Article	2021	Donenberg G.R.; Atujuna M.; Merrill K.G.; Emerson E.; Ndwayana S.; Blachman-Demner D.; Bekker L.G.	An individually randomized controlled trial of a mother-daughter HIV/STI prevention program for adolescent girls and young women in South Africa: IMARA-SA study protocol	BMC Public Health	-	-	-	14712458	10.1186/s12889-021-11727-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115154734&doi=10.1186%2fs12889-021-11727-3&partnerID=40&md5=ce6c0f5c3ebf943b9eac9ec0b5160369	Background: South Africa has the world's largest HIV epidemic, but South African adolescent girls and young women (AGYW) acquire HIV at twice the rate of and seroconvert on average 5–7 years earlier than their male peers. Female caregivers (FC) are an untapped resource for HIV/STI prevention in South Africa and offer a novel opportunity to strengthen AGYW prevention efforts. This study will evaluate the effectiveness and cost-effectiveness of an evidence-based mother-daughter HIV/STI prevention program tested in the United States and adapted for South Africa, Informed Motivated Aware and Responsible Adolescents and Adults (IMARA), to decrease STI incident infections and increase HIV testing and counseling (HTC) and PrEP uptake in AGYW. Methods: This is a 2-arm individually randomized controlled trial comparing IMARA to a family-based control program matched in time and intensity with 525 15–19-year-old Black South African AGYW and their FC-dyads in Cape Town's informal communities. AGYW will complete baseline, 6-, and 12-month assessments. Following randomization, AGYW-FC dyads will participate in a 2-day group workshop (total 10 h) that includes joint and separate mother and daughter activities. Primary outcomes are AGYW STI incidence, HTC uptake, and PrEP uptake at 6 months. Secondary outcomes are AGYW STI incidence, HTC uptake, and PrEP uptake at 12 months, sexual behavior (e.g., condom use, number of partners), HIV incidence, and ART/PrEP adherence and intervention cost-effectiveness. AGYW who test positive for a STI will receive free treatment at the study site. HIV positive participants will be referred to ART clinics. Discussion: Primary prevention remains the most viable strategy to stem new STI and HIV transmissions. HIV and STI disparities go beyond individual level factors, and prevention packages that include supportive relationships (e.g., FC) may produce greater reductions in HIV-risk, improve HTC and PrEP uptake, and increase linkage, retention, and adherence to care. Reducing new HIV and STI infections among South African AGYW is global public health priority. Trial registration: ClinicalTrials.gov Number NCT04758390, accepted 02/16/2021. © 2021, The Author(s). Incorporating oral PrEP into standard prevention services for South African women: a nested interrupted time-series study	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(21)00048-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111502589&doi=10.1016%2fS2352-3018%2821%2900048-5&partnerID=40&md5=49bf8158d31bbda3c1eb45b73ee8885b	Background: As oral pre-exposure prophylaxis (PrEP) becomes the standard of prevention globally, its potential effect on HIV incidence in clinical trials of new prevention interventions is unknown, particularly for trials among women. In a trial measuring HIV incidence in African women, oral PrEP was incorporated into the standard of prevention in the trial's last year. We assessed the effect of on-site access to PrEP on HIV incidence in this natural experiment. Methods: We did a nested interrupted time-series study using data from the ECHO trial. At 12 sites in four countries (Eswatini, Kenya, South Africa, and Zambia), women (aged 16–35 years) were randomly assigned to receive one of three contraceptives between Dec 14, 2015, and Sept 12, 2017, and followed up quarterly for up to 18 months to determine the effect of contraceptive method on HIV acquisition. Women were eligible if they wanted long-acting contraception, were medically qualified to receive study contraceptives, and had not used any of the study contraceptives in the past 6 months. The present analyses are limited to nine South African sites where on-site access to oral PrEP was implemented between March 13 and June 12, 2018. Using an interrupted time-series design, we compared HIV incidence before versus after PrEP access, limited to quarterly study visits at which on-site PrEP access was available to at least some participants and, in a sensitivity analysis, to the 180 days before and after access. The outcome was incident HIV infection, detected using two rapid HIV tests done in parallel for each participant at every scheduled follow-up visit. This study is registered on ClinicalTrials.gov, NCT02550067. Findings: 2124 women were followed up after on-site PrEP access began, of whom 543 (26%) reported PrEP use. A total of 12 HIV seroconversions were observed in 556 person-years (incidence 2·16%) after on-site PrEP access, compared with 133 HIV seroconversions in 2860 person-years (4·65%) before PrEP access (adjusted incidence rate ratio IRR 0·45, 95% CI 0·25–0·82, p=0·0085). Similar results were also observed when limiting the analysis to 180 days before versus after PrEP access. A total of 46 HIV seroconversions were observed in 919 person-years within 180 days before PrEP access, compared with 11 seroconversions in 481 person-years in the 180 days following PrEP access (incidence 5·00 vs 2·29 per 100 person-years; IRR 0·43, 95% CI 0·22–0·88, p=0·012). Interpretation: On-site access to PrEP as part of standard of prevention in a clinical trial among women in South Africa was associated with halving HIV incidence, when approximately a quarter of women started PrEP. Providing access to on-site PrEP could decrease incidence in HIV prevention trials. These data are also among the first to show in any setting that access to PrEP is associated with decreased HIV acquisition among South African women. Article	2021	Dorcé-Medard DO, Jennifer; Okobi Md, Okelue E; Grieb DO, Jesse; Saunders DO, Nzingha; Harberger Md, Seneca	HIV Pre-exposure Prophylaxis in the LGBTQ Community: A Review of Practice and Places.	Cureus	-	-	-	2168-8184	10.7759/cureus.15518	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8253517	One in six bisexual and gay men will be diagnosed with HIV in their lifetime (Human Rights Campaign, 2017). Without a vaccine or cure, prevention may be the best tool to control the HIV pandemic. Since 2012, the World Health Organization (WHO) recommends HIV pre-exposure prophylaxis (PrEP) for a high-risk population. To this day, in the United States (U.S.), the group with the highest risk is MSM (men who have sex with other men) that have condom-less sexual intercourse (Center for Disease Control and Prevention, 2019). In fact, in 2018, over 50% of all HIV infections occurred in MSM and members of the LGBT community. A systematic review was conducted using PubMed, Google Scholar, and Cochrane Library. The inclusive criteria were articles published from 2015-2020, focusing specifically on HIV PrEP among the members of the LGBTQ+ community. The keywords for our search were "Pre-exposure prophylaxis," "HIV," "men who have sex with other men" (MSM), "Bisexual," "transgender." A total of 25 articles met the inclusion criteria. About 50% of the articles focused on MSM while others highlighted bisexual and transgender women. Globally, PrEP is a priority. Programs to educate and promote its use are being developed, but challenges are present regarding access to PrEP and its maintenance for longer than 12 months. In the U.S., PrEP programs started in 2012, intending to promote and educate. Research shows that more than 60% of the high-risk patients are willing to try PrEP if they are correctly educated, showing that physicians were not doing a thorough job educating their patients. PrEP is essential for preventing the transmission of HIV among the LGBTQ+ subpopulation. Existing gaps need to be bridged to create or improve to educate high-risk populations and physicians on HIV PrEP.	pre-exposure prophylaxis, hiv, men who have sex with other men (msm), bisexual, transgender, acquired immune deficiency syndrome (aids), homosexual	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2021	Doyle, Carla M; Maheu-Giroux Mathieu; Lambert, Gilles; Mishra Sharmistha; Apelian Herak; Messier-Peet, Marc; Otis, Joanne; Grace, Daniel; Hart, Trevor A; Moore, David M; Lachowsky, Nathan J; Cox, Joseph	Combination HIV Prevention Strategies Among Montreal Gay, Bisexual, and Other Men Who Have Sex with Men in the PrEP Era: A Latent Class Analysis	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-02965-4	https://www.proquest.com/scholarly-journals/combination-hiv-prevention-strategies-among/docview/2483428954/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) became publicly available in Quebec for gay, bisexual and other men who have sex with men (GBM) in 2013. We used baseline data from Engage, a cohort of GBM recruited by respondent-driven sampling, to examine patterns of combination HIV prevention use among Montreal GBM since PrEP became available. Latent class analysis, stratified by HIV status, was used to categorize GBM by self-reported use of biomedical and behavioural prevention strategies. Correlates of resulting classes were identified using multinomial logistic regression. Among HIV-negative/unknown GBM (n = 968), we identified four classes: low use of prevention (32%), condoms (40%), seroadaptive behaviour (21%), and biomedical (including PrEP; 7%). Those using prevention (condoms, seroadaptive behaviour, and biomedical) had a higher number of anal sex partners and were more likely to report a recent sexually transmitted infection diagnosis. GBM using biomedical prevention also had a higher level of formal education. Among GBM living with HIV (n = 200), we identified three classes: mainly antiretroviral treatment (ART) with viral suppression (53%), ART with viral suppression and condoms (19%), and ART with viral suppression and seroadaptive behaviour (18%). Again, the number of anal sex partners was higher among those using condoms and seroadaptive behaviour. Our findings show antiretroviral-based prevention, either alone or in combination with other strategies, is clearly a component of the HIV prevention landscape for GBM in Montreal. Nevertheless, PrEP uptake remains low, and there is a need to promote its availability more widely. Article	2021	Drak D.; McManus H.; Vickers T.; Heron J.E.; Vaccher S.; Zablotska I.; Guy R.; Bavinton B.; Jin F.; Grulich A.E.; Bloch M.; O'Connor C.C.; Gracey D.M.	Renal impairment in a large-scale HIV preexposure prophylaxis implementation cohort	AIDS	-	-	-	2699370	10.1097/QAD.0000000000003035	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121407598&doi=10.1097%2fQAD.0000000000003035&partnerID=40&md5=27bac7d6b9dc906597b8630079656272	Background:HIV preexposure prophylaxis (PrEP) with fixed-dose tenofovir disoproxil fumarate (TDF) and emtricitabine has been associated with low rates of renal impairment in clinical trials. Large-scale PrEP implementation may result in higher rates, as the prevalence of associated risk factors may be higher than in trial populations.Methods:A posthoc analysis of EPIC-NSW, a large Australian multicentre PrEP implementation trial for patients at high risk of HIV infection. Participants were eligible for inclusion if they commenced PrEP between 1 March 2016 and 30 April 2018, and had renal function assessed at baseline and at least once more before the censor date. The primary outcome was new-onset renal impairment, defined as an estimated glomerular filtration rate (eGFR) <60ml/min per 1.73m2.Results:A total of 6808 participants were eligible for inclusion. Almost all were male (99%), with a median age of 35years interquartile range (IQR): 28-44. Approximately one-quarter (26%) had a baseline eGFR <90ml/min per 1.73m2. Over a median follow-up period of 1.2years (IQR: 0.6-1.7), the rate of renal impairment was 5.8 episodes per 1000 person-years 95% confidence interval (CI): 4.0-7.8. In multivariable Cox regression, there was a higher risk of renal impairment in participants aged ≥50years hazard ratio (HR) 14.7, 95% CI: 5.0-43.3, P<0.001 and those with an eGFR <90ml/min per 1.73m2(HR 28.9, 95% CI: 6.9-121.9) at baseline.Conclusion:In a large-scale implementation study, TDF-containing PrEP was associated with a low risk of renal impairment overall, whereas older patients and those with preexisting renal dysfunction were at substantially increased risk. © 2021 Lippincott Williams and Wilkins. Article	2021	Driver R.; Allen A.M.; Finneran S.; Maksut J.L.; Eaton L.A.; Kalichman S.C.	Masculine ideology and Black men who have sex with men's interest in HIV pre-exposure prophylaxis (PrEP)	Journal of Health Psychology	-	-	-	13591053	10.1177/1359105320941236	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087564738&doi=10.1177%2f1359105320941236&partnerID=40&md5=dc4cacd7e1442c38679d100d2404a269	We examined how traditional masculinity and stigma surrounding HIV pre-exposure prophylaxis (PrEP) affect PrEP interest among Black men who have sex with men (BMSM). One hundred twenty-three men attending a Black Gay Pride event completed measures assessing traditional masculinity, PrEP stigma, and PrEP interest along with two behavioral measures of interest in PrEP. Results demonstrated that avoidance of femininity directly related to interest in PrEP and indirectly through conformity to heterosexual self-presentation. Further, PrEP stigma differentially moderated both of these relationships. Interventions designed to improve engagement of PrEP for BMSM should be attentive to traditional masculinity as a barrier. © The Author(s) 2020. Article	2021	Dubov, Alex; Ogunbajo, Adedotun; Altice, Frederick L; Fraenkel, Liana; Distelberg, Brian	Development and Psychometric Evaluation of the PrEP Sexual Expectancies (PSEXS) Scale.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03087-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7979444	The goal of this study was to develop and evaluate psychometric properties of the PrEP Sexual Expectancies Scale (PSEXS). The PSEXS represents a range of expectations for how PrEP use will affect one's sexual experience. The scale was developed to understand perceived reinforcements of PrEP use among men who have sex with men (MSM), including sexual risk-taking. The study builds upon Expectancy Theory to develop a measure of sex-related PrEP expectancies with a representative sample of 1155 MSM participants from Ukraine and 408 MSM participants from the U.S. Expectancy items represented two domains: increased sexual risk-taking and enhancement of sexual experience. Confirmatory analyses showed that a two-factor model provided a good fit to the data. The PSEXS scale had a high internal reliability in both samples (Ukraine α = 0.88, U.S. α = 0.83), and the identified factor structure explains a large amount of variance in both samples. Recent studies suggest that expectations of intimacy and better sexual experience can be a significant deciding factor for PrEP uptake. The PSEXS provides researchers with a useful measure for examining MSM's expectancy beliefs about the impact of PrEP use on their sexual life.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Dunville R.; Harper C.; Johns M.M.; Heim Viox M.; Avripas S.; Fordyce E.; Stern M.; Schlissel A.; Carpenter R.; Michaels S.	Awareness and Willingness to Use Biomedical Prevention Strategies for HIV Among Sexual and Gender Minority Youth: Results From a National Survey	Journal of Adolescent Health	-	-	-	1054139X	10.1016/j.jadohealth.2020.05.032	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088130995&doi=10.1016%2fj.jadohealth.2020.05.032&partnerID=40&md5=b59831300d877f288bad6f6f6afd14de	Purpose: Sexual and gender minority youth (SGM), an umbrella term encompassing gay, bisexual, and transgender youth, experience disproportionately high rates of new HIV infections, and recent advances in biomedical HIV prevention modalities hold promise in reducing new infections. However, the extent to which SGM youth are aware of and willing to use these modalities is unknown. Methods: Using data from the Survey of Today's Adolescents Relationships and Transitions, we analyze awareness of and willingness to take HIV pre-exposure prophylaxis (PrEP), nonoccupational HIV post-exposure prophylaxis, and rectal microbicides among adolescent sexual minority males aged 13–18 years and transgender youth aged 13–24 years. Results: Overall, we found a majority of our respondents were not aware of any of these prevention modalities. Across both subsamples, age and access to a health care provider were associated with increased PrEP awareness, and any anal sex was associated with PrEP willingness. Conclusions: These findings highlight the importance of provider education on how to discuss SGM issues with patients and educate them about HIV prevention options. © 2020	Gender minority; Microbicides; nPEP; PrEP; Provider education; Sexual minority	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Durosinmi-Etti, Olawale; Nwala, Emmanuel Kelechi; Oki, Funke; Ikpeazu, Akudo; Godwin, Emmanuel; Umoh, Paul; Shaibu, Arome; Ogundipe, Alex; Kalaiwo, Abiye	Communication needs for improved uptake of PrEP and HIVST services among key populations in Nigeria: a mixed-method study	AIDS Research and Therapy	-	-	-	1742-6405	10.1186/s12981-021-00411-6	https://pubmed.ncbi.nlm.nih.gov/34801037/	Abstract Background World Health Organization (WHO) reports that people who indulge in risky behaviours such as penile-anal sex, unprotected intercourse, multiple sex partners, and alcohol and illicit drugs are at risk of HIV/AIDS and classified as Key Populations (KPs). Since the introduction of PrEP and HIVST for the key population groups in Nigeria, government entities and implementing partners have used a range of channels in messaging these essential services across to the target groups—ranging from in-person, social media, television, and radio adverts. Yet, few successes have been documented, thereby necessitating the need to understand the enabling facilitators, barriers to, and communication needs of the KP groups in messaging PrEP and HIVST services in Nigeria. Communicating PrEP and HIVST services will empower the key populations to seek available HIV prevention services and help to increase access to HIV testing services in Nigeria. Methods This study was a mixed-method cross-sectional design; involving 1169 participants from the key populations in Nigeria. The study used a survey and qualitative exploratory methods (interviews and focus group discussion), to collect data from the participants—MSM, FSWs, and key influencers of the KP groups (health providers, peer educators, HIV program officers). In August 2020, data collection was conducted using an open data kit (ODK). Quantitative data were analyzed using SPSS version 20 for descriptive statistics, while qualitative data were analyzed using deductive and thematic analysis based on the codebook. Results The KPs were mainly urban dwellers (77.7%), and the majority of the participants were between 18 to 28 years (89.3%). However, the MSM group was of a younger population compared to the FSWs. A majority completed secondary education (56.1% FSWs and 43.5% MSM). The MSM group showed more tendency to acquire higher education compared to the FSWs. For example, about 51.3% of the MSM group were undergraduates compared to 9.5% of the FSWs. The majority of the KPs were self-employed (56.4% FSWs and 40% MSM). Only about 51% of the KPs were aware of PrEP, with typological variations (39.9% FSWs and 62.3% MSM). MSM group in Lagos (82.5%) were more aware of PrEP services, than 53.1% and 54.5% in A/Ibom (53.1%) and C/River (54.5%). Among the enablers to acquiring PrEP information was the ability of the KPs to network within their communities and on personal relationships. Evidence shows that no single approach influenced the acquisition and use of PrEP information by KPs. Although this proportion varied across the geographic locations, only about 50% of the KPs were aware of HIVST services (40% FSWs and 60% MSM). The factors that enabled the acquisition and use of the prevention commodities were cross-cutting, including a previous or current role as a peer educator, integration of the messages, peer networking, multi-lingual and multi-channel presentation, job aids, and reminders. KPs expressed the need for information on how to take PrEP, eligibility, clarification on differences between PrEP and PEP, clarification on any side effects, for PrEP, price, efficacy, sales point, dosage, available brands. A scale-up of the research across all geopolitical zones and a survey to quantify the prevalence would help understand the dynamics and prioritization of interventions for scaling up PrEP and HIVST services in Nigeria. Conclusions The study documented barriers and facilitators to the uptake of PrEP and HIVST among key populations in Nigeria. It highlighted that KPs are willing to receive PrEP and HIVST messages. The policy actors should consider the preferences of the KPs and the key influencers in reducing barriers to communication and increasing the uptake of PrEP and HIVST services; ensure it reflects in a tailored communication strategy. Since multi-linguistics and multi-channels of presentation were enablers to acquiring PrEP and HIVST messages, the communications strategy for HIV prevention should incorporate these recommendations and adapt to context-specific approaches for effective messaging. Book Section	2021	Duthe J.-C.; Bouzille G.; Sylvestre E.; Chazard E.; Arvieux C.; Cuggia M.	How to identify potential candidates for HIV pre-exposure prophylaxis: An AI algorithm reusing real-world hospital data	-	Public Health and Informatics: Proceedings of MIE 2021	-	NA	-	10.3233/SHTI210265	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107238698&doi=10.3233%2fSHTI210265&partnerID=40&md5=da461c9f0891edfc4132acfadc81e4bb	HIV Pre-Exposure Prophylaxis (PrEP) is effective in Men who have Sex with Men (MSM), and is reimbursed by the social security in France. Yet, PrEP is underused due to the difficulty to identify people at risk of HIV infection outside the "sexual health" care path. We developed and validated an automated algorithm that re-uses Electronic Health Record (EHR) data available in eHOP, the Clinical Data Warehouse of Rennes University Hospital (France). Using machine learning methods, we developed five models to predict incident HIV infections with 162 variables that might be exploited to predict HIV risk using EHR data. We divided patients aged 18 or more having at least one hospital admission between 2013 and 2019 in two groups: cases (patients with known HIV infection in the study period) and controls (patients without known HIV infection and no PrEP in the study period, but with at least one HIV risk factor). Among the 624,708 admissions, we selected 156 cases (incident HIV infection) and 761 controls. The best performing model for identifying incident HIV infections was the combined model (LASSO, Random Forest, and Generalized Linear Model): AUC = 0.88 (95% CI: 0.8143-0.9619), specificity = 0.887, and sensitivity = 0.733 using the test dataset. The algorithm seems to efficiently identify patients at risk of HIV infection. © 2021 European Federation for Medical Informatics (EFMI) and IOS Press. © 2021 European Federation for Medical Informatics (EFMI) and IOS Press. Article	2021	Earlywine, Joel J; Bazzi, Angela R; Biello, Katie B; Klevens, R Monina	High Prevalence of Indications for Pre-exposure Prophylaxis Among People Who Inject Drugs in Boston, Massachusetts.	American Journal of Preventive Medicine	-	-	-	1873-2607	10.1016/j.amepre.2020.09.011	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7902399	INTRODUCTION: In Massachusetts, recent outbreaks of HIV have been fueled by injection and sexual exposures among people who inject drugs. Understanding pre-exposure prophylaxis need, knowledge, and use among people who inject drugs will help inform and evaluate interventions. METHODS: In 2019, investigators analyzed 2018 National HIV Behavioral Surveillance data from people who inject drugs in Boston, MA, who met eligibility criteria. Proportions of people who inject drugs with U.S. Preventive Services Task Force-based pre-exposure prophylaxis indication were estimated by types of HIV acquisition risk in the past year: injection exposure only, sexual exposure only, and overlapping injection and sexual exposures. Investigators then evaluated pre-exposure prophylaxis awareness, conversations with healthcare providers about pre-exposure prophylaxis, and self-reported pre-exposure prophylaxis use among those with and without pre-exposure prophylaxis indications. RESULTS: The prevalence of pre-exposure prophylaxis indication was 92% overall (389/423), with 290 (69%) participants indicated for injection exposures only, 3 (<1%) indicated for sexual exposures only, and 96 (23%) indicated for both injection and sexual exposures. Among those indicated for pre-exposure prophylaxis (n=389), 152 (39%) reported being aware of pre-exposure prophylaxis, 41 (11%) had discussed pre-exposure prophylaxis with a healthcare provider, and 8 (2%) had used pre-exposure prophylaxis in the past year. There were no statistically significant differences between pre-exposure prophylaxisâindicated and ânonindicated people who inject drugs with respect to pre-exposure prophylaxis awareness, discussion with a healthcare provider, and pre-exposure prophylaxis use. CONCLUSIONS: Indication for pre-exposure prophylaxis was high, but awareness was low, conversations about pre-exposure prophylaxis with healthcare providers were uncommon, and pre-exposure prophylaxis use was extremely low. These findings highlight important areas for clinical and community-based interventions to improve pre-exposure prophylaxis uptake among and delivery to people who inject drugs.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Edeza A.; Karina Santamaria E.; Valente P.K.; Gomez A.; Ogunbajo A.; Biello K.	Experienced barriers to adherence to pre-exposure prophylaxis for HIV prevention among MSM: a systematic review and meta-ethnography of qualitative studies	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1778628	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087030461&doi=10.1080%2f09540121.2020.1778628&partnerID=40&md5=eaef160be31f92e98607f7cb0eb0abbc	Men who have sex with men (MSM) in the United States are at disproportionate risk for HIV. Once-daily pre-exposure prophylaxis (PrEP) for HIV prevention is a highly effective method of preventing HIV infection; however, optimal adherence is necessary to maintain effectiveness. Many studies have profiled perceived barriers to adherence among at-risk MSM; however, nearly a decade after FDA approval, there has been little work examining experienced barriers to adherence among MSM who have previously used the medication. To assess the current state of this literature and its implications for behavioral interventions, we conducted a meta-ethnography (i.e., A systematic review and synthesis of qualitative studies) of experiences with PrEP use among cis-gender MSM in the United States. We found that structural-level interventions, such as telehealth and pharmacist-prescribed approaches to PrEP distribution, may circumvent barriers to uptake and adherence for some MSM, but may not be enough for already underserved communities, such as MSM of color. Furthermore, interpersonal-level factors, such as enacted PrEP stigma by providers and peers, highlight the necessary consideration of social identity in the branding of PrEP for HIV prevention. Tailored interventions should consider experienced barriers to PrEP adherence across socioecological levels to be most effective. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	adherence; men who have sex with men; Pre-exposure prophylaxis; qualitative	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2021	Ekama, Sabdat O; Ilomuanya, Margaret O; Azubuike, Chukwuemeka P; Bamidele, Tajudeen A; Fowora, Muinah A; Aina, Oluwagbemiga O; Ezechi, Oliver C; Igwilo, Cecilia I	Mucoadhesive Microspheres of Maraviroc and Tenofovir Designed for Pre-Exposure Prophylaxis of HIV-1: An in vitro Assessment of the Effect on Vaginal Lactic Acid Bacteria Microflora.	HIV AIDS (Auckland)	-	-	-	1179-1373	10.2147/HIV.S291065	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8042296	PURPOSE: To formulate and evaluate microspheres of the antiretroviral drugs maraviroc and tenofovir intended for a candidate vaginal microbicide and assess its effect on the vaginal lactic acid bacteria microflora. METHODS: Ionic gelation technique was used to formulate maraviroc and tenofovir microspheres with subsequent characterization. The effect of varying concentrations of the polymer, crosslinking agent and the curing time on the outcome variables viz: particle size, mucoadhesion and encapsulation efficiency were investigated. Lactic acid bacteria were isolated from the vagina of healthy women using standard microbiologic methods. The analysis of their 16S rRNA sequence data identified Lactobacillus fermentum and Enterococcus faecalis strains which were assigned GenBank accession numbers. The efficacy of the microspheres on HIV-1BaL strain was evaluated using TZM-bl indicator cells. RESULTS: The optimal maraviroc and tenofovir microspheres had particle sizes of (434.82 µm and 456.18 µm), mucoadhesion of (93.3% and 90%) and encapsulation efficiency (92.80% and 78.9%) respectively. Maraviroc release kinetics followed a zero-order model and tenofovir was released via Higuchi model. The assay of a 1 mg/mL suspension of the microspheres on the strains of Lactobacillus fermentum and Enterococcus faecalis showed a viability of 93.9% and 89.7%, respectively. There was a statistically significant difference between the mean absorbance readings of the test agent and that of the positive control (P = 0.001). The microspheres elicited a progressive decline in HIV infectivity until at a concentration of 1 µg/mL. CONCLUSION: The antiretroviral drugs loaded in the microspheres, had good mucoadhesion which is a potential for prolonged residence time in the vagina. The antiretroviral drugs were adequately released from the microspheres and showed efficacy against the HIV-1 BaL virus strain. There was no significant disruption in the growth of the lactic acid bacteria which constitute valuable bacteria microflora of the vagina.	vaginal microbicides, HIV prevention, Lactobacillus fermentum, Enterococcus faecalis	English	New Zealand	Asia and the Pacific	Nigeria	Western and Central Africa	Nigeria	Western and Central Africa	Clinical

Article	2021	Elopre L.; Hussen S.A.; Ott C.; Mugavero M.J.; Turan J.M.	A Qualitative Study: The Journey to Self-Acceptance of Sexual Identity among Young, Black MSM in the South	Behavioral Medicine	-	-	-	8964289	10.1080/08964289.2020.1870428	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103235487&doi=10.1080%2f08964289.2020.1870428&partnerID=40&md5=dcc791570a6f9bf716e4d12986c3a74b	HIV disparities among Young, Black men who have sex with men (YBMSM) persist despite concerted efforts to increase uptake of prevention tools like HIV pre-exposure prophylaxis (PrEP). We conducted in-depth interviews with 25 YBMSM (aged 18-29 years old) to understand factors contributing to PrEP access in Birmingham, Alabama. We identified that one major barrier to PrEP uptake was intersectional stigma related to their multiple identities and contributed to lack of feeling able to accept their sexual identities. Facilitators of validation and acceptance of sexual identity were strong social support networks, which participants reported consisted of, not only other gay and bisexual Black men, but also Black women, an unexplored social support group among YBMSM networks. However, participants felt that internal, perceived and experienced homophobia were exacerbated in Southern, Black communities due to perceived values surrounding masculinity, which were reinforced by religious doctrine. Looking forward, public health officials will need to add additional resources to support interventions that have meso-level impact to effectively change social norms as a critical determinant of individual-level prevention practices within this at-risk group and their social networks. © 2021 Taylor & Francis Group, LLC. Article	2021	Elopre, Latesha; Ott, Corilyn; Lambert, Crystal Chapman; Amico, K Rivet; Sullivan, P S; Marrazzo, J; Mugavero, Michael J; Turan, Janet M	Missed Prevention Opportunities: Why Young, Black MSM with Recent HIV Diagnosis did not Access HIV Pre-exposure Prophylaxis Services	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-02985-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85089019027&doi=10.1007%2fs10461-020-02985-0&partnerID=40&md5=21114e99136281d3e83419464cae627a	In the United States, HIV infection rate inequities persist, with new infections highest among young, Black men who have sex with men (YBMSM) in the South. We conducted 23 in-depth interviews with YBMSM newly diagnosed with HIV to explore awareness of and barriers to uptake of HIV pre-exposure prophylaxis (PrEP). Participants were recruited from two university-based HIV Clinics in Alabama and were: (1) 16–29 years of age, (2) diagnosed with HIV within the prior 365 days, (3) Black race, (4) self-identified as a cis-gender male reporting sex with men AND (5) did not report prior PrEP use. Interview guides were grounded in Anderson's Behavioral Healthcare Utilization Model (ABM), with embedded constructs from the situated Information, Motivation and Behavioral Skills theoretical framework. Coding was conducted by three independent coders using thematic analysis methods. Participants (N = 23) median age was 24, more than two-thirds reported annual incomes less than $15,000 and the majority (84%) identified as gay. Major themes that emerged as barriers to accessing PrEP included low prioritization and interests in using PrEP; low perceived HIV risk due to feelings of invincibility and trust in sex partners; lack of information about accessing PrEP; negative beliefs around PrEP; and the suggestion to change PrEP messaging from only targeting YBMSM. These findings indicate that there are important missed opportunities for HIV prevention with PrEP among YBMSM in the South. In these high-risk young men, tailored interventions are needed to better inform and frame perceptions around risk, knowledge, access and prioritization of PrEP. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Theses and Dissertations	2021	Esmeralda Elia; Esmeralda Munoz; Miguel Davila; Andre Zuloaga	Access Barriers to Pre-Exposure Prophylaxis (PrEP) in the United States and France, with Policy Recommendations	-	-	California State University System	-	na	NA	http://hdl.handle.net/20.500.12680/gt54kt32c	HIV-related deaths have decreased significantly throughout the world in the last decade due to medical advancements that include precautionary prevention medications like pre-exposure prophylaxis (PrEP). Since approval of PrEP in the United States in 2012 and France in 2016, many studies reported similar barriers to PrEP use. After conducting a literature review, findings showcased a common theme of patient/provider barriers resulting from stigma and lack of education and awareness. Primary barriers to accessing PrEP included the cost of care, medical eligibility, and unknown medication side effects. We identified only 14 programs offering PrEP access and assistance, all located in the United States. HIV and minority populations continue to be underserved; therefore, we developed global health policy recommendations for PrEP assistance and access programs based on findings from France and the United States. Article	2021	Espinosa, OJP; Hull, M; MacPherson, P; Woodward, K; Grace, D; Lachowsky, N; Mohammed, S; Fisher, K; Rayek, S; Arkell, C; Cordeiro, T; Durrant, G; Greene, W; Gaspar, M; Hall, D; Harding, M; Jollimore, J; Kilduff, M; Maxwell, J; Mitterni, L; Peters, E; Truong, R; Tan, DHS	PrEP-related stigma and PrEP status among gay, bisexual and other men who have sex with men, and transgender women in Ontario and British Columbia, Canada	HIV Medicine	-	-	-	1464-2662	10.1186/s12981-022-00473-0	https://pubmed.ncbi.nlm.nih.gov/36303191/	Background: We aimed to explore the association between PrEP-related stereotypes and perceived disapproval (hereafter PrEP-related stigma), and PrEP use. Methods: We used data from a cross-sectional online survey among adult gay, bisexual, other men who have sex with men in Ontario and British Columbia, Canada. Participants were recruited 2019-2020 in-person from sexual health clinics and outreach programs, and online through dating mobile applications and websites. We used logistic regression models to explore the relationship between PrEP-related stigma and: 1-being a 'never' versus 'current' PrEP user, and 2-being a 'former' versus 'current' user. Results: The median age of the sample was 32 (Q1-Q3 = 27-40), most were white born in Canada (48%), 45% had never used PrEP, 16% were former PrEP users and 39% were current PrEP users. Of 1527 individuals who started the survey, 1190 participants answered questions about PrEP-related stigma: 254 (21.3%) were classified as having low level of PrEP-related stigma, 776 (65.2%) intermediate, and 160 (13.5%) high. No significant association was found when never PrEP users and current PrEP users were compared: adjusted OR = 1.44 (95%-CI: 0.8-2.5). High PrEP-related stigma was positively associated with being a former PrEP user compared to being a current PrEP user: adjusted OR = 2.5 (95%-CI: 1.3-4.9). Conclusion: PrEP-related stigma is associated with not using PrEP, particularly with PrEP discontinuation. Our findings indicate that stigma persists as a barrier to PrEP use. Article	2021	Estcourt, C; Yeung, A; Nandwani, R; Goldberg, D; Cullen, B; Steedman, N; Wallace, L; Hutchinson, S	Population-level effectiveness of a national HIV preexposure prophylaxis programme in MSM	AIDS	-	-	-	0269-9370	10.1097/QAD.0000000000002790	https://journals.lww.com/aidsonline/fulltext/2021/03150/population_level_effectiveness_of_a_national_hiv.15.aspx	Objective: The aim of this study was to evaluate Scotland's national HIV preexposure prophylaxis (PrEP) programme in relation to PrEP uptake and associated population-level impact on HIV incidence among MSM. Design: A retrospective cohort study within real-world implementation. Methods: Comparison of HIV diagnoses from national surveillance data and HIV incidence within a retrospective cohort of HIV-negative MSM attending sexual health clinics from the National Sexual Health information system between the 2-year periods pre(July 2015-June 2017) and post(July 2017-June 2019) introduction of PrEP. Results: Of 16 723 MSM attending sexual health clinics, 3256 (19.5%) were prescribed PrEP. Between pre-PrEP and PrEP periods, new HIV diagnoses among MSM declined from 229 to 184, respectively relative risk reduction (RRR): 19.7%, 95% confidence interval (95% CI) 2.5-33.8; diagnosed recently acquired infections declined from an estimated 73 to 47, respectively (35.6%, 95% CI 7.1-55.4). Among MSM attending sexual health clinics, HIV incidence per 1000 person-years declined from 5.13 (95% CI 3.90-6.64) pre-PrEP to 3.25 (95% CI 2.30-4.47) in the PrEP period (adjusted IRR 0.57, 95% CI 0.37-0.87). Compared with the pre-PrEP period, incidence of HIV was lower in the PrEP period for those prescribed PrEP (aIRR 0.25, 95% CI 0.09-0.70) and for those not prescribed PrEP (aIRR 0.68, 95% CI 0.43-1.05). Conclusion: We demonstrate national population-level impact of PrEP for the first time in a real-world setting. HIV incidence reduced in MSM who had been prescribed PrEP and, to a lesser extent, in those who had not. Promotion of the benefits of PrEP needs to extend to MSM who do not access sexual health clinics.	prevention; MSM; epidemiology; public health; MEN; HIGH-RISK; DEMAND; incidence; HIV preexposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Theses and Dissertations	2021	Faini, Diana	HIV incidence, sexual and reproductive health among high-risk females recruited for participation in HIV prevention trials in Tanzania	-	-	Karolinska Institute	-	na	NA	http://hdl.handle.net/10616/47551	Background: Testing and evaluating new HIV prevention products such as HIV vaccines, requires identifying, enrolling and retaining cohorts of HIV high risk individuals. This thesis describes the recruitment and follow up of high-risk females for participation in HIV prevention trials in Tanzania. Specifically, the thesis describes a cohort of female sex workers (FSWs) in Dar es Salaam recruited for participation in an upcoming HIV vaccine trial- known as PrEPVacc vaccine trial, as well as changes in sexual risky behaviours in a similarly high-risk cohort from northern Tanzania. Methods: Between October and December 2018, FSWs aged 18–45 years were recruited using a Respondent Driven Sampling method. They were screened for eligibility and 700 of them were enrolled into the PrEPVacc registration cohort in Dar es Salaam. At screening and at 3 monthly follow-up visits, social demographics, HIV risk behavioural assessments and collection of blood samples for HIV testing were done. Qualitative interviews were conducted to explore contraceptive use. Data from a separate cohort of high-risk women from Northern Tanzania was used to explore changes in sexual behaviour and its association with HIV incidence. Results: The baseline HIV prevalence in the PrEPVacc registration cohort was 7.6% (59/773, 95% CI; 5.8%-9.7%). There were 21 HIV seroconversions over a 12 month follow up period. The HIV incidence rate was 3.45 per 100 person-years-at-risk (PYR) (95% CI; 2.25-5.28/100 PYR). The HIV incidence rate was higher among FSWs aged 18-24 years (4.31/100PYR), those using illicit drugs (4.25/100PYR) and those diagnosed with either Syphilis or Hepatitis B/C virus (10.04/100 PYR). (Study I). Nearly half (49%) of high-risk women enrolled in the cohorts from Northern Tanzania did not change their sexual behaviour practices after 12 months, while 25% had higher risk practices after 12 months of follow up. The proportion of women reporting multiple partners, transactional sex and high-risk sex practices declined at each 3 months visit (33%, 43% and 47% reduction in odds per visit respectively, p for linear trend <0.001 for all). There was no evidence of an effect of change in sexual behaviour on HIV rate after adjusting for other factors (adjusted odds ratio (aOR) 0.88 95%CI 0.39-2.01, P=0.76) (Study II). In the PrEPVacc registration cohort, awareness of HIV pre-exposure prophylaxis (PrEP) increased from 67% at cohort enrolment to 97% after 12 months (p<0.001). Willingness to use PrEP was high at both time points (98% vs 96% p=0.84). Only 8% (57/700) of the FSWs reported to have ever initiated PrEP use over the 12 months follow-up period. Use of PrEP was independently associated with: marital status i.e married/cohabiting (aOR) 4.19; 95%CI 1.44-12.18) or separated/divorced/widowed (aOR 2.38; 95%CI 1.17-4.83) and engaging in sex with a HIV infected partner (aOR 3.98;1.20-13.15) (Study III). FSWs in the PrEPVacc registration cohort reported that sex work impedes good contraceptive behaviour because; FSWs felt unable to negotiate consistent condom use, avoided health services due to stigma, missed monthly contraceptive supplies because of inconvenient clinic operating hours and skipped contraceptive pills when intoxicated after taking alcohol. Financial hardships related to child rearing and painful abortion experiences influenced FSWs' commitment to good contraceptive behaviour (Study IV). Conclusions: The high HIV incidence among FSWs in the PrEPVacc registration cohort demonstrates that this population is suitable for participation in HIV vaccine trials. The HIV incidence may decline over time because of reduction in sexual risky behaviour practices and increased PrEP uptake.	na	English	Sweden	Western and Central Europe and North America	Sweden	Western and Central Europe and North America	-	-	Quantitative
Article	2021	Farley J.E.; Dangerfield D.T., II; LaRicci J.; Sacamano P.; Heidari O.; Lowensen K.; Jennings J.M.; Tobin K.E.	Community engagement and linkage to care efforts by peer community-health workers to increase PrEP uptake among sexual minority men	Public Health Nursing	-	-	-	7371209	10.1111/phn.12887	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102783238&doi=10.1111%2fphn.12887&partnerID=40&md5=db84fc3afce2ca83aea0c7caa3786e1f	Purpose: Pre-exposure prophylaxis (PrEP) prevents HIV yet uptake remains suboptimal across the United States. This paper evaluates the impact of outreach activities led by nurse supervised community healthcare workers (CHWs) on the PrEP care cascade. Methods: This is an observational programmatic evaluation of LGBTQ + community outreach between March 1, 2016, to March 31, 2020, as part of a public health initiative. Descriptive statistics are used to characterize the data by outreach type. Results: 2,465 participants were reached. Overall, a PrEP appointment was scheduled for 94 (3.8%) with 70 (2.8%) confirmed to have completed a PrEP visit. Success for each type of community outreach activity was evaluated with virtual models outperforming face-to-face. Face-to-face outreach identified nine persons among 2,188 contacts (0.41%) completing an initial PrEP visit. The website prepmaryland.org identified 4 among 24 contacts (16.7%) and the PrEP telephone/text warm-line identified 18 among 60 contacts (30%). The PrEPme smartphone application identified 39 among 168 contacts (23.2%). Conclusions: Face-to-face community outreach efforts reached a large number of participants, yet had a lower yield in follow-up and confirmed PrEP visits. All virtual platforms reached lower total numbers, but had greater success in attendance at PrEP visits, suggesting enhanced linkage to care. © 2021 The Authors. Article	2021	Faryar K.A.; Ancona R.M.; Braun R.S.; Brown J.L.; Sickles R.K.; Lyons M.S.	Estimated proportion of an urban academic emergency department patient population eligible for HIV preexposure prophylaxis	American Journal of Emergency Medicine	-	-	-	7356757	10.1016/j.ajem.2021.04.087	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105603724&doi=10.1016%2fj.ajem.2021.04.087&partnerID=40&md5=b4dc2724c5a955ed8e85deebc7fef255	Objective: Pre-exposure prophylaxis (PrEP) is a highly effective but underutilized method of HIV prevention. Emergency departments (EDs) have access to at-risk populations meeting CDC eligibility criteria for PrEP. Characterizing this population could help motivate, develop, and implement ED interventions to promote PrEP uptake. Methods: This cross-sectional study explored the proportion of patients from an urban, academic ED who met CDC 2017 PrEP eligibility criteria using three existing datasets that mimic patient selection strategies for HIV screening: 1) study of consecutively approached ED patients from 2008 to 2009 (analogous to non-targeted screening), 2) patients of the ED's HIV screening program in 2017 (analogous to risk-targeted screening), and 3) electronic health record (EHR) diagnostic codes in 2017 (analogous to EHR selected screening). The primary outcome was the proportion eligible for PrEP referral. Secondary outcomes included proportion by risk group: men who have sex with men (MSM), heterosexual men and women (HMW), and persons who inject drugs (PWID). Results: The proportion eligible for PrEP was: 568/1970 (28.8%, 95% CI: 26.9–30.9) for consecutively approached patients, 552/3884 (14%, 95% CI: 13–15) for risk-targeted patients, and 605/66287 (0.9%, 95% CI: 0.8–1.0) for EHR diagnoses of all patients. For the two datasets with behavioral risk information, the proportion eligible was: MSM 1–2%, HMW 12–28%, and PWID 1–4%. Conclusions: A large subgroup of this ED population was eligible for PrEP referral. EDs are a compelling setting for development and implementation of HIV prevention interventions to assist in national efforts to expand PrEP. © 2021 Elsevier Inc. Article	2021	Fayaz Farkhad, Bita; Holtgrave, David R; Albarracín, Dolores	Effect of Medicaid Expansions on HIV Diagnoses and Pre-Exposure Prophylaxis Use.	American Journal of Preventive Medicine	-	-	-	1873-2607	10.1016/j.amepre.2020.10.021	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7903489	INTRODUCTION: Increased insurance coverage and access to health care can increase identification of undiagnosed HIV infection and use of HIV prevention services such as pre-exposure prophylaxis. This study investigates whether the Medicaid expansions facilitated by the Affordable Care Act had these effects. METHODS: A difference-in-differences design was used to estimate the effects of the Medicaid expansions using data on HIV diagnoses per 100,000 population, awareness of HIV status, and pre-exposure prophylaxis use. The analyses involved first calculating differences in new diagnoses and pre-exposure prophylaxis use before and after the expansions and then comparing these differences between treatment counties (i.e., all counties in states that expanded Medicaid) and control counties (i.e., all counties in states that did not expand Medicaid). Further analyses to investigate mechanisms addressed associations with HIV incidence, rates of sexually transmitted infections, and substance use. Analyses were conducted between August 2019 and July 2020. RESULTS: Medicaid expansions were associated with an increase in HIV diagnoses of 0.508 per 100,000 population, or 13.9% (p=0.037), particularly for infections contracted via injection drug use and among low-income, rural counties with a high share of pre-Affordable Care Act uninsured rates that were most likely to be affected by the expansions. In addition, Medicaid expansions were associated with improvements in the knowledge of HIV status and pre-exposure prophylaxis use. There was no impact of the expansions on incident HIV, substance use, or sexually transmitted infection rates with the exception of gonorrhea, which decreased after the expansions. Altogether, these results suggest that the changes in new HIV diagnoses, awareness of HIV status, and pre-exposure prophylaxis were not simply because of a higher incidence or an increase in infection risk. CONCLUSIONS: Medicaid expansions were associated with increases in the percentage of people living with HIV who are aware of their status and pre-exposure prophylaxis use. Expanding public health insurance may be an avenue for curbing the HIV epidemic.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Constructions of HIV Risk among a Diverse Sample of HIV-Negative Young Men Who Have Sex with Men Who Are Repeat Testers	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002614	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102657302&doi=10.1097%2fQAI.0000000000002614&partnerID=40&md5=2bb51f53879dd3f7cf6386f47c805f2a	Introduction: To end the HIV epidemic, HIV prevention and pre-exposure prophylaxis (PrEP) promotion efforts must reach young men who have sex with men (YMSM) at greatest risk for HIV. This study qualitatively explored whether common metrics used by clinicians, scientists, and public health officials to objectively assess HIV risk align with how YMSM conceptualize their risk for HIV and the factors that shape YMSM's risk perceptions.Methods: Interviews with a racially/ethnically diverse sample of HIV-negative YMSM (ages 19-24 years, 60% Latinx; n = 20) examined conceptualizations of HIV risk within the context of repeat HIV testing. Iterative, applied thematic analysis examined how participants conceptualized and constructed their HIV risk, and compared participants' descriptions of their risk with a validated quantitative assessment of HIV risk that reliably predicts HIV seroconversion in this group.Results: Objective quantitative assessments of HIV risk poorly aligned with participants' perceived HIV risk. Participants described their current risk in relative terms (relative to past risk and relative to friends'/peers' risk) and described age/developmental stage and changes in knowledge about HIV prevention as key factors in risk changes over time. Other factors included substance use and trust/mistrust in sexual partners and scientific advances in HIV prevention (eg, U = U and PrEP). Factors that influenced participants' perceived HIV risk were similar regardless of objective risk assessment.Conclusions: Quantitative assessments of risk may poorly align with risk perception among YMSM. Although objective metrics can effectively target YMSM at greatest risk for HIV transmission, interventions to improve prevention behaviors and PrEP uptake may be more effective when tailored to bridge the disconnection between objective HIV risk assessments and YMSM's constructions of risk. © 2020 Wolters Kluwer Health, Inc. Article	2021	Felsher M.; Koku E.; Bellamy S.L.; Mulawa M.I.; Roth A.M.	Predictors of Willingness to Diffuse PrEP Information within Ego-Centric Networks of Women Who Inject Drugs	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03115-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098507780&doi=10.1007%2fs10461-020-03115-6&partnerID=40&md5=3496cbd00855cf9b5507857a30ce548c	Little is known about how social networks among women who inject drugs (WWID) can be leveraged to increase awareness about pre-exposure prophylaxis (PrEP). We tested the hypothesis that interpersonal characteristics influence willingness of WWID to communicate PrEP information with peers. Forty WWID ≥ 18 years completed social network surveys. Participants named on average 9.3 (SD = 3.3) network members, resulting in 375 unique relationships. WWID were willing to share PrEP information with 83% of network members. Participants had higher odds of willingness to share information within relationships when the network member was female, homeless and perceived to be at risk for HIV. Among relationships with family members and transactional sex clients, stronger emotional closeness was associated with higher odds of willingness to share information. Peer interventions where WWID share PrEP information with peers may be an efficient approach to increase PrEP awareness among this vulnerable population. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Article	2021	Felsher M.; Ziegler E.; Amico K.R.; Carrico A.; Coleman J.; Roth A.M.	"PrEP just isn't my priority": Adherence challenges among women who inject drugs participating in a pre-exposure prophylaxis (PrEP) demonstration project in Philadelphia, PA USA	Social Science & Medicine	-	-	-	2779536	10.1016/j.socscimed.2021.113809	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102796414&doi=10.1016%2fj.socscimed.2021.113809&partnerID=40&md5=62adaf77e3b1291868785e14e34f39a2	Pre-exposure prophylaxis (PrEP) has the ability to curb HIV transmission among women if they are highly adherent (e.g. 6/7 weekly doses). In a recent PrEP demonstration project with 95 women who inject drugs (WWID) in Philadelphia, PA, USA, PrEP uptake was high but adherence was low. This qualitative study draws upon the Behavioral Model for Vulnerable Populations (BMVP) to describe how the context of 23 WWID's lives challenged PrEP adherence using narrative data from in-depth interviews. Content analysis suggest that women's need to organize their day around predisposing survival needs made it difficult to prioritize PrEP. Adherence was further challenged by dis-enabling structural forces such as entry into institutions that do not provide PrEP (e.g., drug treatment and correctional facilities) and medication diversion to illicit marketplaces. Overtime, women's perceived need for PrEP was dynamic: in periods they characterized as risky, women considered PrEP highly beneficial and described enhanced motivation to adhere. In periods of low perceived risk, women were less committed to continuing daily PrEP in the context of their competing survival needs. In sum, WWID faced challenges to PrEP adherence that correspond to all of the BMVP domains. To optimize PrEP for WWID, multi-level programs are needed that address the determinants that both increase HIV susceptibility and undermine adherence. © 2021 Elsevier Ltd	Adherence; HIV; Persistence; Pre-exposure prophylaxis; Qualitative; Women who inject drugs	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Felsher Marisa; Dutra Karley; Monseur Brent; Roth, Alexis M; Latkin Carl; Falade-Nwulia Oluwaseun	The Influence of PrEP-Related Stigma and Social Support on PrEP-Use Disclosure among Women Who Inject Drugs and Social Network Members	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03312-x	https://www.proquest.com/scholarly-journals/influence-prep-related-stigma-social-support-on/docview/2598833905/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) is a promising but underutilized HIV prevention strategy for Women who Inject Drugs (WWID). Stigma and disclosure concerns have been key barriers to PrEP use among women in PrEP efficacy trials. Social support has been found to buffer against some PrEP stigma, though these factors have been largely unexplored among WWID. Investigating how WWID disclose PrEP use is important given evidence that disclosure is associated with higher adherence. We aimed to identify the impact of stigma and support on PrEP disclosure within social networks of WWID participating in a PrEP demonstration project in Philadelphia, PA, USA. PrEP-using WWID ≥ 18 years completed social network surveys. Generalized estimating equations were used to account for the correlation of network structure. Thirty-nine WWID (i.e. egos) named an average of 9.5 ± 3.3 network members (i.e. alters), for a total sample of 371 unique relationships. Egos disclosed their PrEP use to an average of 4.0 alters (SD = 2.8). Related to PrEP stigma, participants had 0.4 times decreased odds of PrEP disclosure with alters who would disapprove of them taking PrEP (95% CI: 0.1–0.9). Related to support, participants had 2.5 times higher odds of disclosure among peers who could provide PrEP advice (95% CI: 1.0–6.0). Interventions that increase social support and decrease stigma are pivotal for increasing PrEP use disclosure among WWID. Article	2021	Felsher, Marisa; Koku, Emmanuel; Lankenau, Stephen; Brady, Kathleen; Bellamy, Scarlett; Roth, Alexis M	Motivations for PrEP-Related Interpersonal Communication Among Women Who Inject Drugs: A Qualitative Egocentric Network Study	Qualitative Health Research	-	-	-	10497323	10.1177/1049732320952740	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090163434&doi=10.1177%2f1049732320952740&partnerID=40&md5=0ccc63d739ae8eed720e4db642512d59	A qualitative egocentric social network approach was taken to explore motivations for pre-exposure prophylaxis (PrEP)-related communication between women who inject drugs and network members. Eligible participants were HIV-negative, 18 years or older, and participating in a PrEP demonstration project in Philadelphia, PA, USA. The study employed content analysis of in-depth interviews to identify themes related to contextual and relational factors impacting PrEP communication within networks. Participants (n = 20) named on average three network members, resulting in a total of 57 unique relationships. PrEP conversations occurred within 30 of the 57 relationships, and motivations were to benefit others, to benefit themselves, and due to a sense of obligation. Some conversations also occurred when a peer unexpectedly found their pills. Taking a qualitative approach to network analysis provided a nuanced understanding of how interpersonal characteristics motivated PrEP conversations. Network interventions that facilitate information diffusion and social support may increase PrEP uptake and adherence among women who inject drugs. © The Author(s) 2020.	addiction; altruism; behavior; communication; community and public health; confidentiality; disclosure; egocentric network analysis; health; health behavior; health promotion; HIV/AIDS; infection; motivation; Pennsylvania; Philadelphi; privacy; qualitative content analysis; social networks; social participation; substance use; USA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Ferraz D.; Dourado I.; Zucchi E.M.; Mabire X.; Magno L.; Grangeiro A.D.; Couto M.T.; Ferguson L.; Westin M.; Alves Dos Santos L.; Préau M.	Effects of the COVID-19 pandemic on the sexual and mental health of adolescent and adult men who have sex with men and transgender women participating in two PrEP cohort studies in Brazil: COBra study protocol	BMJ Open	-	-	-	20446055	10.1136/bmjopen-2020-045258	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103701820&doi=10.1136%2fbmjopen-2020-045258&partnerID=40&md5=784fd1a97fa7ed70f0f81eb040a0e185	Introduction The COVID-19 pandemic and its control measures have impacted health and healthcare provision in various levels. Physical distancing measures, for instance, may affect sexual health, impacting access to HIV prevention supplies and changing sexual behaviour, as well as mental health, increasing feelings of unsafety and weakening community support ties. These effects can be worsened among socially marginalised groups, such as men who have sex with men (MSM) and transgender women (TGW). Brazil is among the countries most affected by COVID-19 in the world, where control measures have been inconsistently implemented. We aim to investigate the effects of the COVID-19 pandemic on the sexual and mental health of adolescent and adult MSM and TGW in Brazil. Methods Convergent mixed-method prospective cohort study, nested in two ongoing HIV pre-exposure prophylaxis (PrEP) cohorts in Brazil, named PrEP1519 and Combina. Participants will be invited to answer, at baseline and after 6 months, a questionnaire about the effects of the COVID-19 pandemic on sexual behaviour, HIV prevention and mental health. Data on HIV infection and sexually transmitted infections (STI) will be collected as part of routine follow-up from the cohorts. Main outcome measures (HIV infection, STI and depression symptoms) will be observed within 12 months after baseline. Sample size is estimated at 426 participants. Complementarily, 50 participants will be invited to in-depth interviews through video calls or interactive voice response, and 20 will be invited to chronicle their lives during the pandemic through digital diaries. Triangulation will be done across qualitative methods and with the quantitative data. Ethics and dissemination The study was approved by Research Ethics Committees from the Brazilian Universities coordinating the study. Findings will be published in scientific journals and presented at meetings. Informative flyers will be elaborated to communicate study findings to participants and key stakeholders. © Author(s) (or their employer(s)) 2021. Re-use permitted under CC BY-NC. Article	2021	Fields E.L.; Thornton N.; Long A.; Morgan A.; Uzzi M.; Arrington-Sanders R.; Jennings J.M.	Young black MSM's exposures to and discussions about PrEP while navigating geosocial networking apps	Journal of LGBT Youth	-	-	-	19361653	10.1080/19361653.2019.1700205	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076923232&doi=10.1080%2f19361653.2019.1700205&partnerID=40&md5=1837ca73be510693409919dec6263e0c	Young Black gay, bisexual and other men who have sex with men (YBMSM) carry a disproportionate HIV burden perpetuated by exposure to sexual networks with higher untreated HIV prevalence and incidence. In Baltimore, these sexual networks include high utilization of geosocial networking apps (GSN-apps). Our prior work suggests these apps can be important access points for targeted interventions like PrEP. To inform online PrEP outreach we explored YBMSM GSN-app users' exposure to and discussions about PrEP while navigating apps. We actively recruited YBMSM (n = 17) age 18–24 from the GSN-app most frequently reported by MSM newly diagnosed with HIV in Baltimore. Participants were recruited through direct messaging within the GSN-app while logged-on in high HIV transmission areas. Participants completed 60–90 minute semi-structured interviews, which were analyzed using a 3-stage analytic coding strategy. While some participants had not heard of PrEP, the majority described mentions or conversations about PrEP on GSN-apps. Three themes emerged: (1) Mistrust of PrEP, (2) Association with sexual promiscuity, and (3) Concerns about lack of protection from other STIs. Proper messaging, accurate information, and education are needed to account for the negative perceptions that surround PrEP; otherwise, continued underuse among YBMSM will expand rather than reduce HIV disparities. © 2019 Taylor & Francis Group, LLC.	adolescent; pre-exposure prophylaxis; YBMSM; young adult; Young Black men who have sex with men	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Fields N.F.; Wood S.; Amutah C.; Timko C.A.; Petsis D.; Akers A.Y.	Identifying Opportunities to Discuss Pre-Exposure Prophylaxis During Contraceptive Coaching Discussions With Urban Adolescent Women	Journal of Adolescent Health	-	-	-	1054139X	10.1016/j.jadohealth.2021.04.031	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108226253&doi=10.1016%2fj.jadohealth.2021.04.031&partnerID=40&md5=cff962723e8084cb5c156a54d720347a	Purpose: HIV pre-exposure prophylaxis (PrEP) reduces HIV transmission and is approved for adolescents aged 12–17 years. Adolescent girls and young women (AGYW) have modest PrEP uptake rates, while many receive reproductive health counseling. We sought to identify opportunities for incorporating PrEP education in contraceptive counseling delivered to AGYW. Methods: We performed a secondary analysis of data from the Health Coaching for Contraceptive Continuation pilot study, which supported contraceptive use among AGYW. Participants were 14–22 years old, sexually active with males, and not desiring pregnancy within 12 months. Coaches were sexual health educators with ≥5 years' experience providing contraceptive and PrEP counseling to youth. Participants completed a baseline visit within 30 days of contraceptive initiation and completed up to five monthly coaching sessions. Of 33 enrollees, this analysis includes the 21 who completed ≥4 sessions. Two coders deductively coded session transcripts for five themes: opportunities to discuss PrEP; HIV knowledge, risk perception, and testing attitudes; changes in HIV risk status; condom use knowledge and skills; and sexually transmitted infection knowledge and risk perception. Results: Of the 111 transcripts coded, 24 contained opportunities to discuss PrEP and were inductively analyzed. Thematic analysis demonstrated three types of opportunities for PrEP discussions: failure to introduce information, and provision of incomplete information or misinformation. Analysis also revealed four opportunity contexts: sexually transmitted infection prevention strategies, HIV risk reduction, avoidance of adverse sexual health outcomes, and disclosures of condom nonprotected sexual behaviors. Only one transcript mentioned PrEP. Conclusions: Multiple opportunities to introduce PrEP counseling exist within contraceptive counseling provided to AGYW. © 2021 Society for Adolescent Health and Medicine	Contraception; Family planning services; HIV PrEP; HIV risk mismatch; PrEP stigma; Reproductive health counseling; Sexual health education	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Fields S.D.; Tung E.	Patient-Focused Selection of PrEP Medication for Individuals at Risk of HIV: A Narrative Review	Infectious Diseases and Therapy	-	-	-	21938229	10.1007/s40121-020-00384-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100796413&doi=10.1007%2fs40121-020-00384-5&partnerID=40&md5=194e289eb84737636c945837c04bece4	Pre-exposure prophylaxis (PrEP) medication is a key component of the HIV prevention strategy in the US, which has been demonstrated to be highly effective in preventing HIV acquisition among individuals at risk. Two PrEP medications are currently approved: emtricitabine/tenofovir disoproxil fumarate (Truvada®; F/TDF) was approved by the US Food and Drug Administration in 2012, followed by emtricitabine/tenofovir alafenamide (Descovy®; F/TAF) in 2019. An ongoing randomized, double-blind, Phase 3 study (DISCOVER) demonstrated that F/TAF had non-inferior efficacy to F/TDF. While both medications have been found to be efficacious and well tolerated, several studies have identified that important differences exist with regards to pharmacokinetics, bone and renal safety profiles, and other factors. In this narrative review, we conducted a comprehensive evaluation of the populations at risk of HIV who may also be affected by, or at risk of, bone or renal conditions. We reviewed the safety profiles of F/TDF and F/TAF to develop an evidence-based algorithm for selecting the appropriate PrEP medication, based on biological, behavioral, and health characteristics of an individual at risk of HIV, and considered how the choice of PrEP medication may or may not compound safety concerns for these individuals. We identified that the introduction of F/TAF provides a valuable alternative to F/TDF, allowing the personalization of PrEP. F/TAF may be the preferred medication for cisgender men and transgender women at risk of HIV infection who are predisposed to, or already have, bone or renal conditions. While the approval of F/TAF is the first step in personalization of PrEP, additional options are still warranted to help accommodate the wide spectrum of individuals at risk of HIV with different lifestyles, medical histories, preferences, and requirements. © 2021, The Author(s). Article	2021	Fisher, Celia B; Puri, Leah Ibrahim; Macapagal, Kathryn; Feuerstahler, Leah; Ahn, Jungwon Rachael; Mustanski, Brian	Competence to Consent to Oral and Injectable PrEP Trials Among Adolescent Males Who Have Sex with Males.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03077-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8052255	Adherence to oral pre-exposure prophylaxis (PrEP) is challenging for adolescent males who have sex with males (AMSM). Once adult trials comparing oral to longer lasting injectable PrEP are completed, there will be a need for adolescent studies. However, lack of data on adolescent consent capacity may sustain guardian permission requirements identified as a barrier to AMSM participation in prior PrEP trials. This online study assessed AMSM's (14-17 years) consent capacity for these trials, comparing performance to MSM (18-19 years) for whom guardian permission is not required. Applying the MacCAT-CR, participants (N = 214) viewed a video and mock consent form followed by open-ended and yes/no items. Cognitive diagnostic models and means testing analyses supported AMSM capacity to consent to these trials: 16-17 and most 14-15 year-olds, demonstrated consent understanding, appreciation and reasoning at 18-19 year-old levels. Data also identified vulnerabilities requiring attention during informed consent. Article	2021	Fitch C.; Foley J.; Klevens M.; Cermeño J.N.; Batchelder A.; Mayer K.; O'Cleirigh C.	Structural Issues Associated with Pre-exposure Prophylaxis Use in Men Who Have Sex with Men	International Journal of Behavioral Medicine	-	-	-	10705503	10.1007/s12529-021-09986-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104051478&doi=10.1007%2fs12529-021-09986-w&partnerID=40&md5=9dcb8868dd2be662b5f244cdffd858a1	Background: Limited access to healthcare has been associated with limited uptake of pre-exposure prophylaxis (PrEP) for HIV among men who have sex with men (MSM). This descriptive analysis examined, in a near universal healthcare setting, differences between MSM reporting using versus not using PrEP in the past 12 months. Method: Data come from the 2017 Boston sample of the National HIV Behavioral Surveillance (NHBS) system, containing a venue-based and time-spaced sample of 530 MSM. The analysis used descriptive frequencies and tests of bivariate associations by PrEP use using Fisher's exact test. Results: Five hundred four respondents had data necessary to determine if PrEP was indicated, and 233 (43.9%) had an indication for PrEP. Of these 233 participants, 117 (50.2%) reported using PrEP in the past 12 months. Not being out, in terms of disclosing one's sexual orientation to a healthcare provider, lack of health insurance, limited access to healthcare, and history of incarceration were all significantly associated with not using PrEP in the past 12 months. Race/ethnicity was not significantly associated with PrEP use in the past 12 months. Conclusions: In the setting of Massachusetts healthcare expansion and reform, and in a sample somewhat uncharacteristic of the population of individuals experiencing difficulties accessing PrEP, structural and demographic factors remain potent barriers to PrEP uptake. Targeted PrEP expansion efforts in Massachusetts may focus on identifying vulnerable subgroups of MSM (e.g., underinsured or criminal justice system-involved MSM) and delivering evidence-based interventions to reduce stigma and promote disclosure of same-sex behavior in healthcare settings. © 2021, International Society of Behavioral Medicine. Article	2021	Flax V.L.; Hawley I.; Ryan J.; Chitukuta M.; Mathebula F.; Nakalega R.; Seyama L.; Taulo F.; van der Straten A.	After their wives have delivered, a lot of men like going out: Perceptions of HIV transmission risk and support for HIV prevention methods during breastfeeding in sub-Saharan Africa	Maternal and Child Nutrition	-	-	-	17408695	10.1111/mcn.13120	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097627345&doi=10.1111%2fmcn.13120&partnerID=40&md5=c3ef737345769d5e2303b125c82bf699	Female-initiated HIV prevention methods, such as oral pre-exposure prophylaxis (PrEP) and the vaginal ring, may be important risk reduction strategies for breastfeeding women. Given their novelty, information about the sociocultural context and how it influences perceptions of and support for their use during breastfeeding is lacking. To address this gap, we conducted 23 focus group discussions separately with pregnant and breastfeeding women, male partners and grandmothers (N = 196) and 36 in-depth interviews with key informants in Malawi, South Africa, Uganda and Zimbabwe. We analysed the data using a framework analysis method. Overall, breastfeeding was the norm, and participants described the transference of health (e.g., nutrition) and disease (e.g., HIV) to children through breast milk. Participants considered the early breastfeeding period as one of high HIV transmission risk for women. They explained that male partners tend to seek outside sexual partners during this period because women need time to recover from delivery, women focus their attention on the child, and some men are disgusted by breast milk. Participants highlighted concerns about the drugs in oral PrEP transferring to the child through breast milk, but fewer worried about the effects of the vaginal ring because the drug is localized. Women, grandmothers and key informants were supportive of women using these HIV prevention methods during breastfeeding, while male partners had mixed opinions. These findings can be used to tailor messages for promoting the use of PrEP or the vaginal ring during breastfeeding in sub-Saharan Africa. © 2020 The Authors. Article	2021	Flores Anato, Jorge Luis; Panagiotoglou, Dimitra; Greenwald, Zoë R; Trottier, Claire; Vaziri, Maliheh; Thomas, Réjean; Maheu-Giroux, Mathieu	Chemsex practices and pre-exposure prophylaxis (PrEP) trajectories among individuals consulting for PrEP at a large sexual health clinic in Montréal, Canada (2013-2020).	Drug and Alcohol Dependence	-	-	-	1879-0046	10.1016/j.drugalcdep.2021.108875	https://dx.doi.org/10.1016/j.drugalcdep.2021.108875	INTRODUCTION: Chemsex among gay, bisexual and other men who have sex with men (gbMSM) has raised public health concerns because of its association with sexual behaviours that can increase transmission of sexually transmitted infections, including HIV. Pre-exposure prophylaxis (PrEP) is highly effective at blocking HIV acquisition, addressing important prevention needs among individuals practicing chemsex. This study aims to improve our understanding of chemsex practices and PrEP trajectories of gbMSM and transgender women consulting for PrEP. METHODS: We used data from the PrEP cohort of Clinique médicale l'Actuel, a major sexual health clinic in Montréal. We describe the sociodemographic profile of clients consulting for PrEP, characterize chemsex and polysubstance use trends over time, and evaluate PrEP trajectories using Kaplan-Meier curves. RESULTS: Among 2923 clients who consulted for PrEP between 2013-2020 (2910 cisgender gbMSM, 6 transgender gbMSM, 7 transgender women), 24 % reported chemsex in the past year and 13 % reported polysubstance use. The most common chemsex substances were ecstasy (14 %), GHB (13 %), and cocaine (12 %). The proportion of clients reporting chemsex and polysubstance use decreased over time. In both the chemsex and no-chemsex group, 73 % of clients initiated PrEP. The median time to discontinuation was similar between the chemsex (6.5 months; 95 %CI: 5.3-7.2) and no-chemsex group (6.9 months; 95 %CI: 6.3-7.5). CONCLUSION: Chemsex is not a barrier to PrEP initiation or persistence. However, these results suggest a high prevalence of chemsex among gbMSM consulting for PrEP, highlighting the need for services addressing the intersection of sexual health and substance use for this population. Theses and Dissertations	2021	Flores, Jorge Luis	Chemsex, sexually transmitted infections, and pre-exposure prophylaxis among men who have sex with men: longitudinal analyses of sexual health clinic attendees in Montréal	-	-	-	McGill University	na	NA	-	Background: Chemsex - the use of illicit substances during sex to enhance pleasure - has become more prevalent in the last decade among gay, bisexual and other men who have sex with men (gbMSM). This has raised public health concerns because chemsex can be associated with transmission of HIV and other sexually transmitted infections (STIs). Pre-exposure prophylaxis (PrEP) is highly effective at preventing HIV and is recommended for gbMSM and transgender women at elevated risk of HIV acquisition. As PrEP can provide an important prevention tool for people who practice chemsex, it is important to better understand the role of chemsex in PrEP use and STI incidence.Objectives: Understand the evolving patterns of chemsex practices among gbMSM and transgender women consulting for PrEP in Montréal (Canada) and their impact on STI transmission among PrEP users.Methods: The (1) describing temporal trends in chemsex practices and their impact on PrEP trajectories, and (2) estimating the impact of chemsex on incidence of gonorrhea and chlamydia among PrEP users.Methods: The 3-Cities PrEP Cohort was established in 2012 at the Clinique médicale l'Actuel, a major sexual health clinic in Montréal, Canada. Participants are followed every 3 months for the collection of sociodemographic, behavioural, clinical and biological data. For this study, we used data collected between 2012 and 2019. We first described the sociodemographic and behavioural data, and quarterly follow-up behavioural and STI screening data. I first described the sociodemographic profile of clients who consulted for PrEP, characterized chemsex and polysubstance use trends over time, and evaluated PrEP trajectories. Then, for the second objective, I used survival analyses to estimate the effect of chemsex at baseline on incidence of gonorrhea and chlamydia, focusing on the 24 months following PrEP initiation. I also investigated the role of polysubstance use and potential effect modification by age, education, and income.Results: A total of 2,923 clients consulted for PrEP between 2013-2020 (2,910 cisgender gbMSM, 6 transgender gbMSM, 7 transgender women). Among these clients, 24% reported any chemsex and 13% reported polysubstance use in the past year. Ecstasy (14%), GHB (13%), and cocaine (12%) were the most commonly reported chemsex substances. Prevalence of chemsex and polysubstance use decreased over time. The proportion of clients initiating PrEP (75%) was similar between groups, and the median time to discontinuation was also similar (4.5 months (95% CI: 5.3- 7.2) in the chemsex group compared to 6.9 months (95% CI: 6.2-7.6) in the non-chemsex group). Chemsex was associated with a 1.5-fold increased incidence of gonorrhea and chlamydia (adjusted HR=1.50; 95% CI: 1.08-2.08). There was no incident HIV infection among clients on PrEP. When controlling for age, education, income, PrEP regimen, and year of baseline consultation, chemsex was linked to a 32% higher hazard of gonorrhea or chlamydia diagnosis (adjusted HR=1.32; 95% CI: 1.10- 1.57). This effect was stronger among clients reporting polysubstance use (adjusted HR=1.51; 95% CI: 1.21-1.89). The strength of the effect of chemsex on STI incidence varied by age, education, and income.Conclusions: One in four gbMSM consulting for PrEP at a large Canadian sexual health clinic reported chemsex in the past year. Chemsex, however, is not an obstacle to PrEP initiation or persistence. Among PrEP users, chemsex at baseline is linked to increased incidence of gonorrhea and chlamydia. Incidence was higher for people who report two or more chemsex substances. The high prevalence of chemsex practices and high STI incidence highlight the need for integrated services addressing unmet needs at the intersection of sexual health and substance use. The high STI incidence also stresses the importance of PrEP as an effective HIV prevention tool for this population	Chemsex; sexualized substance use; pre-exposure prophylaxis; gbMSM; Canada	English	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	-	-	Clinical

Article	2021	Fontenot H.B.; Krukowski D.; White B.P.; Marquez S.M.; Dominiczak J.; Psares C.; O'Creigh C.; Mayer K.H.	Condom use philosophy and behaviors among young men who have sex with men: Variations among HIV pre-exposure prophylaxis users and nonusers	Journal of the American Association of Nurse Practitioners	-	-	-	23270886	10.1097/JXX.0000000000000406	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111785Q&doi=10.1097%2fJXX.0000000000000406&partnerID=40&md5=71a013c0b4fb7aa446bd2e6dfbd3d	Background:In the United States, sexually transmitted infections, particularly HIV, occur at disproportionally high rates among young men who have sex with men (YMSM). Oral pre-exposure prophylaxis (PrEP) is a highly effective in reducing HIV acquisition. Reduction of condom use has been noted among adult populations of MSM using PrEP. However, little is known about PrEP and condom use among YMSM.PurposeOur objective was to understand condom attitudes/beliefs and behaviors among YMSM in the context of PrEP use and nonuse.Methodological orientationWe conducted qualitative interviews between May and November, 2017 in Boston, MA. ATYMSM were HIV negative by self-report. Participants sampled 2 youth who used PrEP and those who did not use PrEP. Data were analyzed using content analysis.SampleThe sample consisted of 31 YMSM aged 17-24 years (mean = 21.5 years).Conclusions:Young men who have sex with men provided rich descriptions of their condom-use philosophies and behaviors. Findings suggest that PrEP use may be associated with reduced condom use among YMSM. Providers should be aware of YMSM's condom philosophies and behaviors regardless of PrEP use with certain partner types, if low self-efficacy was reported, and when sex occurred during periods of substance use and/or intoxication.Implications for practiceThis study provides understanding of YMSM condom decision-making process in the context of PrEP use or nonuse. Findings are useful to inform development and testing of individually tailored interventions for YMSM based on their personal condom-use philosophies and behaviors to improve risk reduction decision making, use of condoms, and PrEP. © 2021 Lippincott Williams and Wilkins. Article	2021	Franco R.	"Seropedagogy" Teaching the Global History of HIV/AIDS	Radical History Review	-	-	-	1636543	10.1215/01636545-8841658	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131087833&doi=10.1215%2f01636545-8841658&partnerID=40&md5=d2508d26c1c05ba8f8e1375cfcfb0b02	Since the beginnings of the HIV/AIDS pandemic, pedagogy has been a crucial survival strategy, especially when government agencies failed to prevent mass deaths. However, contemporary sex education on HIV/AIDS—if taught to undergraduates before they arrive on campus—often does not account for the disproportionate effects of the pandemic on racial minorities and global South countries. In this teaching essay, the author shows how his course on the history of HIV/AIDS takes a global approach to highlight that the AIDS crisis is not over. Starting with historical developments in the United States, China, and elsewhere that sought to find a scapegoat for the pandemic, the course then turns to the global power of the pharmaceutical industry. It examines the marketing and lobbying strategies of companies such as Gilead, which saw the stigma of HIV/AIDS to transform impoverished global South countries into new markets for research and capital extraction. Finally, it also highlights how the AIDS crisis remains an ongoing struggle against health disparities in South Africa that prevent access to life-saving treatments and preventative drugs such as Truvada and Descovy for pre-exposure prophylaxis (PrEP). Using a range of primary sources, including AIDS activist literature, the author argues that the AIDS crisis is not over. It forces free radicals like bodies of the poor, women, and Black, Latinx, trans, and global South citizens as expendable in the fight against HIV/AIDS. © 2022 by MARHO: The Radical Historians' Organization, Inc.	global health; health care; HIV/AIDS; pharmaceuticals; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Qualitative

Article	2021	Fu, Yuansheng; Ashton, Akhila Aleena; Feng, Xiaoxiang; Wang, Ting; Zhang, Sichen; Ye, Dongqing; Fan, Yingzong	Willingness to use HIV pre-exposure prophylaxis and associated factors among men who have sex with men in Liaoluo, China.	AIDS Research and Therapy	-	-	-	1742-6405	10.1186/s12981-021-00374-8	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8332257/	BACKGROUND: HIV pre-exposure prophylaxis (PrEP) is a key component of HIV combination prevention strategies and has the potential to decrease the incidence of HIV in men who have sex with men (MSM). This study aimed to evaluate levels of PrEP acceptability and explore factors associated with willingness to use PrEP among MSM in Liaoluo, China. METHODS: Between November 2017 and May 2019, a cross-sectional survey was conducted among 829 MSM. The study participants were recruited through a respondent-driven sampling method. The participants' demographic and knowledge, sexual behaviors, drug use and HIV test history were collected. Multivariate logistic regression was performed to identify factors associated with willingness to use PrEP. RESULTS: A total of 829 MSM participated in the survey. The mean age was 28.5 ± 6.9 years, and the majority were unmarried (n = 615, 74.2%). In multivariate logistic regression, factors associated with a higher willingness to use PrEP included Zhuang or Han ethnic origin, recruitment through peer networks (vs. gay venues), history of a higher education level, previous HIV testing and oral sex with a man. Conversely, having casual sex in the past 6 months was associated with a lower willingness to use PrEP. CONCLUSIONS: MSM in Liaoluo reported a relatively low level of willingness to use PrEP. The factors associated with willingness to use PrEP were identified. Article	2021	Gaillard L.; Gonzalez-Argote T.; Philip S.; Josephs L.S.; Martell J.F.; Beaman L.J.	How come they don't talk about it in school? Identifying adolescent barriers to PrEP use	Health Education Research	-	-	-	2681153	10.1093/her/cyab030	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112178578&doi=10.1093%2fher%2fcyab030&partnerID=40&md5=61e4c81aeb0bd4f22bb5167b0fcce0f0	Although 21% of new human immunodeficiency virus (HIV) diagnoses in the United States are in youth aged 13-24 years, adolescent awareness and uptake of the HIV prevention medication pre-exposure prophylaxis (PrEP) are low. This study explores the attitudes and challenges that adolescents face when taking PrEP. Thirty interviews were conducted with adolescents (aged 15-17 years) who were prescribed same (same-sex/same-gender) PrEP in the Bronx, NY. Transcripts were coded inductively and deductively using thematic analysis. Most participants were unaware of PrEP, but nearly all were enthusiastic when informed about it; a majority believed that they would feel empowered when taking PrEP. Despite this high receptivity, multiple barriers were identified, particularly confidentiality from parents, low-perceived need of PrEP and concerns about daily adherence and side effects. Adolescents overall were enthusiastic about the availability of PrEP and felt it empowered them to have control over their health. HIRICs were considered trusted sources of confidential, accessible care, and we believe that they can be uniquely positioned to mitigate barriers to PrEP distribution in the future. © 2021 The Author(s) 2021. Article	2021	Gao, Fei; Gladden, David V; Hughes, James P; Donnell, Deborah J	Sample size calculation for active-arm trial with counterfactual incidence based on recency assay	Statistical Communications in Infectious Diseases	-	-	-	2194-6310	10.1515/scid-2020-0009	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8085857/	Objectives: The past decade has seen tremendous progress in the development of biomedical agents that are effective as pre-exposure prophylaxis (PrEP) for HIV prevention. To expand the choice of products and delivery methods, new medications and delivery methods are under development. Future trials of non-inferiority, given the high efficacy of ARV-based PrEP products as they become current or future standard of care, would require a large number of participants and long follow-up time that may not be feasible. This motivates the construction of a counterfactual estimate that approximates incidence for a randomized concurrent control group receiving no PrEP. Methods: We propose an approach that is to enroll a cohort of prospective PrEP users and augment screening for HIV with laboratory markers of recent infection. Statistical methods are developed to estimate counterfactual incidence among PrEP users by adjusting for misclassification of recency assay and dropout. Sample size calculations for non-inferiority trial of PrEP users are developed. We consider two hypothetical trials for one who have sex with men (MSM) and transgender women (TGW) from different regions and young women in sub-Saharan Africa. The calculated sample sizes are reasonable and yield desirable power in simulation studies. Conclusions: Future one-arm trials with counterfactual placebo incidence based on a recency assay can be conducted with reasonable total screening sample sizes and adequate power to determine treatment efficacy.	counterfactual placebo incidence; HIV prevention; pre-exposure prophylaxis; recency assay; sample size calculation	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Garrison L.E.; Habeeb J.E.	Pre-exposure Prophylaxis Uptake, Adherence, and Persistence: A Narrative Review of Interventions in the U.S.	American Journal of Preventive Medicine	-	-	-	7493797	10.1016/j.amepre.2021.04.036	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116507973&doi=10.1016%2fj.amepre.2021.04.036&partnerID=40&md5=e0303caaa0f29065431d72f26f6bb617	Since 2012, HIV pre-exposure prophylaxis (PrEP) has been available to prevent HIV transmission; yet, uptake, adherence, and persistence to PrEP have been suboptimal. This narrative review examines the latest interventions and programs to improve all 3 stages of PrEP adherence and reviews ongoing studies to promote effective PrEP use. From 2017 to 2020, a total of 20 studies analyzed different individual- and structural-level approaches to increase PrEP adherence, including behavior change interventions, technology-based interventions (e.g., short message service messages and mobile applications), and alternate delivery strategies (e.g., pharmacy-based PrEP, integration with other services, and home delivery). Most published interventions involved men who have sex with men, although 3 assessed women (2 transgender, 1 cisgender). Randomized, controlled data support 3 behavioral change interventions and 1 technology-based intervention. Alternate delivery strategies were promising, although more robust study designs are generally needed. In addition, data on the alignment of ongoing HIV risk and PrEP persistence (i.e., persontime-effective adherence) were limited. The authors also identified 20 ongoing studies that may provide additional data. Although the number of studies is small, there is a growing body of literature to support interventions to improve PrEP adherence and persistence. Several promising approaches may work well in combination and next steps need to be aligned with the introduction of long-acting pre-exposure prophylaxis formulations. Collectively, this body of work indicates considerable progress toward understanding the role PrEP adherence will play in Ending the HIV Epidemic in the U.S. But will be bolstered by the outcomes of ongoing trials. © 2021 American Journal of Preventive Medicine	anti human; immunodeficiency virus agents; long acting drug; anti human immunodeficiency virus agent	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2021	Gaskins M.; Sammons M.K.; Kutscha F.; Nast A.; Werner R.N.	Factors that motivate men who have sex with men in Berlin, Germany, to use or consider using HIV pre-exposure prophylaxis:A multi-methods analysis of data from a multicentre survey	PLOS One	-	-	-	19526203	10.1371/journal.pone.0260168	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120886307&doi=10.1371%2fjournal.pone.0260168&partnerID=40&md5=361e81aeab0e4f22bb5167b0fcce0f05	Background While our knowledge of what motivates men who have sex with men (MSM) to use HIV pre-exposure prophylaxis (PrEP) has grown in recent years, quantitative survey-based studies have not always been able to capture the full range of factors that play a role in the decision-making process. Our aim was to explore the factors that motivate MSM to use PrEP along a conceptual continuum of PrEP care. Methods In a multicentre survey examining knowledge and use of PrEP among MSM in Berlin, Germany, we additionally asked an open-ended question about motivations for using or considering PrEP. Data were collected from 10/2017-04/2018. One researcher developed a thematic framework deductively from the literature and another did so inductively from the free-text data, and a merged framework was used to code responses independently. We used Fisher's exact test to assess whether the frequency of motivations differed significantly between groups in considering PrEP. Results Of 875 questionnaires, 473 were returned and 228 contained a free-text response. Motivations in the following categories were reported: (1) Safety/protection against HIV (80.2% of participants, including general safety, additional protection to condoms), (2) Mental well-being and quality of life (23.7%, including reduced anxiety, better sex life), (3) Autonomy/sexual freedom (18.9% intent not to use condoms), (4) Expectations about sexuality (14.4%, including worry-free sex or more pleasurable sex, with explicit mention of sex or sexuality), (5) Normative perspectives (8.8%). The difference in frequencies of motivations between those using or considering PrEP was not statistically significant. Conclusions Safety and protection against HIV, particularly having additional protection if condoms fail, were the most common motivations for using or considering PrEP, followed by mental well-being and quality of life. Many respondents reported several motivations, and responses overall were diverse, indicating that PrEP can be meaningful to MSM in a variety of ways. Our findings suggest that PrEP can be a powerful tool to support the sexual health and well-being of multiple motivations and how these fit into the broader sexual and psychological health of MSM. Article	2021	Gaspar M.; Skalsson-Sperling S.; Aden B.D.; Brennan D.J.; Lachowsky N.J.; Cox J.; Moore D.; Hart T.A.; Grace D.	"You're Gay, It's Just What Happens": Sexual Minority Men Recounting Experiences of Unwanted Sex in the Era of MeToo	Journal of Sex Research	-	-	-	224499	10.1080/00224499.2021.1962236	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112305431&doi=10.1080%2f00224499.2021.1962236&partnerID=40&md5=6b1c0605ade6e7b538604b0f2774e2b6	Our grounded theory analysis derives from in-depth interviews conducted with 24 gay, bisexual, queer, and other men who have sex with men (MSM) living in Toronto, Canada, to understand their experiences of sexual coercion. Participants drew on discourse from the #MeToo movement to reconsider the ethics of past sexual experiences. The idea that gay or queer sex is inherently risky and unique HIV prevention challenges contributed to participants' difficulties in identifying sexual coercion and navigating consent. Participants' experiences were also shaped by gendered scripts of heteronormativity, hegemonic masculinity, and HIV prevention on the other. Biomedical advances in HIV prevention such as pre-exposure prophylaxis (PrEP) and undetectable viral load affected how some participants felt about sexual autonomy and safety. Participants held themselves responsible for needing to be more assertive within sexual encounters to avoid coercion. Many believed that unwanted sex is unavoidable among GBM. If "you're gay, it's just what happens." Targeted education aimed at GBM communities that incorporates insights on GBM sexual subcultures is necessary. This work must be situated within a broader understanding of how gender norms and hegemonic masculinity, racism, HIV status, and other power imbalances affect sexual decision-making, consent, pleasure, and sexual harm. © 2021 The Author(s). Article	2021	Goldberg, Lily; Mitchell, Kery M; Akey, Michel; Mbuagbaw, Anriamy; Bilhaxnis, Luc; Galdino, Fernand; Geraldo, Nassirou; Gomo-Muteteiwi, Ella; Gignoux, Karine; Aza-Gnandji, Marlène; Kouoss, Lion; Diallo, Mamadou; Kiki, René K; Buchabi, Moussa; Dramane, Kone; Lafrance, Christian; Alibalo, Diouss; Souleymane, Gagoua; Marie-Pierre, Zannou; Djènon M, Ginette; Flore, Sibok; Romain, Cianci; Fiona, Vickerman; Peter, Body; Marie-Claude	Mathematical Model Impact Analysis of a Real-Life Pre-exposure Prophylaxis and Treatment-As-Prevention Study Among Female Sex Workers in Cotonou, Benin.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002535	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7883681/	BACKGROUND: Daily pre-exposure prophylaxis (PrEP) and treatment-as-prevention (TasP) reduce HIV acquisition and transmission risk, respectively. A demonstration study (2015-2017) assessed TasP and PrEP feasibility among female sex workers (FSW) in Cotonou, Benin. SETTING: Cotonou, Benin. METHODS: We developed a compartmental HIV transmission model featuring PrEP and antiretroviral therapy (ART) among the high-risk (FSW and clients) and low-risk populations. Model parameters, calibrated to historical epidemiological and demonstration study data, estimated lower PrEP uptake, adherence, and persistence compared with TasP. We estimated the population-level impact of the 2-year study and several 20-year intervention scenarios, varying coverage and adherence independently and together. We report HIV infections averted, PrEP and ART person-years, and number needed to treat (NNT) to avert 1 infection. RESULTS: The 2-year study (2017 coverage: 8% PrEP and 83% ART) prevented an estimated 8% (95% UI 6-12) and 6% (3-10) infections among FSW over 2 and 20 years, respectively, compared with 7% (5-11) and 5% (2-9) overall. The PrEP and TasP arms prevented 0.4% (0.2-0.8) and 4.6% (2.2-8.7) infections overall over 20 years, respectively. Twenty-year PrEP and TasP scale-ups (2033 coverage: 47% PrEP and 88% ART) prevented 21% (17-26) and 17% (10-27) infections among FSW, respectively, and 5% (3-10) and 17% (10-27) overall. Compared with TasP scale-up alone, PrEP and TasP combined scale-up prevented 1.9× and 2.2× more infections among FSW and overall, respectively. CONCLUSIONS: The demonstration study impact was modest, and mostly from TasP. Increasing PrEP adherence and coverage improves impact substantially among FSW, but little overall. We recommend TasP in prevention packages. Article	2021	George W.H.; Bleymey J.A.; Stappenbeck C.A.; Davis K.C.	The Role of Alcohol-Related Behavioral Risk in the Design of HIV Prevention Interventions in the Era of Antiretrovirals: Alcohol Challenge Studies and Research Agenda	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03331-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110296226&doi=10.1007%2fs10461-021-03331-4&partnerID=40&md5=f63c5e9c916cb1d04154c68e2f6f45f	HIV/AIDS remains a significant health threat and alcohol is a robust contributing factor. After 25 years of alcohol challenge studies investigating alcohol-related behavioral risk (ARBR), much has been learned delineating how drinking influences sexual transmission. We examine this research and consider its relevance for interventions in the era of antiretrovirals. We consider prototypic alcohol challenge methods, including their strengths and limitations, and review findings from studies using these methods. We then consider how this research can inform the development of HIV prevention interventions. (1) modify existing interventions by cultivating psychobehavioral content related to alcohol expectancies, alcohol myopia, sexual arousal, risk perception, sexual edification, and condom use resistance; and (c) innovate new interventions through Science of Behavior Change approaches and repurposing ARBR paradigms. Finally, we suggest research directions concluding that until HIV incidence diminishes significantly, psychosocial interventions addressing the nexus of alcohol use, sexual transmission, and adherence to biomedical protocols will be an important priority. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Gillespie D.; Knapper C.; Hughes D.; Cosgrove, C; Wood F.; De Brain M.; Ma R.; Jones A.T.; Williams A.; Hood K.	Early impact of COVID-19 social distancing measures on reported sexual behaviour of HIV pre-exposure prophylaxis users in Wales	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2020-054598	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099891016&doi=10.1136%2fsextrans-2020-054598&partnerID=40&md5=db37166435f80ca4b6e2c7c1dafec439	Objectives To describe the early impact of COVID-19 and associated control measures on the sexual behaviour of pre-exposure prophylaxis (PrEP) users in Wales. Methods Data were obtained from an ecological momentary assessment study of PrEP use and sexual behaviour. Participants were individuals accessing PrEP through the National Health Service (NHS) sexual health clinics across four health boards in Wales. Weekly data documenting condomless sex in the preceding week were analysed between 03/02/2020 and 10/05/2020. The introduction of social distancing measures and changes to sexual health services in Wales were used to define 'pre-COVID-19' and 'COVID-19' periods. Multivariable logistic regression was used to estimate the impact of COVID-19 on condomless sex. Free-text responses were analysed to explore different circumstances by relationship status and sexual health clinic. Results Data were available from 241 participants and 4 sexual health clinics (59% of the total PrEP population). Of these, 70 (29%) reported at least one condomless sex act in the period prior to the introduction of social distancing measures and 20% reported condomless sex after (OR=0.6, 95% CI 0.07 to 4.57, p=0.001). There was some evidence to suggest that this association was moderated by relationship status (OR for single participants=0.09, 95% CI 0.06 to 0.22; OR for not single participants=0.46, 95% CI 0.16 to 1.25). Conclusions The introduction of social distancing measures and changes to PrEP services across Wales was associated with a marked reduction in reported instances of condomless sexual intercourse among respondents, with a larger reduction in those who were single compared with those who were not. The long-term impact of COVID-19 and associated control measures on this population's physical and mental health and well-being requires close examination. © 2021 Author(s) (or their employer(s)). Article	2021	Giovenco D.; Gill K.; Fynn L.; Dayrat M.; O'Rourke S.; van der Straten A.; Morton J.F.; Celum C.L.; Bekker L.-G.	Experiences of oral pre-exposure prophylaxis (PrEP) use disclosure among South African adolescent girls and young women and its perceived impact on adherence	PLOS One	-	-	-	19526203	10.1371/journal.pone.0248307	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102650950&doi=10.1371%2fjournal.pone.0248307&partnerID=40&md5=97475c2ad057f3d0d4158d6ea7fea9f0	Introduction There is limited understanding of how social dynamics impact pre-exposure prophylaxis (PrEP) adherence among adolescent girls and young women (AGYW) in generalized HIV-epidemic settings. We examined experiences of oral PrEP use disclosure to various social groups with the goal of identifying supportive relationships that can be leveraged to promote adherence. Methods We used qualitative methods to explore experiences disclosing PrEP use and the perceived impact of disclosure on adherence among 22 South African AGYW (16-25 years) taking daily oral PrEP. Serial in-depth interviews (IDIs) were conducted 1-, 3-, and 12-months post-PrEP initiation. Respondents also self-reported their disclosures separately for various social groups and adherence was assessed using intracellular tenofovir-diphosphate levels. Results Qualitative respondents had a median age of 20.5 years and reported disclosing their PrEP use to friends (n = 30 disclosures), sexual partners (n = 24 disclosures) and parents (n = 19 disclosures). IDI data revealed that parents and partners provided the most support to respondents and a lack of support from these groups was most often perceived as a barrier to PrEP use. Peers were frequently told about PrEP use but rarely provided support. Conversely, disclosure to a few peers who were also PrEP users or household members was notably meaningful for AGYW (both positively and negatively). Respondents reported leveraging supportive relationships for pill reminders. For respondents who perceived a household member would be unsupportive, however, non-disclosure was less feasible and PrEP use was often stigmatized. To avoid stigma, several respondents hid or discontinued PrEP. Conclusions While supportive relationships may facilitate PrEP use, disclosure can also lead to stigma. Counselors should support AGYW in disclosing to key people in their social networks and provide AGYW with materials that lend credibility to explanations of PrEP. Community education is necessary to alleviate PrEP-related stigma and facilitate disclosure. Copyright: © 2021 Giovenco et al. Article	2021	Giwenco D.; Murang K.E.; Horwitz C.; Bielo K.B.; Liu A.Y.; Horvath K.J.; Golshefi J.M.; Rebuck C.J.; Highrow-Wedman L.	Adopting technology-based HIV prevention and care interventions for youth: Lessons learned across five U.S. Adolescent Trials Network studies	mHealth	-	-	-	23069740	10.21037/mhealth-20-43	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107637994&doi=10.21037%2fmhealth-20-43&partnerID=40&md5=6eee7fc8b876e3c5e024265e2b2ca1fa	Background: U.S. sexual and gender minority youth experience individual, interpersonal, and structural-level barriers to HIV prevention and care. Innovative, youth-driven approaches to mobile and electronic interventions that support use of new biomedical prevention, testing, and treatment options may address these barriers. Adapting evidence-based interventions for youth must balance core intervention components with responsiveness to the distinct needs of end-users. Methods: The UNC/Emory Center for Innovative Technology (iTech) adapts and evaluates technology-based interventions for youth living with or at risk for HIV. We leveraged formative research with youth, program and individual stability resources (PAIRS) for safer choices (a skills-based, risk-reduction intervention for HIV-positive youth), and motivational interviewing to develop myPEEPS mobile, a gay, and men seeking-men-centered website for increasing viral suppression, with the aim of informing best practices for technology-based interventions. Each study presented points of adaptation and core components. We synthesized findings from these studies to identify strategies of their adaptation. Results: Findings from these studies with racially/ethnically diverse youth across seven geographically diverse sites provided feedback during the intervention adaptation process. We found high interest in and acceptability of all five intervention prototypes. Cross-study themes included: (I) Desire for multiple privacy protections (e.g., password, fingerprint) to keep HIV status, sexual identity, and sexual behavior confidential. (II) Strong but varied preferences for the look and feel of platforms. Imagery should be discrete but representative. Participants valued customizable platforms and positive themes, motivational language, and humor. Youth wanted information presented using multiple modalities (e.g., text, video, image) to increase engagement. (III) Youth preferred engagement features and functions consistent with familiar platforms (e.g., Snapchat, Instagram). Gamification features that resulted in tangible versus virtual rewards were preferred to increase engagement. Intervention messaging functions were perceived as useful; customization was desired as a way to control frequency, mode (e.g., SMS, in-app message, push notification), and content. (IV) Youth voiced varied preferences for platform content including: featuring young-role models from the lesbian, gay, bisexual, transgender, queer (LGBTQ) community; incorporating interactive components; and providing content that was relevant, accurate, and timely. Conclusions: Findings from these studies underscore the importance of including youth in the co-creation of youth's evaluations of these mHealth interventions; divergence was most commonly found in preferred content versus features and functions. Identifying broadly accepted aspects of mHealth interventions for youth supports the feasibility of adaptation (versus de novo creation) and should guide the focus of future formative research phases. Continued research is needed to better understand how to balance usability	Adolescent; HIV; Intervention; MHealth; Youth	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

