priority PrEP population, but there are no data from sub-Saharan Africa (SSA) confirming the effectiveness of integrating PrEP into STI clinics. Assisted partner notification may further enhance STI clinic–based PrEP programming by recruiting PrEP users from the pool of named sexual partners of individuals presenting with an incident STI. However, the acceptability, feasibility, and effectiveness of these integrated and enhanced strategies are unknown. Objective: This study aims to describe the implementation outcomes of acceptability, feasibility, and effectiveness (regarding PrEP uptake and persistence) of integrating an enhanced PrEP implementation strategy into an STI clinic in Malawi. Methods: The enhanced PrEP STI study is a prospective cohort study enrolling patients who are eligible for PrEP (aged ≥15 years) who are seeking STI services at a Lilongwe-based STI clinic. Data collection relies on a combination of in-depth interviews, patient and clinic staff surveys, and clinic record review. All enrolled PrEP users will be screened for acute HIV infection and receive quarterly testing for Neisseria gonorrhea, Chlamydia trachomatis, and syphilis. Participants will be asked to name recent sexual partners for assisted notification; returning partners will be screened for PrEP eligibility and, if interested, enrolled into the cohort of PrEP initiators. We will also enroll patients who are eligible for PrEP but choose not to initiate it, from the STI clinic. Patient participants will be followed for 6 months; we will assess self-reported PrEP use, PrEP refills, sexual behaviors, perceived HIV risk, and incident STIs. Clinic staff participants will be interviewed at baseline and at approximately 6 months and will complete surveys examining the perceived acceptability and feasibility of the integrated and enhanced PrEP strategy. Results: Enrollment began in March 2022 and is projected to continue until February 2023, with patient participant follow-up through August 2023. The results of this study are expected to be reported in 2024. Conclusions: This study will generate important evidence regarding the potential integration of PrEP services into STI clinics in SSA and preliminary data regarding the effectiveness of an enhanced intervention that includes assisted partner notification as a strategy to identify potential PrEP users. Furthermore, this trial will provide some of the first insights into STI incidence among PrEP users recruited from an STI clinic in SSA—critical data to inform the use of etiologic STI testing where syndromic management is the current standard. These findings will help to design future PrEP implementation strategies in SSA. Article	2022	Saberi P.; Ming K.; Shrestha I.; Scott H.; Thorson B.; Liu A.	Feasibility and Acceptability of Home-Collected Samples for Human Immunodeficiency Virus Preexposure Prophylaxis and Severe Acute Respiratory Syndrome Coronavirus 2 Laboratory Tests in San Francisco Primary Care Clinics	Open Forum Infectious Diseases	-	-	23288957	10.1093/ofid/ofab657	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124912812&doi=10.1093%2fofid%2fofab657&partnerID=40&md5=515d101ffc78e7626b8d68138bae38a5	Background: Due to the difficulty of conducting laboratory testing during the pandemic shelter-in-place orders, the objective of this study was to examine the feasibility and acceptability of conducting home-collected samples for preexposure prophylaxis (PrEP) and severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) laboratory tests. Methods: We conducted a pilot study among patients on PrEP in San Francisco primary care clinics. Individuals on PrEP provided home-collected laboratory samples using dried blood spot for fourth-generation human immunodeficiency virus antigen/antibody test, serum creatinine, syphilis antibody, and hepatitis C antibody, as needed; 3-site (oropharyngeal, rectal, and urine) swabbing for sexually transmitted infections; and nasopharyngeal swabbing for SARS-CoV-2 polymerase chain reaction. We examined feasibility and acceptability of collecting these laboratory samples using predefined benchmarks to determine feasibility or acceptability. Results: Of 92 individuals who consented to participate, 73 (79.3%) mailed back their home-collected kit. Nearly 87.7% noted being extremely to moderately satisfied with the ability to complete the laboratory tests without having to come into a clinic. Approximately 49.3% of participants chose this home-collection method as their first choice for providing laboratory samples. Mean time from collection of samples by the participant to receipt of test results was reduced from the first quarter of the study (17 days) to the last quarter of the study (5 days). Conclusions: We report high levels of feasibility and acceptability with the use of home-collected laboratory samples for patients on PrEP. Our results indicate that home-collected laboratory samples for patients on PrEP is a viable option that should be offered as an alternative to clinic-collected laboratory samples. © 2022 Published by Oxford University Press on behalf of Infectious Diseases Society of America 2022. Article	2022	Saberi, Parya; Stoner, Marie C D; Ming, Kristin; Lisha, Nadra E; Hojilla, J Carlo; Scott, Hyman M; Liu, Albert Y; Steward, Wayne T; Johnson, Mallory O; Neilands, Torsten B	The effect of an HIV preexposure prophylaxis panel management strategy to increase preexposure prophylaxis prescriptions.	AIDS	-	-	-	-	1473-5571	10.1097/QAD.0000000000003283	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9529898	OBJECTIVE: The HIV preexposure prophylaxis optimization intervention (PrEP-OI) study evaluated the efficacy of a panel management intervention using PrEP coordinators and a web-based panel management tool to support healthcare providers in optimizing PrEP prescription and ongoing PrEP care. DESIGN: The PrEP-OI study was a stepped-wedge randomized clinical trial conducted across 10 San Francisco Department of Public Health primary care sites between November 2018 and September 2019. Each month, clinics one-by-one initiated PrEP-OI in random order until all sites received the intervention by the study team. METHODS: The primary outcome was the number of PrEP prescriptions per month. Secondary outcomes compared pre- and postintervention periods on whether PrEP was discussed and whether PrEP-related counseling (e.g., HIV risk assessment, risk reduction counseling, PrEP initiation/continuation assessment) was conducted. Prescription and clinical data were abstracted from the electronic health records. We calculated incidence rate ratios (IRR) and risk ratios (RR) to estimate the intervention effect on primary and secondary outcomes. RESULTS: The number of PrEP prescriptions across clinics increased from 1.85/month (standard deviation SDâ=â2.55) preintervention to 2.44/month (SDâ=â3.44) postintervention (IRRâ=â1.34; 95% confidence interval CIâ=â1.05-1.73; P â=â0.021). PrEP-related discussions during clinic visits (RRâ=â1.13; 95% CIâ=â1.04-1.22; P â=â0.004), HIV risk assessment (RRâ=â1.40; 95% CIâ=â1.14-1.72; P â=â0.001), and risk reduction counseling (RRâ=â1.16; 95% CIâ=â1.03-1.30; P â=â0.011) increased from the pre- to the postintervention period. Assessment of PrEP initiation/continuation increased over time during the postintervention period (RRâ=â1.05; 95% CIâ=â0.99-1.11; P â=â0.100). CONCLUSIONS: A panel management intervention using PrEP coordinators and a web-based panel management tool increased PrEP prescribing and improved PrEP-related counseling in safety-net primary care clinics. Article	2022	Sakana, Béninwendé Leticia Delphine; Mennecier, Anaïs; Fao, Paulin; Tassembedo, Souleymane; Moles, Jean-Pierre; Kania, Dramane; Taofiki, Ajani Ousmane; Kadeba, Franck Edgar; Diallo, Ibrahima; Eymard-Duvernay, Sabrina; D'Ottavi, Morgana; Meda, Nicolas; Mosqueira, Beatriz; Van de Perre, Philippe; Nagot, Nicolas	Prevention of mother-to-child transmission of HIV at the second immunization visit: a cross-sectional study, Burkina Faso.	Bulletin of the World Health Organization	-	-	-	-	1564-0604 0042-9686	10.2471/BLT.22.288522	https://pubmed.ncbi.nlm.nih.gov/36466198/	OBJECTIVE: To evaluate the performance of the cascade of activities for prevention of mother-to-child transmission (PMTCT) of human immunodeficiency virus (HIV) at the second immunization visit in Burkina Faso. METHODS: In a cross-sectional study, we recruited mothers attending the second immunization visit for their infant in 20 health centres of Bobo-Dioulasso city, Burkina Faso over 12 months (2019-2020). We administered a short questionnaire to 14 176 mothers and performed HIV serological tests on mothers who had not been tested in the last 3 months. All mothers were asked about their attendance for antenatal care and HIV rapid testing. HIV-infected mothers were also asked about the timing of their HIV diagnosis, antiretroviral therapy, pre-exposure prophylaxis initiation at birth and infant diagnosis of HIV. FINDINGS: Of 14 136 respondents, 13 738 (97.2%) had at least one HIV serological test in their lifetime. Of 13 078 mothers who were never tested or were HIV-negative, 12 454 (95.2%) were tested during or after their last pregnancy. Among HIV-infected mothers already aware of their status, 110/111 (99.1%) women were on antiretroviral therapy. Among HIV-exposed infants, 84/101 (83.2%) babies received 6 weeks of antiretroviral prophylaxis at birth and 58/110 (52.7%) had a blood sample collected for early infant diagnosis. Only two mothers received their child's test results at the time of the second immunization visit. Four mothers were newly diagnosed as HIV-positive during the study. CONCLUSION: Collecting data at the second immunization visit, a visit rarely missed by mothers, could be useful for identifying gaps in the PMTCT cascade in settings where mothers are difficult to reach, such as in low-income countries with intermediate or low HIV prevalence. Article	2022	Salabarría-Peña Y.; Douglas C.; Brantley M.; Johnson A.K.	Informing the future of PrEP navigation: Findings from a five-site cluster evaluation	Evaluation and Program Planning	-	-	-	-	1497189	10.1016/j.evalprogplan.2021.101999	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114482209&doi=10.1016%2fj.evalprogplan.2021.101999&partnerID=40&md5=7de31f77cc96ef064012c46cfd946ec4	The PrEP (pre-exposure prophylaxis) Implementation, Data to Care and Evaluation (PrIDE) demonstration project funded 12 health departments (HD) (2016–2019) to scale up PrEP among sexual minorities at risk for HIV. Each health department (HD) conducted an evaluation of at least one local strategy, and, to maximize crossvalidation, an adapted cluster evaluation approach was employed. As a result, five HDs with similar evaluation questions regarding PrEP navigation were identified. Overall, PrEP navigation fit in well with HD clinics and community-based organizations. A hybrid model of patient, peer, and systems navigation linking clients to PrEP and social services was commonly used. Although there were no differences by setting regarding linking clients to PrEP providers, one HD demonstrated that having all PrEP services in the same location contributed the most to PrEP uptake. Navigator skill for case management and rapport building facilitated navigation, whereas staff turnover and lack of client health insurance were challenges. While one HD in a non-Medicaid expansion state was affected by health insurance issues the most, another HD demonstrated that providing payment assistance increased client PrEP use. The findings pinpoint PrEP navigation hybrid modality and having health insurance as promising strategies to increase PrEP uptake among priority groups. © 2021	Cluster evaluation; HIV; MSM; Navigation; Patient navigation; Peer navigation; PrEP; PrEP navigation; Systems navigation; Transgender	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Salabarría-Peña Y.; Robinson W.T.	Going beyond performance measures in HIV-prevention: A funder-recipient expedition	Evaluation and Program Planning	-	-	-	-	1497189	10.1016/j.evalprogplan.2021.101996	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114601704&doi=10.1016%2fj.evalprogplan.2021.101996&partnerID=40&md5=8f84f6cd2553d712de85e9aab8c57226	Project PrIDE (PrEP Implementation, Data to Care, and Evaluation) was a multi-site demonstration project implemented in 12 health departments (HDs) from 2016 to 2019. In Project PrIDE, there were two monitoring and evaluation components: crossjurisdictional performance monitoring (CJPM) and local program evaluation (LE). Project PrIDE was innovative in that a portion of funds were allocated for LE in order to support robust process and outcome evaluations. The purpose of this article is threefold: to describe Project PrIDE LE conceptualization, to share lessons learned about LE development and implementation processes that may benefit other programs and evaluation initiatives, and to introduce the Special Issue. This experience highlights the importance of using a health equity lens in future evaluation efforts in HIV prevention involving historically marginalized populations to ensure that priority groups are treated as equal partners of and benefit from the evaluations. © 2021	Cluster evaluation; HIV; LGBTQ; Participatory evaluation; PrEP; Program evaluation	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review

Preferences for Conditional Economic Incentives to Improve Pre-exposure Prophylaxis Adherence: A Discrete Choice Experiment Among Male Sex Workers in Mexico	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03443-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113591844&doi=10.1007%2fs10461-021-03443-1&partnerID=40&md5=b04248e006f09f23496fc7d0d34e96a5	Pre-exposure prophylaxis (PrEP) is highly effective in preventing HIV but requires sustained adherence. Conditional economic incentives (CEIs) can improve medication-taking behaviors, yet preferences for programs that employ CEIs to increase PrEP use among male sex workers (MSWs) have not been investigated. We conducted a discrete choice experiment in Mexico City to elicit stated preferences for a CEI-based PrEP adherence program among MSWs. Respondents expressed their preferences for different program characteristics: incentive amount; incentive format; incentive type; and adherence-verification method. We used a random utility logit model to estimate the relative importance of each attribute and estimated willingness-to-pay. MSWs preferred a higher, fixed incentive, with PrEP adherence measured via hair sampling. MSWs were willing to forego up to 21% of their potential maximum CEI amount to ensure receipt of a fixed payment. MSWs are highly willing to accept a CEI-based intervention for PrEP adherence, if offered along with fixed payments. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Samji H.; Hu J.; Otterstatter M.; Hull M.; Grennan T.; Moore D.; Gilbert M.; Higgins R.; Wong J.	Gay, bisexual, and other men who have sex with men accessing STI clinics: Optimizing HIV PrEP implementation	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0261705	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123714210&doi=10.1371%2fjournal.pone.0261705&partnerID=40&md5=81555ed41c0027601e914aea9fac7977	Background Gay, bisexual and other men who have sex with men (gbMSM) who attend STI clinics represent an easily accessible population for promoting HIV prevention interventions. We examined characteristics of gbMSM STI clinic attendees to identify those who could most benefit from pre-exposure prophylaxis (PrEP). Setting GbMSM STI clinic attendees in British Columbia (BC), Canada Methods A clinical electronic charting system of STI clinics in BC was used to identify gbMSM from 2004 to 2017. Incident HIV cases were defined as testers who had at least one HIV-negative test and a subsequent HIV-positive test. Seroconversion rates were calculated by risk factor variables and by year. Cox proportional hazards regression was used to identify independent predictors of HIV seroconversion. Results There were 9,038 gbMSM included, of whom 257 HIV seroconverted over the study period and 8,781 remained negative HIV testers, contributing 650.8 and 29,591.0 person-years to the analysis, respectively. The overall rate of seroconversion was 0.85 per 100 personyears (95% CI: 0.75-0.96). Incidence rates were higher among patients reporting >5 partners in the previous six months, inconsistent condom use, or having a partner living with HIV and who had a previous or concurrent diagnosis of rectal gonorrhea or rectal chlamydia. gbMSM presenting with two STIs such as rectal gonorrhea and syphilis (3.59/100 person-years 95%CI: 2.33-5.22) or rectal chlamydia and syphilis (3.01/100 person-years 95%CI: 2.00-4.29) had the highest incidence rates. Conclusion gbMSM with preceding or concurrent rectal STI diagnoses or syphilis had higher rates of HIV seroconversion. The data support the inclusion of specific STI diagnoses as an indication for PrEP. © 2022 Samji et al. Article	2022	Sang, JRM; McAllister, K; Wang, L; Barath, J; Lal, A; Parlette, A; Noor, SW; Apelian, H; Skakoon-Sparling, S; Hull, M; Moore, DM; Cox, J; Hart, TA; Lambert, G; Grace, D; Jollimore, J; Hogg, RS; Lachowsky, NJ	Examining provincial PrEP coverage and characterizing PrEP awareness and use among gay, bisexual and other men who have sex with men in Vancouver, Toronto and Montreal, 2017-2020	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.26017	https://pubmed.ncbi.nlm.nih.gov/36306245/	Introduction Accessibility of pre-exposure prophylaxis (PrEP) in Canada remains complex as publicly funded coverage and delivery differs by province. In January 2018, PrEP became publicly funded and free of charge in British Columbia (BC), whereas PrEP coverage in Ontario and Montreal is more limited and may require out-of-pocket costs. We examined differences over time in PrEP uptake and assessed factors associated with PrEP awareness and use. Methods Gay, bisexual and other men who have sex with men (GBM) were recruited through respondent-driven sampling (RDS) in Toronto, Vancouver and Montreal, Canada, in a prospective biobehavioural cohort study. We applied generalized estimating equations with hierarchical data (RDS chain, participant, visit) to examine temporal trends of PrEP use and correlates of PrEP awareness and use from 2017 to 2020 among self-reported HIV-negative/unknown GBM. Results Of 2008 self-identified HIV-negative/unknown GBM at baseline, 5093 study visits were completed from February 2017 to March 2020. At baseline, overall PrEP awareness was 88% and overall PrEP use was 22.5%. During our study period, we found PrEP use increased in all cities (all p<0.001): Montreal 14.2% during the first time period to 39.3% during the last time period (p<0.001), Toronto 21.4-31.4% (p<0.001) and Vancouver 21.7-59.5% (p<0.001). Across the study period, more Vancouver GBM used PrEP than Montreal GBM (aOR = 2.05, 95% CI = 1.60-2.63), with no significant difference between Toronto and Montreal GBM (aOR = 0.90, 95% CI = 0.68-1.18). Conclusions Full free-of-charge public funding for PrEP in BC likely contributed to differences in PrEP awareness and use. Increasing public funding for PrEP will improve accessibility and uptake among GBM most at risk of HIV. Article	2022	Sarno E.L.; Swann G.; Xavier Hall C.D.; Newcomb M.E.; Mustanski B.	Minority Stress, Identity Conflict, and HIV-Related Outcomes Among Men Who Have Sex with Men, Transgender Women, and Gender Nonbinary People of Color	LGBT Health	-	-	-	-	23258292	10.1089/lgbt.2021.0401	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137745233&doi=10.1089%2flgbt.2021.0401&partnerID=40&md5=a18a6b0e652eb10830b715e4f9e95788	Purpose: This study investigated conflict between sexual orientation and racial/ethnic identities as a mechanism linking minority stress to HIV-related outcomes among men who have sex with men (MSM), transgender women and gender nonbinary (TGN) people of color (POC). Methods: We tested longitudinal mediation models with sexual orientation microaggressions, internalized heterosexism (IH), and sexual orientation concealment at Time 1, and pre-exposure prophylaxis (PrEP) use and number of condomless anal sex (CAS) partners at Time 3, mediated by identity conflict at Time 2. Participants were 337 MSM and TGN POC. Data were collected in Chicago, Illinois, from September 2018 to February 2021. Results: Indirect associations of IH and sexual orientation concealment, respectively, at Time 1 with CAS partners at Time 3 through identity conflict at Time 2 were significant. Mediation models with sexual orientation microaggressions as the predictor and PrEP use as the outcome were not significant. Conclusion: Minority stress may contribute to identity conflict and increase CAS by isolating MSM and TGN POC from sexual and gender minority communities, thus restricting access to safer sex resources, and by increasing psychological distress and decreasing self-care (e.g., condom use). © 2022 Mary Ann Liebert, Inc., publishers. Article	2022	Saxton P.J.W.; Azariah S.; Cavadino A.; Forster R.F.; Jenkins R.; Werder S.F.; Southey K.; Rich J.G.	Adherence, Sexual Behavior and Sexually Transmitted Infections in a New Zealand Prospective PrEP Cohort: 12 Months Follow-up and Ethnic Disparities	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03617-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124758001&doi=10.1007%2fs10461-022-03617-5&partnerID=40&md5=9dea131330ed9f8e42f750e6a6ccb19	Inequities in pre-exposure prophylaxis (PrEP) experiences will impede HIV epidemic elimination among gay and bisexual men (GBM). Ethnicity is a strong marker of inequity in the United States, but evidence from other countries is lacking. We investigated experiences on-PrEP to 12 months follow-up in a prospective cohort of 150 GBM in Auckland, New Zealand with an equity quota of 50% non-Europeans. Retention at 12 months was 85.9%, lower among Māori/Pacific (75.6%) than non-Māori/Pacific participants (90.1%). Missed pills increased over time and were higher among Māori/Pacific. PrEP breaks increased, by 12 months 35.7% of Māori/Pacific and 15.7% of non-Māori/Pacific participants had done so. Condomless receptive and intercourse partners were stable over time. STIs were common but chlamydia declined; 12-month incidence was 8.7% for syphilis, 36.0% gonorrhoea, 46.0% chlamydia, 44.7% rectal STI, 64.0% any STI. Structural interventions and delivery innovations are needed to ensure ethnic minority GBM gain equal benefit from PrEP. Clinical trial number ACTRN12616001387415. © 2022, The Author(s). Article	2022	Schaefer, R; Leite, PHAD; Silva, R; Karim, QA; Akolo, C; Cáceres, CF; Dourado, I; Green, K; Hettema, A; Hoornenborg, E; Jana, S; Kerschberger, B; Mahler, H; Matse, S; McManus, H; Molina, JM; Reza-Paul, S; Azwa, I; Shahmanesh, M; Taylor, D; Vega-Ramirez, H; Veloso, VG; Baggaley, R; Dalal, S	Kidney function in tenofovir disoproxil fumarate-based oral pre-exposure prophylaxis users: a systematic review and meta-analysis of published literature and a multi-country meta-analysis of individual participant data	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(22)00004-2	https://pubmed.ncbi.nlm.nih.gov/35271825/	Background Previous WHO guidance on tenofovir disoproxil fumarate-based oral pre-exposure prophylaxis (PrEP) suggests measuring creatinine levels at PrEP initiation and regularly afterwards, which might represent barriers to PrEP implementation and uptake. We aimed to systematically review published literature on kidney toxicity among tenofovir disoproxil fumarate-based oral PrEP users and conducted an individual participant data meta-analysis (IPDMA) on kidney function among PrEP users in a global implementation project dataset. Methods In this systematic review and meta-analysis we searched PubMed up to June 30, 2021, for randomised controlled trials (RCTs) or cohort studies that reported on graded kidney-related adverse events among oral PrEP users (tenofovir disoproxil fumarate-based PrEP alone or in combination with emtricitabine or lamivudine). We extracted summary data and conducted meta-analyses with random-effects models to estimate relative risks of grade 1 and higher and grade 2 and higher kidney-related adverse events, measured by elevated serum creatinine or decline in estimated creatinine clearance or estimated glomerular filtration rate. The IPDMA included (largely unpublished) individual participant data from 17 PrEP implementation projects and two RCTs. Estimated baseline creatinine clearance and creatinine clearance change after initiation were described by age, gender, and comorbidities. We used random-effects regressions to estimate the risk in decline of creatinine clearance to less than 60 mL/min. Findings We identified 62 unique records and included 17 articles reporting on 11 RCTs with 13 523 participants in meta-analyses. PrEP use was associated with increased risk of grade 1 and higher kidney adverse events (pooled odds ratio OR 1 center dot 49, 95% CI 1 center dot 22-1 center dot 81; I-2=25%) and grade 2 and higher events (OR 1 center dot 75, 0 center dot 68-4 center dot 49; I-2=0%), although the grade 2 and higher association was not statistically significant and events were rare (13 out of 6764 in the intervention group vs six out of 6782 in the control group). The IPDMA included 18 676 individuals from 15 countries (1453 7 center dot 8% from RCTs) and 79 (0 center dot 42%) had a baseline estimated creatinine clearance of less than 60 mL/min (increasing proportions with increasing age). Longitudinal analyses included 14 368 PrEP users and 349 (2 center dot 43%) individuals had a decline to less than 60 mL/min creatinine clearance, with higher risks associated with increasing age and baseline creatinine clearance of 60 center dot 00-89 center dot 99 mL/min (adjusted hazard ratio aHR 8 center dot 49, 95% CI 6 center dot 44-11 center dot 20) and less than 60 mL/min (aHR 20 center dot 83, 12 center dot 83-33 center dot 82). Interpretation RCTs suggest that risks of kidney-related adverse events among tenofovir disoproxil fumarate-based oral PrEP users are increased but generally mild and small. Our global PrEP user analysis found varying risks by age and baseline creatinine clearance. Kidney function screening and monitoring might focus on older individuals, those with baseline creatinine clearance of less than 90 mL/min, and those with kidney-related comorbidities. Less frequent or optional screening among younger individuals without kidney-related comorbidities may reduce barriers to PrEP implementation and use. Article	2022	Schaffer, DH; Sawczuk, LM; Zheng, H; Macias-Konstantopoulos, WL	Community-Based, Rapid HIV Screening and Pre-Exposure Prophylaxis Initiation: Findings From a Pilot Program	Cureus Journal of Medical Science	-	-	-	-	2168-8184	10.7759/cureus.20877	https://www.cureus.com/articles/78549-community-based-rapid-hiv-screening-and-pre-exposure-prophylaxis-initiation-findings-from-a-pilot-program#!/	Objective Many individuals do not have regular access to medical care and preventative health services, suggesting the need for alternative access to HIV testing and pre-exposure prophylaxis (PrEP). The purpose of this study is to describe a novel, community-based HIV screening, a PrEP initiation program, and report preliminary findings. Methods One Tent Health, a 501(c)(3) nonprofit organization, launched a pop-up HIV screening and PrEP initiation program in high-risk areas of Washington, DC in 2017. We describe the unique features of the program and report 25 months of screening, risk assessment, and PrEP education data. Odds ratios were calculated to identify disparities in both HIV risk factors and prior HIV testing. Results Between October 2017 and November 2019, 846 individuals underwent HIV screening. Six individuals (0.709%) screened HIV-positive. Approximately 13% had never been screened for HIV, and another 13% had at least one major risk factor for HIV. Individuals who self-identified as White were more likely to have risk factors (OR 2.19, p= 0.0170) and less likely to have ever been tested (OR 0.50, p= 0.0409). Individuals who self-identified as Black or African American were less likely to have risk factors for HIV (OR 0.57, p= 0.0178). Disparities by sex and gender were also observed. Conclusions This program appears to be the first of its kind within the United States. We found the program to be cost-effective, well-received by the community, and accessible by high-risk and unreached populations while further revealing the role of race and gender in the HIV epidemic. Article	2022	Schexnayder J.; Elamin F.; Mayes E.; Cox L.; Martin E.; Webel A.R.	Is Tailoring of PrEP Programs Needed to Overcome Racial Disparities in PrEP Uptake in Local Health Departments? A Mixed-Methods Evaluation of PrEP Implementation in Virginia	Journal of Public Health Management and Practice	-	-	-	-	10784659	10.1097/PHH.0000000000001463	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128001407&doi=10.1097%2fPHH.0000000000001463&partnerID=40&md5=65e7b2a0de2dce0edcb6eca7bc3d0834	Context: African American and Hispanic adults share a disproportionate burden of HIV infections in the United States but continue to experience suboptimal uptake of HIV pre-exposure prophylaxis (PrEP). Increasing PrEP accessibility in nontraditional care settings is a potential strategy to increase PrEP uptake in these high-risk groups. PrEP implementation in local health departments (LHDs) is not well characterized. Objective: To evaluate HIV PrEP implementation for African American and Hispanic adults receiving medical care in Virginia's LHDs. Design: We conducted a retrospective, mixed-methods evaluation of PrEP services implementation at LHDs completing their first PrEP program year between June 1, 2016, and June 30, 2019. Using pharmacy records, we estimated PrEP coverage and adherence using PrEP to need ratios (PnRs) and medication possession ratios (MPRs), respectively. Thematic analysis was used to identify barriers to PrEP delivery in interviews with 6 multidisciplinary LHD workers. Results: Of the 433 PrEP clients receiving an emtricitabine/tenofovir disoproxil fumarate (Truvada) prescription in year 1, 52.0% self-identified as African American and 8.9% self-identified as Hispanic. PnRs were greater for White adults in 50.0% of clinics. The average MPR (0.79) was consistent with protective medication adherence levels; however, 25.0% of clients filled only one prescription in the program year. Qualitative findings suggest incompatibilities between health PrEP services delivery and community preferences for African American and Hispanic adults; however, LHDs in one health region were able to link communities of color to PrEP at similar rates as Whites. Conclusions: Incorporating a metric sensitive to racial/ethnic differences in the burden of HIV infection improved recognition of PrEP disparities; however, population-specific targets are needed to enhance use of the PnR for program evaluation. Tailoring of PrEP services to communities with the greatest local PrEP burden may be needed to optimize the effectiveness of PrEP programs in LHDs. © 2022 Lippincott Williams and Wilkins. Conjoint Analysis of User Acceptability of Sustained Long-Acting Pre-Exposure Prophylaxis for HIV	AIDS Research and Human Retroviruses	-	-	-	-	8892229	10.1089/aid.2021.0075	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128251152&doi=10.1089%2faid.2021.0075&partnerID=40&md5=1ee469875ce51a895b5afd8b2f8658fb	Long-acting delivery modalities of HIV pre-exposure prophylaxis (PrEP), such as subdermal implants, are in development. To facilitate end-user uptake and sustained use, it is critical to understand potential consumers' and physician prescribers' preferences about, interest in, and relative importance of different implant features. The ordered identification of these key attributes allows implant developers to incorporate this feedback into product design, which theoretically improves acceptability, feasibility, and user experience with the device. In this study, n = 75 PrEP-prescribing physicians and n = 143 men having sex with men (MSM) at risk for HIV completed web-based surveys that directly compared the importance of eight to nine different implant features, respectively. Conjoint analysis determined the importance of these features, relative to each other. Implants presented in the study were well received, with a majority of physicians and MSM indicating that they were likely to recommend or use them. The implant was perceived as unique, reliable, and convenient, as well as able to deliver better compliance. The attributes most critical to the adoption of the implant among physicians and MSM were (1) the chance of becoming infected with HIV while on implant treatment, (2) the length of protection and size of the implant, and (3) the side effect advantages over current PrEP oral pill treatment. Some concerns about the implant included side effects and the product's safety (among MSM) and the cost or insurance coverage level for the implant (both physicians and MSM). There was also some resistance to the implantation procedure itself. © Copyright 2022, Mary Ann Liebert, Inc., publishers 2022.	conjoint analysis; HIV prevention; MSM; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Schmidt H.-M.A.; Schaefer R.; Nguyen V.T.T.; Radebe M.; Sued O.; Rodolph M.; Ford N.; Baggaley R.	Scaling up access to HIV pre-exposure prophylaxis (PrEP): should nurses do the job?	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(22)00006-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129175068&doi=10.1016%2fS2352-3018%2822%2900006-6&partnerID=40&md5=d699110b03ebd2ec39f7384fecdc6796	Task sharing has been one of the most important enabling policies supporting the global expansion of access to HIV testing and treatment. The WHO public health approach, which relies on delivery of antiretroviral therapy (ART) by nurses, has enabled a trebling of the number of people receiving ART during the past decade. WHO recognises that HIV pre-exposure prophylaxis (PrEP) can also be provided by nurses; however, many countries still do not have policies in place that support nurse provision of PrEP. In sub-Saharan Africa, most countries allow nurses to prescribe ART, but only a few countries have policies in place that allow nurses to prescribe PrEP. Nurse-led PrEP delivery is particularly low in the Asia-Pacific region, which has some of the world's fastest growing epidemics. Even in many high-income countries, PrEP scale-up has been limited because policies often require medical doctors or specialists to prescribe. Service providers in many countries are coming to realise that scaling up access to PrEP cannot be achieved by medical doctors alone, and nurse-led PrEP delivery can help to lay the groundwork for supporting uptake of other HIV prevention approaches that will become available in the future. Countries with policies that authorise nurses to prescribe ART could be early adopters and help to pave the way for wider adoption of nurse-led PrEP delivery. © 2022 World Health Organization. Article	2022	Schmidt M.A.; Dickerson J.F.; O'Keeffe-Rosetti M.C.; Salas S.B.; Donald J.L.; Tao G.	Sexually Transmitted Infection Testing, Prevalence, and Treatment Among Individuals Receiving HIV Preexposure Prophylaxis Within an Integrated Healthcare Delivery System	Sexually Transmitted Diseases	-	-	-	-	1485717	10.1097/OLQ.0000000000001665	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136472008&doi=10.1097%2fOLQ.0000000000001665&partnerID=40&md5=a23a8eb60a6d0e1fa3cebc781e34aaec	Background Initial and follow-up sexually transmitted infection (STI) and human immunodeficiency virus (HIV) testing are recommended when taking HIV preexposure prophylaxis (PrEP). We assessed STI services before and after PrEP initiation among persons 18 years or older. Methods We conducted this retrospective cohort study at a US integrated healthcare delivery system. We measured HIV/STI testing rates, STI prevalence and treatment at 3 time points: (1) at PrEP initiation, (2) at 120 days, and (3) at 210 days. Results Of 685 PrEP initiators, 67.2% continued PrEP use at 120 days and 49.5% at 210 days. Of PrEP users, HIV and STI testing were greater than 85% and greater than 80%, respectively, at all 3 time points. Prevalence for any chlamydia, rectal chlamydia, and any gonorrhea, rectal gonorrhea, or pharyngeal gonorrhea was always high at the 120 days and 210 days (eg, 6.9%, 10.5%, 6.7%, 5.0%, and 5.2%, respectively, at the 120 days for continuous PrEP users). Over 90% of all individuals who tested positive for chlamydia and gonorrhea received antibiotic pharmacy fills within 7 days at 120 and 210 days. Monthly PrEP-related pharmacy cost was about \$2259 to \$2659. The proportion of the total medical cost that was PrEP-related pharmacy was about 82% for PrEP continuous users. Conclusions Although HIV/STI testing rates were high, they can still be improved during HIV PrEP management. High STI prevalence after PrEP initiation in this study suggests that patients taking PrEP are at risk of acquiring an STI. Interventions to improve STI services during PrEP management are continuously needed. © Lippincott Williams & Wilkins. Article	2022	Schneiderman, Bethany S.; Barski, Michal S.; Maertens, Goedele N.	Cabotegravir, the Long-Acting Integrase Strand Transfer Inhibitor, Potently Inhibits Human T-Cell Lymphotropic Virus Type 1 Transmission in vitro.	Frontiers in Medicine	-	-	-	-	2296-858X	10.3389/fmed.2022.889621	https://www.frontiersin.org/articles/10.3389/fmed.2022.889621/full	Human T-cell lymphotropic virus type 1 (HTLV-1) is a deltaretrovirus most prevalent in southwestern Japan, sub-Saharan Africa, Australia, South America, and the Caribbean. Latest figures approximate 10 million people worldwide to be infected with HTLV-1. This is likely a significant underestimation due to lack of screening in endemic areas and absence of seroconversion symptoms. The two primary diseases associated with HTLV-1 infection are adult T cell leukaemia-lymphoma, a malignant and, sometimes, aggressive cancer; and HTLV-1 associated myelopathy/tropical spastic paraparesis, a debilitating neurological degenerative disease. Unfortunately, despite the poor prognosis, there is currently no effective treatment for HTLV-1 infection. We previously showed that integrase strand transfer inhibitors (INSTIs) clinically used for human immunodeficiency virus type 1 (HIV-1) prophylaxis and treatment are also effective against HTLV-1 transmission in vitro. In 2021 a new INSTI, cabotegravir, was approved by the FDA for HIV-1 treatment. We thus set out to evaluate its efficacy against HTLV-1 infection in vitro. Strand transfer assays performed using recombinant HTLV-1 integrase treated with increasing concentrations of cabotegravir, effectively inhibited strand transfer activity, displaying an IC(50) of 77.8 ± 22.4 nM. Furthermore, cabotegravir blocked HTLV-1 transmission in tissue culture; we determined an EC(50) of 0.56 ± 0.26 nM, similar to bictegravir. Alu-PCR confirmed the block in integration. Thus, there are four INSTIs and one reverse transcriptase inhibitor approved by the FDA for HIV-1 treatment, that potently block HTLV-1 infection in vitro. This should strongly encourage the establishment of a new standard of HTLV-1 treatment - particularly for pre-exposure prophylaxis and prevention of mother-to-child transmission.	tenofovir disoproxil fumarate; pre-exposure prophylaxis; INSTI; integrase; cabotegravir; HTLV-1; MTCT	English	Switzerland	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2022	Schnepf M.	Chemical becoming. Embodied moments of urban belonging in Berlin; Chemisch-Werden Verkörperte Momente urbaner Zugehörigkeit in Berlin	Sub\Urban	-	-	-	-	21972567	10.36900/SUBURBAN.V10I2/3.762	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85148222581&doi=10.36900%2fSUBURBAN.V10I2%2f3.762&partnerID=40&md5=02492994e886f3fdf906b2211201abba	This paper focuses on chemistry, bodies and the city in their intimate entanglements and mutual interference. It explores how the city variously inscribes itself into bodies through chemistry and how the urban is constantly re-produced in chemically mediated body practices. Based on ethnographic research in an upmarket hair salon in Berlin, I analyze how the intentional and pleasurable use of chemical substances produces belonging. Urban belonging is not understood as a finished state. Instead, it constitutes a vanishing point that some Berliners aspire to in the intersecting usages of beauty products, drugs and pharmaceuticals. "Chemical becoming" describes specific localities in Berlin, bodily intimacies, and urban imaginaries as constantly constituting each other. I present these affective and material co-transformations through two ethnographic moments of "chemical becoming": First, I analyze, how looks are produced with the help of beauty products in the salon and, second, how pleasure is achieved with help of recreational drugs and the pharmaceutical HIV prophylaxis PrEP in the (gay) club scene. In these practices, urban belonging does not necessarily translate into a shared identity or fixed subculture but appears as an affective orientation and material-corporeal striving. © 2022 suburban eV. Article	2022	Schwartz J.; Grimm J.; Zimmerman R.; Clement M.	Information Seeking and MSM's Beliefs about PrEP and Condoms	Health Communication	-	-	-	-	10410236	10.1080/10410236.2021.1876323	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099859627&doi=10.1080%2f10410236.2021.1876323&partnerID=40&md5=9921306343ee19979e9be3579463989e	This study examined how frequently men who have sex with men (MSM) used a selection of sources, including news media, social media, health organizations, and dating/hookup apps, for HIV information. Additionally, the study explored the extent to which MSM's efficacy beliefs about pre-exposure prophylaxis (PrEP) and perceptions of condom importance could be predicted by the sources they used. A sample of MSM (N= 969) were surveyed online. Results showed that respondents obtained information about HIV most often from HIV organizations, LGBT organizations, and dating/hookup apps, particularly the apps Growlr, Scruff, and Grindr. Use of the app Scruff was the strongest source-based predictor of beliefs about both PrEP and condoms. Implications for health promotion are discussed. © 2021 Taylor & Francis Group, LLC. Article	2022	Schwartz, Joseph; Grimm, Josh	Communication Strategies for Discussing PrEP with Men Who Have Sex with Men.	Journal of Homosexuality	-	-	-	-	1540-3602	10.1080/00918369.2020.1813509	https://dx.doi.org/10.1080/00918369.2020.1813509	HIV continues to be a pressing problem, particularly for men who have sex with men (MSM). Pre-exposure prophylaxis (PrEP) is a highly effective means of preventing HIV infection, but adoption of it by MSM has been sluggish. Though there are many reasons for PrEP's limited adoption, healthcare providers' lack of skill in communicating with MSM likely plays a role. This study employed in-depth interviews with MSM who have adopted PrEP to explore how effective patient-provider communication surrounding PrEP takes place. Findings revealed that healthcare providers utilized five strategies to communicate with their MSM patients about PrEP. These strategies included (1) disclosure of identity and personal information; (2) knowledge of information that may be relevant to MSM patients; (3) positivity; (4) relationship inquiries; and (5) remaining calm. Employing the strategies uncovered in this study may be useful in improving communication between healthcare providers and their MSM patients and may help to increase MSM's adoption of PrEP. Article	2022	Scott R.K.; Hull S.J.; Huang J.C.; Coleman M.; Ye P.; Lotke P.; Beverley J.; Moriarty P.; Balaji D.; Ward A.; Holiday J.; Brant A.R.; Cameron M.; Elion R.; Visconti A.	Factors Associated with Intention to Initiate Pre-exposure Prophylaxis in Cisgender Women at High Behavioral Risk for HIV in Washington, D.C.	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-021-02274-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130832320&doi=10.1007%2fs10508-021-02274-4&partnerID=40&md5=6dd9004d493cb3f6401ea6709f9e288f	Pre-exposure prophylaxis (PrEP) for HIV prevention is underutilized by cisgender women at risk for HIV in the USA. Published research on PrEP initiation among cisgender women at risk for HIV focuses on identifying barriers and facilitators associated with intention to initiate, but few apply a behavioral theoretical lens to understand the relative importance of these diverse factors. This study provides a theoretically grounded view of the relative importance of factors associated with intention to initiate PrEP. We conducted an anonymous, cross-sectional survey of 1437 cisgender women seeking care at family planning and sexual health clinics to evaluate hypothesized barriers and facilitators of PrEP adoption. We categorized cisgender women with ≥ 3 behavioral risk factors as "high-risk" for HIV acquisition; 26.9% (N = 387) met high-risk criterion. Among cisgender women in the high-risk sample, the majority were Black and single. Perceived risk of HIV acquisition was low and 13.7% reported intention to initiate PrEP. Positive attitudes toward PrEP, self-efficacy, perceived support from medical providers and social networks, and prior discussion about PrEP were associated with intention to initiate PrEP; stigma was negatively associated. Background characteristics (other than age), risk factors for HIV acquisition, prior awareness of PrEP, and perceived risk of HIV were not associated with uptake intention. These findings support interventions that center on the role of providers in the provision of PrEP and on social networks in destigmatization of PrEP use. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Scott R.K.; Hull S.J.; Richards R.C.; Klemmer K.; Salmoran F.; Huang J.C.	Awareness, acceptability, and intention to initiate HIV pre-exposure prophylaxis among pregnant women	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2021.1916870	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104777122&doi=10.1080%2f09540121.2021.1916870&partnerID=40&md5=a8b1a44c4dbef67eebb1da6dc7bffa12	HIV prevention is critically important during pregnancy, however, pre-exposure prophylaxis (PrEP) is underutilized. We conducted a survey of pregnant and non-pregnant women in a high HIV prevalence community in Washington D.C. to evaluate determinants of PrEP initiation during pregnancy. 201 pregnant women and a reference population of 1103 non-pregnant women completed the survey. Among pregnant women, mean age was 26.9 years; the majority were Black with household-incomes below the federal poverty level. Despite low perceived risk of HIV acquisition and low prior awareness of PrEP, 10.5% of respondents planned to initiate PrEP during pregnancy. Pregnant women identified safety, efficacy, and social network and medical provider support as key factors in PrEP uptake intention. The belief that PrEP will "protect (their) baby from HIV" was associated with PrEP uptake intention during pregnancy. Concerns regarding maternal/fetal side effects, and safety in pregnancy or while breastfeeding were not identified as deterrents to uptake intention. When compared to a nonpregnant sample, there were no significant differences in uptake intention between the two samples. These findings support the need for prenatal educational interventions to promote HIV prevention during pregnancy, as well as interventions that center on the role of providers in the provision of PrEP. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2022	Secchi, Massimiliano; Vangelista, Luca	Rational Engineering of a Sub-Picomolar HIV-1 Blocker.	Viruses	-	-	-	-	1999-4915	10.3390/v14112415	https://pubmed.ncbi.nlm.nih.gov/36366513/	With the aim of rationally devising a refined and potent HIV-1 blocker, the cDNA of CCL5 5p12 5m, an extremely potent CCR5 antagonist, was fused to that of C37, a gp41-targeted fusion inhibitor. The resulting CCL5 5p12 5m-C37 fusion protein was expressed in E. coli and proved to be capable of inhibiting R5 HIV-1 strains with low to sub-picomolar IC(50), maintaining its antagonism toward CCR5. In addition, CCL5 5p12 5m-C37 inhibits R5/X4 and X4 HIV-1 strains in the picomolar concentration range. The combination of CCL5 5p12 5m-C37 with tenofovir (TDF) exhibited a synergic effect, promoting this antiviral cocktail. Interestingly, a CCR5-targeted combination of maraviroc (MVC) with CCL5 5p12 5m-C37 led to a synergic effect that could be explained by an extensive engagement of different CCR5 conformational populations. Within the mechanism of HIV-1 entry, the CCL5 5p12 5m-C37 chimera may fit as a powerful blocker in several instances. In its possible consideration for systemic therapy or pre-exposure prophylaxis, this protein design represents an interesting lead in the combat of HIV-1 infection. "I expected little, although I learned a lot": perceived benefits of participating in HIV risk reduction sessions among women engaged in sex work in Uganda	BMC Women's Health	-	-	-	-	14726874	10.1186/s12905-022-01759-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130024664&doi=10.1186%2fs12905-022-01759-1&partnerID=40&md5=25c9b5b1b13a4b0a5a9c04b9e62dde58	Background: The global HIV burden remains a public health concern. Women engaged in sex work (WESW) are at higher risk of acquiring HIV compared to the general adult population. Uganda reports high rates of HIV prevalence among WESW. While WESW in Uganda have long been the subject of surveillance studies, they have not been targeted by theory-informed HIV prevention intervention approaches. In this study, we explored the perceived benefits of an evidence-based HIV risk reduction intervention that was implemented as part of a combination intervention tested in a clinical trial in Uganda. Methods: As part of a larger randomized clinical trial, we conducted semi-structured in-depth interviews with 20 WESW selected using a stratified purposive sampling. All interviews were conducted in Luganda, language spoken in the study area, and audio-recorded. They were transcribed verbatim and translated to English. Thematic analysis was used to analyze the data. Results: WESW's narratives focused on: (1) condom use; (2) alcohol/drug consumption; (3) PrEP use; (4) "handling" customers; and (5) "massaging" customers. WESW agreed that male condom was one of the important learning points for them and planned to continue using them while female condoms were received with mixed reactions. Many women appreciated receiving information about the risks of consuming alcohol and drugs, and discussed how they reduced/ eliminated their consumption. PrEP information was appreciated though identified by fewer WESW. Handling a client was discussed as a helpful strategy for safer sex through improved ability to convince customers to use condoms or avoiding sex. Massaging was also beneficial to avoid penetrative sex, but similar to female condom, massaging also yielded mixed perceptions. Conclusion: WESW found the intervention beneficial and described ways in which it improved their ability to engage in safer sex and stay healthy. The fact that WESW identified other strategies beyond condom use as helpful underlines the importance of adopting a comprehensive approach to behavioral interventions targeting HIV prevention even when combined with other interventions. Additionally, WESW's narratives suggest that incorporating the tenets of social cognitive theory and harm reduction approaches in HIV prevention among this population can result in risk behavior change. © 2022, The Author(s). Article	2022	Sewell, Janey; Fakoya, Ibidun; Lampe, Fiona C.; Howarth, Alison; Phillips, Andrew; Burns, Fiona; Rodger, Alison J.; Cambiano, Valentina	Effectiveness of interventions aimed at reducing HIV acquisition and transmission among gay and bisexual men who have sex with men (GBMSM) in high income settings: A systematic review.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0276209	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9581368/	INTRODUCTION: HIV transmission continues among gay and bisexual men who have sex with men (GBMSM), with those who are younger, or recent migrants, or of minority ethnicity or who are gender diverse remaining at increased risk. We aimed to identify and describe recent studies evaluating the effectiveness of HIV prevention interventions for GBMSM in high income countries. METHODS: We searched ten electronic databases for randomized controlled trials (RCTs), conducted in high income settings, and published since 2013 to update a previous systematic review (Stromdahl et al, 2015). We predefined four outcome measures of interest: 1) HIV incidence 2) STI incidence 3) condomless anal intercourse (CLAI) (or measure of CLAI) and 4) number of sexual partners. We used the National Institute for Health and Care Excellence (UK) Quality Appraisal of Intervention Studies tool to assess the quality of papers included in the review. As the trials contained a range of effect measures (e.g. odds ratio, risk difference) comparing the arms in the RCTs, we converted them into standardized effect sizes (SES) with 95% confidence intervals (CI). RESULTS: We identified 39 original papers reporting 37 studies. Five intervention types were identified: one-to-one counselling (15 papers), group interventions (7 papers), online interventions (9 papers), Contingency Management for substance use (2 papers) and Pre-exposure Prophylaxis (PrEP) (6 papers). The quality of the studies was mixed with over a third of studies rated as high quality and 11% rated as poor quality. There was some evidence that one-to-one counselling, group interventions (4-10 participants per group) and online (individual) interventions could be effective for reducing HIV transmission risk behaviours such as condomless anal intercourse. PrEP was the only intervention that was consistently effective at reducing HIV incidence. CONCLUSIONS: Our systematic review of the recent evidence that we were able to analyse indicates that PrEP is the most effective intervention for reducing HIV acquisition among GBMSM. Targeted and culturally tailored behavioural interventions for sub-populations of GBMSM vulnerable to HIV infection and other STIs should also be considered, particularly for GBMSM who cannot access or decline to use PrEP.	*Homosexuality, Male; Humans; Male; Randomized Controlled Trials as Topic; Pre-Exposure Prophylaxis; Developed Countries; *Sexual and Gender Minorities; *HIV Infections/prevention & control	English	United States	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review

Article	2022	Sha, Y; Li, C; Xiong, Y; Hazra, A; Lio, J; Jiang, I; Huang, H; Kerman, J; Molina, J; Li, L; Liang, K; Gong, D; Li, Q; Wu, S; Sherer, R; Tucker, JD; Tang, W	Co-creation using crowdsourcing to promote PrEP adherence in China: study protocol for a stepped-wedge randomized controlled trial	BMC Public Health	-	-	-	36071401	10.1186/s12889-022-14117-5	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02462003/full	BACKGROUND: Adherent pre-exposure prophylaxis (PrEP) uptake can prevent HIV infections. Despite the high HIV incidence, Chinese key populations have low PrEP uptake and adherence. New interventions are needed to increase PrEP adherence among key populations in China. Co-creation methods are helpful to solicit ideas from the community to solve public health problems. The study protocol aims to describe the design of a stepped-wedge trial and to evaluate the efficacy of co-created interventions to facilitate PrEP adherence among key populations in China. METHODS: The study will develop intervention packages to facilitate PrEP adherence among Chinese key populations using co-creation methods. The study will then evaluate the efficacy of the co-created intervention packages using a stepped-wedge randomized controlled trial. This four-phased closed cohort stepped-wedge design will have four clusters. Each cluster will start intervention at three-month intervals. Seven hundred participants who initiated PrEP will be recruited. Participants will be randomized to the clusters using block randomization. The intervention condition includes receiving co-created interventions in addition to standard of care. The control condition is the standard of care that includes routine clinical assessment every 3 months. All participants will also receive an online follow-up survey every 3 months to record medication adherence and will be encouraged to use a WeChat mini-app for sexual and mental health education throughout the study. The primary outcomes are PrEP adherence and retention in PrEP care throughout the study period. We will examine a hypothesis that a co-created intervention can facilitate PrEP adherence. Generalized linear mixed models will be used for the primary outcome analysis. DISCUSSION: Developing PrEP adherence interventions in China faces barriers including suboptimal PrEP uptake among key populations, the lack of effective PrEP service delivery models, and insufficient community engagement in PrEP initiatives. Our study design addresses these obstacles by using co-creation to generate social media-based intervention materials and embedding the study design in the local healthcare system. The study outcomes may have implications for policy and intervention practices among CBOs and the medical system to facilitate PrEP adherence among key populations. TRIAL REGISTRATION: The study is registered in Clinical Trial databases in China (ChiCTR2100048981, July 19, 2021) and the US (NCT04754139, February 11, 2021).	*Human immunodeficiency virus infection /epidemiology; *crowdsourcing; *pre-exposure prophylaxis; China; Crowdsourcing; HIV Infections epidemiology; Human; Humans; Medication Adherence; Medication compliance; Pre-Exposure Prophylaxis methods; Procedures; Randomized Controlled Trials as Topic; Randomized controlled trial (topic)	English	United Kingdom	Western and Central Europe and North America	China	Asia and the Pacific	United States	Western and Central Europe and North America	Quantitative
Article	2022	Shaik, Jafar Sadik; Weld, Ethel D; Edick, Stacey; Fuchs, Edward; Riddler, Sharon; Marzinke, Mark A; D'Amico, Ronald; Bakshi, Kalpana; Lou, Yu; Hendrix, Craig; Han, Kelong; Ford, Susan L; Margolis, David; Spreen, William; Patel, Parul	Multicompartmental pharmacokinetic evaluation of long-acting cabotegravir in healthy adults for HIV preexposure prophylaxis.	British Journal of Clinical Pharmacology	-	-	-	1365-2125	10.1111/bcp.14980	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9290068	AIMS: Cabotegravir is an integrase strand transfer inhibitor in clinical development as long-acting (LA) injectable HIV preexposure prophylaxis. METHODS: This phase I study assessed pharmacokinetics of cabotegravir in plasma and anatomical sites associated with sexual HIV-1 transmission after repeated oral and single intramuscular (IM) LA dosing in healthy adults. Following a 28-day oral lead-in period of cabotegravir 30 mg and a washout period of 14-42 days, participants were administered a single ultrasound-guided gluteal IM cabotegravir LA 600-mg injection. The study objective was to characterize cabotegravir concentrations in plasma, cervical, vaginal and rectal tissues, and cervicovaginal and rectal fluids and up to Week 12 after IM injection. RESULTS: Nineteen participants enrolled and 16 completed the study through Week 52. Cabotegravir was detected in plasma and all tissues and fluids. Median plasma cabotegravir concentrations exceeded the in vitro protein-adjusted 90% maximal inhibitory concentration through Week 12. Median tissue- and fluid-to-plasma cabotegravir concentration ratios across all visits were 0.32 for rectal fluid and 0.08-0.16 for other tissues and fluids. Adjusted R2 coefficients between cabotegravir concentrations in plasma and cervical, vaginal and rectal tissues were 0.78, 0.79 and 0.90, respectively. Injection-site reactions were common (88% of participants) and were mostly grade 1 in intensity (82%). Two participants reported 11 non-drug-related serious adverse events. CONCLUSION: Concentrations of cabotegravir in tissues and fluids were proportional to plasma over time, with strong correlations between tissue and plasma concentrations. Cabotegravir LA tissue-to-plasma ratios may be important for understanding its use as preexposure prophylaxis. Article	2022	Sharma, Akshay; Gandhi, Monica; Sallabank, Gregory; Merrill, Leland; Stephenson, Rob	Study Evaluating Self-Collected Specimen Return for HIV, Bacterial STI, and Potential Pre-Exposure Prophylaxis Adherence Testing Among Sexual Minority Men in the United States.	American Journal of Men's Health	-	-	-	1557-9891	10.1177/15579883221115591	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9380227	Web-based HIV and sexually transmitted infection (STI) prevention studies are increasingly requesting gay, bisexual, and other men who have sex with men (GBMSM) to return self-collected specimens for laboratory processing. Some studies have solicited self-collected extragenital swabs for gonorrhea and chlamydia testing, but to date, none have solicited self-collected hair samples for pre-exposure prophylaxis (PrEP) adherence testing. Project Caboodle! offered 100 racially/ethnically diverse GBMSM aged 18 to 34 years residing across the United States a choice to self-collect at home and return by mail any of the following: a finger-stick blood sample (for HIV testing), a pharyngeal swab, a rectal swab and a urine specimen (for gonorrhea and chlamydia testing), and a hair sample (to visually assess its adequacy for PrEP drug level testing). Despite not incentivizing specimen return, 51% mailed back at least one type of specimen within 6 weeks (1% returned three specimens, 11% returned four specimens and 39% returned all five specimens). The majority of returned specimens were adequate for laboratory processing. Significantly more participants without a college education (p = .0003) and those who were working full-time or part-time (p = .0070) did not return any specimens. In addition, lower levels of HIV-related knowledge (p = .0390), STI-related knowledge (p = .0162), concern about contracting HIV (p = .0484), and concern about contracting STIs (p = .0108) were observed among participants who did not return any specimens. Self-collection of specimens holds promise as a remote monitoring strategy that could supplement testing in clinical settings, but a better understanding of why some GBMSM may choose to fully, partially, or not engage in this approach is warranted. Article	2022	Sharpe J.D.; Sanchez T.H.; Siegler A.J.; Guest J.L.; Sullivan P.S.	Association between the geographic accessibility of PrEP and PrEP use among MSM in nonurban areas	Journal of Rural Health	-	-	-	0890765X	10.1111/jrh.12645	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122497239&doi=10.1111%2fjrh.12645&partnerID=40&md5=8ebcedf51d48aebc7c72daac433143ab	Purpose: The US HIV epidemic has become a public health issue that increasingly affects men who have sex with men (MSM), including those residing in nonurban areas. Increasing access to pre-exposure prophylaxis (PrEP) in nonurban areas will prevent HIV acquisition and could address the growing HIV epidemic. No studies have quantified the associations between PrEP access and PrEP use among nonurban MSM. Methods: Using 2020 PrEP Locator data and American Men's Internet Survey data, we conducted multilevel log-binomial regression to examine the association between area-level geographic accessibility of PrEP-providing clinics and individual-level PrEP use among MSM residing in nonurban areas in the United States. Findings: Of 4,792 PrEP-eligible nonurban MSM, 20.1% resided in a PrEP desert (defined as more than a 30-minute drive to access PrEP), and 15.2% used PrEP in the past 12 months. In adjusted models, suburban MSM residing in PrEP deserts were less likely to use PrEP in the past year (adjusted prevalence ratio aPR = 0.35; 95% confidence interval CI = 0.15, 0.80) than suburban MSM not residing in PrEP deserts, and other nonurban MSM residing in PrEP deserts were less likely to use PrEP in the past year (aPR = 0.75; 95% CI = 0.60, 0.95) than other nonurban MSM not residing in PrEP deserts. Conclusions: Structural interventions designed to decrease barriers to PrEP access that are unique to nonurban areas in the United States are needed to address the growing HIV epidemic in these communities. © 2022 National Rural Health Association. Article	2022	Sharpless L.; Kershaw T.; Hatcher A.; Alexander K.A.; Katague M.; Phillips K.; Willie T.C.	IPV, PrEP, and Medical Mistrust	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002956	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132131604&doi=10.1097%2fQAI.0000000000002956&partnerID=40&md5=1bb021f796180a542fa587867d5c8ec7	Introduction:HIV pre-exposure prophylaxis (PrEP) is an effective HIV prevention method for women experiencing intimate partner violence (IPV). This study aimed to examine (1) relationships between physical, sexual, and psychological IPV and women's PrEP communication with a health care provider and domestic violence advocate; and (2) how IPV-specific medical mistrust modifies the association between IPV and PrEP communication.Methods:Data were from 2 studies conducted in Connecticut and Baltimore, MD on adult women experiencing IPV (N = 272). Logistic regressions examined associations between IPV, PrEP communication, and IPV-specific medical mistrust.Results:The average age was 25.7. The most common identity was non-Hispanic black (37.1%), followed by non-Hispanic white (33.8%), Hispanic (20.6%), and non-Hispanic another racial group (8.5%). Higher severity of psychological IPV was associated with more embarrassment to initiate a PrEP discussion with a health care provider (P = 0.009) or domestic violence advocate (P = 0.026). However, women with more severe psychological IPV were more willing to accept a PrEP recommendation from a health care provider (P = 0.033) or domestic violence advocate (P = 0.044). IPV-specific medical mistrust modified the association between physical IPV and willingness to accept a PrEP recommendation by a domestic violence advocate, such that women with physical IPV were significantly less likely to accept a PrEP recommendation by a domestic violence advocate, but only for women with high IPV-specific medical mistrust (P = 0.021).Conclusions:PrEP initiation among women experiencing IPV may be strengthened by addressing and dismantling systems that perpetuate IPV-specific medical mistrust and stigma against IPV survivors. © 2022 Lippincott Williams and Wilkins. Article	2022	Sheira L.A.; Kwena Z.A.; Charlebois E.D.; Agot K.; Ayieko B.; Gandhi M.; Bukusi E.A.; Thirumurthy H.; Camlin C.S.	Testing a social network approach to promote HIV self-testing and linkage to care among fishermen at Lake Victoria: study protocol for the Owete cluster randomized controlled trial	Trials	-	-	-	17456215	10.1186/s13063-022-06409-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131346851&doi=10.1186%2fs13063-022-06409-3&partnerID=40&md5=8d90804e45c575643f858c779b87e052	Background: Nearly 50% of men living with HIV in many countries are unaware of their HIV status; men also have lower uptake of HIV treatment and pre-exposure prophylaxis (PrEP). In SSA, highly mobile men such as those working in fishing communities alongside Lake Victoria have low uptake of HIV treatment and PrEP, despite increasing availability of these services. HIV self-testing (HIVST) kits hold promise for overcoming barriers to HIV testing and linkage to services for HIV-positive and HIV-negative men. We describe here a protocol for an HIV status-neutral, social network-based approach to promote HIV testing, linkage to care and prevention, and better health outcomes, including adherence, in fishermen around Lake Victoria. Methods: Utilizing beach management unit (BMU) registries of fishermen operating in three Lake Victoria fishing communities in Siaya County, Kenya, we completed a census and social network mapping to identify close social networks of men. Network clusters identified by a socially-central lead ("promotor") and selected to ensure maximal separation between treatment and control will be randomized. Promotors in both arms will receive basic HIV training; intervention promotors are further trained in HIVST to distribute kits to their cluster, while control promotors will distribute to their cluster vouchers for free HIVST at nearby clinics. We will test whether these promoters can enhance linkage to ART and PrEP after self-testing, thereby addressing a key limitation of HIVST. We will also measure 6- and 12-month viral load in those living with HIV and PrEP adherence among those without HIV via urine tenofovir levels as objective markers of adherence. Discussion: This study has the potential to improve HIV health and promote HIV prevention among a hard to reach, at-risk, and highly mobile population of men in Western Kenya—a critical population in Kenya's HIV prevention and treatment program. Further, if successful, this innovative social networks-based model could be scaled at the regional level to address HIV prevention and care among similarly at-risk populations of men in eastern Africa and inland fisheries settings across the continent. Trial registration: Self-Test Strategies and Linkage Incentives to Improve ART and PrEP Uptake in Men, registered on February 26, 2021, registration #NCT04772469. © 2022, The Author(s). Article	2022	Shengzi F.; Guiyuan H.; Xiaoguang S.	Natural conception and conception with assisted reproductive technique for male only HIV positive couples; 单纯男方 HIV 阳性夫妇的自然备孕与辅助生殖技术助孕	Chinese Journal of Reproduction and Contraception	-	-	-	20962916	10.3760/cma.j.cn101441-20210201-00053	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138992233&doi=10.3760%2fcma.j.cn101441-20210201-00053&partnerID=40&md5=955282766f42e76a4bf92de80669b839	With the implement of long-term effective highly active antiretroviral therapy (HAART), it not only significantly improves the survival expectation of HIV-infected men, but also significantly reduces the risk of sexually transmitted infections. The combination of pre-exposure prophylaxis (PrEP) and precisely timed intercourse during easy pregnancy period significantly improves the prevention of HIV non-infected female partners from sexually transmitted infection, and has proved to be an effective way for male only HIV positive couples to conceive naturally. Using processed semen of HIV-infected men for assisted reproduction treatment, no female partner or children infection is found, which is the preferred treatment for male only HIV positive couples with decreased fertility. The quality of life and fertility desires of HIV infected people cannot be ignored. © 2022 The authors.	assited; Human immunodeficiency virus; Natural conception; Pre-exposure prophylaxis; Reproductive technique; Sexually transmitted infections; Timed intercourse	Chinese	China	Asia and the Pacific	China	Asia and the Pacific	China	Asia and the Pacific	Review
Article	2022	Shi L.; Tang W.; Liu X.; Hu H.; Qiu T.; Chen Y.; Xu X.; Chen Y.; Zhang Z.; Zhou Y.; Lu J.; Fu G.	Trends of late HIV presentation and advance HIV disease among newly diagnosed HIV cases in Jiangsu, China: A serial cross-sectional study from 2008 to 2020	Frontiers in Public Health	-	-	-	22962565	10.3389/fpubh.2022.1054765	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144581495&doi=10.3389%2ffpubh.2022.1054765&partnerID=40&md5=cc07c12b942f085ce7ec1604bc7ebbe0	Background: This study aimed to assess the trends and determine the factors associated with late presentation (LP) and advanced HIV disease (AHD) among newly diagnosed people living with HIV (PLWH) from 2008 to 2020 in Jiangsu, China. Methods: Newly diagnosed PLWH registered in the HIV surveillance system from 2008 to 2020 were included. Multivariable logistic regression models were used to analyze the factors associated with LP and AHD. The LP and AHD trends were assessed using Joint-point analysis. Results: Of 37,251 newly diagnosed PLWH identified, 30,251(81.2%) patients met the inclusion criteria. Among those, 16,672 (55.1%) were considered LP, and 8,691 (28.7%) had AHD. LP trends steadily increased from 2008 (39.0%) to 2020 (59.4%), but AHD trends decreased visibly from 2016 (32.3%) to 2020 (23.4%). The overall median CD4 trends decreased slowly from 389 to 305 cells/mm3 between 2008 and 2020. Married patients and those older than 35 years were more likely to be LP and have AHD. Patients infected via heterosexual transmission had a higher risk of being classified as AHD (aOR: 1.13, 95%CI: 1.06–1.21) than patients infected via homosexual transmission. Patients that were diagnosed at sexually transmitted infections (STIs) clinics (aOR: 1.10, 95%CI: 1.01–1.20) and in hospitals (aOR: 1.69, 95%CI: 1.59–1.79) were more likely to be classified as LP compared with patients diagnosed at voluntary counseling and testing (VCT) centers. Similar, patients diagnosed at STIs clinics (aOR: 1.23, 95%CI: 1.11–1.36) and hospitals (aOR: 2.27, 95%CI: 2.12–2.43) were more likely to have AHD than patients diagnosed in VCT. Conclusion: Our findings indicate an alarming burden of LP in Jiangsu, suggesting the need for more attention toward HIV diagnosis at early CD4 stages. National HIV control programs must strengthen comprehensive interventions for HIV prevention and promote HIV services. Also, strategies for HIV prevention (PrEP and PEP), testing, and treatment must be extended, especially among the general population. Article	2022	Shorrock F.; Alvarenga A.; Hailey-Fair K.; Vickroy W.; Cos T.; Kwait J.; Trexler C.; Wirtz A.L.; Galai N.; Beyrer C.; Celentano D.; Arrington-Sanders R.	Dismantling Barriers and Transforming the Future of Pre-Exposure Prophylaxis Uptake in Young Black and Latinx Sexual Minority Men and Transgender Women	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2021.0222	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129415567&doi=10.1089%2fapc.2021.0222&partnerID=40&md5=a457e34fc2d02b6113454239aa655b00	Pre-exposure prophylaxis (PrEP) has the potential to transform HIV in young Black and Latinx sexual minority men (SMM) and transgender women (TW). Addressing low PrEP uptake in this population depends on the better understanding of barriers to PrEP use. This article uses an ecological framework to explore barriers to daily oral PrEP in a sample of young Black and Latinx SMM and TW in three geographically prioritized cities in the United States. In-depth interviews were completed with 33 young Black and Latinx SMM and TW (22 at risk for and 11 recently diagnosed with HIV), aged 17-24, participating in a randomized trial aimed at increasing PrEP and antiretroviral therapy (ART) uptake and adherence. Interviews were recorded and transcribed, and then analyzed using inductive and deductive coding. Coded transcripts were organized into individual, interpersonal, community, and structural categories, by PrEP use and HIV status. Among participants, nine reported having been prescribed PrEP, with five actively or recently taking PrEP, whereas only one participant diagnosed with HIV had been prescribed PrEP. Major themes related to barriers emerged across the individual, family, community, and structural level. Limited barriers related to partners, instead participants who were HIV encouraged PrEP use. Participants commonly reported low perceived HIV risk, fear of disclosure, barriers relating to insurance/cost, and medication use as reasons for nonuse of PrEP. For youth to remain on a healthy life course, HIV preventative measures will need to be adopted early in adolescence for those at risk of HIV acquisition. Interventions need to simultaneously address multilevel barriers that contribute to nonuse in adolescents. Copyright © 2022, Mary Ann Liebert, Inc. Article	2022	Shrestha R.; Wickersham J.A.; Khati A.; Azwa I.; Ni Z.; Kamarulzaman A.; Sullivan P.S.; Jadkarim L.; Eger W.H.; Gautam K.; Altice F.L.	Clinic-Integrated Mobile Health Intervention ("JomPrEP" App) to Improve Uptake of HIV Testing and Pre-exposure Prophylaxis Among Men Who Have Sex With Men in Malaysia: Protocol for an Intervention Development and Multiphase Trial	JMIR Research Protocols	-	-	-	19290748	10.2196/43318	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144752908&doi=10.2196%2f43318&partnerID=40&md5=9d82cb68bdc95f9f99e3aae70503391d	Background: Men who have sex with men (MSM) are disproportionately affected by the HIV epidemic in Malaysia and globally. Cross-cutting prevention strategies such as mobile health (mHealth), particularly smartphone apps, hold great promise for HIV prevention efforts among Malaysian MSM, especially when linked to HIV testing and pre-exposure prophylaxis (PrEP). Objective: This study aims to adapt an existing app to create and test a clinic-integrated app (JomPrEP), a virtual platform to deliver HIV testing and PrEP services for MSM in Malaysia. Methods: The JomPrEP project involves developing and testing an app-based platform for HIV prevention among Malaysian MSM and will be conducted in 2 phases. In phase I (development phase), we will adapt an existing mHealth app (HealthMindr) to create a new clinic-integrated app called "JomPrEP" to deliver holistic HIV prevention services (eg, HIV testing, PrEP, support services for mental health and substance use) among MSM in Malaysia. During phase II (testing phase), we will use a type I hybrid implementation science trial design to test the efficacy of JomPrEP while gathering information on implementation factors to guide future scale-up in real-world settings. Results: As of September 2022, we have completed phase I of the proposed study. Based on a series of formative work completed during phase I, we developed a fully functional, clinic-integrated JomPrEP app, which provides a virtual platform for MSM in Malaysia to facilitate their engagement in HIV prevention in a fast and convenient manner. Based on participant feedback provided during phase I, we are currently optimizing JomPrEP and the research protocols for a large-scale efficacy trial (phase II), which will commence in January 2023. Conclusions: Scant HIV prevention resources coupled with entrenched stigma, discrimination, and criminalization of same-sex sexual behavior and substance use hamper access to HIV prevention services in Malaysia. If found efficacious, JomPrEP can be easily adapted for a range of health outcomes and health care delivery services for MSM, including adaptation to other low- and middle-income countries. Article	2022	Shuper P.A.; Varatharajan T.; Kinitz D.J.; Gesink D.; Joharchi N.; Bogoch I.I.; Loutfy M.; Rehm J.	Perceived influence of alcohol consumption, substance use, and mental health on PrEP adherence and condom use among PrEP-prescribed gay, bisexual, and other men-who-have-sex-with-men: a qualitative investigation	BMC Public Health	-	-	-	14712458	10.1186/s12889-022-14279-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139456062&doi=10.1186%2fs12889-022-14279-2&partnerID=40&md5=cb775e5af143e67cbbad25f84c8b0892	Background: Gay, bisexual, and other men-who-have-sex-with-men (GBMSM) continue to be disproportionately affected by Human Immunodeficiency Virus (HIV). Although HIV pre-exposure prophylaxis (PrEP) offers an effective means of reducing incident HIV among this population, the HIV-preventive success of oral-based PrEP is contingent upon regimen adherence. Elevated rates of alcohol-, substance use-, and mental health-related issues among GBMSM potentially hinder PrEP-taking efforts, however the evidence for this remains mixed. Accordingly, the present study entailed a comprehensive qualitative investigation to explore PrEP-prescribed GBMSM's perceptions surrounding the influence of alcohol, substance use, and mental health on PrEP adherence. Methods: PrEP-prescribed GBMSM (age ≥ 18 years; prescribed PrEP for ≥ 3 months) were recruited from two PrEP-delivery clinics in Toronto, Canada for focus groups as part of the formative phase of an alcohol-, substance use-, and mental health-focused randomized controlled intervention trial. Focus group discussions qualitatively explored perceived strengths and barriers associated with adherence to PrEP treatment; with an emphasis on alcohol, substance use, and mental health concerns. Condom use among PrEP-prescribed GBMSM within the context of these concerns was also discussed. Results: A total of five focus groups involving 35 GBMSM were conducted (4–10/group; mean age = 42.4; white = 71.4%). Although participants themselves generally reported successfully adhering to their PrEP regimens—resulting from a strong, underlying motivation for self-care—they recognized the detrimental impact that alcohol, substance use, and mental health had on adherence among their peers. In this regard, alcohol and substances were perceived as detracting from adherence only when consumption was excessive or temporally linked to PrEP dosing. Pronounced mental health issues (e.g., severe depression) were also seen as hindering adherence, although these effects were nuanced and perceived as person-dependent. Alcohol and substances were linked to condomless sex, regardless of PrEP use, and PrEP was therefore viewed as an HIV-protective 'safety net.' Conclusions: Overall, findings suggest that PrEP adherence can often be successfully achieved in the presence of alcohol-, substance use-, and mental health-related issues. Augmenting self-care, and addressing pronounced addictions- and mental health-related concerns, may enhance PrEP treatment among GBMSM. © 2022, The Author(s). Article	2022	Silva C.J.	STABILITY and OPTIMAL CONTROL of A DELAYED HIV/AIDS-PREP MODEL	Discrete and Continuous Dynamical Systems - Series S	-	-	-	19371632	10.3934/dcdss.2021156	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124380343&doi=10.3934%2fdcdss.2021156&partnerID=40&md5=3ab4adf33e59555131b1ca6cb5abf2ff	In this paper, we propose a time-delayed HIV/AIDS-PrEP model which takes into account the delay on pre-exposure prophylaxis (PrEP) distribution and adherence by uninfected persons that are in high risk of HIV infection, and analyze the impact of this delay on the number of individuals with HIV infection. We prove the existence and stability of two equilibrium points, for any positive time delay. After, an optimal control problem with state and control delays is proposed and analyzed, where the aim is to find the optimal strategy for PrEP implementation that minimizes the number of individuals with HIV infection, with minimal costs. Different scenarios are studied, for which the solutions derived from the Minimum Principle for Multiple Delayed Optimal Control Problems change depending on the values of the time delays and the weights constants associated with the number of HIV infected individuals and PrEP. We observe that changes on the weights constants can lead to a passage from bang-singular-bang to bang-bang extremal controls. © 2022 American Institute of Mathematical Sciences. All rights reserved. Article	2022	Silva Junior, Aureliano Lopes da; Brigeiro, Mauro; Monteiro, Simone	Irmandade travesti é a nossa cura': solidariedade política entre travestis e mulheres trans no acesso ao cuidado em saúde e à prevenção ao HIV	Saúde Debate	-	-	-	0103-1104	10.1590/0103-11042022e707	http://www.scielosp.org/scielo.php?script=sci_arttext&pid=S0103-11042022001200103	RESUMO Diversos estudos descrevem as condições de vulnerabilidade social das pessoas trans e suas experiências de discriminação nos serviços de saúde. Tais situações dificultam o acesso dessa população à promoção e ao cuidado em saúde e, no caso particular da Aids, resultam na baixa adesão à prevenção e ao tratamento. Este artigo discute as estratégias para o acesso aos serviços públicos de saúde e à prevenção ao HIV desenvolvidas por travestis e mulheres trans da Região Metropolitana do Rio de Janeiro. A reflexão baseou-se em dois estudos: um sobre testagem de HIV e outro sobre o uso das tecnologias biomédicas de prevenção (PrEP, PEP). Os achados, decorrentes da observação participante e de entrevistas, demonstram que a produção do cuidado em saúde desse grupo se constrói alicerçada em uma certa solidariedade política, aqui denominado de irmandade, que medeia a relação de travestis e mulheres trans com o território, os dispositivos de saúde e a experiência com o HIV/Aids. Tais dados sugerem a importância de as políticas de saúde considerarem as condições de vulnerabilidade das pessoas trans, as demandas concernentes à: autonomia e autodeterminação na produção de saúde; legitimação de suas formas de subjetivação e cuidado de si; especificidade da relação entre pares. Theses and Dissertations	2022	SILVA, DYEMISON PINHEIRO DA	Uso de PrEP e PEP, testagem de HIV, outras ISTS e sua relação com a homonegatividade internalizada: Um estudo transversal em 18 países da América Latina	-	-	FACULDADE DE CIÊNCIAS MÉDICAS DA SANTA CASA DE SÃO PAULO	-	-	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=11945670	A epidemia de HIV na América Latina tem se concentrado em populações-chave, como a de gays e outros homens que fazem sexo com homens. A prevenção combinada é uma estratégia central na resposta às novas infecções por HIV. Entender quais fatores estão relacionados ao uso de tecnologias de prevenção é passo fundamental no enfrentamento da epidemia na região. Este trabalho tem como objetivo avaliar a relação entre Homonegatividade Internalizada (HI) e a utilização de métodos preventivos em HIV/Aids, como PEP, PrEP, testagem de HIV e testagem de outras ISTs. Foi realizado inquérito online (LAMIS) com gays e outros homens que fazem sexo com homens em 18 países da América Latina. Neste estudo analisamos a distribuição da Homonegatividade Internalizada por país, sendo a HI utilizada como principal variável de exposição na construção da análise multivariada, para os desfechos de uso de PEP, uso de PrEP, testagem de HIV e testagem de outras ISTs. Observou-se menor chance de testagem de HIV (OR = 0,92 IC 95%: 0,91-0,93), testagem de ISTs (OR = 0,91 IC 95%: 0,90-0,93) e uso de PEP (OR = 0,90 IC 95%: 0,85-0,95) nas pessoas com HI. Não foi observada associação entre HI e uso de PrEP (OR = 0,97 IC 95%: 0,91-1,02). Os resultados mostram a necessidade da ampliação do olhar dos formuladores de políticas públicas para questões estruturais que podem impactar diversos aspectos da vida de gays e outros homens que fazem sexo com homens, e que precisam ser consideradas quando da implementação da prevenção ao HIV e a outras ISTs, centrais no controle da epidemia. Article	2022	Silva-Brandao, Roberto Rubem da; Ianni, Aurea Maria Zöllner	Othering discourse and stigma amidst the identity formation process among gays, bisexuals and other men who have sex with men on HIV pre-exposure prophylaxis (PrEP).	Ciência & Saúde Coletiva	-	-	-	1678-4561	10.1590/1413-81232022275.12692021	https://dx.doi.org/10.1590/1413-81232022275.12692021	With the global emergence of the HIV pre-exposure prophylaxis (PrEP), questions have emerged on which ways the social identity formation process among gays, bisexuals and other men who have sex with men on PrEP arise and constitute beyond exclusive sexual orientation expressions. We conducted a content analysis with thematic categories in a PrEP online group guided by group-web affiliation and individualization approaches. Individuals identify themselves as PrEPsters as part of a PrEP club, while dealing with conflicts on serosorting sexual partners and stigmatizing reactions towards people living with HIV/AIDS (PLWH). Self-worth and othering discourses towards PLWH emerged as complex themes in men's production of identity processes across four overlapping domains: (1) self-worth as a strategy to challenge individual HIV-acquisition-related anxiety and fear, (2) group-worth and group empowerment, (3) body control and reclaiming power on sexual health, and (4) othering discourses, HIV/AIDS stigma and criminalization of PLWH. Paradoxically, internal and external discourses to the group constitute and challenge identity differentiation; individuals on PrEP claim to fight against the HIV/AIDS stigma, while this reverberates alongst HIV-related discriminatory expressions in their discourses. Article	2022	Skakoon-Sparling S.; Berlin G.; Lachowsky N.J.; Moore D.M.; Lambert G.; Cox J.; Grace D.; Apelian H.; Sang J.M.; Hart T.A.	Social Support and HIV Prevention Behaviors Among Urban HIV-Negative Gay, Bisexual, and Other Men Who Have Sex With Men	Health Psychology	-	-	-	2786133	10.1037/hea0001131	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122384627&doi=10.1037%2fhea0001131&partnerID=40&md5=b183fc6db1f4adff9e8d200d44767f62	Objective: Supportive social relationships can have direct positive effects on health and mitigate the negative impact of stressors. This study investigated the main effect of perceived social support on STI/HIV risk and prevention behaviors. The buffering effect of perceived social support on the impact of proximal minority stressors, like internalized homonegativity, was also examined on one risk behavior specifically, condomless anal sex (CAS) without HIV preexposure prophylaxis (PrEP) use. Method: HIV-negative gay, bisexual, and other men who have sex with men (GBM) were recruited using respondent driven sampling from three major Canadian urban centers (n = 1,409). GBM completed measures of perceived social support, proximal minority stress, and engagement in STI/HIV risk and prevention behaviors. Results: Higher perceived social support was positively associated with a several health behaviors, including recent STI and HIV testing, discussing HIV status with prospective partners, the use of behavioral HIV-risk reduction strategies during sexual encounters, and a lower likelihood of engaging in CAS without PrEP. There was evidence of moderation as well. Among GBM with higher perceived social support, internalized homonegativity was no longer associated with increased odds of engaging in CAS without PrEP. Conclusions: The results of the current study advance social support theory to GBM in the context of biomedical prevention, showing both evidence of both direct associations and buffering effects on STI/HIV risk and prevention behaviors. This highlights the importance of promoting social support seeking in interventions aimed at improving GBM health © 2021 American Psychological Association	Condomless anal sex (cas); Hiv; Internalized homophobia; Msm; Social support	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Quantitative