Theses and Dissertations	2021	Giovenco, Danielle Elaine; Pettifor, Audrey	Social and Behavioral Predictors of Adherence to Oral Antiretroviral Pre-Exposure Prophylaxis for HIV Prevention Among Adolescent Girls and Young Women in Southern Africa	-	-	University of North Carolina	-	NA	NA	https://www.proquest.com/dissertations-theses/social-behavioral-predictors-adherence-oral/docview/2570551093/se-2?accountid=8113	Adolescent girls and young women (AGYW) in sub-Saharan Africa represent a key population at risk for acquiring HIV infection. Oral antiretroviral pre-exposure prophylaxis, or PrEP, is an efficacious biomedical HIV prevention strategy that holds enormous potential to reduce HIV acquisition in key populations if taken consistently. Research is needed to identify barriers and facilitators to PrEP adherence among AGYW to inform implementation efforts. The aims of this dissertation were to examine how disclosure of PrEP use and intimate partner violence (IPV) affect adherence to daily oral PrEP among AGYW in southern Africa. We used data from two prospective cohort studies evaluating PrEP uptake and adherence among sexually-active HIV-uninfected women aged 16-25 years. Participants who initiated once daily oral PrEP were included in analyses. We first conducted descriptive analysis of PrEP use disclosure and IPV exposure variables. Participants self-reported disclosure of their PrEP use during follow-up separately for parents, partners, and peers. IPV included any self-reported physical, emotional, sexual, or psychological partner violence. Then, for both aims, we estimated the relative prevalence of high PrEP adherence at months 3 and 6, defined as TFV-DP ≥700 fmol/punch at a given visit, using univariate and multivariable (adjusted) modified Poisson or log-binomial regression. Effects were estimated in the full study population and within younger and older AGYW age group strata (dichotomized at the sample median). We did not observe a strong effect of disclosure or IPV on adherence overall; however, the effect of disclosure to a parent and IPV were significantly modified by age (α=.15). For the parent disclosure-adherence relationship, there was evidence of effect modification by age at month 6 (p=.062): among younger AGYW (≤18 years), those who disclosed to a parent were 6.8 times as likely to have high adherence at month 6 than those who did not (95% CI 1.02, 45.56); among older AGYW (>18 years), there was no significant effect of disclosure to a parent (aPR=0.69, 95% CI 0.17, 2.90). For the IPV-adherence relationship, there was evidence of effect modification by age at month 3 (p<.001): among younger AGYW (<21 years), those who reported IPV were less than half as likely to have high PrEP adherence (aPR=0.43, 95% CI 0.22, 0.86); among older AGYW (≥21 years), those who reported IPV were more than twice as likely to have high PrEP adherence (aPR=2.21, 95% CI 1.34, 3.66). There was also evidence of effect modification by age for the IPV-adherence relationship at month 6 (p=.128), and effect estimates within each age stratum were consistent in direction with month-3 results.Findings from our investigation of disclosure and PrEP adherence suggest that parents may play an important role in facilitating PrEP use among younger AGYW, and more work is needed to develop strategies for engaging parents in their child's PrEP use. Further, adherence support programs for AGYW should find ways that peers and partners can help motivate effective PrEP use. Findings from our investigation of IPV and PrEP adherence suggest that adherence programs may be especially necessary to support younger AGYW who have experienced violence from a partner previously or are currently in a violent partnership. Further, insight into the indirect effects of IPV among older AGYW may inform efforts aimed at optimizing adherence among younger AGYW. Alternative PrEP formulations may provide benefits for AGYW who have trouble adhering to a daily oral PrEP regimen. Lastly, findings from both aims suggest that the impact of social and behavioral factors on PrEP adherence is likely to vary between younger and older AGYW. Future research should consider the transitional nature of the adolescent developmental stage when designing interventions for this group. Article	2021	Giovenco, Danielle; Kuo, Caroline; Underhill, Kristen; Hoare, Jacqueline; Operario, Don	Adolescent-Centered HIV Prevention: Perspectives on Acceptability of Oral Antiretroviral Pre-exposure Prophylaxis for Adolescents in a Global Priority Setting.	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-021-02052-2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8744480	With oral antiretroviral pre-exposure prophylaxis (PrEP) rollout expanding to include adolescents in South Africa, research is needed to better understand perceptions of PrEP acceptability among adolescents and clinical service providers. We conducted an exploratory mixed-methods study among 57 adolescents, 16-17 years of age, living with and without HIV, and 25 clinical service providers in Cape Town, South Africa from 2015 to 2016. Cross-sectional survey and semi-structured qualitative interview data were used to explore (1) willingness to use PrEP and support partner PrEP use among adolescents living with and without HIV, (2) willingness to prescribe or support prescription of PrEP among service providers, and (3) perceptions of barriers and facilitators to PrEP implementation and interpretations of PrEP efficacy messaging for adolescent HIV prevention among all participants. Acceptability of PrEP among participants was high. Support for PrEP uptake was linked to messages that positively framed PrEP's protection potential (i.e., success- versus failure-framed messaging) among both adolescents and providers. Adolescents without HIV endorsed high willingness to use PrEP and adolescents living with HIV endorsed high support for partner PrEP use. However, both groups noted that potential side effects, stigma, and PrEP's partial efficacy may hinder uptake. Clinical service providers endorsed PrEP for sexually active adolescents and shared stigma and efficacy concerns. Further, service providers expressed desire for adolescent-tailored training and integration of PrEP delivery into primary care and family planning services. Efforts to educate adolescents and service providers about PrEP should consider how message framing may influence acceptability. Community PrEP education and adolescent-friendly delivery should be prioritized to alleviate predicted PrEP stigma and facilitate uptake. Article	2021	Girometti, Nicolò; Delpech, Valerie; McCormack, Sheena; Khawam, Jameel; Nash, Sophie; Ogaz, Dana; Mohammed, Hamish; Gedela, Keerti; Nugent, Diarmuid; Patel, Sheel; Suchak, Tara; Tittle, Victoria; McOwan, Alan; Whitlock, Gary	The success of HIV combination prevention: The Dean Street model.	HIV Medicine	-	-	-	1468-1293	10.1111/hiv.13149	https://dx.doi.org/10.1111/hiv.13149	The 56 Dean Street combination prevention model, a strong engagement with the LGBTQI community and flexible services adapted to users' changing needs led to an 80% drop in HIV diagnoses in gay, bisexual and other men who have sex with men (GBMSM) from 2015 to 2017. We describe the service changes at 56 Dean Street since 2012 which resulted in an increase in the frequency of HIV testing, the introduction of pre-exposure prophylaxis, earlier HIV diagnosis and a shorter time to viral suppression in those living with HIV. This model could be adapted to deliver similar results in those settings of high HIV prevalence among GBMSM and where access to technological innovation in healthcare and engagement with the community can be achieved. Article	2021	Glidden, David V; Das, Moupali; Dunn, David T; Ebrahimi, Ramin; Zhao, Yongwu; Stirrup, Oliver T; Baeten, Jared M; Anderson, Peter L	Using the adherence-efficacy relationship of emtricitabine and tenofovir disoproxil fumarate to calculate background hiv incidence: a secondary analysis of a randomized, controlled trial	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25744	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106724073&doi=10.1002%2fjia2.25744&partnerID=40&md5=79ecd38047b043f3b0fd423ebb5c3f3c	Introduction: Randomized trials of new agents for HIV pre-exposure prophylaxis (PrEP) compare against emtricitabine and tenofovir disoproxil fumarate (F/TDF), without a placebo group. We used the well-characterized adherence-efficacy relationship for F/TDF to back-calculate the (non-PrEP) counterfactual background HIV incidence (bHIV) in a randomized trial of a novel PrEP agent and estimate comparative efficacy (to counterfactual bHIV). Methods: The DISCOVER trial (ClinicalTrials.gov: NCT02842086) randomized 5387 men who have sex with men (MSM) and transgender women who have sex with men and demonstrated non-inferiority of emtricitabine and tenofovir alafenamide (F/TAF) to F/TDF (HIV incidence rate ratio IRR 0·47, 95% CI: 0·19 to 1.15). Tenofovir diphosphate (TFV-DP) levels in dried blood spots (DBS) were assessed for all diagnosed with HIV and in a random 10% of the cohort. We used a Bayesian model with a diffuse prior distribution, derived from established data relating tenofovir diphosphate levels to HIV prevention efficacy. This prior, combined with the F/TDF seroconversion rate and tenofovir diphosphate levels in DISCOVER, yielded Bayesian inferences on the counterfactual bHIV. Results: There were six versus 11 postbaseline HIV infections (0.14 vs. 0.25/100 person-years PY) on F/TAF and F/TDF respectively. Of the 11 on F/TDF, 10 had low, none had medium and one had high tenofovir diphosphate levels; among HIV-negative controls, 5% of the person-time years had low, 9% had medium and 86% had high TFV-DP levels. A non-informative prior distribution for counterfactual bHIV, combined with the prior for TFV-DP level-efficacy relationship, yielded a posterior counterfactual bHIV of 3·4 infections/100 PY (0.80 Bayesian credible interval CrI 1·9 to 5·9), which suggests a median HIV efficacy of 96% (0.95 CrI 88% to 99%) for F/TAF and 93% (0.95 CrI 87% to 96%) for F/TDF compared to bHIV. Conclusions: Based on the established connection of drug concentrations to PrEP prevention efficacy, a Bayesian framework can be used to estimate a synthetic non-PrEP control group in randomized, active-controlled PrEP trials that include a F/TDF-comparator group. © 2021 The Authors. Article	2021	Goldwirt, Lauriane; Bauer, Rebecca; Liegeon, Geoffroy; Charreau, Isabelle; Delaugerre, Constance; Cotte, Laurent; Pialou, Gilles; Cua, Eric; Laghzal, Aïcha; Buschman, Lane; Anderson, Peter L; Mourah, Samia; Meyer, Laurence; Molina, Jean-Michel	Estimated pill intake with on-demand PrEP with oral TDF/FTC using TFV-DP concentration in dried blood spots in the ANRS IPERGAY trial.	Journal of Antimicrobial Chemotherapy	-	-	-	1460-2091	10.1093/jac/dkab253	https://dx.doi.org/10.1093/jac/dkab253	BACKGROUND: Tenofovir diphosphate (TFV-DP) concentration in dried blood spots (DBSs) is a reliable pharmacokinetics biomarker of adherence to tenofovir disoproxil fumarate (TDF). We aimed to use DBSs to estimate pill intake among participants using on-demand pre-exposure prophylaxis (PrEP) and to identify predictive factors associated with higher TFV-DP concentrations. METHODS: DBSs were collected at the last study visit of the open-label phase of the ANRS IPERGAY study, assessing on-demand oral TDF/emtricitabine for PrEP among MSM and transgender female participants. We quantified TFV-DP in DBSs centrally. We assessed correlation between pill count and TFV-DP concentration by Spearman correlation and explored associations between participant demographics, sexual behaviour and PrEP use during sexual intercourse (SI) with TFV-DP concentrations by univariate and multivariate logistic regression models. RESULTS: The median age of the 245 participants included in this study was 40 years, with a median body weight of 73 kg. Median (IQR) TFV-DP concentration reached 517 (128-868) fmol/punch, corresponding to an estimated intake of 8-12 tablets per month (2-3 doses per week). Only 39% of participants had a TFV-DP concentration above 700 fmol/punch. TFV-DP concentrations were moderately correlated with pill count (r: 0.59; Pâ<â0.001). In multivariate analysis, only systematic use of PrEP during SI and more frequent episodes of SI in the past 4 weeks were significantly associated with higher TFV-DP levels OR (95% CI): 11.30 (3.62-35.33) and 1.46 (1.19-1.79), respectively; Pâ<â0.001. CONCLUSIONS: Among participants using on-demand PrEP, estimated pill intake reached 8-12 tablets per month and was correlated with frequency and systematic use of PrEP for SI. Article	2021	Goodreau S.M.; Maloney K.M.; Sanchez T.H.; Morris M.; Janulis P.; Jenness S.M.	A Behavioral Cascade of HIV Seroadaptation Among US Men Who Have Sex with Men in the Era of PrEP and U = U	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03266-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112370136&doi=10.1007%2fs10461-021-03266-0&partnerID=40&md5=ac7bd08022fdaee000c903b6b0aa590d	Seroadaptive behaviors help reduce HIV risk for some men who have sex with men (MSM), and have been well documented across MSM populations. Advancements in biomedical prevention have changed the contexts in which seroadaptive behaviors occur. We thus sought to estimate and compare the prevalence of four stages of the "seroadaptive cascade" by PrEP use in the recent era: knowledge of own serostatus, knowledge of partner serostatus; serosorting (matching by status), and condomless anal intercourse. Serosorting overall appeared to remain common, especially with casual and one-time partners. Although PrEP use did not impact status discussion, it did impact serosorting and the likelihood of having condomless anal intercourse. For respondents not diagnosed with HIV and not on PrEP, condomless anal intercourse occurred in just over half of relationships with HIV-positive partners who were not on treatment. Biomedical prevention has intertwined with rather than supplanted seroadaptive behaviors, while contexts involving neither persist. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Govender E.M.	Tailoring Communication to Increase the Promotion of Oral PrEP: A Culture-Centred Approach	Communicatio	-	-	-	2500167	10.1080/02500167.2021.1894195	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107597962&doi=10.1080%2f02500167.2021.1894195&partnerID=40&md5=df4697a18b0a04aeb44d905f22e7ef82	In Sub-Saharan Africa, human immunodeficiency virus (HIV) incidence rates remain disproportionately high among adolescent girls and young women (AGYW), who are five to seven times more likely to contract HIV than their male peers. Following the 2015 World Health Organization (WHO) Guideline on When to Start Antiretroviral Therapy and on Pre-Exposure Prophylaxis (PrEP) for HIV, the South African Department of Health (DoH) released the National Policy on HIV PrEP and Test and Treat (T&T) in June 2016. At the time of writing, several demonstration projects were underway to assess the feasibility of oral PrEP for AGYW in South Africa, with extensive access for sex workers and limited access for AGYW. It is within this context that the article explores the current perceptions of oral PrEP utilising the data from two previous studies conducted in three high HIV burden districts in KwaZulu-Natal (KZN), South Africa. Through an analysis of the current perceptions of oral PrEP, the article prioritises the cultural communication imperative to promote inclusivity and acceptability of biomedical innovations. The article argues that communication about oral PrEP is embedded in cultural discourses that must be discussed, critiqued and incorporated into a new framework for combination HIV prevention. © 2021 Unisa Press.	adolescent girls and young women; culture-centred approach; human immunodeficiency virus communication; pre-exposure prophylaxis; prevention strategies; tailored communication	English	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Review
Article	2021	Grammatico M.A.; Moll A.P.; Choi K.; Springer S.A.; Shenoi S.V.	Feasibility of a community-based delivery model for HIV pre-exposure prophylaxis among bar patrons in rural South Africa	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25848	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119983656&doi=10.1002%2fjia2.25848&partnerID=40&md5=6a2661ae21372344e6e3c002fdc397fb	Introduction: South Africa, home to the world's largest HIV epidemic, has made great strides in improving access to HIV services, but specific groups, particularly young men, remain difficult to engage in the HIV care cascade. Alcohol use disorder, prevalent in South Africa, further complicates engagement. Congregate settings where alcohol is served, known as shebeens, are an ideal place to engage young people for HIV testing, treatment and prevention, including pre-exposure prophylaxis (PrEP). Here, we characterize the uptake of PrEP in shebeen patrons and explore the effect of alcohol consumption on PrEP uptake by piloting a community-based delivery model. Methods: In the rural Kwazulu-Natal province (KZN) of South Africa, a field team made up of all men offered screenings outside of shebeens at 27 events over 6 months in 2020. Screenings included rapid HIV testing and Alcohol Use Disorder Identification Test (AUDIT). Participants who tested negative for HIV were offered PrEP as once daily oral tenofovir disoproxil fumarate/emtricitabine. Short-term retention was determined. Logistic regression was performed to identify predictors of PrEP uptake, including unadjusted and adjusted odds ratios (OR) with 95% confidence interval. Results: One hundred and sixty-two shebeen patrons were screened, and 136 (84%) were eligible for PrEP. Among those eligible, 37 (27%) completed clinical evaluation and initiated PrEP. Among PrEP initiators, 91.9% were men, median age was 26.0 years (interquartile range 21–31), 32.4% were employed, 18.9% had running water and 70.3% had AUDIT scores indicating hazardous drinking. Among 37 initiators, 25 (68%) were retained at 1 month, and 19 (51%) were retained at 4 months. Independent predictors of PrEP uptake among all bar patrons, and only men (108 screened and 34 initiators), included younger age (OR 0.92 0.88–0.97) and lifetime number of sexual partners (OR 1.07 1.02–1.13). Conclusions: Community-based PrEP delivery after engagement at shebeens in rural South Africa is a feasible and novel approach to reach a traditionally difficult-to-engage population, particularly young men. In this small sample, sexual risk behaviours predicted PrEP uptake. Hazardous drinking was not a barrier to PrEP initiation. © 2021 The Authors. Article	2021	Grant, Robert M; Pellegrini, Marion; Defechereux, Patricia A; Anderson, Peter L; Yu, Michelle; Glidden, David V; O'Neal, Joshua; Yager, Jenna; Bhasin, Shalender; Sevelius, Jae; Deutsch, Madeline B	Sex Hormone Therapy and Tenofovir Diphosphate Concentration in Dried Blood Spots: Primary Results of the Interactions Between Antiretrovirals And Transgender Hormones Study	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciaa1160	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118283545&doi=10.1093%2fcid%2fciaa1160&partnerID=40&md5=fa03d73a320ff86e61c9a939949533	Background. Sex hormone and preexposure prophylaxis (PrEP) drug interactions among transgender women (TGW), transgender men (TGM), and cisgender men (CGM) are not fully understood. Methods. TGM and TGW on at least 6 months of stable sex hormone therapy containing testosterone or estradiol (respectively) were enrolled in a 4-week study of directly observed dosing of daily oral coformulated emtricitabine and tenofovir disoproxil fumarate (FTC/TDF). TFV-DP in dried blood spots and sex hormones in serum were measured at weekly intervals. TFV-DP was compared with 2- and 4-week samples from Directly Observed Therapy Dried Blood Spots (DOT-DBS) Study (NCT02022657). Results. From May 2017 to June 2018, 24 TGM and 24 TGW were enrolled. Testosterone (total and free) and estradiol concentrations were comparable before and after 4 weeks of PrEP use in TGM and TGW, respectively. Historical controls included 17 cisgender women (CGW) and 15 CGM. TFV-DP concentrations at week 4 were comparable between TGW and CGM (mean difference, −6%; 95% confidence interval CI, −21% to 12%; P = .47), comparable between TGW and CGM (mean difference, −12%; 95% CI, −27% to 7%; P = .21) and were lower among TGM compared with CGW (mean difference, −23%; 95% CI, −36% to −7%; P = .007). All persons in all groups were projected to reach the TFV-DP threshold that has been associated with high protection from human immunodeficiency virus. Conclusions. CGM, TGM, and TGW had comparable TFV-DP concentrations in dried blood spots after 4 weeks of directly observed daily FTC/TDF PrEP use. Serum hormone concentrations were not affected by FTC/TDF PrEP use. © The Author(s) 2020. Published by Oxford University Press for the Infectious Diseases Society of America. All rights reserved. Article	2021	Gras, J; Charreau, I; Minier, M; Carette, D; Gabassi, A; Foubert, V; Chaix, ML; Meyer, L; Molina, JM; Delaugerre, C	Epidemiology and risk factors for HHV8 infection among men who have sex with men in the ANRS IPERGAY PrEP trial	HIV Medicine	-	-	-	NA	10.1111/hiv.13183	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02371029/full	Purpose: To assess the epidemiology and baseline characteristics associated with HHV8 infection among MSM in the ANRS IPERGAY Pre-exposure prophylaxis (PrEP) trial. Method: In the IPERGAY trial, HIV-negative male at high-risk for HIV infection were followed between February 2012 and June 2016. Characteristics of participants were recorded at enrolment. During follow-up, sera and oral & anal swabs were collected at day 0, M1, M2 and then every 2 months. An indirect immunofluorescence assay was used for the detection of HHV8 antibodies against latent nuclear antigens using the BCP-1 cell line (1: 50 serum dilution). For patients who seroconverted during follow-up, HHV8 DNA detection was performed on available swabs using in-house qPCR. Baseline characteristics associated with HHV8 infection were determined using linear logistic regression. Results: 417 participants with an available serum at day 0 were included. Prevalence of HHV8 infection at inclusion was 24% (100/417; 95%CI: 20.0-28.4). Baseline characteristics associated with HHV-8 seropositivity at inclusion were an older age, a high number of sexual partners in prior 2 months, chemsex during last sexual intercourse, and poppers consumption in prior 12 months (Table 1). Among the 386 participants with available data at last trial visit, 310 were seronegative at day 0 and followed for a median duration of 26 months (IQR, 18-36). 18/300 seroconverted during the study (incidence rate 2.65/100 person-years of follow-up, 95%CI: 1.57-4.18). Among them, 8/18 had intermittent detectable HHV8 DNA in oral and/or anal swabs (median viral load 2986 copies/ ml, IQR:1620-17226); HHV8 DNA positivity preceded antibody detection in 5/8. No baseline characteristic was associated with HHV8 seroconversion during follow-up. Conclusions: HHV8 infection prevalence is high among HIV-negative MSM on PrEP, and associated with older age, a high number of sexual partners, the practice of chemsex and poppers consumption. Intermittent HHV8 oral and anal shedding may facilitate sexual transmission in this population.	*Human herpesvirus 8; *men who have sex with men; *pre-exposure prophylaxis; *risk factor; Age; Aged; Anal swab; Antibody detection; BCP-1 cell line; Conference abstract; Controlled study; Dilution; Follow up; Human; Human cell; Human immunodeficiency virus infection; Human tissue; Immunofluorescence; Major clinical study; Male; Nonhuman; Prevalence; Seroconversion; Sexual intercourse; Sexual transmission; Virus load	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Quantitative
Article	2021	Grau-Pujol, Berta; Camprubí-Ferrer, Daniel; Marti-Soler, Helena; Fernández-Pardos, Marc; Carreras-Abad, Clara; Andrés, Maria Velasco-de; Ferrer, Elisabet; Muelas-Fernandez, Magdalena; Jullien, Sophie; Barilaro, Giuseppe; Ajanovic, Sara; Vera, Isabel; Moreno, Laura; Gonzalez-Redondo, Eva; Cortes-Serra, Núria; Roldán, Montserrat; Arcos, Ana Artes-de; Mur, Isabel; Domingo, Pere; Garcia, Felipe; Guinovart, Caterina; Muñoz, Jose	Pre-exposure prophylaxis with hydroxychloroquine for COVID-19: a double-blind, placebo-controlled randomized clinical trial.	Trials	-	-	-	1745-6215	10.1186/s13063-021-05758-9	https://pubmed.ncbi.nlm.nih.gov/34781981/	BACKGROUND: Pre-exposure prophylaxis (PrEP) is a promising strategy to break COVID-19 transmission. Although hydroxychloroquine was evaluated for treatment and post-exposure prophylaxis, it is not evaluated for COVID-19 PrEP yet. The aim of this study was to evaluate the efficacy and safety of PrEP with hydroxychloroquine against placebo in healthcare workers at high risk of SARS-CoV-2 infection during an epidemic period. METHODS: We conducted a double-blind placebo-controlled randomized clinical trial in three hospitals in Barcelona, Spain. From 350 adult healthcare workers screened, we included 269 participants with no active or past SARS-CoV-2 infection (determined by a negative nasopharyngeal SARS-CoV-2 PCR and a negative serology against SARS-CoV-2). Participants allocated in the intervention arm (PrEP) received 400 mg of hydroxychloroquine daily for the first four consecutive days and subsequently, 400 mg weekly during the study period. Participants in the control group followed the same treatment schedule with placebo tablets. RESULTS: 52.8% (142/269) of participants were in the hydroxychloroquine arm and 47.2% (127/269) in the placebo arm. Given the national epidemic incidence decay, only one participant in each group was diagnosed with COVID-19. The trial was stopped due to futility and our study design was deemed underpowered to evaluate any benefit regarding PrEP efficacy. Both groups showed a similar proportion of participants experiencing at least one adverse event (AE) (p=0.548). No serious AEs were reported. Almost all AEs (96.4%, 106/110) were mild. Only mild gastrointestinal symptoms were significantly higher in the hydroxychloroquine arm compared to the placebo arm (27.4% (39/142) vs 15.7% (20/127), p=0.041). CONCLUSIONS: Although the efficacy of PrEP with hydroxychloroquine for preventing COVID-19 could not be evaluated, our study showed that PrEP with hydroxychloroquine at low doses is safe. Article	2021	Green, Kimberly Elizabeth; Nguyen, Long Hoang; Phan, Huong Thu Thi; Vu, Bao Ngoc; Tran, Minh Hung; Ngo, Huu Van; Tieu, Van Thi Thu; Van, Hung; Le, Thanh Minh; Do, Khang Quang; Nguyen, Phong Anh; Ngo, Trang Minh; Doan, Anh Hong; Bui, Diep Thi Ngoc; Nguyen, Trang Nguyen Nhu; Hang, Lan Thi Xuan; Tran, Tham Thi; Luong, Binh Quoc	Prepped for PrEP? Acceptability, continuation and adherence among men who have sex with men and transgender women enrolled as part of Vietnam's first pre-exposure prophylaxis program	Sexual Health	-	-	-	14485028	10.1071/SH20167	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101993315&doi=10.1071%2fSH20167&partnerID=40&md5=055b3fca63b3b28b025275721a38c101	Background: HIV prevalence among men who have sex with men (MSM) and transgender women (TGW) in Vietnam is high, whereas coverage of effective HIV prevention serVICes has been inadequate. Studies have measured MSM and TGW demand for pre-exposure prophylaxis (PrEP) serVICes, which led to the design of the first ever PrEP program in Vietnam, Prepped for PrEP (P4P). Methods: In March 2017, PrEP serVICes were offered in Ho Chi Minh City as part of the P4P demonstration project, enabling same-day enrolment in three key population (KP)-led clinics and four public clinics. P4P aimed to assess acceptability and feasibility of PrEP serVICes through calculating the rate of PrEP enrolment over time, and quarterly measures of continuation and adherence over an 18-month period. Results: A total of 1069 MSM and 62 TGW were enrolled in P4P. Average monthly PrEP enrolment among MSM increased five-fold from the first 3 months (March-June 2017) to the last 3 months of active enrolment (March-June 2018), whereas for TGW, no increased trend in PrEP enrolment per quarter was seen. Self-reported PrEP adherence was >90% at all time points among MSM, but varied from 11.1% to 88.9% among TGW. PrEP continuation was calculated at months 3, 6, 9, 12, 15 and 18. For MSM, it was 88.7% at month 3, 68.8% at month 12 and 46.6% at month 18, whereas for TGW, it was 87.1%, 54.8% and 52.8%, respectively. Multivariable regression identified that MSM with lower-Than-Average income (adjusted odds ratio (aOR) 2.38 (95% confidence interval (CI): 1.59-3.54), P = 0.000), aged >30 years (aOR 2.03 (95% CI: 1.30-3.40), P = 0.007) and with an increasing number of sex partners (aOR: 1.06 (1.01-1.11), P = 0.011) had greater odds of remaining on PrEP. For TGW, being aged >30 years was associated with continuing on PrEP (aOR 5.62 (95% CI: 1.05-29.9), P = 0.043). Conclusions: We found PrEP to be highly acceptable among MSM and moderately acceptable among TGW. Continuation rates were relatively high for the first roll-out of PrEP; however, those aged ≤30 years were much more likely to discontinue serVICes. Scaling-up PrEP through differentiated and community-led and engaged PrEP serVICe delivery will be key to effectively increase access and uptake over the next 5 years. © 2021 CSIRO. Article	2021	Grimshaw C.; Boyd L.; Smith M.; Estcourt C.S.; Metcalfe R.	Evaluation of an inner city HIV pre-exposure prophylaxis service tailored to the needs of people who inject drugs	HIV Medicine	-	-	-	14642662	10.1111/hiv.13181	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115879095&doi=10.1111%2fhiv.13181&partnerID=40&md5=690cc5874546ecb0db8675ee5597987f	Objectives: HIV prevention strategies including pre-exposure prophylaxis (PrEP) must reach all in need to achieve elimination of transmission by 2030. Mainstream provision may inadvertently exclude key populations. Incidence of HIV in people who inject drugs (PWID) in Glasgow, Scotland's largest city, is increasing, partly due to sexual transmission. Scotland provides publicly funded oral PrEP for individuals at sexual risk of HIV through sexual health services; however, uptake by PWID has been negligible. We developed a tailored outreach PrEP service based in the local homeless health centre. We used active case finding, flexibility of assessment location, supervised community daily dispensing and active follow-up to optimise uptake and adherence. We describe a two-year service evaluation. Methods: We reviewed the case records of all PWID identified by the outreach team as being at higher risk of sexual acquisition for whom PrEP was considered between November 2018 and November 2020. Evaluation focused on PrEP uptake, adherence and monitoring. We conducted a descriptive statistical analysis. Results: Of 41 PWID assessed as eligible, 32 (78.0%) commenced PrEP. The proportion of PrEP-covered days was 3320/3400 days (97.6%); 31/32 (96.9%) had regular HIV serology monitoring. The service was feasible to run, but it relied on outreach provision and liaison with other services. Discussion: Tailored PrEP services can reach PWID effectively. Uptake and adherence were high but the model was resource-intensive. Appropriately tailored PrEP delivery may be required to meet the needs of this and other key populations who experience barriers to accessing mainstream services. © 2021 British HIV Association	adherence; people who inject drugs; pre-exposure prophylaxis; service; uptake	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review
Article	2021	Grov C.; Westmoreland D.; Carneiro P.B.; Bauermeister J.A.; Carrico A.W.	Getting Clear About Rectal Douching Among Men Who Have Sex With Men	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-021-01933-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116038867&doi=10.1007%2fs10508-021-01933-w&partnerID=40&md5=64641879407594b2ed5a92d23d124ab5	Receptive anal sex is the primary means through which HIV is transmitted among men who have sex with men (MSM). Recently, researchers have begun investigating the role that rectal douching may play in amplifying risk for transmission. Yet, there is limited research on the frequency with which MSM douche, the products they use, and how this may vary across sociodemographic characteristics. A U.S. national sample of 4745 MSM completed an online survey that assessed their douching behavior, demographic characteristics, sexual behavior, and their anal sexual positioning (i.e., top, bottom, versatile). Nearly two-thirds (65.8%) had engaged in rectal douching in the last three months. Among those who douched, water was commonly reported (84.2%) and 20.1% reported using commercial enemas (e.g., Fleet), as well as water and soap (15.0%)—numbers exceed 100% as some participants reported more than one. Men who douched reported significantly more receptive and insertive condomless anal sex acts in the prior 3 months. One-in-ten men reported rectal bleeding after douching. Compared to HIV-negative participants who had not taken PrEP, participants had higher odds of reporting douching in the past 3 months if they were HIV-negative and currently on PrEP (AOR = 1.82), HIV-negative and previously used PrEP (AOR = 1.58), and HIV-positive (AOR = 1.83). Douching was common in this sample. Given that douching could amplify risk for HIV transmission, healthcare providers should discuss douching safety with their patients, with a focus on harm reduction (e.g., reduce risk of bleeding, as opposed to abstinence from douching). © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Article	2021	Grov C.; Westmoreland D.A.; D'Angelo A.B.; Pantalone D.W.	How Has HIV Pre-Exposure Prophylaxis (PrEP) Changed Sex? A Review of Research in a New Era of Bio-behavioral HIV Prevention	Journal of Sex Research	-	-	-	224499	10.1080/00224499.2021.1936440	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113085723&doi=10.1080%2f00224499.2021.1936440&partnerID=40&md5=c7ce2922ddf23866f8b76ce4efa51322	In 2012, the U.S. FDA approved the first drug for use as HIV Pre-Exposure Prophylaxis (PrEP), which is nearly 99% effective when taken as prescribed. Although the manifest function of PrEP is to prevent HIV infection in the event of exposure, the drug has also had a significant impact on various facets of sexuality. In this review, we focus on research that emerged in the near decade since PrEP's approval, with a specific focus on the ways in which different elements of sex and sexuality have been impacted by gay, bisexual, and other men who have sex with men (GBMSM), cisgender women, and transgender individuals. We highlight evidence showing how PrEP has enhanced sexual self-esteem, improved sexual pleasure, reduced sexual anxiety, and has increased sexual agency for those taking it. For many, PrEP also serves as a gateway to improve routine health and increase sexual health-care utilization. Additionally, we review the question of whether PrEP is associated with increased sexual risk taking (i.e. risk compensation), and note that, although some data are mixed, PrEP is not intended as an intervention to reduce condomless anal sex or STIs: it aims to prevent HIV. Finally, our review highlights that, although the volume of research on PrEP among GBMSM is robust, it is underdeveloped for cisgender women and transgender populations and insufficient for inclusion in such a review for cisgender heterosexual men was. PrEP research with these populations is an important direction for future research. Finally, from 2012 to 2019, a single PrEP formulation and delivery method was FDA approved (oral emtricitabine/tenofovir disoproxil fumarate). As additional drug formulations (e.g., emtricitabine/tenofovir alafenamide) and delivery methods (e.g., microbiocides, vaginal ring, injectable) come to market, it will be important to examine how these, too, impact the spectrum of sexuality. © 2021 The Society for the Scientific Study of Sexuality. Article	2021	Grov, Christian; Westmoreland, Drew A; D'Angelo, Alexa B; Johnson, Jeremiah; Nash, Denis; Daskalakis, Demetre C	Marketing of Tenofovir Disoproxil Fumarate (TDF) Lawsuits and Social Media Misinformation Campaigns' Impact on PrEP Uptake Among Gender and Sexual Minority Individuals	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-02977-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088839117&doi=10.1007%2fs10461-020-02977-0&partnerID=40&md5=60bc6523e619fe376526e6ba707094cb	There has been an influx of ads on social media seeking plaintiffs in lawsuits for harms/side-effects caused by tenofovir disoproxil fumarate/Emtricitabine (TDF/FTC, Truvada) for PrEP. Community groups and researchers have suggested these ads may be undermining efforts to disseminate PrEP to key populations. In October 2019, we began assessing the impact of injury lawsuit ads on social media platforms in an ongoing U.S. national cohort study of HIV-negative cis men, trans men, and trans women who have sex with men. Although assessments are ongoing, given the alarming nature of our findings, we report data collected as of March 2020 (n = 2078). Most (59.9%) said they had seen ads for TDF-related lawsuits on social media. Twenty-eight percent said they would probably or definitely not start PrEP and 22.1% said they would not stay on PrEP (were they on it) as a result of seeing these ads. Next, 38.2% agreed or strongly agreed that seeing these ads made them think that TDF/FTC for PrEP was not safe. Black, Latinx, and multiracial individuals were most likely to be negatively impacted by the ads including perceptions that these ads made them think PrEP is not safe. In contrast, past year experience taking PrEP was positively associated with intentions to start and/or stay on PrEP despite seeing the ads. Due to forthcoming affordable/generic options, TDF/FTC is projected to become the most scalable option for disseminating PrEP to key populations. Results suggest that ads for TDF lawsuits on social media are having a negative impact on individual PrEP decision-making. Our findings highlight the urgency for accurate and balanced messaging on the benefits and risks of PrEP, so that individuals can make informed choices about whether PrEP is right for them. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Here, we report trends in HIV incidence over 3 years in individuals at high risk who were prescribed PrEP in New South Wales (NSW), as well as adherence before the transition to subsidised PrEP. Methods: Expanded PrEP Implementation in Communities–New South Wales (EPIC-NSW) was a pragmatic, prospective, single-arm, implementation study of daily, oral PrEP in 31 sites (sexual health clinics, general practices, and a hospital) in NSW, Australia. Eligible participants were HIV-negative adults (aged ≥18 years) who were at high risk of HIV infection as defined in local PrEP guidelines. Participants were prescribed coformulated (once-daily, oral tablet) tenofovir disoproxil fumarate (300 mg) and emtricitabine (200 mg) as HIV PrEP and were followed up with HIV testing, sexually transmitted infection testing, and PrEP dispensing. Originally planned for 3700 participants followed for 1 year, the study was expanded so that all eligible participants in the state could obtain PrEP and extended until publicly subsidised PrEP became available in Australia. The primary outcome was new HIV infection among all participants who were dispensed PrEP at least once and had at least one follow-up HIV test result. Adherence was estimated by medication possession ratio (MPR), defined as the proportion of PrEP pills dispensed in 90 days, assuming daily dosing. This study is registered with ClinicalTrials.gov, NCT02870790. Findings: Between March 1, 2016, and April 30, 2018, we enrolled 9709 participants. 9596 participants were dispensed PrEP, of whom 9448 (98·3%) were gay or bisexual men. Participants were followed up until March 31, 2019, with at least one follow-up HIV test available in 9520 (99·2%) participants. Mean MPR declined from 0·93 to 0·64 from the first to the ninth quarter. There were 30 HIV seroconversions over 18 628 person-years, an incidence of 1·61 per 1000 person-years (95% CI 1·13–2·30). Being younger, living in a postcode with fewer gay men, reporting more risk behaviours at baseline, and having an MPR of less than 0·6 were each univariately associated with increased HIV incidence. In the final year of follow-up, when PrEP was mostly purchased rather than provided free by the study, HIV incidence remained low at 2·24 per 1000 person-years (1·46–3·44). Interpretation: HIV incidence remained low over up to 3 years of follow-up, including during a transition from study-provided to publicly subsidised PrEP. In a setting of affordable PrEP and associated health-care services, very low HIV incidence of 1 to 2 per 1000 person-years can be maintained in gay and bisexual men who were previously at high risk. Article	2021	Guiraud, Jennifer; Lounnas, Manon; Boissière, Anne; Le Roy, Chloé; Elguero, Eric; Banuls, Anne Laure; Bébéar, Cécile; Godreuil, Sylvain; Pereyre, Sabine	Lower mgpB diversity in macrolide-resistant Mycoplasma genitalium infecting men visiting two sexually transmitted infection clinics in Montpellier, France	Journal of Antimicrobial Chemotherapy	-	-	-	3057453	10.1093/JAC/DKAA410	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098451420&doi=10.1093%2fJAC%2fDKAA410&partnerID=40&md5=355fe4a85374d068a47a0ae35248c1b1	Objectives: Men engaged in high-risk sexual behaviour, such as MSM, are likely to be infected by resistant Mycoplasma genitalium strains. Understanding the transmission dynamics is challenging. We aimed to investigate the molecular epidemiology of M. genitalium in men visiting sexually transmitted infection (STI) clinics. Patients and methods: Between June 2017 and February 2018, 95 M. genitalium-positive specimens from 78 men, including 76.9% MSM, visiting two STI clinics in Montpellier, France, were analysed for SNPs in the mgpB adhesin gene and number of tandem repeats in the MG_309 gene. Macrolide and fluoroquinolone resistance were determined. Typing results were compared with antibiotic resistance, sexual behaviour, sampling site, HIV pre-exposure prophylaxis (PrEP) usage and HIV status. Results: Thirty-eight mgpB STs were identified, including 23 new STs, with ST4 being most prevalent. The mgpB/ MG_309 typing method identified 52 genetic profiles, resulting in a discriminatory index of 0.979. Macrolide and fluoroquinolone resistance-associated mutations were detected in 58.3% and 10.8% of patients, respectively. The macrolide resistance rate was higher among MSM than among men who have sex with women only (68.4% versus 9.1%; adjusted OR, 1.57; 95% CI, 1.13–2.18; P = 0.007). A lower mgpB diversity of 0.870 was found among macrolide-resistant strains in comparison with 0.978 in macrolide-susceptible strains, with an over-representation of mgpB ST62 and ST153. Conclusions: Although macrolide resistance spread appears polyclonal in M. genitalium, the lower diversity of mgpB types among macrolide-resistant strains may reflect the easier spread of a few specific mgpB types or the occurrence of sexual networks among MSM. © The Author(s) 2020. Article	2021	Gutierrez, JI; Dubov, A; Altice, FL; Vlahov, D	Preferences for pre-exposure prophylaxis among US military men who have sex with men: results of an adaptive choice based conjoint analysis study	Military Medical Research	-	-	-	2095-7467	10.1186/s40779-021-00323-6	https://pubmed.ncbi.nlm.nih.gov/34006328/	Background Pre-exposure prophylaxis (PrEP) prevents human immunodeficiency virus (HIV) infection, but its use remains low among U.S. military men who have sex with men (MSM), likely due to mis-matching with personal preferences. We conducted a study to characterize preferences to PrEP measures within this population. Methods HIV-negative military MSM were recruited through a closed, Lesbian, Gay, Bisexual, and Transgendered (LGBT) military social media group. The survey was anonymous, and consisted of five experimentally varied attributes in service delivery: dosing method, provider type, visit location, lab work evaluation location, and dispensing venue. Relative importance and part-worth utility scores were generated using hierarchical bayes (HB) estimation, and the randomized first choice model was used to examine participation interest across eight possible PrEP program scenarios. Results A total of 429 participants completed the survey. Among the eight scenarios with varying attributes, the most preferred scenario featured a daily tablet, PrEP injection or implant, along with a military provider, smartphone/telehealth visit, and on-base locations for lab evaluation and medication pick-up. The results also emphasized the importance for providers to be familiar with PrEP prescription knowledge, and to provide interactions sensitive to sexual identity and mental health. Conclusion A PrEP program consisting of daily tablet is preferred in military healthcare settings is preferred. Long-acting implants and injections are also desired. Article	2021	Guyonvarch O.; Vaillant L.; Hanslik T.; Blanchon T.; Rouveix E.; Supervie V.	HIV prevention with PrEP: Challenges and prospects; Prévenir le VIH par la PrEP: enjeux et perspectives	Revue de Médecine Interne	-	-	-	2488663	10.1016/j.revmed.2020.10.005	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094561881&doi=10.1016%2fj.revmed.2020.10.005&partnerID=40&md5=71c5781950c5d5e298380be2c36a0eff	Pre-exposure prophylaxis (PrEP) is the use of antiretroviral drugs by uninfected people to prevent human immunodeficiency virus (HIV) infection. PrEP is used by people who are at substantial risk of being exposed to HIV. Numerous clinical trials have confirmed its effectiveness in reducing HIV acquisition and PrEP has been approved and allowed in several countries including France. However, PrEP uptake remains low as concerns about increase in sexual risk behaviour with PrEP use in the wake of a growing epidemic of sexually transmitted infections, and fear of drug resistance have been expressed. As a result, the difference between the proportion of people on PrEP and the proportion of people who would be very likely to use PrEP if they could access it -otherwise known as the PrEP gap- remains high. Nowadays, studies continue to explore long-term effects of PrEP as well as expand the array of available technologies and regimens. © 2020 Société Nationale Française de Médecine Interne (SNFMI)	HIV; Pre-exposure prophylaxis; Sexual and gender minorities	English	France	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical
Article	2021	Haas O.; Maier A.; Rothgang E.	Machine Learning-Based HIV Risk Estimation Using Incidence Rate Ratios	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/frph.2021.756405	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135033284&doi=10.3389%2ffrph.2021.756405&partnerID=40&md5=9fa135782c7431a48ac7b98ac0b2983f	HIV/AIDS is an ongoing global pandemic, with an estimated 39 million infected worldwide. Early detection is anticipated to help improve outcomes and prevent further infections. Point-of-care diagnostics make HIV/AIDS diagnoses available both earlier and to a broader population. Wide-spread and automated HIV risk estimation can offer objective guidance. This supports providers in making informed decision when considering patients with high HIV risk for HIV testing or pre-exposure prophylaxis (PrEP). We propose a novel machine learning method that allows providers to use the data from a patient's previous stays at the clinic to estimate their HIV risk. All features available in the clinical data are considered, making the set of features objective and independent of expert opinions. The proposed method builds on association rules that are derived from the data. The incidence rate ratio (IRR) is determined for each rule. Given a new patient, the mean IRR of all applicable rules is used to estimate their HIV risk. The method was tested and validated on the publicly available clinical database MIMIC-IV, which consists of around 525,000 hospital stays that included a stay at the intensive care unit or emergency department. We evaluated the method using the area under the receiver operating characteristic curve (AUC). The best performance with an AUC of 0.88 was achieved with a model consisting of 53 rules. A threshold value of 0.66 leads to a sensitivity of 98% and a specificity of 53%. The rules were grouped into drug abuse, psychological illnesses (e.g., PTSD), previously known associations (e.g., pulmonary diseases), and new associations (e.g., certain diagnostic procedures). In conclusion, we propose a novel HIV risk estimation method that builds on existing clinical data. It incorporates a wide range of features, leading to a model that is independent of expert opinions. It supports providers in making informed decisions in the point-of-care diagnostics process by estimating a patient's HIV risk. Effect of SMS reminders on PrEP adherence in young Kenyan women (MPYA study): a randomised controlled trial	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(20)30307-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101783668&doi=10.1016%2fS2352-3018%2820%2930307-6&partnerID=40&md5=37d2e988c55d2ebe897afc50944400bc	Background: Pre-exposure prophylaxis (PrEP) is highly effective for preventing HIV acquisition. However, adherence among young women (aged 18–24 years) has been challenging. SMS reminders have been shown to improve adherence to antiretroviral therapy in some contexts, including in combination with real-time adherence monitoring. We aimed to determine the effect of SMS reminders on PrEP adherence among young women in Kenya over a 2-year period. Methods: The monitoring PrEP among young adult women (MPYA) study was an open label randomised controlled trial involving young adult women at high risk of HIV in Thika and Kisumu, Kenya. Participants were recruited from colleges, vocational institutions, informal settlements, and community-based organisations supporting young women. Women had to be aged 18–24 years and at high risk of HIV acquisition (defined as a VOICE risk score of 5 or higher, or being in a serodiscordant relationship). Study staff randomly assigned participants (1:1) to receive either SMS reminders (SMS reminder group) or no reminders (no SMS reminder group). Study group assignment was known to trial staff but masked to investigators. Reminders were initially sent daily and participants could switch to as-needed reminders (ie, sent only if they missed opening the monitor as expected) after 1 month. Study visits occurred at 1 month, 3 months, and then quarterly (ie, every 3 months). The primary outcome was PrEP adherence over 24 months measured with a real-time electronic monitor and assessed by negative binomial models adjusted for the study site and quarter among participants who collected PrEP. This trial is registered with ClinicalTrials.gov, NCT02915367. Findings: Of 642 women initially approached, 348 eligible women were enrolled between Dec 21, 2016, and Feb 5, 2018. Participants were randomly assigned to either the SMS reminder group (n=173) or the no SMS reminder group (n=175). The median age was 21 years (IQR 19–22) and 228 (66%) of the 348 participants reported condomless sex in the month before baseline. 24 (14%) of the 173 participants assigned to receive daily SMS reminders later opted for as-needed reminders. 69 291 (97%) of 71 791 SMS reminders were sent as planned. Among participants collecting PrEP (thus potentially suggesting a desire for HIV protection), electronically monitored adherence averaged 26·8% over 24 months and was similar by study group (27·0% with SMS, 26·6% without SMS, adjusted incidence rate ratio 1·16 95% CI 0·93–1·45, p=0·19). There were no serious adverse events related to trial participation; five social harms occurred in each study group, primarily related to PrEP use. Interpretation: SMS reminders were ineffective in promoting PrEP adherence among young Kenyan women. Given the overall low adherence in the trial, additional interventions are needed to support PrEP use in this population. Article	2021	Haire, Bridget; Murphy, Dean; Maher, Lisa; Zablotska-Manos, Iryna; Vaccher, Stephanie; Kaldor, John	What does PrEP mean for 'safe sex' norms? A qualitative study.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0255731	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8341650	While HIV pre-exposure prophylaxis (PrEP) is highly effective, it has arguably disrupted norms of 'safe sex' that for many years were synonymous with condom use. This qualitative study explored the culture of PrEP adoption and evolving concepts of 'safe sex' in Sydney, Australia, during a period of rapidly escalating access from 2015-2018, drawing on interviews with sexually active gay men (n = 31) and interviews and focus groups with key stakeholders (n = 10). Data were analysed thematically. Our results explored the decreasing centrality of condoms in risk reduction and new patterns of sexual negotiation. With regards to stigma, we found that there was arguably more stigma related to not taking PrEP than to taking PrEP in this sample. We also found that participants remained highly engaged with promoting the wellbeing of their communities through activities as seemingly disparate as regular STI testing, promotion of PrEP in their social circles, and contribution to research. This study has important implications for health promotion. It demonstrates how constructing PrEP as a rigid new standard to which gay men 'should' adhere can alienate some men and potentially create community divisions. Instead, we recommend promoting choice from a range of HIV prevention options that have both high efficacy and high acceptability. Article	2021	Haldar P.; Reza-Paul S.; Daniel R.A.; Lazarus L.; Rewari B.B.; Lorway R.; Steen R.	A rapid review of pre-exposure prophylaxis for HIV in the Asia-Pacific region: Recommendations for scale up and future directions	Sexual Health	-	-	-	14485028	10.1071/SH20058	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101918923&doi=10.1071%2fSH20058&partnerID=40&md5=1bd95fafbfee858cc015f92a349d93aa	Decline in new HIV infections in the Asia-Pacific region (APAC) continues to be slow, emphasising the importance of scaling up new HIV prevention strategies, such as pre-exposure prophylaxis (PrEP). To help inform PrEP rollout in APAC, we conducted a rapid review of published literature on PubMed from 2015 to 2020, to assess feasibility, implementation strategies, cost-effectiveness, and availability of national policies and guidelines; for the latter, we also did an expanded Internet search. This review focussed on nine countries contributing >95% of new infections in this region. A total of 36 PrEP-related studies conducted among men who have sex with men, female sex workers, and transgender women were included, of which 29 were quantitative, six were qualitative and one was a mixed-method study. Most of the studies have addressed the availability and acceptability of PrEP, whereas cost-effectiveness of any approach was assessed by limited studies. Limited published information was available about national PrEP policies and guidelines; of the selected nine countries, five have adopted the recommended World Health Organization PrEP policy of which four have integrated it in their national HIV response. HIV risk perception concerns about safety, side-effects, stigma, and affordability were major challenges to PrEP acceptance. Community-based implementation has the potential to address these. Limited evidence suggested merging PrEP implementation with ongoing targeted intervention and treatment programs could be a cost-effective approach. To stem the epidemic, newer effective prevention strategies, like PrEP, should be urgently adopted within the context of combination HIV prevention approaches. © 2021 CSIRO.	acceptability; Asia-Pacific; availability; combination-prevention; feasibility; HIV prevention; pre-exposure prophylaxis; PrEP; prevention	English	United States	Western and Central Europe and North America	India	Asia and the Pacific	India	Asia and the Pacific	Review
Article	2021	Hamilton D.T.; Rosenberg E.S.; Sullivan P.S.; Wang L.Y.; Dunville R.L.; Barrios L.C.; Aslam M.; Mustanski B.; Goodreau S.M.	Modeling the Impact of PrEP Programs for Adolescent Sexual Minority Males Based on Empirical Estimates for the PrEP Continuum of Care	Journal of Adolescent Health	-	-	-	1054139X	10.1016/j.jadohealth.2020.06.041	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85089291008&doi=10.1016%2fj.jadohealth.2020.06.041&partnerID=40&md5=674cfef12a8c7be68f93d62d389a4a4	Purpose: Pre-exposure prophylaxis (PrEP)—an effective and safe intervention to prevent HIV transmission—was recently approved by the Food and Drug Administration for use by adolescents. Informed by studies of sexual behavior and PrEP adherence, retention, and promotion, we model the potential impact of PrEP use among at-risk adolescent sexual minority males. Methods: We simulate an HIV epidemic among men who have sex with men (MSM) aged 13–39. We assume adult MSM ages 19–39 have had PrEP available for 3 years with 20% coverage among eligible MSM based on the Centers for Disease Control and Prevention guidelines. PrEP interventions for ages 16–18 are then simulated using adherence and retention profiles drawn from the ATN113 and Enhancing Preexposure Prophylaxis in Community studies across a range of uptake parameters (10%–100%). Partnerships across age groups were modeled using parameterizations from the RADAR study. We compare the percent of incident infections averted (efficiency), and changes in prevalence over 10 years. Results: As compared to no PrEP use, baseline PrEP adherence and retention among adolescent sexual minority males drawn from the ATN113 and Enhancing Preexposure Prophylaxis in Community studies averted from 2.8% to 41.0% of HIV infections depending on the fraction of eligible adolescent sexual minority males that initiated PrEP at their annual health-care visit. Improved adherence and retention achieved with an array of focused interventions from real-world settings increased the percent of infections averted by as much as 26%–70%. Conclusions: Empirically demonstrated improvements in the PrEP continuum of care in response to existing interventions can substantially reduce incident HIV infections among adolescent sexual minority males. © 2020 Society for Adolescent Health and Medicine	Adolescent sexual minority; Agent-based network model; HIV; Pre-exposure prophylaxis	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Theses and Dissertations	2021	Hamilton, Akeen Lowell	Pre-Exposure Prophylaxis (PrEP) Knowledge, Willingness to Use & Uptake Among Black Heterosexual Men	-	-	University of South Carolina	-	NA	NA	https://scholarcommons.sc.edu/etd/6703 https://scholarcommons.sc.edu/context/etd/article/7519/viewcontent/Hamilton_sc_0202A_17909.pdf	INTRODUCTION: Pre-exposure prophylaxis (PrEP) is a pill, taken orally, that has been shown to be effective at reducing the chance that someone who is HIV-negative and at-risk for HIV will contract the disease during sexual intercourse with someone who is living with HIV. One demographic group that has been under-researched is Black heterosexual men. This dissertation presents research on evaluating the heterosexual Black men's awareness of, prior use, and network of friends/family's perceived interest in learning more about PrEP. METHODS: Two-hundred and six Black heterosexual men living in Brooklyn, New York City, were surveyed about their sexual behaviors and PrEP use and interest at their local barbershop in 2016. Another 505 Black heterosexual men were surveyed about sexual behaviors and PrEP awareness of, use, and interest in Dar Es Salaam, Tanzania during the baseline phase of a controlled-randomized trial surrounding HIV self-testing in social camps in 2019. RESULTS: In Brooklyn, 82% of men reported not having heard of PrEP and 55.3% of the 206 surveyed men reported not having used PrEP themselves or knowing someone who had. Some 45.1% of men believed that their network of friends and family would be somewhat interested in learning more about PrEP, while 28.2% believed their friends and family would be very interested. In Dar Es Salaam, 85.6% of men reported having never heard of PrEP prior to the survey. Still, 71.5% of men reported being likely to take PrEP if it were offered to them. Thirty-six percent of men reported that a reason that would make other men not want to take PrEP is not knowing where to get it from. Nearly 40% of men stated that they believed they would use PrEP before sexual intercourse either every time or every other time. CONCLUSION: Future research should explore intervention strategies for increasing PrEP access and use for heterosexual Black men such as barbershops and social camps as venues to raise awareness and for delivering PrEP. In tandem with strategic partnerships among community-based organizations, health departments, health clinics and hospital systems, both barbershops and social camps offer unique and useful opportunities to reach heterosexual Black men and their peers. Article	2021	Hammack, Amanda Y.; Bickham, Jacquelyn N.; Gilliard, Isaac 3rd; Robinson, William T.	A Community Health Worker Approach for Ending the HIV Epidemic.	American Journal of Preventive Medicine	-	-	-	1873-2607 0749-3797	10.1016/j.amepre.2021.06.008	https://pubmed.ncbi.nlm.nih.gov/34686287/	INTRODUCTION: In the second half of 2019, East Baton Rouge Parish, Louisiana was selected as 1 of the 3 jump-start pilot jurisdictions for the Centers for Disease Control and Prevention-funded Ending the HIV Epidemic in the U.S. Initiative. An innovative community health worker program was among the strategies developed to reduce the number of new HIV infections. In addition to testing for HIV/sexually transmitted infections in nontraditional settings, community health workers provided integrated services, including linkage for people with HIV, pre-exposure prophylaxis navigation, sterile injection supplies and referrals to syringe services programs, and other social services. METHODS: The 5-member community health worker team was representative of the populations they intended to reach. They conducted outreach, from October 2019 to December 2020, within areas known to have a high incidence of new HIV infections. RESULTS: The community health worker team documented 977 encounters with individuals in their communities. The vast majority of encounters were among Black clients; 9% were among White clients. In total, 48% were among cisgender women, 50% were among cisgender men, and 2% were among transgender women. People who inject drugs represented 7% of the sample. Community health workers conducted rapid testing for HIV (n=320), hepatitis C (n=274), and syphilis (n=280). In addition, they successfully linked 10 people with HIV to HIV medical care and 20 people who inject drugs to a syringe services program and assisted 19 people at risk of HIV infection with pre-exposure prophylaxis initiation. CONCLUSIONS: The community health worker team successfully facilitated access to HIV prevention and treatment for priority populations in East Baton Rouge Parish. Article	2021	Hammoud M.A.; Grulich A.; Holt M.; Maher L.; Murphy D.; Jin F.; Bavinton B.; Haire B.; Ellard J.; Vaccher S.; Saxton P.; Bourne A.; Degenhardt L.; Storer D.; Prestage G.	Substantial decline in use of hiv preexposure prophylaxis following introduction of covid-19 physical distancing restrictions in australia: Results from a prospective observational study of gay and bisexual men	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002514	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098472279&doi=10.1097%2fQAI.0000000000002514&partnerID=40&md5=5d5dadcbce073a83446162ca85d69373	Background: In response to the novel coronavirus disease (COVID-19) pandemic, Australia introduced public health and physical distancing restrictions in late March 2020. We investigated the impact of these restrictions on HIV preexposure prophylaxis (PrEP) use among Australian gay and bisexual men (GBM). Methods: Participants in an ongoing online cohort study previously reported PrEP use from 2014 to 2019. In April 2020, 847 HIVnegative and untested participants completed questionnaires assessing changes in PrEP use as a result of COVID-19 public health measures. Binary logistic multiple regression was used to estimate adjusted odds ratios (aOR) and 95% confidence intervals (95% CI) to compare changes in PrEP use behaviors. Results: Among 847 men, mean age was 44.1 years (SD: 12.7). PrEP use rose from 4.9% in 2015 to 47.2% in 2020. Among those, 41.8% (n = 167) discontinued PrEP use during COVID-19 restrictions. Discontinuing PrEP during COVID-19 restrictions was independently associated with being less likely to have recently tested for HIV (aOR: 0.17; 95% CI: 0.09 to 0.34; P , 0.001) and less likely to report sex with casual partners (aOR: 0.28; 95% CI: 0.14 to 0.54; P , 0.001). Conclusions: By April 2020, following the introduction of COVID-19 restrictions, GBM dramatically reduced PrEP use, coinciding with a reduction in sexual activity. Longer-term impacts of COVID-19 restrictions on sexual behaviors among GBM need to be monitored because they may foreshadow fluctuations in prevention coverage and risk of HIV infection. Our findings indicate a potential need for clear, targeted information about resumption of PrEP and on-demand optimal dosing regimens in response to ongoing changes in restrictions. © 2020 Wolters Kluwer Health, Inc. Article	2021	Hannaford A.; Arens Y.; Koenig H.	Real-time monitoring and point-of-care testing: A review of the current landscape of prep adherence monitoring	Patient Preference and Adherence	-	-	-	1177889X	10.2147/PPA.S248696	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100670413&doi=10.2147%2fPPA.S248696&partnerID=40&md5=3a5614d33ae1b561b4ec410841d77c1e	Background: Despite pre-exposure prophylaxis (PrEP) being highly effective at preventing HIV, HIV infections among individuals prescribed PrEP continue to occur. The vast majority of these new infections occur among individuals with sub-optimal adherence. One factor that is likely to decrease HIV incidence among PrEP users is a real-time, objective measurement of adherence. Monitoring adherence to PrEP can identify those at risk of becoming lost to follow-up and therefore at greater risk of HIV infection, those in need of additional layers of support to overcome barriers to PrEP, and individuals who need enhanced adherence support. Objective: This paper reviews subjective and objective methods for monitoring PrEP including self-report, drug level monitoring (including serum, plasma, peripheral blood mononuclear cells PBMC, red blood cell dried blood spots DBS, hair, and urine) and by measuring participant interaction with the study drug (pill counts, medication event monitoring systems MEMS caps). Clinical Use: A multitude of methods exist for monitoring and supporting adherence. Objective monitoring using DBS and urine will provide a more accurate picture of adherence compared to subjective and non-biomarker objective methods. Preliminary data show that detection of non-adherence using biomarkers, followed by augmented adherence support and counseling, is associated with improved adherence, although more research is needed. PrEP providers will need knowledge of and access to these various strategies, which will require investment and resource allocation from clinics and other PrEP care sites to provide these tools. © 2021 Hannaford et al. Article	2021	Hanum, Nadia; Cambiano, Valentina; Sewell, Janey; Rodger, Alison J; Nwokolo, Nneka; Asboe, David; Gilson, Richard; Clarke, Amanda; Miltz, Ada R; Collins, Simon; Delpech, Valerie; Croxford, Sara; Phillips, Andrew N; Lampe, Fiona C	Trends in HIV incidence between 2013–2019 and association of baseline factors with subsequent incident HIV among gay, bisexual, and other men who have sex with men attending sexual health clinics in England: A prospective cohort study	PLOS Medicine	-	-	-	15491277	10.1371/journal.pmed.1003677	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108910128&doi=10.1371%2fjournal.pmed.1003677&partnerID=40&md5=a68a69db33e7a9b771bb4e9c1797de57	Background Prospective cohort studies of incident HIV and associated factors among gay, bisexual, and other men who have sex with men (GBMSM) in the United Kingdom are lacking. We report time trends in and factors associated with HIV incidence between 2013 and 2019 among a cohort of GBMSM: the AURAH2 prospective study. Methods and findings Participants were recruited through 1 of 3 sexual health clinics in London and Brighton (July 2013 to April 2016) and self-completed a baseline paper questionnaire and subsequent 4-monthly and annual online questionnaires (March 2015 to March 2018), including information on sociodemographics, lifestyle, health and well-being, HIV status, sexual/HIV-related behaviours, and preexposure prophylaxis and postexposure prophylaxis (PrEP/PEP). Incident HIV was ascertained by linkage with national HIV surveillance data from Public Health England (PHE). We investigated the associations of HIV incidence with (1) baseline factors using mixed-effects Weibull proportional hazard models, unadjusted and adjusted for age, country of birth and ethnicity, sexuality, and education level; and (2) time-updated factors, using mixed-effects Poisson regression models. In total, 1,162 men (mean age 34 years, 82% white, 94% gay, 74% university-educated) were enrolled in the study. Thirty-three HIV seroconversions occurred over 4,618AU .9 person-: Pleasenotethatsp years (PY) of follow-up: an overall HIV incidence rate (IR) of 0.71 (95% confidence interval (CI) 0.51 to 1.00) per 100 PY. Incidence declined from 1.47 (95% CI 0.48 to 4.57) per 100 PY in 2013/2014 to 0.25 (95% CI 0.08 to 0.78) per 100 PY in 2018/2019; average annual decline was 0.85-fold (p < 0.001). Baseline factors associated with HIV acquisition included the following: injection drug use (6/38 men who reported injection drug-acquired HIV; unadjusted conditional hazard ratio (HR) 27.96, 95% CI 6.99 to 111.85, p < 0.001), noninjection chemsex-related drug use (13/321; HR 6.45, 95% CI 1.84 to 22.64, p < 0.001), condomless anal sex (CLS) (26/741; HR 3.75, 95% CI 1.31 to 1074, p = 0.014); higher number of CLS partners (HRs >10 partners 7/57; 5 to 10 partners 5/60; and 2 to 4 partners 11/293: 14.04, 95% CI 4.11 to 47.98; 9.60, 95% CI 2.58 to 35.76; and 4.05, 95% CI 1.29 to 12.72, respectively, p < 0.001); CLS with HIV–positive partners (14/147; HR 6.45, 95% CI 3.15 to 13.22, p < 0.001), versatile CLS role (21/362; HR 6.35, 95% CI 2.18 to 18.51, p < 0.001), group sex (64/500; HR 8.81, 95% CI 3.07 to 25.24, p < 0.001), sex for drugs/money (4/55, HR 3.27, 95% CI 1.14 to 9.38, p = 0.027) (all in previous 3 months); previous 12-month report of a bacterial sexually transmitted infection (STI) diagnosis (21/440; HR 3.95, 95% CI 1.81 to 8.63, p < 0.001), and more than 10 new sexual partners (21/471, HRs 11 to 49, 50 to 99, and >100 new partners: 3.17, 95% CI 1.39 to 7.26; 4.40, 95% CI 1.35 to 14.29; and 4.84, 95% CI 1.05 to 22.4, respectively, p < 0.001). Results were broadly consistent for time-updated analysis (n = 622 men). The study's main limitation is that men may not be representative of the broader GBMSM population in England. Conclusions We observed a substantial decline in HIV incidence from 2013 to 2019 among GBMSM attending sexual health clinics. Injection drug use, chemsex use, and measures of high-risk sexual behaviour were strongly associated with incident HIV. Progress towards zero new infections could be achieved if combination HIV prevention including Test and Treat strategies and routine commissioning of a PrEP programme continues across the UK and reaches all at-risk populations. Article	2021	Hart T.A.; Moore D.M.; Noor S.W.; Lachowsky N.; Grace D.; Cox J.; Skakoon-Sparling S.; Jollimore J.; Parlette A.; Lal A.; Apelian H.; Sang J.M.; Tan D.H.S.; Lambert G.	Prevalence of HIV and sexually transmitted and blood-borne infections, and related preventive and risk behaviours, among gay, bisexual and other men who have sex with men in Montreal, Toronto and Vancouver: results from the Engage Study	Canadian Journal of Public Health	-	-	-	84263	10.17269/s41997-021-00546-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106070413&doi=10.17269%2fs41997-021-00546-z&partnerID=40&md5=b0d077579d2ed2ac2136089b0914f6f	Objectives: The last Canadian biobehavioural surveillance study of HIV and other sexually transmitted and blood-borne infections (STBBI) among gay, bisexual and other men who have sex with men (GBM) was conducted in 2010. We designed a study to measure STBBI prevalence among GBM in metropolitan Montreal, Toronto and Vancouver and to document related preventive and risk behaviours. Methods: The Engage Cohort Study used respondent-driven sampling (RDS) to recruit GBM who reported sex with another man in the past 6 months. At baseline, we examined recruitment characteristics of the samples, and the RDS-II-adjusted distributions of socio-demographics, laboratory-confirmed HIV and other STBBI prevalence, and related behaviours, with a focus on univariate differences among cities. Results: A total of 2449 GBM were recruited from February 2017 to August 2019. HIV prevalence was lower in Montreal (14.2%) than in Toronto (22.2%) or Vancouver (20.4%). History of syphilis infection was similar across cities (14–16%). Vancouver had more HIV-negative/unknown participants who reported never being HIV tested (18.6%) than Toronto (12.9%) or Montreal (11.5%). Both Montreal (74.9%) and Vancouver (78.8%) had higher proportions of men who tested for another STBBI in the past 6 months than Toronto (67.4%). Vancouver had a higher proportion of men who used pre-exposure prophylaxis (PrEP) in the past 6 months (18.9%) than Toronto (11.1%) or Montreal (9.6%). Conclusion: The three largest cities of Canada differed in HIV prevalence, STBBI testing and PrEP use among GBM. Our findings also suggest the need for scale-up of both PrEP and STI testing among GBM in Canada. © 2021, The Author(s). Article	2021	Hartmann M.; Minnis A.M.; Krogstad E.; Ndwayana S.; Sindelo S.; Atujuna M.; O'Rourke S.; Bekker L.-G.; Montgomery E.T.	iPrevent: Engaging youth as long-acting HIV prevention product co-researchers in Cape Town, South Africa	African Journal of AIDS Research	-	-	-	16085906	10.2989/16085906.2021.1998784	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121332931&doi=10.2989%2f16085906.2021.1998784&partnerID=40&md5=81c1e868fd73211ad11f8f2f15877727	South African youth are one of the highest risk groups, globally, for HIV acquisition. Identifying prevention methods that will be acceptable and used consistently is an urgent priority. Engaging youth as co-designers is a targeted strategy to achieve the goal of developing prevention products that meet youth's needs. The iPrevent study engaged male and female youth, aged 18–24 years, in Cape Town, South Africa, to co-design critical aspects of the research project aimed at understanding youth preferences for long-acting pre-exposure prophylaxis (PrEP). An established advisory board of young men who have sex with men, women who have sex with men and men-who-have-sex-with-men, as well as a purposively selected youth cohort were involved in film-making, survey design and interpretation of study results. Convening youth as co-designers had several impacts on iPrevent's approach and outputs. Youth input informed the use of local actors in the study's educational video, creating a "real-world" community setting that meaningfully situated the content. Their participation led to the successful development of survey language and images to explain scientific concepts in terms that would resonate (e.g. chili peppers to express product-associated pain). Lastly, their insight reviewing results led to clarifications around misinterpretations of risk perception and confirmed youth's desires for products that fit into their goals around family, future happiness and education. The engagement of youth through creative, interactive activities contributed to adaptations of the study design, research implementation and understanding of results. This was important for connecting with young end-users and translating study findings for product developers in a way that reflected the context of their lives. © 2021 NISC (Pty) Ltd.	pre-exposure prophylaxis; sub-Saharan Africa; youth engagement	English	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Review
Article	2021	Hartmann, Miriam; Otticha, Sophie; Agot, Kawango; Minnis, Alexandra M; Montgomery, Elizabeth T; Roberts, Sarah T	Tu'washindi Na prep: Working with young women and service providers to design an intervention for prep uptake and adherence in the context of gender-based violence	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2021.33.2.103	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104047700&doi=10.1521%2faeap.2021.33.2.103&partnerID=40&md5=028b2639d146c0dfdc042f85de2db13d	HIV pre-exposure prophylaxis (PrEP) reduces HIV acquisition among adolescent girls and young women (AGYW). Existing evidence suggests that uptake and adherence are low among AGYW and that relationship factors such as gender-based violence (GBV) are important barriers. Through a community-based participatory research (CBPR) process, a youth advisory board (YAB), service providers (SP), and a study team developed the Tu'Washindi na PrEP intervention to support AGYW PrEP use in the context of GBV. The YAB also guided the formative research and interpretation of results. The authors pretested the intervention with SP, AGYW and their partners, and community change agents, and then developed guides for AGYW support clubs, community-based male sensitization sessions, and couples-based events that included formulation of story lines for dramatized PrEP negotiation and information dissemination skills. Stakeholder engagement led to an intervention responsive to AGYW's needs for PrEP support in the context of their relationships, which was evaluated through a 6-month pilot community randomized controlled trial. © 2021 The Guilford Press. Article	2021	Haukoos J.S.; White D.A.E.; Rowan S.E.; Lyle C.; Gravitz S.; Basham K.; Godoy A.; Kamis K.; Hopkins E.; Anderson E.	HIV Risk and Pre-Exposure Prophylaxis Eligibility among Emergency Department Patients	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2021.0012	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107631122&doi=10.1089%2fapc.2021.0012&partnerID=40&md5=907eea2e5225374c43367ff2b02636b9	Our objective was to estimate the prevalence of pre-exposure prophylaxis (PrEP) eligibility, characterize self-perceived and quantified human immunodeficiency virus (HIV) risk, and assess PrEP knowledge and receptiveness of initiating PrEP among emergency department (ED) patients. We performed an IRB-approved cross-sectional study from two urban EDs. Patients were eligible if ≥18 years of age and not known to have HIV. Research staff obtained verbal consent and used a structured 29-item instrument to assess HIV risk, PrEP eligibility based on 2017 Centers for Disease Control and Prevention (CDC) guidelines, and general PrEP knowledge among unselected and enriched patient samples, the latter informed by the Denver HIV Risk Score (DHRS). We enrolled 1002 patients with a median age of 39 years; 54.8% were male, 30.9% White/non-Hispanic, 29.5% Black/non-Hispanic, and 22.5% Hispanic. In the full cohort, 119 11.9%, 95% confidence interval (CI): 9.9-14.0% were PrEP eligible, and among the unselected cohort, 36 (7.1%, 95% CI: 5.1-9.8%) were PrEP eligible. Using the DHRS, 100 patients were considered "high risk"with 32 (32.0%) reporting zero perceived risk. Correlation between the DHRS and self-perceived HIV risk was low (r = 0.13). Of the full cohort, 203 (20.3%) had heard of PrEP, and of these, 33 (16.3%) were PrEP eligible with 25 (75.8%) willing to start PrEP immediately. Yet, of the 119 patients who were PrEP eligible, only 34 (28.6%) had heard of PrEP. In summary, among a heterogeneous ED population, there was discordance in self-perceived and quantified HIV risk. HIV PrEP eligibility was ∼7% with the highest eligibility among those identified as DHRS "high risk."A significant opportunity exists to identify and initiate PrEP among ED patients. © Copyright 2021, Mary Ann Liebert, Inc., publishers 2021. Article	2021	Heads A.M.; Hill M.J.; Suchting R.; Yammine L.; Gilmore-Thomas A.	Predictors of Anticipated PrEP Stigma among Women with Self-Reported Problematic Substance Use: Implications for Engaging Women in the PrEP Care Continuum	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-021-02031-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115626871&doi=10.1007%2fs10508-021-02031-7&partnerID=40&md5=bc31fb9f40b6b23afa2bfb8c9ed4a16d	Pre-exposure prophylaxis (PrEP) is an effective HIV prevention method, but it has been underutilized by women. Anticipated stigma regarding use of PrEP is a contributing factor in the underutilization of this prevention strategy. The current study explored the relationships among PrEP stigma, sex risk (i.e., inconsistent condom use, condomless sex with persons of unknown serostatus, or sex in exchange for money or drugs), substance use, attitudes toward HIV testing, and medical mistrust. Participants were 106 primarily ethnic-minority women who reported recent substance use and agreed to participate in a study exploring HIV prevention attitudes. Within this sample, the majority of participants had one or more CDC-defined PrEP indications. Findings indicate that medical mistrust was associated with perceived PrEP stereotypes and HIV testing attitudes. These results provide some insight into reasons for low PrEP uptake among women at risk for HIV. Implications for HIV prevention with women are discussed. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Hedrick A.M.; Carpentier F.R.D.	How current and potential pre-exposure prophylaxis (PrEP) users experience, negotiate and manage stigma: disclosures and backstage processes in online discourse	Culture, Health & Sexuality	-	-	-	13691058	10.1080/13691058.2020.1752398	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087176298&doi=10.1080%2f13691058.2020.1752398&partnerID=40&md5=19060400732b55bd7143ac1d20bb0e2d	Research on stigma as a barrier to pre-exposure prophylaxis (PrEP) uptake for reducing risk of HIV infection has focused on the experience of stigma—othering, shaming and blaming and the associated negative social consequences of this stigmatisation. This study expands this focus to examine how current and potential users of PrEP discuss their experiences of stigmatisation, in addition to their anticipation, preparation and management of stigmatising encounters. The corpus of testimonial blog posts from the "My PrEP Experience" website, reader comments on those posts, and information available through hyperlinks in the posts and comments, were subjected to a qualitative textual analysis. Findings revealed stigmatising labels and perceptions identified in other PrEP and HIV-related stigma research. Findings also revealed the active seeking and sharing of strategies for coping with and challenging stigma, including the creative re-appropriation of negative labels and calls for advocacy. The discussion considers how the described preparation and management strategies can inform future efforts to reduce stigma and encourage PrEP uptake. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	backstage processes; HIV; pre-exposure prophylaxis; PrEP; sexual health; social media; stigma	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Qualitative
Article	2021	Heffron R.; Casmir E.; Aswani L.; Ngure K.; Kwach B.; Ogello V.; Kiptinness C.; Ambiyo F.; Wairimu N.; Ossome E.; Machafu H.; Zia Y.; Thomas D.; Scoville C.; Barker T.; Bukusi E.; Mugo N.	HIV risk and pre-exposure prophylaxis interest among women seeking post-abortion care in Kenya: a cross-sectional study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25703	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105770848&doi=10.1002%2fjia2.25703&partnerID=40&md5=88457847cf2dbc0e8408e477b1c1065b	Introduction: Post-abortion clinics located in regions with high HIV burden may ideal locations to integrate counselling and delivery of HIV pre-exposure prophylaxis (PrEP), aligning with normative goals for integrated delivery of HIV and reproductive health care. The objective of this study was to gauge the degree to which Kenyan women seeking care for a pregnancy loss, including induced abortion, are at risk for HIV and whether women would welcome an introduction to PrEP prior to discharge from post-abortion care. Methods: We conducted a mixed-methods study from August 2019 to February 2020 with women ages 15 to 30 recruited sequentially as they were accessing post-abortion care at public and private facilities in Thika and Kisumu, Kenya. Data collection was through a cross-sectional survey and laboratory testing for common sexually transmitted infections (N = 200), and in-depth interviews (N = 30). Descriptive statistics summarize PrEP knowledge and referrals and a multivariable log-link binomial model estimated correlates of receiving a referral for PrEP. Qualitative data were analysed using inductive and deductive approaches. Results: Among 200 HIV-negative women (median age 21.0, interquartile range 19.0 to 22.0), the prevalence of Chlamydia trachomatis was 18.2% and Neisseria gonorrhoeae was 2.0%. Half of the women scored ≥5 on a validated tool that would correspond to an expected HIV incidence of 9.5% per year. Approximately half (55.8%) of women were familiar with PrEP prior to the study and 33.3% received a referral from study staff to a clinic offering PrEP. In qualitative interviews, women expressed interest in accessing PrEP from the gynaecology ward that provided post-abortion care but they preferred alternative locations for PrEP refills. Conclusions: Kenyan women accessing post-abortion care have substantial HIV risk and were favourable about the idea of receiving support to initiate PrEP as part of care offered during post-abortion care. These settings can be integrated into national PrEP programmes as locations providing PrEP referrals and initiation. © 2021 The Authors. Article	2021	Henny K.D.; Duke C.C.; Sutton M.Y.	Uptake of online HIV-related continuing medical education training among primary care providers in Southeast United States, 2017–2018	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1822986	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091610341&doi=10.1080%2f09540121.2020.1822986&partnerID=40&md5=c9eb502184262a564976ff9e80133a83	Primary care providers play a vital role for HIV prevention and care in high burden areas of the Southeast United States. Studies reveal that only a third of these providers had previous HIV-related training. We evaluated the effects of targeted online continuing medical education training on HIV-related knowledge, attitudes and practices among providers in the Southeast. During April 2017–February 2018, we administered baseline and six-month follow-up surveys to assess changes attributed to online training among a representative sample of providers from six Southeast locations. Data were analyzed using logistic regression analysis (p < 0.05). Baseline and follow-up surveys were completed by 349 participants (61.2% female, 64.6% white, 69.6% physicians, and 27.5% aged 40 years or less); 18% (n = 63) of whom visited online training websites sent following the baseline survey. Comparing baseline versus follow-up responses, providers who completed online training were half as likely to identify "patients' age" (30% vs. 15%) and "patients' race" (3% vs. 1.4%) as barriers to discussing sex with clients; survey responses by participants who declined training remained unchanged. Based on baseline versus follow-up responses, providers who visited online training websites were more likely to become familiar with preexposure prophylaxis (PrEP) (38% vs. 58%); participants who declined training remained unchanged at 45%. No impact on clinical practices such as PrEP prescriptions was identified. Targeted online training can enhance HIV readiness and should be explored for providers in the Southeast, particularly for enhancing PrEP service delivery. ©, This work was authored as part of the Contributor's official duties as an Employee of the United States Government and is therefore a work of the United States Government. How Can We Support the Use of Oral PrEP Among Young Women who Sell Sex? A PrEP Cascade Analysis	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002733	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114383956&doi=10.1097%2fQAI.0000000000002733&partnerID=40&md5=57e43b7d9eef932b80f1b98f37cfb72	Background:We constructed self-reported pre-exposure prophylaxis (PrEP) cascades and explored factors associated with and barriers to PrEP use to inform efforts to support PrEP use among young women who sell sex.Methods:Using self-reported data from HIV-negative young women who sell sex enrolled into a cohort study using respondent-driven sampling in Zimbabwe, we constructed PrEP cascades assessing knowledge of, ever offered, ever used, and current PrEP use in 2017 and 2019. We used logistic regression to examine factors associated with PrEP use by 2019. Through qualitative interviews with 43 women enrolled in the cohort, we investigated barriers to PrEP use.Results:At enrollment, 50% of women had heard of PrEP, 12% had ever been offered PrEP, and 7% ever used PrEP. Over time, all cascade domains: 96% of women had heard of and 55% reported an active offer of PrEP. Among women retained in the study in 2019 (56%; n = 538), 34% ever took PrEP by 2019. PrEP use was associated with, at enrollment, reporting more clients in the past month (10+: 45% vs 1-3: 27% adjOR = 1.71 95% CI: 1.06 to 2.76), duration of selling sex (24% <2 years vs 38% 2-3 years; adjOR = 0.51 95% CI: 0.32 to 0.83), and having visited a female sex worker program in the past 12 months (55% vs 27%; adjOR = 2.92 95% CI: 1.91 to 4.46). Qualitative interviews revealed fear of disclosing sex work, HIV-related/ART-related stigma, and (opportunity) costs of accessing PrEP as barriers to use.Conclusion:PrEP use was associated with factors known to increase HIV risk. Fear of stigma, disclosure, and supply-side barriers need to be addressed to increase women's ability to use PrEP. © 2021 Lippincott Williams and Wilkins. Article	2021	Heredia, JLA; Goldklank, S	The relevance of pre-exposure prophylaxis in gay men's lives and their motivations to use it: a qualitative study	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-021-11863-w	https://pubmed.ncbi.nlm.nih.gov/34627221/	Background HIV has affected gay men disproportionately in the U.S. for four decades. Pre-exposure prophylaxis (PrEP) was developed as a prevention strategy for individuals at high risk of HIV infection. Although highly effective, many gay and other men who have sex with men continue not to take PrEP. Researchers have focused on sexual risk behaviors as the primary determinant of who should be on PrEP and identified various objective systemic and societal barriers to PrEP access. Public health measures have promoted PrEP based on these objective criteria. Researchers have recently begun to inquire into subjective and relational motivators for PrEP usage beyond self-perceived risk. Methods Participants were recruited through snowball sampling. Data were collected between August and November 2018 from PrEP users (n = 7) and PrEP non-users (n = 6). Data were analyzed in a modified grounded theory qualitative analysis. Results The thirteen participants' narratives contained three superordinate categories: (1) what it's like to be someone on PrEP, (2) an environment of changing sexual norms, and (3) the continued importance of education. These categories comprised ten themes, each of which had various repeating ideas. The ten themes were the following: (1) PrEP's social acceptability, (2) PrEP and HIV stigma, (3) PrEP and sexual relationships, (4) dissatisfaction with condoms, (5) negotiating risk, (6) peace of mind, (7) developing a relationship with PrEP, (8) putting yourself first, (9) PrEP awareness, and (10) PrEP logistics. Conclusions The gay men in our study took into consideration their social roles and relationships, their personal beliefs, and emotional histories as well as risk as prominent motivators for PrEP use. They stated that PrEP use is associated with their sense of belonging, trust, and security about their sexuality. They also identified the most relevant aspects of the medication (e.g., side effects, adherence, and awareness) to their lives. Article	2021	Hermosa-Bosano C.; Paz C.; Hidalgo-Andrade P.; Aguayo-Romero R.	Sexual Behaviors and HIV/STI Prevention Strategies Among Sexual Minority Men in Ecuador Who Use Geosocial Networking Apps	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-021-02093-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115848738&doi=10.1007%2fs10508-021-02093-7&partnerID=40&md5=7087309a1d73f36868a4c0b02aa083ab	Around the world, geosocial networking apps have become widely popular among sexual minority men (SMM). This research analyzed the sexual behaviors and HIV and STI prevention strategies (HIV/STI testing, HIV/STI inquiry, and HIV/STI disclosure) of an online-recruited sample of 284 SMM living in Ecuador. Sexting and oral sex were the most common sexual behaviors among SMM in the sample. Most participants had low perceptions of HIV and STI risk; 85% reported being tested for HIV and 70% for STIs. Being older predicted higher odds of being tested for either HIV or STIs at least once. Being single also predicted HIV testing. Future interventions in the country should explore apps' utility as intervention tools to spread information about sexual health and HIV prevention strategies, such as condom use and event-driven PrEP. Apps can also facilitate connections to sexual health services, including programs for PrEP initiation and linkage to HIV treatment. They should also focus on promoting sexual harm reduction conversations among potential app-met sexual partners. © 2021, The Author(s). Theses and Dissertations	2021	Hernández Martínez, A. M	Conocimiento, actitudes y percepción sobre la profilaxis pre-exposición contra el virus de la inmunodeficiencia humana en estudiantes de medicina	-	-	Universidad Peruana Cayetano Heredia	-	NA	NA	https://repositorio.upch.edu.pe/bitstream/handle/20.500.12866/10073/Conocimiento_HernandezMartinez_Adela.pdf?sequence=1&isAllowed=y	Antecedentes: Estudios demuestran la relación entre el conocimiento sobre la profilaxis pre-exposición (PrEP) con factores sociodemográficos y actitudes de pacientes y proveedores de la salud. Sin embargo, no se han realizado estudios en estudiantes de medicina, que serán los futuros proveedores. Objetivos: Determinar la relación entre el nivel de conocimiento sobre la PrEP contra el VIH y los factores sociodemográficos en estudiantes de medicina de una universidad privada, así como la relación entre su nivel de conocimiento sobre la PrEP y sus actitudes y percepción. Materiales y métodos: El estudio transversal utilizó un cuestionario virtual autoaplicable. Se calificó con puntajes la sección de conocimientos y se otorgó un valor numérico a las actitudes y percepciones. Para analizar la correlación de las variables se utilizó el coeficiente RHO de Spearman. Resultados: 478 estudiantes respondieron la encuesta. El promedio de puntaje fue de 6,3. Article	2021	Herrera C.; Lwanga J.; Lee M.; Mantori S.; Amara A.; Else L.; Penchala S.D.; Egan D.; Challenger E.; Dickinson L.; Boffito M.; Shattock R.; Khoo S.; Fox J.	Pharmacokinetic/pharmacodynamic investigation of raltegravir with or without lamivudine in the context of HIV-1 pre-exposure prophylaxis (PrEP)	Journal of Antimicrobial Chemotherapy	-	-	-	3057453	10.1093/jac/dkab136	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112124950&doi=10.1093%2fjac%2fdkab136&partnerID=40&md5=52555698e399064c4ad6e64a0c787bdb	Background: To characterize their potential use in pre-exposure prophylaxis (PrEP) we compared the pharmacokinetics of raltegravir and lamivudine in genital tissue against ex vivo tissue infection with HIV-1. Methods: Open-label trial of 36 HIV-negative females and males randomized to 7 days raltegravir 400 mg twice daily and 7 days raltegravir 400 mg+lamivudine 150 mg twice daily (after washout), or vice versa. Blood, saliva, rectal fluid, rectal tissue, vaginal fluid and vaginal tissue were sampled at baseline and on and off PrEP during a total of 12 days, for pharmacokinetics and antiviral activity via ex vivo HIV-1BaL challenge. Ex vivo infectivity was compared with baseline. The trial has been registered in https://clinicaltrials.gov/ with the identifier NCT03205566. Results: Steady state for both drugs was reached by day 4. Dosing with raltegravir alone provided modest ex vivo HIV protection with higher drug levels in rectal tissue and vaginal tissue than in plasma on and off PrEP. Off PrEP, plasma and vaginal concentrations declined rapidly, while persisting in the rectum. On PrEP, the highest lamivudine concentrations were in the rectum, followed by vaginal tissue then plasma. Lamivudine washout was rapid in plasma, while persisting in the rectum and vagina. Raltegravir/lamivudine increased ex vivo protection on and off PrEP compared with raltegravir alone, reaching maximum protection at day 2 in rectal tissue and at day 8 in vaginal tissue. Conclusions: Raltegravir 400 mg+lamivudine 150 mg showed high levels of ex vivo HIV protection, associated with high drug concentrations persisting after discontinuation in vaginal and rectal compartments, supporting further investigation of these agents for PrEP. © 2021 The Author(s) 2021. Article	2021	Herrera, Carolina; Harman, Sarah; Aldon, Yoann; Rogers, Paul; Armanasco, Naomi; Ziprin, Paul; Stieh, Daniel; Nuttall, Jeremy; Shattock, Robin J	The entry inhibitor DS003 (BMS-599793): a BMS-806 analogue, provides superior activity as a pre-exposure prophylaxis candidate.	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000002974	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8416713	OBJECTIVE: Small molecule inhibitors able to bind to gp120 and prevent CD4+-induced HIV-1 envelope conformational change provide an important class of inhibitors. Currently, only Fostemsavir is approved for HAART, which makes this class of inhibitors attractive candidates for prevention. We assessed the activity of DS003 (BMS-599793), an analogue of BMS-378806, in different mucosal tissues and elucidated its mechanism of action. DESIGN: Preclinical analysis was performed with human mucosal tissue models as surrogates of in-vivo activity. METHODS: Antiviral efficacy of DS003 was assessed in mucosal tissue explants (ecto-cervical, penile and colorectal) and in trans-infection models (co-cultures of dendritic or mucosal migratory cells with CD4+ T cells) with several dosing times (2, 24h and sustained) and in combination with a fusion inhibitor. Binding of DS003 to gp120 was assessed by flow cytometry and bio-layer interferometry and further probed in competitive studies using soluble CD4+ (sCD4+) and an anti-CD4+ induced antibody, 17b. RESULTS: In all models, the inhibitory activity of DS003 was increased with longer periods of exposure and by combination with a fusion inhibitor. Pre-exposure to sCD4+ impeded DS003 binding to viral envelope. In contrast, DS003 did not impact subsequent binding of sCD4+. Furthermore, sCD4+-induced epitope exposure as assessed by 17b binding was significantly reduced in the presence of DS003. CONCLUSION: DS003 inhibits HIV-1 infection by binding to or near the CD4+ binding site of gp120, preventing CD4+-induced conformational change essential for viral fusion. These data highlight the potential of DS003 for development as a pre-exposure prophylaxis candidate.	prevention, antiretroviral, entry, mucosal, explant, HIV-1	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2021	Hil S.V.; Johnson J.; Rahman F.; Dauria E.F.; Mugavero M.; Matthews L.T.; Simpson T.; Elopre L.	Exploring adults as support persons for improved pre-exposure prophylaxis for HIV use among select adolescents and young adults in the Deep South	PLOS One	-	-	-	19326203	10.1371/journal.pone.0248858	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102890307&doi=10.1371%2fjournal.pone.0248858&partnerID=40&md5=c3762e71b739b78796aadeabbaaea4b2	Purpose Pre-exposure prophylaxis for HIV (PrEP) is an effective yet underutilized biomedical tool for adolescents and young adults' (AYA) HIV prevention due to barriers such as PrEP adherence. We assessed HIV prevention knowledge, attitudes and beliefs from adults who selfidentified as a primary support person to an AYA. Methods We surveyed AYA primary support persons at an academic hospital. Univariate and multivariate regression analyses were completed to identify factors associated with the belief AYAs engaging in HIV-associated behaviors should use PrEP and willingness to support AYAs on PrEP. Results 200 primary support persons completed the survey. Participants were predominately female (77%) and black (56%). Nearly all primary support persons believed AYAs engaging in HIVassociated behaviors should take PrEP (94%) and 98% would support an AYA taking PrEP via transportation to appointments, assistance with refilling prescriptions, medication reminders, or encouragement. Conclusions Primary support persons are willing to support AYAs using PrEP. © 2021 Public Library of Science. All rights reserved. Article	2021	Hill B.J.; Anderson B.; Lock L.	COVID-19 Pandemic, Pre-exposure Prophylaxis (PrEP) Care, and HIV/STI Testing Among Patients Receiving Care in Three HIV Epidemic Priority States	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03195-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101220261&doi=10.1007%2fs10461-021-03195-y&partnerID=40&md5=654d79c659fb288562788fb75beca686	The COVID-19 pandemic has the potential to disrupt HIV prevention services. We conducted an electronic health record analysis of PrEP, HIV, and STI visits at eight sexual health clinics in Arkansas, Missouri, and Oklahoma during the onset of the pandemic (March 1, 2020 to June 30, 2020) and compared the data with pre-pandemic (March 1, 2019 to June 30, 2019) volumes. Our data revealed a significant increase in the proportion of male PrEP visits during the pandemic compared to the pre-pandemic period, with the majority provided via telehealth/telePrEP. Overall, HIV and STI testing significantly decreased during the pandemic period. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Article	2021	Hill L.M.; Lightfoot A.F.; Riggins L.; Golin C.E.	Awareness of and attitudes toward pre-exposure prophylaxis among African American women living in low-income neighborhoods in a Southeastern city	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1769834	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086044133&doi=10.1080%2f09540121.2020.1769834&partnerID=40&md5=d95f6477874ca09ce89aaaef334cdd90	African American women in the South are disproportionately affected by HIV but have often been ignored in HIV prevention efforts, including in the rollout of pre-exposure prophylaxis (PrEP). To inform strategies to promote PrEP awareness and access in this population, we conducted a venue-based community survey with 53 African American women living in low-income neighborhoods of a Southeastern city to understand women's knowledge of and attitudes toward PrEP. Awareness of PrEP was very low (37%) with only 16% being aware that PrEP is used for HIV prevention. The vast majority of women (85%) reported that they would use or would consider using PrEP, most frequently citing a general interest in HIV prevention or a lack of awareness of their partners' HIV status as motivations for their interest. Some women expressed concerns about side effects or low perceived HIV risk as disincentives for PrEP use. Information regarding side effects and HIV risk assessments will be needed to ensure the acceptable delivery of PrEP in this population. © 2020 Informa UK Limited, trading as Taylor & Francis Group. Article	2021	Hill, Lauren M; Saidi, Friday; Freeborn, Kellie; Amico, K Rivet; Rosenberg, Nora E; Maman, Suzanne; Phanga, Twambilile; Tsidya, Mercy; Chirwa, Sara; Zimba, Chifundo; Mutale, Wilbroad; Chi, Benjamin H	Tonse Pamodzi: Developing a combination strategy to support adherence to antiretroviral therapy and HIV pre-exposure prophylaxis during pregnancy and breastfeeding	PLOS One	-	-	-	19326203	10.1371/journal.pone.0253280	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108694224&doi=10.1371%2fjournal.pone.0253280&partnerID=40&md5=eb52424f4a17352db83865ceed1ac607	To eliminate mother-to-child transmission of HIV (EMTCT), scalable strategies to enhance antiretroviral adherence for both antiretroviral therapy (ART) and pre-exposure prophylaxis (PrEP) are needed as part of integrated HIV and maternal-child health services. We developed Tonse Pamodzi ("all of us together"), an adaptable intervention integrating biomedical and behavioral components to support HIV treatment and prevention. We describe our intervention development process, which comprised formative qualitative research, a review of the literature, and technical input from stakeholders representing the community, health systems, and policymakers. The resulting intervention, described herein, integrates patient-centered counseling and engagement of a patient-selected adherence supporter for pregnant and breastfeeding women initiating ART or PrEP. Patients receiving the intervention engage in Integrated Next Step Counseling (iNSC) sessions delivered by trained counselors to build and maintain adherence skills. Each patient also has the option of selecting an adherence supporter (partner, family member, or friend) who may participate in iNSC sessions and provide adherence support outside of these sessions. This flexible intervention is adaptable not only to ART or PrEP use, but also to the needs and preferences of each woman and the clinical context. If shown to be acceptable and feasible, the Tonse Pamodzi intervention may be an important tool in continuing efforts for EMTCT. © 2021 Hill et al. Article	2021	Hillis A.; Germain J.; Hibbert M.P.; Hope V.; Van Hout M.C.	"Belt and braces approach; added benefit and … extra reassurance": a multi-stakeholder examination of the challenges to effective provision of pre-exposure prophylaxis (PrEP) for HIV prevention among men who have sex with men (MSM) in Northern and Central England	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.1871721	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099434051&doi=10.1080%2f09540121.2021.1871721&partnerID=40&md5=386dcfa91a8744aca17df6fc3e410eb5	Pre-exposure prophylaxis (PrEP) involves HIV negative individuals taking antiretroviral drugs to reduce the probability of infection if exposed and is available through the IMPACT trial in England. This study aimed to explore men who have sex with men (MSM) and service provider (SP) perspectives on provision and accessibility of PrEP in Northern and Central England. Twenty MSM and 25 SPs from four Northern cities and one city in the West Midlands region were recruited for semi-structured interviews (December 2018 to October 2019). Interviews were analysed using Interpretative Phenomenological Analysis (IPA). Three key themes emerged: "Self-sourcing PrEP"; "Service delivery learnings"; and "Impact of using PrEP". Problems with equity of access and accessibility were noted, and recommendations for the future of PrEP programming and equitable service delivery were also presented. The study highlighted divergence in PrEP service experience from patients and providers, with results informing policy, practice and professional training. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2021	Ho D.-K.; LeGrayder C.; Srinivasan S.; Roy D.; Vlaskin V.; Chavas T.E.J.; Lopez C.L.; Snyder J.M.; Postma A.; Charlait J.; Stayton P.S.	Fully synthetic injectable depots with high drug content and tunable pharmacokinetics for long-acting drug delivery	Journal of Controlled Release	-	-	-	-	1683659	10.1016/j.jconrel.2020.11.030	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097373436&doi=10.1016%2Fj.jconrel.2020.11.030&partnerID=40&md5=f7ce5fda0f0d5a5a1a8b0f0e43f2d866	Clinical studies have validated that antiretroviral (ARV) drugs can serve as an HIV pre-exposure prophylactic (PrEP) strategy. Dosing adherence remains a crucial factor determining the final efficacy outcomes, and both long-acting implants and injectable depot systems are being developed to improve patient adherence. Here, we describe an injectable depot platform that exploits a new mechanism for both formation and controlled release. The depot is a polymeric prodrug synthesized from monomers that incorporate an ARV drug tenofovir alafenamide (TAF) with degradable linkers that can be designed to control release rates. The prodrug monomers are synthetically incorporated into homopolymer or block designs that exhibit high drug weight percent (wt%) and also are hydrophobized in these prodrug segments to drive depot formation upon injection. Drug release converts these monomers to more hydrophilic pendant groups via linker cleavage, and as this drug release proceeds, the polymer chains losing hydrophobicity are then disassociated from the depot and released over time to provide a depot dissolution mechanism. We show that long-acting TAF depots can be designed as block copolymers or as homopolymers. They can also be designed with different linkers, for example with faster or slower degrading p-hydroxybenzyloxycarbonyl (hbzoc) and ethyloxycarbonyl (Alkyl) linkers, respectively. Diblock designs of *poly(oxo monomethacrylate)-b-poly(hbzoc TAF-methacrylate)* and *poly(oxo monomethacrylate)-b-poly(hbzoc TAF-methacrylate)* were first characterized in a mouse subcutaneous injection model. The alkylcarbamate linker design (TAF 51 wt%) showed excellent sustained release profiles of the key metabolites tenofovir (TFV) in skin and plasma over a 50-day period. Next, the homopolymer design with TAF (TAF 39 wt%) was tested in a rat subcutaneous injection model and showed sustained TFV-DP concentrations in dried blood spots (DBS) over 50 days. Importantly, TFV-DP concentrations in peripheral blood mononuclear cells (PBMC) were found to be at least 16-fold higher than the clinically suggested minimally IUPR protective concentration of 24 fmol/106 cells. These are the first reports of sustained parent TAF dosing observed in mouse and TFV-DP in mouse *PBMC*. PET imaging of ibodutuzumab labeled homopolymer depots showed that degradation and release of the depot coincided with the sustained TAF release. Finally, these polymers showed excellent stability in accelerated stability studies over a six-month time period, and exceptional solubility of over 750 mg/mL in the DMSO formulation solvent. The homopolymer designs have a drug reservoir potential of well over a year at mg/day dosing and may not require cold chain storage for global health and developed world long-acting drug delivery applications. © 2020	Drug delivery; HIV; Infectious disease; Long-acting depot; Polymer; Pre-exposure prophylaxis; RAPT; TAF	English	Netherlands	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Hoagland B.; Torres T.S.; Bezerra D.R.B.; Benedetti M.; Pimenta C.; Veloso V.G.; Grinsztejn B.	High acceptability of PrEP telconsultation and HIV self-testing among PrEP users during the COVID-19 pandemic in Brazil	Brazilian Journal of Infectious Diseases	-	-	-	-	14138670	10.1016/j.bjid.2020.11.002	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097739429&doi=10.1016%2Fj.bjid.2020.11.002&partnerID=40&md5=3f9e7a95f02110b1fa37a6faa67ce0e0	In March 2020, telemedicine and HIV self-testing were adopted by Brazilian Public Health services to minimize disruptions in pre-exposure prophylaxis (PrEP) access and delivery during the COVID-19 pandemic. To understand the acceptability of PrEP telconsultation and HIV self-testing, we conducted a web-based study during social distancing period (April–May, 2020) among men who have sex with men and transgender women. Participants were recruited from a PrEP demo project, individuals using social media. Out of the 2275 HIV negative respondents, 886 reported PrEP use and were included in this analysis. Median age was 33 years (IQR: 27–41), 96% cisgender men, 56% white, 74% high education, and 69% middle/high income. Willingness to use HIVST was 79% and 32% received an HIV self-testing during social distancing period. The majority (94%) reported using PrEP for HIV prevention before the pandemic, and 6% started PrEP during the pandemic. Most participants (98%) reported receiving PrEP medication every three months. High acceptability of PrEP telconsultation was reported by 78%. In refined logistic model, having higher education was associated with high acceptability of PrEP telconsultation (aOR1.62; 95%CI: 1.07–2.45). Our results point out that PrEP telconsultation and PrEP/HIV self-testing home delivery could be implemented by PrEP services in Brazil to avoid PrEP shortage during the COVID-19 pandemic and thereafter as an option to increase retention and adherence. © 2020 Brazilian Society of Infectious Diseases	Brazil; COVID-19; HIV self-testing; PrEP; Telemedicine	English	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Quantitative