Article	2022	Skovdal M.; Clausen C.L.; Magoge-Mandizvidza P.; Dzamatira F.; Maswera R.; Nyamwanza R.P.; Nyamukapa C.; Thomas R.; Gregson S.	How gender norms and 'good girl' notions prevent adolescent girls and young women from engaging with PrEP: qualitative insights from Zimbabwe	BMC Women's Health	-	-	-	14726874	10.1186/s12905-022-01928-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135992296&doi=10.1186%2fs12905-022-01928-2&partnerID=40&md5=ff5098651ca297ff40d037d3dab0f1b	Background: Pre-exposure prophylaxis, or PrEP, has been hailed for its promise to provide women with user-control. However, gender-specific challenges undermining PrEP use are beginning to emerge. We explore the role of gender norms in shaping adolescent girls and young women's (AGYW) engagement with PrEP. Methods: We draw on qualitative data from 12 individual interviews and three focus group discussions with AGYW from eastern Zimbabwe. Interviews were transcribed and thematically coded in NVivo 12. Emerging themes were further investigated using Connell's notion of 'emphasised femininity'. Results: Participants alluded to the patriarchal society they are part of, with 'good girl' notions subjecting them to direct and indirect social control. These controls manifest themselves through the anticipation of intersecting sexuality- and PrEP-related stigmas, discouraging AGYW from engaging with PrEP. AGYW recounted the need for permission to engage with PrEP, forcing them to consider engaging with PrEP in secrecy. In addition, limited privacy at home, and fear of disclosure of their health clinic visits, further heightened their fear of engaging with PrEP. PrEP is not simply a user-controlled HIV prevention method, but deeply entrenched within public gender orders. Conclusion: AGYW face significant limitations in their autonomy to initiate and engage with PrEP. Those considering PrEP face the dilemma of Scylla and Charybdis: The social risks of stigmatisation or risks of HIV acquisition. Efforts to make PrEP available must form part of a combination of social and structural interventions that challenge harmful gender norms. © 2022, The Author(s). Article	2022	Skovdal M.; Magoge-Mandizvidza P.; Dzamatira F.; Maswera R.; Nyamukapa C.; Thomas R.; Mugurungi O.; Gregson S.	Improving access to pre-exposure prophylaxis for adolescent girls and young women: recommendations from healthcare providers in eastern Zimbabwe	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-022-07376-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128722495&doi=10.1186%2fs12879-022-07376-5&partnerID=40&md5=7156167e2989c518b2d366c944d9dea7	Background: In sub-Saharan Africa, adolescent girls and young women (AGYW) are at high risk of acquiring HIV. A growing number of sub-Saharan African countries are beginning to avail pre-exposure prophylaxis, or PrEP, but with limited success. Unpacking strategies to overcome barriers to the uptake of PrEP is critical to prevent HIV amongst AGYW. This article explores health professionals' views and recommendations on what is required to increase uptake of PrEP. Methods: The study draws on interview data from 12 providers of HIV prevention services in eastern Zimbabwe. The healthcare providers were purposefully recruited from a mix of rural and urban health facilities offering PrEP. The interviews were transcribed and imported into NVivo 12 for thematic coding and network analysis. Results: Our analysis revealed six broad strategies and 15 concrete recommendations which detail the range of elements healthcare providers consider central for facilitating engagement with PrEP. The healthcare providers called for: (1) PrEP marketing campaigns; (2) youth-friendly services or corners; (3) improved PrEP delivery mechanisms; (4) improvements in PrEP treatment; (5) greater engagement with key stakeholders, including with young people themselves; and (6) elimination of costs associated with PrEP use. These recommendations exemplify an awareness amongst healthcare providers that PrEP access is contingent on a range of factors both inside and outside of the clinical setting. Conclusions: Healthcare providers are at the frontline of the HIV epidemic response. Their community-embeddedness, coupled with their interactions and encounters with AGYW, make them well positioned to articulate context-specific measures for improving access to PrEP. Importantly, the breadth of their recommendations suggests recognition of PrEP use as a complex social practice that requires integration of a combination of interventions, spanning biomedical, structural, and behavioural domains. © 2022, The Author(s). Article	2022	Slogrove, Amy L; Burmen, Barbara; Davies, Mary Ann; Edmonds, Andrew; Abrams, Elaine J; Chadwick, Ellen G; Goetghebuer, Tessa; Mofenson, Lynne M; Paul, Mary E; Thorne, Claire; Williams, Paige L; Vicari, Marissa; Powis, Kathleen M	Standardized Definitions of In Utero Human Immunodeficiency Virus and Antiretroviral Drug Exposure Among Children.	Clinical Infectious Diseases	-	-	-	1537-6591	10.1093/cid/ciab974	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9410726	In countries with high human immunodeficiency virus (HIV) prevalence, up to 30% of pregnant women are living with HIV, with fetal exposure to both HIV and antiretroviral therapy during pregnancy. In addition, pregnant women without HIV but at high risk of HIV acquisition are increasingly receiving HIV preexposure antiretroviral prophylaxis (PrEP). Investments are being made to establish and follow cohorts of children to evaluate the long-term effects of in utero HIV and antiretroviral exposure. Agreement on a key set of definitions for relevant exposures and outcomes is important both for interpreting individual study results and for comparisons across cohorts. Harmonized definitions of in utero HIV and antiretroviral drug (maternal treatment or PrEP) exposure will also facilitate improved classification of these exposures in future observational studies and clinical trials. The proposed definitions offer a uniform approach to facilitate the consistent description and estimation of effects of HIV and antiretroviral exposures on key child health outcomes. Article	2022	Smith A.K.J.; Newman C.E.; Haire B.; Holt M.	Prescribing as affective clinical practice: Transformations in sexual health consultations through HIV pre-exposure prophylaxis	Sociology of Health and Illness	-	-	-	1419889	10.1111/1467-9566.13502	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130962979&doi=10.1111%2f1467-9566.13502&partnerID=40&md5=b59b57fd521b5b09db2c71649cc29957	New medicines can transform routines and priorities in clinical practice, but how do clinicians think and feel about these changes, and how does it affect their work? In Australia, the HIV prevention regimen pre-exposure prophylaxis (PrEP) has been rapidly rolled out, transforming the sexual cultures and practices of users, but less attention has been given to the ways PrEP has reconfigured clinical practice. This paper draws on 28 qualitative semi-structured interviews conducted between 2019 and 2020 with PrEP-providing doctors and nurses in Australia to consider how they have affectively engaged with PrEP and put it into practice. Through a reflexive thematic analysis, we explore how clinicians adapted to PrEP, how the field of HIV prevention has been transformed, and how these developments have changed how clinicians approach patients. While the introduction of PrEP was initially received with uncertainty and shock, clinicians described PrEP as enjoyable to prescribe, and better aligned with the moral duties of sexual health consultations than existing HIV prevention strategies like condoms. Through approaching clinical work as an 'affective practice', we argue for attending not only to how new interventions change expectations and practices, but also how these changes are felt and valued by clinicians. © 2022 The Authors. Article	2022	Smith D.K.; Rawlings M.K.; Glick N.; Mena L.; Coleman M.; Houlberg M.; McCallister S.; Wiener J.	Adherence to Daily Oral TDF/FTC for PrEP in Community Health Center Populations: The Sustainable Health Center Implementation PrEP Pilot (SHIPP) Study	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03388-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111729411&doi=10.1007%2fs10461-021-03388-5&partnerID=40&md5=448b6bde867bd1f6d40ec719a895ff81	The prevention effectiveness of oral preexposure prophylaxis (PrEP) is highly dependent on medication adherence but no validated longer term PrEP adherence measures are readily available for use by primary care clinicians caring for diverse populations. We compared two self-report measures (number of doses missed in past 7 days and day-by-day past week pill taking) to results of tenofovir concentrations in dried blood spot (DBS) samples at quarterly visits over the first 12 months of PrEP use. 1420 men and women in five US community health centers enrolled in a medication adherence substudy. For 3, 6, 9 and 12 months, the respective percentages of persons with self-report vs DBS levels consistent having taken all 7 doses in the week prior were 71% (51%), 70% (47%), 71% (46%) and 69% (44%). Conversely, the percentage of participants reporting taking 0–1 doses in the week prior by self-report vs DBS drug levels at 3, 6, 9 and 12 months consistent with this level of nonadherence of 6% (9%), 5% (10%), 8% (9%), and 9% (15%). The estimated risk of low adherence (estimated 0–1 doses in the week prior) was higher for participants of Black (RR 1.60, CI 1.09–2.34) or "Other" race (RR 1.62, CI 0.99–2.65) compared with participants of White race; being a transgender female (RR 2.31, CI 1.33–4.02) compared to men who have sex with men; or enrollment at a study site with less experience in the provision of PrEP. The estimated risk of low adherence by DBS was lower for participants with a higher number of sex partners in the past 3 months and those having a bachelor's degree or higher. More work is needed to provide clinicians with measures to assess medication adherence in diverse US populations being prescribed PrEP to support its effective use in reducing HIV acquisition in individuals and at the community level. © 2021, This is a U.S. government work and not under copyright protection in the U.S.; foreign copyright protection may apply. Article	2022	Smith L.R.; Shumskaia N.; Kurmanalieva A.; Patterson T.L.; Werb D.; Blyum A.; Algarin A.B.; Yeager S.; Cepeda J.	Cohort profile: the Kyrgyzstan InterSectional Stigma (KISS) injection drug use cohort study	Harm Reduction Journal	-	-	-	14777517	10.1186/s12954-022-00633-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130753188&doi=10.1186%2fs12954-022-00633-5&partnerID=40&md5=1f0fa803cac8bd7ba6c25ee6964d3aa9	Background: In Kyrgyzstan and other Eastern European and Central Asian countries, injection drug use and HIV-related intersectional stigma undermines HIV prevention efforts, fueling a rapidly expanding HIV epidemic. The Kyrgyzstan InterSectional Stigma (KISS) Injection Drug Use Cohort is the first study designed to assess the impact of drug use, methadone maintenance treatment (MMT) and HIV stigma experiences among people who inject drugs (PWID) on HIV prevention service utilization. Methods: Adult PWID were recruited from Bishkek city and the surrounding rural Chuy Oblast region in northern Kyrgyzstan via modified time location sampling and snowball sampling. All participants completed a baseline rapid HIV test and interviewer-administered survey. A subsample of participants were prospectively followed for three months and surveyed to establish retention rates for future work in the region. Internal reliability of three parallel stigma measures (drug use, MMT, HIV) was evaluated. Descriptive statistics characterize baseline experiences across these three stigma types and HIV prevention service utilization, and assess differences in these experiences by urbanicity. Results: The KISS cohort (N = 279, 50.5% Bishkek, 49.5% Chuy Oblast) was mostly male (75.3%), ethnically Russian (53.8%), median age was 40 years old (IQR 35–46). Of the 204 eligible participants, 84.9% were surveyed at month 3. At baseline, 23.6% had a seropositive rapid HIV test. HIV prevention service utilization did not differ by urbanicity. Overall, we found 65.9% ever utilized syringe service programs in the past 6 months, 8.2% were utilizing MMT, and 60.8% met HIV testing guidelines. No participants reported PrEP use, but 18.5% had heard of PrEP. On average participants reported moderate levels of drug use (mean M = 3.25; α = 0.80), MMT (M = 3.24; α = 0.80), and HIV stigma (M = 2.94; α = 0.80). Anticipated drug use stigma from healthcare workers and internalized drug use stigma were significantly higher among PWID from Bishkek (p < 0.05), while internalized HIV stigma among PWID living with HIV was significantly greater among PWID from Chuy Oblast (p = 0.03). Conclusion: The KISS cohort documents moderate levels of HIV-related intersectional stigma and suboptimal engagement in HIV prevention services among PWID in Kyrgyzstan. Future work will aim identify priority stigma reduction intervention targets to optimize HIV prevention efforts in the region. © 2022, The Author(s). Article	2022	Smith M.-S.R.; Mohan H.; Ajaykumar A.; Hsieh A.Y.Y.; Martineau L.; Patel R.; Gadawska I.; Sherwood C.; Serghides L.; Piret J.M.; Côté H.C.F.	Second-Generation Human Immunodeficiency Virus Integrase Inhibitors Induce Differentiation Dysregulation and Exert Toxic Effects in Human Embryonic Stem Cell and Mouse Models	Journal of Infectious Diseases	-	-	-	221899	10.1093/infdis/jiac386	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142940857&doi=10.1093%2finfdis%2fjiac386&partnerID=40&md5=7e43314727df00eadf3c24156c8f4d97	Background. Each year, approximately 1.1 million children are exposed in utero to human immunodeficiency virus antiretrovirals, yet their safety is often not well characterized during pregnancy. The Tsepamo study reported a neural tube defect signal in infants exposed to the integrase strand transfer inhibitor (InSTI) dolutegravir from conception, suggesting that exposure during early fetal development may be detrimental Methods. The effects of InSTIs on 2 human embryonic stem cell (hESC) lines were characterized with respect to markers of pluripotency, early differentiation, and cellular health. In addition, fetal resorptions after exposure to InSTIs from conception were analyzed in pregnant mice. Results. At subtherapeutic concentrations, second-generation InSTIs bictegravir, cabotegravir, and dolutegravir decreased hESC counts and pluripotency and induced dysregulation of genes involved in early differentiation. At therapeutic concentrations, bictegravir induced substantial hESC death and fetal resorptions. It is notable that first-generation InSTI raltegravir did not induce any hESC toxicity or differentiation, at any concentration tested. Conclusions. Exposure to some InSTIs, even at subtherapeutic concentrations, can induce adverse effects in hESCs and pregnant mice. Given the increasingly prevalent use of second-generation InSTIs, including in women of reproductive age, it is imperative to further elucidate the effect of InSTIs on embryonic development, as well as their long-term safety after in utero exposure. © The Author(s) 2022. Theses and Dissertations	2022	Smith, Anthony	PrEP in Practice: a sociological study of HIV pre-exposure prophylaxis prescribing	-	-	University of New South Wales	-	-	NA	http://hdl.handle.net/1959.4/100740 https://unsworks.unsw.edu.au/bitstreams/5c32d2d5-b3b0-442b-aa61-f16c148a4ba7/download https://doi.org/10.26190/unsworks/24447	HIV pre-exposure prophylaxis (PrEP) is a highly effective strategy for preventing new HIV infections. Since 2015, PrEP has been rapidly implemented with gay and bisexual men in Australia. While there is recognition of the importance of optimising the clinical delivery of PrEP, there has been scarce empirical research in Australia documenting how clinicians engage with prescribing PrEP, and minimal international social science research considering how PrEP has (re)shaped clinical practice. In this thesis I explore the role of clinicians in delivering PrEP in Australia. Drawing on the sociology of prescribing, I approach PrEP prescribing as a social practice, and attend to how clinicians anticipate and imagine patients, and how they think and feel about PrEP. This study draws on qualitative methodologies, including findings from semi-structured interviews conducted with clinicians who provide PrEP in New South Wales and Western Australia between 2019 and 2020, and with HIV expert stakeholders across Australia in 2017. Through empirical findings, I consider debates about which types of clinicians are best suited to prescribing PrEP and workforce challenges for providing PrEP in different clinical settings. I analyse clinician imaginaries of PrEP users and broader patient collectives, as well as clinicians' views on providing PrEP to alleviate different types of 'HIV anxiety'. I also examine prescribing as an affective clinical practice. I identify recommendations for supporting clinical workforces to improve the implementation of PrEP across Australian communities. This thesis demonstrates how PrEP has transformed HIV prevention for clinicians, requiring them to adapt to new ways of approaching HIV and sexual health. Clinicians develop expertise through routine opportunities to prescribe, and they develop imaginaries about patients and communities through consultations that shape their future interactions with patients. Conversely, a lack of patient demand makes it challenging for general practitioners to develop confidence and competence with PrEP prescribing. Providing PrEP involves the complexity of discussing sex and managing ideas about risk and responsibility, which are persistent challenges for both HIV-experienced and inexperienced clinicians. I argue for the value of sociological perspectives on clinical workforces to support and sustain effective HIV prevention. Article	2022	Smith, Anthony K J; Newman, Christy E; Haire, Bridget; Holt, Martin	Clinician imaginaries of HIV PrEP users in and beyond the gay community in Australia	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2021.1957152	https://www.proquest.com/scholarly-journals/clinician-imaginaries-hiv-prep-users-beyond-gay/docview/2720725463/se-2?accountid=8113	Through the development and implementation of HIV pre-exposure prophylaxis (PrEP), the characteristics of PrEP users have been configured in a range of ways. Drawing on the concept of 'imaginaries', we consider how clinicians imagine PrEP users and related communities. We conducted 28 semi-structured interviews in 2019–2020 with PrEP-providing clinicians based in New South Wales and Western Australia. Participants included general practitioners, sexual health nurses and sexual health doctors. We inductively developed three themes through a reflexive thematic analysis: 'PrEP users as 99% gay men/MSM', 'The informed and connected PrEP user', and 'Condom users in the PrEP era'. Participants imagined PrEP users primarily as gay men, and so we focused on how gay community was imagined in relation to PrEP users. Users were imagined as supporting one another to use PrEP effectively, but some were imagined as threatening norms of condom use amongst gay community. Analysing clinician imaginaries of PrEP users reveals insight into how clinicians speculate about and engage with changing community norms related to condom use and accessing PrEP. These imaginaries reveal ongoing tensions about who is believed to be best suited to PrEP, and PrEP's impact on norms of conduct in imagined biosocial communities like gay men. Article	2022	Sonalkar S.; McAllister A.; Kete C.; Fishman J.; Frarey A.; Short W.R.; Schreiber C.A.; Teitelman A.	Implementation of an HIV Pre-exposure Prophylaxis Strategy Into Abortion and Early Pregnancy Loss Care	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002972	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132453371&doi=10.1097%2fQAI.0000000000002972&partnerID=40&md5=5469774d8bd72c5bc67ad4f7daa6c58f	Background:Family planning and abortion clinics routinely address sexual health. We sought to evaluate implementation outcomes of an HIV pre-exposure prophylaxis (PrEP) care strategy for patients seeking management of induced abortion and pregnancy loss.Setting:Single-center, urban, academic, hospital-based family planning service.Methods:We used a multifaceted implementation strategy directed toward family planning providers comprised of educational sessions, an electronic medical record-prompted verbal assessment of HIV risk, electronic medical record shortcuts for PrEP prescription, and support of a PrEP navigator. We assessed penetration of the intervention by calculating the penetration of a PrEP offer, measured as the proportion of encounters in which PrEP was offered to PrEP-eligible individuals. We evaluated feasibility, acceptability, and appropriateness of the intervention using belief elicitation interviews with providers.Results:From November 2018 to April 2019, the proportion of PrEP eligible patients who were offered PrEP, was 87.9% (29/33). Providers found the intervention acceptable and appropriate, but reported barriers including time constraints, and disappointment if patients did not adhere to PrEP. Providers liked that PrEP provision in abortion care settings felt innovative, and that they could contribute to HIV prevention.Conclusion:Family planning providers in an academic center found HIV risk assessment and PrEP provision to be feasible, acceptable, and appropriate. Further research should evaluate implementation outcomes of PrEP care strategies in additional abortion care contexts, including clinics offering reproductive health care outside of academia. © 2022 Lippincott Williams and Wilkins. Article	2022	Sonalkar S.; Short W.R.; McAllister A.; Kete C.; Ingeno L.; Fishman J.; Koenig H.C.; Schreiber C.A.; Teitelman A.M.	Incorporating HIV Pre-Exposure Prophylaxis Care for Patients Seeking Induced Abortion and Pregnancy Loss Management	Women's Health Issues	-	-	-	10493867	10.1016/j.whi.2021.12.005	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122302717&doi=10.1016%2fj.whi.2021.12.005&partnerID=40&md5=1d77b3a043b0cd22674decdcb3bc2624	Background: Family planning clinical encounters are important opportunities for HIV prevention. Our objectives were to 1) estimate the proportion of patients seeking induced abortion and early pregnancy loss management eligible for HIV pre-exposure prophylaxis (PrEP) and 2) compare PrEP eligibility and uptake between patients with unintended and intended pregnancy. Methods: We conducted a cross-sectional survey and a nested prospective cohort study of patients seeking an induced abortion or early pregnancy loss management. We assessed pregnancy intendedness, PrEP awareness, HIV risk and risk perception, desire for same-day PrEP start, and PrEP continuation at 30 days. We used the χ^2 and Fisher's exact tests to assess differences between the participants with intended and unintended pregnancy. We had 80% power to detect a 14% difference in PrEP eligibility between the groups. Results: We enrolled 250 women. Fifty-six percent (139) had an unintended pregnancy and 44% (110) had an intended pregnancy. PrEP eligibility did not differ significantly between the patients with intended and unintended pregnancy (16% vs. 10%; p =.18). More than one-half (54%, 135/250) were unaware of PrEP before their study visit, and 93% (232/250) considered themselves unlikely to acquire HIV. Of 33 women who were PrEP eligible, 11 accepted same-day start and 1 continued PrEP at 30 days. Conclusions: Intendedness of pregnancy was unrelated to PrEP eligibility in women seeking induced abortion and early pregnancy loss management. Most patients seeking these services are unaware of PrEP. Integrating PrEP into family planning care is likely to increase awareness and uptake of PrEP in women. © 2021 Jacobs Institute of Women's Health, George Washington University	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Songtaweesin W.N.; Pornpaisalsakul K.; Kawichai S.; Wacharachaisurapol N.; Wongharn P.; Yodkitudomying C.; Panichnantakul P.; Theerawit T.; Pankam T.; Puthanakit T.	Sexually transmitted infections incidence in young Thai men who have sex with men and transgender women using HIV pre-exposure prophylaxis	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624211056749	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126240531&doi=10.1177%2f09564624211056749&partnerID=40&md5=85a00940003a42d3b55a1af92968cba3	Background: Sexually transmitted infections are a major public health issue worldwide. HIV pre-exposure prophylaxis (PrEP) use among youth may be associated with increased incidence of sexually transmitted infections (STIs). Objectives: To measure the prevalence and incidence of STIs among young men who have sex with men (YMSM) and young transgender women (YTGW) using PrEP. Methods: A prospective cohort of 15- to 19-year-old YMSM and YTGW with HIV defined as inconsistent condom use and/or multiple sex partners were enrolled. Participants were provided daily oral tenofovir disoproxil fumarate/emtricitabine. STI screening was done at baseline and month 6 for syphilis, urine, and anal swab nucleic acid amplification testing for C. trachomatis (CT) and N. gonorrheae (NG). Results: From March 2018 to June 2019, 200 adolescents (147 MSM and 53 TGW) with a median (IQR) age of 18 years (17–19) were enrolled. STI prevalence was 22.5% (95% CI 16.7–28.3). STI incidence was 25.2 per 100 person–years (95% CI 14.7, 40.3). Factors associated with STI incidence were self-reported >2 sex partners in the past month (unadjusted rate ratio uRR 4.6, 95% CI 1.0, 20.6), and moderate PrEP adherence (uRR 7.3, 95% CI 1.6, 32.6). Conclusions: STI incidence in YMSM and YTGW PrEP users was high at approximately one in five. Regular screening and treatment of STIs should be implemented in youth HIV prevention packages. © The Author(s) 2022. Article	2022	Sönmez İ.; Berg R.C.; Yazıcılaroğlu S.S.; Thurlby N.; Schmidt A.J.	Comparison of the Influence of Internalized Homonegativity on Sexual Risk Behavior of Men Who Have Sex with Men in Spain and Turkey	International Journal of Sexual Health	-	-	-	19317611	10.1080/19317611.2022.2094043	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133687182&doi=10.1080%2f19317611.2022.2094043&partnerID=40&md5=eb45fa11b70ed186365ab18b40d8933d	Objectives: This study aimed to understand how the association between internalized homonegativity (IH) and sexual risk behavior differed in Spain (N = 3,336) and Turkey (N = 550). Methods: We used multigroup structural equation modeling. Results: HIV and pre-exposure prophylaxis (PrEP) knowledge mediated the relationship between IH and sexual risk behavior among MSM in Spain, but not among men in Turkey. Higher HIV/PrEP knowledge was associated with higher sexual risk behavior among MSM in Spain, while among MSM in Turkey the association was in the opposite direction. Conclusions: The meaning of safe-sex may differ across contexts, and this should be taken into consideration when tailoring HIV prevention programs. © 2022 Taylor & Francis Group, LLC. Article	2022	Sönmez İ.; Folch C.; Lorente N.; Berg R.C.; Thurlby N.; Schmidt A.J.	Influence of Internalised Homonegativity on Sexual Risk Behaviour of Men Who Have Sex with Men in Spain	Sexuality & Culture	-	-	-	10955143	10.1007/s12119-021-09925-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120078274&doi=10.1007%2fs12119-021-09925-7&partnerID=40&md5=718134c788e4865dd61a6ff2e43a5f14	In a sample of men who have sex with men (MSM) (N = 3436) in Spain who bear intrinsic HIV risk, we investigated how internalised homonegativity (IH) is associated with the number of non-steady male partners with condomless intercourse (as a proxy of sexual risk behaviour). Using structural equation modelling (SEM), we examined the relationship between IH and sexual risk behaviour, and mediating effects of HIV/PrEP knowledge and substance use during sex on this relationship. We found no direct association between IH and sexual risk behaviour, nor did IH influence substance use during sex. In line with our hypothesis, association between IH and sexual risk behaviour was significant when mediated by HIV/PrEP knowledge. We found that as IH increased, sexual risk behaviour decreased, because higher IH was associated with lower HIV/PrEP knowledge while higher HIV/PrEP knowledge was associated with increased non-condom use with non-steady partners. Substance use during sex was significantly associated with sexual risk behaviour. Our results emphasize the continuing importance of prevention strategies focused on behavioural changes and community level interventions, especially targeting substance use. © 2021, The Author(s). Theses and Dissertations	2022	Sophus, Amber	Is PrEP for me? Knowledge, Attitudes, Behaviors, and Perspectives about PrEP among Black Women Living in the South	-	-	University of Hawaii	-	NA	NA	http://hdl.handle.net/10125/103943	Significant racial and regional disparities are associated with HIV incidence rates among Black women in the United States, particularly of those who live in the South. While strides to improve HIV prevention efforts with Black, heterosexual women have occurred, more is needed. Pre-exposure prophylaxis (PrEP) is a woman-controlled HIV prevention strategy that can combat high rates of HIV and be used without the need to negotiate with a sexual partner. Although Black women are at the highest risk for HIV acquisition, they have the lowest rates of PrEP uptake in the U.S. The purpose of this dissertation was to expand public health understanding of the current status of HIV and AIDS prevention interventions for Black women in the U.S., highlight key aspects of recruitment ads that appeal to Black women to improve recruitment efforts for this population, and expand PrEP-related research on population characteristics and health behaviors associated with PrEP use among Black women who live in the South. This dissertation reports on findings from three studies. Study 1 was a systematic review that provided an examination of the status of HIV/AIDS prevention interventions for Black, heterosexual women in the U.S. from 2012-2019. Findings highlight gaps in HIV/AIDS prevention interventions for Black women in the U.S., specifies sub-populations of Black women that may need more attention in terms of HIV/AIDS services and programs, and provides recommendations for current and future HIV/AIDS prevention interventions that are specified for Black women. Study 2 used formative qualitative research to examine Black women's general likes and dislikes about women-focused ads, and their preferences for ad content and ad locations in order to gain the interest of Black women to participate in health-related research. Findings not only extend the existing literature by describing aspects of online and physical ads that may appeal to Black women but highlight a specific area of featuring Black health providers as well as patients within ads that has not yet been identified in the current literature. Study 3 used quantitative methods through the use of an online survey to identify population characteristics and health behaviors associated with general likelihood to use PrEP and whether an individual planned to start PrEP soon (i.e., in the next 3 months) among a sample of at-risk HIV-negative cisgender Black women. Findings extend current PrEP-related literature about PrEP uptake among Black women by providing insight into additional factors associated with likelihood to use PrEP and future plan to use PrEP within this population. Findings also indicate a need to further examine how PrEP stigma may affect PrEP use among Black women.Overall, findings from this dissertation highlight the need for additional programs and resources that improve HIV prevention strategies for Black women and help promote PrEP uptake within this vulnerable population. Article	2022	Soriano V.; Treviño A.; de Mendoza C.; Moreno-Torres V.; Pintos I.; Barreiro P.; Corral O.	Pre-Exposure Prophylaxis for viral infections other than HIV	Infezioni in Medicina	-	-	-	11249390	10.53854/liim-3003-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137874267&doi=10.53854%2fliim-3003-5&partnerID=40&md5=06f4c4736fe812281367817763aaf26c	The battle against human viral infections has histori-cally relied on two medical strategies, namely vaccines to protect from contagion and antivirals to treat infected patients. In the absence of vaccines, antivirals have occasionally been used as periexposure prophylaxis, given either before (pre-exposure prophylaxis) or right after (post-exposure prophylaxis). In an unprecedented way, the use of antiretrovirals as chemoprophylaxis has triumphed in the HIV field. Indeed, oral antiretro-virals given either daily or at demand to HIV-uninfected individuals engaged in high-risk behaviors protect from contagion. More recently, the advent of long-acting formulations has allowed HIV protection following intramuscular injections every few months. Can we envision a similar prophylactic strategy for other human viral infections? The advent of such 'chemical vaccines' would fill an unmet need when classical vaccines do not exist, can-not be recommended, immune responses are suboptimal, escape mutants emerge or immunity wanes. In this review, we discuss the opportunities for antiviral chemoprophylaxis for viral hepatitis B and C, retroviruses HTLV-1 and HIV-2, and respiratory viruses influenza and SARS-CoV-2, among others. © 2022, EDIMES Edizioni Medico Scientifiche. Article	2022	Sosnowy C.; Predmore Z.; Dean L.T.; Raifman J.; Chu C.; Galipeau D.; Nocka K.; Napoleon S.; Chan P.	Paying for PrEP: A qualitative study of cost factors that impact pre-exposure prophylaxis uptake in the US.	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624221132406	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140625770&doi=10.1177%2f09564624221132406&partnerID=40&md5=0d3dc69bcd54164906b3a0477a23bd25	Background: Concerns about the actual and perceived costs of pre-exposure prophylaxis (PrEP) continue to be a major barrier to uptake among gay, bisexual and men who have sex with men (GBMSM) in the United States. Methods: We conducted semi-structured interviews with 25 GBMSM who presented for routine health care at a STD clinic in the northeastern United States. The cohort included GBMSM who were or were not currently taking PrEP and represented varied health care coverage and financial resources. We used a structured coding scheme to analyze transcripts and identify themes relevant to cost factors. Results: Participants shared their perspectives about PrEP and their experiences with accessing and paying for PrEP. Our findings suggest that health care coverage or financial assistance were essential to PrEP access but were not easily accessible to all people and did not always cover all costs. Therefore, paying for PrEP had to be balanced with other life expenses. Participants had multiple sources for information about PrEP cost and assistance from clinic and pharmacy staff helped reduce burden and resolve difficulties. Conclusion: Addressing gaps in health care coverage, providing financial support, and improving the enrollment process in a financial assistance program may improve PrEP uptake. © The Author(s) 2022. Article	2022	Spence, AB; Wang, CW; Michel, KG; Merenstein, D; Kharfen, M; Goparaju, L; Kassaye, S	UnPrEPed for HIV prevention services: Hesitancy among US primary care providers	Medicine (United States)	-	-	-	0025-7974	10.1097/MD.0000000000031242	https://pubmed.ncbi.nlm.nih.gov/36316940/	Provision of HIV prevention services by primary care (PCP) healthcare providers is critical to reduce the number of new HIV infections. We examined the performance of HIV risk assessments and provision of HIV prevention services by PCPs. In our cohort, less than one-half of respondents asked about sex and drug use all or most of the time, and among those that did not routinely ask about sex and drug use only 66% and 59%, respectively, would ask given more time. Less than a quarter of respondents noted that HIV prevention services were part of their clinical practice. These findings demonstrate gaps in the provision of HIV prevention services by a key population of healthcare providers. Article	2022	Spicehandler, Rebecca; Zucker, Jason; Yumori, Caitlin; Adan, Matthew; Carnevale, Caroline; Theodore, Deborah; Castor, Delivette; Meyers, Kathrine; Whittier, Susan; Yin, Michael T; Cohall, Alwyn; Olender, Susan; Gordon, Peter; Sobieszczyk, Magdalena E	Get2PrEP: An Electronic Medical Record Laboratory Comment Increased Safe Sex Counseling But Not Preexposure Prophylaxis Services at a Large Urban Academic Medical Center in Northern Manhattan.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001682	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9481682	BACKGROUND: HIV preexposure prophylaxis (PrEP) remains underutilized despite its efficacy and potential population impact. Achieving PrEP's full potential depends on providers who are knowledgeable and comfortable prescribing it to individuals at risk of acquiring HIV. Previous educational interventions targeting provider-related uptake barriers have had limited success. We designed and tested an electronic medical record (EMR) interpretative comment to improve the delivery of PrEP. METHODS: An EMR comment provided information on PrEP eligibility and referral resources to providers delivering positive chlamydia and gonorrhea results. Positive test results for bacterial sexually transmitted infections before intervention (January 1, 2019-August 23, 2019) and after intervention (August 24, 2019-December 31, 2019) were identified. A retrospective chart review was conducted to ascertain provider documentation of PrEP discussions or provision, HIV prevention discussions, and HIV screening. Pretest-posttest analysis was performed to compare the provision of PrEP and HIV prevention services. RESULTS: We reviewed 856 preintervention encounters spanning 8 months and 461 postencounters spanning 4 months. Patient demographics were comparable. We observed an increase in provider documentation of safe sex and condom counseling (odds ratios ORs, 1.2 95% confidence interval {CI}, 1.07-1.18 and 1.11 95% CI, 1.05-1.17, respectively), and the absence of any HIV prevention discussion decreased (OR, 0.85; 95% CI, 0.80-0.90), but not HIV screening or PrEP documentation. CONCLUSIONS: We demonstrated that an EMR laboratory comment had a modest effect on increasing risk reduction counseling, although not HIV screening or PrEP prescriptions. Future strategies to encourage provider delivery of sexual health services may benefit from more targeted strategies that combine behavioral and information technology approaches. Article	2022	Spieldenner A.; Santella A.J.; Cooper S.C.; Rosales K.; Goedel W.C.; Jones H.E.	Knowledge, Attitudes, and Practices towards PrEP from Cisgender Men and Transgender Women Who Have Sex with Men in the Largest Suburban HIV Epidemic	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph191811640	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138323900&doi=10.3390%2fijerph191811640&partnerID=40&md5=161f96829af3bf52bafc9f3edf8e4c50	We conducted a cross-sectional web-based study to assess attitudes and experiences with HIV pre-exposure prophylaxis (PrEP) amongst a multiracial cohort of gay, bisexual, and other men who have sex with men (MSM) and transgender women in Long Island, New York. Participants were recruited through clinical providers and community-based organizations. The survey assessed knowledge and attitudes toward PrEP and factors that facilitate willingness to take it. Of the 189 respondents, most participants were Latinx/Hispanic (57.1%; n = 105), gay-identifying (81.2%; n = 151), and cisgender men (88.7%; n = 165). One in five participants completed high school or lower (19.4%; n = 36). Among those who had never used PrEP (53.4%; n = 101), nearly all participants were willing to use it if it were free or covered as part of their insurance (89.4%; n = 84). The most common barriers to not using PrEP was not knowing where to obtain it (68.3%; n = 69), concerns about side effects (42.1%; n = 35), and concerns about affordability (38.5%; n = 25). This study discusses specific nuances to the suburbs, including cultural norms and structural barriers that should be incorporated in health promotion initiatives in addressing these factors. © 2022 by the authors.	gay and bisexual men; HIV/AIDS; PrEP; suburban health	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Spinelli, Matthew A; Grinsztejn, Beatriz; Landovitz, Raphael J	Promises and challenges: cabotegravir for preexposure prophylaxis.	Current Opinion in HIV and AIDS	-	-	-	1746-6318	10.1097/COH.0000000000000733	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9240402	PURPOSE OF REVIEW: Tenofovir-based oral PrEP has been effective in reducing population-level HIV incidence in multiple settings, although disparities remain. Injectable cabotegravir-based PrEP is an alternative that may be attractive to individuals with adherence challenges or who do not desire to take a daily medication. We review promises and challenges of cabotegravir-based PrEP. RECENT FINDINGS: Cabotegravir has demonstrated higher effectiveness than oral PrEP in two randomized trials, with a hazard ratio of 0.31 for HIV incidence among MSM and transgender women across multiple settings 95% confidence interval (CI) 0.18-0.62 and 0.11 for cisgender women in sub-Saharan Africa (95% CI 0.040.32). Cabotegravir was also highly effective among populations with disproportionate HIV incidence. Although cabotegravir breakthrough was rare, diagnosis was delayed with use of antigen/antibody-based HIV tests, and resistance occurred with breakthrough infections. Implementation will need to overcome several challenges, including HIV RNA laboratory monitoring not being widely available, requirement for additional staff time and clinic space, and need to provide oral medication during interruptions in dosing. SUMMARY: Cabotegravir-based PrEP is a highly effective additional PrEP option that will expand HIV prevention options. For successful roll-out, strategies for streamlined and accessible delivery of cabotegravir in real-world settings will need to be developed. Study protocol of a randomized controlled trial comparing two linkage models for HIV prevention and treatment in justice-involved persons	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-022-07354-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128487861&doi=10.1186%2fs12879-022-07354-x&partnerID=40&md5=a591811c17d73d6f2e90202e6b0fac	Background: Persons involved in the justice system are at high risk for HIV and drug overdose upon release to the community. This manuscript describes a randomized controlled trial of two evidence-based linkage interventions for provision of HIV prevention and treatment and substance use disorder (SUD) services in four high risk communities to assess which is more effective at addressing these needs upon reentry to the community from the justice system. Methods: This is a 5-year hybrid type 1 effectiveness-implementation randomized controlled trial that compares two models (Patient Navigation PN or Mobile Health Unit MHU service delivery) of linking justice-involved individuals to the continuum of community-based HIV and SUD prevention and treatment service cascades of care. A total of 864 justice-involved individuals in four US communities with pre-arrest histories of opioid and/or stimulant use who are living with or at-risk of HIV will be randomized to receive either: (a) PN, wherein patient navigators will link study participants to community-based service providers; or (b) services delivered via an MHU, wherein study participants will be provided integrated HIV prevention/ treatment services and SUD services. The six-month post-release intervention will focus on access to pre-exposure prophylaxis (PrEP) for those without HIV and antiretroviral treatment (ART) for people living with HIV (PLH). Secondary outcomes will examine the continuum of PrEP and HIV care, including: HIV viral load, PrEP/ ART adherence; HIV risk behaviors; HCV testing and linkage to treatment; and sexually transmitted infection incidence and treatment. Additionally, opioid and other substance use disorder diagnoses, prescription, receipt, and retention on medication for opioid use disorder; opioid and stimulant use; and overdose will also be assessed. Primary implementation outcomes include feasibility, acceptability, sustainability, and costs required to implement and sustain the approaches as well as to scale-up in additional communities. Discussion: Results from this project will help inform future methods of delivery of prevention, testing, and treatment of HIV, HCV, substance use disorders (particularly for opioids and stimulants), and sexually transmitted infections for justice-involved individuals in the community. Editorial	2022	Srikanth, Karishma; Killelea, Amy; Strumpf, Andrew; Corbin-Gutierrez, Edwin; Horn, Tim; McManus, Kathleen A	Associated Costs Are a Barrier to HIV Preexposure Prophylaxis Access in the United States.	American Journal of Public Health	-	-	-	1541-0048	10.2105/AJPH.2022.306793	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9137017	HIV preexposure prophylaxis (PrEP), a biomedical HIV prevention intervention, reduces the risk of HIV acquisition by upwards of 90% for sexual encounters and 70% for injection drug use. If widely used, PrEP has the potential to help end the HIV epidemic in the United States.1 In 2015, the Centers for Disease Control and Prevention (CDC) estimated that approximately 1.2 million people were at high risk of acquiring HIV and had a clinical indication for PrEP.2 One of the four pillars of the federal government's Ending the HIV Epidemic (EHE) initiative is increasing access to and use of PrEP; in fiscal year 2021, \$386 million was appropriated for the EHE initiative, of which \$102 million was allocated to provide "HIV testing, linkage to care, and prescription of PrEP."1 Additionally, an objective of the National HIV/AIDS Strategy for the United States (2022–2025) is to increase PrEP coverage to 50% from a 2017 baseline of 13.2%.3 Despite the first PrEP antiretroviral being approved by the US Food and Drug Administration in 2012, less than 20% of those at high risk of HIV received a PrEP prescription in 2019.4	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	NA	NA	Other
Article	2022	Ssemata, Andrew Sentoogo; Bwalya, Chiti; Muhumuza, Richard; Ndekezi, Denis; Mbewe, Madalitso; Simwinga, Musonda; Bond, Virginia; Seeley, Janet	Assessing knowledge, acceptability and social implications of a peer-to-peer HIV self-testing kit distribution model among adolescents aged 15-24 in Zambia and Uganda-HISTAZU: a mixed-method study protocol.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2021-059340	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9150152	INTRODUCTION: HIV self-testing (HIVST) across sub-Saharan African countries may be acceptable as it overcomes significant barriers to clinic-based HIV testing services such as privacy and confidentiality. There are a number of suggested HIVST distribution models. However, they may not be responsive to the testing service needs of adolescents and young people (AYP). We will investigate the knowledge, acceptability and social implications of a peer-to-peer distribution model of HIVST kits on uptake of HIV prevention including pre-exposure prophylaxis, condoms, and voluntary medical male circumcision and testing services and linkage to anti-retroviral therapy among AYP aged 15-24 in Zambia and Uganda. METHODS AND ANALYSIS: We will conduct an exploratory mixed methods study among AYP aged 15-24 in Uganda and Zambia. Qualitative data will be collected using audio-recorded in-depth interviews (IDIs), focus group discussions (FGDs), and participant observations. All IDIs and FGDs will be transcribed verbatim, coded and analysed through a thematic-content analysis. The quantitative data will be collected through a structured survey questionnaire derived from the preliminary findings of the qualitative work and programme evaluation quantitative data collected on uptake of services from a Zambian trial. The quantitative phase will evaluate the number of AYP reached and interested in HIVST and the implication of this on household social relations and social harms. The quantitative data will be analysed through bivariate analyses. The study will explore any social-cultural and study design barriers or facilitators to uptake of HIVST. ETHICS AND DISSEMINATION: This study is approved by the Uganda Virus Research Institute Research and Ethics committee, Uganda National Council for Science and Technology, University of Zambia Biomedical Ethics Committee, Zambia National Health Research Authority and the London School of Hygiene and Tropical Medicine. Dissemination activities will involve publications in peer-reviewed journals, presentations at conferences and stakeholder meetings in the communities. Article	2022	Ssemata, Andrew Sentoogo; Muhumuza, Richard; Stranix-Chibanda, Lynda; Nematadzira, Teacler; Ahmed, Nadia; Hornschuh, Stefanie; Dietrich, Janan Janine; Tshabalala, Gugulethu; Atujuna, Millicent; Ndekezi, Denis; Nalubega, Phiona; Awino, Esther; Weiss, Helen A; Fox, Julie; Seeley, Janet	The potential effect of pre-exposure prophylaxis (PrEP) roll-out on sexual-risk behaviour among adolescents and young people in East and southern Africa.	African Journal of AIDS Research	-	-	-	1727-9445	10.2989/16085906.2022.2032218	https://dx.doi.org/10.2989/16085906.2022.2032218	Pre-exposure prophylaxis (PrEP) is an HIV-prevention strategy recommended for those at high-risk of infection, including adolescents and young people (AYP). We explored how PrEP roll-out could influence sexual risk behaviour among AYP in East and southern Africa. Twenty-four group discussions and 60 in-depth interviews were conducted with AYP between 13 and 24 years old, recruited from community settings in Uganda, Zimbabwe and South Africa, from September 2018 to January 2019. Participants perceived that PrEP availability could change sexual behaviour among AYP, influencing: (1) condom use (increased preference for condomless sex, reduced need and decrease in use of condoms, relief from condom use discomfort, consistent condom use to curb sexually transmitted infections and pregnancies); (2) sexual activities (increase in sexual partners and sexual encounters, early sexual debut, sexual experimentation and peace of mind during risky sex, sexual violence and perversion); (3) HIV risk perception (neglect of other HIV prevention strategies, unknown sexual partner HIV status, adoption of PrEP). PrEP initiation may be associated with increased interest in sexual activities and risky sexual behaviour among AYP. PrEP should be included as part of a combination package of HIV prevention strategies for AYP with methods to prevent other sexually transmitted infections and unwanted pregnancies. Article	2022	Ssempijja V.; Nakigozi G.; Ssekubugu R.; Kagaayi J.; Kigozi G.; Nalugoda F.; Nantume B.; Batte J.; Kigozi G.; Yeh P.T.; Nakawooya H.; Serwadda D.; Quinn T.C.; Gray R.H.; Wawer M.J.; Grabowski K.M.; Chang L.W.; Van't Hoog A.; Cobelens F.; Reynolds S.J.	High Rates of Pre-exposure Prophylaxis Eligibility and Associated HIV Incidence in a Population with a Generalized HIV Epidemic in Rakai, Uganda	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002946	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132131671&doi=10.1097%2fQAI.0000000000002946&partnerID=40&md5=91d777ca8ebc0a436039eda65c06628b	Background:The utility of using pre-exposure prophylaxis (PrEP) eligibility assessments to identify eligibility in general populations has not been well studied in sub-Saharan Africa. We used the Rakai Community Cohort Study to conduct a cross-sectional analysis to estimate PrEP eligibility and a cohort analysis to estimate HIV incidence associated with PrEP eligibility.Methods:Based on Uganda's national PrEP eligibility tool, we defined eligibility as reporting at least one of the following HIV risks in the past 12 months: sexual intercourse with more than one partner of unknown HIV status; nonmarital sex act without a condom; sex engagement in exchange for money, goods, or services; or experiencing genital ulcers. We used log-binomial and modified Poisson models to estimate prevalence ratios for PrEP eligibility and HIV incidence, respectively.Findings:We identified 12,764 participants among whom to estimate PrEP eligibility prevalence and 11,363 participants with 17,381 follow-up visits and 30,721 person-years (pys) of observation to estimate HIV incidence. Overall, 29% met at least one of the eligibility criteria. HIV incidence was significantly higher in PrEP-eligible versus non-PrEP-eligible participants (0.91/100 pys versus 0.41/100 pys; P < 0.001) and independently higher in PrEP-eligible versus non-PrEP-eligible female participants (1.18/100 pys versus 0.50/100 pys; P < 0.001). Among uncircumcised male participants, HIV incidence was significantly higher in PrEP-eligible versus non-PrEP-eligible participants (1.07/100 pys versus 0.27/100 pys; P = 0.001), but there was no significant difference for circumcised male participants.Interpretation:Implementing PrEP as a standard HIV prevention tool in generalized HIV epidemics beyond currently recognized high-risk key populations could further reduce HIV acquisition and aid epidemic control efforts. © 2022 Lippincott Williams and Wilkins. Article	2022	Ssuna B.; Katahoire A.; Armstrong-Hough M.; Kalibbala D.; Kalyango J.N.; Kiweewa F.M.	Factors associated with willingness to use oral pre-exposure prophylaxis (PrEP) in a fisher-folk community in peri-urban Kampala, Uganda	BMC Public Health	-	-	-	14712458	10.1186/s12889-022-12859-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126170324&doi=10.1186%2fs12889-022-12859-w&partnerID=40&md5=db38744f0b5a4cc4a07250562a52b069	Background: The World Health Organization (WHO) recommends the use of pre-exposure prophylaxis (PrEP) in key populations at elevated risk for exposure to HIV. If used effectively, PrEP can reduce annual HIV incidence to below 0.05%. However, PrEP is not acceptable among all communities that might benefit from it. There is, therefore, a need to understand perceptions of PrEP and factors associated with willingness to use PrEP among key populations at risk of HIV, such as members of communities with exceptionally high HIV prevalence. Objective: To examine the perceptions and factors associated with willingness to use oral PrEP among members of fishing communities in Uganda, a key population at risk of HIV. Methods: We conducted an explanatory sequential mixed-methods study at Ggaba fishing community from February to June 2019. Survey data were collected from a systematic random sample of 283 community members in which PrEP had not been rolled out yet by the time we conducted the study. We carried out bivariate tests of association of willingness to use PrEP with demographic characteristics, HIV risk perception, HIV testing history. We estimated prevalence ratios for willingness to use PrEP. We used backward elimination to build a multivariable modified Poisson regression model to describe factors associated with willingness to use PrEP. We purposively selected 16 participants for focus group discussions to contextualize survey findings, analysing data inductively and identifying emergent themes related to perceptions of PrEP. Key results: We enrolled 283 participants with a mean age of 31 ± 8 years. Most (80.9%) were male. The majority of participants had tested for HIV in their lifetime, but 64% had not tested in the past 6 months. Self-reported HIV prevalence was 6.4%. Most (80.6, 95%CI 75.5–85.0) were willing in principle to use PrEP. Willingness to use PrEP was associated with perceiving oneself to be at high risk of HIV (aPR 1.99, 95%CI 1.31–3.02, P = 0.001), having tested for HIV in the past 6-months (aPR 1.13, 95%CI 1.03–1.24, P = 0.007), and completion of tertiary education (aPR 1.97, 95%CI 1.39–2.81, P < 0.001). In focus group discussions, participants described pill burden, side-effects and drug safety as potential barriers to PrEP use. Conclusions and recommendations: Oral PrEP was widely acceptable among members of fishing communities in peri-urban Kampala. Programs for scaling-up PrEP for fisherfolk should merge HIV testing services with sensitization about PrEP and also increase means of awareness of PrEP as an HIV preventive strategy. © 2022, The Author(s). Article	2022	St. Vil N.M.; Leblanc N.; Bleasdale J.; Wilson K.; Przybyla S.	An Analysis of Sex Practices and Behaviors Among African Americans in Sexually Concurrent and Sexually Exclusive Relationships	Journal of Racial and Ethnic Health Disparities	-	-	-	21973792	10.1007/s40615-021-01130-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112781999&doi=10.1007%2fs40615-021-01130-4&partnerID=40&md5=0abeb3bf7d8149b2b5d793d9c29caefe	Historically, sexually concurrent relationships have been associated with increased risk for sexually transmitted infections (STIs), including HIV. Due to socio-structural factors, African Americans (AAs) have higher rates of STIs compared to other racial groups and are more likely to engage in sexually concurrent (SC) relationships. Current research has challenged the assumption that SC is the only risky relationship type, suggesting that both SC and sexually exclusive (SE) relationships are at equal risk of STI and HIV acquisition and that both relationship types should engage in safer sex practices. This study aimed to compare sex practices and behaviors among AA men and women in SC and SE relationships (N = 652). Results demonstrate differences in sexual practices and behaviors between SC and SE men and women. Overall, SC and SE women report condom use with male partners less frequently than SC and SE men. SC men were more likely to report substance use during sex compared to SC and SE women. Pre-exposure prophylaxis (PrEP) use did not differ across groups. SE men were less likely to report STI testing and diagnosis compared to SC women. Findings support the need to focus on culturally and gender-specific safer sex interventions among AAs. © 2021, W. Article	2022	Stafylis C.; Vavala G.; Wang Q.; McLeman B.; Lemley S.M.; Young S.D.; Xie H.; Matthews A.G.; Oden N.; Revoredo L.; Shmueli-Blumberg D.; Hichborn E.G.; McKelle E.; Moran L.M.; Jacobs P.; Marsch L.A.; Klausner J.D.	Relative Effectiveness of Social Media, Dating Apps, and Information Search Sites in Promoting HIV Self-testing: Observational Cohort Study	JMIR Formative Research	-	-	-	2561326X	10.2196/35648	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139731296&doi=10.2196%2f35648&partnerID=40&md5=4782a1fba1cef43577bd5937c8cbd990	Background: Social media sites, dating apps, and information search sites have been used to reach individuals at high risk for HIV infection. However, it is not clear which platform is the most efficient in promoting home HIV self-testing, given that the users of various platforms may have different characteristics that impact their readiness for HIV testing. Objective: This study aimed to compare the relative effectiveness of social media sites, dating apps, and information search sites in promoting HIV self-testing among minority men who have sex with men (MSM) at an increased risk of HIV infection. Test kit order rates were used as a proxy to evaluate promotion effectiveness. In addition, we assessed differences in characteristics between participants who ordered and did not order an HIV test kit. Methods: Culturally appropriate advertisements were placed on popular sites of three different platforms: social media sites (Facebook, Instagram), dating apps (Grindr, Jack'D), and information search sites (Google, Bing). Advertisements targeted young (18-30 years old) and minority (Black or Latinx) MSM at risk of HIV exposure. Recruitment occurred in 2 waves, with each wave running advertisements on 1 platform of each type over the same period. Participants completed a baseline survey assessing sexual or injection use behavior, substance use including alcohol, psychological readiness to test, attitudes toward HIV testing and treatment, and HIV-related stigma. Participants received an electronic code to order a free home-based HIV self-test kit. Follow-up assessments were conducted to assess HIV self-test kit use and uptake of pre-exposure prophylaxis (PrEP) at 14 and 60 days post enrollment. Results: In total, 271 participants were enrolled, and 254 were included in the final analysis. Among these 254 participants, 177 (69.7%) ordered a home HIV self-test kit. Most of the self-test kits were ordered by participants enrolled from dating apps. Due to waves with low enrollment, between wave statistical comparisons were not feasible. Within wave comparison revealed that Jack'D showed higher order rates (3.29 kits/day) compared to Instagram (0.34 kits/day) and Bing (0 kits/day). There were no associations among self-test kit ordering and HIV-related stigma, perceptions about HIV testing and treatment, and mistrust of medical organizations. Conclusions: Our findings show that using popular dating apps might be an efficient way to promote HIV self-testing. Stigma, perceptions about HIV testing and treatment, or mistrust of medical organizations may not affect order rates of HIV test kits promoted on the internet. ©Chrysovalantis Stafylis, Gabriella Vavala, Qiao Wang, Bethany McLeman, Shea M Lemley, Sean D Young, Haiyi Xie, Abigail G Matthews, Neal Oden, Leslie Revoredo, Dikla Shmueli-Blumberg, Emily G Hichborn, Erin McKelle, Landhing M Moran, Petra Jacobs, Lisa A Marsch, Jeffrey D Klausner.	dating apps; digital health; health promotion; HIV; HIV prevention; home HIV test; human immunodeficiency virus; infection; medical information; MSM; pre-exposure prophylaxis; PrEP; search engines; self-testing; social media	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Stanton, AM; O'Cleirigh, C; Knight, L; Davey, DLJ; Myer, L; Joska, JA; Mayer, KH; Bekker, LG; Psaros, C	The importance of assessing and addressing mental health barriers to PrEP use during pregnancy and postpartum in sub-Saharan Africa: state of the science and research priorities	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26026	https://pubmed.ncbi.nlm.nih.gov/36251124/	Introduction: Pregnant and postpartum women (PPW) in sub-Saharan Africa are at disproportionately high risk of HIV infection compared to non-pregnant women. When used consistently, pre-exposure prophylaxis (PrEP) can prevent HIV acquisition and transmission to the foetus or infant during these critical periods. Recent studies have demonstrated associations between mental health challenges (e.g. depression and traumatic stress associated with intimate partner violence) and decreased PrEP adherence and persistence, particularly among adolescents, younger women and women in the postpartum period. However, mental health is not currently a major focus of PrEP implementation research and programme planning for PPW. Discussion: PrEP implementation programmes for PPW need to assess and address mental health barriers to consistent PrEP use to ensure effectiveness and sustainability in routine care. We highlight three key research priorities that will support PrEP adherence and persistence: (1) include mental health screening tools in PrEP implementation research with PPW, both to assess the feasibility of integrating these tools into routine antenatal and postpartum care and to ensure that limited resources are directed towards women whose symptoms may interfere most with PrEP use; (2) identify cross-cutting, transdiagnostic psychological mechanisms that affect consistent PrEP use during these periods and can realistically be targeted with intervention in resource-limited settings; and (3) develop/adapt and test interventions that target those underlying mechanisms, leveraging strategies from existing interventions that have successfully mitigated mental health barriers to antiretroviral therapy use among people with HIV. Conclusions: For PPW, implementation of PrEP should be guided by a robust understanding of the unique psychological difficulties that may act as barriers to uptake, adherence and persistence (i.e. sustained adherence over time). We strongly encourage PrEP implementation research in PPW to incorporate validated mental health screening tools and ultimately treatment in routine antenatal and postnatal care, and we stress the potential public health benefits of identifying women who face mental health barriers to PrEP use. Article	2022	Starbuck L.; Golub S.A.; Klein A.; Harris A.B.; Guerra A.; Rincon C.; Radix A.E.	Transgender Women and Preexposure Prophylaxis Care: High Preexposure Prophylaxis Adherence in a Real-World Health Care Setting in New York City	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002915	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128245902&doi=10.1097%2fQAI.0000000000002915&partnerID=40&md5=69df1c652cfdf84bf6bb1eda371f18c6	Background:Transgender women and trans feminine individuals (TGW/TFI) are a high priority population for the provision of HIV preexposure prophylaxis (PrEP) care within the United States, but there is limited research that focuses specifically on PrEP adherence within this population.Setting:Observational study of patients prescribed PrEP at a community-based health center.Methods:We enrolled 100 TGW/TFI PrEP patients at a community health center during clinic visits. Adherence data were collected at 3 time points, using self-report surveys, patient interviews, and urine assays measuring tenofovir. Data were summarized descriptively.Results:The sample was diverse in age, race/ethnicity, and socioeconomic characteristics. Participants demonstrated strong PrEP adherence; at least 80% of the sample reported 90% or greater adherence at each time point. Concordance between self-report and urine assay was high. Among patients who reported taking PrEP within the past 48 hours, 82%-92% had detectable urine tenofovir. However, many patients reported PrEP stop periods of 4 or more days (28%-39% per time point).Conclusions:Our data highlight TGW/TFI's capacity to adhere to daily PrEP and sustain PrEP use over time. The concordance between patient self-report and urine TFV levels suggest that providers can trust patient reports of PrEP adherence behavior and support the use of adherence conversations in clinical settings, without the need for point of care biological monitoring. Findings also underscore the importance of continued attention to drivers of PrEP stops at the patient, clinic, and systems levels and the development of strategies that support sustained PrEP use. © 2022 Lippincott Williams and Wilkins. Article	2022	Staten, M. Colten; Webster, Alicia; Carter, Gregory	Do Ask, Do Tell: Understanding Disclosure of Sexuality and Implications Among MSM Active Duty Service Members.	Military Medicine	-	-	-	1930-613X 0026-4075	10.1093/milmed/usac209	https://pubmed.ncbi.nlm.nih.gov/35860852/	INTRODUCTION: Men who have sex with men (MSM) account for over half of new diagnoses of human immunodeficiency virus (HIV) every year in the United States, with over one-third of this population being unaware of their HIV status. The U.S. Military requires biannual HIV testing for all service members. Although this may be an appropriate recommendation for the military at large, current health protection agencies suggest more frequent testing for those at increased risk of HIV transmission, such as those in the MSM community. However, more frequent testing for those at higher risk relies heavily on the preliminary step of patient disclosure of sexual practices to health care providers. MATERIALS AND METHODS: An exploratory cross-sectional study was conducted in order to gain a better understanding of the relationship between sexual health variables and the disclosure of sexual identity to health care providers by MSM service members. A convenience sample of MSM currently serving in the U.S. military services (N = 354) was used to collect demographic data, sexual health and history, and opinions concerning medical treatment and HIV. Analyses of the data were conducted using univariate analysis and multivariate regression. RESULTS: Men of color were more likely to report a higher degree of sexual identification transparency with their health care providers, which deviates from the civilian population. Pre-exposure prophylaxis (PrEP) uptake was increased among individuals who were more transparent with their health care providers. CONCLUSIONS: Findings from this study indicate that feeling more comfortable sharing one's sexual identification with a health care provider results in increased engagement with HIV prevention measures. Potential implications for the Military Health System are the advancement of preventive sexual health screening procedures and the development and revision of policies that promote positive outcomes for gender and sexual minorities. Article	2022	Steinegger B.; Iacopini I.; Teixeira A.S.; Bracci A.; Casanova-Ferrer P.; Antonioni A.; Valdano E.	Non-selective distribution of infectious disease prevention may outperform risk-based targeting	Nature Communications	-	-	-	-	20411723	10.1038/s41467-022-30639-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131013046&doi=10.1038%2fs41467-022-30639-3&partnerID=40&md5=0d0f1e1671fd6ff40d9a5d8170dda7a4	Epidemic control often requires optimal distribution of available vaccines and prophylactic tools, to protect from infection those susceptible. Well-established theory recommends prioritizing those at the highest risk of exposure. But the risk is hard to estimate, especially for diseases involving stigma and marginalization. We address this conundrum by proving that one should target those at high risk only if the infection-averting efficacy of prevention is above a critical value, which we derive analytically. We apply this to the distribution of pre-exposure prophylaxis (PrEP) of the Human Immunodeficiency Virus (HIV) among men-having-sex-with-men (MSM), a population particularly vulnerable to HIV. PrEP is effective in averting infections, but its global scale-up has been slow, showing the need to revisit distribution strategies, currently risk-based. Using data from MSM communities in 58 countries, we find that non-selective PrEP distribution often outperforms risk-based, showing that a logistically simpler strategy is also more effective. Our theory may help design more feasible and successful prevention. © 2022, The Author(s). Article	2022	Stella G.; Volpicelli L.; Carlo D.D.; Vicenti I.; Celani L.; Maggiolo F.; Callegaro A.P.; Gennari W.; Francisci D.; Lombardi F.; Piermatteo L.; Bezenchek A.; Micheli V.; Rossetti B.; Santoro M.M.	Impact of pre-existent drug resistance on virological efficacy of single-tablet regimens in people living with HIV	International Journal of Antimicrobial Agents	-	-	-	-	9248579	10.1016/j.ijantimicag.2022.106636	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135297347&doi=10.1016%2fj.ijantimicag.2022.106636&partnerID=40&md5=68252d0c26319f61b5e93bfb81e74bd4	Despite the wide use of single-tablet regimens (STRs), few real-life data are available regarding the impact of pre-existent drug resistance on virological failure (VF). We aimed to fill this gap by analysing a large cohort of individuals selected from the ARCA database. The impact on VF of pre-existent resistance-associated mutations (RAMs) and cumulative genotypic susceptibility score (cGSS) before STR start was evaluated through survival analysis. Potential emergence of resistance at VF was also evaluated. Overall, 3916 individuals were included, comprising 678 treatment-naïve (G1), 2309 treatment-experienced aviraemic (G2) and 929 viraemic (G3), of whom 65.2% were treated with a STR based on efavirenz (35.2%) or rilpivirine (30.0%). At 2 years after starting a STR, the overall probability of VF was 5.9% in G1, 8.7% in G2 and 20.8% in G3. No impact of pre-existent resistance on VF was found in G1. The probability of VF was higher in patients with cGSS < 3 (reduced susceptibility to at least one drug) than in those with cGSS = 3 (full susceptibility to STR drugs) both in G2 and G3. A higher probability of VF was also found in the presence of pre-existent M184V (alone or in combination with pre-existent thymidine analogue mutations). Among patients who failed STR, a significant emergence of RAMs was found only in those exposed to EFV/FTC/TDF in G3 (specifically K103N and M184V). Our results confirm a high efficacy of STRs in clinical settings. Pre-existent resistance appears to influence virological efficacy of STRs in treatment-experienced individuals (both aviraemic and viraemic). © 2022 Elsevier Ltd and International Society of Antimicrobial Chemotherapy	Antiretroviral therapy; Drug resistance; Genotypic susceptibility score; HIV; Single-tablet regimen; Virological response	English	Netherlands	Western and Central Europe and North America	Italy	Western and Central Europe and North America	Italy	Western and Central Europe and North America	Clinical