Article	2021	Hojilla, J Carlo; Hurley, Leo B; Marcus, Julia L; Silverberg, Michael J; Skarbinski, Jacek; Satre, Derek D; Volk, Jonathan E	Characterization of HIV Preexposure Prophylaxis Use Behaviors and HIV Incidence Among US Adults in an Integrated Health Care System	JAMA Network Open	-	-	-	-	NA	10.1001/jamanetworkopen.2021.22092	https://www.proquest.com/scholarly-journals/characterization-hiv-preexposure-prophylaxis-use/docview/2667862230/se-2?accountid=9113	Importance Long-term follow-up is needed to evaluate gaps in HIV preexposure prophylaxis (PrEP) care delivery and to identify individuals at risk for falling out of care. Objective To characterize the PrEP cascade and HIV incidence among US adults in an integrated health care system. Design, Setting, and Participants This cohort study used data from the Kaiser Permanente Northern California electronic health records (EHR) or Kaiser Permanente Northern California to identify individuals aged 18 years and older who received PrEP care between July 2012 and March 2019. Individuals were followed up from date of linkage (defined as a PrEP referral or PrEP-coded encounter) until March 2019, HIV diagnosis, discontinuation of health plan membership, or death. Data were analyzed from December 2019 to January 2021. Exposures Sociodemographic factors included age, sex, race and ethnicity, and neighborhood deprivation index, and clinical characteristics were extracted from the EHR. Main Outcomes and Measures The primary outcomes were attrition at each step of the PrEP continuum of care and incident HIV infections. Results Among 13 596 individuals linked to PrEP care, the median (interquartile range [IQR]) age was 33 (27-43) years, 6771 individuals (50.1%) were White, and 11 227 (95.1%) were men. Total follow-up was 26 210 person-years (PY). Of 12 207 individuals linked to PrEP care, 89.1% (95% CI, 86.1%-89.9%) were prescribed PrEP and of these, 98.2% (95% CI, 97.2%-98.8%) initiated PrEP. After PrEP initiation, 52.2% (95% CI, 48.9%-55.7%) were retained in PrEP care during the study period, and 40.2% (95% CI, 36.8%-43.6%) were persistent with PrEP medication refills. There were 24 HIV seroconversions during the study period, for an HIV incidence rate of 0.09 (95% CI, 0.06-0.14) per 100 PY. In the Kaplan-Meier analysis, 1-year HIV incidence was 0.3% (95% CI, 0.1%-0.8%) among those who initiated PrEP care, 0.9% (95% CI, 0.4%-2.2%) among those who were linked to PrEP care, and 1.9% (95% CI, 1.0%-3.6%) among those who were referred to PrEP care. In the Black subsample, those aged 18 to 25 years had higher HIV incidence (1.3 per 100 PY; 95% CI, 0.4-3.9) than those aged 26 to 35 years (0.4 per 100 PY; 95% CI, 0.1-1.6) and those aged 36 to 45 years (0.4 per 100 PY; 95% CI, 0.1-1.7). Conclusions and Relevance In this cohort study, the PrEP cascade was suboptimal, with substantial attrition at each step of the PrEP continuum of care and incident HIV infections. Results from this study suggest that interventions to address these gaps in the PrEP continuum of care are needed to maximize PrEP impact and equity.	pre-exposure prophylaxis; Infectious; Disease prevention; African Americans; Age; hiv; substance use disorders; Electronic health records; Medical Sciences; hiv infections; attrition (experimental); continuity of patient care	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Holt M.; Broady T.R.; Mao L.; Chan C.; Bede J.; Ellard J.; O'Donnell D.; Grulich A.E.; Prestage G.; Bavinton B.R.	Increasing preexposure prophylaxis use and 'set prevention coverage' in behavioural surveillance of Australian gay and bisexual men	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000002797	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102227327&doi=10.1097%2FQAD.0000000000002797&partnerID=40&md5=1d4a0f63bca9f03bb7fc8253dc1feb	Objective(s): To assess trends in HIV preexposure prophylaxis among Australian gay and bisexual men (GBM) since the introduction of preexposure prophylaxis (PrEP), the level of set prevention coverage (the use of safe strategies), and the characteristics of HIV-negative and untested GBM who remain at risk of HIV. Design: Repeated behavioural surveillance of GBM recruited from venues, events and online in seven Australian states and territories. Methods: Participants with casual male partners were included. Trends in sexual practices, prevention strategies, set prevention coverage and the characteristics of at-risk participants were assessed with binary and multivariate logistic regression. Results: A total of 32 048 survey responses (2014-2019) were included. The proportion of participants who reported consistent condom use declined (48.6-32.2%). The proportion who reported any combination of strategies with casual partners increased (17.8-42.0%) but set prevention coverage (the use of safe strategies) declined (66.4-54.2%). The proportion who reported using condomless anal intercourse with casual partners increased (37.8-62.0%) but set prevention coverage declined (88.3-74.9%), with higher levels of undetectable viral load among HIV-positive participants and rapidly increasing PrEP use by HIV-negative participants. PrEP became the most commonly reported prevention strategy in 2019 (32.0%). In 2019, 1.9% of HIV-negative participants were using PrEP, 3.2% were taking other antiretroviral-based strategies and 4.9% were at risk of HIV because they were condomlessly viral load set on PrEP, 'At risk' participants became more likely to identify as bisexual and to be born overseas. Conclusion: There has been a rapid, historic uptake of HIV prevention among GBM in Australia. Net prevention coverage has increased among GBM and 'at risk' GBM have become less at risk of HIV, facilitating reductions in HIV transmission. © 2020 Wolters Kluwer Health, Inc. Article	2021	Holt M.; Lee E.; Lea T.; Bavinton B.; Broady T.; Mao L.; MacGibbon J.; Keen P.; Murphy D.; Bear B.; Crawford D.; Ellard J.; Kolstee J.; Power C.; Prestage G.; Grulich A.; Guy R.; de Wit J.	HIV preexposure prophylaxis cascades to assess implementation in australia: Results from repeated, national behavioral surveillance of gay and bisexual men, 2014-2018	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002243	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090807816&doi=10.1097%2FQAI.0000000000002243&partnerID=40&md5=3c4f9f7f8c9c910b4b5f98c2e6e39fa1	Background: HIV prevention cascades can assist in monitoring the implementation of prevention methods like preexposure prophylaxis (PrEP). We developed 2 PrEP cascades for Australia's primary HIV-affected population, gay and bisexual men. Methods: Data were drawn from 2 national, repeated, cross-sectional surveys (the Gay Community Periodic Surveys and PrEPARE Project). One cascade had 3 steps, and the other had 5 steps. Trends over time were assessed using logistic regression. For the most recent year, we identified the biggest drop between steps in each cascade and compared the characteristics of men between the 2 steps using multivariate logistic regression. Results: Thirty-nine thousand one hundred and seventy-seven HIV-positive men participated in the Gay Periodic Surveys during 2014-2018. PrEP eligibility increased from 20.1% (1901/8782) in 2014 to 37.3% (2935/7870) in 2018 (P < 0.001), awareness increased from 29.6% (563/1901) to 47.1% (1555/2935; P < 0.001), and PrEP use increased from 1.1% (21/1901) to 7.9% (232/2935; P < 0.001). Among PrEP-eligible men, 3.7% (108/2935) were using PrEP, 7.9% (232/2935) were aware but not using PrEP, and 88.4% (2595/2935) were neither aware nor using PrEP. Of those who were aware but not using PrEP, 37.5% (87/232) had discussed PrEP with a doctor, 76.3% (213/272) were using PrEP, 87.2% (207/233) had recently tested, and 73.8% (127/207) reported evidence of adherence. Ninety-two percent (176/547) were willing to use PrEP. Of the 5-step cascade, 7.9% (232/2935) reported concern and discussed PrEP with a doctor, 3.7% (108/2935) were using PrEP, 87.2% (207/233) had recently tested, and 73.8% (127/207) reported evidence of adherence. Conclusions: PrEP eligibility, awareness, and use have rapidly increased among Australian gay and bisexual men. The cascades identify disparities to uptake by eligible men as a result of socioeconomic factors and PrEP's acceptability. © 2020 Wolters Kluwer Health, Inc. Article	2021	Hoh, Marnie; MacGibbon, James; Bear, Brandon; Lea, Toby; Kolstee, Johann; Crawford, David; Murphy, Dean; Power, Cherie; Ellard, Jeanne; de Wit, John	Trends in Belief That HIV Treatment Prevents Transmission Among Gay and Bisexual Men in Australia: Results of National Online Surveys 2013-2019.	AIDS Education and Prevention	-	-	-	-	1943-2755	10.1521/aeap.2021.33.1.62	https://dx.doi.org/10.1521/aeap.2021.33.1.62	We have tracked belief in the effectiveness of HIV treatment as prevention (TasP) among Australian gay and bisexual men (GBM) since 2013. National, online, cross-sectional surveys of GBM were conducted in 2013, 2016, and 2019 (n = 5,095). Participants were recruited through gay community organizations, digital media, and dating apps. Logistic regression was used to identify factors associated with HIV-positive participants believing that their HIV treatment prevents transmission. Belief increased from 2.8% in 2013 to 24.6% in 2019. Belief in the effectiveness of TasP was consistently higher among HIV-positive participants than others. In 2019, higher levels of belief in TasP were independently associated with university education, being HIV positive, using pre-exposure prophylaxis, knowing more HIV-positive people, being recently diagnosed with a sexually transmitted infection (STI), and use of post-exposure prophylaxis. Belief that HIV treatment prevents transmission has increased substantially among Australian GBM, but remains concentrated among HIV-positive GBM, those who know HIV-positive people, and GBM who use antiretroviral-based prevention. Article	2021	Hong C.M.; Xu Y.; Chung J.Y.L.; Schultz D.M.; Wriedt M.; Varsolona R.J.; Zhong Y.-L.; Purohit A.K.; Hu C.Q.; Gauthier D.R., Humphrey G.R.; Maloney K.M.; Lovenjoe F.; Wang Z.; Whittaker A.M.; Sirois E.; McMullen J.P.	Development of a Commercial Manufacturing Route to 2-Fluoroalanine, the Key Unnatural Nucleobase of Islatravir	Organic Process Research and Development	-	-	-	-	10836160	10.1021/acs.oprd.0c00304	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108889888&doi=10.1021%2Facs.oprd.0c00304&partnerID=40&md5=505a9731c4e0b04ab0687bcdbc3f6f	We report the practical synthesis of a key fragment of islatravir (MK-8591), a novel nucleoside reverse transcriptase translocation inhibitor (NRTTI) currently under investigation for treatment and pre-exposure prophylaxis (PrEP) against HIV infection. The fragment, the unnatural nucleobase 2-fluoroalanine, is incorporated into MK-8591 via a biocatalytic aldol-glycosylation cascade, which imposes stringent requirements for its synthesis by synthesis and isolation. Presented herein is the development work leading to a practical, scalable route from guanine, featuring a diol fluorination sequence as well as Ti(III)-2,6-dihydroxypyridine intermediate that enables a mild, highly selective, direct amination. This one-pot fluorination/amination sequence utilizes a direct isotope to deliver high purity N-Teoc-2-fluoroalanine, which was then converted to the HCl salt in 5 steps and 30% overall yield. The aldol-catalyzed fluorination of 2-fluoroalanine in aqueous buffer delivers the appropriate purity profile to facilitate the enzymatic cascade to access MK-8591. © 2021 American Chemical Society. AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-021-03231-x	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8377598/	Understanding characteristics associated with adherence to pre-exposure prophylaxis (PrEP) methods for HIV-1 prevention may assist with optimizing intervention efforts. The dapivirine vaginal ring is a novel topical PrEP delivery method. Using data from a randomized, double-blind, placebo-controlled, phase III trial of the dapivirine vaginal ring conducted in four African countries, generalized estimating equation models were used to evaluate correlates of ring adherence. Two levels of quarterly dapivirine blood plasma, and dapivirine released from returned rings defined measures of adherence for recent and cumulative use, respectively. Time on study, calendar time, primary partner knowledge that the participant was taking part in the study, and use of long-acting contraceptive methods were associated with ring adherence whereas younger age, ring worries, condom use, episodes of menstrual bleeding and vaginal washing were associated with non-adherence. These findings may be useful for recruitment into future clinical studies and dapivirine ring implementation efforts. Article	2021	Hyndman I.; Nugent D.; Whitlock G.G.; McOwan A.; Gkrania-Klotsas E.	COVID-19 restrictions and changing sexual behaviours in HIV-negative MSM at high risk of HIV infection in London, UK	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2020-054768	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098945008&doi=10.1136%2Fsextrans-2020-054768&partnerID=40&md5=6643f3c6c996c73d0fc3c7f04c426c22	Objectives The COVID-19 pandemic and its related restrictions have affected attendance to and delivery of UK sexual healthcare services (SHS). We surveyed the impact on sexual behaviour of men having sex with men (MSM) to inform future SHS provision. Methods We conducted a cross-sectional, anonymous, web-based survey among HIV-negative MSM at high risk of HIV infection who attended 56 Dean Street, a sexual health and HIV clinic. The survey was conducted over a 7-day period in August 2020. Data on sociodemographic characteristics, sexual behaviour and related mental well-being (previously validated tools) during lockdown (defined as 23 March-30 June 2020) were extracted. Categorical and non-categorical variables were compared according to HIV pre-exposure prophylaxis (PrEP) use. Results 814 MSM completed the questionnaire: 75% were PrEP users; 70% reported they have been sexually active, of which 76% reported sex outside their household; 73% reported fewer partners during lockdown. Isolation/loneliness (40%) and anxiety/stress (27%) triggered sexual activity, and 71% had discussed COVID-19 transmission risks with their sexual partners. While 46% reported no change to emotion regulation/well-being during lockdown, PrEP users were more likely to report worsening mental well-being (p=0.01). Condomless sex was more frequent in PrEP users (p=0.01) with reduced COVID-19 transmission during sex. 30% accessed SHS and 30% reported difficulties in accessing testing/treatment. Of those who accessed SHS, 29% reported an STI diagnosis. PrEP users reported higher partner number, engagement in 'chemsex' and use of SHS than non-PrEP users. Conclusions COVID-19 restrictions had a considerable impact on sexual behaviour and mental well-being in our survey respondents. High rates of sexual activity and STI diagnoses were reported during lockdown. Changes to SHS provision for MSM must respond to high rates of psychological and STI-related morbidity and the challenges faced by this population in accessing services. © 2021 Author(s). Article	2021	Iannuzzi, Sara; von Kleist, Max	Mathematical Modelling of the Molecular Mechanisms of Interaction of Tenofovir with Emtricitabine against HIV.	Viruses	-	-	-	-	1999-4915	10.3390/v13071354	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8301035/	The combinations of the two nucleoside reverse transcriptase inhibitors (NRTI) tenofovir disoproxil fumarate (TDF) and emtricitabine (FTC) is used in most highly active antiretroviral therapies for treatment of HIV-1 infection. Besides its role in antiviral therapy, tenofovir has been proposed to act as a broad-spectrum antiviral drug by inducing premature chain termination during DNA synthesis in competition with natural deoxynucleoside triphosphates (dNTP) for incorporation into nascent viral DNA during reverse transcription. Once incorporated, they halt reverse transcriptase. In vitro studies have proposed that TDF and FTC act synergistically within an HIV-infected cell. However, it is unclear whether, and which, direct drug-drug interactions mediate the apparent synergy. The goal of this work was to refine a mechanistic model for the molecular mechanism of action (MMOA) of nucleoside analogues in order to analyse whether putative direct interactions may account for the in vitro observed synergistic effects. Our analysis suggests that depletion of dNTP pools can explain apparent synergy between TDF and FTC in HIV-infected cells at clinically relevant concentrations. Dead-end complex (DEC) formation does not seem to significantly contribute to the synergistic effect. However, in the presence of non-nucleoside reverse transcriptase inhibitors (NNRTIs), its role might be more relevant, as previously reported in experimental in vitro studies. Article	2021	Ibrahim M.E.; Castillo-Mancilla J.R.; Yager J.; Brooks K.M.; Ibrahman L.; Saba L.; Kiser J.J.; Mawhinney S.; Anderson P.L.	Individualized Adherence Benchmarks for HIV Pre-Exposure Prophylaxis	AIDS Research and Human Retroviruses	-	-	-	-	8892229	10.1089/aid.2020.0108	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107582003&doi=10.1089%2Faid.2020.0108&partnerID=40&md5=fc23f4d0f0c7d25bedb3eea3cc7cffb	Tenofovir diphosphate (TFV-DP) concentrations measured with dried blood spots (DBS) can be used to classify adherence to emtricitabine/tenofovir disoproxil fumarate (F/TDF) for HIV pre-exposure prophylaxis (PrEP). A TFV-DP of 700 fmol/punch was previously associated with high PrEP efficacy, and was estimated to represent ≥6 doses/week on average. However, intersubject variability in TFV-DP concentrations may lead to misclassification and decrease the precision of adherence-efficacy relationships. The purpose of this analysis was to evaluate sources of TFV-DP variability to improve the precision of TFV-DP for adherence assessments by incorporating individual characteristics. Data and samples from a 36-week study of TFV-DP in DBS, collected biweekly, among 48 HIV-negative volunteers (7 Females [26 Caucasian/10 African American/14 Hispanic] receiving F/TDF at 33%, 67%, and 100% of daily dosing under directly observed therapy) were analyzed. Mixed-effect pharmacokinetic models to describe TFV-DP accumulation with acceptable performance was a one-compartment constant input model. Covariates, including laboratory values and demographics were ranked by their contribution to model performance. Simulations were performed to identify benchmarks for adherence. Higher TFV-DP concentrations were observed in females than males, and in women benchmarks for ≥2, 2-3, 4-5, and 6-7 doses/week. Based on these simulations, the previously established protective TFV-DP concentration of ≥700 fmol/punch was observed in those taking 2-3 (in individuals ≤110 kg) and ≥4 (in individuals >110 kg) doses/week, amounting to a much lower rate of misclassification (17% vs. 30%) with this individualized model versus previous interpretations. Incorporating body weight and platelet count improved the precision of TFV-DP concentrations for adherence assessments. Previous benchmarks were conservative, indicating that pharmacological forgiveness of F/TDF may be higher than currently recognized and supports continued investigation of intermittent PrEP dosing regimens. Article	2021	Ibrahim, P; Samarawickrama, A; Hamzah, L; Vincent, R; Gilleece, Y; Waters, L; Kegg, S; Barbini, B; Campbell, L; Post, FA	Bone mineral density, kidney function, weight gain and insulin resistance in women who switch from TDF/FTC/NNRTI to ABC/3TC/DTG	HIV Medicine	-	-	-	-	NA	10.1111/hiv.12961	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02170861/full	Objectives: Tenofovir disoproxil fumarate (TDF) is associated with reduced bone mineral density (BMD). We evaluated changes in BMD in women who switched from TDF, emtricitabine and a nonnucleoside reverse transcriptase inhibitor (TDF/FTC/NNRTI) to abacavir, lamivudine and dolutegravir (ABC/3TC/DTG). Methods: We conducted a randomized controlled trial in which women aged ≥40 years were randomized 1:2 to continue TDF/FTC/NNRTI or switch to ABC/3TC/DTG. The primary endpoint was change in BMD measured by dual-energy X-ray absorptiometry at week 48. Secondary endpoints were changes in BMD of the lumbar spine and femoral neck and markers of bone turnover and kidney function up to week 48. We conducted exploratory analyses of weight gain, insulin resistance and lipids. Results: Of 120 women, 80 were randomized to ABC/3TC/DTG and 40 to TDF/FTC/NNRTI. Median (IQR) age was 51 (46–56) years, median CD4 cell count was 648 (interquartile range 479–880) cells/μL were randomized. Women who switched to ABC/3TC/DTG experienced greater bone mineral density (BMD) suppression and improvement in total hip BMD (mean adjusted difference = 3%, P = 0.027) and lumbar spine BMD (3%, P = 0.002), with no change in specific markers of bone turnover or renal tubular function. Although participants in the ABC/3TC/DTG arm gained more weight (2.8 kg, P = 0.046), the switch strategy was not associated with reduced insulin sensitivity or new-onset insulin resistance. Conclusions: Switching from TDF/FTC/NNRTI to ABC/3TC/DTG resulted in improved BMD. Although weight gain was common in women who switched from TDF/FTC/NNRTI to ABC/3TC/DTG, we did not detect adverse effects on glucose homeostasis. Larger studies need to confirm these findings.	*body weight gain; *bone density; *femoral neck; *kidney tubule function; *metabolic syndrome X; Adult; Anti-HIV Agents therapeutic use; Article; Bone Density Conservation Agents therapeutic use; Clinical article; Clinical trial; Controlled study; Dideoxynucleosides therapeutic use; Drug therapy; Dual-energy X-ray absorptiometry; Emtricitabine therapeutic use; Exploratory research; Female; Glucose homeostasis; HIV Infections drug therapy; Heterocyclic Compounds, 3-Ring; Human; Humans; Insulin Resistance; Insulin sensitivity; Kidney; Lamivudine therapeutic use; Linear regression analysis; Lumbar spine; Major clinical study; Middle Aged; Middle aged; Ovariectomy; Pelvic girdle; Pilot study; Prospective; Randomized controlled trial; Tenofovir therapeutic use; Weight Gain	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2021	Ikeda D.J.; Kaha K.; Agins B.D.; Habeeb J.E.; Tsai A.C.	Roll-out of HIV pre-exposure prophylaxis: A gateway to mental health promotion	BMJ Glob Health	-	-	-	-	20597908	10.1136/bmjgh-2021-007212	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112492745&doi=10.1136%2Fbmjgh-2021-007212&partnerID=40&md5=98ece4f4e7f7d2bc2de6c6a07bdcf6d9	HIV remains a pressing global health problem, with 1.5 million new infections reported globally in 2020. HIV pre-exposure prophylaxis (PrEP) can lower the likelihood of HIV acquisition among populations at elevated risk, yet its global roll-out has been discouragingly slow. Psychosocial factors, such as co-occurring mental illness and substance use, are high likelihood predictors likely to benefit from PrEP, and have been shown to undermine persistence and adherence. In this analysis, we review the high burden of mental health problems among PrEP candidates and contend that inattention to mental health status undermines efforts to implement PrEP on a global scale. We conclude that integration of mental health screening and treatment within PrEP scale-up efforts represents an important strategy for maximising PrEP effectiveness while addressing the high burden of mental illness among at-risk populations. As implementers seek to integrate mental health services within PrEP services, efforts to keep access to PrEP as low-threshold as possible should be maintained. Moreover, programmes should seek to implement mental health interventions that are sensitive to local resource constraints and seek to reduce intersecting stigmas associated with HIV and mental illness. ©	HIV; mental health & psychiatry	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review

Implementation of pre-exposure prophylaxis programme in Spain. Feasibility of four different delivery models	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0246129	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102390568&doi=10.1371%2Fjournal.pone.0246129&partnerID=40&md5=59ab83f0a8d547c56084455f62264f96	BACKGROUND: Daily oral pre-exposure prophylaxis (PrEP) is highly effective in preventing human immunodeficiency virus (HIV) infection if used adherently throughout periods of HIV risk. We estimated PrEP persistence among cohorts of persons with commercial or Medicaid insurance. METHODS: We analyzed data from the IBM MarketScan Research Database to identify persons aged 18-64 years who initiated PrEP between 2012 and 2017. We assessed PrEP persistence by calculating the time period that each person continued filling PrEP prescriptions without gaps of ≥30 days. We used Kaplan-Meier time-to-event methods to estimate the proportion of PrEP users who persisted with PrEP at 3, 6, and 12 months after initiation, and constructed Cox proportional hazards models to determine patient characteristics associated with PrEP discontinuation. RESULTS: We studied 11 807 commercially insured and 645 Medicaid insured persons with PrEP prescriptions. Commercially insured patients persisted for a median time of 13.7 months (95% confidence interval-CI, 13.3-14.1), compared to 6.8 months (95% CI, 6.1-7.6) among Medicaid patients. Additionally, female sex, younger age, residence in the South, and receipt of care from a gastroenterologist were associated with PrEP discontinuation. By 12 months, 38.2% (95% CI, 37.3%-39.1%), 29.1% (95% CI, 28.2%-30.0%), and 23.3% (95% CI, 20.9%-25.9%) of commercially insured persons aged 18-24, 25-44, and 45-64 years, respectively, persisted with PrEP. Among Medicaid patients, 2.3% (95% CI, 1.7%-3.0%) of persons aged 18-24 and 5.3% (95% CI, 4.4%-6.3%) of persons aged 25-44 persisted with PrEP. CONCLUSIONS: More than half of commercially insured patients initiated PrEP persisted with it for 12 months, compared to a third of those with Medicaid. A better understanding of reasons for nonpersistence is important to support persistent PrEP use and to develop interventions designed for the diverse needs of at-risk populations. Institutional	2021	Instituto Nacional de Salud-INS (Peru)	Profilaxis intermitente pre-exposición a la infección por VIH en población clave	-	-	-	-	-	NA	NA	https://fi-admin.hvsalud.org/document/view/m4gfv	INTRODUCCION: Este documento técnico se realiza a solicitud de la Estrategia Sanitaria de Prevención y Control de ITS, VIH/SIDA y Hepatitis B (ESPC ITS, VIH/SIDA y HB), CUADRO CLÍNICO: La profilaxis pre-exposición de la infección de VIH (PrEP) añade una opción adicional de prevención del VIH al uso de condones y lubricantes, asesoramiento conductual, profilaxis posterior a la exposición, tratamiento de las infecciones de transmisión sexual, circuncisión médica masculina voluntaria y terapia antirretroviral para las parejas que viven con el VIH. La PrEP reduce el VIH hasta en un 90 % en comparación con el placebo cuando se toma correctamente. Usualmente se basa en regímenes diarios utilizando Truvada ® o Descovy ®. TECNOLOGÍA SANITARIA: La PrEP se diaria se conocido también como "intermitente". También se utilizan términos para describir esquemas no diarios como "impulsado por eventos", "a demanda" o "off-label". Este ejemplo de esquema intermitente se pondría como: alternativa debido a la baja adherencia reportada de esquemas de PrEP diario. El lapso de PrEP "no diario" o "intermitente" que se ha descrito más consistentemente es el programa "2-1-1", lino significa tomar 2 pastillas de PrEP 2 a 24 horas antes del sexo, 1 pastilla 24 horas después de la primera dosis y 1 pastilla 24 horas después de la segunda dosis. OBJETIVOS: El objetivo de este documento es evaluar la eficacia y seguridad, así como documentos relacionados a la decisión de cobertura de esquemas de PrEP no diarios o intermitentes en la prevención de infección de VIH en hombres que tienen sexo con otros hombres (HSH), mujeres transgénero y trabajadores sexuales. METODOLOGÍA: Se realizó una búsqueda en las principales bases de datos bibliográficas: MEDLINE, LILACS, COCHRANE, así como en buscadores genéricos de Internet incluyendo Google Scholar y TRIPDATABASE. Adicionalmente, se hizo una búsqueda dentro de la información generada por los principales instituciones internacionales de infectología, y agencias de tecnologías sanitarias que realizan revisiones sistemáticas (RS), evaluación de tecnologías sanitarias (ETS) y guías de práctica clínica (GPC). RESULTADOS: Se seleccionaron seis RS, cuatro EC-As (presentadas en 5 publicaciones) y 2 estudios adhoc observacionales. Se identificaron cuatro GPC que abordan el uso de PrEP intermitente en HSH y mujeres transgénero. Los estudios incluyeron a HSH y mujeres transgénero de diferentes países, con edades de 18 años o más y de alto riesgo de infección, es abundante y se basa en dos grandes ensayos clínicos aleatorizados, así como en otros estudios posteriores. El estudio de cuatro regímenes no diarios se fundamenta a partir del estudio IPERGAY que demuestra que regímenes de PrEP no diarios son efectivos disminuyendo la incidencia de VIH comparado con placebo. Posteriormente, el estudio ADAPT, en múltiples publicaciones, demuestra que existe evidencia que los esquemas no diarios son de igual adherencia que los esquemas de PrEP diario en población de HSH y mujeres transgénero, sin embargo, muestra que en un subgrupo de HSH en New York los regímenes de PrEP diarios tendrían mayor adherencia. Otros ensayos clínicos muestran que la adherencia a regímenes diarios y no diarios sería equivalente. En general todos los guías de práctica clínica recabadas (cinco), aceptan PrEP no diario dentro de sus recomendaciones como una opción de esquema PrEP de VIH, cuya elección se basa en la preferencia del usuario. Article	2021	Irungu E.; Kilonzo N.; Velleza J.	Multi-level Interventions to Promote Oral Pre-exposure Prophylaxis Use Among Adolescent Girls and Young Women: a Review of Recent Research	Current HIV/AIDS Reports	-	-	-	-	15403568	10.1007/s11904-021-00576-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121570308&doi=10.1007%2fs11904-021-00576-9&partnerID=40&md5=a0646a0e9097317a300e9c0957a3d8b23	Purpose of review: This review summarizes interventions to promote HIV pre-exposure prophylaxis (PrEP) use among adolescent girls and young women (AGYW) in HIV endemic settings, while also highlighting gaps in our current measures of PrEP intervention success. Recent findings: AGYW report challenges with PrEP use, although the field is currently grappling with defining metrics of optimal PrEP use applicable for AGYW with dynamic HIV prevention needs. Ongoing studies are exploring multilevel interventions to address barriers to PrEP use for AGYW. At the individual and interpersonal levels, mHealth, drug-level feedback, adherence counseling, peer groups, and PrEP decision-support interventions are acceptable and feasible for AGYW although limited effectiveness data are available. At the health facility and community levels, PrEP service delivery models and social empowerment interventions are being explored to increase PrEP uptake and persistence among AGYW. Summary: As PrEP delivery continues to expand, improved metrics of success and evidence on the effectiveness of multi-level adherence support interventions are needed to maximize the impact of PrEP for AGYW in HIV endemic settings. We present case studies of these intervention approaches but limited data are currently available on the effectiveness of these approaches. We will look toward forthcoming study results on the impact of PrEP interventions, including mHealth, drug-level feedback and other enhanced counseling, peer support, decision-support tools, PrEP demand creation, modified refills, and integrated service delivery, to determine the ideal package of PrEP support approaches for AGYW. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Irungu E.M.; Mugwanya K.K.; Mugo N.R.; Bukusi E.A.; Donnell D.; Odoyo J.; Wamoni E.; Peacock S.; Morton J.F.; Ngure K.; Mugambi M.; Mukui I.; O'Malley G.; Baeten J.M.	Integration of pre-exposure prophylaxis services into public HIV care clinics in Kenya: a pragmatic stepped-wedge randomised trial	The Lancet Global Health	-	-	-	-	2214109X	10.1016/S2214-109X(21)00391-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110870768&doi=10.1177%2f13591821211026830&partnerID=40&md5=e17265	Background: Successful and sustainable models for HIV pre-exposure prophylaxis (PrEP) delivery in public health systems in Africa are needed. We aimed to evaluate the implementation of PrEP delivery integrated in public HIV care clinics in Kenya. Methods: As part of Kenya's national PrEP roll-out, we conducted a stepped-wedge cluster-randomised pragmatic trial to catalyse scale-up of PrEP delivery integrated in public HIV care clinics. We selected high-volume clinics in three regions (ie, those with a high number of people living with HIV currently in HIV care and treatment). Clinics (each representing a cluster) were stratified by region and randomly assigned to the order in which clinic staff would receive PrEP training and ongoing technical support using optimal sequences balanced on a bag. There was no masking. PrEP provision was done by clinic staff without additional financial support. Data were abstracted from records of individuals initiating PrEP. The primary outcome was the number of people initiating PrEP per clinic per month comparing intervention to control periods. Other outcomes included PrEP continuation, adherence, and incident HIV infections. This trial is registered with ClinicalTrials.gov, NCT03925181. Findings: After the baseline period, which started in January, 2017, every month two to six HIV care clinics crossed over from control to intervention, until August, 2017, when all clinics were implementing the intervention. Of 4898 individuals initiating PrEP (27 during the control period and 4871 during the intervention period), 2640 (54%) were women, the median age was 31 years (IQR 25–39), and 4092 (84%) reported having a partner living with HIV. The mean monthly number of PrEP initiations per clinic was 0·1 (SD 0·5) before the intervention and 7·5 (2·7) after intervention (adjusted rate ratio 36·42, 95% CI 16·04–82·68; p<0·0001). Of 4898 individuals who initiated PrEP, 3652 (75%) had documented follow-up visits, and 1206 (33%) discontinued PrEP at initiation. Tenofovir diphosphate was detected in 88 (96%) of 71 blood samples collected from a randomly selected subset of participants. Six HIV infections were observed over 2211 person-years of observation (incidence 0·26 cases per 100 person-years), three of which occurred at the first visit after PrEP initiation. Interpretation: We observed high uptake, reasonable continuation with high adherence, frequent PrEP restarts, and low HIV incidence. Integration of PrEP services within public HIV care clinics in Africa is feasible. Funding: National Institute of Mental Health and Bill & Melinda Gates Foundation. © 2021 The Author(s). Article	2021	Irungu E.M.; Odoyo J.; Wamoni E.; Bukusi E.A.; Mugo N.R.; Ngure K.; Morton J.F.; Mugwanya K.K.; Baeten J.M.; O'Malley G.	Process evaluation of PrEP implementation in Kenya: adaptation of practices and contextual modifications in public HIV care clinics	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25799	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119121054&doi=10.1002%2fjia2.25799&partnerID=40&md5=957f13e9ba42b4dcc4b533a731c33df	Introduction: In Africa, oral pre-exposure prophylaxis (PrEP) is largely provided via over-burdened public HIV care clinics. Successfully incorporating PrEP services into these clinics may require adaptations to practices outlined in national implementation guidelines and modifications to routine existing service delivery. We aimed to describe adaptations made by public HIV clinics in Kenya to integrate PrEP delivery into existing services. Methods: The Partners Scale-Up Project aimed to catalyse integration of PrEP in 25 public HIV care clinics. Between May and December 2018, we conducted qualitative interviews with health providers and documented clinic observations in technical assistance (TA) reports to understand the process of PrEP service integration. We analysed 36 health provider interview transcripts and 25 TA reports to identify clinic-level adaptations to activities outlined in Kenyan Ministry of Health PrEP guidelines and modifications made to existing service delivery practices to succeed with PrEP integration. We used a framework approach to code and analyse data, and summarized findings according to the RE-AIM framework. Results: Of 25 clinics, 52% were in urban settings. HIV care clinics often had long queues, limited space and inadequate HIV testing services. Most clinics adapted clinic flow to PrEP without extensive testing if education and adherence counselling as stipulated in the guidelines. More clinics initiated clients on PrEP without extensive testing if education and adherence counselling were provided. Where counselling and testing were done separately, PrEP clients were not recommended, a majority of clinics issued PrEP users two to three months of pills at a time. Clinics also implemented practices that had not been specified in the guidelines including incorporating PrEP-related topics into routine health talks, calling clients with missed PrEP appointments, discussing PrEP service delivery in regular staff meetings, 'fast-tracking' PrEP clients and dispensing PrEP in clinic rooms rather than at clinic-based pharmacies. PrEP initiation numbers were highest among clinics that did not require creatinine testing, conducted peer on-the-job PrEP training and those that decreased PrEP delivery in their routine meetings. Above-average continuation was observed among clinics that discussed PrEP in their routine meetings, dispensed PrEP in clinic rooms and offered PrEP at nontraditional hours. Conclusions: Health providers in public HIV care clinics instituted practices and made innovative adaptations to PrEP delivery to reduce barriers for clients and staff. Encouraging clinic level adaptations to national implementation guidelines will facilitate scale-up of PrEP delivery. © 2021 The Authors. Article	2021	Irungu, Elizabeth M.; Ngure, Kenneth; Mugwanya, Kenneth K; Awuor, Maryclline; Dollah, Annabelle; Ongolly, Fernandes; Mugo, Nelly; Hakim, Elizabeth; Wamoni, Elizabeth; Odoyo, Josephine; Morton, Jennifer F; Bershteyn, Gene; Mukui, Irene; Baeten, Jared M; O'Malley, Gabrielle	"Now that PrEP is reducing the risk of transmission of HIV, why then do you still insist that we use condoms?" the condom quandary among PrEP users and health care providers in Kenya	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2020.1744507	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85082633272&doi=10.1080%2f09540121.2020.1744507&partnerID=40&md5=3056a657a6ca64d540d6e8f27b862914	Communication around condom use in the context of PrEP service presents a potential conundrum for patients and providers. Within the Partners Scale-Up Project, which supports integration of PrEP delivery in HIV care clinics, we interviewed 43 providers and 61 PrEP users and identified themes relating to condom messaging and use. Most providers counselled PrEP initiators to always use both PrEP and condoms, except when trying to conceive. However, others reported concerns and rationales for not emphasizing condom use. Providers reported that PrEP users were sometimes confused or frustrated, with their insistence on using condoms in addition to PrEP. PrEP users generally regarded PrEP as a more flexible and desirable HIV prevention method than condoms, enabling increased sexual pleasure and congruence, and reducing the conflict and stigma associated with condom use. Innovative approaches to condom counselling in PrEP programs are needed. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	condoms; health care providers; HIV serodiscordant couples; Kenya; PrEP-scale up; public HIV care clinics	English	United Kingdom	Western and Central Europe and North America	Kenya	Eastern and Southern Africa	Kenya	Eastern and Southern Africa	Qualitative
Article	2021	Isermia, Valentine; Pheng, Bao; Lejeune, Annie Marie; Assafi, Bahar; Rincon, Giovanna; Zelie, Julia; Le Gac, Sylvie; Dupecz, Andrea; Michard, Florence; Veeralampatu, Yaralu; Ghosn, Jade	Pre-exposure HIV prophylaxis (PrEP) among transgender women: 3 years of follow-up in a university hospital in Paris.	Sexually Transmitted Diseases	-	-	-	-	1472-3263	10.1136/sextrans-2020-054618	https://dx.doi.org/10.1136/sextrans-2020-054618	OBJECTIVES: The principal outcome was to describe clinical characteristics of a transgender male-to-female (TGW) cohort followed for pre-exposure HIV prophylaxis (PrEP). INTRODUCTION: Few efforts and preventive interventions have targeted transgender population, despite them being at great risk of HIV infection. METHODS: This was a retrospective transgender male-to-female (TGW) cohort followed for PrEP at the Hôpital Européen Georges Pompidou in Paris between 2016 and January 2019.The principal outcome was to describe clinical characteristics of this TGW population. Secondary outcomes were PrEP uptake, treatment adherence and tolerance, sanitary system retention, hormonal therapy and STIs.Data about age, ethnicity, language, sex work and sanitary healthcare insurance coverage were also collected. RESULTS: Forty-nine TGW were included, with a median age of 31 years; 63/49 (67.7%) were from South America and 43/49 (87.7%) were sex workers. Forty-four 44/49 TGW (89.7%) had no regular healthcare insurance coverage. Nineteen out of 49 (38.7%) had a history of STI in the last 12 months. Hormone intake was reported in 16/49 (32.68%). PrEP with oral TDF/FTC was prescribed on a daily basis to 47/49 (95.9%) TGW. Thirty-seven TGW were followed-up for a median duration of 12 months (IQR 6–18 months). Adherence to PrEP was excellent: 36/37 (97.3%) TGW were still in follow-up was 9 months. CONCLUSIONS: Our data showed a very vulnerable population, with a high proportion of migrants, sex workers and with a low healthcare insurance coverage. Retention rate was high (71.4%). Further multi-component interventions are needed to improve global sex health approach, PrEP follow-up and sanitary system retention among TGW population. Article	2021	Iversen, Jenny; Ul H Qureshi, Salman; Zafar, Maliha; Buse, Mechtild; Maher, Lisa	HIV incidence and associated risk factors in female spouses of men who inject drugs in Pakistan.	Harm Reduction Journal	-	-	-	-	1477-7517	10.1186/s12954-021-00497-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8130466/	INTRODUCTION: Female sexual partners of men who inject drugs (MWID) living with HIV are at risk of HIV transmission. HIV prevalence estimates among non-drug-using female sex partners of MWID are scarce, with no studies documenting HIV incidence. We investigated HIV prevalence and incidence among female spouses of MWID registered at Nai Zindagi Trust (NZT), Pakistan, between 2012 and 2019. METHODS: NZT registration and service provision data for female spouses who participated in HIV testing and counselling calculated HIV prevalence and incidence using the person years (PY) method. Cox proportional hazards models identified factors associated with incident infection. RESULTS: Overall HIV prevalence among female spouses of MWID was 8.5%. Among 1,109 HIV-negative female spouses, 109 incident infections were observed, yielding an incidence rate of 3.5/100PY (95% CI 1.2-1.8). Independent predictors of incident infection were registration in Punjab province (AHR 1.73 (95% CI 1.2–2.48, p = 0.003) and 5 years of relationship duration (AHR 1.73 (95% CI 1.2–2.48, p = 0.003). Receiving HIV testing services was protective against infection (AHR 0.51, 95% CI 0.25-0.99, p = 0.047). Lack of condom use at last sex with husband was associated with HIV (AHR 2.03, 95% CI 1.4–2.94, p < 0.001), as was sexual violence by husband (AHR 1.67, 95% CI 1.1–2.53, p = 0.016) and husband's drug injection (≥ 5 children AHR 0.44 95% CI 0.22-0.88, p = 0.022). CONCLUSIONS: Additional efforts are needed to protect HIV transmission-vulnerable female spouses of MWID, including targeted provision of HIV education and access to HIV screening. Interventions that target MWID are also required, including evidence-based drug treatment and access to ART, including support to maximize adherence. Finally, consideration should be given to making HIV pre-exposure prophylaxis available to female spouses at high risk of HIV transmission, particularly young women and those whose husbands are not receiving, or have difficulty adhering to, ART. Article	2021	Jacht, M.; Bitter T.; Chromy D.; Schulz H.; Pichler K.; Bauer D.; Simbruner B.; Hartl L.; Schmidbauer C.; Mayer F.; Strassl R.; Maukonen M.; Aschwanden M.; Rulkruger T.	Outcomes of an HCV elimination program targeting the Viennese MSM population	Wiener Klinische Wochenschrift	-	-	-	-	435325	10.1007/s00508-021-01898-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110417494&doi=10.1371%2fjournal.pone.0246717&partnerID=40&md5=c92a3252cb2c1d89bd0528a6e38b4f31	Background and aims: Recent reports suggest an increasing incidence of hepatitis C virus (HCV) infections among MSM (men-who-have-sex-with-men). Early treatment with direct-acting antivirals (DAAs) achieves high cure rates and prevents further HCV transmission. We offered barrier-free HCV screening in the Viennese MSM population and immediate access to DAA treatment. Methods: In collaboration with gay health specialists, we screened for HCV-seropositivity in Viennese MSM between 2015 and 2020. Barrier-free HCV-RNA-PCR tests, transient elastography (TE) and immediate access to DAA treatment were offered. Results: A total of 310 HCV-seropositive patients were identified. Of these, 145 could be contacted and 109 attended their appointment at our clinic. HIV-coinfection was highly prevalent (n = 73, 67.0%). Most patients (n = 96, 88.1%) were treated with DAAs. Sustained virologic response (SVR) was achieved in 100% of patients with available follow-up. As reported by 32.1% and 13.8% of patients, respectively, Most MSM had already achieved sustained virological response (SVR) in previous antiviral treatment (n = 72, 66.1%) or experienced spontaneous clearance (n = 10, 9.2%). Advanced fibrosis was only detected in 3/109 (2.8%) patients. 30 MSM tested positive for HCV-RNA and DAA treatment was initiated in 29 patients – all achieved SVR. Conclusion: A targeted HCV test-and-treat program revealed a high prevalence of HCV seropositivity among Viennese MSM, potentially associated with high-risk sexual behavior and drug use. Early DAA treatment seems warranted in viremic HCV-MSM as SVR was 100%, which in turn prevents further HCV transmission. © 2021, The Author(s). Article	2021	Jackson, Kristopher J. Judge, Shana M.	Age- and Race-Related Differences in Advertised Health Behaviors Among Male Sex Workers in San Francisco Who Have Sex With Men.	Journal of the Association of Nurses in AIDS Care	-	-	-	-	1552-6917	10.1097/JNC.0000000000000199	https://dx.doi.org/10.1097/JNC.0000000000000199	ABSTRACT: Given the stigma surrounding sex work and the illegal nature of many aspects of commercial sex activity, empirical research is lacking regarding the health-related behaviors of sex workers, particularly male sex workers who have sex with men (MSM sex workers). To better understand the MSM sex worker community and their potential health needs, we assessed health-related behaviors as advertised online by MSM sex workers in the San Francisco area. Using descriptive and bivariate statistical tests, we examined whether age- and race-related differences existed among these sex workers in the following publicly advertised behaviors: use of pre-exposure prophylaxis and a willingness to engage in illicit drug use or condomless anal intercourse. Although we found no significant differences by race in terms of advertised pre-exposure prophylaxis use or willingness to engage in condomless sex, our results show statistically significant differences by race with respect to willingness to use illicit drugs. This difference could be driven by the younger average age of the non-White sex workers in our sample. These findings help inform our understanding of MSM sex work and its associated risks. Article	2021	Jackson-Gibson M.; Ezema A.U.; Orvos W.; Ware L; Okunrobu R.O.; Mbulla P.O.; Hirschhorn L.R.	Facilitators and barriers to HIV pre-exposure prophylaxis (PrEP) uptake through a community-based intervention strategy among adolescent girls and young women in Soshanguve, South Africa	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-021-11335-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85109936946&doi=10.1186%2f12889-021-11335-1&partnerID=40&md5=5ac63db138a0e11787b0fdbbe2ee4f	Background: While the introduction of HIV Pre-Exposure Prophylaxis (PrEP) as an HIV prevention strategy has allowed women to exercise more control over the reduction of HIV transmission rates, adolescent girls and young women in Sub-Saharan Africa continue to experience higher rates of HIV infections and bear the greatest disease burden. Understanding progress in PrEP uptake among adolescent girls and young women would enhance risk reduction in this vulnerable population. The Determined, Resilient, AIDS-Free, Mentored and Safe women (DREAMS) Initiative plays a key role in this risk reduction strategy. Methods: We performed a qualitative study to explore the facilitators and assess factors affecting initiation and persistence on PrEP among adolescent girls and young women enrolled in the DREAMS Initiative at Pamoja Community Based Organization in Kisumu, Kenya. We conducted key informant interviews (n = 15) with Pamoja Community Based Organization staff, health care providers and civic leaders. Additionally, we conducted focus group discussions with young women receiving PrEP and non-users (n = 40). We performed theory directed content analysis using the Consolidated Framework for Implementation Research to organize the identified facilitators and barriers. Results: We found that the use of the safe space model, decentralization of PrEP services, integration of sexual reproductive health services, and the availability of adolescent friendly services facilitated PrEP uptake. Barriers to PrEP implementation, initiation and persistence included stigma associated with the use of anti-retroviral drugs, drug side effects, frequent relocation of beneficiaries, limited resources for routine screening and medication monitoring, and a limited number of qualified health care workers for PrEP distribution and administration. Conclusion: Overall, the community roll-out of PrEP within the DREAMS Initiative was successful due to a number of key facilitating factors, which ultimately led to successful PrEP implementation, increased PrEP initiation and enhanced persistence among adolescent girls and young women. The identified barriers should be addressed so that a larger scale-up of PrEP roll-out is possible in the future. © 2021, The Author(s). Theses and Dissertations	2021	Jardim, Lucilia de Fátima Santana	Tecnologia educacional sobre profilaxia pré-exposição para travestis e mulheres trans: produção baseada em evidências	-	-	-	Universidade Federal do Amazonas	-	NA	NA	https://tede.ufam.edu.br/handle/tede/8486	Objetivo: Produzir uma tecnologia educacional sobre profilaxia pré-exposição - PrEP, para travestis e mulheres trans. Métodos: Estudo metodológico realizado em três etapas: revisão narrativa da literatura, análise de conteúdo temática e validação de conteúdo por especialistas. Resultados: Na revisão narrativa da literatura, foram encontrados 1.109 artigos, após aplicação dos critérios de inclusão, restaram 10 artigos, os temas geradores com base em informações técnicas do Protocolo Clínico e Diretrizes Terapêuticas para Profilaxia Pré-exposição de Risco à Infecção pelo HIV e outras do Ministério da Saúde. Na terceira etapa, foi produzida a tecnologia a partir da síntese dos resultados da revisão e dos temas geradores identificados. Resultados: Na etapa de revisão, obteve-se 64 produções; após o processo de análise, obteve-se uma amostra de 7 produções, publicadas entre 2015 e 2019, verificou-se que os estudos científicos encontrados que contemplavam tecnologias educacionais voltadas ao uso da PrEP foram restritos a poucos estudos, no entanto evidenciaram a importância do uso de tecnologias educacionais como meio social, aplicativo móvel para smartphone, plataformas on line de aconselhamento e realização de testes para o HIV, informação entre pares, intervenções grupais com pessoas trans que possibilitaram às mulheres trans e travestis sentirem-se acolhidas e que também permitiram maior conhecimento e interesse pelo uso da PrEP. Na etapa de identificação, emergiram 10 temas geradores: PrEP, Prevenção Combinada, Gerenciamento de Risco, Parceiros Sorodiscordantes, Práticas Sexuais, Parceiros Sexuais, Experiência Sexual, Violência e Estigma. Na etapa de síntese, foi produzida a tecnologia educacional sobre profilaxia pré-exposição para travestis e mulheres trans, intitulada "Prevenção Combinada: Profilaxia pré-exposição ao HIV para mulheres trans e travestis", que poderá ser veiculada na forma impressa ou digital, com 29 páginas, organizada a partir de 11 tópicos, com textos e ilustrações relacionadas à PrEP. Considerações Finais: A tecnologia educacional produzida poderá mediar processos de trabalhos educativos de profissionais de saúde com vistas à prevenção do HIV na população de mulheres trans e travestis, contribuir para o trabalho pelos pares, de prevenção e promoção à saúde sexual, promovida pelas próprias trans e travestis de associações e organizações da sociedade civil, do estado do Amazonas, sobre a importância do advento e uso da PrEP, focando uso de um gás com algumas especificidades elaboradas e direcionadas a essa população, como a linguagem de "pajubá", numa tentativa de melhor apropriação das informações básicas e terapêuticas quanto ao seu dessa importante ferramenta biomédica de prevenção. Article	2021	Jeanjean Bruno-Matieo; Kehkeshbech, Jennifer; Murphy, Anielle; Carvello, Lorena; Hadas, Eran; Tezli, Lydia; Scott, Travis M; Rivera-Mindt, Monica; Cunningham, Chinazo O; Arentzen, Julia H; Vinkey, David J; Berman, Joan W	Treatment with buprenorphine prior to EcoHIV infection of mice prevents the development of neurocognitive impairment.	Journal of Leukocyte Biology	-	-	-	-	1938-3673	10.1002/JLB.5AB0426-531R	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8752761/	Approximately 15-40% of people living with HIV develop HIV-associated neurocognitive disorders, HAND, despite successful antiretroviral therapy. There are no therapies to treat these disorders. HIV enters the CNS early after infection, in part by transmigration of infected monocytes. Currently, there is a major opioid epidemic in the United States. Opioid use disorder in the context of HIV infection is important because studies show that opioids exacerbate HIV-mediated neuroinflammation that may contribute to more severe cognitive deficits. Buprenorphine is an opioid derivate commonly prescribed for opiate opioid treatment. We used the EcoHIV mouse model to study the effects of buprenorphine on cognitive impairment and to correlate these with monocyte migration into the CNS. We show that buprenorphine treatment prior to mouse EcoHIV infection prevents the development of cognitive impairment, in part, by decreased accumulation of monocytes in the brain. We propose that buprenorphine has a novel therapeutic benefit of limiting the development of neurocognitive impairment in HIV-infected opioid abusers as well as in nonabusers, in addition to decreasing the use of harmful opioids. Buprenorphine may also be used in combination with HIV prevention strategies such as pre-exposure prophylaxis because of its safety profile. Article	2021	Jeyachandran, Priya; Garcia-Cremades, Maria; Vucicevic, Katerina; Bumpus, Namandjé N; Anton, Peter; Hendrix, Craig; Savic, Radojka	A Mechanistic In Vivo/Ex Vivo Pharmacokinetic-Pharmacodynamic Model of Tenofovir for HIV Prevention.	CPT: Pharmacometrics & Systems Pharmacology	-	-	-	-	2163-8306	10.1002/psp4.12583	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7905818/	Defining tissue and plasma-specific prophylactic drug concentrations is central to pre-exposure prophylaxis product development for sexual transmission of HIV-1. Pharmacokinetic (PK) data from study RMP-02/RV217 were used to develop a mechanistic model describing tenofovir (TFV) and tenofovir-diphosphate (TFV-DP) PK in plasma and rectal tissue. The data were collected in five matrices: TFV (plasma, rectal tissue homogenate), TFV-dp (peripheral blood mononuclear cells, rectal mononuclear cells (MMCs), rectal tissue homogenate). A vital growth compartment and a delayed effect compartment for gi24 antigen expression were measured from an ex vivo explant assay described HIV-1 infection and replication. Using a linear PK/pharmacodynamic model, MMC TFV/dp levels over 9,000 fmol/million cells in the explant assay provided apparent vital replication suppression down to 1%. Parameters were estimated using NONMEM version 7.4. Article	2021	Jenness S.M.; Knowlton G.; Smith D.K.; Marcus J.L.; Anderson E.J.; Siegler A.J.; Jones J.; Sullivan P.S.; Enns E.	A decision analytics model to optimize investment in interventions targeting the HIV preexposure prophylaxis cascade of care	AIDS	-	-	-	-	2690370	10.1097/QAD.0000000000002909	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111782216&doi=10.1097%2FQAD.0000000000002909&partnerID=40&md5=35a1d6c77569a52d4da0b0f1125265d2	Objectives:Gaps between recommended and actual levels of HIV preexposure prophylaxis (PrEP) use remain among MSM. Interventions can address these gaps but it is unknown how public health initiatives should invest prevention funds into these interventions to maximize their population impact.Design/We used a stochastic network-based HIV transmission model for MSM in the Atlanta area paired with an economic budget optimization model.MethodsThe model simulated MSM participating in up to three real-world PrEP cascade interventions designed to improve initiation, adherence, or persistence. The primary outcome was infections averted over 10 years. The budget optimization model identified the investment mixes that would produce different budgets that maximized infections averted, given current costs. A payer perspective Results:From the base 3.9% PrEP coverage level, the three interventions could increase coverage to 27%, trending to 12.3% of infections averted over 10 years. Uptake of each intervention had the greatest impact on infections averted, followed by persistence and adherence. Budgets of $1 million, $2 million, and $3 million maximized infections averted when investments involved a mixture of the initiation and persistence interventions but not the adherence intervention. If adherence intervention costs were halved, the optimal investment was roughly equal across interventions.Conclusion:Investments into the PrEP cascade through initiatives should account for the interactions of the interventions as they are collectively deployed. Given current intervention efficacy estimates, the total population impact of each intervention may be improved with greater total budgets or reduced intervention costs. © 2021 Lippincott Williams and Wilkins. Article	2021	Jewsbury, Sally; Garner, Anna; Redmond, Michael; Saxon, Care; Tee, Siew Yee; Ward, Chris James; McQuillen, Orla	Preparing for PrEP: the cost of delaying universal access in England.	Sexually Transmitted Diseases	-	-	-	-	1472-3263	10.1136/sextrans-2019-054410	https://dx.doi.org/10.1136/sextrans-2019-054410	OBJECTIVES: Pre-exposure prophylaxis (PrEP) is not commissioned within National Health Service (NHS) England. Individuals can access it privately online or by enrolment into a clinical trial. We established a list of individuals not enrolled in trials, awaiting PrEP. In response to the observation that patients awaiting PrEP trials were being referred with newly diagnosed HIV, we aimed to measure attendance, incident HIV, STI acquisition and missed opportunities for prevention. METHODS: The search was conducted for patients on the list from November 2017 to November 2019. We examined the electronic clinical records of those on the list and extracted demographic information, STI and HIV diagnoses. In addition, for those diagnosed with HIV, we reviewed risk factors including clearance and prior attendance at sexual health clinics. RESULTS: Of 1015 individuals on the list, 915 (90.1%) were successfully contacted and 100 (9.9%) were unreachable. Among those contacted, 137 (14.97%) had been contacted and deemed ineligible according to PrEP trial criteria, 45 (32.13%) had not responded to contact. We identified 17 new HIV infections in patients awaiting PrEP. Of these, 9/15 (60.00%) did not meet eligibility criteria at point of contact, though had been eligible at first referral. CONCLUSION: It is unacceptable that 15 patients acquired HIV while waiting. The individual lifetime cost of treating HIV is estimated at £360 000(1). This equals £3 432 000 for these 15 infections notwithstanding the psychological and physical burden. We advocate the immediate roll-out of universal PrEP for those who need it on the NHS. While this decision is delayed, harm is coming to those waiting. Wider provision of PrEP may encourage increased attendance, but must consider additional resources to accommodate added visits. We are relieved that at the point of final submission (21 March 2020) NHS England have recently announced funding of PrEP for eligible patients from, further details are pending. Article	2021	Jhunjhunwala K.; Dolward C.W.; Sharma S.; Makarova N.; Hoklder A.; Dinh C.; Mitchell J.; Wang L.; Zhang J.; Patel S.K.; Hirsekorn W.; Kuhan L.C.	Development, characterization and in vivo pharmacokinetic assessment of rectal suppositories containing combination antiretroviral drugs for bi-prevention	Pharmaceutics	-	-	-	-	19994923	10.3390/pharmaceutics13081110	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111432315&doi=10.3390%2Fpharmaceutics13081110&partnerID=40&md5=e026e8575fd525cdbe4056c41fe2bdb2a	Receptive anal intercourse (RAI) contributes significantly to HIV-acquisition underscoring the need to develop HIV prevention options for populations engaging in RAI practices. We explored the feasibility of formulating rectal suppositories with potent antiviral drugs for on-demand use. A fixed-dose combination of tenofovir (TFV) and elvitegravir (EVG) (40 mg each) was co-formulated in six different suppository bases (three fat-and three water-soluble). Fat-soluble witepsol H15 and water-soluble polyethylene glycol (PEG) based suppositories demonstrated favorable in vitro release and were advanced to assess in vivo pharmacokinetics (PK) and rectal safety following single dose administration in macaques. In vitro drug release profiles were similar for both suppository bases. Median concentrations of TFV and EVG detected in rectal fluids at 2 h were 2-and 2-logs higher than the in vitro IC50, respectively. TFV-diphosphate levels in rectal tissues met or exceeded those associated with high efficacy against rectal simian HIV (SHIV) exposure in macaques. Leveraging on these findings, a PEG-based suppository with a lower dose combination of tenofovir alafenamide (TAF) and EVG (8 mg each) was co-formulated in an effort to achieve similar rectal drug exposures in macaques. This study establishes the utility of rectal suppositories as a promising on-demand strategy for HIV PrEP and supports their clinical development. © 2021 by the authors. Theses and Dissertations	2021	Jijon Albán, Sofía	Prevention of infectious diseases in the context of effective treatment : a game-theoretic approach : La prévention des maladies infectieuses dans le contexte de traitements efficaces : une approche par la théorie des jeux	-	-	-	Sorbonne Université	-	NA	NA	http://www.theses.fr/2021SORUS104	The thesis concerns the mathematical modelling of infectious diseases, addressing the individuals' dilemma of prevention versus treatment. In particular, we address the decision-making on whether to adopt prevention, to avoid infection during an ongoing epidemic, in a context where efficient treatment is available. We aim to determine whether and under what conditions prevention measures for the population could avert an epidemic. We build a mathematical model combining a deterministic model, to describe disease transmission at the population level, and a game-theoretic model, to describe decision-making the individual level. We assume that individuals who balance between the dilemma of prevention versus treatment by choosing the strategy that benefits them the most, in the long term. First, we study voluntary vaccination against childhood infectious diseases, and apply our findings to measles. Second, we study the voluntary adoption of pre-exposure prophylaxis to avoid HIV infection by individuals at high risk of infection. We consider cases where the decision-making is influenced by the behaviour of others, and cases where it is not. Finally, we study the adoption of an individual to adopt prevention voluntarily, as a function of prevention cost and effectiveness. Our results suggest that epidemic elimination is possible, provided that individuals perceive the relative cost of	Épidémiologie comportementale; Prévention volontaire; Élimination épidémique; Théorie des jeux; Modèle compartimental; Santé publique; Behavioral epidemiology; Voluntary prevention; Epidemic elimination; Game theory; Compartmental model; Public health; 614.44	English	France	Western and Central Europe and North America	France	Western and Central Europe and North America	-	-	Quantitative
Article	2021	Jijón S.; Molina J.-M.; Costagliola D.; Supervie V.; Bruhan R.	Can HIV epidemics among MSM be eliminated through participation in preexposure prophylaxis rollouts?	AIDS	-	-	-	-	2690370	10.1097/QAD.0000000000003012	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121480898&doi=10.1097%2FQAD.0000000000003012&partnerID=40&md5=4c34dce051c1b41a2f6d8f0328078bb2	Objective:To study the conditions under which preexposure prophylaxis (PrEP) coverage can eliminate HIV among MSM in the Paris region.Design:Mathematical modeling.Methods:We propose an innovative approach, combining a transmission model with a game-theoretic model, for decision-making about PrEP use. Individuals at high risk of HIV infection decide to use PrEP, depending on their perceived risk of infection and the relative cost of using PrEP versus antiretroviral treatment (ART), which includes monetary and/or nonmonetary aspects, such as pain and aversion. The transmission model of ART-naive, HIV-infected and lifelong ART-Results:If individuals assessed correctly their infection risk, and the cost of using PrEP were sufficiently low, then the PrEP rollout could lead to elimination. Specifically, assuming that PrEP was 86% effective, HIV incidence was reduced by 90% within 10 years, and elimination was achieved, if the probability of using PrEP was at least 9 times greater for 10% of the most at-risk MSM and 3 times greater for the remaining 90% than for the rest of the MSM population. Elimination was also achieved if 30% of MSM used PrEP and 30% of samples condom drop by MSM using PrEP slightly increases the minimum PrEP coverage required for elimination, by +1%, whereas underestimation of their own HIV infection risk would require PrEP programs reduce the cost of using PrEP by a factor ~2 to achieve elimination.Conclusion:Elimination conditions are not yet met in the Paris region, where at most 47% of high-risk MSM were using PrEP as of mid-2019. Further lowering the cost of PrEP and promoting a better perception of HIV risk are required and should be monitored in the long-run, to maintain elimination status. © 2021 Lippincott Williams and Wilkins. Adherence to daily HIV pre-exposure prophylaxis in a large-scale implementation study in New South Wales, Australia	AIDS	-	-	-	-	2690370	10.1097/QAD.0000000000002970	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114499124&doi=10.1097%2FQAD.0000000000002970&partnerID=40&md5=e6c39bc389f321d4be7c70af92e0f5a78	Objective:To examine patterns of long-term adherence to pre-exposure prophylaxis (PrEP) adherence and its association with HIV seroconversion in NSW, Australia.Design/Population-based HIV PrEP implementation study.Methods:Data from enrolled PrEP implementation participants in New South Wales was an open-label study of daily oral PrEP which recruited participants from March 2016 to April 2018. Adherence was measured using dispensing records. PrEP discontinuation was defined as an at least 120-day period without PrEP dispensing records. Long-term adherence patterns were identified using group-based trajectory modelling.Results:Participants dispensed at least once (n = 9586) were almost all male (98.5%), identified as gay (91.3%), with a median age of 34 years (range: 18-80). Of the 6840 (67.4%) participants who had at least 9 months of follow-up since their first dispensing, 1982 (38.1%) discontinued PrEP. Four distinct groups of PrEP adherence were identified: 'Steep decline' (13.9%), 'Steady decline' (11.6%), 'Good adherence' (37.4%), and 'Excellent adherence' (37.2%). Older (P < 0.001) and gay-identified (P < 0.001) participants were more likely to have higher adherence, as were those living in postcodes with a higher proportion of gay-identified male residents (P = 0.001). Conversely, those who at baseline reported recent crystal methamphetamine use and had a recent diagnosis of sexually transmitted infection (STI) had lower adherence (P < 0.001). Overall HIV incidence was 0.84 per 1000 person-years (95% confidence interval: 0.49-1.81; n=9) and was highest in the 'steep decline' group (2.74 per 1000 person-years). Those who had HIV seroconversion events were younger, more likely to have a recent STI and reported lower levels of adherence. They were more likely to be younger and report a recent STI or methamphetamine use prior to PrEP initiation. © 2021 Lippincott Williams and Wilkins. Article	2021	Jinda, Lydia; Gu, Siye; Plyumkar, Widhastuti; Anti Setiawati; Cornelia, Arthe; Putri, Tarisanda Adrani; Rukhmat, Fani Fadillah; Warwandani, Rizky Annise; Prabhu, Shirley Mark; Sulaiman, Nurjamdi; Pronyk, Paul M	Alarmingly High HIV Prevalence Among Adolescent and Young Men Who have Sex with Men (MSM) in Urban Indonesia.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-021-03347-0	https://pubmed.ncbi.nlm.nih.gov/34143341/	Indonesia's HIV epidemic is concentrated among key populations. While prevalence among men who have sex with MSM is high, transmission among young MSM (15-24 years-old) remains poorly understood. We conducted a respondent-driven sampling survey of 211 young MSM in urban Bandung, Indonesia in 2018-2019 to estimate HIV prevalence and associated risk factors. Thirty percent of young MSM were HIV-infected, 4-times greater than in nearly 100-fold greater than Indonesia's population prevalence and overall higher than average estimates for young MSM across Asia and the Pacific Region. Individual risk factors associated with HIV infection were being 20-24 years old, having a steady partner and preferring the receptive position during sex. Issues of stigma, discrimination and social exclusion were common. For young MSM who were open with family members about their sexual identity. Among those that were, close to half reported experiencing feelings of aversion from those groups. Wider structural factors that reduce social tolerance, restrict the rights of young MSM and compel concealment of sexual identity are likely to fuel high-risk behaviors and limit access to essential testing care and support services including pre-exposure prophylaxis which is not yet widely available. Urgent health, social, legal and political actions are required to respond to these factors and reduce the disproportionate contribution of young MSM to Indonesia's HIV epidemic. Article	2021	Jones J.T.; Smith D.K.; Wiener J.; August E.M.; Finlayson T.; Wejnert C.	Assessment of PrEP Awareness, PrEP Discussion with a Provider, and PrEP Use by Transmission Risk Group with an Emphasis on the Southern United States	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03164-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100195758&doi=10.1007%2Fs10461-021-03164-5&partnerID=40&md5=40a23b4e05554a8c6ca7dd7266af7e	The number of new HIV diagnoses is highest in the South. Many persons who might benefit from pre-exposure prophylaxis (PrEP) are not engaged in the HIV PrEP continuum of care. We analyzed National HIV Behavioral Surveillance data to assess engagement in the PrEP continuum of care among persons with increased HIV risk. We compared PrEP awareness, discussion with a clinical provider, and use among persons living in the South with those living elsewhere in the US. Among persons who reported condomless anal sex with a male partner, PrEP awareness was 10% lower (p < 0.001) and PrEP use was 6% lower (p < 0.001) among persons who inject drugs. PrEP use was low among each population (≤ 35% for all cycles). There was limited evidence of differences in PrEP use between persons in southern and non-southern U.S. Efforts are needed to increase use of PrEP among each of the groups with increased HIV risk. © 2021, This is a U.S. government work and not under copyright protection in the U.S.; foreign copyright protection may apply. Theses and Dissertations	2021	Jones, Michael; Pybluk, Scott	The #Tweeterhere Experience: A Phenomenological Exploration of Young Gay Men on Pre-exposure Prophylaxis (PrEP)	-	-	-	Adler University	-	NA	NA	https://www.proquest.com/dissertations-theses/tweeterhere-experience-phenomenological/docview/2585002750/se-2?accountid=8113	This qualitative study explored the lived experiences of ten young gay men on Pre-Exposure Prophylaxis (PrEP) for HIV prevention. This study focused on ten semi-structured interviews of gay men aged 27–39 who had been taking PrEP for HIV prevention for a minimum of six months. Questions were asked about their general experiences on PrEP as well how they felt the effected various domains of their lives, including their sexual, interpersonal, psychological and overall experiences of being on PrEP. Questions were also asked about their experiences of mental health, stigma, perception of HIV and sexual health, and how PrEP has impacted these experiences. Participants were also asked about their experiences of PrEP in relation to their sexual orientation and gender identity. The experiences of stigma and knowledge of HIV and PrEP, prevention. Each key theme was broken down into sub-themes to further explore each participant's lived experiences on PrEP. The underlying theme of "essence" of the experiences was a shift in autonomy, from loss to more. Results from this study are of particular importance for clinicians as we continue to learn more about the changing impact of HIV and evolving HIV prevention methods have on the individual and collective experiences of the gay male community. Article	2021	Jongen V.W.; Hoornenborg E., van den Elshout M.A.M.; Boyd A.; Zimmermann H.M.L.; Coyer L.; Davidovich U.; Anderson P.L.; de Vries H.J.C.; Prins M.; Schim van der Loeff M.F.	Adherence to event-driven HIV PrEP among men who have sex with men in Amsterdam, the Netherlands: analysis based on online diary data, 3-monthly questionnaires and intracellular TFV-DP.	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25708	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107349406&doi=10.1002%2Fjia2.25708&partnerID=40&md5=985dc0b1fdd6e4b9bc7a9f43dfc760a	Introduction: Event-driven pre-exposure prophylaxis (edPrEP) with oral tenofovir disoproxil fumarate (TDF)/emtricitabine (FTC) is highly effective for preventing HIV acquisition in men who have sex with men (MSM) and is preferred over daily PrEP by some MSM. However, it is largely unknown how well MSM adhere to edPrEP. We then aimed to assess PrEP protection during CAS among MSM using edPrEP and participating in the Amsterdam PrEP demonstration project (AMPrEP). Methods: We analysed data from participants enrolled in AMPrEP who were taking edPrEP. We measured adherence through (1) a mobile application in which sexual behaviour and PrEP use were recorded daily, (2) three-monthly self-completed questionnaires and (3) dried blood spot (DBS) samples collected around sti, urethr and rectalv three months after PrEP initiation. We assessed the proportion of days with PrEP use (CAD) acts that were protected by PrEP, per participant (i.e. steady partners, casual partners, unknown casual partners), and the proportion of three-month periods during which PrEP was correctly used. Intracellular TFV-diphosphate (TFV-DP) concentrations were determined from DBS. Results: Between 1 December 2015 and 1 December 2017, 200 MSM were enrolled in AMPrEP. Of 200 participants, 180 (90%) were taking edPrEP. Of 180 edPrEP users, 164 (91%) had at least one three-month period. Of the 8254 CAS days that were reported in the app during edPrEP use, we observed good protection for most CAS days involving steady partners (n = 2625/2655, 98.9%), known casual partners (n = 3210/3472, 92.4%) and unknown casual partners (n = 2074/2297, 90.3%). Men reported consistently correct PrEP use in 851 (81.4%) of the 1046 three-month periods of edPrEP-use. The median TFV-DP concentration was 591 fmol/sample (interquartile range = 276 to 896). Conclusions: Adherence to edPrEP was high as determined from the online app and questionnaires. DBS measurements were consistent with two to three tablets per week on average. © 2021 The Authors. Article	2021	Jongen V.W.; Reynders T.; Ypma Z.M.H.; Schim van der Loeff M.F.; Davidovich U.; Zimmermann H.M.L.; Coyer L.; van den Elshout M.A.M.; de Vries H.J.C.; Wouters K.; Smeekens T.; Vuylsteke B.; Prins M.; Lage M.; Hoornenborg E.	Choosing event-driven and daily HIV pre-exposure prophylaxis - data from two European PrEP demonstration projects among men who have sex with men	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25768	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141190224&doi=10.1002%2Fjia2.25768&partnerID=40&md5=ea9b25f0b8178d8f7199d207ba815589	Introduction: Daily and event-driven PrEP are both efficacious in reducing the risk for HIV infection. However, the practice of event-driven PrEP (edPrEP) is less well studied, in particular when provided as an alternative to daily PrEP. We studied regimen preferences and switches, and sexually transmitted infection (STI) incidence. Methods: We analysed pooled data from two prospective cohort studies among MSM: the PrEP-need, Belgium and AMPrEP, the Netherlands. In both studies, participants could choose between daily and edPrEP at three-monthly study visits, were offered free access to and for sexually transmitted infections including hepatitis C (HCV). We assessed the proportion choosing each regimen, and the determinants of choosing edPrEP at baseline. Additionally, we compared the incidence rates (IR) of STI, HCV and HIV between participants choosing daily PrEP and edPrEP. Results: Between 2015 and 2018, 1032 MSM were enrolled in PrEP-need and AMPrEP. Of 1032 MSM, 649 (63%) chose daily PrEP and 383 (37%) edPrEP. Participants choosing edPrEP were younger (aOR = 0.96, 95%CI: 0.94–0.98), more often used recreational drugs (aOR = 1.66, 95%CI: 1.15–2.40), and more often had sex with casual partners (aOR = 1.20 per 10 years, 95% confidence interval (CI): = 1.15 to 1.66) and those unemployed (aOR = 1.68, 95% CI = 1.03 to 2.75) were more likely to initially choose edPrEP. IR of HCV and syphilis did not differ between regimens, but the IR of chlamydia/gonorrhoea was higher among daily users (adjusted incidence rate ratio = 1.61, 95% CI = 1.35 to 1.94). Conclusions: A quarter of participants chose edPrEP at baseline and at 28 months this proportion was similar. Although the IR of HCV and syphilis were similar in the two regimens, the lower incidence of chlamydia and gonorrhoea among edPrEP users may suggest that less frequent STI testing of this group could be considered. © 2021 The Authors. Article	2021	Jongen V.W.; Zimmermann H.M.L.; Boyd A.; Hoornenborg E.; Van Den Elshout M.A.M.; Davidovich U.; Van Duijnhoven Y.T.H.P.; De Vries H.J.C.; Prins M.; Schim Van Der Loeff M.F.; Coyer L.	Transient Changes in Preexposure Prophylaxis Use and Daily Sexual Behavior after the Implementation of COVID-19 Restrictions among Men Who Have Sex with Men	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002697	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110961606&doi=10.1097%2FQAI.0000000000002697&partnerID=40&md5=c4552bc40fa6f0fb77801c4dbc17bc	Background:We assessed how the Dutch restrictions imposed on March 15, 2020, affected sexual behavior, pre-exposure prophylaxis (PrEP), and condom use among PrEP users in Amsterdam.Methods:We used data on (1) PrEP use, (2) anal sex acts, and (3) condom use, per partner type steady partners (SPs), known casual partners (KCPs), and unknown casual partners (UCPs), collected daily through a mobile application used between October 1, 2016, and June 30, 2020. We compared these parameters before versus after March 15, 2020, regarding average proportions of days per week on which each end point was reported and average proportion of anal sex acts covered by PrEP and/or condoms.Results:We included data from 236 men who have sex with men, of whom 200 (84.7%) were white, and 200 (84.7%) were living in Amsterdam. Between March 15, 2020, and June 30, 2020, 1,690 anal sex acts were reported by 151 participants (64.0%). Of 1,690 acts, 1,183 (70.0%) were with SPs, 411 (24.3%) with KCPs, and 96 (5.7%) with UCPs. Between March 15, 2020, and June 30, 2020, PrEP use during sex decreased with UCPs (β = −0.36; 95% CI = −0.72 to 0.00) but not with SPs and KCPs. Condom use during sex decreased with KCPs (β = −0.36; 95% CI = −0.67 to 0.04) and UCPs (β = −0.24; 95% CI = −0.46 to 0.01) but not with SPs.Conclusions:MSM decreased sex with casual partners and increased sex with SP, but changes were transient. Decreases in sex acts with casual partners paralleled decreases in PrEP use. However, condom use during sex with casual partners decreased, indicating the importance of continued sexual health services, including sexually transmitted infections screening and PrEP care, during COVID-19 restrictions. © 2021 Lippincott Williams and Wilkins. Article	2021	Jose, Rishi; Narendran, G; Manigbas, M.J.; Nelson, K.E.; Ranganathan, K.	Rising prevalence of HIV infection and associated risk factors among young Thai Men in 2018.	Scientific Reports	-	-	-	-	20452322	10.1038/s41598-021-87474-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104849784&doi=10.1038%2Fs41598-021-87474-7&partnerID=40&md5=f8c8a7cb0a6ad0c45d2f0d9f1b836aca	The prevalence of HIV among young Thai men stabilized at 0.3% from 2005 to 2011. A cross-sectional study was conducted among the male army conscripts in 2018 at 30 military training units nationwide. All new conscripts in each selected unit were invited to participate in the study. Questionnaires were used to determine risk factors for HIV infection that had been developed from related risk factors studies among young Thai men. Among 4629 participants, 44 (1.0%) HIV positive individuals were identified. The proportion subject reporting a history of sex with another man was 10.1%. The prevalence of HIV infection among men who have sex with men (MSM) was 6.0%. The proportion of consistent condom use with a male partner was 39.7%. The risk factors of HIV infection included having sex with another man, history of sexually transmitted infection and history of sex in exchange for gift/money. Only 1.4% of MSM used pre-exposure prophylaxis (PrEP). HIV prevention programs including PrEP in Thailand should be emphasized among MSM to both retail and urban settings. © 2021, The Author(s).	adolescent-sectional study;human|human immunodeficiency virus infection/molecular homosexuality|military personnel|pre-exposure prophylaxis|prevalence|questionnaire|risk factors|sexual behavior|Thailand|young adult	English	United Kingdom	Western and Central Europe and North America	Thailand	Asia and the Pacific	Thailand	Asia and the Pacific	Quantitative

Article	2021	Jose Ramon Fore; Sica, Salvatore; Mariottonetta Di Stefano	To Run with the Hares and Hunt with the Hounds: How to get HIV Transmission Reduced in MSM Using PrEP without Increasing STI Incidence?	Open AIDS Journal	-	-	-	-	1874613X	10.2174/1874613602115010001	https://www.proquest.com/scholarly-journals/run-with-hares-hunt-hounds-how-get-hiv/docview/2669115682/se-2?accountid=9113	HIV pre-exposure prophylaxis (PrEP) refers to a primary prevention strategy aimed to reduce the risk of HIV acquisition through sexual contacts that consists in administering antiretroviral drugs to uninfected individuals belonging to high-risk populations, in particular men who have sex with men (MSM), not compliant to regular condom use and nonetheless engaging in high risk promiscuous sexual activities. Undoubtedly, the introduction of PREP in the HIV prevention in clinical setting had dramatic effects on HIV transmission in at-risk categories: several studies demonstrated significant decreases in HIV infection incidence in cohorts subjected to PrEP administration 2 and this leads health authorities to promote implementation of PrEP use worldwide ... why speak about the relationships between PrEP MSM users and STI? Because we are facing nowadays an STI epidemic reaching all-time highs that leads to greater health problems and rises concerns about both morbidity and issues such as antimicrobial resistance and MSM is the population more heavily affected by the problem. ... PrEP, nor may or may not increase STI incidence in MSM. Article	2021	Kadamudla-Ibarra H.; Harvley N.L.; Sosa-Rubí S.G.; Wilson-Barthes M.; Galárraga O.; Franco R.R.	Barriers and facilitators to pre-exposure prophylaxis uptake among male sex workers in Mexico: an application of the RE-AIM framework	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-021-12167-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120881704&doi=10.1186%2fs12889-021-12167-9&partnerID=40&md5=e75bd8c714c3e729f4b7c3ae9f70ca3	Background: The InPrEP Mexico demonstration project is the first to distribute free HIV pre-exposure prophylaxis (PrEP) to men who have sex with men (MSM) and transgender women living in Mexico. In Mexico City, MSM who are also male sex workers (MSWs) face a disproportionately high risk of HIV infection. PrEP, a highly effective HIV prevention, yet "real-life" implementation among MSWs is a challenge due to the unique adherence barriers faced by this population. Methods: This study uses the RE-AIM implementation science framework to characterize the unique barriers to and facilitators of PrEP uptake among MSWs in Mexico City. We conducted 9 in-depth key informant interviews and 2 focus group discussions with MSWs across 3 clinic and community sites. Qualitative data were analyzed using the RE-AIM framework to identify barriers and facilitators to PrEP uptake among MSWs and recommendations to improve the implementation of PrEP among this population. Results: The Reach of the InPrEP program among MSWs in Mexico City and the potential for PrEP Adoption among other high-risk populations is the strength of the implementation. Results: The Reach of the InPrEP program among MSWs was 10% of known HIV-negative MSWs in Mexico City. Program Reach was lowest among MSWs who were street-based sex workers, of lower socioeconomic status, migrants from other states and self-identified as heterosexual. Barriers to program Reach included limited PrEP knowledge, HIV-related stigma, and structural barriers; facilitators included in-person program recruitment, patient-centered care, and spread of information through word of mouth among MSWs. Two out of the four eligible institutions had adopted the InPrEP protocol. Barriers to wider program Adoption included HIV- and sexual identity -related stigma, protocol limitations, and lack of a national policy for PrEP distribution; facilitators of Adoption included existing healthcare infrastructure, sensitized providers, and community support from non-governmental organizations. Conclusions: Increasing the InPrEP program's Reach among MSWs will depend on improving PrEP education and addressing HIV-related stigma and access barriers. Further Adoption of the InPrEP program should leverage existing clinical infrastructure and community support. Creation of a national policy for PrEP distribution may improve the Reach and Adoption of PrEP among highest-risk populations in Mexico. © 2021, The Author(s). Article	2021	Kaggiah A.; Kimemia G.; Morua H.; Muiruri P.; Kinuthia J.; Reedy A.C.	Experiences With Safer Conception Services for HIV-Serodiscordant Couples at a Referral Hospital in Nairobi, Kenya	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2021.693429	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103159961&doi=10.3389%2ffrph.2021.693429&partnerID=40&md5=a0f02a612f9cf3ba6b90a6a6a2e61d7f	Human immunodeficiency virus-serodiscordant couples are an important source of new HIV infections in Africa. When trying to conceive, uninfected partners may be at high risk of infection if the infected partner is not study suppressed. Multiple strategies targeting safer conception exist, but these services are limited. However, when services are available and used, serodiscordant couples can have protected from HIV transmission, and safe to have children if desired. To successfully introduce, integrate, promote, and optimize the service delivery of safer conception with HIV care, it is crucial to understand how HIV-serodiscordant couples seeking safer conception care at a referral hospital in Nairobi, Kenya experience the safer conception services. We conducted a qualitative study among 30 HIV-serodiscordant couples seeking safer conception care at a referral hospital in Nairobi, Kenya. In-depth interviews of HIV-serodiscordant couples were conducted from April to July 2017, and transcripts were analyzed to identify the themes central to the experience of safer conception services. Couples were eligible if they had been enrolled in care for at least 6 months with PrEP, were ≥18 years old, and HIV-1 serodiscordant. Couples with FSWs multivariable logistic regression. Of 300 patients meeting inclusion criteria, 90% were male, 59% were ≥40 and 27% endorsed recent condomless anal intercourse. Of PrEP initiators, 133 (44.3%) were persistent in the first year, whereas 167 (55.7%) were not persistent. PrEP persistence was positively associated with age ≥40 and ≥30,000 UGX (OR: 1.04, 95% CI 1.0 to 1.08) and negatively associated with non-white race (OR 0.31, 95% CI 0.12 to 0.81). There were no HIV seroconversions among persistent patients. In our study, younger and minority patients were less likely to persist in PrEP care and persistence was poor despite many being insured and 'high-risk'. Further research is needed to identify and address barriers that hinder PrEP persistence, specifically among younger, minority patients. Article	2021	Kamau M.; Mureas A.; Were D.; Warugaru G.; Kabue M.; Mutugi J.; Plotkin M.; Reed J.	Unmet Need for Contraception Among Female Sex Workers Initiating Oral Pre-Exposure Prophylaxis for HIV Prevention During Kenya's National Scale-Up: Results From a Programmatic Surveillance Study	Frontiers in Global Women's Health	-	-	-	-	26726059	10.3389/fgwh.2021.747784	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119875054&doi=10.3389%2ffgwh.2021.747784&partnerID=40&md5=77d3503dc4fd8c27b3dc40a0e4294e11	Background: Female sex workers (FSWs) experience a higher risk for both HIV acquisition and unwanted pregnancies compared to women in the general population. Pre-exposure prophylaxis (PrEP) for HIV prevention offers protection against HIV infection but has no contraceptive effect. We examined the determinants of unmet need for contraception among FSWs who initiated PrEP to inform programs and policies to optimize contraceptive services and avert unwanted pregnancy among this high-risk group. Materials and Methods: A cross-sectional analysis was conducted on routine, de-identified client data from a large-scale PrEP service delivery project, from February 2017 to December 2020. Data were collected from FSWs during clinic visits using Ministry of Health approved tools. Records for all 17,456 FSWs initiated on PrEP from 79 health facilities in 10 counties across three geographic clusters with high and medium HIV incidence were examined for eligibility for the analysis. Unmet need for non-barrier contraception was defined as not using any contraception or using barrier methods only (male condoms, female condoms, or spermicides) among FSWs who were sexually active with men. Bivariate and multivariate logistic regression analyses were conducted with selected variables to examine associations. Results: In the 79 sites, eligible records from 17,063 FSWs who initiated PrEP were included. Two-thirds were under 30 years, and the majority were not married and had received PrEP at drop-in centers. Overall, the unmet need for non-barrier contraception was 52.6%, higher for those under 20 years of age (60.9%) and those served in public and private health facilities (67.4 and 61.2%, respectively) rather than drop-in centers (50.6%). Women from the Nairobi and Coast cluster regions reported a higher unmet need for contraception compared to those from the Lake region. All these associations were significant ($p < 0.05$) at the multivariate level. Conclusions: The high unmet need for non-barrier contraception among FSWs initiating PrEP highlights the need for integrated delivery of contraception services within PrEP programs. Identifying groups with a high unmet need could help target services in an integrated program. Two recommended approaches include training healthcare providers to deliver clear contraception messaging during PrEP initiation and making a range of contraceptives accessible within PrEP services for high-risk groups. Furthermore, accelerated revisions to national pre-exposure prevention technologies is necessary to reduce the burden on individuals using multiple prevention products concurrently. Article	2021	Karlstrom D.; Stoecker C.	Impact of Medicaid Expansion on PrEP Utilization in the US: 2012–2018	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-020-03070-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096213398&doi=10.1007%2fs10461-020-03070-2&partnerID=40&md5=0b5a4d4ed8c35c2b4f9fdbd1574f3515	We investigated the impact of Medicaid expansions made possible by the 2010 Affordable Care Act on HIV Pre-Exposure Prophylaxis (PrEP) utilization in the US over the period 2012–2018. We used data on PrEP users from the IQVIA National Prescription Audit and estimated difference-in-differences models to examine the impact of Medicaid expansion on the number of PrEP users per 100,000 population on a yearly basis ($p = 2.72$; $p = 0.007$). When restricting the sample to males, Medicaid Expansion resulted in 14.47 additional PrEP users per 100,000 population per year attributable to Medicaid Expansion ($t = 5.2$; $p < 0.001$). People in the age group 25–34 were those who benefitted the most from Medicaid Expansion with 16.95 additional PrEP users per 100,000 population per year attributable to Medicaid Expansion ($t = 5.2$; $p < 0.001$). States that are considering expanding Medicaid may recognize the benefits in PrEP utilization we document here. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Karunakaran, Dipsi; Simpson, Solange M; Su, Jonathan T; Bryndza-Tlidy, Ewa; Hope, Thomas J; Veazey, Ronald; Dobek, Georgine; Qiu, Jiang; Watrous, David; Sung, Samuel; Chacon, Jorge E; Kiser, Patrick F	Design and Testing of a Cabotegravir Implant for HIV Prevention.	Journal of Controlled Release	-	-	-	-	1873-4995	10.1016/j.jconrel.2020.12.024	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7909097/	Long-acting antiretroviral implants could help protect high-risk individuals from HIV infection. We describe the design and testing of a long-acting reservoir subcutaneous implant capable of releasing cabotegravir for several months. We compressed cabotegravir and excipients into cylindrical pellets and heat-sealed them in tubing composed of hydrophilic poly(ether-urethane) ... The implants have a 47 mm lumen length, 3.4 mm outer diameter, and 200 μm wall thickness. Four cabotegravir pellets were used per membrane, with a total drug loading of 274 ± 1 mg. In vivo, the implanted 348 ± 107 μg/day (median value per implant, N = 41) of cabotegravir in rhesus macaques. Five implants generated an average cabotegravir plasma concentration of 373 ng/ml in rhesus macaques. The non-human primate data, which was in the therapeutic range, showed no tissue damage pathology or microscopic signs of histopathology compared to placebo implants. Cabotegravir plasma levels in macaques dropped below detectable levels within two weeks after the removal of the implants. Article	2021	Kaseto M.P.; Sindano N.; Chinyama M.; Mudenda M.; Chikasha F.; Price J.T.; Chilimbe M.	Integration of HIV Prevention With Sexual and Reproductive Health Services: Evidence for Contraceptive Options and HIV Outcomes Study Experience of Integrating Oral Pre-exposure HIV Prophylaxis in Family Planning Services in Lusaka, Zambia	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2021.684717	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150846846&doi=10.3389%2ffrph.2021.684717&partnerID=40&md5=7cc5e6a6e12e8c585e3595f8ed8a1d4e3b	The WHO guideline on the integration of family planning (FP) and pre-exposure HIV prophylaxis (PrEP) to enhance the health of women and adolescent girls is reflected in the Zambia Consolidated Guidelines for Treatment and Prevention of HIV Infection, 2020. There is however a dearth of data on the integration of PrEP and FP in Zambia.We describe the integration of oral PrEP in FP services using the Evidence for Contraceptive Options and HIV Outcomes (ECHO) study experience at Kanwoka District Health Center in Lusaka, Zambia. The provision of oral PrEP at Kanwoka started in October 2017; lasting for 15 months, and enlisted the model where initial processes to offer PrEP were on-site followed by off-site referral to laboratory and PrEP provider services. The characteristics of 654 women who received PrEP at Kanwoka were analyzed descriptively.Among 654 women who received PrEP at Kanwoka, 50% were aged 25–34 years, 46% were married, and 44% had primary education. Most (93%) were HIV-negative and the proportion of male sex partners living with HIV was 61%. Those who accepted PrEP were married was also high at 61%. Those who accepted PrEP were above 20 years old, married, and at least primary education. Uptake of PrEP was comparable to declines. The ECHO study experience indicates that the setup and integration of oral PrEP and FP services are feasible in the setting. However, uptake of PrEP was very low. Possible contributory factors were as follows: (1) timing of introduction of PrEP midway in the study, (2) PrEP being a new intervention, (3) challenges of autonomy of young women to include a daily pill into their lives and anticipated challenges to adherence because of fear of adverse events, (4) possible underdetermined risk due to use of an unvalidated risk assessment tool and assessment by health care provider vs. self-assessment, and (5) extra layer of challenges to negotiate due to needing for off-site referrals. Following these findings, we conclude that further research through demonstration projects of integration of oral PrEP and FP may provide solutions to low uptake. This information is critical for scaling up of integration HIV prevention services and sexual and reproductive health (SRH) services. © 2021 Kasaro, Sindano, Chinyama, Mudenda, Chikasha, Price and Chilimbe.	family planning; HIV prevention; integration; oral pre-exposure prophylaxis; sexual and reproductive health	English	Switzerland	Western and Central Europe and North America	Zambia	Eastern and Southern Africa	Zambia	Eastern and Southern Africa	Quantitative