Article	2022	Stephenson R.; Chavanduka T.M.D.; Sullivan S.; Mitchell J.W.	Partner Support and Communication for Pre-exposure Prophylaxis (PrEP) Use Among Male Couples	Archives of Sexual Behavior	-	-	-	-	40002	10.1007/s10508-021-02118-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119529863&doi=10.1007%2fs10508-021-02118-1&partnerID=40&md5=ced2fcdb535a0fbc0519d6688924fde8	Between one to two-thirds of HIV infections among gay, bisexual, and other men who have sex with men are from primary partners, and there has been increased research attention focused on strategies to increase PrEP adoption among male couples. While there is evidence that partner support is a strong correlate of pre-exposure prophylaxis (PrEP) adoption, there has been a lack of attention on PrEP communication dynamics among male couples. In this paper, we build upon this literature through analysis of dyadic data from a large cross-sectional survey of 543 concordant sero-negative and serodiscordant male couples to examine individual and relationship factors associated with reports of partner communication around PrEP, comfort in discussing PrEP, and perceived partner-level support for PrEP use. PrEP use was relatively low (16.2%), and although 87.5% of men reported their partners would support their PrEP use, only 26.3% had talked to their partner recently about PrEP. PrEP communication and perceived support for PrEP were significantly negatively associated with PrEP stigma and stigma based on sexuality (i.e., internalized homophobia and enacted external stigma based on sexuality), while men with sexual agreements were more comfortable talking about PrEP with their partner. There is a need to adapt current interventions, or develop new dyadic interventions, that provide opportunities for male couples to talk and learn about PrEP together, as a potential pathway to engage them toward PrEP use. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Stephenson R.; Chavanduka T.M.D.; Sullivan S.P.; Mitchell J.W.	Dyadic Influences on Pre-exposure Prophylaxis (PrEP) Use and Attitudes Among Male Couples	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03389-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111496510&doi=10.1007%2fs10461-021-03389-4&partnerID=40&md5=7093ad6fdd44a01edf355befa74f14a6	Pre-exposure prophylaxis (PrEP) affords an opportunity to significantly reduce the risk of HIV infection among male couples. We used cross-sectional dyadic data from 382 concordant-negative male couples to examine demographic and relationship characteristics associated with current PrEP use, willingness to use PrEP in the future, and perceived ability to adhere to PrEP using Actor–Partner Independence Models. Few partnered men reported currently using PrEP (16.4%) and 57.7% of non-users reported being unlikely to use PrEP in the future. Actor and partner perceptions of PrEP stigma significantly reduced PrEP use and perceptions of willingness to use PrEP or the ability to adhere to PrEP, while perceiving a higher prevalence of HIV among men was associated with significant increases in PrEP use, willingness and perceived ability to adhere. Perceptions that more friends would support PrEP use were also significantly associated with increases in willingness and perceived ability to adhere to PrEP. Dyadic interventions are needed to provide couples the skills to communicate about HIV risk and prevention, and address myths around the protective effect of relationships against HIV acquisition. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Stephenson R.; Chavanduka T.M.D.; Sullivan S.P.; Mitchell J.W.	Pre-Exposure Prophylaxis Stigma and Beliefs in the Efficacy of Pre-Exposure Prophylaxis: An Analysis of a Cross-Sectional Survey of Male Couples in the United States	Journal of the Association of Nurses in AIDS Care	-	-	-	-	10553290	10.1097/JNC.0000000000000315	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133294806&doi=10.1097%2fJNC.0000000000000315&partnerID=40&md5=43f57280f9129944f466c14eb968c5d8	Increasing the use of pre-exposure prophylaxis (PrEP) among male couples is critical to the success of the United States' Ending the HIV Epidemic campaign. By leveraging dyadic data from a larger cross-sectional study of male couples, the present analysis examined individual, partner, and relationship characteristics associated with PrEP stigma and perceived efficacy of PrEP. Actor-Partner Independence Models were fit separately for both outcomes. Individual and partner risk behaviors, including substance use, binge drinking, and higher number of condomless casual sex partners, were associated with lower levels of both PrEP stigma and belief in the efficacy of PrEP. Networks that supported PrEP use were associated with decreased PrEP stigma and increased belief in PrEP efficacy. Stigma-informed PrEP interventions for couples should be considered foundational to the success of the United States' Ending the HIV Epidemic campaign. © 2022 Elsevier USA. All rights reserved. Article	2022	Stephenson R.; Sullivan S.P.; Mitchell J.W.; Johnson B.A.; Sullvian P.S.	Efficacy of a Telehealth Delivered Couples' HIV Counseling and Testing (CHTC) Intervention to Improve Formation and Adherence to Safer Sexual Agreements Among Male Couples in the US: Results from a Randomized Control Trial	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03619-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124972028&doi=10.1007%2fs10461-022-03619-3&partnerID=40&md5=a4744e12a1c7b9ea3c2a209a5cf2fbf3	This paper reports the results of a randomized controlled trial (RCT) to assess the efficacy of Nexus, a telehealth delivered intervention that combines Couples' HIV counseling and testing (CHTC) with home-based HIV-testing, examining the impact of the intervention on the couples' formation and adherence to safer sexual agreements. Between 2016 and 2018, 424 couples were recruited online from the U.S and randomized to the intervention arm (a telehealth delivered CHTC session with two home HIV-testing kits) or a control arm (two home HIV-testing kits), with study assessments at baseline, 3 and 6 months. Outcomes were the formation and adherence to safer sexual agreements, dyadic discordance in sexual agreements, breakage of sexual agreements, and perceptions of PrEP. Couples in the intervention arm had significantly greater odds of reporting a safer sexual agreement (3 months OR 1.87, p-value 0.005, and 6 months OR 1.84, p-value 0.007), lower odds of reporting discordant sexual agreements at 6 months (OR 0.62, p-value 0.048), and a significantly lower odds of reporting breaking their sexual agreement (3 months OR 0.51, p-value 0.035, and 6 months OR 0.23, p-value 0.000). By 6 months, couples in the intervention arm were less likely to say PrEP was beneficial to one (RRR 0.33, P = 0.000) or both of them (RRR 0.29, P = 0.000) than being beneficial to neither of the partners. The high levels of acceptability and efficacy of the intervention demonstrate strong potential for the scale-up of this efficacious intervention that is delivered through a low-cost telehealth platform. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Stephenson R.; Sullivan S.P.; Pitter R.A.; Hunter A.S.; Chavanduka T.M.D.	Are We Still Having Sex? Results of Round Two of the Love and Sex in the Time of COVID Survey with Gay, Bisexual and Other Men Who Have Sex with Men	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03580-1		This paper presents data from the Love and Sex in the Time of COVID survey, an online survey with US gay, bisexual and other men who have sex with men. The first round of the Love and Sex in the Time of COVID-19 survey was conducted online from April to May, 2020: the second round was collected November 2020 to January 2021. GBMSM were recruited through advertisements featured on social networking platforms. Analysis examines changes in self-reported measures of sexual behavior (number of sex partners, number of anal sex partners and number of anal sex partners not protected by pre-exposure prophylaxis (PrEP) or condoms) between those with complete data for round one and round two of the surveys (n = 280). While in round one, men reported a moderate willingness to have sex during COVID-19 (3.5 on a scale from 1 to 5), this had reduced significantly to 2.1 by round two. Men reported declines in the number of unprotected anal sex partners since pre-COVID. Perceptions of a longer time until the end of the COVID-19 pandemic were associated with increases in the number of sex partners and UAI partners. The results illustrate some significant declines in sexual behavior among GBMSM as the COVID-19 pandemic progressed. As vaccine programs continue to roll out across the U.S, as lockdowns ease and as we return to some normalcy, it will be important to continue to think critically about ways to re-engage men in HIV prevention. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Stephenson, Rob; Rogers, Erin; Mansergh, Gordon; Hirshfield, Sabina; Sullivan, Patrick	Intimate Partner Violence and Preferences for Pre-exposure Prophylaxis (PrEP) Modes of Delivery Among A Sample of Gay, Bisexual, and Other Men Who Have Sex with Men.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-022-03587-8	https://dx.doi.org/10.1007/s10461-022-03587-8	While there is strong evidence that the experience of intimate partner violence (IPV) shapes PrEP use among heterosexual women, evidence for similar relationships among gay, bisexual and other men who have sex with men (GBMSM) is scant. In this paper we analyze baseline data from a large randomized controlled trial (RCT) of an HIV prevention intervention for GBMSM recruited from three cities (Atlanta, Detroit and New York City) to examine how the recent experience of IPV shapes their rankings of PrEP delivery options. Men were asked to rank from 1 to 8 PrEP taken by daily pill, event-based pill, injection, anal suppository (before sex), suppository (after sex), gel (penile or rectal) (before sex), and gel (after sex) and condoms. The analysis sample is 694 HIV-negative, sexually active GBMSM. Analysis considers an ordinal outcome measuring participant's ranked preferences for their future use of eight HIV prevention options. Men who experienced physical IPV preferred PrEP in pill form, while men who experienced partners monitoring their behaviors (monitoring IPV) preferred PrEP by injection. Men who experienced emotional IPV ranked PrEP by pill lower than other methods. Sexual and controlling IPV were not significantly associated with PrEP modality ranking. As more modes of PrEP delivery become available, providers should be encouraged to screen GBMSM seeking PrEP for IPV, and to provide men with the necessary information to facilitate an informed choice when deciding on a PrEP modality that will work for them and their relationship context. Article	2022	Stewart J.; Baeten J.M.	HIV pre-exposure prophylaxis and sexually transmitted infections: intersection and opportunity	Nature Reviews Urology	-	-	-	-	17594812	10.1038/s41585-021-00527-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117912660&doi=10.1038%2fs41585-021-00527-4&partnerID=40&md5=025da2c3ff86c9b35289320fcc6fd2c5	Pre-exposure prophylaxis (PrEP) has revolutionized HIV prevention, but PrEP does not protect against other sexually transmitted infections (STIs). Rates of STIs are rising worldwide, with notably high incidences among PrEP-using men who have sex with men in high-income countries; in low-income and middle-income countries, data are sparse, but results from a limited number of studies among African women initiating and taking PrEP have shown high STI prevalence and incidence. Efforts aimed at markedly reducing HIV in populations worldwide include a major focus on increasing PrEP use, along with improving HIV testing and treatment in order to eliminate HIV transmission. Together, these efforts could augment continued expansion of the global STI epidemic, but they could alternatively create an opportunity to improve STI control, including the development of comprehensive sexual health programmes and research to develop new STI prevention strategies. The introduction of PrEP globally has been characterized by challenges and many successes, and its role as part of a range of robust strategies to reduce HIV infections is clear. Looking ahead, understanding rising rates of curable STIs and their relationship to HIV prevention, and considering the future directions for synergies in PrEP and STI prevention will be integral to improving sexual health. © 2021, Springer Nature Limited. Article	2022	Stewart J.; Bukusi E.; Sesay F.A.; Oware K.; Donnell D.; Soge O.O.; Celum C.; Odoyo J.; Kwena Z.A.; Scoville C.W.; Violette L.R.; Morrison S.; Simoni J.; McClelland R.S.; Barnabas R.; Gandhi M.; Baeten J.M.	Doxycycline post-exposure prophylaxis for prevention of sexually transmitted infections among Kenyan women using HIV pre-exposure prophylaxis: study protocol for an open-label randomized trial	Trials	-	-	-	-	17456215	10.1186/s13063-022-06458-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132079505&doi=10.1186%2fs13063-022-06458-8&partnerID=40&md5=a11c5e7fbdacd6e397b3ec50d4f8dee0	Background: Women in Africa face disproportionate risk of human immunodeficiency virus (HIV) acquisition, accounting for more than half of new infections in Africa and similarly face a disproportionate burden of sexually transmitted infections (STIs). Very high STI prevalence is being observed globally, especially among people taking pre-exposure prophylaxis (PrEP) for HIV prevention. Doxycycline post-exposure prophylaxis (dPEP) has been proposed as an STI prevention strategy to reduce chlamydia, syphilis, and possibly gonorrhea, and trials are ongoing among cisgender men who have sex with men (MSM) and transgender women who are taking PrEP in high-income settings. We designed and describe here the first open-label trial to determine the effectiveness of dPEP to reduce STI incidence among cisgender women. Methods: We are conducting an open-label 1:1 randomized trial of dPEP versus standard of care (STI screening and treatment and risk-reduction counseling without dPEP) among 446 Kenyan women aged ≥ 18 and ≤ 30 years old women taking PrEP. Women are followed for 12 months, with quarterly STI testing, treatment, and adherence counseling. The primary trial outcome will be the combined incidence of Chlamydia trachomatis, Neisseria gonorrhoeae, and Treponema pallidum, compared between the randomized groups. We will also assess dPEP acceptability, tolerability, safety, impact on sexual behavior, adherence, and occurrence of antimicrobial resistance (AMR) in N. gonorrhoeae and C. trachomatis isolates. Finally, we will estimate cost per incident STI case and complications averted accounting for nonadherence and benefits relative AMR or side effects. Discussion: The results of this trial may have immediate implications for the global epidemic of STIs and sexual health. If effective, dPEP could put STI prevention into women's hands. While dPEP may be able to prevent STIs, it carries important risks that could counter its benefits; global debate about the balance of these potential risks and benefits requires data to inform policy and implementation and our study aims to fill this gap. Article	2022	Stoner, Marie C D; Bhushan, Nivedita L; Maragh-Bass, Allysha C; Mitchell, John T; Riggins, Linda; Walker, Maleka; LeMasters, Katherine; Reese, Bianka; Dearing, Aissa; Debnam, Summer; Golin, Carol; Lightfoot, Alexandra F; Pettifor, Audrey	Using Participatory Methods to Assess PrEP Interest and Uptake Among Young People Living in the Southeastern US: A Mixed Methods Assessment.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-021-03519-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9007838	Adolescents and young adults (AYA; 13-24 years-old) comprise 22% of new HIV infections in the United States (US), most of whom live in the South. We used the situated-Information, Motivation, Behavioral skills (sIMB) model to identify priorities for intervention on multi-level factors that influence HIV preventive care among Black AYA in Durham, North Carolina. We conducted two participatory workshops (ages 13-17, N = 6; ages 18-24, N = 7) to engage youth about how to discuss HIV. We also assessed sIMB constructs from a separate quantitative sample of youth to contextualize the workshop findings (N = 80). HIV knowledge was low overall, but lower among younger Black AYA, suggesting a need for comprehensive sexual education. Trusted adults provided sexual health information, motivation for health maintenance, and behavioral skills support. HIV prevention interventions should provide comprehensive sexual health education to Black AYA, be age-specific, and include social supporters like parents, teachers, and community members. Article	2022	Storholm E.D.; Siconolfi D.E.; Wagner G.J.; Huang W.; Nacht C.L.; Sallabank G.; Felner J.K.; Wolf J.; Lee S.D.; Stephenson R.	Intimate Partner Violence and HIV Prevention Among Sexual Minority Men: Protocol for a Prospective Mixed Methods Cohort Study	JMIR Research Protocols	-	-	-	-	19290748	10.2196/41453	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142355748&doi=10.2196%2f41453&partnerID=40&md5=af9464f7090f669d6ccbdeadf47ae76a	Background: Sexual minority men experience intimate partner violence (IPV) at rates similar to those reported by heterosexual women in the United States. Previous studies linked both IPV victimization and perpetration to HIV risk and seroconversion; however, less is known about the impact of IPV on HIV testing, sexually transmitted infection (STI) testing, pre-exposure prophylaxis (PrEP) uptake, and the persistence of PrEP use among sexual minority men experiencing IPV. Although prior work suggests that IPV may influence HIV prevention behavior, experiences of IPV are so highly varied among sexual minority men (eg, forms, frequency, and severity; steady vs casual partnerships; perpetration vs receipt; and sexual vs physical vs psychological violence) that additional research is needed to better understand the impact that IPV has on HIV risk and protective behaviors to develop more effective interventions for sexual minority men. Objective: This study aims to contribute to our understanding of the antecedents of IPV and the direct and indirect pathways between perpetration and receipt of IPV and HIV or STI risk behavior, STIs, and use of PrEP among sexual minority men experiencing IPV. Methods: This mixed methods study has 2 phases: phase 1 involved formative qualitative interviews with 23 sexual minority men experiencing IPV and 10 key stakeholders or providers of services to sexual minority men experiencing IPV to inform the content of a subsequent web-based cohort study, and phase 2 involves the recruitment of a web-based cohort study of 500 currently partnered HIV-negative sexual minority men who reside in Centers for Disease Control and Prevention-identified Ending the HIV Epidemic priority jurisdictions across the United States. Participants will be followed for 24 months. They will be assessed through a full survey and asked to self-collect and return biospecimen kits assessing HIV, STIs, and PrEP use at 0, 6, 12, 18, and 24 months. They will also be asked to complete abbreviated surveys to assess for self-reported changes in key study variables at 3, 9, 15, and 21 months. Results: Phase 1 was launched in May 2021, and the phase 1 qualitative interviews began in December 2021 and were concluded in March 2022 after a diversity of experiences and perceptions were gathered and no new ideas emerged in the interviews. Rapid analysis of the qualitative interviews took place between March 2022 and June 2022. Phase 2 recruitment of the full cohort began in August 2022 and is planned to continue through February 2024. Conclusions: This mixed methods study will contribute valuable insights into the association that IPV has with HIV risk and protective behaviors among sexual minority men. The findings from this study will be used to inform the development or adaptation of HIV and IPV prevention interventions for sexual minority men experiencing IPV. © 2022 Erik D Storholm.	cohort study; HIV; intimate partner violence; pre-exposure prophylaxis; PrEP; sexual minority men; sexually transmitted infections	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Stover J.; Teng Y.	The impact of condom use on the HIV epidemic	Gates Open Research	-	-	-	-	25724754	10.12688/gatesopenres.13278.2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129043467&doi=10.12688%2fgatesopenres.13278.2&partnerID=40&md5=c3bcfca45fa2205258af97cfceef0b45	Background: Condom promotion and supply was one the earliest interventions to be mobilized to address the HIV pandemic. Condoms are inexpensive and provide protection against transmission of HIV and other sexually transmitted diseases (STIs) as well as against unintended pregnancy. As many as 16 billion condoms may be used annually in all low- and middle-income countries (LMIC). In recent years the focus of HIV programs as been on testing and treatment and new technologies such as PrEP. Rates of condom use have stopped increasing short of UNAIDS targets and funding from donors is declining. Methods: We applied a mathematical HIV transmission model to 77 high HIV burden countries to estimate the number of HIV infections that would have occurred from 1990 to 2019 if condom use had remained at 1990 levels. Results: The results suggest that current levels of HIV would be five times higher without condom use and that the scale-up in condoms use averted about 117 million HIV infections. Conclusions: HIV programs should ensure that affordable condoms are consistently available and that the benefits of condom use are widely understood. © 2022 Stover J and Teng Y. Article	2022	Streeck, Hendrik; Jansen, Klaus; Crowell, Trevor A; Esber, Allahna; Jessen, Heiko K; Cordes, Christiane; Scholten, Stefan; Schneeweiss, Stephan; Brockmeyer, Norbert; Spinner, Christoph D; Bickel, Markus; Esser, Stefan; Hartikainen, Jukka; Stoehr, Albrecht; Lehmann, Clara; Marcus, Ulrich; Vehreschild, Jörg Janne; Knorr, Alexandra; Brillen, Anna-Lena; Tiemann, Carsten; Robb, Merlin L; Michael, Nelson L	HIV pre-exposure prophylaxis was associated with no impact on sexually transmitted infection prevalence in a high-prevalence population of predominantly men who have sex with men, Germany, 2018 to 2019.	Eurosurveillance	-	-	-	-	1560-7917	10.2807/1560-7917.ES.2022.27.14.2100591	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8991735	IntroductionDespite increased use of pre-exposure prophylaxis (PrEP) in Germany, HIV infection rates are not declining and little is known about how this prevention method affects the prevalence of sexually transmitted infections (STI) among men who have sex with men (MSM).AimWe studied, in a large multicentre cohort, STI point prevalence, co-infection rates, anatomical location and influence of PrEP.MethodsThe BRAHMS study was a prospective cohort study conducted at 10 sites in seven major German cities that enrolled MSM reporting increased sexual risk behaviour. At screening visits, MSM were tested for Mycoplasma genitalium (MG), Neisseria gonorrhoeae (NG), Chlamydia trachomatis (CT) and Treponema pallidum (TP), and given a behavioural questionnaire. With binomial regression, we estimated prevalence ratios (PR) and 95% confidence intervals (CI) for the association of PrEP and STI.ResultsWe screened 1,043 MSM in 2018 and 2019, with 53.0% currently using PrEP. At screening, 370 participants (35.5%) had an STI. The most common pathogen was MG in 198 (19.0%) participants, followed by CT (n = 133; 12.8%), NG (n = 105; 10.1%) and TP (n = 37; 3.5%). Among the 370 participants with at least one STI, 14.6% (n = 54) reported STI-related symptoms. Infection prevalence was highest at anorectal site (13.4% MG, 6.5% NG, 10.2% CT). PrEP use was not statistically significant in adjusted models for STI (PR: 1.10; 95% CI: 0.91-1.32), NG/CT, only NG or only CT.ConclusionsPrevalence of asymptomatic STI was high, and PrEP use did not influence STI prevalence in MSM eligible for PrEP according to national guidelines. Article	2022	Streed, Carl G. Jr; Morgan, Jake R.; Gai, Mam Jarra; Larochelle, Marc R.; Paasche-Orlow, Michael K.; Taylor, Jessica L.	Prevalence of HIV Preexposure Prophylaxis Prescribing Among Persons With Commercial Insurance and Likely Injection Drug Use.	JAMA Network Open	-	-	-	-	2574-3805	10.1001/jamanetworkopen.2022.21346	https://pubmed.ncbi.nlm.nih.gov/35819784/	IMPORTANCE: Although HIV preexposure prophylaxis (PrEP) implementation among persons who inject drugs has been inadequate, national HIV monitoring programs do not include data on PrEP, and specific trends in PrEP use are not well understood. OBJECTIVE: To estimate HIV PrEP uptake among commercially insured persons with opioid or stimulant use disorder by injection drug use (IDU) status. DESIGN, SETTING, AND PARTICIPANTS: This cross-sectional study used deidentified data from the MarketScan Commercial Claims and Encounters Database to identify a sample of 547 709 commercially insured persons without HIV but with opioid and/or stimulant use disorder, including 110 592 with evidence of IDU between January 1, 2010, and December 31, 2019. Data were analyzed from November 1, 2020, to July 1, 2021. EXPOSURES: Persons with opioid and/or stimulant use disorder and evidence of IDU were identified through claims data. MAIN OUTCOMES AND MEASURES: The outcome was receipt of tenofovir disoproxil fumarate and emtricitabine for PrEP as identified from filled pharmacy claims. Multivariable logistic regression was used to assess the association of demographic and clinical characteristics with receipt of PrEP. RESULTS: The study cohort included 211 609 (28.6%) females and 336 100 (61.4%) males with a combined mean (SD) age of 34.8 (13.1) years, including 110 592 individuals with evidence of IDU. During the study period, 508 (0.09%) persons with opioid and/or stimulant use disorder, including 170 (0.15%) with evidence of IDU, received PrEP. Receipt of PrEP increased from 0.001 to 0.243 per 100 person-years from 2010 through 2019 among the entire cohort and from 0.000 to 0.295 per 100 person-years among those with IDU. In multivariable analysis, PrEP use was more likely among males (adjusted odds ratio aOR 8.72; 95% CI, 6.39-11.89), persons with evidence of IDU (aOR, 1.47; 95% CI, 1.21-1.79), and persons with evidence of sexual risk indications for PrEP (aOR, 23.68; 95% CI, 19.57-28.66). CONCLUSIONS AND RELEVANCE: In this cross-sectional study of commercially insured persons with opioid and/or stimulant use disorder, HIV PrEP delivery remained low, including among those with evidence of IDU. PrEP should be consistently offered alongside substance use disorder treatment and other harm reduction and HIV prevention services. Article	2022	Stutterheim S.E.; Kuijpers K.J.R.; Waldén M.I.; Finkenflügel R.N.N.; Brokx P.A.R.; Bos A.E.R.	TRENDS IN HIV STIGMA EXPERIENCED BY PEOPLE LIVING WITH HIV IN THE NETHERLANDS: A COMPARISON OF CROSS-SECTIONAL SURVEYS OVER TIME	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2022.34.1.33	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125156029&doi=10.1521%2faeap.2022.34.1.33&partnerID=40&md5=289bafbf83b8c6c1c2a8e21c89846a05	We investigated whether HIV stigma has changed in recent years. We compared data on stigma settings and manifestations from 2007 (n = 667) and, specifically for health care, 2009 (n = 262), to data acquired in 2019/2020 (n = 258). Results showed reductions in stigma from friends, family, acquaintances, at work, in the financial services sector, and in media, but stigmatizing messages in media remained highly prevalent. Stigma in the LGBTQI+ community, with sexual partners, and while partying also remained prevalent and, disconcertingly, relatively unchanged. Stigma in health care increased. HIV stigma was positively related to psychological distress, and negatively related to social support and medication adherence. Further, most participants were familiar with U=U and PrEP, but 13.3% questioned the accuracy of U=U. Stigma reduction efforts should focus on reducing stigma in media, in the LGBTQI+ community and while dating, and in health care, with U=U as a key message. © 2022 The Guilford Press. Article	2022	Stutts L.A.; Robinson P.A.; Witt B.; Terrell D.F.	Lost in translation: College students' knowledge of HIV and PrEP in relation to their sexual health behaviors	Journal of American College Health	-	-	-	-	7448481	10.1080/07448481.2020.1757679	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85085013208&doi=10.1080%2f07448481.2020.1757679&partnerID=40&md5=45f04e9de4616f6ea996e7f552d071ee	Objective: Human immunodeficiency virus (HIV) is a notable public health problem among young adults. The present study examined college students' knowledge of HIV and pre-exposure prophylaxis (PrEP) in relation to their sexual health behaviors. Participants and Method: Participants included 1516 students who completed questionnaires on actual and perceived HIV knowledge, perceived PrEP knowledge, and sexual health behaviors. Results: While knowledge of HIV was high, knowledge of PrEP was low. Approximately 73% of the sample reported not using condoms at all times, and 41% reported never having been tested for HIV. Women, students at public schools, upper-year students, and students with higher HIV and PrEP knowledge were more likely to get tested for HIV than their counterparts. Knowledge of HIV and PrEP did not relate to condom use. Conclusion: These results suggest the need for increased education about PrEP and strategies to help students translate knowledge about HIV to recommended sexual health behaviors. © 2020 Taylor & Francis Group, LLC.	college students; HIV; PrEP; sexual health behaviors	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Su, R.; Li, D. M.	Research advances of cognition and willingness to use HIV pre-exposure prophylaxis drug among female sex workers.	Zhonghua Liu Xing Bing Xue Za Zhi (Chinese Journal of Epidemiology)	-	-	-	-	0254-6450	10.3760/cma.j.cn112338-20220711-00622	https://pubmed.ncbi.nlm.nih.gov/36572483/	Female sex workers (FSW) are in a weak position in the process of sexual behavior and have a high risk of HIV infection. Promoting pre-exposure prophylaxis (PrEP) in this population can prevent HIV infection. This article reviews the cognition, willingness, influencing factors, and potential risk compensation of PrEP in FSW to provide a reference for expanding the use of PrEP in this population. Article	2022	Sudarto B.; Chow E.P.F.; Medland N.; Fairley C.K.; Wright E.J.; Armishaw J.; Price B.; Phillips T.R.; Ong J.J.	"How PrEPared are you?": Knowledge of and attitudes toward PrEP among overseas-born and newly arrived gay, bisexual, and other men who have sex with men in Australia	Frontiers in Public Health	-	-	-	-	22962565	10.3389/fpubh.2022.946771	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137187913&doi=10.3389%2ffpubh.2022.946771&partnerID=40&md5=1a074f277cb6a9bfae73f9e1797eb113	Introduction: Overseas-born and newly arrived gay and bisexual men and men who have sex with men (GBMSM) are at higher risk of acquiring HIV in comparison to Australian-born GBMSM. Pre-exposure prophylaxis (PrEP) is subsidized by the Australian government under Medicare, Australia's universal health insurance scheme, however many members of this population are Medicare-ineligible, which could prevent them from accessing PrEP. We wanted to explore participants' knowledge of and attitudes toward PrEP and their opinions of new PrEP modalities, namely injectable PrEP and PrEP implants. Methods: We conducted in-depth qualitative interviews between February 2021 to September 2021 with 22 overseas-born, newly arrived (<5 years in Australia) GBMSM of varying PrEP use. We asked their opinions of PrEP and their preferences of new PrEP modalities. Interviews were audio recorded and transcribed verbatim. We conducted a reflexive thematic analysis to interpret the data. Results: Participants' views reflect the intersections between systemic factors, such as Medicare ineligibility and the high cost of PrEP, with socio-cultural factors, such as lack of knowledge about PrEP, internalized stigma stemming from homo- and sex-negativity, and stigmatizing attitudes toward PrEP and PrEP users. For participants who were on PrEP, being community connected, having a positive relationship with doctors and nurses, and being informed of the option to purchase PrEP from overseas pharmacies at a low cost helped them to overcome some of these barriers. Additionally, there was a strong preference for injectable PrEP but not PrEP implants. Participants stressed the importance of providing a comprehensive information about PrEP specific to this population and to make PrEP free for all. Conclusions: We concluded that resources about PrEP specific to this population that address both systemic and socio-cultural factors are needed, and for these resources to be available in languages other than English. This is to coincide with on-going advocacy to increase the capacity of publicly funded sexual health clinics to provide multilingual PrEP services for people without Medicare, and to make PrEP free for all. These combined strategies have the potential to increase PrEP knowledge and uptake among this population. Copyright © 2022 Sudarto, Chow, Medland, Fairley, Wright, Armishaw, Price, Phillips and Ong. Article	2022	Sued, Omar; Nardi, Norma; Spadaccini, Luciana	Key population perceptions and opinions about long-acting antiretrovirals for prevention and treatment: a scoping review.	Current Opinion in HIV and AIDS	-	-	-	-	1746-6318	10.1097/COH.0000000000000734	https://dx.doi.org/10.1097/COH.0000000000000734	PURPOSE OF REVIEW: Key populations are disproportionately affected by human immunodeficiency virus (HIV). Access, retention, and adherence are important barriers for the efficacy of preexposure prophylaxis (PrEP) and HIV treatment among these populations. Long-acting (LA) antiretrovirals hold the promise to solve some of these backdrops. The objective of the current review is to update the perceptions of key populations and PLWH about LA, based on their opinion, acceptability, and willingness to use it. RECENT FINDINGS: According to the review preferences for LA vary with the population studied. Regarding people living with HIV (PLWH), male having sex with men are interested in having different options, adolescents are interested in LA (strong preference for implants), yet also perceive substantial obstacles to using biomedical prevention; transgender women aimed to nonvisible small implants, with long-lasting effects or LA injections that can be applied in other areas than buttocks, and women who experienced history of medical injections might increase preference for LA (except for history of people who inject drugs IDU). Female sex workers and IDU both showed interest in LA-PrEP. Regarding antiretroviral therapy, LA increased treatment satisfaction and acceptance, mainly among those receiving injections every 2âmonths. LA helped overcome pill fatigue, stigma, and adherence issues. SUMMARY: Knowing preferences for biomedical interventions will contribute to better understanding and developing effective strategies for these populations. Article	2022	Suen Y.T.; Chan R.C.H.; Wong E.M.Y.	SEX CONSERVATISM, INTERNALIZED HOMONEGATIVITY, PREP STIGMA, AND INTENTION TO USE PREP: A STUDY OF CHINESE-SPEAKING GAY AND BISEXUAL MALE YOUTH IN HONG KONG	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2022.34.6.467	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143197989&doi=10.1521%2faeap.2022.34.6.467&partnerID=40&md5=d1088a6cfa1b1eec3fa23dddc032c520	Pre-exposure prophylaxis (PrEP) stigma has been found to be a major barrier to PrEP acceptability and uptake. Research has found that dif-ferent ethnic/cultural groups display varying levels of PrEP stigma. This article studies sex conservatism and internalized homonegativity as two sexuality-and culture-related aspects that influence PrEP stigma and intention to use PrEP. An online survey of 279 young gay and bisexual men in Hong Kong found that internalized homonegativity was positively associated with PrEP stigma. Respondents who were more conservative about sex showed lower intention to use PrEP, whereas those who had higher income and more positive attitudes about PrEP were more likely to express intention to use PrEP. This study provides novel empirical evidence for understanding PrEP stigma and uptake from a sexuality and cultural perspective. The influence of sexuality-and culture-related factors on PrEP stigma and uptake warrants greater attention, especially in the Asia-Pacific region. © 2022 The Guilford Press.	gay and bisexual men; Hong Kong; PrEP; sex conservatism; sexual minorities	English	United States	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Quantitative

Validation of spectrophotometric method to quantify cabotegravir in simulated vaginal fluid and porcine vaginal tissue in ex vivo permeation and retention studies from thermosensitive and mucoadhesive gels	Spectrochimica Acta - Part A: Molecular and Biomolecular Spectroscopy	-	-	-	-	13861425	10.1016/j.saa.2021.120600	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119409807&doi=10.1016%2fj.saa.2021.120600&partnerID=40&md5=a0519859 9d46300c7fb1432dd9b5e17c	Cabotegravir (CAB) is an antiretroviral therapy (ARV) used for Human Immunodeficiency Virus (HIV) treatment. CAB has low solubility, which affects its bioavailability in oral therapy. Moreover, the injection form of CAB has difficulty in the administration process. Therefore, it is essential to develop a new drug delivery system for CAB. Vaginal drug delivery system offers many advantages such as a large surface area, increased drug bioavailability, and improved drug delivery. CAB was developed in thermosensitive and mucoadhesive vaginal gel preparations that provided optimal distribution in the vaginal mucosa. To support the process of formulation development, in this study, UV–visible spectrophotometry method was validated in methanol, simulated vaginal fluid (SVF) and vaginal tissue to quantify the amount of CAB in the gel preparations, in vitro, and ex vivo studies, respectively. The developed analytical method was subsequently validated according to ICH guidelines. The calibration curves in these matrices were found to be linear with correlation coefficient values (R2) ≥ 0.998. The LLOQ values in methanol, SVF and vaginal tissue were 2.15 µg/mL, 2.22 µg/mL, and 5.13 µg/mL, respectively. The developed method was found to be accurate and precise without being affected by dilution integrity. These methods were successfully applied to quantify the amount of CAB in gel preparations, in vitro, and ex vivo studies, showing uniformity of drug content and controlled release manner in the permeation profile for 24 h for both thermosensitive and mucoadhesive vaginal gels. Further analytical method is required to be developed for the quantification of CAB in in vivo studies. © 2021 Elsevier B.V. Article	2022	Sullivan P.S.; Siegler A.J.	What will it take to meet UNAIDS targets for preexposure prophylaxis users?	Current Opinion in Infectious Diseases	-	-	-	-	9517375	10.1097/QCO.0000000000000809	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123025383&doi=10.1097%2fQCO.0000000000000809&partnerID=40&md5=18e98c7f8f0b18363f59853996beef08	Purpose of reviewPreexposure prophylaxis (PrEP) is a critical strategy to curb new HIV infections globally. National and global targets have been set for people starting PrEP. However, global PrEP initiations fell short of UNAIDS 2020 targets, and reflection is needed on how we set and meet targets for PrEP use.Recent findingsRecent literature documents challenges to meeting ambitious goals for PrEP coverage in multiple phases of PrEP: PrEP initiations are limited by gaps in the identification of those who might benefit from PrEP. Conversely, getting PrEP to those who need it most is threatened by inaccurate risk perception and HIV and PrEP stigma. Once people are on PrEP, a substantial number discontinue PrEP in the first year (the 'PrEP Cliff'), a finding that is robust across groups of PrEP users (e.g., women, men who have sex with men, transwomen) and across global prevention settings. Further, PrEP inequities - by which we refer to utilization of PrEP in a population that is not commensurate with their epidemic risk - threaten the overall population benefit of PrEP because those at highest risk of acquiring HIV are not adequately protected.SummaryTo realize global goals for PrEP utilization and impact, we must address multiple points of PrEP delivery programs that address not just PrEP starts, but also retention in PrEP and measurement and accountability to PrEP equity. We call for new approaches to better identify PrEP candidates, suggest additional research to address the known and consistent reasons for PrEP discontinuations, and advocate for metrics to measure and be accountable to PrEP equity. © 2022 Lippincott Williams and Wilkins. Article	2022	Sullivan, Patrick Sean; Woodyatt, Cory R; Kouzouian, Oskian; Parrish, Kristen J; Taussig, Jennifer; Conlan, Chris; Phillips, Harold	America's HIV Epidemic Analysis Dashboard: Protocol for a Data Resource to Support Ending the HIV Epidemic in the United States.	JMIR Public Health and Surveillance	-	-	-	-	2369-2960	10.2196/33522	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8874801	BACKGROUND: The Ending the HIV Epidemic (EHE) plan aims to end the HIV epidemic in the United States by 2030. Having timely and accessible data to assess progress toward EHE goals at the local level is a critical resource to achieve this goal. OBJECTIVE: The aim of this paper was to introduce America's HIV Epidemic Analysis Dashboard (AHEAD), a data visualization tool that displays relevant data on the 6 HIV indicators provided by the Centers for Disease Control and Prevention. AHEAD can be used to monitor progress toward ending the HIV epidemic in local communities across the United States. Its objective is to make data available to stakeholders, which can be used to measure national and local progress toward 2025 and 2030 EHE goals and to help jurisdictions make local decisions that are grounded in high-quality data. METHODS: AHEAD displays data from public health data systems (eg, surveillance systems and census data), organized around the 6 EHE indicators (HIV incidence, knowledge of HIV status, HIV diagnoses, linkage to HIV medical care, viral HIV suppression, and preexposure prophylaxis coverage). Data are displayed for each of the EHE priority areas (48 counties in Washington, District of Columbia, and San Juan, Puerto Rico) which accounted for more than 50% of all US HIV diagnoses in 2016 and 2017 and 7 primarily southern states with high rates of HIV in rural communities. AHEAD also displays data for the 43 remaining states for which data are available. Data features prioritize interactive data visualization tools that allow users to compare indicator data stratified by sex at birth, race or ethnicity, age, and transmission category within a jurisdiction (when available) or compare data on EHE indicators between jurisdictions. RESULTS: AHEAD was launched on August 14, 2020. In the 11 months since its launch, the Dashboard has been visited 26,591 times by 17,600 unique users. About one-quarter of all users returned to the Dashboard at least once. On average, users engaged with 2.4 pages during their visit to the Dashboard, indicating that the average user goes beyond the informational landing page to engage with 1 or more pages of data and content. The most frequently visited content pages are the jurisdiction webpages. CONCLUSIONS: The Ending the HIV Epidemic plan is described as a "whole of society" effort. Societal public health initiatives require objective indicators and require that all societal stakeholders have transparent access to indicator data at the level of the health jurisdictions responsible for meeting the goals of the plan. Data transparency empowers local stakeholders to track movement toward EHE goals, identify areas with needs for improvement, and make data-informed adjustments to deploy the expertise and resources required to locally tailor and implement strategies to end the HIV epidemic in their jurisdiction. Article	2022	Sullivan, PS; Stephenson, R; Hirshfield, S; Mehta, CC; Zahn, R; Bauermeister, JA; Horvath, K; Chiasson, MA; Gelaude, D; Mullin, S; Downing, MJ; Olansky, EJ; Wiatrek, S; Rogers, EQ; Rosenberg, E; Siegler, AJ; Mansergh, G	Behavioral Efficacy of a Sexual Health Mobile App for Men Who Have Sex With Men: randomized Controlled Trial of Mobile Messaging for Men	Journal of Medical Internet Research	-	-	-	-	-	10.2196/34574	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8851328/?report=printable	BACKGROUND: Gay, bisexual, and other men who have sex with men (GBMSM) face the highest burden of HIV in the United States, and there is a paucity of efficacious mobile health (mHealth) HIV prevention and care interventions tailored specifically for GBMSM. We tested a mobile app combining prevention messages and access to core prevention services for GBMSM. OBJECTIVE: This study aims to measure the efficacy of the Mobile Messaging for Men (M-cubed) app and related services to increase HIV prevention and care behaviors in diverse US GBMSM. METHODS: We conducted a randomized open-label study with a waitlist control group among GBMSM in 3 groups (low-risk HIV-negative group, high-risk HIV-negative group, and living-with-HIV LWH group) recruited online and in venues in Atlanta, Detroit, and New York City. Participants were randomly assigned to receive access to the app immediately or at 9 months after randomization. The app provided prevention messages in 6 domains of sexual health and offered ordering of at-home HIV and sexually transmitted infection test kits, receiving preexposure prophylaxis (PrEP) evaluations and navigation, and service locators. Serostatus- and risk-specific prevention outcomes were evaluated at baseline, at the end of the intervention period, and at 3, 6, and 9 months after the intervention period. RESULTS: In total, 1226 GBMSM were enrolled and randomized; of these 611 (49.84%) were assigned to the intervention group and 608 (99.51%) were analyzed, while 615 (50.16%) were assigned to the control group and 612 (99.51%) were analyzed. For high-risk GBMSM, allocation to the intervention arm was associated with higher odds of HIV testing during the intervention period (adjusted odds ratio aOR 2.02, 95% CI 1.11-3.66) and with higher odds of using PrEP in the 3 months after the intervention period (aOR 2.41, 95% CI 1.00-5.76, P<.05). No changes in HIV prevention or care were associated with allocation to the intervention arm for the low-risk HIV-negative and LWH groups. CONCLUSIONS: Access to the M-cubed app was associated with increased HIV testing and PrEP use among high-risk HIV-negative GBMSM in 3 US cities. The app could be made available through funded HIV prevention providers; additional efforts are needed to understand optimal strategies to implement the app outside of the research setting. TRIAL REGISTRATION: ClinicalTrials.gov NCT03666247; https://clinicaltrials.gov/ct2/show/NCT03666247. Article	2022	Sullivan-Blum, Zoe C.; Brophy, Margaret; Didde, Ryan; Nagireddy, Radha; Swagerty, Hannah; Weir, Sumiko; Sykes, Kevin J.; Dietz, Craig; Alt, Marcus; Ramaswamy, Megha; Rotert, Paul	PrEP patient attitudes, beliefs and perceived barriers surrounding HPV vaccination: a qualitative study of semistructured interviews with PrEP patients in primary care clinics in Kansas and Missouri.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2021-058510	https://pubmed.ncbi.nlm.nih.gov/35379639/	OBJECTIVES: Men who have sex with men who use pre-exposure prophylaxis (PrEP) have not traditionally been targets for human papillomavirus (HPV) vaccine programmes, despite their high risk for HPV-related cancers and HPV vaccine being approved by the U.S. Food and Drug Administration (FDA) for people up to age 45. The objective of this study was to assess attitudes and barriers towards HPV vaccine for adult PrEP users in the primary care context. METHODS: Semistructured phone interviews of 16 primary care patients taking PrEP in the Kansas City metropolitan area were conducted, with interviews assessing HPV vaccination status, and attitudes, beliefs and perceived barriers surrounding HPV vaccine. Interview notes were open-coded by student authors, and themes were generated through code review and consensus. Data were then analysed using thematic analysis. RESULTS: The results showed that most patients believed that preventative health was important and felt the HPV vaccine was important. Most patients were open to vaccination if recommended by their primary care physician and covered by insurance. Most participants believed HPV infection to be far worse in women, and there were gaps in knowledge surrounding HPV and its effects in men. CONCLUSIONS: While more research is needed to better understand facilitators of a linkage between PrEP and HPV vaccine in clinical settings for groups at high risk for HPV-related cancers, getting primary care providers involved in educating high-risk patients about the importance of HPV vaccination and actively recommending the vaccine to those patients has the potential to prevent HPV-related cancers. Article	2022	Sun Z.; Gu Q.; Dai Y.; Zou H.; Agins B.; Chen Q.; Li P.; Shen J.; Yang Y.; Jiang H.	Increasing awareness of HIV pre-exposure prophylaxis (PrEP) and willingness to use HIV PrEP among men who have sex with men: a systematic review and meta-analysis of global data	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25883	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126078956&doi=10.1002%2fjia2.25883&partnerID=40&md5=b04994cda25d08a89b1db0ca0cba3c86	Introduction: Integrated knowledge regarding pre-exposure prophylaxis (PrEP) awareness and willingness to use PrEP can be useful for HIV prevention in high incidence groups. This review summarizes the awareness of PrEP and willingness to use PrEP among men who have sex with men (MSM). Methods: Online electronic databases were searched before 31 August 2021. A meta-analysis was conducted to pool studies analysing PrEP awareness and willingness to use PrEP. LOESS regression and linear regression were applied to fit the trends over time for the proportion of MSM aware of PrEP and willing to use PrEP. Dose–response meta-analysis (DRMA) was conducted by a restricted cubic spline model to explore the relationship between willingness to use PrEP and selected factors. Results and Discussion: A total of 156 articles involving 228,403 MSM were included. The pooled proportions of MSM aware of PrEP and willing to use PrEP were 50.0 (95% CI: 44.8–55.2) and 58.6% (95% CI: 54.8–62.4), respectively. PrEP awareness varied among countries with different economic status and different WHO regions, among different publication and research years, PrEP types and support policies. PrEP willingness differed among countries with different economic status and groups with different risks of HIV. The awareness of PrEP increased from 2007 to 2019 with a slope of 0.040260 (p<0.0001), while the proportion of MSM willing to use PrEP decreased from 2007 to 2014 (slope = −0.03647, p = 0.00390) but increased after 2014 (slope = 0.04187, p = 0.03895). The main facilitators of willingness to use PrEP were PrEP awareness, condomless sexual behaviours, high perceived risk of HIV infection and influence of social network. The main barriers were doubts about the efficacy and side effects of PrEP. DRMA results indicated that MSM with more sexual partners and lower level of education were more willing to use PrEP. No publication bias was observed. Conclusions: The proportions of PrEP awareness and willingness to use PrEP among MSM have increased since 2014, although the awareness was low and the willingness was moderate. Improving awareness of PrEP through increasing access to PrEP-related health education and enhancing risk perceptions of HIV infection could have positive effects on the willingness to use PrEP among MSM. © 2022 The Authors. Article	2022	Sundararajan, Radhika; Wyatt, Monique A; Muwonge, Timothy R; Pisarski, Emily E; Mujugira, Andrew; Haberer, Jessica E; Ware, Norma C	Understanding PrEP Acceptability Among Priority Populations: Results from a Qualitative Study of Potential Users in Central Uganda.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03606-8	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9252941	Daily oral pre-exposure prophylaxis (PrEP) can safely and effectively prevent HIV acquisition in HIV-negative individuals. However, uptake of PrEP has been suboptimal in sub-Saharan Africa. The goal of this qualitative study was to identify facilitators of and barriers to PrEP acceptability among target users not taking PrEP. Fifty-nine individuals belonging to Ugandan priority populations participated in a single in-depth interview. Participants perceived themselves as being at high risk for HIV acquisition, and expressed interest in PrEP as an HIV prevention strategy. Two forms of stigma emerged as potential barriers to PrEP use: (1) misidentification as living with HIV; and (2) disclosure of membership in a priority population. Acceptability of PrEP was dampened for this sample of potential PrEP users due to anticipated stigmatization. Mitigating stigma should be a key component of effective PrEP delivery to reach UNAIDS goal of ending the AIDS epidemic by 2030. Article	2022	Sundelson A.E.; Meunier É.; Schrimshaw E.W.; Siegel K.	Barriers to Pre-Exposure Prophylaxis Uptake Among Online Male Sex Workers in the US	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03510-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117887490&doi=10.1007%2fs10461-021-03510-7&partnerID=40&md5=a997f33994175bc03a8ac46a2bb121f7	Though barriers to HIV pre-exposure prophylaxis (PrEP) uptake among gay, bisexual, and other men who have sex with men (MSM) have received substantial research attention, less is known about what factors may be affecting PrEP uptake among male sex workers (MSWs), a population at high risk of HIV. This paper presents qualitative findings regarding why a subsample of MSM engaged in exchange sex (receiving money, drugs, shelter, or other goods in exchange for sex) with partners they met on dating/hookup websites and apps had never used PrEP. Analysis revealed several barriers to PrEP uptake including lack of awareness and knowledge about PrEP, scientific and medical concerns, issues related to individual risk perception and beliefs/preferences about risk management, practical and logistical barriers, and provider-level barriers. Nuances to these barriers are discussed, particularly as they relate to the specific type of sex work participants were engaged in. Implications for interventions are also discussed. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Surgers L.; Chiarabini T.; Royer G.; Rougier H.; Mercier-Darty M.; Decr D.; Valin N.; Woerther P.-L.; Decousser J.-W.; Girard P.-M.; Lacombe K.; Boyd A.	Evidence of Sexual Transmission of Extended-Spectrum β-Lactamase-Producing Enterobacterales: A Cross-sectional and Prospective Study	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciac218	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138359161&doi=10.1093%2fcid%2fciac218&partnerID=40&md5=2124f2206b2065c1cd331cdaec840dbe	Background: Extended-spectrum β-lactamase-producing Enterobacterales (ESBL-E) represent a major threat to public health. Little is known on their potential for sexual transmission. Methods: We recruited individuals at a sexually transmitted infection and human immunodeficiency virus (HIV) outpatient clinic in Paris, France, in whom we evaluated the prevalence of ESBL-E intestinal carriage and, among those testing positive, the proportion with clearance 6 months thereafter. We compared carriage prevalence between groups using logistic regression adjusted for age, geographic origin, travel outside Europe, and antibiotic use in the past 6 months. Results: A total of 2157 individuals participated, of whom 226 (10.5%) were ESBL-E carriers. The proportions of ESBL-E carriers varied across sexual groups and were as follows: HIV-negative men who have sex with men (MSM) and who were on preexposure prophylaxis (PrEP), 16.3% (41 of 251); HIV-negative MSM not on PrEP, 9.7% (47 of 487); HIV-positive MSM, 12.2% (61 of 500); HIV-negative men who have sex exclusively with women, 10.0% (44 of 439); and HIV-negative women who have sex with men, 6.9% (n = 33 of 480). After adjustment, ESBL-E prevalence was significantly higher in HIV-negative MSM on PrEP (P < .001) and HIV-positive MSM (P = .01) than in women who have sex with men. A higher number of sexual partners in the past 6 months was associated with ESBL-E carriage after adjustment (P = .004). Escherichia coli sequence type 14 and blaSHV-12-producing ESBL-E were observed only in MSM. Of 102 individuals with ESBL-E returning for testing, 26 (25%) had carriage at 6 months. Conclusion: ESBL-E carriage is more frequent in MSM undergoing PrEP or living with HIV and with increasing number of sexual partners. More research is warranted to understand the consequences of ESBL-E carriage in these populations and how transmission can be reduced. © 2022 The Author(s). Article	2022	Surratt H.L.; Yeager H.J.; Adu A.; González E.A.; Nelson E.O.; Walker T.	Pre-Exposure Prophylaxis Barriers, Facilitators and Unmet Need Among Rural People Who Inject Drugs: A Qualitative Examination of Syringe Service Program Client Perspectives	Frontiers in Psychiatry	-	-	-	16640640	10.3389/fpsyt.2022.905314	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132311349&doi=10.3389%2ffpsyt.2022.905314&partnerID=40&md5=82d22a9687462df932fa35989630e66d	Background: People who inject drugs (PWID) are at high risk for HIV infection, yet in rural areas PWID are understudied with respect to prevention strategies. Kentucky is notable for heavy rural HIV burden and increasing rates of new HIV diagnoses attributable to injection drug use. Despite high need and the strong evidence for Pre-Exposure Prophylaxis (PrEP) as a gold-standard biomedical HIV prevention tool, scale up has been limited among PWID in Kentucky and elsewhere. This paper explores individual, environmental, and structural barriers and facilitators of PrEP care from the perspective of PWID in rural Kentucky. Methods: Data are drawn from an ongoing NIH-funded study designed to adapt and integrate a PrEP initiation intervention for high-risk PWID at point of care in two rural syringe service programs (SSPs) in southeastern Kentucky. As part of this initiative, a qualitative study guided by PRISM (Practical, Robust, Implementation, and Sustainability Model) was undertaken to gather SSP client perspectives on intervention needs related to PrEP, competing needs related to substance use disorder, as well as tangible supports for and barriers to PrEP uptake. Recruitment and interviews were conducted during September-November 2021 with 26 SSP clients, 13 from each of the two SSP sites. A semi-structured guide explored injection behaviors, SSP use, knowledge of PrEP, perceived barriers to PrEP, as well as aspects of the risk environment (e.g., housing instability, community stigma) that may impact PrEP uptake. Interviews were digitally recorded, transcribed verbatim and verified by project staff. A detailed coding scheme was developed and applied by independent coders using NVivo. Coded transcripts were synthesized to identify salient themes in the data using the principles of thematic analysis All study procedures were approved by the University IRB. Results: Participants were 96% white, 42% female, with a median age of 41 years (range 21–62); all reported injection use within the past month. Overall, we found low PrEP awareness among this sample, yet interest in PrEP was high, with several indicating PrEP is urgently needed. Clients reported overwhelmingly positive experiences at the SSPs, considering them trusted and safe locations to receive health services, and were enthusiastic about the integration of co-located PrEP services. Lack of basic HIV and PrEP knowledge and health literacy were in evidence, which contributed to common misperceptions about personal risk for HIV. Situational risks related to substance use disorder, particularly in the context of withdrawal symptoms and craving, often lead to heightened HIV injection and sexual risk behaviors. Stigma related to substance use and HIV arose as a concern for PrEP uptake, with several participants reflecting that privacy issues would impact their preferences for education, prescribing and monitoring of PrEP. Noted tangible barriers included inconsistent access to phone service and transportation. Primary supports included high levels of insurance coverage, consistent pharmacy access, and histories with successful medication management for other health conditions. Conclusions: Drawing on the critical perspectives of people with substance use disorder, our findings provide important and actionable information on individual and environmental barriers and facilitators of PrEP uptake among rural PWID at high risk for HIV infection. These data will drive the adaptation and implementation of a client-centered approach to integrated PrEP care within rurally located SSP settings to address unmet needs for PrEP care. Theses and Dissertations	2022	Surreira, Ana João Rafael	Profilaxia Pré-Exposição da Infeção pelo VIH e Infeções sexualmente transmissíveis - a experiência de um centro Português	-	-	Universidade do Porto	-	NA	NA	https://repositorio-aberto.up.pt/handle/10216/142271	Background: Human immunodeficiency virus (HIV) Pre-exposure prophylaxis (PrEP) is indicated for individuals at increased risk of acquiring this infection. Since the introduction of this measure, several studies have reported a decrease in condom use and an increase in other sexually transmitted infections (STIs) among PrEP users. This study aims to characterize, socio-demographically and clinically, the population followed at the PrEP appointment and to estimate the incidence of STIs after starting PrEP. Methods: Retrospective cohort study of individuals evaluated at the PrEP appointment Infectious Diseases Service of Centro Hospitalar Universitário de São João, between May 2018 and September 2021. Follow-up involved regular testing for HIV, hepatitis C virus, Treponema pallidum, Neisseria gonorrhoea and Chlamydia trachomatis. Results: 296 subjects were included, with a mean age of 32 years (standard deviation 9 years), of which 256 were men (86,5%). Two hundred and fifty-one (84,8%) were men who have sex with men and 41 (13,9%) were sex workers. The prevalence of STIs diagnosed in the first evaluation was 34,4%, with anal infection by Chlamydia trachomatis being the most prevalent (27,7%). Two hundred and twenty-four individuals (75,6%) started PrEP, with a median follow-up of 9 months (interquartile range 13,5 months). The incidence of STIs was 74,3 / 100 person-years (95% CI, 66,4 - 86,4). Infections caused by Chlamydia trachomatis were the most incident 25,7 / 100 people - year (95% CI, 19,5 - 33,1). Conclusion: The prevalence of STIs in this population is very high. The PrEP appointment allows an active screening for STIs, with a special impact on the diagnosis of asymptomatic individuals and on the research of extragenital infections. The identification of individuals at risk and their appropriate referral, as well as the reinforcement of health education strategies throughout the follow-up are crucial and should be reinforced in higher risk subgroups. Article	2022	Sutton, KC; De Vente, J; Leblanc, R; Dejesus, E; Smith, G; Mills, A; Baril, J-G; St Clair, M; Stancil, BS; Vandermeulen, K; Spreen, WR	Long-Term Efficacy, Safety, and Durability of Cabotegravir and Rilpivirine as 2-Drug Oral Maintenance Therapy after 6 Years of Study	Open Forum Infectious Diseases	-	-	-	NA	10.1093/ofid/ofac067	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02394981/full	Background: In the LATTE study, daily oral cabotegravir + rilpivirine demonstrated higher rates of efficacy than efavirenz + 2 nucleoside reverse-transcriptase inhibitors (NRTIs) through Week 96 in antiretroviral therapy (ART)-naive adults with human immunodeficiency virus (HIV)-1. We present the results from 6 years of continued treatment with oral cabotegravir + rilpivirine. Methods: LATTE was a phase IIb, randomized, multicenter, partially blinded, dose-ranging study in ART-naive adults with HIV-1. After a 24-week induction phase with cabotegravir + 2 NRTIs, participants with HIV-1 ribonucleic acid (RNA) <50 copies/mL were randomized to receive cabotegravir (10, 30, or 60 mg) + rilpivirine (25 mg) in the maintenance phase through Week 96 and switched to cabotegravir 30 mg + rilpivirine 25 mg in the open-label phase through Week 312. Results: Of 160 participants who entered the maintenance phase, 111 completed the study at Week 312. At Week 312, 105 (66%) participants maintained HIV-1 RNA <50 copies/mL, 15 (9%) had HIV-1 RNA ≥50 copies/mL, and 40 (25%) had no virologic data. Eight participants met protocol-defined virologic failure criteria through Week 312, 2 of whom met protocol-defined virologic failure criteria after Week 144. Six participants developed treatment-emergent resistance to 1 or both agents during the study, 3 of whom developed integrase inhibitor resistance substitutions. Two participants (1%) reported drug-related serious adverse events. Few adverse events led to withdrawal during the open-label phase (n=5, 3%). Conclusions: Oral cabotegravir + rilpivirine demonstrated efficacy in the majority of participants and an acceptable safety profile through 6 years of treatment, demonstrating its durability as maintenance therapy for HIV-1.	*antiretroviral therapy; *drug efficacy; *drug safety; *maintenance therapy; Adult; Appendicitis /side effect; Article; Backache /side effect; Body weight loss; Bronchitis /side effect; Burkitt lymphoma /side effect; Cellulitis /side effect; Clinical trial; Controlled study; Depression /side effect; Diarrhea /side effect; Disease exacerbation; Drug withdrawal; Electrocardiography; Fatigue /side effect; Flow cytometry; Follow up; Gastrointestinal hemorrhage /side effect; Genotyping; Headache /side effect; Human; Human experiment; Human immunodeficiency virus infection /drug therapy; Irritable colon /side effect; Liver function test; Male; Multicenter study; Nausea /side effect; Phase 2 clinical trial; Phenotype; Pneumonia /side effect; Randomized controlled trial; Suicidal ideation /side effect; Thorax pain /side effect; Upper respiratory tract infection /side effect	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Szetela, B; Cielniak, I; Kubicka, J; Rojewski, T; Katafias, A; Jakubowski, P; Hlebowicz, M; Sitko, M; Loster, J; Jablonowska, O; Cybula, A; Aksak-Was, B; Gierlotka, K; Bociaga-Jasik, M; Parczewski, M; Szymanski, R; Bludzin, W; Grzeszczuk, A; Niemczyk, W; Giniewicz, K; Rosinska, M; Gasiorowski, J	Pre-exposure prophylaxis (PrEP) in Poland 2017 to 2021: lessons from a country with no national PrEP programme	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.26009	https://ppm.pum.edu.pl/info/article/PUMdc87c751af8842d586d82615aace781c/	Background: PrEP has been the mainstay of HIV prophylaxis in key populations, especially among MSM [1-3]. Nonetheless, there are still countries with no national PrEP programmes leaving many individuals at risk of infection. As medical professionals from Polish AIDS Scientific Society we decided to develop PrEP guidelines in 2015 [1] to help create PrEP clinics in Poland. Generic TDF/FTC was available at a cost of 28 Euros/30 tablets. Materials and methods: Questionnaires among medical professionals during an annual HIV conference in Poland were taken to ascertain attitudes and readiness to provide PrEP care. PrEP.edu.pl webpage was created as information exchange point for the whole country. Seventeen dedicated PrEP clinics were systematically created in largest cities. PrEP evaluation was based on actual prescriptions from Central E-Health Systems, wholesale volume to pharmacies and data from PrEP clinics. HIV prevalence and incidence among MSM in Poland were calculated based on VCT data, national reports for 2017 to 2021 [4]. Results: There was a steady increase in PrEP patients with around 1000 new patients every year (smaller increase only in 2020) leading to over 4400 PrEP users at the end of 2021 (Table 1). Most of the clinics were private with no reimbursement of medical care, testing or medication. There were 15 HIV infections during 7898 PY of follow-up giving incidence of 0.19/100PY. Based on HIV incidence of 3.8/100PY among MSM at testing sites in Poland the relative risk reduction in our cohort was 95% and NNT 27 (almost equal cost of PrEP compared to cART). With 1200 annual new HIV infections among MSM in Poland we require 32,400 MSM on PrEP to prevent them. There was no change in HIV prevalence or incidence on national level during observation period. Conclusions: Despite no financial support from the Health Ministry and no reimbursement, almost 5000 patients received access to PrEP and STI care. The programme was highly efficacious with incidence similar to other PrEP projects with highly adherent and dedicated patients [5-10]. Improvement in access is urgently needed, new clinics have to be set up also outside of large cities and universal reimbursement of medical care and medication implemented to see actual reduction in HIV incidence. Article	2022	Tabatabavakili S.; Aleyadeh W.; Cerrocchi O.; Janssen H.L.A.; Hansen B.E.; Bogoch I.I.; Feld J.J.	Incidence of Hepatitis C Virus Infections Among Users of Human Immunodeficiency Virus Pre-exposure Prophylaxis	Clinical Gastroenterology and Hepatology	-	-	-	15423565	10.1016/j.cgh.2021.03.006	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105264182&doi=10.1016%2fj.cgh.2021.03.006&partnerID=40&md5=6bd49ab54e04557909fc0ede98280bf3	Background & Aims: Sexual transmission of hepatitis C virus (HCV) is well documented among human immunodeficiency virus (HIV)-uninfected individuals. The use of HIV pre-exposure prophylaxis (PrEP) may be associated with engagement in activities that facilitate the transmission of sexually transmitted infections (STIs) and possibly HCV among PrEP users. Methods: Between 2012 and 2019, the incidence of HCV and bacterial STIs were calculated among HIV-negative individuals receiving PrEP at the University Health Network HIV Prevention Clinic. Mucosal, anal, and blood samples were taken to test for HIV, syphilis, and anti-HCV antibodies. Results: Among 344 HIV-uninfected patients receiving PrEP, 86% were men having sex with men (MSM). Five individuals were HCV-antibody positive at the time of PrEP initiation. Serologic and virologic follow-up data were available for 109 HCV-negative individuals over 282 patient-years (PY). Two new infections were recorded, yielding an incidence of primary HCV infection of 0.7 per 100 PY. In contrast with HCV, the incidence rates of chlamydia, gonorrhea, and syphilis were 49.2 per 100 PY, 36.3 per 100 PY, and 5.2 per 100 PY, respectively. Both individuals with new HCV diagnoses reported being MSM with a history of unprotected intercourse and 1 individual also reported recreational drug use. Both individuals were asymptomatic at the time of diagnosis and the infections were detected by routine laboratory monitoring. Conclusions: The low incidence of HCV infections despite significantly higher rates of other STIs suggests that sexual transmission of HCV is uncommon in HIV-negative MSM PrEP users in this community. Performing routine risk-based HCV surveillance among PrEP users should be evaluated. The high incidence of STIs in this population indicates a vital role for periodic STI monitoring in those receiving PrEP. © 2022 AGA Institute	Hepatitis C; Human Immunodeficiency Virus; Incidence; Pre-exposure Prophylaxis	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Quantitative
Article	2022	Tagliaferri Rael C.; Giguere R.; Sutton S.; Horn E.; Schieffer R.J.; Greene G.J.; D'Aquila R.; Bryndza Tfaily E.; Kiser P.F.; Hope T.J.	Preferences among Physicians and Men Who Have Sex with Men (MSM) for a Long-Acting, Removable Implant for HIV Prevention: A Discrete Choice Study	AIDS Research and Human Retroviruses	-	-	-	8892229	10.1089/aid.2022.0035	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144584388&doi=10.1089%2faid.2022.0035&partnerID=40&md5=371e61b55a3a322fe781653302fab33b	A longer acting, removable implant for HIV prevention has the potential to improve uptake of HIV pre-exposure prophylaxis (PrEP) by removing the need for daily adherence to an oral tablet, reducing potential side effects, and eliminating concerns about residual drug following injections. To end the HIV epidemic, we must understand the needs and preferences of groups most affected by HIV (e.g., men who have sex with men; MSM), and the physicians who prescribe PrEP to them. This article describes a discrete choice experiment to estimate the preference share for the implant within a competitive context of other PrEP products (including the oral tablet, dissolvable implant, and injection) and evaluate the impact of potential implant attributes. Physicians who had prescribed oral PrEP (n = 75) and MSM at risk for HIV (n = 175) completed a web-based survey that prompted decision-making about PrEP product preferences. The findings from both physicians and MSM demonstrated that the removable implant could capture a meaningful portion of the preference share, making it feasible to advance in the development pipeline as an important addition to the biomedical HIV prevention toolkit. Among MSM, specifically, the cost of treatment was the most important attribute impacting product preference. Our findings inform implant developers and future payers (e.g., commercial manufacturers, insurance companies) about specific device attributes that will likely affect MSM's willingness to use and physicians' willingness to prescribe this HIV prevention strategy. © Copyright 2022, Mary Ann Liebert, Inc., publishers 2022.	discrete choice model; HIV prevention; MSM; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Tailor, Janki; Rodrigues, Jessica; Meade, John; Segal, Kate; Benjamin Mwakyosi, Lilian	Correlations between oral Pre-Exposure Prophylaxis (PrEP) initiations and policies that enable the use of PrEP to address HIV globally.	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0001202	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10021197	Policies facilitating access to HIV prevention services, specifically for pre-exposure prophylaxis (PrEP), can foster enabling environments for service uptake. This analysis aims to establish whether policies enabling broad PrEP eligibility, HIV self-testing, and lowered age of consent to HIV testing and treatment services are correlated with PrEP uptake. Ages of consent vary by country, therefore this analysis focused on how age of consent policies, in general, affect adolescent PrEP uptake. Data was collected from the HIV Policy Lab and AVAC's Global PrEP Tracker, a database of approximately 334 PrEP projects operating across 95 countries, and linear regression and correlation analyses were conducted via STATA to examine relationships amongst national oral PrEP eligibility, HIV self-testing, lowered age of consent, and national cumulative oral PrEP initiations, as of December 2021. Of all 194 countries tracked by the HIV Policy Lab, only about 7% have adopted all three policies (HIV self-testing, lowered age of consent, and PrEP eligibility policies). Less than 50% have adopted have adopted at least one of these policies. Of the 54 countries that have fully adopted PrEP eligibility policies, less than 30% have co-adopted HIV self-testing or lowered age of consent policies. About 30% of these 194 countries have yet to adopt any of these policies, of which about 14% have indicated information is "unavailable" for at least one of the policies. Analyses conducted for the 91 countries tracked by both the HIV Policy Lab and the Global PrEP Tracker revealed a significant and positive relationship between cumulative individuals initiated on oral PrEP and adoption of HIV self-testing policies (p = 0.01, r = 0.26), lowered age of consent policies (p = 0.01, r = 0.25), and PrEP eligibility policies (p = 0.01, r = 0.26). Stronger advocacy efforts towards approving public health policies, such as those outlined in our analysis, that enshrine and enable access to HIV prevention are necessary. Article	2022	Tanner, Mary R; Iqbal, Kashif; Dominguez, Kenneth L; Zhu, Weiming; Obi, Jane; Hoover, Karen W	Key Factors for Successful Implementation of HIV Prevention Services by THRIVE Community Collaboratives.	Public Health Reports	-	-	-	1468-2877	10.1177/00333549211005793	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8900238	OBJECTIVE: The Targeted Highly Effective Interventions to Reverse the HIV Epidemic (THRIVE) demonstration project created collaboratives of health departments, community-based organizations, and clinical partners to improve HIV prevention services for men who have sex with men (MSM) and transgender women (TGW) of color. We administered an online survey from September 2018 through February 2019 to assess the collaboratives. METHODS: We used a Likert scale to measure agreement on collaborative characteristics. We used Fisher exact tests to compare success ratings by health department employment and funding status. We created a radar chart to compare the percentage agreement on key characteristics of the most and least successful collaboratives. We used a general inductive approach in the qualitative analysis of open-ended question responses. RESULTS: Of 262 survey recipients, 133 responded (51%); 49 (37%) respondents were from health departments. Most respondents (≥70%) agreed that their collaborative is diverse, cooperates, meets regularly, has realistic goals, has effective leadership, and has effective communication. Most respondents (87%) rated their collaborative as successful in implementing HIV prevention services for MSM and TGW of color. Comparison of the most and least successful collaborative found the greatest difference in respondent agreement in the presence of effective leadership, communication, and adequate resources. The most commonly cited challenge in the open-ended questions was inadequate resources. The most commonly cited success was increased provision of services, particularly preexposure prophylaxis. CONCLUSIONS: Community collaboratives were considered successful by most collaborative members and may be an effective part of HIV prevention strategies. Article	2022	Tapsoba, Jean de Dieu; Cover, Jane; Obong'o, Christopher; Brady, Martha; Cressey, Tim R; Mori, Kira; Okomo, Gordon; Kariithi, Edward; Obanda, Rael; Oluoch-Madiang, Daniel; Chen, Ying Qing; Drain, Paul; Duerr, Ann	Continued attendance in a PrEP program despite low adherence and non-protective drug levels among adolescent girls and young women in Kenya: Results from a prospective cohort study.	PLOS Medicine	-	-	-	1549-1676	10.1371/journal.pmed.1004097	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9521917	BACKGROUND: In sub-Saharan Africa (SSA), adolescent girls and young women (AGYW) ages 15 to 24 years represent <10% of the population yet account for 1 in 5 new HIV infections. Although oral pre-exposure prophylaxis (PrEP) with tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) can be highly effective, low persistence in PrEP programs and poor adherence have limited its ability to reduce HIV incidence among women. METHODS AND FINDINGS: A total of 336 AGYW participating in the PEPFAR-funded DREAMS PrEP program in western Kenya were enrolled into a study of PrEP use conducted between 6/2019 to 1/2020. AGYW, who used daily oral TDF/FTC, completed interviews and provided dried blood spots (DBS) for measurement of tenofovir-diphosphate (TFV-DP) concentrations at enrollment and 3 months later, and 176/302 (58.3%, 95% confidence interval 95% CI 52.3 to 63.8) met our definition of PrEP persistence: having expressed intention to use PrEP and attended both the second interview and an interim refill visit. Among AGYW with DBS taken at the second interview, only 9/197 (4.6%, 95% CI 1.6 to 7.5) had protective TFV-DP levels (≥700 fmol/punch) and 163/197 (82.7%, 95% CI 77.5 to 88) had levels consistent with no recent PrEP use (<10 fmol/punch). Perception of being at moderate-to-high risk for HIV if not taking PrEP was associated with persistence (adjusted odds ratio, 10.17 95% CI 5.14 to 20.13, p < 0.001) in a model accounting for county of residence and variables that had p-value <0.1 in unadjusted analysis (age, being in school, initiated PrEP 2 to 3 months before the first interview, still active in DREAMS, having children, having multiple sex partners, partner aware of PrEP use, partner very supportive of PrEP use, partner has other partners, AGYW believes that a partner puts her at risk, male condom use, injectable contraceptive use, and implant contraceptive use). Among AGYW who reported continuing PrEP, >90% indicated they were using PrEP to prevent HIV, although almost all had non-protective TFV-DP levels. Limitations included short study duration and inclusion of only DREAMS participants. CONCLUSIONS: Many AGYW persisted in the PrEP program without taking PrEP frequently enough to receive benefit. Notably, AGYW who persisted had a higher self-perceived risk of HIV infection. These AGYW may be optimal candidates for long-acting PrEP. Article	2022	Tassiopoulos K.; Travers R.; Cameron R.; Coulombe S.; Davis C.E.; Wilson C.L.; Woodford M.R.; Coleman T.	Knowledge of viral load, PrEP, and HIV-related sexual risk among men who have sex with men in the Waterloo region	Canadian Journal of Human Sexuality	-	-	-	11884517	10.3138/cjhs.2021-0054	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85145440851&doi=10.3138%2fcjhs.2021-0054&partnerID=40&md5=4a65bcfce4f930f26795b13c34b5833e	Gay, bisexual, and other men who have sex with men (GBMSM) remain most disproportionately affected by HIV in Canada. HIV-related sexual risk behaviours have been linked to high HIV risk among GBMSM, but prior research has not focused on knowledge of viral load, and the risk it presents for HIV acquisition. The purpose of this study was to explore the relationship between HIV-related sexual risk behaviour and knowledge of viral load among GBMSM. A cross-sectional survey was conducted using a convenience sample of individuals age 16 and older who self-identified as LGBTQ and lived, worked, or resided in the Waterloo region, an urban-rural area in southwestern Ontario (N = 526). Responses were analyzed from those identifying as GBMSM (N = 269). Logistic regression models were created to explore sociodemographic, outness, social support, and HIV-related sexual risk variables associated with knowledge of viral load. Multivariable regression models were built to explore the same associations while controlling for confounders. HIV risk was not associated with knowledge of viral load in bivariate or multivariable analyses. Point estimates for low/ negligible (odds ratio OR 1.10; 95% CI 0.46–2.51) and high risk (OR 1.88; 95% CI 0.68–5.20) suggest trends of higher knowledge with increased HIV risk. Men who engage in sexual risk behaviour may have increased sexual health literacy and awareness of biomedical interventions (e.g., pre-exposure prophylaxis, or PrEP) that reduce HIV risk. Policies are needed that promote acceptance of sexual orientation, improve awareness and access to PrEP, and ensure optimal delivery of HIV education to at-risk groups prior to engagement in higher risk activities. © Sex Information and Education Council of Canada, 2022. Article	2022	Teitelman A.M.; Tieu H.-V.; Flores D.; Bannon J.; Brawner B.M.; Davis A.; Gugerty P.; Koblin B.	Individual, social and structural factors influencing PrEP uptake among cisgender women: a theory-informed elicitation study	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.1894319	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102534978&doi=10.1080%2f09540121.2021.1894319&partnerID=40&md5=f27d8502b6492e874799df5be3dded5d	The underutilization of pre-exposure prophylaxis (PrEP) among cisgender women in the U.S. limits this population's ability to reduce their risk for HIV infection, especially within the unique individual, social and structural systems they navigate. There is a need to identify the relevant multi-level barriers and facilitators to PrEP use among cisgender women to inform theory-guided efforts that address HIV disparities by race/ethnicity among cisgender women. Guided by the Integrated Behavioral Model and the Behavioral Model of Vulnerable Populations we conducted 41 interviews with PrEP eligible cisgender women in New York City and Philadelphia. Directed content analysis identified 11 modal behavioral beliefs crucial to PrEP uptake, including anticipated negative social consequences, 5 normative beliefs centered on available social supports, and 9 control beliefs such as anticipated barriers such as cost. Awareness and knowledge of PrEP as a biobehavioral HIV prevention method is limited for this sample. Through conventional content analysis we identified interpersonal and structural barriers to PrEP uptake including lack of partner support, transportation, mental health challenges, and challenges in accessing PrEP care. Potential solutions to structural barriers were enumerated along with implications for future intervention work and public health programming. © 2021 Informa UK Limited, trading as Taylor & Francis Group.	cisgender women; HIV prevention; PrEP; qualitative research; risk reduction	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Tekko, IA; Vora, LK; Volpe-Zanutto, F; Moffatt, K; Jarrahian, C; McCarthy, HO; Donnelly, RF	Novel Bilayer Microarray Patch-Assisted Long-Acting Micro-Depot Cabotegravir Intradermal Delivery for HIV Pre-Exposure Prophylaxis	Advanced Functional Materials	-	-	-	1616-301X	10.1002/adfm.202106999	https://onlinelibrary.wiley.com/doi/full/10.1002/adfm.202106999	Injectable long-acting cabotegravir (CAB LA) is effective and safe for pre-exposure HIV prophylaxis. It is recently approved for clinical use in those at high risk of contracting HIV. However, injections are invasive and access to trained healthcare personnel to administer CAB LA can be limited, especially in low-income countries (LICs). Herein, for the first time, the development of a bilayer microarray patch (MAP) with unique design and novel formulation as a potential alternative self-administered intradermal delivery system for CAB is reported. The novel MAP has a high drug load (approximate to 3 mg/0.5 cm(2) of CAB LA or its micronized sodium salt) and fast-dissolving tips (<30 min) and shows good mechanical properties and skin insertion capabilities. Importantly, in preclinical in vivo studies using Sprague Dawley rats, this MAP is able to implant the drug-loaded tips in the skin, forming micro-depots. Both drug forms are then released in a sustained manner, maintaining human therapeutic levels in the rats for one month after a single application. Weekly repeated MAP dosing in the rats showed the MAPs to be reproducible and well-tolerated. This bilayer MAP presents a promising minimally-invasive, self-administered, alternative delivery system for CAB for enhanced HIV prevention, especially in LICs. Article	2022	Teleshova N.; Keller M.J.; Romero J.A.F.; Friedland B.A.; Creasy G.W.; Plagianos M.G.; Ray L.; Barnable P.; Kizima L.; Rodriguez A.; Cornejal N.; Melo C.; Rodriguez G.C.; Mukhopadhyay S.; Calenda G.; Sinkar S.U.; Bonnaire T.; Wesenberg A.; Zhang S.; Kleinbeck K.; Palmer K.; Alami M.; O'Keefe B.R.; Gillevet P.; Hur H.; Liang Y.; Santone G.; Fichorova R.N.; Kalir T.; Zydowsky T.M.	Results of a phase 1, randomized, placebocontrolled first-in-human trial of griffithsin formulated in a carrageenan vaginal gel	PLOS One	-	-	-	19326203	10.1371/journal.pone.0261775	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123297350&doi=10.1371%2fjournal.pone.0261775&partnerID=40&md5=ec1e083e6354458be5a734bc000fb819	HIV pre-exposure prophylaxis (PrEP) is dominated by clinical therapeutic antiretroviral (ARV) drugs. Griffithsin (GRFT) is a non-ARV lectin with potent anti-HIV activity. GRFT's preclinical safety, lack of systemic absorption after vaginal administration in animal studies, and lack of cross-resistance with existing ARV drugs prompted its development for topical HIV PrEP. We investigated safety, pharmacokinetics (PK), pharmacodynamics (PD), and immunogenicity of PC-6500 (0.1% GRFT in a carrageenan (CG) gel) in healthy women after vaginal administration. This randomized, placebo-controlled, parallel group, double-blind first-in-human phase 1 study enrolled healthy, HIV-negative, non-pregnant women aged 24-45 years. In the open label period, all participants (n = 7) received single dose of PC- 6500. In the randomized period, participants (n = 13) were instructed to self-administer 14 doses of PC-6500 or its matching CG placebo (PC-535) once daily for 14 days. The primary outcomes were safety and PK after single dose, and then after 14 days of dosing. Exploratory outcomes were GRFT concentrations in cervicovaginal fluids, PD, inflammatory mediators and gene expression in ectocervical biopsies. This trial is registered with ClinicalTrials. gov, number NCT02875119. No significant adverse events were recorded in clinical or laboratory results or histopathological evaluations in cervicovaginal mucosa, and no anti-drug (GRFT) antibodies were detected in serum. No cervicovaginal proinflammatory responses and no changes in the ectocervical transcriptome were elicited. Decreased levels of proinflammatory chemokines (CXCL8, CCL5 and CCL20) were observed. GRFT was not detected in plasma. GRFT and GRFT/CG in cervicovaginal lavage samples inhibited HIV and HPV, respectively, in vitro in a dose-dependent fashion. These data suggest GRFT formulated in a CG gel is a safe and promising on-demand multipurpose prevention technology product that warrants further investigation. © 2022 Teleshova et al. Article	2022	ten Brink D.C.; Martin-Hughes R.; Minnery M.E.; Osborne A.J.; Schmidt H.-M.A.; Dalal S.; Green K.E.; Ramaurtarsing R.; Wilson D.P.; Kelly S.L.	Cost-effectiveness and impact of preexposure prophylaxis to prevent HIV among men who have sex with men in Asia: A modelling study	PLOS One	-	-	-	19326203	10.1371/journal.pone.0268240	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130782764&doi=10.1371%2fjournal.pone.0268240&partnerID=40&md5=6f48ace78bf4d3b809f6f3bcc363d432	Introduction More than 70% of new HIV infections in Asia occurred in eight countries in 2020: Cambodia, China, India, Indonesia, Myanmar, Nepal, Thailand, and Vietnam—with a rising incidence among men who have sex with men (MSM). The World Health Organization (WHO) recommends pre-exposure prophylaxis (PrEP) for those at risk of acquiring HIV, yet wide-scale implementation of PrEP, on a daily or event-driven basis, has been limited in Asia. Methods The Optima HIV model was applied to examine the impact of scaling-up PrEP over five-years to cover an additional 15% of MSM compared with baseline coverage, a target deemed feasible by regional experts. Based on behavioral survey data, we assume that covering 15% of higher-risk MSM will cover 30% of all sexual acts in this group. Scenarios to compare the impact of generic-brand daily dosing of PrEP with generic event-driven dosing (15 days a month) were modelled from the start of 2022 to the end of 2026. Cost-effectiveness of generic versus branded PrEP was also assessed for China, the only country with an active patent for branded, higher cost PrEP. The impact on new HIV infections among the entire population and cost per HIV-related disability-adjusted life year (DALY) averted were estimated from the beginning of 2022 to the end of 2031 and from 2022 to 2051. Results If PrEP were scaled-up to cover an additional 15% of MSM engaging in higher-risk behavior from the beginning of 2022 to the end of 2026 in the eight Asian countries considered, an additional 100,000 (66,000–130,000) HIV infections (17%) and 300,000 (198,000–390,000) HIV-related DALYs (3%) could be averted over the 2022 to 2031 period. The estimated cost per HIV-related DALY averted from 2022 to 2031 ranged from US$600 for event-driven generic PrEP in Indonesia to US$34,400 for daily branded PrEP in Thailand. Over a longer timeframe from 2022 to 2051, the cost per HIV-related DALY averted could be reduced to US$100–US$12,700. Conclusion PrEP is a critical tool to further reduce HIV incidence in highly concentrated epidemics. Implementing PrEP in Asia may be cost-effective in settings with increasing HIV prevalence among MSM and if PrEP drug costs can be reduced, PrEP could be more cost-effective over longer timeframes. Article	2022	Tesoriero J.M.; Yuan Y.; Newport R.; O'Grady T.; Cotroneo R.; Stevens L.; Grisham T.; Seo S.; Gonzalez C.	Assessing the Impact of a PrEP Aware Week Campaign on PrEP Prescription Fills in NYS	Journal of Public Health Management and Practice	-	-	-	10784659	10.1097/PHH.0000000000001554	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135202220&doi=10.1097%2fPHH.0000000000001554&partnerID=40&md5=fac497561657db1d59726016d1eab9b9	Context: The New York State (NYS) Department of Health AIDS Institute engaged stakeholders across NYS to participate in the state's first "PrEP Aware Week"(PAW). PAW sought to increase the knowledge, interest, and number of PrEP (pre-exposure prophylaxis) prescriptions filled across NYS. PAW activities were designed to be easy to implement, with minimal cost. Stakeholders were provided activities to implement, along with a social media tool kit featuring videos, graphic ads, and sample social media posts in English and Spanish to use as is or modify. PAW included more than 750 distinct events and activities undertaken by more than 250 participating providers. Objective: To assess the impact of PAW on PrEP prescription filling patterns in NYS. Design: An interrupted time-series analysis was conducted to estimate the impact of PAW on overall and new PrEP prescription filling patterns. Separate models were developed by sex (male, female), race and ethnicity (White non-Hispanic, Black non-Hispanic, Hispanic, other, unknown), and region (New York City, rest of NYS). Setting: PAW took place across NYS during the week beginning October 20, 2019. Participants: PAW was undertaken by more than 250 health care providers, nonmedical health & human services providers, local and state health department staff, and colleges and universities. Main Outcome Measures: The number of overall and new PrEP prescriptions. Results: PAW was associated with modest increases (6%-9%) in the number of PrEP prescription fills in NYS. The PAW impact lasted for about 2 months, generated an estimated 2727 additional PrEP prescription fills statewide, and was realized across sex, region, and racial and ethnic subgroups. Increased prescription fills were driven by those previously prescribed PrEP. Increases in new prescriptions were noted among Latinx individuals (21% increase, 55 additional prescriptions) but not overall or across other groups. Conclusion: NYS's PAW was effective at increasing PrEP prescription refills in NYS. Copyright © 2022 Wolters Kluwer Health, Inc. All rights reserved. Theses and Dissertations	2022	Tessema, Hanna; Hull, Shawnika J.	Understanding Individual & Product-Related Factors Influencing Diffusion of PrEP & PrEP + Contraception among Black Women Who Have Sex with Men	-	-	The George Washington University	-	NA	NA	https://scholarspace.library.gwu.edu/concern/gw_etds/g158bj11q	This dissertation research seeks to better understand the individual and product-related factors influencing Pre-Exposure Prophylaxis (PrEP) and bundled PrEP and contraception uptake intention among Black women who have sex with men. A key consideration in this research is partnership status and whether it influences decisions around PrEP uptake intent. Black women are often overlooked in HIV prevention efforts, especially regarding health messaging around PrEP as an HIV prevention tool. As a result, very little is known about the factors that influence their decisions around HIV prevention and the role of male partners. The first chapter (n = 1431) uses a reasoned action approach to investigate whether partnership status is a background variable predicting PrEP intention but being mediated by other psychosocial factors (attitudes, norms, and self-efficacy) or if it is a moderator influencing the strength and direction of the aforementioned psychosocial factors' effect on PrEP intent. The data were collected through a survey administered at Washington, DC-based sexual health clinics. The second chapter (n = 20) uses the diffusion of innovations theory to investigate the factors that may speed or slow the diffusion of an innovation combining PrEP and contraception among Black women. The data were collected through a series of phone interviews at a research, policy and education institute and its affiliated community health center specializing in LGBTQ and HIV care. While the mode of delivery and frequency of administration were identified as key factors influencing perceptions of the attributes of the innovation, partnership status and life stage were also key in decision making. This research contributes to the body of knowledge about Black women, their male partners and PrEP intention and the factors influencing decisions to try an innovation combining PrEP and contraception. Article	2022	Tester G.; Hoxmeier J.C.	A life course perspective and the qualitative examination of gay men's PrEP perceptions	Journal of Gay and Lesbian Social Services	-	-	-	10538720	10.1080/10538720.2021.2004481	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119327293&doi=10.1080%2f10538720.2021.2004481&partnerID=40&md5=a8963c14466ee0ab2771e998fa264926	Pre-exposure prophylaxis (PrEP) is an effective HIV prevention strategy, but uptake remains low and more research examining its social dimensions is needed. Studies suggest a life course perspective is useful for understanding gay men's PrEP perceptions. We extend this work by using interviews, focus groups, and key principles of the life course perspective, including those not used in the current research, to explore PrEP perceptions among 25 gay men of distinct generational cohorts who live in Seattle, Washington. Consistent with the life course perspective, participants gained PrEP knowledge, made sense of stigma, and developed perceptions through interactions with others in their social networks, including current and past friends, sexual and romantic partners, and community members of various ages and serostatuses. Additionally, participants comprehended PrEP by considering their own age-based HIV experiences and the experiences of gay men in different generations, highlighting how PrEP is shaped by HIV history and the experiences of multiple generations. The findings also indicate that, to communicate PrEP efficacy and increase uptake, it is important to create nuanced, and effective, messages, which consider positive and negative feelings about HIV and prevention, and emotionally laden behavior, knowledge, and beliefs. © 2021 Taylor & Francis Group, LLC.	gay men; HIV/AIDS; life course perspective; Pre-exposure prophylaxis (PrEP)	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