Article	2021	Kawuma R.; Ssemata A.S.; Bernays S.; Seeley J.	Women at high risk of HIV-infection in Kampala, Uganda, and their candidacy for PrEP	SSM - Population Health	-	-	-	-	23528273	10.1016/j.ssmph.2021.100746	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104014434&doi=10.1016%2fj.ssmph.2021.100746&partnerID=40&md5=e4fd350f2eb158bcca4d6230292f2e51	Pre-exposure prophylaxis (PrEP), antiretroviral medication for prevention of HIV-acquisition, is part of biomedical HIV prevention strategies recommended for people at risk of HIV-infection. A decision to take PrEP depends on an assessment of being at risk either by an individual, or healthcare provider. In this paper, we draw on the concept of 'candidacy' to examine the different ways in which women attending a dedicated clinic in Kampala, Uganda, for women at risk of HIV infection (including sex workers), assessed their suitability for PrEP. We conducted in-depth interviews with 30 HIV negative women up to four different times, to gather information on the motives for taking PrEP, and their life history and daily life. All the women described themselves as being at risk of HIV infection. However, there were challenges to adherence because of alcohol use, irregular working hours and a fear of being seen taking pills that others might assume to be HIV treatment. The ways in which the women negotiated these challenges, and the ways in which they did not, led us to identify three 'candidacy trajectories' for PrEP: 'early adopters' who were able to take PrEP with little difficulty; 'strugglers' who found it difficult to take their regular pills, and as a tool to allow them to make more money safely, by having sex without a condom with clients. While eligibility to access PrEP was predicated on the women being in an 'at risk' population group, an incentive to use PrEP was to protect themselves from HIV acquisition from a long-term partner and preserve the 'trust' in their intimate relationship by having condomless sex. Applying a candidacy lens to highlight the complexity in how women experience and present as being 'at risk' and query the criteria on which categories of risk and PrEP eligibility are determined. © 2021 The Author(s). Article	2021	Kovajovic A.; Melko-Erwin Z.C.; Busch C.H.; Hammonds M.	A Thematic Analysis of Pre-Exposure Prophylaxis (PrEP) YouTube Videos	Journal of Homosexuality	918369	10.1080/00918369.2020.1712142	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85078573344&doi=10.1080%2f00918369.2020.1712142&partnerID=40&md5=f7e07325a4db6631142a45b9d7a80	Pre-exposure prophylaxis (PrEP) is an encouraging approach to HIV prevention, yet there is a paucity of research aimed at understanding individual PrEP experiences. The current study aims to examine first-hand narratives of individuals detailing their PrEP experiences via the YouTube platform. We searched YouTube.com using the keywords, "pre-exposure prophylaxis" and "Truvada". Search results were limited to the 15 most-viewed videos. Informed by a thematic content analysis approach, we conducted an iterative analysis of video transcripts. Narratives covered a wide range of themes, including motivations to start PrEP, interaction with providers, side effects, insurance coverage, and stigma. By and large, the videos encouraged those at risk for HIV to consider PrEP. Narratives were often characterized by emotional engagement. Given that YouTube videos are used to share individual PrEP experiences with a wider audience, our analysis may inform the development of strategies aimed at utilizing YouTube for increasing uptake of PrEP. © 2020 Taylor & Francis Group, LLC. Article	2021	Kelleher S.; Dichter M.E.; Hamilton A.B.; Chhatre S.; Sonalkar S.	Awareness of HIV Preexposure Prophylaxis among People at Risk for HIV: Results from the 2017-2019 National Survey of Family Growth	Sexually Transmitted Diseases	-	10.1097/OLQ.0000000000001494	-	-	1485717	10.1097/OLQ.0000000000001494	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121975626&doi=10.1097%2fOLQ.0000000000001494&partnerID=40&md5=4e23acbc3227464ffa76dff0e4049b2c	Background Although daily preexposure prophylaxis (PrEP) is now widely accepted as a safe and effective method for reducing the risk of HIV in high-risk groups, uptake has been slow. The goal of this analysis was to identify factors associated with PrEP awareness among individuals at risk for HIV. Methods This investigation analyzed data from the Centers for Disease Control and Prevention nationally representative survey, National Survey of Family Growth, for the years 2017 to 2019. Logistic regression was used to explore the relationship between awareness and demographic HIV risk factors, and provider HIV risk screening. Results Only 37% of survey respondents with an increased risk of HIV were aware of PrEP. Several segments of the at-risk population had lower odds of being aware of PrEP, including women (adjusted odds ratio [aOR], 0.66; 95% confidence interval [CI], 0.49 to 0.89), Hispanic individuals (aOR, 0.66; 95% CI, 0.46 to 0.94), and those with a high school diploma or less (aOR, 0.59; 95% CI, 0.39 to 0.89). Awareness was significantly lower among nonheterosexual sex and both men and women who have sex with men (MSM) compared with heterosexual men who have sex with women (MSW). Lastly, those who had been screened by a provider for HIV risk had significantly higher odds of being aware of PrEP. Conclusions This research supports the need for policies and programs to increase awareness of PrEP, especially among certain segments of the population at increased risk for HIV. © Lippincott Williams & Wilkins. Article	2021	Kerese, Lance C; Dehlin, Jessica M; Pickett, Jim; Berringer, Kathryn R; Little, Imani; Tsang, Ashley; Bouris, Alida M; Schneider, John A	#PrEPLove: success and stigma following release of the first sex-positive PrEP public health campaign.	Culture, Health & Sexuality	-	1464-5351	https://dx.doi.org/10.1080/13691058.2020.1715482	-	1464-5351	10.1080/13691058.2020.1715482	Pre-exposure prophylaxis (PrEP) is an effective yet under-utilised method for preventing HIV transmission in high-risk groups. Despite ongoing social marketing to increase PrEP awareness, few studies have evaluated public responses. This paper contextualises negative responses to Chicago's PrEP4Love campaign. In February 2016, a sex-positive ad campaign called PrEP4Love was launched online and throughout public spaces in Chicago. A gender and sexuality inclusive campaign, PrEP4Love is intended to be culturally responsive and sex positive, while retaining a focus on risk reduction. Advertisements prominently feature Black sexual-minority men, and Black transgender women, and were strategically placed in diverse Chicago neighborhoods. In response, there were 222 new callers to the PrEP Line during the two-month study period. Negative responses were concerned with negatively depicting Black homosexuality (4), general anti-LGBTQ comments (7), adverse effects on children (6), sexually explicit content (5), and general stigmatisation of racial minorities (4). Discussion focuses on sex-positive frameworks, normalising intimacy, stigma and historical interest of medical and pharmaceutical institutions, and the role of social media in amplifying negative responses. Future research should explore the role of social media in amplifying negative public responses to a sex-positive PrEP campaign. More studies of PrEP social marketing are needed to evaluate targeted public health campaigns to guide future PrEP promotion strategies. Article	2021	Kenyon, Chris; De Baetselier, Irith; Vanbaelen, Thibaut; Buyze, Jozefien; Florence, Eric	The Population-Level Effect of Screening for Mycoplasma genitalium on Antimicrobial Resistance: A Quasi-Experimental Study.	Sexually Transmitted Diseases	-	1537-4521 0148-5717	10.1097/OLQ.0000000000001404	https://pubmed.ncbi.nlm.nih.gov/34110732/	1537-4521	10.1097/OLQ.0000000000001404	BACKGROUND: No studies have evaluated the utility and risks of screening for Mycoplasma genitalium in men who have sex with men taking preexposure prophylaxis (PrEP). We made use of a quasi-experimental design to evaluate the effect of `screening for M. genitalium in a demonstration PrEP cohort with 3-monthly follow-up. METHODS: We compared the proportion of PrEP participants with M. genitalium clearance, the duration of persistence, proportions with incident symptoms, the incidence of fluoroquinolone and macrolide resistance, and the proportion of resistance-associated infections with resistance-associated mutations between `2 groups: those in whom the first episode of M. genitalium was treated and those in whom it was not treated. RESULTS: M. genitalium was detected in 70 of 179 individuals. The first episode of infection was treated in 46 individuals. Treatment was not significantly associated with the incidence of symptomatic infections or the acquisition of genotypic resistance. Treatment was associated with a higher probability of clearance of infection but at the expense of increasing the proportion of remaining infections that were resistant. In the nontreated group, the infections that did not clear had a 2.5-fold increased probability of resistance (79% vs 32%; 95% CI, 7%-73%; Mann-Whitney $P = 0.040$). In contrast, in the treated group, there was no significant difference in the proportions of fluoroquinolone resistance between the infections that persisted and cleared. CONCLUSIONS: If screening and treatment increase the rate of transfer to susceptible M. genitalium in a population, then this could play a role in the spread of antimicrobial resistance. Article	2021	Kim, Yeon-Sook	Long-Acting Injectable Antiretroviral Agents for HIV Treatment and Prevention.	Infection and Chemotherapy	-	-	-	-	2093-2340	10.3947/ic.2021.0136	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8373125/	Current oral antiretroviral agents provide highly effective treatment for patients infected with human immunodeficiency virus (HIV), and can be used as pre-exposure prophylaxis (PrEP) to prevent new HIV infections. Several single-tablet regimens with excellent antiviral efficacy have dramatically improved the quality of life of patients who can adhere to daily medication therapy. However, there is increasing demand on long-acting injectable antiretroviral agents for patients who cannot take oral agents or feel fatigue related to daily pill burden. Monthly long-acting (LA) cabotegravir (CAB) combined with rilpivirine (RPV) has been approved for treatment and PrEP. Several clinical trials are ongoing to assess the safety and efficacy of HIV suppressive antiretroviral regimens every other month or every 2 months. Once-monthly RPV ring has been tested in cabotegravir-naïve but 3 to 6 months. Two-drug regimens of CAB LA and RPV LA are now licensed as an option and long-half-life extending dosing interval are being tested in phase 2 and 3 clinical trials. This review summarizes the data of efficacies and safety profiles of LA CAB with RPV regimen, and also new long-acting injectable antiretroviral agents in pipeline.	-	English	South Korea	Asia and the Pacific	South Korea	Asia and the Pacific	South Korea	Asia and the Pacific	Review
Article	2021	Kimani M.; van der Elst E.M.; Chiro O.; Wahome E.; Ibrahim F.; Mukuria N.; Rinke de Wit T.F.; Graham S.M.; Operario D.; Sanders E.J.	'I wish to remain HIV negative': Pre-exposure prophylaxis adherence and persistence in transgender women and men who have sex with men in coastal Kenya	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0244226	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100134226&doi=10.1371%2fjournal.pone.0244226&partnerID=40&md5=1e3393f3c82ea05bc1245960b971942	Background Transgender women (TGW) and men who have sex with men (MSM) in sub-Saharan Africa have high HIV acquisition risks and can benefit from daily pre-exposure prophylaxis (PrEP). We assessed PrEP adherence by measuring tenofovir-diphosphate (TFV-DP) levels and explore factors that influence PrEP persistence in TGW and MSM. Methods Participants were enrolled in a one-year PrEP programme and made quarterly visits irrespective of whether they were still using PrEP. At first month-9 visit, participants provided a dried blood spot to test for TFV-DP levels; protective levels were defined as concentrations ≥ 1246 fmol/mg. TFV-DP levels were tested at month 9, 11 and 12 among participants who were still using PrEP at month 9. Factors associated with TFV-DP levels ≥ 1246 fmol/mg in TGW and MSM groups were tested in logistic regression models, adhere to, and discontinue PrEP. IDI data were analyzed thematically. Results Fifty-three participants (14 MSM and 11 TGW) were enrolled. At month 9, 11 (20.7%) participants (8 MSM and 3 TGW) were lost to follow up or stopped taking PrEP. Any TFV-DP was detected in 62.3% (5/8) of TGW vs. 14.7% of MSM (5/34, $p < 0.01$). Protective levels were detected in 37.5% of TGW (3/8), but not in any MSM. Adherence IDI were conducted with 7 TGW and 9 MSM on PrEP, and 1 TGW and 2 MSM off PrEP. Unplanned or frequent risky sexual risk behaviour were the main motives for PrEP uptake. Among participants on PrEP, TGW had a more complete understanding of the benefits of PrEP. Inconsistent PrEP use was attributed to situational factors. Motives to discontinue PrEP included negative reactions from partners and stigmatizing healthcare services. Conclusion While MSM evinced greater adherence challenges in this PrEP programme, almost 60% of TGW were protected by PrEP. Given high HIV incidences in TGW these findings hold promise for TGW PrEP programming in the region. Copyright © 2021 Kimani et al. Theses and Dissertations	2021	Kimani, M.	Strengthening HIV preventive services for transgender women and men who have sex with men in coastal Kenya	-	-	-	NARCIS	-	NA	NA	https://darc.ova.ai/personal/paris/sci/publications/strengthening-hiv-preventive-services-for-transgender-women-and-men-who-have-sex-with-men-in-coastal-kenya(2993ab51-dcd6-43bd-9296-5a8c8c5336fc).html	Men who have sex with men (MSM) and transgender women (TW), are at the highest risk for infection with the Human Immunodeficiency Virus (HIV). Globally, MSM and TW have higher prevalence of common mental disorders (CMD) including depression, anxiety and substance abuse. Finally, most of sub-Saharan Africa countries are rights constrained settings for both MSM and TW. The lack of legal recognition and protection for MSM and TW results in both internal and enacted stigma. Mental health challenges, stigma, lack of social protection and reduced access to healthcare services create a vicious cycle of increased risk for HIV infection. Pre-exposure prophylaxis (PrEP), could help prevent incident HIV infections in MSM and TW. In the empirical chapters of this thesis the author present studies in the thesis address the challenges MSM and TW face in accessing PrEP. The studies demonstrate the PrEP provision cascade including PrEP knowledge, desire to take it up, adherence and retention in follow-up. Additionally, the author explores the prevalence of CMD in MSM and any associations with HIV status. In the discussion chapter, the author synthesizes the findings from the studies against current literature. Finally, there are recommendations to improve HIV prevention for MSM and TW specifically in coastal Kenya. There are also recommendations addressing diagnosis and management of CMD in MSM. The author also gives suggestions for areas of further research especially in the TW who are still underserved and underresearched in sub-Saharan Africa. Article	2021	Kerr, Jelani; Ayangeakaa, Sinn; Combs, Ryan; Harris, Lesley; Sears, Jeanelle; Northington, Teya; Burton, Kelsey; Sterrett-Hong, Emma; Parker, Kimberly; Kriegel, Karen	Community-Informed Development of a Campaign to Increase HIV Pre-exposure Prophylaxis (PrEP) Awareness Among African-American Young Adults.	Journal of Racial and Ethnic Health Disparities	-	-	-	-	2196-8837	10.1007/s40615-020-00848-x	https://dx.doi.org/10.1007/s40615-020-00848-x	Pre-exposure prophylaxis (PrEP) for HIV prevention can help reduce racial/ethnic HIV disparities in the USA. However, the benefits of PrEP have not been equally distributed across races. Community-informed PrEP campaigns can help address racial/ethnic disparities in PrEP awareness and acceptability among vulnerable African-American populations. More research is needed to identify media preferences around PrEP for these groups in order to optimize effectiveness of health messaging. This study details the development of a community-informed PrEP campaign, #PrEPLove, designed to leverage social media campaigns to increase PrEP awareness among African-American young adults (age 18-29 years). Eleven focus groups with African-American young adults and a community advisory board informed the intervention. Focus group participants expressed concerns with PrEP safety, efficacy, accessibility, the universality of HIV vulnerability, and representation. Campaign elements were then developed based on this feedback. Future studies should examine the effectiveness of culturally tailored multimedia PrEP campaigns. Article	2021	Knox J.; Chen Y.-N.; Hu Q.; Liu G.; Jones J.; Wang X.; Sullivan P.; Siegler A.	Use of geosocial networking apps and HIV risk behavior among men who have sex with men: Cross-crossover study	JMIR Public Health and Surveillance	-	-	-	23692960	10.2196/17173	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100108259&doi=10.2196%2F17173&partnerID=40&md5=2f2529421312d0e2b08f37ba4c3bcffe	Background: HIV disproportionately affects men who have sex with men (MSM) in China. The HIV epidemic is largely driven by unprotected anal sex (ie, sex not protected by condoms or HIV pre-exposure prophylaxis PrEP). The possible association between unprotected anal sex and the use of geospatial networking apps has been the subject of scientific debate. Objective: This study assessed whether users of a gay geospatial networking app in China were more likely to use condoms when they met their partners online versus offline. A case-crossover analysis, with each person serving as his own control, was employed to address the potential bias that men looking for sex partners through an online dating medium might have inherently different (and riskier) patterns of sexual behavior than men who do not use online dating media. Methods: A cross-sectional survey was administered in 2018 to adult male users of Blued-a gay geospatial networking app-in Beijing, Tianjin, Sichuan, and Yunnan, China. A case-crossover analysis was conducted among 1311 MSM not infected with HIV who reported engaging in both unprotected and protected anal sex in the previous 6 months. Multivariable conditional logistic regression models with generalized estimating equations were fitted to identify factors associated with condom use during unprotected versus protected anal sex encounters. Subgroup analyses were conducted to assess other potential sources of bias. Results: We identified 1311 matched instances where a person reported having both an unprotected anal sex act and a protected anal sex act in the previous 6 months. Of the most recent unprotected anal sex acts, 22.3% (292/1311), were initiated offline. Of the most recent protected anal sex acts, 16.3% (214/1311), were initiated offline. In multivariable analyses, initiating a partnership offline was positively associated with unprotected anal sex (odds ratio 2.66, 95% CI 1.88 to 3.85; P<.001) compared with initiating a partnership online. These results were robust to each of the different sensitivity analyses we conducted. Conclusions: Among Blued users in 4 Chinese cities, men were less likely to have unprotected anal sex in partnerships that they initiated online compared with those that they initiated offline. The relationship was strong, with over 2.5 times the likelihood of engaging in unprotected anal sex in partnerships initiated offline compared with those initiated online. These findings suggest that geospatial networking apps are a proxy for, and not a cause of, high-risk behaviors for HIV infection; these platforms should be viewed as a useful venue to identify populations of MSM who engage in high-risk sexual behaviors. ©Jason Knox, Yen-Nee Chen, Qinglin Hu, Guangyu Liu, Jeffrey Jones, Xiaoyi Wang, Patrick Sullivan, Alexander Siegler. Article	2021	Kolak M.A.; Chen Y.-T.; Lin Q.; Schneider J.	Social-spatial network structures and community ties of egocentric sex and confidant networks: A Chicago case study	Social Science & Medicine	-	-	-	2779536	10.1016/j.socscimed.2021.114462	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110684722&doi=10.1016%2Fj.socscimed.2021.114462&partnerID=40&md5=6c3fa3826e7b05d0879452fe6215bfe98b	Exploring how sexual and confidant networks overlap spatially and socially could facilitate a better understanding of sexually transmitted infection risk, as well as help identify areas for interventions. This study uses egocentric network data collected from a sample of 304 women who have sex with men (WHSM) and egocentric women in Chicago (2013–2014) that includes partner and confidant links, geolocations, and pre-exposure prophylaxis (PrEP) awareness. We examine different types of social networks and examine joint social-spatial community ties to both identify and differentiate social-spatial behavioral patterns. We explore the spatial structures of the social network by comparing ego-alter network residence patterns, visualizing ego-alter community ties in aggregate, and grouping different types of dyad relationships based on their spatial structure. Findings showed overlapping social and sexual networks. Egos with partners residing in more resourced communities further away, with wider alter-ego power differentials, also tended to be at greatest risk. Identifying the social-spatial structures of community ties is critical to enhance our understanding of the spatial context of social relationships, and further distill risk heterogeneity in vulnerable populations within an equitable health framework. © 2021	HIV; Network analysis; Social-spatial network; Spatial analysis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Theses and Dissertations	2021	Kolodziej, Jacek	Beyond prevention : lived experiences of pre-exposure prophylaxis in Aotearoa New Zealand	-	-	Massey University	NA	NA	http://hdl.handle.net/10179/16590	The prevailing research perspectives surrounding the use of pre-exposure prophylaxis (PrEP) among men who have sex with men (MSM) revolve around public health aspects, offering less insights into the lived experiences of those who use it. This project aimed to expand this perspective and examine the experiences of PrEP users in Aotearoa New Zealand by contextualising them in the local social and cultural backgrounds. Ten individuals (nine men and one non-binary person) who identified as gay were interviewed individually, each on two separate occasions. A method of interviewing that followed the interpretive Gadamerian hermeneutical approach was used to elicit the deeper meanings of PrEP for its users. The theoretical lens of analysis included Bourdieu's habitus and symbolic understanding of PrEP use and sexual behaviours as social practices. During the interviews, participants shared how their connection with the gay community grew them an informed and empowered status as they actively engaged in the community's sexual and political practices. Participants' sexual habitus was shaped by the gay community's norms, values, and beliefs, which included condoms, including diarrhoea, hookups, and closeness, were well accepted, a flexible approach adopting either or both regimens with possible switching as warranted in order to suit individual health needs. Article	2021	Koppe, Uwe; Marcus, Ulrich; Albrecht, Stefan; Jansen, Klaus; Jessen, Heike; Gunsenheimer-Bartmeyer, Barbara; Bremer, Viviane	Barriers to using HIV pre-exposure prophylaxis (PrEP) and sexual behaviour after stopping PrEP: a population-based study in Germany	BMC Public Health	-	-	-	1471-2458	https://doi.org/10.1186/s12889-021-10174-4	https://bmcpublichealth.biomedcentral.com/articles/10.1186/s12889-021-10174-4	Persistence of individuals at risk of HIV with Pre-Exposure Prophylaxis (PrEP) is critical for its impact on the HIV epidemic. We analysed factors associated with stopping PrEP, barriers that may detect people from continuing PrEP and investigated sexual behaviour after stopping PrEP. Current and former PrEP users in Germany were recruited to complete an anonymous online survey on PrEP use and sexual behaviour. Participants were recruited via social media, dating apps, and clinical and community facilities. Logistic regression was used to identify factors associated with PrEP use. We recruited 4568 current and 609 former PrEP users in two study waves (July–October 2018, April-June 2019). Former PrEP users were more likely (8.3% years old [IQR = 8.1], aOR = 1.16, 95% confidence interval (CI) 1.1–2.31). Moreover, they were more often unhappy with their sex life, which was more pronounced in former daily PrEP users (aOR = 4.5, 95% CI 2.9–7.1) compared to former on-demand users (aOR = 1.6, 95% CI 1.1–2.5, $p = 0.005$). The most common reason for stopping PrEP was a reduced need for PrEP (49.1%). However, 31.4% of former users identified logistic reasons and 17.5% stopped due to side effects. Former PrEP users using PrEP < 3 months were more likely to stop PrEP due to concerns over long-term side effects (52.0% vs. 22.5%, $p < 0.013$) and not wanting to take a chemical substance (33.2% vs. 24.0%, $p = 0.020$) compared to former PrEP users who used PrEP for longer. After stopping PrEP, 18.7% of former PrEP users indicated inconsistent condom use while having ≥ 6 sex partners within the previous 6 months. Former PrEP users with many partners and inconsistent condom use more often indicated logistic reasons for stopping (46.5% vs. 27.9%, $p < 0.001$) than all other former PrEP users. To maximise persistence with PrEP we need to develop strategies for younger PrEP users, reduce logistic barriers to access PrEP, and to develop effective communication on side effect management. Moreover, prevention strategies for people stopping PrEP are required, since some remain at high risk for HIV. HIV incidence after pre-exposure prophylaxis initiation among women and men at elevated HIV risk: A population-based study in rural Kenya and Uganda	PLOS Medicine	-	-	-	15491277	10.1371/JOURNAL.PMED.1003492	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108225284&doi=10.1371%2Fjournal.pmed.1003492&partnerID=40&md5=1e4b2a7a61d9992e351c80b0a27e9bfc	Background: Oral pre-exposure prophylaxis (PrEP) is highly effective for HIV prevention, but data are limited on HIV incidence among PrEP users in generalized epidemic settings, particularly outside of selected risk groups. We performed a population-based PrEP study in rural Kenya and Uganda and sought to enhance HIV incidence and clinical and virologic outcomes following seroconversion on PrEP. Methods and findings During population-level HIV testing of individuals ≥15 years in 16 communities in the Sustainable East Africa Research in Community Health (SEARCH) study (NCT01864603), we offered universal access to PrEP with enhanced counseling for persons at elevated HIV risk (based on sexual/lifetime partnership, machine learning-based risk score, or self-identified HIV risk). We offered rapid or same-day PrEP initiation and flexible service delivery with follow-up visits at facilities or community-based sites at 4, 12, and every 12 weeks up to week 144. Among participants who initiated PrEP, we tested for HIV at PrEP visits and monthly by phone. We estimated HIV incidence using Poisson regression with cluster-robust standard errors. From 12/2017–12/2019, 4,847 participants (≥1,000 cisgender women and available assays) were enrolled and offered PrEP. Using Poisson regression with cluster-robust standard errors, we compared HIV incidence among PrEP initiators to incidence among propensity score–matched recent historical controls (from the year before PrEP availability) in 8 of the 16 communities, adjusted for risk group. Among 754 participants who initiated PrEP (15.6% [754/4,847] were assessed to be at elevated HIV risk), 2,447/3,613 (33%) initiated PrEP ≥90% from home. 29% (219/754) were 15–24 years, 19% (142/754) were female, and 62% (467/754) reported PrEP adherence at ≥1 visit. Over 7,150 person-years of follow-up, HIV incidence was 0.35 per 100 person-years (95% confidence interval (CI) 0.2–0.49) among PrEP initiators. Among matched controls, HIV incidence was 0.92 per 100 person-years (95% CI 0.49–1.41), corresponding to 76% lower incidence among PrEP initiators compared to matched controls (adjusted incidence rate ratio aIRR 0.24, 95% CI 0.09–0.75, $p = 0.013$). Among women, HIV incidence was 76% lower among PrEP initiators versus matched controls (aIRR 0.24, 95% CI 0.07–0.79, $p = 0.019$); among men, HIV incidence was 75% lower among PrEP initiators versus matched controls (aIRR 0.25, 95% CI 0.06–1.04, $p = 0.057$). Among PrEP initiators, 6/754 (0.8%) seroconverted on PrEP (4 women, 2 men), and 242/2,447 (10%) started ART. Of those with repeat HIV RNA after ART start, 38/39 (97%) had <1,000 viral load. One participant with viral non-suppression was found to have transmitted viral resistance, as well as emtricitabine resistance possibly related to PrEP use. Limitations include the lack of contemporaneous controls to assess HIV incidence without PrEP and that plasma samples were not archived to assess for baseline acute infection. Conclusions Population-level offer of PrEP with rapid start and flexible service delivery was associated with 76% lower HIV incidence among PrEP initiators compared to matched recent controls prior to PrEP availability. HIV infections were significantly lower among women who started PrEP. Universal HIV testing with linkage to treatment and prevention, including PrEP, is a promising approach to accelerate reductions in new infections in generalized epidemic settings. © 2021 Koss et al. HIV incidence among persons at high risk for HIV infection in Zimbabwe: Results from a multicountry demonstration study	The Lancet HIV	-	-	-	23525038	10.1016/S2352-3018(21)00005-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108525284&doi=10.1016%2FS2352-3018%2821%2900005-9&partnerID=40&md5=3cafc27a61d9992e351c80b0a27e9bfc	Background: In Kenya, South Africa, and Zimbabwe, oral pre-exposure prophylaxis (PrEP) is recommended for adolescent girls and young women (AGYW) at high risk of HIV. Health providers play a critical role in the uptake and effective use of sexual and reproductive health services, however, few published studies have explored providers' attitudes toward and experiences delivering PrEP to AGYW. We conducted a cross-sectional qualitative study, interviewing 113 providers at 36 public, private, and nongovernmental health facilities in Kenya, South Africa, and Zimbabwe that were offering PrEP during the research period or were likely to offer PrEP in the future. Data were coded in NVivo 11, a mixed-is applied thematic analysis was conducted. Results: Most providers described PrEP as beneficial for girls who could not rely on their partners to use condoms consistently, but some providers described PrEP as only for girls who could not say no to sex. Providers reported that it was more challenging to deliver PrEP to younger than 18. Those with experience providing PrEP pointed to stigma and lack of PrEP awareness in communities as two primary barriers to PrEP uptake and use. Conclusions: Providers were generally accepting of oral PrEP as an HIV prevention option for AGYW; however, many had negative attitudes about adolescents' ability to use PrEP correctly, mostly active and concerns about whether they could take PrEP daily. Results were used to update national PrEP training materials to address negative provider attitudes about PrEP use by AGYW. © 2021. The Author(s). Sociodemographic Characteristics of HIV Pre-Exposure Prophylaxis Use and Reasons for Nonuse among Gay, Bisexual, and Other Men Who Have Sex with Men from Three US Cities	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2020.0231	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106592562&doi=10.1089%2Fapc.2020.0231&partnerID=40&md5=d0e0f3f1c7b4b9f2bd0b67e22f5e1e7f	Background: HIV pre-exposure prophylaxis (PrEP) is a preventive medication that could reduce new infections among men who have sex with men (MSM). There are limited data on differing reasons for PrEP nonuse by condomless anal sex (CAS). We examined demographic and behavioral variables associated with PrEP use and reasons for PrEP nonuse by CAS. Data are from the MyGuyHealth, conducted in a 2018 baseline assessment of MSM ($n = 790$) in Atlanta, Detroit, and New York City. Participants reported current PrEP use (31%), previous use (8%), and never use (61%). MSM reporting CAS adjusted odds ratio (aOR) = 2.66, confidence interval (95% CI) = 1.73–3.93, age 18–24 (aOR = 2.11, 95% CI = 1.20–3.72), 30–39 (aOR = 2.12, 95% CI = 1.23–3.58), with a college degree (aOR = 1.96, 95% CI = 1.20–3.21), or postgraduate education (aOR = 2.58, 95% CI = 1.53–4.40) had greater odds of current (vs. never) use; uninsured (aOR = 0.30, 95% CI = 0.16–0.57) men had lower odds of current (vs. never) use. For never use, more MSM who reported CAS (vs. did not) endorsed the following reasons ($p < 0.05$): Insurance wouldn't cover PrEP (20% vs. 12%), Didn't know where to get it (13% vs. 24%) and fewer reported Didn't need PrEP (23% vs. 39%) and Started a committed relationship (7% vs. 2%). For discontinuation, more MSM who reported CAS (vs. did not) endorsed Worry about the safety of PrEP (19% vs. 6%), Didn't like taking a pill every day (19% vs. 6%), and Started a committed relationship (11% vs. 3%) as reasons for discontinuing PrEP. These findings may inform how providers can facilitate PrEP use by encouraging an access and safety for MSM who reported CAS. © Copyright 2021, Mary Ann Liebert, Inc., publishers 2021.	current PrEP users; HIV; MSM; PrEP nonuse; previous PrEP users	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Safety and Pharmacokinetic Profiles of Long-Acting Injectable Antiretroviral Drugs for HIV-1 Pre-Exposure Prophylaxis: A Systematic Review and Meta-analysis of Randomized Trials	Frontiers in Pharmacology	-	-	-	16639812	10.3389/fphar.2021.666875	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111131631&doi=10.3389%2Fphar.2021.666875&partnerID=40&md5=7b0ca5170c6d9e8b9fbb67b12256e1e7	Objectives: To investigate the safety and pharmacokinetic profiles of long-acting injectable pre-exposure prophylaxis (LAI PrEP), notably cabotegravir (CAB-LA) and rilpivirine (RPV-LA), for the prevention of human immunodeficiency virus-1 (HIV-1) infection. Methods: Eligible randomized trials of LAI PrEP in HIV-uninfected and/or healthy patients were included and assessed with the Revised Cochrane risk-of-bias tool for randomized trials. Where feasible, a meta-analysis was performed for pooled estimates of safety outcomes using a random-effects model with risk ratios (RR) and 95% confidence intervals as the common effect measure. The protocol was registered with PROSPERO (CRD42020154572). Results: Eight trials considering a total of 666 participants were included in this systematic review, including five 2N2 intervention trials (HPTN 077, HPTN 083, HPTN 084, ECLAIR, and MWRI) and three 1N2 trials (LATTE-2, ATLAS, and FLAIR). Overall, the safety profiles of CAB-LA and RPV-LA were similar to placebo in terms of any adverse event (AE), serious AE, and AE-related withdrawals. Furthermore, pharmacokinetic analyses revealed favorable properties to total inhibitory activity of CAB-LA and RPV-LA. Intramuscular (IM) injection of CAB-LA 600 mg Q8W was superior to CAB-LA 800 mg Q12W in male participants, while the same was true for RPV-LA 1200 mg IM Q8W over other dosing regimens. Although these results are promising, further research is required to confirm the findings as RPV-LA as current evidence is limited. Conclusion: CAB-LA and RPV-LA have promising safety and pharmacokinetic profiles. The preventive efficacy of these agents is being evaluated in Phase 3 trials. © Copyright © 2021 Laurenz, Wanggaarts, Christanto, Louisa, Soetikno and Hamers.	cabotegravir; HIV-human immunodeficiency virus; long acting injectable (LAI); pre-exposure (PrEP) prophylaxis; rilpivirine	English	Switzerland	Western and Central Europe and North America	Indonesia	Asia and the Pacific	Indonesia	Asia and the Pacific	Review
Article	2021	Laurenz L.; Reza-Paul S.; Hafeez Ur Rahman S.; Lorway R.	In Search of 'Success': The Politics of Care and Responsibility in a PrEP Demonstration Project	Medical Anthropology: Cross-Cultural Studies in Health and Illness	-	-	-	1459740	10.1080/01459740.2020.1854753	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098102962&doi=10.1080%2F01459740.2020.1854753&partnerID=40&md5=90c7cf7d1cf87841c76ecb6f1e3653c4	We illustrate the lively existence of the notion of success in the unfolding of a PrEP project led by a sex worker organization in India. In what we call the "search for success," particular attention is placed on the role that care plays among sex workers guiding the project. Drawing on our ethnographic work, we highlight how the search for success underlines particular affective dispositions that are understood by overlapping temporal registers; in the early stages of fostering adherence, when project fatigue sets in; and as the project draws to a close, in the anticipation of what comes next for the organization. © 2020 Taylor & Francis Group, LLC	community-led; demonstration projects; HIV; India; PrEP; sex work	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Qualitative
Article	2021	Lazarus, Lisa; Reza-Paul, Susheua; Rahman, Syed Hafeez Ur; Ramaiah, Manjula; Venugopal, M S; Venukumar, K T; Moses, Stephen; Becker, Marissa; Lorway, Robert	Beyond remedicalculation: a community-led PrEP demonstration project among sex workers in India.	-	-	-	-	1464-5351	10.1080/13691058.2020.1774656	https://dx.doi.org/10.1080/13691058.2020.1774656	Global health policy-makers have called for demonstration projects to better understand pre-exposure prophylactic (PrEP) effectiveness across geographies and populations. Ashodaya, a sex worker collective, initiated a PrEP project in Mysuru, India. We conducted a project ethnography to explore the role that community participation played within the project. Although the project proved immensely successful in terms of retention and adherence, to explain these findings we point towards Ashodaya's history of collectivization around sexual health a history of community action that has given rise to new spaces of belonging and empowerment. We argue that the project's success was contingent on three factors: (1) the ability to leverage existing social capital and trust in the collective to recruit and retain community leaders as the first participants in a new PrEP, followed by the sharing of these experiences through testimonials to their peers; (2) the enforcement of PrEP among community leaders living with HIV, to avoid social divisions around HIV status; and (3) ongoing community-level support from outreach workers that went beyond administering PrEP to address the various needs of the community. These community-led approaches demonstrate that communities hold key insights into the delivery of clinically-oriented interventions, suggesting the vital role they continue to play in planning and implementing new prevention technologies. Article	2021	Le Guillou, Adrien; Buchbinder, Susan; Scott, Hyman; Liu, Albert; Havlir, Diane; Scheer, Susan; Jenness, Samuel M	Population Impact and Efficiency of Improvements to HIV PrEP Under Conditions of High ART Coverage Among San Francisco Men Who Have Sex With Men.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002781	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8558568/	-	BACKGROUND: Key components of Ending the HIV Epidemic (EHE) plan include increasing HIV antiretroviral therapy (ART) and HIV pre-exposure prophylaxis (PrEP) coverage. One complication to addressing this service delivery challenge is the wide heterogeneity of HIV burden and health care access across the United States. It is unclear how the effectiveness and efficiency of expanded PrEP will depend on different baseline ART coverage. METHODS: We used a network-based model of HIV transmission for men who have sex with men (MSM) in San Francisco. Model scenarios increased varying levels of PrEP coverage relative under current empirical levels of baseline ART coverage and 2 counterfactual levels. We assessed the effectiveness of PrEP with the cumulative percentage of infections averted (PIA) over the next decade and efficiency with the number of additional person-years needed to treat (NNT) by PrEP required to avert one HIV infection. RESULTS: In our projections, only the highest levels of PrEP coverage (80%) led to substantial PIA (>25%) and low NNT (<30) under current ART coverage. Lower PrEP coverage (40%) led to a PIA of 15% and NNT of 50. At the lowest baseline ART coverage population and 75% in the highest. The efficiency declined with increasing ART (NNT range from 41 to 113). CONCLUSIONS: Improving both PrEP and ART coverage would have a synergistic impact on HIV prevention even in a high baseline coverage city such as San Francisco. Efforts should focus on narrowing the implementation gaps to achieve higher levels of PrEP retention and ART sustained viral suppression. Theses and Dissertations	2021	Lee-Foon , Nikin	Exploring the State of Sexual Health Literacy among Young Black Gay and Other Men who Have Sex with Other Men in Toronto, Ontario, Canada	-	-	-	University of Toronto	-	NA	NA	http://hdl.handle.net/1807/106374	-	Despite advancements in diagnosis, treatment and prevention for HIV and other sexually transmitted infections (STIs), young Black gay and other men who have sex with men (YBGM) experience significantly higher HIV rates compared to other young gay and other men who have sex with men. While sexual health literature indicates various socio-structural factors (e.g., systemic racism, low income) contribute to these disparities, YBGM's sexual health literacy (SHL) remains underexplored. Moreover, existing SHL research has been criticized for its narrow conceptualization and methodologically informed by Chatman's constructivist grounded theory to begin addressing this scarcity. My primary research question was: what is the state of YBGM's sexual health literacy? My sub-questions were: 1) what or who are YBGM's sources of sexual health information?; 2) how do YBGM evaluate the information they gather from these sources? and 3) in what ways, if any, are YBGM applying this information in their everyday lives? Twenty-two YBGM aged 16 to 21 years underwent a socio-demographic survey and one-on-one semi-structured interviews. The first round centered on YBGM's pre-exposure prophylaxis (PrEP) knowledge. My findings revealed that YBGM's limited PrEP knowledge was due to healthcare institutions' inability to effectively disseminate PrEP information coupled with the impact of PrEP stigma and their social locations on this knowledge. Manuscript two explored YBGM's approaches to evaluating the credibility of key sexual health information sources. My findings countered common narratives in the literature that identified sex-ed, some aged peers and family as key sources. Older Black peers were seen as a key source who used 'testimonials', a commonly used health communication skills throughout the lens of YBGM. Participants' evaluations of these sources were also influenced by YBGM's social locations. Manuscript three explored sexual health communication skills through the lens of YBGM. Participants' responses to these points to providers' inadequate skills and to their healthcare system's misconceptions of YBGM's sexuality (race, sex, sexual orientation and/or age automatically categorized them as needing HIV and other STI testing even when they might non-sexual healthcare. We conclude with the study's implications on sexual healthcare research, policy and practice. Article	2021	Letlika M.H.; Notungabeni T.R.	A Plea Of Those Who Are Affected Most By HIv: The Utterances By Women Who Inject Nyaope Residing In The City Of Tshwane Municipality, Gauteng	African Journal of Primary Health Care and Family Medicine	-	-	-	2071/2928	10.4102/phcfm.v13i1.2416	-	Background: Nyaope injecting practice brought the field of Human Immunodeficiency Virus (HIV) prevention and Substance Use Disorder (SUD) together. It is complex and requires sus drugs face individual, social, and structural factors that fuel their vulnerability to contract HIV, and other blood-borne infections. Women subpopulations that is neglected from HIV prevention and SUD treatment interventions, and are hardly the subject of services. Aim: This study explored the utterances on the HIV epidemic among WWIDI it is imperative that they become part of the process of finding solutions. Aim: This study explored the strategies to curb HIV incidence among Women Who Inject (WWIN), residing in City of Tshwane Municipality, Gauteng Province. Setting: The research was conducted within COSUP. COSUP was considered more appropriate as it is a harm reduction based organisation, qualitative research approach. Semi-structured interviews were conducted with 24 women with a history of injecting Nyaope aged between 19 to 35 years. The data was analysed using thematic data analysis. Results: Health intervention, economic intervention and educational intervention was stressed as key strategies to curb HIV among WWIN. Needle and syringe programmes (NSP) were highlighted as the HIV prevention strategy that participants were familiar with. Participants also mentioned condom use, substitution therapy, and counselling as strategies to curb HIV among WWID. Conclusion: Mechanisms to curb HIV among WWIN exist, and when implemented, they have the potential to address high HIV incidence among women who inject Nyaope. © 2021. The Authors. Licensee: AOSIS. Article	2021	Lois M.; McDermott M.; Kouiaev A.; Smalkowski L.; Kariri A.; Beattie T.S.; Kaul R.; Kimani J.	Intimate partner and client-perpetrated violence are associated with reduced HIV pre-exposure prophylaxis (PrEP) uptake, depression and generalized anxiety in a cross-sectional study of female sex workers from Nairobi, Kenya	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25711	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116833354&doi=10.1002%2Fjia2.25711&partnerID=40&md5=7f4e67a9d01ba7365f3b9752a72274a	-	Introduction: UNAIDS has identified female sex workers (FSW) as a key HIV at-risk population. FSW disproportionately experience gender-based violence, which compounds their risk of HIV acquisition and may contribute to adverse mental health outcomes. Pre-exposure prophylaxis (PrEP) is a powerful but underused HIV prevention tool for these women. This study explored the associations between intimate partner violence (IPV) and client-perpetrated violence against FSW, mental health outcomes and PrEP use. Methods: An anonymous questionnaire was administered to a convenience sample of 220 Nairobi FSW attending dedicated clinics from June to July 2019, where PrEP was available free of charge. A modified version of the WHO Violence Against Women Instrument assessed IPV and client-perpetrated violence, and the Patient Health Questionnaire-9 (PHQ-9) and Generalized Anxiety Disorder-7 (GAD-7) assessed depressive and anxiety symptoms respectively. Multivariable logistic regressions evaluated predictors of depression, generalized anxiety and PrEP use. Results: Of the total 220 women (median IQR: age 32; 27-38), 56.8% (125/220) reported depression (PHQ-9 ≥ 10) and 59.1% (130/220) reported anxiety (GAD-7 ≥ 10). Only 43.4% (95/220) reported optimal use of PrEP (taken correctly six to seven days/week) despite the cohort pursuing sex work for a median of 7 (4 to 12) years. Most women reported experiencing IPV (68.6%, 151/220) and violence from clients (70.5%, 155/220) in the past 12 months. Physical IPV was reported by 40.5% (89/220) and sexual IPV by 39.1% (86/220) women in the past 12 months (95.5%, 176/220). Experiencing violence was associated with depression (adjusted OR, aOR 0.39; 95% CI 2.30 to 36.42; p = 0.0002) and generalized anxiety (aOR 3.42; 95% CI 1.10 to 10.66, p = 0.03), with the strongest associations between emotional IPV and both depression and anxiety. Recent client-perpetrated emotional violence (aOR 0.23; 95% CI 0.07 to 0.72, p = 0.01) was associated with decreased PrEP use, whereas client-perpetrated physical violence was associated with increased PrEP use (aOR 2.01; 95% CI 1.16 to 7.81, p = 0.02). Conclusions: There was a high prevalence of recent violence by different perpetrators as well as depression and anxiety among FSW from Nairobi. PrEP use was relatively infrequent, and recent client-perpetrated emotional violence was associated with PrEP non-use. Interventions to reduce gender-based violence may independently enhance HIV prevention and reduce the mental health burden in this community. © 2021 The Authors. Article	2021	Lemeshow, Ashley; Hamilton, Jessica; Hoffman, Risa M.; Sun, Paul E.; Mayo, Skhalelle; Chaldekova, Natalia; Stringer, Jeffrey Sa; Medows, Gurewhyr; Kershaw, Kristen; Vinkle, Cassie; Hussong, Mindaga; Blandina T.; Jolie, Lara; Hanley, Sheika; Parker, Lynette; Holmes, Lewis B.; Monroe, Jeremiah D.; Shapiro, Roger L.; Theofat, Nurdesje K.; Rooney, James F.; Frenkel, Lisa M.; Anstee, K. River; Chanda, Lamuch; Currier, Judith	Efficacy and safety of dolutegravir with emtricitabine and tenofovir alafenamide fumarate or tenofovir disoproxil fumarate, and efavirenz, emtricitabine, and tenofovir disoproxil fumarate HIV antiretroviral therapy regimens started in pregnancy (IMPAACT 2010/VESTED): a multicentre, open-label, randomised, controlled, phase 3 trial.	The Lancet	-	-	-	1474-547X/ 0140-6736	10.1016/S0140-6736(21)00314-7	https://pubmed.ncbi.nlm.nih.gov/33812487/	-	BACKGROUND: Antiretroviral therapy (ART) during pregnancy is important for both maternal health and prevention of perinatal HIV-1 transmission; however adequate data on the safety and efficacy of different ART regimens that are likely to be used by pregnant women are scarce. In this trial we compared the safety and efficacy of three antiretroviral regimens started in pregnancy: dolutegravir, emtricitabine, and tenofovir alafenamide fumarate; dolutegravir, emtricitabine, and tenofovir disoproxil fumarate; and efavirenz, emtricitabine, and tenofovir disoproxil fumarate. METHODS: This multicentre, open-label, randomised controlled, phase 3 trial was done at 22 clinical research sites in nine countries (Botswana, Brazil, India, South Africa, Tanzania, Thailand, Uganda, the USA, and Zimbabwe). Pregnant people (aged ≥18 years) with HIV-1 were enrolled at 14–28 weeks' gestation and were randomly assigned (1:1:1) to receive one of the three ART regimens from 14–28 weeks' gestation until 6 weeks after delivery. Participants were not assigned to receive ART during the current pregnancy was permitted), as were women known to be pregnant with multiple fetuses, or those with known fetal anomaly or a history of psychiatric illness. Participants were randomly assigned (1:1:1) using a central computerised randomisation system. Randomisation was done using permuted blocks (size six) stratified by gestational age (14–18, 19–23, and 24–28 weeks' gestation) and country. Participants were randomly assigned to receive either once-daily oral dolutegravir 50 mg, and once-daily oral fixed-dose combination emtricitabine 200 mg and tenofovir alafenamide fumarate 25 mg; once-daily oral dolutegravir 50 mg, and once-daily oral fixed-dose combination emtricitabine 200 mg and tenofovir disoproxil fumarate 300 mg; or once-daily oral fixed-dose combination of efavirenz 600 mg, emtricitabine 200 mg, and tenofovir disoproxil fumarate 300 mg. The primary efficacy outcome was the proportion of participants with viral suppression, defined as with HIV-1 RNA concentration of less than 200 copies per mL, at or within 14 days of delivery, assessed in all participants with an HIV-1 RNA result available from the delivery visit, with a prespecified non-inferiority margin of 12%. The primary safety outcome was the proportion of participants with adverse pregnancy outcomes, defined as a composite of stillbirth, neonatal death, or neonatal admission, among treatment groups, were the occurrence of a composite adverse pregnancy outcome, i.e. either preterm delivery, the infant being born small for gestational age, stillbirth, or spontaneous abortion, in participants with a pregnancy outcome, and the occurrence of grade 3 or higher maternal and infant adverse events in all randomised participants. This trial was registered with ClinicalTrials.gov, NCT03060822. FINDINGS: Between 16 Dec 2016, and 30 Jan 2018, and 1844 (76%) of 2434 people screened were enrolled and randomly assigned 643 pregnant women: 217 to the dolutegravir, emtricitabine, and tenofovir disoproxil fumarate group, 213 to the dolutegravir, emtricitabine, and tenofovir alafenamide fumarate group, and 211 to the efavirenz, emtricitabine, and tenofovir disoproxil fumarate group. At enrolment, median gestational age was 21·9 weeks (IQR 18·3–25·3), the median HIV-1 RNA concentration among participants was 982·5 copies per mL (132·0–5142·5); 181 (28%) of 643 participants had HIV-1 RNA concentrations of >200 copies per mL), and the median CD4 count was 466 cells per mL (IQR 624). HIV-1 RNA concentrations at delivery were available for 603 (94%) participants. Of these, 395 (98%) of 405 participants in the dolutegravir groups had HIV-1 RNA concentrations of less than 200 copies per mL at delivery compared with 182 (91%) of 200 participants in the efavirenz group (adjusted difference 6·9% (95% CI 2·9 to 10·8; p=0·0007), thus meeting the non-inferiority margin of 12%. Viral suppression at delivery was also higher among participants in the dolutegravir groups compared with the efavirenz group (adjusted difference 6·9% (95% CI 2·9 to 10·8; p=0·0007). Adverse pregnancy outcomes were similar between dolutegravir groups (152 (24% of 2181) had a composite adverse pregnancy outcome) and efavirenz groups (52 (24% of 216) had a composite adverse pregnancy outcome; difference −0·8% (95% CI −7·3 to 5·7; p=0·80). Stillbirth, neonatal death, or neonatal admission occurred in 15 (2%) participants in the dolutegravir groups and 5 (2%) participants in the efavirenz group (95 CI 1·3 to 5·2; p=0·80). The proportion of participants who had a preterm delivery was significantly lower in the dolutegravir, emtricitabine, and tenofovir alafenamide fumarate group (12·6% of 208) than in the efavirenz, emtricitabine, and tenofovir disoproxil fumarate group (25·12% of 207; −8·5% (−11·8 to −0·5; p=0·02). Neonatal mortality was significantly higher in the efavirenz, emtricitabine, and tenofovir disoproxil fumarate group (ten 5% of 207 infants) than in the dolutegravir, emtricitabine, and tenofovir alafenamide fumarate group (two 1% of 208; p=0·019) or the dolutegravir, emtricitabine, and tenofovir disoproxil fumarate group (three 2% of 202; p=0·050). INTERPRETATION: When started in pregnancy, dolutegravir-containing regimens had superior virological efficacy at delivery compared with the efavirenz, emtricitabine, and tenofovir disoproxil fumarate regimen. The dolutegravir, emtricitabine, and tenofovir alafenamide fumarate regimen had the lowest frequency of preterm delivery and neonatal mortality. Article	2021	Logan, Rachel; Seidman, Dominika	Lessons Learned from Longer Acting Reversible Contraception Applied to Longer Acting HIV Prevention Technologies	Current HIV/AIDS Reports	-	-	-	1548-3576	10.1007/s11904-021-00571-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8436250/	-	PURPOSE OF REVIEW: This review describes lessons learned from longer acting contraception and employs a reproductive justice lens to inform expansion of emerging HIV prevention technologies. RECENT FINDINGS: Reproductive justice is a framework that advocates for the promotion of universal sexual and reproductive freedoms, particularly among historically marginalized communities. This framework takes a holistic view of individuals and sees the interconnections between sexual health, reproductive health, and overall health. Employing a sexual and reproductive justice perspective is essential to understanding and helping to mitigate the role intersecting structural, sexual, and reproductive oppressions, including those demonstrated through perpetuation of gaps using contraceptives, and can critically inform rollout of future prevention technologies, such as longer acting HIV pre-exposure prophylaxis. This review highlights the need for researchers, clinicians, and policymakers to apply lessons learned from contraception and specifically focuses on principles of reproductive justice to offer expanding HIV prevention options. Article	2021	Logie C.H.; Wang Y.; Lalor P.; Williams D.; Lewenson K.	Pre and Post-exposure Prophylaxis Awareness and Acceptability Among Sex Workers in Jamaica: A Cross-Sectional Study	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-02972-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087697224&doi=10.1007%2Fs10461-020-02972-5&partnerID=40&md5=4e353457e0bcdcea7f3e8a2d6a722	-	The HIV prevention cascade is understudied among sex workers in Jamaica, where sex work and same sex practices are criminalized. We implemented a cross-sectional survey with cisgender women, transgender women, and cisgender men sex workers in Jamaica. We conducted multivariable logistic regression analyses to identify factors associated with PrEP awareness and acceptability. Participants (n = 340) included cisgender men (n = 124), transgender women (n = 101), and cisgender women (n = 115). PrEP awareness was low (33.2%), yet acceptability was high (78.8%). In multivariable analysis, recent condomless sex, recent client violence, recent police violence, and sex work social cohesion were associated with PrEP awareness and acceptability. One-third (32.7%) reported PrEP awareness, with high acceptability (80.2%). Relationship status and recent physical violence were associated with PrEP awareness and acceptability. In multivariable analyses, gender identity was not associated with differences in PrEP awareness/acceptability. Findings highlight the need to increase PrEP awareness and access among sex workers in Jamaica. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Lorenz A.; Nichells J.; Kosten J.M.; Macgregor L.; Spurrr N.; Hartyman L.; Turner K.M.E.; Horner P.; Horwood J.	Human Immunodeficiency Virus Pre-exposure Prophylaxis Knowledge, Attitudes and Perceptions of Sexual Health Risk in an Age of Sexually Transmitted Infection Antimicrobial Resistance	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001384	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113110111&doi=10.1097%2FOLQ.0000000000001384&partnerID=40&md5=6c577a4b3146a5ca888a6fc446228c	-	Background: Human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) has helped reduce new HIV infections. However, bacterial sexually transmitted infections (STIs) have increased among PrEP users. We examined PrEP knowledge, access, and risk perceptions in an age of antimicrobial resistance (AMR). Methods: An online anonymous survey was distributed to all cisgender men/transgender women who have sex with men (MSM) attending a large sexual health clinic in London, United Kingdom, between October and December 2019. Participants were asked questions on PrEP and associated risk behaviors and perceptions of AMR. Results: In total, 1,001 MSM participated in the survey. Of these, 34.9% had ever used PrEP. Interviewees (n = 24) reported widespread awareness of and enthusiasm for PrEP. Among nonusers, 39% (146/376) were unaware how to access PrEP, and 27% (103/376) could not access PrEP through the national "impacPrEP" service when 75% (181/931) were eligible. The PrEP was described as "life-changing"but current users felt the pill was too much barrier to use. Sixty-two percent (238/376) of HIV-negative/unknown respondents on PrEP were more likely to have condomless anal intercourse with someone they thought was HIV-negative. Interviewees used PrEP with other risk-reduction strategies. Sexually transmitted infections were seen as "curable"and AMR rarely influenced risk perception or sexual decision making. Conclusions: The PrEP awareness was high, but practices could be improved. Improving clinic processes could increase access. PrEP may increase condomless anal intercourse, but interviewees used PrEP as one of many risk-reduction tools. Reduced fear of HIV transmission and testing was highly valued. Sexually transmitted infection AMR was not seen as an immediate threat and did not influence risk perception or sexual decision making. © Lippincott Williams & Wilkins. Article	2021	Luo, Sheng; Wang, Zixia; Lau, Joseph Tak-Fai	The General Public's Support Toward Governmental Provision of Free/Subsidized HIV Preexposure Prophylaxis to At-Risk Chinese People: A Population-Based Study.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001304	https://ids.doi.org/10.1097/OLQ.0000000000001304	-	Background: Growth in new HIV infections among men who have sex with men (MSM) in China has been fueled by their high-risk sexual behaviors and low uptake of HIV testing. To achieve the UNAIDS 90-90-90 goals, China, from June to July, 2019. Descriptive analyses and logistic regression were performed. RESULTS: The prevalence rates of supportive attitude for free and subsidized PrEP were 30.0% and 30.3%, respectively; epidemic was a favorable psychosocial environment for PrEP implementation. Those who were older, had less education, did not have a full-time job, or reported a lower household income were less likely to support free or subsidized PrEP. Stigmatizing attitudes against homosexuals (adjusted odds ratio AOR, 0.81; 95% CI, 0.73-0.89) and perceived negative sexual impacts of free PrEP (AOR, 0.79; 95% CI, 0.70-0.87) were negatively associated with the support for free PrEP. Compassion to others (AOR, 1.16; 95% CI, 1.01-1.21), perceived positive sexual impacts of free PrEP (AOR, 1.80; 95% CI, 1.43-2.44), and the belief that the positive impacts would outweigh the negative impacts (AOR, 26.97; 95% CI, 10.60-68.24) were positively associated with the support for free PrEP. Similar associations were observed for the support toward subsidized PrEP. CONCLUSIONS: The Hong Kong general public's support for government financial assistance of PrEP for people at high risk of HIV was low. Prexposure prophylaxis advocacy campaigns are warranted and suggested to incorporate components that address the associated factors. Article	2021	Lutz S.; Hirberling M.; Gredlich K.J.	Patient perspectives of pharmacists prescribing HIV pre-exposure prophylaxis: A survey of patients receiving antiretroviral therapy	Journal of the American Pharmacists Association	-	-	-	15443191	10.1016/j.japh.2020.09.020	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85092715969&doi=10.1016%2Fj.japh.2020.09.020&partnerID=40&md5=37f751d8c23ca026dd3c5fcaa139aad	-	Background: Groundbreaking new laws granting community pharmacists the authority to prescribe human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) medications have the potential to increase patient access to PrEP. However, little information is available regarding patients' perceptions of this new role for pharmacists. Objective: To assess the attitudes and perceptions of patients toward the prospective pharmacist PrEP prescribing and identify potential barriers to acceptance of pharmacists prescribed PrEP. Methods: Adult patients currently receiving antiretroviral therapy for HIV prophylaxis or treatment at a specialty pharmacy were surveyed telephonically from January 2020–April 2020. A 4-point Likert scale was used to measure perceptions in addition to open-ended questions. Results: The participation rate was 87.5%. Of the 49 respondents, 100% agreed/strongly agreed that pharmacists were knowledgeable about medications, but they were less likely to strongly agree that pharmacists were knowledgeable about HIV drugs (14.3% vs. 75.5% for other drugs, P < 0.001). Most (93.9%) of the patients agreed/strongly agreed that they would feel comfortable seeking a pharmacist for PrEP information or HIV testing. With respect to PrEP prescribing, 16.3% disagreed that they would feel comfortable having a pharmacist prescribe their first dill of PrEP, preferring to speak to their physician or expressing concerns that pharmacists have inadequate training. All patients expressed a desire for additional HIV PrEP training requirements for pharmacists before allowing them to prescribe PrEP. A portion of patients (14.3%) disagreed/strongly disagreed that the increased availability of PrEP would lead to persons becoming less afraid to contract HIV. However, 100% of the patients agreed/strongly agreed that having pharmacists prescribed PrEP would benefit their community. Conclusion: Patients receiving antiretroviral therapy reported overall favorable perceptions of pharmacist PrEP prescribing; however, some concerns relating to pharmacists' level of training in HIV exist. This may be ameliorated through increased pharmacist education, including how to counsel patients seeking PrEP on behavioral risk reduction. © 2021 American Pharmacists Association®	AdultHealth Knowledge, Attitudes, Practice/HIV InfectionsHumansPharmaciansPre-Exposure Prophylaxis/Surveys and Questionnaires	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Lu, Albert Y; Laborde, Nicole D; Coleman, Kenneth; Yittinghoff, Eric; Gonzalez, Rafael; Wilde, Gretchen; Thorne, Annie L; Raspuzki, Ed; Shelner, Laura; Sunshine, Lauren; van der Straten, Ariane; Siegler, Aaron J; Buchbinder, Susan	DOT Duty: Developing a Novel Mobile App Using Artificial Intelligence and an Electronic Sexual Diary to Measure and Support PrEP Adherence Among Young Men Who Have Sex with Men.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03054-2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7979467/	-	Young men who have sex with men (YMSM) are highly vulnerable to HIV. While pre-exposure prophylaxis (PrEP) has demonstrated effectiveness, adherence has been low among YMSM and difficult to measure accurately. In collaboration with a healthcare company, we configured an automated directly-observed therapy (aDOT) platform for monitoring and supporting PrEP use. Based on interest expressed in focus groups among 30 YMSM, we combined aDOT with an electronic sexual diary to provide feedback on level of protection during sex and to motivate app use. In an 8-week optimization pilot with 20 YMSM in San Francisco and Atlanta, the app was found to be highly acceptable, with median System Usability Scale scores in the "excellent" range (80/100). App use was high, with median PrEP adherence of 91% based on aDOT. Combined dosing and sexual behavior data from 1,077 sessions showed PrEP dose-timing feedback support further evaluation of DOT Duty in future effectiveness studies.	pre-exposure prophylaxis, adherence, HIV, mobile health, artificial intelligence	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2021	Liu, Anna Y.; Vittinghoff, Eric; Sellmeyer, Deborah E.; Kolaczkowski, Sarah; Buchbinder, Susan; Anderson, Peter L.	Predictors of Tenofovir-Diphosphate in Hair among Participants in the iPrEx Open-Label Extension (POPLHIV Study).	PLoS ONE	-	-	-	1932-6203	10.1371/journal.pone.0066916	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC3688744/	-	Introduction: Vaginal rings are a promising approach to provide a woman-centered, long-acting HIV prevention strategy. Prior trials of a 25 mg dapivirine (DPV) ring have shown a favourable safety profile and approximately 30% risk reduction of HIV-1 infection. Extended duration rings replaced every three months may encourage user adherence, improve health service efficiency and reduce cost overall. We evaluated safety, pharmacokinetics, adherence and acceptability of two three-month rings with different DPV dosages, compared with the monthly DPV ring. Methods: From December 2013 to October 2014, MTN-020/IPM 047 enrolled 49 HIV-negative participant in Birmingham, Alabama and San Francisco, California into a phase 1, randomized trial comparing two extended duration (three-month) rings (100 or 200 mg DPV/ring; 25 and 50 mg/day release in vivo) to the monthly ring (25 mg DPV/ring; 8.3 mg/day release in vivo). Participants were randomized in a 2:2:1 ratio to receive the assigned investigational product (IP) for 12 months. Genital tissue, plasma and cervicovaginal fluid (CVF) and cervical tissue, at scheduled interpoints, Genital tissue mean ratios (GMRs) relative to the comparator ring were estimated using a regression model. Results: There were no differences in the proportion of participants with grade ≥2 genitourinary AEs or grade ≥3 AEs in the extended duration versus monthly ring arms (p = 1.0). Plasma and CVF DPV concentrations were higher in the extended duration rings compared to the monthly ring. Plasma GMRs were 1.53 to 1.85 and 1.41 to 1.46 and CVF GMRs were 1.45 to 2.87 and 1.74 to 2.40 for the 100 and 200 mg ring respectively. Cervical tissue concentrations were consistently higher in the 200 mg ring (GMRs 2.36 to 3.97). The majority of participants (92%) were fully adherent (ring inserted at all times, with no product discontinuation>ranges) with no differences between the monthly versus three-month rings. Most participants found the ring acceptable (median = 8 on 10-point Likert scale), with a greater proportion of participants reporting high acceptability (9 or 10) in the 25 mg arm (75%) compared with the 100 mg (25%) and 200 mg (44%) arms (p = 0.01 and p = 0.15 respectively). Conclusions: The extended duration DPV rings were well-tolerated and achieved higher DPV concentrations compared with the monthly DPV ring. These findings support further evaluation of these extended DPV rings for HIV prevention. Article	2021	Liu J.; Dong R.; Lin B.; Pan H.; Gao Y.; Dai J.; Liang H.; Huang A.; Zhong X.	Risk management on pre-exposure prophylaxis adherence of men who have sex with multiple men: A multicenter prospective cohort study	Risk Management and Healthcare Policy	-	-	-	11791594	10.2147/RMHP.S295114	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116465027&doi=10.2147%2FRMHP.S295114&partnerID=40&md5=4f4bc51d184da3bb5e7ba3cd57c5f4e	-	Background: MSM who have sex with multiple men (MMSM) belong to a high-risk group for HIV infection, and pre-exposure prophylaxis (PrEP) is an effective measure to prevent the infection. However, few studies on PrEP adherence by MMSM in China exist. We aimed to explore the protective motivation-related factors for PrEP adherence in an HIV-negative MMSM population in China and to provide a reference for future risk management and effective prevention strategies. Methods: Data were collected from a 2-year follow-up cohort study of PrEP in MSM in China. Regret/ protective motivation theory (RPMT) was used to design the questionnaire. Univariate and multivariate logistic regression analyses were performed to identify the factors associated with PrEP adherence. Results: A total of 296 (69.26%) of the 427 participants had good PrEP adherence, and 179 (59.72%) in the good adherence group. The three assessment scores of the good and poor adherence groups were 2.81 ± 0.62 and 2.74 ± 0.62, respectively. Poor PrEP adherence was associated with un-distressed PrEP medication (OR=0.670), students at school (OR=1.837), occasional condom use (OR=1.621), and good HIV knowledge (OR= 0.959). The higher the threat assessment score, the higher the susceptibility; and the lower the response cost, the stronger the protection motivation and the less likely MMSM were to have poor adherence. Conclusion: On-demand PrEP medication is more conducive to adherence. Preventive management should focus on MSMMs who are students at school, those who occasionally use condoms, and those with poor HIV knowledge. Improving threat perception and susceptibility, and controlling and reducing the response cost can effectively improve PrEP adher-ence, and the subsequent application of PMT during intervention research can provide a reference for HIV prevention in MSMM. © 2021 Liu et al.	pre-exposure prophylaxis, adherence, HIV, mobile health, artificial intelligence	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2021	Luz P.M.; Torres T.S.; Almeida-Brasil C.C.; Marins L.M.S.; Veloso V.G.; Grinsztejn B.; Cox J.; Moodie E.E.M.	High-Risk Sexual Behavior, Binge Drinking and Use of Stimulants are Key Experiences on the Pathway to High Perceived HIV Risk Among Men Who Have Sex with Men in Brazil	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03055-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091139897&doi=10.1007%2Fs10461-020-03055-5&partnerID=40&md5=e885222dc7f2c56a4c6dc0b39f6f3d2	-	In Brazil, pre-exposure prophylaxis (PrEP) is currently available for gay, bisexual, and other men who have sex with men. As PrEP use depends on an individual's perceived risk, we explored pathways by which potentially modifiable behaviors lead to high perceived HIV risk. Using online surveys (N = 16,667), we conducted a path analysis on the basis of ordered sequences of multivariate logistic regressions. High perceived HIV risk was low (26.3%) compared to condomless receptive anal sex (41.4%). While younger age increased the odds of binge drinking and of condomless receptive anal sex, it was associated with decreased odds of high perceived HIV risk. In contrast, use of stimulants increased the odds of condomless receptive anal sex and of high perceived HIV risk. Our results suggest that binge drinking and use of stimulants are key points in different pathways to high risk sexual behavior and may lead to different perceptions of HIV risk. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Ma Y.; Zhong X.; Lin B.; He W.	Factors influencing the intention of MSM to use the PrEP intelligent reminder system	Risk Management and Healthcare Policy	-	-	-	11791594	10.2147/RMHP.S337287	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119954500&doi=10.2147%2fRMHP.S337287&partnerID=40&md5=5fdd90f5aa3b44cf1df5c8f70f36be68	Purpose: Low adherence to medication is an important reason why pre-exposure prophylaxis (PrEP) is not effective at reducing the rate of new human immunodeficiency virus (HIV) infections among men who have sex with men (MSM). The intelligent reminder system (IRS) has been designed to improve user compliance, but the intention of MSM to use the IRS remains unclear. This study establishes a theoretical model to analyze the factors influencing their intention to use the IRS. Patients and Methods: Non-probability sampling was used to recruit MSM volunteers in Chongqing and Sichuan, China, and the data were collected from MSM who had used the IRS. A model based on the unified theory of acceptance and use of technology (UTAUT) was established for the data through a structural equation model, and the perceived privacy risk was considered to explore the subjects' behavior intention. Results: A total of 111 volunteers who had used the IRS filled out a questionnaire. Social influence had the greatest impact on behavior intention (β = 0.360, P < 0.001), followed by performance expectancy (β = 0.331, P < 0.001), and perceived privacy risk had a negative impact on behavior intention (β = −0.151, P = 0.040). In addition, social influence had an indirect effect on behavior intention (β = 0.182, P = 0.003) and performance expectancy played a mediating role in this indirect effect. Conclusion: Developments in the IRS are required to improve its usefulness and adequately explain its role when recommending it to MSM. It is also important to improve the system's ability to protect user privacy. Clinical evidence for the effectiveness of the IRS is conducive to its widespread use. © 2021 Ma et al. Article	2021	Macapagal K.; Nery-Hurwit M.; Matson M.; Crosby S.; Greene G.J.	Perspectives on and Preferences for On-Demand and Long-Acting PrEP Among Sexual and Gender Minority Adolescents Assigned Male at Birth	Sexuality Research & Social Policy	-	-	-	18689884	10.1007/s13178-020-00441-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85080960202&doi=10.1007%2fs13178-020-00441-1&partnerID=40&md5=c649653ae8eb10e6575d8c007fbfd959	Introduction: Sexual and gender minority (SGM) adolescents assigned male at birth who have sex with male partners are at increased risk for HIV. Daily oral pre-exposure prophylaxis (PrEP) is available for minor adolescents in the United States, who may have difficulty with adherence. Adolescents' perspectives toward emerging PrEP delivery methods that would not require daily pill-taking have not been well-explored. Methods: We conducted online surveys and focus groups in November 2018–February 2019 with 59 SGM adolescents assigned male at birth who reported sex with or attraction to male partners. Questions assessed their perspectives on and preferences for biomedical (on-demand, injection, implant) and non-biomedical HIV prevention options (condoms). Data were analyzed thematically. Results: Of all prevention options, the implant and condoms were rated highest, and participants preferred the implant over other biomedical options. Convenience, duration, and ease of access played important roles in adolescents' preferences. Parents were viewed as a barrier to taking PrEP regardless of delivery method due to their role in adolescents' ability to access healthcare. Conclusions: SGM adolescents are interested in long-acting PrEP, yet also perceive substantial obstacles to using biomedical prevention that reflect adolescents' developmental contexts. Policy Implications: State laws expanding adolescents' access to HIV preventive services, sex education inclusive of PrEP information, and parent- and provider-initiated PrEP conversations can reduce barriers regardless of PrEP delivery method. Research to accelerate the availability of long-acting implants for adolescents is needed. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	MacCarthy, Sarah; Mendoza-Graf, Alexandra; Wagner, Zachary; L Barreras, Joanna; Kim, Alice; Giguere, Rebecca; Carballo-Dieguez, Alex; Linnemayr, Sebastian	The acceptability and feasibility of a pilot study examining the impact of a mobile technology-based intervention informed by behavioral economics to improve HIV knowledge and testing frequency among Latinx sexual minority men and transgender women.	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-021-10335-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7880516	BACKGROUND: We developed a novel intervention that uses behavioral economics incentives and mobile-health text messages to increase HIV knowledge and testing frequency among Latinx sexual minority men and Latinx transgender women. Here we provide a theoretically-grounded assessment regarding the intervention's acceptability and feasibility. METHODS: We conducted 30-min exit interviews with a stratified sample of participants (n = 26 Latinx sexual minority men, 15 Latinx transgender women), supplemented with insights from study staff (n = 6). All interviews were recorded, transcribed, and translated for a content analysis using Dedoose. Cohen's Kappa was 89.4% across coded excerpts. We evaluated acceptability based on how participants cognitively and emotionally reacted to the intervention and whether they considered it to be appropriate. We measured feasibility based on practical, scientific and process assessments (e.g., functionality of text messaging service, feedback on study recruitment procedures and surveys). RESULTS: Regarding acceptability, most participants clearly understood the intervention as a program to receive information about HIV prevention methods through text messages. Participants who did not complete the intervention shared they did not fully understand what it entailed at their initial enrollment, and thought it was a one-time engagement and not an ongoing program. Though some participants with a higher level of education felt the information was simplistic, most appreciated moving beyond a narrow focus on HIV to include general information on sexually transmitted infections; drug use and impaired sexual decision-making; and differential risks associated with sexual positions and practices. Latinx transgender women in particular appreciated receiving information about Pre-Exposure Prophylaxis. While participants didn't fully understand the exact chances of winning a prize in the quiz component, most enjoyed the quizzes and chance of winning a prize. Participants appreciated that the intervention required a minimal time investment. Participants shared that the intervention was generally culturally appropriate. Regarding feasibility, most participants reported the text message platform worked well though inactive participants consistently said technical difficulties led to their disengagement. Staff shared that clients had varying reactions to being approached while being tested for HIV, with some unwilling to enroll and others being very open and curious about the program. Both staff and participants relayed concerns regarding the length of the recruitment process and study surveys. CONCLUSIONS: Our theoretically-grounded assessment shows the intervention is both acceptable and feasible. TRIAL REGISTRATION: The trial was registered on May 5, 2017 with the ClinicalTrials.gov registry NCT03144336 . Article	2021	MacGibbon J.; Lea T.; Ellard J.; Murphy D.; Kolstee J.; Power C.; Crawford D.; Bear B.; De Wit J.; Holt M.	Access to subsidized health care affects HIV Pre-Exposure Prophylaxis (PrEP) uptake among gay and bisexual men in australia: Results of national surveys 2013-2019	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002572	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102222016&doi=10.1097%2fQAI.0000000000002572&partnerID=40&md5=7a4756ae3e39c429c647a976b20427af	Background: We assessed willingness to use HIV pre-exposure prophylaxis (PrEP) and current PrEP use among gay and bisexual men (GBM) in Australia. Methods: National, online cross-sectional surveys of GBM were conducted in 2013, 2015, 2017, and 2019. Willingness to use PrEP was measured on a previously validated scale. Trends and associations with key measures were analyzed using multivariate logistic regression. Results: During 2013-2019, 4908 surveys were completed. Among HIV-negative and untested men not currently using PrEP, willingness to use PrEP increased from 23.0% in 2013 to 36.5% in 2017 (P < 0.001) but then plateaued at 32% in 2019 (P = 0.13). The proportion of current PrEP users increased significantly from 2.5% in 2015 to 38.5% in 2019 (P < 0.001). In 2019, factors independently associated with being a current PrEP user (compared with non-PrEP users who were willing to use PrEP) included having subsidized health care (Medicare), knowing HIV-positive people, being recently diagnosed with an STI other than HIV, having higher numbers of recent male sexual partners, recent condomless sex with casual and regular partners, and frequent PrEP sorting. Conclusion: Willingness to use PrEP has plateaued as its use has rapidly increased among GBM in Australia. PrEP use is concentrated among more sexually active men with access to subsidized health care. Free or low cost access schemes may facilitate broader access among GBM who want or need PrEP but lack access to subsidized health care. © 2020 Wolters Kluwer Health, Inc. Article	2021	Macgregor L.; Kohli M.; Looker K.J.; Hickson F.; Weatherburn P.; Schmidt A.J.; Turner K.M.E.	Chemsex and diagnoses of syphilis, gonorrhoea and chlamydia among men who have sex with men in the UK: A multivariable prediction model using causal inference methodology	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2020-054629	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099714702&doi=10.1136%2fsextrans-2020-054629&partnerID=40&md5=cea7c33da3d4acd3a7ab91dad79515da	Introduction In the last decade diagnoses of most STIs have risen among men who have sex with men (MSM). Although a significant proportion of this is likely due to increased STI screening, understanding the role of behavioural drivers remains critical. We measure the associations between stimulant use to enhance and prolong sexual experiences (chemsex) and bacterial STI diagnoses in UK MSM, individually considering HIV-diagnosed MSM, pre-exposure prophylaxis (PrEP) users and other MSM. Methods We used the UK 2017-2018 European MSM Internet Survey data (n=9375). We constructed causal inference models using multivariable logistic regression, calculating adjusted OR (aOR) and 95% CI of the associations between participation in recent (≤12 months) exclusively dyadic or multipartner chemsex versus no chemsex and recent self-reported diagnoses of syphilis, gonorrhoea and chlamydia. Results Among MSM with an HIV diagnosis, 25% of users indicated recent multipartner chemsex, vs 28% of PrEP users and 5% of other MSM. Adjusting for age, ethnicity, UK birth, cis-trans status, sexual identity, education, settlement size and relationship status, participation in recent multipartner chemsex versus no chemsex was associated with greater odds of recent syphilis, gonorrhoea and chlamydia diagnosis. aORs for recent syphilis, gonorrhoea and chlamydia diagnoses were 2.6 (95% CI 1.7 to 4.1), 3.9 (95% CI 2.6 to 5.8) and 2.9 (95% CI 1.9 to 4.3), respectively, in HIV-diagnosed MSM; 1.9 (95% CI 1.1 to 3.3), 2.9 (95% CI 2.0 to 4.2) and 1.9 (95% CI 1.3 to 2.8), respectively, in PrEP users; and 4.0 (95% CI 2.3 to 6.9), 2.7 (95% CI 1.9 to 3.8) and 2.3 (95% CI 1.6 to 3.4), respectively, in other MSM. Conversely, exclusively dyadic chemsex had no significant associations with bacterial STI diagnoses among HIV-diagnosed MSM, only gonorrhoea (aOR 2.4, 95% CI 1.2 to 4.7) among PrEP users and syphilis (aOR 2.8, 95% CI 1.4 to 5.6) among other MSM. Discussion Multipartner chemsex may drive the association between chemsex and bacterial STI diagnoses and thus should be the focus of future tailored chemsex interventions. Additionally, PrEP acceptability among MSM and particularly chemsex participants has generated an emergent group suitable for such interventions. © Author(s) (or their employer(s)) 2021. Article	2021	MacGregor L.; Speare N.; Nicholls J.; Harryman L.; Horwood J.; Kesten J.M.; Lorenc A.; Horner P.; Edelman N.L.; Muir P.; North P.; Gompels M.; Turner K.M.E.	Evidence of changing sexual behaviours and clinical attendance patterns, alongside increasing diagnoses of STIs in MSM and TPSM	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2020-054588	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119303727&doi=10.1136%2fsextrans-2020-054588&partnerID=40&md5=76c2098dd690f8da8106895f12c590d6	Background Due to rising numbers of STI diagnosis and increasing prevalence of antimicrobial resistance, we explored trends in STI testing frequency and diagnoses, alongside sexual decision making and attitudes concerning condom use and HIV pre-exposure prophylaxis (PrEP) at a large urban UK sexual health clinic. Methods We examined 66 528 electronic patient records covering 40 321 attendees between 2016 and 2019, 3977 of whom were men who have sex with men or trans persons who have sex with men (MSM/TPSM). We also explored responses from MSM/TPSM attendees sent an electronic questionnaire between November 2018 and 2019 (n=1975) examining behaviours/ attitudes towards PrEP. We measured trends in STI diagnoses and sexual behaviours including condomless anal intercourse (CAI), using linear and logistic regression analyses. Results Tests resulting in gonorrhoea, chlamydia or syphilis diagnoses increased among MSM/TPSM from 13.5% to 18.5% between 2016 and 2019 (p<0.001). The average MSM/TPSM STI testing frequency increased from 1.5/person/year to 2.1/person/year (p=0.017). Gay MSM/TPSM had the highest proportions of attendances resulting in diagnoses, increasing from 15.1% to 19.6% between 2016 and 2019 (p<0.001) compared with bisexual/other MSM/TPSM increasing from 6.9% to 14.5% (p<0.001), alongside smaller but significant increases in non-MSM/TPSM from 5.9% to 7.7% (p<0.001). The proportion of MSM/TPSM clinic attendees reporting CAI in the previous 3 months prior to at least one appointment in a given year increased significantly from 40.6% to 45.5% between 2016 and 2019 (p<0.0001) and average number of partners from 3.8 to 4.5 (p=0.002). Of 617 eligible questionnaire responses, 339/578 (58.7%) HIV-negative and 29/39 (74.4%) HIV-positive MSM/TPSM indicated they would be more likely to have CAI with someone on PrEP versus not on PrEP. 358/578 (61.9%) HIV-negative respondents said that PrEP use would make them more likely to have CAI with HIV-negative partners. Conclusion Rising numbers of STI diagnoses among MSM/TPSM are not attributable to increased testing alone. Increased CAI and number of partners may be attributable to evolving sexual decision making among PrEP users and their partners. Proportionally, bisexual/ other MSM/TPSM have the steepest increase in STI diagnoses. © Author(s) (or their employer(s)) 2021. Re-use permitted under CC BY. Published by BMJ. Article	2021	Maisto, Stephen A; Simons, Jeffrey S; Palfai, Tibor P; Moskal, Dezarie; Luehring-Jones, Peter	Daily Associations Among Alcohol Intoxication, Partner Familiarity, Participant Effortful Control, Urgency, and PrEP Uptake on Sexual Behavior in Men Who Have Sex with Men.	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-020-01852-2	https://dx.doi.org/10.1007/s10508-020-01852-2	The purpose of this study was to examine the effects of alcohol intoxication and its interaction with contextual or situation (partner familiarity) and individual differences variables (effortful control, urgency, and whether taking pre-exposure prophylaxis (PrEP) medication) on sexual behaviors in men who have sex with men (MSM), a subgroup for whom HIV continues to be a major public health problem in the U.S. The participants were 236 men recruited from two northeastern U.S. cities and aged 21-50 years, M = 27.8). These men participated in a 6-week (two 3-week sampling bursts) experience sampling method (ESM) study. The ESM data were collected via use of software installed on the participant's own or study-provided mobile phone. Individual differences variables were measured by participants' completing questionnaires measuring effortful control and urgency, and the participant's self-report of whether he was currently taking PrEP. The ESM data pertained to sexual behavior as well as situation variables of familiarity of relevant sexual partners and number of standard alcohol drinks consumed. The results generally were consistent with hypotheses, as alcohol intoxication showed a curvilinear relation to the occurrence of condomless anal intercourse. Furthermore, the likelihood of occurrence of condomless anal sex increased with increased familiarity of the sexual partner. Similarly, taking PrEP increased the likelihood of occurrence of condomless anal sex. At the same time, alcohol's effects were moderated by all three individual difference variables as expected, but the prediction that partner familiarity would moderate alcohol's effects on the occurrence of condomless sex was not supported. Clinical implications of the findings center on the application of the data to HIV prevention programs toward inclusion of more empirically supported, nuanced information on the relation between acute alcohol intoxication and sexual behavior. Directions for further research address the need for additional testing and refinement of a person × situation approach to alcohol and sexual behavior. Furthermore, it is argued that it is important to refine further the concept of sexual risk in the context of taking PrEP and to conduct more detailed, multivariate studies of the relation between taking PrEP and patterns of sexual behavior. Theses and Dissertations	2021	Makhakhe, Nosipho Faith.	Let's talk about pre-exposure prophylaxis: a participatory HIV prevention intervention with and for female sex workers in Durban, South Africa.	-	-	University of KwaZulu-Natal	-	NA	NA	https://researchspace.ukzn.ac.za/handle/10413/19971	Introduction: Since the discovery of HIV/AIDS in the early 1980s, scientists have been in search of a cure. Significant scientific efforts have so far led to the discovery of antiretroviral treatment that suppresses the replication of HIV that leads to AIDS. Recently, Tenofovir or Tenofovir-emtricitabine as antiretroviral treatment for HIV-positive persons can now be used as prevention in the form of oral pre-exposure prophylaxis (PrEP). This HIV prevention therapy is currently being administered to people considered at high risk of HIV, such as men who have sex with men, intravenous drug users and serodiscordant couples. In 2015, the WHO expanded its oral PrEP guidelines to include female sex workers (FSWs) who are a high-risk group for HIV worldwide. In response to these WHO guidelines, the South African government approved oral PrEP distribution among FSWs in 2016, as part of combination prevention with the expectation that FSWs would take up PrEP and this will reduce the rate of new HIV infections. However, the response to PrEP was underwhelming. Identifying the reasons for the low uptake of PrEP among FSWs is the primary objective of this study. This was followed with engaging FSW peer educators in a participatory intervention mapping process to design an intervention plan to address these challenges to uptake and potentially inform PrEP programming in Durban in the KwaZulu-Natal province which is a high HIV prevalence area in South Africa. Methods: This study was a participatory action intervention research that was conducted in two phases. The first phase was a qualitative needs analysis conducted from May to November 2018 to identify the challenges associated with PrEP uptake and retention, as well as to ascertain the motivating factors for PrEP use among FSWs. Interviews were conducted with 39 participants, 30 individual participants, and nine focus group participants. Eleven participants were FSW peer educators including one health worker and one researcher from sex work and PrEP distributing organisations (13 in total); the rest of the participants were FSWs (n=26). Consent was obtained from all participants. Data were analysed thematically. The second phase of this study was an intervention mapping phase during which a PrEP intervention plan was developed with eight FSW peer educators who were at the forefront of PrEP promotion among FSWs. This intervention plan was informed by data obtained from the needs analysis. A total of six meetings took place in which the individual, interpersonal and environmental determinants that have an impact on PrEP uptake, adherence, and retention were discussed. This resulted in the performance and change objectives, including a theory of change logic framework that systematically depicted the process of change. Furthermore, theory-based methods and activities were established which culminated into a PrEP intervention workshop programme. Additionally, the implementation and evaluation plans were also formulated. Results: The needs analysis…	HIV and AIDS.; Antiretroviral treatment.; Pre-exposure prophylaxis.; Female sex workers.; Antiretroviral use. Article	2021	Maksut J.L.; Eaton L.A.; Driver R.; Knowles C.M.; Watson R.J.	Factors associated with awareness and use of pre-exposure prophylaxis (PrEP) among Black men who have sex with men with a recent STI diagnosis	Behavioral Medicine	-	-	-	8964289	10.1080/08964289.2019.1692776	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087126586&doi=10.1080%2f08964289.2019.1692776&partnerID=40&md5=a9d0dd0cff07e7e68dbf5a667d0cfc43	Black men who have sex with men (BMSM) with a recent STI diagnosis are at particularly high risk for HIV infection and, as such, are a population for whom we must focus our antiretroviral pre-exposure prophylaxis (PrEP) implementation efforts. Understanding the factors that are associated with awareness and use of PrEP among BMSM with a recent STI diagnosis is a critical component of meeting our HIV prevention goals. For the current study, BMSM (N = 209) diagnosed with a STI in the past year residing in the Atlanta, Georgia metropolitan and surrounding areas were assessed on PrEP awareness and use, HIV risk behaviors (e.g., condomless anal intercourse) HIV risk perceptions, HIV treatment optimism, and HIV status communication self-efficacy. BMSM aware of PrEP (n = 152, 72.7%) were younger in age (OR = 0.96, 95% CI: 0.93-0.98, p = 0.030) and had significantly higher educational attainment (OR = 1.96, 95% CI: 1.28-3.02, p = 0.027) than PrEP unaware participants. In addition, participants who were aware of PrEP had significantly higher levels of HIV risk perceptions (OR = 1.27, 95% CI: 1.04-1.56, p = 0.019) than PrEP unaware participants. Finally, participants who had ever used PrEP (n = 15, 7.1%) had significantly higher HIV treatment optimism (OR = 1.55, 95% CI: 1.05-2.96, p = 0.034) than PrEP non-users. The present study showed that, while nearly three-fourths of the sample were PrEP aware, PrEP use among BMSM with STI diagnoses was limited and that PrEP is utilized less often by individuals who have less HIV treatment optimism. These findings call attention to the need to better understand how to effectively target PrEP uptake strategies for key populations. © 2020 Taylor & Francis Group, LLC. Article	2021	Malik A.; Antonino A.; Khan M.L.; Nieminen M.	Characterizing HIV discussions and engagement on Twitter	Health and Technology	-	-	-	21907188	10.1007/s12553-021-00577-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111256036&doi=10.1007%2fs12553-021-00577-z&partnerID=40&md5=fe459c4dfe3998ec18dccf138705d2ae	The novel settings provided by social media facilitate users to seek and share information on a wide array of subjects, including healthcare and wellness. Analyzing health-related opinions and discussions on these platforms complement traditional public health surveillance systems to support timely and effective interventions. This study aims to characterize the HIV-related conversations on Twitter by identifying the prevalent topics and the key events and actors involved in these discussions. Through Twitter API, we collected tweets containing the hashtag #HIV for a one-year period. After pre-processing the collected data, we conducted engagement analysis, temporal analysis, and topic modeling algorithm on the analytical sample (n = 122,807). Tweets by HIV/AIDS/LGBTQ activists and physicians received the highest level of engagement. An upsurge in tweet volume and engagement was observed during global and local events such as World Aids Day and HIV/AIDS awareness and testing days for trans-genders, blacks, women, and the aged population. Eight topics were identified that include "stigma", "prevention", "epidemic in the developing countries", "World Aids Day", "treatment", "events", "PrEP", and "testing". Social media discussions offer a nuanced understanding of public opinions, beliefs, and sentiments about numerous health-related issues. The current study reports various dimensions of HIV-related posts on Twitter. Based on the findings, public health agencies and pertinent entities need to proactively use Twitter and other social media by engaging the public through involving influencers. The undertaken methodological choices may be applied to further assess HIV discourse on other popular social media platforms. © 2021, The Author(s). Article	2021	Malone J.; Reisner S.L.; Cooney E.E.; Poteat T.; Cannon C.M.; Schneider J.S.; Radix A.; Mayer K.H.; Haw J.S.; Althoff K.N.; Wawrzyniak A.J.; Beyrer C.; Wirtz A.L.	Perceived HIV Acquisition Risk and Low Uptake of PrEP Among a Cohort of Transgender Women With PrEP Indication in the Eastern and Southern United States	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002726	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114522221&doi=10.1097%2fQAI.0000000000002726&partnerID=40&md5=0d8d13ce107f3cb0a6d0882af6458784	Introduction:Preexposure prophylaxis (PrEP) is effective in preventing HIV among adherent users. However, PrEP uptake among transgender women is low, and current prescribing guidelines from the Centers for Disease Control and Prevention (CDC) are not specific to transgender women. Self-perceived risk of HIV among those who are PrEP-indicated is not well understood.Methods:This cross-sectional analysis included 1293 transgender women screened at baseline from March 2018 to May 2020 for a multisite, prospective cohort study. We compared the prevalence of PrEP indication using current CDC prescribing criteria versus transgender women-specific criteria developed by study investigators with community input. We identified factors associated with study-specific PrEP indication and factors associated with self-perceived low to no HIV risk among those who were PrEP-indicated. We also calculated descriptive statistics to depict the PrEP care continuum.Results:PrEP indication prevalence using transgender women-specific criteria was 47% (611), 155 more than who were identified using the CDC criteria. Eighty-three percent were aware of PrEP, among whom 38% had ever used PrEP. Among PrEP ever users, 63% were using PrEP at the time of the study. There were 66% of current PrEP users who reported 100% adherence within the previous 7 days. Among those who were PrEP-indicated, 13% were using and adherent to PrEP at the time of the study. More than half (55%) of PrEP-indicated participants had low or no self-perceived HIV risk.Conclusions:These findings suggest that further guidance is needed for health care providers in prescribing PrEP to transgender women. Greater uptake and adherence are also needed for optimal effectiveness. © 2021 Lippincott Williams and Wilkins. Article	2021	Maloney K.M.; Le Guillou A.; Driggers R.A.; Sarkar S.; Anderson E.J.; Malik A.A.; Jenness S.M.	Projected Impact of Concurrently Available Long-Acting Injectable and Daily-Oral Human Immunodeficiency Virus Preexposure Prophylaxis: A Mathematical Model	Journal of Infectious Diseases	-	-	-	221899	10.1093/infdis/jiaa552	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099427621&doi=10.1093%2finfdis%2fjiaa552&partnerID=40&md5=85db63e06cc250c3f421210c1653644c	Background: Long-acting injectable (LAI) human immunodeficiency virus (HIV) preexposure prophylaxis (PrEP) is reportedly efficacious, although full trial results have not been published. We used a dynamic network model of HIV transmission among men who have sex with men to assess the population impact of LAI-PrEP when available concurrently with daily-oral (DO) PrEP. Methods: The reference model represents the current HIV epidemiology and DO-PrEP coverage (15% among those with behavioral indications for PrEP) among men who have sex with men in the southeastern United States. Primary analyses investigated varied PrEP uptake and proportion selecting LAI-PrEP. Secondary analyses evaluated uncertainty in pharmacokinetic efficacy and LAI-PrEP persistence relative to DO-PrEP. Results: Compared with the reference scenario, if 50% chose LAI-PrEP, 4.3% (95% simulation interval,-7.3% to 14.5%) of infections would be averted over 10 years. The impact of LAI-PrEP is slightly greater than that of the DO-PrEP-only regimen, based on assumptions of higher adherence and partial protection after discontinuation. If the total PrEP initiation rate doubled, 17.1% (95% simulation interval, 6.7%-26.4%) of infections would be averted. The highest population-level impact occurred when LAI-PrEP uptake and persistence improved. Conclusions: If LAI-PrEP replaces DO-PrEP, its availability will modestly improve the population impact. LAI-PrEP will make a more substantial impact if its availability drives higher total PrEP coverage, or if persistence is greater for LAI-PrEP. © 2020 The Author(s). Article	2021	Mandal S.; Prathipati P.K.; Sunagawa S.W.; Destachea C.J.	