Article	2022	Thepthien B.-O.; Srivanichakorn S.; Udomsubpayakul U.; Sein Win Z.Z.K.; Zaw A.M.M.	HIV risk behavior and testing among MS M in Bangkok 2015–2019: a short report	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.2001418	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119339941&doi=10.1080%2f09540121.2021.2001418&partnerID=40&md5=9ccb0909ca0210594dd0ad8786782c42	Men who have sex with men (MSM) in Thailand have high HIV prevalence. This analysis used three years of data from the Behavioral Surveillance Survey (BSS) to examine the behaviors and biomedical interventions among MSM in Bangkok. Percent MSM with an HIV or STI test in the past 12 months decreased from 50.8% to 29.8%, and 42.2% to 33.0%, respectively. The frequency of HIV/STI testing was higher among those who had university-level education, as well as among those who reported higher AIDS knowledge, and had utilized prevention services. Additionally, awareness of PrEP peaked in 2017 (74.1%). The study found an increasing trend of men who had sex without a condom the last time they had anal sex with a man, and/or with multiple partners. Nearly two-thirds of the sample were reached by HIV prevention interventions. One-third had correct AIDS knowledge. These findings suggest that, after an increase of sex behavior risk, a decrease in PrEP awareness, and unknown HIV status, HIV prevalence among MSM in Bangkok may have begun to increase again. Intensified prevention interventions are urgently needed to reduce HIV behavioral risk for MSM since that is a major driver of the HIV epidemic in Thailand. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2022	Thomas B.; Piron P.; de La Rochebrochard E.; Segouin C.; Troude P.	Is HIV Pre-Exposure Prophylaxis among Men Who Have Sex with Men Effective in a Real-World Setting? Experience with One-On-One Counseling and Support in a Sexual Health Center in Paris, 2018–2020	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph192114295	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141554323&doi=10.3390%2fijerph192114295&partnerID=40&md5=f5bb4ed43c96105447b0977ca00a5910	HIV pre-exposure prophylaxis (PrEP) is highly effective but depends on patients' care engagement, which is often mediocre and poorly measured in real-world settings. This study aimed to assess the effectiveness of a PrEP program in a sexual health center that included accompanying measures to improve engagement. A retrospective observational study was conducted. All men who have sex with men (MSM) who initiated PrEP for the first time between 1 August 2018 and 30 June 2019 in the Fernand-Widal sexual health center, Paris, France, were included. Among the 125 MSM who initiated PrEP, the median age was 33 and most had only male partners. At initiation, 58% were considered at very high risk of HIV infection, mainly due to a history of post-exposure prophylaxis. During the first year, patients attended a median of three visits (Q1–Q3, 2–4). At 12 months, 96% (95% CI, 92.6 to 99.4) had a successful PrEP course, assessed by a novel metric. These results highlight the possibility of achieving a high PrEP success ratio among MSM in a real-world setting. The accompanying measures and one-on-one counseling by a trained counselor could explain the effectiveness of this PrEP program. © 2022 by the authors. Article	2022	Thomas D.; Mujugira A.; Ortblad K.; Namanda S.; Kibuuka J.; Nakitende M.; Nambi F.; Nakabugo L.; Scoville C.; Muwonge T.; Heffron R.	A pragmatic approach to identifying implementation barriers and facilitators for a novel pre-exposure prophylaxis (PrEP) delivery model at public facilities in urban Uganda	Implementation Science Communications	-	-	-	26622211	10.1186/s43058-022-00254-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136642010&doi=10.1186%2fs43058-022-00254-w&partnerID=40&md5=fbfaa73ef10477ae05fcca939490fb5e	Background: Scalable HIV pre-exposure prophylaxis (PrEP) delivery models for resource-limited settings are critical for improving PrEP coverage and interrupting HIV transmission. This research uses technical assistance (TA) reports to evaluate implementation barriers and facilitators for a novel delivery model integrating PrEP and antiretroviral therapy (ART) delivery for HIV sero-different couples in public health facilities in Kampala, Uganda. Methods: We used data from the Partners PrEP Program (PPP)—a stepped-wedge cluster randomized trial that is launching PrEP delivery through an integrated model of oral PrEP and antiretroviral therapy (ART) delivery for HIV sero-different couples at public health facilities in Kampala and Wakiso, Uganda (NCT03586128). Technical assistance teams, comprised of PPP program staff, conducted monthly TA visits to implementing facilities where they identified and addressed implementation challenges in collaboration with health facility staff. Findings were recorded in TA reports, a standardized form structured using the Consolidated Framework for Implementation Research (CFIR). We used a conceptual content analysis approach to evaluate TA reports completed from January to December 2019 and identify implementation barriers and facilitators. Results: Among 39 reports from the 8 implementing facilities (~ 5 per facility), we identified 11 CFIR constructs. Key implementation facilitators included sensitizing and educating facility staff about PrEP (knowledge and beliefs about the innovation); establishing formal and informal feedback and accountability mechanisms (reflecting and evaluating); and empowering facility staff to address implementation challenges (self-efficacy). Key implementation barriers were related to ineffective recruitment and referral of sero-different couples to and from nearby facilities (cosmopolitanism) as well as stockouts of laboratory resources and testing supplies (available resources). Conclusions: This analysis featured a robust implementation science framework to assess the relationship between early implementation determinants and outcomes of this innovative PrEP delivery model. Further, we have provided important descriptions of early implementation barriers and facilitators that will inform scale-up efforts for PrEP delivery within and beyond Uganda. Future work will refine the analysis of pragmatic program data, qualitatively investigate the identified key themes, and explore strategies for addressing implementation barriers. © 2022, The Author(s). Article	2022	Thompson, Kyle A; Blank, Gabriel; Toy, Junine; Moore, David M; Lachowsky, Nathan; Bacani, Nicanor; Zhang, Wendy; Sereda, Paul; Lima, Viviane D; Barrios, Rolando; Montaner, Julio S G; Hull, Mark W	Prevalence and incidence of hepatitis C infection amongst men who have sex with men in a population-based pre-exposure prophylaxis program in British Columbia, Canada.	Liver International	-	-	-	1478-3231	10.1111/liv.15237	https://dx.doi.org/10.1111/liv.15237	BACKGROUND: Men who have sex with men (MSM) are at risk for sexually-transmitted hepatitis C (HCV). Evidence for HCV infection in the context of pre-exposure prophylaxis (PrEP) use in North America is limited. We sought to characterize baseline HCV prevalence and incidence in MSM receiving PrEP in British Columbia (BC), Canada. METHODS: We followed individuals in the BC PrEP program from January 2018 to August 2019. We evaluated baseline prevalence and incident seroconversions (newly positive HCV antibody). A multivariable logistic regression model was performed in MSM for factors associated with HCV prevalence at enrollment, including reported prior sexually transmitted infection (STI), HIV Incidence Risk Index for MSM score, PrEP use because of a partner living with HIV, and location of residence. RESULTS: The median age of the cohort was 33 years, 98.3% male, with 3058 person years (PY) of follow-up. Baseline HCV prevalence was 0.82% (31/3907 MSM enrollees) and HCV incidence (n = 3) was 0.15 per 100 PY (95% confidence interval CI 0.03-0.45). In multivariable analysis, initiating PrEP because of a partner living with HIV (adjusted odds ratio aOR 5.02; 95% CI 1.87-13.47) and prior STI (aOR 2.34; 95% CI 1.04-5.24) were associated with baseline HCV status. CONCLUSIONS: Baseline HCV prevalence and incidence was low amongst MSM in a population-based PrEP program in BC, Canada. HCV was associated with bridging from populations living with HIV and evidence of a reported prior STI as a PrEP indicator condition amongst MSM. PrEP initiation may be an opportunity for linkage to HCV screening and treatment. Article	2022	Thongsri T.; Laopaiboonkan S.; Thanon N.; Thongthumnuchart V.; Yunta A.; Muthuma F.M.S.	Awareness of existence, knowledge, and acceptability of HIV pre-exposure prophylaxis (PrEP) among university students in Thailand	Journal of Applied Pharmaceutical Science	-	-	-	22313354	10.7324/JAPS.2022.121206	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144721504&doi=10.7324%2FJAPS.2022.121206&partnerID=40&md5=f59e6b7b4fcecb99195f021365752f84	Despite the fact that teenagers in South Thailand have higher rates of human immunodeficiency virus (HIV) infection, little is known about HIV pre-exposure prophylaxis (PrEP), which is considered one of the prevention strategies suggested to control HIV illness. PrEP is a once-daily pill that has been shown to be more than 90% effective in HIV prevention. This study aimed to meet the need for a better and more comprehensive understanding of the awareness, knowledge, and acceptability of PrEP among undergraduate students in Southern Thailand. A cross-sectional survey was conducted among 259 undergraduate students at Walailak University from December 2020 to March 2021. The convenient sampling technique method was used to select the participants. For data analysis, descriptive and inferential statistics were used. According to the study findings, the majority (81%) of the participants were female, and 31.68% of the participants were aged between 18 and 21 years. It was also discovered that 20.8% of the participants had heard of PrEP and that 39.8% were ready to accept the use of PrEP. Furthermore, nearly half of the participants were unable to determine who was eligible for PrEP, and only a small percentage of them were aware of the cost and how to use PrEP. The results of the current setting revealed that participants had a low level of awareness, knowledge, and acceptability of PrEP, despite a high level of intention to use it. Our findings also found that participants who were aware of the existence of PrEP were more likely to accept it than those who were not. Awareness campaigns and public education are required to increase PrEP acceptability in Thailand. © 2022 Tawaphon Thongsri et al. Article	2022	Thorpe S.; Hargons C.N.; Tanner A.E.; Stevens-Watkins D.	Perceived HIV Invulnerability and PrEP Knowledge and Attitudes among Black Sexual Minority Women	American Journal of Sexuality Education	-	-	-	15546128	10.1080/15546128.2022.2035291	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125770495&doi=10.1080%2f15546128.2022.2035291&partnerID=40&md5=24ef7865cfbb7746307ea9372e902ca8bd	Black women have disproportionate rates of HIV compared to women of all other racial groups. The purpose of this analysis was to investigate perceived HIV risk, HIV and sexually transmitted infection (STI) testing behaviors, and pre-exposure prophylaxis (PrEP) knowledge and attitudes among Black sexual minority women (SMW) and examine differences based on the history of male sex partners. Secondary data analysis was conducted using data from the Generations Study. This analysis used a sample of N = 169 participants who identified as Black cisgender women. Results showed Black SMW with a history of male sex partners reported a higher perceived risk of contracting HIV and significantly more frequent HIV and STI testing than those without a history of male sex partners. Overall, most of the sample was not familiar with PrEP, but once-third had favorable attitudes toward it, and half felt like they did not know enough about PrEP to form an opinion. Implications for culturally relevant public health campaigns and comprehensive sexuality education that integrate PrEP are included. © 2022 Taylor & Francis Group, LLC. Article	2022	Thurman, AR; Ravel, J; Gaipe, P; Marzinke, MA; Ouattara, LA; Jacot, T; Peet, MM; Clark, MR; Doncel, GF	Vaginal Microbiota and Mucosal Pharmacokinetics of Tenofovir in Healthy Women Using a 90-Day Tenofovir/Levonorgestrel Vaginal Ring	Frontiers in Cellular and Infection Microbiology	-	-	-	NA	10.3389/fcimb.2022.799501	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02300078/full	Background: A relationship between the vaginal microbiota and tenofovir (TFV) concentrations and activity after topical administration has been previously reported. Objective: CONRAD A15-138 was a randomized, placebo-controlled Phase I study aimed at characterizing the safety, pharmacokinetics (PK), and pharmacodynamics (PD) of TFV and levonorgestrel (LNG) administered through a vaginal ring (TFV/LNG IVR). Here, we report the effect of TFV/LNG IVR on the vaginal microbiota. Methods: Forty-eight healthy, HIV-uninfected, reproductive-age women were enrolled in 4 participants each assigned to 12 (3 TFV/LNG, 1 placebo), assessing the vaginal microbiota by sequencing the V3-V4 regions of 16S rRNA genes prior to IVR insertion and monthly for 3 months. Concentrations of TFV in vaginal fluid (VF), and TFV and TFV-diphosphate (TFV-DP) in vaginal tissue, and modeled PD against HIV-1 in vitro were measured before and after treatment. Results: There were no clinically significant changes in relative abundance of vaginal bacterial phylotypes from pre-insertion baseline at any month among active and placebo IVR users. There were no changes in the community state type (CST) with IVR use. Participants with diverse, anaerobic-CST IVA/B microbiota had higher in vivo release of TFV from the IVR compared to women with Lactobacillus-dominated (LD) microbiota, who had expected in vivo TFV release rates. Median VF TFV concentrations were significantly higher among women with CST IV-A/B microbiota in months 1 (1,135 ng/mg VF) and 2 (3,800 ng/mg). Women with LD microbiota had significantly higher median VF TFV concentrations (1,423 ng/mg) and median TFV (103 ng/mg) and TFV-DP (5,877 fmol/mg) tissue concentrations versus women with CST IV-A/B microbiota at month 3. All women demonstrated a significant increase from pre-insertion baseline of in vitro HIV-1 inhibition by VF (p values <0.05). PD differences in tissue according to CST, however, were not statistically significant. Conclusion: TFV/LNG IVR use did not change the vaginal microbiota nor increase the incidence of CST IV-A/B. Vaginal microbiota, and in particular CST IV-A/B, may influence TFV exposure in the vaginal pill, impacted in vivo TFV release and cervicovaginal (CV) PK, but both PK and PD data suggest CV protection against HIV-1. Article	2022	Tidd M.; Shiyanbola O.; Ford J.H., II; Richert L.	Assessing the use of an infographic on pre-exposure prophylaxis for Wisconsin community pharmacists	Journal of the American Pharmacists Association	-	-	-	15443191	10.1016/j.japh.2022.07.010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136209906&doi=10.1016%2Fj.japh.2022.07.010&partnerID=40&md5=9c1010f2c3b0049d9dc5a1f94c6d8e99	Background: Pre-exposure prophylaxis (PrEP) treatments reduce the risk of contracting human immunodeficiency virus (HIV). However, despite proven effectiveness, PrEP use remains low among populations at risk of contracting HIV. Successful PrEP uptake includes developing partnerships with health care providers to implement PrEP-related tools and interventions. Pharmacists are uniquely positioned health professionals who can provide PrEP services in the community, such as pharmacy-led PrEP clinics, to increase uptake, adherence, and retention. Unfortunately, prior evidence shows that not all community pharmacists are knowledgeable about PrEP and willing to provide PrEP services. Objectives: The purpose of this study was to assess the use of an infographic on PrEP for community pharmacists' intention of utilizing an infographic on PrEP for HIV prevention to educate themselves on PrEP and in consultations with patients starting PrEP. Methods: An adaptive survey, using the Theory of Planned Behavior, was conducted to assess pharmacists' intentions by measuring their attitudes, subjective norms, and perceived behavioral control. The Fisher exact tests were performed to examine associations between the 3 theoretical constructs against intentions. Results: Pharmacists reported high intentions of utilizing the infographic to educate themselves (62%) and counsel patients starting PrEP (54%). Their attitudes, subjective norms, and perceived behavioral controls were all significantly associated with their intentions. However, their intentions were reported lower than their attitudes, subjective norms, and perceived behavioral control, suggesting that additional factors may influence intentions that were not measured in this study. Conclusion: The results from this study demonstrate Wisconsin community pharmacists' intentions of using an infographic on PrEP for HIV prevention in practice while measuring their attitudes, subjective norms, and perceived behavioral control. Future research is warranted to explore adapting and using the infographic to better understand its influence in improving pharmacy care among HIV-negative individuals. © 2022 American Pharmacists Association®	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Institutional	2022	Timoney, Maria Teresa (Teno); McGowan, Joseph P.; Fine, Steven M.; Vail, Rena M.; Merrick, Samuel T.; Rasla, Ava E.; Rodrigues, Jessica; Hoffmann, Christopher J.; Gonzalez, Charles J.	HIV Testing During Pregnancy, at Delivery, and Postpartum	-	HIV Testing During Pregnancy, at Delivery, and Postpartum	-	-	NA	NA	https://www.ncbi.nlm.nih.gov/books/NBK568683/	This guideline was developed by the New York State Department of Health AIDS Institute (NYSDOH AI) to provide clinicians in NYS with evidence-based recommendations for HIV testing of all pregnant patients, including those in labor. The purpose is to promote universal HIV screening in pregnancy to ensure timely diagnosis of HIV and rapid initiation of antiretroviral therapy, which can prevent perinatal transmission and protect the health of patients and their infants. To meet these goals, this guideline emphasizes the following: In each pregnancy, HIV testing is recommended as early as possible and again during the third trimester. Expedited HIV testing during labor is required for patients without documented negative HIV status and is recommended for patients with risk factors for HIV infection. Third-trimester testing is also recommended for patients who live in areas with high HIV incidence or prevalence. Rapid HIV testing is recommended for any patient who presents with signs or symptoms of acute HIV infection during pregnancy or postpartum as well as for those with newly diagnosed sexually transmitted infections. Pre-exposure prophylaxis and post-exposure prophylaxis are available and recommended for pregnant and postpartum patients with negative HIV test results who are at high risk of acquiring HIV. Thesis and Dissertations	2022	Tsou, Nguyen Khai; Welles, Seth L.; Goldstein, Neal D.	Elevated Bacterial STI Incidence in Canada: Reframing Clinical Decision Making for HIV PrEP Beyond Risk Compensation	-	-	-	Drexel University	-	NA	NA	https://www.proquest.com/dissertations-theses/elevated-bacterial-sti-incidence-canada-reframing-decision/docview/2724078604/se-2?accountid=9113	Rates of sexually transmitted infections (STI) have increased among gay, bisexual, and men who have sex with other men (GBM) in Canada, particularly gonorrhea and syphilis. If left untreated, these bacterial STI can cause serious sequalae among GBM such infertility and prostrate as well as increase the risk of HIV transmission. Based on the theory of risk compensation, pre-exposure prophylaxis (PrEP) has been hypothesized as the primary contributing factor to the recent growth in bacterial STI incidence. However, findings are conflicting due to the methodological challenges of assessing how PrEP use facilitate behavioral changes. The purpose of this study was to examine the association between PrEP uptake and bacterial STI incidence among GBM in Ontario, Canada. Specifically, the association between bacterial STI detection and sex-related life events (i.e. relationship breakup, incarceration, and substance use) was examined. Additionally, the association between PrEP uptake and bacterial STI, and (c) characteristics of sexual partnerships were examined. Finally, the results from this study demonstrate Wisconsin community pharmacists' intentions of using an infographic on PrEP for HIV prevention in practice while measuring their attitudes, subjective norms, and perceived behavioral control. Future research is warranted to explore adapting and using the infographic to better understand its influence in improving pharmacy care among HIV-negative individuals. © 2022 American Pharmacists Association® incidence among GBM in the era of PrEP. To answer address these research aims, this dissertation used data from the iCrisis study, an online longitudinal study of GBM in Ontario, Canada. I used methods in causal inference to construct marginal structural models to evaluate the effect of PrEP uptake on rates of bacterial STI incidence and mediation models to quantify the indirect effect through confounders and sex. In the final aim, I broaden the scope of possible mechanisms contributing to increased STI risk and adopt a descriptive epidemiology approach to generate hypotheses regarding the potential impact of partnership characteristics on STI incidence. Overall, this dissertation did not find sufficient evidence of risk compensation among iCrisis participants. It demonstrates that a different mechanism (or a set of mechanisms) may better explain the observed increases in STI incidence among GBM and those on PrEP. Essay	2022	Tsvetko-Perez, Sandra Carlota; Vega Yahor, Alfonso; Martínez-Abarca, Cheistan Ivan; Estrada-Zarzeta, Guadalupe; Pérez-Camargo, Luis Alberto; Barroyo-Sánchez, Gabriela	Medical Care of people living with HIV in the Instituto Mexicano del Seguro Social	Revista Médica del Instituto Mexicano del Seguro Social	-	-	-	2448-5667/0443-5117	NA	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10650749/	Infection by the human immunodeficiency virus (HIV) is a public health problem worldwide; however, the incidence has remained relatively stable. In Mexico, around 10,000 new cases are reported each year. The Instituto Mexicano del Seguro Social (IMSS) is the largest HIV care provider in the country, with 1,200 active clinics and 1,000 pharmacies. Since the beginning of the epidemic, HIV care has changed at the individual level was noticeable, in the 1990s, and later other agents were incorporated, such as protease inhibitors, drugs from the group of non-nucleoside analogs, and integrase inhibitors. In 2020, the migration to ARV schemes conformished in a single tablet based on integrase inhibitors, which constitute a highly effective option and timely supply of drugs has been achieved in 99% of the population. In the context of pandemics, the IMSS has also been a pioneer by being the first institution to implement HIV pre-exposure prophylaxis in 2021 at the national level and since 2022 antiretroviral post-exposure prophylaxis is available. The IMSS continues to be at the forefront incorporating the use of different management tools and instruments for the benefit of the population living with HIV. This document summarizes the history of HIV in the IMSS from the beginning of the epidemic to the present time. Article	2022	Trinchuk, Taise; Little, Bradley; LeBrun, Marlys	Providing HIV preexposure prophylaxis.	Canadian Family Physician	-	-	-	1715-5258	10.46747/cfp.6803197	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9833205/	Transmission of HIV is an ongoing concern in Canada. Since 1990, there have been approximately 2000 to 2500 Canadians diagnosed with HIV per year.1 Most of these infections are diagnosed among those identifying as gay, bisexual, or men who have sex with men (MSM), although regional differences exist.1 Preexposure prophylaxis (PrEP) is a prevention strategy for HIV using antiretroviral medications to decrease the risk of acquiring HIV. Increased ongoing risk. Preexposure prophylaxis involves taking medication before and after potential HIV exposure to prevent transmission. Other risk reduction strategies such as frequent HIV testing, condom use, and opioid agonist therapy can be used in combination with PrEP. Canadian guidelines on HIV PrEP and other resources are available; however, recent data suggest that many MSM who could benefit from this strategy are not currently using PrEP.2-4 Family physicians are trusted by their patients and thus well situated to offer PrEP to those who may benefit. This article will outline considerations when prescribing PrEP for MSM. Article	2022	Truong J.M.; Chermesich T.; Wirtz A.L.; Mon S.H.H.; Varangrat A.; Decker M.; Jaeyam S.; Lajangsat D.; Sirivongrungson P.; Hickey A.C.; Weir B.W.; Beyrer C.	Diverse contexts and social factors among young cisgender men and transgender women who sell or trade sex in Bangkok and Pattaya, Thailand: formative research for a PrEP program implementation study	AIDS Care	-	-	-	9540121	10.1080/09540121.2022.2067317	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130823433&doi=10.1080%2f09540121.2022.2067317&partnerID=40&md5=ea5cf9f6ac2b698afa6e3d9f47f3641d6	HIV incidence is high and persistent among cisgender men who have sex with men (MSM) and transgender women (TGW) who have sex with men, particularly among those who sell or trade sex. In preparation for implementation of biomedical HIV prevention interventions, we conducted formative research to inform the design of a pre-exposure prophylaxis (PrEP) program to reflect implementation of PrEP and behavioral interventions. This study analyzed interviews with 20 young (aged 18–28 years) MSM and TGW who sell/trade sex and drew on venue managers in Bangkok and Pattaya, Thailand. Participants described diverse contexts of sex work/trade, including in multiple informal and formal sex venues. Several participants reported mobility across provinces and out of the country, which led to interruptions sex work/trade. TGW sex workers reported challenges with access and cost of feminizing hormones and limited employment opportunities. Factors that could facilitate or challenge PrEP program implementation included HIV stigma, the role of venue management in sexual health practice, lack of PrEP knowledge, lower perceived HIV risk, and interest in personal health and wellbeing. Program implementers must consider myriad factors to successfully implement PrEP among MSM and TGW engaged in sex work or trade in Thailand. © 2022 The Author(s). Article	2022	Tsai, Hung-Chin; Chen, I-Tzu; Chang, Hui-Min; Lee, Susan Shin-Jung; Chen, Yao-Shen	High Prevalence of Dolutegravir Resistance in HIV-1-Infected Patients with Virological Failure to an NNRTI-Based Single-Tablet Regimen.	Infection and Drug Resistance	-	-	-	1178-6973	10.2147/IDR.S363012	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135803908&partnerID=40&md5=ea5cf9f6ac2b698afa6e3d9f47f3641d6	Purpose: This study aimed to investigate the prevalence of resistance to a non-nucleoside reverse transcriptase inhibitor (NNRTI)-based single-tablet regimen (STR) in Taiwanese patients and clarify the clinical implications of using dolutegravir in patients who fail NNRTI treatment. Patients and Methods: Taiwanese patients infected with HIV-1 who failed NNRTI-based STR treatment were enrolled in this retrospective cohort study from 2015 to 2020. Mutations associated with drug resistance were identified using the 2019 International Antiviral Society-USA list of drug-resistant mutations in HIV, and drug susceptibility was assessed according to the Stanford HIV Drug Resistance Database version 9. Median values of continuous variables were compared between two groups using the Mann-Whitney U-test, and categorical variables were compared using the chi-square test or Fisher's exact test. Results: A total of 107 patients were included, of whom 29 were resistant HIV-1 to the initial STRs, and 78 failed treatment after switching to an STR. Seventy-four patients failed treatment with TDF/FTC/EFV (Atripla), 30 with TDF/FTC/RPV (Complera) and 3 with TAF/FTC/RPV (Odefsey). The prevalence rates of resistance to dolutegravir, elvitegravir, and bictegravir were 14.0%, 14.0%, and 13.1%, respectively. Patients with K65R mutations were more likely to have NNRTI resistance ($p = 0.037$) and dolutegravir resistance ($p < 0.001$) compared to the infected STRs, 62% developed dolutegravir resistance, compared to 44% of the 78 the patients who failed treatment after switching to an STR. There were no significant differences in the prevalence of specific NNRTI or dolutegravir resistance-associated mutations between those two groups. The patients with K65R mutations were more likely to have NNRTI resistance ($p = 0.037$) and dolutegravir resistance ($p < 0.001$). Conclusion: Our findings showed a high rate of dolutegravir cross-resistance in patients with NNRTI-based STR treatment failure. Dolutegravir should be used cautiously as a salvage regimen in patients who fail NNRTI treatment. Article	2022	Tsang, J; Butt, A; El Sakka, N	TRANSITIONING FROM PEP TO PREP: A CASE OF FALSE POSITIVE ABBOTT DETERMINE EARLY DETECT HIV RAPID TEST AFTER RECENT COVID INFECTION	Sexually Transmitted Infections	-	-	-	1368-4973	10.1136/sextrans-BASHH-2022.69	https://doi.org/10.1136/sextrans-BASHH-2022.69	30 year GBMSM presented to our sexual health service requesting PrEP. He was taking PEP after a sexual exposure and was keen to transition straight to PrEP. Baseline testing including HIV were negative before PEP was initiated. He was given a supply of PrEP and returned for HIV testing post PEP as per BASHH guidelines. He reported a recent Covid infection confirmed by PCR testing. We carried out a rapid Abbott Determine Early Detect HIV test which was reactive. The assay is a 4th generation test that detects both HIV-1/2 antibodies and free HIV-1 p24 antigen. The patient was advised of this test result and a repeat rapid test the same day remained reactive. He was advised that this could be as a result of recent Covid infection resulting in a cross reaction and that we would await confirmatory testing. He was advised to discontinue PrEP until the result was clarified. Laboratory testing was requested expeditiously and the sample tested on 2 different immunoassay analysers for the detection of HIV Ab/Ag. Both results were confirmed negative and he was advised to restart the PrEP. A literature search showed that cross reaction with the HIV rapid test had been reported after recent Covid 19 infection in other contex but not in the UK. He was seen 4 weeks later for further screening and rapid HIV testing on this occasion was negative together with the virology HIV immunoassay test. The patient was tested for COVID at the same time and was PCR negative at this stage. Article	2022	Tsou, Benjamin W.; Finn, Steven M.; McGowan, Joseph P.; Vail, Rena; Merrick, Samuel T.; Rasla, Ava; Gonzalez, Charles J.; Hoffmann, Christopher J.	HIV Testing	-	HIV Testing	-	-	NA	NA	https://www.ncbi.nlm.nih.gov/books/NBK581840/pdf/Bookshelf_NBK581840.pdf	This guideline was developed by the New York State Department of Health (NYSDOH) AIDS Institute (AI) Clinical Guidelines Program to accomplish the following: goals: Provide clinicians in NYS with up-to-date information on HIV testing policies and practices. Ensure awareness of and access to the standard 3-step HIV testing algorithm recommended by the Centers for Disease Control and Prevention (CDC) and the NYSDOH. Increase HIV testing in NYS to increase the number of people who know their HIV status. Ensure that clinicians recognize and respond to HIV testing as a gateway to care, such that an HIV diagnosis prompts a referral for HIV treatment and a negative HIV test result prompts a referral for HIV prevention services, including pre- and post-exposure prophylaxis (PrEP and PEP). Emphasize that rapid antiretroviral therapy (ART) initiation is the standard of care for all individuals diagnosed with HIV. Article	2022	Tucker, Joseph D.; Hocking, Jane; Oladele, David; Estcourt, Claudia	Digital sexually transmitted infection and HIV services across prevention and care continuums: evidence and practical resources.	Sexual Health	-	-	-	1448-4987 1448-5028	10.1071/SH22023	https://pubmed.ncbi.nlm.nih.gov/35705515/	Increased demand for sexual health services (including prevention and treatment) have spurred the development of digital STI/HIV services. Earlier advances in testing technologies opened the door for self-testing and self-sampling approaches, in line with broader shifts in service strategies. Advances in HIV management mean that many people are living well with HIV and can no longer need intensive in-person monitoring, whereas those at-risk of HIV are recommended to have regular asymptomatic STI screening and pre-exposure prophylaxis. This narrative review examines the evidence and implications of digital STI/HIV services, focused on promoting testing, facilitating testing, clinical management and referrals, partner services, and prevention. We have used a prevention and care continuum to structure the review to increase utility to policy as well as practice. Digital STI/HIV services can be interwoven into existing clinical pathways to enhance face-to-face services or standalone digital STI/HIV services. A growing evidence base, including randomised controlled trials and observational studies, should help inform strategies for designing effective digital STI/HIV services. However, most studies to date have focused on high-income countries and people with smartphones, despite a substantial burden of STI/HIV in low- and middle-income countries. There are also important differences between digital STI and HIV services that require careful consideration. We discuss digital STI/HIV services evidence and implications to inform research and programs in this exciting field. Article	2022	Turpin R.E.; Hawthorne D.J.; Rosario A.D.	Pre-Exposure Prophylaxis Interventions among Black Sexual Minority Men: A Systematic Literature Review	International Journal of Environmental Research and Public Health	-	-	-	1661782T	10.3390/ijerph19041934	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8873176/pdf/ijerph-19-01934.pdf	Background: Interventions to promote HIV pre-exposure prophylaxis (PrEP) among Black sexual minority men (BSMM) are especially important, given the disproportionate HIV incidence and relatively low uptake of PrEP among BSMM. Methods: We conducted a systematic literature review to identify the characteristics of interventions between 2016 and 2021 promoting PrEP use among BSMM. We synthesized these studies based on sample size, location, the use of peer-based delivery, and key intervention targets. Results: Of the starting total 198 articles, 10 were included in the final review, with the majority of included studies being randomized controlled trials. We identified providing PrEP access, PrEP counseling, HIV and PrEP education, linkage to general health care, and peer-based support as key successful intervention components. The starkest difference between interventions with and without demonstrated PrEP improvements was the outcome: all interventions focused on PrEP initiation led to large improvements, but those focused on PrEP adherence did not. No other factors demonstrated distinct differences between successful and unsuccessful interventions. Conclusion: We identified notable differences in intervention efficacy between PrEP initiation and PrEP adherence outcomes; PrEP adherence is necessary for optimal HIV prevention. Future interventions promoting and measuring PrEP adherence, with a focus on client-competence and peer components, are recommended. © 2022 by the authors. Licensee MDPI, Basel, Switzerland. Article	2022	Turpin, Rodman; Smith, Jamil; Watson, Lakeshia; Heine, Bridgette; Dyer, Typhanye; Liu, Hongjie	Latent profiles of stigma and HIV pre-exposure prophylaxis among Black sexual minority men: an exploratory study.	SN Social Sciences	-	-	-	2662-9283	10.1007/s43545-022-00490-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9472176	Black sexual minority men (BSMM) are a priority population for HIV prevention efforts, including pre-exposure prophylaxis (PrEP) promotion. Intersectional stigma can be associated with deterrence from PrEP utilization among BSMM; this stigma has a novel context in the COVID-19 pandemic. To examine this, we investigated latent profiles of racial, sexuality-based, and related stigmas among HIV-negative BSMM in the COVID-19 pandemic and tested their association with PrEP use. We analyzed cross-sectional data from a pilot sample of HIV-negative BSMM (n = 151) collected between July 2nd and September 3rd, 2020 in the United States, primarily located on the east coast. We conducted latent profile analysis using internalized racism and homophobia, anticipated racism and homophobia, HIV stigma, healthcare stigma, and PrEP stigma. We then tested associations between latent profiles and both PrEP use (binary) and PrEP acceptability (ordinal) using modified Poisson regression and cumulative log models, respectively. We identified three latent profiles, characterized as 'Low Internalized Stigma, High Anticipated Stigma' (reference profile), 'High Internalized Stigma, Low Anticipated Stigma,' and 'High Internalized and Anticipated Stigma.' The 'High Internalized and Anticipated Stigma' profile was associated with PrEP use (aPR 0.37, 95% CI 0.17, 0.82) and acceptability (aPR 0.32, 95% CI 0.18, 0.57) nearly three times as low as the comparing profile after adjustment for confounders. The 'High Internalized Stigma, Low Anticipated Stigma' was also associated with PrEP acceptability nearly three times as low as the reference (aPR 0.38, 95% CI 0.22, 0.68). We identified latent profiles characterized by internalized and anticipated stigmas among BSMM during the COVID-19 pandemic and found that the profile with the highest levels of both internalized and anticipated stigma was associated with the lowest PrEP use and acceptability. Internalized stigma may be a particularly relevant intervention target in efforts to promote PrEP uptake among BSMM. Supplementary Information: The online version contains supplementary material available at 10.1007/s43545-022-00490-w. Article	2022	Uhrmacher M.; Skaletz-Rorowski A.; Nambiar S.; Schmidt A.J.; Ahaus P.; Serova K.; Mordhorst I.; Kayser A.; Wach J.; Tiemann C.; Münstermann D.; Brockmeyer N.H.; Potthoff A.	HIV pre-exposure prophylaxis during the SARS-CoV-2 pandemic: Results from a prospective observational study in Germany	Frontiers in Public Health	-	-	-	22962565	10.3389/fpubh.2022.930208	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137736286&doi=10.3389%2ffpubh.2022.930208&partnerID=40&md5=0b85314b1bb070e327cbc786b5c12f6d	Aims: Since 2017, HIV pre-exposure prophylaxis (PrEP) care has been provided through an intersectoral collaboration at WIR (Walk-in-Ruhr, Center for Sexual Health and Medicine, Bochum, Germany). The aim of this study was to establish possible impact of COVID-restrictions on the sexual behavior of PrEP users in North Rhine-Westphalia. Methods: The current PrEP study collected data of individuals using PrEP, their sexual behavior and sexually transmitted infections (STIs) before (each quarter of year 2018) and during the COVID-19 pandemic (each quarter of year 2020). Results: During the first lockdown in Germany from mid-March until May 2020, PrEP-care appointments at WIR were postponed or canceled. Almost a third of PrEP users had discontinued their PrEP intake in the 2nd quarter of 2020 due to alteration of their sexual behavior. The number of sexual partners decreased from a median of 14 partners in the previous 6 months in 1st quarter of 2020, to 7 partners in 4th quarter of 2020. Despite such a significant reduction in partner number during the pandemic in comparison to the pre-pandemic period, a steady rate of STIs was observed among PrEP users in 2020. Conclusion: The SARS-CoV-2-pandemic has impacted PrEP-using MSM in North Rhine-Westphalia with respect to their PrEP intake regimen and sexual behavior in 2020. Our study revealed a steady rate of STI among PrEP users even during the pandemic, thus highlighting the importance of ensuring appropriate HIV/STI prevention services in times of crisis. Essay	2022	Ungar S.P.; Paret M.; Shust G.F.	HIV Pre-Exposure Prophylaxis: What Do Pediatricians Need to Know?	Pediatric Annals	-	-	-	904481	10.3928/19382359-20220314-07	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130048473&doi=10.3928%2f19382359-20220314-07&partnerID=40&md5=cfc0d21c84a6e24e40cddd7e0f927ed8	Pediatricians and adolescent providers play an important role in the health and well-being of adolescents and young adults, including their sexual health. HIV remains an ongoing concern for young people, with 21% of new HIV diagnoses occurring in this age group. The use of antiretroviral therapy for pre-exposure prophylaxis (PrEP) to prevent transmission of HIV to people who are not infected has been proven safe and effective. PrEP can be considered as part of a comprehensive risk mitigation strategy for adolescents and young adults, with clear guidelines for baseline evaluation and ongoing man-agement. © SLACK Incorporated.	cabotegravir; creatinine; emtricitabine; hepatitis B surface antibody; hepatitis B surface antigen; tenofovir disoproxil; anti human immunodeficiency virus agent	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Other
Article	2022	Unger, Zoe D; Golub, Sarit A; Borges, Christine; Edelstein, Zoe R; Hedberg, Trevor; Myers, Julie	Reasons for PrEP Discontinuation After Navigation at Sexual Health Clinics: Interactions Among Systemic Barriers, Behavioral Relevance, and Medication Concerns.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002952	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9203912	BACKGROUND: Pre-exposure prophylaxis (PrEP) for HIV prevention requires engagement throughout the PrEP care continuum. Using data from a PrEP navigation program, we examine reasons for PrEP discontinuation. SETTING: Participants were recruited from New York City Health Department Sexual Health Clinics with PrEP navigation programs. METHODS: Participants completed a survey and up to 3 interviews about PrEP navigation and use. This analysis includes 94 PrEP initiators that were PrEP-naive before their clinic visit, started PrEP during the study, and completed at least 2 interviews. Interview transcripts were reviewed to assess reasons for PrEP discontinuation. RESULTS: Approximately half of PrEP initiators discontinued PrEP during the study period (n = 44; 47%). Most participants (71%) noted systemic issues (insurance or financial problems, clinic or pharmacy logistics, and scheduling barriers) as reasons for discontinuation. One-third cited medication concerns (side effects, potential long-term side effects, and medication beliefs; 32%) and behavioral factors (low relevance of PrEP because of sexual behavior change; 34%) as contributing reasons. Over half (53.5%) highlighted systemic issues alone, while an additional 19% attributed discontinuation to systemic issues in combination with other factors. Of those who discontinued, approximately one-third (30%) restarted PrEP during the follow-up period, citing resolution of systemic issues or behavior change that increased PrEP relevance. CONCLUSIONS: PrEP continuation is dependent on interacting factors and often presents complex hurdles for patients to navigate. To promote sustained engagement in PrEP care, financial, clinic, and pharmacy barriers must be addressed and counseling and navigation should acknowledge factors beyond sexual risk that influence PrEP use. Theses and Dissertations	2022	URBANO, AYRA ZAINE RODRIGUES	PERCEPÇÕES E PRÁTICAS DE PROFISSIONAIS DE SAÚDE NO ATENDIMENTO A ADOLESCENTES E JOVENS GAYS, HOMENS QUE FAZEM SEXO COM HOMENS, TRAVESTIS E MULHERES TRANSEXUAIS QUE USAM A PROFILAXIA PRÉ-EXPOSIÇÃO AO HIV (PrEP)	-	-	Universidade Católica de Santos	-	-	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=11680533	Os profissionais de saúde estiveram presentes desde as primeiras discussões sobre Cuidado e prevenção e hoje são parte fundamental na resposta à epidemia de HIV que atinge adolescentes e jovens e evidencia a importância de ações estratégicas que possibilitem redução da vulnerabilidade à infecção. A Profilaxia pré-exposição ao HIV (PrEP) é amplamente estudada e comprovadamente eficaz e desde 2017 integra a Prevenção Combinada no Brasil. Essa pesquisa se justifica a partir da compreensão que práticas e percepções dos profissionais de saúde sobre o atendimento e oferta influenciam e colaboram na efetivação da PrEP para adolescentes como política pública. Objetivo: Compreender práticas e percepções dos profissionais de saúde sobre o atendimento de adolescentes e jovens HSH e TrMT que usam PrEP. Procedimentos metodológicos: Os dados foram produzidos de julho de 2020 a fevereiro de 2021 como parte de uma investigação qualitativa inserida no contexto do estudo PrEP15-19 que avaliou a efetividade da PrEP entre adolescentes e jovens de 15 a 19 anos. Foram analisados profissionais de saúde que atuaram no sítio São Paulo e combinadas as técnicas de observação participante e entrevistas em profundidade. O processo analítico envolveu imersão no material empírico, codificação e categorização. A organização dos dados foi realizada com o apoio do software NVivo®. A interpretação seguiu o princípio hermenêutico-dialético e teve como quadro conceitual o Cuidado inserido nas práticas de saúde. As análises compreenderam as percepções sobre os adolescentes e jovens atendidos, a relação da PrEP com o cuidado e autonomia, as práticas de Cuidado alinhadas à Integralidade e a relação dos contextos de vulnerabilidade ao HIV com as práticas dos profissionais. Resultados: Foram entrevistados oito profissionais com idade entre 25 e 52 anos. A imprevisibilidade e a percepção de baixo risco foram relacionados como desafios no atendimento e a compreensão desses comportamentos favorecia ações de promoção e proteção à saúde. A escuta sensível e solidária foi apontada como uma prática de acolhimento propulsora das ações de Cuidado e sua ausência identificada como uma barreira de acesso que reforçava a percepção de baixa procura pelos serviços de saúde. O uso de uma linguagem mais próxima do cotidiano favorecia a construção de relações de confiança, capazes de influenciar no desenvolvimento da autonomia e na adesão ao tratamento. Atitudes acolhedoras e suporte frente a situações de estigma e preconceito relacionados ao uso da PrEP convergiam para o desenvolvimento da autonomia dos adolescentes e jovens. Adolescentes e jovens transexuais e os que relataram transtornos mentais foram reconhecidos como mais vulneráveis à exposição para o risco e por isso recebiam atendimento diferenciado, alinhado às práticas da Integralidade. Conclusão: As percepções e práticas dos profissionais de saúde estão incorporadas ao conceito de Cuidado, pois compreendem ações além dos saberes técnicos, e igualmente alinhadas ao princípio da Integralidade visto que reconhecem os contextos que aumentam a vulnerabilidade dos adolescentes e jovens ao HIV. No entanto existem tensões entre o discurso e a prática, observadas a partir da busca pelo êxito técnico em oposição ao sucesso prático. Article	2022	Urena A.	Relational Risk: How Relationships Shape Personal Assessments of Risk and Mitigation	American Sociological Review	-	-	-	31224	10.1177/00031224221112902	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136540330&doi=10.1177%2f00031224221112902&partnerID=40&md5=d2f7b0f02b4cc39a99b2195e00e9d1b7	Objects of risk mitigation are typically viewed as neutral items that limit exposure to an established hazard. However, people may refuse to adopt such tools, even when they feel vulnerable. This article explores how people assess their personal risk and mitigation options by examining PrEP use for HIV prevention. Drawing on semi-structured in-depth interviews with 40 Black and Latino gay, bisexual, and queer men, I argue PrEP uptake is a socially contextualized decision influenced by relational concerns. I develop the concept of relational inoculation, wherein individuals enact a sense of protection against harm through relational work. As individuals consider PrEP, they also contemplate how it may bolster or undermine intimacy they value for reducing interpersonal HIV exposure, as well as dispelling stigmatized notions of riskiness held by their intersecting ethno-racial and sexual minority communities. I develop testable propositions about how respondents' HIV risk assessments and PrEP use are enmeshed in a societal context of surveillance, in ongoing relations with intimate partners and socially significant others, and in navigation of community belonging within this milieu of risk. This article contributes to sociological research at the nexus of race, sexuality, and health, and offers health policy insight. © American Sociological Association 2022. Article	2022	Üsküp, Dilara K; Nieto, Omar; Rosenberg-Carlson, Elena; Sung-Jae, Lee; Milburn, Norweeta G; Brooks, Ronald A	Acceptability and Appropriateness of Digital PrEP Interventions for Black and Latina Cisgender Women: Perspectives From Service Providers in Los Angeles County: JAIDS	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002973	https://www.proquest.com/scholarly-journals/acceptability-appropriateness-digital-prep/docview/2676543876/se-2?accountid=8113	Background:Black and Latina cisgender women (BLCW) experience disproportionately high rates of HIV infection compared with White women. BLCW also experience disparities in uptake of pre-exposure prophylaxis (PrEP), a highly effective HIV prevention strategy. Digital technology interventions may help to improve PrEP accessibility among BLCW and address barriers to receiving PrEP services in clinical settings.Methods:We conducted a formative implementation research project with service providers to explore the use of digital technology interventions to improve PrEP care continuum outcomes among priority populations in Los Angeles County. A thematic analysis approach was then used to assess the perceived acceptability and appropriateness of digital PrEP interventions for BLCW.Results:Of the five technology products presented, service providers viewed the stand-alone telemedicine platforms as the most acceptable intervention type for BLCW. Service providers also noted perceived benefits and barriers that BLCW may experience in using stand-alone telemedicine platforms, and offered recommendations for tailoring the products to meet the individual needs of BLCW.Conclusions:Digital PrEP interventions may help address barriers BLCW experience in accessing PrEP in clinical settings. We offer suggestions of implementation strategies to optimize the use of digital PrEP interventions among BLCW. Theses and Dissertations	2022	Usman, Dave M.; Goodwin, Julia A.	Implementation of the CDC's PrEP Practice Guideline to Improve PrEP Prescribing	-	-	Grand Canyon University	-	NA	NA	https://www.proquest.com/dissertations-theses/implementation-cdc-s-prep-practice-guideline/docview/2731430830/se-2?accountid=8113	Preexposure prophylaxis (PrEP) may prevent new human immunodeficiency virus (HIV) infections. At the project site, there was no consistent process in place for prophylaxis for HIV, so an evidence-based solution was sought. The purpose of this quantitative quasi-experimental quality improvement project was to determine if the implementation of the Centers for Disease Control and Prevention's (CDC) Preexposure (PrEP) Practice Guideline would impact new PrEP prescriptions among high-risk adults in a community health center in urban California over four weeks. Nola Pender's health promotion theory and Kurt Lewin's change theory provided the theoretical underpinnings of the project. Data on PrEP prescriptions were extracted from the electronic health record. A total of N = 49 patients were included in the project, n = 22 in the comparison group, and n = 27 in the intervention group. A chi-square test showed no statistically significant difference in the PrEP prescription rate between the comparison group (36.4%, n = 8) and the implementation group (63.0%, n = 17), X2 (1, N = 49) = 3.43, p = .064. Despite the lack of statistical significance, clinical significance was demonstrated by a 26.6 % increase in PrEP prescriptions after the implementation. Based on these results, the CDC's PrEP Practice Guideline may increase PrEP prescription rates. Recommendations are to continue using the CDC Preexposure (PrEP) Practice with PrEP guideline among high-risk adults at the project site, and to expand the project to other primary care clinics to obtain data on a larger sample size over an extended period. Article	2022	Ussery, Faith; Bachanas, Pamela; Alwano, Mary Grace; Lebelonyane, Refeletswe; Block, Lisa; Wirth, Kathleen; Ussery, Gene; Sento, Baraedi; Gaolathe, Tendani; Kadima, Etienne; Abrams, William; Segolodi, Tebogo; Hader, Shannon; Lockman, Shahin; Moore, Janet	HIV Incidence in Botswana Rural Communities With High Antiretroviral Treatment Coverage: Results From the Botswana Combination Prevention Project, 2013-2017.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000003017	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9388617	BACKGROUND AND SETTING: The Botswana Combination Prevention Project demonstrated a 30% reduction in community HIV incidence through expanded HIV testing, enhanced linkage to care, and universal antiretroviral treatment and exceeded the Joint United Nations Programme on HIV/AIDS 90-90-90 targets. We report rates and characteristics of incident HIV infections. METHODS: The Botswana Combination Prevention Project was a community-randomized controlled trial conducted in 30 rural/periurban Botswana communities from 2013 to 2017. Home-based and mobile HIV-testing campaigns were conducted in 15 intervention communities, with 39% of participants testing at least twice. We assessed the HIV incidence rate IR; number of new HIV infections per 100 person-years (py) at risk among repeat testers and risk factors with a Cox proportional hazards regression model. RESULTS: During 27,517 py, 195 (women: 79%) of 18,597 became HIV-infected (0.71/100 py). Women had a higher IR (1.01/100 py; 95% confidence interval: 0.99 to 1.02) than men (0.34/100 py; 95% confidence interval: 0.33 to 0.35). The highest IRs were among women aged 16-24 years (1.87/100 py) and men aged 25-34 years (0.56/100 py). The lowest IRs were among those aged 35-64 years (women: 0.41/100 py; men: 0.20/100 py). The hazard of incident infection was the highest among women aged 16-24 years (hazard ratio = 7.05). Sex and age were significantly associated with incidence (both P < 0.0001). CONCLUSIONS: Despite an overall reduction in HIV incidence and approaching the United Nations Programme on HIV/AIDS 95-95-95 targets, high HIV incidence was observed in adolescent girls and young women. These findings highlight the need for additional prevention services (pre-exposure prophylaxis and DREAMS) to achieve epidemic control in this subpopulation and increased efforts with men with undiagnosed HIV. Article	2022	Uzoeghelu U.; Bogart L.M.; Mahoney T.; Ghebremichael M.S.; Kerr J.; Ojikutu B.O.	HIV Risk-Related Behaviors and Willingness to Use Pre-Exposure Prophylaxis Among Black Americans with an Arrest History	Journal of Racial and Ethnic Health Disparities	-	-	-	21973792	10.1007/s40615-021-00980-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100522732&doi=10.1007%2fs40615-021-00980-2&partnerID=40&md5=f847b71285699dbd9f9ac923d7ce7378	Objective: Black individuals in the USA are arrested and incarcerated at a significantly higher rate than White individuals, and incarceration is associated with increased HIV vulnerability. Pre-exposure prophylaxis (PrEP) reduces the risk for HIV transmission, but little is known about the relationship between HIV risk behavior and willingness to use PrEP among Black individuals with an arrest history. Method: A total of 868 individuals completed a nationally representative survey and provided baseline data on sexual risk. Participants were grouped as those with a history of arrest (N = 226) and those with no history of arrest (N=619) based on self-reported arrest history. Our study examined HIV risk behaviors associated with willingness to use PrEP between those with arrest history and those without arrest history. Results: Participants with an arrest history were more likely to have a lifetime history of anal sex (p<0.0001) and sexually transmitted diseases (p=0.0007). A history of multiple sexual partners in the past 3 months was associated with PrEP willingness in individuals with an arrest history aPR 2.61 (1.77, 3.85), p<0.0001, adjusting for other covariates in the model. Conclusions: Differences in risk behavior and willingness to use PrEP exist by arrest history. Understanding these risk behaviors are necessary to increase access to PrEP. PrEP uptake and adherence interventions, when recommended and made available for individuals at substantive risk of HIV infection at the time of arrest and during incarceration, are essential to reducing the spread of HIV in correctional facilities and in communities to which they return. © 2021, W. Preferences Across Pre-Exposure Prophylaxis Modalities Among Young Men Who Have Sex with Men in the United States: A Latent Class Analysis Study	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2022.0111	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141715840&doi=10.1089%2fapc.2022.0111&partnerID=40&md5=de7fd3861041e74e6951d59ea983c9af	Access to daily oral pre-exposure prophylaxis (PrEP) is suboptimal among young cisgender men who have sex with men (YMSM) in the United States. Next-generation modalities that do not involve daily oral regimens may mitigate some of the barriers to PrEP use. We identified latent classes of YMSM based on health care decision-making patterns and examined associations between latent classes and access to health care and PrEP modality preferences (i.e., daily and event-driven oral, rectal douches, broadly neutralizing antibodies, subcutaneous implants, and an injectable). Between October 2020 and June 2021, we administered an online survey to 737 YMSM. Latent class analysis (LCA) identified groups of YMSM based on communication with providers, stigma and mistrust in health care, and autonomy in sexual health decisions. Logistic regression examined associations between class membership and health care access, and exploded logit regression examined associations between class membership and ranked PrEP modality preferences. LCA identified three classes: shared decision-making (high communication with providers and high autonomy); provider-led decision-making (high communication and low autonomy); and patient-driven decision-making (low communication and high autonomy). Shared decision-making was associated with higher access to health care in comparison with the other classes. Across all classes, YMSM preferred daily oral PrEP over all next-generation PrEP modalities. Preferences for daily oral PrEP over next-generation PrEP modalities were particularly marked among the patient-driven decision-making class. Shared decision-making is associated with access to health care and HIV prevention and higher acceptability of next-generation PrEP modalities, and should be considered as part of future interventions to promote use of daily oral and next-generation PrEP. Article	2022	Valente P.K.; Bauermeister J.A.; Lin W.Y.; Operario D.; Rusley J.; Hightow-Weidman L.; Mayer K.H.; Biello K.B.	Next Generation Pre-Exposure Prophylaxis for Young Men who have Sex with Men: Lessons from System and Provider-level barriers to oral PrEP	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03665-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128768239&doi=10.1007%2fs10461-022-03665-x&partnerID=40&md5=9343139d4e9eb4cb1a2ff69efdac4f66	Next generation pre-exposure prophylaxis (PrEP) modalities that do not require daily regimens may address some of the barriers to daily oral PrEP among young men who have sex with men (YMSM). We conducted online semi-structured interviews with 30 YMSM to examine experiences and preferences related to HIV prevention care that may inform implementation of next generation PrEP. Barriers to PrEP care included initiating conversations about sexuality with providers; confidentiality concerns regarding disclosure of sexual practices and PrEP use to family; gaps in access to healthcare; and limited availability of affordable health services. Future implementation of next generation PrEP may benefit from providers addressing confidentiality concerns when discussing PrEP with YMSM; PrEP programs accounting for discontinuities in healthcare access among YMSM while strengthening access to affordable services; and collaborations between generalist providers and specialized clinics and providers to address providers' education needs, which may increase as next generation PrEP becomes available. We have linked affiliation 9 to author name "Katie B. Biello". Article	2022	Valentine S.S.; Carnes N.; Caldwell J.; Gelaude D.; Taylor R.	Mapping Nurse Practitioners' Scope of Practice Laws: A Resource for Evaluating Pre-Exposure Prophylaxis Prescriptions	Health Equity	-	-	-	24731242	10.1089/heq.2021.0113	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123300477&doi=10.1089%2fheq.2021.0113&partnerID=40&md5=d84a98f9bcf9e626b584182076b2be9b	Context: Reducing the number of new HIV infections will require addressing barriers to HIV pre-exposure prophylaxis (PrEP) access and uptake. Nurse practitioners (NPs) may help increase PrEP access and uptake. State scope of practice laws determines NPs' ability to work independently and their authority to prescribe PrEP, a legend nonscheduled medication. Methods: This analysis applied legal epidemiology methods to analyze the laws of the 50 states and the District of Columbia that govern NPs' scope of practice as they may apply to prescribing legend nonscheduled medications. These laws were extracted from Westlaw Next between April and June 2019. Results: As of June 8, 2019, 17 states had laws that allowed NPs to both practice independently and prescribe legend nonscheduled drugs without restriction. Conclusion: The role that state scope of practice laws play in potentially limiting NPs' ability to prescribe PrEP should be considered. Increasing PrEP access and uptake is essential in reaching national HIV prevention goals. This analysis can inform further studies and polices on barriers to PrEP access and uptake. © Sheila Salvant Valentine et al., 2022; Published by Mary Ann Liebert, Inc. 2022. Article	2022	Valera P.; Ali Z.S.; Cunningham D.; McLaughlin C.; Acevedo S.	Exploring Pre-Exposure Prophylaxis (PrEP) and Post-Exposure Prophylaxis (PEP) Knowledge in Incarcerated Men	American Journal of Men's Health	-	-	-	15579883	10.1177/15579883221107192	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133632979&doi=10.1177%2f15579883221107192&partnerID=40&md5=9cdd8680f83666a28d42273496c56502	People who are incarcerated have a disproportionately high risk of contracting human immunodeficiency virus (HIV). While there is no known cure for HIV, there are biomedical approaches that can successfully manage the virus and prevent its transmission. A total of 267 men who are incarcerated completed a cross-sectional survey focused on cancer health, HIV prevention, and mental health in three state prisons. The mean age was 39 years. The majority had an annual income of US$10,000 or less, self-identified as heterosexual, not married, had children, did not have any military status, and identified as African American/Black. Less than 4% indicated that they had heard about Pre-Exposure Prophylaxis (PrEP), and only 3% had heard of Post-Exposure Prophylaxis (PEP). PrEP and PEP effectively prevent HIV infection, but little attention has focused on increasing the knowledge and awareness of these HIV prevention interventions in the incarcerated population. © The Author(s) 2022.	human immunodeficiency virus; men; post-exposure prophylaxis; pre-exposure prophylaxis; prisons	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Impact of COVID-19 on the Belgian HIV epidemic: slowdown of HIV transmission and testing and adaptation of care	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-022-07879-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143349781&doi=10.1186%2fs12879-022-07879-1&partnerID=40&md5=9ee514c49955c9cb7e9ae88d2cb20478	Background: To gain insight into the impact of the COVID-19 pandemic and containment measures on the HIV epidemic and services, this study aims to describe HIV trends in 2020 and compare them with previous years. Methods: Belgian national HIV surveillance data 2017–2020 were analysed for trends in HIV testing, HIV diagnoses, VL measurements, ART uptake and PrEP purchase. Descriptive statistics from 2020 are compared to annual averages from 2017 to 2019 (proportional difference, %). Results: In 2020, 725 HIV infections were diagnosed in Belgium (− 21.5% compared to 2019). The decline was most pronounced during the first lockdown in April–May but also present in July–December. The number of HIV tests performed decreased by 17.6% in 2020, particularly in March–May and October–December (− 57.5% in April and -25.4% in November 2020 compared to monthly 2017–19 numbers). Diagnosis of acute HIV infections decreased by 47.1% in 2020 (n = 27) compared to 2019 (n = 51). Late HIV diagnoses decreased by 24.7% (95% CI − 40.7%; -9.7%) in 2020 compared to 2019. Of patients in care in 2019, 11.8% interrupted HIV care in 2020 compared to 9.1% yearly in the 3 previous years. The number of HIV patients with VL monitoring per month dropped in March–May 2020, whilst proportions of VL suppression and ART coverage remained above 86% and 98.5% respectively in 2020. PrEP purchases, number of purchasers and starters dropped during April–May 2020 (respectively − 45.7%, − 47.4%, − 77.9% in April compared to February 2020). Conclusions: The significant decrease in HIV diagnoses in Belgium in 2020 coincided with the COVID-19 pandemic and following containment measures, particularly in April–May during the first lockdown. A slowdown of HIV transmission due to reduced HIV risk exposure is suggested by the halving in diagnosis of acute HIV infections in March-December 2020 compared to the previous year, and the adaptive decrease in PrEP use and PrEP initiation from April onwards. Despite a slight increase in HIV care interruptions, the indicators of quality of HIV care remained stable. Access to prevention, testing and care for all people living with HIV and at risk of acquiring HIV is a priority during and after times of pandemic. © 2022, The Author(s). Article	2022	van der Elst, Elise M; Abuna, Mitchelle; Agutu, Clara; Ogada, Fred; Galole, Aisha; Shikuku, Joyce; Oduor, Tony; Graham, Susan M; Sanders, Eduard J; Operario, Don	"Facilitating HIV status adjustment: Qualitative insights from the Tambua Mapema proof-of-concept study in Kenya".	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0261255	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8758194	Systematic efforts are needed to prepare persons newly diagnosed with acute or chronic HIV infection to cope. We examined how patients dealt with this news, looking at how readiness to accept an HIV diagnosis impacted treatment outcomes, prevention of transmission, and HIV status disclosure. We examined vulnerability and agency over time and considered implications for policy and practice. A qualitative sub-study was embedded in the Tambua Mapema ("Discover Early") Plus (TMP) study (NCT03508908), conducted in coastal Kenya between 2017 and 2020, which was a stepped wedge trial to evaluate an opt-out HIV-1 nucleic acid testing intervention diagnosing acute and chronic HIV infections. Diagnosed participants were offered antiretroviral therapy (ART), viral load monitoring, HIV partner notification services, and provision of pre-exposure prophylaxis (PrEP) to their uninfected partners. Data were analyzed using thematic approaches. Participants included 24 individuals who completed interviews at four time points (2 weeks and 3, 6, and 9 months after diagnosis), including 18 patients (11 women and 7 men) and 6 partners (1 woman, 5 men, of whom 4 men started PrEP). Acceptance of HIV status was often a long, individualized, and complex process, whereby participants' coping strategies affected day-to-day issues and health over time. Relationship status strongly impacted coping. In some instances, couples supported each other, but in others, couples separated. Four main themes impacted participants' sense of agency: acceptance of diagnosis and commitment to ART; positive feedback after attaining viral load suppression; recognition of partner supportive role and focus on sustained healthcare support whereby religious meaning was often key to successful transition. To support patients with acute or newly diagnosed chronic HIV, healthcare and social systems must be more responsive to the needs of the individual, while also improving quality of care, strengthening continuity of care across facilities, and promoting community support. Article	2022	Van Dijck C.; De Baetselier I.; Cuylaerts V.; Buyze J.; Laumen J.; Vuylsteke B.; Kenyon C.	Gonococcal bacterial load in PrEP users with Mycoplasma genitalium coinfection	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624211048678	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118590177&doi=10.1177%2f09564624211048678&partnerID=40&md5=4b68d907a834010b4a966d4eb127c14f	Objectives: Gonococcal infections with a higher bacterial load may pose a higher risk of transmission. We assessed the association between gonococcal bacterial load and coinfection with Mycoplasma genitalium. Methods: From September 2015 until May 2018, 200 men and transgender women who have sex with men participated in an HIV pre-exposure prophylaxis (PrEP) demonstration trial in Antwerp, Belgium. They underwent 3-monthly 3-site (anus, urine, and pharynx) molecular testing for N. gonorrhoeae and C. trachomatis and M. genitalium, irrespective of symptoms. Gonococcal bacterial load was determined on remnant DNA extracts using an in-house quantitative PCR. Results were expressed as log10 transformed copies/mL and analyzed with a linear regression model. Results: Gonococcal bacterial load could be determined for 82 (80.4%) of 102 anal, 17 (73.9%) of 23 urine, and 64 (90.1%) of 71 pharyngeal samples. M. genitalium was detected in five of these anal, two urine, and two pharyngeal samples and C. trachomatis was detected in 16 anal, one urine, and two pharyngeal samples. Gonococcal bacterial load was significantly higher in the presence of M. genitalium (difference 0.92 log copies/mL, 95% CI 0.16–1.67). Conclusions: Gonococcal bacterial load was higher with M. genitalium coinfection. M. genitalium may thus be a cofactor in gonococcal transmission. © The Author(s) 2021.	bacterial load; coinfection; gonococcus; Gonorrhoea; men who have sex with men; Mycoplasma genitalium; observational study; quantitative PCR	English	United Kingdom	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Quantitative
Article	2022	Van Gerwen, Olivia T; Austin, Erika L; Camino, Andres F; Odom, L Victoria; Muzny, Christina A	"It's behaviors, not identity": Attitudes and beliefs related to HIV risk and pre-exposure prophylaxis among transgender women in the Southeastern United States.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0262205	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8794203	HIV prevalence is high among transgender women (TGW) in the Southeastern U.S. Uptake of HIV Pre-Exposure Prophylaxis (PrEP) is low among TGW nationwide. We aimed to explore beliefs associated with PrEP among TGW in the Southeastern U.S., framed by the Health Belief Model. HIV-negative TGW ≥18 years old in Alabama participated in virtual focus group discussions. Authors coded and amended transcripts to explore emerging themes. Between July-December 2020, 17 TGW participated in 4 sessions. Mean age was 28.1±8.5 years. Several themes were identified: frustration with conflation of transgender identity and HIV risk, inappropriate transgender representation in PrEP advertising, concerns for interactions between PrEP and hormone therapy, perception that PrEP is meant for cisgender men who have sex with men and limited trans-affirming healthcare. Nuanced messaging is necessary to properly educate and engage TGW in HIV prevention strategies including PrEP given the diversity of this population. Article	2022	van Griensven, Frits; Phanuphak, Nittaya; Manopaiboon, Chomnad; Dunne, Eileen F; Colby, Donn J; Chaiphosri, Pannee; Ramautarsing, Reshmie; Mock, Philip A; Guadamuz, Thomas E; Rangsin, Ram; Benjamaneepairoj, Kanya; Na Nakorn, Panus; Vannakit, Ravipa; de Lind van Wijngaarden, Jan Willem; Avery, Matthew; Mills, Stephen	HIV prevalence and incidence among men who have sex with men and transgender women in Bangkok, 2014-2018: Outcomes of a consensus development initiative.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0262694	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8782340	To reach its goal of ending AIDS by 2030, Thailand has adopted antiretroviral treatment as prevention and HIV pre-exposure prophylaxis for men who have sex with men (MSM) and transgender women (TGW) as its core HIV control strategy. However, in the absence of reliable epidemiologic indicators, the impact of these policies on the course of the HIV epidemic in these groups remains unknown. To help answer this question, we formulated an HIV epidemic consensus initiative for Bangkok, Thailand, to analyze epidemiologic and program data and reach agreement between experts and stakeholders on the evolving state of the HIV epidemic among MSM and TGW. A customized Delphi process was used to consult and consolidate viewpoints of experts and stakeholders. Experts presented and discussed HIV prevalence and incidence data from recent and ongoing studies among MSM and TGW in Bangkok (2014 to 2018) during a meeting with stakeholders representing government, donors, and civil society. Agreement about the course of the HIV epidemic among MSM and TGW was attained by voting consensus. Based on presented data, meeting participants agreed that HIV prevalence and incidence had decreased among Bangkok MSM from 2014 to 2018. Despite these declines, HIV prevalence and incidence were found to remain high. This was particularly the case among younger MSM. Participants agreed that there was no evidence for a decrease in HIV prevalence and incidence among Bangkok TGW. Introduction of antiretroviral treatment as prevention and HIV pre-exposure prophylaxis may have contributed to these declines. However, HIV prevalence and incidence remained high, and no signs of a decrease were reported among Bangkok TGW. At the current rate of new HIV infections in MSM and TGW, Thailand will not reach its goal of ending AIDS by 2030. This HIV consensus initiative may serve as a model for building agreement and advocacy on epidemiologic and program data and their implications for a large metropolitan city. Article	2022	van Wees D.A.; Diexer S.; Rozhnova G.; Matser A.; den Daas C.; Heijne J.; Kretzschmar M.	Quantifying heterogeneity in sexual behaviour and distribution of STIs before and after pre-exposure prophylaxis among men who have sex with men	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2021-055227	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137008161&doi=10.1136%2fsextrans-2021-055227&partnerID=40&md5=474b8ce39f0e29c927abdc85d861cf94	Objectives: Pre-exposure prophylaxis (PrEP) use may influence sexual behaviour and transmission of STIs among men who have sex with men (MSM). We aimed to quantify the distribution of STI diagnoses among MSM in the Netherlands based on their sexual behaviour before and after the introduction of PrEP. Methods: HIV-negative MSM participating in a prospective cohort study (Amsterdam Cohort Studies) completed questionnaires about sexual behaviour and were tested for STI/HIV during biannual visits (2009–2019). We developed a sexual behaviour risk score predictive of STI diagnoses and used it to calculate Gini coefficients for gonorrhoea, chlamydia and syphilis diagnoses in the period before (2009 to mid-2015) and after PrEP (mid-2015 to 2019). Gini coefficients close to zero indicate that STI diagnoses are homogeneously distributed over the population, and close to one indicate that STI diagnoses are concentrated in individuals with a higher risk score. Results: The sexual behaviour risk score (n=630, n visits=10 677) ranged between 0.00 (low risk) and 3.61 (high risk), and the mean risk score increased from 0.70 (SD=0.66) before to 0.93 (SD=0.80) after PrEP. Positivity rates for chlamydia (4%) and syphilis (1%) remained relatively stable, but the positivity rate for gonorrhoea increased from 4% before to 6% after PrEP. Gini coefficients increased from 0.37 (95% CI 0.30 to 0.43) to 0.43 (95% CI 0.36 to 0.49) for chlamydia, and from 0.37 (95% CI 0.19 to 0.52) to 0.50 (95% CI 0.32 to 0.66) for syphilis comparing before to after PrEP. The Gini coefficient for gonorrhoea remained stable at 0.46 (95% CI 0.40 to 0.52) before and after PrEP. Conclusions: MSM engaged in more high-risk sexual behaviour and gonorrhoea diagnoses increased after PrEP was introduced. Chlamydia and syphilis diagnoses have become more concentrated in a high-risk subgroup. Monitoring the impact of increasing PrEP coverage on sexual behaviour and STI incidence is important. Improved STI prevention is needed, especially for high-risk MSM. © Author(s) (or their employer(s)) 2022. Article	2022	Vanhamel, Jef; Reyniers, Thijs; Wouters, Edwin; van Olmen, Josefien; Vanbaelen, Thibaut; Nöstlinger, Christiana; Mieghem, Heleen Van; Landeghem, Ella Van; Rotsaert, Anke; Laga, Marie; Vuylsteke, Bea	How Do Family Physicians Perceive Their Role in Providing Pre-exposure Prophylaxis for HIV Prevention?-An Online Qualitative Study in Flanders, Belgium.	Frontiers in Medicine (Lausanne)	-	-	-	2296-858X	10.3389/fmed.2022.828695	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9005841	Introduction: In Belgium, the provision of pre-exposure prophylaxis (PrEP) for HIV prevention is centralized in specialized HIV clinics. Engaging family physicians in PrEP care could help scale-up its delivery and reach underserved populations. The objective of this study was to gain insight into family physicians' self-perceived roles in providing PrEP. Methods: We conducted 16 online group discussions with a total of 105 Flemish family physicians, between November 2020 and February 2021. A brief online questionnaire assessed their socio-demographics and experience with sexual health. We analyzed verbatim transcribed data using a grounded theory approach. Results: Despite limited awareness and experience, participants reported a high willingness to be more actively involved in PrEP care. Four potential roles for the family physician in PrEP care were identified: acting as low-threshold entry point for advice; opportunistic case finding of PrEP candidates; initiating appropriate care for PrEP-eligible clients; and ensuring high-quality follow-up care for PrEP users. Participants framed each of these roles within their current activities and responsibilities as primary care providers. Yet, participants differed in their views on the concrete operationalization of these roles, and in the extent of their involvement in PrEP. Particular challenges were a lack of experience with antiretrovirals, perceived limited exposure to clients at high HIV risk, and a lack of expertise and resources to conduct time-intensive risk assessments and counseling related to PrEP. Conclusion: Belgian family physicians demonstrated a keen willingness to be involved in PrEP care, but had differing views on the practical implementation into their practices. Providing tailored training on sexual health and PrEP, and investing in collaboration between primary and secondary care, could optimize the integration of PrEP in the primary care practice.	pre-exposure prophylaxis, HIV prevention, family physicians, primary care, service delivery	English	Switzerland	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Qualitative
Theses and Dissertations	2022	Vargas Bernal, Esteban	Three studies on random walks and disease dynamics on networks	-	-	The Ohio State University	-	NA	NA	http://rave.ohiolink.edu/etdc/view?acc_num=osu1658156591819527	The projects presented in this thesis are related to disease dynamics and random walks on networks. These projects consider networks of different spatial scales. In one project, we consider vector-borne disease dynamics on discrete spatial locations connected by host movement. Specifically, we compare two commonly used modeling frameworks for host movements, the Lagrangian and the Eulerian frameworks. In the second project, we extend the widely-used community detection algorithm InfoMap to absorbing random walks. The third project is a detailed study of a sexual network among men who have sex with men (MSM) in Columbus, Ohio. In particular, this latter project involves application of the InfoMap extensions developed in project two. While the Lagrangian-Eulerian and InfoMap projects are seemingly quite different, there is a shared theme of random walks on networks that connects the different projects of the thesis. We define Lagrangian and Eulerian frameworks to be consistent if there is a graph Laplacian L (representing the movement in the Eulerian framework) such that the residence times of infectious hosts in the two frameworks match. We provide a sufficient condition for consistency in terms of the mixing matrix associated with the Lagrangian approach. We examine the two-patch case, where we observe that the basic reproduction numbers of the two frameworks can be similar even when the frameworks are not consistent. In contrast, disease quantities such as outbreak final size can be significantly different even when the two frameworks are consistent. The second project concerns the community-detection algorithm InfoMap developed by Rosvall and Bergstrom. InfoMap builds on regular Markov chains and information theory to detect tightly-knit sets of nodes of a network via the minimization of an objective function called the map function. We examine the effect of disease dynamics on community structure of a network by extending InfoMap to absorbing random walks. One of our InfoMap extensions has the desirable property that its map function converges to the map function of standard InfoMap when all of the absorption rates approach zero. We study additional properties of this extension.The third project consists of application of our InfoMap extensions to empirical data on sexual networks among MSM collected through the Network Epidemiology of Syphilis Transmission (NEST) study in Columbus, Ohio. We fit an exponential random graph model (ERGM) to the NEST data, and sample a network of the fitted ERGM for our analysis. We consider pre-exposure prophylaxis (PrEP) usage as a proxy for health-care seeking to define syphilis treatment rates. We study the effect of differential absorption rates associated with differential PrEP usage on effective community structure. We also study the effect of PrEP use on disease quantities such as probability of a large outbreak, final outbreak size, outbreak peak, infection prevalence, and outbreak duration. We establish relationships between these disease quantities and effective community…	Epidemiology; Mathematics	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Quantitative
Article	2022	Vartak R.; Jablonski J.; Deore B.; Mediouni S.; Sanhueza C.A.; Valente S.T.; Patel K.	Bictegravir nanomicelles and anionic pullulan loaded vaginal film: Dual mechanistic pre-exposure prophylaxis (PrEP) for HIV	International Journal of Biological Macromolecules	-	-	-	1418130	10.1016/j.ijbiomac.2022.08.211	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137360028&doi=10.1016%2fj.ijbiomac.2022.08.211&partnerID=40&md5=8aae257dec26d18e1d01d93132b155c3	Locally delivered pre-exposure prophylaxis (PrEP) has proven to be a promising strategy to combat Human immunodeficiency virus (HIV) transmission but several findings encountered toxicities or proved to be marginally effective in clinical settings. Therefore, innovative, multifunctional, and safer alternatives are being progressively investigated. Herein, we explored negatively charged carbohydrate, anionic pullulan (AP) as a rapidly soluble film-former and novel anti-HIV agent. Additionally, Bictegravir (BCT), an HIV integrase inhibitor was co-delivered in the form of nanomicelles for sustained antiviral activity. BCT-loaded PLGA-PEG polymeric nanomicelles (BN) were incorporated into PVA/pullulan-based film matrix comprising of 2 % w/v AP (BN-AP film). In cell-based assays, biocompatibility and TEER values for BN-AP films were similar to control while the commercial vaginal contraceptive film (VCF®) showed severe cytotoxicity and drastically reduced the tight junction integrity. Rapid disintegration of BN-AP film with >85 % drug release was observed in simulated vaginal and seminal fluid. Most importantly, AP and BN-AP film significantly inhibited HIV-1 replication with IC50 at as low as 91 μg/mL and 0.708 nM, respectively. Therefore, this study entails successful development of BN-AP film that functioned as an effective, biocompatible dual-acting PrEP formulation. © 2022 Elsevier B.V. Article	2022	Vasco E.K.; Crowley T.	Young women's lived experiences of using PrEP in Namibia: A qualitative phenomenological study	International Journal of Africa Nursing Sciences	-	-	-	22141391	10.1016/j.ijans.2022.100481	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140734627&doi=10.1016%2fj.ijans.2022.100481&partnerID=40&md5=3d28e8cd42208f08cbd91ae0440210d1	Background: Young women are more likely to acquire Human Immunodeficiency Virus (HIV) than other population groups. Pre-exposure prophylaxis (PrEP) is using antiretroviral medicines by HIV-negative individuals before HIV exposure to avert HIV infection. Various conditions may influence women's decisions to initiate and continue PrEP. Objective: This study aimed to explore young women's lived experiences using PrEP in the Rundu district, Namibia. Method: Face-to-face in-depth interviews were conducted with nine young women between 21 and 24 years who had experience of current or previous use of PrEP and attended at least one follow-up visit after commencing PrEP. Colaizzi's seven-step process of qualitative data analysis was used to analyse data. Findings: Young women were aware of their risk of acquiring HIV, prompting them to use PrEP. These risks included a lack of awareness of their partner's HIV status, a lack of trust in their partners, or being in a sexual relationship with a partner living with HIV. Awareness also emanated from information provided by healthcare workers, peers and the media. Using PrEP empowered young women for self-care by enabling them to make choices about managing their risk. Some women persisted using PrEP despite several challenges, including the lack of privacy, stigma and inadequate support. Conclusion: PrEP is an empowering HIV prevention strategy for young women; however, much still needs to be done to promote young women's willingness to initiate and continue PrEP. © 2022 The Authors	HIV prevention; Human Immunodeficiency Virus; Lived experiences; Pre-exposure prophylaxis; Young women	English	Netherlands	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Qualitative