A concept evaluation study of a new combination bictegravir plus tenofovir alafenamide nanoformulation with prolonged sustained-drug-release potency for HIV-1 preexposure prophylaxis	Antimicrobial Agents and Chemotherapy	-	-	-	664804	10.1128/AAC.02320-20	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103057646&doi=10.1128%2fAAC.02320-20&partnerID=40&md5=78f5e1df598c38921387b1ab96baa0e1	The antiretroviral treatment (ART) approach is the best-prescribed approach to date for preexposure prophylaxis (PrEP) for high-risk individuals. However, the daily combination antiretroviral (cARV) regimen has become cumbersome for healthy individuals, leading to nonadherence. Recent surveys showed high acceptance of parenteral sustained-release ART enhancing PrEP adherence. Our approach is to design a parenteral nanoparticle (NP)-based cARV sustained-release (cARV-SR) system as long-acting HIV PrEP. Here, we report a new combination of two potent ARVs (tenofovir alafenamide fumarate TAF and bictegravir BIC) loaded as a nanoformulation intended as a cARV-SR for PrEP. The BIC+TAF NPs were fabricated by using a standardized in-house methodology. In vitro intracellular kinetics, cytotoxicity, and HIV-1 protection studies demonstrated that BIC+TAF encapsulation prolonged drug retention, reduced drug-associated cytotoxicity, and enhanced HIV protection. In human peripheral blood mononuclear cells, nanoformulated BIC+TAF demonstrated significant (P<0.05) improvement in the drug's selectivity index by 472 times compared to the BIC+TAF in solution. In vivo pharmacokinetic study of BIC, TAF, and respective drug metabolites in female BALB/c mice after single subcutaneous doses of BIC+TAF NPs demonstrated plasma drug concentrations of BIC and tenofovir above the intracellular 50% inhibitory concentration during the entire 30-day study period and prolonged persistence of both active drugs in the HIV target organs, including the vagina, colon, spleen, and lymph nodes. This report demonstrates that the encapsulation of BIC+TAF in a nanoformulation improved its therapeutic selectivity and the in vivo pharmacokinetics of free drugs. Based on these preliminary studies, we hypothesize that cARV-SR has potential as an innovative once-monthly delivery treatment for PrEP. Copyright © 2021 American Society for Microbiology. Article	2021	Mann-Jackson L.; Alonzo J.; Garcia M.; Trent S.; Bell J.; Horridge D.N.; Rhodes S.D.	Using community-based participatory research to address STI/HIV disparities and social determinants of health among young GBMSM and transgender women of colour in North Carolina, USA	Health and Social Care in the Community	-	-	-	9660410	10.1111/hsc.13268	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098134308&doi=10.1111%2fhsc.13268&partnerID=40&md5=b30199d57350ef927f7ae7abd4ce0a65	Sexually transmitted infections (STIs) and HIV disproportionately affect young persons; gay, bisexual and other men who have sex with men (GBMSM) and transgender women; persons of colour; and the U.S. South. Complex issues contribute to these high STI/HIV rates. Our community-based participatory research (CBPR) partnership conducted a community-driven needs assessment to inform an intervention addressing STI/HIV disparities and related social determinants of health (SDH) among young GBMSM and transgender women of colour in a high-incidence STI/HIV community in North Carolina. In 2018, in-depth interviews were conducted with 21 community members and 29 community organisation representatives to explore needs, priorities and assets. Interview data were analysed using constant comparison, an approach to grounded theory, and an empowerment theory-based planning process was used to develop multilevel intervention strategies based on findings. Thirteen themes emerged from the interviews that were organised into five domains: health (e.g., limited health services use; need for lesbian, gay, bisexual and transgender LGBT-friendly providers; prioritisation of mental health and gender transition and limited knowledge of and access to pre-exposure prophylaxis PrEP for HIV); employment (e.g., employment as a priority and relying on sex work to 'make ends meet'); education (e.g., barriers to education and needs for training to improve employment opportunities); social support (e.g., few welcoming activities and groups; strong informal support networks and little interaction between GBMSM and transgender women) and discrimination (e.g., frequent experiences of discrimination and the impact of frontline staff on services use). Three strategies – community-based peer navigation, use of social media, and anti-discrimination trainings for organisations – were identified and integrated into a new intervention known as Impact Triad. CBPR was successfully applied to identify needs, priorities and assets and develop a multilevel intervention focused on health disparities and SDH among young GBMSM and transgender women of colour in the U.S. South. © 2020 The Authors. Article	2021	Mansergh G.; Kota K.K.; Stephenson R.; Hirshfield S.; Sullivan P.	Preference for using a variety of future HIV pre-exposure prophylaxis products among men who have sex with men in three US cities	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25664	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100246704&doi=10.1002%2fjia2.25664&partnerID=40&md5=be30b9321263d7a5a1395a2fa4b9a49f	Background: Daily oral pre-exposure prophylaxis (PrEP) is available and recommended for men who have sex with men (MSM) at risk for HIV infection. Other HIV prevention products are being developed, including long-acting injectable (LAI) and event-based oral and topical formulations. Understanding preferences for potential products by MSM can help direct further development of prevention messaging. Methods: We present baseline data from HIV-negative participants enrolled in the US Mobile Messaging for Men (M-cubed) Study. Participants were asked their likelihood of and rank order preference for using daily oral PrEP and various potential prevention products (one- to -three-month injections, 2-1-1 sexual event oral dosing, anal or penile gel, or anal suppository), and their sociodemographic characteristics. Bivariate and multivariable logistics regression assessed demographic associations with likelihood of use and rank order preference. Results: Overall, most MSM reported a likelihood of using LAI (74%), sexual event-based pills (67%) and penile gel (64%). Men who reported recent unprotected (condomless and PrEPless) anal sex most preferred a penile gel formulation (74%), followed closely by LAI and event-based pills (73% each). Current PrEP users (vs. non-users) had greater odds of reporting likelihood to use LAI (AOR = 3.29, 95% CI = 2.12 to 5.11), whereas men reporting recent unprotected anal sex had a greater odds of likelihood to use a penile gel (AOR = 1.79, 95% CI = 1.27 to 2.52) and an anal suppository (AOR = 1.48, 95% CI = 1.08 to 2.02). Hispanic/Latino (vs. White) MSM (AOR = 2.29, 95% CI = 1.40 to 3.73) and, marginally, Black MSM (AOR = 1.54, 95% CI = 1.00 to 2.38) had greater odds of reporting likelihood to use penile gel. Similar patterns were found for rank ordering preference of products, including condoms. Conclusions: Most MSM were interested in using various potential future HIV prevention products, especially LAI. However, two typologies of potential users emerged: men who prefer sexual event-based methods (condoms, event-based pill, sexual gels and suppositories) and men who prefer non-sexual event-based methods (daily pill, LAI). Men who reported recent unprotected anal sex preferred a penile gel product most, followed closely by sexual event-based pills and LAI. Racial/ethnic differences were noted as well. These findings on product preferences can help in formulation development and messaging. © 2021 The Authors. Article	2021	Mantell, Joanne E; Franks, Julie; Lahuerta, Maria; Omollo, Dan; Zerbe, Allison; Hawken, Mark; Wu, Yingfeng; Odera, Doris; El-Sadr, Wafaa M; Agot, Kawango	Life in the Balance: Young Female Sex Workers in Kenya Weigh the Risks of COVID-19 and HIV.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03140-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7778484	The COVID-19 pandemic has had serious health, economic and psychosocial consequences. Marginalized populations including female sex workers face the stark choice of risking exposure to SARS-CoV-2 as they engage with clients or prioritizing their health at the cost of losing a primary source of income. As part of an ongoing open-label, randomized controlled trial providing daily oral pre-exposure prophylaxis and adherence support, we interviewed 193 of 200 enrolled young female sex workers (18-24 years) in Kisumu, Kenya, about COVID-19 awareness and precautions, access to health services, and sex work during Kenya's pandemic-related lockdown. Nearly all participants were aware of COVID-19 and reported taking protective measures, but only half reported concerns about acquiring SARS-CoV-2. Night curfews and bar closures adversely affected participants' sex work business, reducing the number of clients and payment amounts from clients. Nearly 15% experienced violence from a client or regular, non-paying sex partner during the lockdown period. Participants' access to healthcare services was not disrupted. Article	2021	Mantovanelli, LS; Boas, BELRV; Previdi, LML	PRE-EXPOSURE HIV PROPHYLAXIS (PREP): PERSPECTIVE STUDY IN HEALTH SCIENCES ACADEMICS AT A PRIVATE HIGHER EDUCATION INSTITUTION IN THE INTERIOR OF RONDONIA	Revista Científica da Faculdade de Educação e Meio Ambiente	-	-	-	2179-4200	10.31072/rcf.v12i1.927	https://revista.unifaema.edu.br/index.php/Revista-FAEMA/article/view/933	In Brazil, the Human Immunodeficiency Virus (HIV) epidemic is concentrated in some specific risk groups, which correspond to the highest incidence of cases, such as gay men and other men who have sex with men (MSM), transgender people and sex workers. who registered 65% of cases in 2017, thinking of reducing the number of HIV infections, scientists have been able to produce drugs that can protect cells from attack by these viruses. This strategy, called HIV Pre-Exposure Prophylaxis (PrEP), is an association of two antiretrovirals that have been shown to be safe in people at higher risk for infection. The aim of this study was to evaluate the perspective of health sciences scholars on PrEP. This is a descriptive quantitative observational epidemiological study that was carried out through a self-administered questionnaire at a higher education institution in the municipality of Ariquemes - RO. Data were analyzed using Microsoft Office Excel 2013 (R) software. The results showed that the majority of the students are from the Pharmacy Baccalaureate course (51%) and it was observed that the majority of the participants (81%) were never informed about this prevention method, 41% would not use PrEP, 22% would drop out. condom use if using PrEP and 49% do not believe in the effectiveness of antiretroviral. Relevant data was found, showing the lack of information on HIV prevention methods. It is necessary to have PrEP disclosed by the Ministry of Health, especially to groups at higher risk of infection, thus collaborating with public health policies. Article	2021	Marcus J.L.; Levine K.; Sewell W.C.; Solleveld P.; Mayer K.H.; Krakower D.S.	Switching from Tenofovir Disoproxil Fumarate to Tenofovir Alafenamide for Human Immunodeficiency Virus Preexposure Prophylaxis at a Boston Community Health Center	Open Forum Infectious Diseases	-	-	-	23288957	10.1093/ofid/ofab372	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118262095&doi=10.1093%2fofid%2fofab372&partnerID=40&md5=cd309b323ca75ab76a73b775b72bcd0c	Background. Efforts to end the human immunodeficiency virus (HIV) epidemic may be threatened if limited preexposure prophylaxis (PrEP) resources are funneled from tenofovir disoproxil fumarate with emtricitabine (TDF/FTC) to tenofovir alafenamide with emtricitabine (TAF/FTC) without proportional clinical benefits. Methods. The study population was patients at a Boston community health center who were assigned male sex at birth, aged .18 years, and prescribed TDF/FTC for PrEP in the 12 months before TAF/FTC approval (October 2019). We determined the frequency of switching to TAF/FTC in the 12 months after approval, including clinically indicated switching (ie, creatinine clearance ≥60 mL/minute or reduced bone density), potentially unnecessary switching (ie, no indications for switching and no cardiovascular risk factors), and potentially harmful switching (ie, no indications for switching and either obesity or dyslipidemia). Results. Of 2892 TDF/FTC users, mean age was 38 years, 96.0% were cisgender men, and 78.9% were white. A total of 343 (11.9%) switched to TAF/FTC. Based on documented renal, bone, and cardiovascular risk factors, we identified 24 (7.0%) with clinically indicated switching, 271 (79.0%) with potentially unnecessary switching, and 48 (14.0%) with potentially harmful switching. When indications for switching additionally included hypertension, diabetes, and creatinine clearance 60.70 mL/minute, 27.1% of switching was clinically indicated. Conclusions. Few who switched to TAF/FTC had documented indications for switching, although some appear to have been switched in anticipation of indications developing. As generic TDF/FTC is further discounted, provider education and patient decision aids are needed to facilitate selection of PrEP medications that is both clinically sound and cost-effective. © 2021 Oxford University Press. Article	2021	Marcus U.; Schink S.B.	The European MSM Internet Survey as a basis for prevention work in Germany for men who have sex with men; Der Europäische MSM Internet Survey als Grundlage für die Präventionsarbeit in Deutschland für Männer, die Sex mit Männern haben	Bundesgesundheitsblatt - Gesundheitsforschung - Gesundheitsschutz	-	-	-	14369990	10.1007/s00103-021-03429-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116993971&doi=10.1007%2fs00103-021-03429-3&partnerID=40&md5=12631227c6f95144dc06cc35ebca6765	Background: Sexual minorities are highly vulnerable to sexually transmitted infections (STIs), mental health problems such as depression and suicidality, and substance use-associated health and social problems. Research question: We describe selected findings from the European MSM Internet Survey (EMIS) 2017, one of the largest online surveys of men who have sex with men, and discuss their implications for prevention in MSM in Germany. Materials and methods: The overall aim of EMIS-2017 was to collect data for planning HIV and STI prevention and treatment programs. The target population were men living in Europe who have sex with men and/or are attracted to men. The questionnaire contained questions on demography, morbidities, behaviour, needs and interventions. Participants were recruited mainly via two popular online dating platforms from 10/2017 to 01/2018. Results and discussion: EMIS-2017 shows that MSM are severely affected by psychological stress and STIs. In terms of psychological stress, younger MSM suffer in particular from depressive disorders and suicidality, while the use of alcohol and other psychoactive substances is of concern among older MSM. MSM are more often affected by STIs than the heterosexual majority population. Many STIs are a- or pauci-symptomatic; thus, screening based on risk-assessment is favoured to detect infections. However, for the time being, for some STIs there is no medical and/or public health evidence to support treatment of asymptomatic infections. EMIS-2017 identified needs by subgroups as far as knowledge gaps on PEP (HIV post-exposure prophylaxis) and PrEP (HIV pre-exposure prophylaxis), being reached by information and prevention offers as well as insufficient uptake of such offers. © 2021, The Author(s). Article	2021	Martinez-Lacabe A.	The PrEP response in England: enabling collective action through public health and PrEP commodity activism	Critical Public Health	-	-	-	9581596	10.1080/09581596.2020.1844152	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095828551&doi=10.1080%2f09581596.2020.1844152&partnerID=40&md5=8b6d71178c10f6ef29971a940599f67c	Drawing on testimonies from oral history interviews with HIV/AIDS community activists and PrEP users, this paper analyses new forms of collective action in relation to the efforts to implement PrEP in England. The analysis of this PrEP response, delivered by an assemblage of independent actors and public health-related agents exposes three important aspects in relation to the lived experiences of first-wave PrEP users and HIV activists: (i) the negotiation of PrEP as a medical commodity, (ii) the use of gay dating apps as enabling technologies in regard to peer support, and (iii) the fact that access to PrEP was not equally distributed and differed between gay communities. This paper concludes that although this response was effective in decreasing HIV infection, it was only partially transformative in terms of social/health justice. However, the response featured forms of collective action that contrasted with the individualistic paradigm of the biomedicalisation of HIV prevention, pointing to a shift in future HIV prevention interventions. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	collective agency; commodity activism; HIV; HIV assemblage; PrEP activism	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Qualitative
Article	2021	Marton, T; Johnson, K; Katz, A; Ray, S; Southwell, B; van der Straten, A	MISINFORMATION ABOUT PRE-EXPOSURE PROPHYLAXIS (PREP) AND HIV VACCINES IN SUB-SAHARAN AFRICA: A CLINICAL PERSPECTIVE	Annals of Behavioral Medicine	-	-	-	0883-6612	https://doi.org/10.1093/abm/kaab020	https://www.rti.org/publication/misinformation-pre-exposure-prophylaxis-prep-hiv-vaccines-sub-saharan-africa-clinical-perspective	The spread of misinformation about novel and investigative HIV preventatives (e.g. Oral Pre-Exposure Prophylaxis (PrEP) and vaccines) can impede uptake and providers' ability to provide care. We have limited empirical evidence regarding the extent of such misinformation diffusion in sub-Saharan Africa (SSA). Furthermore, limited research has been done in SSA to explore clinicians' perspectives on health misinformation and its impact, specifically regarding HIV prevention methods. We conducted a pilot web-based anonymous 24-item-survey soliciting insights about experiences with misinformation associated with both PrEP and vaccine-based HIV prevention. Social media as a source of misinformation was also explored (i.e. Facebook, WhatsApp and others). We sent the survey to 113 health professionals, who work at organizations that conduct HIV prevention research trials, suggesting that they share the survey link with other relevant colleagues. Of the 75 survey responses received, 59 (79%) indicated working in a clinical setting, which was the focus of this analysis. Of the 59, nearly all (95%) identified as clinical researchers; 34% worked in Zimbabwe, 29% in Kenya and the remainder in South Africa, Uganda and Malawi (22%, 8%, and 7% respectively). Nearly 93% of those working in clinical settings agreed that misinformation is detrimental to the goals of their work and to the lives of those they serve. The most common piece of misinformation about PrEP that those working in clinical settings reported hearing from their participants (51%) was that taking PrEP equates to having a high number of sexual partners. Additionally, over half (51%) of those working in clinical settings indicated that the most reported misinformation about HIV vaccines was that they have severe side effects (i.e. cancer or liver disease). According to these survey respondents, participants' friends and family were the primary source of misinformation about PrEP (80%) and HIV vaccines (83%). Respondents most frequently reported that WhatsApp was a source of misinformation, with 53% for PrEP and 60% for HIV vaccines. The results of this survey suggest that health misinformation likely proliferates through the exchange of specious advice from friends and family and from social media platforms in which close networks are featured. These results emphasize the need for more research to determine the best way to intervene given the challenges of formally tracking and monitoring such sources. Theses and Dissertations	2021	Marzinke, Mark A; Grinsztejn, Beatriz; Fogel, Jessica M; Piwowar-Manning, Estelle; Li, Maoji; Weng, Lei; McCauley, Marybeth; Cummings, Vanessa; Ahmed, Shahnaz; Haines, Casey D; Bushman, Lane R; Petropoulos, Christos; Persaud, Deborah; Adeyeye, Adeola; Kofron, Ryan; Rinehart, Alex; St Clair, Marty; Rooney, James F; Pryluka, Daniel; Coelho, Lara; Gaur, Aditya; Middelkoop, Keren; Phanuphak, Nittaya; Cohen, Myron S; Hendrix, Craig W; Anderson, Peter; Hanscom, Brett; Donnell, Deborah; Landovitz, Raphael J	Characterization of HIV infection in cisgender men and transgender women who have sex with men receiving injectable cabotegravir for HIV prevention: HPTN 083.	-	-	University of California	-	0022-1899	https://doi.org/10.1093/infdis/jiab152	https://escholarship.org/uc/item/3133r6jx	IntroductionThe HIV Prevention Trials Network (HPTN) 083 trial demonstrated that long-acting cabotegravir (CAB-LA) was more effective than tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) for HIV prevention in cisgender men and transgender women who have sex with men. We characterized HIV infections that occurred in the blinded phase of HPTN 083.MethodsRetrospective testing included HIV testing, viral load testing, quantification of study drugs and HIV drug resistance testing.ResultsFifty-eight infections were evaluated, including 51 incident infections (12 CAB, 39 TDF/FTC). In many cases (5 CAB, 37 TDF/FTC), infection was associated with low or unquantifiable study drug concentrations. In four cases, infection occurred with on-time CAB-LA injections and expected plasma CAB concentrations. CAB exposure was associated with prolonged viral suppression and delayed antibody expression. In some cases, delayed HIV diagnosis resulted in CAB provision to participants with undetected infection, delayed antiretroviral treatment (ART), and emergence of drug resistance; most of these infections would have been detected earlier with viral load testing.ConclusionsEarly detection of HIV infection and prompt ART initiation could improve clinical outcomes in persons who become infected despite CAB-LA prophylaxis. Further studies are needed to elucidate the correlates of HIV protection in persons receiving CAB-LA. Article	2021	Mason, E; Osman, R; Hibbert, M; Enayat, Q; Mitchell, H; Chiavenna, C; Saunders, J; Sullivan, A; Chhibbar, P; Golombek, R; McCormack, S; Desai, M; Manavi, K	Distance travelled to access pre-exposure prophylaxis (PrEP) for HIV prevention on the PrEP Impact trial in England during 2017-2020	HIV Medicine	-	-	-	1464-2662	https://doi.org/10.1111/hiv.13492	https://onlinelibrary.wiley.com/doi/full/10.1111/hiv.13492	Objectives: HIV pre-exposure prophylaxis (PrEP) delivery in the UK is inequitable; over 95% of PrEP users were men who have sex with men (MSM) despite making up less than 50% of new HIV diagnoses. We conducted a systematic review to identify modifiable barriers and facilitators to PrEP delivery in the UK among underserved populations. Methods: We searched bibliographic/conference databases using the terms HIV, PrEP, barriers, facilitators, underserved populations, and UK. Modifiable factors were mapped along the PrEP Care Continuum (PCC) to identify targets for interventions. Results: In total, 44 studies were eligible: 29 quantitative, 12 qualitative and three mixed-methods studies. Over half (n = 24 [54.5%]) exclusively recruited MSM, whereas 11 were in mixed populations (all included MSM as a sub-population) and the other nine were in other underserved populations (gender and ethnicity minorities, women, and people who inject drugs). Of the 15 modifiable factors identified, two-thirds were at the PrEP contemplation and PrEParation steps of the PCC. The most reported barriers were lack of PrEP awareness (n = 16), knowledge (n = 19), willingness (n = 16), and access to a PrEP provider (n = 16), whereas the more reported facilitators were prior HIV testing (n = 8), agency and self-care (n = 8). All but three identified factors were at the patient rather than provider or structural level. Conclusions: This review highlights that the bulk of the scientific literature focuses on MSM and on patient-level factors. Future research needs to ensure underserved populations are included and prioritized (e.g. ethnicity and gender minorities, people who inject drugs) and provider and structural factors are investigated. Article	2021	Matambanadzo P.; Busza J.; Mafaune H.; Chinyanganya L.; Machingura F.; Ncube G.; Steen R.; Phillips A.; Cowan F.M.	"It went through the roof": an observation study exploring the rise in PrEP uptake among Zimbabwean female sex workers in response to adaptations during Covid-19	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25813	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118337403&doi=10.1002%2fjia2.25813&partnerID=40&md5=7d3a0adc28283d1ec224ea86cd6e3936	Introduction: Sisters with a Voice (Sisters), a programme providing community-led differentiated HIV prevention and treatment services, including condoms, HIV testing, pre-exposure prophylaxis (PrEP) and antiretroviral therapy linkage for sex workers, reached over 26,000 female sex workers (FSW) across Zimbabwe in 2020. Zimbabwe's initial Covid "lockdown" in March 2020 and associated movement restrictions interrupted clinical service provision for 6 weeks, particularly in mobile clinics, triggering the adaptation of services for the Covid-19 context and a scale up of differentiated service delivery (DSD) models. PrEP service delivery decentralized with shifts from clinical settings towards community/home-based, peer-led PrEP services to expand and maintain access. We hypothesize that peer-led community-based provision of PrEP services influenced both demand and supply-side determinants of PrEP uptake. We observed the effect of these adaptations on PrEP uptake among FSW accessing services in Sisters in 2020. Methods: New FSW PrEP initiations throughout 2020 were tracked by analysing routine Sisters programme data and comparing it with national PrEP initiation data for 2020. We mapped PrEP uptake among all negative FSW attending services in Sisters alongside Covid-19 adaptations and shifts in the operating environment throughout 2020: prior to lockdown (January–March 2020), during severe restrictions (April–June 2020), subsequent easing (July–September 2020) and during drug stockouts that followed (October–December 2020). Results and discussion: PrEP uptake in 2020 occurred at rates <25% (315 initiations or fewer) per month prior to the emergence of Covid-19. In response to Covid-19 restrictions, DSD models were scaled up in April 2020, including peer demand creation, community-based delivery, multi-month dispensing and the use of virtual platforms for appointment scheduling and post-PrEP initiation support. Beginning May 2020, PrEP uptake increased monthly, peaking at an initiation rate of 51% (n = 1360) in September 2020. Unexpected rise in demand coincided with national commodity shortages between October and December 2020, resulting in restriction of new initiations with sites prioritizing refills. Conclusions: Despite the impact of Covid-19 on the Sisters Programme and FSW mobility, DSD adaptations led to a large increase in PrEP initiations compared to pre-Covid levels demonstrating that a peer-led, community-based PrEP service delivery model is effective and can be adopted for long-term use. © 2021 The Authors. Article	2021	Matos, Matheus Costa Brandão; Araújo, Telma Maria Evangelista de; Queiroz, Artur Acelino Francisco Luz Nunes; Borges, Paulo de Tarso Moura	Knowledge of health students about prophylaxis pre and post exposure to HIV	Revista Gaúcha de Enfermagem	-	-	-	1983-1447	10.1590/1983-1447.2021.20190445	http://www.scielo.br/scielo.php?script=sci_arttext&pid=S1983-14472021000100428&lang=pt	ABSTRACT Objective To evaluate students' knowledge of nursing and medical courses at a public university on prophylaxis before and after exposure to HIV/AIDS. Method cross-sectional study, carried out with nursing and medical students (n = 167). In order to explain the effect of variables on knowledge, the Multinomial Logistic Regression was used. Results Participants had a mean of 23.03 years, female (56.5%), unmarried (64.3%), and heterosexual (86.3%). The level of knowledge demonstrated was mostly medium (49.4%), and only 28.6% showed a high knowledge about the subject. The multivariate analysis showed that the course (p = 0.03) and age (p = 0.01) were associated with a higher level of knowledge. Conclusions Nursing and medical students possess knowledge considered as average about HIV preventive prophylaxis, thus it is up to the health education institutions to provide subsidies for a better training of students, treating the theme as a transversal subject in their training. Article	2021	Matson, Margaret; Nery-Hurwit, Mara; Crosby, Shariell; Greene, George J; Macapagal, Kathryn	Awareness and Knowledge of Pre-exposure Prophylaxis Among Sexual and Gender Minority Adolescents Assigned Male at Birth in the United States.	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-020-01904-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8919433	Sexual and gender minority (SGM) adolescents assigned male at birth are at increased risk for HIV infection. Pre-exposure prophylaxis (PrEP) is a daily pill taken to prevent HIV, which the United States Food and Drug Administration approved for minors under age 18 years weighing at least 77.5 lb in 2018. A lack of awareness and knowledge of PrEP are barriers to uptake among adults and adolescents, but SGM adolescents' awareness and knowledge about PrEP remain underexplored and no studies have assessed SGM adolescents' informational needs. We collected data on 59 SGM adolescents' (ages 14-18 years) awareness, knowledge, and questions about PrEP in an online survey and six online focus groups. Although a majority of SGM adolescents (83.1%) were aware of PrEP before the study, many wanted more information about side effects and how to navigate potential barriers to PrEP initiation. Findings can inform public health efforts to promote PrEP knowledge and uptake among SGM adolescents. Article	2021	Matthews, Lynn T; Greener, Letitia; Khidir, Hazar; Psaros, Christina; Harrison, Abigail; Mosery, F Nzwakie; Mathenjwa, Mxolisi; O'Neil, Kasey; Milford, Cecilia; Safren, Steven A; Bangsberg, David R; Smit, Jennifer A	"It really proves to us that we are still valuable": Qualitative research to inform a safer conception intervention for men living with HIV in South Africa.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0240990	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7993862	OBJECTIVE: Many men living with HIV want to have children. Opportunities to reduce periconception HIV transmission include antiretroviral therapy as prevention, pre-exposure prophylaxis, limiting condomless sex to peak fertility, and sperm processing. Whether men have knowledge of or want to adopt these strategies remains unknown. METHODS: We conducted focus group discussions (FGDs) with men accessing HIV care in South Africa in 2014 to inform a safer conception intervention for men. Eligible men were 25-45 years old, living with HIV, not yet accessing treatment, and wanting to have a child with an HIV-negative or unknown serostatus female partner (referred to as the "desired pregnancy partner"). FGDs explored motivations for having a healthy baby, feasibility of a clinic-based safer conception intervention, and acceptability of safer conception strategies. Data were analyzed using thematic analysis. RESULTS: Twelve participants from three FGDs had a median age of 37 (range 23-45) years, reported a median of 2 (range 1-4) sexual partners, and 1 (range 1-3) desired pregnancy partner(s). A third (N = 4) had disclosed HIV-serostatus to the pregnancy partner. Emergent themes included opportunities for and challenges to engaging men in safer conception services. Opportunities included enthusiasm for a clinic-based safer conception intervention and acceptance of some safer conception strategies. Challenges included poor understanding of safer conception strategies, unfamiliarity with risk reduction versus "safe" (condoms) and "unsafe" (condomless) sex, mixed acceptability of safer conception strategies, and concerns about disclosing HIV-serostatus to a partner. CONCLUSIONS: Men living with HIV expressed interest in safer conception and willingness to attend clinic programs. Imprecise prevention counseling messages make it difficult for men to conceptualize risk reduction. Effective safer conception programs should embrace clear language, e.g. undetectable = untransmittable (U = U), and support multiple approaches to serostatus disclosure to pregnancy partners. Article	2021	Matthews, Randolph P; Patel, Munjal; Barrett, Stephanie E; Haspeslagh, Liesbeth; Reynders, Tom; Zhang, Saijuan; Rottey, Sylvie; Goodey, Adrian; Vargo, Ryan C; Grobler, Jay A; Stoch, S Aubrey; Iwamoto, Marian	Safety and pharmacokinetics of islatravir subdermal implant for HIV-1 pre-exposure prophylaxis: a randomized, placebo-controlled phase 1 trial.	Nature Medicine	-	-	-	1546-170X	10.1038/s41591-021-01479-3	https://dx.doi.org/10.1038/s41591-021-01479-3	Islatravir (MK-8591) is a highly potent type 1 human immunodeficiency virus (HIV-1) nucleoside reverse transcriptase translocation inhibitor with a long intracellular half-life that is in development for the prevention and treatment of HIV-1. We conducted a randomized, double-blind, placebo-controlled, phase 1 trial in adults without HIV-1 infection. Participants received islatravir or placebo subdermal implants for 12 weeks and were monitored throughout this period and after implant removal. The co-primary end points were safety and tolerability of the islatravir implant and pharmacokinetics, including concentration at day 85, of islatravir triphosphate in peripheral blood mononuclear cells (PBMCs). Secondary end points included additional pharmacokinetic parameters for islatravir triphosphate in PBMCs and the plasma pharmacokinetic profile of islatravir. Based on preclinical data, two doses were assessed: 54 mg (n = 8, two placebo) and 62 mg (n = 8, two placebo). The most frequently reported adverse events were mild-to-moderate implant-site reactions (induration, hematoma, pain). Throughout the 12-week trial, geometric mean islatravir triphosphate concentrations were above a pharmacokinetic threshold of 0.05 pmol per 106 PBMCs, which was estimated to provide therapeutic reverse transcriptase inhibition (concentration at day 85 (percentage of geometric coefficient of variation): 54 mg, 0.135 pmol per 106 cells (27.3); 62 mg, 0.272 pmol per 106 cells (45.2)). Islatravir implants at both doses were safe and resulted in mean concentrations above the pharmacokinetic threshold through 12 weeks, warranting further investigation of islatravir implants as a potential HIV prevention strategy. Article	2021	Mauka W.; Mbotwa C.; Moen K.; Lichtwarck H.O.; Haaland I.; Kazaura M.; Leyna G.H.; Leshabari M.T.; Mmbaga E.J.	Development of a mobile health application for hiv prevention among at-risk populations in urban settings in east africa: A participatory design approach	JMIR Formative Research	-	-	-	2561326X	10.2196/23204	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117119900&doi=10.2196%2f23204&partnerID=40&md5=06cd31d528dc1e46504192464ea8c60c	Background: There is limited evidence in Africa on the design and development of mobile health (mHealth) applications to guide best practices and ensure effectiveness. A pragmatic trial for HIV pre-exposure prophylaxis roll-out among key populations in Tanzania is needed. Objective: We present the results of the development of a mobile app (Jichunge) intended to promote adherence to pre-exposure prophylaxis (PrEP) among men who have sex with men (MSM) and female sex workers (FSW) in Tanzania. Methods: A participatory design approach was employed and guided by the information system research framework. MSM and FSW were the target populations. A total of 15 MSM and 15 FSW were engaged in the relevance and design cycles, while the piloting phase included 10 MSM and 20 FSW. Results: The relevance cycle enabled the description of the existing problem, provided the compatible app features for the target population, and identified the need to develop an mHealth app that provides health services in a stigmatizing and discriminating environment. User involvement in the app's design and evaluation provided an opportunity to incorporate social, cultural, and community-specific features that ensured usability. In addition, the participants suggested valuable information to inform the app, text message services, medication registration, and chat platform designs. Conclusions: The participatory design approach in the development of mHealth apps is useful in identifying and validating population-specific functional features, improving usability, and ensuring future health impacts. Through this participatory process, the Jichunge app took end-user needs, perspectives, and experiences into account, eliciting enthusiasm regarding its potential role in supporting pre-exposure prophylaxis adherence for HIV and related behavioral change promotion. © 2021 Fundacion Instituto de Historia Social. Article	2021	Mavhandu-Ramarumo L.G.; Tambe L.A.M.; Matume N.D.; Katerere D.; Bessong P.O.	Undisclosed exposure to antiretrovirals prior to treatment initiation: An exploratory analysis	Southern African Journal of HIV Medicine	-	-	-	16089693	10.4102/SAJHIVMED.V22I1.1200	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104934366&doi=10.4102%2fSAJHIVMED.V22I1.1200&partnerID=40&md5=687346398608d6e98b79fc9745d1ba21	Background: The proportion of individuals with a history of exposure ('pre-exposure') to antiretrovirals (ARVs) prior to formal initiation into antiretroviral treatment (ART) is unknown. Objectives: This study describes the detection of ARVs in plasma and/or hair, of persons who self-reported no pre-exposure to ART at their first-time initiation onto ART in three clinics in the province of Limpopo, South Africa (SA). Method: Concentrations of tenofovir (TDF), emtricitabine (FTC) and efavirenz (EFV) in the plasma and hair of individuals initiating ART were analysed using a validated liquid chromatography tandem mass spectrometry (LC-MS/MS) method. Next generation sequences of HIV polymerase gene were analysed with Geneious software 11.15, and drug resistance (DR) mutations were determined according to the Stanford HIV Drug-Resistance database. Participants' demographic data were collected on a structured questionnaire. Data that describe prior exposure to ARV were also collected by this self-reporting method. Results: Paired blood and hair samples were collected from 77 individuals newly initiated onto ART from 2017 to 2019. We detected at least one of the drugs in the plasma or hair of 41/77 (53.2%) patients who responded with a 'no' to the question 'have you received ARVs before initiation onto ART?' Thirty-one participants (n = 31/77, 40.3%) had TDF in either plasma or hair. Emtricitabine and EFV were found in the plasma or hair of 12/77 (15.6%) and 25/77 (32.4%) of participants respectively. Six (n = 6/77, 7.792%) had all three ARVs in plasma or hair. Prevalence of DR mutations at the > 5% significance threshold level in those known to have had ARV-exposure determined by LC-MS/MS prior to ART-initiation was not significant (x2 = 0.798; p = 0.372), when compared to those who had no prior exposure but still showed DR. Conclusion: Antiretroviral levels in the hair of individuals initiating treatment imply prolonged prior-exposure to that ARV. The presence of ARV in plasma and hair of persons living with HIV (PLWH) who deny ARV-use, requires an explanation. A larger study at multiple sites and regular DR surveillance of ART-naïve PLWH will be necessary to confirm the generalisability of these findings to the wider South African population. © 2021 AOSIS (pty) Ltd. Theses and Dissertations	2021	Maxwell, Steven	Pre-exposure prophylaxis use among men who have sex with men who have engaged in chemsex	-	-	University College London (University of London)	-	NA	NA	https://discovery.ucl.ac.uk/id/eprint/10134742/ https://ethos.bl.uk/OrderDetails.do?uin=uk.bl.ethos.863750	Background: Men who have sex with men (MSM) in the United Kingdom are one of groups most effected by HIV. Due to the multitude of risk behaviours, MSM who engage in chemsex are at heightened risk of acquiring HIV. Pre-exposure prophylaxis (PrEP) reduces the risk of HIV acquisition by up to 99%, although this is dependent on high levels of adherence. There were public health concerns that MSM chemsex behaviour may negatively impact upon PrEP use. The PhD aim was to examine the interface relationship between MSM chemsex engagement and PrEP use. The PhD will inform interventions that improve PrEP uptake/medication adherence amongst MSM who engage in chemsex. Methods: I used multiple methods that adopted a pragmatic approach with a biopsychosocial perspective on health. Firstly, I completed two systematic reviews: MSM chemsex behaviours and MSM PrEP uptake/medication adherence. Secondly, I performed a quantitative analysis of PrEP use among MSM who experienced problematic chemsex. Finally, I completed a qualitative study of PrEP uptake/ medication adherence among MSM chemsex participants. The cascade approach to HIV prevention and perception/practicalities approach (PAPA) to adherence were used to understand the PrEP use journey. Results: MSM chemsex participants were at high risk of HIV acquiring as it involved multiple risk behaviours, including drug and sexual activities. MSM who experienced problematic chemsex were at heightened risk of HIV acquisition which was intertwined with complex psycho-social factors. The wider MSM population had high PrEP adherence levels. Chemsex participants' motivation to use PrEP was driven by high perceived HIV risk and necessity to protect against the biopsychosocial consequences of an HIV diagnosis. MSM social discourse and norms influenced chemsex participants candidacy for PrEP. PrEP accessibility was facilitated by free and trustworthy sources from dynamic established providers. Generally, chemsex participants had high PrEP adherence levels. However, a sub-group of MSM who experience problematic chemsex may be at heightened risk of non-adherence. MSM used PrEP to contain the impact chemsex had on their health and psychosocial wellbeing. They used multiple strategies in their day to day lives and chemsex context to promote PrEP adherence. Conclusion: MSM chemsex participants were at high risk of HIV acquiring and those that experienced problematic chemsex had increased vulnerability. Chemsex participants' motivation to use PrEP was driven by high-perceived HIV risk and biopsychosocial implications of an HIV diagnosis. Their access to PrEP was facilitated by structural opportunities. Chemsex participants had high PrEP adherence levels but there was increased a risk of non-adherence when behaviours became problematic and/or had a negative impact on health. Multi-level strategies were used to promote adherence to PrEP regimens. Article	2021	Mayer, Kenneth H; Nelson, LaRon; Hightow-Weidman, Lisa; Mimiaga, Matthew J; Mena, Leandro; Reisner, Sari; Daskalakis, Demetre; Safren, Steven A; Beyrer, Chris; Sullivan, Patrick S	The persistent and evolving HIV epidemic in American men who have sex with men.	The Lancet	-	-	-	1474-547X	10.1016/S0140-6736(21)00321-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9639667	Men who have sex with men (MSM) in the USA were the first population to be identified with AIDS and continue to be at very high risk of HIV acquisition. We did a systematic literature search to identify the factors that explain the reasons for the ongoing epidemic in this population, using a social-ecological perspective. Common features of the HIV epidemic in American MSM include role versatility and biological, individual, and social and structural factors. The high-prevalence networks of some racial and ethnic minority men are further concentrated because of assortative mixing, adverse life experiences (including high rates of incarceration), and avoidant behaviour because of negative interactions with the health-care system. Young MSM have additional risks for HIV because their impulse control is less developed and they are less familiar with serostatus and other risk mitigation discussions. They might benefit from prevention efforts that use digital technologies, which they often use to meet partners and obtain health-related information. Older MSM remain at risk of HIV and are the largest population of US residents with chronic HIV, requiring culturally responsive programmes that address longer-term comorbidities. Transgender MSM are an understudied population, but emerging data suggest that some are at great risk of HIV and require specifically tailored information on HIV prevention. In the current era of pre-exposure prophylaxis and the undetectable equals untransmittable campaign, training of health-care providers to create culturally competent programmes for all MSM is crucial, since the use of antiretrovirals is foundational to optimising HIV care and prevention. Effective control of the HIV epidemic among all American MSM will require scaling up programmes that address their common vulnerabilities, but are sufficiently nuanced to address the specific sociocultural, structural, and behavioural issues of diverse subgroups. Article	2021	Mboup, Aminata; Diabaté, Souleymane; Béhanzin, Luc; Guédou, Fernand Aimé; Zannou, Djimon Marcel; Kêkê, René K; Bachabi, Moussa; Gangbo, Flore; Marzinke, Mark A; Hendrix, Craig; Gagnon, Marie-Pierre; Alary, Michel	Determinants of HIV Preexposure Prophylaxis Adherence Among Female Sex Workers in a Demonstration Study in Cotonou, Benin: A Study of Behavioral and Demographic Factors.	Sexually Transmitted Diseases	-	-	-	1537-4521	10.1097/OLQ.0000000000001373	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8284381	BACKGROUND: HIV preexposure prophylaxis (PrEP) efficacy is closely linked to adherence, and factors associated with PrEP adherence are not well understood and may differ across populations. As PrEP demonstration projects and implementation are ongoing, it is essential to understand factors associated with adherence to oral PrEP to design effective adherence interventions and maximize the public health impact of PrEP. We thus aimed to assess demographic and behavioral factors associated with optimal PrEP adherence (100%) among female sex workers (FSWs) participating in a demonstration project in Cotonou, Benin. METHODS: Female sex workers were provided with daily Truvada and followed quarterly for 1 to 2 years. Sociodemographics, partners, and behaviors were collected through face-to-face questionnaires. Another questionnaire based on sexual the theory of planned behavior and the theory of interpersonal behavior was also administered. Generalized estimating equations were used to identify factors associated with optimal daily adherence. RESULTS: At baseline, 255 FSWs were followed up. One-year increase in age of FSWs was associated with a 3% increase in optimal adherence (prevalence ratio, 1.03; 95% confidence interval, 1.01-1.05; P for trend = 0.0003), and optimal adherence decreased by 31% for every 6 months of follow-up (prevalence ratio, 0.69; 95% confidence interval, 0.59-0.79; P for trend < 0.0001). For the participants who have completed the behavioral questionnaires, high intention to adhere to the treatment was also a predictor of optimal adherence. CONCLUSIONS: Efforts should be geared toward FSWs intending to use PrEP to help them reach adequate adherence levels for effective HIV protection. Response to a Large HIV Outbreak, Cabell County, West Virginia, 2018-2019.	American Journal of Preventive Medicine	-	-	-	1873-2607 0749-3797	10.1016/j.amepre.2021.05.039	https://pubmed.ncbi.nlm.nih.gov/34686283/	INTRODUCTION: In January 2019, the West Virginia Bureau for Public Health detected increased HIV diagnoses among people who inject drugs in Cabell County. Responding to HIV clusters and outbreaks is 1 of the 4 pillars of the Ending the HIV Epidemic in the U.S. initiative and requires activities from the Diagnose, Treat, and Prevent pillars. This article describes the design and implementation of a comprehensive response, featuring interventions from all pillars. METHODS: This study used West Virginia Bureau for Public Health data to identify HIV diagnoses during January 1, 2018-October 9, 2019 among (1) people who inject drugs linked to Cabell County, (2) their sex or injecting partners, or (3) others with an HIV sequence linked to Cabell County people who inject drugs. Surveillance data, including HIV-1 polymerase sequences, were analyzed to estimate the transmission rate and timing of infections using molecular clock phylogenetic analysis. Federal, state, and local partners designed and implemented a comprehensive response during January 2019-October 2019. RESULTS: Of 82 people identified in the outbreak, most were male (60%), were White (91%), and reported unstable housing (80%). In a large molecular cluster containing 56 of 60 (93%) available sequences, 93% of inferred transmissions occurred after January 1, 2018. HIV testing, HIV pre-exposure prophylaxis, and syringe services were rapidly expanded, leading to improved linkage to HIV care and viral suppression. CONCLUSIONS: Evidence of rapid transmission in this outbreak galvanized robust collaboration among federal, state, and local partners, leading to critical improvements in HIV prevention and care services. HIV outbreak response requires increased coordination and creativity to improve service delivery to people affected by rapid HIV transmission. Article	2021	McClure, T; Davis, J; Garcia, M; Eddy, KR; Palanee-Phillips, T; Bam, B; Nair, G; Kassim, S; Agwau Akello, C; Ndadziyira, P; Ngure, K; Celum, C; Soto-Torres, L; Van Der Straten, A	Implementing a rapid response to the COVID-19 global pandemic in MTN-034/REACH: an HIV prevention trial among adolescent girls and young women in Africa	Journal of the International AIDS Society	-	-	-	NA	10.1002/jia2.25659	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02271736/full	Background: The MTN-034/REACH trial, evaluating safety and preferences of oral pre-exposure prophylaxis (PrEP) and the dapivirine vaginal ring among adolescent girls and young women (AGYW) in sub-Saharan Africa, was in full implementation when the COVID-19 pandemic erupted. Associated socio-economic upheaval and mobility disruptions impacted the 247 enrolled AGYW, and staff, potentially jeopardizing study quality and development of HIV prevention methods. In response, accrual was paused and rapid modifications to follow-up procedures were implemented to distribute study product, monitor safety, handle biological samples and testing, and support product adherence. Methods: As sites prepared for impending lockdowns, guidance was issued regarding safety and confidentiality precautions, mitigating social harms (e.g. counseling/referrals, reimbursements for food security) and COVID-19 education for participants and staff. A contingency plan for study conduct, tiered by operational status, was developed and implemented according to site capacity. All modifications, including telephonic visits in lieu of clinic visits, providing extra study product, and prioritizing in-person procedures, were monitored in real-time for operational and analysis considerations. Community engagement included study updates to local stakeholders and delivery of COVID- 19 key messages for community sensitization. Results: Implementation modifications during country lockdowns resulted in nearly uninterrupted study product and contraceptive access for participants. Clinic access remained critical for participants without options for secure telephonic visits or with onsite needs, therefore sites operated in reduced capacity, with staff rotations and transport for staff and participants. Counselors expanded adherence support with remote reminders and check-ins, using alternative documentation and confidentiality practices. Completion rates for expected study visits and procedures were high. Sites maintained contact with most participants despite lockdowns (Table 1). Conclusions: Well-orchestrated modifications to study implementation ensured participant and staff safety, and maintained study integrity and community engagement during COVID-related disruptions. The MTN-034/REACH strategy serves as a template for optimal study operations during times of upheaval, especially when supporting AGYW.	*Africa; *Human immunodeficiency virus; *coronavirus disease 2019; *pandemic; Adolescent; Child; Clinical trial; Conference abstract; Confidentiality; Controlled study; Counseling; Counselor; Documentation; Drug safety; Education; Female; Food security; Human; Nonhuman; Prevention; Reimbursement; Rotation; Sensitization	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	McCormack H.; Nathan S.; Varma R.; Haire B.	Dissonances in communication with sexual health consumers in an inner-Sydney sexual health clinic in relation to health literacy: A mixed-methods study	Health Promotion Journal of Australia	-	-	-	10361073	10.1002/hpja.429	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85093647347&doi=10.1002%2fhpja.429&partnerID=40&md5=ffe00e16c6f6398ca733c87509b63d7f	Issues addressed: This study examined the navigation of health care interactions by health consumers attending Sydney Sexual Health Centre (SSHC), an inner-city sexual health clinic in Sydney, Australia. We aimed to assess the accessibility and appropriateness of communications between SSHC and patients in the context of health literacy. Methods: We conducted 20 semi-structured interviews with health consumers, assessed health literacy using the Short Health Literacy Assessment for English-Speaking Adults (SAHL-E) and conducted a focus group with clinical staff. Results: We identified dissonances around assumed knowledge in communications between health professionals and health consumers, which were most apparent when lack of knowledge about sexual health, HIV and pre-exposure prophylaxis (PrEP) intersected with poor English fluency. So what?: This study suggests that existing models of access for HIV treatment and PrEP in Australia have been developed for high health literacy and may not support consumers who experience communication barriers due to low health literacy. The Australian Commission on Safety and Quality in Health Care recommends addressing health literacy systemically, including embedding assessment of health literacy into organisational systems and policies. We recommend developing tools to assess knowledge levels of consumers accessing sexual health services and incorporating health literacy into clinician training on working with patients from non-English–speaking backgrounds. © 2021 Australian Health Promotion Association	accessibility; communications; consumer engagement; health literacy; HIV; pre-exposure prophylaxis; sexual health	English	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Mixed methods
Article	2021	McMahon, James M; Simmons, Janie; Haberer, Jessica E; Mannheimer, Sharon; Leblanc, Natalie M; Torres, Leilani; Quiles, Robert; Aedo, Guillermo; Javier, Anabel; Braksmajer, Amy; Harriman, Graham; Trabold, Nicole; Pouget, Enrique R; Kurth, Ann; Smith, Martez D R; Brasch, Judith; Podsiadly, Eric J; Anderson, Peter L	The Magnetic Couples Study: protocol for a mixed methods prospective cohort study of HIV-serodifferent heterosexual couples' perspectives and use of pre-exposure prophylaxis (PrEP).	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2021-048993	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8252879	INTRODUCTION: HIV transmission within serodifferent heterosexual couples plays a key role in sustaining the global HIV pandemic. In the USA, transmission within established mixed-status couples accounts for up to half of all new HIV infections among heterosexuals. Oral HIV pre-exposure prophylaxis (PrEP) is a highly effective prevention method, although underutilised among serodifferent couples. Moreover, there is a dearth of research on US HIV-serodifferent couples' perspectives and use of PrEP, alone or in combination with other prevention methods. In this paper, we describe the study protocol for the Magnetic Couples Study, designed to fill critical knowledge gaps regarding HIV-serodifferent heterosexual couples' perspectives, experiences and utilisation of PrEP. METHODS AND ANALYSIS: The Magnetic Couples Study is a mixed methods prospective cohort study designed to describe temporal patterns and identify determinants at multiple levels (individual, couple, HCF) of PrEP outcomes along the care continuum (PrEP awareness, linkage, uptake, retention and medication adherence) among HIV-serodifferent heterosexual couples residing in New York City. The study will also examine clinical management of PrEP, side effects and changes in sexual-related and substance use-related behaviour. A prospective cohort of 230 mixed-status couples already on oral PrEP was recruited, with quarterly assessments over 18 months; in addition, a cross-sectional sample of 150 mixed-status couples not currently on PrEP was recruited. In-depth semistructured qualitative interviews were conducted with a subsample of 25 couples. Actor-partner interdependence modelling using multilevel analysis will be employed for the analysis of longitudinal dyadic data. Framework analysis will be used to analyse qualitative data. A parallel convergent design will be used for mixed methods integration. ETHICS AND DISSEMINATION: The study was approved by the University of Rochester Institutional Review Board (RSRB00052766). Study findings will be disseminated to community members and providers and to researchers and policy makers. Article	2021	Meanley, Steven; Chandler, Cristian; Jaiswal, Jessica; Flores, Dalmacio D; Stevens, Robin; Connochie, Daniel; Bauermeister, José A	Are Sexual Minority Stressors Associated with Young Men who Have Sex with Men's (YMSM) Level of Engagement in PrEP?	Behavioral Medicine	-	-	-	0896-4289	10.1080/08964289.2020.1731675	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7774673	Sexual minority stressors (community homophobia, sexuality-related discrimination, and internalized homonegativity) are negatively associated with accessing HIV prevention services among men who have sex with men (MSM). Few studies have tested minority stressors' associations with PrEP engagement among high-HIV risk young MSM (YMSM). Therefore, we assessed the associations between PrEP-indicated YMSM's progression along the PrEP continuum and their experiences of minority stress. N = 229 YMSM completed a web-survey on PrEP-related behaviors and minority stress. Adjusted for covariates, we developed two partial-proportional odds models examining the associations between PrEP continuum progression and minority stressors, as a composite, and community homophobia, sexuality-related discrimination, and internalized homonegativity, respectively. Our multivariable model demonstrated minority stress levels to be negatively associated with PrEP continuum location (AOR = 0.76, 95% CI: 0.58-0.99). Broken down, discrimination was positively associated with reporting being at an advanced location along the continuum (AOR = 1.39, 95% CI: 1.06-1.82). Internalized homonegativity was negatively associated with continuum location between PrEP-aware participants with no intention to initiate and participants who intended to initiate PrEP (AOR = 0.45, 95% CI: 0.27-0.77) and between those who intended to initiate and those who had ever used PrEP (AOR = 0.39, 95% CI: 0.22-0.69). Our findings suggest that minority stress, especially internalized homonegativity, remains a barrier to PrEP among PrEP-indicated YMSM. Sexuality-related discrimination was associated with PrEP continuum progression, suggesting potentially well-developed, adaptive coping skills (e.g., ability to locate sexuality-affirming providers). Coupled with stigma reduction efforts, HIV prevention services aiming to promote PrEP should incorporate internalized homonegativity screenings and referrals into sexuality-affirming resources for PrEP-indicated YMSM. Article	2021	Meanley, Steven; Connochie, Daniel; Choi, Seul Ki; Bonett, Stephen; Flores, Dalmacio D; Bauermeister, José A	Assessing the Role of Gay Community Attachment, Stigma, and PrEP Stereotypes on Young Men Who Have Sex with Men's PrEP Uptake.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03106-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8084892	Negative stereotypes about pre-exposure prophylaxis (PrEP) hinder PrEP uptake among young men who have sex with men (YMSM). Prior research suggests community homophobia may be linked to negative PrEP attitudes. Conversely, individuals with high gay community attachments (GCA) may have more access to credible PrEP information/resources. Among 285 YMSM recruited online, we estimated structural equation models to test competing conceptual models that inform pathways from perceived stigmas, GCA, and negative PrEP stereotype endorsements to PrEP uptake. In Model A, perceived stigma was directly associated with PrEP uptake, partially mediated by stereotype endorsement (β = - 0.05; 95% CI - 0.09, - 0.01) and GCA (β = - 0.06; 95% CI - 0.11, 0.02). In Model B, perceived stigma was associated with PrEP uptake (β = - 0.07; 95% CI - 0.14, - 0.01) through stereotype endorsement among high GCA YMSM. Complemented by anti-stigma initiatives, PrEP outreach for YMSM should utilize sex-positive messaging and disentangle negative PrEP stereotypes within gay-centric social spaces. Article	2021	Medina-Marino, Andrew; Bezuidenhout, Dana; Hosek, Sybil; Barnabas, Ruanne V; Atujuna, Millicent; Bezuidenhout, Charl; Ngwepe, Phuti; Peters, Remco P H; Little, Francesca; Celum, Connie L; Daniels, Joseph; Bekker, Linda-Gail	The Community PrEP Study: a randomized control trial leveraging community-based platforms to improve access and adherence to pre-exposure prophylaxis to prevent HIV among adolescent girls and young women in South Africa-study protocol.	Trials	-	-	-	1745-6215	10.1186/s13063-021-05402-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8314507	BACKGROUND: HIV incidence among South African adolescent girls and young women (AGYW) remains high, but could be reduced by highly effective pre-exposure prophylaxis (PrEP). Unfortunately, AGYW report significant barriers to clinic-based sexual and reproductive health services. Even when AGYW access PrEP as an HIV prevention method, poor prevention-effective use was a serious barrier to achieving its optimal HIV prevention benefits. Determining the acceptability and feasibility of community-based platforms to increase AGYW's access to PrEP, and evaluating behavioural interventions to improve prevention-effective use of PrEP are needed. METHODS: We propose a mixed-methods study among AGYW aged 16-25 years in Eastern Cape Province, South Africa. In the first component, a cross-sectional study will assess the acceptability and feasibility of leveraging community-based HIV counselling and testing (CBCT) platforms to refer HIV-negative, at-risk AGYW to non-clinic-based, same-day PrEP initiation services. In the second component, we will enrol 480 AGYW initiating PrEP via our CBCT platforms into a three-armed (1:1:1) randomized control trial (RCT) that will evaluate the effectiveness of adherence support interventions to improve the prevention-effective use of PrEP. Adherence will be measured over 24 months via tenofovir-diphosphate blood concentration levels. Qualitative investigations will explore participant, staff, and community experiences associated with community-based PrEP services, adherence support activities, study implementation, and community awareness. Costs and scalability of service platforms and interventions will be evaluated. DISCUSSION: This will be the first study to assess the acceptability and feasibility of leveraging CBCT platforms to identify and refer at-risk AGYW to community-based, same-day PrEP initiation services. It will also provide quantitative and qualitative results to inform adherence support activities and services that promote the prevention-effective use of PrEP among AGYW. By applying principles of implementation science, behavioural science, and health economics research, we aim to inform strategies to improve access to and prevention-effective use of PrEP by AGYW. TRIAL REGISTRATION: ClinicalTrials.gov NCT03977181 . Registered on 6 June 2019-retrospectively registered. Article	2021	Medina-Marino, Andrew; Daniels, Joseph; Bezuidenhout, Dana; Peters, Remco; Farirai, Thato; Slabbert, Jean; Guloba, Geoffrey; Johnson, Suzanne; Bekker, Linda-Gail; Nkhwashu, Nkhensani	Outcomes from a multimodal, at-scale community-based HIV counselling and testing programme in twelve high HIV burden districts in South Africa.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25678	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7952633	INTRODUCTION: Facility-based HIV testing services (HTS) have been less acceptable and accessible by adolescents, men and key populations in South Africa. Community-based HIV counselling and testing (CBCT) modalities, including mobile unit and home-based testing, have been proposed to decrease barriers to HIV testing uptake. CBCT modalities and approaches may be differentially acceptable to men and women based on age. Implementation of multimodal CBCT services may improve HIV testing rates among adolescents and men, and support the roll-out of prevention services. METHODS: A cross-sectional analysis was conducted using aggregate, routine programmatic data collected from 1 October 2015 through 31 March 2017 from a multimodal, at-scale CBCT programme implemented in 12 high-burden districts throughout South Africa. Data collection tools were aligned to reporting standards for the National Department of Health and donor requirements. HIV testing rates (i.e. number of tests performed per 100,000 population using South African census data) and testing proportions by modality were stratified by sex, age groups and health districts. Descriptive statistics were performed using STATA 13.0. RESULTS: Overall, 944,487 tests were performed during the 1.5-year testing period reported. More tests were conducted among females than males (53.6% vs. 46.4%). Overall, 8206 tests per 100,000 population (95% CI: 8190.2 to 8221.9) were performed; female-to-male (F:M) testing ratio was 1.11. Testing rates were highest among young men aged 20 to 24 years (16,328.4; 95% CI: 16,237.9 to 16,419.1) and adolescent girls aged 15 to 19 years (12,817.0; 95% CI: 12,727.9 to 12,906.6). Home-based testing accounted for 61.3% of HIV tests, followed by near-home mobile unit testing (30.2%) and workplace mobile unit testing (4.7%). More women received HTS via home-based testing (F:M ratio = 1.29), whereas more men accessed work-place mobile testing (M:F ratio = 1.35). No sex differential was observed among those accessing near-home mobile testing (F:M ratio = 0.98). CONCLUSIONS: Concurrent implementation of multiple, targeted CBCT modalities can reduce sex disparities in HIV testing in South Africa. Given the acceptability and accessibility of these CBCT services to adolescent girls and young women, evident from their high testing rates, leveraging community-based services delivery platforms to increase access to HIV prevention services, including pre-exposure prophylaxis (PrEP), should be considered. Article	2021	Mehrotra M.L.; Westmoreland D.A.; Patel V.V.; Hojilla J.C.; Grov C.	Breaking Inertia: Movement Along the PrEP Cascade in a Longitudinal US National Cohort of Sexual Minority Individuals at Risk for HIV	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002611	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102482970&doi=10.1097%2fQAI.0000000000002611&partnerID=40&md5=a2afee9c8a80fa1db9a80667d0f41f40	Background: The pre-exposure prophylaxis (PrEP) cascade outlines sequential steps to maximize PrEP's impact and highlights potential intervention targets to improve PrEP implementation. We evaluate the PrEP cascade in the Together 5000 study (T5K).Methods: T5K is an internet-based, US national cohort study of PrEP-eligible men and trans persons who have sex with men who were not taking PrEP at enrollment. Using longitudinal data from baseline (2017-2018) and year 1 follow-up (2018-2019, n = 4229), we evaluated 5 steps of the PrEP cascade - PrEP contemplation: believes they are a good candidate for PrEP; PrEParation: plans to initiate PrEP; PrEP action: speaks to a provider about PrEP; PrEP initiation: receives a prescription for PrEP; and PrEP maintenance: continues to take PrEP. We compared the cascade across geographic region and identified factors associated with gaps in the cascade.Results: After 1 year, 1092 (26%) participants had initiated PrEP, 709 (17%) were still using PrEP, and 177 (4%) were no longer clinically indicated for PrEP. Participants in the South and Midwest were less likely to speak to a provider about PrEP or initiate PrEP. Baseline characteristics associated with lower odds of PrEP initiation at year 1 include: not having a college degree; earning <$20,000/year; not having health insurance; having very low food security; and not having a primary care doctor.Conclusions: Lack of health care access is a major barrier to PrEP implementation and may exacerbate disparities in PrEP uptake across geographic regions. © 2020 Wolters Kluwer Health, Inc. Article	2021	Mehrotra, Megha L; Westreich, Daniel; Glymour, M Maria; Geng, Elvin; Glidden, David V	Transporting Subgroup Analyses of Randomized Controlled Trials for Planning Implementation of New Interventions.	American Journal of Epidemiology	-	-	-	1476-6256	10.1093/aje/kwab045	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8489435	Subgroup analyses of randomized controlled trials guide resource allocation and implementation of new interventions by identifying groups of individuals who are likely to benefit most from the intervention. Unfortunately, trial populations are rarely representative of the target populations of public health or clinical interest. Unless the relevant differences between trial and target populations are accounted for, subgroup results from trials might not reflect which groups in the target population will benefit most from the intervention. Transportability provides a rigorous framework for applying results derived in potentially highly selected study populations to external target populations. The method requires that researchers measure and adjust for all variables that 1) modify the effect of interest and 2) differ between the target and trial populations. To date, applications of transportability have focused on the external validity of overall study results and understanding within-trial heterogeneity; however, this approach has not yet been used for subgroup analyses of trials. Through an example from the Iniciativa Profilaxis Pre-Exposición (iPrEx) study (multiple countries, 2007-2010) of preexposure prophylaxis for human immunodeficiency virus, we illustrate how transporting subgroup analyses can produce target-specific subgroup effect estimates and numbers needed to treat. This approach could lead to more tailored and accurate guidance for resource allocation and cost-effectiveness analyses.	external validity; implementation; number needed to treat; subgroup analyses; target-specific subgroup analyses; transportability	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Mehta S.D.; Okall D.; Graham S.M.; N'gety G.; Bailey R.C.; Otieno F.	Behavior Change and Sexually Transmitted Incidence in Relation to PREP Use Among Men Who Have Sex with Men in Kenya	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03150-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099012366&doi=10.1007%2fs10461-020-03150-3&partnerID=40&md5=ac994bbfe1cf2b847eb489b42d663e62	We measured change in sexual practices and the incidence of C. trachomatis (CT) and N. gonorrhoeae (NG) within a prospective cohort of Kenyan MSM taking PrEP in Kenya. Over the one year of study participation, CT and NG were diagnosed in urine at baseline, 6- and 12- months. Multivariable Cox regression identified factors associated with incident infection. Sexual practices were assessed at baseline and every 3 months. We evaluated changes over time and in relation to PrEP adherence via generalized estimating equation analysis. From October 2017—January 2018, 158 participants initiated PrEP, having 10.3% baseline CT/NG prevalence (either or both). The incidence was 17.2 cases per 100 person-years (95% CI 11.7–25.5). Incident CT/NG increased with report of: transactional male sex partner (adjusted Hazard Ratio (aHR) = 2.46, p = 0.016, z = 2.40), regular female sex partner (aHR = 2.22, p = 0.051, z = 1.96), greater social support (highest vs. lowest quartile, aHR = 6.24, p = 0.012, z = 2.51), and CT/NG infection prior to enrollment (aHR = 2.90, p = 0.002, z = 3.03). Multiple sex partners, condomless sex, and transactional sex decreased over time and were not associated with PrEP adherence. Urethral CT/NG incidence remained high and there was no evidence of PrEP-related behavioral change. There is need for ongoing etiologic testing, improved understanding of risk from female sex partners, and development of more effective risk reduction interventions. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Article	2021	Meireles P.; Fernandes F.; Rocha M.; Plankey M.; Barros H.	Provision of Preexposure Prophylaxis at the Portuguese National Health Service and Uptake in the Lisbon Cohort of Men Who Have Sex with Men	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03127-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098739621&doi=10.1007%2fs10461-020-03127-2&partnerID=40&md5=f5dcc341f60648bebaa8e452ff5c7797	We aimed to study the uptake of preexposure prophylaxis (PrEP) before and after its implementation in the Portuguese National Health Service (PNHS) among men who have sex with men (MSM). We studied 6164 participants in the Lisbon Cohort of MSM who participated between March 2014 and July 2019. 198 participants (3.2%) reported having recently used PrEP. Approximately one-third started PrEP after its implementation. PrEP uptake increased from 0.15% in 2014 to 5.36% in 2019. In their first use, 86 participants (70.5%) used it daily. How PrEP was obtained varied according to the timing of the first use: prescribed by a physician in Portugal (11.1% before vs 68.8% after implementation) and online (40.7% before vs 14.1% after). We observed an increase in the uptake and in the prescription by a physician, particularly after its implementation in the PNHS representing a change to a more equitable and safer way of using PrEP. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Article	2021	Mennecier, A; Kankasa, C; Fao, P; Moles, JP; Eymard-Duvernay, S; Mwiya, M; Kania, D; Chunda-Liyoka, C; Sakana, L; Rutagwera, D; Tassembedo, S; Wilfred-Tonga, MM; Mosqueira, B; Tylleskär, T; Nagot, N; Van de Perre, P	Design and challenges of a large HIV prevention clinical study on mother-to-child transmission: ANRS 12397 PROMISE-EPI study in Zambia and Burkina Faso	Contemporary Clinical Trials	-	-	-	NA	10.1016/j.cct.2021.106402	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02272982/full	Post-natal HIV infection through breastfeeding remains a challenge in many low and middle-income countries, particularly due to non-availability of alternative infant feeding options and the suboptimal Prevention of Mother to Child Transmission of HIV-1 (PMTCT) cascade implementation and monitoring. The PROMISE-EPI study aims to address the latter by identifying HIV infected mothers during an almost never-missed visit for their infant, the second extended program on immunization visit at 6-8 weeks of age (EPI-2). The study is divided into 3 components inclusive of an open-label randomized controlled trial aiming to assess the efficacy of a responsive preventive intervention compared to routine intervention based on the national PMTCT guidelines for HIV-1 uninfected exposed breastfeeding infants. The preventive intervention includes: a) Point of care testing for early infant HIV diagnosis and maternal viral load; b) infant, single-drug Pre-Exposure Prophylaxis (PrEP) (lamivudine) if mothers are virally unsuppressed. The primary outcome is HIV-transmission rate from EPI-2 to 12 months. The study targets to screen 37,000 mother/infant pairs in Zambia and Burkina Faso to identify 2000 mother/infant pairs for the clinical trial. The study design and challenges faced during study implementation are described, including the COVID-19 pandemic and the amended HIV guidelines in Zambia in 2020 (triple-drug PrEP in HIV exposed infants guided by quarterly maternal viral load). The changes in the Zambian guidelines raised several questions including the equipoise of PrEP options, the standard of care-triple-drug (control arm in Zambia) versus the study-single-drug (intervention arm). Trial registration number (www.clinicaltrials.gov): NCT03869944. Submission category: Study Design, Statistical Design, Study Protocols.	*Burkina Faso; *Human immunodeficiency virus 1; *Zambia; *mother to child transmission; *pre-exposure prophylaxis; Adolescent; Adult; Anti-HIV Agents administration & dosage, adverse effects, *therapeutic use; Article; Breast Feeding; Breast feeding; Burkina Faso; COVID-19 epidemiology; Comparative effectiveness; Controlled study; Coronavirus disease 2019; Cross-Sectional Studies; Equipoise; Female; HIV Infections diagnosis, *drug therapy, *transmission; Human; Human immunodeficiency virus infection; Humans; Immunization; Infant; Infectious Disease Transmission, Vertical *prevention & control; Lamivudine administration & dosage, adverse effects, *therapeutic use; Middle income country; Nonhuman; Outcome assessment; Pandemic; Pandemics; Point of care testing; Prevention; Pre-Exposure Prophylaxis methods; Randomized controlled trial; Research Design; SARS-CoV-2; Viral Load; Virus load; Young Adult; Zambia	English	United States	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical
Article	2021	Meyer, Jaimie; Price, Carolina; Tracey, DeShana; Sharpless, Laurel; Song, Yue; Madden, Lynn; Elwyn, Glyn; Altice, Frederick	Preference for and Efficacy of a PrEP Decision Aid for Women with Substance Use Disorders.	Patient Preference and Adherence	-	-	-	1177-889X	10.2147/PPA.S315543	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8420782	BACKGROUND: Women with substance use disorders (SUDs) are a key population for HIV prevention with pre-exposure prophylaxis (PrEP), though uptake is limited by awareness of PrEP, misestimation of personal HIV risk, and minimally integrated HIV prevention and addiction treatment services. Patient-centered decision aids (DA) could address these barriers to PrEP, but no extant DA for PrEP has been published, including for women with SUDs. METHODS: We developed a patient-centered PrEP DA for women in addiction treatment. In a pilot randomized preference trial, we compared the DA to enhanced standard of care (eSOC) providing standardized information. The primary outcome was opting to receive more information through the DA; we also assessed the impact of the DA on PrEP decisional preference and PrEP uptake over 12 months. RESULTS: A total of 164 enrolled participants (DA: 83; eSOC: 81) were similar in terms of HIV risk and demographics, which are representative of women in addiction treatment programs nationally, and most (92%) had opioid use disorder. Half of participants were PrEP eligible, though 37% underestimated their personal HIV risk. Independent correlates of selecting the PrEP DA relative to eSOC included higher alcohol use severity (aOR 4.13, 95% CI 1.05-16.28, p=0.04) and perception of high risk for HIV (aOR 2.95, 95% CI 1.19-7.35, p=0.02). For those selecting the DA, interest in PrEP increased significantly from 25% to 89%. DA participants were also significantly more likely than eSOC participants to see a provider for PrEP during follow-up (15.7% vs 6.2%; p=0.05). CONCLUSION: Half of the women selected to use the DA, and those who did significantly increased their engagement in the HIV prevention cascade through increased interest in and initiation of PrEP. Future iterations should accelerate the HIV prevention cascade for women with SUDs by integrating PrEP decision aids into existing addiction treatment services and actively linking women to PrEP. Article	2021	Meyers, Kathrine; Wu, Yumeng; Shin, Kee-Young; Hou, Jianhua; Hu, Qinghai; Duan, Junyi; Li, Yao; He, Xiaoqing	Salient Constructs for the Development of Shared Decision-Making Tools for HIV Pre-Exposure Prophylaxis Uptake and Regimen Choice: Behaviors, Behavioral Skills, and Beliefs.	AIDS Patient Care and STDs	-	-	-	-	1557-7449	10.1089/apc.2021.0066	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8215423	The availability of multiple pre-exposure prophylaxis (PrEP) regimens creates a preference-sensitive choice for individuals weighing alternative HIV prevention strategies. Investigating factors that are associated with PrEP uptake and regimen choice are key to developing tools to support that decision. A cross-sectional survey was offered to 536 participants in a PrEP demonstration project for gay, bisexual, and other men who have sex with men across 3 cities in China, of which 412 completed surveys and were included in the analysis. We conducted bivariable analyses followed by multi-variable logistic regressions to examine factors associated with overall PrEP uptake and PrEP regimen choice. Among the 412 participants, 36.9% were daily PrEP users, 28.4% were event-driven users, and 34.7% were non-PrEP users. Higher levels of education, lower PrEP use stigma, and higher perceived benefits of PrEP were associated with greater PrEP uptake. More frequent sex, higher PrEP adherence self-efficacy, higher endorsement of the belief in elevated efficacy of daily over on-demand PrEP, and lower endorsement of a desire for a PrEP method that is only taken when needed led to greater odds of choosing the daily PrEP regimen. As multiple HIV prevention modalities become available, there is a greater need for a shared decision-making approach to support this preference-sensitive choice of HIV prevention method. Our findings suggest salient constructs to inform the development of shared decision-making tools to support regimen choice. Article	2021	Miller S.J.; Harrison S.E.; Sanasi-Bhola K.	A scoping review investigating relationships between depression, anxiety, and the PrEP care continuum in the United States	International Journal of Environmental Research and Public Health	-	-	-	-	16617827	10.3390/ijerph182111431	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118228440&doi=10.3390%2fijerph182111431&partnerID=40&md5=5bbe21798dcf562281d49ca5d537db50	Men who have sex with men and transgender women in the United States are at increased risk for HIV and may benefit from pre-exposure prophylaxis (PrEP), a once-a-day pill to prevent HIV. Due to stigma and discrimination, sexual and gender minority (SGM) populations are also at risk for depression and anxiety. This scoping review sought to identify literature addressing relationships between the PrEP care continuum, depression, and anxiety among SGM individuals and others at high risk for HIV. We conducted a systematic review of four databases (i.e., PubMed, PsycInfo, Web of Science, Google Scholar) and identified 692 unique articles that were screened for inclusion criteria, with 51 articles meeting the final inclusion criteria. Data were extracted for key study criteria (e.g., geographic location, participant demographics, study design, main findings). Results suggest that while depression and anxiety are not associated with PrEP awareness or willingness to use, they can be barriers to seeking care and to PrEP adherence. However, empirical studies show that taking PrEP is associated with reductions in anxiety. Findings suggest the need to implement mental health screenings in PrEP clinical care. In addition, addressing systemic and structural issues that contribute to mental health disorders, as well as PrEP-related barriers, is critical. © 2021 by the authors. Article	2021	Milovanovic, Minja; Jewkes, Rachel; Otwombe, Kennedy; Jaffer, Maya; Hopkins, Kathryn; Hlongwe, Khuthadzo; Mathaludi, Mokgadi; Mbowane, Venice; Gray, Glenda; Dunkle, Kristin; Hunt, Gillian; Welte, Alex; Kassanjee, Reshma; Slingers, Nevilene; Vanleeuw, Lieve; Puren, Adrian; Kinghorn, Anthony; Martinson, Neil; Abdullah, Fareed; Coetzee, Jenny	Community-led cross-sectional study of social and employment circumstances, HIV and associated factors amongst female sex workers in South Africa: study protocol.	Global Health Action	-	-	-	-	1654-9880	10.1080/16549716.2021.1953243	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8330713	BACKGROUND: In South Africa, female sex workers (FSWs) are perceived to play a pivotal role in the country's HIV epidemic. Understanding their health status and risk factors for adverse health outcomes is foundational for developing evidence-based health care for this population. OBJECTIVE: Describe the methodology used to successfully implement a community-led study of social and employment circumstances, HIV and associated factors amongst FSWs in South Africa. METHOD: A community-centric, cross-sectional, survey of 3,005 adult FSWs was conducted (January-July 2019) on 12 Sex Work (SW) programme sites across nine provinces of South Africa. Sites had existing SW networks and support programmes providing peer education and HIV services. FSWs were involved in the study design, questionnaire development, and data collection. Questions included: demographic, sexual behaviour, HIV testing and treatment/PrEP history, and violence exposure. HIV rapid testing, viral load, CD4 count, HIV recency, and HIV drug resistance genotypic testing were undertaken. Partner organisations provided follow-up services. RESULTS: HIV Prevalence was 61.96%, the median length of selling sex was 6 years, and inconsistent condom use was reported by 81.6% of participants, 88.4% reported childhood trauma, 46.2% reported physical or sexual abuse by an intimate partner and 57.4% by a client. More than half of participants had depression and post-traumatic stress disorder (52.7% and 54.1%, respectively). CONCLUSION: This is the first national survey of HIV prevalence amongst FSWs in programmes in South Africa. The data highlight the vulnerability of this population to HIV, violence and mental ill health, suggesting the need for urgent law reform. Based on the unique methodology and the successful implementation alongside study partners, the outcomes will inform tailored interventions. Our rapid rate of enrolment, low rate of screening failure and low proportion of missing data showed the feasibility and importance of community-centric research with marginalised, highly vulnerable populations. Article	2021	Mistler, Colleen B; Copenhaver, Michael M; Shrestha, Roman	The Pre-exposure Prophylaxis (PrEP) Care Cascade in People Who Inject Drugs: A Systematic Review	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-020-02988-x	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-care-cascade-people/docview/2513421227/se-2?accountid=8113	Injection drug use is a key risk factor for the transmission of HIV. Prevention strategies, such as the use of pre-exposure prophylaxis (PrEP), are effective at reducing the risk of HIV transmission in people who inject drugs (PWID). Following PRISMA guidelines, a literature search was conducted to identify the current state of the PrEP care cascade in PWID. Twenty-three articles were evaluated in this systematic review. A decline in engagement throughout the stages of the PrEP care cascade was found. High awareness and willingness to use PrEP was found, yet PrEP uptake was relatively low (0–3%). There is a lack of research on interventions to increase engagement of PrEP across all levels of the care cascade in PWID. Implications from the interventions that have been published provide insight into practice and public policy on efficacious strategies to reduce HIV incidence in PWID. Our findings suggest that more efforts are needed to identify and screen PWID for PrEP eligibility and to link and maintain them with appropriate PrEP care. Article	2021	Mistler, Colleen B; Curley, Christine M; Rosen, Aviana O; El-Krab, Renee; Wickersham, Jeffrey A; Copenhaver, Michael M; Khati, Antoine; Shrestha, Roman	The Impact of COVID-19 on Access to HIV Prevention Services Among Opioid-Dependent Individuals.	Journal of Community Health	-	-	-	-	1573-3610	10.1007/s10900-021-00979-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7996112	The COVID-19 pandemic has necessitated restrictive orders and programmatic changes that may be associated with disruptions in services, including those for opioid-dependent people who inject drugs (PWID). This study aims to assess the impact of COVID-19 pandemic on access to and utilization of various HIV prevention services among PWID with opioid use disorder (OUD). We interviewed 110 PWID enrolled in medication for opioid use disorder (MOUD) treatment (e.g., methadone) between May and October, 2020 to identify if this sample experienced changed in access to the following services due to the COVID-19 pandemic: (a) HIV or sexually transmitted infection (STI) testing, (b) pre-exposure prophylaxis (PrEP) services, (c) HIV counselor or doctor appointments, and (d) clean injection equipment. A majority of the sample reported that COVID-19 had not changed their access to HIV testing or access to STI testing. Almost half of the sample reported that getting an appointment with a doctor decreased due to COVID-19. Participants reported that access to a lab or blood testing, access to injection equipment, and sessions with a case manager or counselor decreased. One-fourth of the 32 participants who were taking PrEP before the onset of COVID-19 reported that they had trouble getting their PrEP prescription due to COVID-19, and some reported that they had difficulty getting the PrEP prescription filled at their pharmacy. Our results indicate that PWID did not experience reduced access to HIV or STI testing, but difficulties in obtaining appointments with HIV counselors or doctors and limited access to PrEP were presented. Innovative strategies are needed to reduce the adverse effects of COVID-19 on HIV prevention among PWID. Article	2021	Mitchell, Kate M; Dimitrov, Dobromir; Silhol, Romain; Geidelberg, Lily; Moore, Mia; Liu, Albert; Beyrer, Chris; Mayer, Kenneth H; Baral, Stefan; Boily, Marie-Claude	The potential effect of COVID-19-related disruptions on HIV incidence and HIV-related mortality among men who have sex with men in the USA: a modelling study	The Lancet HIV	-	-	-	-	23523018	10.1016/S2352-3018(21)00022-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103250577&doi=10.1016%2fS2352-3018%2821%2900022-9&partnerID=40&md5=eaae0ea696771ab40b480827c1c3e39e	Background: During the COVID-19 pandemic, men who have sex with men (MSM) in the USA have reported similar or fewer sexual partners and reduced HIV testing and care access compared with before the pandemic. Pre-exposure prophylaxis (PrEP) use has also declined. We aimed to quantify the potential effect of COVID-19 on HIV incidence and HIV-related mortality among US MSM. Methods: We used a calibrated, deterministic, compartmental HIV transmission model for MSM in Baltimore (MD, USA) and available data on COVID-19-related disruptions to HIV services to predict effects of reductions in sexual partners (0%, 25%, 50%), condom use (5%), HIV testing (20%), viral suppression (10%), PrEP initiations (72%), PrEP adherence (9%), and antiretroviral therapy (ART) initiations (50%). In our main analysis, we modelled disruptions due to COVID-19 starting Jan 1, 2020, and lasting 6 months. We estimated the median change in cumulative new HIV infections and HIV-related deaths among MSM over 1 and 5 years, compared with a base case scenario without COVID-19-related disruptions. Findings: A 25% reduction in sexual partners for 6 months among MSM in Baltimore, without HIV service changes, could reduce new HIV infections by median 12·2% (95% credible interval 11·7 to 12·8) over 1 year and median 3·0% (2·6 to 3·4) over 5 years. In the absence of changes in sexual behaviour, the 6-month estimated reductions in condom use, HIV testing, viral suppression, PrEP initiations, PrEP adherence, and ART initiations combined are predicted to increase new HIV infections by median 10·5% (5·8 to 16·5) over 1 year, and by median 3·5% (2·1 to 5·4) over 5 years. Disruptions to ART initiations and viral suppression are estimated to substantially increase HIV-related deaths (ART initiations by median 1·7% 0·8 to 3·2, viral suppression by median 9·5% 5·2 to 15·9) over 1 year, with smaller proportional increases over 5 years. The other individual disruptions (to HIV testing, PrEP and condom use, PrEP initiation, and partner numbers) were estimated to have little effect on HIV-related deaths (<1% change over 1 or 5 years). A 25% reduction in sexual partnerships is estimated to offset the effect of the combined service disruptions on new HIV infections (change over 1 year: median –3·9% –7·4 to 1·0; over 5 years: median 0·0% –0·9 to 1·4), but not on HIV deaths (change over 1 year: 11·0% 6·2 to 17·7; over 5 years: 2·6% 1·5 to 4·3). Interpretation: Maintaining access to ART and adherence support is of the utmost importance to maintain viral suppression and minimise excess HIV-related mortality due to COVID-19 restrictions in the USA, even if disruptions to services are accompanied by reductions in sexual partnerships. Article	2021	Mocorro I.; Sandhu P.J.; Rowniak S.; Leonard A.	Initiation of HIV pre-exposure prophylaxis in adolescents and young adults: Barriers and opportunities	Journal of the American Association of Nurse Practitioners	-	-	-	-	23276886	10.1097/JXX.0000000000000485	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115324835&doi=10.1097%2fJXX.0000000000000485&partnerID=40&md5=b9b800371e50cee7a10e1d10f9a2beba	Background:Adolescents and young adults (AYA) ages 13 to 24 years comprise a quarter of the new HIV diagnoses in the United States. Lack of access to HIV-preventive biomedical tools such as pre-exposure prophylaxis (PrEP) reduces opportunities to prevent HIV infection in this population. Initiating PrEP in AYA significantly reduces the negative health outcomes of HIV, but many providers are still reluctant to initiate PrEP in their AYA patients based on perceived threats and barriers.Objectives:This review aims to highlight the barriers and opportunities for initiating PrEP services in AYA and provides recommendations for PrEP services in this population.Data sources:Ten scholarly articles rated levels IIA through IIIB were identified using the Johns Hopkins Evidence-Based Practice ratings. These included quasi-experimental and nonexperimental publications. Both quantitative and qualitative data contributed to identifying perceived barriers, opportunities, and recommendations for increased PrEP access and prescription in AYA.Conclusions:Pre-exposure prophylaxis is a vital component of a robust HIV prevention program. Themes that emerged hindering optimal PrEP utilization in AYA included provider-related barriers (e.g., knowledge deficit, lack of familiarity with PrEP guidelines, and protocols), patient-related barriers (e.g., lack of awareness, confidentiality issue, and HIV stigma), and structure-related barriers (e.g., lack of AYA-friendly clinics and insurance coverage).Implications for practice:Providers in any setting should be able identify at-risk AYA and prescribe PrEP accordingly. Nurse practitioners should make PrEP accessible to AYA by addressing the barriers to PrEP utilization, prescribing, and continuity of care. Nurse practitioner curriculum, training, and continuing education should include PrEP for AYA. © 2021 Lippincott Williams and Wilkins. All rights reserved. Article	2021	Monteiro Spindola Marins, Luana; Silva Torres, Thiago; Luz, Paula Mendes; Moreira, Ronaldo I; Leite, Iuri C; Hoagland, Brenda; Kallas, Esper G; Madruga, José V; Grinsztejn, Beatriz; Veloso, Valdilea Gonçalves	Factors associated with self-reported adherence to daily oral pre-exposure prophylaxis among men who have sex with man and transgender women: PrEP Brasil study.	International Journal of STD & AIDS	-	-	-	-	1758-1052	10.1177/09564624211031787	https://dx.doi.org/10.1177/09564624211031787	Understanding the factors associated with pre-exposure prophylaxis (PrEP) adherence may help in the development of strategies to support, motivate and sustain PrEP use. This study estimated self-reported adherence, described perceived barriers and facilitators and investigated factors associated with adherence to daily oral PrEP among men who have sex with man (MSM) and transgender women after 1 year of PrEP use in Brazil. PrEP Brasil was a prospective, multicentre, open-label demonstration study with MSM and transgender women at high risk for HIV infection. We used logistic regression to evaluate factors associated with complete adherence (not forgetting to take any pills in the past 30 days) at week 48. Of 338 participants included in this analysis, 60% reported complete adherence to daily oral PrEP at week 48. Perceived barriers and facilitators to daily oral PrEP were reported by 38.2% and 98.5%, respectively. The most reported barrier and facilitator were 'I forgot to take my pills' (19.2%) and 'Associate PrEP with a daily activity/task' (58.6%), respectively. In final multivariable analysis, living in Rio de Janeiro (aOR: 0.38; 95% CI: 0.20-0.73), being transgender women (aOR: 0.22; 95% CI: 0.07-0.73), reporting stimulant use (a OR: 0.40; 95% CI: 0.20-0.80) and having any perceived barriers to daily oral PrEP (aOR: 0.12; 95% CI: 0.07-0.23) were associated with decreased odds of complete adherence. Our findings provide information for developing the best practices to promote PrEP adherence in the Brazilian context. Article	2021	Montgomery E.T.; Browne E.N.; Atujuna M.; Boeri M.; Mansfield C.; Sindelo S.; Hartmann M.; Ndwayana S.; Bekker L.-G.; Minnis A.M.	Long-Acting Injection and Implant Preferences and Trade-Offs for HIV Prevention among South African Male Youth	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002670	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108123649&doi=10.1097%2fQAI.0000000000002670&partnerID=40&md5=47bed895240534b5d0bbdb8d4b576361	Background: Long-acting pre-exposure prophylaxis (LA-PrEP) formulated as implants and injections are promising prevention method strategies offering simplicity, discretion, and long dose duration. Men are important end users of LA-PrEP, and early assessment of their preferences could enhance downstream male engagement in HIV prevention.Methods: A discrete-choice experiment survey was conducted with 406 men, aged 18-24, in Cape Town, South Africa, to assess preferences for 5 LA-PrEP attributes with 2-4 pictorially-depicted levels: delivery form, duration, insertion location, soreness, and delivery facility. Latent class analysis was used to explore heterogeneity of preferences and estimate preference shares.Results: The median age was 21 (interquartile range 19-22), and 47% were men who have sex with men. Duration was the most important product attribute. Latent class analysis identified 3 classes: "duration-dominant decision makers"(46%) were the largest class, defined by significant preference for a longer duration product. "Comprehensive decision makers"(36%) had preferences shaped equally by multiple attributes and preferred implants. "Injection-dominant decision makers"(18%) had strong preference for injections (vs. implant) and were significantly more likely to be men who have sex with men. When estimating shares for a 2-month injection in the buttocks with mild soreness (HPTN regimen) vs. a 6-month implant (to arm) with moderate soreness (current target), 95% of "injection-dominant decision makers"would choose injections, whereas 79% and 63% of "duration-dominant decision makers"and "comprehensive decision makers"would choose implant.Conclusions: Young South African men indicated acceptability for LA-PrEP. Preferences were shaped mainly by duration, suggesting a sizeable market for implants, and underscoring the importance of product choice. Further research into men's acceptability of LA PrEP strategies to achieve engagement in these HIV prevention tools constitutes a priority. © 2021 Wolters Kluwer Health, Inc.	implant; injection; LCA; long-acting PrEP; men; South Africa	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Montgomery, Madeline C; Ellison, Jacqueline; Chan, Philip A; Harrison, Laura; van den Berg, Jacob J	Sexual satisfaction with daily oral HIV pre-exposure prophylaxis (PrEP) among gay and bisexual men at two urban PrEP clinics in the United States: an observational study.	Sexual Health	-	-	-	-	1449-8987	10.1071/SH20207	https://dx.doi.org/10.1071/SH20207	Background Pre-exposure prophylaxis (PrEP) is highly effective in preventing HIV infection among men who have sex with men (MSM). However, limited data are available on the effect of PrEP use and sexual satisfaction among MSM taking PrEP. METHODS: We conducted a one-time, cross-sectional survey of MSM receiving PrEP care at two hospital-based PrEP clinics in Providence, Rhode Island and Boston, Massachusetts, USA (April-September 2017). We oversampled Black and Hispanic/Latino individuals. Participants completed the 20-item New Sexual Satisfaction Scale (NSSS) twice, once for before and once for after starting PrEP. Participants reported sexual behaviours, PrEP adherence, PrEP attitudes, and quality of life with PrEP. RESULTS: A total of 108 gay and bisexual men (GBM) participated. Overall, 15.7% were Black (non-Hispanic/Latino) and 23.1% were Hispanic/Latino, with an average age of 36.6 years. Most participants reported private health insurance coverage (71.3%), and 88.9% identified as homosexual, gay, or same gender-loving. The mean NSSS score before PrEP initiation across all 20 items was 3.94 (maximum = 5; 95% CI: 4.22, 4.43), and increased significantly after PrEP initiation (4.33, 95% CI: 4.22, 4.43; P < 0.001). Most participants (73.2%) reported that PrEP increased quality of life. This was associated with significant change in pre- to post-PrEP NSSS scores (linear regression coefficient = 1.21; 95% CI: 0.585, 1.84). CONCLUSIONS: Initiating PrEP and reporting improved quality of life were significantly associated with an increase in sexual satisfaction. PrEP implementation efforts should consider sexual satisfaction to promote PrEP engagement and retention, and researchers and providers should adopt a sex-positive approach with PrEP patients, especially among MSM. Article	2021	Moreira, JS; Vasconcelos, R; Doi, AM; Avelino-Silva, VI	Real-life occurrence of bacterial sexually transmitted infections among PrEP users: improving the diagnosis of Chlamydia trachomatis and Neisseria gonorrhoeae with multisite screening	Revista do Instituto de Medicina Tropical de São Paulo	-	-	-	-	0036-4665	10.1590/S1678-9946202163076	https://www.scielo.br/j/rimtsp/a/Vyg4VMZKGDPqhbmvNTyBbGt/	PrEP users are under high risk for bacterial sexually transmitted infections (STI), including those caused by Treponema pallidum (Tp), Chlamydia trachomatis (Ct) and Neisseria gonorrhoeae (Ng). Ct and Ng screening at multiple anatomic sites may improve the diagnostic sensitivity among high-risk populations. We analyzed the prevalence and incidence of Ct, Ng, and Tp and investigated predictors of bacterial STI occurrence between January 2018 and November 2019 in a retrospective cohort of PrEP users in Sao Paulo, Brazil. We describe the frequency and percentage of Ct/Ng per anatomical site and calculate the percentage of missed diagnosis if molecular testing were applied only in symptomatic patients, or only in urine samples. Patients underwent syphilis testing every 3-4 months and Ct/Ng testing every 6 months. We included 413 PrEP users with a median age of 31 years. At baseline, 25% had a positive treponemal test and 7% had active syphilis; Ct and Ng were more frequently detected in the oropharynx and anus (6.4-6.9%) than in urine samples (0.7-2.6%). Twelve months after the onset of PrEP, the incidence of Tp, Ct and Ng was, respectively, 13.4%, 11.4% and 8.9%. During follow-up, 23 out of 33 Ct/Ng cases (69%, 95% CI 51-84) would have been missed if oropharynx and anus samples had not been tested. In addition, if only symptomatic cases had been tested, 30 out of 33 Ct/Ng cases (90%, 95% CI 75-98) would have been missed. Participants with incident STI had a higher baseline number of sexual partners and a longer follow-up. Our study reinforces that active and frequent screening for STI is a powerful strategy to improve the diagnostic sensitivity. Article	2021	Morgan, Jeffrey; Schwartz, Cameron; Ferlatte, Olivier; Mniszak, Caroline; Lachowsky, Nathan; Jollimore, Jody; Hull, Mark; Knight, Rod	Community-Based Participatory Approaches to Knowledge Translation: HIV Prevention Case Study of the Investigaytors Program.	Archives of Sexual Behavior	-	-	-	-	1573-2800	10.1007/s10508-020-01789-6	https://dx.doi.org/10.1007/s10508-020-01789-6	Approaches to knowledge translation (KT) that engage community stakeholders in the research cycle have been identified as particularly promising for addressing the "know-do" gap. Using the case study of a long-standing community-based participatory research (CBPR) project known as the "Investigaytors," this article describes the development and implementation of a KT intervention aimed at facilitating access to HIV pre-exposure prophylaxis for gay, bisexual, and other sexual minority men in British Columbia, Canada, through a publicly funded program. In doing so, we offer a model of CBPR for KT that is highly participatory, driven by community members, and centered around capacity building. We also present findings from a focus group with eight volunteer co-researchers to capture the perspectives of community members involved in the CBPR process and to evaluate the strengths and challenges associated with the use of a CBPR framework for KT. Findings from the focus group reveal how the inclusion of multiple perspectives from community, academic, and healthcare partners contributes to the perceived strength and credibility of the KT intervention opportunities for improving the CBPR process and how the CBPR process itself can be a form of integrated KT. This work has implications for future KT that deploys a CBPR framework, including an expanded understanding of reciprocity that can include benefits such as training and professional development, as well as introducing a novel approach to KT that is driven by community and integrates multiple perspectives. We conclude with reflections on implementing CBPR practices for KT in different settings. Article	2021	Morgat, M; Bouiller, K; Vuillemenot, J B; Puget, L; Marty-Quinternet, S; Leblanc, T; Jeannot, K; Chirouze, C; Hustache-Mathieu, L; Lepiller, Q	Number, type and cost of microbiological tests during HIV Pre-Exposure Prophylaxis: The experience of a French hospital.	Infectious Diseases Now	-	-	-	-	2666-9919	10.1016/j.medmal.2020.10.017	https://dx.doi.org/10.1016/j.medmal.2020.10.017	BACKGROUND: Microbiological tests are required for individuals on HIV Pre-Exposure Prophylaxis (PrEP), but their real-life numbers, types and cost are poorly described. METHODS: Number, type, and results of microbiological tests performed in a Besançon Hospital-associated laboratory, France, from 2016 to 2019, in the setting of PrEP consultations were retrospectively collected. Costs were estimated by the current reimbursement rate set by the French national protection system. RESULTS: 756 consultations for PrEP initiation or follow-up of 135 persons were performed over 4 years. Among 3434 tests performed in the institution-associated laboratory, 1083 and 2351 were virological and bacteriological tests, respectively. Serology was predominant in virology (98% of virological tests), with HIV, HCV, and HBV screening as the 3 more frequent assays, whereas molecular biology was predominant in bacteriology (63.1% of bacteriological tests) with N. gonorrhoeae and C. trachomatis screening as leader assays. Agar-based culture accounted for 1% of bacterial tests. The global cost of microbiological tests was 45,983.20 euros, corresponding to a mean cost of 60.80 euros per consultation. Virological and bacteriological tests accounted for 37.7% and 62.3% of this budget, respectively. No seroconversion was observed for HIV or HCV. N. gonorrhoeae and C. trachomatis were detected at least once in 39.3% and 22.4% of individuals, respectively, with 15% of symptomatic episodes in both cases. Active syphilis infection was detected in 15.4% of individuals. CONCLUSIONS: Since numerous microbiological tests are required during PrEP, the availability of specific technical platforms should not be neglected by centers wishing to set up PrEP consultations. Article	2021	Moseholm, Ellen; Gilleece, Yvonne; Collins, Ben; Kowalska, Justyna D; Vasylyev, Marta; Pérez Elía, María Jesús; Cairns, Gus; Aebi-Popp, Karoline	Achievements and gaps to provide pre-exposure prophylaxis (PrEP) for women across the European Region - Results from a European survey study.	Journal of Virus Eradication	-	-	-	-	2055-6640	10.1016/j.jve.2020.100026	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7809379	INTRODUCTION: The use of pre-exposure prophylaxis (PrEP) is a safe and effective prevention option to all people at substantial risk of HIV acquisition, irrespective of gender. However, in most European countries PrEP services focus on key populations, in particular men who have sex with men (MSM). This study aims to explore PrEP availability and implementation for women across the European region. METHODS: An online survey was sent to all members of Women Against Viruses in Europe (WAVE) from 50 countries in September 2019. It consisted of 19 questions, including both multiple choice and free text answers. RESULTS: In total, responses from 34 countries were included in the study (Western Europe n â= â12, Central Europe â= â12, Eastern Europe n â= â6). PrEP was accessible in 30 WHO European countries. More than half of them stated that PrEP was available for all groups at-risk of HIV acquisition (n â= â18), while in many countries PrEP was only available to MSM and transgender persons. Two-thirds of country respondents confirmed the availability of a national guideline for PrEP (n â= â23), of which six countries had specific recommendations for PrEP in women. The most cited obstacles for PrEP access were lack of information about PrEP, lack of political support, and high cost for the individual. Fifteen country respondents stated that there were specific obstacles for PrEP access for women, such as guidelines prioritizing MSM, women not being seen as a target population for PrEP, and lack of knowledge about which subgroup of women would benefit most from PrEP. Seven countries had made efforts to encourage women's access to PrEP, most of which were individually based or initiated by local NGOs. CONCLUSIONS: PrEP is an important addition to HIV combination prevention. Women's access to PrEP in Europe remains limited. Women are often not included in the guidelines or targeted with education or information, resulting in a general lack of information about the use of PrEP for women. Article	2021	Moskowitz, David A; Moran, Kevin O; Matson, Margaret; Alvarado-Avila, Andrés; Mustanski, Brian	The PrEP Cascade in a National Cohort of Adolescent Men Who Have Sex With Men.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000002613	https://dx.doi.org/10.1097/QAI.0000000000002613	BACKGROUND: Pre-exposure prophylaxis (PrEP) has been an available biomedical intervention for at-risk adolescents for over 2 years; however, progression from awareness to uptake and adherence has been slow. In response, we map adolescent men who have sex with men (AMSM) onto the PrEP Motivation Cascade to identify stages for intervention. METHODS: We analyzed PrEP-related attitudinal and behavioral data from a US national cohort of 1398 AMSM. RESULTS: A majority of the sample (53.9%) were identified as appropriate PrEP candidates. Of those identified as appropriate candidates, 51.8% were precontemplative (stage 1; unwilling to take or believing they were inappropriate candidates for PrEP), and 48.2% reached contemplation (stage 2; willing and self-identified as appropriate candidates). Only 16.3% of candidates reached preparation (stage 3; seeing PrEP as accessible and planning to initiate PrEP), and 3.1% reached PrEP action (stage 4; prescribed PrEP). Although few of the AMSM identified as appropriate candidates were on PrEP, most users (87%) reported high adherence to 4+ doses per week (stage 5; PrEP maintenance). Factors associated with reaching later stages were being older, being out to parents, and engaging in previous HIV/sexually transmitted infection testing. CONCLUSIONS: AMSM PrEP use falls short of recommended levels. PrEP campaigns are needed to raise awareness by targeting key AMSM subgroups that underestimate the appropriateness of use. Equally important, parents and health providers of AMSM should serve educational roles to help facilitate potential PrEP uptake, by motivating adolescents and giving them the skills needed to request, fill, and adhere to a prescription. Article	2021	Mounzer K.C.; Fusco J.S.; Hsu R.K.; Brunet L.; Vannappagari V.; Frost K.R.; Shaefer M.S.; Rinehart A.; Rawlings K.; Fusco G.P.	Are We Hitting the Target? HIV Pre-Exposure Prophylaxis from 2012 to 2020 in the OPERA Cohort	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2021.0064	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118951677&doi=10.1089%2fapc.2021.0064&partnerID=40&md5=527e5d775befbc8558e215d8ce098d5f	Preventing HIV transmission is a crucial step in ending the HIV epidemic. Safe and effective pre-exposure prophylaxis (PrEP) has been available in the United States since 2012. We set out to determine if persons at greatest risk for HIV acquisition were receiving HIV PrEP. HIV-negative individuals from the Observational Pharmaco-Epidemiology Research & Analysis (OPERA) cohort who were prescribed daily PrEP were contrasted with newly diagnosed HIV persons without PrEP use between July 16, 2012 and October 31, 2020 to determine if the PrEP prescriptions reached the populations who were seroconverting. Poisson regression was used to estimate incidence rates of seroconversion to HIV among PrEP initiators, as well as new diagnoses of sexually transmitted infections among both the PrEP group and the newly HIV+ group. Out of the 14,598 PrEP users and 3558 persons newly diagnosed with HIV in OPERA, demographics varied widely. Older individuals, those of non-Black race, men, nonintravenous (IV) drug users, and those with commercial insurance were proportionally overrepresented among those prescribed PrEP compared to persons newly diagnosed with HIV during the same time period. Over 82% of new HIV+ individuals received care in the southern United States compared to only 45% of PrEP users. Seroconversion to HIV among PrEP users was generally uncommon, although more frequent among those who identified as Black individuals, especially in the 13-25 years old age range. In conclusion, providers need innovative programs to better identify, educate, and link those at greatest risk of HIV acquisition, especially young people, women, Black individuals, and IV drug users, to PrEP. © Karam C. Article	2021	Mpunga E.; Persaud N.; Akolo C.; Boyee D.; Kamanga G.; Trapence G.; Chilongozi D.; Ruberintwari M.; Banda L.M.	Readiness for use of HIV preexposure prophylaxis among men who have sex with men in Malawi: Qualitative focus group and interview study	JMIR Public Health and Surveillance	-	-	-	-	23692960	10.2196/26177	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118527228&doi=10.2196%2f26177&partnerID=40&md5=190d91d1de4814eeb072cac89230558f	Background: Men who have sex with men (MSM) are a key group for HIV interventions in Malawi considering their high HIV prevalence (17.5% compared to 8.4% among men in the general population). The use of oral preexposure prophylaxis (PrEP) presents a new opportunity for MSM to be protected. We present the findings from a qualitative assessment designed to assess awareness of and willingness and barriers to using PrEP among MSM in Malawi. Objective: The 3 main objectives of this assessment were to determine: (1) awareness of PrEP, (2) factors that influence willingness to use PrEP, and (3) potential barriers to PrEP use and adherence among MSM in order to guide the design and implementation of a PrEP program in Malawi. Methods: Ahead of the introduction of PrEP in Malawi, a qualitative study using in-depth interviews (IDIs) and focus group discussions (FGDs) was conducted in October 2018 in Blantyre, Lilongwe, and rural districts of Mzimba North and Mangochi. With support of members of the population, study participants were purposively recruited from 4 MSM-friendly drop-in centers where MSM receive a range of health services to ensure representativeness across sites and age. Participants were asked what they had heard about PrEP, their willingness to use PrEP, their barriers to PrEP use, and their preferences for service delivery. The data were analyzed using a thematic content analysis framework that was predetermined in line with objectives. Results: A total of 109 MSM were interviewed - 13 through IDIs and 96 through FGDs. Most participants were aware of PrEP as a new HIV intervention but had limited knowledge related to its use. However, the majority were willing to use it and were looking forward to having access to it. IDI participants indicated that they will be more willing to take PrEP if the dosing frequency were appropriate and MSM were involved in information giving and distribution of the drug. FGD participants emphasized that places of distribution and characteristics of the service provider are the key factors that will affect use. Knowing the benefits of PrEP emerged as a key theme in both the IDIs and FGDs. Participants highlighted barriers that would hinder them from taking PrEP such as side effects which were cited in IDIs and FGDs. Key factors from FGDs include cost, fear of being outed, drug stockouts, fear of being known as MSMs by wives, and lack of relevant information. FGDs cited stigma from health care workers, forgetfulness, and community associated factors. Conclusions: Despite having inadequate knowledge about PrEP, study participants were largely willing to use PrEP if available. Programs should include an effective information, education, and communication component around their preferences and provide PrEP in MSM-friendly sites. © Elizabeth Mpunga, Navindra Persaud, Christopher Akolo, Dorica Boyee, Gift Kamanga, Gift Trapence, David Chilongozi, Melchiade Ruberintwari, Louis Masankha Banda. Scales to Assess Knowledge, Motivation, and Self-Efficacy for HIV PrEP in Colombian MSM: PrEP-COL Study	AIDS Research and Treatment	-	-	-	-	20901240	10.1155/2021/4789971	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115892859&doi=10.1155%2f2021%2f4789971&partnerID=40&md5=9610f88c5d11a3b6ebfc8de1581a5674	Objective. We evaluated the construct validity Spanish version of knowledge, stigma, norms, and self-efficacy scales regarding PrEP in MSM. Methods. Sample of 287 MSM. Exploratory confirmatory factor analysis and item response theory were used to validate the constructs. Correlations and confidence interval-based estimation of relevance analyses were conducted to correlate the scales with willingness and intention to use PrEP. Results. Attitude, stigma, and descriptive and subjective norms scales showed good construct validity and were related to intention and willingness to use PrEP. However, the knowledge scale and self-efficacy scales require further refinement. Conclusions. The study provides useful information for assessing information, motivation, and self-efficacy related to PrEP use. Our results could be used to test the scales and the theoretical model in other contexts to confirm their usefulness. © 2021 Héctor F. Mueses-Marín et al. Article	2021	Mugambi, Melissa Latigo; Baeten, Jared M; Kinuthia, John; Hauber, Brett; Weiner, Bryan J; John-Stewart, Grace; Barnabas, Ruanne Vanessa	Design and evaluation of strategies to implement HIV prevention interventions for pregnant women in community pharmacy settings in western Kenya: a mixed-methods study protocol.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2021-052311	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8679098	INTRODUCTION: Community pharmacies play an important role in the healthcare system: they are frequently accessed and have increasing capacity to deliver HIV prevention services. In communities where the prevalence of HIV is high and access to antenatal care clinics is delayed or irregular, there is a unique opportunity to leverage pharmacies to enhance early and sustained access to HIV prevention among pregnant women. This study will identify women's preferences for delivery of HIV prevention services and provider-level and system-level strategies to design a new pharmacy-based model of care for pregnant women. The overall objective of this study is to design and evaluate strategies to implement HIV prevention interventions for pregnant women in community pharmacy settings in western Kenya. METHODS AND ANALYSIS: We propose to conduct a discrete choice experiment to quantify preferences for delivery of HIV prevention interventions (including pre-exposure prophylaxis, partner testing and sexually transmitted infection screening and treatment) for pregnant women in community pharmacy settings. Latent class analysis will be used to quantify women's stated preferences and identify packages of intervention components that will optimise uptake among different subgroups of women. We will apply the Theoretical Domains Framework to identify provider-level and system-level factors that might influence the implementation of the optimal intervention packages. We will then use the Behaviour Change Wheel and survey a panel of experts to select and gain consensus on strategies to improve implementation. Finally, we will evaluate the potential costs of extending the implementation of HIV prevention interventions from the clinic to community pharmacy settings. ETHICS AND DISSEMINATION: The protocol was approved by the Kenyatta National Hospital-University of Nairobi Ethics Research Committee and the University of Washington Institutional Review Board. The results of this research will be published in peer-reviewed journals and shared with various stakeholders, including community members, policymakers and researchers, through local and international conferences. Article	2021	Mugwanya K.K.; Kinuthia J.	Integrating Pre-Exposure Prophylaxis Delivery in Public Health Family Planning Clinics: Lessons Learned From a Programmatic Implementation Project in Kenya	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2021.683415	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85150057982&doi=10.3389%2ffrph.2021.683415&partnerID=40&md5=f15884d1d0419dfbbd021386868536ab	Sexually active African women are a priority population for HIV prevention due to the disproportionately high frequency of new HIV infections. Family planning (FP) clinics offer an already trusted platform that can be used to reach women for HIV prevention services, including pre-exposure prophylaxis (PrEP). In the recent PrEP Implementation in Young Women and Adolescent (PrIYA program), we piloted PrEP implementation in FP clinics in Kisumu, Kenya, and demonstrated that it was possible to integrate PrEP provision in FP systems with a program-dedicated staff. In this perspective, we describe experiences and strategies employed to introduce PrEP implementation in FP clinics and lessons learned. We identified the following lessons for PrEP introduction in FP clinics in Kenya: (1) possible to integrate and generate high enthusiasm for PrEP delivery in FP clinics but persistence on PrEP is a challenge, (2) involvement of national and regional stakeholders is critical for buy-in, contextualization, and sustainability, (3) delivery models that do not integrate fully with existing staff and systems are less sustainable, (4) creatinine testing at PrEP initiation may not be necessary, (5) fully integrated HIV and FP data systems need to be developed, and (6) incorporating implementation science evaluation is important to understand and document effective implementation strategies. In summary, integration of HIV prevention and FP services provides an opportunity to promote one-stop women-centered care efficiently. However, a broader focus on delivery models that utilize existing staff and novel strategies to help women identify their own risk for HIV are needed to ensure greater success and sustainability. Article	2021	Mugwanya K.K.; Matemo D.; Scoville C.W.; Beima-Sofie K.M.; Meisner A.; Onyango D.; Mugambi M.; Feutz E.; Grabow C.; Barnabas R.; Weiner B.; Baeten J.M.; Kinuthia J.	Integrating PrEP delivery in public health family planning clinics: a protocol for a pragmatic stepped wedge cluster randomized trial in Kenya	Implementation Science Communications	-	-	-	-	26622211	10.1186/s43058-021-00228-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133542759&doi=10.1186%2fs43058-021-00228-4&partnerID=40&md5=383a5556d4b58b42d3978c3f7b167faa	Background: Adolescent girls and young women account for a disproportionate fraction of new HIV infections in Africa and are a priority population for HIV prevention, including provision of pre-exposure prophylaxis (PrEP). Anchoring PrEP delivery to care settings like family planning (FP) services that women already access routinely may offer an efficient platform to reach HIV at-risk women. However, context-specific implementation science evaluation is needed. Methods: The Family Planning Plus Project is a prospective, pragmatic implementation evaluation, designed as a stepped wedge, cluster randomized trial, at 12 clinics in Kenya. In collaboration with the Kenya Ministry of Health and Kisumu County Department of Health, we will introduce integration of HIV risk screening and PrEP delivery in public health FP clinics. The core multifaceted implementation strategies to integrate PrEP in FP clinics will include: (1) PrEP delivery by existing FP clinic staff, (2) health provider training, (3) PrEP technical assistance to coach and mentor providers, (4) joint supervision with Kisumu County health officials, and (5) stakeholder engagement. All core components of PrEP delivery—including screening for HIV risk, HIV testing, dispensing, adherence and risk reduction counseling, assessment of side effects, and provision of refills, or safety assessment—will be conducted by existing FP clinic staff as part of a standard care service package. The goal is to catalyze sustainable scale-up within existing infrastructures beyond the project. We will rigorously evaluate implementation outcomes and impact, using the RE-AIM (Reach, Effectiveness, Adoption, Implementation, Maintenance) framework, and we will use Organizational Readiness for Implementing Change (ORIC) and the Consolidated Framework for Implementation Science Research (CFIR) to assess readiness to implement and contextual enablers and barriers of implementation, including how clinics innovate efficient delivery systems. Discussion: Anchoring PrEP delivery to existing FP systems and staffing has tremendous potential to address barriers that women face in accessing HIV prevention and PrEP care, including lack of time, cost, and stigma of visiting a facility solely for HIV prevention. The FP Plus Project will initiate preparation for full-scale and sustainable model of integration of comprehensive HIV prevention services, including PrEP implementation, in public health FP clinics in low-income settings. Article	2021	Muhula, Samuel; Opanga, Yvonne; Oramisi, Violet; Ngugi, Catherine; Ngunu, Caroline; Carter, Jane; Marita, Enock; Osur, Joachim; Memiah, Peter	Impact of the First Wave of the COVID-19 Pandemic on HIV/AIDS Programming in Kenya: Evidence from Kibera Informal Settlement and COVID-19 Hotspot Counties.	International Journal of Environmental Research and Public Health	-	-	-	-	1660-4601	10.3390/ijerph18116009	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8199875	The study sought to determine the impact of COVID-19 on HIV/AIDS programming in the Kibera informal settlement and COVID-19 hotspot counties during the first wave of the pandemic. The study was conducted in two phases. The first phase entailed the analysis of HIV care and treatment secondary data (2018-2020) from the Kenya Health Information System. In the second phase, a prospective cohort study was conducted among people living with HIV in the Kibera informal settlement. A total of 176 participants aged 18 years and above accessing HIV services at selected healthcare facilities in Kibera were randomly sampled from facility electronic medical records and followed up for three months. Socio-demographics and contact details were abstracted from the records and telephone interviews were conducted with consenting participants. Results from the retrospective review of HIV program data indicated a 56% (p < 0.000, 95% CI: 31.3%-62.8%) reduction in uptake of HIV services. Clients starting antiretroviral therapy (ART) reduced significantly by 48% (p < 0.001, 95% CI: 35.4%-77%) in hotspot counties. However, pre-exposure prophylaxis uptake increased significantly by 24% (p < 0.019, 95% CI: 4%-49%). In Kibera, 14% reported missing medications at the onset of the COVID-19 pandemic because of lack of food (38%) and government measures (11%), which affected ART access; 11% did not access health facilities due to fear of contracting COVID-19, government regulations and lack of personal protective equipment. Socioeconomic factors, food insecurity and government measures affected uptake of HIV/AIDS services; hence, the need for scaling up measures to increase access to HIV/AIDS services during the onset of pandemics. Archives of Sexual Behavior	-	-	-	-	1573-2800	10.1007/s10508-020-01880-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8213546	Pre-exposure prophylaxis (PrEP) is an effective HIV prevention strategy. Few studies have explored adolescents and young people's perspectives toward PrEP. We conducted 24 group discussions and 60 in-depth interviews with males and females aged 13-24 years in Uganda, Zimbabwe, and South Africa between September 2018 and February 2019. We used the framework approach to generate themes and key concepts for analysis following the social ecological model. Young people expressed a willingness to use PrEP and identified potential barriers and facilitators of PrEP uptake. Barriers included factors at individual (fear of HIV, fear of side effects, and PrEP characteristics), interpersonal (parental influence, absence of a sexual partner), community (peer influence, social stigma), institutional (long waiting times at clinics, attitudes of health workers), and structural (cost of PrEP and mode of administration, accessibility concerns) levels. Facilitators included factors at individual (high HIV risk perception and preventing HIV/desire to remain HIV negative), interpersonal (peer influence, social support and care for PrEP uptake), community (adequate PrEP information and sensitization, evidence of PrEP efficacy and safety), institutional (convenient and responsive services, provision of appropriate and sufficiently resourced services), and structural (access and availability of PrEP, cost of PrEP) levels. The findings indicated that PrEP is an acceptable HIV prevention method. PrEP uptake is linked to personal and environmental factors that need to be considered for successful PrEP roll-out. Multi-level interventions needed to promote PrEP uptake should consider the social and structural drivers and focus on ways that can inspire PrEP uptake and limit the barriers. Article	2021	Mujugira A.; Nakyanzi A.; Kasiita V.; Kamusiime B.; Nalukwago G.K.; Nalumansi A.; Twesigye C.C.; Muwonge T.R.; Baeten J.M.; Wyatt M.A.; Haberer J.E.; Ware N.C.	HIV self-testing and oral pre-exposure prophylaxis are empowering for sex workers and their intimate partners: a qualitative study in Uganda	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25782	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85115884078&doi=10.1002%2fjia2.25782&partnerID=40&md5=957a736459d7885c3bbaf2b4a9d57c2a	Introduction: HIV self-testing (HIVST) and oral pre-exposure prophylaxis (PrEP) are complementary, evidence-based, self-controlled HIV prevention tools that may be particularly appealing to sex workers. Understanding how HIVST and PrEP are perceived and used by sex workers and their intimate partners could inform prevention delivery for this population. We conducted qualitative interviews to examine ways in which HIVST and PrEP use influence prevention choices among sex workers in Uganda. Methods: Within a randomized trial of HIVST and PrEP among 110 HIV-negative cisgender women, cisgender men and transgender women sex workers (NCT03426670), we conducted 40 qualitative interviews with 30 sex workers and 10 intimate partners (June 2018 to January 2020). Sex worker interviews explored (a) experiences of using HIVST kits; (b) how HIVST was performed with sexual partners; (c) impact of HIVST on PrEP pill taking; and (d) sexual risk behaviours after HIVST. Partner interviews covered (i) introduction of HIVST; (ii) experiences of using HIVST; (iii) HIV status disclosure; and (iv) HIVST's effect on sexual behaviours. Data were analysed using an inductive content analytic approach centering on descriptive category development. Together, these categories detail the meaning of HIVST and PrEP for these qualitative participants. Results: Using HIVST and PrEP was empowering for this group of sex workers and their partners. Three types of empowerment were observed: (a) economic; (b) relational; and (c) sexual health. (i) Using HIVST and PrEP made sex without condoms safer. Sex workers could charge more for condomless sex, which was empowering economically. (ii) Self-testing restored trust in partners' fidelity upon being reunited after a separation. This trust, in combination with condomless sex made possible by PrEP use, restored intimacy, empowering partnered relationships. (iii) HIVST and PrEP enabled sex workers to take control of their HIV prevention efforts and avoid the stigma of public clinic visits. In this way they were empowered to protect their sexual health. Conclusions: In this sample, sex workers' use of HIVST and PrEP benefitted not only prevention efforts, but also economic and relational empowerment. Understanding these larger benefits and communicating them to stakeholders could strengthen uptake and use of combination prevention interventions in this marginalized population. © 2021 The Authors. Article	2021	Medawa, Marta J; Rosengren, A Linn; Amico, K Rivet; Hightow-Weidman, Lisa B; Macsuga, Kathryn E	mHealth to reduce HIV-related stigma among youth in the United States: a scoping review.	mHealth	-	-	-	2306-9740	10.21037/mhealth-20-68	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8063667/	Multiple intersecting stigmas and discrimination related to sex, gender, HIV, and race/ethnicity may challenge HIV prevention and treatment service utilization, particularly among youth. This scoping review describes recent and ongoing innovative mHth health (mHealth) interventions among youth in the United States that aim to reduce stigma as an outcome or as part of the intervention model. To identify examples of stigma-mitigation via mHealth, we searched peer-reviewed published literature using keyword strategies related to mHealth, HIV, stigma, and youth (ages 10 to 29). We identified eleven articles that met our inclusion criteria, including three describing data from two randomized controlled trials (RCTs), five describing pilot studies, one describing the process evaluation of an ongoing intervention, one describing formative work for intervention development, and one published study protocol for an ongoing intervention. We review these articles, grouped by HIV prevention and care continuum stages, and describe the mHealth approach used, including telehealth, simulation video games, motion comics, smartphone applications (apps), social media forums, online video campaigns, video vignettes, and a computerized behavioral learning module. Four studies focused on preventing primary acquisition through individual-level behavior change (e.g., reducing condomless anal intercourse), three focused on increasing HIV testing, three focused on linking to prevention services e.g., pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) and one focused on promoting adherence to antiretroviral therapy (ART). Our review did not identify any published studies using mHealth with a primary aim to reduce stigma as a way to improve care engagement and increase viral suppression among youth in the United States. Additional RCTs and implementation studies examining the effectiveness of mHealth interventions to reduce stigma and improve HIV-related outcomes are needed to end the HIV epidemic among youth. mHealth offers unique advantages to address the complex intersecting stigma barriers along the HIV continuum to improve HIV-related outcomes for youth. Article	2021	Murchu, Eamon O; Mc, BCh, MPH; Teljeur, Conor; PhD; Hayes, Catherine; MB, MPH; Harrington, Patricia; PhD; Moran, Patrick; PhD; Ryan, Mairin; PhD	Cost-Effectiveness Analysis of a National Pre-Exposure Prophylaxis (PrEP) Program in Ireland	Value in Health	-	-	-	10983015	10.1016/j.jval.2021.02.005	https://www.proquest.com/scholarly-journals/cost-effectiveness-analysis-national-pre-exposure/docview/2554668703/se-2?accountid=9133	Objectives: To estimate the cost-effectiveness of introducing a publicly funded pre-exposure prophylaxis (PrEP) program in Ireland. Methods: We constructed a state-transition Markov model. This was a cross-sectional population study that used all HIV surveillance data from the National Virus Reference Laboratory (NVRL) in Ireland over the time period. Access to a publicly funded PrEP program (medications + frequent HIV testing) in surrounding HIV infection among at-risk women living in SSA. RESULTS: From 2062 non-duplicate articles, four RCTs evaluating the effectiveness of one or more of the interventions against placebo were included. TFV-1% vaginal gel, oral TDF or TDF-FTC were not effective in preventing the acquisition of HIV infection in women living in SSA. However, poor adherence by study participants could have confounded the true effectiveness of TFV-PrEP in this high-risk population. Meta-analysis was not conducted given the limited number of eligible studies identified from the search. CONCLUSION: the current evidence does not support the effectiveness of TFV-PrEP for HIV in SSA women. More studies aimed at addressing factors driving low adherence to HIV interventions in this high risk populations are urgently needed in order to improve the design of future RCTs leading to the determination of more reliable estimates of TFV-1% vaginal gel or oral TDF or TDF-FTC effectiveness. Article	2021	Mutevwanesu, Grant; Mahdetsi, Moffat; Takah, Noah Fongwen	The effectiveness of tenofovir-based pre-exposure prophylaxis for prevention of seroconversion among sub-Saharan African women at high risk: a systematic review.	Pan African Medical Journal	-	-	-	1937-8688	10.11604/pamj.2021.38.308.26014	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8193792/	INTRODUCTION: women in sub-Saharan Africa (SSA) are disproportionately affected by the HIV epidemic. In 2019, they constituted 59% of new infections; thus, they remain a key population for control. Public health interventions to prevent acquisition of HIV in this high-risk population are urgently needed. Tenofovir-based pre-exposure prophylaxis (TFV-PrEP) has been shown to reduce HIV infections in other key populations. However, comprehensive evidence regarding TFV-PrEP effectiveness in women living in SSA has not been determined. Therefore, we undertook a systematic review to determine the effectiveness of tenofovir-1% (TFV-1%) vaginal gel, oral tenofovir (TFV) and tenofovir-emtricitabine (TDF-FTC) pre-exposure prophylaxis for primary acquisition of HIV in at-risk women living in SSA. METHODS: OVID Medline, Embase, CENTRAL, Web of Science and Clinical Trials.gov were searched for eligible studies from 1st January 2020 to 31st July 2020. Only randomised controlled trials (RCTs) evaluating the effectiveness of TFV-PrEP for HIV in SSA women were included. TFV-1% vaginal gel, oral TDF or TDF-FTC were not effective in preventing the acquisition of HIV infection among at-risk women living in SSA. However, poor adherence by study participants could have confounded the true effectiveness of TFV-PrEP in this high-risk population. Meta-analysis was not conducted given the limited number of eligible studies identified from the search. CONCLUSION: the current evidence does not support the effectiveness of TFV-PrEP for HIV in SSA women. More studies aimed at addressing factors driving low adherence to HIV interventions in this high risk populations are urgently needed in order to improve the design of future RCTs leading to the determination of more reliable estimates of TFV-1% vaginal gel or oral TDF or TDF-FTC effectiveness. Article	2021	Mwesigwa, PA; Kotyabana, P; Ongadde, CP; Nasunna, EM; Kitutu, FE; Ngabirano, TD; Nsakanabi, J; Mulindo, R; Kabiri, L; Namisete, M; Nabunya, R; Kwesiga, N; Sewankambo, N	Conducting an ongoing HIV clinical trial during the COVID-19 pandemic in Uganda: a qualitative study of research team and participants' experiences and lessons learnt	BMJ Open	-	-	-	NA	10.1136/bmjopen-2021-048825	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8487966/	Objective To explore the experiences and lessons learnt by the study team and participants of the Workplace-based HIV self-testing among Men trial during the COVID-19 pandemic in Uganda. Design An exploratory qualitative study comprising two virtual focus group discussions (FGDs) with 12 trial team members and 32 in-depth participant interviews (N=40). Data were collected via telephone calls for in-depth interviews or Zoom for FGDs and manually analysed by inductive content analysis. Setting Fourteen private security companies in two Uganda districts. Participants Members of the clinical trial study team and participants who had been enrolled in the trial. Results Participants' experiences during the COVID-19 pandemic were influenced by the fear of contracting COVID-19 infection, and preventive measures (i.e., mandatorymasks) and difficulty participating in research activities'. The effects on HIV treatment and prevention resulted from a misperception of the COVID-19 vaccine, participants fear of contraction and negative experiences at health facilities. The difficulty in participating in research activities arose from: fear of infection with COVID-19 for the participants who tested HIV negative, transport difficulties, limited post-test psychosocial support and lack of support to initiate pre-exposure prophylaxis. The key study team reflections focused on the management of the clinical trial, effects of the local regulations and government policies and the need to adhere to ethical principles of research. Conclusions Findings highlight the need to organise different forms of HIV support for persons living with HIV during a pandemic. Additionally, the national research regulators and ethics committees or review boards are strongly urged to develop policies and guidelines for the continuity of research and clinical trials in the event of future shocks. Furthermore, this study calls on the appropriate government agencies to ensure public and researchers' preparedness through continuing education and support. Article	2021	Mwesigwa, Catherine; Saya, Uzo; Okanda, Jackson; Bukusi, Elizabeth; Abuogi, Lisa; Wanyenze, Rhoda; Haberer, Jessica	Barriers and facilitators to pre-exposure prophylaxis among African migrants in high income countries: a systematic review.	Sexual Health	-	-	-	1449-8987 1448-5028	10.1071/SH20175	https://pubmed.ncbi.nlm.nih.gov/33650106/	Background The aim of this review is to explore acceptability, barriers, and facilitators to PrEP use among African migrants in high-income countries. METHODS: A systematic review was conducted to explore reasons that contribute to low PrEP uptake in this population. Three online databases, abstracts from key conferences and reference lists of relevant studies articles published between the 2 July 2013 and 31 July 2020 were searched. Eligible studies were published in English and conducted among African migrants in HICs. RESULTS: Of the 1,668 articles identified, 10 met the inclusion criteria. Seven studies (United States (US) (n = 2), United Kingdom (UK) (n = 1) and no qualitative studies (US (n = 2), UK (n = 1), Australia (n = 1)) met inclusion criteria. PrEP acceptability was reported in one cross-sectional article and two qualitative articles. Cross-sectional studies measured acceptability and willingness to use PrEP; in one study, 46% of African migrant men found PrEP use acceptable, and following PrEP education, another study categorized 60% of participants as willing to use PrEP if it were cost-free. Qualitative studies reported mixed perceived acceptability, with higher acceptability reported for serodiscordant couples. Barriers and facilitators to PrEP use were coded into five themes: cultural aspects of stigma; knowledge gap in health literacy; risks unrelated to HIV transmission; practical considerations for PrEP use; and the impact of PrEP use on serodiscordant couples. CONCLUSIONS: Several common barriers to PrEP use, including stigma, health literacy and risk perception and cost, were identified. Findings were limited by there being no published data on uptake. Additional work is needed to understand PrEP acceptability and uptake among African migrants. Article	2021	Nabisubi, Patricia; Kanyerezi, Stephen; Kebirungi, Grace; Mbonwa, Gerald	Knowledge and attitude of secondary school students in Nakaseke, Uganda towards HIV transmission and treatment.	AAS Open Res	-	-	-	2515-9321	10.12688/aasopenres.13210.2	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8370371/	Background: One of the major health concerns in Nakaseke district, Uganda is the high prevalence of HIV/AIDS. According to the Joint United Nations Programme on HIV/AIDS (UNAIDS), as of March 2014, the prevalence rate of the disease in the district was estimated at about 8%, compared to the national average of 6.2%, making Nakaseke district have the sixth highest prevalence rate of HIV/AIDS in the entire country. We set out to explore the knowledge and attitude of secondary school students in Nakaseke, Uganda on HIV transmission and treatment. Methods: This was a cross-sectional survey design. A total of 384 students were randomly selected from 5 secondary schools in Nakaseke district. Data was collected using a questionnaire. Results: The majority of the respondents (63.8%) were female with ages ranging from 12 – 20 years. Participants came from 5 senior classes (S1, S2, S3, S4 and S6). In total, 87.2% participants were aware of HIV/AIDS while 12.8% were not. The major source of information was through teachers/schools. 96.58% knew the mode of transmission of HIV/AIDS and 95.11% were conversant with HIV/AIDS prevention. 61.6% were aware of the terms DNA and germs whereas 36.36% were not. Discussion: Generally, the students in Nakaseke district, Uganda had a high level of awareness of HIV/AIDS. However, with regards to aspects such as the cause and modern prevention methods like taking prep and prevention of mother to child transmission were less known to them. Efforts to find a cure for HIV/AIDS are still in vae. Therefore, strong emphasis on up to date control and prevention methods should be implemented to fight the HIV/AIDS scourge . Article	2021	Nakiganda L.J.; Bell S.; Grelich A.E.; Serwadda D.; Nakubulwa R.; Poynten I.M.; Baveinton B.R.	Understanding and managing HIV infection risk among men who have sex with men in rural Uganda: a qualitative study	BMC Public Health	-	-	-	14712458	10.1186/s12889-021-11365-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110841533&doi=10.1186%2fs12889-021-11365-9&partnerID=40&md5=698d8e93c8a4e2992ef25f30f0f5f6e2	BACKGROUND: Same-sex sexual relations are criminalised in Uganda, and men who have sex with men (MSM) experience a high burden of HIV infection. In Uganda, health promotion policies focus on equity in healthcare and creating enabling environments. At present there is limited evidence upon which to enhance engagement of MSM in rural settings into effective HIV prevention. To fill this gap, our study explored HIV risk and strategies of reducing their own HIV risks among MSM living in rural Uganda. METHODS: We conducted in-depth interviews with 30 participants recruited in Southwestern Uganda. Inductive thematic analysis examined emic perspectives of HIV risk and strategies of reducing their own HIV risks. RESULTS: Understandings of HIV risk and practices were framed by lack of access to condoms, challenges negotiating condom and pre-exposure prophylaxis (PrEP) use, and condomless sex being reported as more pleasurable than sex with condoms. Strategies men perceived as enabling them to manage HIV risk included PrEP use; condom use; knowing partners' HIV status; avoiding partners associated with HIV risk; and sex; withdrawal before ejaculation and washing one's penis after sex. There were several misconceptions arising from poor HIV prevention knowledge. Strategies reliant on communication and negotiation with sexual partners were inhibited by gendered powered imbalances. CONCLUSIONS: Our findings illustrate that MSM in rural settings in Uganda are making concerted efforts to implement strategies that might reduce risk of HIV transmission and infection within their sexual relationships. Key HIV health promotion and service-related strategies to support MSM with these efforts include an effective condom and lubricant supply chain; a PrEP program in trusted local health units, implemented in discreet community-outreach mechanisms; and same-sex specific HIV-related health promotion. Article	2021	Nakkwago G.K.; Isunju J.B.; Muwonge T.; Kamatte T.; Bunasi N.; Semitala F.; Kyambadde P.; Matovu F.	Adherence to oral hiv pre-exposure prophylaxis among female sex workers in kampala, uganda	African Health Sciences	-	-	-	16808905	10.4314/ahs.v21i1.12	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114905464&doi=10.4314%2fahs.v21i1.12&partnerID=40&md5=71a9c56d47a3bd5a5a1d7f4f2d51d07	Introduction: In Kampala Uganda, female sex workers (FSWs) have high HIV prevalence (33%). Oral PrEP is a novel HIV prevention intervention that offers hope to decrease HIV incidence in key populations especially among FSWs. Studies have shown that with poor adherence, oral PrEP has no efficacy, and therefore adherence to PrEP is critical among FSWs to maximize HIV prevention. However, there is limited information about PrEP adherence among FSWs in Uganda. We therefore assessed the level of adherence to PrEP and factors associated with adherence to PrEP among FSWs, and 411/1600546&doi=10.4314%2fahs.v21i1.12&partnerID=40&md5=71a9c56d47a3bd5a5a1d7f4f2d51d07) and test using a questionnaire. Adherence was categorically defined as high adherence and low adherence. Logistic regression was done. Results: Using long-term contraception methods (OR:1.06, 95% CI: 0.04-0.27) and test using condoms with clients (OR: 0.07, 95% CI: 0.01-0.42) were negatively associated with high PrEP adherence. Conclusion: Barriers to PrEP adherence need to be addressed for successful PrEP implementation to improve adherence going forward. Service care providers should reinforce positive behaviors such as use of condoms dovetailing during PrEP breaks. © 2021 Nakkwago GK et al. Article	2021	Namara D.; Xie H.; Miller D.; Yelosa D.; McFarland W.	Awareness and uptake of pre-exposure prophylaxis for HIV among low-income, HIV-negative heterosexuals in San Francisco	International journal of STD & AIDS	-	-	-	9566624	10.1177/0956462420986663	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106153346&doi=10.1177%2f0956462420986663&partnerID=40&md5=2004f50fdd67b1fd52274802228994aba	Among heterosexuals in San Francisco, awareness and uptake among low-income heterosexual men and women in San Francisco in 2019. Of 250 HIV-negative survey participants, 42.5% were aware of PrEP. Few women (12.2%) and men (8.9%) had discussed PrEP with a healthcare provider; 3.8% of women and 0% of men had used PrEP in the last year. White participants (adjusted odds ratio (aOR) 3.36, 95% CI 1.02, 10.96), women (aOR 2.19, 95% CI 1.30, 3.70), and age 30 years or above (aOR 4.04, 95% CI 1.21, 14.34) had greater odds of being aware of PrEP. Testing for HIV or sexually transmitted infection in the past year was marginally associated with a greater PrEP awareness. Our findings reveal gaps in PrEP implementation associated with social disparities among low-income heterosexuals. Testing services and targeted promotional and educational materials are needed for high-risk, low-income populations are left behind in San Francisco's aggressive "Getting to Zero" efforts. © The Author(s) 2021	HIV; low-income heterosexuals; Pre-exposure prophylaxis; San Francisco	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Ngure K.; Thun N.; Ogollo V.; Kiptinness C.; Kamolloh K.; Burns B.F.O.; Mugo N.R.; Bukusi E.A.; Garrison L.; Baeten J.M.; Haberer J.E.	Dynamic Perceived HIV Risk and Sexual Behaviors Among Young Women Enrolled in a PrEP Trial in Kenya: A Qualitative Study	Frontiers in Reproductive Health	-	-	-	26733153	10.3389/fgh.2021.637869	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126461404&doi=10.3389%2ffgh.2021.637869&partnerID=40&md5=e0f0b7227ba8b30fdcb47df9f65ba93	Background: In Kenya and elsewhere in sub-Saharan Africa, young women are disproportionately affected by the HIV epidemic compared to young men. The extent to which young women's self-perceptions about risk of HIV acquisition influence their sexual behaviors and use of HIV prevention methods remains unclear. We therefore conducted a qualitative study to explore these issues among young women enrolled in a pre-exposure prophylaxis (PrEP) trial. Methods: From January 2017 to January 2020, we conducted serial semi-structured in-depth interviews 30 purposively selected young women (18–24 years old) who were participating in the MPY A (Mentoring PrEP for Young Adult women) study—a randomized controlled trial in Thika and Kisumu, Kenya, assessing the impact of SMS reminders on PrEP adherence. Interviews were conducted at three time points (< 1 week, 3, and 12 months after initiating PrEP). We used an inductive, content analytic approach to identify themes related to perceived HIV risk, sexual behavior, and use of HIV prevention tools. Results: Around the time of enrollment, most of the 30 women interviewed reported being at high risk of HIV because of their own sexual behaviors, such as having concurrent sexual partners, engaging in transactional sex, and not using condoms. Over time, however, many participants described changes in their sexual behaviors and perceived HIV risk, with a reduction in perceived risk for some women. Those who reported a persistently perceived risk of HIV acquisition were the most supportive for PrEP initiation and continuation. Overall PrEP use, participants who reported a persistently perceived risk of HIV acquisition were also more likely to report consistent condom use, while those who reported no longer using condoms because they were confident that PrEP provided adequate protection against HIV described reducing risky sexual behaviors because of the regular counseling and HIV testing they received as part of their PrEP services. This lowered risk perception was in most cases accompanied by discontinuation of PrEP. Conclusions: HIV risk perception among young women in Kenya was dynamic and influenced their use of PrEP and condoms over time, suggesting an often-deliberate approach to HIV prevention and sexual health. Article	2021	Nyblade, Laird A; Dickson-Gomez, Julie; Ko Ku, Thant	A Longitudinal, Qualitative Exploration of Perceived HIV Risk, Healthcare Experiences, and Social Support as Facilitators and Barriers to PrEP Adoption Among Black Women.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03015-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7575511/	Black women contract HIV at much higher rates than White or Hispanic women. Pre-exposure prophylaxis (PrEP) is an underutilized prevention tool among this population. We sought to determine participants' interest in PrEP and facilitators and barriers to PrEP adoption. This longitudinal, qualitative study included 30 Black women (Mage = 32.2) interviewed 4 times over 6 months. Most participants were unmarried (n = 24), unemployed (n = 20), and had children (n = 24). Participants described PrEP as a way to avoid HIV and to protect their children and loved ones. Other facilitators included support from family and friends, low perceived efficacy to adherence, and transportation. This study demonstrated actual, rather than hypothetical, PrEP intakes among Black women, and the barriers that arose over time during the study. PrEP awareness needs to be promoted among Black women and medical providers. Future research should address individual risk perception, medical mistrust, increasing social support, and decreasing transportation barriers.	Black/African-American women; HIV/AIDS; Medical mistrust; Perceived HIV risk; PrEP barriers. Article	2021	Nyblade, Laird A; Dickson-Gomez, Julie; Ko, Thant Ko	Structural and syndemic barriers to PrEP adoption among Black women at high risk for HIV: a qualitative exploration.	Culture, Health & Sexuality	-	-	-	1464-5351	10.1080/13691058.2020.1726297	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7529613/	In the USA, Black women are at disproportionately higher risk for HIV compared to women of other races/ethnicities, which can be explained by the Substance Abuse, Violence and AIDS (SAVA) syndemic. Disparities in HIV, substance use and violence are driven by multiple influences, including structural factors (e.g. housing and poverty), which exacerbate social and individual-level factors. Black women have sex partners, engaging in unprotected sex, having sex for money, experiencing forced sex from an intimate partner or increased substance use, all of which increase HIV risk. Pre-exposure prophylaxis (PrEP), a pill that can prevent HIV, is also underutilized method that Black women experiencing syndemics can use to decrease their risk. This study explored Black women's interest in, and barriers to, adopting PrEP over 6 months. Thirty Black women (age M = 32.2) who experienced multiple substance use, violence and HIV-related syndemic factors were interviewed four times over a 6-month period. Results demonstrated that experiencing intimate partner violence, substance use, community violence and other structural factors (poor access to social services, transport and childcare) all acted as barriers to PrEP adoption. Future research should consider multi-level interventions that include methods such as media campaigns, providing PrEP or referrals where women who experience syndemic and structural factors seek help, and implement a PrEP adherence programmeto and interventions to support group settings.	Black/African American women; HIV; SAVA syndemic; housing instability; pre-exposure prophylaxis adoption. Article	2021	O'Byrne P.; Masten A.; Orser L.; Isarnder G.; Grayson M.-O.; Jones C.; Francoeur M.; Lachance S.; Pardin V.	At-home HIV self-testing during COVID: implementing the GetMeX project in Ottawa	Canadian Journal of Public Health	-	-	-	84263	10.17269/s41997-021-00505-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106207834&doi=10.17269%2fs41997-021-00505-8&partnerID=40&md5=5e5a72e0f7248a3320c4145e4e4bd2	Setting: In March 2020, COVID-19 shuttered access to many healthcare settings offering HIV testing and there is no licensed HIV self-test in Canada. Intervention: A team of nurses at the University of Ottawa and Ottawa Public Health and staff from the Ontario HIV Treatment Network (OHTN) obtained Health Canada's Special Access approval on April 23, 2020, and launched GetMeX (GMX) HIV self-test in Ottawa; we received REB approval on May 15, 2020. As of July 20, 2020, eligible participants (≥16 years old, HIV-negative, not on PrEP, not in an HIV vaccine trial, living in Ottawa, no bleeding disorders) could register via www.GetMeX.ca to order kits. Outcomes: In the first 6 weeks, 637 persons completed our eligibility screener; 43.3% (n = 276) were eligible. Of eligible participants, 203 completed a baseline survey and 182 ordered a test. These 203 participants were an average of 31 years old, 72.3% were white, 60.4% were cis-male, and 53% self-identified as gay. Seventy-one percent (n = 144) belonged to a priority group for HIV testing. We have results for 70.9% (n = 129/182) of participants who ordered a kit: nine were positive, 104 were negative, 22 were invalid, and 2 "preferred not to say". 1 participant reported an intermediate to test. Implications: Our results show that HIV self-testing is a pandemic-friendly strategy to help ensure access to sexual health services among persons who are good candidates for PrEP. Results also suggest that we may be underserving Black and other racialized persons. Given the 0.98% positivity rate for HIV testing in Ottawa. As such, we advocate for scale-up of HIV self-testing in Canada. © 2021, The Author(s). Article	2021	O'Byrne P.; Vandyk A.; Orser L.; Holmes M.	Nurse-led PrEP-RN clinic: A prospective cohort study exploring task-Shifting HIV prevention to public health nurses	BMJ Open	-	-	-	20440055	10.1136/bmjopen-2020-040817	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099183230&doi=10.1136%2fbmjopen-2020-040817&partnerID=40&md5=2949faa6388b4064c4a96e4ebaf8fd	Objective: To report the results of a nurse-led pre-exposure prophylaxis (PrEP) delivery service. Design: This was a prospective cohort study conducted from 5 August 2018 to 4 March 2020. It involved manual chart review to collect data. Variables were described using frequencies and percentages and analysed using χ 2 testing. Those significant in bivariate analysis were retained and entered into a binary multiple logistic regression model. Survival modelling was used, and only participants with a baseline HIV test were included in the survival analysis. Setting: Community-based nursing clinic in Ottawa, Canada. Participants: Adult clients (≥18 years) who were HIV negative and enrolled in the Ottawa Public Health nurse-led PrEP clinic. Results: 347 patients who met our high-risk criteria for PrEP, those criteria included patients who newly presented with any of the following: HIV contacts, diagnosed with a bacterial STI or made use of HIV PEP. Further, eligibility could be determined based on clinical judgement. Patients who met the foregoing criteria were appropriate for PrEP-RN; while lower-risk patients were referred elsewhere. Of the 347 patients who met our high-risk criteria, 47% accepted and 53% declined. Of those who accepted, 80% selected PrEP-registered nurse (RN). Primary and secondary outcome measures Uptake, acceptance, engagement and attrition factors of participants who obtained PrEP through PrEP-RN. Findings 69% of participants who were eligible attended their intake PrEP-RN visit. 66% were retained in care. Half of participants continued PrEP and half were lost to follow-up. We found no significant differences in the uptake, acceptance, engagement and attrition factors of participants who accessed PrEP-RN regarding reasons for referral, age, ethnicity, sexual orientation, annual income, education attained, insurance status, if they have a primary care provider, presence or absence of depression or anxiety and evidence of newly acquired STI during the study period. Conclusions: Nurse-led PrEP is an appropriate strategy for PrEP delivery. © Author(s) (or their employer(s)) 2021. Article	2021	O'Byrne, P.; Orser, L.; Haines, M; Holmes, D	Active-offer PrEP for HIV prevention: control, discipline, and public health nursing practice	Critical Public Health	-	-	-	0958-1596	10.1080/09581596.2019.1690633	https://www.tandfonline.com/doi/abs/10.1080/09581596.2019.1690633	Whereas public health efforts to prevent HIV transmission need to focus exclusively on HIV diagnosis and reductions in the practices that transmit HIV, they now include the provision of HIV medication to those who are HIV negative to prevent them from acquiring HIV (pre-exposure prophylaxis [PrEP]). Using Foucault's concepts of discipline and biopower, we explored the practices of active-offering of PrEP referrals by public health nurses as part of their mandated follow-up with patients diagnosed with sexually transmitted infections (STIs). This occurred due to research showing high rates of HIV seroconversion among those diagnosed with infectious syphilis and rectal bacterial STIs. In this way, public health practices have incorporated PrEP as part of standard STI follow-up. While this approach of offering PrEP to those at highest risk for HIV acquisition can be considered a public health success, we review it using the works of Foucault and Dehlese, ultimately arguing that what we call active-offer PrEP can also be seen as a combination of discipline and control; that is, as a mechanism of social regulation. As a final point, however, we caution against rejecting active-offer PrEP, arguing that while critique is necessary, ethical practices are as well, which includes providing much needed services, such as PrEP, to those afflicted by HIV. We assert that critique should not lead to inaction, but should be used to dismantle social inequities and misguided public health practices. Article	2021	O'Connell, Hill R; Cristi, Shannon M	The Impact of HIV Pre-Exposure Prophylaxis (PrEP) Counseling on PrEP Knowledge and Attitudes Among Women Seeking Family Planning Care.	Journal of Women's Health (Larchmont)	-	-	-	1931-843X	10.1089/jwh.2019.8217	https://dx.doi.org/10.1089/jwh.2019.8217	Background: Adult women account for ~19% of all new HIV diagnoses in the United States, but receive only 7%-8% of new prescriptions for HIV pre-exposure prophylaxis (PrEP), and report low awareness of PrEP even within communities with high risk of HIV transmission. Family planning (FP) programs are a promising, underutilized setting for the provision of PrEP counseling to women, especially the 40% of women FP clients who receive no other form of health care. This study tested the feasibility of integrating routine PrEP counseling in a high-volume FP clinic with no previous PrEP experience. Materials and Methods: Trained FP counselors at a FP clinic in Philadelphia surveyed women about knowledge and attitudes related to PrEP, then provided a brief PrEP counseling intervention. After counseling, knowledge and attitudes were reassessed. In response to counselor requests, we developed the Women's PrEP Counseling Checklist (WPCC) tool to structure and standardize each counseling session. We then compared baseline and postintervention data among participants overall and in two cohorts: those receiving unguided counseling (initial design) and those receiving WPCC-guided counseling (enhanced design). Results: Both cohorts displayed significant ($p < 0.0001$) gains in PrEP knowledge and acceptability after counseling. Participants receiving WPCC-guided counseling reported higher knowledge scores postintervention ($p = 0.01$) and greater gains in PrEP acceptability ($p = 0.008$) than their peers receiving unguided counseling. Conclusions: Introducing PrEP counseling into routine FP care is feasible, and effectively improves knowledge and attitudes about PrEP within a large population of women, broadening access to PrEP on individual and population levels. The WPCC tool both enhances the impact of counseling on patients and reduces the work burden on providers. Article	2021	Ogbuagu, Oyeyemi; Ruane, Peter J; Podzamczer, Daniel; Salazar, Laura C; Henry, Keith; Antinoli, David M; Wohl, David; Gilson, Richard; Sluis, Yvapreu; Elvidottir, Kassie; Cao, Stephanie; Spinelli, Kim; Alexander, Caren; Christoph, Dan; Mosqueda, Ibarra; Jarad, M; Brainard, Diana M; Wiebicki, Gary; Brunetta, Jason M; Kranzberg, Gitte; Spinner, Christoph D	Long-term safety and efficacy of emtricitabine and tenofovir alafenamide vs emtricitabine and tenofovir disoproxil fumarate for HIV-1 pre-exposure prophylaxis: week 96 results from a randomised, double-blind, placebo-controlled, phase 3 trial.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(21)00071-0	https://dx.doi.org/10.1016/S2352-3018(21)00071-0	BACKGROUND: In DISCOVER, a multinational, randomised controlled trial, emtricitabine and tenofovir alafenamide compared with emtricitabine and tenofovir disoproxil fumarate showed non-inferior efficacy for HIV prevention and improved bone mineral density and renal safety biomarkers at week 48. We report outcomes analysed after all participants had completed 96 weeks of follow-up. METHODS: This study is an ongoing, randomised, double-blind, multicentre, active-controlled, phase 3, non-inferiority trial done at 96 community, public health, and hospital-associated clinics located in Europe and North America. Adult cisgender men and transgender women who have sex with men, both with a high risk of acquiring HIV as determined by self-reported sexual behaviour or recent sexually transmitted infections, were randomly assigned (1:1) to receive either emtricitabine and tenofovir alafenamide (200/25 mg) tablets daily, with matched placebo tablets (emtricitabine and tenofovir alafenamide group), or emtricitabine and tenofovir disoproxil fumarate (200/300 mg) tablets daily, with matched placebo tablets (emtricitabine and tenofovir disoproxil fumarate group). The primary efficacy outcome was incident HIV infection. Incidence of HIV-1 infection per 100 person-years was assessed when the last participant had completed 96 weeks of follow-up. This trial is registered with ClinicalTrials.gov, number NCT02842086. FINDINGS: Between June 13, 2016, and June 30, 2017, 5387 participants were randomly assigned to receive emtricitabine and tenofovir alafenamide (n=2696) or emtricitabine and tenofovir disoproxil fumarate (n=2691), contributing 10 083 person-years of follow-up. At 96 weeks of follow-up, there were eight HIV infections in participants who had received emtricitabine and tenofovir alafenamide (incidence 0·08 per 100 person-years, 95% CI 0·04–0·16) and 16 in participants who had received emtricitabine and tenofovir disoproxil fumarate (0·16, 0·09–0·25; p=0·0001). Emtricitabine and tenofovir alafenamide maintained its non-inferiority to emtricitabine and tenofovir disoproxil fumarate for HIV prevention (RR 0·54 95% CI 0·23–1·26). Approximately 78·82% of participants reported taking study medication more than 95% of the time across all study visits. Rates of sexually transmitted infections remained high and similar across groups (21 cases per 100 person-years for rectal gonorrhoea and 23 cases per 100 person-years for rectal chlamydia). Emtricitabine and tenofovir alafenamide continued to show superiority over emtricitabine and tenofovir disoproxil fumarate in all but one of the six prespecified bone mineral density and renal biomarkers. There was more weight gain among participants who had received emtricitabine and tenofovir alafenamide (median weight gain 1·7 kg vs 0·5 kg, p<0·0001). INTERPRETATION: Emtricitabine and tenofovir alafenamide is safe and effective for longer-term pre-exposure prophylaxis in cisgender men and transgender women who have sex with men. FUNDING: Gilead Sciences. Article	2021	Ogbuagu, Oeyeyme; Wachekwa, Ian; Yasin, Faiza; Nota, Cecilia; Donato, Sean; Toomey, Jelie; Adeiza, Mukhtar; Burnket, Lydia Asun	High HIV Detection in a Tertiary Facility in Liberia: Implications and Opportunities.	Annals of Global Health	-	-	-	2214-9996	10.5334/aogh.3243	https://pubmed.ncbi.nlm.nih.gov/34900617	Background: HIV/AIDS remains one of the world's most significant public health challenges; sub-Saharan Africa accounts for 71% of the global burden of HIV. Testing for HIV is pivotal to achieving UNAIDS 95-95-95 target towards bringing an end to the epidemic. Objective: The study reviewed five-year HIV testing data from the largest tertiary hospital in Monrovia, Liberia and highlights risk groups that would benefit from targeted testing and prevention interventions. Methods: This was a single-center academic hospital-based retrospective analysis of HIV testing data from January 2016 to December 2018 obtained from the hospital's HIV testing registry. Data collected included age, sex, HIV test result, and the reason for testing (symptomatic, provider-initiated, voluntary, antenatal, or pregnancy status). Annual diagnoses rates were reported as proportion of individuals tested within a specified category (age <15 years, age 15-24 years and >25 years, gender, and pregnancy status) that had a positive HIV test. Five-year trends were analyzed. Results: Over the study period, 41,343 non-pregnant individuals were screened for HIV. In addition, the antenatal clinic performed 24,913 tests. Of non-pregnant individuals tested, 4,066 (10%) were diagnosed with HIV ranging from 7% (909/12621) in 2018 to 13% (678/5070) in 2014. Case detection rates for individuals aged 15-24 were 7%, 5%, 6%, 6% and 3% for years 2014, 2015, 2016, 2017 and 2018 respectively. Annually, 2-3% of all pregnant women tested were diagnosed with HIV. While HIV detection rates decreased over time overall, children less than 15 years of age showed an annual increase from 6.7% in 2014 to 12.5% in 2018. Conclusions: A large five-year dataset from the largest tertiary facility in Liberia shows broad HIV detection rates that are much higher than national prevalence estimates. Ramping up HIV testing and prevention interventions including pre-exposure prophylaxis are sorely needed. Article	2021	Ogunbajo A.; Storbeck E.D.; Ober A.J.; Bogart L.M.; Reback C.J.; Flynn R.; Lyman P.; Morris S.	Multilevel Barriers to HIV PrEP Uptake and Adherence Among Black and Hispanic/Latinx Transgender Women in Southern California	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03159-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099935207&doi=10.1007%2fs10461-021-03159-2&partnerID=40&md5=45d6803f0ffbf9b5f9b7f5e403151 9cea996	Black and Hispanic/Latinx transgender women in the United States (U.S.) are disproportionately affected by HIV. Pre-exposure prophylaxis (PrEP) reduces risk of HIV infection but PrEP uptake remains low among transgender women. Understanding multilevel barriers to PrEP uptake and adherence among this population is critical to inform the development of tailored interventions. We conducted a PrEP demonstration project and 35 healthcare providers who provide PrEP services to transgender women in Los Angeles and San Diego, California. The interviews assessed general attitudes, experiences, and beliefs about PrEP as well as individual-, interpersonal-, community-, and structural-level barriers to PrEP uptake and adherence. PrEP adherence was assessed by collecting quantitative semicollate tenofovir-diphosphate (TFV-DP) levels in retrospect on finished, dried blood spot (DBS) samples. We utilized qualitative content analysis to identify themes from the interviews. Findings indicated the presence of individual-level barriers including low conscious, mental health issues, substance use, and concerns about PrEP side effects including hormone interaction. Interpersonal-level barriers included the influence of intimate/romantic partners and the impact of patient-provider communication. Community-level barriers consisted of experiencing stigma and negative community opinions about PrEP use as well as having negative experiences in healthcare settings. Structural-level barriers included unreliable transportation, employment, and housing insecurity. Interventions aiming to increase PrEP uptake and adherence among Black and Hispanic/Latinx transgender women in the U.S. should employ a multilevel approach to addressing the needs of transgender women, especially the structural barriers that have greatly limited the use of PrEP. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature.	10907165	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

Article	2021	O'Halloran C.; Crawford S.; Mohammed H.; Gill O.N.; Hughes G.; Fifer H.; Allen H.; Owen G.; Nutland W.; Delpech V.; Saunders J.M.	Factors associated with reporting antibiotic use in STI prophylaxis among HIV PrEP users: Findings from a cross-sectional online community survey, May-July 2019, UK.	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2020-054592	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094193753&doi=10.1136%2fsextrans-2020-054592&partnerID=40&md5=ea4e0b43dd0b4c381f4a6cb3164b2f2	Objectives The use of antibiotics as pre-exposure or postexposure prophylaxis for sexually transmitted infection (STI) prevention (STI prophylaxis) is not currently recommended in the UK, but there is evidence that STI prophylaxis is effective and some HIV pre-exposure prophylaxis (PrEP) users are using antibiotics in this way. We aimed to describe factors associated with reporting STI prophylaxis among PrEP users. Methods The 2019 online PrEP User Survey was between 17 May and 1 July. Eligible participants included UK residents reporting HIV PrEP use or having used to obtain HIV PrEP since January 2015. STI prophylaxis use was defined as reporting buying antibiotics to prevent STIs, either primarily or through the internet; this question was only asked to HIV PrEP users. Factors associated with STI prophylaxis use were assessed using univariable and multivariable logistic regression. Results Overall, 9% (167/1836) of HIV PrEP users reported STI prophylaxis use in the past 12 months. 84% reported white ethnicity, 55% resided in London and 69% were aged ≥35 years. Factors associated with STI prophylaxis included: reporting ≥3 compared with 1-4 condomless sex partners in the past 6 months (12% vs 5.6%, adjusted odds ratio (aOR) 1.88, 95% CI 1.22 to 2.68), reporting chemsex drug use compared with no sexualised drug use in the past 12 months (16% vs 6.0%, aOR=1.86, 95% CI 1.20 to 2.83) and reporting an STI diagnosis in the past 12 months (12% vs 6.6%, aOR=1.54, 95% CI 1.08 to 2.18). Variables not significant in multivariable analysis included: ethnicity, age, residence and HIV PrEP testing. Conclusions Approximately 1 in 10 HIV PrEP users in this UK online community reported STI prophylaxis use. STI prophylaxis was associated with sexual behaviour known to influence STI transmission and history of recent STIs acquisition. Given the potential risk of antimicrobial resistance, sexual health clinicians should consider asking attendees, especially HIV PrEP users, about the use of antibiotics as STI prophylaxis, to inform appropriate counselling, testing and management. © 2022 BMJ Publishing Group. Article	2021	Okeke N.L.; McLeavitt T.; Gillam-Phillips R.; Wagner D.H.; Barnwell V.J.; Johnson Y.M.; James O.; Webb P.B.; Parker S.D.; Hill B.; McKellar M.S.; Mitchell J.T.	Awareness and acceptability of HIV pre-exposure prophylaxis (PrEP) among students at two historically Black universities (HBCU): a cross-sectional survey	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-021-10996-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106397734&doi=10.1186%2fs12889-021-10996-2&partnerID=40&md5=4b9016fa4bdfa03dfcf75160f6 4ccde2e7	Background: Despite young African American adults (ages 18–24) being among the highest risk groups for HIV infection, little is known about their awareness of HIV pre-exposure prophylaxis (PrEP) – a once daily pill shown to be > 90% effective in preventing HIV. To explore awareness and acceptability of PrEP among college students in this demographic, we conducted a survey of attendees at two large historically Black universities (HBCU) in North Carolina. Methods: We administered a 14-item questionnaire to students at two HBCUs in North Carolina between February and April 2018. Questions were formatted in a yes/no or multiple choice format. Questionnaires were distributed using a convenience sampling method. Participants were approached by research staff members at a campus health fair and while roaming the campus student union via iPad. Response to all questions was optional. We fit a logistic regression model to determine association of key demographic determinants with PrEP acceptability and awareness. Statistical analyses were conducted using SAS 9.4 (SAS, Cary, NC). Results: Overall, 210 students participated in the survey, of which 60 completed all survey items. Participants were 76% female, 89% heterosexual and 39% freshmen. The mean age of respondents was 19.8 years (SD: 1.8). Fifty-two percent of survey respondents reported that they were aware of PrEP prior to the time of survey administration. Of those who were aware of PrEP, 63% reported that they had learned about it in the 6 months prior to survey administration, while only 19% say they were aware of it for more than a year. Regarding acceptability of PrEP, 58% of respondents reported that they would take a once a day pill for HIV if they were at risk. Our logistic regression analysis found no statistically significant associations between key demographic factors and PrEP awareness. However, persons who perceived themselves to be at risk for HIV acquisition were more likely to find once daily oral PrEP (relative risk 2.44 (95% CI 1.31–5.42)) as an acceptable prevention strategy than the rest of the survey cohort. Conclusions: African American HBCU students are becoming aware of PrEP, and generally perceive the intervention as acceptable and worth consideration. © 2021, The Author(s).	historically black colleges and universities; HIV; Pre-exposure prophylaxis; PrEP; Sexual health	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Okoli, C; Oka, S; Philbert, P; Brinson, C; Bunu, A; Gaasi, D; Dapo, O; Garcia, JG; Morell, EB; Tao, DDS, D'Amico, R; Dorsy, D; Griffith, S; Thiagarajah, S; St Clair, M; Van Solingen-Ristea, Ri; Cisneros, H; Ford, SL; Del Rio, I; Thomas, V; Yarrough, S; Cottrell, A; Van Epps, V; Vandermosten, K; Margolis, DA; Smith, JC; Spreen, WR	Tenofovir and emtricitabine concentrations in hair are comparable between individuals on tenofovir disoproxil fumarate versus tenofovir alafenamide-based ART.	Drug Testing and Analysis (Drug Test Anal)	-	-	-	1942-7611	10.1002/dta.3033	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9131177/	Tenofovir disoproxil fumarate (TDF) in combination with emtricitabine (FTC) is the backbone for both human immunodeficiency virus (HIV) treatment and pre-exposure prophylaxis (PrEP) worldwide. Tenofovir alafenamide (TAF) with FTC is increasingly used in HIV treatment and was recently approved for PrEP among men who have sex with men. TDF and TAF are both metabolized into tenofovir diphosphate (TFV-DP) in peripheral blood mononuclear cells (PBMC), but TAF results in lower plasma TFV concentrations. We developed and validated a sensitive and specific high performance liquid chromatography coupled with tandem mass spectrometry (LC/MS/MS)-based analytical method for analyzing TFV and FTC from individuals on either TDF/FTC or TAF/FTC dose. Hair samples were collected and TFV/FTC are extracted from ~5 mg hair and separated on a column using a gradient elution. The lower quantification limits are 0.00200 (TFV) and 0.0200 (FTC) ng/mg hair; the assay is linear up to 6.400 (TFV) and 64.00 (FTC) ng/mg hair. The day-to-day and inter-day coefficients of variance (CVs) are 5.39–12.8% and 6.06–13.3% for TFV and 6.571–2.85% and 2.19–5.10% for FTC. TFV concentrations from participants on TDF/FTC-based regimens with undetectable plasma HIV RNA were 0.0255 ± 0.0293 ng/mg, whereas those from individuals on TAF/FTC-based regimens were 0.0426 ± 0.0246 ng/mg. Despite the dose of TFV in TDF being 10 times that of TAF, hair concentrations of TFV were not significantly different for those on TDF versus TAF regimens. Pharmacological enhancers (ritonavir and cobicistat) did not boost TFV concentrations in hair. In summary, we developed and validated a sensitive analytical method to analyze TFV and FTC in hair and found that hair concentrations of TFV were essentially equivalent among those on TDF and TAF.	emtricitabine (FTC); hair concentrations; tenofovir (TFV); tenofovir alafenamide (TAF); tenofovir disoproxil fumarate (TDF)	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Okunowo, Ayokunle O; Sullivan, Benjamin P; Burden, Ashley R; Lu, Tiffany J; Creasy, Tim R; Posner, Jonathan D; Dean, Paul K	Pilot evaluation of an enzymatic assay for rapid measurement of antiretroviral drug concentrations	Virology	-	-	-	1743422X	10.1186/s12985-021-01543-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104820868&doi=10.1186%2fs12985-021-01543-x&partnerID=40&md5=67881b0ce453cdc97f2ed0b0 2b92f0f2	Objective: Maintaining adequate drug adherence is crucial to ensure the HIV prevention benefits of pre-exposure prophylaxis (PrEP). We developed an enzymatic assay for rapidly measuring tenofovir diphosphate (TFV-DP) concentrations—a metabolite that indicates long-term PrEP adherence. Setting: The study was conducted at the Madison HIV Clinic at Harborview Medical Center in Seattle. Methods: We enrolled adults receiving standard oral PrEP, and individuals not receiving any antiretrovirals. We measured TFV-DP concentrations in diluted whole blood using our novel RESTrieve TRanscriptase Chain Termination (RESTRCT) assay, based on inhibition of HIV reverse transcriptase (RT) enzyme. Blood samples were diluted in water, DNA isolated, RT activity measured by RESTRCT, and results measured with a fluorescence reader—stronger fluorescence indicated higher RT activity. We compared RESTRCT assay results to TFV-DP concentrations from matched dried blood spot samples measured by liquid chromatography-tandem mass spectrometry (LC-MS/MS). Results: We enrolled 30 participants (20 PrEP users, 10 non-users) between October 2019 and February 2020. The 20 participants receiving PrEP had TFV-DP levels ≥ 700 fmol/punch by LC-MS/MS. RESTRCT fluorescence correlated with LC-MS/MS measurements (τ = − 0.845, p < 0.0001). Median fluorescence was 93.1 (95% confidence interval CI 90.9 to 114) for samples < 700 fmol/punch and 54.4 (CI 38.0 to 72.0) for samples ≥ 700 fmol/punch. When calibrated to an a priori defined threshold of 82.7, RESTRCT distinguished both groups with 100% sensitivity and 92.9% specificity. Conclusions: This novel enzymatic assay for measuring HIV reverse transcriptase activity may be suitable for distinguishing TFV-DP concentrations in blood that correspond to protective HIV prevention. © 2021, The Author(s). Article	2021	Okoi, C; Oka, S; Philbert, P; Brinson, C; Bunu, A; Gaasi, D; Dapo, O; Garcia, JG; Morell, EB; Tao, DDS, D'Amico, R; Dorsy, D; Griffith, S; Thiagarajah, S; St Clair, M; Van Solingen-Ristea, Ri; Cisneros, H; Ford, SL; Del Rio, I; Thomas, V; Yarrough, S; Cottrell, A; Van Epps, V; Vandermosten, K; Margolis, DA; Smith, JC; Spreen, WR	Long-acting cabotegravir plus rilpivirine for treatment in adults with HIV-1 infection: 96-week results of the randomised, open-label, phase 3 FLAIR study	The Lancet HIV	-	-	-	NA	10.1016/S2352-3018(20)30340-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7811275/	Background: There is a need for more convenient, less frequent treatment to help address challenges associated with daily oral HIV treatment in people living with HIV, including stigma, pill burden, drug–food interactions, and adherence. The phase 3 ATLAS and FLAIR studies showed non-inferiority of long-acting cabotegravir and rilpivirine dosed every 8 weeks compared with standard oral therapy for the maintenance of virological suppression in adults with HIV-1 over 48 weeks. We present the 96-week findings. Methods: FLAIR is a randomised, phase 3, open-label, multicentre study done in 11 countries investigating whether switching to long-acting cabotegravir and rilpivirine is non-inferior to daily dolutegravir, abacavir, and lamivudine in virologically suppressed adults living with HIV-1. Antiretroviral therapy (ART)-naive participants received induction therapy with daily oral dolutegravir (50 mg), abacavir (600 mg), and lamivudine (300 mg) for 20 weeks. After 16 weeks, participants with less than 50 HIV-1 RNA copies per mL were randomly assigned (1:1) to continue the standard of care regimen (randomised care group) or switch to receive daily oral cabotegravir 30 mg and rilpivirine 25 mg for at least 4 weeks followed by long-acting cabotegravir 400 mg and rilpivirine 600 mg, administered as two 2 mL intramuscular injections, every 4 weeks for at least 96 weeks (long-acting group). Randomisation was stratified by baseline (preinduction) HIV-1 RNA (<100 000 or >100 000 copies per mL) and sex at birth and used permuted-block, interactive web response system (Quintiles, Durham, NC, USA) allocation assignment. The primary endpoint was the proportion of participants with plasma HIV-1 RNA of 50 copies per mL or more assessed as per the US Food and Drug Administration (FDA) Snapshot algorithm at week 96 in the modified intention-to-treat (mITT) exposed population (participants who received ≥1 dose of study drug). Safety was assessed in all participants who received at least one dose of study drug. This trial is registered with ClinicalTrials.gov, NCT02938520. Findings: Between Oct 27, 2016, and March 22, 2017, 309 participants were screened, 413 (78%) participants entered the induction phase and 566 (74%) were randomly assigned to either the standard care group (283 [50%] participants) or the long-acting group (283 [50%]). Median age was 34 years (IQR 29 to 43), 62 (11%) were 50 years or older, 127 (22%) were women (sex at birth), and 410 (74%) were white. At week 96, nine (3%) participants in each arm had 50 or more HIV-1 RNA copies per mL, with an adjusted difference of 0·0 (95% CI −2·9 to 2·9), consistent with non-inferiority established at week 48. Across both treatment groups, adverse events leading to withdrawal were infrequent (14 3% participants in the long-acting group and four 1% in the standard care group). Injection site reactions were the most common adverse event, reported by 245 (88%) participants in the long-acting group; their frequency decreased over time. Median injection site reaction duration was 3 days (IQR 2 to 4), and 3082 (99%) of 3108 reactions were grade 1 or 2. No deaths occurred during the maintenance phase. Interpretation: Through 96 weeks, switching to long-acting cabotegravir and rilpivirine continued to be non-inferior compared with continuing a standard care regimen in adults with HIV-1 for the maintenance of viral suppression. These results support the durability of long-acting cabotegravir and rilpivirine, even an almost 2-year-long period, as a therapeutic option for virally suppressed adults with HIV-1. Article	2021	O'Rourke, Shannon; Hartmann, Miriam; Myers, Laura; Lawrence, Nosiphiwe; Gill, Katherine; Morton, Jennifer F; Celum, Connie L; Bekker, Linda-Gail; van der Straten, Ariane	The PrEP Journey: Understanding How Internal Drivers and External Circumstances Impact The PrEP Trajectory of Adolescent Girls and Young Women in Cape Town, South Africa.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-03145-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8651257/	Despite high risk for HIV, South African adolescent girls and young women (AGYW) experience numerous challenges with adherence to PrEP. To better understand AGYWs motivations for PrEP and factors that impact PrEP adherence, we conducted serial in-depth interviews with 22 South African AGYW during a 12-month prospective study. Interviews explored initial experiences of PrEP, and trajectories of PrEP use, including patterns of adherence, social support, and reasons for stopping or persisting with PrEP. We also assessed drug levels as a biomarker of adherence; dried blood spots were collected at months 1, 2, 3, 6, and 12 to assess intracellular tenofovir diphosphate levels. An end-user journey analytical approach revealed themes related to behavioral and emotional aspects of use, including multilevel factors leading to divergent PrEP adherence trajectories. Our findings highlight how internal versus external motivations drive PrEP use, as well as how positive identity formation and challenges are handled, which are essential to understand AGYW in their PrEP journeys. Article	2021	Orser, Lauren; O'Byrne, Patrick	Examining patient characteristics and HIV-related risks among women with syphilis as indicators for pre-exposure prophylaxis in a nurse-led program (PrEP-IN).	International Journal of STD & AIDS	-	-	-	1758-1052	10.1177/0956462420958347	https://dx.doi.org/10.1177/0956462420958347	Current HIV pre-exposure prophylaxis (PrEP) guidelines primarily target men who have sex with men (MSM) as candidates for HIV prevention; however, such recommendations often come at the expense of other risk and gender minorities, including women. To address barriers to PrEP care among non-MSM, we developed and implemented the first nurse-led PrEP program in Canada, known as PrEP-IN. As part of PrEP-IN, patients who meet objective indicators of HIV risk are offered a referral for PrEP, regardless of sexual orientation. One such measure is syphilis, which has increased in incidence among various population groups and is known to cause biological vulnerabilities to HIV. To better understand HIV-related risks and assess intentions for PrEP use among women, we undertook an 18-month retrospective review of syphilis diagnoses within this group in Ottawa, Canada. As part of this review, we examined 25 patient files, noting their unique characteristics, socio-behavioural risk factors, and noted barriers to PrEP uptake. While some of the women diagnosed with syphilis were diagnosed with HIV, the findings raise some important considerations to facilitate opportunities for HIV prevention among non-MSM, which must take into consideration individual risk practices, sexual health histories, and population groups. Article	2021	Osma-Giraldo A.C.; Correa J.S.; Moreno C.L.; Blanquicett Y.; Flórez-Álvarez L.; Contreras-Ramírez K.; Higuita-Gutiérrez L.F.; Hernández J.C.; Zapata W.	Sexual Behaviors and Factors Associated with Condomless Sexual Practice in Colombian Men Who Have Sex with Men at High Risk of HIV Transmission	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-020-01856-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102963513&doi=10.1007%2fs10508-020-01856-y&partnerID=40&md5=ae5395dfb3e6ff2f9038e9b9 4bcbefe4	Men who have sex with men (MSM) have a disproportionate burden of HIV infection worldwide. In Colombia, the prevalence of HIV in MSM is ~ 43 times higher than in the general population (12%) vs. 0.28%). The objective of this study was to describe the sexual behaviors and factors associated with condomless sexual practice in Colombian MSM at high risk of HIV infection in Medellín. The subjects were recruited through a community-based approach, and the data were collected by a structured survey and in-depth interviews. Participants were classified into three groups according to the number of sexual partners in the last three months, to compare the sociodemographic conditions and sexual behaviors. Univariate analysis was described by absolute and relative frequencies; bivariate analysis and multivariate logistic regression were used to compare the groups and to explore the associated factors with condomless sexual practice. The overall HIV estimated prevalence was 4.2%, while the estimated prevalence for MSM with > 10 sexual partners in the last three months was 14.8%. This last group showed higher average age, higher percentage of subjects who have had sex with people living with HIV, and increased frequency of previous sexually transmitted infections. Having condomless sex with casual partners was associated with the number of sexual partners in the last three months. This study demonstrates that Colombian MSM continue to have a high risk of HIV infection/transmission and reinforce the need to implement adequate prevention programs, PrEP and guarantee access to treatment for people living with HIV. © 2021, Springer Science+Business Media, LLC, part of Springer Nature.	high-risk sex; HIV; Men who have sex with men; PrEP; Sexual behavior; Sexual orientation	English	United States	Western and Central Europe and North America	Colombia	Western and Central Europe and North America	Colombia	Western and Central Europe and North America	Quantitative

Article	2021	Overton, ET; Richmond, G; Rizzardini, G; Jaeger, H; Orrell, C; Nagimova, F; Bredeek, F; García Deltoro, M; Swindells, S; Andrade-Villanueva, JF; Wong, A; Khuong-Josses, MA; Van Solingen-Ristea, R; van Eygen, V; Crauwels, H; Ford, S; Talarico, C; Benn, P; Wang, Y; Hudson, KJ; Chounta, V; Cutrell, A; Patel, P; Shaefer, M; Margolis, DA; Smith, KY; Vanveggel, S; Spreen, W	Long-acting cabotegravir and rilpivirine dosed every 2 months in adults with HIV-1 infection (ATLAS-2M), 48-week results: a randomised, multicentre, open-label, phase 3b, non-inferiority study	The Lancet	-	-	NA	10.1016/S0140-6736(20)32666-0	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02210274/full	Background: Phase 3 clinical studies showed non-inferiority of long-acting intramuscular cabotegravir and rilpivirine dosed every 4 weeks to oral antiretroviral therapy. Important phase 2 results of every 8 weeks dosing, and supportive modelling, underpin further evaluation of every 8 weeks dosing in this trial, which has the potential to offer greater convenience. Our objective was to compare the week 48 antiviral efficacy of cabotegravir plus rilpivirine long-acting dosed every 8 weeks with that of every 4 weeks dosing. Methods: ATLAS-2M is an ongoing, randomised, multicentre (13 countries; Australia, Argentina, Canada, France, Germany, Italy, Mexico, Russia, South Africa, South Korea, Spain, Sweden, and the USA), open-label, phase 3b, non-inferiority study of cabotegravir plus rilpivirine long-acting maintenance therapy administered intramuscularly every 8 weeks (cabotegravir 600 mg plus rilpivirine 900 mg) or every 4 weeks (cabotegravir 400 mg plus rilpivirine 600 mg) to treatment-experienced adults living with HIV-1. Eligible newly recruited individuals must have received an uninterrupted first or second oral standard-of-care regimen for at least 6 months without virological failure and be aged 18 years or older. Eligible participants from the ATLAS trial, from both the oral standard-of-care and long-acting groups, must have completed the 52-week comparative phase with an ATLAS-2M screening plasma HIV-1 RNA less than 50 copies per mL. Participants were randomly assigned 1:1 to receive cabotegravir plus rilpivirine long-acting every 8 weeks or every 4 weeks. The randomisation schedule was generated by means of the GlaxoSmithKline validated randomisation software RANDALL NG. The primary endpoint at week 48 was HIV-1 RNA ≥50 copies per mL (Snapshot, intention-to-treat exposed), with a non-inferiority margin of 4%. The trial is registered at ClinicalTrials.gov, NCT03299049 and is ongoing. Findings: Screening occurred between Oct 27, 2017, and May 31, 2018. Of 1149 individuals screened, 1045 participants were randomised to the every 8 weeks (n=522) or every 4 weeks (n=523) groups; 37% (n=391) transitioned from every 4 weeks cabotegravir plus rilpivirine long-acting in ATLAS. Median participant age was 42 years (IQR 34–50); 27% (n=280) female at birth; 73% (n=763) white race. Cabotegravir plus rilpivirine long-acting every 8 weeks was non-inferior to dosing every 4 weeks (HIV-1 RNA ≥50 copies per mL; 2% vs 1%) with an adjusted treatment difference of 0·8 (95% CI −0·6–2·2). There were eight (2%, every 8 weeks group) and two (<1%, every 4 weeks group) confirmed virological failures (two sequential measures ≥200 copies per mL). For the every 8 weeks group, five (63%) of eight had archived non-nucleoside reverse transcriptase inhibitor resistance-associated mutations to rilpivirine at baseline. The safety profile was similar between dosing groups, with 844 (81%) of 1045 participants having adverse events (excluding injection site reactions); no treatment-related deaths occurred. Interpretation: The efficacy and safety profiles of dosing every 8 weeks and dosing every 4 weeks were similar. These results support the use of cabotegravir plus rilpivirine long-acting administered every 2 months as a therapeutic option for people living with HIV-1. Article	2021	Pagkas-Bather J.; Khosropour C.M.; Golden M.R.; Thibault C.; Dombrowski J.C.	Population-Level Effectiveness of HIV Pre-exposure Prophylaxis among MSM and Transgender Persons with Bacterial Sexually Transmitted Infections	Journal of Acquired Immune Deficiency Syndromes	-	-	15254135	10.1097/QAI.0000000000002646	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116668298&doi=10.1097%2fQAI.0000000000002646&partnerID=40&md5=845ba70b4e809984fdf636e76b616387	Background: Pre-exposure prophylaxis (PrEP) is highly efficacious, but its effectiveness may be limited by poor adherence or discontinuation. Our objective was to estimate the effectiveness of real-world PrEP use in a population at increased risk of HIV infection. Setting: King County, Washington. Methods: We conducted a retrospective cohort study using sexually transmitted infection (STI) partner services (PS) interview data collected January 2014–August 2018 in King County, Washington, USA. During PS interviews, men who have sex with men and transgender persons who have sex with men were asked if they were taking PrEP. We linked STI PS data to HIV surveillance data to estimate HIV incidence among self-reported PrEP users vs. nonusers using Cox proportional hazards regression, adjusting for age, race/ ethnicity, and calendar year. Results: Among 4368 individuals, 1206 (28%) were taking PrEP at the time of the PS interview. The median observation time was 14 months (interquartile range 6–23 months). Five (0.4%) of 1206 PrEP users and 97 (3%) of 2162 PrEP nonusers were subsequently diagnosed with HIV (P, 0.001). HIV incidence was lower among PrEP users than nonusers 0.17 vs. 1.86 cases per 100 person-years, adjusted hazards ratio 0.21 (95% confidence interval: 0.08 to 0.58). Latinx ethnicity, Native Hawaiian/Pacific Islander ethnicity, gonorrhea, and syphilis were also independently associated with higher HIV risk. Conclusions: Self-reported PrEP use was associated with a 79% reduction in HIV incidence among men who have sex with men and transgender persons who have sex with men with STIs in King County. Article	2021	Pampati S.; Emrick K.; Siegler A.J.; Jones J.	Changes in Sexual Behavior, PrEP Adherence, and Access to Sexual Health Services Because of the COVID-19 Pandemic among a Cohort of PrEP-Using MSM in the South	Journal of Acquired Immune Deficiency Syndromes	-	-	15254135	10.1097/QAI.0000000000002640	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103993346&doi=10.1097%2fQAI.0000000000002640&partnerID=40&md5=c9dd523294fe8b1377e60276c86ee344	Background: The coronavirus disease 2019 (COVID-19) pandemic has had unforeseen consequences on the delivery of HIV and sexually transmitted disease (STD) prevention services. However, little is known about how the pandemic has impacted pre-exposure prophylaxis (PrEP)-using men who have sex with men (MSM). Methods: Data come from an online cohort of PrEP-using MSM in the Southern United States from October 2019 to July 2020. Participants were administered 10 surveys in total, including 1 ad hoc survey specifically on COVID-19. We conducted a cross-sectional analysis of this ad hoc survey (n = 56) and present changes in sexual behaviors and utilization of and access to sexual health services. Using linear mixed-effect regression models, we also analyzed data from the larger cohort and document how sexual behaviors and PrEP use varied longitudinally across several months. Results: A fifth of participants discontinued or changed how often they take PrEP because of COVID-19. A quarter of the cohort documented challenges when attempting to access PrEP, HIV testing, or STD testing. For all sexual behaviors examined longitudinally—number of male sexual partners, anal sex acts, condomless anal sex, and oral sex (all measured in the past 2 weeks)—there was a decrease from February to April followed by an increase from April to June. Discussion: Our findings suggest reduced access to and utilization of STD and HIV services coupled with a continuation of behaviors which confer STD/HIV risk. Ensuring appropriate delivery of STD/ HIV prevention services during this pandemic is imperative. Copyright © 2021 Wolters Kluwer Health, Inc. All rights reserved. Article	2021	Pantavou K.; Tsiakalakis G.; Chanos S.; Polkas G.; Papageorgiou G.; Dedes N.; Schmidt A.J.; Nikolopoulos G.K.	Key Findings from the European Men-Who-Have-Sex-With-Men Internet Survey in Greece	Epidemiologia	-	-	26733986	10.3390/epidemiologia2010010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85146391285&doi=10.3390%2fepidemiologia2010010&partnerID=40&md5=b8843cbbe7960ad99cc6748aa1ef7daf	The European Men-Who-Have-Sex-With-Men Internet Survey (EMIS-2017) is an international survey for men who have sex with men (MSM) designed to measure the level and distribution of four dimensions: (a) sexual health outcomes, (b) risk and precaution behaviors, (c) health promotion needs, and (d) coverage/uptake of interventions. The aim of the current work is to provide an overview of key demographics and findings for MSM in Greece covering the abovementioned dimensions of EMIS-2017, especially regarding HIV. Overall, 2909 men met the inclusion criteria for the analysis. The participants' age ranged between 15 and 74 years old (median 35 years). According to the descriptive analysis, 14.4% of the participants reported moderate and 8.9% severe anxiety and depression. The self-reported HIV prevalence was 11%. A high number of participants had non-steady male partners (74%, n = 2153). The number of non-steady intercourse partners in the last 12 months was over two for about 61.5% (n = 1321) of the participants. A very small number of participants had ever tried to get pre-exposure prophylaxis (PrEP) (2.2%, n = 63), and 41.2% of the participants (n = 1199) were unaware of PrEP. About half of the participants (51.6%, n = 1501) did not know that vaccination against both hepatitis A and B viruses is recommended for MSM. The results of EMIS-2017 identify important needs and can help policy making and prevention planning. © 2021 by the authors. Article	2021	Park J.J.; Stafylis C.; Pearce D.D.; Taylor J.; Little S.J.; Kojima N.; Gorin A.M.; Klausner J.D.	Interest, Concerns, and Attitudes among Men Who Have Sex with Men and Health Care Providers Toward Prophylactic Use of Doxycycline against Chlamydia trachomatis Infections and Syphilis	Sexually Transmitted Diseases	-	-	1485717	10.1097/OLQ.0000000000001395	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112626026&doi=10.1097%2fOLQ.0000000000001395&partnerID=40&md5=92a4f0d6d689928685d9428dd9990d61	Background Prophylactic administration of doxycycline is regarded as a potential new public health strategy to combat the rising rates of Chlamydia trachomatis infections and syphilis among men who have sex with men. We conducted a survey-based study to evaluate how community members and health care providers in Southern California would perceive doxycycline preexposure/postexposure prophylaxis (PrEP/PEP) to predict its acceptability and identify potential areas of concern. Methods We conducted an online cross-sectional survey among community members who identify as men who have sex with men and health care providers with prescribing authority in Southern California to investigate the current attitudes toward doxycycline PrEP/PEP, including their willingness to accept. We analyzed the data using descriptive statistics and binary logistic regression. Results Among 212 enrolled community member participants, 67.5% indicated they would take doxycycline PrEP/PEP if offered by their provider. Higher acceptability was significantly associated with several characteristics, including recent history of bacterial sexually transmitted infection diagnosis and current use of HIV PrEP. For health care providers, 89.5% of 76 enrolled participants expressed willingness to prescribe doxycycline PrEP/PEP to their patients if recommended by the Centers for Disease Control and Prevention, but only 43.4% were willing if not. Both community members and health care providers demonstrated high levels of concern toward possible drug resistance. Conclusions Doxycycline PrEP/PEP as a preventive strategy against chlamydial infections and syphilis would likely be accepted among community members and health care providers. Clear guidelines from public health officials and further clarification on the strategy's potential impact on developing drug resistance may be necessary to ensure successful implementation. © Lippincott Williams & Wilkins. Article	2021	Parker I.; Khalil G.; Martin A.; Martin M.; Vanichseni S.; Leelawiwat W.; McNicholl J.; Hickey A.; García-Lerma J.G.; Choopanya K.; Curtis K.A.	Altered Antibody Responses in Persons Infected with HIV-1 while Using Preexposure Prophylaxis	AIDS Research and Human Retroviruses	-	-	8892229	10.1089/aid.2020.0137	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102307351&doi=10.1089%2faid.2020.0137&partnerID=40&md5=1f91cd064da94066c9e9d99c58adb44a	Preexposure prophylaxis (PrEP) is an effective HIV prevention tool, although effectiveness is dependent upon adherence. It is important to characterize the impact of PrEP on HIV antibody responses in people who experience breakthrough infections to understand the potential impact on timely diagnosis and treatment. Longitudinal HIV-1-specific antibody responses were evaluated in 42 people who inject drugs (PWID) from the Bangkok Tenofovir Study (BTS) (placebo = 28; PrEP = 14) who acquired HIV while receiving PrEP. HIV-1 antibody levels and avidity to three envelope proteins (gp41, gp160, and gp120) were measured in the plasma using a customized Bio-Plex (Bio-Rad Laboratories, Hercules, CA) assay. A time-to-event analysis was performed for each biomarker to compare the distribution of times at which study subjects exceeded the recent/long-term assay threshold, comparing PrEP and placebo treatment groups. We fit mixed-effects models to identify longitudinal differences in antibody levels and avidity between groups. Overall, longitudinal antibody levels and avidity were notably lower in the PrEP breakthrough group compared to the placebo group. Time-to-event analyses demonstrated a difference in time to antibody reactivity between treatment groups for all Bio-Plex biomarkers. Longitudinal gp120 antibody levels within the PrEP breakthrough group were decreased compared to the placebo group. When accounting for PrEP adherence, both gp120 and gp160 antibody levels were lower in the PrEP breakthrough group compared to the placebo group. We demonstrate hindered envelope antibody maturation in PWID who became infected while receiving PrEP in the BTS, which has significant implications for HIV diagnosis. Delayed maturation of the antibody response to HIV may increase the time to detection for antibody-based tests. Article	2021	Pasipanodya E.C.; Stockman J.; Phuntsog T.; Morris S.; Psaros C.; Landovitz R.; Amico K.R.; Moore D.J.; Blumenthal J.	"PrEP"ing for a PrEP demonstration project: understanding PrEP knowledge and attitudes among cisgender women	BMC Women's Health	-	-	14726874	10.1186/s12905-021-01348-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106898366&doi=10.1186%2fs12905-021-01348-8&partnerID=40&md5=3db534dc0a1955630cdd1a616b4d9309	Background: Prior to implementing a pre-exposure prophylaxis (PrEP) demonstration study, we sought to explore cisgender women's experiences with HIV prevention, PrEP knowledge and attitudes, and anticipated barriers and facilitators for PrEP uptake and adherence in Southern California. Methods: Three focus groups were held with cisgender women of mixed HIV serostatus in San Diego and Los Angeles between November 2015 and January 2016. Women were recruited through local testing sites, community-based organizations, and social media. Focus groups were audio-recorded and transcripts were analyzed using thematic analysis. Results: Twenty-two women participated in focus groups, with median age 44 (IQR 30–53) and 6 identifying as non-Hispanic Black, 7 non-Hispanic White, 8 Latina and 1 mixed race. Despite limited prior PrEP knowledge and no PrEP experience, participants expressed interest in taking PrEP. Anticipated benefits were freedom from worry about HIV and control over sexual health; however, these were tempered by concerns including the possibility of increased HIV risk behaviors and potential side effects. Cisgender women reported potential barriers to PrEP uptake and adherence barriers, like competing priorities and poor PrEP access. Conversely, PrEP facilitators included utilizing practical tools such as phone apps and pill boxes as well as receiving encouragement from loved ones and support from other cisgender women on PrEP, women living with HIV and their medical providers. Conclusions: Although PrEP awareness was low, participants recognized the importance of PrEP and ways to facilitate adherence. Exploring perspectives of cisgender women is integral to developing effective interventions to support PrEP uptake and adherence for women at elevated risk for HIV. © 2021, The Author(s). Article	2021	Pazos A.P.	Technology, Sex, and Power: Biopolitical Approach to Pre-exposure Prophylaxis in the Spanish State; Tecnología, sexo y poder: enfoque biopolítico de la profilaxis preexposición en el Estado español	Nomadas	-	-	1217550	10.30578/nomadas.n55a9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128775510&doi=10.30578%2fnomadas.n55a9&partnerID=40&md5=93dc6acaa9259fe778dc8d1d173139ab	This article considers the topic of pre-exposure prophylaxis (PrEP), a type of biomedical intervention aimed at preventing HIV transmission. The author develops a map and traces, historically and conceptually, some biopolitical courses of PrEP as a sociotechnical dispositive in the structural framework of science, technology, and society. In addition, it proposes an approach in the light of contemporary theorizations regarding biomedicalization in the context of biocapitalism. As a conclusion, the article shows some challenges posed by the frameworks underlying these new approaches to serological risk within the Spanish State. © 2021 Instituto de Estudios Sociales Contemporaneos IESCO. Article	2021	Pazzini, Michele; Ignácz, Zsófia S; Tuppat, Julia	Underlying factors related to HIV/AIDS prevention: investigating the willingness to take pre-exposure prophylaxis among men-who-have-sex-with-men in Germany.	AIDS Research and Therapy	-	-	1742-6405	10.1186/s12981-021-00386-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8447767	BACKGROUND: This study investigates the willingness of men-who-have-sex-with-men (MSM) to use HIV pre-exposure prophylaxis (PrEP). Research in the HIV/AIDS field typically relies on clinical and epidemiological studies, thereby often excluding social dimensions of the illness as well as factors explaining its prevention. The current study analyzes HIV-prevention through an interdisciplinary theoretical approach. It aims to comprehensively understand the mechanisms associated with the willingness to take PrEP among MSM in terms of psychological, social, behavioral, cultural, and demographic factors. METHODS: We analyze data from the survey "Gay Men and AIDS" conducted in Germany in 2013 prior to market approval for PrEP. Analyses were performed using the statistical software SPSS 25.0, while results were visualized using the R programming language. RESULTS: We find that perceived risk of infection, social norms (anticipated HIV-stigma), practices (e.g. regular condomless sex), and socio-demographic factors (young age, being single) all have a positive effect on the willingness to take PrEP, while education reveals a negative, and income no effect. CONCLUSIONS: Results indicate that beyond well-established socio-psychological mechanisms of health behavior, social factors play a crucial role in understanding the willingness of PrEP uptake. This study enriches existing health behavior theories with sociological concepts such as social norms and social practices. Article	2021	Pečavar B.; Kokošar Ulčar B.; Kordiš M.; Pleško M.; Turel G.; Vovko T.; Tomažič J.	Pre-exposure prophylaxis for HIV with oral tenofovir disoproxil fumarate/emtricitabine in men who have sex with men: Slovenian national demonstration project	International journal of STD & AIDS	-	-	9564624	10.1177/09564624211019876	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106317935&doi=10.1177%2f09564624211019876&partnerID=40&md5=737598c352f0c1cb48114741de7f53dd	Prevalence of HIV in Slovenia is low, and men who have sex with men (MSM) have the highest risk for infection. Rates of enrolment into HIV care, initiation of antiretroviral therapy and reaching an undetectable viral load in HIV-infected patients are very high. Prevention of HIV infection for MSM with PrEP is not formally available in Slovenia. The aim of this study was to demonstrate possible implementation of PrEP in Slovenia. Sixty-nine (n = 69) MSM with increased risk for HIV received PrEP with oral tenofovir disoproxil fumarate /emtricitabine and acquisition were followed for a mean of 566.6 days. They had 71 episodes of STIs (incidence 61.7 per 100 person-years). No one got acquired HIV infection. Estimated glomerular filtration rate (EGFR) was significantly lower 4 (p = 0.014) and 19 (p = 0.021) months after inclusion; however, there was no clinically significant renal failure (mean EGFR 110–115 mL/min). Self-reported body weight significantly increased after 7 months (p < 0.05). Overall EGFR and self-reported body weight did not change significantly. No significant change in adherence (overall mean 81.0%; 95% CI 77.5%–84.6%; p = 0.728), condom use (p = 0.077) and number of sexual partners (overall mean 2.36 per 30 days; 95% CI 2.06 to 2.65; p = 0.235) was found throughout the study. Participants reported 110 graded adverse effects (AE), 104 (94.5%) grade 1–2 and 6 (5.5%) grade 3–4. No participant discontinued PrEP due to AE. The study showed successful implementation of PrEP among MSM at high risk for HIV infection in Slovenia. Based on the results of our study, PrEP should be formally available in Slovenia. © The Author(s) 2021.	antiretroviral therapy; Europe; HIV; men who have sex with men; Prevention	English	United Kingdom	Western and Central Europe and North America	Slovenia	Western and Central Europe and North America	Slovenia	Western and Central Europe and North America	Clinical