Article	2022	Vega-Ramirez, Hamid; Torres, Thiago S; Guillen-Diaz, Centli; Pimenta, Cristina; Diaz-Sosa, Dulce; Konda, Kelika A; da Cunha, Alessandro Ricardo Caruso; Robles-Garcia, Rebeca; Benedetti, Marcos; Hoagland, Brenda; Bezerra, Daniel R B; Caceres, Carlos F; Grinsztejn, Beatriz; Veloso, Valdilea G	Awareness, knowledge, and attitudes related to HIV pre-exposure prophylaxis and other prevention strategies among physicians from Brazil and Mexico: cross-sectional web-based survey.	BMC Health Services Research	-	-	-	1472-6963	10.1186/s12913-022-07900-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9027096	BACKGROUND: In order to end the HIV epidemic by 2030, combination HIV prevention including pre-exposure prophylaxis (PrEP) should be widely available, especially for the most vulnerable populations. In Latin America and the Caribbean (LAC), only 14 out of 46 countries have access to PrEP. In Brazil and Mexico, PrEP has been provided at no cost through the Public Health System since 2017 and 2021, respectively. Thus, HIV physicians' perspectives about PrEP and other prevention strategies may differ. This study aimed to compare awareness, knowledge, and attitudes related to PrEP and other prevention strategies among HIV physicians from Brazil and Mexico. METHODS: Cross-sectional, web-based survey targeting physicians who prescribe antiretrovirals from both countries. Participants answered questions on socio-demographic, medical experience, awareness, knowledge, and attitudes towards PrEP and other HIV prevention strategies. We stratified all variables per country and compared frequencies using Chi-square, Fisher exact, and Wilcoxon-Mann-Whitney tests, as appropriate. RESULTS: From January-October 2020, 481 HIV physicians were included: 339(70.5%) from Brazil, 276(57.4%) male, and median age was 43 years (IQR = 36-53). Awareness of PrEP did not differ between Brazil and Mexico (84.6%), while awareness of other prevention strategies, including post-exposure prophylaxis and new PrEP technologies, was higher in Brazil. More Brazilians perceived U=U as completely accurate compared to Mexicans (74.0% vs. 62.0%, P < .001). Willingness to prescribe PrEP was 74.2%, higher among Brazilians (78.2%, P = .01). Overall, participants had concerns about consistent access to PrEP medication and the risk of antiretroviral resistance in case of acute HIV infection or seroconversion. The main barriers reported were assumptions that users could have low PrEP knowledge (62.0%) or limited capacity for adherence (59.0%). Compared to Brazilians, Mexicans reported more concerns and barriers to PrEP prescription (all; P ≤ .05), except for consistent access to PrEP medication and the lack of professionals to prescribe PrEP (both; P ≤ .01). CONCLUSIONS: Although awareness of PrEP was similar in Brazil and Mexico, differences in knowledge and attitudes may reflect the availability and stage of PrEP implementation in these countries. Strengthening and increasing information on PrEP technologies and other HIV prevention strategies among HIV physicians could improve their comfort to prescribe these strategies and facilitate their scale-up in LAC. Article	2022	Velloza, Jennifer; Donnell, Deborah; Hosek, Sybil; Anderson, Peter L; Chirenje, Z Mike; Mgodi, Nyaradzo; Bekker, Linda-Gail; Marzinke, Mark A; Delany-Moretlwe, Sinead; Celum, Connie	Alignment of PrEP adherence with periods of HIV risk among adolescent girls and young women in South Africa and Zimbabwe: a secondary analysis of the HPTN 082 randomised controlled trial.	The Lancet HIV	-	-	2352-3018	10.1016/S2352-3018(22)00195-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9530001	BACKGROUND: Adolescent girls and young women in southern and eastern Africa have adherence challenges with daily oral HIV pre-exposure prophylaxis (PrEP). High adherence is most important during periods of HIV risk (prevention-effective adherence). We aimed to describe HIV risk behaviour and to understand patterns in PrEP adherence during periods of risk among adolescent girls and young women from sub-Saharan Africa. METHODS: We did a secondary analysis of the HPTN 082 trial, an open-label, interventional, randomised controlled trial of sexually active adolescent girls and young women (aged 16-25 years) testing negative for HIV in Johannesburg and Cape Town, South Africa, and in Harare, Zimbabwe. The primary outcomes were high cumulative PrEP adherence, dichotomised as intracellular tenofovir diphosphate concentrations of at least 700 fmol/punch in dried blood spots at weeks 13, 26, and 52, and high recent PrEP adherence, dichotomised as plasma tenofovir concentrations of at least 40 ng/mL at weeks 13, 26, and 52, among participants who accepted PrEP. We collected data on sexual behaviour every 3 months. We categorised visits into a binary variable of any HIV risk based on condomless sex, more than one sexual partner, primary partner's HIV status and antiretroviral use, transactional sex, drug or alcohol use around sexual activity, and laboratory-diagnosed STIs. We used generalised estimating equations to evaluate associations between HIV risk (reflecting behaviour during the previous 3 months) and high cumulative and recent adherence to PrEP and any PrEP use (quantifiable drug concentrations). The trial is registered with ClinicalTrials.gov, NCT02732730. FINDINGS: Between Oct 12, 2016, and Oct 25, 2018, 451 women were recruited, and 427 participants (median age 21·0 years IQR 19·0-22·0) were eligible for inclusion in this analysis. The proportion of participants reporting at least one HIV risk factor decreased significantly over follow-up, from 364 (85%) participants at enrolment, 226 (60%) at week 13, and 243 (65%) at week 26, to 224 (61%) at week 52 (p<0·0001). Any HIV risk was significantly associated with high PrEP adherence, measured by both tenofovir diphosphate concentrations of at least 700 fmol/punch (adjusted relative risk 1·57 95% CI 1·09-2·25; p=0·014) and plasma tenofovir concentrations of at least 40 ng/mL (1·36 1·11-1·65; p=0·0025). Any HIV risk was also associated with quantifiable concentrations of tenofovir diphosphate (1·15 1·03-1·29; p=0·013) and tenofovir (1·27 1·09-1·49; p=0·0022). We observed significant dose-response relationships between number of HIV risk factors and PrEP drug concentrations. INTERPRETATION: The association between any HIV risk and high PrEP adherence suggests that adolescent girls and young women were able to use PrEP during periods of risk, an indicator of prevention-effective PrEP adherence. Our findings support a shift in the PrEP framework to acknowledge prevention-effective adherence practices, which might improve PrEP delivery and adherence support for adolescent girls and young women in HIV-endemic settings. Article	2022	Velloza, Jennifer; Poovan, Nicole; Ndlovu, Nontokozo; Khoza, Nomhle; Morton, Jennifer F; Omony, Jeanne; Mkwanazi, Edwin; Grabow, Cole; Donnell, Deborah; Munthali, Richard; Baeten, Jared M; Hosek, Sybil; Celum, Connie; Delany-Moretlwe, Sinead	Adaptive HIV pre-exposure prophylaxis adherence interventions for young South African women: Study protocol for a sequential multiple assignment randomized trial.	PLOS One	-	-	1932-6203	10.1371/journal.pone.0266665	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9007385	INTRODUCTION: Pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention strategy and is recommended for populations at risk of HIV, including adolescent girls and young women (AGYW) in HIV endemic settings. However, PrEP continuation and high adherence remain challenges to its impact. Existing PrEP adherence interventions can be time- and cost-intensive. Widescale PrEP delivery will require the identification of layered PrEP support strategies for AGYW with diverse prevention needs. We describe the design of a sequential multiple assignment randomized trial (SMART) to evaluate a PrEP adherence support model using scalable, stepped interventions in AGYW in South Africa. METHODS: "PrEP SMART" is a randomized trial in Johannesburg, South Africa, enrolling AGYW who are between 18 and 25 years of age, sexually active, newly initiating PrEP, and have regular access to a mobile phone. Participants are randomized 1:1 to standard-of-care PrEP counseling with either two-way SMS or WhatsApp group adherence support. Adherence is assessed at three months using tenofovir diphosphate (TFV-DP) levels from dried blood spots collected at month 2 to categorize participants as "responders" (TFV-DP ≥500 fmol/punch) or "non-responders" (TFV-DP <500 fmol/punch). AGYW defined as 'non-responders' undergo a secondary 1:1 randomization to either quarterly drug-level feedback counseling or monthly issue-focused counseling, in addition to their first-level intervention. The primary outcome is PrEP adherence at nine months (TFV-DP ≥700 fmol/punch). We will assess the effect of our two initial interventions on TFV-DP levels among responders, assess the effect of our intensified interventions on TFV-DP levels among non-responders, and identify the optimal sequence of adherence interventions through nine months. TRIAL REGISTRATION: ClinicalTrials.gov, NCT04038060. Registered on 30 July 2019. Article	2022	Velter, A; Ousseine, Y M; Duchesne, L; Lydie, N	Non-use of combination HIV prevention tools and its determinants among men who have sex with men living in France.	Infectious Diseases Now	-	-	2666-9919	10.1016/j.idnow.2022.06.002	https://dx.doi.org/10.1016/j.idnow.2022.06.002	OBJECTIVES: This study explores sexual HIV preventive behaviors of men who have sex with men (MSM), including the use of treatment as prevention (TasP) and PrEP, during their most recent anal intercourse (MRAI) with a casual partner. We especially look at factors associated with the non-use of these prevention tools during MRAI with a casual partner. PATIENTS AND METHODS: Data were extracted from the cross-sectional online survey called 'Rapport au sexe 2019', conducted in France among MSM. We performed univariate analyses to describe respondents' characteristics, and simple and multiple logistic regression models to investigate the associations between unprotected MRAI with a casual partner and personal characteristics and situational determinants. Statistical analyses were performed using Stata software version 15. RESULTS: Among participants, 76.2% self-reported they were HIV-negative, 9.7% HIV-positive, and 14.1% were unaware of their HIV status. Condoms were the most common prevention tool used during MRAI. The use of TasP was reported by 29.1% of HIV-positive respondents and PrEP by 17.8% of HIV-negative respondents. The proportion of MSM who declared no prevention practice was significant (24.7%). A high level of social vulnerability was associated with unprotected anal intercourse in HIV-negative and unknown HIV status respondents. CONCLUSIONS: Our findings underline the existence of specific vulnerable groups at great risk of HIV infection. Prevention programs must be adapted to the entire MSM population in all its diversity by promoting the whole range of current prevention tools. Article	2022	Venkatesan Chakrapani; Newman, Peter A; Shunmugam, Murali; Rawat, Shruta; Baruah, Dicky; Nelson, Ruban; Roungkraphon, Surachet; Suchon Tepjan	PrEP eligibility, HIV risk perception, and willingness to use PrEP among high-risk men who have sex with men in India: A cross-sectional survey	AIDS Care	-	-	09540121	10.1080/09540121.2021.1887801	https://www.proquest.com/scholarly-journals/prep-eligibility-hiv-risk-perception-willingness/docview/2645751973/se-2?accountid=8113	HIV pre-exposure prophylaxis (PrEP) is not yet included in India's national AIDS program, with demonstration projects for MSM in planning stages. In order to support PrEP roll-out for MSM, we assessed: (1) associations between guideline-informed PrEP eligibility, HIV risk perception, and perceived PrEP benefits and costs, with willingness to use PrEP (WTUP); and (2) correlates of non-WTUP among PrEP-eligible MSM. Data were collected from MSM (n = 197) sampled from cruising sites in Mumbai and Chennai. More than half (58.4%) reported inconsistent condom use with male partners, 88.3% >1 male partner, and 48.6% engaging in sex work (all past month). Overall, 76.6% reported they would "definitely use" PrEP. Among 92.9% deemed PrEP-eligible, 79.2% reported WTUP. In adjusted analyses, PrEP eligibility (aOR = 5.31, 95% CI 1.11, 25.45), medium (aOR = 2.41, 95% CI 1.03, 5.63) or high (aOR = 13.08, 95% CI 1.29, 132.27) perceived HIV risk, and greater perceived benefits (aOR = 1.13, 95% CI 1.03, 1.24) were associated with higher odds of WTUP. Among PrEP-eligible MSM, non-WTUP was associated with low HIV risk perception and lower perceived benefits. Facilitating accurate risk assessment and promoting awareness of PrEP benefits and eligibility criteria may increase PrEP uptake among MSM in India. Article	2022	Vermeer W.; Gurkan C.; Hjorth A.; Benbow N.; Mustanski B.M.; Kern D.; Brown C.H.; Wilensky U.	Agent-based model projections for reducing HIV infection among MSM: Prevention and care pathways to end the HIV epidemic in Chicago, Illinois	PLOS One	-	-	19326203	10.1371/journal.pone.0274288	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140271686&doi=10.1371%2fjournal.pone.0274288&partnerID=40&md5=8c0b04b597727ec45a7d0442244c16b6	Our objective is to improve local decision-making for strategies to end the HIV epidemic using the newly developed Levers of HIV agent-based model (ABM). Agent-based models use computer simulations that incorporate heterogeneity in individual behaviors and interactions, allow emergence of systemic behaviors, and extrapolate into the future. The Levers of HIV model (LHM) uses Chicago neighborhood demographics, data on sex-risk behaviors and sexual networks, and data on the prevention and care cascades, to model local dynamics. It models the impact of changes in local preexposure prophylaxis (PrEP) and antiretroviral treatment (ART) (ie, levers) for meeting Illinois' goal of "Getting to Zero" (GTZ) — reducing by 90% new HIV infections among men who have sex with men (MSM) by 2030. We simulate a 15-year period (2016-2030) for 2304 distinct scenarios based on 6 levers related to HIV treatment and prevention: (1) linkage to PrEP for those testing negative, (2) linkage to ART for those living with HIV, (3) adherence to PrEP, (4) viral suppression by means of ART, (5) PrEP retention, and (6) ART retention. Using tree-based methods, we identify the best scenarios at achieving a 90% HIV infection reduction by 2030. The optimal scenario consisted of the highest levels of ART retention and PrEP adherence, next to highest levels of PrEP retention, and moderate levels of PrEP linkage, achieved 90% reduction by 2030 in 58% of simulations. We used Bayesian posterior predictive distributions based on our simulated results to determine the likelihood of attaining 90% HIV infection reduction using the most recent Chicago Department of Public Health surveillance data and found that projections of the current rate of decline (2016-2019) would not achieve the 90% (p = 0.0006) reduction target for 2030. Our results suggest that increases are needed at all steps of the PrEP cascade, combined with increases in retention in HIV care, to approach 90% reduction in new HIV diagnoses by 2030. These findings show how simulation modeling with local data can guide policy makers to identify and invest in efficient care models to achieve long-term local goals of ending the HIV epidemic. © 2022 Vermeer et al. Article	2022	Versteegh, Lisbeth; Amatavete, Sorawit; Chinbunchorn, Tanat; Thammasiha, Noppawith; Mukherjee, Shreoshee; Popping, Stephanie; Triamvichanon, Ratthaphon; Pusamang, Artit; Colby, Donn J; Avery, Matthew; Mills, Stephen; Phanuphak, Nittaya; Ramautarsing, Reshmie A; van de Vijver, David	The epidemiological impact and cost-effectiveness of key population-led PrEP delivery to prevent HIV among men who have sex with men in Thailand: A modelling study.	The Lancet Regional Health - Americas	-	-	2772-3682	10.1016/j.lansea.2022.100097	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10305989	Background: Although key populations (KPs), such as men-who-have-sex-with-men (MSM) are disproportionately affected by HIV, many prevention and treatment services are not easily accessible for KP members. To address the needs of KPs, Thailand established pre-exposure prophylaxis (PrEP) service delivery together with and led by KP members. This study determines the epidemiological impact and cost-effectiveness of key population-led (KP-led) PrEP. Methods: We calibrated a compartmental deterministic HIV transmission model to the HIV epidemic among Thai MSM. Besides KP-led PrEP, we included other Thai service delivery models of PrEP (fee-based PrEP, the government PrEP program).Data on consistent PrEP use (5 years daily use, 95% effectiveness for preventing HIV) came from Thai PrEP delivery models. For the period 2015-2032, we ranged the number of PrEP starters (40,000-120,000), effectiveness of PrEP (45%-95%), and proportion of consistent users (10%-50%). The analysis started in 2015 when PrEP was introduced. A cost-effectiveness ratio of <160,000 Baht per quality-adjusted life year (QALY) over 40 years was cost-effective. Findings: Without PrEP, 53,800 (interquartile range 48,700-59,700) new HIV infections are expected in 2015-2032. KP-led PrEP was found to have the strongest epidemiological impact of all delivery models averting 58% of infections compared to without PrEP. The epidemiological impact depends on the number of PrEP starters and proportion of consistent use. Although all PrEP service delivery models are cost-effective, KP-led PrEP is most cost-effective with incremental cost-effectiveness ratios of 28,000-37,300 Thai Baht per QALY. Interpretation: Our model projects KP-led PrEP having the greatest epidemiological impact and being the most cost-effective service delivery model of PrEP in Thailand. Funding: This study was supported by the US Agency for International Development and U.S. President's Emergency Plan for AIDS Relief through the Linkages Across the Continuum of HIV Services for Key Populations cooperative agreement (AID-OAA-A-14- 0045) managed by FHI 360. Article	2022	Viamonte M.; Ghanooni D.; Reynolds J.M.; Grov C.; Carrico A.W.	Running with Scissors: a Systematic Review of Substance Use and the Pre-exposure Prophylaxis Care Continuum Among Sexual Minority Men	Current HIV/AIDS Reports	-	-	15483568	10.1007/s11904-022-00608-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131796991&doi=10.1007%2fs11904-022-00608-y&partnerID=40&md5=8ce60b04a95cce7a51c2c76e47eaa4ae	Purpose of Review: Patterns of sexualized drug use, including stimulants (e.g., methamphetamine) and chemsex drugs, are key drivers of HIV incidence among sexual minority men (SMM). Although pre-exposure prophylaxis (PrEP) mitigates HIV risk, there is no consensus regarding the associations of substance use with the PrEP care continuum. Recent Findings: SMM who use substances are as likely or more likely to use PrEP. Although SMM who use stimulants experience greater difficulties with daily oral PrEP adherence, some evidence shows that SMM who use stimulants or chemsex drugs may achieve better adherence in the context of recent condomless anal sex. Finally, SMM who use substances may experience greater difficulties with PrEP persistence (including retention in PrEP care). Summary: SMM who use stimulants and other substances would benefit from more comprehensive efforts to support PrEP re-uptake, adherence, and persistence, including delivering behavioral interventions, considering event-based dosing, and providing injectable PrEP. © 2022, The Author(s). Article	2022	Vidal, Samuel J; Bekerman, Elena; Hansen, Derek; Lu, Bing; Wang, Kelly; Mwangi, Judy; Rowe, William; Campigotto, Federico; Zheng, Jim; Kato, Darryl; Chandrashekar, Abishek; Barrett, Julia; Patel, Shivani; Wan, Huahua; Anioke, Tochi; Mercado, Noe B; Nkolola, Joseph P; Ferguson, Melissa J; Rinaldi, William J; Callebaut, Christian; Blair, Wade; Cihlar, Tomas; Geleziunas, Romas; Yant, Stephen R; Barouch, Dan H	Long-acting capsid inhibitor protects macaques from repeat SHIV challenges.	Nature	-	-	1476-4687	10.1038/s41586-021-04279-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8753592	Because no currently available vaccine can prevent HIV infection, pre-exposure prophylaxis (PrEP) with antiretrovirals (ARVs) is an important tool for combating the HIV pandemic1,2. Long-acting ARVs promise to build on the success of current PrEP strategies, which must be taken daily, by reducing the frequency of administration3. GS-CA1 is a small-molecule HIV capsid inhibitor with picomolar antiviral potency against a broad array of HIV strains, including variants resistant to existing ARVs, and has shown long-acting therapeutic potential in a mouse model of HIV infection4. Here we show that a single subcutaneous administration of GS-CA1 provides long-term protection against repeated rectal simian-human immunodeficiency virus (SHIV) challenges in rhesus macaques. Whereas all control animals became infected after 15 weekly challenges, a single 300 mg kg-1 dose of GS-CA1 provided per-exposure infection risk reduction of 97% for 24 weeks. Pharmacokinetic analysis showed a correlation between GS-CA1 plasma concentration and protection from SHIV challenges. GS-CA1 levels greater than twice the rhesus plasma protein-adjusted 95% effective concentration conferred 100% protection in this model. These proof-of-concept data support the development of capsid inhibitors as a novel long-acting PrEP strategy in humans. Article	2022	Viera, Adam; van den Berg, Jacob J.; Sosnowy, Collette D.; Mehta, Nikita A.; Edelman, E. Jennifer; Kershaw, Trace; Chan, Philip A.	Barriers and Facilitators to HIV Pre-Exposure Prophylaxis Uptake Among Men Who have Sex with Men Who Use Stimulants: A Qualitative Study	AIDS and Behavior	-	-	10907165	10.1007/s10461-022-03633-5	https://www.proquest.com/scholarly-journals/barriers-facilitators-hiv-pre-exposure/docview/2700906650/se-2?accountid=8113	The HIV epidemic disproportionately impacts men who have sex with men (MSM), particularly those who use stimulants. We explored barriers and facilitators to pre-exposure prophylaxis (PrEP) uptake among this population. From June 2018 through February 2019, we conducted semi-structured interviews in Providence, Rhode Island, and New Haven, Connecticut, with 21 MSM who reported recent (past six months) stimulant use. We identified individual, interpersonal, and structural barriers to PrEP, including: (1) high awareness but mixed knowledge of PrEP, resulting in concerns about side effects and drug interactions; (2) interest that was partly determined by substance use and perceived HIV risk; (3) fragmented and constrained social networks not conducive to disseminating PrEP information; and (4) PrEP access, such as insurance coverage and cost. Our findings suggest potential approaches to increase PrEP uptake in this group, including promotion through mainstream and social media, clarifying misinformation, and facilitating increased access through structural interventions. Article	2022	Villalba, Karina; Jean-Gilles, Michele; Rosenberg, Rhonda; Cook, Robert L; Ichite, Amanda; Martin, Pilar; Dévieux, Jessy G	Understanding the Impact of Intimate Partner Violence Type and Timing on Pre-exposure Prophylaxis Knowledge, Acceptability, Sexual Behavior, and Gender Roles Among Women of Color.	Journal of Interpersonal Violence	-	-	1552-6518	10.1177/08862605211001468	https://dx.doi.org/10.1177/08862605211001468	Knowledge and acceptability are key factors for pre-exposure prophylaxis (PrEP) use among women with a history of intimate partner violence (IPV) and research suggests that different types of IPV affect PrEP uptake differently. Few studies have examined whether the type (i.e., physical, sexual, and psychological) and timing (i.e., lifetime, past year) of IPV experiences are related to PrEP knowledge and acceptability, or whether gender roles and sexual risk behaviors affect PrEP use. We aimed to examine the associations between lifetime and past-year physical, sexual, and psychological IPV experiences on PrEP-related outcomes (i.e., knowledge, acceptability, sexual behavior if on PrEP) and the association between gender roles and PrEP-related outcomes. A total of 186 women of color at risk for HIV participated in this study, of whom 54% had ever experienced partner violence. Results showed that lifetime psychological (OR 3.0, 95% CI 1.1-9.4) and lifetime physical IPV (OR 5.5, 95% CI 1.2-18.9) were significantly associated with increased PrEP knowledge. lifetime psychological (OR 6.3, 95% CI 1.0-13.6) and lifetime physical IPV (OR 4.3, 95% CI 4.3-11.5) were significantly associated with increased sexual behavior if on PrEP. Past year physical IPV was significantly associated with interest in using PrEP (OR 1.9, 95% CI 1.7-4.3) and with sexual behavior if on PrEP (OR 4.0, 95% CI 1.1-13.1). Being subordinate to others was also significantly associated with interest in using PrEP (OR 1.5, 95% CI 1.2-2.4) Self-silencing was significantly associated with increased sexual behavior if on PrEP (OR 1.2, 95% CI 1.0-1.5). Gender norms and IPV type and timing can influence whether a person is interested in PrEP use. Both lifetime and past-year IPV experiences need to be examined in the context of gender norms when prescribing PrEP to encourage uptake and continuation among vulnerable women at risk for HIV. Article	2022	Vincent W.; McFarland W.	Missed opportunities for healthcare providers to discuss HIV preexposure prophylaxis with people who inject drugs	International Journal of Drug Policy	-	-	9553959	10.1016/j.drugpo.2022.103873	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139835824&doi=10.1016%2fj.drugpo.2022.103873&partnerID=40&md5=c1d44d7ff55ecfb5965f227dcd3cce3c	Objective: To identify missed opportunities for healthcare providers to discuss HIV pre-exposure prophylaxis (PrEP) with people who inject drugs (PWID). Methods: Participants were 395 HIV-negative PWID recruited for the 2018 National HIV Behavioral Surveillance survey in San Francisco, California via respondent-driven sampling. Adjusted logistic regression tested whether discussing PrEP with a provider in the last year was associated with sociodemographic characteristics, structural factors, and accessing HIV/STI and substance use treatment services. Results: Most PWID (86.3%) reported seeing a healthcare provider, but only 15.0% of these reported discussing PrEP with a healthcare provider. PWID who were sexual minority men had greater odds of having a discussion about PrEP with a healthcare provider than PWID who were heterosexual men (aOR=3.42, 95% CI=1.21-9.73) or heterosexual women (aOR=3.69, 95% CI=1.08-12.62). Additionally, factors associated with discussing PrEP included: being tested for HIV (aOR=4.29, 95% CI=1.21-15.29), having a healthcare provider recommend HIV testing (aOR=2.95, 95% CI=1.23-7.06), and receiving free condoms from a prevention program (aOR=5.45, 95% CI=1.78-16.65). Conclusions: In the face of low PrEP uptake, continuing HIV transmission, and many missed opportunities to discussed PrEP (e.g., PWID who are women, substance use treatment services), these findings from San Francisco indicate that healthcare providers and public health efforts need to systematically offer PrEP to PWID. Additional research may clarify missed opportunities in other locations as well as the impact of COVID-19. © 2022	Harm reduction; Healthcare providers; HIV; People who inject drugs; Pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Violette, Lauren R; Cornelius-Hudson, Andy; Snidarich, Madison; Niemann, Lisa A; Assennato, Sonny Michael; Ritchie, Allyson; Goel, Neha; Chavez, Pollyanna R; Ethridge, Steven F; Katz, David A; Lee, Helen; Delaney, Kevin P; Stekler, Joanne D	Evaluation of SAMBA II: A Qualitative and Semiquantitative HIV Point-of-Care Nucleic Acid Test.	Journal of Acquired Immune Deficiency Syndromes	-	-	1944-7884	10.1097/QAI.0000000000002902	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9058199	BACKGROUND: Point-of-care (POC) nucleic acid tests (NATs) have potential to diagnose acute HIV infection and monitor persons taking pre-exposure prophylaxis or antiretroviral therapy (ART). POC NATs have not yet been evaluated in the US. METHODS: From June 2018-March 2019, we conducted a cross-sectional evaluation of the Simple Amplification-Based Assay version II (SAMBA II) POC NAT. People with HIV (PWH) and persons testing for HIV were tested with the SAMBA II qualitative (Qual) whole blood (WB) test. From April-September 2019, the Qual test was used on persons who were ART-naive, and SAMBA II Semi-quantitative (Semi-Q) WB was used with ART-experienced PWH. Both were performed on unprocessed venipuncture (VP) and, when indicated by protocol, fingerstick (FS) WB and plasma. SAMBA results were compared with Abbott RealTime HIV-1 polymerase chain reaction results on plasma. We calculated sensitivity, specificity, and concordance between tests. RESULTS: SAMBA was used in 330 visits among 280 participants: 202 (61.2%) visits from PWH, and 128 (38.8%) from HIV-negative persons. Qual test sensitivity with ART-naive participants was 91.4% 32/35, 95% confidence interval (CI): 77.6% to 97.0% using VP WB and 100% (27/27, 95% CI: 87.5% to 100%) using FS WB. Specificity was 100% using both specimen types. Concordance between the gold standard and Semi-Q at 1000 copies/mL among PWH on ART was 97.7% (86/88, 95% CI: 92.1% to 99.4%) and 100% (30/30, 95% CI: 88.7% to 100%) using VP and FS WB, respectively. CONCLUSIONS: The SAMBA II POC NATs showed high sensitivity, specificity, and concordance with the gold standard assay, indicating its potential use in diagnostics and monitoring. Future work will evaluate POC NAT implementation in the US.	point-of-care, nucleic acid test, acute HIV infection, HIV testing, ART monitoring	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Volpe-Zanutto, Fabiana; Vora, Lalitkumar K; Tekko, Ismaiel A; McKenna, Peter E; Permana, Andi Dian; Sabri, Akmal H; Anjani, Qonita K; McCarthy, Helen O; Paredes, Alejandro J; Donnelly, Ryan F	Hydrogel-forming microarray patches with cyclodextrin drug reservoirs for long-acting delivery of poorly soluble cabotegravir sodium for HIV Pre-Exposure Prophylaxis.	Journal of Controlled Release	-	-	1873-4995	10.1016/j.jconrel.2022.06.028	https://dx.doi.org/10.1016/j.jconrel.2022.06.028	Hydrogel-forming microarray patches (HF-MAPs) offer minimally invasive, pain-free and prolonged drug delivery. These devices are designed to be self-administered and self-disabling, avoiding contaminated sharps waste generation. Cabotegravir sodium (CAB-Na) is a poorly soluble anti- human immunodeficiency virus (HIV) drug for the treatment and pre-exposure prophylaxis of HIV infection that lends itself to depot formation following intradermal delivery but presents significant challenges when delivered via HF-MAPs, whose nature is aqueous. Herein, we have investigated, for the first time, the use of hydroxypropyl-β-cyclodextrin (HP-β-CD) to enhance the solubility of CAB-Na, and its effect on intradermal delivery via HF-MAPs. Accordingly, tablet reservoirs containing CAB-Na and HP-β-CD were formulated. These novel reservoirs were combined with two different HF-MAP formulations (MAP1 (Gantrez S97® + poly (ethylene glycol) 10,000 + Na2CO3) and MAP2 (poly (vinyl pyrrolidone) 58 kDa + poly (vinyl alcohol) 85-120 kDa + citric acid)) to form fully integrated MAP devices which were tested in both ex vivo and in vivo settings. Ex vivo skin deposition results for MAP1 and MAP2 showed that 141 ± 40 μg and 342 ± 34 μg of CAB-Na was deposited into 0.5 cm2 of excised neonatal porcine skin after 24 h, respectively. Based on these findings, the in vivo pharmacokinetics of MAP2 were investigated over 28 days using a Sprague-Dawley rat model. After 24 h patch application, MAP2 demonstrated an extended drug release profile and an observed Cmax of 53.4 ± 10.16 μg/mL, superior to that of an FDA-approved CAB-nanosuspension administered via intramuscular application (Cmax of 43.6 ± 5.3 μg/mL). Consequently, this tablet integrated MAP device is considered to be a viable option for the intradermal delivery of hydrophobic anti-HIV drugs. Article	2022	Vyas, Darshali A.; Marinacci, Lucas; Bearnot, Benjamin; Wakeman, Sarah E.; Sundt, Thoralf M.; Jassar, Arminder S.; Triant, Virginia A.; Nelson, Sandra B.; Dudzinski, David M.; Paras, Molly L.	Creation of a Multidisciplinary Drug Use Endocarditis Treatment (DUET) Team: Initial Patient Characteristics, Outcomes, and Future Directions.	Open Forum Infectious Diseases	-	-	2328-8957	10.1093/ofid/ofac047	https://pubmed.ncbi.nlm.nih.gov/35252467/	BACKGROUND: Consensus guidelines recommend multidisciplinary models to manage infective endocarditis, yet often do not address the unique challenges of treating people with drug use-associated infective endocarditis (DUA-IE). Our center is among the first to convene a Drug Use Endocarditis Treatment (DUET) team composed of specialists from Infectious Disease, Cardiothoracic Surgery, Cardiology, and Addiction Medicine. METHODS: The objective of this study was to describe the demographics, infectious characteristics, and clinical outcomes of the first cohort of patients cared for by the DUET team. This was a retrospective chart review of patients referred to the DUET team between August 2018 and May 2020 with DUA-IE. RESULTS: Fifty-seven patients were presented to the DUET team between August 2018 and May 2020. The cohort was young, with a median age of 35, and injected primarily opioids (82.5% heroin/fentanyl), cocaine (52.6%), and methamphetamine (15.8%). Overall, 14 individuals (24.6%) received cardiac surgery, and the remainder (75.4%) were managed with antimicrobial therapy alone. Nearly 65% of individuals were discharged on medication for opioid use disorder, though less than half (36.8%) were discharged with naloxone and only 1 patient was initiated on HIV pre-exposure prophylaxis. Overall, the cohort had a high rate of readmission (42.1%) within 90 days of discharge. CONCLUSIONS: Multidisciplinary care models such as the DUET team can help integrate nuanced decision-making from numerous subspecialties. They can also increase the uptake of addiction medicine and harm reduction tools, but further efforts are needed to integrate harm reduction strategies and improve follow-up in future iterations of the DUET team model.	substance use; drug use; endocarditis; multidisciplinary team	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review

We examined factors associated with PrEP persistence among Greek SMM in PrEP for Greece, the first PrEP study in Greece. Participants (n = 100) were recruited from 2016 to 2018 through respondent-driven sampling among SMM in Athens, receiving supplies for daily PrEP at interval visits over 12-months. PrEP persistence, operationalized as Total PrEP Time, was high, 74% of participants achieving perfect persistence. Higher alcohol risk scores (OR 1.27, 95% CI 1.08–1.49) and adherence to HIV testing guidelines (OR 1.23, 95% CI 1.00–1.51) were associated with persistence. Housing impermanence (OR 0.14, 95% CI 0.04–0.48) and serostatus disclosure concerns (OR 0.77, 95% CI 0.60–0.97) were associated with limited PrEP persistence. While PrEP persistence among Greek SMM is high, socioeconomic factors and societal attitudes may challenge prevention efforts. Article	2022	Wahome, Elizabeth; Boyd, Anders; Thiong'o, Alexander N; Mohamed, Khamisi; Oduor, Tony; Gichuru, Evans; Mwambi, John; van der Elst, Elise; Graham, Susan M; Prins, Maria; Sanders, Eduard J	Stopping and restarting PrEP and loss to follow-up among PrEP-taking men who have sex with men and transgender women at risk of HIV-1 participating in a prospective cohort study in Kenya.	HIV Medicine	-	-	1468-1293	10.1111/hiv.13237	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9276557	OBJECTIVE: To assess frequency and predictors of switching between being on and off PrEP and being lost to follow-up (LTFU) among men who have sex with men (MSM) and transgender women (TGW) with access to PrEP services in Sub-Saharan Africa. METHODS: This was a prospective cohort study of MSM and TGW from coastal Kenya who initiated daily oral PrEP from June 2017 to June 2019. Participants were followed monthly for HIV-1 testing, PrEP refill, risk assessment and risk reduction counselling. Follow-up was censored at the last visit before 30 June 2019, or the last HIV-1-negative visit (for those with HIV-1 seroconversion), whichever occurred first. We estimated transition intensities (TI) and predictors of switching: (i) between being off and on PrEP; and (ii) from either PrEP state and being LTFU (i.e. not returning to the clinic for > 90 days) using a multi-state Markov model. RESULTS: In all, 134 participants starting PrEP were followed for a median of 20.3 months interquartile range (IQR): 7.7-22.1. A total of 49 (36.6%) people stopped PrEP 73 times TI = 0.6/person-year (PY), 95% confidence interval (CI): 0.5-0.7 and, of these, 25 (51.0%) restarted PrEP 38 times (TI = 1.2/PY, 95% CI: 0.9-1.7). In multivariable analysis, stopping PrEP was related to anal sex ≤ 3 months, substance-use disorder and travelling. Restarting PrEP was related to non-Christian or non-Muslim religion and travelling. A total of 54 participants were LTFU: on PrEP (n = 47, TI = 0.3/PY, 95% CI: 0.3-0.5) and off PrEP (n = 7, TI = 0.2/PY, 95% CI: 0.1-0.4). In multivariable analysis, becoming LTFU while on PrEP was associated with secondary education or higher, living in the area for ≤ 1 year, residence outside the immediate clinic area and alcohol-use disorder. CONCLUSIONS: Switching between being on and off PrEP or becoming LTFU while on PrEP was frequent among individuals at risk of HIV-1 acquisition. Alternative PrEP options (e.g. event-driven PrEP) may need to be considered for MSM and TGW with PrEP-taking challenges, while improved engagement with care is needed for all MSM and TGW regardless of PrEP regimen. Article	2022	Walker M.L.; Stiasny D.; Guy R.J.; Law M.G.; Holt M.; Mao L.; Donovan B.; Grulich A.E.; Gray R.T.; Regan D.G.	Assessing the Impact of HIV Preexposure Prophylaxis Scale-Up on Gonorrhea Incidence among Gay and Bisexual Men in Sydney: A Mathematical Modeling Study	Sexually Transmitted Diseases	-	-	1485717	10.1097/OLQ.0000000000001649	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134334312&doi=10.1097%2fOLQ.0000000000001649&partnerID=40&md5=a378f1ceb1ebf8e102ecaf0c501e1408	Background The rollout of preexposure prophylaxis (PrEP) for HIV prevention among gay and bisexual men (GBM) is associated with increases in condomless anal intercourse, potentially increasing the incidence of other sexually transmissible infections (STIs). Methods We developed an individual-based mathematical model to simulate the transmission of Neisseria gonorrhoeae among GBM in Sydney, accounting for changes in sexual practices, STI testing, and PrEP use. We calibrated and validated the model using reported incidence rates for HIV-positive and HIV-negative GBM from 2010 to 2019. Scenarios were run with varying PrEP uptake, PrEP-related STI testing, and PrEP-related sexual behavior and testing intervals up to 2030 to assess the impact of PrEP use on gonorrhea incidence. Results Preexposure prophylaxis uptake and associated 3-monthly STI testing from 2015 onward resulted in a predicted increase from 20 to 37 N. gonorrhoeae infections per 100 person-years among HIV-negative GBM by the end of 2020. This is lower than the counterfactual predictions of 45 per 100 person-years if PrEP were not scaled up and 48 per 100 person-years with nonadherence to 3-monthly STI testing. Increasing the time between STI tests for PrEP users by 1 month from 2018 results in the incidence rate among HIV-negative GBM increasing by 8% by 2030. If PrEP coverage doubles from 24% to 53%, incidence among HIV-negative GBM declines by 25% by 2030. Conclusions Behavior change due to widespread PrEP use may lead to significant increases in gonorrhea incidence in GBM, but the recommended quarterly STI testing recommended for PrEP users should reduce incidence by 18% by 2030. © Lippincott Williams & Wilkins. Article	2022	Wallace, Jennillee; Gonzalez, Hemil; Rajan, Reshma; Narasipura, Srinivas D.; Virdi, Amber K.; Olali, Arnold Z.; Naqib, Ankur; Arbieva, Zarema; Maienschein-Cline, Mark; Al-Harthi, Lena	Anti-HIV Drugs Cause Mitochondrial Dysfunction in Monocyte-Derived Macrophages.	Antimicrobial Agents and Chemotherapy	-	-	1098-6596 0066-4804	10.1128/aac.01941-21	https://pubmed.ncbi.nlm.nih.gov/35293780/	Combination antiretroviral therapy (cART) dramatically changed the face of the HIV/AIDS pandemic, making it one of the most prominent medical breakthroughs of the past 3 decades. However, as the life span of persons living with HIV (PLWH) continues to approach that of the general population, the same cannot be said regarding their quality of life. PLWH are affected by comorbid conditions such as high blood pressure, diabetes, and neurocognitive impairment at a higher rate and increased severity than their age-matched counterparts. PLWH also have higher levels of inflammation, the drivers of which are not entirely clear. As cART treatment is lifelong, we assessed here the effects of cART, independent of HIV, on primary human monocyte-derived macrophages (MDMs). MDMs were unskewed or skewed to an alternative phenotype and treated with Atripla or Triumeq, two first-line cART treatments. We report that Triumeq skewed alternative MDMs toward an inflammatory nonsenescent phenotype. Both Atripla and Triumeq caused mitochondrial dysfunction, specifically efavirenz and abacavir. Additionally, transcriptome sequencing (RNA-seq) demonstrated that both Atripla and Triumeq caused differential regulation of genes involved in immune regulation and cell cycle and DNA repair. Collectively, our data demonstrate that cART, independent of HIV, alters the MDM phenotype. This suggests that cART may contribute to cell dysregulation in PLWH that subsequently results in increased susceptibility to comorbidities.	antiretroviral agents; human immunodeficiency virus; macrophages; mitochondria; monocyte-derived macrophage. Article	2022	Walsh J.L.; John S.A.; Robles G.; Wesche R.; Hirshfield S.	Talking to My Partners About PrEP: Factors Associated with PrEP-Related Communication in a Longitudinal US Study of Sexual Minority Men Living with HIV	Prevention Science	-	-	13894986	10.1007/s11121-022-01372-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129475176&doi=10.1007%2fs11121-022-01372-6&partnerID=40&md5=77d23b4fb084ad87ba8f3c3405a4741c	Treatment as prevention and pre-exposure prophylaxis (PrEP) have reduced HIV transmission among sexual minority men (SMM). However, little is known about PrEP-related communication in serodiscordant partnerships. In 2015–2016, 965 US SMM living with HIV (Mage = 39; 63% White, 19% Black, 18% Latinx) enrolled in a year-long longitudinal study with surveys every 3 months (2,850 surveys). Multilevel models explored factors associated with PrEP-related communication with HIV-negative partners. Most participants (77%) reported PrEP-related communication. Participants were more likely to discuss PrEP during periods with more sexual partners, AOR = 2.89, p <.001, and group sex, AOR = 1.99, p =.001. Those with more partners on average, β = 0.48, p <.001, and those engaging in other drug use more frequently, β = 0.11, p =.002, were more likely to discuss PrEP. PrEP-related communication was more common for men who disclosed their HIV status, β = 0.22, p <.001, and who had undetectable viral loads, β = 0.25, p =.007. Communication was also more common for those with higher incomes, β = 0.12, p =.02, and from larger cities, β = 0.07, p =.048, and less common for Black participants, β = − 0.29, p =.003, and older participants, β = − 0.18, p <.001. PrEP-related communication increased over the course of the study, AOR = 1.16, p=.02.PrEP can confer additional HIV prevention benefits within serodiscordant partnerships, and future research should continue toexplore the role PrEP plays in these partnerships. © 2022, Society for Prevention Research. Article	2022	Walters, Suzan M; Frank, David; Van Ham Brent; Jaiswal, Jessica; Muncan Brandon; Earnshaw, Valerie; Schneider, John; Friedman, Samuel R; Ompad, Danielle C	PrEP Care Continuum Engagement Among Persons Who Inject Drugs: Rural and Urban Differences in Stigma and Social Infrastructure	AIDS and Behavior	-	-	10907165	10.1007/s10461-021-03488-2	https://www.proquest.com/scholarly-journals/prep-care-continuum-engagement-among-persons-who/docview/2641697755/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) is a medication that prevents HIV acquisition, yet PrEP uptake has been low among people who inject drugs. Stigma has been identified as a fundamental driver of population health and may be a significant barrier to PrEP care engagement among PWID. However, there has been limited research on how stigma operates in rural and urban settings in relation to PrEP. Using in-depth semi-structured qualitative interviews (n = 57) we explore PrEP continuum engagement among people actively injecting drugs in rural and urban settings. Urban participants had more awareness and knowledge. Willingness to use PrEP was similar in both settings. However, no participant was currently using PrEP. Stigmas against drug use, HIV, and sexualities were identified as barriers to PrEP uptake, particularly in the rural setting. Syringe service programs in the urban setting were highlighted as a welcoming space where PWID could socialize and therefore mitigate stigma and foster information sharing. Article	2022	Wang H.; d'Abreu de Paulo K.J.I.; Gültzow T.; Zimmermann H.M.L.; Jonas K.J.	Perceived Monkeypox Concern and Risk among Men Who Have Sex with Men: Evidence and Perspectives from The Netherlands	Tropical Medicine and Infectious Disease	-	-	24146366	10.3390/tropicalmed7100293	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140620864&doi=10.3390%2ftropicalmed7100293&partnerID=40&md5=1cebe5ff44abf8363f9e7f01a2bd6fbc	The current monkeypox epidemic is most prevalent among men who have sex with men (MSM). PrEP users and MSM with HIV (MSMHIV) are considered at highest risk of monkeypox infection in The Netherlands, and are being targeted for monkeypox vaccination. Together with the epidemiological evidence, perceived concern and risk are also relevant for decision making about health behaviour, e.g., vaccination uptake. It is thus timely to examine which subpopulations among MSM consider themselves to be most at risk and are most concerned about monkeypox. This study aimed to help determine if the current measures to curb the epidemic are successfully targeted or not in The Netherlands. We conducted an online survey among 394 MSM living in The Netherlands. We first calculated the prevalence and standardised prevalence ratio (SPR) of high perceived monkeypox concern/risk by PrEP-use and HIV status. We then conducted two multivariable logistic regression analyses to investigate perceived monkeypox concern/risk and their potential socio-demographic/behavioural/health/psycho-social determinants. Among the included MSM, 52% showed high perceived concern about and 30% showed high perceived risk of monkeypox infection. PrEP users (SPR = 0.83) showed a significantly lower chance of perceived concern; in addition, MSMHIV (SPR = 2.09) were found to have a significantly higher chance of perceiving high risk of monkeypox infection. In the multivariable logistic analyses, non-PrEP users (aOR = 2.55) were more likely to perceive higher concern, while MSM who were retired (aOR = 0.23) and who had had chemsex recently (aOR = 0.63) were less likely to perceive higher concern. MSMHIV (aOR = 4.29) and MSM who had an unknown/undisclosed HIV status (aOR = 6.07), who had attended private sex parties (aOR = 2.10), and who knew people who have/had monkeypox (aOR = 2.10) were more likely to perceive a higher risk for monkeypox infection. We found that high perceived risk (aOR = 2.97) and high perceived concern (aOR = 3.13) were correlated with each other. In sum, only one-third of MSM living in The Netherlands considered themselves at high risk of monkeypox infection, and only half of them reported high concern. We identified a potential discrepancy between "actual risk" and perceived risk of and concern about monkeypox among MSM in this early stage of the monkeypox epidemic in The Netherlands, especially among PrEP users and MSMHIV. More refined public health communication strategies may be needed to improve the understanding and knowledge of the "actual risk" of monkeypox infections among MSM sub-populations, to facilitate health behaviour uptake. © 2022 by the authors.	concern about infection; monkeypox; MSM; perceived risk of infection; prevention	English	United Kingdom	Western and Central Europe and North America	Netherlands	Western and Central Europe and North America	Netherlands	Western and Central Europe and North America	Quantitative
Article	2022	Wang L.; Din A.; Wu P.	Dynamics and optimal control of a spatial diffusion HIV/AIDS model with antiretrovial therapy and pre-exposure prophylaxis treatments	Mathematical Methods in the Applied Sciences	-	-	1704214	10.1002/mma.8359	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129831267&doi=10.1002%2fmma.8359&partnerID=40&md5=8ac18d4def87aa765bddb0525ac9fccb	In this paper, to investigate the synthetic effect of PrEP (pre-exposure prophylaxis) and ART (antiretrovial therapy) on HIV transmission among MSM (men who have sex with men) in heterogenous environment, a realistic HIV epidemic model with spatial diffusion is established. Here, HIV infectious people are divided into three immunity based compartments, that is, CD4+ T cell count less than 350, between 350 and 500, and more than 500, respectively. The basic reproduction number (Formula presented.) is established and proved as a threshold parameter: The global asymptotic stability of the disease-free steady state holds for (Formula presented.), and the disease will be present if (Formula presented.). Considering the substantial advantages of PrEP and ART in controlling HIV transmissions among MSM, the optimal control problem is presented for the case of positive constant diffusion coefficients, which minimize the total population of susceptible individual and HIV infected individual, the cost of PrEP and ART therapy. As an illustration of our theoretical results, we conduct numerical simulations. We also conduct an optimal control case study where model parameters are estimated from the demographic and epidemiological data from China. This work suggests the following: (1) Spatial factors cannot be ignored during the HIV intervention; (2)taking the PrEP intervention measure for HIV transmissions among MSM as early as possible will help to improve the control efficiency and reduces its cost; (3) reducing the PrEP drug costs will promote the efficiency of PrEP treatment in preventing the spread of HIV among MSM. © 2022 John Wiley & Sons, Ltd. Article	2022	Wang X.; Hu X.; Liu Z.; Hui H.	Associations between self-test and pre- or post-exposure prophylaxis of HIV among men who have sex with men in China	International journal of STD & AIDS	-	-	9564624	10.1177/09564624221108038	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133432066&doi=10.1177%2f09564624221108038&partnerID=40&md5=b4127a6ea42a0442a55d9e8e5acc2596	Background: This study aims to assess HIV self-testing (HIVST), pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) uptake and associations of three HIV prevention strategies among men who have sex with men (MSM) in China. Methods: This study included two stages, baseline and follow-up, and was conducted in Harbin, the capital city of Heilongjiang province in North China. MSM were recruited online and by peer-referral. Data contained an online questionnaire and sampling blood for HIV tests. The research group generated a QR code linking to the survey, and participants were asked to scan this QR code with a cellphone to fill out the questionnaire. MSM at the baseline were imparted knowledge of PrEP, PEP and condom use. Results: Between January 2018 and March 2019, the research team enrolled 773 MSM for baseline analysis, and 699 were HIV negative at baseline. For follow-up, 62% (430/699) participants were retained. At baseline, 11.6% (50/430) of the participants was aware of PrEP and 40.9% (176/430) of PEP; 0.7% (3/430) had ever taken PrEP and 3.3% (14/430) had taken PEP. At follow-up, 77.7% (334/430) reported awareness of PrEP and 54.0% (232/430) for PEP; Only 2.6% (11/430) initiated PrEP uptake and 3.0% (13/430) for PEP. Additionally, at follow-up, only 21 participants newly conducted HIVST. Results showed that being willing to pay for PrEP and PEP uptake was associated with conducting HIVST, and initiations of two HIV prevention methods, PrEP and PEP uptake, were significantly associated with each other. Conclusions: Knowledge dissemination increased participant awareness and acceptance of PrEP and PEP effectively. Uptake of HIVST, PrEP, and PEP were low and associated with each other. It is promising to achieve high uptake by promoting HIVST, PrEP and PEP as one prevention package. © The Author(s) 2022. Article	2022	Wang, Haoyi; Shobowale, Oladipupo; den Daas, Chantal; Op de Coul, Eline; Bakker, Bouko; Radyowijati, Aryanti; Vermey, Koenraad; van Bijnen, Arjan; Zuilhof, Wim; Jonas, Kai J.	Determinants of PrEP Uptake, Intention and Awareness in the Netherlands: A Socio-Spatial Analysis	International Journal of Environmental Research and Public Health	-	-	1660-4601	10.3390/ijerph19148829	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9315833/	PrEP uptake in the Netherlands is growing but remains at suboptimal levels. Hence, the analysis of hurdles is paramount. Given the initial focus of PrEP provision among men-who-have-sex-with-men (MSM) via a demonstration project that was launched in June 2015, AmPrEP in Amsterdam, and pharmacies in the main urban areas (so called "Randstad", entailing Amsterdam, Utrecht, Leiden, The Hague and Rotterdam), investigating regional differences is necessary. This study seeks to unravel regional differences jointly with the psycho-social determinants of PrEP uptake. This cross-sectional study included 3232 HIV-negative MSM recruited via the Dutch subsample of the European-MSM-Internet-Survey in late 2017 (EMIS-2017), which aimed to inform interventions for MSM who are highly affected by infections with HIV and other sexually transmitted infections. Prevalence and the standardised prevalence ratio (SPR) of PrEP awareness, intention and uptake were measured on a regional level (Randstad vs. the rest of the country). Multi-level logistic modelling was conducted to identify the association of PrEP uptake with PrEP awareness and intention, socio-demographic, psycho-social determinants and random effects from regional differences. MSM from the Randstad used more PrEP (SPR = 1.4 vs. 0.7) compared to the rest of the country, but there were minor differences for awareness and intention. The regional distinction was estimated to explain 4.6% of the PrEP use variance. We observed a greater influence from PrEP intention (aOR = 4.5, 95% CI 2.0–10.1), while there was limited influence from the awareness of PrEP (aOR = 0.4, 95% CI 0.04–4.4). Lower education (aOR = 0.4, 95% CI 0.2–0.9) was negatively associated with PrEP uptake; however, no significant difference was found between middle (aOR = 1.2, 95% CI 0.7–2.0) and high education. We showed that regional differences—MSM in non-urban regions—and other psycho-social determinants account for lower PrEP uptake. Based on these findings, more fine-tuned PrEP access with a focus on non-urban regions can be implemented, and tailored campaigns increasing intention/use can be conducted among target populations. Article	2022	Wang, Hongyi; Wang, Zixin; Huang, Xiaojie; Chen, Yanhui; Wang, Hui; Cui, Sitong; Zhang, Jing; Chu, Zhenxing; Hu, Qinghai; Ding, Haibo; Qian, Huizhu; Zou, Huachun; Tang, Weiming; Gao, Yongyong; Jin, Xia; Liu, Zhaoshun; Zhang, Lishun; Zhao, Jinchi; Xiaoqing, Jiang; Yongmin, Geng; Wenqing, Xu; Junjie, Shang; Hong	Association of HIV Preexposure Prophylaxis Use With HIV Incidence Among Men Who Have Sex With Men in China: A Nonrandomized Controlled Trial.	JAMA Network Open	-	-	-	-	2574-3805	10.1001/jamanetworkopen.2021.48762	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8837830/	Importance: Evidence on HIV preexposure prophylaxis (PrEP) among Chinese men who have sex with men (MSM) is critical to guide its large-scale implementation in low- and middle-income countries. Objective: To evaluate incident HIV infection, adherence, safety, and changes in sexual behaviors among MSM using daily PrEP (D-PrEP) and event-driven PrEP (ED-PrEP) in 4 cities in China. Design, Setting, and Participants: This nonrandomized controlled trial was conducted among HIV-seronegative MSM from December 11, 2018, to November 30, 2020, in Beijing, Shenyang, Chongqing, and Shenzhen. Participants self-chose D-PrEP or ED-PrEP regimens at baseline and could switch regimens during the 12-month study period. HIV-negative MSM who declined to initiate PrEP (nonusers) in the same cities joined a separate parallel prospective cohort and served as control individuals. Interventions: PrEP consisted of coformulated tenofovir disoproxil fumarate, 300 mg, and emtricitabine, 200 mg. Main Outcomes and Measures: The main outcome was incident HIV infection. Poisson regression was used to obtain the HIV incidence rate ratio (IRR). Results: A total of 1138 MSM were included in the analysis (median age, 30 [IQR, 25-37 years). At baseline, 520 MSM chose D-PrEP (median age, 29 [IQR, 25-35 years) and 501 chose ED-PrEP (median age, 29 [IQR, 25-36 years). The median HIV Risk Index score was 18 (IQR, 12-22) among D-PrEP users and 18 (IQR, 11-22) among ED-PrEP users. Among 507 PrEP nonusers, the median age was 31 (IQR, 27-43) years, and the median HIV Risk Index score was 12 (IQR, 7-18). Although PrEP users had more baseline behaviors associated with HIV risk, the HIV incidence was lower among all PrEP users (adjusted IRR, 0.09 95% CI, 0.04-0.21). ED-PrEP users (adjusted IRR, 0.06; 95% CI, 0.02-0.17) and D-PrEP users (adjusted IRR, 0.13; 95% CI, 0.04-0.39) had significantly lower HIV incidence than PrEP nonusers. Daily PrEP users had lower HIV incidence than ED-PrEP users (IRR, 0.33 95% CI, 0.08-1.24). Event-driven PrEP users consumed 40% fewer tablets than D-PrEP users during the study period. Adherence, defined as the proportion of self-reported days with sexual intercourse in which PrEP was taken according to prescription of at least 90%, increased over time among ED-PrEP users (from 57.4% to 77.8%; P < .001 for trend) and decreased over time among D-PrEP users (from 75.5% to 72.1%; P = .02 for trend). Daily PrEP users reported fewer adverse events than ED-PrEP users (101 of 520 (17.1% vs 241 of 507 (47.9%). Conclusions and Relevance: The findings of this study suggest that D-PrEP and ED-PrEP regimens are associated with lower incidence of HIV and a good safety profile among high-risk MSM in China. Article	2022	Wang, Ying; Mitchell, Jason W.; Zhang, Chen; Liu, Yu	Evidence and implication of interventions across various socioecological levels to address pre-exposure prophylaxis uptake and adherence among men who have sex with men in the United States: a systematic review.	AIDS Research and Therapy	-	-	-	-	1742-6405	10.1186/s12981-022-00456-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9233180/	BACKGROUND Pre-exposure prophylaxis (PrEP) represents a proven biomedical strategy to prevent HIV transmissions among men who have sex with men (MSM) in the United States (US). Despite the design and implementation of various PrEP-focus interventions in the US, aggregated evidence for enhancing PrEP uptake and adherence is lacking. The objective of this systematic review is to synthesize and evaluate interventions aimed to improve PrEP uptake and adherence among MSM in the US, and identify gaps with opportunities to inform the design and implementation of future PrEP interventions for this priority populations. METHODS: We followed the PRISMA guidelines and conducted a systematic review of articles (published by November 28, 2021) with a focus on PrEP-related interventions by searching PubMed/MEDLINE, Embase, PsycINFO, Web of Science, and CINAHL databases. Eligible articles were limited to those with study populations of MSM in the US, and empirical findings, and targeted at PrEP outcomes. RESULTS: Among the 1343 articles retrieved from multiple databases, 42 interventions identified from 47 publications met the inclusion criteria for this review. Most individual-level interventions were delivered via text messages and/or apps and incorporated personalized elements to tailor the intervention content on participants' demographic characteristics or HIV risk behaviors. Interpersonal-level interventions often employed peer mentors or social network strategies to enhance PrEP adoption among MSM of minority race. However, few interventions were implemented at the community-, healthcare/institution- or multiple levels. CONCLUSIONS: Interventions that incorporate multiple socioecological levels hold promise to facilitate PrEP adoption and adherence among MSM in the US given their acceptability, feasibility, efficacy and effectiveness. Future PrEP interventions that simultaneously address PrEP-related barriers/facilitators across multiple socioecological levels should be enhanced with a focus to tackle contextual and structural barriers (e.g., social determinants of health, stigma or medical mistrust) at the community- and healthcare/institution-level to effectively promote PrEP use for MSM of color. Article	2022	Ward H.; Papagiorgiou V.; Crittenden E.; Coskan F.; Davies B.	Impact of daily, oral pre-exposure prophylaxis on the risk of bacterial sexually transmitted infections among cisgender women: A systematic review and narrative synthesis	Wellcome Open Research	-	-	-	-	2398502X	10.12688/wellcomeopenres.17457.2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136090716&doi=10.12688%2Fwellcomeopenres.17457.2&partnerID=40&md5=e7c434a8536602736602f0e6e6c9e475296	Background: There are concerns that the use of pre-exposure prophylaxis (PrEP) may result in an increased incidence of sexually transmitted infections (STIs). Evidence for this is mixed and has mostly been based on reviews focussed on gay and bisexual men and transgender women, while none have summarised evidence in cisgender women. Methods: We conducted a systematic review to explore whether PrEP use is linked to STIs in cisgender women. Searches were conducted in Medline, Embase, PsycINFO and Global Health databases. Studies were critically appraised and assessed using the Grading of Recommendations, Assessment, Development and Evaluation (GRADE) tool. Results: We included 11 full text articles in a narrative synthesis, with the studies published between 2012 and 2021. The studies were mostly based in Africa (n=7, 63.6%) and reported on 3168 ciswomen using PrEP aged 16-56 years. Studies had marked differences in variables, including measurements and definitions (e.g., STI type) and limited data available looking specifically at ciswomen, principally in studies with both male and female participants. The limited evidence suggests that PrEP use is not associated with increased STI rates in ciswomen generally; however, adolescent girls and young women in Sub Saharan Africa have a higher prevalence of bacterial STIs prior to PrEP initiation, compared to adult ciswomen and female sex workers. Conclusions: We suggest future PrEP research make efforts to include ciswomen as study participants and report stratified results by gender identity to provide adequate data to inform guidelines for PrEP implementation. Article	2022	Waryold J.M.; Shihabeddin C.; Mascola R.	Barriers to Culturally Competent Human Immunodeficiency Virus Care Among the Black, Indigenous, and People of Color Community	Journal for Nurse Practitioners	-	-	-	-	15554155	10.1016/j.nurpra.2021.08.021	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113129611&doi=10.1016%2Fj.nurpra.2021.08.021&partnerID=40&md5=41a6508051fa830d0f0d1ea0f2bae61ad	Black, Indigenous, and people of color (BIPOC) are at a higher risk for human immunodeficiency virus (HIV) infection and face unique challenges in the United States health care system. Health care providers can understand the barriers to care for at-risk groups and identify interventions to improve health outcomes. Demographic, social, and economic factors all play a role in the health disparities regarding the HIV infection rate in these at-risk populations. There are many challenges to establishing early diagnosis of HIV infection and linking newly diagnosed people living with HIV (PLWH) to evidence-based care. Systemic barriers include a lack of access to testing resources, a lack of primary care provider training in HIV testing and counseling, and a delay of linkage to care of newly diagnosed PLWH to treatment. Delays of initiation of HIV treatment can increase morbidity and mortality and perpetuate HIV transmission. Consistent use of pre-exposure prophylaxis (PrEP) has been shown to decrease the risk of HIV transmission while maintaining a low side effect profile; however, PrEP usage among the BIPOC population is low, increasing the risk of HIV seroconversion. Increased testing, PrEP utilization, and treatment adherence in PLWH promote viral suppression, reducing HIV transmission. Specific, population-based interventions for prevention, testing, and treatment can encourage providers to empower patients to seek and remain in care. By decreasing racial disparities in the delivery of care, providers can help achieve viral suppression, improving the overall health outcomes among BIPOC communities. © 2021 Elsevier Inc.	and people of color; Black; cultural competency; cultural humility; HIV care; Indigenous	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	Wheldon C.W.	HPV vaccination and HIV pre-exposure prophylaxis (PrEP): Missed opportunities for anal cancer prevention among at risk populations	Human Vaccines and Immunotherapeutics	-	-	-	-	21645515	10.1080/21645515.2022.2114258	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136672834&doi=10.1080%2F21645515.2022.2114258&partnerID=40&md5=5a5fd836aaf727d1706629b0e1570f0a	Gay, bisexual, and other men who have sex with men (GBMs), in addition to transgender women who have sex with men (TW), are at disproportionate risk for anal cancer. Anal cancer can be prevented with HPV vaccination, but uptake among adult GBMTW is low. Targeted HPV vaccination during the clinical management of pre-exposure prophylaxis (PrEP) is an unexplored strategy relevant to these populations. The purpose of this study was (1) to determine the need for HPV vaccination among GBM and transgender women PrEP users and (2) to identify correlates of receipt of HPV vaccination among PrEP users. Secondary analysis of the 2020 Pennsylvania LGBT Health Needs Assessment was conducted to estimate prevalence ratios of HPV vaccination among PrEP users. Overall, 43.8% of the sample had initiated HPV vaccination. Vaccine initiation was significantly lower among Black (aPR = 0.68, 95% CI 0.48–0.96) and Latinx (aPR = 0.68, 95% CI 0.49–0.94) participants. Education and income were significantly associated with likelihood of HPV vaccination after adjusting for race (aPR = 2.60, 95% CI 1.73–3.88). Overall, more than half of eligible GBM and TW engaged in PrEP care have not initiated HPV vaccination and represent potential missed opportunities for anal cancer prevention. © 2022 The Author(s). Article	2022	Wiginton, John Mark; Eaton, Lisa A; Watson, Ryan J; Mokrzi, Jessica L; Earnshaw, Valerie A; Berman, Marcie	Sex Positivity, Medical Mistrust, and PrEP Conspiracy Beliefs Among HIV-Negative Cisgender Black Sexual Minority Men in Atlanta, Georgia.	Archives of Sexual Behavior	-	-	-	-	1573-2800	10.1007/s10508-021-02174-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9030596/	Because the public health response to the disproportionate HIV burden faced by Black sexual minority men (BSMMM) has focused on sexual risk reduction and disease prevention, other vital components of sexual health (e.g., intimacy, pleasure, benefits of sex) have been often overlooked. Sex-positive describes a more open, holistic approach toward sex and sexuality that prioritizes these other components, though such an approach is rarely applied to BSMMs sexual health. For sex-positive BSMM, risk-preventive discourse may foster or exacerbate medical mistrust as a reaction to the dissonance between how these men view sexual health and how the medical establishment views it, which may discourage sexual healthcare-seeking. We assessed sex-positivity and its association with PrEP conspiracy beliefs among 206 HIV-negative cisgender BSMM in Atlanta, Georgia. We performed exploratory factor analytic procedures on responses to a sex-positivity scale, followed by multivariable linear regressions to determine sex-positivity's associations with medical mistrust and PrEP conspiracy beliefs. We extracted two sex-positivity factors: sexual freedom (α = 0.90), reflecting openness toward casual sex and rejection of sexual norms, and essence of sex (α = 0.77), reflecting the intimate, relational, and pleasurable qualities of sex. Sexual freedom was independently associated with perceived racism in healthcare ($$\beta$$ = 0.14, CI = − 0.00, 0.29). Essence of sex was associated with lower ($$\beta$$ = − 0.14, CI = − 0.28, 0.00) and sexual freedom was associated with greater ($$\beta$$ = 0.14, CI = − 0.00, 0.29) conspiracy beliefs. Healthcare providers and public health practitioners may cultivate greater trust with BSMM by incorporating a sex-positive approach into patient/provider-level interactions, clinical decision-making, and interventions. Improving access to sexual pleasure acknowledges BSMMs right to optimal, holistic sexual health. Article	2022	Wilborn, Brittany; Howard-Howell, Tyrissa; Cantil, Amanda; D'Angelo, Lawrence; Trexler, Constance; Carr, Rashida; Greenberg, Daniel	Barriers and Facilitators to HIV Testing Among Adolescents and Young Adults in Washington, District of Columbia: Formative Research to Inform the Development of an mHealth Intervention.	JMIR Formative Research	-	-	-	-	2561-326X	10.2196/29196	https://pubmed.ncbi.nlm.nih.gov/35270383/	BACKGROUND: Adolescents and young adults (AYA) in the United States, and in Washington, District of Columbia (DC), specifically, are disproportionately affected by HIV. Both the national Ending the HIV Epidemic initiative and DC-specific plans emphasize HIV testing, and innovative strategies to encourage testing among AYA are needed. OBJECTIVE: The purpose of this study is to identify sexual behaviors, HIV testing practices, and preferences among AYA in DC to inform the development of a mobile health (mHealth) app to promote HIV testing. METHODS: As a first step of a larger study to determine the acceptability of using a life-real-dating online game to increase HIV testing among AYA, focus groups and surveys stratified by self-reported sexual orientation were conducted among, and administered to, AYA aged 13-24 years in DC. HIV knowledge was explored during focus groups and measured using an adapted version of the Brief HIV Knowledge Questionnaire. Survey data were summarized using descriptive statistics and associations were examined using bivariate statistics. Transcripts were thematically analyzed. RESULTS: Of the 43 AYA who took part in 6 focus groups, 30 (69.7%) identified as heterosexual and 16 (37%) as lesbian, gay, bisexual, transgender, or queer. A higher proportion of lesbian, gay, bisexual, transgender, or queer AYA reported sexual activity (12/16, 75%, vs 18/30, 60%), condomless sex (11/12, 92%, vs 15/18, 83%), HIV testing (13/16, 81%, vs 17/29, 59%) than heterosexual AYA. HIV testing ("condom use" and "transmission ["exchange of fluids"] knowledge was high, and most (34/44, 77%) of the AYA perceived HIV testing as beneficial. However, the AYA also demonstrated some misinformation concerning HIV testing: over one-third (15/44, 34%) of the participants believed that an HIV test could deliver accurate results 2 weeks after a potential exposure and an average of 72% (33/46, SD 0.453) believed that an HIV "vaccine exists. The AYA also identified individual ("...people...are scared"), interpersonal ("It's an awkward conversation"), and structural ("...people don't...know where they can go") barriers to testing. AYA rated the likelihood of using an mHealth app to increase HIV testing among their friends (median 8.0, IQR 5.0-9.0), themselves (median 8.0, IQR 6.0-9.0), and DC youth (median 8.0, IQR 6.0-9.0), indicating high likelihood) and strongly agreed that the game was interesting (median 5.0, IQR 5.0-5.0), fun (median 5.0, IQR 4.0-5.0), and easy to learn (median 5.0, IQR 5.0-5.0, using a scale ranging from 1 to 5, with 5 indicating strong agreement). CONCLUSIONS: These results suggest a need for multilevel HIV testing interventions and informed the development of a mobile health intervention aiming to increase HIV knowledge and risk perception among AYA, while reducing barriers to testing at the individual and structural levels, supporting efforts to end the domestic HIV epidemic. Article	2022	Williams, Adam Dale Newman; Wood, Fiona; Gillespie, David; Cousens, Zoë; Hughes, Kathryn; Hood, Kerenza	The relationship between HIV pre-exposure prophylaxis, sexually transmitted infections, and antimicrobial resistance: a qualitative interview study of men who have sex with men.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-022-14645-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9708615/	BACKGROUND: HIV pre-exposure prophylaxis (PrEP) is a medication that prevents the acquisition of HIV. It has been targeted towards men who have sex with men (MSM). Since its introduction there have been concerns raised around changes in sexual behaviour such as increased condomless anal intercourse (CAI), leading to an elevation in sexually transmitted infections (STIs). With antimicrobial resistant strains of STIs rising, there are concerns that PrEP may be contributing to this growth. This study aims to understand how MSM conceptualise the relationship between PrEP, STIs and antimicrobial resistance (AMR). METHODS: Twenty semi-structured interviews were conducted online using Zoom. Participants included a mix of PrEP related experiences (never used, currently use, previously used). Reflexive thematic analysis was undertaken by the lead author with 10% of transcripts double coded. RESULTS: MSM in Wales have positive views and a good knowledge of PrEP and awareness of bacterial STIs. PrEP is perceived by many to lead to a reduction in condom use and increase in STIs but reported condom use behaviours presented to be stable in terms of PrEP initiation. PrEP use is influenced by perceptions of HIV risk, relationship dynamics and sexual desire. PrEP was not viewed as a risk factor for AMR. Those who had used PrEP were more likely to report increased use of condoms use, despite reported behaviours often being stable in relation to PrEP initiation. PrEP stigma may be influencing this dichotomy. Concern and awareness for resistant STIs is low, with little association to PrEP. Article	2022	Willie, Tiara C; Knight, Doja; Bazzi, Stefan D; Chen, Philip A; Kershaw, Trace; Mayer, Kenneth H; Stockman, Jamila K; Addonizio, Aubrey A; Morgan, Micaela; Mena, Leandro A; Phillips, Kathy-An; Nunn, Amy	Where's the "Everyday Black Woman"? An intersectional qualitative analysis of Black Women's decision-making regarding HIV pre-exposure prophylaxis (PrEP) in Mississippi.	BMC Public Health	-	-	-	-	1471-2458	10.1186/s12889-022-13999-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9396876/	BACKGROUND: Black cisgender women in the U.S. South bear a disproportionate burden of HIV compared to cisgender women in other racial and ethnic groups and in any other part of the US. Critical to decreasing new HIV infections is the improved delivery of pre-exposure prophylaxis (PrEP) for Black cisgender women as a womens-underutilized in 2021. Informed by intersectionality, the study sought to elucidate the sociostructural determinants of PrEP among Black cisgender women in Mississippi. We also sought to understand their PrEP within the context of interlocking systems of oppression including racism, sexism, and stigma. METHODS: We conducted in-depth interviews with 27 Black women living in Jackson, Mississippi who had ever heard of PrEP. Participants were recruited through social media platforms and were interviewed with 25 Black women who had never used PrEP and 2 Black women who reported a PrEP prescription. RESULTS: Six themes were identified as contributing PrEP differentiation among Black women: 1) limited PrEP awareness, 2) low perceived HIV risk and side effects, 4) concerns about costs, 5) limited marketing, and 6) distrust in the healthcare system. Three themes were identified as facilitators during PrEP deliberations: 1) women's empowerment and advocacy, 2) need for increased PrEP-specific education, and 3) the positive influence of PrEP-engaged women's testimonials. Black women shared a limited awareness of PrEP exacerbated by the lack of Black women specific marketing. Opportunities to support Black women-specific social marketing could increase awareness and knowledge regarding PrEPs benefits and costs. Black women also shared their concerns about discrimination in healthcare and distrust, but they felt that these barriers may be addressed by patient testimonials from PrEP-engaged Black women, empowerment strategies, and directly addressing provider biases. CONCLUSIONS: An effective response to PrEP implementation among Black women in the South requires developing programs to center the needs of Black women and carry out active strategies that prioritize peer advocacy while reinforcing positive and mitigating negative influences from broader social and historical contexts. Article	2022	Willie, Tiara C; Sharpless, Laurel; Monger, Maude; Kershaw, Trace S; Mahoney, Wendy B; Stockman, Jamila K	Enhancing domestic violence advocates' ability to discuss HIV pre-exposure prophylaxis (PrEP): Feasibility and acceptability of an educational intervention.	Women's Health	-	-	-	-	1745-5065	10.1177/17455065211070548	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9074469/	BACKGROUND: Survivors of intimate partner violence are at elevated risk for HIV acquisition, yet there is limited research on the best strategies to optimize biomedical HIV prevention, such as pre-exposure prophylaxis among this population. Domestic violence agencies are critical collaborating partners and function as potential entry point into HIV prevention services for survivors; however, limited knowledge regarding HIV prevention has been an important barrier to advocate-led discussions. This study aimed to develop, implement, and evaluate an HIV prevention intervention for domestic violence advocates. SETTING: A nonrandomized, group-based intervention with pre-intervention, immediate post-intervention, and 3-month post-intervention periods were conducted with multiple domestic violence agencies in Mississippi. METHODS: Overall, 25 domestic violence advocates participated in the two-session intervention. Surveys were administered to assess pre-exposure prophylaxis knowledge, self-efficacy, subjective norms, and willingness to provide HIV prevention services to intimate partner violence survivors. Generalized estimating equations were conducted to assess change in behavioral outcomes over time. RESULTS: Compared to pre-intervention, there were significant increases at immediate and 3-month post-intervention in advocates' intervention accessibility, pre-exposure prophylaxis knowledge, and self-efficacy to provide HIV prevention information, discuss pre-exposure prophylaxis eligibility criteria, assist pre-exposure prophylaxis-engaged clients, and initiate pre-exposure prophylaxis counseling. CONCLUSION: This group-based intervention enhanced domestic violence advocates' acceptability, pre-exposure prophylaxis knowledge, and self-efficacy to offer HIV care information, discuss pre-exposure prophylaxis, and initiate pre-exposure prophylaxis counseling. Findings underscore the importance of engaging domestic violence advocates as collaborative partners to reduce HIV vulnerabilities. Efforts should focus on training domestic violence advocates in HIV prevention care for survivors and also include these agencies in collaborative strategies to reduce HIV incidence.	domestic violence advocates, HIV, pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Quantitative