Article	2021	Peebles K.; Mugwanya K.K.; Irungu E.; Odoyo J.; Wamoni E.; Morton J.F.; Ngure K.; Bukusi E.A.; Mugo N.R.; Masyuko S.; Mukui I.; Baeten J.M.; Barnabas R.V.	Low costs and opportunities for efficiency: a cost analysis of the first year of programmatic PrEP delivery in Kenya's public sector	BMC Health Services Research	-	-	14726963	10.1186/s12913-021-06832-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113159593&doi=10.1186%2fs12913-021-06832-3&partnerID=40&md5=a3b1f8b369db556e4a393b49a1046b63	Background: In 2017, the Kenyan Ministry of Health integrated provision of pre-exposure prophylaxis (PrEP) into public HIV-1 care clinics as a key component of the national HIV-1 prevention strategy. Estimates of the cost of PrEP provision are needed to inform the affordability and cost-effectiveness of PrEP in Kenya. Methods: We conducted activity-based micro-costing from the payer perspective to estimate both the financial and economic costs of all resources and activities required to provide PrEP in Kenya's public sector. We estimated total and unit costs in 2019 United States dollars from a combination of project expense reports, Ministry of Health training reports, client staff interviews, time-and-motion observations, and routinely collected data from PrEP recipient files from 25 high-volume HIV-1 care clinics. Results: In the first year of programmatic PrEP delivery in 25 HIV-1 care clinics, 2,567 persons initiated PrEP and accrued 8,847 total months of PrEP coverage, accounting for 2 % of total outpatient clinic visits. The total financial cost to the Ministry of Health was $91,175, translating to an average of $10.31 per person per month. The majority (69 %) of financial costs were attributable to PrEP medication, followed by administrative supplies (17 %) and training (9 %). Economic costs were higher ($188,584 total; $21.32 per person per month) due to the inclusion of the opportunity cost of staff time re-allocated to provide PrEP and a proportional fraction of facility overhead. The vast majority (88 %) of the annual $80,811 economic cost of personnel time was incurred during activities to recruit new clients (e.g., discussion of PrEP within HIV-1 testing and counselling services), while the remaining 12 % was for activities related to both initiation and maintenance of PrEP provision (e.g., client consultations, technical advising, support groups). Conclusions: Integration of PrEP provision into existing public health HIV-1 care service delivery platforms resulted in minimal additional staff burden and low incremental costs. Efforts to improve the efficiency of PrEP provision should focus on reductions in the cost of PrEP medication and extra-clinic demand creation and community sensitization to reduce personnel time dedicated to recruitment-related activities. Article	2021	Peel, Joanne; Chow, Eric P. F.; Denham, Ian; Schmidt, Tina; Buchanan, Andrew; Fairley, Christopher K.; Williamson, Deborah A.; Bissessor, Melanie; Chen, Marcus Y.	Clinical Presentation of Incident Syphilis Among Men Who Have Sex with Men Taking HIV Pre-Exposure Prophylaxis in Melbourne, Australia.	Clinical Infectious Diseases	-	-	1537-6591 1058-4838	10.1093/cid/ciab052	https://academic.oup.com/cid/article/73/4/e934/6125283	BACKGROUND: Current international guidelines on human immunodeficiency virus (HIV) Pre-Exposure Prophylaxis (PrEP) recommend serological screening for syphilis at routine 3-monthly PrEP appointments. The aim of our study was to describe the pattern of clinical presentation of syphilis among men who have sex with men (MSM) taking PrEP. We were interested in whether syphilis is detected through screening at scheduled3-monthly PrEP clinic appointments or whether primary or secondary syphilis presented at unscheduled interval visits. METHODS: This was a retrospective study of MSM attending the PrEP clinic at the Melbourne Sexual Health Centre between February 2016 and March 2019. Serological screening for syphilis was routinely undertaken at 3-monthly PrEP clinic appointments. Diagnoses of early syphilis were identified from PrEP clinic visits and from interim walk-in STI clinic attendances. RESULTS: There were 69 cases of early syphilis among 61 MSM taking PrEP during the study period. There were 24 (35%) primary, 16 (23%) secondary, and 29 (42%) early latent infections. The incidence of early syphilis was 8.6 per 100 person-years. A substantial proportion of primary (58%) and secondary (44%) syphilis diagnoses were made at interim STI clinic attendances, between PrEP appointments. CONCLUSIONS: Syphilis screening at routine 3-monthly PrEP visits alone fails to detect a proportion of primary and secondary syphilis infections and may be insufficient in preventing onward transmission. Education of MSM taking PrEP regarding the risk of syphilis and symptom recognition is necessary together with access to syphilis testing between PrEP visits. Article	2021	Pelaez, D; Weicker, N P; Glick, J; Mesenburg, J V; Wilson, A; Kirkpatrick, H; Clouse, E; Sherman, S G	The PEARL study: a prospective two-group pilot PrEP promotion intervention for cisgender female sex workers living in Baltimore, MD, U.S.	AIDS Care	-	-	09540121	10.1080/09540121.2021.1889954	https://www.proquest.com/scholarly-journals/pearl-study-prospective-two-group-pilot-prep/docview/2629523637/se-2?accountid=8113	HIV remains elevated among female sex workers (FSW) globally, with a number of structural (e.g., poverty, access to care) factors driving these persistently high rates. Pre-exposure prophylaxis (PrEP), a user-controlled prevention method, is a promising means of empowering vulnerable populations to protect themselves and enhance agency. Yet there is a dearth of PrEP research and interventions targeting cisgender women in the United States, and even fewer aimed to reach FSW. We developed and implemented a multifaceted PrEP pilot intervention, the Promoting Empowerment And Risk Reduction (PEARL) study, to meet this gap. This paper describes the development process and nature of a community-informed intervention for tenofovir/emticitrabine (TDF/FTC) pre-exposure prophylaxis engagement among street-based cisgender FSW in Baltimore, Maryland, U.S. In the course of the study's implementation, structural, programmatic, and medical barriers have already posed significant barriers to full engagement. PEARL implemented a number of strategies in an effort to counter barriers and facilitate increased success of PrEP uptake and maintenance. The study will provide critical insights into the nature of intervention components that could help FSW to initiate PrEP and reduce PrEP care cascade gaps. Viraemic participants were able to re-suppress within 3 follow-up visits of protocol-defined virological failure (PDVF) in 77/121 (64%), 85/126 (67%), and 44/138 (32%) cases respectively (DTG regimens vs. TDF/FTC/EFV; P < 0.001).	*Human immunodeficiency virus; *clinical protocol; *protocol defined virological failure; *treatment failure; Article; Combination drug therapy; Controlled study; Follow up; Human; Major clinical study; Non-inferiority trial; Open study; Phase 3 clinical trial; Randomized controlled trial; South Africa; Validation study; Viremia	English	United States	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2021	Pereira C.C.D.A.; Torres T.S.; Luz P.M.; Hoagland B.; Farias A.; Brito J.D.U.; Guimarães Lacerda M.V.; Da Silva D.A.R.; Benedetti M.; Pimenta M.C.; Grinsztejn B.; Veloso V.G.	Preferences for pre-exposure prophylaxis (PrEP) among men who have sex with men and transgender women at risk of HIV infection: A multicentre protocol for a discrete choice experiment in Brazil	BMJ Open	-	-	20446055	10.1136/bmjopen-2021-049011	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116478881&doi=10.1136%2fbmjopen-2021-049011&partnerID=40&md5=735c690e54dcf65a75756f6045280cc0	Introduction Pre-exposure prophylaxis (PrEP) is an important and well-established prevention strategy for sexual acquisition of HIV. In Brazil, transgender women (TGW) and men who have sex with men (MSM) bear the largest burden among key populations. Little is known about preferences for PrEP characteristics in these vulnerable populations in Latin America. The goal of this study is to investigate preferences of TGW and MSM with respect to PrEP characteristics, whether current user or not, and to assess any attributes and levels that may improve the decision to start using PrEP (uptake) and optimal continuity of use (adherence), which are important dimensions for PrEP success. Methods and analysis We hereby outline the protocol of a discrete choice experiment (DCE) to be conducted among TGW and MSM in Brazil. The study will be carried out in two phases. The first phase involves literature review and qualitative approaches including in-depth interviews to inform the development of the DCE (attributes and levels). The second phase entails the DCE survey and supporting questions pertaining to sociodemographic and risk behaviour information. The survey is aimed at current PrEP users and non-users, consisting of two modes of administration: face to face in five Brazilian capitals (Rio de Janeiro, Brasília, Manaus, Porto Alegre and Salvador) and online targeting the entire country. A D-efficient zero-prior blocked experimental design will be used to select 60 paired-profile DCE choice tasks, in which participants will be randomly assigned to one of four groups and presented with a set of 15 choice tasks. The planned sample size is 1000 volunteers. Ethics, timeline and dissemination The study was approved by Comitê de Ética em Pesquisa - Instituto Nacional de Infectologia Evandro Chagas - INI/FIOCRUZ, CEP/INI, CAAE 28416220.2.1001.5262, approval number 3.979.759 in accordance with the Comissão Nacional de Ética em Pesquisa (CONEP - Brazilian National Board of Research Ethics). The study will be conducted between 2020 and 2021. The results will be disseminated to the scientific community and to the public in general through publications in published in peer-reviewed journals and in scientific conferences. © Author(s) (or their employer(s)) 2021. Article	2021	Pereira, Carolina Hultmann Gonçalves; Dias, Frederico Alves; Miranda, Gabriela Santos de; Höfelmann, Doroteia Aparecida; Rattmann, Yanna Dantas	Avaliação do uso da Profilaxia Pré-Exposição ao HIV: coorte retrospectiva	Revista Brasileira de Promoção da Saúde (Impresso)	-	-	1806-1222	10.5020/18061230.2021.11550	https://periodicos.unifor.br/RBPS/article/view/11550	Objetivo: Identificar o perfil da população que buscou a Profilaxia Pré-Exposição ao HIV (PrEP) no Paraná e, entre os usuários da PrEP, avaliar modificações nos comportamentos de risco de adquirir infecções sexualmente transmissíveis (IST's), além de alterações nos exames laboratoriais de monitoramento. Métodos: Coorte retrospectiva com dados secundários obtidos do Sistema de Controle Logístico de Medicamentos acessados em 2018 e 2019. Investigou-se o perfil sociodemográfico da população que buscou a PrEP, de forma a correlacioná-lo aos segmentos prioritários para o uso do medicamento profilático. Entre os usuários, avaliaram-se dados comportamentais, testes diagnósticos para IST's, funções renal e hepática referentes a diferentes momentos no decorrer do uso. Os resultados comparados deram-se por meio dos testes Wilcoxon e Exato de Fisher. Resultados: 255 pessoas buscaram a PrEP. Predominaram-se o sexo masculino (92,28%), homossexuais (78,04%), de 20 a 39 anos (83,53%), brancos (71,76%), com 12 ou mais anos de estudo (74,90%). Para uso da PrEP elegeram-se 188 pessoas. Entre estas, durante o uso, observou-se aumento de práticas sexuais sem preservativo (p=0,012), diminuição no número de parceiros e do consumo de álcool (p=0,001), aumento da atividade de enzimas hepáticas ALT/AST (p=0,018), sem diferença no diagnóstico do HIV e outras IST's. Conclusão: Homens que fazem sexo com homens predominaram na busca pela profilaxia. Entre os usuários da PrEP, apesar do aumento de práticas sexuais desprotegidas, não houve aumento do diagnóstico de IST's no período do estudo. O medicamento da PrEP demonstrou bom perfil de segurança nos exames laboratoriais de seguimento. METHODS AND ANALYSIS: We hereby outline the protocol of a discrete choice experiment (DCE) to be conducted among TGW and MSM in Brazil. The study will be carried out in two phases. The first phase involves literature review and qualitative approaches including in-depth interviews to inform the development of the DCE (attributes and levels). The second phase entails the DCE survey and supporting questions pertaining to sociodemographic and risk behaviour information. The survey is aimed at current PrEP users and non-users, consisting of two modes of administration: face to face in five Brazilian capitals (Rio de Janeiro, Brasília, Manaus, Porto Alegre and Salvador) and online targeting the entire country. A D-efficient zero-prior blocked experimental design will be used to select 60 paired-profile DCE choice tasks, in which participants will be randomly assigned to one of four groups and presented with a set of 15 choice tasks. The planned sample size is 1000 volunteers. ETHICS, TIMELINE AND DISSEMINATION: The study was approved by Comitê de Ética em Pesquisa-Instituto Nacional de Infectologia Evandro Chagas-INI/FIOCRUZ, CEP/INI, CAAE 28416220.2.1001.5262, approval number 3.979.759 in accordance with the Comissão Nacional de Ética em Pesquisa (CONEP-Brazilian National Board of Research Ethics). The study will be conducted between 2020 and 2021. The results will be disseminated to the scientific community and to the public in general through publications in published in peer-reviewed journals and in scientific conferences. Article	2021	Perez-Brumer, Amaya; Naz-McLean, Sarah; Huerta, Leyla; Salazar, Ximena; Lama, Javier R; Sanchez, Jorge; Silva-Santisteban, Alfonso; Reisner, Sari L; Mayer, Kenneth H; Clark, Jesse L	The wisdom of mistrust: qualitative insights from transgender women who participated in PrEP research in Lima, Peru.	Journal of the International AIDS Society	-	-	1758-2652	10.1002/jia2.25769	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9936804	INTRODUCTION: Although pre-exposure prophylaxis (PrEP) is a remarkable biomedical advance to prevent HIV, ongoing research on PrEP contributes to and interacts with a legacy of HIV experimentation on marginalized communities in resource-limited settings. This paper explores the complexity of PrEP research mistrust among Peruvian transgender (trans) women who completed a PrEP adherence intervention and those who refused participation (i.e. declined to enrol, voluntarily withdrew, and/or were lost to follow-up). METHODS: Data were derived from 86 trans women (mean age 29 years) participants in the formative (four focus groups (n = 32), 20 interviews) and the evaluation stages (34 interviews) of a social network-based PrEP intervention for trans women in Lima, Peru. The formative stage took place from May to July 2015, while the evaluative stage took place from April to May 2018. Audio files were transcribed verbatim and analysed via an immersion crystallization approach using Dedoose (v.6.1.18). RESULTS: Three paradoxes of trans women's participation in PrEP science as a "key" population emerged as amplifying mistrust: (1) increases in PrEP research targeting trans women but limited perceived improvements in HIV outcomes; (2) routine dismissal by research physicians and staff of PrEP-related side effects and the associated risks of taking PrEP, resulting in questions about who PrEP research is really for and (3) persistent limitations on PrEP access for trans women despite increasing involvement in clinical trials, fostering feelings of being a "guinea pig" to advance PrEP science. CONCLUSIONS: Findings highlight the wisdom inherent in PrEP mistrust as a reflection of trans women's experiences that underscore the broken bonds of trust between communities, researchers and the research enterprise. PrEP mistrust is amplified through perceived paradoxes that suggest to trans women that they are key experimental participants but not target PrEP users outside of research settings. Findings highlight the urgent need to reframe mistrust not as a characteristic of trans women to be addressed through education and outreach, but as a systemic institutional- and industry-level problem replicated, manifested and ultimately to be corrected, through global HIV science. Article	2021	Perler, Bryce K; Reinhart, Elizabeth M; Montgomery, Madeline; Maynard, Michaela; Shapiro, Jason M; Belenky, Peter; Chan, Philip A	Evaluation of the Microbiome in Men Taking Pre-exposure Prophylaxis for HIV Prevention.	AIDS and Behavior	-	-	1573-3254	10.1007/s10461-020-03130-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8169604	Tenofovir-based regimens as pre-exposure prophylaxis (PrEP) are highly effective at preventing HIV infection. The most common side-effect is gastrointestinal (GI) distress which may be associated with changes in the microbiome. Dysbiosis of the microbiome can have numerous health-related consequences. To understand the effect of PrEP on dysbiosis, we evaluated 27 individuals; 14 were taking PrEP for an average of 171 weeks. Sequencing of 16S rRNA was performed using self-collected rectal swabs. Mixed beta diversity testing demonstrated significant differences between PrEP and non-PrEP users with Bray-Curtis and unweighted UniFrac analyses (p = 0.05 and 0.049, respectively). At the genus level, there was a significant reduction in Finegoldia, along with a significant increase in Catenibacterium and Prevotella in PrEP users. Prevotella has been associated with inflammatory pathways, insulin resistance and cardiovascular disease, while Catenibacterium has been associated with morbid obesity and metabolic syndrome. Overall, these results suggest that PrEP may be associated with some degree of microbiome dysbiosis, which may contribute to GI symptoms. Long-term impact of these changes is unknown. Article	2021	Peterson S.; Ibrahim M.; Anderson P.L.; Moore C.M.; MaWhinney S.	A comparison of covariate selection techniques applied to pre-exposure prophylaxis (PrEP) drug concentration data in men and transgender women at risk for HIV	Journal of Pharmacokinetics and Pharmacodynamics	-	-	1567567X	10.1007/s10928-021-09763-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106253329&doi=10.1007%2fs10928-021-09763-y&partnerID=40&md5=0552a8bb3cc582c13292d2a0381a6a35	Pre-exposure prophylaxis (PrEP) containing antiretrovirals tenofovir disoproxil fumarate (TDF) or tenofovir alafenamide (TAF) can reduce the risk of acquiring HIV. Concentrations of intracellular tenofovir-diphosphate (TFV-DP) measured in dried blood spots (DBS) have been used to quantify PrEP adherence; although even under directly observed dosing, unexplained between-subject variation remains. Here, we wish to identify patient-specific factors associated with TFV-DP levels. Data from the iPrEX Open Label Extension (OLE) study were used to compare multiple covariate selection methods for determining demographic and clinical covariates most important for drug concentration estimation. To allow for the possibility of non-linear relationships between drug concentration and explanatory variables, the component selection and smoothing operator (COSSO) was implemented. We compared COSSO to LASSO, a commonly used machine learning approach, and traditional forward and backward selection. Training (N = 387) and test (N = 166) datasets were utilized to compare prediction accuracy across methods. LASSO and COSSO had the best predictive ability for the test data. Both predicted increased drug concentration with increases in age and self-reported adherence, the latter with a steeper trajectory among Asians. TFV-DP reductions were associated with increasing eGFR, hemoglobin and transgender status. COSSO also predicted lower TFV-DP with increasing weight and South American countries. COSSO identified non-linear relationships between log(TFV-DP) and adherence, weight and eGFR, with differing trajectories for some races. COSSO identified non-linear log(TFV-DP) trajectories with a subset of covariates, which may better explain variation and enhance prediction. Future research is needed to examine differences identified in trajectories by race and country. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. A Qualitative Exploration of Women's Interest in Long-Acting Injectable Antiretroviral Therapy across Six Cities in the Women's Interagency HIV Study: Intersections with Current and Past Injectable Medication and Substance Use	AIDS Patient Care and STDs	-	-	10872914	10.1089/apc.2020.0164	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099015316&doi=10.1089%2fapc.2020.0164&partnerID=40&md5=931b84cdaf86849bfc434a7fa45ce196	Medications for antiretroviral therapy (ART) and preexposure prophylaxis (PrEP) are currently daily pill regimens, which pose barriers to long-Term adherence. Long-Acting injectable (LAI) modalities have been developed for ART and PrEP, but minimal LAI-focused research has occurred among women. Thus, little is known about how women's history of injection for medical or nonmedical purposes may influence their interest in LAI. We conducted 89 in-depth interviews at 6 sites (New York, NY; Chicago, IL; San Francisco, CA; Atlanta, GA; Chapel Hill, NC; Washington, DC) of the Women's Interagency HIV study. Interviews occurred with women living with HIV (n = 59) and HIV-negative women (n = 30) from November 2017 to October 2018. Interviews were recorded, transcribed, and analyzed using thematic content analysis. Women's prior experiences with injections occurred primarily through substance use, physical comorbidities, birth control, or flu vaccines. Four primary categories of women emerged; those who (1) received episodic injections and had few LAI-related concerns; (2) required frequent injections and would refuse additional injections; (3) had a history of injection drug use, of whom some feared LAI might trigger a recurrence, while others had few LAI-related concerns; and (4) were currently injecting drugs and had few LAI-related concerns. Most women with a history of injectable medication would prefer LAI, but those with other frequent injections and history of injection drug use might not. Future research needs to address injection-related concerns, and develop patient-centered approaches to help providers best identify which women could benefit from LAI use. © Copyright 2021, Mary Ann Liebert, Inc., publishers 2021.	antiretroviral therapy; HIV; long-Acting injectable; women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Philbin M.M.; Parish C.; Kinnard E.N.; Reed S.E.; Kerrigan D.; Alcaide M.L.; Cohen M.H.; Sosanya O.; Sheth A.N.; Adimora A.A.; Cocohoba J.; Goparaju L.; Golub E.T.; Fischl M.; Metsch L.R.	Interest in Long-Acting Injectable Pre-exposure Prophylaxis (LAI PrEP) Among Women in the Women's Interagency HIV Study (WIHS): A Qualitative Study Across Six Cities in the United States	AIDS and Behavior	-	-	10907165	10.1007/s10461-020-03023-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091381851&doi=10.1007%2fs10461-020-03023-9&partnerID=40&md5=dbb8b30fd51c765a146b3005d29632f7	Long-acting injectable (LAI) pre-exposure prophylaxis (PrEP) has the potential to facilitate adherence and transform HIV prevention. However, little LAI PrEP research has occurred among women, who face unique barriers. We conducted 30 in-depth interviews with HIV-negative women from 2017–2018 across six sites (New York; Chicago; San Francisco; Atlanta; Washington, DC; Chapel Hill) of the Women's Interagency HIV Study. Interviews were recorded, transcribed, and analyzed using thematic content analysis. Few women expressed interest in PrEP and when prompted to choose a regimen, 55% would prefer LAI, 10% daily pills, and 33% said they would not take PrEP regardless of formulation. Perceived barriers included: (1) the fear of new—and perceived untested—injectable products and (2) potential side effects (e.g., injection-site pain, nausea). Facilitators included: (1) believing shots were more effective than pills; (2) ease and convenience; and (3) confidentiality. Future studies should incorporate women's LAI PrEP-related experiences to facilitate uptake. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Potential Impact and Cost-Effectiveness of Condomless-Sex-Concentrated PrEP in KwaZulu-Natal Accounting for Drug Resistance	Journal of Infectious Diseases	-	-	221899	10.1093/infdis/jiz667	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85089977637&doi=10.1093%2finfdis%2fjiz667&partnerID=40&md5=12105292967f79821f8aae0eb227d1f7	Introduction: Oral preexposure prophylaxis (PrEP) in the form of tenofovir-disoproxil-fumarate/emtricitabine is being implemented in selected sites in South Africa. Addressing outstanding questions on PrEP cost-effectiveness can inform further implementation. Methods: We calibrated an individual-based model to KwaZulu-Natal to predict the impact and cost-effectiveness of PrEP, with use concentrated in periods of condomless sex, accounting for effects on drug resistance. We consider (1) PrEP availability for adolescent girls and young women aged 15-24 years and female sex workers, and (2) availability for everyone aged 15-64 years. Our primary analysis represents a level of PrEP use hypothesized to be attainable by future PrEP programs. Results: In the context of PrEP use in adults aged 15-64 years, there was a predicted 33% reduction in incidence and 36% reduction in women aged 15-24 years. PrEP was cost-effective, including in a range of sensitivity analyses, although with substantially reduced (cost) effectiveness under a policy of ART initiation with efavirenz-rather than dolutegravir-based regimens due to PrEP undermining ART effectiveness by increasing HIV drug resistance. Conclusions: PrEP use concentrated during time periods of condomless sex has the potential to substantively impact HIV incidence and be cost-effective. © 2019 The Author(s). Article	2021	Phillips T.R.; Fairley C.K.; Bradshaw C.S.; Hocking J.S.; Choi E.P.H.; Ong J.J.; Tabesh M.; Maddaford K.; Chow E.P.F.	Group sex among men who have sex with men in the era of PrEP: A cross-sectional study	Journal of Acquired Immune Deficiency Syndromes	-	-	15254135	10.1097/qai.0000000000002550	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097249639&doi=10.1097%2fqai.0000000000002550&partnerID=40&md5=42a07b3953daaa9a684bd61e8bd17b32	Background: Group sex has been commonly reported among gay and bisexual men who have sex with men (GBMSM); however, there are limited studies on the factors associated with participating in group sex. Setting: A cross-sectional study among GBMSM attending a sexual health clinic in Melbourne, Australia. Methods: Univariable and multivariable logistic regression were performed to examine the association between GBMSM participating in group sex in the previous 3 months and their demographic characteristics, including age, pre-exposure prophylaxis (PrEP) use, HIV status, any STI (gonorrhea, chlamydia, syphilis) diagnosis on the day, and method of seeking partners. Results: There were 357 GBMSM who participated in the survey and their mean age was 32.9 years (SD = 10.9). Almost a third (n = 115; 32.2%) had participated in group sex in the previous 3 months. GBMSM who sought sex partners at sex on premises venues (SOPVs) aOR 5.83; 95% confidence interval (CI): 3.23 to 10.53 had the highest odds of group sex participation after adjusting for other potential confounders. Compared with GBMSM not living with HIV and not taking PrEP, GBMSM taking PrEP had higher odds of group sex participation (aOR 2.09; 95% CI: 1.05 to 4.15), but GBMSM living with HIV did not (aOR 0.93; 95% CI: 0.23 to 3.68).Recent group sex participation was not associated with being diagnosed with any STI (chlamydia, syphilis, or gonorrhea) on the day in the adjusted analyses. Conclusion: PrEP users and MSM attending SOPVs are more likely to participate in group sex. SOPV could be important venues for future public health campaigns. Article	2021	Phillips, J Craig; Hidayat, Jufri; Clark, Kristen D; Melisek, Julia; Balthazar, Monique S; Beck, Albert GD; Moore, Scott E	A Review of the State of HIV Nursing Science With Sexual Orientation, Gender Identity/Expression Peoples	Journal of the Association of Nurses in AIDS Care	-	-	1055-3290	https://doi.org/10.1097/jnc.0000000000000250	https://escholarship.org/uc/item/4db24621	AbstractThroughout the HIV pandemic, nurses have contributed to or led approaches to understanding the effects of HIV disease at individual and societal levels. Nurses have advocated for socially just care for more than a century, and our efforts have created a foundation on which to further build the state of HIV nursing science with sexual orientation and gender identity/expression (SOGI) Peoples. Nurses have also participated in the development of approaches to manage HIV disease for and in collaboration with populations directly affected by the disease. Our inclusive approach was guided by an international human rights legal framework to review the state of nursing science in HIV with SOGI Peoples. We identified articles that provide practice guidance (n = 44) and interventions (n = 26) to address the health concerns of SOGI Peoples and our communities. Practice guidance articles were categorized by SOGI group: SOGI People collectively, bisexual, transgender, cisgender lesbian, women who have sex with women, cisgender gay men, and men who have sex with men. Interventions were categorized by societal level (i.e., individual, family, and structural). Our review revealed opportunities for future HIV nursing science and practices that are inclusive of SOGI Peoples. Through integrated collaborative efforts, nurses can help SOGI communities achieve optimal health outcomes that are based on dignity and respect for human rights. Acceptability of blood-based HIV self-testing among adolescents aged 15–19 years at risk of HIV acquisition in Bangkok	International journal of STD & AIDS	-	-	9564624	10.1177/09564624211003742	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104834638&doi=10.1177%2f09564624211003742&partnerID=40&md5=b29a1cf79e3461a8dbbeecb3d29392a6	Introduction: Young men who have sex with men (YMSM) and young transgender women (YTGW) in Thailand are at high HIV risk. HIV self-tests (HIVSTs) are rapidly administrable and prompt linkage to HIV treatment or prevention services. This study assesses the acceptability and feasibility of blood-based HIVST use in adolescents. Methods: A cross-sectional study was conducted among YMSM and YTGW aged 15–19 years with HIV acquisition risk. Participants completed questionnaires on the HIVST and then administered INSTI® independently, an HIVST immunoassay detecting gp41 and gp36 antibodies from finger-stick blood. Confirmatory HIV antibody tests were performed. Results: Between July and September 2020, 90 adolescents were enrolled. Mean (SD) age was 17.6 (1.1) years. Half (N = 45) were YMSM. Forty-six (51%) were first-time HIV testers, and 32 (36%) had "ever used" HIV pre-exposure prophylaxis (PrEP). Two (2.2%, 95% CI: 0.0–5.3) tested positive, 21 (23.4%) invalid, and 67 (74.4%) negative. Invalidity causes included 17 (81%) insufficient blood, 3 (14%) buffer spillage, and 1 (5%) procedural missteps; all had negative HIV antibody tests. HIV self-test acceptability was 87.8% (95% CI: 81.0–94.5). Most (79%) preferred HIVST performance in hospital rather than at home. Conclusions: HIVSTs are acceptable in HIV at-risk adolescents. Blood-based HIVSTs should be positioned as rapid point-of-care tests with real-time linkage to HIV services. © The Author(s) 2021.	adolescents; HIV self-testing; transgender women; young men who have sex with men	English	United Kingdom	Western and Central Europe and North America	Thailand	Asia and the Pacific	Thailand	Asia and the Pacific	Mixed methods

Article	2021	Pina P.; Taggart T.; Sanchez Acosta M.; Eweka I.; Muñoz-Laboy M.; Albritton T.	Provider Comfort with Prescribing HIV Pre-Exposure Prophylaxis to Adolescents	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2021.0045	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117892836&doi=10.1089%2fapc.2021.0045&partnerID=40&md5=822eddad72b1a9298aee0dffac14b103	In the United States, Black and Latinx youth remain disproportionately affected by HIV. Oral antiretroviral pre-exposure prophylaxis (PrEP) is a proven effective HIV prevention strategy. PrEP is approved for use in people younger than the age of 18 years, but little is known about provider comfort and preparedness with prescribing it to adolescents. In this study, physicians provide their perspectives on the facilitators and barriers to PrEP access among adolescents. Focus groups (n = 23) were conducted with pediatric and family practitioners practicing in an urban community hospital setting to assess PrEP awareness and receptivity to use among adolescents. Most providers were unfamiliar with clinical guidelines for PrEP use, especially in determining adolescent candidates for PrEP use, including appropriate dosing regimen and follow-up procedures. Overall, providers had low intent on prescribing PrEP, citing concerns about consent, medication adherence, and appropriateness of primary care providers in prescribing and managing adolescent PrEP use. Strategies that will address provider education and comfort in prescribing PrEP to adolescents are required to increase PrEP access and uptake among communities disproportionally affected by HIV. © 2021, Mary Ann Liebert Inc.	adolescent; focus groups; HIV; pre-exposure prophylaxis (PrEP); provider	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

Influences on Early Discontinuation and Persistence of Daily Oral PrEP Use Among Kenyan Adolescent Girls and Young Women: A Qualitative Evaluation From a PrEP Implementation Program	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002587	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102221642&doi=10.1097%2fQAI.0000000000002587&partnerID=40&md5=c7187df337b5d7e7f785ac52a3e86e69	Background:Discontinuation of daily oral pre-exposure prophylaxis (PrEP) is frequent among adolescent girls and young women (AGYW) in African settings. We explored factors influencing early PrEP discontinuation and persistence among Kenyan AGYW who accepted PrEP within a programmatic setting.Methods:We conducted in-depth interviews with AGYW (aged 15-24 years) who accepted PrEP from 4 maternal child health (MCH) and family planning (FP) clinics. AGYW were identified by nurses at routine clinic visits and purposively sampled based on 4 categories: (1) accepted PrEP pills, but never initiated PrEP use (eg, never swallowed PrEP pills), (2) discontinued PrEP <1 month after initiation, (3) discontinued PrEP within 1-3 months, and (4) persisted with PrEP use >3 months. Informed by the Stages of Change Model, thematic analysis characterized key influences on PrEP discontinuation/persistence.Results:We conducted 93 in-depth interviews with AGYW who accepted PrEP pills. Median age was 22 years, 71% were married; 89% were from MCH, and 11% were from FP clinics. Early PrEP use was positively influenced by encouragement from close confidants and effective concealment of PrEP pill-taking when necessary to avoid stigma or negative reactions from partners. Pregnancy helped conceal PrEP use because pill-taking is normalized during pregnancy, but concealment became more difficult postpartum. AGYW found keeping up with daily PrEP pill-taking challenging, and many noted only episodic periods of the HIV risk. Frequently testing HIV-negative reassured AGYW that PrEP was working and motivated persistence.Discussion:As PrEP programs scale-up in MCH/FP, it is increasingly important to enhance protection-effective PrEP use through approaches tailored to AGYW, with special considerations during pregnancy and postpartum. © 2021 Lippincott Williams and Wilkins. Article	2021	Piper K.N.; Escoffery C.; Sales J.M.; Sheth A.N.	Models of HIV Pre-Exposure Prophylaxis Care Used in Title X Family Planning Clinics in the Southern U.S.	Journal of Adolescent Health	-	-	-	-	1054139X	10.1016/j.jadohealth.2020.10.005	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85095580808&doi=10.1016%2fj.jadohealth.2020.10.005&partnerID=40&md5=c40791e61ac21d381067912585ce0b6c	Purpose: HIV pre-exposure prophylaxis (PrEP) is underutilized by adolescent and young adult women, especially in the Southern U.S. Family planning (FP) clinics are potentially ideal PrEP delivery sites for adolescent and young adult women, but little is known about their PrEP services. We describe models of PrEP care in Title X FP clinics in the South and explore clinic resources that are needed to facilitate PrEP provision. Methods: Providers and administrators from 38 clinics participated in qualitative interviews. We assessed five steps of PrEP care: (1) HIV risk assessment; (2) PrEP education; (3) laboratory testing; (4) PrEP prescription; and (5) PrEP monitoring. Results: Among 38 clinics, 23 conducted at least one step and were classified into three models. Model 1 (n = 8) and Model 2 (n = 4) clinics provided up to Steps 1 and 2, respectively, but referred to an external PrEP provider. Model 3 clinics (n = 11) conducted all steps. Few barriers were identified for Step 1; using an HIV risk assessment tool was a key facilitator. PrEP educational materials facilitated Step 2; clinics not providing education believed they could easily do so with training and educational resources. Funding- and staff-related resource barriers were noted for Steps 3–5, including costs of laboratory tests and lack of time for longitudinal visits. Conclusions: PrEP-providing publicly funded FP clinics in the Southern U.S. use referral services for many steps of PrEP care, which introduce patient burden. Increasing onsite PrEP services will require addressing concerns related to training, educational materials, cost, and staffing. © 2020 Society for Adolescent Health and Medicine	Adolescents; Family planning; HIV/AIDS; Implementation; PrEP	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Piper, Kaitlin N; Haardörfer, Regine; Escoffery, Cam; Sheth, Anandi N; Sales, Jessica	Exploring the heterogeneity of factors that may influence implementation of PrEP in family planning clinics: a latent profile analysis.	Implementation Science Communications	-	-	-	-	2662-2211	10.1186/s43058-021-00148-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8097793	BACKGROUND: Title X-funded family planning clinics have been identified as optimal sites for delivery of pre-exposure prophylaxis (PrEP) for HIV prevention. However, PrEP has not been widely integrated into family planning services, especially in the Southern US, and data suggest there may be significant implementation challenges in this setting. Because Title X clinics vary greatly in provider-, organizational-, and systems-level characteristics, there is likely variation in capacity to implement PrEP across clinics. METHODS: We conducted a survey from February to June 2018 among providers and administrators of non-PrEP-providing Title X-funded clinics across 18 southern states. Survey items were designed using the Consolidated Framework for Implementation Research (CFIR) to assess constructs relevant to PrEP implementation. To explore the heterogeneity of CFIR-related implementation determinants and identify distinct sub-groups of Title X clinics, a latent profile analysis was conducted using nine CFIR constructs: complexity, relative advantage, cost, attitudes, implementation climate, compatibility, leadership engagement, available resources, and cosmopolitanism. We then conducted a multi-level analysis (accounting for nesting of participants within clinics) to test whether group membership was associated with readiness for implementation of PrEP, controlling for key sociodemographic characteristics. RESULTS: Four hundred and fourteen providers/administrators from 227 non-PrEP-providing Title X clinics participated in the survey. We identified six sub-groups of clinics that each had distinct patterns of PrEP implementation determinants. Clinic sub-groups included "Highest Capacity for Implementation", "Favorable Conditions for Implementation", "Mixed Implementation Context", "Neutral Implementation Context", "Incompatible Setting for Implementation", and "Resource-Strained Setting". Group membership was related to numerous provider-level (i.e., ability to prescribe medication) and clinic-level (i.e., provision of primary care) characteristics. In comparison to the "Neutral" group (which held neutral perceptions across the implementation determinants), the "Highest Capacity" and "Favorable Conditions" groups had significantly higher levels of implementation readiness, and the "Resource-Strained" group had a significantly lower level of implementation readiness. CONCLUSIONS: Latent profile analyses can help researchers understand how implementation readiness varies across healthcare settings, promoting tailoring of implementation strategies to unique contexts. Article	2021	Piper, KN; Escoffery, C; Sales, JM; Sheth, AN	Original Models of HIV Pre-Exposure Prophylaxis Care Used in Title X Family Planning Clinics in the Southern US	Journal of Adolescent Health	-	-	-	-	1054-139X	10.1016/j.jadohealth.2020.10.005	https://pubmed.ncbi.nlm.nih.gov/33160826/	Purpose: HIV pre-exposure prophylaxis (PrEP) is underutilized by adolescent and young adult women, especially in the Southern U.S. Family planning (FP) clinics are potentially ideal PrEP delivery sites for adolescent and young adult women, but little is known about their PrEP services. We describe models of PrEP care in Title X FP clinics in the South and explore clinic resources that are needed to facilitate PrEP provision. Methods: Providers and administrators from 38 clinics participated in qualitative interviews. We assessed five steps of PrEP care: (1) HIV risk assessment; (2) PrEP education; (3) laboratory testing; (4) PrEP prescription; and (5) PrEP monitoring. Results: Among 38 clinics, 23 conducted at least one step and were classified into three models. Model 1 (n = 8) and Model 2 (n = 4) clinics provided up to Steps 1 and 2, respectively, but referred to an external PrEP provider. Model 3 clinics (n = 11) conducted all steps. Few barriers were identified for Step 1; using an HIV risk assessment tool was a key facilitator. PrEP educational materials facilitated Step 2; clinics not providing education believed they could easily do so with training and educational resources. Fundingand staff-related resource barriers were noted for Steps 3-5, including costs of laboratory tests and lack of time for longitudinal visits. Conclusions: PrEP-providing publicly funded FP clinics in the Southern U.S. use referral services for many steps of PrEP care, which introduce patient burden. Increasing onsite PrEP services will require addressing concerns related to training, educational materials, cost, and staffing. (C) 2020 Society for Adolescent Health and Medicine. Article	2021	Pitasi M.A.; Beer L.; Cha S.; Lyons S.J.; Hernandez A.L.; Prejean J.; Valleroy L.A.; Crim S.M.; Trujillo L.; Hardman D.; Painter E.M.; Petty J.; Mermin J.H.; Daskalakis D.C.; Hall H.I.	Vital Signs: HIV Infection, Diagnosis, Treatment, and Prevention among Gay, Bisexual, and Other Men Who Have Sex with Men - United States, 2010-2019	MMWR Recommendations and Reports	-	-	-	-	1492195	10.15585/MMWR.MM7048E1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121849188&doi=10.15585%2fMMWR.MM7048E1&partnerID=40&md5=19213425a8388674dee7d2706532b93d	Background. Men who have sex with men (MSM) accounted for two thirds of new HIV infections in the United States in 2019 despite representing approximately 2% of the adult population. Methods. CDC analyzed surveillance data to determine trends in estimated new HIV infections and to assess measures of undiagnosed infection and HIV prevention and treatment services including HIV testing, preexposure prophylaxis (PrEP) use, antiretroviral therapy (ART) adherence, and viral suppression, as well as HIV-related stigma. Results. The estimated number of new HIV infections among MSM was 25,100 in 2010 and 23,100 in 2019. New infections decreased significantly among White MSM but did not decrease among Black or African American (Black) MSM and Hispanic/Latino MSM. New infections increased among MSM aged 25-34 years. During 2019, approximately 83% of Black MSM and 80% of Hispanic/Latino MSM compared with 90% of White MSM with HIV had received an HIV diagnosis. The lowest percentage of diagnosed infection was among MSM aged 13-24 years (55%). Among MSM with a likely PrEP indication, discussions about PrEP with a provider and PrEP use were lower among Black MSM (47% and 27%, respectively) and Hispanic/Latino MSM (45% and 31%) than among White MSM (59% and 42%). Among MSM with an HIV diagnosis, adherence to ART and viral suppression were lower among Black MSM (48% and 62%, respectively) and Hispanic/Latino MSM (59% and 67%) compared with White MSM (64% and 74%). Experiences of HIV-related stigma among those with an HIV diagnosis were higher among Black MSM (median = 33; scale = 0-100) and Hispanic/Latino MSM (32) compared with White MSM (26). MSM aged 18-24 years had the lowest adherence to ART (45%) and the highest median stigma score (39). Conclusion. Improving access to and use of HIV services for MSM, especially Black MSM, Hispanic/Latino MSM, and younger MSM, and addressing social determinants of health, such as HIV-related stigma, that contribute to unequal outcomes will be essential to end the HIV epidemic in the United States. © 2021 Department of Health and Human Services. Article	2021	Platt, Laura; Shebl, Fatma M; Qian, Yiqi; Bunda, Bridget; Ard, Kevin L; Bassett, Ingrid V	Urban Sexual Health Clinic Patients With "Undetermined Risk" for HIV Are Less Likely to Receive Preexposure Prophylaxis.	Sexually Transmitted Diseases	-	-	-	-	1537-4521	10.1097/OLQ.0000000000001460	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8505145	BACKGROUND: New diagnoses of HIV increasingly occur among people who fall outside traditional transmission risk categories. This group remains poorly defined, and HIV prevention efforts for this group lag behind efforts for patients in other risk groups. METHODS: We conducted a retrospective review of patient visits at sexual health clinics in Boston, MA, over a 14-month period. Patients were classified into Centers for Disease Control and Prevention-defined HIV transmission risk categories. We compared frequencies of sexually transmitted infections (STIs), HIV, preexposure prophylaxis (PrEP) indications, and PrEP prescriptions. Predictors of HIV or STI among patients in the undetermined risk category were assessed with logistic regression. RESULTS: There were 4723 clinic visits during the study period. Patients in the undetermined risk group constituted the largest proportion (55.8%), followed by men who have sex with men (MSM; 42.7%). The proportion of visits by patients in the undetermined risk group with an indication for PrEP was low (28.0%) compared with MSM (91.3%) and MSM who also inject drugs (93.8%); however, the absolute number was high (737). Among patients with an indication for PrEP, those in the undetermined risk group were least likely to receive a prescription. Behavioral risk factors were poorly predictive of STI or HIV among patients in the undetermined risk group. CONCLUSIONS: Patients with undetermined risk for HIV constituted a large proportion of clinic visits and had a large volume of sexual health needs but rarely received PrEP when indicated. To end the HIV epidemic in the United States, prevention efforts must include people who fall outside traditional risk categories. Article	2021	Pleaner M.; Fipaza Z.; Mabetha K.; Greener L.; Ncube S.; Butler V.; Beksinska M.; Mullick S.	Uptake of Contraception Among Adolescent Girls and Young Women PrEP Clients: Leveraging the Opportunity to Strengthen HIV and Sexual and Reproductive Health Integration	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2021.684114	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85147005405&doi=10.3389%2ffrph.2021.684114&partnerID=40&md5=6a53aeb3e15ab7cf96d656fd55d096e9	The introduction of oral pre-exposure prophylaxis (PrEP) for HIV prevention was a major breakthrough in South Africa (SA). While the initial introduction focused on issues such as the development and implementation of new guidelines, supply, and the development of demand creation strategies, the need to integrate PrEP services with sexual and reproductive health (SRH) services has gained traction both globally and locally. Project PrEP was implemented in eight healthcare facilities and four mobile clinics in three provinces in SA. Using monitoring data from across the four project clusters, and 4,949 clients, over a 21-month period, we conducted an analysis of baseline routine monitoring data to examine contraceptive uptake in adolescent girls and young women (AGYW) initiating PrEP at project sites. Two-thirds of women (62.3%, n = 3,083) reported the current use of contraception at baseline, with the most commonly used methods being hormonal injectables (61.9%, n = 1,829) and male condoms (19.4%, n = 575). A third (32.3%, n = 603) of the non-contraceptive users accepted a method at PrEP initiation. From a total of 1,007 (32.7%) current contraceptive users at baseline, 865 (85.9%) chose the same or a differentmethod at this visit. Themethod uptake at PrEP initiation increased the overall contraceptive prevalence by 12.2 to 74.5%. Data indicated that over a third (38.8%, n = 725) who were not using a method at baseline described themselves as consistent condom users. Although a major focus of the project was on PrEP service provision, all women were counseled and offered contraceptive services. The acceptance of a method by a third of non-users was promising; however, more understanding of those who did not take up a method is required. The need to leverage opportunities for the promotion of the integration of HIV and family planning at all levels of PrEP provision was highlighted. © 2021 Pleaner, Fipaza, Mabetha, Greener, Ncube, Butler, Beksinska and Mullick.	adolescent girls and young women; contraception; HIV prevention; integration; pre-exposure prophylaxis; sexual and reproductive health; South Africa	English	Switzerland	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Quantitative
Article	2021	Plomer A.-S.; McCool-Myers M.; Apfelbacher C.	Exploring real-world experiences of early PrEP adopters in southern Germany	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2021.1876835	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099837952&doi=10.1080%2f09540121.2021.1876835&partnerID=40&md5=4c95006a88c640e69a3e0a9ed7eca46b	Germany authorized reimbursement for PrEP and established PrEP provider training in 2019, much later than its Western European counterparts. Understanding the lived experiences of early adopters of PrEP could inform the ramp-up phase of PrEP implementation in Germany. The purpose of this study was to explore the experience of southern German men who started PrEP prior to 2019. In Spring 2018, we conducted 13 in-depth interviews with men who have sex with men (MSM) regarding PrEP initiation, adoption and routine care. Transcripts were transcribed, translated, validated, then analysed using thematic content analysis. Participants started PrEP in 2017–2018. They described the security that PrEP provided and the ability to enjoy their sex lives more fully. Some raised concerns about side effects and the lack of long-term data. Users valued a non-judgmental relationship with their providers. Users' aspirations for future HIV prevention included: prescription-free PrEP, decreased dosing frequency, and telemedicine consultations. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2021	Pollock L.; Warren M.; Levison J.	Missed Opportunities for HIV Prevention in Perinatal Care Settings in the United States	Frontiers in Reproductive Health	-	-	-	-	26733153	10.3389/frph.2021.680046	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85152905734&doi=10.3389%2ffrph.2021.680046&partnerID=40&md5=f5e9eb60cafd7eab7e4ac310d7e0f049	Universal opt-out HIV screening in pregnancy is an essential intervention toward eliminating perinatal HIV transmission in the US. However, it fails to identify pregnant people who are HIV negative at the time of testing but are at ongoing risk for HIV acquisition. Those of us involved in caring for women living with HIV are acutely aware of the many diagnoses of HIV that might have been prevented if only a partner had been tested for HIV or preexposure prophylaxis (PrEP) had been offered to a patient. This perspective article will review current recommendations and evidence-based interventions to evaluate missed opportunities for HIV prevention in US perinatal care settings. We identified three barriers to implementation of HIV prevention strategies during pregnancy and breastfeeding: (1) HIV risk for women is underestimated and poorly defined in clinical practice; (2) Partner testing is challenging and implementation studies in the US are lacking; and (3) PrEP remains underutilized. In March 2020, the National Perinatal HIV Hotline convened a group of clinicians and researchers specializing in perinatal HIV care to a case-based discussion of missed opportunities in perinatal HIV prevention. Fromour review of the literature via PubMed search as well as expert opinions gathered in this discussion, we make recommendations for addressing these barriers. © 2021 Pollock, Warren and Levison.	breastfeeding; hiv prevention; HIV self-testing; partner testing; pre-exposure prophylaxis; pregnancy	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review

Tenofovir alafenamide (TAF) is a potent antiretroviral drug, with numerous long-acting (LA) delivery systems under development to improve PrEP adherence. However, none has undergone preventive efficacy assessment. Here it is shown that LA TAF using a novel subcutaneous nanofluidic implant (nTAF) confers partial protection from HIV transmission. It is demonstrated that sustained subcutaneous delivery through nTAF in rhesus macaques maintains tenofovir diphosphate concentration at a median of 390 fmol per 106 peripheral blood mononuclear cells, nine times above clinically protective levels. In a non-blinded, placebo-controlled rhesus macaque study with repeated low-dose rectal simian HIVSF162P3 (SHIVSF162P3) challenge, the nTAF cohort has a 62.50% reduction (95% CI: 1.72–85.69%; p = 0.068) in risk of infection per exposure compared to the control. This finding mirrors that of tenofovir disoproxil fumarate (TDF) monotherapy, where 60% protective efficacy is observed in macaques, and clinically, 67% reduction in risk with 86% preventive efficacy in individuals with detectable drug in the plasma. Overall, this nanofluidic technology shows potential as a subcutaneous delivery platform for long-term PrEP and provides insights for clinical implementation of LA TAF for HIV prevention. © 2020 The Authors. Article	2021	Popovic, Nashira; Yang, Qiuying; Archibald, Chris	Trends in HIV pre-exposure prophylaxis use in eight Canadian provinces, 2014-2018.	Canada Communicable Disease Report	-	-	-	-	1188-4169	10.14745/ccdr.v47i56a02	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8219062	INTRODUCTION: : Canada has endorsed the Joint United National Programme on HIV and AIDS global targets to end the acquired immunodeficiency syndrome (AIDS) epidemic, including reducing new human immunodeficiency virus (HIV) infections to zero, by 2030. Given the effectiveness of pre-exposure prophylaxis (PrEP) to prevent new infections, it is important to measure and report on PrEP utilization to help inform planning for HIV prevention programs and policies. METHODS: : Annual estimates of persons using PrEP in Canada were generated for 2014-2018 from IQVIA's geographical prescription monitor dataset. An algorithm was used to distinguish users of tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) for PrEP versus treatment or post-exposure prophylaxis. We provide the estimated number of people using PrEP in eight Canadian provinces by sex, age group, prescriber specialty and payment type. RESULTS: : The estimated number of PrEP users increased dramatically over the five-year study period, showing a 21-fold increase from 460 in 2014 to 9,657 in 2018. Estimated PrEP prevalence was 416 users per million persons across the eight provinces in 2018. Almost all PrEP users were male. Use increased in both sexes, but increase was greater for males (23-fold) than females (five-fold). Use increased across all provinces, although there were jurisdictional differences in the prevalence of use, age distribution and prescriber types. CONCLUSION: : The PrEP use in Canada increased from 2014 to 2018, demonstrating increased awareness and uptake of its use for preventing HIV transmission. However, there was uneven uptake by age, sex and geography. Since new HIV infections continue to occur in Canada, it will be important to further refine the use of PrEP, as populations at higher risk of HIV infection need to be offered PrEP as part of comprehensive sexual healthcare. Article	2021	Poteat, Tonia; Cooney, Erin; Malik, Mannat; Restar, Arjee; Dangerfield, Derek T; White, Jordan	HIV Prevention Among Cisgender Men Who have Sex with Transgender Women.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-021-03194-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8222096	Cisgender men who have sex with transgender women face elevated risk for HIV, yet are understudied in prevention research. We conducted in-depth interviews with 19 men who have sex with transgender women in Baltimore, Maryland and Atlanta, Georgia to explore perspectives on HIV prevention. Participants used several strategies to reduce HIV risk: condoms, frequent HIV testing, communication about HIV status with partners, and limiting the types of sex acts performed. While condom use was inconsistent, it was preferred over pre-exposure prophylaxis, in part due to medical distrust. HIV self-testing was generally viewed unfavorably. Although most participants were referred to the study by their transgender women partners, they recommended reaching other men who have sex with transgender women in bars, nightclubs, online, and through social media. HIV prevention interventions should be inclusive of the needs and experiences of men who have sex with transgender women. Article	2021	Powell, Laura; Dhummakupt, Adit; Siems, Lilly; Singh, Dolly; Le Duff, Yann; Uprety, Priyanka; Jennings, Cheryl; Szewczyk, Joseph; Chen, Ya; Nastouli, Eleni; Persaud, Deborah	Clinical validation of a quantitative HIV-1 DNA droplet digital PCR assay: Applications for detecting occult HIV-1 infection and monitoring cell-associated HIV-1 dynamics across different subtypes in HIV-1 prevention and cure trials.	Journal of Clinical Virology	-	-	-	-	1873-5967	10.1016/j.jcv.2021.104822	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8212401	BACKGROUND: In HIV-1-exposed infants, nucleic acid testing (NAT) is required to diagnose infection since passively transferred maternal antibodies preclude antibody testing. The sensitivity of clinical NAT assays is lowered with infant antiretroviral prophylaxis and, with empiric very early antiretroviral treatment of high-risk infants, thereby impacting early infant diagnosis. Similarly, adult HIV-1 infections acquired under pre-exposure prophylaxis may occur at low levels, with undetectable plasma viremia and indeterminate antibody tests, for which HIV-1 DNA testing maybe a useful adjunct. Cell-associated HIV-1 DNA concentrations are also used to monitor HIV-1 persistence in viral reservoirs with relevance to HIV-1 cure therapeutics, particularly in perinatal infections. OBJECTIVES: We clinically validated an HIV-1 DNA quantitative assay using droplet digital PCR (ddPCR), across different HIV-1 subtypes. STUDY DESIGN: The analytical sensitivity and specificity of an HIV-1 DNA ddPCR assay was determined using serial dilutions of a plasmid containing HIV-1 LTR-gag spiked into peripheral blood mononuclear cells (PBMCs), with MOLT-4 cells or PBMCs infected with different HIV-1 subtypes (A, B and C), and U1 cells spiked into PBMCs. Inter- and intra-run variability were used to determine assay precision. RESULTS: The HIV-1 LTR-gag ddPCR assay was reliable and reproducible, and exhibited high analytical specificity with sensitivity to near single copy level, across multiple HIV-1 subtypes, and a limit of detection of 4.09 copies/million PBMCs. CONCLUSIONS: This assay has applications for detecting occult HIV-1-infection in the setting of combination and long-acting regimens used for HIV-1 prevention, across different HIV-1 subtypes, in infants and adults, and in HIV-1 cure interventions. Article	2021	Przybyla S.; Fillo J.; Kamper-DeMarco K.; Bleasdale J.; Parks K.; Klasko-Foster L.; Morse D.	HIV pre-exposure prophylaxis (PrEP) knowledge, familiarity, and attitudes among United States healthcare professional students: A cross-sectional study	Preventive Medicine Reports	-	-	-	-	22113355	10.1016/j.pmedr.2021.101334	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101688987&doi=10.1016%2fj.pmedr.2021.101334&partnerID=40&md5=e6db1cef14f82d105435ab739db02e15	The United States' initiative to End the HIV Epidemic by 2030 includes a primary goal to reduce new HIV infections by 90 percent. One key contributor to this plan is HIV pre-exposure prophylaxis (PrEP). While knowledge and acceptance of PrEP among clinicians is growing, few studies have assessed knowledge and awareness among future healthcare professionals in academic training programs. The present study aimed to assess and compare healthcare trainees' awareness, knowledge, and familiarity with PrEP prescribing guidelines to better understand and prevent gaps in academic training regarding PrEP. A cross-sectional web-based survey of medical, nurse practitioner, and pharmacy students enrolled at two universities was conducted between October 2017 and January 2018. The study assessed participants' awareness, knowledge, and familiarity with PrEP prescribing guidelines and willingness to prescribe PrEP and refer to another healthcare provider. The survey was completed by 744 participants (response rate = 36.2%). Overall, PrEP awareness was high though PrEP knowledge was low. There were significant differences among student groups in domains of interest. Pharmacy students had the greatest PrEP knowledge, awareness, and familiarity with prescribing guidelines. However, medical students reported the greatest comfort with performing PrEP-related clinical activities and willingness to refer a candidate to another provider. Study findings enhance our understanding of healthcare professional students' perspectives of PrEP as a biomedical prevention strategy for HIV. The gaps in students' knowledge offer opportunities for the development of educational strategies to support HIV prevention among future healthcare professionals. © 2021 The Authors	Education; HIV prevention; HIV/AIDS; Pre-exposure prophylaxis; Students	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Pyra, M; Rusie, L; Blum, C; Irby, S; Ridgway, J	HIV Pre-exposure Prophylaxis Use and Persistence among Black Ciswomen: "Women Need to Protect Themselves, Period"	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1007/s40615-021-01020-9	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7968858/	Background: Disparities in HIV incidence and PrEP use among Black ciswomen remain. We examine factors associated with PrEP persistence using mixed methods. Setting: Black ciswomen in Chicago, IL, prescribed PrEP at a federally qualified health center (FQHC). Methods: We used electronic health data to determine PrEP persistence (Proportion of Days Covered ≥86% at 6 months) and tested demographic and clinical factors in logistic regressions. We interviewed eight Black ciswomen, purposefully selected by PrEP persistence. Results Among 112 Black ciswomen, 18% were persistent. In adjusted models, neighborhood, visit reason (at initiation), and initiation year were significantly associated with persistence. Qualitatively, we found little evidence of cost or adherence as barriers; participants reported low community awareness, importance of providers, and concerns around stigma, side effects, and pregnancy while using PrEP. Conclusion: While persistence among Black ciswomen was low, patients were often making decisions based on perceived HIV risk. We identified real-world barriers to address in future interventions. Article	2021	Qin F.; Liang B.; Liang H.; Abdullah A.S.; Huang H.; Huang J.; Zhou B.; Ning C.; Liao Y.; Yang Y.; Liu H.; Yu J.; Lai J.; Wei W.; Liu X.; Jiang J.; Ye L.	High HIV prevalence, low awareness of and willingness to use HIV pre-exposure prophylaxis among male migrant workers in Southwestern, China: a short report	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2021.1877249	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100274913&doi=10.1080%2f09540121.2021.1877249&partnerID=40&md5=1d89f932c699c379da2f6d7661d2f647	Little is known about pre-exposure prophylaxis (PrEP) awareness and willingness among male rural-to-urban migrant workers, a high-risk population of HIV infection and transmission in China. The aim of this study was to assess the awareness of and willingness to use PrEP among this vulnerable population in two cities in Guangxi Zhuang autonomous region, a province in southwestern China. A cross-sectional survey was conducted among male rural-to-urban migrant workers in Guangxi province, during June to August, 2015. Multivariable logistic regression analysis was used to examine the factors related to PrEP acceptance. Among 669 male rural-to-urban migrant workers surveyed, the HIV prevalence was 1.79%. Among the 657 HIV-negative participants, 23.0% had heard of PrEP, 1.2% had used PrEP, and 64.7% were willing to use PrEP. Being afraid of HIV/AIDS (OR = 2.08, 95%CI: 1.04–4.19) and willing to have an HIV test (OR = 3.74, 95%CI: 1.64–8.52) were associated with willingness to use PrEP. The findings suggest that among male migrant workers in Southwestern China, the awareness of and willingness to use PrEP were relatively low. Given the fact that the HIV prevalence was high among this population, more educational campaigns about PrEP and targeted interventions are necessary for this high-risk population in Guangxi. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2021	Qiu J.; Chen S.; Yang Q.; He J.; Gu J.; Li J.; Xu H.; Cheng W.; Liu H.; Hao C.; Hao Y.	Association between relationship characteristics and willingness to use PrEP among same-sex male couples: a cross-sectional actor-partner analysis in Guangzhou, China	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/0956462420953007	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101036056&doi=10.1177%2f0956462420953007&partnerID=40&md5=c7e733f092ccb68b35f4b1a5ad04ed2c	The association between relationship characteristics and pre-exposure prophylaxis (PrEP) acceptability among same-sex male couples has been limitedly examined. Dyadic survey data of 139 concordant HIV-negative same-sex male couples in Guangzhou, China were collected. The willingness to use PrEP was measured assuming that the participant's partner was HIV-positive. The actor–partner interdependence model was used to examine how one's relationship characteristics affected the PrEP willingness of the subject and his partner. Most participants (79.5%) were willing to use PrEP. The two individuals of the couple were distinguished by sex role in relationship, namely one usually playing the insertive role and the other usually playing the receptive role in anal intercourse. The former was labeled as "top" and the latter labeled as "bottom". The PrEP willingness of the top partner increased when he would think his partner is having sex with other people if the partner requests condom use in relationship (AOR: 5.74, 95% CI: 1.10–29.87), and decreased when his partner would get violent upon condom use requests in relationship (AOR: 0.19, 95% CI: 0.04–0.88). The PrEP willingness of the bottom partner increased when he trusted his partner (AOR: 1.13, 95% CI: 1.02–1.25) and when he or his partner disclosed the relationship to parents (AOR: 10.57, 95% CI: 1.91–58.61). Considering the sex role and relationship characteristics in couple-based interventions are important to optimize PrEP uptake among HIV-discordant same-sex male couples. © The Author(s) 2021.	actor–partner interdependence model; dyadic data; Men who have sex with men; pre-exposure prophylaxis; relationship characteristics	English	United Kingdom	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Quantitative
Article	2021	Quaife, Matthew; Terris-Prestholt, Fern; Mukandavire, Zindoga; Vickerman, Peter	Modelling the effect of market forces on the impact of introducing human immunodeficiency virus pre-exposure prophylaxis among female sex workers	Health Economics	-	-	-	-	10579230	10.1002/hec.4211	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098270901&doi=10.1002%2fhec.4211&partnerID=40&md5=d8a88df5bd181de8d12022ab8040376c	Pre-exposure prophylaxis (PrEP) to prevent human immunodeficiency virus (HIV) enables female sex workers (FSWs) to protect themselves from HIV without relying on clients using condoms. Yet, because PrEP reduces HIV risk, financial incentives to not use condoms may lead to risk compensation: reductions in condom use and/or increases in commercial sex, and may reduce the price of unprotected sex. In this analysis, we integrate market forces into a dynamic HIV transmission model to assess how risk compensation could change the impact of PrEP among FSWs and clients. We parameterise how sexual behavior may change with PrEP use among FSWs using stated preference data combined with economic theory. Our projections suggest the impact of PrEP is sensitive to risk compensatory behaviors driven by changes in the economics of sex work. Condom substitution could reduce the impact of PrEP on HIV incidence by 55%, while increases in the frequency of commercial sex to counter decreases in the price charged for unprotected sex among PrEP users could entirely mitigate the impact of PrEP. Accounting for competition between PrEP users and nonusers exacerbates this further. Alternative scenarios where increases in unprotected sex among PrEP users are balanced by decreases in non-PrEP users have the opposite effect, resulting in PrEP having much greater impact. Intervention studies need to determine how HIV prevention products may change the economics of sex work and provision of unprotected sex to enable a better understanding of their impact. © 2020 The Authors. Article	2021	Radix A.; Vail R.	Pre-exposure Prophylaxis in LGBT Communities	Primary Care - Clinics in Office Practice	-	-	-	-	954543	10.1016/j.pop.2021.02.004	https://pubmed.ncbi.nlm.nih.gov/33985706/	Gay, bisexual and other men who have sex with men (MSM) and transgender individuals face the highest burden of human immunodeficiency virus (HIV) infection. HIV pre-exposure prophylaxis (PrEP) is an effective evidence-based biomedical intervention to reduce acquisition of HIV infection but uptake has been suboptimal in lesbian, gay, bisexual, and transgender (LGBT) populations. Primary care providers play an integral role in addressing HIV disparities by educating patients and facilitating access to PrEP. After PrEP initiation, primary care providers should assess for and manage adverse effects, provide appropriate laboratory monitoring, support adherence, and assist patients with access to low-cost or free PrEP options if needed. Article	2021	Rael C.T.; Das D.; Bauermeister J.; Lentz C.; Carballo-Diéguez A.; Giguere R.; Scott R.K.; Hendrix C.W.	Understanding Women's Vaginal Douching Behaviors and Practices for Consideration in the Development of a Potential Future Vaginal Microbicide Douche for HIV Prevention: A Systematic Review of the Literature	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03290-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105863626&doi=10.1007%2fs10461-021-03290-0&partnerID=40&md5=93acaf8c2d2b5df0c33787e974b28e9e	Despite clinicians consistently advising against vaginal douching, 29–92% of women worldwide report douching. This review documents women's douching practices, motivations for douching, and specific associations (or absence of associations) between vaginal douche use and vaginal outcomes thought to be associated with douching. Understanding women's existing douching behaviors and vaginal health outcomes is critical for developing a safe vaginal microbicide douche that can be used as HIV pre-exposure prophylaxis (PrEP). A vaginal douche as PrEP could help prevent new HIV infections, since emerging evidence shows some women discontinue oral PrEP. We performed a systematic review of the literature using the guidelines for Preferred Reporting Items for Systematic Review and Meta-Analyses (PRISMA). Articles included in the analysis (N = 48) were published 2009–2019 in English and focused on women's experiences with douching. Two trained independent reviewers assessed these articles for content on vaginal douching, including racial/ethnic focus of studies, study design, sampling, women's reasons for douching, contents of douche solutions, and associations between vaginal douching and vaginal health outcomes. Several studies focused on Black women (N = 12 studies) or had no racial/ethnic focus (N = 12). Just over half of all studies (N = 24) were cross-sectional and involved a self-reported questionnaire and lab samples. Studies sampled women from health clinics where they were (N = 13) or were not (N = 14) presenting for vaginal health complaints. Women's primary motivation for douching was for "general cleanliness" (N = 13), and most douche solutions contained water (N = 12). There was little empirical agreement between vaginal douche use and most vaginal health outcomes. Future studies of PrEP vaginal douches should be well controlled and prioritize safety to ensure positive vaginal health outcomes. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Under the standard protocol, CAB-LA is injected into the gluteal muscle by a healthcare provider every eight weeks. To explore transgender women's barriers and facilitators to tailored delivery strategies—including self-injection and injection in "drop-in" centers—we completed in-depth interviews with N = 15 transgender women in New York City. Participants endorsed the alternative delivery methods and the corresponding features we proposed, and expressed likes and dislikes about each. These fell into the following categories: competence (e.g., the person delivering CAB-LA must have skills to do so), convenience (e.g., CAB-LA must be easy to obtain), and privacy or fear of judgement (e.g., participants did not want to feel judged for using CAB-LA by providers or other service consumers). Findings suggest the need to offer CAB-LA to transgender women through multiple delivery protocols. Article	2021	Ragonetti T.; Coleman T.; Travers R.; Tran B.; Coulombe S.; Wilson C.; Woodford M.R.; Davis C.; Cameron R.	Factors associated with interest in and knowledge of preexposure prophylaxis (PrEP) among gay, bisexual, and other men who have sex with men (GBMSM) in the Region of Waterloo, Ontario, Canada: Insights from the outlook study	Canadian Journal of Human Sexuality	-	-	-	-	11884517	10.3138/CJHS.2019-0060	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098774161&doi=10.3138%2fCJHS.2019-0060&partnerID=40&md5=c6f7e31d1b97ed1c5174e254754b0aca	Pre-exposure prophylaxis (PrEP) is an effective HIV-prevention tool for gay, bisexual, and other men who have sex with men (GBMSM), a group known to be disproportionately affected by HIV/AIDS. We aimed to identify sociodemographic, psychosocial, and health factors associated with awareness of PrEP or interest in PrEP among GBMSM in a mid-sized Canadian city, where PrEP availability is arguably more scarce compared to larger metropolitan regions. The OutLook Study was a comprehensive online survey of LGBTQ health and well-being that collected data from sexual minorities aged 16+ in the Region of Waterloo, Ontario, Canada. Participants were cisgender MSM with an unknown or negative HIV status (n = 203). Bivariate logistic regression was performed to analyze factors associated with both awareness of PrEP and interest in PrEP. Multivariate logistic regression explored sexual behaviours in the past 12 months while controlling for sociodemographic and psychosocial variables. Increasing number of sexual partners (OR: 1.10; 95% CI: 1.03-1.53) was significantly associated with interest in PrEP and lifetime experiences of homophobia remained significant from the bivariate model (ORs ranged from 1.11-1.12). Since GBMSM with low educational attainment were shown to have less knowledge about PrEP, educational campaigns could be targeted in high schools rather than colleges, universities, and trade schools. Prevention initiatives should be aimed at places where single or non-monogamous GBMSM frequent due to these men being disproportionately affected by HIV/AIDS. These findings provide insights for potential interventions targeting MSM from mid-sized cities. © 2020 University of Toronto Press Inc.. All rights reserved. Article	2021	Rahib, Delphine; Delagreverie, Heloïse; Gabassi, Audrey; Le Thi, Thanh-Thuy; Vassel, Eleonore; Vodosin, Pierre; Leveau, Benjamin; Pisoni, Amandine; Tuaillon, Edouard; Digne, Julien; Icard, Vinca; Delaugerre, Constance; Lydié, Nathalie	Online self-sampling kits to screen multipartner MSM for HIV and other STIs: participant characteristics and factors associated with kit use in the first 3 months of the MemoDepistages programme, France, 2018.	Sexually Transmitted Diseases	-	-	-	-	1472-3263	10.1136/sextrans-2020-054790	https://dx.doi.org/10.1136/sextrans-2020-054790	OBJECTIVES: In 2017, to reduce the proportion of men who have sex with men (MSM) in the undiagnosed HIV population in France (38%), HIV screening is advised each 3 months and STI screening is advised each year in multipartner MSM. Despite the range of testing solutions, over 40% of MSM were not tested for HIV and over 50% for STIs in the past year. Based on international experiments that offer screening solutions via online advertising, the French National Health Agency launched a programme (MemoDepistages) to provide a free self-sampling kit (SSK) for HIV and STIs. This article analyses the sociodemographic and behavioural characteristics of MSM in terms of kit acceptance and sample return. METHODS: Participants were registered for the programme online after ordering an SSK. The study included men aged over 18 years, living in one of the four selected French regions, and willing to disclose their postal and email address; they had health insurance, acknowledged more than one male partner in the past year, indicated a seronegative or unknown HIV status and were not taking medically prescribed pre-exposure prophylaxis drugs. Samples were collected by users and posted directly to the laboratory. Characteristics associated with kit acceptance and sample return were analysed using logistic regression. RESULTS: Overall, 7158 eligible MSM were offered to participate in the programme, with 3428 ordering the kit (47.9%) and 1948 returning their sample, leading to a return rate of 56.8% and an overall participation rate of 27.2%. Acceptance and return rates were strongly associated with sociodemographic characteristics, mainly education level but not with behavioural characteristics. Non-college graduates had lower acceptance (44.2%) and return rates (47.7%). CONCLUSION: The programme rapidly recruited a large number of MSM. It removed geographical inequalities related to screening access.	men; screening; service delivery. Article	2021	Rai, B; Ross, S; Richardson, D	GENERAL PRACTITIONERS' (GPS') KNOWLEDGE OF AND ATTITUDES TO PRESCRIBING PRE-EXPOSURE PROPHYLAXIS FOR HIV (PREP): A PILOT STUDY	Sexually Transmitted Infections	-	-	-	-	1368-4973	10.1136/sextrans-2021-sti.195	https://sti.bmj.com/content/97/Suppl_1/A74.1	Background In the UK PrEP is available only from sexual health services. The 2018 BHIVA/BASHH PrEP guidelines acknowledge the advantages of PrEP being delivered in sexual health services but raise concerns that this may restrict access for some people. Locally we have a large population of men who have sex with men (MSM) and provide PrEP to over 800, however many MSM and other people who would benefit from PrEP do not access sexual health services and may have more contact with primary care. We aimed to gain some insight into the knowledge and attitudes primary care have around PrEP to design an educational package. Methods An online survey was circulated to GPs and trainee GPs working in an acute hospital trust. Results Of the 12 respondents; 11(92%) were aware of PrEP, 6(50%) reported having been asked about PrEP by patients, 5(42%) had previously prescribed PrEP (as part of training in attachment in a sexual health clinic): 7(58%) felt that some of their patients would benefit from PrEP, with the remaining 5(42%) being unsure. 3(25%) said they would prescribe PrEP for a patient at high risk of HIV in future, 4 (33%) said they would not prescribe PrEP and 5(42%) were unsure. Barriers to prescribing PrEP included unfamiliarity and uncertainty around which patients would benefit. 10(83%) respondents felt PrEP should only be prescribed in dedicated clinics or sexual health and 2(17%) suggested that PrEP should be available in primary care: 8(67%) felt training in prescribing and monitoring PrEP would be useful for primary care. Conclusion Our educational package on PrEP in primary care needs to focus on identification of patients at high risk of HIV and increase the general knowledge of PrEP in primary care to facilitate clinical pathways and signposting to sexual health services. Article	2021	Ralph, Jessika Ann; Yeh, Chen; Cowett, Allison; Hirschhorn, Lisa R; Hammond, Cassing	Get PrEPPT (pre-exposure prophylaxis and pregnancy termination): an exploration of the values, attitudes and preferences regarding HIV and PrEP among women seeking abortion.	BMJ Sexual and Reproductive Health	-	-	-	-	2515-2009	10.1136/bmjsrh-2020-200623	https://dx.doi.org/10.1136/bmjsrh-2020-200623	INTRODUCTION: Pre-exposure prophylaxis (PrEP) for the prevention of HIV transmission is under utilised by women in the US. Women seeking abortion have a higher HIV prevalence than women who continue prenatal care and could benefit from HIV risk assessment and PrEP counselling. We assessed the knowledge, attitudes, and preferences of women seeking abortion care regarding their HIV risk and knowledge of PrEP, and identified individual and system barriers to PrEP access. METHODS: We performed a cross sectional descriptive study of English speaking women at a freestanding abortion clinic through an anonymous survey. Participants with indications for PrEP care included those who performed sex work, experienced a recent sexually transmitted infection, or had multiple sexual partners and inconsistent condom use. We performed descriptive statistics on response data; Wilcoxon tests were used to compare continuous variables across groups. RESULTS: 64 (32.3%) participants had indications for PrEP, but only 31 (16.1%) had previous knowledge of PrEP. After the concept was explained, attitudes towards PrEP were generally positive, and 54 participants (27.8%) would consider starting PrEP in the next 6 months. Participants were most interested in receiving PrEP care from their primary care provider rather than from an abortion clinic. CONCLUSIONS: Among women seeking abortion, women vulnerable to HIV infection outnumbered those with PrEP knowledge by 2 to 1. Prior knowledge of PrEP as an HIV prevention method was low, but women found PrEP acceptable. While women reported preferring to receive PrEP from a primary care provider, the abortion clinic visit may also represent an important time for HIV education and risk screening.	abortion; human immunodeficiency virus; surveys. Article	2021	Ramos, S Raquel; LardierJr, David T; Boyd, Donte T; GutierrezJr, José I; Carasso, Eliana; Houng, David; Kershaw, Trace	Profiles of HIV Risk, Sexual Power, and Decision-Making among Sexual Minority Men of Color Who Engage in Transactional Sex: A Latent Profile Analysis	International Journal of Environmental Research and Public Health	-	-	-	-	1661-7827	10.3390/ijerph18094961	https://www.proquest.com/scholarly-journals/profiles-hiv-risk-sexual-power-decision-making/docview/2528253389/se-2?accountid=8113	Though the transmission of HIV is preventable, there were still 37,968 new documented cases in the United States in 2018. HIV incidence is disproportionate in sexual minority men of color. The purpose of this study was to examine sexual relationship power risk profiles to identify distinct subgroups within the profiles who carry the highest HIV risk. Latent class profile analysis was used to identify subgroups of sexual minority men of color at the highest risk for contracting HIV based on their sexual power profiles. Among 322 sexual minority men, we identified four latent profiles. Profile 1: Low transactional sex and high power (n = 133; 14.3%); Profile 2: Transactional sex, high decision-making in sexual relationships, and low control in sexual relationship (n = 99; 30.7%); Profile 3: Low transactional sex, low decision-making, and moderate control (n = 43; 13.4%); Profile 4: High transactional sex and low power (n = 47; 14.6%). LPA was useful to identify distinct subgroups based on measures of sexual risk and relationship sexual power. Findings carry significant implications for developing tailored strategies to increase HIV knowledge and related HIV prevention and risk reduction services for sexual minority men of color who engage in transactional sex. Article	2021	Ramos, S Raquel; Nelson, LaRon E; Jones, Sandra Gracia; Ni, Zhao; Turpin, Rodman E; Portillo, Carmen J	A State of the Science on HIV Prevention Over 40 Years Among Black and Hispanic/Latinx Communities.	Journal of the Association of Nurses in AIDS Care	-	-	-	-	1552-6917	10.1097/JNC.0000000000000266	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8223201	ABSTRACT: We present a state of the science on HIV behavioral prevention interventions in Black and Hispanic/Latinx communities. The purpose of this article is threefold: (a) highlight the early documented underlying social and political barriers that constrained interventions to prevent new HIV infections; (b) address the structural inequities in HIV prevention and treatment; and (c) describe the need for increasing HIV multilevel prevention interventions that support greater HIV testing and pre-exposure prophylaxis uptake. To address HIV prevention, multilevel interventions that address individual, structural, and social level components have demonstrated more sustainable outcomes. Implications for research and clinical practice include (a) updating antiquated curricula in nursing, medicine, and public health that perpetuate racial, structural-level inequities and (b) increasing the pipeline for Black and Hispanic/Latinx persons to pursue research or clinical-focused doctorate degrees.	253-263	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2021	Ramsey S.E.; Ames E.G.; Uber J.; Habib S.; Hunt L.; Brinkley-Rubinstein L.; Teitelman A.M.; Clarke J.; Kaplan C.; Phillips N.J.; Murphy M.	Linking women experiencing incarceration to community-based HIV pre-exposure prophylaxis care: A qualitative study	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2021.33.3.216	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106647377&doi=10.1521%2faeap.2021.33.3.216&partnerID=40&md5=8c88e28f3ec09acbf38edf6bf8fc9466	Women experiencing incarceration (WEI) in the United States are disproportionately impacted by HIV, yet HIV pre-exposure prophylaxis (PrEP) is underutilized by women in the United States. In order to inform an intervention to promote PrEP initiation during incarceration and facilitate linkage to PrEP care following release from incarceration, we conducted individual, semistructured qualitative interviews with WEI (N = 21) and key stakeholders (N = 14). While WEI had little or no previous knowledge about PrEP, they viewed it as something that would benefit women involved in the criminal justice system. Participants stated that HIV-related stigma and underestimation of HIV risk might serve as barriers to PrEP initiation during incarceration. Participants reported that competing priorities, difficulty scheduling an appointment, and lack of motivation could interfere with linkage to PrEP care in the community. Further, cost, substance use, and difficulty remembering to take the medication were cited most commonly as likely barriers to adherence. © 2021 The Guilford Press. Article	2021	Randolph S.D.; Johnson R.; Meyers D.; Washington D.; Saint-Hillaire L.	Leveraging social networks of Black women in beauty salons to improve uptake of pre-exposure prophylaxis	Health Education Journal	-	-	-	-	178969	10.1177/0017896920959383	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091403120&doi=10.1177%2f0017896920959383&partnerID=40&md5=0677270c8fe4f93ac4ad99f6380166e8	Objective: The purpose of this study was to assess social networks among Black women and beauty salons to see whether these could be leveraged to increase the awareness, knowledge and uptake of pre-exposure prophylaxis (PrEP) in this population. Design: Qualitative descriptive design. Setting: Beauty salons in counties in North Carolina, USA, with high rates of HIV among the local Black population. Method: A total of 13 focus groups were conducted: 6 with stylists and 7 with Black women customers. In addition, six individual interviews were conducted with salon owners. Structured focus group questions were used to explore participants' perspectives on the functions and characteristics of the social networks in salons and among women customers and how these might inform a PrEP intervention. Results: Results across all subgroups indicated social networks are pre-formed, developed and nurtured in a beauty salon setting. In addition, there is a positive influence of social networks on information sharing, specifically with respect to health-related topics. Variations in the results suggest salon settings differ and interventions within these settings should be tailored to specific salon's characteristics. Conclusion: Black women are disparately affected by HIV, having the highest incidence rates among all women in the USA. PrEP is an effective HIV prevention strategy, yet there is low uptake among Black women due to lack of awareness and knowledge of PrEP, HIV- and PrEP-related stigma, and medical mistrust. Social networks are a powerful source of influence on health behaviour. Findings from this study suggest a social network–based PrEP intervention in a salon setting may be promising and has the potential to extend the reach beyond its initial participants. © The Author(s) 2020. Article	2021	Rangel J.C.; Crath R.	Managing risk, managing affects: The emerging biopolitics of HIV neutrality: Short Title: The emerging biopolitics of HIV Neutrality	Health, Risk & Society	-	-	-	-	13698575	10.1080/13698575.2021.1972088	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113705166&doi=10.1080%2f13698575.2021.1972088&partnerID=40&md5=cc7b8cd85d5301b87647555ebbe7297a	Discourses of HIV status neutrality have emerged in the wake of advances in biomedical technologies for HIV prevention and treatment of HIV. The combined effects of Treatment as Prevention (TasP) and Pre-Exposure Prophylaxis (PrEP) give rise to the possibility of dramatically curbing new HIV infections and nurture fantasies about an HIV-free/risk-free futurity. In this article, we consider the possibilities of HIV neutrality as a social-material assemblage entangling different institutional investments and practices, discourses about HIV risk and prevention, historical memories, political rationalities, and as a generative point of contact between and across different actors, institutions and objects. We explore the different logics and sentiments that are being drawn together in three different sites where HIV neutrality is configured. Borrowing from cultural and social science approaches that grapple with emotions and feelings as 'distributed phenomena' that carry political and social significance, we interrogate the work of HIV neutrality in effecting new tensions in the affective economies underpinning gay sexual socialities' relation to HIV/AIDS and HIV risk. Our analysis suggests that as these new social-material strategies emerge to manage HIV risk, they entangle historically sedimented effects of HIV/AIDS. We ask to what extent these assemblages are productive of new intimacies and alliances, and possibly renewed entrenchments of bio-social boundaries cutting across gay male socialities in North America. © 2021 Informa UK Limited, trading as Taylor & Francis Group.	affective economies; Gay men; HIV; preexposure prophylaxis (PrEP); Risk	English	United Kingdom	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Qualitative