Article	2022	Wilson E.C.; Hernandez C.J.; Scheer S.; Trujillo D.; Arayasirikul S.; Sievo S.; McFarland W.	Improved PrEP Awareness and Use among Trans Women in San Francisco, California	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03417-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125428268&doi=10.1007%2Fs10461-021-03417-3&partnerID=40&md5=465bedfc1db3a3acc8ce01457f0bfc85	Transgender women face a serious risk of HIV infection. Despite this, there is limited knowledge and use of Pre-exposure prophylaxis (PrEP). We measured the continuity of prevention across services in the PrEP cascade and correlates of PrEP use among trans women in San Francisco enrolled in the 2019/20 National HIV Behavioral Surveillance Study. Knowledge and use of PrEP among trans women in San Francisco increased in recent years; almost all (94.0%) had heard about PrEP, 66.7% had discussed PrEP with a healthcare provider, and 44.0% had taken PrEP in the past 12 months. PrEP use was associated with participation in a PrEP demonstration project (aOR = 31.44, p = 0.001) and condomless receptive anal intercourse (aOR = 3.43, p = 0.024). Injection drug use was negatively associated (aOR = 0.19, p = 0.014). Efforts are needed to combat the gender-based stigma and discrimination faced by trans women, which can result in avoidance and mistrust of the medical system. © 2021, The Author(s). Article	2022	Wilson K.; Przybyla S.; Bluestein J.; Gabriel S.; Leblanc N.; St. Vil N.	Factors correlated with pre-exposure prophylaxis (PrEP) awareness and use among black adults in the United States: implications for improving HIV prevention	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2022.2111027	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136210602&doi=10.1080%2F09540121.2022.2111027&partnerID=40&md5=7c4b08d3a2f2591207388d2f9555fbb0	HIV remains a significant public health concern for Black adults (BA) in the United States. Pre-exposure prophylaxis (PrEP) is a highly effective prevention tool prescribed to protect the health of HIV-uninfected individuals. Yet, low rates of PrEP awareness and utilization persist among BA. Less is understood about the pathways that may promote PrEP uptake. The present study explored factors associated with PrEP awareness and use among BA. Participants were recruited through Facebook and completed an online survey. Logistic regression models were used to examine factors associated with PrEP awareness and use. More participants were aware of PrEP (71%). Reporting history of incarceration history aOR 5.76 (1.19, 2.59), $$p < 0.05$$ had greater odds of PrEP awareness. Only 6% of respondents had ever taken PrEP. Reports of incarceration history aOR 9.96 (2.82, 35.14), $$p < 0.05$$, concurrent sexual partners aOR 1.09 (1.00, 1.18), $$p < 0.05$$, and substance use during sex aOR 4.23 (1.02, 17.60), $$p < 0.05$$ had greater odds of PrEP use. Interventions aiming to improve PrEP uptake among BA must consider the individual, social, and structural contexts associated with awareness and use. Enhanced efforts by healthcare providers and institutions may better facilitate access to PrEP for HIV prevention and control transmission. © 2022 Informa UK Limited, trading as Taylor & Francis Group.	awareness; Black adults; HIV prevention; pre-exposure prophylaxis; uptake	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Wilson, Kate S; Mugo, Cyrus; Kate, David A; Matyoki, Vivienne; Mungwala, Carol; Otiso, Lilian; Bukusi, David; McClelland, R Scott; Simoni, Jane M; Drewe, Matt; Mercalio, Sarah; Inwani, Irene; Kohler, Pamela K	High Acceptance and Completion of HIV Self-testing Among Diverse Populations of Young People in Kenya Using a Community-Based Distribution Strategy.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-021-03451-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8340927/	Oral HIV self-testing (HIVST) may expand access to testing among hard-to-reach reach adolescents and young adults (AYA). We evaluated community-based HIVST services for AYA in an urban settlement in Kenya. Post-meRiders recruited AYA ages 15-24 through homes, bars/clubs, and pharmacies. Participants were offered oral HIVST, optional assistance and post-test counseling. Outcomes were HIVST acceptance and completion (self-report and returned kits). Surveys were given at enrollment, post-testing, and 4 months. Log-binomial regression evaluated HIVST preferences by venue. Among 315 reached, 312 (99%) accepted HIVST and 310 (99%) returned kits. Acceptance was 100% in homes, 99% in bars/clubs, and 98% in pharmacies ($$p = 0.07$$). Of 296 who ever confirmed positive result, 294 (99%) participants engaged in sex work in the last 30 days; among these, 229 (82%) reported exchanging sex by the primary question, and 160 (57%) based on secondary questions only. Recent sex exchange was associated with being in a relationship, social media recruitment, less recent oral intercourse, and not discussing PrEP. CONCLUSIONS: That MSM and TGW who exchange sex need regular access to HIVST/ITI prevention, testing, and treatment services, and multiple approaches to assessing sex work will help identify and serve this diverse and dynamic population. Article	2022	Winkelman S.	A Human Rights Case Study on Access to Preexposure Prophylaxis for Female Sex Workers in South Africa	Health and Human Rights	-	-	-	-	10790969	NA	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125193098&partnerID=40&md5=6cf2ea19b2103a6296c19dbaa9e	This paper examines the extent to which access to HIV preventive medicines such as pre-exposure prophylaxis (PrEP) are ensured under the International Covenant on Economic, Social and Cultural Rights. There is a lack of human rights-focused research on access to HIV preventive medicines for vulnerable populations such as female sex workers in HIV-endemic countries. To help fill this gap, I utilized a case study approach to critically examine the rollout of PrEP for female sex workers in South Africa, drawing on the country's Bill of Rights, health care policies, and PrEP implementation. My analysis found that PrEP rollout for female sex workers in South Africa is not consistent with the right to health as articulated in the International Covenant on Economic, Social and Cultural Rights. Specifically, (1) both high-risk female sex workers who are HIV-negative and those living with HIV (PLWH) are not receiving adequate information about PrEP, which is available for free, and (2) PrEP is not always being made available in locations that are accessible and convenient for female sex workers, such as sex work venues, bars, and clubs, reducing the medicine's acceptability; and (3) South Africa's overburdened public health care system and continued criminalization of sex work limited the accessibility and quality of HIV prevention services, contributing to weak uptake of PrEP among female sex workers. To remedy these issues, state leaders should prioritize PrEP counseling and socially acceptable information dissemination; expand comprehensive, coherent, and coordinated sexual health services for female sex workers; increase the financial resources available for programs specific to female sex workers; and decriminalize sex work. © 2022 Winkelman. Article	2022	Winter, Babette L; Hovaguimian, Frédérique; Kouyos, Roger D; Schmidt, Axel Jeremias; Bernasconi, Enos; Braun, Dominique L; Calmy, Alexandra; Notter, Julia; Stoeckle, Marcel; Surial, Bernard; Christinet, Vanessa; Cavassini, Matthias; Depmeier, Carsten; Läuchli, Severin; Boffi El Amari, Emmanuelle; Reinacher, Matthias; Rasi, Manuela; Bruggmann, Philip; Haerry, David; Bize, Raphaël; Low, Nicola; Lehner, Andreas; Quednow, Boris B; Fehr, Jan S; Hampel, Benjamin	Changes in mental and sexual health among MSM using HIV pre-exposure prophylaxis during the SARS-CoV-2 pandemic: longitudinal analysis of the SwissPrEPared cohort study.	Swiss Medical Weekly	-	-	-	1424-3997	10.4414/smw.2022.w30192	https://dx.doi.org/10.4414/smw.2022.w30192	BACKGROUND: Changes in mental and sexual health among men having sex with men (MSM) due to the SARS-CoV-2 pandemic remain unclear. METHODS: Design: Longitudinal analysis of an ongoing, multicentre, pre-exposure prophylaxis (PrEP) cohort (NCT03893188) in Switzerland. Participants: HIV-negative MSM aged ≥18 who completed at least one questionnaire before and one after the start of the SARS-CoV-2 pandemic. Outcomes: Primary: mental health, defined as anxiety and depression scores assessed by the Patient Health Questionnaire-4. Secondary: sexual behaviour, well-being, PrEP use and disruption of care. Outcomes were assessed over seven periods corresponding to different SARS-CoV-2 prevention measures in Switzerland. We performed pairwise comparisons between periods (Wilcoxon signed rank test). RESULTS: Data from 1,043 participants were included. Whilst anxiety scores remained stable over time, depression scores worsened in the second wave and the second lockdown period compared to pre-pandemic scores. This was confirmed by pairwise comparisons (pre-SARS-CoV-2/second wave and pre-SARS-CoV-2/second lockdown: p <0.001). Downward trends in sexual activity,sexualized substance use, and a switch from daily to "event-driven" PrEP were found. Disruption of care affected 42.6% (790/1856) of daily PrEP users' follow-up visits. CONCLUSION: In this longitudinal analysis of a PrEP cohort enrolling MSM, depression scores worsened in the second wave and the second lockdown compared to the pre-pandemic period. Article	2022	Wirtz, Andrea L; Burns, Paul A; Poteat, Tonia; Malik, Mannat; White, Jordan J; Brooks, Durryle; Kasaie, Parastu; Beyrer, Chris	Abuse in the Continua: HIV Prevention and Care Outcomes and Syndemic Conditions Associated with Intimate Partner Violence Among Black Gay and Bisexual Men in the Southern United States.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03705-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9561062	Intimate partner violence (IPV) has been implicated in HIV acquisition and worse HIV outcomes. Limited research focuses on the experiences of Black gay and bisexual men. Using data from cross-sectional surveys in Baltimore, Maryland, and Jackson, Mississippi, we analyzed the association between IPV victimization and HIV-related outcomes among 629 adult Black gay and bisexual men, among whom 53% self-reported a negative result at last HIV test. 40% of participants reported lifetime physical, sexual, and/or psychological IPV victimization, and 24% past-year victimization. Recent and lifetime IPV were associated with recent clinical diagnosis of STI (adjPrR: 1.44; 95%CI: 1.08-1.92) and ART medication interruptions (adjPrR: 1.59; 95%CI: 1.25-2.01), respectively. Physical IPV was inversely associated with current PrEP use (adjPrR: 0.35; 95%CI: 0.13-0.90). Recent IPV was independently correlated with depression symptomatology (adjPrR: 2.36; 95%CI: 1.61-3.47) and hazardous alcohol use (adjPrR: 1.93; 95%CI: 1.42-2.61), with evidence of interactions. IPV-HIV relationships were intersected by internalized stigma, housing instability, poverty, and lack of insurance. Tailored IPV services are urgently needed for comprehensive HIV services for Black gay and bisexual men in the U.S.	gay or bisexual, Black or African American, intimate partner violence, HIV, depression, hazardous alcohol use, syndemic	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Witte, Susan S; Filippone, Prema; Ssewamala, Fred M; Nabunya, Proscovia; Bahar, Ozge Sensoy; Mayo-Wilson, Larissa Jennings; Namuwonge, Flavia; Damulira, Christopher; Tozan, Yesim; Kiyingi, Joshua; Nabayinda, Josephine; Mwebembezi, Abel; Kagaayi, Joseph; McKay, Mary	PrEP acceptability and initiation among women engaged in sex work in Uganda: Implications for HIV prevention.	EClinicalMedicine	-	-	-	2589-5370	10.1016/j.eclinm.2022.101278	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8808048	BACKGROUND: Women engaged in sex work (WESW) are disproportionately affected by HIV. In Uganda, HIV prevalence among WESW is estimated at 37%, accounting for 18% of all new infections in the country. WESW experience poverty, gender-based violence, and other issues that reduce their power and limit their ability to negotiate condom use. Female-controlled strategies, including pre-exposure prophylaxis (PrEP), may afford women more transmission protection, but barriers to access and use persist. This cross-sectional study examined baseline PrEP acceptability and initiation among WESW recently enrolled in a randomized clinical trial in Uganda to test the impact of a combination HIV risk reduction and economic empowerment intervention on sexual risk outcomes (clinicaltrials.gov, NCT03583541). METHODS: A total of 542 WESW from 19 high HIV-prevalent geographical areas were enrolled in the Kyaterekera study between June 2019 and March 2020. Women were eligible for the study if they: (1) were age 18 or over; (2) reported engagement in transactional sex (a sex act in exchange for pay) in the past 30 days; and (3) reported engagement in one or more episodes of unprotected sex in the past 30 days. Women completed a baseline assessment, were tested for HIV and other sexually transmitted infections (STIs) at enrollment, and were connected with antiretroviral therapy (ART), STI treatment, or PrEP, based on need and interest. Descriptive statistics examined baseline data on PrEP acceptability and initiation. Independent variables (i.e. years in sex work, recent sexual coercion, perceived HIV and sex work stigmas, harmful alcohol use, barriers to medical care, and social support) were derived from the empirical literature and women's self-report. Bivariate analysis was performed to test associations between main effects of these variables. Using binomial logistic regression models, predictive models were evaluated for two distinct outcomes-PrEP acceptability and PrEP initiation/uptake. FINDINGS: At baseline, 59% of women (n = 322) tested HIV negative. Among WESW testing negative, 11% (n = 36) were already PrEP enrolled. Most women reported willingness to use PrEP (n = 317; 91%). Slightly over half of WESW not already on PrEP agreed to initiate PrEP (n = 158; 55%). Logistic regression models demonstrate that acceptability of or willingness to use PrEP was significantly associated with fewer years engaged in sex work (AOR= ·18, 95% CI 0·05-·66, p<·01) and greater perceived social support from family (AOR= 1·39, 95% CI 1·03 -1.88, p<·05). PrEP initiation was negatively associated with greater perceived social support from friends (AOR= ·81, 95% CI ·68-0·97, p<·05) and positively associated with higher perceived stigma due to sex work among family members (AOR=2·20, 95% CI 1·15-4·22, p<·05). INTERPRETATION: Despite endorsing PrEP use, many WESW remain reluctant to use it. This gap in prevention practice highlights the heart of a failing PrEP prevention cascade. Findings point to the important role family and friend support may play in destigmatizing sex work and PrEP use for women. Social and structural-level efforts are needed to improve educational messaging and to integrate positive messaging into health promotion campaigns for women and their families, while also working toward decriminalizing sex work. FUNDING: This paper was made possible with funding from United States National Institute of Mental Health (Grant number: R01MH116768). Theses and Dissertations	2022	Wolfe, Hill Landon	Exploring stigma in utilizing HIV prevention strategies and addressing substance use and HIV risk in primary care encounters with transgender and gender diverse adults	-	-	Boston University	-	NA	NA	https://hdl.handle.net/2144/45386	Transgender and gender diverse (TGD) individuals experience high levels of stigma in a variety of settings and contexts, including during healthcare encounters. Persistent stigma and discrimination accumulating over a lifetime lead to hardships that increase health risks, such as engaging in harmful substance use and becoming infected with HIV. Yet, it is not yet clear if there is a relationship between stigma and engaging in HIV prevention clinical services among TGD individuals, and how substance use and HIV sexual risk behaviors might mediate this relationship. Further, little is known about the experiences and preferences of TGD patients when discussing substance use and HIV risk during primary care encounters and how providers address these health topics. Using a combination of elements from four distinct conceptual models which postulates components of syndemics, functions of communication, and clinical care delivery to TGD adult patients, this dissertation adds to the literature through three aims: Aim 1 uses structural equation modeling to test whether substance use, HIV sexual risk behaviors and gender-affirming hormone therapy mediate any observed association between TGD-related stigma and utilization of HIV prevention clinical services (i.e., HIV prevention services or programs, pre-exposure prophylaxis use). This analysis includes a sample of 529 TGD adults in Massachusetts and Rhode Island who were HIV-negative or had an unknown HIV serostatus. Aim 2 uses semi-structured interview data with 25 TGD adults to explore experiences and communication preferences when discussing substance use and HIV risk during primary care encounters. Aim 3 uses in-depth interviews with 15 primary care providers to describe how they report discussions about substance use and HIV risk with TGD adult patients and characterizes how these communication approaches align with varying orientations of self-efficacy and subjective norms. Findings from this dissertation reveal several ways stigma manifests during clinical encounters and underscores the need for improving patient care experiences by alleviating provider knowledge deficits and fostering institutional support within clinic environments. Article	2022	Wood, Sarah M; Meanley, Steven; Bonett, Stephen; Torres, Mary E; Watson, Dovie L; Williams, Javontae L; Brady, Kathleen A; Bauermeister, José A	Strengthening HIV Prevention Services Through an Implementation Science Approach: Perspectives From the HIV Testers in Philadelphia.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002969	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9204788	BACKGROUND: Strengthening HIV prevention services is a key priority of the Ending the HIV Epidemic plan. Informed by the Consolidated Framework for Implementation Research, we examined HIV testers' perceived barriers and facilitators to implementing HIV prevention services, including testers' strengths and weaknesses; enabling factors within the inner and outer settings; and willingness to adopt potential implementation strategies. METHODS: In 2019, the Penn Center for AIDS Research (CFAR) partnered with the Philadelphia Department of Public Health (PDPH) to examine system-level challenges and opportunities experienced by PDPH-funded HIV testers (individuals conducting HIV testing) in Philadelphia. We recruited HIV testers to complete 2 web surveys (n ≈ 40 each) and in-depth interviews (n = 11). RESULTS: Testers self-reported high HIV testing self-efficacy and competence, despite identifying gaps in their knowledge of STI testing, reporting moderate willingness to recommend pre-exposure prophylaxis, and having insufficient cultural competency when working with priority populations. Testers indicated that educational materials and policies within their agencies might require realignment to affirm sexual and gender minority clients. In qualitative interviews, testers noted challenges to implementing PDPH priorities because limited funding fueled competition between local agencies, deterred interagency partnerships, and limited their ability to serve key populations locally. DISCUSSION: HIV testers are critical partners in addressing agency-level barriers to HIV prevention service provision through multilevel implementation strategies. In partnership with PDPH, we will create and implement a train-the-trainers program consisting of skill-building activities, technical assistance, and capacity-building for all agency personnel to address missed opportunities in HIV prevention. These activities will reinforce scalability and sustainability of PDPH-supported HIV prevention programs. Article	2022	Woodward, Shannon C; Baynes, Anne M; Tyson, Hayley A; Dunlop, William A; Martin, Sarah J	Is non-occupational HIV Post Exposure Prophylaxis (nPEP) still used? An exploration of nPEP use since widespread availability of HIV PrEP.	International Journal of STD & AIDS	-	-	-	1758-1052	10.1177/09564624221116527	https://dx.doi.org/10.1177/09564624221116527	BACKGROUND: Non-occupational Post-Exposure Prophylaxis (nPEP) is an effective HIV prevention strategy in gay and bisexual men (GBM) taken after possible exposure. HIV Pre-Exposure Prophylaxis (PrEP) is also a highly effective HIV prevention strategy. METHODS: A retrospective audit of medical records of GBM presenting to a sexual health centre and provided with nPEP compared two periods to determine if nPEP usage changed following availability of PrEP. In the first period (P1) PrEP was available through extended trials. In the second period (P2) PrEP became more accessible through the Australian Pharmaceutical Benefits Scheme (PBS). Period comparisons were performed using a two-population test of proportions with one-tailed testing and significance set at P < .05 using SPSS Statistics Version 25. RESULTS: There were 232 GBM provided with nPEP in P1, and 202 in P2. A two-population test of proportions demonstrated that GBM presentations for nPEP decreased significantly from 302/4779 (6.3%) of GBM visits in P1 to 221/7205 (3.1%) in P2 when PrEP was more accessible (Z=8.53, P < .001). PrEP uptake after presentation for nPEP increased from 30 (12.9%) of total GBM visits in P1 to 69 (34.2%) in P2 (Z=5.26, p < .001). CONCLUSIONS: GBM accessing nPEP decreased with statistical significance post introduction of PBS PrEP. Institutional	2022	World Health Organization	Differentiated and simplified pre-exposure prophylaxis for HIV prevention: update to WHO implementation guidance. Technical Brief	-	Differentiated and simplified pre-exposure prophylaxis for HIV prevention: update to WHO implementation guidance. Technical Brief	-	-	NA	NA	https://books.google.com.br/books?id=6LKFEAAAQBAJ&hl=pt-PT	WHO recommends multiple pre-exposure prophylaxis (PrEP) options as part of combination prevention approaches and there has been a global uptake of PrEP into national guidelines and widespread implementation of PrEP services, although projects and programmes are still commonly small-scale. In many countries, services have been demedicalized, simplified, differentiated, digitalized, and integrated to increase uptake and effective use of PrEP. This technical brief aims to support these trends, accelerated by the COVID-19 pandemic, and improve PrEP uptake, persistence, and effective use by providing implementation guidance for differentiated and simplified service delivery. The brief aims to support a range of stakeholders in planning and implementing PrEP services and supplements and updates previously published WHO PrEP implementation guidance. Article	2022	Wray, Tyler B; Chan, Philip A; Guigayoma, John P; Kahler, Christopher W	Game Plan-a Brief Web-Based Intervention to Improve Uptake and Use of HIV Pre-exposure Prophylaxis (PrEP) and Reduce Alcohol Use Among Gay and Bisexual Men: Content Analysis.	JMIR Formative Research	-	-	-	2561-326X	10.2196/30408	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8771347	BACKGROUND: HIV pre-exposure prophylaxis (PrEP) has considerable potential for reducing incidence among high-risk groups, such as gay, bisexual, and other men who have sex with men (GBM). However, PrEP's effectiveness is closely linked with consistent use, and a variety of individual-level barriers, including alcohol use, could impede optimal uptake and use. Web-based interventions can encourage medication adherence, HIV prevention behaviors, and responsible drinking and may help support PrEP care, particularly in resource-limited settings. OBJECTIVE: We previously developed a web application called Game Plan that was designed to encourage heavy drinking GBM to use HIV prevention methods and reduce their alcohol use and was inspired by brief motivational interventions. This paper aims to describe the web-based content we designed for integration into Game Plan to help encourage PrEP uptake and consistent use among GBM. In this paper, we also aim to describe this content and its rationale. METHODS: Similar to the original site, these components were developed iteratively, guided by a thorough user-centered design process involving consultation with subject-matter experts, usability interviews and surveys, and user experience surveys. RESULTS: In addition to Game Plan's pre-existing content, the additional PrEP components provide specific, personal, and digestible feedback to users about their level of risk for HIV without PrEP and illustrate how much consistent PrEP use could reduce it; personal feedback about their risk for common sexually transmitted infections to address low-risk perceptions; content challenging common beliefs and misconceptions about PrEP to reduce stigma; content confronting familiar PrEP and alcohol beliefs; and a change planning module that allows users to select specific goals for starting and strategies for consistent PrEP use. Users can opt into a weekly 2-way SMS text messaging program that provides similar feedback over a 12-week period after using Game Plan and follows up on the goals they set. CONCLUSIONS: Research preliminarily testing the efficacy of these components in improving PrEP outcomes, including uptake, adherence, sexually transmitted infection rates, and alcohol use, is currently ongoing. If supported, these components could provide a scalable tool that can be used in resource-limited settings in which face-to-face intervention is difficult. Article	2022	Wray, Tyler B; Chan, Philip A; Klausner, Jeffrey D; Ward, Lori M; Ocean, Erik M S	Gay, Bisexual, and Other Men Who Have Sex With Men Who Are Not on Oral PrEP may be Less Interested in Available Injectable Products than in Oral PrEP: Examining Individual-Level Determinants of Interest and Barriers Across Products.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03708-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9912751	Approval of the first injectable PrEP product (cabotegravir) provides an exciting addition to oral PrEP that could encourage those not currently on PrEP to use it. However, few studies have explored interest in injectable cabotegravir among those at increased risk who are not currently on PrEP. We conducted an online survey with 327 gay, bisexual, and other men who have sex with men (GBM) with limited PrEP history to explore their interest and intentions to use oral and injectable PrEP (cabotegravir), and examine barriers and individual-level predictors of both product types. Results showed that 17% of participants who reported being uninterested/neutral about oral PrEP expressed interest in injectable PrEP. Slightly more racial/ethnic minority GBM who were uninterested/neutral for oral PrEP expressed interest in injectable PrEP than White GBM (23% vs. 14%). Determinants were similar across PrEP types. Findings can directly inform interventions encouraging use of both PrEP products. Article	2022	Wu Y.; Meyers K.; Xie L.	HIV risk management among sexual minority men in China: context, lived experience, and implications for pre-exposure prophylaxis implementation	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2021.1885740	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101219457&doi=10.1080%2f13691058.2021.1885740&partnerID=40&md5=66a5561973a6fcc635b9202e0c89b241	This study examined the social context and lived experience of HIV risk management among sexual minority men in China. An interpretative phenomenological analysis of 25 in-depth interviews with participants in five Chinese cities was undertaken. Findings show how men managed HIV risk in the context of high risk perception and anxiety, and strong perceived social discrimination and marginalisation. Men's choice of risk management strategies was influenced by their often-negative perceptions of gay community, social norms around condom use, and prior lived experience. Results underscore the importance of considering these contexts when planning pre-exposure prophylaxis (PrEP) implementation in China and highlight the need for strategies to address potential PrEP-related stigma among sexual minority men. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2022	Wu, Huei-Jiuan; Yu, Yi-Fang; Ku, Stephane Wen-Wei; Tseng, Yuan-Chi; Yuan, Chien-Wen; Li, Chia-Wen; Huang, Po-Hsien; Ko, Nai-Ying; Anderson, Peter L; Strong, Carol	Usability and effectiveness of adherence monitoring of a mobile app designed to monitor and improve adherence to event-driven and daily HIV pre-exposure prophylaxis among men who have sex with men in Taiwan.	Digit Health	-	-	-	2055-2076	10.1177/20552076221102770	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9131382	Objective: The UPrEPU mobile app is a self-monitoring system to enable men who have sex with men to optimize their pre-exposure prophylaxis adherence for HIV prevention. The app was designed to accommodate a rather complicated event-driven dosing schedule. We aim to evaluate the usability of the UPrEPU app and its effectiveness in improving adherence monitoring. Methods: From May to October 2020, 35 participants were enrolled for the usability study and followed up for 4 months. Blood samples for the drug concentration in the dried blood spots were obtained once during the second to fourth follow-up visits. The effectiveness of adherence monitoring was analyzed using Cohen's kappa statistic to calculate the concordance between the average number of pills taken and drug concentration in the dried blood spots. Results: Overall retention was 91.4% (32 participants) at the end of the study. Participants used the app for a mean of 29 days and made 2565 data entries in total, with an average of 76 data entries. The average systematic usability scale score for the app was 71.5, indicating acceptable usability. Slight agreement was reached between the dried blood spots measurement and the number of pills taken and recorded in the app (weighted kappa: 0.21). Conclusions: Our user-centered UPrEPU app designed that it could accommodate both daily and event-driven dosing schedules for men who have sex with men clients with acceptable usability scores. We confirmed that complex behaviors such as different drug-dosing regimens that are contingent on sexual behaviors could be incorporated into the design of a mobile app.	Mobile apps, pre-exposure prophylaxis,	English	United Kingdom	Western and Central Europe and North America	Australia	Asia and the Pacific	Taiwan	Asia and the Pacific	Clinical
Article	2022	Wulandari L.P.L.; He S.Y.; Fairley C.K.; Bavinton B.R.; Marie-Schmidt H.; Wiseman V.; Guy R.; Tang W.; Zhang L.; Ong J.J.	Preferences for pre-exposure prophylaxis for HIV: A systematic review of discrete choice experiments	EClinicalMedicine	-	-	-	25895370	10.1016/j.eclinm.2022.101507	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134584814&doi=10.1016%2fj.eclinm.2022.101507&partnerID=40&md5=0149f8816541d1e4a05b8675cba87a68	Background: We aimed to systematically review the health preference literature using discrete choice experiments (DCEs), an attribute-based stated preference method, to investigate patient preferences for HIV pre-exposure prophylaxis (PrEP). Methods: A search in PubMed, Scopus, CINAHL, and Embase was conducted on July 1, 2021, and updated on November 3, 2021. We used two concepts to create our search strategy: (1) discrete choice experiments/conjoint analysis/best-worst scaling, and (2) HIV PrEP.The study is registered in PROSPERO (CRD42021267026). Findings: In total, 1060 studies were identified, and 18 were included in the analysis. Various attributes were examined, including dosing regimen, type of PrEP products, side effects, other side benefits, cost, effectiveness, dispensing venue, and additional support services. Dosing frequency, cost, the effectiveness of PrEP, dispensing venue, and side effects were the most common attributes examined in DCEs. Despite significant heterogeneity in preferences across subpopulations, overall, the most important attributes were cost (28%, 5/18), effectiveness (28%, 5/18) followed by dosing frequency (17%, 3/18). Interpretation: Notably, in studies where all of these three attributes were examined, some individuals would trade effectiveness for cost or vice versa. Ensuring PrEP is low cost or free, widely disseminating information of its effectiveness and advancements in reducing dosing frequency could accelerate the uptake of PrEP for those who would benefit from PrEP the most. Funding: None. © 2022 The Authors	Discrete choice experiment; HIV; Pre-exposure prophylaxis; Preferences; Systematic review	English	United Kingdom	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Review
Article	2022	Xavier Hall C.D.; Feinstein B.A.; Rusie L.; Phillips II G.; Beach L.B.	Race and Sexual Identity Differences in PrEP Continuum Outcomes Among Latino Men in a Large Chicago Area Healthcare Network	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03544-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122399504&doi=10.1007%2fs10461-021-03544-x&partnerID=40&md5=25491295c6d14bdd31351c64f4ce89e5	U.S. HIV incidence is threefold higher among Latino individuals than non-Latino Whites. Pre-exposure prophylaxis (PrEP) uptake remains low among Latino men. Most HIV studies view Latino communities as a monolithic group, ignoring racial and sexual diversity. This analysis examines PrEP-related outcomes including eligibility, first prescription, and second prescription across race and sexual identity in a sample of Latino cisgender men (n = 8271) who sought services from a healthcare network in Chicago in 2012–2019. Logistic regression was used to calculate adjusted odds ratios. Latino-only participants had lower odds of PrEP eligibility and first prescription compared to White-Latino participants. No other significant differences by race were detected. While bisexual participants had equivalent odds of PrEP eligibility, they had lower odds of first PrEP prescription compared to gay participants. Heterosexual participants also had lower odds of PrEP eligibility and initiation. Future research should address unique factors shaping PrEP-related outcomes among diverse Latino populations. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Xavier Hall, Casey D; Newcomb, Michael E; Dyar, Christina; Mustanski, Brian	Predictors of Re-Initiation of Daily Oral Preexposure Prophylaxis Regimen After Discontinuation.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03625-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8907393	Daily oral preexposure prophylaxis (PrEP) for reducing HIV transmission is recommended for those at elevated risk, including sexual gender and minorities assigned male at birth (SGM-AMAB). Few studies have examined re-initiation among PrEP discontinuers, which is critical to ensuring optimization of PrEP's protection. The current study examined predictors of re-initiation in a longitudinal sample of SGM-AMAB PrEP discontinuers (n = 253) from 10 waves of an ongoing cohort study (analytic n = 1,129). Multilevel structural equation models were used to examine the effects of psycho-social variables on re-initiation. In adjusted models, health insurance, and partner HIV positive status were significantly positively associated with PrEP re-initation. Being bisexual was significantly negatively associated with re-initiation relative to gay participants. Single status and open relationship agreements were associated with higher odds of re-initiation relative to monogamous relationships. Findings suggest that demographic, partnership characteristics and structural factors influence decisions to re-initiate PrEP after discontinuation.	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8907393	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Xiao, Peng; Gumber, Sanjeev; Marzinke, Mark A.; Hoang, Thuy; Myers, Rohan; Date, Abhijit A.; Hanes, Justin; Ensign, Laura M.; Wang, Lin; Rohan, Lisa C.; Cone, Richard; Fuchs, Edward J.; Hendrix, Craig W.; Villinger, Francois	Hypo-osmolar rectal douche tenofovir formulation prevents simian/human immunodeficiency virus acquisition in macaques.	JCI Insight	-	-	-	2379-3708	10.1172/jci.insight.161577	https://insight.jci.org/articles/view/161577/sd/1	In spite of the rollout of oral pre-exposure prophylaxis (PrEP), the rate of new HIV infections remains a major health crisis. In the United States, new infections occur predominantly in men having sex with men (MSM) in rural settings where access to PrEP can be limited. As an alternative congruent with MSM sexual behavior, we have optimized and tested tenofovir (TFV) and analog-based iso-osmolar and hypo-osmolar (HOsm) rectal douches for efficacy against rectal simian/human immunodeficiency virus (SHIV) infection of macaques. Single TFV HOsm high-dose douches achieved peak plasma TFV levels similar to daily oral PrEP, while other formulations yielded lower concentrations. Rectal tissue TFV-diphosphate (TFV-DP) concentrations at the portal of virus entry, however, were markedly higher after HOsm douching than daily oral PrEP. Repeated douches led to significantly higher plasma TFV and higher TFV-DP concentrations in rectal tissue at 24 hours compared with single douches, without detectable mucosal or systemic toxicity. Using stringent repeated intrarectal SHIV exposures, single HOsm high-dose douches delivered greater protection from virus acquisition for more than 24 hours compared with oral PrEP. Our results demonstrate a rapid delivery of protective TFV doses to the rectal portal of virus entry as a potential low-cost and safe PrEP alternative. Article	2022	Xu, Qing; Nali, Matthew C; McMann, Tiana; Godinez, Hector; Li, Jiawei; He, Yifan; Cai, Mingxiang; Lee, Christine; Merenda, Christine; Araojo, Richardae; Mackey, Tim Ken	Unsupervised Machine Learning to Detect and Characterize Barriers to Pre-exposure Prophylaxis Therapy: Multiplatform Social Media Study.	JMIR Infodemiology	-	-	-	2564-1891	10.2196/35446	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10014091	Background: Among racial and ethnic minority groups, the risk of HIV infection is an ongoing public health challenge. Pre-exposure prophylaxis (PrEP) is highly effective for preventing HIV when taken as prescribed. However, there is a need to understand the experiences, attitudes, and barriers of PrEP for racial and ethnic minority populations and sexual minority groups. Objective: This infodemiology study aimed to leverage big data and unsupervised machine learning to identify, characterize, and elucidate experiences and attitudes regarding perceived barriers associated with the uptake and adherence to PrEP therapy. This study also specifically examined shared experiences from racial or ethnic populations and sexual minority groups. Methods: The study used data mining approaches to collect posts from popular social media platforms such as Twitter, YouTube, Tumblr, Instagram, and Reddit. Posts were selected by filtering for keywords associated with PrEP, HIV, and approved PrEP therapies. We analyzed data using unsupervised machine learning, followed by manual annotation using a deductive coding approach to characterize PrEP and other HIV prevention-related themes discussed by users. Results: We collected 522,430 posts over a 60-day period, including 408,637 (78.22%) tweets, 13,768 (2.63%) YouTube comments, 8728 (1.67%) Tumblr posts, 88,177 (16.88%) Instagram posts, and 3120 (0.6%) Reddit posts. After applying unsupervised machine learning and content analysis, 785 posts were identified that specifically related to barriers to PrEP, and they were grouped into three major thematic domains: provider level (13/785, 1.7%), patient level (570/785, 72.6%), and community level (166/785, 21.1%). The main barriers identified in these categories included those associated with knowledge (lack of knowledge about PrEP), access issues (lack of insurance coverage, no prescription, and impact of COVID-19 pandemic), and adherence (subjective reasons for why users terminated PrEP or decided not to start PrEP, such as side effects, alternative HIV prevention measures, and social stigma). Among the 785 PrEP posts, we identified 320 (40.8%) posts where users self-identified as racial or ethnic minority or as a sexual minority group with their specific PrEP barriers and concerns. Conclusions: Both objective and subjective reasons were identified as barriers reported by social media users when initiating, accessing, and adhering to PrEP. Though ample evidence supports PrEP as an effective HIV prevention strategy, user-generated posts nevertheless provide insights into what barriers are preventing people from broader adoption of PrEP, including topics that are specific to 2 different groups of sexual minority groups and racial and ethnic minority populations. Results have the potential to inform future health promotion and regulatory science approaches that can reach these HIV and AIDS communities that may benefit from PrEP.	infoveillance, HIV, minority health, PrEP, social media	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Xu, Xianglong; Yu, Zhen; Ge, Zongyuan; Chow, Eric P. F.; Bao, Yining; Ong, Jason J.; Li, Wei; Wu, Jinrong; Fairley, Christopher K.; Zhang, Lei	Web-Based Risk Prediction Tool for an Individual's Risk of HIV and Sexually Transmitted Infections Using Machine Learning Algorithms: Development and External Validation Study.	Journal of Medical Internet Research	-	-	-	1438-8871 1439-4456	10.2196/37850	https://pubmed.ncbi.nlm.nih.gov/36006685/	BACKGROUND: HIV and sexually transmitted infections (STIs) are major global public health concerns. Over 1 million curable STIs occur every day among people aged 15 years to 49 years worldwide. Insufficient testing or screening substantially impedes the elimination of HIV and STI transmission. OBJECTIVE: The aim of our study was to develop an HIV and STI risk prediction tool using machine learning algorithms. METHODS: We used clinic consultations that tested for HIV and STIs at the Melbourne Sexual Health Centre between March 2, 2015, and December 31, 2018, as the development data set (training and testing data set). We also used 2 external validation data sets, including data from 2019 as external "validation data 1" and data from January 2020 and January 2021 as external "validation data 2." We developed 34 machine learning models to assess the risk of acquiring HIV, syphilis, gonorrhea, and chlamydia. We created an online tool to generate an individual's risk of HIV or an STI. RESULTS: The important predictors for HIV and STI risk were gender, age, men who reported having sex with men, number of casual sexual partners, and condom use. Our machine learning-based risk prediction tool, named MySTIRisk, performed at an acceptable or excellent level on testing data sets (area under the curve AUC for HIV=0.78; AUC for syphilis=0.84; AUC for gonorrhea=0.78; AUC for chlamydia=0.70) and had stable performance on both external validation data from 2019 (AUC for HIV=0.79; AUC for syphilis=0.85; AUC for gonorrhea=0.81; AUC for chlamydia=0.69) and data from 2020-2021 (AUC for HIV=0.71; AUC for syphilis=0.84; AUC for gonorrhea=0.79; AUC for chlamydia=0.69). CONCLUSIONS: Our web-based risk prediction tool could accurately predict the risk of HIV and STIs for clinic attendees using simple self-reported questions. MySTIRisk could serve as an HIV and STI screening tool on clinic websites or digital health platforms to encourage individuals at risk of HIV or an STI to be tested or start HIV pre-exposure prophylaxis. The public can use this tool to assess their risk and then decide if they would attend a clinic for testing. Clinicians or public health workers can use this tool to identify high-risk individuals for further interventions. Article	2022	Xue, Jing; Chong, Huihui; Zhu, Yuanmei; Zhang, Jingjing; Tong, Ling; Lu, Jiahan; Chen, Ting; Cong, Zhe; Wei, Qiang; He, Yuxian	Efficient treatment and pre-exposure prophylaxis in rhesus macaques by an HIV fusion-inhibitory lipopeptide.	Cell	-	-	-	1097-4172 0092-8674	10.1016/j.cell.2021.11.032	https://www.sciencedirect.com/science/article/pii/S0092867421013829	Two HIV fusion-inhibitory lipopeptides (LP-97 and LP-98) were designed with highly potent, long-acting antiviral activity. Monotherapy using a low dose of LP-98 sharply reduced viral loads and maintained long-term viral suppression in 21 SHIV(SF162P3)-infected rhesus macaques. We found that five treated monkeys achieved potential posttreatment control (PTC) efficacy and had lower viral DNA in deep lymph nodes, whereas monkeys with a stable viral rebound had higher viral DNA in superficial lymph nodes. The tissues of PTC monkeys exhibited significantly decreased quantitative viral outgrowth and fewer PD-1(+) central memory CD4(+) T cells, and CD8(+) T cells contributed to virologic control efficacy. Moreover, LP-98 administrated as a pre-exposure prophylaxis (PrEP) provided complete protection against SHIV(SF162P3) and SIVmac239 infections in 51 monkeys via intrarectal, intravaginal, or intravenous challenge. In conclusion, our lipopeptides exhibit high potential as an efficient HIV treatment or prevention strategy. Article	2022	Yager J.; Brooks K.M.; Brothers J.; Mulligan K.; Landovitz R.J.; Reirden D.; Malhotra M.; Glenny C.; Harding P.; Powell T.; Anderson P.L.; Hosek S.	Gender-Affirming Hormone Pharmacokinetics among Adolescent and Young Adult Transgender Persons Receiving Daily Emtricitabine/Tenofovir Disoproxil Fumarate	AIDS Research and Human Retroviruses	-	-	-	8892229	10.1089/aid.2022.0044	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144584358&doi=10.1089%2faid.2022.0044&partnerID=40&md5=d69ef2dea999abe9e5ded93a5dd0610d	Transgender persons have an increased vulnerability to HIV infection yet have not been well-represented in past clinical trials for pre-exposure prophylaxis (PrEP). Because of this, there are few data available to understand whether gender-affirming hormone concentrations are influenced by PrEP agents in transgender men (TM) and transgender women (TW). The objective of this study was to compare gender-affirming hormone concentrations with versus without emtricitabine (F, FTC)-tenofovir disoproxil fumarate (TDF). TM and TW without HIV, aged 15-24 years, were enrolled for 1 month of directly observed daily F/TDF. Participants were required to be receiving a stable hormone dose (estradiol or testosterone) for at least 1 month or three consecutive doses, whichever was longer, before enrollment and willing to continue the same dose. Intensive pharmacokinetic (PK) sampling for gender-affirming hormones was collected before and 2-3 weeks after daily F/TDF. Serum estradiol and total testosterone were determined by liquid chromatography-tandem mass spectrometry; free testosterone by equilibrium dialysis. Maximum concentrations (Cmax) and area under the curve (AUClast) were log-transformed and compared between baseline and on F/TDF using geometric mean ratios (GMRs) with 95% confidence intervals (CIs). Twenty-five TW and 24 TM were enrolled (median age: 20 and 21 years, respectively). In TW, estradiol Cmax (GMR 95% CI: 0.85 0.65-1.11) and AUClast (GMR 95% CI: 0.87 0.73-1.03) were comparable on F/TDF versus baseline. In TM, similar comparability was observed for PrEP versus baseline including total testosterone Cmax (GMR 95% CI: 0.91 0.80-1.03) and AUClast (GMR 95% CI: 0.91 0.81-1.04) and free testosterone Cmax (GMR 95% CI: 0.89 0.74-1.07) and AUClast (GMR 95% CI: 0.88 0.74-1.03). Estradiol and testosterone exposures in young TW and TM did not significantly differ on F/TDF versus baseline. These findings should reassure patients and providers that F/TDF can be used as PrEP without concern for altering gender-affirming hormone PK. Article	2022	Yager, Jenna; Brooks, Kristina M; Brothers, Jennifer; Mulligan, Kathleen; Landovitz, Raphael; Reirden, Daniel; Glenny, Carrie; Malhotra, Meena; Anderson, Peter L; Hosek, Sybil	Pharmacokinetics of Emtricitabine/Tenofovir Disoproxil Fumarate Among Transgender Adolescents and Young Adults Without HIV Receiving Gender Affirming Hormones.	AIDS Research and Human Retroviruses	-	-	-	1931-8405	10.1089/AID.2022.0043	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9910104	The transgender community has expressed concerns regarding drug-drug interactions between HIV-pre-exposure prophylaxis (PrEP) and gender-affirming hormones. In this study, we evaluated emtricitabine (F, FTC)/tenofovir (TFV) disoporoxil fumarate (TDF) pharmacokinetics (PK) among adolescent and young adult transgender persons receiving gender-affirming hormone therapy (GAHT). This was a prospective, observational study among transgender women (TW) and men (TM) without HIV, 15-24 years of age, receiving GAHT (estradiol with/without spironolactone, or testosterone). Participants received 1 month of directly observed daily F/TDF. Weekly convenience blood samples were collected for plasma TFV and FTC, and intracellular TFV-diphosphate (TFV-DP) and FTC-triphosphate (FTC-TP) in peripheral blood mononuclear cells (PBMC) and dried blood spots (DBS). After 2-3 weeks of F/TDF dosing, intensive PK sampling was conducted. PK parameters were estimated using noncompartmental methods. Data were log-transformed and compared between TM and TW, and to historical data among cisgender adults. Plasma TFV exposures were similar between TM and TW geometric mean ratio (GMR); confidence interval (95% CI): 1.06 (0.89-1.28), whereas FTC plasma exposures were 21% higher in TM versus TW (95% CI: 1.07-1.38). TFV-DP in PBMC and DBS and FTC-TP in DBS did not differ between TM versus TW after controlling for creatinine clearance (CrCl), but FTC-TP in PBMC remained 46% (95% CI: 1.15-1.86) higher in TM versus TW. All PK exposures were within expected ranges based on historical studies. TM had higher FTC exposures compared with TW, but overall plasma and intracellular exposures for both drugs were within the range of historical studies, suggesting high PrEP efficacy will be retained in adolescent and young adult transgender persons. Article	2022	Yam, Eileen A; Namukonda, Edith; McClair, Tracy; Souidi, Samir; Chelwa, Nachela; Muntalima, Nelly; Mbizvo, Michael; Bellows, Ben	Developing and Testing a Chatbot to Integrate HIV Education Into Family Planning Clinic Waiting Areas in Lusaka, Zambia.	Global Health Science and Practice	-	-	-	2169-575X	10.9745/GHSP-D-21-00721	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9622293	BACKGROUND: To maximize protection against both unintended pregnancy and HIV, it is important that family planning (FP) services integrate HIV counseling, both to support method choice and identify potential HIV services of interest, such as pre-exposure prophylaxis (PrEP). However, FP providers often lack sufficient time and knowledge to address HIV vulnerability with clients. To potentially offload some of the initial HIV counseling burden from FP providers, we developed and tested a chatbot that provided information about HIV and dual protection to FP clients in waiting areas of FP clinics in Lusaka, Zambia. CHATBOT DEVELOPMENT: We drafted a scripted conversation and tested it in English in formative workshops with Zambian women between the ages of 15 and 49 years. After translating the content to Bemba and Nyanja, we conducted a second round of workshops to validate the translations, before uploading the content into the chatbot platform. CHATBOT USER TEST: Thirty volunteers tested the chatbot in 3 Lusaka FP clinics, completing an exit survey to provide feedback. A large majority (83%) said they learned new HIV information from the chatbot. Twenty (67%) learned about PrEP for the first time through the chat. Most (96%) reported discussing HIV with the provider, after engaging with the chatbot. In response to an open-ended question, several testers volunteered that they wanted to learn more about PrEP. CONCLUSIONS: Pre-consultation waiting-area time is an underutilized opportunity to impart HIV information to FP clients, thereby preparing them to discuss their dual HIV and pregnancy prevention needs when they see their providers. FP clients expressed particular interest in learning more about PrEP, underscoring the importance of integrating HIV into FP services. Article	2022	Yamamoto N.; Koizumi Y.; Tsuzuki S.; Ejima K.; Takano M.; Iwami S.; Mizushima D.; Oka S.	Evaluating the cost-effectiveness of a pre-exposure prophylaxis program for HIV prevention for men who have sex with men in Japan	Scientific Reports	-	-	-	20452322	10.1038/s41598-022-07116-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125214910&doi=10.1038%2fs41598-022-07116-4&partnerID=40&md5=7b5fc4504d5ccb9711253126505516b2	Men who have sex with men (MSM) have been disproportionally affected by the HIV epidemic in many countries, including Japan. Although pre-exposure prophylaxis (PrEP) is a strong prevention tool, it is not yet approved in Japan. A Markov model was developed to describe HIV infection and disease progression in an MSM cohort (N = 1000) in Japan receiving a PrEP program. The model was used to evaluate the cost-effectiveness of a PrEP program. HIV/AIDS treatment, screening, hospitalization due to AIDS, and PrEP were considered as costs and quality-adjusted life-years (QALYs) gained as utilities. Cost-effectiveness was assessed by comparing the incremental cost-effectiveness ratio (ICER) over a 30-year period against the willingness to pay (WTP) threshold. One-way sensitivity and probabilistic sensitivity analyses were performed. With 50% PrEP coverage, the PrEP program became dominant against the program without PrEP, using a threshold of 5.0 million JPY/QALY (45,455 USD). The probabilistic sensitivity analysis revealed that the PrEP program was dominant or at least cost-effective in most cases of 10,000 simulations. Therefore, preparing cheaper PrEP pills, which results in PrEP being dominant or ICER being lower than the WTP threshold, is important to make the program cost-effective. Introduction of PrEP to an MSM cohort in Japan would be cost-effective over a 30-year time horizon. © 2022, The Author(s). Theses and Dissertations	2022	Yamashiro, Nichole Rene; Holmes, Dave	Using the 5 P's to Identify Risk Stratification for PrEP Therapy in the LGBTQIA Community	-	-	UNIVERSITY OF CALIFORNIA	-	NA	NA	https://www.proquest.com/dissertations-theses/using-5-p-s-identify-risk-stratification-prep/docview/2700278840/se-2?accountid=8113	Background: The Lesbian, Gay, Bisexual, Transgender, Queer/Questioning, Intersex, Asexual/Agender community (LGBTQIA), and in particular, Men who has sex with Men (MSM), continue to be at the hub of the Human Immunodeficiency Virus (HIV). Pre-Exposure Prophylaxis (PrEP) has been FDA approved since 2012 and has been shown to be efficacious by nearly 99% at preventing new HIV infections via sexual transmission route, and 74%–84% in injection drug use transmission route, yet much ambiguity of prescribing continues prevent eligible individuals from therapy (CDC, 2021). The ambiguity coincides with a lack of assessment, comfort level of risk-assessment and barriers to communication amongst non-HIV providers. Thus, interventions to expand education to providers use of PrEP therapy to protect and preserve life strategically is needed. Objectives: This project aimed at developing an intervention to improve primary care providers knowledge and comfort in screening "at-risk" patients using a systematic, evidence-based approach that can be applied in a comprehensive manner to ensure an all-inclusive approach. Methodology: An online educational session was implemented at the monthly provider meeting at the University of California Irvine Student Health Center (SHC). There were two phases: the pre-survey and post-survey phase. A paired t-test was performed to measure efficacy. Results: A percent of change test revealed all positive changes, with an average increase of 15% from pre to post intervention surveys. A one-tailed paired samples t-test yielded a p value of < 0.000. While the sample size is too small for generalization, this reflects the trend toward positive knowledge gain. Conclusion: Increasing provider knowledge in sexual health history taking amongst the LGBTQIA community, using an all-inclusive evidence-based strategy, can improve providers risk-stratification and adoption of PrEP therapy within their current practices. Theses and Dissertations	2022	Yap, Alexander Gregory	Metabolic adverse effects of different HIV pre-exposure prophylaxis medications in minority populations : a United States multicenter research network propensity-matched analysis	-	-	University of Texas – Austin	-	NA	NA	http://dx.doi.org/10.26153/tsw/44045	Purpose: To evaluate the association between human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) formulations and their metabolic side effects in a national sample of United States (U.S.) hospital systems and side effect disparities by race and ethnicity. Methods: This retrospective cohort study utilized the TriNetX research database to compare emtricitabine/tenofovir disoproxil fumarate (FTC/TDF) or FTC/tenofovir alafenamide (TAF) from October 2019 to February 2022. Males 18 years or older exposed to either FTC/TDF or FTC/TAF were included. A cohort for each drug was compiled and analyzed for all races/ethnicities, Black-only patients, and Hispanic-only patients. The index event was first exposure to FTC/TDF or FTC/TAF. Screening for baseline characteristics was performed from one year prior to index date up until inclusion. Propensity score matching was performed by demographics and key comorbidities and medications associated with metabolic syndrome and weight gain. Outcomes included documented BMI >30kg/m^2, diagnoses of metabolic disease, and medications associated with treatment of metabolic disease. Results: Overall, 9856 patients were included for analysis (4978 patients per arm). Patients were predominantly White (40.8% in FTC/TAF and 56.1% in FTC/TDF) and overweight (BMI 27 kg/m^2) with a median age of 39 years. Black-only patients (n=1950; 975 patients in each arm) in both cohorts were a median 37 years old, 1.5% Hispanic, and had an average BMI of 27.6 kg/m^2. Hispanic patients in both cohorts (n=988; 494 patients in each arm) were a median 34 years old, 53% White, and had an average BMI of 27.6 kg/m^2. For all cohort comparisons, no differences were found in newly documented BMI >30 kg/m^2 or metabolic disease diagnosis. The cohort with all patients had a higher exposure rate of statins (2.6% vs 1.7%, p=0.0054), insulin (1.2% vs 0.7%, p=0.0186), and metformin (1.0% vs 0.6%, p=0.0142) in the FTC/TAF vs FTC/TDF groups. In the Hispanic-only analysis, the FTC/TDF cohort had higher exposure rates to sulfonylureas (2.0% vs 0%, p=0.0015), SGLT2 inhibitors (2.0% vs 0%, p=0.0015), and thiazides (2.0% vs 0%, p=0.0015). Conclusion: Despite growing concerns for TAF causing weight gain in HIV patients, this study did not show any differences in metabolic disease diagnoses or new documented BMI >30 kg/m^2 in a composite cohort and in racial/ethnic minority patients for HIV PrEP. Article	2022	Yeager S.; Montoya J.L.; Burke L.; Chow K.; Moore D.J.; Morris S.	Patient and Physician Preferences Regarding Long-Acting Pre-Exposure Prophylaxis and Antiretroviral Therapy: A Mixed-Methods Study in Southern California, USA	AIDS Research and Human Retroviruses	-	-	-	8892229	10.1089/aid.2022.0029	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141892389&doi=10.1089%2faid.2022.0029&partnerID=40&md5=954fdd8558f63b5154fb4e8a944ec6b5	Antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP) are key strategies in ending the HIV epidemic. However, poor adherence to daily ART and PrEP increases the risk of HIV transmission and acquisition. Long-acting ART and PrEP formulations attempt to improve adherence through providing long-lasting forms of the medication delivered through different routes of administration: oral (potentially monthly), injection (1-6 months), and subdermal implant (up to annually). This study explored patient and physician preferences for long-acting ART and PrEP as well as adherence support strategies. Adult patients (n = 42) with experience taking ART or PrEP participated in individual interviews or focus groups. Physicians (n = 13) currently prescribing ART and/or PrEP completed an online questionnaire. Rapid qualitative analysis systematically synthesized qualitative data, and descriptive statistics examined survey responses. Patients supported improved adherence as a top potential advantage of long-acting ART and PrEP, and reduced internal stigma as a strong benefit specific to long-acting ART. Annual coverage offered through subdermal implants had strong appeal; however, oral was the preferred modality for long-acting ART and PrEP. Patients preferred injectable ART and PrEP if concurrently receiving hormone therapy injections. Side effects, medication cost, and treatment accessibility were potential barriers. Patients preferred calendar tracking and text messages/phone reminders for adherence supports. Physicians reported that they would reduce clinic visits and HIV testing for all patients on long-acting PrEP, except men who have sex with men who would continue to complete HIV testing every 3 months. Physicians were mixed on whether they believed long-acting ART and PrEP would improve patient adherence. Overall, findings demonstrate the potential benefits of long-acting ART and PrEP, while highlighting the need to obtain additional information to address treatment concerns. © Copyright 2022, Mary Ann Liebert, Inc., publishers 2022.	antiretroviral therapy; HIV; long-acting antiretrovirals; medication adherence; pre-exposure prophylaxis; qualitative	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Young I.	Biopolitics, citizenship, and inequalities in HIV assemblages	Dialogues in Human Geography	-	-	-	20438206	10.1177/20438206211054595	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118310789&doi=10.1177%2f20438206211054595&partnerID=40&md5=e5340d0e77980ecd2002c02c122b9a2d	Di Feliciantonio and Brown offer an important overview of key research areas for the geographies of PrEP, TasP, and undetectability, and they consider what matters for the lives of gay and bisexual men. I offer two areas of further consideration. Firstly, I suggest that rather than setting the biopolitical critiques of PrEP and TasP as at odds with grassroots activism, sexual pleasure, and subjectivities, that these particular forms of biosexual activism are indeed central to subject formation and sexual practices and are constitutive of the other within HIV assemblages. Secondly, I highlight the need to consider inequalities more directly both within the context of national borders in relation to jurisdictional health policy, implementation, and access, and within gay communities themselves in relation to intersectional and embodied identities. © The Author(s) 2021.	activism; Biosexual citizenship; HIV; intersectional inequalities; PrEP; TasP; UK	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Qualitative
Article	2022	Young L.E.; Baird A.; Schneider J.A.	Diagnosing PrEP Communication Self-Efficacy in a Community-Based Peer Leader Intervention for Black Sexual Minority Men	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03704-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130222597&doi=10.1007%2fs10461-022-03704-7&partnerID=40&md5=19192635f85872ed687f82ac72c7f197	HIV prevention interventions that leverage endogenous peer leaders to communicate about Pre-Exposure Prophylaxis (PrEP) and other HIV prevention tools in their social networks offer a way to reach greater portions of communities most impacted by HIV like Black/African American gay, bisexual, same gender-loving, and other sexual minority men (BSMM). However, the success of these interventions hinge on the communication self-efficacy of its peer leaders. In this exploratory study, we present a multi-theoretical framework that situates the PrEP communication self-efficacy (PCSE) of a cohort of young BSMM peer leaders (n = 303) in the context of personal, behavioral, social, and structural factors. Using censored regression models, our analysis shows that PCSE is influenced by evaluations of PrEP itself (its relative advantage, complexity, and compatibility), network embeddedness (degree centrality) among other BSMM, social media network exposure to HIV information, and medical mistrust. We conclude with a discussion of the practical implications of our findings for intervention design and implementation. © 2022, The Author(s). Article	2022	Young, Alinda; Ryan, Julia; Reddy, Krishnaveni; Palanee-Phillips, Thesla; Chitukuta, Miria; Mwenda, Wezi; Kemigisha, Doreen; Musara, Petina; van der Straten, Ariane	Religious leaders' role in pregnant and breastfeeding women's decision making and willingness to use biomedical HIV prevention strategies: a multi-country analysis.	Culture, Health & Sexuality	-	-	-	1464-5351	10.1080/13691058.2021.1874054	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8627258	Oral Pre-Exposure Prophylaxis (PrEP) is an established option, and the dapivirine vaginal ring is emerging as a promising strategy for HIV prevention option for women. Because of this, understanding the contextual and cultural factors that will support the increased uptake of these products is crucial. In sub-Saharan Africa, religious leaders may be important stakeholders to involve in product information, education and roll-out. We conducted a sub-analysis of data from 232 participants taking part in the MTN-041/MAMMA study to explore religious leaders' involvement in pregnant and breastfeeding women's health. Study participants viewed biomedicine and spirituality as interlinked and believed that women could seek health-related care from medical experts and turn to faith-based organisations for religious or spiritual needs. Religious leaders were invested in the health of their congregations, endorsed a variety of sexual health strategies, and were eager to learn more about emerging HIV prevention technologies. These data signal the role of religious leaders in supporting their communities, and the importance of involving religious leaders in efforts to roll out new HIV prevention products to facilitate uptake. Article	2022	Young, Anna Marie; Fruhauf, Timothee; Okonkwo, Obianuju; Gingher, Erin; Coleman, Jenell	Developing Educational Animations on HIV Pre-exposure Prophylaxis (PrEP) for Women: Qualitative Study	JMIR Formative Research	-	-	-	NA	10.2196/33978	https://pmc.ncbi.nlm.nih.gov/articles/PMC9308066/	Background: Despite experiencing the second-highest rate of HIV incidence in the United States, pre-exposure prophylaxis (PrEP) use remains low among Black women due, in part, to a lack of patients' awareness and providers' knowledge. Objective: Our goal was to design animated educational tools informed by patients and women's health providers to address these barriers, specifically for women at risk for HIV. Methods: Two animation storyboards about PrEP for women were created by academic stakeholders (eg, HIV clinical experts, educators, and HIV peer counselors), one for patients and one for providers. Four focus groups with community members from Baltimore, Maryland and four with women's health providers (eg, obstetrician/gynecologists, midwives, nurse practitioners, and peer counselors) at an academic center were conducted to discuss the storyboards. Transcripts were analyzed using conventional content analysis, and themes were incorporated into the final versions of the animations. Results: Academic stakeholders and 30 focus group participants (n=16 female community members and n=14 women's health providers) described important themes regarding PrEP. The themes most commonly discussed about the patient animation were understandability of side effects, HIV risk factors, messaging, PrEP access, and use confidence. Provider animation themes were indications for PrEP, side effects, and prescribing confidence. Conclusions: We created two PrEP animations focused on women. Stakeholder feedback highlighted the importance of ensuring the understandability and applicability of PrEP educational materials while including necessary information to facilitate use or prescribing confidence. Both community members and women's health providers reported greater use confidence after viewing the animations. Theses and Dissertations	2022	Yu, Yifan; Bigos, Kristin L; Marzinke, Mark A; Landovitz, Raphael J; McCauley, Marybeth; Ford, Susan; Hendrix, Craig W; Bies, Robert R; Weld, Ethel D	A population pharmacokinetic model based on HPTN 077 of long-acting injectable cabotegravir for HIV PrEP	-	-	University of California	-	0306-5251	https://doi.org/10.1111/bcp.15477	https://escholarship.org/uc/item/3p19b592	AimsCabotegravir delivered as a long-acting intramuscular injection has shown superior efficacy to oral tenofovir-emtricitabine as pre-exposure prophylaxis (PrEP) for HIV. Cabotegravir pharmacokinetics (PK), like those of other long-acting depot preparations, exhibit variability between individuals and between injection occasions. The aim of this study is to describe the population pharmacokinetics of long-acting cabotegravir (CAB-LA).MethodsUsing available PK measurements from 133 participants in the HIV Prevention Trials Network (HPTN) 077 trial, we analysed CAB-LA PK data using nonlinear mixed-effects modelling to develop a population PK model.ResultsA two-compartment model with first order absorption best described the CAB-LA PK. The analysis identified between-occasion variability (BOV, i.e., differences in PK within one individual from one injection to the next) as a significant covariate affecting the absorption rate, with an estimated contribution of BOV to PK variability on the absorption rate (ka) of 38.5%. Sex and body weight were identified as significant covariates influencing the absorption rate and apparent clearance of CAB-LA after intramuscular injection at various doses and frequencies. Male participants had 67% higher ka than female participants. Serially adding to the model body weight on clearance, sex on ka , and BOV on ka led to a decrease in the objective function value (OFV) of 24.4, 36 and 321.4, respectively.ConclusionThe public availability of this model will facilitate and enable a wide variety of future clinically relevant simulations to inform the optimal use of CAB-LA. Article	2022	Yuan D.; Yin Y.; Chen J.; Lu J.; Zhou Y.; Fu G.; Wang B.	Acceptability of HIV pre-exposure prophylaxis in China: A systematic review and meta-analysis	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624211042308	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124021764&doi=10.1177%2f09564624211042308&partnerID=40&md5=1ff6963ca30a87d5b48630036dd1442d	Using pre-exposure prophylaxis (PrEP) for the prevention of HIV infection is a popular, contemporary research topic. We retrieved PubMed, Web of Science, MEDLINE, Wanfang, CNKI, and Sinomed databases, and related websites to identify studies both in Chinese and English, which reported the acceptability of PrEP in China. A total of 3203 citations were retrieved, of which 54 were included. We found that the acceptability varied widely across the country, ranging from 19.1% to 94.6%, and the pooled estimate was 66.8% (95% CI: 62.0%–71.3%). Higher acceptability of PrEP was associated with the following factors: individuals with a lower educational degree, higher income, non-discriminatory attitude towards AIDS or AIDS patients, self-perceived high HIV risk, feeling that PrEP should be promoted, familiarity with PrEP, history of HIV testing, history of anal intercourse, inconsistent condom use, higher number of sexual partners. The main reasons for not using PrEP are doubting its validity, fear of potential side effects and financial burden, and fear of stigma for using PrEP. This review found that the acceptance in China was moderate. © The Author(s) 2022. Theses and Dissertations	2022	Zaffari, Marcos Antonio, Jr.; Vikström, Johan	The Effect of Pre-Exposure Prophylaxis for HIV Implementation on the Spread of Syphilis: Evidence from Brazil	-	-	Uppsala University	-	NA	NA	https://www.proquest.com/dissertations-theses/effect-pre-exposure-prophylaxis-hiv/docview/2685718021/se-2?accountid=8113	This study investigates the effect of offering Pre-Exposure Prophylaxis (PrEP) against HIV, as a public policy, on the spread of syphilis through behavioral changes on the willingness to engage on riskier sex behavior (i.e. condomless sex). To explore such phenomena, a Difference in Differences method is applied to groups of municipalities in the southeastern region of Brazil. No significant effect was found after restricting the sample to approximate the underlying characteristics of the groups. The results do not support the findings of the previous studies, performed on smaller target groups, nor contradict them. The inconclusiveness of the results is likely due to, amongst other factors, the small number of individuals both taking PrEP or diagnosed with syphilis, compared to the general population of the municipalities. Article	2022	Zaman, Muhammad; Butt, Muhammad Hammad; Siddique, Waqar; Iqbal, Muhammad Omer; Nisar, Naveed; Mumtaz, Asma; Nazeer, Hafiza Yusra; Alshammari, Abdulrahman; Riaz, Muhammad Shahid	Fabrication of PEGylated Chitosan Nanoparticles Containing Tenofovir Alafenamide: Synthesis and Characterization.	Molecules (Basel, Switzerland)	-	-	-	1420-3049	10.3390/molecules27238401	https://pubmed.ncbi.nlm.nih.gov/36500493/	Tenofovir alafenamide (TAF) is an antiretroviral (ARV) drug that is used for the management and prevention of human immunodeficiency virus (HIV). The clinical availability of ARV delivery systems that provide long-lasting protection against HIV transmission is lacking. There is a dire need to formulate nanocarrier systems that can help in revolutionizing the way to fight against HIV/AIDS. Here, we aimed to synthesize a polymer using chitosan and polyethylene glycol (PEG) by the PEGylation of chitosan at the hydroxyl group. After successful modification and confirmation by FTIR, XRD, and SEM, TAF-loaded PEGylated chitosan nanoparticles were prepared and evaluated for their particle size, zeta potential, morphology, crystallinity, chemical interactions, entrapment efficacy, drug loading, in vitro drug release, and release kinetic modeling. The fabricated nanoparticles were found to be in a nanosized range (219.6 nm), with ~90% entrapment efficacy, ~14% drug loading, and a spherical uniform distribution. The FTIR analysis confirmed the successful synthesis of PEGylated chitosan and nanoparticles. The in vitro analysis showed ~60% of the drug was released from the PEGylated polymeric reservoir system within 48 h at pH 7.4. The drug release kinetics were depicted by the Korsmeyer-Peppas release model with thermodynamically nonspontaneous drug release. Conclusively, PEGylated chitosan has the potential to deliver TAF from a nanocarrier system, and in the future, cytotoxicity and in vivo studies can be performed to further authenticate the synthesized polymer. Article	2022	Zapata, Juan P; Petroll, Andrew; de St Aubin, Ed; Quinn, Katherine	Perspectives on Social Support and Stigma in PrEP-related Care among Gay and Bisexual Men: A Qualitative Investigation.	Journal of Homosexuality	-	-	-	1540-3602	10.1080/00918369.2020.1819709	https://dx.doi.org/10.1080/00918369.2020.1819709	Despite its effectiveness at preventing HIV, uptake of PrEP has been slow. PrEP-related stigma is a potential barrier to uptake. Social support has been found to buffer against some PrEP stigma. Unfortunately, little research has investigated the relationship between social support and PrEP-related care. In 2018, we conducted 20 semistructured interviews with MSM who use PrEP (ages 22-70). Interview questions explored social support and PrEP-related stigma, and how these and other psychosocial factors affected PrEP use and continuation. Data were analyzed using grounded theory. Social support was important in PrEP-related care and promoted adaptive behavioral responses, such as adherence to PrEP-related care and enhancing resilience to stress. Participants described psychosocial benefits of PrEP, such as reduced HIV-related anxiety, but some also reported that PrEP-related stigma was an additional stressor. Findings suggest that social support has significant impacts within PrEP-related care and may help buffer against stigma. Article	2022	Zapata, Juan Pablo; Dang, Madeline; Quinn, Katherine G; Horvath, Keith J; Stephenson, Rob; Dickson-Gomez, Julia; John, Steven A	COVID-19-Related Disruptions to HIV Testing and Prevention Among Young Sexual Minority Men 17-24 Years Old: A Qualitative Study Using Synchronous Online Focus Groups, April-September 2020.	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-021-02166-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8589091	Prior research has highlighted the impact of the COVID-19 pandemic on HIV prevention services within the U.S., but few studies have explored this impact through an exploratory, qualitative lens. In this study, we sought to highlight the voices of young sexual minority men (YSMM) 17-24 years old and explored the perceived impact of the pandemic on HIV prevention among a diverse, nationwide sample of YSMM who participated in synchronous online focus group discussions between April and September 2020. Forty-one YSMM described the negative effects of the COVID-19 pandemic on HIV testing and prevention services, including limited and disrupted access to HIV testing, HIV pre-exposure prophylaxis (PrEP), and HIV post-exposure prophylaxis. COVID-19-related challenges were compounded by ongoing, pre-COVID-19 barriers experienced by YSMM in the U.S. For instance, many YSMM relocated back home with family, causing men to avoid HIV prevention services for fear of outing themselves to relatives. YSMM also worried about placing their family at increased risk of COVID-19 by attending clinical appointments. YSMM who did seek HIV prevention services, including access to PrEP, experienced significant barriers, including limited appointment availability and services not tailored to YSMM. Further efforts are needed to support YSMM re-engaging in HIV prevention during and after the COVID-19 era. Article	2022	Zapata, Juan Pablo; de St Aubin, Ed; Rodriguez-Diaz, Carlos E; Malave-Rivera, Souhail	Using a Structural-Ecological Model to Facilitate Adoption of Preexposure Prophylaxis Among Latinx Sexual Minority Men: A Systematic Literature Review.	Journal of Latina/o Psychology	-	-	-	2163-0070	10.1037/lat0000204	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10348365	Research has consistently shown that individual, interpersonal, community and structural factors influence the degree to which individuals' access and utilize health care services, and these factors may play a role in explaining racial and ethnic differences in health care outcomes. Differences in HIV prevalence and treatment between Latinx adults and white adults in the U.S. must be considered in the context of these factors. However, much of the existing research connecting these factors and HIV/AIDS outcomes in Latinxs remains disparate, limited in scope, and has yet not been applied to the use of biomedical HIV preventions. The following systematic literature review examined research related to PrEP in Latinx sexual minority men (SMM) to build a structural-ecological framework of the existing research, while identifying gaps in the literature and areas for future research. We searched two electronic databases using a systematic review protocol, screened 71 unique records, and identified 23 articles analyzing data from Latinx SMM and intended and/or actual PrEP-use in the United States. Based on the present review, disparities in PrEP uptake by Latinx SMM could be explained, in part, by examining how all levels of the structural-ecological framework uniquely contributes to how Latinx SMM engage with HIV prevention measures and come to understand PrEP. It is clear from the existing literature base that some of the most prominent barriers deterring Latinx SMM from seeking PrEP services are the lack of information surrounding PrEP and HIV/gay stigmas. However, higher order structural-level risks can facilitate or reduce access to PrEP. We propose a structural-ecological model to help visualize multi-level domains of unique stressors that limit the implementation of PrEP among Latinxs. At this stage, the available literature provides little guidance beyond suggesting that culturally adapted interventions can be effective in this population. The model developed here provides that needed specificity regarding targeted interventions that will fit the needs of this population. Article	2022	Zapata, Juan Pablo; de St. Aubin, Ed	HIV Prevention among HIV-Negative Latinx Men: Identifying Cultural Factors Associated with Prep	J Clin Transl Sci.	-	NA	-	NA	NA	https://www.proquest.com/dissertations-theses/hiv-prevention-among-negative-latinx-men/docview/2652936121/se-2?accountid=8113	Latinx sexual minority men (SMM) continue to be disproportionately impacted by HIV/AIDS in the U.S. Pre-exposure prophylaxis (PrEP) has been one of the most significant and successful biomedical advances in HIV prevention. While there have been some notable successes in PrEP implementation, uptake among Latinx SMM is considerably lower compared to non-Hispanic Whites. The extant literature suggests that culturally sensitive HIV prevention programs have the potential to increase engagement with PrEP. The current study sought to understand how Latinx cultural concepts may impact the implementation of PrEP. The method chosen for this study was a convergent, parallel mixed-methods design.This approach involved simultaneous qualitative and quantitative data collection and analysis. The purpose of Study I was to better understand how community stakeholders understood PrEP in their community setting, and to provide the information needed to package PrEP for Latinxs. The purpose of Study II was to examine how cultural factors impact PrEP willingness and attitudes. For the study, 151 Latinxs were recruited from a Community Clinic. As expected, perceived health and social benefit(s) were positively associated with PrEP intentions, and that association became stronger with specific cultural concepts. The present study is the first to confirm the relationship between acculturation and willingness to use PrEP. Results from these studies are presented in a pathway model that reflects cultural and behavioral practices that have the potential to increase engagement with PrEP among Latinxs. Article	2022	Zapata-Pizarro, Antonio; Muena-Bugueño, Cristina; Quiroz-Nilo, Susana; Serri-Venegas, Michel; Usedo-López, Pedro	Consideraciones en población transgénero respecto a la infección por VIH, terapia antiretroviral, profilaxis preexposición (PreP) e interacción con tratamiento de reafirmación de género	Revista Chilena de Infectología	-	-	-	0716-1018	10.4067/S0716-10182022000200149	http://www.scielo.cl/scielo.php?script=sci_arttext&pid=S0716-10182022000200149&lng=en&nrm=iso&tlng=en	Resumen La infección por VIH es una epidemia global (prevalencia de 0,8%). En Latinoamérica, Chile, Brasil y Uruguay son los países con mayores índices. Entre las más afectadas están la población transgénero (OR 48,8 respecto a la población general). Múltiples factores bio-psico-sociales explican estas cifras. Bajo uso del preservativo, la idea de reafirmación de género, el temor a ser reemplazadas(os) por personas cisgéneros, presencia de comercio sexual, entre otros, influyen en las mayores tasas de infección. Se han implementado medidas de prevención del VIH, pero pocas dirigidas en específico a personas transgénero. La profilaxis preexposición (PreP) provee de una alternativa de prevención en este género, y la integración de las unidades de atención de transgénero (primarily administration... que entregan PreP, podrían aumentar su adherencia y cobertura. En las personas transgénero con infección por VIH existe baja adherencia a terapia antirretroviral (TARV), en parte por priorización del tratamiento hormonal y miedo a que la TARV altere su proceso de hormonización. Los pocos datos existentes muestran que la mayoría de la TARV, pero algunos tratamientos hormonales podrían disminuir las concentraciones plasmáticas y tisulares de ciertos antirretrovirales. Faltan estudios que evalúen la interacción entre antirretrovirales y tratamiento hormonal de reafirmación de género. Article	2022	Zeggagh J.; Bauer R.; Delaugerre C.; Carette D.; Fressard L.; Charreau I.; Chidiac C.; Pialoux G.; Tremblay C.; Cua E.; Robineau O.; Raffi F.; Capitant C.; Spire B.; Meyer L.; Molina J.M.	Incidence and risk factors for recurrent sexually transmitted infections among MSM on HIV pre-exposure prophylaxis	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003187	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133888579&doi=10.1097%2fQAD.0000000000003187&partnerID=40&md5=69c39e93558a6306e6d90df374421d58	Objective: High rates of sexually transmitted infections (STIs) have been reported among pre-exposure prophylaxis (PrEP) users. We wished to assess the incidence and risk factors for recurrent STIs. Design: The ANRS IPERGAY trial was a prospective study investigating PrEP among MSM and transgender women in outpatient clinics in France and Canada. In all, 429 participants were enrolled, offered up to 4 years of PrEP and screened for bacterial STIs (syphilis, chlamydia and gonorrhea) at baseline and every 6 months. Methods: STIs incidence was calculated yearly. Cox proportional hazards model regression was used to explore associations between participants characteristics at baseline and recurrent STI during follow-up. Results: Over a median follow-up of 23 months, bacterial STI incidence was 75, 33, 13, 32 and 30 per 100 person-years for all STIs, rectal STIs, syphilis, gonorrhea and chlamydia, respectively. STI incidence significantly increased from the first year to the fourth year of the study (55 vs. 90 per 100 person-years, P < 0.001). During the study period, 167 participants (39%) presented with more than one bacterial STIs which accounted for 86% of all STIs. Baseline risk factors associated with recurrent STIs in a multivariate analysis were an STI at baseline hazards ratio: 1.48 (95% confidence interval (CI): 1.06 – 2.07), P ¼ 0.02, more than eight sexual partners in prior 2 months hazards ratio: 1.72 (95% CI: 1.21 – 2.43), P ¼ 0.002 and the use of gamma-hydroxybutyrate hazards ratio: 1.66 (95% CI: 1.16 – 2.38), P ¼ 0.005. Article	2022	Zeuli, JD; Rivera, CG; Smith, BL; Otto, A; Temesgen, Z	Cabotegravir: a novel HIV integrase inhibitor combined with rilpivirine as the first long-acting injectable program for the treatment of HIV infection	Drugs of Today (Barcelona, Spain : 1998)	-	-	-	NA	10.1358/dot.2022.58.12.3448340	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02533510/full	Cabotegravir, a novel HIV integrase inhibitor, shares structural similarity with dolutegravir and bictegravir. Its oral half-life is 32 hours, but cabotegravir nanosuspension for intramuscular injection yields half-lives ranging from 25 to 54 days, enabling extended interval dosing. Drug interactions are minimal, although oral doses require spacing from polyvalent cations, and potent uridine glucuronosyltransferase induction (e.g., rifampin, carbamazepine) requires avoidance due to anticipated subtherapeutic cabotegravir exposure through extended intervals. Randomized clinical trials combined cabotegravir treatment with rilpivirine to demonstrate treatment efficacy in patients living with HIV who had attained virologic suppression, lacked known/suspected mutations to either component, and had not experienced prior HIV treatment failure. Together, oral cabotegravir and rilpivirine maintained viral suppression in the LATTE study while the combination, given intramuscularly, performed comparably to conventional oral therapy in LATTE-2. FLAIR and ATLAS, respectively, demonstrated HIV suppression maintenance for monthly injections in treatment-naive participants and treatment-experienced patients, with ATLAS-2M supporting the efficacy of injections given every 2 months. Investigations to date show an excellent safety profile. Injectable cabotegravir causes short-lived, mild injection site reactions (primarily administration site pain/soreness) that decrease in frequency over time, produce attributable discontinuation rates of at least 2%, and generate satisfaction scores that favor injectable therapy over oral therapy. Virologic failure with resistance development is rare, primarily occurs in the first year of therapy, and is associated with baseline proviral DNA mutations to coadministered rilpivirine. A key component of the first U.S. Food and Drug Administration (FDA)-approved injectable maintenance treatment program for HIV, injectable cabotegravir heralds a new era in HIV treatment innovation. Here we provide a detailed review of the clinical pharmacology, administration and available formulations of the novel HIV integrase inhibitor cabotegravir with in-depth analysis of the clinical trial data, safety, satisfaction and viral resistance development when combined with rilpivirine as the first long-acting injectable program for the treatment of HIV infection.	*HIV Infections drug therapy; *HIV Integrase Inhibitors therapeutic use; *Human immunodeficiency virus infection /drug therapy; Drug Therapy, Combination adverse effects; Human; Humans; Pyridones therapeutic use; Randomized Controlled Trials as Topic; Rilpivirine therapeutic use	English	Spain	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	Zewdie, Kidist; Kiptinness, Catherine; Ngure, Kenneth; Kipkurui, Nicholas; Wairimu, Njeri; Ambiyo, Faith; Mugo, Nelly R; Baeten, Jared M; Mugwanya, Kenneth K	Targeted Implementation of HIV Self-Testing Increases Testing Uptake Among Partners of Index Persons Known to Have HIV in Kenya.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000003003	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9283250	BACKGROUND: Partners of persons living with HIV (PLHIV) are at a high risk of HIV acquisition, particularly if PLHIV are newly diagnosed or not virally suppressed. A focused partner HIV testing strategy could stimulate efficient identification of persons for pre-exposure prophylaxis (PrEP) or antiretroviral therapy (ART) programs. METHODS: We sequentially implemented 2 partner testing strategies at 2 Kenyan HIV clinics: (1) an invitation for clinic-based testing and (2) HIV self-testing (HIVST) kits distribution to index PLHIV. For each testing strategy, we enrolled approximately 150 consecutive index PLHIV with partners of unknown HIV status, not on ART, <6 months on ART, or who had detectable viral load. We compared partner engagement, testing uptake, and linkage for ART or PrEP between the 2 testing strategies. RESULTS: Of 313 index PLHIV enrolled (160 in invitation, 153 in HIVST), the median age was 32 years (interquartile range 26-40) and 76% were women. Overall, 73% of participants (229) discussed HIV testing with their partners: 76% (121) in the invitation strategy vs 71% (108) in the HIVST strategy adjusted odds ratio (adjOR): 0.54, 95% confidence interval (CI): 0.31 to 0.97. Overall, 52% (79) partners in the HIVST strategy tested vs 38% (60) in the invitation strategy (adjOR: 1.78, 95% CI: 1.13 to 2.78). Among partners engaged, 73% in the HIVST strategy vs 50% in the invitation tested (adjOR: 2.68, 95% CI: 1.46 to 4.96); 25% (35/139) tested positive for HIV. Eighty-nine percentage (31/35) who tested positive initiated treatment, but only 21% (20/93) who tested negative initiated PrEP. CONCLUSIONS: HIVST kit distribution to PLHIV with partners of unknown HIV status effectively increased partner testing. Only one-fifth of partners who tested negative initiated PrEP-thus innovations to link to prevention services are urgently needed. Article	2022	Zhang C.; Fiscella K.; Liu Y.	Exploring the Role of Provider—Patient Communication in Women's Sexual Health and Pre-Exposure Prophylaxis Care in the Primary Care Settings in New York State of the United States	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph19138084	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133131925&doi=10.3390%2fijerph19138084&partnerID=40&md5=b39055f137a12e9a80111aed688c65e3	Background: Women shoulder a disproportionate burden of HIV infection in the United States and worldwide. Pre-exposure prophylaxis (PrEP) is an effective tool for HIV prevention, but its use is suboptimal. Primary care providers (PCP) are considered the ideal PrEP caregivers, but they generally underperform in PrEP care implementation. Methods: From 2020 to 2022, we employed semi-structured in-depth interviews to collect information about barriers and facilitators in PrEP care and beliefs and opinions regarding sexual wellness among 18 PCP and 29 PrEP-eligible women. We employed content analysis and thematic analysis to explore the transcribed narrative data. Results: The current study was guided by the "Communication Pathways" Framework. We studied how communication functions affect PrEP care and women's sexual wellness on the pathways. We identified several specific pathways between communication and PrEP care implementation in primary care settings, including patient knowledge, linkage to care, therapeutic alliance, and decision making on PrEP care. A paradox regarding who should initiate the discussion regarding sexual history and PrEP care was identified. Conclusions: Findings suggested that a navigation and assistance system for PrEP care in patients and providers is urgently needed. Future studies should facilitate PrEP discussion, engagement, and monitoring in primary care settings. © 2022 by the authors. Article	2022	Zhang J.Y.; Zhang Y.; Bender A.T.; Sullivan B.P.; Olanrewaju A.O.; Lillis L.; Boyle D.; Drain P.K.; Posner J.D.	HIV pre-exposure prophylaxis adherence test using reverse transcription isothermal amplification inhibition assay	Analytical Methods	-	-	-	17599660	10.1039/d2ay00008c	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85127746771&doi=10.1039%2fd2ay00008c&partnerID=40&md5=82a63bf2f226899f85326e40ef299cbf	Current HIV antiretroviral therapy (ART) or pre-exposure prophylaxis (PrEP) therapy adherence monitoring relies on either patient self-reported adherence or monitored drug dispensing, which are not reliable. We report a proof-of-concept adherence monitoring assay which directly measures nucleotide reverse transcriptase inhibitor (NRTI) concentration using a reverse transcription isothermal amplification inhibition assay. We measure the concentration of Tenofovir diphosphate (TFV-DP) - an NRTI that functions as a deoxyadenosine triphosphate (dATP) analog and long-term adherence marker for PrEP - by measuring the inhibition of the reverse transcription of an RNA template. The completion of reverse transcription is evaluated by recombinase polymerase amplification (RPA), an isothermal nucleic acid amplification assay commonly used for point-of-care diagnostics. We present and validate a model that predicts the amplification probability as a function of dATP and TFV-DP concentrations, nucleotide insertion sites on the RNA template, and RNA template concentration. The model can be used to rationally design and optimize the assay to operate at clinically relevant TFV-DP concentrations. We provide statistical analysis that demonstrates how the assay may be used as a qualitative or semi-quantitative tool for measuring adherence to NRTI drugs and used to support patient compliance. Due to its simple instrumentation and short runtime (<1 hour), this assay has the potential for implementation in low-complexity laboratories or point-of-care settings, which may improve access to ART and PrEP adherence monitoring. © 2022 The Royal Society of Chemistry	NA	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Zhang, Chen; Fiscella, Kevin; Przybylek, Shelby; Chang, Wonkyung; Liu, Yu	Telemedicine Experience for PrEP Care among PrEP-Eligible Women and Their Primary Care Providers during the First Year of the COVID-19 Pandemic in the United States	Tropical Medicine and Infectious Disease	-	-	-	24146366	10.3390/tropicalmed7100280	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140457563&doi=10.3390%2ftropicalmed7100280&partnerID=40&md5=1406aecb3fc87caeadb6d10a9119792	(1) Background: During the two-year-long siege from the COVID-19 pandemic, a significant proportion of doctor visits transitioned from in-person to virtual. Scare evidence is available to assess the quality of patient-provider communication via the platform of telemedicine, especially for PrEP care within primary care settings. (2) Methods: Participants included 18 primary care providers and 29 PrEP-eligible women. Through content analysis and thematic analysis, facilitators and barriers embedded at different levels of telemedicine were identified and assessed. (3) Results: Women and providers reported pros and cons regarding their telemedicine experiences during the initial wave of COVID-19. Both groups of participants agreed that telemedicine visits were more convenient, efficient, and comfortable than in-person visits. However, without face-to-face interactions, some women felt less empathy, caring, and connected with their providers during virtual visits. Health providers expressed concerns with telemedicine, including patients' privacy, lack of intimacy between patients and providers, and delayed lab work. (4) Conclusions: Our data indicate multi-level factors may affect telemedicine experience among PrEP-eligible women and health providers. Participants expressed concerns that may further entrench these long-existing health disparities in healthcare. Proactive efforts from policymakers, health professionals, researchers, and stakeholders are urgently required to tackle identified barriers and to pave the way for the new infrastructure that ensures health equity in society. © 2022 by the authors. Article	2022	Zhang, Chen; Liu, Yu	Understanding the Association between PrEP Stigma and PrEP Cascade Moderated by the Intensity of HIV Testing.	Tropical Medicine and Infectious Disease	-	-	-	2414-6366	10.3390/tropicalmed7050074	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9147022	(1) Background: In the U.S., men who have sex with men (MSM) account for the majority of new HIV infections. On the other hand, pre-exposure prophylaxis (PrEP) is an effective strategy to curb HIV transmission, but it is widely underutilized. It is unknown how stigma affects PrEP care in the context of other HIV prevention strategies. (2) Methods: We included a total of 318 MSM in the current analysis. We employed bivariate and multivariable analyses to assess the association between PrEP stigma and PrEP cascade while controlling for potential confounders on each specific pathway. We further used a series of moderation analyses based upon the intensity of HIV testing within different timeframes to assess the association between PrEP stigma and PrEP cascade. (3) Results: Compared with MSM who used PrEP, those who never used PrEP reported higher internalized and vicarious PrEP stigma. Internalized PrEP stigma has significantly reduced the likelihood of PrEP willingness and PrEP uptake among this group. The trend analysis showed significant trend patterns across different frequencies of HIV testing. (4) Conclusions: A structural-level reform is urgently needed to turn the HIV service encounters into opportunities to facilitate and optimize the PrEP cascade among this group who may benefit from PrEP use.	men who have sex with men, pre-exposure prophylaxis, PrEP stigma, United States, HIV testing	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Zhang, Jing; Li, Chunyan; Xu, Junjie; Hu, Zhili; Rutstein, Sarah E; Tucker, Joseph D; Ong, Jason J; Jiang, Yongjun; Geng, Wenqing; Wright, Sarah T; Cohen, Myron S; Shang, Hong; Tang, Weiming	Discontinuation, suboptimal adherence, and reinitiation of oral HIV pre-exposure prophylaxis: a global systematic review and meta-analysis.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(22)00030-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9124596	BACKGROUND: Poor adherence to oral HIV pre-exposure prophylaxis (PrEP) diminishes its clinical and public health benefits. This study synthesises evidence regarding discontinuation, adherence, and reinitiation of PrEP among geographically diverse PrEP users. METHODS: We did a systematic review and meta-analysis evaluating studies published in MEDLINE, Embase, and Cochrane Central Register of Controlled Trials from inception to Dec 18, 2020. We included longitudinal studies that presented data for PrEP discontinuation, defined as investigator-reported loss to follow-up or participant self-reported PrEP stoppage. Data were extracted from published reports and assessed for risk of bias. We used a random-effects meta-analysis to pool estimates of discontinuation and I2 and τ2 to evaluate heterogeneity. This study is registered with PROSPERO, CRD42020155675. FINDINGS: We identified 4129 records, of which 59 articles were included (n=43â917 participants). 41·0% (95% CI 18·8-63·5) of participants discontinued PrEP within 6 months, with the highest rates in observational studies. The discontinuation rate in sub-Saharan Africa (47·5%, 95% CI: 29·4-66·4%) was higher than in other regions (p<0·001). Discontinuation rates were lower in studies with adherence interventions than in those without (24·7% vs 36·7%, p=0·015). Gay or bisexual men who have sex with men and transgender women offered daily or non-daily dosing options had lower discontinuation rates than those offered daily dosing alone (21·6% vs 31·5%; p<0·001). The pooled suboptimal adherence within 6 months was 37·7% (95% CI 8·4-66·9). Among people who discontinued PrEP, 47·3% (95% CI 31·5-63·2) reinitiated PrEP within 1 year of PrEP initiation. The included studies had poor quality in terms of study design, with a moderate risk of bias. INTERPRETATION: Strategies to encourage reinitiating PrEP for new or persistent risk should be a focus of future PrEP implementation strategies. Article	2022	Zhang, Jing; Ma, Bing; Han, Xu; Ding, Shuangning; Li, Yongze	Global, regional, and national burdens of HIV and other sexually transmitted infections in adolescents and young adults aged 10-24 years from 1990 to 2019: a trend analysis based on the Global Burden of Disease Study 2019.	The Lancet Child and Adolescent Health	-	-	-	2352-4650 2352-4642	10.1016/S2352-4642(22)00219-X	https://www.sciencedirect.com/science/article/abs/pii/S235246422200219X	BACKGROUND: Sexually transmitted infections (STIs), including HIV, are major sexual health issues among adolescents and young adults globally, but data on the burden and trends of these diseases are sparse. We aimed to assess the trends in the burden of HIV and other STIs among adolescents and young adults aged 10-24 years from 1990 to 2019 on the global, regional, and national level. METHODS: In this trend analysis based on the Global Burden of Diseases, Injuries, and Risk Factors Study (GBD) 2019, we reported on the number, rates per 100 000 population, and average annual percentage changes (AAPCs) of incidence and disability-adjusted life-years (DALYs) of HIV and other STIs (syphilis, chlamydia, gonorrhoea, trichomonas, and genital herpes) at the global, regional, and national level among individuals aged 10-24 years. We further analysed these global trends by age, sex, and social development index (SDI). We also used joinpoint regression analysis to identify the year with the most substantial changes in global trends. FINDINGS: Globally, the incidence of HIV among adolescents and young adults decreased from 34·5 per 100 000 population (95% uncertainty interval UI 29·3 to 39·7) in 1990 to 22·7 per 100 000 population (20·3 to 25·8) in 2019, AAPC -2·6 95% CI -3·1 to -2·0); specific years in which HIV incidence decreased significantly were 1998, 2005, and 2014. Incidence of other STIs increased from 6986·3 per 100 000 population (95% UI 5504·8-8645·0) in 1990 to 7088·7 100 000 population (5620·1-8697) in 2019 (AAPC 0·2 95% CI 0·1-0·3); we found a substantial decrease in the incidence of other STIs in 2011 only. The rate of decrease in the incidence of other global STIs between 2009 and 2019 was approximately one-fifth the rate of the decrease in the global incidence of HIV for the same time period (AAPC -0·7 95% CI -0·8 to -0·7 vs AAPC -3·4 -3·8 to -3·1). Regionally, sub-Saharan Africa had the highest incidence and highest DALYs from HIV and other STIs, and Oceania and Eastern Europe had the largest increase in the incidence and DALYs from HIV and other STIs between 1990 and 2019. By SDI quintile, the middle-SDI countries had the largest increase in HIV incidence between 1990 and 2019 and the DALYs from other STIs in the same period decreased in all SDI quintiles. Globally, females accounted for 278 076 (65·8%) of the 0·42 million incident HIV cases in 2019 and 68 115 077 (51·6%) of the 132·0 million incident cases of other STIs. Of all age groups, adolescents aged 10-14 years had the largest increase in the incidence of other STIs between 1990 and 2019 (from 1158·9 per 100 000 population 95% UI 857·8-1556·5 in 1990 to 1215·4 per 100 000 population 893·5-1616·1 in 2019; AAPC 0·1 95% CI 0·1-0·2). The individual STIs with the highest incident rates varied between age groups and sex. INTERPRETATION: Global HIV incidence among adolescents and young adults decreased between 1990 and 2019, with significant decreases coinciding with the implementation of antiretroviral therapy and pre-exposure prophylaxis. The incidence of other STIs in this population increased over the same period and only started decreasing in 2011, at a rate of only one-fifth of the rate of decrease of HIV. Earlier sexual health education and targeted STI screening are urgently required for adolescents and young adults. Article	2022	Zhang, Ke Chun; Fang, Yuan; Cao, He; Chen, Hongbiao; Hu, Tian; Chen, Ya Qi; Zhou, Xiaofeng; Wang, Zixin	The Impacts of the COVID-19 Pandemic on HIV Testing Utilization Among Men Who Have Sex With Men in China: Cross-sectional Online Survey.	JMIR Public Health and Surveillance	-	-	-	2369-2960	10.2196/30070	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9135116	BACKGROUND: The COVID-19 pandemic has created disruptions in HIV prevention and sexual health services for men who have sex with men (MSM). OBJECTIVE: This study compared HIV testing utilization in 3 different reference periods (period 1: before the COVID-19 outbreak, November 2019-January 2020; period 2: after the outbreak, February-April 2020; and period 3: after the pandemic was under initial control, May-July 2020). Factors associated with HIV testing utilization after the COVID-19 outbreak (combined periods 2 and 3) were also investigated. METHODS: Participants were MSM aged ≥18 years living in Shenzhen, China. Those self-reporting as HIV positive were excluded. A total of 595 participants recruited through multiple sources completed a self-administered online survey during August-September 2020. HIV testing utilization after the COVID-19 outbreak was the dependent variable, and multivariate logistic regression models were fitted. RESULTS: HIV testing utilization was significantly lower in period 2 than in period 1 (n=262 vs 363, 44.0% vs 61.0%, P<.001). However, HIV testing utilization was not significantly higher in period 3 than in period 2 (n=277 vs 262, 46.6% vs 44.0%, P=.21). The prevalence of HIV testing utilization after the COVID-19 outbreak was seen in 331 (55.6%) participants. After adjusting for significant background characteristics, condomless anal intercourse (CAI) with regular male sex partners (RPs; adjusted odds ratio AOR 2.15, 95% CI 1.29-3.57) and sexualized drug use (SDU; AOR 2.94, 95% CI 1.41-6.06) both before and after the COVID-19 outbreak, CAI with RPs (AOR 2.07, 95% CI 1.06-4.07) and nonregular male sex partners (NRPs; AOR 3.57, 95%CI: 1.43-8.89) only after the COVID-19 outbreak was positively associated with the dependent variable. Regarding HIV prevention service utilization, HIV testing utilization before the COVID-19 outbreak (AOR 10.75, 95% CI 7.22-16.02) and the use of sexually transmitted infection (STI) testing (AOR 7.02, 95% CI 4.10-12.02), other HIV/STI prevention (AOR 3.15, 95% CI 2.16-4.60), and preexposure prophylaxis (PrEP; AOR 3.58, 95% CI 1.54-8.34) after the COVID-19 outbreak were associated with higher HIV testing utilization. The current perceived risk of HIV infection was higher than that before the COVID-19 outbreak (AOR 1.15, 95% CI 1.01-1.30), and perceived COVID-19 preventive measures taken by HIV testing service providers to be effective (AOR 1.52, 95% CI 1.29-1.78) and perceived higher behavioral control to undergo HIV testing (AOR 1.18, 95% CI 1.00-1.40) were positively associated with HIV testing utilization. Concerns about COVID-19 infection during HIV testing (AOR 0.78, 95% CI 0.68-0.89), avoiding crowded places (AOR 0.68, 95% CI 0.48-0.98), and HIV testing service providers reducing their working hours (AOR 0.59, 95% CI 0.48-0.98) were negatively associated with the dependent variable. CONCLUSIONS: HIV testing utilization among Chinese MSM declined after the COVID-19 outbreak and did not increase after the pandemic was under initial control. Removing structural barriers to accessing HIV testing caused by COVID-19, modifying perceptions related to HIV testing, and making use of HIV self-testing (HIVST) might be useful strategies to improve HIV testing among MSM during the pandemic. Theses and Dissertations	2022	Zhang, Ye	Mixed-methods approaches to inform the implementation of HIV self-testing in Australia	-	-	University of New South Wales	-	NA	https://doi.org/10.26190/unsworks/24789	http://hdl.handle.net/1959.4/101082	Gay, bisexual, and other men who have sex with men (GBMSM) are a priority population for HIV prevention in Australia. HIV testing is a key prevention strategy, and clinical guidelines recommend all sexually active GBMSM should test for HIV at least once a year, and up to four times per year if they have had 1) any condomless anal intercourse, 2) group sex, 3) more than 10 sexual partners in 6 months, or 4) using crystal methamphetamine. However, the frequency of HIV testing is suboptimal among specific subgroups of GBMSM. HIV self-testing provides a promising option to increase the frequency of HIV testing among these subgroups of GBMSM. The first HIV self-test became commercially available in Australia in 2018 but with restricted access. The key question remains of how to accelerate the implementation of HIV self-testing among these subgroups of GBMSM. In this thesis, I used mixed-methods research to answer this question. In Chapter 2, I conducted a prospective cohort analysis to assess the sustainability of HIV testing frequency among those participating in the second year of a wait-list randomised controlled trial. I found only a small decline in HIV testing frequency between the first and second year of the trial, with a relatively stable HIV self-testing frequency in the second year among overseas-born GBMSM. In Chapter 3, I analysed in-depth interviews with the same trial participants and found that some men were concerned about the window period, but the modality was particularly attractive to men living in regional or rural areas with lower proportions of GBMSM. Participants also highlighted the practical, psychological, and social benefits of HIV self-testing. In Chapter 4, I conducted a cross-sectional analysis of data from Australia's Gay Community Periodic Survey among GBMSM. I found the uptake of HIV self-testing among Australian GBMSM was very low but slightly higher among migrant men who had recently arrived in Australia, men at higher risk of HIV and not taking pre-exposure prophylaxis, and infrequent testers. In Chapter 5, I used a discrete choice experiment design to examine the heterogeneity in HIV self-testing preferences among migrant and Australian-born GBMSM and found that migrant GBMSM preferred free HIV self-tests, provided online and via pharmacies. My thesis provides important new information to optimise HIV self-testing implementation in Australia's strategy to reach subgroups of GBMSM who currently are not accessing HIV testing regularly, a key goal of HIV prevention programs. Article	2022	Zhao A.; Dangerfield D.T., II; Nunn A.; Patel R.; Farley J.E.; Ugoji C.C.; Dean L.T.	Pharmacy-Based Interventions to Increase Use of HIV Pre-exposure Prophylaxis in the United States: A Scoping Review	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03494-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117396985&doi=10.1007%2fs10461-021-03494-4&partnerID=40&md5=6502438d2a36e1ff4e3ad57e07614010	HIV pre-exposure prophylaxis (PrEP) remains underutilized in the U.S. Since greater than 85% of PrEP prescriptions are filled at commercial pharmacies, pharmacists are uniquely positioned to increase PrEP use. This scoping review explores pharmacy-based initiatives to increase PrEP use. We searched PubMed, PsycINFO, CINAHL, and Scopus for peer-reviewed studies on pharmacist-led interventions to increase PrEP use or pharmacy-based PrEP initiatives. Forty-nine articles were included in this review. Overall, studies demonstrated that patients expressed strong support for pharmacist prescription of PrEP. Three intervention designs compared changes in PrEP initiation or knowledge pre- and post-intervention. Commentary/review studies recommended PrEP training for pharmacists, policy changes to support pharmacist screening for HIV and PrEP prescription, and telemedicine to increase prescriptions. Pharmacists could play key roles in improving PrEP use in the U.S. Studies that assess improvements in PrEP use after interventions such as PrEP prescription, PrEP-specific training, and adherence monitoring by pharmacists are needed. © 2021, The Author(s), under exclusive license to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Zhao, Alexa Vyain; Crutchley, Rustin D.; Guduru, Rakesh Chowdary; Ton, Kathy; Lam, Tammie; Min, Amy Cheng	A clinical review of HIV integrase strand transfer inhibitors (INSTIs) for the prevention and treatment of HIV-1 infection.	Retrovirology	-	-	-	1742-4690	10.1186/s12977-022-00608-1	https://pubmed.ncbi.nlm.nih.gov/36273165/	Integrase strand transfer inhibitors (INSTIs) have improved the treatment of human immunodeficiency virus (HIV). There are currently four approved for use in treatment-naïve individuals living with HIV; these include first generation raltegravir, elvitegravir, and second generation dolutegravir and bictegravir. The most recent INSTI, cabotegravir, is approved for (1) treatment of HIV infection in adults to replace current antiretroviral therapy in individuals who maintain virologic suppression on a stable antiretroviral regimen without history of treatment failure and no known resistance to its components and (2) pre-exposure prophylaxis in individuals at risk of acquiring HIV-1 infection. Cabotegravir can be administered intramuscularly as a monthly or bi-monthly injection depending on the indication. This long-acting combination has been associated with treatment satisfaction in clinical studies and may be helpful for individuals who have difficulty taking daily oral medications. Worldwide, second generation INSTIs are preferred for treatment-naïve individuals. Advantages of these INSTIs include their high genetic barrier to resistance, limited drug-drug interactions, excellent rates of virologic suppression, and favorable tolerability. Few INSTI resistance-associated mutations have been reported in clinical trials involving dolutegravir, bictegravir and cabotegravir. Other advantages of specific INSTIs include their use in various populations such as infants and children, acute HIV infection, and individuals of childbearing potential. The most common adverse events observed in clinical studies involving INSTIs included diarrhea, nausea, insomnia, fatigue, and headache, with very low rates of treatment discontinuation versus comparator groups. The long-term clinical implications of weight gain associated with second generation INSTIs dolutegravir and bictegravir warrants further study. This review summarizes key clinical considerations of INSTIs in terms of clinical pharmacology, drug-drug interactions, resistance, and provides perspective on clinical decision-making. Additionally, we summarize major clinical trials evaluating the efficacy and safety of INSTIs in treatment-naïve patients living with HIV as well as individuals at risk of acquiring HIV infection. Article	2022	Zhikang L.; Yang Z.; Xiao Y.; Xiaoting C.; Jing G.; Yuantao H.; Wangnan C.; Jinghua L.	Willingness to use the three types of pre-exposure prophylaxis and associated factors among men who have sex with men in Chengdu; 成都市男男性行为人群3 种类型 HIV 暴露前预防用药使用意愿及影响因素分析	Chinese Journal of Endemiology	-	-	-	20954255	10.3760/cma.j.cn112338-20220501-00367	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142445710&doi=10.3760%2fcma.j.cn112338-20220501-00367&partnerID=40&md5=83df8f5d0e681a7927559d1396b0b631	Objective To investigate the willingness to use three types of pre-exposure prophylaxis (PrEP) and its associated factors among MSM in Chengdu. Methods A total of 793 MSM were recruited through Chengdu Tongle Health Consultation Service Centre between November 2021 to January 2022. Data were collected, including demographic characteristics, sexual behaviors in the last six months, PrEP-related stigma, HIV anticipated stigma, MSM internalized stigma, and willingness to use three types of PrEP. Univariate and multivariate logistic regression models were conducted to investigate the associated factors of willingness in using the three types of PrEP. Results Among 793 participants, willingness to take on-demand PrEP was higher (68.3%). Higher education and multiple sexual partners increased the willingness to use oral PrEP, higher education compared with junior high school or below, high school or technical secondary school (aOR=2.43, 95%CI: 1.13-5.21), junior college (aOR=2.67, 95%CI: 1.27-5.61), bachelor degree (aOR= 3.21, 95%CI: 1.52-6.74), master degree or above (aOR=3.77, 95%CI: 1.54-9.26), multiple sexual partners (aOR=1.54, 95%CI: 1.12-2.11) were positively associated with daily oral PrEP. HIV anticipated stigma was positively associated with the willingness in using all three types of PrEP: daily oral PrEP (aOR=1.07, 95%CI: 1.02-1.12), on-demand PrEP (aOR=1.09, 95%CI: 1.03-1.15), and injectable PrEP every 8 week (aOR=1.06, 95%CI: 1.01-1.11). Conclusions The overall willingness in using PrEP in MSM in Chengdu is relatively high, and the promotion of PrEP is highly feasible. In the future, we should continue to promote publicity and education on HIV and PrEP-related knowledge in this population, improve the cognitive level, and guide MSM to establish the correct motivation for PrEP use. © 2022 Chinese Medical Association. Article	2022	Zhou L.; Assanangkornchai S.	Current Perspectives on the Determinants of Acceptability of Pre-Exposure Prophylaxis and Nonoccupational Post-Exposure Prophylaxis among People at Risk for HIV: A Scoping Review	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph191912605	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139821210&doi=10.3390%2fijerph191912605&partnerID=40&md5=559fb01112b725630a75548d98f880b8	Pre-exposure prophylaxis (PrEP) and nonoccupational post-exposure prophylaxis (nPEP) were found to be effective HIV biomedical interventions. However, several barriers to acceptance of these interventions were discovered among populations at risk for HIV, and the Coronavirus Disease 2019 (COVID-19) pandemic may also exacerbate these. The current scoping review aims to update information in regards to facilitators and barriers for PrEP and nPEP acceptability among key populations collected in the past two years and to identify any existing knowledge gaps during the time of the COVID-19 pandemic. Of 1453 studies retrieved, 16 met the final inclusion criteria. The review synthesized a range of individual, PrEP-specific, psychosocial, and health system factors that may affect the acceptability of PrEP or nPEP. The conclusion from this scoping review is that more research is needed to enable a comprehensive understanding of the determinants of acceptability of PrEP and nPEP in the context of COVID-19, particularly among PWID and FSWs. © 2022 by the authors.	acceptability; HIV; nonoccupational post-exposure prophylaxis; pre-exposure prophylaxis	English	Switzerland	Western and Central Europe and North America	Thailand	Asia and the Pacific	Thailand	Asia and the Pacific	Review
Article	2022	Zhou L.; Assanangkornchai S.; Shi Z.; Jiang F.; Yang D.; Shi W.	Acceptability of Pre-Exposure Prophylaxis and Non-Occupational Post-Exposure Prophylaxis among Men Who Have Sex with Men in Guilin, China	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph19063579	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126551497&doi=10.3390%2fijerph19063579&partnerID=40&md5=fd08e7780a121252bb2a399edac843cd	Pre-exposure prophylaxis (PrEP) and non-occupational post-exposure prophylaxis (nPEP) are both effective strategies for preventing HIV. There is limited information about the acceptability of these prevention measures in undeveloped areas of China. We aimed to examine the acceptability of PrEP and nPEP and their determinants among men who have sex with men (MSM). 219 MSM were recruited in Guilin, China. In total, 28.6% (95% CI: 20.0–41.0) and 35.9% (95% CI: 27.3–49.5) of the participants had heard of PrEP and nPEP, respectively, while 57.0% (95% CI: 43.1–68.2) and 58.6 (95% CI:44.8–68.8) reported they would be willing to use PrEP and nPEP after the methods were explained. A higher acceptability of PrEP was seen among participants who were previously married (aOR = 3.30; 95% CI: 1.22–9.19), working as a laborer (aOR = 5.13; 95% CI: 1.64–17.59), migrant workers/farmers (aOR = 2.56; 95% CI: 1.15–5.79), government employees (aOR = 4.76; 95%CI: 1.80–13.02), had higher social support (aOR = 1.05; 95% CI: 1.03–1.08), and had been previously tested for HIV (aOR = 2.79; 95% CI: 1.36–5.94). A higher acceptability of nPEP was associated with those having higher social support (aOR = 1.06; 95% CI: 1.04–1.09), not knowing their sexual partner's HIV status (aOR = 2.72; 95% CI: 1.23–6.12), and having a prior HIV test (aOR = 5.53; 95% CI: 2.58–12.51). PrEP and nPEP are acceptable, especially among MSM with higher social support and had received a previous HIV test. Effective education and different dissemination strategies to promote the acceptance of PrEP and nPEP among MSM are needed. © 2022 by the authors. Licensee MDPI, Basel, Switzerland. Article	2022	Zhou L.; Shi W.; Assanangkornchai S.; Vichitkunakorn P.; Tang J.	Application of Bayesian networks to identify factors influencing acceptability of HIV pre-exposure prophylaxis in Guilin, China	Scientific Reports	-	-	-	20452322	10.1038/s41598-022-24965-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142920683&doi=10.1038%2fs41598-022-24965-1&partnerID=40&md5=26e886534808984c5127660cb10a46d5	Pre-exposure prophylaxis (PrEP) is an effective strategy to prevent uninfected individuals from contracting human immunodeficiency virus (HIV), however it must be acceptable to stakeholders in order to be effective. This study aimed to assess the acceptability of PrEP and related influencing factors. A cross-sectional survey was conducted among female sex workers (FSW), people who inject drugs (PWID), and men who have sex with men (MSM) using respondent driven sampling. Factors influencing PrEP acceptability were estimated using ordinal logistic regression and Bayesian networks. The survey included 765 eligible participants. The mean score of the perceived acceptability index was 3.9 (SD = 1.97). Multivariable logistic regression analysis revealed a higher acceptance of PrEP was associated with elder age, having other medical insurance, higher perceived utility of PrEP in facilitating prevention of HIV, higher perceived ease of use, higher perceived risk of increased risk behavior, higher perceived privacy problem in using PrEP, higher perceived comparative advantage over condom use, higher perceived comparative advantage of having sex when the urge arises, and higher perceived image of PrEP user as having sexual risky behavior, as public-minded and as health-conscious. The Bayesian network model showed perceived ease of use, perceived image of user as health-conscious, and perceived comparative advantage of having sex when the urge arises were directly associated with acceptability of PrEP. If these three factors were at a high level, 74.6% of the participants would have a high level of acceptability of PrEP. Effective education strategies to promote the acceptance of PrEP are needed. Implementation strategies should incorporate more inclusive messaging and build positive publicity for PrEP to reduce the stigma that PrEP use indicates risky behavior. © 2022, The Author(s). Article	2022	Zhou Q.; Liu J.; Li H.; Han Y.; Yin Y.	Increased Risk of Sexually Transmitted Infections in Men Who Have Sex with Men Taking Preexposure Prophylaxis: A Meta-analysis	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001698	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139739379&doi=10.1097%2fOLQ.0000000000001698&partnerID=40&md5=a40a1c76c2aa9650d2f4904b6399dff5	Background Men who have sex with men (MSM) are a priority population for preexposure prophylaxis (PrEP) for HIV prevention. We summarized the surveillance data from the studies of MSM taking PrEP versus before taking PrEP to investigate the possible increased risk of sexually transmitted infections (STIs). Methods Two researchers independently searched 5 databases from January 2012 to April 2022 to identify relevant studies reporting the incidence density of syphilis, gonorrhea, and chlamydia infection. Subgroup analyses based on the type and location of research were conducted. The publication bias was detected by Egger's publication bias plot. Results Twenty studies met the inclusion criteria for the meta-analysis. The pooled estimate of incidence density of syphilis was 9.53 per 100 person-years (PY), whereas 36.48 per 100 PY for chlamydial infection and 34.79 per 100 PY for gonorrhea, higher than the MSM before taking PrEP. The results of the subgroup analysis showed that the incidence density tended to be lower in prospective studies than in retrospective studies and lower in North American studies than in other regions' studies. Conclusions The high incidence of STIs in the MSM taking PrEP needs to be increasingly appreciated, and more effective prevention method for STIs is valuable among MSM alongside HIV prevention uptake. © Lippincott Williams & Wilkins. Article	2022	Zondo N.M.; Sobia P.; Sivro A.; Ngcapu S.; Ramsuran V.; Archary D.	Pharmacogenomics of drug transporters for antiretroviral long-acting pre-exposure prophylaxis for HIV	Frontiers in Genetics	-	-	-	16648021	10.3389/fgene.2022.940661	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140021841&doi=10.3389%2ffgene.2022.940661&partnerID=40&md5=a4aa35cd69ea5618932111c64d453692	The use of antiretrovirals (ARVs) as oral, topical, or long-acting pre-exposure prophylaxis (PrEP) has emerged as a promising strategy for HIV prevention. Clinical trials testing Truvada® tenofovir disoproxil fumarate (TDF)/tenofovir (TFV) and emtricitabine (FTC) as oral or topical PrEP in African women showed mixed results in preventing HIV infections. Since oral and topical PrEP effectiveness is dependent on adequate drug delivery and availability to sites of HIV infection such as the blood and female genital tract (FGT); host biological factors such as drug transporters have been implicated as key regulators of PrEP. Drug transporter expression levels and function have been identified as critical determinants of PrEP efficacy by regulating PrEP pharmacokinetics across various cells and tissues of the blood, renal tissues, FGT mucosal tissues and other immune cells targeted by HIV. In addition, biological factors such as genetic polymorphisms and genital inflammation also influence drug transporter expression levels and functionality. In this review, drug transporters and biological factors modulating drug transporter disposition are used to explain discrepancies observed in PrEP clinical trials. This review also provides insight at a pharmacological level of how these factors further increase the susceptibility of the FGT to HIV infections, subsequently contributing to ineffective PrEP interventions in African women. Article	2022	Zucker J.; Carnevale C.; Gordon P.; Sobieszczyk M.E.; Rai A.J.	Am i Positive? Improving Human Immunodeficiency Virus Testing in the Era of Preexposure Prophylaxis and Immediate Antiretroviral Therapy Using Machine Learning	Open Forum Infectious Diseases	-	-	-	23288957	10.1093/ofid/ofac259	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136282703&doi=10.1093%2fofid%2fofac259&partnerID=40&md5=3d4e83be96c162959cc330b4a4a776ae	Background: Human immunodeficiency virus (HIV) testing is the first step in the HIV prevention cascade. The Centers for Disease Control and Prevention HIV laboratory diagnostic testing algorithm was developed before preexposure prophylaxis (PrEP) and immediate antiretroviral therapy (iART) became standards of care. PrEP and iART have been shown to delay antibody development and affect the performance of screening HIV assays. Quantitative results from fourth-generation HIV testing may be helpful to disambiguate HIV testing. Methods: We retrospectively reviewed 38 850 results obtained at an urban, academic medical center. We assessed signal-to-cutoff (s/co) distribution among positive and negative tests, in patients engaged and not engaged in an HIV prevention program, and evaluated changes in patients with multiple results. Classification and regression tree (CART) analysis was used to determine a threshold cutoff, and logistic regression was used to identify predictors of true positive tests. Results: Ninety-seven percent of patients with a negative HIV test had a result that was ≤0.2 s/co. For patients tested more than once, we found differences in s/co values did not exceed 0.2 s/co for 99.2% of results. CART identified an s/co value, 38.78, that in logistic regression on a unique validation cohort remained associated with the likelihood of a true-positive HIV result (odds ratio, 2.49). Conclusions: Machine-learning methods may be used to improve HIV screening by automating and improving interpretations, incorporating them into robust algorithms, and improving disease prediction. Further investigation is warranted to confirm if s/co values combined with a patient's risk profile will allow for better clinical decision making for individuals on PrEP or eligible for iART. © 2022 The Author(s). Article	2022	Zucker, Roy; Gaisa, Michael; Sigel, Keith; Singer, Ilan; Adler, Amos; Turner, Dan; Ben Ami, Ronen; Nissan, Israel; Chan, Courtney; Halperin, Tamar	Triple site sexually transmitted infection testing as a crucial component of surveillance for men who have sex with men: A prospective cohort study.	International Journal of STD & AIDS	-	-	-	1758-1052	10.1177/09564624211047477	https://dx.doi.org/10.1177/09564624211047477	Chlamydia trachomatis (CT) and Neisseria gonorrhoeae (NG) infections are common among men who have sex with men (MSM). Many oropharyngeal and anorectal infections remain asymptomatic. We aimed to evaluate triple-site screening following PrEP introduction. We enrolled a prospective cohort study including 210 asymptomatic MSM during 2019-2020, analyzed by groups: HIV positive (HIV+), HIV-uninfected using PrEP (HIV-/PrEP+), or HIV-uninfected not using PrEP (HIV-/PrEP-). A self-administered questionnaire captured demographic information and sexual risk-taking behaviors. CT/NG testing results were compared between study groups and predictors of infection were evaluated. We included 59 HIV+, 70 HIV-/PrEP+, and 81 HIV-/PrEP- subjects. 30% (n = 62) of participants tested positive for CT/NG. HIV-/PrEP+ group had highest proportion of infections (n = 33, 47%) followed by HIV-/PrEP- (n = 16, 22%) and HIV+ (n=13, 20%; p < .001). Importantly, 98% (80/82) of pharyngeal/anorectal CT/NG infections were missed in genitourinary testing alone. PrEP use and previous syphilis infection were the strongest risk factor for CT/NG. Extra-genital asymptomatic CT/NG infections were prevalent among MSM. These data highlight the importance of routine extra-genital CT/NG testing in asymptomatic sexually active MSM. The study describes the consequences for three-site testing lack of implementation in the PrEP era. Article	2022	Zucker, Roy; Mor, Zohar; Abudin, Anuar; Davis, Glen; Arroyo, Hansel; Wagner Kolasko, Gal; Arad, Dan; Shilo, Guy	Party keepers: a significant community-based intervention for harm reduction.	Israel Journal of Health Policy Research	-	-	-	2045-4015	10.1186/s13584-022-00535-8	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9165538	BACKGROUND: Gay men use recreational drugs more often than heterosexuals-especially at social events. While partying at a venue, partygoers are at risk of drug overdosing, without access to an emergency help. This study evaluates a unique and novel intervention aimed at training men who have sex with men (MSM) and transgender individuals who frequent parties, to provide immediate assistance on-site to partygoers who have overdosed. METHODS: The Party Keepers (PK) course is a unique 4-h training course that provides the participants with tools to identify, prevent, and treat common medical syndromes that are associated with excessive substance use. Participants were asked to complete a questionnaire on their sociodemographic attributes; their sexual risk behaviour; pre-exposure prophylaxis (PrEP) use and drug-use behaviour before and after the course; and the emergency situations they encountered in party venues after the course. RESULTS: Of the 85 participants who completed the training and left valid contact information, 52 (62%) completed the questionnaires. Their average age was 37.0 years, most lived in Tel-Aviv, and were single. Participants reported that, after the course, they reduced their own use of recreational drugs (cocaine, amyl nitrates, alcohol), reduced their sexual risk behaviours, and significantly increased their use of PrEP. Of all the PKs, 63% (N = 32) indicated that they now provided first-aid and other assistance to partygoers at public venues, which enhanced their sense of community responsibility. In the multivariate analysis, a high level of confidence as a PK, and the knowledge gained in the course, predicted the incidence of subsequent assistance to partygoers in emergency situations. CONCLUSIONS: The PK initiative-a harm-reduction intervention led by peers, aimed at fighting drug overdosing at gay venues-was useful in reducing drug use and sexual risk behaviours among the course participants. Most course participants also responded to drug-related emergency situations at gay parties, as a result. This evaluation of community health intervention within a sexual minority community can help health policy makers design more community based interventions and allocate resources to include community participants in harm-reduction policies. Article	2022	Zucman D.; Fourn E.; Touche P.; Majerholc C.; Vallée A.	Monkeypox Vaccine Hesitancy in French Men Having Sex with Men with PrEP or Living with HIV in France	Vaccines	-	-	-	2076393X	10.3390/vaccines10101629	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140760892&doi=10.3390%2fvaccines10101629&partnerID=40&md5=63a2467121e301e89ea5224aa9168bf8	People with pre-exposure prophylaxis (PrEP) or living with HIV are a high-risk population for monkeypox virus (MPXV) infection. It is important to achieve high MPXV vaccination coverage rates in this group. This project used self-reporting to assess vaccine hesitancy for the smallpox vaccine and acceptance among men having sex with men with PrEP or living with HIV. In total, 52 (33.6%) participants among the 155 declared their hesitancy to be vaccinated against MPXV. Moreover, 20.7% patients with PrEP declared a hesitant attitude towards the smallpox vaccine compared to 40.2% of the HIV patients, p = 0.013. This difference remained not significant after adjustment for age (p = 0.119) and after adjustment for both age and number of different sexual partners (p = 0.406). Among PrEP people, those who expressed concerns about people getting more vaccines than needed (p = 0.012) were less likely to accept vaccination, whereas an increased number of different sexual partners during the previous month was significantly associated with acceptance of vaccination (p = 0.034). Among HIV people, those who expressed concerns about being infected by MPXV (p < 0.001), those who expressed that the smallpox vaccine should be compulsory for people at risk (p < 0.001) and those with an increased the number of different sexual partners the previous month (p = 0.018) were significantly associated with higher acceptance of MPXV vaccination. Our results suggest that vaccine strategy would be efficient in France with a communication strategy emphasizing the benefits of vaccination and the potential MPXV risk infection for health in PrEP and HIV people. Other preventive actions should be implemented, including reduction in sexual partners. © 2022 by the authors.	epidemic; gay; HIV; men; monkeypox virus; PrEP; vaccine; vaccine hesitancy	English	Switzerland	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Quantitative
Article	2023	Abu-Ba'are, Gamji Rabiu; Shamrock, Osman Wumpini; Apreku, Amos; Agbemedu, George Rudolph Kofi; Zigah, Edem Yaw; Ezechi, Oliver C; Nelson, LaRon E; Torpey, Kwasi	Awareness and Willingness to use Condoms and Preexposure Prophylaxis among Gay, Bisexual, and Other Cisgendered Men who Have sex with men in Slum Communities in Ghana. BSGH-004.	Journal of the International Association of Providers of AIDS Care	-	-	-	2325-9582	10.1177/23259582231209649	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10631318	Introduction: Research has begun to examine human immunodeficiency virus (HIV) prevention strategies within the Ghanaian context. Still, little is known about specific populations such as gay, bisexual, and other cisgender men who have sex with men (GBMSM) living in slum communities. We studied HIV prevention strategies such as condoms and preexposure prophylaxis (PrEP) in slum communities and the awareness and willingness to use these choices among GBMSM. This qualitative study examines HIV prevention strategies, specifically examining PrEP and condom use behaviors among GBMSM in Ghana. Methods: We conducted in-depth face-to-face interviews among 12 GBMSM from slums in Accra and Kumasi cities in Ghana. Data were analyzed through a summative content analysis with multiple reviewers to develop codes. Data were collected from participants in January 2022. Results: We found the fear and perceived risk of infection were motivators for consistent condom use, especially during anal sex. GBMSM living with HIV receiving antiretroviral therapy were more inclined to use condoms. We found motivations for using PrEP were influenced by the type of sexual activity and a history of negative HIV status. Also, the barriers to PrEP for GBMSM included limited access to healthcare facilities and the distance to these facilities. Conclusions: To improve condom and PrEP access and uptake, we recommend addressing structural barriers by increasing the number of health facilities and implementing targeted interventions to address the lack of information on HIV awareness and prevention. Involving peer educators may also effectively promote HIV prevention strategies, especially in communities with limited access to healthcare such as slums. Overcoming these access constraints could significantly enhance awareness and prevention of HIV, leading to improved health outcomes for GBMSM living in slum communities.	bisexual, condom, HIV, PrEP, gay	English	United States	Western and Central Europe and North America	Ghana	Western and Central Africa	Ghana	Western and Central Africa	Qualitative
Article	2023	Adams, Alex J; Klepser, Michael E	Pharmacist Prescribing Models for HIV Pre-exposure and Post-exposure Prophylaxis.	Annals of Pharmacotherapy	-	-	-	1542-6270	10.1177/10600280231187171	https://dx.doi.org/10.1177/10600280231187171	State strategies for pharmacist prescribing exist on a continuum from most restrictive to least restrictive. Using human immunodeficiency virus (HIV) pre-exposure prophylaxis and post-exposure prophylaxis as a case study, there are 3 viable pharmacist prescribing models: (1) population-based collaborative practice agreements; (2) government protocols; and (3) standard of care prescribing. The advantages and disadvantages of these 3 models are reviewed.	(1) population-based collaborative practice agreements; (2) government protocols; and (3) standard of care prescribing. Article	2023	Adeagbo, Oluwafemi Atanda; Badru, Oluwaseun Abdulganiyu; Nkfusai, Claude Ngwayu; Bain, Luchuo Engelbert	Effectiveness of Linkage to Care and Prevention Interventions Following HIV Self-Testing: A Global Systematic Review and Meta-analysis.	AIDS and Behavior	-	-	-	NA	10.1007/s10461-023-04162-5	https://dx.doi.org/10.1007/s10461-023-04162-5	Over 38.4 million people were living with HIV globally in 2021. The HIV continuum includes HIV testing, diagnosis, linkage to combined antiretroviral therapy (cART), and retention in care. An important innovation in the HIV care continuum is HIV self-testing. There is a paucity of evidence regarding the effectiveness of interventions aimed at linking self-testers to care and prevention, including pre-exposure prophylaxis (PrEP). To bridge this gap, we carried out a global systematic review and meta-analysis to ascertain the effectiveness of interventions post-HIV self-testing regarding: (1) linkage to care or ART, (2) linkage to PrEP, and (3) the impact of HIV self-test (HIVST) interventions on sexual behaviors. We searched PubMed, Web of Science, SCOPUS, Cochrane Library, CINAHL Plus (EBSCO), MEDLINE (Ovid), Google Scholar, and ResearchGate. We included only published randomized controlled trials (RCTs) and quasi-experiment that compared HIVST to the standard of care (SoC). Studies with sufficient data were aggregated using meta-analysis on RevMan 5.4 at a 95% confidence interval. Cochrane's Q test was used to assess heterogeneity between the studies, while Higgins and Thompson's I2 was used to quantify heterogeneity. Subgroup analyses were conducted to identify the source of heterogeneity. Of the 2669 articles obtained from the databases, only 15 studies were eligible for this review, and eight were included in the final meta-analysis. Overall, linkage to care was similar between the HIVST arm and SoC (effect size: 0.92 0.45-1.86; I2: 51%; p: 0.04). In the population subgroup analysis, female sex workers (FSWs) in the HIVST arm were significantly linked to care compared to the SoC arm (effect size: 0.53 0.30-0.94; I2: 0%; p: 0.41). HIVST interventions did not significantly improve ART initiation in the HIVST arm compared to the SoC arm (effect size: 0.90 0.45-1.79; I2: 74%; p: < 0.001). We found that more male partners of women living with HIV in the SoC arm initiated PrEP compared to partners in the HIVST arm. The meta-analysis showed no difference between the HIVST and SoC arm regarding the number of clients (effect size: - 0.66 1.35-0.02; I2: 64%; p: 0.09) and non-clients FSWs see per night (effect size: - 1.45 - 1.45 to 1.38; I2: 93%; p: < 0.001). HIVST did not reduce the use of condoms during insertive or receptive condomless anal intercourse among MSM. HIVST does not improve linkage to care in the general population but does among FSWs. HIVST intervention does not improve linkage to ART nor significantly stimulate healthy sexual behaviors among priority groups. The only RCT that linked HIVST to PrEP found that PrEP uptake was higher among partners of women living with HIV in the SoC arm than in the HIVST arm. More RCTs among priority groups are needed, and the influence of HIVST on PrEP uptake should be further investigated. Article	2023	Ademe, Bezza; Bogale, Eyob Ketema; Anagaw, Tadele Fentabil	Utilization of HIV Pre-exposure Prophylaxis and Associated Factors Among Female Sex Workers in Bahir Dar City, North-West Ethiopia, Cross-sectional Study, 2022.	International Journal of General Medicine	-	-	-	1178-7074	10.2147/IJGM.S443477	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10749782	Objective: This study aimed to assess the utilization of HIV pre-exposure prophylaxis and associated factors among commercial female sex workers in Bahir Dar City, Northwest Ethiopia, in 2022. Methods: An institution-based cross-sectional study was conducted in Bahir Dar City from November 1 to 30, 2022. The random sampling technique was used to select 396 commercial female sex workers. Kobo Collector was used to gather the data, which was then exported to STATA 14 for analysis. In bivariate regression analysis, all variables with a P-value of <0.2 were entered into multivariable logistic regression. Multivariable logistic regression variables with P-values ≤0.05 at a 95% confidence interval were declared to be significantly linked with the utilization of HIV pre-exposure prophylaxis. Results: In this study, 183 (46.2%) (95%CI: 41.33-51.16) of respondents utilized HIV pre-exposure prophylaxis. Educational status: secondary and above (AOR: 2.18, 95%CI: 1.05-4.53). Age of sex workers 26-36 (AOR: 0.20, 95%CI: 0.17-0.84); experience of sex work 3-5 years (AOR: 0.25, 95%CI: 0.24-0.83); and having good knowledge (AOR: 4.98, 95%CI: 3.90-10.65) were significantly associated with the utilization of HIV pre-exposure prophylaxis. Conclusion: In this study, HIV pre-exposure prophylaxis was not widely used by commercial female sex workers. Therefore, social and behavioral change communication strategies focus on creating awareness and building knowledge on HIV pre-exposure prophylaxis utilization.	pre-exposure prophylaxis, HIV pre-exposure prophylaxis, female sex workers, Ethiopia	English	New Zealand	Asia and the Pacific	Ethiopia	Eastern and Southern Africa	Ethiopia	Eastern and Southern Africa	Quantitative
Article	2023	Adeyemi O.A.; Nowak R.G.; Marzinke M.; Morgan D.; Sam-Agudu N.; Craddock J.; Zhan M.; Trevor A. Crowell; Baral S.; Ndembi N.; Adebajo S.; Charurat M.E.	Correlates of self-reported and biomarker based adherence to daily oral HIV preexposure prophylaxis among a cohort of predominantly men who have sex with men in Nigeria	PLOS One	-	-	-	19326203	10.1371/journal.pone.0282999	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150466231&doi=10.1371%2fjournal.pone.0282999&partnerID=40&md5=a66c750f7062a0957551c310cccf5452	Introduction HIV pre-exposure prophylaxis (PrEP) significantly reduces the risk of HIV acquisition. However, studies have demonstrated discordance between self-reported measures and biomedical benchmarks of PrEP adherence. We estimated the correlation between selfreported PrEP adherence and PrEP biomarkers and explored factors associated with adherence among men who have sex with men (MSM) in Nigeria. Methods TRUST-PrEP, an open-label, prospective study; conducted in Abuja between April 2018 and May 2019. MSM 18 years with substantial HIV risk were enrolled. Participants reported PrEP adherence in the last month using a 4-point scale from "poor" to "perfect" and serum samples for PrEP biomarkers were collected at months 3 and 9. Serum tenofovir concentration was measured by liquid chromatography-Tandem mass spectrometry and considered protective for adherence if 4.2 ng/ml. Spearman s rank correlation was used to estimate correlation between self-reported adherence and measured tenofovir levels. Generalized estimating equations with a logit link was used to estimate adjusted odds ratios (aORs) and 95% confidence intervals (CIs) for associations between self-reported adherence and laboratory-measured adherence. Results A total of 219 MSM with median age 23 (interquartile range 20 27) years had at least one PrEP biomarker assay. Only 66/219 (30%) had at least one record of protective tenofovir concentration. Correlation between tenofovir and self-reported adherence at 3 and 9 months were 0.1 and 0.02 respectively. Furthermore, 17/219 (8%,) and 49/219 (22%) had serum tenofovir of 4.2 35.4 ng/mL and 35.5 ng/mL, corresponding to at least 4 and 7 days PrEP use in a week, respectively. PrEP adherence was higher among participants introduced to PrEP in the clinics compared with communities (aOR: 8.35, 95%CI: 3.24, 21.5) and those with same-sex practices family disclosure (aOR: 3.60 95% CI: 1.73, 7.51). Conclusion Self-reported PrEP adherence poorly correlated with biomarkers. Facilitating clinic-based PrEP introduction and disclosure of same-sex practices to family among MSM may improve PrEP adherence. © 2023 Public Library of Science. Article	2023	Agada S.J.; Ezekiel P.; Kachiside D.; Mbanefo C.; Leeleebari S.; Ikaraoha G.; Menyaga U.O.	Barriers to Uptake of Oral Pre-exposure Prophylaxis for HIV among Adolescents' Young boys and Girls an Assessment of Cross River North Nigeria	Texila International Journal of Public Health	-	-	-	25203134	10.21522/TIJPH.2013.11.02.Art026	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85175659857&doi=10.21522%2fTIJPH.2013.11.02.Art026&partnerID=40&md5=72d8bce5a0e81418ff18d1640334cf4a	Antiretroviral pre-exposure prevention (PrEP) to stop HIV transmission was 1st approved by the USA Food and Drug Administration in 2012. Despite correlations of decreases in new HIV infections being greatest wherever PrE-exposure prophylaxis has been deployed, the uptake of PrE-exposure prophylaxis is insulant, significantly among populations with disproportionate HIV burden. This narrative review seeks to spot individual and general barriers to PrE-exposure prophylaxis usage in African country. A comprehensive search of recent literature uncovered a fancy array of structural, social, clinical, and behavioral barriers, as well as knowledge/awareness of PrE exposure prophylaxis, perception of HIV risk, stigma from care suppliers or family/partners/friends, distrust of care providers/systems, access to school assignment, prices of PrE exposure prophylaxis, and issues around school assignment facet effects/medication interactions. significantly, these barriers might have totally different effects on specific populations in danger. The complete potential of PrE-exposure prophylaxis for HIV interference won't be realized till these problems area unit self-addressed. Ways to realize this goal ought to embody academic interventions, innovative approaches to delivery of HIV care, resource, and DE stigmatization of PrE-exposure prophylaxis and PrE-exposure prophylaxis users. Until then, PrE-exposure prophylaxis `uptake can still be suboptimal, significantly among people who would like it most. Results: Stigma influences uptake of pre-exposure prophylaxis; HIV risk perception does not affect uptake of pre-exposure prophylaxis; and a significant negative relationship between stigma and pre-exposure prophylaxis uptake. Conclusion: This study was conducted to investigate barriers to oral pre-exposure prophylaxis. Significant findings of the study conclude: stigma influences uptake of oral pre-exposure prophylaxis for HIV. © 2023, Texila International Journal (TIJ). All rights reserved. Article	2023	Aggarwal, Abhishek; Zhang, Ran; Qiao, Shan; Wang, Bo; Lwatula, Clementina; Menon, Anitha; Ostermann, Jan; Li, Xiaoming; Harper, Gary	Physician-Patient Interaction Quality Mediates the Association Between HIV-Related Stigma and HIV-Prevention Behaviors Among Sexual Minority Men in Zambia.	AIDS and Behavior	-	-	-	1573-3254 1090-7165	10.1007/s10461-023-04171-4	https://link.springer.com/article/10.1007/s10461-023-04171-4	HIV-related stigma is a major challenge to HIV prevention for sexual minority men (SMM) in Zambia, but little is known about the underlying mechanisms. This study aimed to investigate whether physician-patient interaction quality mediates the relationship between HIV-related stigma and HIV-prevention behaviors among SMM. Data were collected using a cross-sectional survey from 194 SMM (aged: mean = 24.08, SD = 4.27) across four districts in Zambia between February and November 2021. Participants were asked about their demographic characteristics, HIV-related stigma, SMM-related stigma, physician-patient interaction quality, HIV-testing intention, and use of pre-exposure prophylaxis (PrEP). Path analysis was used to test the mediation effect of physician-patient interaction quality in the associations of HIV-related stigma/SMM-related stigma with HIV-testing intention and current PrEP use. Higher self-reported physician-patient interaction quality was negatively associated with HIV-related stigma (β = - 0.444, z = - 2.223, p < 0.05), and positively associated with HIV-testing intention (β = 0.039, z = 5.121, p < 0.001) and current PrEP use (β = 0.008, z = 2.723, p < 0.01). HIV-related stigma among SMM had a significant and negative indirect effect on HIV-testing intention (β = - 0.017, z = - 2.006, p < 0.05), and current PrEP use (β = - 0.004, z = - 2.009, p < 0.05) through physician-patient interaction quality. Contrary to our expectations, SMM-related stigma did not have a significant and negative indirect effect on HIV prevention behaviors through physician-patient interaction quality. Health interventions need to improve physician-patient interaction quality by offering healthcare provider training, targeting HIV-related stigma in healthcare settings, and devising inclusive healthcare policies to promote HIV prevention efforts. Article	2023	Aguilera-Mijares, Santiago; Martínez-Davalos, Araczy; Bautista-Arredondo, Sergio; Vermandere, Heleen	The Preexposure Prophylaxis Care Continuum Among Mexican Men Who Have Sex With Men and Transwomen: A Qualitative Study.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001759	https://dx.doi.org/10.1097/OLQ.0000000000001759	BACKGROUND: This article describes perceptions and experiences related to the preexposure prophylaxis (PrEP) care continuum of Mexican men who have sex with men (MSM) and transwomen (TW). METHODS: Between June and July 2020, we applied 24 online semistructured interviews regarding PrEP use with 10 PrEP users, 6 ex-users, and 8 potential users (at risk, not enrolled). RESULTS: Awareness: TW did not always receive the information they needed from trusted people. Acceptability: Potential users were reluctant to use PrEP because of fear of adverse effects, and only a few participants worried about stigma. Uptake: Potential users missed their enrollment visit and did not know how to reschedule. Adherence: Barriers included routine changes interfering with PrEP-taking habits (arriving home later, traveling, etc.), whereas feeling protected was reported as a facilitator. Retention: Ex-users quit PrEP services, mostly without reducing their HIV risk, because of difficulties keeping appointments and fearing long-term effects. CONCLUSION: Inclusive awareness activities, tackling misbeliefs regarding adverse effects, and more flexible services may improve PrEP usage and enhance its impact. Article	2023	Agustí, Cristina; Martínez Riveros, Héctor; García-Pérez, Jorge; Descalzo, Vicente; Fernandez, Gema; Ramírez-Marinero, Aida; Gonzalez, Maria Victoria; Díaz, Yesika; Montoro-Fernandez, Marcos; Romano-deGea, Pol; Araujo, Silvia G; Muntada, Esteve; Casabona, Jordi	Feasibility and impact of online HIV/STI screening addressed to men who have sex with men and transgender women users of pre-exposure prophylaxis (PrEP) in Spain (TESTATE PrEP): a study protocol for a non-blinded randomised controlled trial.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2023-073459	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10582878	INTRODUCTION: The objectives of the study are: to design and implement a pilot intervention to offer self-sampling kits to detect HIV, Chlamydia trachomatis (CT), Neisseria gonorrhoeae (NG) and Treponema pallidum (TP) among gay, bisexual and other men who have sex with men and transgender women users of pre-exposure prophylaxis (PrEP) as part of PrEP follow-up. To evaluate if the pilot intervention causes a reduction of the retention to PrEP follow-up among the target population. To analyse the capacity of the intervention to reduce the healthcare burden on the PrEP service. To evaluate the acceptability of the intervention among PrEP users and PrEP service healthcare workers and; to validate dried blood samples for treponemal and non-treponemal antibody detection using the Dual Path Platform syphilis screening and confirmatory assay compared with blood drawn by venous puncture. METHODS AND ANALYSIS: We will perform a non-blinded randomised controlled non-inferiority trial among PrEP users on follow-up. Participants on the control arm will follow the usual follow-up protocol with quarterly face-to-face visits where they will be tested for HIV and sexually transmitted infections (STIs). Participants in the experimental arm will alternate face-to-face meetings with online screening of HIV and STIs. The website https://testate.org/ will include a module for online follow-up visits of participants. Participants of the experimental arm will order self-sampling kits for HIV, CT, NG and TP through the website, will send the samples to the laboratory and check their results online. We will compare the retention to follow up and the healthcare burden in both arms. The acceptability of the intervention among participants and healthcare workers will be assessed. ETHICS AND DISSEMINATION: The project has been approved by the CEIC-HUGTIP (Reference: PI-22-051). Subjects will be included after giving their informed consent. Final conclusions and recommendations will be shared with stakeholders. Two publications in peer-reviewed journals are expected. TRIAL REGISTRATION NUMBER: NCT05752643. Article	2023	Agwang, Winnie; Nangendo, Joanita; Nabikande, Sherifah; Okello, Tom; Tusabe, Joan; Semitala, Fred C; Kasasa, Simon; Matovu, Joseph K B	Factors associated with willingness to take Pre-Exposure Prophylaxis (PrEP) among high-risk adolescent boys and young men in Masese fishing community, Uganda	PLOS Global Public Health	-	-	-	2767-3375	10.1371/journal.pgph.0001191	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10249897	Pre-Exposure Prophylaxis (PrEP) is a known HIV prevention strategy for high-risk populations however, some high-risk communities have not yet fully embraced it. We sought to determine willingness to take PrEP and the associated factors among high-risk adolescent boys and young men (ABYM) in Masese fishing community, Jinja district, Eastern Uganda. We conducted a cross-sectional study, between October and November 2020, using a semi-structured questionnaire among ABYM aged 10-24 years in Masese fishing community, Eastern Uganda. We surveyed 479 participants, who had two or more sexual partners with inconsistent or no condom use. We carried out modified Poisson regression analysis to determine factors associated with willingness to take PrEP.Of 479 high-risk ABYM, 86.4% (n = 414) were willing to take PrEP. Confidence in PrEP safety (adj.PR = 1.56; 95%CI: 1.55, 2.24), availability of PrEP in areas easily accessible by ABYM (adj.PR = 1.40; 95%CI: 1.25, 1.57), and perceiving oneself as being at a very high risk of HIV infection (adj.PR = 1.11; 95%CI: 1.03, 1.20) were positively associated with willingness to take PrEP. On the other hand, being unmarried (adj.PR = 0.92; 95%CI: 0.87, 0.98) and earning more than USD 27 a month (adj.PR = 0.92; 95%CI: 0.87, 0.97) were negatively associated with willingness to take PrEP. There was high willingness to take PrEP among adolescent boys and young men in Masese fishing community. Confidence in PrEP safety, access to PrEP in their community and self-perception to be at high risk for HIV acquisition had a positive bearing on willingness to take PrEP while being unmarried and earning more than USD27 had a negative bearing on willingness to take PrEP. These findings suggest a need for target-specific interventions for unmarried men and those earning >USD27. Article	2023	Aidoo-Frimpong, Gloria; Agbemenu, Kafuli; Adzrago, David; Akyirem, Samuel; Boateng, Sarpong; Nelson, LaRon E	The Promise of Pre-Exposure Prophylaxis - Examining Awareness, Knowledge, and Willingness to use Different Modalities Among US-Based African Immigrants.	Journal of Immigrant and Minority Health	-	-	-	1557-1920	10.1007/s10903-023-01515-z	https://dx.doi.org/10.1007/s10903-023-01515-z	This study aims to describe and understand the relationship between sociodemographic factors and PrEP awareness, and willingness to use a PrEP modality (oral or injectable).Despite the availability of effective prevention tools such as HIV preexposure prophylaxis (PrEP), African immigrants in the United States are disproportionately affected by HIV. Although PrEP can significantly reduce HIV infection in this population, research evidence on PrEP outcomes, such as awareness, knowledge, and willingness to use, is extremely limited. Between April and May 2022, 92 participants completed an online survey assessing their awareness, knowledge, and willingness to use oral or injectable PrEP. The association between sociodemographic characteristics and PrEP-related measures was examined using descriptive and Pearson's chi-squared or Fisher's exact tests. Participants (N = 92) were born between 1990 and 1999 (46.7%), female (70.76%) and highly educated (59.6%). About 52.2% were unaware of PrEP, and 65.6% were willing to use a PrEP modality. Findings indicate that individuals who reported being aware of PrEP demonstrated a high level of knowledge regarding the medication. Having a healthcare provider was associated with PrEP awareness and willingness to use, while educational status was associated with PrEP awareness. 51.1% of participants were willing to use an oral pill for prevention and 47.8% were willing to use injectable PrEP. Our findings highlight the need for PrEP-related research and interventions for African immigrants to increase awareness and provide options for HIV prevention, as African immigrants are currently not well-represented in PrEP delivery systems in the US. Article	2023	Ali U.; Pasha S.K.; Patel R.; Schmidt H.-M.; Altaf A.	Assessment of Acceptability of Pre-exposure Prophylaxis for HIV Prevention Among Men Who Sex with Men and Transgender Community in Pakistan	Journal of the College of Physicians and Surgeons Pakistan	-	-	-	1022386X	10.29271/jcpsp.2023.09.983	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85170408859&doi=10.29271%2fjcpsp.2023.09.983&partnerID=40&md5=6cbbd57c108d5e97953c08882be14015	Objective: To assess the level of acceptability of oral pre-exposure prophylaxis (PrEP) among men who have sex with men (MSM) and transwomen (TW) in Pakistan. Study Design: Cross-sectional study. Place and Duration of the Study: Online study portal from September to November 2021. Methodology: The study participants were recruited through snowball sampling. Consenting individuals who were >13 years and were identified as MSM or TW were included in the study. Data were analysed using SPSS version 25. Frequencies, percentages and correlation coefficients were computed. Results: A total of 347 participants were recruited. The mean age of all participants was 29.8 ± 6.7 years. Fifty-eight (19.7%) of the participants had chemsex with amphetamine-type stimulants (ATS) at least once in preceding six months of the study, and 58 (19.7%) had a sexually transmitted infection (STI) in preceding six months whereas 10 (3.4%) participants had used drugs via injection. Two hundred and thirty-eight (72%) of the participants were aware of PrEP, 30 (11.7%) had used PrEP in the past, and 3.88% were currently using PrEP. The willingness to use PrEP, free of cost, was shown by 300 participants (86.45%) and by 180 (54.5%), if available at a low cost. Conclusion: There was a high prevalence of risk factors posing them at considerable risk of human immunodeficiency virus (HIV). The majority was aware of PrEP for HIV prevention. The willingness to use PrEP was high when PrEP was offered free of cost but dropped down when participants were asked to pay for PrEP. Based on this finding, PrEP should be available free of cost at the community preferred outlets. © 2023 College of Physicians and Surgeons Pakistan. All rights reserved. Article	2023	Almahfoud, M; Matthews, H; Weimann, L; Scheiter, RL; Hüfner, AD; Weichel, HM; Koch, T; Grenz, M; Eckstein, K; Schäfer, G; Pestel, J; zur Wiesch, JS; Schmiedel, S; Degen, O	Sexualised drug use among PrEP-users at University Medical Center Hamburg-Eppendorf	HIV Medicine	-	-	-	1464-2662	10.1186/s12889-022-14279-2	https://link.springer.com/article/10.1186/s12889-022-14279-2	Background Gay, bisexual, and other men-who-have-sex-with-men (GBMSM) continue to be disproportionately affected by Human Immunodeficiency Virus (HIV). Although HIV pre-exposure prophylaxis (PrEP) offers an effective means of reducing incident HIV among this population, the HIV-preventive success of oral-based PrEP is contingent upon regimen adherence. Elevated rates of alcohol-, substance use-, and mental health-related issues among GBMSM potentially hinder PrEP-taking efforts, however the evidence for this remains mixed. Accordingly, the present study entailed a comprehensive qualitative investigation to explore PrEP-prescribed GBMSM's perceptions surrounding the influence of alcohol, substance use, and mental health on PrEP adherence. Method PrEP-prescribed GBMSM (age ≥ 18 years; prescribed PrEP for ≥ 3 months) were recruited from two PrEP-delivery clinics in Toronto, Canada for focus groups as part of the formative phase of an alcohol-, substance use-, and mental health-focused randomized controlled intervention trial. Focus group discussions qualitatively explored perceived strengths and barriers associated with adherence to PrEP treatment; with an emphasis on alcohol, substance use, and mental health concerns. Condom use among PrEP-prescribed GBMSM within the context of these concerns was also discussed. Results A total of five focus groups involving 35 GBMSM were conducted (4–10/group; mean age = 42.4; white = 71.4%). Although participants themselves generally reported successfully adhering to their PrEP regimens—resulting from a strong, underlying motivation for self-care—they recognized the detrimental impact that alcohol, substance use, and mental health had on adherence among their peers. In this regard, alcohol and substances were perceived as detracting from adherence only when consumption was excessive or temporally linked to PrEP dosing. Pronounced mental health issues (e.g., severe depression) were also seen as hindering adherence, although these effects were nuanced and perceived as person-dependent. Alcohol and substances were linked to condomless sex, regardless of PrEP use, and PrEP was therefore viewed as an HIV-protective 'safety net.' Conclusions Overall, findings suggest that PrEP adherence can often be successfully achieved in the presence of alcohol-, substance use-, and mental health-related issues. Augmenting self-care, and addressing pronounced addictions- and mental health-related concerns, may enhance PrEP treatment among GBMSM. Theses and Dissertations	2023	ALMEIDA, MAYARA CRISTINA MARQUES DE	A PROFILAXIA PRÉ EXPOSIÇÃO(PrEP) À INFECÇÃO PELO HIV NO ESTADO DE MINAS GERAIS: AVALIAÇÃO DE SUA IMPLANTAÇÃO,ACOMPANHAMENTO ANTES E DURANTE A PANDEMIA DE COVID-19 (de janeiro de 2018 a dezembro de2021)	-	-	Universidade Federal de Minas Gerais	-	-	NA	http://hdl.handle.net/1843/60153	A Profilaxia Pré Exposição ao HIV (PrEP) foi incorporada no Sistema Único de Saúde (SUS) em 2017, sendo efetivamente incorporada em Minas Gerais no ano de 2018. A PrEP é um método de prevenção ao HIV que consiste na tomada diária ou sob demanda de um comprimido de Tenofovir+ Entricitabina para reduzir o risco de adquirir a infecção pelo HIV. O presente estudo tem como objetivo principal analisar a implantação da Profilaxia Pré Exposição (PrEP) ao HIV no Sistema Único de Saúde (SUS) antes e durante a pandemia de Covid-19, através do monitoramento do Sistema de Controle Logístico de Medicamentos (SICLOM), entre janeiro de 2018 e dezembro de 2021. Trata-se de estudo de coorte retrospectiva, realizado através de dados de usuários cadastrados no SICLOM, para a análise de dados utilizou-se o software Stata e os resultados foram apresentados de forma descritiva. Dentre os 2.353 usuários cadastrados para o início da PrEP somente 1.025 permaneceram até o final da realização do estudo. A idade média foi de 33 anos; 53,97% se classificaram como brancos; 68,08% relataram que possuíam 12 anos ou mais de escolaridade; 75,22% se identificaram como homossexuais/gays/lésbicas e 86,23% se definiram como homens. Quanto aos fatores de vulnerabilidade para a infecção do HIV 48,90% relataram o uso de álcool e 28,45% o uso de drogas ilícitas e 9,57% relataram sexo transacional. No primeiro atendimento 10,62% dos usuários relataram que não utilizavam o preservativo em todas as relações sexuais no último atendimento esse percentual foi 23,22%. Não houve aumento significativo no número de parcerias sexuais, mas observou-se uma incidência de Sífilis de 6,91%. Os dados do estudo mostram que o cenário de pandemia do Covid-19 pode ter interferido no número de pessoas em utilização da PrEP, visto a diminuição de cadastros no ano de 2020. Apesar de um número considerável de pessoas que utilizaram álcool e drogas, não houve interferência na adesão ao tratamento e observa-se a eficácia da PrEP para evitar novas infecções de HIV, considerando que houve somente um usuário diagnosticado com HIV. A análise dos dados do presente estudo poderá ser útil para o aperfeiçoamento e expansão das políticas do SUS para a prevenção do HIV e de outras ISTs. Article	2023	Alohan, Daniel I; Evans, Gabrielle; Sanchez, Travis; Harrington, Kristin R V; Quamina, Alvan; Young, Henry N; Crawford, Natalie D	Examining pharmacies' ability to increase pre-exposure prophylaxis access for black men who have sex with men in the United States.	Journal of the American Pharmacists Association	-	-	-	1544-3450	10.1016/j.japh.2022.11.004	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10065894	BACKGROUND: Pre-exposure prophylaxis (PrEP) has not effectively reached black men who have sex with men (BMSM). Using innovative, nontraditional health care settings-such as community pharmacies-may improve PrEP uptake among BMSM. OBJECTIVE: To examine correlates of patient willingness to be screened for PrEP (via human immunodeficiency virus HIV testing and risk assessment) in pharmacies among BMSM in the United States. METHODS: Data from the 2020 American Men's Internet Survey were analyzed. Using a modified Poisson regression method with robust variance estimates, we examined differences in willingness to screen for PrEP in pharmacies among BMSM. A 95% confidence interval (95% CI) was calculated for each estimated prevalence ratio (PR). RESULTS: Of 826 respondents, 637 (77%) were willing to be screened for PrEP in pharmacies. Having a high school degree (PR 0.76 95% CI 0.62-0.95), willingness to use PrEP (1.70 1.41-2.05), and comfort speaking with pharmacy staff about PrEP (2.5 1.86-3.51) were significantly associated with willingness to screen for PrEP in a pharmacy setting. Importantly, there were no observed differences in willingness by age, employment status, annual household income, or insurance status. CONCLUSION: Pharmacy-based PrEP access may be an effective strategy to end inequities in HIV, given that our results indicate that most BMSM are willing to be screened for PrEP in pharmacies. Future studies should examine whether willingness to use pharmacy-based HIV prevention services is associated with subsequent uptake of these services among BMSM. Article	2023	Alpire, Maria Esther Suarez; Souza, Daniel Vitor de; Masutti, Carolina Marquez da Costa Brites; Caseiro, Marcos Montani; Ribeiro, Daniel Araki	Cytogenetic changes in oral mucosa cells from individuals submitted to oral human immunodeficiency virus pre-exposure prophylaxis use.	Revista da Associação Médica Brasileira (1992)	-	-	-	1806-9282	10.1590/1806-9282.20230961	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10645041	OBJECTIVE: The objective of this study was to evaluate cytogenetic changes in individuals submitted to oral human immunodeficiency virus pre-exposure prophylaxis use through the micronucleus test in oral mucosa. METHODS: This study consisted of 37 individuals, of whom 17 comprised the pre-exposure prophylaxis group and 20 comprised the control group. A total of 2,000 cells per slide were analyzed for the determination of micronuclei, binucleation, nuclear buds, and cytotoxicity parameters: pyknosis, karyolysis, and karyorrhexis (KR), in a double-blind manner. The repair index was also evaluated in this setting. RESULTS: In the mutagenicity parameters, the pre-exposure prophylaxis group showed increased frequencies of micronuclei (p=0.0001), binucleation (p=0.0001), and nuclear buds (p=0.07). Regarding the cytotoxicity parameters, there was an increase with a statistical difference (p≤0.05) in the karyorrhexis frequency (p=0.001). Additionally, the repair system efficiency decreased in the pre-exposure prophylaxis group. CONCLUSION: These results indicate that individuals undergoing pre-exposure prophylaxis use have geno- and cytotoxicity in oral mucosal cells. Article	2023	Amaral, Gabriela Morais Celestino; Silva, Lucas Emanuel de Oliveira; Lessa, Simone Schwartz	Analysis of combined prevention measures on HIV/AIDS incidence in Brazil (1980-2020)	DST Journal of Brazilian Sexually Transmitted Diseases	-	-	-	0103-4065	10.5327/DST-2177-8264-2023351389	https://bjstd.org/revista/article/view/1389/1450	Introduction: The Human Immunodeficiency Virus (HIV) attacks the immune system, with acquired immunodeficiency syndrome (AIDS) being the most advanced clinical manifestation. Prevention strategies have evolved over time in response to scientific advancements. From an institutional perspective, the Unified Health System (SUS) provides tools for Combined Prevention to the entire Brazilian population, universally and free of charge. However, despite therapeutic advances, HIV/AIDS remains a significant public health problem. Objective: To analyze the impact of Combined Prevention measures on the incidence of HIV/AIDS in Brazil from 1980 to 2020. Methods: Quantitative, observational, longitudinal, and retrospective study. Descriptive and multivariate analyses were conducted, specifically employing linear regression techniques. The variables of interest included case incidence and the distribution of: tests for sexually transmitted infections (STIs), condoms, post-exposure prophylaxis for HIV (PEP), and pre-exposure prophylaxis for HIV (PrEP). Publicly available data were sourced from governmental repositories. Results: The country has accumulated 1,037,878 infection cases, with an average of 25,947 new cases per year. Regarding prophylaxis inputs, five out of six variables demonstrated a negative correlation with the incidence rate, with only the distribution of male condoms showing a positive correlation. The analysis of the effect of PrEP was not statistically significant. Conclusion:Brazil has reduced the incidence of the disease as Combined Prevention measures have advanced. More time is needed to assess the impact of PrEP on the incidence of new cases. Article	2023	Amick, Alyssa K; Eskibozkurt, G Ege; Hosek, Sybil G; Flanagan, Clare F; Landovitz, Raphael J; Jin, Elena Y; Wilson, Craig M; Freedberg, Kenneth A; Weinstein, Milton C; Kazemian, Pooyan; Paltiel, A David; Ciaranello, Andrea L; Neilan, Anne M	Daily Oral Human Immunodeficiency Virus (HIV) Pre-exposure Prophylaxis Among Young Men Who Have Sex With Men in the United States: Cost-saving at Generic Drug Price.	Clinical Infectious Diseases	-	-	-	1537-6591	10.1093/cid/ciad566	https://dx.doi.org/10.1093/cid/ciad566	BACKGROUND: Adherence and retention concerns raise questions about the effectiveness and cost-effectiveness of oral HIV pre-exposure prophylaxis (PrEP) in young men who have sex with men (YMSM). METHODS: Using an adolescent-focused simulation model, we compared annual HIV screening alone with tenofovir disoproxil fumarate/emtricitabine-based oral PrEP with every 3-month HIV screening in YMSM (aged 15-24) at increased risk of HIV. Data derived from published sources included: age-stratified HIV incidence/100 person-years (PY) on- or off-PrEP (0.6-10.1 or 0.4-6.4), PrEP retention at 6 years (28%), transmissions by HIV RNA level (0.0-78.4/100PY) and annual costs of antiretroviral therapy ($32 000-69 000), HIV care ($3100-34 600), and PrEP program/generic drug ($900/360). Outcomes included transmissions (percent of cohort infected), quality-adjusted life-years (QALYs), costs ($), and incremental cost-effectiveness ratios ($/QALY). We explored the sensitivity of findings to variation in HIV incidence and drug prices. RESULTS: Compared with annual screening alone, PrEP would increase QALYs (9.58 to 9.67), reduce new infections (37% to 30%), and decrease costs (by $5000) over 10 years. PrEP would remain cost-saving for HIV incidence off-PrEP ≥5.1/100PY or annual PrEP price ≤$1200. Over a lifetime horizon, PrEP would be cost-saving for HIV incidence off-PrEP ≥1.0/100PY, across all retention assumptions examined. PrEP would not be cost-effective at HIV incidence ≤0.1/100PY, regardless of drug price, due to programmatic costs. CONCLUSIONS: In US YMSM at increased risk of HIV, generic oral PrEP and every-3-month screening would be cost-saving compared with annual screening alone, even with high discontinuation and low adherence, over a range of HIV incidences. Article	2023	Amico, K R; Mayer, K H; Landovitz, R J; Marzinke, M; Hendrix, C; McCauley, M; Wilkin, T; Gulick, R	Influence of Participant Perceptions of Adherence-Related Interactions with Study/Study Team on Drug Levels: HPTN069 Analysis of Self-Reported Adherence Experiences While on Study.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-023-04215-9	https://dx.doi.org/10.1007/s10461-023-04215-9	Adherence to HIV pre-exposure prophylaxis (PrEP) study drug is critical for safety, tolerability, and efficacy trials, and may be affected by how adherence is communicated by the study staff to trial participants. Increasingly, clinical trials investigating PrEP are creating and implementing 'participant-centered' approaches that discuss potential non-adherence neutrally (without negative judgement) and support efforts to adhere versus insisting on perfect adherence. In the HPTN069/ACTG A5305 study, we evaluated participant experiences of potentially negative adherence-related interactions with study teams using ten items to characterize the frequency of such experiences. We related these individual items and a combined set of seven negative experience items (total negative experience score) to drug concentrations (detectable or consistent with daily-dosing). The exploratory analyses used logistic regression for each experience item on the full sample and disaggregated by sex. Several experiences were related to drug detection and to daily-dosing, although more so for participants identifying as men than women. Total negative experience scores associated with not having detection drug concentrations for the full sample, and remained significant even when controlling for sex, age, and race. Daily dosing was associated with total negative experience score for men in the sample. Additional investigations into adherence-related interactions with study teams that are most problematic or helpful in general and uniquely for men and women are warranted. Article	2023	Anand P.; Wu L.; Mugwanya K.	Integration of sexually transmitted infection and HIV pre-exposure prophylaxis services in sub-Saharan Africa: a scoping review	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/frph.2023.944372	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164916109&doi=10.3389%2ffrph.2023.944372&partnerID=40&md5=fb47cb58fb8f9031d42f2c50122f0f60	Background: Persons living in sub-Saharan Africa (SSA) face disproportionate risk from overlapping epidemics of HIV and bacterial sexually transmitted infections (STIs). Pre-exposure prophylaxis (PrEP) for prevention is gradually being scaled up globally including in several settings in SSA, which represents a key opportunity to integrate STI services with HIV pre-exposure prophylaxis (PrEP). However, there is limited literature on how to successfully integrate these services, particularly in the SSA context. Prior studies and reviews on STI and PrEP services have largely focused on high income countries. Methods: We conducted a scoping review of prior studies of integration of STI and PrEP services in SSA. We searched PubMed, EMBASE, Cochrane, and CINAHL, in addition to grey literature to identify studies that were published between January 2012 and December 2022, and which provided STI and PrEP services in SSA, with or without outcomes reported. Citations and abstracts were reviewed by two reviewers for inclusion. Full texts were then retrieved and reviewed in full by two reviewers. Results: Our search strategy yielded 1951 records, of which 250 were retrieved in full. Our final review included 61 reports of 45 studies. Most studies were conducted in Southern (49.2%) and Eastern (24.6%) Africa. Service settings included public health clinics (26.2%), study clinics (23.0%), sexual and reproductive care settings (23.0%), maternal and child health settings (8.2%), community based services (11.5%), and mobile clinics (3.3%). A minority (11.4%) of the studies described only syndromic STI management while most (88.6%) included some form of etiological laboratory STI diagnosis. STI testing frequency ranged from baseline testing only to monthly screening. Types of STI tested for was also variable. Few studies reported outcomes related to implementation of STI services. There were high rates of curable STIs detected by laboratory testing (baseline genitourinary STI rates ranged from 5.6–30.8% for CT, 0.0–11.2% for GC, and 0.4–8.0% for TV). Discussion: Existing studies have implemented a varied range of STI services along with PrEP. This range reflects the lack of specific guidance regarding STI services within PrEP programs. However, there was limited evidence regarding implementation strategies for integration of STI and PrEP services in real world settings. 2023 Anand, Wu and Mugwanya. Article	2023	Andrade E.A.; Betancourt G.; Morales G.; Zapata O.; Marrero L.; Rivera S.; Nieves E.; Miranda C.; Diaz C.; Beil R.; Patel V.V.; Ross J.	A Community-Based Pre-Exposure Prophylaxis Telehealth Program Focused on Latinx Sexual Minority Men	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2023.0185	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85176881214&doi=10.1089%2fapc.2023.0185&partnerID=40&md5=beb33d7a661e95cccef767c3f6bcd612	Latinx sexual minority men (LSMM) face multilevel barriers to accessing HIV pre-exposure prophylaxis (PrEP). To address these barriers, we designed and implemented community-based organization (CBO)-PrEP, a collaborative community-based telehealth PrEP program for LSMM. We designed this PrEP delivery program through a collaborative process involving staff from local CBOs and a primary care-based HIV prevention program. Staff met weekly over a 3-month period to establish protocols for referrals, obtaining insurance coverage, and navigation to appointments and laboratory testing. To assess feasibility, we extracted electronic medical record data including demographics and clinical outcomes of PrEP care. Between December 2020 and May 2023, 102 individuals were referred to CBO-PrEP of which 85 had Hispanic/Latino as their ethnicity in their medical records; out of 102 individuals, 72 (70.6%) were scheduled for an initial appointment. Out of 72 individuals scheduled for an appointment, 58 (80.6%) were seen by a health care provider a median of 7.5 days after referral interquartile range (IQR), 2–19; 48 (82.6%) of initial appointments were through telemedicine, 10 (17.2%) were seen in person. Of the 48 patients who had a telehealth appointment, 36 (75%) underwent initial laboratory testing and 42 (87.5) were prescribed PrEP; all 10 patients who were seen in person underwent laboratory testing and were prescribed PrEP. PrEP prescriptions were received in a median of 17.5 days (IQR 4.5–33.5) after referral. CBO-PrEP successfully engaged LSMM, a population that is often hard to reach. Expanding collaborative approaches with CBOs could have a significant impact on improving PrEP uptake for LSMM and other priority populations. © Mary Ann Liebert, Inc.	community-based organization; implementation science; Latino; men who have sex with men; pre-exposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Andrade E.A.; Stoukides G.; Santoro A.F.; Karasz A.; Arnsten J.; Patel V.V.	Individual and Health System Factors for Uptake of Pre-exposure Prophylaxis Among Young Black and Latino Gay Men	Journal of General Internal Medicine	-	-	-	8848734	10.1007/s11606-023-08274-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164454423&doi=10.1007%2fs11606-023-08274-5&partnerID=40&md5=969d83823d66ef869035cfd19fbaf8e6	Background: Young Black and Latino men who have sex with men (YBLMSM) have the highest rates of new HIV infections in the USA and use PrEP at lower rates than White MSM. Objective: To explore YBLMSM's perspectives and experiences of PrEP use to identify factors enabling or impeding uptake. Design: Qualitative study using semi-structured interviews conducted between August 2015 and April 2016. Participants: Black and Latino MSM, 18–20 years of age, who live, socialize, or work in the Bronx, and were fluent in English or Spanish. Approach: We used a thematic analysis to identify themes related to not taking PrEP and PrEP uptake. Key Results: Half the participants (n = 9) were currently using PrEP, a majority had Medicaid (n = 13), all reported having a PCP, all identified English as their primary language (n = 15), and all identified as gay. Salient themes included concerns over-side effects, stigma related to HIV and sexuality, mistrust of medical providers, provider's refusal to prescribe PrEP, and insurance and cost. Conclusions: Modifiable barriers for PrEP uptake and persistence were reported by most participants, with an emphasis on PrEP misinformation and the pervasiveness of intersectional stigma, providers' low awareness, and hesitant attitudes towards PrEP and barriers created by insurance companies. Supportive infrastructures for PrEP providers and patients are needed. © 2023, The Author(s), under exclusive licence to Society of General Internal Medicine.	delivery of healthcare; pre-exposure prophylaxis; racial and ethnic minorities; sexual and gender minorities	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

Article	2023	Antonini, Marcela; Silva, Ingred Evangelista da; Elias, Henrique Ciabotti; Gerin, Larissa; Oliveira, Aliete Cunha; Reis, Renata Karina	Barriers to Pre-Exposure Prophylaxis (PrEP) use for HIV: an integrative review	Revista Brasileira de Enfermagem	-	-	-	0034-7167	10.1590/0034-7167-2021-0963	http://www.scielo.br/scielo.php?script=sci_arttext&pid=S0034-71672023000700600	ABSTRACT Objectives: to identify and synthesize scientific evidence on the barriers and difficulties for Pre-exposure Prophylaxis (PrEP) use and compliance for HIV. Methods: an integrative literature review, using the MEDLINE/PubMed, Cumulative Index to Nursing and Allied Health Literature (CINAHL), Academic Search Premier and Scopus (Elsevier) databases. Results: all (100%) the articles included identified that PrEP users experience some type of structural barrier related to health services such as long distance from the units, suboptimal logistics for taking pills and professional resistance to prescribing PrEP. Furthermore, 63.21% identified social barriers, such as stigma about sexuality and HIV, in addition to individual barriers such as alcohol use, adverse effects, and concerns about long-term toxicity. Conclusions: the barriers to PrEP use are multifactorial. Effective interventions are needed to support PrEP users in accessing, complying with, and retaining health services. Article	2023	Arapali, Tyson; Grulich, Andrew E; Heywood, Anita E; Chan, Curtis; Fraser, Doug; Zablotska, Iryna B; Holt, Martin; Vaccher, Stefanie J; Bavinton, Benjamin R	Factors Associated With Willingness to Use Daily Antibiotics as Sexually Transmitted Infection Prophylaxis Among HIV Preexposure Prophylaxis-Experienced Gay and Bisexual Men in Australia.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001731	https://dx.doi.org/10.1097/OLQ.0000000000001731	BACKGROUND: Gay and bisexual men (GBM) who use HIV preexposure prophylaxis (HIV-PrEP) have high rates of bacterial sexually transmitted infections (STIs). The use of daily antibiotics as STI preexposure prophylaxis (STI-PrEP) may be appealing to GBM who are using or have previously used HIV-PrEP (HIV-PrEP-experienced) for the prevention of bacterial STIs. METHODS: We examined willingness to use daily STI-PrEP among a cross-sectional sample of HIV-PrEP-experienced GBM in Australia who participated in an observational online cohort study from August 2018 to March 2020. Factors associated with willingness to use daily STI-PrEP were determined using bivariate and multivariate logistic regression. RESULTS: Of the 1347 participants, half (54.3%) were willing to use daily STI-PrEP. Factors independently associated with greater willingness to use daily STI-PrEP included having >10 sexual partners in the last 6 months, using methamphetamine in the last 6 months, being more conscious about avoiding STIs, having a greater number of STIs since commencing HIV-PrEP, being willing to take HIV-PrEP for as long as they were at risk of acquiring HIV, and only using condoms when a sexual partner requested them. Conversely, factors associated with less willingness to use daily STI-PrEP included being university educated, using nondaily dosing regimens of HIV-PrEP, preferring event-driven HIV-PrEP, and being concerned about long-term HIV-PrEP adverse effects. CONCLUSIONS: Sexually transmitted infection PrEP is likely to be appealing to many HIV-PrEP-experienced GBM, especially those who engage in activities associated with a higher risk of STI transmission. However, they are less likely to be willing to use STI-PrEP unless it aligns with their HIV-PrEP dosing regimen, suggesting that research into the safety and efficacy of alternative STI prophylaxis dosing options should be prioritized. Article	2023	Ard K.L.; Bruno J.; Uzoeghelu U.; Lambert C.; Khan T.; Davis J.A.; Mayer K.H.; Keuroghlian A.S.	PrEP ECHO: A NATIONAL INTERDISCIPLINARY TELEMENTORING PROGRAM FOR HIV PREVENTION THROUGH PRACTICE TRANSFORMATION	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2023.35.3.247	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85164271571&doi=10.1521%2faeap.2023.35.3.247&partnerID=40&md5=c7a14ff804d07e8842e435dbc4e37ad2	HIV pre-exposure prophylaxis (PrEP) is highly effective, but PrEP use has been suboptimal. We describe a telementoring program for clinics in high-HIV burden areas, focusing on systems-level practice transformation and care for populations disproportionately affected by HIV. We developed and delivered a telementoring program for U.S. health centers. We analyzed par-ticipants' baseline and post-session surveys to ascertain experiences providing PrEP and caring for people disproportionately affected by HIV, compar-ing responses between medical and behavioral health clinicians. Forty-eight people from 16 health centers participated. Medical clinicians were more likely than behavioral health clinicians to care for people taking PrEP, but the groups did not differ in self-rated capacity to counsel about PrEP or care for populations disproportionately affected by HIV. Virtual training on practice transformation for PrEP, involving medical and behavioral health clinicians, is feasible and acceptable. PrEP training and delivery efforts should include behavioral health clinicians. © 2023 The Guilford Press.	education; HIV; LGBTQ health; preexposure prophylaxis (PrEP); team-based care	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Argüello, Tyler M.	HIV Stress Exchange: Queer Men, Intergenerational Stress, and Intimacy Amidst the Time of HIV.	Journal of Homosexuality	-	-	-	1540-3602 0091-8369	10.1080/00918369.2022.2036533	https://pubmed.ncbi.nlm.nih.gov/35133953/	HIV remains a principal inequity for queer men across the United States. Biomedical practices all but dominate interventions, and HIV-related stress persists among queer men. Regarding HIV as discourse is not well represented in prevention and care. This study is a response, then, to this need that seeks to build an HIV-informed model of praxis, entitled HIV Stress Exchange. A Queer Discourse Study was conducted with 20 queer men across two generations, pre-AIDS and post-AIDS. The data included in-depth interviews and material resources participants brought to the conversation. In all, this data speaks to the ways in which HIV is given life in discourse and what meaning it holds in embodied lives. Resultantly, five themes materialized, inclusive of all ages and sero-statuses: HIV provided meaning as in-/validated, un-/voiced, un-/intelligible, holding intimacy/-ies, and being PrEP/-ared. Based on the findings, the conceptual model for HIV Stress Exchange is presented along with an HIV-informed model of practice. Article	2023	Arnold T.; Gaudiano B.A.; Barnett A.P.; Rani Elwy A.; Whiteley L.; Giorlando K.K.; Rogers B.G.; Ward L.M.; Leigland A.; Brown L.K.	Development of an acceptance based PrEP intervention (ACTPrEP) to engage young black MSM in the South utilizing the Adaptome Model of intervention adaptation	Journal of Contextual Behavioral Science	-	-	-	22121447	10.1016/j.jcbs.2023.03.009	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150411585&doi=10.1016%2fj.jcbs.2023.03.009&partnerID=40&md5=71b70db5f54393e7acbab7f141dbef4d	Objectives: HIV disproportionately affects young Black men who have sex with men (YBMSM) in the Southern United States. Pre-exposure prophylaxis (PrEP) is an efficacious, biomedical approach to prevent HIV. While Mississippi (MS) has among the highest rates of new HIV infections, it also ranks among the top three states for unmet PrEP need. Thus, increasing engagement in PrEP care for YBMSM in MS is imperative. A potential method to improve psychological flexibility and promote PrEP uptake, explored by this study, is the incorporation of Acceptance and Commitment Therapy (ACT) into PrEP interventions. ACT is an evidence-based intervention used to treat a wide range of mental and physical illnesses. Methods: Twenty PrEP-eligible YBMSM and ten clinic staff working with YBMSM in MS were surveyed and interviewed between October 2021 and April 2022. The brief survey covered PrEP structural barriers, PrEP stigma, and psychological flexibility. Interview topics included internal experiences related to PrEP, existing health behaviors, PrEP related personal values, and relevant constructs from the Adaptome Model of Intervention Adaptation (service setting, target audience, mode of delivery, and cultural adaptations). Qualitative data were coded based on ACT and the Adaptome model, organized using NVivo, then thematically analyzed. Results: Patients identified side effects, costs, and taking a daily prescription as top barriers to taking PrEP. Staff reported the top barrier to PrEP for clients was concern others would believe they were living with HIV. Levels of psychological flexibility and inflexibility varied widely among participants. The resulting thematic categories derived from the interviews included 1) thoughts, emotions, associations, memories, and sensations (TEAMS) related to PrEP and HIV, 2) general health behaviors (existing coping techniques, views on medication, HIV/PrEP approach and avoidance), 3) values related to PrEP use (relationship values, health values, intimacy values, longevity values), and 4) Adaptome Model adaptations. These results informed the development of a new intervention, ACTPrEP. Conclusions: Interview data organized by the Adaptome Model of Intervention Adaptation determined appropriate ACT-informed intervention components, content, intervention adaptations, and implementation strategies. Interventions informed by ACT that help YBMSM endure short-term discomfort related to PrEP by relating it to their values and long-term health goals are promising for increasing individuals' willingness to initiate and maintain PrEP care. © 2023 Association for Contextual Behavioral Science	Acceptance and commitment therapy (ACT); Adaptome model; Black MSM; HIV prevention; Pre-exposure prophylaxis (PrEP)	English	Netherlands	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Arnold, Trisha; Barnett, Andrew P; Giorlando, Kayla K; Leigland, Avery; Sims-Gomillia, Courtney; Whiteley, Laura; Brown, Larry K	A Comparison of COVID-19 Vaccine and PrEP Hesitancy Among Individuals Living in Mississippi: A Qualitative Study.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-023-04067-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10112324	Mississippi (MS) trails behind other states in both pre-exposure prophylaxis (PrEP) and COVID-19 vaccine uptake. This study investigated similarities in willingness to receive the COVID-19 vaccine and use PrEP. Semi-structured interviews were conducted between April 2021 and January 2022 with 15 clinical staff and 49 PrEP-eligible patients living in MS. Reflexive thematic analysis was conducted. Overall, 51% of patients were on PrEP, and 67% received the COVID-19 vaccine. Among PrEP users, 64% had received the vaccine. Participants reported similar hesitations (efficacy, side effects, and no perceived risk) and reasons for use (health autonomy and protecting themselves and others) regarding PrEP and the COVID-19 vaccine. Taking PrEP did not increase the likelihood of getting the COVID-19 vaccine, thus engaging in one prevention behavior does not lead to engaging in other preventive behaviors. However, results indicated commonalities in hesitancy and motivators to utilize both preventive measures. Future prevention and implementation efforts can be informed by these commonalities. Article	2023	Arnold, Trisha; Giorlando, Kayla K; Barnett, Andrew P; Gaudiano, Brandon A; Rogers, Brooke G; Whiteley, Laura; Ward, Lori M; Edet, Precious Patrick; Elwy, A Rani; Brown, Larry K	Social, Structural, Behavioral, and Clinical Barriers Influencing Pre-exposure Prophylaxis (PrEP) Use Among Young Black Men Who Have Sex with Men in the South: A Qualitative Update to a 2016 Study	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-023-02721-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174925770&doi=10.1007%2fs10508-023-02721-4&partnerID=40&md5=79569161031ca6904e7f4152459 80b39	Antiretroviral pre-exposure prophylaxis (PrEP) is highly effective in preventing HIV. Despite its promise, PrEP use is low, especially among young Black men who have sex with men (YBMSM). The prevalence of HIV in Mississippi (MS) is among the highest in the United States, with the bulk of new infections occurring amongst YBMSM living in Jackson, MS. We recruited 20 PrEP-eligible YBMSM and 10 clinic staff from MS health clinics between October 2021 and April 2022. Data were collected remotely using in-depth interviews and a brief survey, which lasted approximately 45–60 min. Interview content included PrEP knowledge/experiences, HIV risk perception, and PrEP use barriers and facilitators. Qualitative data were coded then organized using NVivo. Using thematic analysis methodology, data were assessed for current barriers to PrEP use. An array of barriers were identified by participants. Barriers included structural factors (cost of PrEP, lack of discreet clinics, time commitment, competing interests); social factors (unaware of HIV risk, stigma and homophobia, fear that partners would find out about PrEP use, not knowing anyone on PrEP); behavioral factors (sexual risk factors, denial, less priority for prevention vs treatment); and clinical factors (misunderstood side effects, fear PrEP won't work). Significant barriers to PrEP use among YBMSM stem from structural, social, behavioral, and clinical factors. These results will inform intervention efforts tailored to mitigate barriers and improve PrEP uptake among YBMSM in the southern United States. © 2023, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Arnold, Trisha; Whiteley, Laura; Elwy, Rani A; Ward, Lori M; Konkle-Parker, Deborah J; Brock, James B; Giorlando, Kayla K; Barnett, Andrew P; Sims-Gomillia, Courtney; Craker, Lacey K; Lockwood, Khadijra R; Leigland, Avery; Brown, Larry K	Mapping Implementation Science with Expert Recommendations for Implementing Change (MIS-ERIC): Strategies to Improve PrEP Use among Black Cisgender Women Living in Mississippi	Journal of Racial and Ethnic Health Disparities	-	-	-	21973792	10.1007/s40615-022-01452-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142151578&doi=10.1007%2fs40615-022-01452-x&partnerID=40&md5=5436e8e58eac7af9c825639879fd6a56	Background: Black women are disproportionately affected by the HIV epidemic. Strategies to increase Black women's use of pre-exposure prophylaxis (PrEP) are needed. Methods: Interviews were conducted in Mississippi (MS) with Black, cisgender women at risk for HIV, and community healthcare clinic (CHC) staff who work directly with this population. Reflexive thematic analysis was used to identify barriers and select appropriate implementation strategies to increase PrEP care. Results: Twenty Black women and twelve CHC staff were interviewed. PrEP use barriers resulted from low HIV risk awareness, lack of PrEP knowledge, and structural and stigma-related barriers. Methods for PrEP education and information included normalizing PrEP in public communications, providing education at places where women congregate, and tailoring PrEP content with Black women as educators. The Expert Recommendations for Implementing Change (ERIC) project provides a way for implementation scientists to select strategies that are consistent within research and practice across studies. Strategies from the ERIC project were selected to address implementation barriers. Conclusions: Tailoring PrEP implementation protocols to increase Black women's access, engagement, and adherence to PrEP is needed. This is one of the first implementation studies to incorporate these four implementation concepts into a single study: (1) implementation outcomes, (2) i-PARIHS, (3) ERIC's strategy list, and (4) operationalizing the strategies using the Proctor et al., guidelines. Results provide an in-depth comprehensive list of implementation strategies to increase PrEP uptake for Black women in MS. © 2022, W. Montague Cobb-NMA Health Institute. Article	2023	Arnull, Liam Gary; Kapilashrami, Anuj; Sampson, Margaret	Visualizing patterns and gaps in transgender sexual and reproductive health: A bibliometric and content analysis of literature (1990-2020).	International Journal of Transgender Health	-	-	-	2689-5277 2689-5269	10.1080/26895269.2021.1997691	https://www.tandfonline.com/doi/full/10.1080/26895269.2021.1997691	BACKGROUND: Transgender people face numerous obstacles to accessing adequate, affordable, and appropriate sexual and reproductive health (SRH) services as outlined by the UN's Sustainable Development Goal 3.7 target of achieving universal access to SRH services by 2030. However, transgender SRH sits as a poorly researched area within public health that makes it difficult to understand the current dilemmas facing transgender SRH. This article reports the findings of a study aimed at taking stock of global research in transgender SRH. METHODS: A bibliometric analysis, used to gain insights from the retrieved literature's metadata, alongside a content analysis were utilized to examine the growth, impact, and content of retrieved articles. RESULTS: Nine hundred fourteen journal articles were retrieved, predominately in English (884; 96.7%). These involved 3653 authors from 46 affiliated countries. Most frequent keywords included HIV, PrEP, and gender identity; corresponding to the SRH issues studied, namely HIV/AIDs and gender reassignment. Top cited and overall articles originated heavily from US affiliated authors. Literature reflected the authors' inclusion of the transgender community to largely have a mixed focus with cisgender people in research, these articles largely disease-focused and conducted within cities in the United States. CONCLUSIONS: Growth in transgender SRH research was minimal until the early-2010s, after which a steep rise can be observed. Research retrieved has a disproportionate clinical and biomedical focus around HIV and related STI issues suggesting a failure to engage with reproductive justice and more comprehensive rights-based understanding of SRH. The sustained use of derogative language suggests a need for greater inclusion and awareness of trans identities within research and publishing. The dominance of the United States in authorship and as a site of research establishes the need for more geographically diverse research, trans, and LMIC-led research enquiry and creating greater opportunities for cross-cultural, comparative, and collaborative scholarly work.	human rights; sexual and reproductive health; transgender; health; content analysis; Bibliometric analysis; reproductive justice	English	United States	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review
Article	2023	Aronson B.; Kulie P.; Castel A.D.; Powell N.N.; McCarthy M.	Evaluating Patient Perceptions on PrEP Screening and Referral in the Acute Care Setting	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03839-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139617726&doi=10.1007%2fs10461-022-03839-7&partnerID=40&md5=31a0507bd85df3bb3db51efdb5c7464c	Pre-exposure prophylaxis (PrEP) for HIV is highly effective, yet uptake has been limited. We measured PrEP knowledge, eligibility, and referral willingness among patients receiving emergency or acute care in Washington, DC. We surveyed HIV-negative patients with STI-related complaints on HIV risk behaviors, PrEP knowledge, eligibility, and willingness for PrEP referral. Among 174 participants, 70% were PrEP unaware and 33% were PrEP eligible. Most participants (81%) supported learning more, 64% would consider taking PrEP, and 28% agreed to immediate referral. Willingness to learn more about PrEP suggests referral from non-traditional settings may increase uptake. Further evaluation of this approach is warranted. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2023	Arreola, Sonya; Santos, Glenn-Milo; Solares, Diego; Tohme, Johnny; Ayala, George	Barriers to and enablers of the HIV services continuum among gay and bisexual men worldwide: Findings from the Global Men's Health and Rights Study.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0281578	https://pubmed.ncbi.nlm.nih.gov/37141206/	OBJECTIVES: To assess ecological, structural, community and individual level correlates of health services utilization along a continuum of HIV care, and sexual health and support services among gay and bisexual men worldwide. METHODS: Using a nonprobability internet sample of 6,135 gay and bisexual men, we assessed correlates of utilization of health services. Chi-Square Tests of Independence were performed to assess drop off along a continuum of HIV care. Multivariable logistic regression analyses using generalized estimating equation models were conducted adjusting for geographic region and clustering by country. In multivariable analyses, we determined the association between utilization outcomes, and ecologic, structural, community and individual correlates by fitting separate generalized estimating equation (GEE) logistic regression models for each of the outcomes, fitted with robust SEs, and accounting for clustering by country. Stratified by sexual identity, analyses adjusted for variables that could influence HIV-related health outcomes including racial/ethnic minority status, participant age, insurance status, ability to make ends meet, as well as country-level income (income of country of residence defined by the World Bank). RESULTS: Among men living with HIV (n = 1001), being in HIV care (n = 867) was associated with being on ART (X2 = 191.17, p < .001), and viral load suppression (X2 = 14.03, p < .001); and using ART (n = 840) was associated viral load suppression (X2 = 21.66, p < .001). Overall, the pattern of utilization outcomes were similar for both gay and bisexual men. For example, utilization of PrEP, being in HIV care and utilization of most of the sexual health and support services were negatively associated with sexual stigma. Whereas, utilization of most HIV prevention, and sexual health and support services were positively associated with provider discrimination. Utilization of all HIV prevention and all sexual health services were positively associated with greater community engagement, and receiving services from LGBT-led organizations. Bisexual men had higher odds of reporting provider discrimination when utilizing condom services (gay: AOR = 1.14, 0.95-1.36; bisexual: 1.58, 1.10-2.28), PrEP (gay: AOR = 1.06, 0.77-1.45; bisexual: AOR = 2.14, 1.18-3.89, mental health services (gay: AOR = 1.03, 0.86-1.23; bisexual: AOR = 1.32, 1.07-1.64), and community-based support (gay: AOR = 1.23, 1.05-1.45; bisexual: AOR = 1.49, 1.14-1.93) than gay men. Bisexual men also reported higher odds of accessing services from LGBT-led organizations when utilizing PrEP (gay: AOR = 5.26, 2.50-11.05; bisexual: AOR = 7.12, 3.16-16.04), and community-based support/self-help groups/individual counseling (gay: AOR = 2.63, 1.72-4.01; bisexual: AOR = 3.35, 2.30-4.88. CONCLUSIONS: It is essential that barriers to health services utilization be addressed at structural and community levels. Structural interventions should be designed to reduce sexual stigma, as well as train and sensitize healthcare providers; and strengthen community level interventions that bring gay and bisexual men together to lead comprehensive health services. Article	2023	Aryal, Anu; A Leibowitz, Arleen; Comulada, Warren Scott; Rotheram-Borus, Mary Jane; Bolan, Robert; Ocasio, Manuel A; Swendeman, Dallas	PrEP Use and HIV Incidence Among Youth At-Risk for HIV Infection in Los Angeles and New Orleans: Findings From ATN 149	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003272	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85174751493&doi=10.1097%2fQAI.0000000000003272&partnerID=40&md5=0f9c56ea383d79d93d0a97905e7a54c1	Introduction: Expanding HIV pre-exposure prophylaxis (PrEP) use is key to goals for lowering new HIV infections in the U.S. by 90% between 2022 and 2030. Unfortunately, youth aged 16–24 have the lowest PrEP use of any age group and the highest HIV incidence rates. Methods: To examine the relationship between HIV seroconversion and PrEP uptake, adherence, and continuity, we used survival analysis and multivariable logistic regression on data of 895 youth at-risk for HIV infection enrolled in Adolescent Trials Network for HIV Medicine protocol 149 in Los Angeles and New Orleans, assessed at 4-month intervals over 24 months. Results: The sample was diverse in race/ethnicity (40% Black, 28% Latine, 20% White). Most participants (79%) were cis-gender gay/ bisexual male but also included 7% transgender female and 14% trans masculine and nonbinary youth. Self-reported weekly PrEP adherence was high (98%). Twenty-seven participants acquired HIV during the study. HIV incidence among PrEP users (3.12 per 100 person year PY) was higher than those who never used PrEP (2.53/ 100 PY). The seroconversion incidence was highest among PrEP users with discontinuous use (3.36/100 PY). If oral PrEP users were adherent using 2-monthly long-acting injectables, our estimate suggests 2.06 infections per 100 PY could be averted. Conclusions: Discontinuous use of PrEP may increase risk of HIV acquisition among youth at higher risk for HIV infection and indications for PrEP. Thus, to realize the promise of PrEP in reducing new HIV infections, reducing clinical burdens for PrEP continuation are warranted. Copyright © 2023 Wolters Kluwer Health, Inc. Article	2023	Aslam Khan M.W.; Nawaz U.; Faheem A.; Memon M.; Memon M.; Haq A.U.	Effectiveness of HIV Pre-Exposure Prophylaxis (PrEP) in Pakistan	Journal of Islamic International Medical College	-	-	-	18154018	10.57234/jiimc.march23.1550	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85158078410&doi=10.57234%2fjiimc.march23.1550&partnerID=40&md5=91866295afe7ceeb096ffea90cb1b71f	Objective: To evaluate the effectiveness of HIV Pre-Exposure Prophylaxis (PrEP) in HIV Clinic of a tertiary care hospital in Pakistan. Study Design: A descriptive study covering the data of clients who were offered PrEP. Place and Duration of Study: HIV treatment center Pakistan Institute of Medical Sciences (PIMS) Islamabad, Pakistan, from October 2019 to September 2022. Materials and Methods: Total of 118 people without HIV from various high-risk population groups were reported in HIV treatment center PIMS during a period of 3 years including 39 females from serodiscordant couples, 16 transgender females, and 63 men having sex with men (MSM). All of them were given oral PrEP after necessary screening, investigations, and evaluation. These clients were prescribed a fixed drug combination of Tenofovir/Lamivudine (TDF/3TC) one tablet daily as PrEP. The alternate regimen used was Event-driven PrEP (EDP) for MSM. Monthly follow-up was performed, and all patients were found to be HIV negative. Results: All 118 clients receiving PrEP remained seronegative on regular monthly follow-ups after a sufficiently long period of unsafe sexual practices that frequently exposed them to HIV-positive sex partners. Based on their age mean age of the clients in young group below 35 years was 27 + 6, all 62 young clients had 100% protection. Similarly, 41 middle aged (mean age 43 + 6) and 15 old clients (mean age 56 + 5) had 100% protection with PrEP. Six women from serodiscordant couples while receiving PrEP became pregnant with partners who had completely suppressed viral load (<50 copies). Conclusion: Oral PrEP has offered complete protection to all seronegative individuals belonging to high-risk population groups despite their frequent exposure to HIV-positive partners. All 118 individuals who received PrEP remained seronegative. © The Author(s) 2023.	Event-driven PrEP. Article	2023	Augustus, Eden Hope; George, Clemon; Rocke, Kern D	Preexposure Prophylaxis in Latin America and the Caribbean-The Barbados Experience.	Journal of Health Care for the Poor and Underserved	-	-	-	1548-6869	10.1353/hpu.2023.0005	https://dx.doi.org/10.1353/hpu.2023.0005	This study explored oral pre-exposure prophylaxis (PrEP) awareness, and sexual behavior of gay, bisexual, and other men who have sex with men (gbMSM) in Barbados. Factors associated with PrEP use were examined using Pearson chi-square and logistic regression. Of the 171 male participants who completed the survey, 22% were under 25 years old, 70% identified as gay/homosexual, and 59% were single. PrEP awareness was 77%, and of these 29% were current PrEP users. Users were more likely to have stable living arrangements (p < .05) and to identify as gay/homosexual (p=.03). Uptake by current PrEP users was attributed to non-judgmental and confidential PrEP services. Barriers identified by former PrEP users included cost and risks of STIs. Since the PrEP program is free, as is general health care for STIs, this suggests that there may be a knowledge gap. Further studies are needed to explore perceived barriers to the program. Article	2023	Aung, Ei T.; Fairley, Christopher K.; Ong, Jason J.; Chen, Marcus Y.; Phillips, Tiffany R.; Tran, Julien; Samra, Ranjit; Chow, Eric P. F.	Incidence and Risk Factors for Early Syphilis Among Men Who Have Sex With Men in Australia, 2013-2019: A Retrospective Cohort Study.	Open Forum Infectious Diseases	-	-	-	2328-8957	10.1093/ofid/ofad017	https://academic.oup.com/ofid/article/10/2/ofad017/6986302	BACKGROUND: We aimed to examine the incidence of syphilis in men who have sex with men (MSM) and identify subgroups of MSM at a higher risk of syphilis infection. METHODS: We conducted a retrospective cohort study of MSM attending a sexual health clinic in Australia, during 2013-2019, who had at least 2 syphilis serological tests during the study period. The incidence of syphilis was expressed as per 100 person-years. A cox regression analysis was conducted to identify risk factors for syphilis. RESULTS: A total of 24 391 individual MSM (75 086 consultations) were included. A total of 1404 new syphilis cases were diagnosed with an incidence of 3.7/100 person-years (95% confidence interval, 3.5-3.9). Syphilis incidence was higher in MSM with human immunodeficiency virus (HIV 9.3/100 person-years) than in MSM taking HIV pre-exposure prophylaxis (PrEP) (6.9/100 person-years) or HIV-negative MSM not taking PrEP (2.2/100 person-years). Risk factors associated with high incidence of syphilis included the following: MSM with HIV (adjusted hazard ratio aHR 2.7), MSM taking HIV PrEP (aHR 2.1), past history of syphilis infection (aHR 2.4), injecting drug use (aHR 2.7), condomless anal sex (aHR 1.7), >4 sexual partners in the last 12 months (aHR 1.2), and concurrent sexually transmitted infection (chlamydia and gonorrhoea) (aHR 1.6). CONCLUSIONS: The incidence of syphilis remains high among MSM, particularly in subgroups with associated risk factors for syphilis infections. These data highlight the need for biomedical and behavioral interventions to be targeted to subgroups of MSM at the highest risk of syphilis infection.	syphilis; sexually transmitted infections; men who have sex with men; risk factors; incidence	English	United Kingdom	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Quantitative
Article	2023	Aung, Ei T; Fairley, Christopher K; Williamson, Deborah A; Azzato, Francesca; Wigan, Rebecca; Tran, Julien; Buchanan, Andrew; Schmidt, Tina; Chow, Eric P F; Chen, Marcus Y	Treponema pallidum PCR screening at mucosal sites of asymptomatic men who have sex with men taking HIV pre-exposure prophylaxis.	Microbiol Spectr	-	-	-	2165-0497	10.1128/spectrum.00794-23	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10581241	Early detection and treatment of syphilis will reduce the infectious period and transmission. We aimed to determine whether screening men who have sex with men (MSM) taking HIV pre-exposure prophylaxis (PrEP) for syphilis using Treponema pallidum polymerase chain reaction (PCR) could detect syphilis before the appearance of syphilis antibodies in serology. MSM attending 3-monthly PrEP clinic visits in Melbourne, Australia, were screened with a PCR assay targeting the polA gene of T. pallidum from an anal swab and an oral rinse between November 2019 and March 2020. Participants were serologically screened for syphilis using chemiluminescence immunoassay. A total of 309 asymptomatic participants provided an anal swab and oral rinse sample for T. pallidum PCR screening. Two syphilis cases (0.6%) were detected: one man had a positive serology only; another man had T. pallidum detected by PCR from an anal swab and a positive serology. PCR positivity was 0.3% (n = 1) for anal swabs and 0% (n = 0) for oral rinse. In this study, T. pallidum PCR screening at routine PrEP clinic visits did not identify additional cases of early syphilis over serological screening performed at these visits. IMPORTANCE With the ongoing syphilis epidemic in men who have sex with men (MSM), we investigated the role of using Treponema pallidum polymerase chain reaction (PCR) testing at the oral cavity and anus in MSM taking pre-exposure prophylaxis for the early detection of syphilis. We evaluated whether the PCR tests from these mucosal sites can detect syphilis infection early, before the development of syphilis antibodies in serology. Our study found two syphilis cases among 309 MSM, and only one syphilis case had a positive anal PCR swab, although serology was positive. We conclude that additional PCR testing is likely to be expensive and would not be cost effective for individuals who regularly screen for syphilis. However, future studies with a larger sample size are required. Article	2023	Avlani, Dhruti; Kumar, Avichal; H N, Shivakumar	Development of Dispersible Vaginal Tablets of Tenofovir Loaded Mucoadhesive Chitosan Microparticles for Anti-HIV Pre-Exposure Prophylaxis.	Molecular Pharmaceutics	-	-	-	1543-8392 1543-8384	10.1021/acs.molpharmaceut.3c00288	https://pubmed.ncbi.nlm.nih.gov/37656937/	Tenofovir disoproxil fumarate (TDF)-loaded bioadhesive chitosan microparticles (CM) were developed by an emulsification internal gelation technique. Among different batches produced, ECH-4 was found to display a high % entrapment efficiency (68.93 ± 1.76%) and sustained drug release of 88.05 ± 0.38% at 24 h. Solid state characterization of ECH-4 employing DSC and PXRD indicated that the TDF existed in an amorphous state as a solid-solid solution in chitosan. Scanning electron microscopy revealed CM of ECH-4 was spherical in shape with a rough surface topography. Laser scattering analysis using Malvern Master sizer indicated that particle size of ECH-4 was in the range of 0.52 ± 0.10 μm to 284.79 ± 21.42 μm with a surface-mean diameter of 12.41 ± 0.06 μm. Ex vivo mucoadhesion studies using rabbit mucosa as a substrate indicated that 10.34 ± 2.08% of CM of ECH-4 was retained at the end of 24 h. The microparticles of ECH-4 were incorporated into dispersible tablets (DT-TCM) intended for intravaginal administration, in view to arrest the pre-exposure transmission of HIV during sexual intercourse. In vitro release from the dispersible tablet (F3) into simulated vaginal fluid (pH 4.5) displayed a sustained release profile of TDF as 89.98 ± 1.61% of TDF was released at 24 h. The in vitro dissolution profile of the DT-TCM was found to be similar to that of TDF loaded CM with the values of f(1) (difference factor) and f(2) (similarity factor) being 1.52 and 78.02, respectively. Therefore, DT-TCM would be a promising novel drug delivery platform for pre-exposure prophylaxis against HIV. Article	2023	Ayangeakaa S.D.; Kerr J.; Combs R.M.; Harris L.M.; Sears J.S.; Parker K.; Sterrett-Hong E.	Sociocultural and structural influences on HIV Pre-Exposure Prophylaxis (PrEP) Engagement and Uptake among African American Young adults	BMC Public Health	-	-	-	14712458	10.1186/s12889-023-16273-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85165910085&doi=10.1186%2fs12889-023-16273-8&partnerID=40&md5=c9b4cfd560e25f13c11fa5211884f367b	Background: Pre-exposure prophylaxis (PrEP) demonstrates effectiveness in decreasing new cases of HIV. However, few African Americans use PrEP, despite being disproportionately impacted by HIV. Understanding the influence of sociocultural and structural factors on PrEP use among multiple priority groups of African Americans, including but not limited to men who have sex with men, may improve PrEP engagement and uptake. The social ecological model (SEM) as a framework guided the understanding of how these factors operate on multiple levels to influence PrEP use among this population. Methods: This study derived data from the Afya PrEP study consisting of eleven focus groups (N = 63) with 18-29-year-old African American sexual and gender minority and heterosexual individuals at heightened behavioral vulnerability to HIV. We employed constructivist grounded theory processes to inductively analyze the data. A pooled kappa score of 0.90 indicated excellent inter-rater agreement. Results: Factors impacting PrEP engagement among African American young adults included: (1) Community/social network influences; (2) medical mistrust; (3) stigma; (4) PrEP availability and accessibility, which had two sub-categories: (a) cost and (b) where to obtain PrEP; and (5) PrEP engagement strategies, which had two sub-categories: (a) current AIDS service organizations' PrEP engagement practices and (b) recommended future PrEP engagement strategies. Categories one through three represent sociocultural factors, and categories four and five represent structural factors that influence perceptions and attitudes of African American young adults regarding PrEP. Conclusion: Our study highlights sociocultural and structural factors that act as barriers and facilitators to PrEP engagement. The SEM guided the understanding of how these factors operated on multiple levels. One of the sociocultural factors, community/social network influences operated at the interpersonal level of the SEM; the other two, stigma and medical mistrust, operated at the community level. The structural factors (PrEP availability, accessibility, and engagement strategies) operated at the institutional/organizational level. Thus, multi-level interventions are warranted to improve PrEP engagement among various African American young adult priority groups. © 2023, The Author(s). Article	2023	Ayangeakaa, Suur D; Kerr, Jelani; Combs, Ryan; Harris, Lesley; Sears, Jeanelle; Parker, Kimberly; Sterrett-Hong, Emma	Understanding Influences on Intention to Use Pre-exposure Prophylaxis (PrEP) Among African American Young Adults.	Journal of Racial and Ethnic Health Disparities	-	-	-	2196-8837	10.1007/s40615-022-01278-7	https://dx.doi.org/10.1007/s40615-022-01278-7	Pre-exposure prophylaxis (PrEP), a potent medication for HIV prevention, shows promise for reducing HIV disparities. However, PrEP is not equitably utilized by all races and ethnicities in the USA. Its uptake is especially low among African Americans, who are disproportionately impacted by HIV. Understanding factors influencing low PrEP uptake among diverse priority groups of African American young adults beyond gender and sexual minority groups (e.g., cisgender heterosexual people) may increase PrEP uptake. Data were from the Afya project, a study examining the use of PrEP for HIV prevention among multiple priority groups of African American young adults at heightened HIV risk, using Theory of Reasoned Action/Theory of Planned Behavior (TRA/TPB) as a theoretical framework. Eleven focus groups (N = 63) were conducted in Louisville, Kentucky from June to November 2018 with African American young adult priority groups (18-29 years old): men who have sex with men, transgender women, and cisgender heterosexual men and women demonstrating heightened sexual risk. Data were analyzed using constructivist grounded theory techniques. PrEP awareness, knowledge, perceived HIV risk and perceived need for PrEP (behavioral beliefs) and adherence beliefs (control beliefs), opinions of others (subjective norms), and confidence in ability to adhere to PrEP (perceived behavior controls) influenced acceptability of PrEP (participants' attitudes) and, in turn, influenced intention to use PrEP either negatively or positively. Thus, understanding factors that create reticence to PrEP use provides useful insight for tailoring outreach interventions towards African American young adults to improve PrEP uptake. Article	2023	Babiarz, Jane; Nix, Chad D; Bowden, Sean; Roberts, Rachel	Insufficient PrEParation: an assessment of primary care prescribing habits and use of pre-exposure prophylaxis in patients at risk of HIV acquisition at a single medical centre.	Sexually Transmitted Diseases	-	-	-	1472-3263	10.1136/sextrans-2022-055551	https://dx.doi.org/10.1136/sextrans-2022-055551	OBJECTIVES: To assess HIV pre-exposure prophylaxis (PrEP) prescribing habits by primary care providers and the number of patients at risk of HIV acquisition at a single medical centre in the Northwestern USA from 1 July 2018 to 31 June 2020. METHODS: An electronic cross-sectional survey was administered in April and May 2021 to providers in family medicine, internal medicine, adolescent and young adult health, student health and women's health clinics affiliated with the medical centre with questions pertaining to PrEP prescribing practices. Electronic medical record abstraction was used to quantify the number of eligible patients who sought care in primary care departments and the adherence to PrEP initiation guidelines from 1 July 2018 to 31 June 2020. RESULTS: 74% (61/82) of providers reported familiarity with national clinical practice guidelines for the prevention of HIV infection. 50% (41/82) of respondents were located in family medicine clinics. 57% (47/82) of providers counseled less than one-quarter of those who they identified as at risk of HIV infection. The major barriers to prescribing PrEP were insufficient time and lack of familiarity with guidelines. Of the 4330 eligible patients for PrEP, 8% (337/4330) received at least one PrEP prescription during the study period. For patients newly prescribed PrEP, only 23% (39/170) had appropriate counseling and labs at initiation. The top three qualifying indications for PrEP were identifying as transgender (36%, n=1562), high-risk sexual behaviour (32%, n=1405) and injection drug use (30%, n=1289). CONCLUSIONS: This study highlights intervention points in the HIV prevention cascade warranting attention in order to achieve the 2025 Ending the HIV Epidemic in the U.S. target for PrEP coverage. These include increasing provider adherence to prescribing guidelines and reducing the logistical barriers to prescribing. Article	2023	Bailey, Robert C; Kimani, Makobu; Kabuti, Rhoda; Gumbe, Edwin; Otieno, George; Kimani, Joshua; Okall, Duncan; Sanders, Eduard J; Otieno, Fredrick O	URCHOICE: Preferences for Pre-Exposure Prophylaxis (PrEP) Options for HIV Prevention Among Kenyan men who have sex with men and Transgender Women in Nairobi, Kisumu and the Coast.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03741-2	https://pmc.ncbi.nlm.nih.gov/articles/PMC7614083/	HIV prevention method preferences were evaluated among Kenyan men who have sex with men (MSM) and transgender women (TW) from three sites: Kisumu, Nairobi and the Coast. Information sessions detailing the attributes, duration of protection, route of administration and probable visibility were attended by 464 HIV negative participants, of whom 423 (median age: 24 years) agreed to be interviewed. Across pairwise comparisons daily PrEP was by far the least preferred (1%); quarterly injections (26%) and monthly pills (23%) were most preferred, followed by yearly implant (19%) and condoms (12%). When participants were "forced" to choose their most preferred PrEP option, only 10 (2.4%) chose the daily pill; more (37.1%) chose the quarterly injection than the monthly pill (34.8%) and the yearly implant (25.8%). TW preferred the yearly implant over the quarterly injection. To achieve the rates of PrEP uptake and adherence necessary for protecting large proportions of vulnerable MSM and TW, a variety of long-acting products should be developed and made accessible to appeal to a diversity of preferences. Article	2023	Bailey, Veronique C.; Kleinhans, Atholl V.; Mokgatle, Mathilda M.	Knowledge and attitudes of HIV pre-exposure prophylaxis among nurses in South Africa	African Journal of Primary Health Care and Family Medicine	-	-	-	2071-2936	10.4102/phcfm.v15i1.4086	http://www.scielo.org.za/scielo.php?script=sci_arttext&pid=S2071-29362023000100058&lang=pt	BACKGROUND: Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) has shown efficacy and effectiveness in populations who practise high-risk sexual activity. Nurses' knowledge and positive attitudes enhance PrEP implementation. AIM: This study aimed to investigate the knowledge of and attitudes towards PrEP among nurses in primary health care facilities. SETTING: The study was conducted in 10 health facilities that offer comprehensive services in Tshwane, South Africa. METHODS: A cross-sectional survey assessed the knowledge of and attitudes towards PrEP among 114 nurses. Univariate, bivariate and logistic regressions were performed to estimate odds ratios and to determine whether age, sex and education had an association with the knowledge and attitudes. RESULTS: Majority of the study sample consisted of female nurses (92.1%), and most respondents (68%) had moderate PrEP knowledge. Logistic regression showed that age and education were not associated with high level of knowledge. Pre-exposure prophylaxis was viewed negatively by 84.5% of the respondents. The odds of positive attitudes towards PrEP were 1.92 times higher among males than females (95% CI 0.54-6.83) and 1.24 times higher among nurses who had bachelor's degree than diploma holders (95% CI 0.51-3.01). CONCLUSION: This study found that there is a need to strengthen the dissemination of information about PrEP, and nurses in South Africa require training to improve their knowledge of and attitudes towards PrEP. CONTRIBUTION: The findings of the study add to the current knowledge base regarding PrEP access in the public healthcare system and it highlights gaps in the training of healthcare providers.	attitudes; HIV and; knowledge; nurses; pre-exposure prophylaxis	English	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2023	Baker J.; Rolls J.	An update on expanding HIV preexposure prophylaxis	Journal of the American Academy of Physician Assistants	-	-	-	15471896	10.1097/01.JAA.0000911184.87186.0f	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146921341&doi=10.1097%2f01.JAA.0000911184.87186.0f&partnerID=40&md5=4e35a5596f3483cbac424f4132bb9237	HIV continues to affect certain populations disproportionately, including sexual and gender minorities, racial/ethnic minorities, and populations with limited resources in southern US states. New CDC guidelines include a recommendation to discuss HIV preexposure prophylaxis (PrEP) with all sexually active patients, which is likely to expand use. The guidelines also include important changes in PrEP monitoring and address PrEP telehealth. The FDA approved the first non-oral PrEP, long-acting injectable cabotegravir, in late 2021. However, PrEP continues to be underused. This article describes how to better employ PrEP in light of these recent significant changes. © 2023 American Academy of Physician Associates.	cabotegravir; emtricitabine; HIV; PrEP; prophylaxis; sexually transmitted infection	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Baker, Venetia; Mulwa, Sarah; Khanyile, David; Sarrassat, Sophie; O'Donnell, Dominique; Piot, Sara; Diogo, Yvonne; Arnold, Georgia; Cousens, Simon; Cawood, Cherie; Birdthistle, Isolde	Young people's access to sexual and reproductive health prevention services in South Africa during the COVID-19 pandemic: an online questionnaire.	BMJ Paediatrics Open	-	-	-	2399-9772	10.1136/bmjpo-2022-001500	https://pubmed.ncbi.nlm.nih.gov/36693683/	INTRODUCTION: The South African government responded swiftly to the first wave of novel coronavirus (SARS-CoV-2) with a nationwide lockdown. Initial restrictions from March-July 2020 required people to stay at home unless accessing essential, life-saving services. We sought to understand how the COVID-19 pandemic and resulting lockdowns affected young people's access to sexual and reproductive health services in a high-prevalence HIV setting. METHODS: We analysed data from a cross-sectional web-based questionnaire conducted with 15-24 year-olds from September-December 2020 in Eastern Cape, South Africa. The questionnaire was promoted through social media platforms. Participants were asked whether and how the COVID-19 pandemic and related restrictions affected their access to sexual and reproductive health services, through closed-ended and open-ended questions. Descriptive statistics using proportions were used to summarise responses, and open text was analysed using thematic analysis. RESULTS: Of 3431 respondents, the proportions reporting 'more difficulty' accessing HIV testing services, HIV self-screening kits, condoms, pre-exposure prophylaxis and antiretroviral treatment since the COVID-19 pandemic were 16.8%, 13.7%, 13.9%, 11% and 7%, respectively. In 796 open-text responses, participants described challenges accessing HIV services due to clinics being overwhelmed and prioritising patients with COVID-19, resulting in young people being turned away. Some were afraid of contracting COVID-19 at or en route to clinics. Others were unable to reach clinics because of restricted transport or financial insecurity. DISCUSSION: Young people in Eastern Cape rely on local clinics for services, and large proportions of young males and females faced difficulties or fears accessing clinics during the COVID-19 lockdown. Clinics became overwhelmed or inaccessible, limiting young people's access to sexual and reproductive health services. In high HIV risk contexts, prevention services and tools must be more accessible to young people, outside of clinics and within the communities and spaces that young people can access without fear or cost. Article	2023	Balogun, Kayode; Slev, Patricia R.	Towards achieving the end of the HIV epidemic: Advances, challenges and scaling-up strategies.	Clinical Biochemistry	-	-	-	1873-2933 0009-9120	10.1016/j.clinbiochem.2022.05.006	https://pubmed.ncbi.nlm.nih.gov/35640680/	We are entering the 5th decade of the HIV epidemic and although there is no cure, critical advances have been made in treatment, prevention and diagnostics, transforming HIV into a survivable disease. Due to these advances, the UNAIDS has set a goal of "90-90-90" target by 2020, which has been extended now to 2030, to have 90% of individuals infected with HIV diagnosed, 90% of those diagnosed linked to care and 90% of people receiving ART and 90% of those receiving ART achieving an undetectable viral load. Today, the focus is on U = U, "undetectable equals untransmittable", which takes advantage of improved diagnostics and treatment and preventive therapies that are combined with scale-up strategies. This article will review the advances in testing strategies and diagnostics, including rapid diagnostic tests and next generation sequencing, as well as the challenges that pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) now present for diagnosing and managing HIV infection. Theses and Dissertations	2023	Bardon, Ashley	NOVEL TESTING STRATEGIES TO SUPPORT HIV TREATMENT AND PREVENTION: ACCEPTABILITY, PREFERENCES, AND IMPACT ON ENGAGEMENT IN CARE AND SEXUAL BEHAVIORS	-	-	University of Washington	-	-	NA	http://hdl.handle.net/1773/50812	The primary goal of this dissertation project was to advance our understanding of the impact of novel testing strategies to support HIV treatment and prevention. Despite significant advancements in antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP), rates of suboptimal medication adherence and disengagement from care, particularly in the first year of care, remain extraordinarily high. Novel strategies are urgently needed to improve ART and PrEP adherence and retention in care, in order to reduce HIV transmission and mortality. Point-of-care (POC) urine tenofovir testing is a newly developed tool that can provide real-time drug-level feedback for people living with HIV (PLWH) receiving ART, which could also prompt timely interventions for those experiencing adherence challenges. However, little is known about how PLWH and healthcare providers will perceive a POC urine tenofovir testing intervention and how it will impact behaviors. In Chapter 1, we conducted a qualitative study to assess the acceptability of monthly POC urine tenofovir testing in the first five months of care for PLWH and healthcare providers in South Africa. We also explored participants' perspectives on differentiated strategies for the implementation of POC urine tenofovir testing that may be useful and appropriate for PLWH. Overall, PLWH and healthcare providers found the monthly POC urine tenofovir testing intervention to be highly acceptable, generally preferred over self-reported adherence, and motivational for improving ART adherence. Other implementation strategies in which participants believed POC urine tenofovir testing could be provided, included: testing at community-based sites where ART is refilled, random testing at clinic visits, and testing delivered by counselors or other healthcare workers. Monthly POC urine tenofovir testing in the first five months of HIV care is an acceptable and potentially effective strategy for improving ART adherence. Novel strategies for HIV testing for people at risk of acquiring HIV may also be beneficial for improving outcomes, but it is important to understand how clients' testing preferences impact the intended outcomes. For HIV prevention, regular HIV testing is a required core component of PrEP delivery necessary to ensure a prompt transition to ART and reduce the risk of drug resistance. HIV self-testing (HIVST) may be an effective tool for supporting efficient PrEP delivery, allowing for non-clinic-based HIV testing when appropriate. A differentiated service delivery (DSD) model for PrEP that includes semiannual clinic visits, six-month PrEP dispensing, and HIVST between clinic visits resulted in non-inferior outcomes for PrEP continuation. In practice, though, PrEP clients' unique needs and preferences should be considered when choosing an appropriate and effective delivery model. In Chapter 2, we used data from the JiPime-JiPrEP trial (NCT03593629) to determine if receiving a preferred HIV testing modality to support PrEP delivery is associated with better PrEP continuation…	adherence; antiretroviral therapy (ART); HIV; pre-exposure prophylaxis (PrEP); testing; Epidemiology; Epidemiology	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Qualitative
Article	2023	Barnabee G.; Billah I.; Ndeikemona L.; Silas L.; Ensminger A.; MacLachlan E.; Korn A.K.; Mawire S.; Fischer-Walker C.; Ashipala L.; Forster N.; O'Malley G.; Velloza J.	PrEP uptake and early persistence among adolescent girls and young women receiving services via community and hybrid community-clinic models in Namibia	PLOS One	-	-	-	19326203	10.1371/journal.pone.0289353	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85169229972&doi=10.1371%2fjournal.pone.0289353&partnerID=40&md5=d825df5c43137dacd986eab3834f44dc	Introduction Adolescent girls and young women (AGYW) face barriers in accessing clinic-based HIV pre-exposure prophylaxis (PrEP) services and community-based models are a proposed alternative. Evidence from such models, however, is limited. We evaluated PrEP service coverage, uptake, and early persistence among AGYW receiving services through community and hybrid models in Namibia. Methods We analyzed routine data for AGYW aged 15-24 who initiated PrEP within HIV prevention programming. PrEP was delivered via three models: community-concierge (fully community- based services with individually-tailored refill locations), community-fixed (communitybased initiation and refills delivered by community providers on a set schedule at fixed sites), and hybrid community-clinic (community-based initiation and referral to clinics for refills delivered by clinic providers). We examined proportions of AGYW engaged in services along a programmatic PrEP cascade, overall and by model, and assessed factors associated with PrEP uptake and early persistence (refill within 15-44 days after initiation) using multivariable generalized estimating equations. Results Over 10-months, 7593 AGYW participated in HIV prevention programming. Of these, 7516 (99.0%) received PrEP education, 6105 (81.2%) received HIV testing services, 6035 (98.9%) tested HIV-negative, and 2225 (36.9%) initiated PrEP. Of the 2047 AGYW expected for PrEP refill during the study period, 254 (12.4%) persisted with PrEP onemonth after initiation. Structural and behavioral HIV risk factors including early school dropout, food insecurity, inconsistent condom use, and transactional sex were associated with PrEP uptake. AGYW who delayed starting PrEP were 2.89 times more likely to persist (95% confidence interval (CI): 1.52-5.46) and those receiving services via the community-concierge model were 8.7 times (95% CI: 5.44-13.9) more likely to persist (compared to the hybrid model). Conclusion Community-based models of PrEP service delivery to AGYW can achieve high PrEP education and HIV testing coverage and moderate PrEP uptake. AGYW-centered approaches to delivering PrEP refills can promote higher persistence. © 2023 Barnabee et al. Article	2023	Barnett, Andrew P.; Arnold, Trisha; Elwy, A. Rani; Brock, James B.; Giorlando, Kayla K.; Sims-Gomillia, Courtney; Leigland, Avery; Whiteley, Laura; Brown, Larry K.	Considerations for PrEP Implementation at Federally Qualified Health Centers in Mississippi: Perspectives From Staff and Patients.	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2023.35.4.309	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85166419772&doi=10.1521%2faeap.2023.35.4.309&partnerID=40&md5=6778bcdb134cd601015950ce899df5a9	Pre-exposure prophylaxis (PrEP) uptake remains low in the southeastern United States ("the South"), likely owing to overlapping structural barriers, including the lack of nearby PrEP providers. Federally qualified health centers (FQHCs) are potential sites through which to expand PrEP availability in the South, and telemedicine is promising for these services. This study investigated considerations for PrEP implementation at FQHCs and the use of telemedicine through qualitative interviews with 19 FQHC staff and 17 PrEP-eligible patients in Mississippi. Results indicated that existing infrastructure and policies at FQHCs can support PrEP implementation and that additional needed resources include more education for providers and strategies to advertise PrEP services. Findings suggest that using telemedicine for PrEP can address some regional implementation barriers (e.g., transportation problems and confidentiality concerns) but may present new ones (e.g., concerns about patients performing home HIV/STI testing procedures). Results can inform future PrEP implementation efforts in the South. © 2023 The Guilford Press.	community health centers; HIV; pre-exposure prophylaxis; PrEP; southeastern United States; telemedicine	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2023	Barnett, George A.; Calabrese, Christopher; Ruiz, Jeanette B.	A comparison of three methods to determine the subject matter in textual data.	Frontiers in Research Metrics and Analytics	-	-	-	2504-0537	10.3389/frma.2023.1104691	https://pubmed.ncbi.nlm.nih.gov/37334104/	This study compares three different methods commonly employed for the determination and interpretation of the subject matter of large corpuses of textual data. The methods reviewed are: (1) topic modeling, (2) community or group detection, and (3) cluster analysis of semantic networks. Two different datasets related to health topics were gathered from Twitter posts to compare the methods. The first dataset includes 16,138 original tweets concerning HIV pre-exposure prophylaxis (PrEP) from April 3, 2019 to April 3, 2020. The second dataset is comprised of 12,613 tweets about childhood vaccination from July 1, 2018 to October 15, 2018. Our findings suggest that the separate "topics" suggested by semantic networks (community detection) and/or cluster analysis (Ward's method) are more clearly identified than the topic modeling results. Topic modeling produced more subjects, but these tended to overlap. This study offers a better understanding of how results may vary based on method to determine subject matter chosen.	social media; cluster analysis; community detection; text analysis; topic modeling	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2023	Barocas J.A.; Gai M.J.; Nurani A.; Bagley S.M.; Hadland S.E.	Initiation of HIV pre-exposure prophylaxis among youth in the United States, 2015–2018	AIDS Care	-	-	-	9540121	10.1080/09540121.2022.2067318	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85151044998&doi=10.1080%2f09540121.2022.2067318&partnerID=40&md5=9f5dfc61d4f555ea9764eaf11480c438	Adolescents and young adults ("youth") account for one-fifth of new HIV diagnoses in the U.S. HIV pre-exposure prophylaxis (PrEP), which became FDA approved in adolescents in May 2018, is highly effective at preventing HIV infection though there are limited data for PrEP initiation in youth. We aimed to quantify PrEP initiation and identify factors associated with PrEP initiation among youth at risk for HIV. We conducted a retrospective cohort study of youth aged 13–26 years who had an indication for PrEP between 1 January 2015, and 31 December 2018. We used data on commercially insured US individuals from the IBM MarketScan Commercial Database. We compared factors among youth who did and did not receive PrEP. We developed a multivariable logistic regression model to identify the association of all study covariates with receipt of PrEP. Among potentially PrEP eligible youth, only 2171 (1.6%) received a PrEP prescription in the year following their PrEP eligible claim. In multivariable models, youth who received PrEP were more likely to be older (adjusted odd ratio aOR for 18–20 year olds = 5.11; 95% CI = 3.35–7.77; aOR for 21–26 year olds = 16.90; 95% CI = 11.0–24.7), male (aOR = 92.42; 95% CI = 68.24–125), have sexual activity with elevated risk (aOR = 7.47; 95% CI = 6.50–8.60), or be diagnosed with gonorrhea or syphilis than youth who did not receive PrEP. Our findings highlight an opportunity to improve HIV prevention early in the life course. © 2022 Informa UK Limited, trading as Taylor & Francis Group.	adolescents; HIV; inject drugs; pre-exposure prophylaxis; young adults	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2023	Barros, Sandra Garrido de; Brasil, Sandra Assis; Rossi, Thais Regis Aranha	The social construction of the PrEP1519 study: conditions of possibility for advances in HIV/AIDS prevention	Cadernos de Saúde Pública	-	-	-	1678-4464	10.1590/0102-311xen201621	http://www.scielosp.org/scielo.php?script=sci_arttext&pid=S0102-311X2023000505007	This paper analyzed the genesis of the PrEP1519 study and feasibility conditions for its construction. A qualitative-approach study was conducted using the Bourdieusian sociology framework to reconstruct the dynamics of the social environment where PrEP1519 emerged during 2015-2018. A document analysis and ten in-depth interviews were carried out to analyze the trajectory of the project. Pre-exposure prophylaxis (PrEP) was introduced in Brazil as a public policy in 2017. The lack of scientific evidence available among the adolescent population led to the development of a demonstrative cohort study, associated with an intervention, aimed at combining the prevention and treatment of sexually transmitted infections at three sites in Brazil. PrEP1519 sought to generate evidence for global use and to help the Brazilian Ministry of Health apply PrEP among adolescents. The articulation of bureaucratic, scientific, and activist stakeholders enabled this study. The feasibility conditions for developing PrEP1519 included a favorable relationship of national organizations with international organizations, the favorable approach that public administrators had at the time towards new technologies and prevention strategies, the researchers' previous experience in studies with the target population or with PrEP, articulation efforts with social movements, civil society organizations, and other public agencies, and the integration between scientific institutions, which allowed using international resources and developing a response to the problem. Completing this study at a moment when conservatism advances in Brazil demands that the scientific community and activists closely monitor and take stances on PrEP to ensure its availability for adolescents as a public policy. Article	2023	Barry, Michael J; Nicholson, Wanda K; Silverstein, Michael; Chelmow, David; Coker, Tumaini Rucker; Davis, Esa M; Donahue, Katrina E; Jaén, Carlos Roberto; Kubik, Marti; Li, Li; Ogedegbe, Gbenga; Rao, Goutham; Ruiz, John M; Stevermer, James J; Tsevat, Joel; Underwood, Sandra Millon; Wong, John B	Preexposure Prophylaxis to Prevent Acquisition of HIV: US Preventive Services Task Force Recommendation Statement.	JAMA - Journal of the American Medical Association	-	-	-	1538-3598	10.1001/jama.2023.14461	https://dx.doi.org/10.1001/jama.2023.14461	Importance: An estimated 1.2 million persons in the US currently have HIV, and more than 760â¯000 persons have died of complications related to HIV since the first cases were reported in 1981. Although treatable, HIV is not curable and has significant health consequences. Therefore, effective strategies to prevent HIV are an important public health and clinical priority. Objective: The US Preventive Services Task Force (USPSTF) commissioned a systematic review to evaluate the benefits and harms of preexposure prophylaxis with antiretroviral therapy for the prevention of HIV acquisition, and the diagnostic accuracy of risk assessment tools to identify persons at increased risk of HIV acquisition. Population: Adolescents and adults who do not have HIV and are at increased risk of HIV. Evidence Assessment: The USPSTF concludes with high certainty that there is a substantial net benefit from the use of effective antiretroviral therapy to reduce the risk of acquisition of HIV in persons at increased risk of acquiring HIV. Recommendation: The USPSTF recommends that clinicians prescribe preexposure prophylaxis using effective antiretroviral therapy to persons at increased risk of HIV acquisition to decrease the risk of acquiring HIV. (A recommendation). Article	2023	Bartels, SM; Galindo, C; Angeles, G; Barrington, C	Assessing Associations Between Stigma and Mental Health Among Preexposure Prophylaxis Users in Guatemala	Stigma and Health	-	-	-	2376-6972	10.1037/sah0000429	https://psycnet.apa.org/fulltext/2023-35388-001.html	The mental health of gay and bisexual men (GBM) who use preexposure prophylaxis (PrEP) may be negatively impacted by experiences of stigma. To assess the relationship between stigma and mental health among GBM who use PrEP in Guatemala, we conducted a survey with 162 PrEP users recruited in a community-based PrEP clinic. In multiple linear regression analyses, greater internalized (beta = 1.94, SE = 0.85, p = .023) and enacted sexual orientation stigma (beta = 0.50, SE = 0.12, p < .001) were associated with greater depressive symptoms. Greater internalized (beta = 1.82, SE = 0.80, p = .023) and enacted sexual orientation stigma (beta = 1.33, SE = 0.11, p = .003) were also associated with greater anxiety symptoms. Additionally, individuals with high social support and high anticipated PrEP stigma had fewer depressive symptoms than individuals with low social support and high anticipated PrEP stigma (beta = -3.25, SE = 1.40, p = .022). This relationship was marginally significant for anxiety (beta = 2.54, SE = 1.31, p = .055). Sexual orientation and PrEP stigma may affect PrEP users' mental health. Interventions addressing stigma are needed to support the uptake and sustained PrEP use in this population. Article	2023	Basdav J.; Reddy P.; Haffejee F.	Motivators for oral PrEP uptake and adherence in the eThekwini municipality, KwaZulu-Natal	AIDS Care	-	-	-	9540121	10.1080/09540121.2023.2208322	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85156214826&doi=10.1080%2f09540121.2023.2208322&partnerID=40&md5=064d7cde409ccb757b02f51e669eb018	Pre-exposure prophylaxis (PrEP) is a single daily pill that prevents a seropositive HIV status. Since 2016, South Africa has staggered PrEP roll-out, with uptake levels not reaching optimal goals. The aim of this study was to determine motivation behind PrEP initiation and adherence among South African users. A phenomenological qualitative study (n=15) was used. Participants were purposively recruited from two primary healthcare clinics in eThekwini, KwaZulu-Natal. Thematic analysis was used to analyse the data. Three themes were identified: motivation for PrEP uptake, PrEP adherence and PrEP awareness. Initiation was influenced by healthcare professionals. Responsibility for one's well-being, serodiscordant relationships and sexual partner's behavioural patterns contributed toward initiation. Most were fully compliant, using reminders to negate medication forgetfulness. The internet and healthcare professionals served as information sources, however, few were aware of PrEP prior to this. Innovative ways are required to increase awareness levels and increase uptake. © 2023 Informa UK Limited, trading as Taylor & Francis Group.	adherence; clinic users or clinic patients; initiation and/or uptake; Pre-exposure prophylaxis (PrEP); South Africa	English	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Qualitative
Article	2023	Bates, M; Blackaby, J; Davis, B; Norcross, C; Richardson, D	HIV-PrEP use among men who have sex with men/transgender women with early syphilis	Sexually Transmitted Infections	-	-	-	1368-4973	https://doi.org/10.1136/sextrans-BASHH-2023.99	https://sti.bmj.com/content/99/Suppl_1/A51.3	Introduction HIV pre-exposure prophylaxis (HIV-PrEP) is highly effective at preventing HIV transmission and has been freely available from the NHS since October 2020. Early syphilis is a risk factor for HIV transmission and all men who have sex with men (MSM) and transgender people (TG) diagnosed with early syphilis should be offered HIV-PrEP . We aimed to explore HIV- PrEP use, offer and uptake amongst MSM/TGW diagnosed with early syphilis. Methods We performed a cross- sectional study from our clinic database, collecting data on HIV status, PrEP status, demographic characteristics and risk factors of MSM and TG patients diagnosed with early syphilis between July 2021 and July 2022. Results 171 MSM/TG (168 MSM, 3 TG) with early syphilis were identified; 83 (49%) were living with HIV. Of the remaining 88 HIV-negative MSM/TG, 33 (38%) were not taking HIV-PrEP at the time of syphilis diagnosis. HIV-PrEP users were more likely to have previous syphilis (p<0.04) and be UK born (p<0.03) than non-PrEP users. All HIV negative MSM/TG not using HIV-PREP were offered, and 21 (64%) started HIV-PrEP at the clinic visit; a further 2 (6%) started HIV-PrEP at a subsequent clinic visit, 6 (18%) declined, and 4 (12%) were lost to follow up. Conclusion A significant number of MSM/TG were not taking HIV-PrEP prior to their syphilis diagnosis. These MSM/TG were more likely to be born outside the UK and less likely to have had syphilis before. Reassuringly, all MSM/TG were offered HIV-PEP, and 64% started HIV-PrEP after their syphilis diagnosis. Discussing HIV-PrEP with MSM/TG with syphilis remains a key objective, but we also need to consider how to reach these individuals earlier. Article	2023	Bauermeister, Jose A.; Dominguez Islas, Clara; Jiao, Yuqing; Tingler, Ryan; Brown, Elizabeth; Zemanek, Jillian; Giguere, Rebecca; Balan, Ivan; Johnson, Sherri; Macagna, Nicole; Lucas, Jonathan; Rose, Matthew; Jacobson, Cindy; Collins, Clare; Livant, Edward; Singh, Devika; Ho, Ken; Hoesley, Craig; Liu, Albert; Kayange, Noel; Palanee-Phillips, Thesla; Chariyalertsak, Suwat; Gonzales, Pedro; Piper, Jeanna	A randomized trial of safety, acceptability and adherence of three rectal microbicide placebo formulations among young sexual and gender minorities who engage in receptive anal intercourse (MTN-035).	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0284339	https://pubmed.ncbi.nlm.nih.gov/37043527/	Efforts to develop a range of HIV prevention products that can serve as behaviorally congruent viable alternatives to consistent condom use and oral pre-exposure prophylaxis (PrEP) remain crucial. MTN-035 was a randomized crossover trial seeking to evaluate the safety, acceptability, and adherence to three placebo modalities (insert, suppository, enema) prior to receptive anal intercourse (RAI). If participants had no RAI in a week, they were asked to use their assigned product without sex. We hypothesized that the modalities would be acceptable and safe for use prior to RAI, and that participants would report high adherence given their behavioral congruence with cleansing practices (e.g., douches and/or enemas) and their existing use to deliver medications (e.g., suppositories; fast-dissolving inserts) via the rectum. Participants (N = 217) were sexual and gender minorities enrolled in five different countries (Malawi, Peru, South Africa, Thailand, and the United States of America). Mean age was 24.9 years (range 18-35 years). 204 adverse events were reported by 98 participants (45.2%); 37 (18.1%) were deemed related to the study products. The proportion of participants reporting "high acceptability" was 72% (95%CI: 65% - 78%) for inserts, 66% (95%CI: 59% - 73%) for suppositories, and 73% (95%CI: 66% - 79%) for enemas. The proportion of participants reporting fully adherent per protocol (i.e., at least one use per week) was 75% (95%CI: 69% - 81%) for inserts, 74% (95%CI: 68% - 80%) for suppositories, and 83% (95%CI: 77% - 88%) for enemas. Participants fully adherent per RAI-act was similar among the three products: insert (n = 99; 58.9%), suppository (n = 101; 58.0%) and enema (n = 107; 58.8%). The efficacy and effectiveness of emerging HIV prevention drug depends on safe and acceptable delivery modalities that are easy to use consistently. Our findings demonstrate the safety and acceptability of, and adherence to, enemas, inserts, and suppositories as potential modalities through which to deliver a rectal microbicide. Article	2023	Bayan, Mohammad Harris; Smalls, Travis; Boudreau, Alec; Mirza, Agha W.; Pasco, Courtney; Demko, Zoe O.; Rothman, Richard E.; Hsieh, Yu-Hsiang; Eshleman, Susan H.; Mostafa, Heba H.; Gonzalez-Jimenez, Nathalie; Chavez, Pollyanna R.; Emerson, Brian; Delaney, Kevin P.; Daugherty, Debra; MacGowan, Robin J.; Manabe, Yukari C.; Hamill, Matthew M.	Evaluating the impact of point-of-care HIV viral load assessment on linkage to care in Baltimore, MD: a randomized controlled trial.	BMC Infectious Diseases	-	-	-	1471-2334	10.1186/s12879-023-08459-7	https://bmcinfectdis.biomedcentral.com/articles/10.1186/s12879-023-08459-7	BACKGROUND: Integration of a sensitive point-of-care (POC) HIV viral load (VL) test into screening algorithms may help detect acute HIV infection earlier, identify people with HIV (PWH) who are not virally suppressed, and facilitate earlier referral to antiretroviral therapy (ART), or evaluation for pre-exposure prophylaxis (PrEP). This report describes a randomized clinical trial sponsored by the Centers for Disease Control and Prevention (CDC): "Ending the HIV Epidemic Through Point-of-Care Technologies" (EHPOC). The study's primary aim is to evaluate the use of a POC HIV VL test as part of a testing approach and assess the impact on time to linkage to ART or PrEP. The study will recruit people in Baltimore, Maryland, including patients attending a hospital emergency department, patients attending an infectious disease clinic, and people recruited via community outreach. The secondary aim is to evaluate the performance characteristics of two rapid HIV antibody tests approved by the United States Food and Drug Administration (FDA). METHODS: The study will recruit people 18 years or older who have risk factors for HIV acquisition and are not on PrEP, or PWH who are not taking ART. Participants will be randomly assigned to either the control arm or the intervention arm. Participants randomized to the control arm will only receive the standard-of-care (SOC) HIV screening tests. Intervention arm participants will receive a POC HIV VL test in addition to the SOC HIV diagnostic screening tests. Follow up will consist of an interim phone survey conducted at week-4 and an in-person week-12 visit. Demographic and behavioral information, and oral fluid and blood specimens will be collected at enrollment and at week-12. Survey data will be captured in a Research Electronic Data Capture (REDCap) database. Participants in both arms will be referred for either ART or PrEP based on their HIV test results. DISCUSSION: The EHPOC trial will explore a novel HIV diagnostic technology that can be performed at the POC and provide viral assessment. The study may help inform HIV testing algorithms and contribute to the evidence to support same day ART and PrEP recommendations. TRIAL REGISTRATION: NIH ClinicalTrials.gov NCT04793750. Date: 11 March 2021. Study protocol for an efficacy trial of the "PrEP for Health" intervention to increase HIV PrEP use among people who inject drugs	BMC Public Health	-	-	-	14712458	10.1186/s12889-023-15429-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150381218&doi=10.1186%2fs12889-023-15429-w&partnerID=40&md5=0a5a54d91aa6ac692b2925e1c36c823a	Background: HIV incidence has recently increased among people who inject drugs (PWID) across the United States, with outbreaks occurring in states with long-standing syringe service programs (SSPs) including Massachusetts (MA). Antiretroviral pre-exposure prophylaxis (PrEP) is an evidence-based HIV prevention strategy recommended for PWID, but uptake in this marginalized population is extraordinarily low. Methods: We describe the design and procedures for a National Institute on Drug Abuse (NIDA)-funded (R01) randomized controlled trial (RCT) testing the efficacy of "PrEP for Health," a multicomponent behavioral intervention to increase PrEP uptake, adherence, and persistence among HIV-negative PWID attending SSPs in two areas of the U.S. Northeast that are heavily affected by injection-related HIV transmission. Participants are equally randomized to receive the "PrEP for Health" intervention (involving individually tailored HIV and PrEP education, motivational interviewing, problem-solving skills and planning, and ongoing navigation support) or an enhanced standard of care (eSOC) control condition involving a brief educational video on the utility of PrEP for HIV prevention. Co-primary outcomes are PrEP uptake (using medical/pharmacy records) and adherence (using tenofovir quantification in hair samples); a secondary outcome is PrEP persistence (using medical/pharmacy records) over 12 months. Major assessments occur at baseline, 1-, 3-, 6-, and 12-month follow-up visits. Planned analyses will examine intervention efficacy, specific hypothesized conceptual mediators of the intervention effect (e.g., self-perceived HIV risk; PrEP knowledge, interest in use, motivation, and behavioral skills) and epidemiologically linked moderators (e.g., age; gender; condomless vaginal or anal sex). Discussion: Findings from our extensive preliminary research with the study population revealed that a multicomponent, theory-based intervention targeting PrEP knowledge, motivation, self-efficacy, behavioral skills, and structural barriers to PrEP access is urgently needed for PWID who are at risk of HIV acquisition. We also learned that SSPs represent a highly acceptable service setting for delivering such interventions. In this study, we are evaluating the efficacy of the "PrEP for Health" intervention. If efficacious, findings from our implementation evaluation could help guide its dissemination to diverse SSPs and possibly other community-based settings accessed by this population. Trial registration: ClinicalTrials.gov number NCT04430257, registered June 12, 2020. © 2023, The Author(s). Article	2023	Bazzi A.R.; Shaw L.C.; Biello K.B.; Vahey S.; Brody J.K.	Patient and Provider Perspectives on a Novel, Low-Threshold HIV PrEP Program for People Who Inject Drugs Experiencing Homelessness	Journal of General Internal Medicine	-	-	-	8848734	10.1007/s11606-022-07672-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130746337&doi=10.1007%2fs11606-022-07672-5&partnerID=40&md5=aa2abad1cbf19625992d8be1c45ddfa4	Background: HIV outbreaks among people who inject drugs (PWID) and experience homelessness are increasing across the USA. Despite high levels of need, multilevel barriers to accessing antiretroviral pre-exposure prophylaxis (PrEP) for HIV prevention persist for this population. The Boston Health Care for the Homeless Program (BHCHP) initiated a low-threshold, outreach-based program to support engagement in PrEP services among PWID experiencing homelessness. Methods: To inform dissemination efforts, we explored patient and provider perspectives on key program components. From March to December 2020, we conducted semi-structured qualitative interviews with current and former BHCHP PrEP program participants and prescribers, patient navigators, and outreach workers (i.e., providers). Thematic analysis explored perspectives on key program components. Results: Participants (n = 21) and providers (n = 11) identified the following five key components of BHCHP's PrEP program that they perceived to be particularly helpful for supporting patient engagement in PrEP services: (1) community-driven PrEP education; (2) low-threshold, accessible programming including same-day PrEP prescribing; (3) tailored prescribing supports (e.g., on-site pharmacy, short-term prescriptions, medication storage); (4) intensive outreach and navigation; and (5) trusting, respectful patient-provider relationships. Discussion: Findings suggest that more patient-centered services formed the basis of BHCHP's innovative, successful PrEP program. While contextual challenges including competing public health emergencies and homeless encampment "sweeps" necessitate ongoing programmatic adaptations, lessons from BHCHP's PrEP program can inform PrEP delivery in a range of community-based settings serving this population, including syringe service programs and shelters. © 2022, The Author(s).	community health services; delivery of health care; harm reduction; HIV infections; homeless persons; patient navigation; pre-exposure prophylaxis; program evaluation; public health; substance use, intravenous	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