Article	2021	Rao S.; Mulatu M.S.; Xia M.; Wang G.; Song W.; Essuon A.; Patel D.; Eke A.; German E.J.	HIV Preexposure Prophylaxis Awareness and Referral to Providers Among Hispanic/Latino Persons — United States, 2019	MMWR Recommendations and Reports	-	-	-	-	10575987	10.15585/mmwr.mm7040a1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117363055&doi=10.15585%2fmmwr.mm7040a1&partnerID=40&md5=8c1477888d98ce0cb2834d429b56ea14	Hispanic or Latino (Hispanic) persons are disproportionately affected by HIV in the United States. In 2019, Hispanic persons accounted for 18% of the U.S. population, but for 29% of new diagnoses of HIV infection (1). The Ending the HIV Epidemic in the U.S. (EHE) initiative aims to reduce new HIV infections by 90% by 2030 (2). Preexposure prophylaxis (PrEP), medication taken to prevent acquisition of HIV, is an effective strategy for preventing HIV infection.† To examine PrEP awareness and referral to providers among Hispanic persons, CDC analyzed 2019 National HIV Prevention Program Monitoring and Evaluation HIV testing data. Approximately one quarter (27%) of Hispanic persons tested for HIV at CDC-funded sites (n = 310,954) were aware of PrEP, and 22% of those who received a negative HIV test result and were eligible for referral (111,644) were referred to PrEP providers. PrEP awareness and referrals among Hispanic persons were lower compared with those among non-Hispanic White persons. Among Hispanic persons, significant differences were found in PrEP awareness and referral by age, gender, race, population group, geographic region, and test setting. HIV testing programs can expand PrEP services for Hispanic persons by implementing culturally and linguistically appropriate strategies that routinize PrEP education and referral, collaborating with health care and other providers, and addressing social and structural barriers. © 2021. Article	2021	Rao, Amrita; Rucinski, Katherine; Jarrett, Brooke A; Ackerman, Benjamin; Wallach, Sara; Marcus, Julia; Adamson, Tyler; Garner, Alex; Santos, Glenn-Milo; Beyrer, Chris; Howell, Sean; Baral, Stefan	Perceived Interruptions to HIV Prevention and Treatment Services Associated With COVID-19 for Gay, Bisexual, and Other Men Who Have Sex With Men in 20 Countries.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000002620	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8276834	BACKGROUND: The coronavirus pandemic has necessitated a range of population-based measures to stem the spread of infection. These measures may be associated with disruptions to other health services including for gay, bisexual, and other men who have sex with men (MSM) at risk for or living with HIV. Here, we assess the relationship between stringency of COVID-19 control measures and interruptions to HIV prevention and treatment services for MSM. SETTING: Data for this study were collected between April 16, 2020, and May 24, 2020, as part of a COVID-19 Disparities Survey implemented by the gay social networking app, Hornet. Pandemic control measures were quantified using the Oxford Government Response Tracker Stringency Index: each country received a score (0-100) based on the number and strictness of 9 indicators related to restrictions, closures, and travel bans. METHODS: We used a multilevel mixed-effects generalized linear model with Poisson distribution to assess the association between stringency of pandemic control measures and access to HIV services. RESULTS: A total of 10,654 MSM across 20 countries were included. Thirty-eight percent (3992/10,396) reported perceived interruptions to in-person testing, 55% (5178/9335) interruptions to HIV self-testing, 56% (5171/9173) interruptions to pre-exposure prophylaxis, and 10% (990/9542) interruptions to condom access. For every 10-point increase in stringency, there was a 3% reduction in the prevalence of perceived access to in-person testing (aPR: 0·97, 95% CI: 0·96 to 0·98), a 6% reduction in access to self-testing (aPR: 0·94, 95% CI: 0·93 to 0·95), and a 5% reduction in access to pre-exposure prophylaxis (aPR: 0·95, 95% CI: 0·95 to 0·97). Among those living with HIV, 20% (218/1105) were unable to access their provider; 65% (820/1254) reported being unable to refill their treatment prescription remotely. CONCLUSIONS: More stringent responses were associated with decreased perceived access to services. These results support the need for increasing emphasis on innovative strategies in HIV-related diagnostic, prevention, and treatment services to minimize service interruptions during this and potential future waves of COVID-19 for gay men and other MSM at risk for HIV acquisition and transmission. Article	2021	Razon N.; Rodriguez A.; Carlson K.; Witt J.; Logan R.; Chambers B.; Weber S.; Seidman D.	"Far More than Just a Prescription": Focus Groups With U.S. Family Planning Providers and Staff About Integrating PrEP for HIV Prevention Into Their Work	Women's Health Issues	-	-	-	-	10493867	10.1016/j.whi.2021.02.006	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103949313&doi=10.1016%2fj.whi.2021.02.006&partnerID=40&md5=289a38eee8b692d7da25fea7942cd13d	Background: Cisgender women in the United States use pre-exposure prophylaxis (PrEP) for HIV prevention at lower rates relative to other groups. Advocacy groups and patients identify family planning clinics as the preferred sites to lead PrEP implementation for women in the United States. However, limited qualitative exploration exists of U.S. family planning practitioners' attitudes toward integrating PrEP into their work. Methods: We conducted qualitative focus groups with a convenience sample of family planning clinicians, counselors, and clinic managers to explore barriers and facilitators to PrEP provision in U.S. family planning clinics. Results: We conducted six focus groups (total participants = 37) with respondents who worked in family planning clinics in San Francisco, California; Kansas City, Missouri; and Philadelphia, Pennsylvania. Key themes emerged highlighting how PrEP at times runs contrary to other family planning agendas, including efficient clinic visits, condom promotion, and long-acting reversible contraception counseling. Throughout these discussions, participants expressed discomfort with HIV vulnerabilities rooted in social and structural determinants of health. Conclusions: Findings suggest that those seeking to implement PrEP for U.S. cisgender women may benefit from exploring 1) how to integrate patient/provider conversations about the structural determinants of health and their relationship to HIV and other sexual and reproductive health outcomes and 2) how to foster person-centered prevention conversations in the context of busy family planning visits. © 2021 Jacobs Institute of Women's Health	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Reback, Cathy J; Fletcher, Jesse B; Mata, Raymond P	A Theory-Based mHealth Intervention (Getting Off) for Methamphetamine-Using Men Who Have Sex With Men: Protocol for a Randomized Controlled Trial.	JMIR Research Protocols	-	-	-	-	1929-0748	10.2196/22572	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7939940	BACKGROUND: Methamphetamine (meth) use among men who have sex with men (MSM) is associated with increased HIV prevalence and transmission and substandard advancement along the HIV prevention and care continuum. Given the growth of mobile health (mHealth) technologies, it is no longer necessary to limit meth treatment options to physical, brick-and-mortar sites, and administration using generic, nontailored content. OBJECTIVE: In a 2-arm randomized controlled trial (RCT; N=300), we aim to evaluate the use of an mHealth intervention (Getting Off) to assess the impact and noninferiority of a cross-platform app (developed from a manualized meth treatment intervention) to help MSM reduce meth use and HIV sexual risk behaviors and improve their advancement along the HIV prevention and care continuum (HIV testing, pre-exposure prophylaxis uptake and persistence, and antiretroviral therapy uptake and adherence). METHODS: Participants will be randomized into 2 arms: arm A, with immediate access to the app (immediate delivery: n=150), or arm B, with delayed access to the app after a 30-day period (delayed delivery: n=150). Participants in both arms will use the same Getting Off app and will have 30 days to complete the 24 sessions. Participants will be assessed at the 1-, 2- (delayed delivery arm only), 3-, 6-, and 9-month timepoints to determine observed treatment effects and will be compared with a historical matched sample of participants (n=~600) who received the brick-and-mortar group-based Getting Off intervention. RESULTS: Recruitment began in January 2019 for phase 1, the formative phase. In January and February 2019, 4 focus groups (N=36) were formed to provide input on the adaptation of the group-based manual intervention to a mobile app. Data collection for phase 2, the RCT, is expected to be completed in January 2023. The final results are anticipated in April 2023. CONCLUSIONS: By creating a culturally responsive mobile app, Getting Off aims to reduce meth use and improve sexual health outcomes among meth-using MSM. The Getting Off app could have significant public health impact by greatly expanding access to effective, affordable, private, culturally competent, and highly scalable meth treatment for MSM. TRIAL REGISTRATION: Clinicaltrials.gov NCT03884946; https://clinicaltrials.gov/ct2/show/NCT03884946. INTERNATIONAL REGISTERED REPORT IDENTIFIER (IRRID): DERR1-10.2196/22572. Article	2021	Reed J.B.; Shrestha P.; Were D.; Chakare T.; Mutegi J.; Wakhutu B.; Musau A.; Nonyana N.M.; Christensen A.; Patel R.; Rodrigues J.; Eakle R.; Curran K.; Mohan D.	HIV PrEP is more than ART-lite: Longitudinal study of real-world PrEP services data identifies missing measures meaningful to HIV prevention programming	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25827	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117888157&doi=10.1002%2fjia2.25827&partnerID=40&md5=f5dd2703422e33512ce8b08191a57928	Introduction: Evidence indicates HIV oral pre-exposure prophylaxis (PrEP) is highly efficacious and effective. Substantial early discontinuation rates are reported by many programs, which may be misconstrued as program failure. However, PrEP use may be non-continuous and still effective, since HIV risk fluctuates. Real-world PrEP use phenomena, like restarting and cyclical use, and the temporal characteristics of these use patterns are not well described. The objective of our study was to characterize and identify predictors of use patterns observed in large PrEP scale-up programs in Africa. Methods: We analysed demographic and clinical data routinely collected during client visits between 2017 and 2019 in three Jhpiego-supported programs in Kenya, Lesotho and Tanzania. We characterized duration on/off PrEP and, using ordinal regression, modelled the likelihood of spending additional time off and identified factors associated with increasing cycle number. The Andersen-Gill model was used to identify predictors of time to PrEP discontinuation. To analyse factors associated with a client's first return following initiation, we used a two-step Heckman probit. Results: Among 47,532 clients initiating PrEP, approximately half returned for follow-up. With each increase in cycle number, time off PrEP between use cycles decreased. The Heckman first-step model showed an increased probability of returning versus not by older age groups and among key and vulnerable population groups versus the general population; in the second-step model older age groups and key and vulnerable populations were less likely in Kenya, but more likely in Lesotho, to return on-time (refill) versus delayed (restarting). Conclusions: PrEP users frequently cycle on and off PrEP. Early discontinuation and delays in obtaining additional prescriptions were common, with broad predictive variability noted. Time off PrEP decreased with cycle number in all countries, suggesting normalization of use with experience. More nuanced measures of use are needed than exist for HIV treatment if effective use of PrEP is to be meaningfully measured. Providers should be equipped with measures and counselling messages that recognize non-continuous and cyclical use patterns so that clients are supported to align fluctuating risk and use, and can readily restart PrEP after stopping, in effect empowering them further to make their own prevention choices. © 2021 The Authors. Article	2021	Rees, Helen; Chersich, Matthew Francis; Munthali, Richard J; Brumskine, William; Palanee-Phillips, Thesla; Nkala, Busi; Ahmed, Khatija; Sebe, Modulakgotla; Mabude, Zonke; Nchabeleng, Maphoshane; Bekker, Linda-Gail; Kotze, Philip; Mogodiri, Thembisile; Naidoo, Ishana; Panchia, Ravindre; Myer, Landon; Lombard, Carl; Doncel, Gustavo F; Gray, Glenda; Delany-Moretlwe, Sinead	HIV Incidence Among Pregnant and Nonpregnant Women in the FACTS-001 Trial: Implications for HIV Prevention, Especially PrEP Use.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000002785	https://dx.doi.org/10.1097/QAI.0000000000002785	BACKGROUND: During pregnancy and postpartum period, the sexual behaviors of women and their partners change in ways that may either increase or reduce HIV risks. Pregnant women are a priority population for reducing both horizontal and vertical HIV transmission. SETTING: Nine sites in 4 South African provinces. METHODS: Women aged 18-30 years were randomized to receive pericoital tenofovir 1% gel or placebo gel and required to use reliable modern contraception. We compared HIV incidence in women before, during, and after pregnancy and used multivariate Cox Proportional hazards models to compare HIV incidence by pregnancy status. RESULTS: Rates of pregnancy were 7.1 per 100 woman-years (95% confidence interval CI: 6.3 to 8.1) and highest in those who reported oral contraceptive use (25.1 per 100 woman-years; adjusted hazard ratio 22.97 higher than other women; 95% CI: 5.0 to 105.4) or had 2 children. Birth outcomes were similar between trial arms, with 59.8% having full-term live births. No difference was detected in incident HIV during pregnancy compared with nonpregnant women (2.1 versus 4.3%; hazard ratio = 0.56, 95% CI: 0.14 to 2.26). Sexual activity was low in pregnancy and the early postpartum period, as was consistent condom use. CONCLUSIONS: Pregnancy incidence was high despite trial participation being contingent on contraceptive use. We found no evidence that rates of HIV acquisition were elevated in pregnancy when compared with those in nonpregnant women. Risks from reductions in condom use may be offset by reduced sexual activity. Nevertheless, high HIV incidence in both pregnant and nonpregnant women supports consideration of introducing antiretroviral-containing pre-exposure prophylaxis for pregnant and nonpregnant women in high HIV prevalence settings. Article	2021	Reisner, Sari L; Deutsch, Madeline B; Mayer, Kenneth H; Potter, Jennifer; Gonzalez, Alex; Keuroghlian, Alex S; Hughto, Jaclyn Mw; Campbell, Juwan; Asquith, Andrew; Pardee, Dana J; Pletta, David R; Radix, Asa	Longitudinal Cohort Study of Gender Affirmation and HIV-Related Health in Transgender and Gender Diverse Adults: The LEGACY Project Protocol.	JMIR Research Protocols	-	-	-	-	1929-0748	10.2196/24198	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7961399	BACKGROUND: Transgender and gender diverse (TGD) adults in the United States experience health disparities, especially in HIV infection. Medical gender affirmation (eg, hormone therapy and gender-affirming surgeries) is known to be medically necessary and to improve some health conditions. To our knowledge, however, no studies have assessed the effects of gender-affirming medical care on HIV-related outcomes. OBJECTIVE: This study aims to evaluate the effects of medical gender affirmation on HIV-related outcomes among TGD primary care patients. Secondary objectives include characterizing mental health, quality of life, and unmet medical gender affirmation needs. METHODS: LEGACY is a longitudinal, multisite, clinic-based cohort of adult TGD primary care patients from two federally qualified community health centers in the United States: Fenway Health in Boston, and Callen-Lorde Community Health Center in New York. Eligible adult TGD patients contribute electronic health record data to the LEGACY research data warehouse (RDW). Patients are also offered the option to participate in patient-reported surveys for 1 year of follow-up (baseline, 6-month, and 12-month assessments) with optional HIV and sexually transmitted infection (STI) testing. Biobehavioral data from the RDW, surveys, and biospecimen collection are linked. HIV-related clinical outcomes include pre-exposure prophylaxis uptake (patients without HIV), viral suppression (patients with HIV), and anogenital STI diagnoses (all patients). Medical gender affirmation includes hormones, surgeries, and nonhormonal and nonsurgical interventions (eg, voice therapy). RESULTS: The contract began in April 2018. The cohort design was informed by focus groups with TGD patients (n=28) conducted between August-October 2018 and in collaboration with a community advisory board, scientific advisory board, and site-specific research support coalitions. Prospective cohort enrollment began in February 2019, with enrollment expected to continue through August 2020. As of April 2020, 7821 patients are enrolled in the LEGACY RDW and 1756 have completed a baseline survey. Participants have a median age of 29 years (IQR 11; range 18-82). More than one-third (39.7%) are racial or ethnic minorities (1070/7821, 13.68% Black; 475/7821, 6.07% multiracial; 439/7821, 5.61% Asian or Pacific Islander; 1120/7821, 14.32% other or missing) and 14.73% (1152/7821) are Hispanic or Latinx. By gender identity, participants identify as 33.79% (2643/7821) male, 37.07% (2900/7821) female, 21.74% (1700/7821) nonbinary, and 7.39% (578/7821) are unsure or have missing data. Approximately half (52.0%) of the cohort was assigned female sex at birth, and 5.4% (421/7821) are living with HIV infection. CONCLUSIONS: LEGACY is an unprecedented opportunity to evaluate the impact of medical gender affirmation on HIV-related health. The study uses a comprehensive research methodology linking TGD patient biobehavioral longitudinal data from multiple sources. Patient-centeredness and scientific rigor are assured through the ongoing engagement of TGD communities, clinicians, scientists, and site clinical staff undergirded by epidemiological methodology. Findings will inform evidence-based clinical care for TGD patients, including optimal interventions to improve HIV-related outcomes. INTERNATIONAL REGISTERED REPORT IDENTIFIER (IRRID): DERR1-10.2196/24198. Article	2021	Reisner, Sari L; Moore, Chiara S; Asquith, Andrew; Pardee, Dana J; Mayer, Kenneth H	The Pre-Exposure Prophylaxis Cascade in At-Risk Transgender Men Who Have Sex with Men in the United States.	LGBT Health	-	-	-	-	2325-8306	10.1089/lgbt.2020.0232	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8195872	Purpose: This analysis was designed to characterize the pre-exposure prophylaxis (PrEP) cascade in a U.S. national sample of transgender men and trans masculine adults who have sex with cisgender men (trans MSM) at-risk for HIV acquisition. Methods: From November to December 2017, 843 HIV-negative trans MSM self-reporting past-6-month receptive sex with a cisgender man were recruited via peer referrals, dating apps, listservs, and social media. A computer-assisted self-interview assessed demographics, health care, and the PrEP cascade. Descriptive statistics and multivariable regression models evaluated factors associated with PrEP uptake and persistence. Results: Mean age was 28.1 years (standard deviation = 7.1); 4.8% were Black, 21.7% Latinx, and 25.6% another race/ethnicity. A total of 84.1% had heard of PrEP, with 67.3% reporting interest. More than half (55.2%) were PrEP indicated, of which 50.8% were PrEP naive. Approximately 1/4 (28.0%) reported PrEP use, of which 65.3% were PrEP persistent. PrEP modality preferences were injectable (51.2%), daily oral pill (22.1%), and anal gel/lube (14.6%). Reasons for PrEP noninterest were no HIV risk (68.5%), cost (24.2%), and side effects (20.1%). Surgical gender affirmation, no health care discrimination, and social media as a primary health information source were associated with increased odds of PrEP uptake and persistence (all p < 0.05). PrEP adherence difficulties were reported by 52.6%, due to busy/inconsistent schedule (53.1%), side effects (27.4%), and too many medical visits (11.6%). Conclusion: PrEP uptake was modest among the trans MSM sampled, given prevalent HIV risk behaviors. The limited PrEP uptake in at-risk trans MSM suggests the need to develop culturally tailored community education and interventions. Article	2021	Resnick, Daniel; Morales, Knashawn; Gross, Robert; Petsis, Danielle; Fiore, Danielle; Davis-Vogel, Annet; Metzger, David; Frank, Ian; Wood, Sarah	Prior Sexually Transmitted Infection and Human Immunodeficiency Virus Risk Perception in a Diverse At-Risk Population of Men Who Have Sex with Men and Transgender Individuals.	AIDS Patient Care and STDs	-	-	-	-	1557-7449	10.1089/apc.2020.0179	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7826433	Prior sexually transmitted infections (STIs) are associated with higher rates of subsequent human immunodeficiency virus (HIV) infection, but the influence of prior STIs on perceived vulnerability to HIV remains unclear. We aimed to assess this relationship, hypothesizing that a prior STI diagnosis is associated with higher self-assessed vulnerability to HIV. We performed a cross-sectional study of men and transgender individuals who have sex with men screening for HIV prevention trials in Philadelphia. An unadjusted regression analysis found no significant association between prior STI and HIV risk perception (p = 0.71) or HIV anxiety (p = 0.32). Multivariate logistic regression models that controlled for predetermined potential cofounders known to impact HIV risk-such as condom use, preexposure prophylaxis use, and demographics-also failed to show statistically significant associations between prior STI and HIV risk perception (p = 0.87) or HIV anxiety (p = 0.10). Furthermore, there was no effect modification by HIV preventive behaviors on the relationship between prior STI and HIV vulnerability. These data suggest that a gap exists between how clinicians may attribute individual HIV risk and how individuals view their own vulnerability at a given moment in time. Future research should focus on the dynamic relationship between perceived HIV vulnerability, STI diagnosis, and adoption of preventive behavior to determine better, individualized targets for HIV prevention interventions. Article	2021	Restar A.J.; Surace A.; Jin H.; Edeza A.; Ogunbajo A.; Goedel W.C.; Adia A.; Cu-Uvin S.; Operario D.	Integrating Pre- and Post-exposure Prophylaxes Programs for HIV Prevention Guidelines in Manila, Philippines	Sexuality Research & Social Policy	-	-	-	-	18689884	10.1007/s13178-020-00490-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85089446085&doi=10.1007%2fs13178-020-00490-6&partnerID=40&md5=eb236b8e5511d8ae4c18da47cd9fcc48	Introduction: Successful implementation and promotion of biomedical HIV prevention strategies like pre- and post-exposure prophylaxes (PrEP/PEP) necessitate healthcare workers possessing sufficient knowledge of and positive attitudes toward PrEP/PEP. Methods: Using semi-structured qualitative interviews conducted between July and August 2017, we examined PrEP/PEP awareness and attitudes among 15 healthcare workers as key informants in Manila, Philippines, where HIV is a rapidly expanding national public health crisis. Results: Most key informants had heard about PrEP (n = 11) and PEP (n = 14). High medication cost and low PrEP/PEP awareness were identified as major barriers for PrEP/PEP implementation. Others expressed concerns for viral resistance and greater risk compensation. Concerns about infrastructural issues such as problems with logistics and funding inequities were identified as potential barriers. Conclusion: Healthcare workers demonstrated awareness of PrEP/PEP and endorsed supportive attitudes toward PrEP/PEP but raised logistic and infrastructural concerns about implementation. Policy Implications: In order for PrEP/PEP to be feasible in the Philippines, public funding, provider education, and standardized national prescription protocols, guidelines, and policies are needed. Such recommendations and support should take into account concerns of and address prescribing barriers among future PrEP/PEP providers. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Reyniers T.; Rotsaert A.; Thunissen E.; Buffel V.; Masquillier C.; Van Landeghem E.; Vanhamel J.; Nöstlinger C.; Wouters E.; Laga M.; Vuylsteke B.	Reduced sexual contacts with non-steady partners and less PrEP use among MSM in Belgium during the first weeks of the COVID-19 lockdown: Results of an online survey	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2020-054756	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096069180&doi=10.1136%2fsextrans-2020-054756&partnerID=40&md5=24f3f9946f63112dceb42b2a0b3f39c1	Objectives To examine changes in the occurrence of physical sex with non-steady partners among men who have sex with men (MSM) in Belgium during the first weeks of the COVID-19 lockdown and associations with sociodemographic factors, sexual practices, drug, alcohol and pre-exposure prophylaxis (PrEP) use. A secondary objective was to explore changes in PrEP use and the need for PrEP follow-up. Methods A cross-sectional online survey. The questionnaire was available in Dutch, French and English, between April 10 and 27 (2020), and disseminated via sexual health and lesbian, gay, bisexual, trans, queer or intersex organisations throughout Belgium. Eligibility criteria included being 18 years or older, not being exclusively heterosexual and living or being born in Belgium. Results The sample included 694 MSM. Physical sex with non-steady partners decreased from 59.1% to 8.9% during the first weeks of the lockdown. Those who had sex with non-steady partners were significantly more likely to be HIV positive, to use PrEP or to have engaged in sexual practices such as group sex, chemsex and sex work before the lockdown, compared with their counterparts. Among those who used PrEP before the lockdown, 47.0% stopped using PrEP, 19.7% used event-driven PrEP and 33.3% used daily PrEP during the lockdown. Almost two-thirds of PrEP users had a PrEP care appointment in the weeks before the lockdown and a minority received follow-up elsewhere or online. Some PrEP users had concerns regarding their follow-up. Conclusions MSM in our survey substantially reduced sexual contact with non-steady partners during the first weeks of the COVID-19 lockdown, suggesting that the risk for HIV and STI transmission in this period was low. We recommend ensuring access to sexual health services, such as HIV testing and follow-up for PrEP for the small group having multiple sex partners and engaging in sexual practices such as chemsex, group sex, even in times of a pandemic threat. © 2021 BMJ Publishing Group. Article	2021	Reyniers T.; Zimmermann H.M.L.; Davidovich U.; Vuylsteke B.; Laga M.; Hoornenborg E.; Prins M.; De Vries H.J.C.; Nöstlinger C.	The social meanings of PrEP use – A mixed-method study of PrEP use disclosure in Antwerp and Amsterdam	Sociology of Health and Illness	-	-	-	-	1419889	10.1111/1467-9566.13283	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105786566&doi=10.1111%2f1467-9566.13283&partnerID=40&md5=8a3e7ebd18a6462764cc3555afd2c4c2	Pre-Exposure Prophylaxis (PrEP) is a novel HIV prevention tool. PrEP stigma is a frequently reported barrier, while social disclosure of PrEP use may be an important facilitator. We explored how PrEP users managed PrEP use disclosure using a symbolic interactionist approach. We interviewed 32 participants from two PrEP demonstration projects (Be-PrEP-ared, Antwerp; AMPrEP, Amsterdam). We validated qualitative findings through Be-PrEP-ared questionnaire data. A minority of participants had received negative reactions on PrEP. The way PrEP use was disclosed was highly dependent on the social situation. In a sexual context among MSM, PrEP use was associated with condomless sex. Friends endorsed PrEP use as a healthy choice, but also related it to carelessness and promiscuity. It was seldom disclosed to colleagues and family, which is mostly related to social norms dictating when it is acceptable to talk about sex. The study findings reveal that PrEP stigma experiences were not frequent in this population, and that PrEP users actively manage disclosure of their PrEP user status. Frequent disclosure and increased use may have helped PrEP becoming normalised in these MSM communities. To increase uptake, peer communication, community activism and framing PrEP as a health promotion rather than a risk-reduction intervention may be crucial. © 2021 Foundation for the Sociology of Health & Illness	disclosure; HIV prevention; MSM; Pre-Exposure Prophylaxis; social interaction; stigma	English	United Kingdom	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Belgium	Western and Central Europe and North America	Mixed methods
Article	2021	Reyniers Thijs; Nöstlinger Christiana; Vuylsteke Bea; De Baetselier Irith; Wouters Kristien; Laga Marie	The Impact of PrEP on the Sex Lives of MSM at High Risk for HIV Infection: Results of a Belgian Cohort	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-020-03010-0	https://www.proquest.com/scholarly-journals/impact-prep-on-sex-lives-msm-at-high-risk-hiv/docview/2483414181/se-2?accountid=8113	There is a need for an in-depth understanding of the impact of PrEP on users' sexual health and behaviour, beyond the focus on 'risk'. This mixed-method study was part of a Belgian PrEP demonstration project following 200 men who have sex with men (MSM) for at least 18 months. Taking a grounded-theory approach, 22 participants were interviewed and their transcripts analysed. The preliminary analysis guided the analysis of the questionnaire data. Overall, PrEP improved sexual health. Participants felt better protected against HIV, which enabled them to change their sexual behaviour. The reduction in condom use was moderated by interviewees' attitudes towards the risk for other STIs. Other changes included having more anal sex and experimentation with new sexual behaviours. While PrEP empowers MSM in taking care of their sexual health, comprehensive sexual health counselling is crucial to provide care for users who feel less in control over their sexual health. Evaluating locally developed interventions to promote PrEP among racially/ethnically diverse transgender women in the united states: A unique CDC initiative	AIDS Education and Prevention	-	-	-	-	8999546	10.1521/aeap.2021.33.4.345	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113469097&doi=10.1521%2faeap.2021.33.4.345&partnerID=40&md5=31534e2d28d9dfc9c95d59264945c76e	In the United States, transgender women are disproportionately affected by HIV. However, few evidence-based prevention interventions exist for this key population. We describe two promising, locally developed interventions that are currently being implemented and evaluated through the Centers for Disease Control and Prevention Combination HIV Prevention for Transgender Women Project: (a) ChiCAS, designed to promote the uptake of pre-exposure prophylaxis (PrEP), condom use, and medically supervised hormone therapy among Spanish-speaking transgender Latinas, and (b) TransLife Care, designed to address the structural drivers of HIV risk through access to housing, employment, legal services, and medical services, including HIV preventive care (e.g., PrEP use) among racially/ethnically diverse urban transgender women. If the evaluation trials determine that these interventions are effective, they will be among the first such interventions for use with transgender women incorporating PrEP, thereby contributing to the evidence-based resources that may be used to reduce HIV risk among this population. © 2021 The Guilford Press. Article	2021	Ribeiro, Rafaela; Sarmento, Bruno; das Neves, José	Production and Characterization of Anti-CCR5 siRNA-Loaded Polycaprolactone Nanoparticles for Topical Pre-exposure Prophylaxis.	Methods in Molecular Biology	-	-	-	-	1940-6029	10.1007/978-1-0716-1298-9_22	https://dx.doi.org/10.1007/978-1-0716-1298-9_22	Topical posttranscriptional silencing of host factors involved in HIV-1 sexual transmission, such as CCR5, presents the potential to prevent new cases of infection. However, issues concerning proper engineering of safe and effective delivery systems for anti-CCR5 siRNA may impair the ability to yield suitable silencing at the mucosal level. Here we describe the production protocol of anti-CCR5 siRNA-loaded polycaprolactone-based nanoparticles (≈100 nm). Furthermore, we present data regarding the physicochemical and in vitro biological characterization of obtained nanosystems, which support their potential as microbicide candidates for topical pre-exposure prophylaxis of HIV-1 infection. Article	2021	Ridgway J.P.; Friedman E.E.; Bender A.; Schmitt J.; Cronin M.; Brown R.N.; Johnson A.K.; Hirschhorn L.R.	Evaluation of an Electronic Algorithm for Identifying Cisgender Female Pre-Exposure Prophylaxis Candidates	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2020.0231	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099024268&doi=10.1089%2fapc.2020.0231&partnerID=40&md5=e8237d35abbb4a6b80b51b62cfe5eab2	We previously developed an electronic medical record-based algorithm for identifying patients at risk for HIV in the emergency department (ED). The aim of this study was to evaluate the performance of the HIV risk algorithm for identifying cisgender women with a pre-exposure prophylaxis (PrEP) indication. To retrospectively evaluate the HIV risk algorithm, we identified cisgender women with HIV diagnosed in the ED and retrospectively calculated the HIV risk algorithm output. To prospectively validate the algorithm, we surveyed cisgender women seeking care in the ED regarding behavioral risks for HIV. We prospectively determined whether the algorithm identified them as PrEP candidates. In the retrospective evaluation, 9.4% (2/21) of women with incident HIV infection were identified as at risk for HIV by the algorithm. In the prospective evaluation, 24% (59/245) of women who completed the survey had a PrEP indication based on self-report of behavioral risk factors for HIV. The sensitivity of the algorithm for identifying cisgender female PrEP candidates was 10%, and the specificity was 96%. PrEP indications missed by the electronic algorithm included condomless sex in a high HIV prevalence area, multiple sex partners, male partners who have sex with men, and recent bacterial sexually transmitted infections diagnosed at outside clinics. An electronic algorithm to identify PrEP candidates in the ED has low sensitivity for identifying cisgender women with PrEP indications. More research is needed to identify electronic data that can improve the algorithm sensitivity among cisgender women. © Copyright 2021, Mary Ann Liebert, Inc., publishers 2021.	algorithms; electronic medical records; pre-exposure prophylaxis; women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Rivera, David B; Brady, John P; Blashill, Aaron J	Traditional Machismo, Caballerismo, and the Pre-Exposure Prophylaxis (PrEP) Cascade Among a Sample of Latino Sexual Minority Men.	Journal of Sex Research	-	-	-	-	1559-8519	10.1080/00224499.2020.1743961	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7541641	Between 2010 and 2017, HIV diagnoses increased 17% among Latino sexual minority men (SMM) while decreasing 19% among White SMM and stabilizing among African American SMM. Traditional machismo is characterized by aggressiveness/power; caballerismo consists of family values/chivalry. Latino SMM high in traditional machismo may avoid seeking Pre-Exposure Prophylaxis (PrEP) to prevent being stigmatized as effeminate. Latino SMM high in caballerismo may be more likely to use PrEP to remain healthy for their family and/or partners. The current study explored the association between traditional machismo and caballerismo with four steps of the PrEP cascade. Participants were 151 HIV-negative/unknown Latino SMM living in San Diego, California (M = 24.18 years old) who completed an online study. Traditional machismo was associated with low odds of PrEP awareness, willingness, and adherence and high odds of PrEP use. Caballerismo was associated with greater odds of PrEP awareness, willingness, use, and adherence. High levels of traditional machismo among Latino SMM may be a barrier to PrEP. Caballerismo may be a facilitator of PrEP awareness, willingness, use, and adherence. Programs which serve to move Latino SMM through the PrEP cascade may benefit from discussing culturally-relevant masculinity given the potential for their differential associations with PrEP variables. Article	2021	Robertson J.; Edén A.; Nyström K.; Hagberg L.; Yilmaz A.; Gostner J.M.; Fuchs D.; Nilsson S.; Blennow K.; Zetterberg H.; Gisslén M.	Increased immune activation and signs of neuronal injury in HIV-negative people on preexposure prophylaxis	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000002980	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118096119&doi=10.1097%2fQAD.0000000000002980&partnerID=40&md5=40e8cebff321e3c305853e84d5f91f26	Objective:Persistent immune activation in the central nervous system and systemically are common in people living with HIV (PLHIV) despite antiretroviral therapy. It is not known whether this is generated by HIV replication or by other components such as coinfections and lifestyle-related factors.Design:The aim of this study was to determine the importance of different factors; it is crucial to find well matched HIV-negative controls. In this context, HIV-negative persons on preexposure prophylaxis (PrEP) may constitute a suitable control group to PLHIV with similar lifestyle-related factors.Methods:Cerebrospinal fluid (CSF) and blood were collected from 40 HIV-negative persons on PrEP and 20 controls without PrEP. Biomarkers of immune activation, blood - brain barrier (BBB) integrity and neuronal injury were analysed.Results:CSF and serum β2-microglobulin, serum neopterin and CSF neurofilament light protein were higher in persons on PrEP compared with controls. Furthermore, persons on PrEP had higher CSF/plasma albumin ratio, and matrix metalloproteinase-3 concentrations, indicating BBB dysfunction. Of persons on PrEP, 90% were cytomegalovirus (CMV)-positive compared to 65% of the controls. CMV-positive individuals as a group had higher levels of serum β2-microglobulin than CMV-negative individuals (P<0.05). Drug users had higher serum β2-microglobulin compared to nonusers (P<0.01).Conclusion:HIV-negative persons on PrEP had higher levels of biomarkers for immune activation, BBB impairment and neuronal injury, compared with volunteers without PrEP. Moreover, serum β2-microglobulin was higher in CMV-positive than in CMV-negative individuals and in drug users compared with nonusers. These findings are important to consider when analysing immune activation and CNS injury in PLHIV, and emphasize the importance of appropriate controls. © Copyright 2021 Wolters Kluwer Health, Inc. Article	2021	Robles, Gabriel; Sauermilch, Daniel; Gandhi, Monica; Starks, Tyrel J	PrEP Demonstration Project Showed Superior Adherence with Tenofovir Alafenamide/Emtricitabine Compared to Tenofovir Disoproxil Fumarate/Emtricitabine in a Sample of Partnered Sexual Minority Men.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-020-03095-7	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7979438	Sexual minority men (SMM) remain at high risk of HIV infection in the United States, and for those in relationships, dyadic functioning may contextualize prevention decisions. Pre-exposure prophylaxis (PrEP) for HIV prevention was previously limited to tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) until the FDA approved tenofovir alafenamide/FTC (TAF/FTC) for PrEP in 2019. Data regarding substance use, sexual behavior, holding an active PrEP prescription, and type of PrEP regimen (TDF/FTC versus TAF/FTC) were analyzed from a sample of 421 partnered SMM. The majority of the sample on PrEP reported a TDF/FTC prescription as opposed to TAF/FTC. However, SMM reported significantly better adherence to TAF/FTC than TDF/FTC in multivariable models. Novelty of TAF/FTC, treatment fatigue with TDF/FTC, and/or a belief in TAF/FTC's superior efficacy and mitigated side effects may be plausible contributing factors. More studies using objective adherence metrics and surveys are needed.	Adherence; HIV; Pre-exposure prophylaxis; Sexual minority men. Article	2021	Roche S.D.; Odoyo J.; Irungu E.; Kwach B.; Dollah A.; Nyerere B.; Peacock S.; Morton J.F.; O'Malley G.; Bukusi E.A.; Baeten J.M.; Mugwanya K.K.	A one-stop shop model for improved efficiency of pre-exposure prophylaxis delivery in public clinics in western Kenya: a mixed methods implementation science study	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25845	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122058946&doi=10.1002%2fjia2.25845&partnerID=40&md5=1aa610683314a0674c3a36c7d536ad7c	Introduction: In public clinics in Kenya, separate, sequential delivery of the component services of pre-exposure prophylaxis (PrEP) (e.g. HIV testing, counselling, and dispensing) creates long wait times that hinder clients' ability and desire to access and continue PrEP. We conducted a mixed methods study in four public clinics in western Kenya to identify strategies for operationalizing a one-stop shop (OSS) model and evaluate whether this model could improve client wait time and care acceptability among clients and providers without negatively impacting uptake or continuation. Methods: From January 2020 through November 2020, we collected and analysed 47 time-and-motion observations using Mann–Whitney U tests, 29 provider and client interviews, 68 technical assistance reports, and clinic flow maps from intervention clinics. We used controlled interrupted time series (cITS) to compare trends in PrEP initiation and on-time returns from a 12-month pre-intervention period (January–December 2019) to an 8-month post-period (January–November 2020, excluding a 3-month COVID-19 wash-out period) at intervention and control clinics. Results: From the pre- to post-period, median client wait time at intervention clinics dropped significantly from 31 to 6 minutes (p = 0.02), while median provider contact time remained around 23 minutes (p = 0.4). Intervention clinics achieved efficiency gains by moving PrEP delivery to lower volume departments, moving steps closer together (e.g. relocating supplies; cross-training and task-shifting), and differentiating clients based on the subset of services needed. Clients and providers found the OSS model highly acceptable and additionally identified increased privacy, reduced stigma, and higher quality client–provider interactions as benefits of the model. From the pre- to post-period, average monthly initiations at intervention and control clinics increased by 6 and 2.3, respectively, and percent of expected follow-up visits occurring on time decreased by 18% and 26%, respectively; cITS analysis of PrEP initiations (n = 1227) and follow-up visits (n = 2696) revealed no significant difference between intervention and control clinics in terms of trends in PrEP initiation and on-time returns (all p>0.05). Conclusions: An OSS model significantly improved client wait time and care acceptability without negatively impacting initiations or continuations, thus highlighting opportunities to improve the efficiency of PrEP delivery efficiency and client-centredness. © 2021 The Authors. Article	2021	Roche S.D.; Wairimu N.; Mogere P.; Kamolloh K.; Odoyo J.; Kwena Z.A.; Bukusi E.A.; Ngure K.; Baeten J.M.; Ortblad K.F.	Acceptability and Feasibility of Pharmacy-Based Delivery of Pre-Exposure Prophylaxis in Kenya: A Qualitative Study of Client and Provider Perspectives	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03229-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103949331&doi=10.1007%2fs10461-021-03229-5&partnerID=40&md5=a5fcd3191ccf398e3a4d2d5f8f5d1239	As countries scale up pre-exposure prophylaxis (PrEP) for HIV prevention, diverse PrEP delivery models are needed to expand access to populations at HIV risk that are unwilling or unable to access clinic-based PrEP care. To identify factors that may influence implementation of retail pharmacy-based PrEP delivery in Kenya, we conducted in-depth interviews with 40 pharmacy clients, 16 pharmacy providers, 16 PrEP clients, and 10 PrEP providers from two provinces. Most participants expressed strong support for expanding PrEP to retail pharmacies, though conditioned their acceptance on assurances that care would be private, respectful, safe, and affordable. Participant-reported determinants of feasibility centered primarily on ensuring that the intervention is compatible with retail pharmacy operations (e.g., staffing levels, documentation requirements). Future research is needed to develop and test tailored packages of implementation strategies that are most effective at integrating PrEP delivery into routine pharmacy practice in Kenya and other high HIV prevalence settings. © 2021, The Author(s). Article	2021	Rodriguez K.; Kelvin E.A.; Grov C.; Meyers K.; Nash D.; Wyka K.	Exploration of the Complex Relationships Among Multilevel Predictors of PrEP Use Among Men Who Have Sex with Men in the United States	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-020-03039-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85091147051&doi=10.1007%2fs10461-020-03039-1&partnerID=40&md5=ea125d1ee0bf58cff2056363ba07080	To explore the relationships among individual-, social-, and contextual- (state-level characteristics, including LBGTQ + and racial inequality) level factors and PrEP use. A cross-sectional survey was conducted in 2015–2016 among a geographically diverse group of men who have sex with men (MSM). Survey data was linked to publicly available state-level data based on participant zip code. Multivariable multilevel logistic regression was used to explore the association between multilevel variables and PrEP use. Of 4165 HIV-negative MSM, 13.4% were taking PrEP. In the regression analysis, several demographic and behavioral factors were associated with higher odds of PrEP use. Importantly, after adjusting for individual- and social-level factors, residents of states with high LGBTQ + equality had significantly higher odds of taking PrEP (OR 1.57; 95% CI 1.119, 2.023) compared to low equality states. LGBTQ + inequality between states may hinder PrEP use. States may need to take proactive measures to reduce LGBTQ + inequality as this may negatively impact the ability to reach the federal administration's stated goal to end the HIV epidemic in the US. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Rossler S.; Sharpe J.D.; Pasupuri S.; Sanchez T.; Zlotorzynska M.; Jones J.	Differences in PrEP Awareness, Discussions with Healthcare Providers, and Use Among Men Who Have Sex with Men in the United States by Urbanicity and Region: A Cross-sectional Analysis	AIDS and Behavior	-	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105049356&doi=10.1007%2fs10461-021-03267-x&partnerID=40&md5=40a0bb5314fa6e85392f6348d39193b7	10907165	10.1007/s10461-021-03267-x		Pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention intervention and is critical to the Ending the HIV Epidemic strategy. Most PrEP research has been conducted among urban populations; less is known about PrEP awareness, willingness to use, and actual use among rural and suburban populations. We examined three PrEP indicators by United States region and urbanicity: awareness among men who have sex with men who responded to the 2019 cycle of the American Men's Internet Survey. Rural and suburban men were less likely than urban men to be aware of PrEP, to have discussed PrEP with a healthcare provider in the past 12 months, and to have ever used PrEP. Smaller differences were observed across regions. Notably, willingness to use PrEP was similar across region and urbanicity. Additional work will be needed to increase PrEP awareness and access among rural and suburban populations. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Roth, Alexis M; Tran, Nguyen K; Felker, Marisa; Gadegbeku, Annette B; Piecara, Brogan; Fox, Rachel; Krakower, Douglas S; Bellamy, Scarlett L; Juneau, K River; Bomkamp, Jesse A; Van Der Pol, Barbara	Integrating HIV Preexposure Prophylaxis With Community-Based Syringe Services for Women Who Inject Drugs: Results From the Project SIDE Demonstration Study	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7876321/	1944-7884	10.1097/QAI.0000000000002558		INTRODUCTION: To guide future preexposure prophylaxis (PrEP) implementation for women who inject drugs (WWID), a population increasingly represented in new HIV cases in the United States, we present results from a demonstration project integrated within a syringe services program (SSP) in Philadelphia, PA. METHODS: WWID ≥18 years were educated about and offered 2-8 weeks of daily PrEP. Participants completed surveys and clinical assessments at baseline and at weeks 1, 3, 12, and 24. We used descriptive statistics to estimate feasibility/acceptability, engagement in the care cascade, HIV-sexually transmitted diseases (STI) and pregnancy, issues of safety/tolerability, and preferences/satisfaction with PrEP services. Multivariable logistic regression with generalized estimating equations was used to identify factors associated with PrEP uptake and retention. RESULTS: We recruited 136 WWID. Of these, 95 were included in the final sample, and 43 accepted a PrEP prescription at week 1. Uptake was associated with greater basal STI exposure (frequency of SSP access; elevated odds ratio (eOR) = 1.85; 95% confidence interval (CI): 1.24 to 2.77; inconsistent condom use (eOR = 3.38; 95% CI: 1.07 to 10.71; and experiencing sexual assault (eOR = 2.94; 95% CI: 1.02, 11.9). Of these 95, 42 (44.2%) were retained at week 24. Retention was higher among women who reported more frequent baseline SSP access (eOR = 1.85; 95% CI: 1.24 to 2.77) and those who were pregnant (eOR = 3.38; 95% CI: 1.07 to 10.71). Self-report of adherence was high (≥4 doses/week: 93%). There were no safety issues identified in pregnancy. Safety/tolerability issues were uncommon, and acceptability/satisfaction was high. CONCLUSIONS: Integrating PrEP with SSP services is feasible and acceptable for WWID. This suggests that daily PrEP is a viable prevention tool for this vulnerable population. Article	2021	Roth, Maria Julia de Moraes; Campos, Valderrama, Mariana Rothermel; Acess, Julia Schernberger; Moro, Marjorie Geetz; Lehenkiel, Jules Victor Borges; Pazin, Dianne Cristina	Analysis of sexually transmitted infections in PrEP users: population assessment in Curitiba, Brazil	DST- Journal of Brazilian Sexually Transmitted Diseases	-	-	-	-	https://www.bjstd.org/site/article/view/1178/1153	0103-4065	10.5327/DST-2177-8264-2021133331		INTRODUCTION: The pre-exposure prophylaxis (PrEP) is a globally recognized pharmacological approach, consisting of a daily dose of antiretroviral drugs used to reduce the contamination rate by the human immunodeficiency virus (HIV). This combined prevention program was first offered by the Brazilian public health system in 2017 and was provided by Testing and Counseling Centers. Objective: To analyze the profile of pre-exposure prophylaxis users seen at Testing and Counseling Centers in Curitiba (state of Paraná, Brazil) and the presence of HIV and other sexually transmitted infections, such as syphilis, hepatitis B or C, in these users. Methods: This is an analytical, cross-sectional study, using database provided by the information system of the Testing and Counseling Centers. Data from users of HIV pre-exposure prophylaxis are mostly young, white, single men, and who are part of the group of men who have sex with other men. It was verified that, even though the HIV pre-exposure prophylaxis plays a major role in HIV prevention, it is paramount to encourage combined prevention, considering there is a significant relationship between the lack of barrier methods and positive results for syphilis. Conclusion: No connection between the use of HIV pre-exposure prophylaxis and increased incidence of sexually transmitted infections was established in the present study. Article	2021	Rousseau E.; Bekker L.-G.; Jules R.F.; Cohen C.; Morton J.; Johnson R.; Barnes J.M.; O'Malley G.	A community-based mobile clinic model delivering PrEP for HIV prevention to adolescent girls and young women in Cape Town, South Africa	BMC Health Services Research	-	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113630968&doi=10.1186%2fs12913-021-06920-4&partnerID=40&md5=3ca4a81a7970daa4db77b1e3430f12e	14726963	10.1186/s12913-021-06920-4		Background: Daily doses of pre-exposure prophylaxis (PrEP) can reduce the risk of acquiring HIV by more than 95 %. In sub-Saharan Africa, adolescent girls and young women (AGYW) are at disproportionately high risk of acquiring HIV, accounting for 25 % of new infections. There are limited data available on implementation approaches to effectively reach and deliver PrEP to AGYW in high HIV burden communities. Methods: We explored the feasibility and acceptability of providing PrEP to AGYW (aged 16–25 years) via a community-based mobile clinic (CMBC) known as the Tsoa Tsoa Tsoa (TTT) in Cape Town, South Africa. The TTT integrated PrEP delivery into its provision of comprehensive sexual and reproductive health services (SRHS). We analyzed data from community meetings and in-depth interviews with 20 AGYW PrEP users to understand the barriers and challenges of PrEP delivery in this context. Results: A total of 389 young women started PrEP at the TTT between July 2017 - October 2019. During in-depth interviews a subset of 30 AGYW described the CMBC intervention for PrEP delivery as acceptable and accessible. The TTT provided services at times and in neighborhood locations where AGYW organically congregate, thus facilitating service access and generating peer demand for PrEP uptake. The community-based nature of the CMBC, in addition to its adolescent-friendly health providers, fostered a trusting provider-community-client relationship and strengthened AGYW HIV prevention self-efficacy. The integration of PrEP and SRHS service delivery was critical to AGYW PrEP uptake. The TTT's community meetings and in-depth interviews revealed that AGYW experienced challenges with PrEP adherence, including forgetting to take PrEP during weather conditions/ also at times interrupted PrEP delivery. Conclusions: PrEP delivery from a CMBC is feasible and acceptable to young women in South Africa. However, to effectively scale-up PrEP it will be necessary to develop diverse PrEP delivery locations and modalities to meet AGYW HIV prevention needs. © 2021, The Author(s). Article	2021	Rousseau E.; Jules R.F.; Madubela N.; Kassim S.	Novel Platforms for Biomedical HIV Prevention Delivery to Key Populations — Community Mobile Clinics, Peer-Supported, Pharmacy-Led PrEP Delivery, and the Use of Telemedicine	Current HIV/AIDS Reports	-	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117901614&doi=10.1007%2fs11904-021-00578-7&partnerID=40&md5=c2fb70ef51f6c2e0dbe99f57c105f7a	15483568	10.1007/s11904-021-00578-7		Purpose of Review: A gap exists between PrEP interest and PrEP uptake in key populations (KP) for HIV prevention that may be ascribed to PrEP delivery services not being acceptable. This review summarizes novel platforms for HIV prevention outside of the traditional health facility-bias environment. Recent Findings: Mobile health clinics provide highly acceptable and effective PrEP services that overcome inconvenient locations with the potential of high PrEP uptake. Telemedicine and health apps decongest health systems and allow for personal agency and informed decision-making on personal health. Pharmacy-led PrEP delivery is a feasible, acceptable, and cost-effective model that could substantially increase PrEP coverage among populations who frequent pharmacies for medications and other services. Summary: Community-based, differentiated and de-medicalized PrEP delivery can address uptake and continued use barriers in key populations. Future research should assess scalability, cost-effectiveness and sustainability of these PrEP delivery platforms, as well as focus on ways to simplify PrEP provision. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Rousseau E.; Katz A.W.K.; O'Rourke S.; Bekker L.-G.; Delany-Moretlwe S.; Bukusi E.; Travill D.; Omollo V.; Morton J.F.; O'Malley G.; Haberer J.E.; Heffron R.; Johnson R.; Celum C.; Barnes J.M.; van der Straten A.	Adolescent girls and young women's PrEP user journey during an implementation science study in South Africa and Kenya	PLOS One	-	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117342862&doi=10.1371%2fjournal.pone.0250542&partnerID=40&md5=4abee5085e0c31a9b8d1896a2e4bea7	19326203	10.1371/journal.pone.0250542		Successful scale-up of PrEP for HIV prevention in African adolescent girls and young women (AGYW) requires integration of PrEP into young women's everyday lives. We conducted interviews and focus group discussions with 37 AGYW PrEP users ages 16–25 from South Africa and Kenya. Individual-level relational enablers and deterrents were explored to map PrEP user journey from awareness, initiation and early use through persistence, including PrEP pauses, restarts, and discontinuation. PrEP uptake was facilitated when offered as part of an integrated sexual reproductive health intervention, and when supported by interventions addressing stigma about PrEP in the community. Daily pill-taking was challenging for AGYW due to individual, relational and structural barriers. Lack of PrEP interruptions (intended or unintended) were described as part of AGYWs PrEP-user journey. Disclosure, social support, adolescent-friendly health counseling, and convenient access to PrEP were reported as key enablers for PrEP persistence. © 2021 Rousseau et al. Article	2021	Rowan S.E.; Patel R.R.; Schneider J.A.; Smith D.K.	Same-day prescribing of daily oral pre-exposure prophylaxis for HIV prevention	The Lancet HIV	-	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096022066&doi=10.1016%2f2352-3018%2820%2930225-1&partnerID=40&md5=3d1e94cc4c14a1e089d6b1765a0fe8b9	23523018	10.1016/S2352-3018(20)30225-1		Pre-exposure prophylaxis (PrEP) is highly effective in reducing HIV transmission but remains underutilised globally. Same-day PrEP prescribing and medication provision is an emerging implementation approach, but data on its safety and effectiveness are limited. We describe the first clinical experience of same-day PrEP prescribing in the USA, where patients were initiated on PrEP before laboratory tests or results were available. Same-day PrEP has the potential to facilitate access to PrEP and to address the attrition seen in usual care between initial evaluation and receipt of a PrEP prescription. A widespread application of same-day prescribing will be needed to assess its effect on PrEP usage. © 2021 Elsevier Ltd		English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2021	Ruppe L.B.; Spencer L.A.; Krebs J.M.	Pre-Exposure Prophylaxis for HIV Infection and the Role of the Women's Health Care Provider in HIV Prevention	Journal of Midwifery and Women's Health	-	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107125681&doi=10.1111%2fjmwh.13231&partnerID=40&md5=2a6e0f3368dc0f1b0a5f0cc5d70a7f8a3	15269523	10.1111/jmwh.13231		HIV infection is a major public health problem for women in the United States. Prevention of new HIV infections is essential to the goal of eliminating HIV in the United States. Pre-exposure prophylaxis (PrEP) is an effective and safe HIV prevention method recommended for women at increased risk for HIV infection, including during pregnancy and lactation. PrEP regimen is a fixed-dose combination of tenofovir disoproxil fumarate and emtricitabine administered as a single daily dose. The initial evaluation for individuals desiring PrEP for HIV prevention includes obtaining a history, laboratory testing, and evaluation of the medication's safety and acceptability of PrEP. Individuals using PrEP medications are seen every 3 months for follow-up. These follow-up visits also include evaluating for adverse signs and symptoms of seroconversion, management of side effects and adverse reactions, and evaluation of adherence to PrEP. Follow-up visits also include testing for HIV, sexually transmitted infections, and renal function and a review of HIV prevention and risk reduction methods. Despite known safety and efficacy of PrEP among women, PrEP use in women in the United States remains low. Gaps exist in HIV prevention that can in part be addressed by women's health care providers through risk screening and provision of HIV prevention methods. All providers of comprehensive sexual health care can and should assess individuals for risk factors for HIV infection and offer HIV prevention methods, including PrEP, to individuals at risk for HIV. © 2021 by the American College of Nurse-Midwives. Article	2021	Russ S.; Zhang C.; Lu V.	Pre-Exposure Prophylaxis Care Continuum, Barriers, and Facilitators among Black Men Who Have Sex with Men in the United States: A Systematic Review and Meta-Analysis	AIDS and Behavior	-	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098927045&doi=10.1007%2fs10461-020-03136-4&partnerID=40&md5=1630f7ada56ade7d0f6fcbbe2a204e7c	10907165	10.1007/s10461-020-03136-4		Pre-exposure prophylaxis (PrEP) represents a viable HIV prevention tool for black men who have sex with men (BMSM). However, aggregated evidence regarding the presentations and determinants of the PrEP continuum (e.g., awareness, willingness, intention, uptake and adherence) remains absent to empirically inform future intervention efforts. We meta-analyzed the proportion of BMSM who qualitatively synthesized key barriers/facilitators of the stages of the PrEP continuum among a pooled sample of 42,870 BMSM aggregated from 56 published studies. Our random-effect models indicated a substantial proportion of BMSM were aware of PrEP (78.2%, 95% CI: 72.2 to 83.4%) and uptake (35.9%, 95% CI: 25.2 to 48.1%) and uptake (35.9%, 95% CI: 25.2 to 48.1%). Qualitative summary revealed that perception of HIV risk, intersectional/PrEP-related stigma and medical mistrust were among the most agreed factors that influence PrEP use. BMSM's racialized, multidimensional key stages of the PrEP continuum. Futures interventions are continuously needed to target multilevel barriers/facilitators to enhance the PrEP continuum among BMSM. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Saeed S.; Goldman M.; Uricanin S.; O'Brien S.F.	Evaluation of a pre-exposure prophylaxis (PrEP)/post-exposure prophylaxis (PEP) deferral policy among blood donors	Transfusion	-	-	-	-	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8321707/	411132	10.1111/trf.16349		Background: The use of pre–/post-exposure prophylaxis (PrEP/PEP) may interfere with routine HIV screening. As a result, blood services worldwide have adopted a variety of deferral policies to mitigate increased residual risk. In this study, we evaluated the quarantined impact of modifying the donor health questionnaire (DHQ) to include explicit questions to assess PrEP/PEP exposure. Study Design and Methods: Using a quasi-experimental design, we compared the number of HIV-positive donations, the number of donations deferred, and the number of donations quarantined between a standard-of-care PrEP/PEP deferral period and a self-reported PrEP/PEP extra and then indications for use. We also assessed deferral rates and the sensitivity of using existing risk questions to defer people exposed to PrEP/PEP. Results: Of 1,122,075 donations, 89 people (eight per 100,000 donations) reported PrEP (64%)/PEP (36%) use in the last 4 months. People exposed to PrEP were more likely to be men (94%) and taking PrEP for lifestyle reasons (87%). In contrast, indications for PEP use included occupational exposure (50%) and sexual assault (27%). Most donors who answered affirmatively to PrEP/PEP exposure were deferred (96%). If potential donors were not directly asked about their PrEP/PEP use, the majority would not have been deferred for any other reasons (PrEP 32/57 (56%) and PEP 15/30 (50%)). Conclusion: Not all blood services have adopted direct questions to identify PrEP/PEP exposure; some rely on existing DHQ questions. In Canada, despite DHQ questions such as medication use in the last 3 days, more than half of people exposed to PrEP/PEP would not have been identified and deferred. © 2021 AABB	deferrals; donors; pre-exposure prophylaxis; PrEP; residual HIV risk	English	United States	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Quantitative
Article	2021	Sahay, Seema; Verma, Archana; Shewale, Sahas; Banger, Sampada; Bijralshruti, Athokpam; Angadkar, Mubsshir; Sharmaan, Thilakavathi; Chandhok, Nonita	Understanding issues around use of oral pre exposure prophylaxis among female sex workers in India.	BMC Infectious Diseases	-	-	-	-	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8126480/	1471-2334	10.1186/s12879-021-06612-0		BACKGROUND: Empowering female sex workers (FSWs) through women controlled HIV prevention option has been in focus globally. FSWs are important target for oral pre exposure prophylaxis (PrEP). A multi-centric qualitative study was conducted to explore the FSWs willingness to use oral PrEP in India. METHODS: Seventy three interviews and 02 focus group discussions were conducted at 3 high HIV prevalent states in India during 2013-14. Study explored issues around willingness to use oral PrEP. The study was approved by the respective institutional ethics committees of the study sites. Thematic analysis was done using framework approach. RESULTS: Willingness to use oral PrEP was influenced by perceived HIV risk, perceived efficacy, safety, side effects, cost, dosing frequency, ease of use, independence, financial gains, and privacy and therefore hoped to use it as an alternative to male condom. However, any impact on physical/ aesthetic attributes and reproductive system were not acceptable and could become a barrier. Provider initiated oral PrEP was not preferred. Providers voiced safety monitoring concerns. Adherence emerged as a challenge because of (1) alcohol use; (2) taking PrEP tablet each day being 3 (3) Stigma because Oral PrEP is ARV based. Alcohol use and dread of repetitive dose brings forth the need for long acting oral PrEP. CONCLUSION: Oral PrEP is acceptable among FSWs; it should be rolled out alongside strong messages on STI protection and PrEP as compliment to condoms. PrEP roll out requires educating communities about HIV treatment versus prevention. Long-acting oral PrEP could address both boredom/ and alcoholism and sustain adherence.	*Human immunodeficiency virus infection /drug therapy /prevention; *antiretroviral therapy; *breast feeding; *clinical trial protocol; *medication compliance; *pregnant women; *pre-exposure prophylaxis; Adult; Anti-HIV Agents therapeutic use; Article; Breast Feeding; Clinical assessment; Clinical outcome; Controlled study; Drug monitoring; Drug safety; Female; HIV Infections drug therapy; prevention & control; High risk population; Human; Human immunodeficiency virus; Human immunodeficiency virus infected patient; Humans; Infectious Disease Transmission, Vertical prevention & control; Major clinical study; Maternal Exposure; Medication Adherence; Multicenter Study; Outcome Assessment; Patient compliance; Patient satisfaction; Pilot Projects; Pilot study; Practice guideline; Pregnancy; Pre-Exposure Prophylaxis; Program acceptability; Randomized Controlled Trials as Topic; Randomized controlled trial; Retention in care; Virus load	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Schneider J.A.; Young L.; Ramachandran A.; Michaels S.; Cohen H.; Robinson I.; Alon L.; Hill B.; Nakasone S.; Balenciaga M.; Morley D.; Bouris A.; Khanna A.; Ferreira M.; Valente T.; Schumm P.	A Pragmatic Randomized Controlled Trial to Increase PrEP Uptake for HIV Prevention: 55-Week Results From PrEPClinic	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098475990&doi=10.1097%2fQAI.0000000000002518&partnerID=40&md5=5c7737a3e9ba84ed95eaeda8d0f8f4	15254135	10.1097/QAI.0000000000002518		Objectives:We tested preliminary efficacy of a peer change agent type I network intervention to increase pre-exposure prophylaxis (PrEP) linkage to care among network members connected to young Black men who have sex with men.Design:Parent study is a pragmatic randomized controlled trial with 110 weeks of total follow-up. Interim midpoint analyses are performed here using participants data before crossover assignment at 55 weeks.Methods:We randomly assigned 423 participants in Chicago to receive the network intervention, an opinion leader workshop with telephonic booster sessions, versus a time-matched control first from 2016 to 2018. The consolidated estimates report outcomes over PrEP referral and linkage to clinical care among network members connected to study participants and were collected from independent administrative data.Results:Each study participant in the trial (n = 423) had on average 1822 network contacts who could be eligible for PrEP referral and linkage. During the 55-week observation period, PrEP referral was more likely to occur within 3 days of an intervention session compared to control odds ratio (OR):107 (0.02-0.81); P = 0.007 resulting in 1.2 referrals of network members per session. Network members with referral or linkage were more likely to be connected to study participants in the intervention arm than the control.condition aOR 1.50 (1.09-2.06); P = 0.012.Conclusions:A network intervention delivered by existing participants can increase PrEP linkage to care among young Black men who have sex with men. Additional analyses will determine if any intervention demonstrated network-level impact among populations that have experienced limited PrEP care engagement in the United States. © 2020 The Author(s). Article	2021	Schneider, Kirstin E; Rebecca Hamilton White; Allison O'Rourke; Kilkenny, Michael F; Perdue, Michelle; Sherman, Susan G; Groh, Suzanne M; Allen, Sean T	Awareness of and interest in oral pre-exposure prophylaxis (PrEP) for HIV prevention and interest in hypothetical forms of PrEP among people who inject drugs in rural West Virginia	AIDS Care	-	-	-	-	https://www.tandfonline.com/doi/full/10.1080/09540121.2020.1822506	9540121	10.1080/09540121.2020.1822506		Injection drug use-associated HIV outbreaks have occurred in rural communities throughout the United States, which often have limited HIV prevention services for people who inject drugs (PWID). Pre-exposure prophylaxis (PrEP) is one tool that may help fill gaps in HIV prevention programing in rural settings. Oral PrEP has been approved for use, and new PrEP formulations are under development. Research is needed to better understand interest in oral and possible forthcoming PrEP formulations among PWID. We used survey data from 407 PWID in rural West Virginia. We asked if participants had heard of, taken, and were interested in taking PrEP, and about interest in several hypothetical forms of PrEP (arm injections, abdomen injections, implants, intravenous infusions). We estimated the prevalence of interest in each formulation and assessed correlates using Chi-squared tests. A minority had heard of oral PrEP (32.0%), and few had used it (3.7%). Many were interested in using oral PrEP (58.3%). Half were interested in arm injections (55.7%). Common correlates of interest across PrEP formulations were sexual minority status, comfort talking to a doctor about sex, sex work, and sharing injection equipment. Oral and injectable PrEP have the potential to fill HIV prevention gaps for rural PWID. Article	2021	Schumacher C.M.; Tao X.; Chandran A.; Fields E.; Price A.; Greenbaum A.; Jennings J.M.	Reaching Those Most at Risk for HIV Acquisition: Evaluating Racial/Ethnic Disparities in the Preexposure Prophylaxis Care Continuum in Baltimore City, Maryland	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002712	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112119523&doi=10.1097%2fQAI.0000000000002712&partnerID=40&md5=8395e5a96038a070f5d5a67b2da5709e	Background:Reducing HIV incidence requires addressing persistent racial/ethnic disparities in HIV burden. Our goal was to evaluate preexposure prophylaxis (PrEP) delivery, overall and relative to community need, among 7 clinical sites participating in a health department-led demonstration project to increase PrEP in Baltimore city, MD.Methods:PrEP care continuum stages (screened, indicated, referred, linked, evaluated, prescribed) were examined among HIV-negative individuals receiving services at participating sites between September 30, 2015 and September 29, 2019. Community need was defined using information on new HIV diagnoses (2016-2018). Differences in care continuum progression by demographics/priority population and comparison of demographic compositions between care continuum stages and new HIV diagnoses were examined using modified Poisson regression and χ2tests, respectively.Results:Among 25,886 PrEP-screened individuals, the majority were non-Hispanic (NH) black (81.1%, n = 20,998), cisgender male (61.1%, n = 15,825), and heterosexual (86.7%, n = 22,452). Overall, 31.1% (n = 8063) were PrEP-indicated; among whom, 56.8% (n = 4578), 15.6% (n = 1250), 10.8% (n = 868), and 9.0% (n = 722) were PrEP-referred, linked, evaluated, and prescribed, respectively. Among 2870 men who have sex with men (MSM), 18.7% (n = 538) were PrEP-prescribed. Across all groups, the highest attrition was between PrEP-referred and PrEP-linked. NH-black race (vs. NH-white) was independently associated with lower likelihood of PrEP prescription (aPR, 0.89; 95% confidence interval, 0.81 to 0.98 controlling for age/gender). Relative to the demographic composition of new HIV diagnoses, fewer NH-blacks (80.2% vs. 54.3%) and more NH-whites (10.7% vs. 30.3%) and MSM were PrEP prescribed (55.2% vs. 74.5%).Conclusions:This project showed promise delivering PrEP referrals and prescriptions overall and to MSM. Substantial improvement is needed to improve linkage overall and to decrease disparities in PrEP prescriptions among NH-blacks. Future work should focus on addressing service gaps that hinder PrEP utilization. © 2021 Lippincott Williams and Wilkins. Article	2021	Schuyler, Ashley; Alidina Zainab; Margaret, Dolcini M; Harper, Gary; Dennis, Fortenberry J; Singh, Ryan; Jamil, Omar; Pollack, Lance; Catania, Joseph	Pre-Exposure Prophylaxis (PrEP) Dissemination: Adapting Diffusion Theory to Examine PrEP Adoption	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03345-2	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-dissemination/docview/2568815198/se-2?accountid=8113	PrEP adoption among African-American men-who-have-sex-with-men (AAMSM) remains low. We applied Diffusion-of-Innovations (DOI) theory to understand PrEP adoption processes among young HIV-negative/status unknown AAMSM (AAYMSM; N = 181; 17–24 years). Quantitative and qualitative analyses were used to examine predictors of PrEP diffusion stages. Most AAYMSM were in the persuasion stage (PrEP-aware, hadn't adopted; 72.4%). Our results suggest that model antecedents are DOI stage-specific. PrEP awareness (knowledge stage) was associated with lower levels of social stigma (p < .03) and greater health literacy (p < .05), while sexual risk (p < .03) and education (p < .03) predicted PrEP adoption (12.2%). PrEP efficacy and side effects were primary innovation characteristics influencing adoption receptivity in the persuasion stage. Interventions to improve PrEP diffusion should be tailored to stage-specific antecedents depending on how a community is stratified across the DOI stages. Article	2021	Schwartz J.; Grimm J.; Zimmerman R.; Clement M.	Exploring perceptions of healthcare providers' communication skill and PrEP use in men who have sex with men	Communication Research Reports	-	-	-	-	8824096	10.1080/08824096.2021.1943343	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85109347261&doi=10.1080%2f08824096.2021.1943343&partnerID=40&md5=3f06c581e54afb903ce326c83197dae8	HIV continues to be serious issue in the U.S., especially for men who have sex with men (MSM). Pre–exposure prophylaxis (PrEP) is a highly effective means of preventing HIV, but its adoption has been slower than expected. The purpose of this study was to investigate the extent to which MSM's perceptions of their healthcare providers' level of communication skill predicted PrEP status. An online survey of 969 MSM was conducted. The results showed that respondents who perceived that their healthcare provider was skilled in information giving, information receiving, and information verifying were more likely to be on PrEP than respondents who perceived their healthcare provider had a lower level of skill in these areas. These findings highlight the importance of providers' communication skill in healthcare, particularly for MSM. © 2021 Eastern Communication Association.	health; HIV; provider–patient communication	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Scorgie, Fiona; Khoza, Nomhle; Baron, Deborah; Lees, Shelley; Harvey, Sheila; Ramskin, Lethabo; Stangl, Anne; Colombini, Manuela; Mashauri, Emma; Delany-Moretlwe, Sinead	Disclosure of PrEP use by young women in South Africa and Tanzania: qualitative findings from a demonstration project.	Culture, Health & Sexuality	-	-	-	-	1464-5351	10.1080/13691058.2019.1703041	https://dx.doi.org/10.1080/13691058.2019.1703041	Investigating how young women disclose oral pre-exposure prophylaxis (PrEP) use is important given evidence that disclosure is associated with higher adherence. We report qualitative results on PrEP disclosure among young women in South Africa and Tanzania who participated in a PrEP demonstration project (EMPOWER). In total, 81 in-depth interviews were conducted with 39 young women aged 16-24 years-25 from Johannesburg and 14 from Mwanza-at approximately 3, 6 and/or 9 months post-enrolment. Analysis of data was thematic and inductive. Most Johannesburg participants were students in the inner-city; in Mwanza, all worked in recreational venues, occasionally engaging in sexual transactions with customers. A continuum of approaches was evident. Partner disclosure was common in Johannesburg but less so in Mwanza, where many partners were feared as judgemental and potentially violent. In both sites, participants commonly disclosed to family to secure support, and to friends and work colleagues to advocate about PrEP and encourage uptake among at-risk peers. Adherence clubs appeared helpful in building participants' skills and confidence to disclose, particularly in gender-inequitable sexual relationships. PrEP counselling for young women should focus on strengthening communication skills and helping develop strategies for safe disclosure. Article	2021	Scorgie, Fiona; Khoza, Nomhle; Delany-Moretlwe, Sinead; Velloza, Jennifer; Mangxilana, Nomvuyo; Atujuna, Millicent; Chitukuta, Miria; Matambanadzo, Kudzai V; Hosek, Sybil; Makhale, Lerato; Celum, Connie	Narrative sexual histories and perceptions of HIV risk among young women taking PrEP in southern Africa: Findings from a novel participatory method	Social Science & Medicine	-	-	-	-	2779536	10.1016/j.socscimed.2020.113600	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098178766&doi=10.1016%2fj.socscimed.2020.113600&partnerID=40&md5=5a78733dc92d01d60d9f484cbacac2a4	Pre-exposure prophylaxis (PrEP) is an important HIV prevention method for adolescent girls and young women (AGYW) in Africa, who are at heightened risk of HIV infection. HIV risk perception is generally a powerful motivator for adoption of HIV prevention behaviours, including PrEP use. While HIV risk perceptions have been evaluated using quantitative measures, these seldom capture how individuals conceptualize and understand risk within local frameworks of meaning. More nuanced understanding may come from qualitative approaches that map these perceptions across the trajectory of sexual histories. Between 2016 and 2018, we implemented a novel participatory method to investigate risk perceptions in interviews with 32 participants in HPTN 082, a study of AGYW's use of PrEP in South Africa and Zimbabwe. Timelines were used to record narrative sexual histories and perceived HIV risk for each relationship. We found that women assessed HIV risk primarily based on their partners' personal qualities and behaviour (especially relating to infidelity); their subjective experience of being treated respectfully; and the practice of perceived 'risk reduction', including younger partners and condoms, even if used inconsistently. A narrative timeline approach grounded in an understanding of young women's sexual histories may increase critical reflection about HIV risks and facilitate risk-reduction counselling with this group. © 2020 Elsevier Ltd	Adolescent girls and young women; HIV risk perceptions; PrEP; Qualitative research; Sexual histories; South Africa; Zimbabwe	English	United Kingdom	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Qualitative
Article	2021	Seed, Clive R; Styles, Claire E; Hoad, Veronica C; Yang, Hung; Thomas, Michael J; Gosbell, Iain B	Effect of HIV pre-exposure prophylaxis (PrEP) on detection of early infection and its impact on the appropriate post-PrEP deferral period.	Vox Sanguinis	-	-	-	-	1423-0410	10.1111/vox.13011	https://dx.doi.org/10.1111/vox.13011	INTRODUCTION: HIV antivirals for pre-exposure prophylaxis (PrEP) are known to affect detection of early HIV infection through suppression of viral load and delayed seroconversion. To cover potential delay in HIV detection associated with PrEP use by blood donors in the context of international reductions in sexual activity-based deferral periods, we analysed the available data to determine the appropriate minimum post-PrEP deferral period for blood donation. MATERIALS AND METHODS: Published cases of incident HIV infection when PrEP use was objectively demonstrable were identified, consisting principally of seroconverters from the Partners PrEP study (a clinical trial of PrEP efficacy). Data were reviewed to determine the impact of PrEP on the detection of HIV RNA, p24 Ag and seroconversion delay. RESULTS: Nucleic acid testing (NAT) detected early HIV infection in the presence of PrEP prior to or in concordance with serological testing in approximately 90% of cases. Undetectable in HIV RNA would rebound to detectable levels within two months of PrEP cessation. PrEP delayed p24 antigen detection and antibody seroconversion by about 7 days. CONCLUSION: Even when daily PrEP is continued, it is likely that the majority of early HIV infections are detectable by individual donation (ID)-NAT, with p24 Ag or antibody seroconversion occurring conservatively within four weeks of exposure. HIV RNA levels also rebound rapidly in the absence of PrEP. In Australia, a three-month deferral period for blood donation after the last dose of PrEP provides an appropriate safety margin to mitigate the residual risk of transfusion-transmitted HIV.	blood donation testing; blood safety; donors; transfusion-transmitted infections	English	Switzerland	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Review
Article	2021	Segarra, Lorena; Simmens, Samuel J; Castel, Amanda D; Kharfen, Michael; Masur, Henry; Greenberg, Alan E	Highly variable trends in rates of newly diagnosed HIV cases in U.S. hotspots, 2008-2017.	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0250179	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8054999	The U.S. Ending the HIV Epidemic (EHE) initiative was announced in early 2019 and rapidly became a focal point for domestic HIV prevention and treatment programs. Using publicly available data from CDC, we examined historical trends in the average annual percent change (AAPC) in HIV diagnosis rates for the 57 EHE high incidence "hotspots" using Joinpoint analysis. We then assessed the ecologic association of various hotspot characteristics with changes in these rates over time using a multivariable regression model. From 2008-2017, the overall rate of newly diagnosed HIV cases in the U.S. declined from 19 to 14 per 100,000 persons, with the AAPC declining significantly in the U.S. overall (-3.1%; 95% CI: -3.7, -2.4) and in the 57 hotspots (-3.3%; 95% CI: -4.6, -2.8). There were large (AAPC <-5.0), moderate (-5.0 to -2.5) and small (-2.5 to 0.0) rates of decline in 14, 19 and 17 hotspots respectively, with increasing trends (AAPC >0.0) noted in seven hotspots. In the multivariable regression analysis, higher initial HIV diagnosis rate and location in the Northeast region were significantly associated with declining AAPC rates whereas no significant differences were found by hotspot gender, age, or race/ethnicity distribution. This analysis demonstrates that the rate of decline in HIV diagnosis rates in hotspots across the U.S. has been highly variable. Further exploration is warranted to assess the correlation between programmatic factors such as HIV testing and antiretroviral therapy and pre-exposure prophylaxis coverage with HIV trends across the hotspots. Article	2021	Sekabira, Rogers; McGowan, Ian; Yuhas, Krista; Brand, Rhonda M; Marzinke, Mark A; Manabe, Yukari C; Frank, Ian; Eron, Joseph; Landovitz, Raphael J; Anton, Peter; Cranston, Ross D; Anderson, Peter; Mayer, Kenneth H; Amico, K Rivet; Wilkin, Timothy J; Chege, Wairimu; Kekitiinwa, Adeodata R; McCauley, Marybeth; Gulick, Roy M; Hendrix, Craig W	Higher colorectal tissue HIV infectivity in cisgender women compared with MSM before and during oral preexposure prophylaxis.	AIDS	-	-	-	-	1473-5571	10.1097/QAD.0000000000002907	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8483241	OBJECTIVE: The objective of this study was to compare HIV-negative cisgender women (CGW) with MSM for mucosal tissue differences in pharmacokinetics, HIV infectivity and cell phenotype. DESIGN: A substudy of HPTN 069/ACTG A5305, 48-week study of three oral candidate preexposure prophylaxis regimens: maraviroc, maraviroc/emtricitabine and maraviroc/tenofovir disoproxil fumarate (TDF) compared with a TDF/emtricitabine control group. METHODS: Plasma, peripheral blood mononuclear cells and cervical and colorectal tissue biopsies were collected at Baseline (no drug), Week 24 and 48 (on drug), and Week 49 (1-week postdrug). Drug concentrations were assessed in all matrices. HIV infectivity was assessed using tissue biopsy 'explants' challenged with HIV ex vivo followed by HIV p24 measurement. Flow cytometry evaluated colorectal cell phenotype. RESULTS: Thirty-seven CGW and 54 MSM participated. CGW's colorectal explant p24 was higher than MSM before (0.31 log10, Pâ=â0.046), during (1.01-1.19 log10, Pâ=â0.016) and one week after (0.61 log10, Pâ=â0.011) study drug dosing. Pooling regimens, cervical explant p24 did not differ among visits. CGW had higher plasma maraviroc and colorectal tissue tenofovir diphosphate and lower colorectal tissue emtricitabine (all Pâ<â0.005) compared with MSM. Each study drug's cervical tissue concentrations were more than 10-fold below paired colorectal concentrations (Pâ<â0.001). Cell phenotype sex differences included 4% higher CD38+/CD8+ cells at baseline and 3-7% higher CD69+/CD8+ cells throughout Weeks 24-49 in CGW compared with MSM (Pâ<â0.05). CONCLUSION: Colorectal explants in CGW demonstrated greater HIV infectivity than MSM with and without study drugs. Small differences in adherence, drug concentration and colorectal tissue flow cytometry cannot fully explain this difference. Article	2021	Sekhon M.; Van Der Straten A.	Pregnant and breastfeeding women's prospective acceptability of two biomedical HIV prevention approaches in Sub Saharan Africa: A multisite qualitative analysis using the Theoretical Framework of Acceptability	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0259779	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119380069&doi=10.1371%2fjournal.pone.0259779&partnerID=40&md5=eb3f70540634dfb5eea72e9d0fba463e	HIV infection during pregnancy and breastfeeding has implications for maternal health. Between May-November 2018, we explored prospective acceptability of two novel HIV Preexposure Prophylaxis (PrEP) products, oral pills and vaginal rings, through focus group discussions with 65 pregnant and breastfeeding women in Malawi, South Africa, Uganda, Zimbabwe. Qualitative analysis was completed, guided by the Theoretical Framework of Acceptability (TFA). First, a deductive thematic analysis was applied to relevant coded data, into the seven TFA constructs (Affective Attitude; Burden; Ethicality, Intervention Coherence; Opportunity Costs; Perceived Effectiveness; Self-efficacy). Next, an iterative analysis was completed to generate themes within each of the TFA constructs. Women's positive attitudes towards daily oral PrEP highlighted the familiarity of taking pills, understanding the purpose of taking pills, and the perception that it is an effective method to protect mothers and babies from HIV during pregnancy and breastfeeding. Women emphasized the ease of using the ring given its monthly duration that lowers burden on the user, its discreetness and invisibility once in place. The TFA analysis highlighted how acceptability of both methods could be enhanced by focusing on perceptions of the end users (i.e. the women) and not just the products themselves. This approach provided insights into how to refine the intervention materials and plans for implementation. © 2021 Sekhon et al. Theses and Dissertations	2021	Seneviratne, Herana Kamal; Hamlin, Allyson N; Li, Sue; Grinsztejn, Beatriz; Dawood, Halima; Liu, Albert Y; Kuo, Irene; Hosseinipour, Mina C; Panchia, Ravindre; Cottle, Leslie; Chau, Gordon; Adeyeye, Adeola; Rinehart, Alex R; McCauley, Marybeth; Eron, Joseph S; Cohen, Myron S; Landovitz, Raphael J; Hendrix, Craig W	Identification of Novel UGT1A1 Variants Including UGT1A1 454C>A through the Genotyping of Healthy Participants of the HPTN 077 Study	-	-	University of California	University of California	-	2575-9108	https://doi.org/10.1021/acsptsci.0c00181	https://escholarship.org/uc/item/54s83800	Cabotegravir (CAB) is an integrase strand-transfer inhibitor of HIV that has proven effective for HIV treatment and prevention in a long-acting injectable formulation, typically preceded by an oral formulation lead-in phase. Previous in vitro studies have demonstrated that CAB is primarily metabolized via glucuronidation by uridine diphosphate glucuronosyltransferase (UGT) 1A1 and 1A9. In this study, we performed next-generation sequencing of genomic DNA isolated from the HPTN 077 participants to explore the variants within UGT1A1 and UGT1A9. Additionally, to enable correlation of UGT1A1 and UGT1A9 genotypes with plasma CAB-glucuronide levels, we quantified glucuronidated CAB following both oral administration of CAB and intramuscular injection of long-acting CAB. From these studies, 48 previously unreported variants of UGT1A1 and UGT1A9 were detected. Notably, 5/68 individuals carried a UGT1A1 454C>A variant that resulted in amino acid substitution P152T, and the use of in silico tools predicted a deleterious effect of the P152T substitution. Thus, the impact of this mutant on a range of UGT1A1 substrates was tested using a COS-7 cell-based assay. The glucuronide conjugates of CAB, dolutegravir, and raltegravir, were not formed in the COS-7 cells expressing the UGT1A1 P152T mutant. Further, formation of glucuronides of raloxifene and 7-ethyl-10-hydroxycamptothecin were reduced in the cells expressing the UGT1A1 P152T mutant. Using the same approach, we tested the activities of two UGT1A9 mutants, UGT1A9 H217Y and UGT1A9 R464G, and found that these mutations were tolerated and decreased function, respectively. These data provide insight into previously unreported genetic variants of UGT1A1 and UGT1A9. Article	2021	Seneviratne, Herana Kamal; Tillotson, Joseph; Lade, Julie M; Bekker, Linda-Gail; Li, Sue; Pathak, Subash; Justman, Jessica; Mgodi, Nyaradzo; Swaminathan, Shobha; Sista, Nirupama; Farrior, Jennifer; Richardson, Paul; Hendrix, Craig W; Bumpus, Namandje N	Metabolism of Long-Acting Rilpivirine After Intramuscular Injection: HIV Prevention Trials Network Study 076 (HPTN 076).	AIDS Research and Human Retroviruses	-	-	-	-	1931-8405	10.1089/AID.2020.0155	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7994431	A long-acting injectable formulation of rilpivirine (RPV), a non-nucleoside reverse transcriptase inhibitor, is currently under investigation for use in human immunodeficiency virus (HIV) maintenance therapy. We previously characterized RPV metabolism after oral dosing and identified seven metabolites: four metabolites resulting from mono- or dioxygenation of the 2,6-dimethylphenyl ring itself or either of the two methyl groups located on that ring, one N-linked RPV glucuronide conjugate, and two O-linked RPV glucuronides produced via glucuronidation of mono- and dihydroxymethyl metabolites. However, as is true for most drugs, the metabolism of RPV after injection has yet to be reported. The phase II clinical trial HPTN 076 enrolled 136 HIV-uninfected women and investigated the safety and acceptability of long-acting injectable RPV for use in HIV pre-exposure prophylaxis. Through the analysis of plasma samples from 80 of these participants in the active product arm of the study, we were able to detect 2 metabolites after intramuscular injection of long-acting RPV, 2-hydroxymethyl-RPV, and RPV N-glucuronide. Of the total of 80 individuals, 72 participants exhibited detectable levels of 2-hydroxymethyl-RPV in plasma samples whereas RPV N-glucuronide was detectable in plasma samples of 78 participants. In addition, RPV N-glucuronide was detectable in rectal fluid, cervicovaginal fluid, and vaginal tissue. To investigate potential genetic variation in genes encoding enzymes relevant to RPV metabolism, we isolated genomic DNA and performed next-generation sequencing of CYP3A4, CYP3A5, UGT1A1 and UGT1A4. From these analyses, four missense variants were detected for CYP3A4 whereas one missense variant and one frameshift variant were detected for CYP3A5. A total of eight missense variants of UGT1A4 were detected, whereas two variants were detected for UGT1A1; however, these variants did not appear to account for the observed interindividual variability in metabolite levels. These findings provide insight into the metabolism of long-acting RPV and contribute to an overall understanding of metabolism after oral dosing versus injection. ClinicalTrials.gov Identifier: NCT02165202. Article	2021	Sepodes B.; Rocha J.; Batista J.; Figueira M.-E.; Dráfi F.; Torre C.	Implementation and Access to Pre-exposure Prophylaxis for Human Immunodeficiency Virus by Men Who Have Sex With Men in Europe	Frontiers in Medicine	-	-	-	-	2296858X	10.3389/fmed.2021.722247	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114611360&doi=10.3389%2ffmed.2021.722247&partnerID=40&md5=7a8e7805b211c06ce86a45873361e61c	Pre-exposure prophylaxis (PrEP) is a significant public health intervention with proven efficacy and safety in the prevention of human immunodeficiency virus (HIV) infection, which has taken a considerable amount of time to reach Europe in relation to their transatlantic counterparts, namely, the United States of America (USA). There, it is perceived as being an essential prevention tool to be integrated within existing medical, behavioral and structural interventions in place for the management and containment of HIV infection in men who have sex with men (MSM). In a region such as Europe, with approximately double the USA population, it is estimated that not even 10% have proper access to PrEP, and given the lack of coordination with healthcare, taking PrEP has to be at their own expense. Here, we identify the reasons behind the 4-year lag in the approval of PrEP in the European Union/European Economic Area (and Europe in general) and explore the efficacy and effectiveness of PrEP needed to be confirmed with some implementation or demonstration studies conducted in the region. Independent of the data gathered, access of MSM to PrEP is far from ideal in Europe and much still needs to be done. The demonstration of the cost-effectiveness of PrEP alongside other social and behavioral factors needs to be addressed, while the clear populations within MSM that will benefit from this intervention are properly identified and make use of the latest recommendations of the World Health Organization that consider not only daily PrEP but also event-driven PrEP. The momentum for the proper implementation of PrEP in the EU is not lost, and with the existence of generics and even new formulations, there is a renewed opportunity for unleashing the public health benefits arising from this pharmacological tool with other interventions in place (e.g., condoms, testing, and counseling). © Copyright © 2021 Sepodes, Rocha, Batista, Figueira, Dráfi and Torre.	acquired immunodeficiency syndrome; aids; Europe; HIV infection; implementation; men who have sex with men; pre-exposure prophylaxis; PrEP	English	Switzerland	Western and Central Europe and North America	Portugal	Western and Central Europe and North America	Portugal	Western and Central Europe and North America	Review
Article	2021	Serrano P.A.; Daubert E.; Munoz A.; Hosek S.G.; French A.L.	Effect of Truvada lawsuit advertising on preexposure prophylaxis attitudes and decisions among sexual and gender minority youth and young adults at risk for HIV	AIDS	-	-	-	-	2699370	10.1097/QAD.0000000000002728	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85097211184&doi=10.1097%2fQAD.0000000000002728&partnerID=40&md5=fe3066d56a97800f918b56362f4195a9	Objective:In 2019, US advocates reported misleading language regarding the safety of TDF/FTC (Truvada) used by lawsuit advertisements against Gilead Sciences. We sought to ascertain the reach and effects of the advertisements on preexposure prophylaxis (PrEP) opinions and decisions in a cohort of youth and young adults at-risk for HIV.Design:An online survey was administered to participants enrolled in Keeping it LITE, a prospective US cohort study of ethnically diverse, sexually active, cisgender and transgender persons ages 13-37.Methods:Quantitative data were analyzed using descriptive and inferential analysis in SAS, and qualitative data via thematic analysis.Results:Survey response rate was 51.3% (n=1485). Mean age at baseline was 24. Previous PrEP use was reported by 43% of respondents and 32.7% reported PrEP use in the past 6 months. Almost half (48.7%) were aware of the lawsuit. Most of these participants (81.3%) reported the advertisements did not impact their PrEP use, but 13.2% decided to not to begin a Truvada-based PrEP regimen and 5.5% decided to stop taking Truvada due to the advertisements claims. Predictors of changing PrEP behavior were lower education and no previous PrEP use. The qualitative analysis revealed the advertisements increased skepticism about safety and benefit of Truvada PrEP and led to greater distrust of the pharmaceutical industry.Conclusion:The advertisements reached a large, diverse US audience. Disturbingly, 18.7% of PrEP candidates who were aware of the lawsuit attributed not initiating or cessation of a Truvada-based PrEP regimen to exposure to the Truvada lawsuit advertisements. © Copyright 2020 Wolters Kluwer Health, Inc. Article	2021	Sevelius J.M.; Glidden D.V.; Deutsch M.; Welborn L.; Contreras A.; Salinas A.; Venegas L.; Grant R.M.	Uptake, Retention, and Adherence to Pre-exposure Prophylaxis (PrEP) in TRIUMPH: A Peer-Led PrEP Demonstration Project for Transgender Communities in Oakland and Sacramento, California	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002808	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125874757&doi=10.1097%2fQAI.0000000000002808&partnerID=40&md5=fad62919051928d277e360b833946961	Background:TRIUMPH (Trans Research-Informed communities United in Mobilization for the Prevention of HIV) was a community-led, transgender-specific pre-exposure prophylaxis (PrEP) demonstration project at 2 community-based clinical sites in California. TRIUMPH used peer health education, community mobilization, and clinical integration of PrEP with hormone therapy to promote PrEP knowledge and acceptability. The goal of this study was to evaluate PrEP uptake, retention, and adherence among TRIUMPH participants and examine site-based differences.Methods:Eligible participants were adult transgender and gender diverse people interested in PrEP. Participants were seen at baseline and at 1, 3, 6, 9, and 12 months for PrEP provision, clinical visits, and HIV testing. PrEP uptake was defined as dispensation of PrEP, PrEP retention was defined as proportion of expected visits completed among those who initiated PrEP, and PrEP adherence was assessed by measuring tenofovir diphosphate concentrations in dried blood spots. Logistic regression models quantified the association of variables with PrEP outcomes.Results:TRIUMPH enrolled 185 participants; the median age was 28 years (interquartile range: 23-35), 7% was Black, and 58% was Latinx. PrEP uptake was as follows: 78% in Oakland and 98% in Sacramento; 91% among trans women, 96% among trans men, and 70% among nonbinary participants. Almost half (47%) rarely/never believed about HIV, and 42% reported condomless sex act in the past 3 months. Participants who reported higher numbers of sex partners were more likely to be retained and adherent; other predictors of adherence included not having a primary partner and not experiencing violence in the past 3 months.Conclusions:This community-led, trans-specific PrEP demonstration project documents high levels of PrEP initiation in a young transgender and gender diverse cohort at risk of HIV acquisition. Article	2021	Sewell W.C.; Powell V.E.; Ball-Burack M.; Mayer K.H.; Ochoa A.; Marcus J.L.; Krakower D.S.	"I Didn't Really Have a Primary Care Provider Until I Got PrEP": Patients' Perspectives on HIV Preexposure Prophylaxis as a Gateway to Health Care	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002719	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114522386&doi=10.1097%2fQAI.0000000000002719&partnerID=40&md5=428d6d762e65a2dcbd3b2b28748a1bfc	Background:HIV prevention is the primary goal of preexposure prophylaxis (PrEP); however, ancillary benefits may exist, including PrEP as an entry point to primary care.Objective:To explore PrEP users' perspectives on how PrEP use relates to broader engagement in health care.Design:In-depth qualitative interviews.Participants:We recruited PrEP users aged 18 years or older from a social media group for people interested in PrEP information and a Boston community health center specializing in health care for sexual and gender minorities.Approach:Inductive content analysis to identify emergent themes.Key results:All 25 participants were men who have sex with men, whose mean age was 34 years, and 84% were White. Three major themes emerged: (1) accessing PrEP was a strong motivator for initial and continued engagement in health care, which for some evolved over time into accessing comprehensive primary care; (2) provider awareness and attitudes about PrEP influenced participants' ongoing engagement in health care; and (3) PrEP engendered a positive sense of control over users' personal health, giving them agency in reducing their risk of HIV and engaging in other aspects of their health. Quarterly PrEP visits helped participants establish and maintain a relationship with a primary care provider, access non-HIV-related care services, and feel empowered to keep themselves healthy.Conclusions:The benefits of PrEP extend beyond HIV prevention to broader engagement in health care, including new relationships with primary care providers and use of other preventive health care services. To maximize those benefits, efforts are needed to ensure that providers are aware, nonjudgmental, and supportive of PrEP use. © 2021 Lippincott Williams and Wilkins. Article	2021	Sewell W.C.; Solleveld P.; Seidman D.; Dehlendorf C.; Marcus J.L.; Krakower D.S.	Patient-Led Decision-Making for HIV Preexposure Prophylaxis	Current HIV/AIDS Reports	-	-	-	-	15483568	10.1007/s11904-020-00535-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099112831&doi=10.1007%2fs11904-020-00535-w&partnerID=40&md5=e5357a1c2769abd936018d7bcd7e1d87	Purpose of Review: Shared decision-making is a process that involves bidirectional exchange of information between patients and providers to support patients in making individualized, evidence-based decisions about their healthcare. We review the evidence on patient-led decision-making, a form of shared decision-making that maximizes patient autonomy, as a framework for decisions about HIV preexposure prophylaxis (PrEP). We also assess the likelihood that patient-led decision-making occurs for PrEP and describe interventions to facilitate this process. Recent Findings: Patient-led decision-making is likely to be uncommon for PrEP, in part because healthcare providers lack knowledge and training about PrEP. Few evidence-based interventions exist to facilitate patient-led decision-making for PrEP. Summary: There is a need for rigorously developed interventions to increase knowledge of PrEP among patients and healthcare providers and support patient-led decision-making for PrEP, which will be increasingly important as the range of available PrEP modalities expands. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Article	2021	Sha Y.; Dong W.; Tang W.; Zheng L.; Huang X.; Muessig K.E.; Tucker J.D.	Gender minority stress and access to health care services among transgender women and transfeminine people: results from a cross-sectional study in China	BMC Infectious Diseases	-	-	-	-	14712334	10.1186/s12879-021-06782-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117262153&doi=10.1186%2fs12879-021-06782-5&partnerID=40&md5=0007ecc1306a3131777fa8f26d9a9f73	Background: Transgender and gender diverse individuals often face structural barriers to health care because of their gender minority status. The aim of this study was to examine the association between gender minority stress and access to specific health care services among transgender women and transfeminine people in China. Methods: This multicenter cross-sectional study recruited participants between January 1st and June 30th 2020. Eligible participants were 18 years or older, assigned male at birth, not currently identifying as male, and living in China. Gender minority stress was measured using 45 items adapted from validated subscales. We examined access to health care services and interventions relevant to transgender and gender diverse people, including gender affirming interventions (hormones, surgeries), human immunodeficiency virus (HIV) and sexually transmitted infections (STIs) testing, pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP). Multivariable regression was used to measure correlations between gender minority stress and access to health care service. Results: Three hundred and twenty-four people completed a survey and data from 277 (85.5%) people were analyzed. The mean age was 29 years old (standard deviation SD = 8). Participants used hormones (118/277, 42.6%), gender affirming surgery (26/277, 9.4%), HIV testing (220/277, 79.4%), STI testing (132/277, 47.7%), PrEP (24/276, 8.7%), and PEP (29/267, 10.9%). Using gender affirming hormones was associated with higher levels of discrimination (adjusted odds ratio aOR 1.41, 95% confidence interval CI 1.17–1.70) and internalized transphobia (aOR 1.06, 95%CI 1.00–1.12). STI testing was associated with lower levels of internalized transphobia (aOR 0.91, 95%CI 0.84–0.98). Conclusions: Our data suggest that gender minority stress is closely related to using health services. Stigma reduction interventions and gender-affirming medical support are needed to improve transgender health. © 2021, The Author(s). Article	2021	Shah, Shahini; Pilkington, Victoria; Hill, Andrew	Is tenofovir disoproxil fumarate associated with weight loss?	AIDS	-	-	-	-	1473-5571 0269-9370	10.1097/QAD.0000000000003083	https://pubmed.ncbi.nlm.nih.gov/34848586/	BACKGROUND: Recent clinical trials have shown weight gain associated with newer antiretrovirals. It is unclear how the nucleoside reverse transcriptase inhibitor backbone affects weight. Recent evidence suggests greater weight gain with tenofovir alafenamide (TAF) compared with tenofovir disoproxil fumarate (TDF). However, it is not fully understood whether TDF contributes to weight suppression. METHODS: A systematic search of PubMed, Embase and clinicaltrials.gov was conducted to identify all randomized control trials comparing TDF/FTC or TDF to control in HIV-negative individuals. The primary endpoint included the number of events of 5% weight loss. Mantel-Haenszel test with random-effects modelling was used to calculate the odds ratio (OR) and 95% confidence intervals (95% CI). Further analyses of gastrointestinal (GI) adverse events were also undertaken. RESULTS: Seven PrEP trials: PARTNERS, VOICE, TDF-2, Bangkok PrEP, iPrEX, FEM-PrEP and HPTN 084 were included in the analysis of weight loss, with a total sample size of 19359. One study (HPTN 084) compared TDF/FTC to cabotegravir (CAB). HIV-negative individuals taking TDF were more likely to experience weight loss compared with control odds ratio (OR) 1.44; 95% CI 1.12-1.85; P=0.005). Exposure to TDF was also linked to greater odds of vomiting (OR 1.81; 95% CI 1.20-2.73; P<0.005). There were no increased odds of nausea, diarrhoea or loss of appetite. CONCLUSION: There is evidence in HIV-negative individuals that TDF may be associated with weight loss. Further research should be carried out in HIV-positive individuals, and clinical trials of TDF/FTC should publish weight data to widen the evidence base. Article	2021	Shahmanesh M.; Mthiyane T.N.; Herbsst C.; Neuman M.; Adeagbo O.; Mee P.; Chimbindi N.; Smit T.; Okesola N.; Harling G.; McGrath N.; Sherr L.; Seeley J.; Subedar H.; Johnson C.; Hatzold K.; Terris-Prestholt F.; Cowan F.M.; Corbett E.L.	Effect of peer-distributed HIV self-test kits on demand for biomedical HIV prevention in rural KwaZulu-Natal, South Africa: A three-armed cluster-randomised trial comparing social networks versus direct delivery	BMJ Glob Health	-	-	-	-	20597908	10.1136/bmjgh-2020-004574	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111421483&doi=10.1136%2fbmjgh-2020-004574&partnerID=40&md5=03d2998d9b02961aa011a0d2e0618cc2	Study objective We investigated two peer distribution models of HIV self-testing (HIVST) in HIV prevention demand creation compared with trained young community members (peer navigators). Methods We used restricted randomisation to allocate 24 peer navigator pairs (clusters) in KwaZulu-Natal 1:1:1: (1) standard of care (SOC): peer navigators distributed clinic referrals, pre-exposure prophylaxis (PrEP) and antiretroviral therapy (ART) information to 18-30 year olds. (2) peer navigator direct distribution (PND): Peer navigators distributed HIVST packs (SOC plus two OraQuick HIVST kits) (3) incentivised peer networks (IPN): peer navigators recruited young community members (seeds) to distribute up to five HIVST packs to 18-30 year olds within their social networks. Seeds received 20 Rand (US$1.5) for each recipient who distributed further packs. The primary outcome was PrEP/ART linkage, defined as screening for PrEP/ART eligibility within 90 days of pack distribution per peer navigator month (pnm) of outreach, in women aged 18-24 (a priority for HIV prevention). Investigators and statisticians were blinded to allocation. Analysis was intention to treat. Total and unit costs were collected prospectively. Results Between March and December 2019, 4163 packs (1098 SOC, 1480 PND, 1585 IPN) were distributed across 24 clusters. During 144 pnm, 272 18-30 year olds linked to PrEP/ART (1.9/pnm). Linkage rates for 18-24-year-old women were lower for IPN (n=26, 0.54/pnm) than PND (n=45, 0.80/pnm; SOC n=49, 0.85/pnm). Rate ratios were 0.68 (95% CI 0.28 to 1.66) for IPN versus PND, 0.64 (95% CI 0.26 to 1.62) for IPN versus SOC and 0.95 (95% CI 0.38 to 2.36) for PND versus SOC. In 18-30 year olds, PND had significantly more linkages than IPN (2.11 vs 0.88/pnm, RR 0.42, 95% CI 0.18 to 0.98). Cost per pack distributed was cheapest for IPN (US$36) c.f. SOC (US$64). Cost per person linked to PrEP/ART was cheaper in both peer navigator arms compared with IPN. Discussion HIVST did not increase demand for PrEP/ART. Incentivised social network distribution reached large numbers with HIVST but resulted in fewer linkages compared with PrEP/ART promotion by peer navigators. Article	2021	Shahmanesh, Maryam; Okesola, Nonhlanhla; Chimbindi, Natsayi; Zuma, Thembelihle; Mdluli, Sakhile; Mthiyane, Nondumiso; Adeagbo, Oluwafemi; Dreyer, Jaco; Herbst, Carina; McGrath, Nuala; Harling, Guy; Sherr, Lorraine; Seeley, Janet	Thetha Nami: participatory development of a peer-navigator intervention to deliver biosocial HIV prevention for adolescents and youth in rural South Africa	BMC Public Health	-	-	-	-	NA	10.1186/s12889-021-11399-z	https://www.proquest.com/scholarly-journals/i-thetha-nami-participatory-development-peer/docview/2553209731/se-2?accountid=8113	Background Despite effective biomedical tools, HIV remains the largest cause of morbidity/mortality in South Africa – especially among adolescents and young people. We used community-based participatory research (CBPR), informed by principles of social justice, to develop a peer-led biosocial intervention for HIV prevention in KwaZulu-Natal (KZN). Methods Between March 2018 and September 2019 we used CBPR to iteratively co-create and contextually adapt a biosocial peer-led intervention to support HIV prevention. Men and women aged 18–30 years were selected by community leaders of 21 intervention implementation areas (izigodi) and underwent 20 weeks of training as peer-navigators. We synthesised quantitative and qualitative data collected during a 2016–2018 study into 17 vignettes illustrating the local drivers of HIV. During three participatory intervention development workshops and community mapping sessions, the peer-navigators critically engaged with vignettes, brainstormed solutions and mapped the components to their own izigodi. The intervention components were plotted to a Theory of Change which, following a six-month pilot and process evaluation, the peer-navigators refined. The intervention will be evaluated in a randomised controlled trial (NCT04532307). Results Following written and oral assessments, 57 of the 108 initially selected participated in two workshops to discuss the vignettes and co-create the Thetha Nami (`talk to me'). The intervention included peer-led health promotion to improve self-efficacy and demand for HIV prevention, referrals to social and educational resources, and aaccessible youth-friendly clinical services to improve uptake of HIV prevention. During the pilot the peer-navigators approached 6871 young people, of whom 6141 (89%) accepted health promotion and 438 were linked to care. During semi-structured interviews peer-navigators described the appeal of providing sexual health information to peers of a similar age and background but wanted to provide more than just "onward referral". In the third participatory workshop 54 peer-navigators refined the Thetha Nami intervention to add three components: structured assessment tool to tailor health promotion and referrals, safe spaces and community advocacy to create an enabling environment, and peer-mentorship and navigation of resources to improve retention in HIV prevention. Conclusion Local youth were able to use evidence to develop a contextually adapted peer-led intervention to deliver biosocial HIV prevention. Article	2021	Shamu S.; Shamu P.; Khupakonke S.; Farirai T.; Chidarikire T.; Guloba G.; Nkhwashu N.	Pre-exposure prophylaxis (PrEP) awareness, attitudes and uptake willingness among young people: gender differences and associated factors in two South African districts	Global Health Action	-	-	-	-	16549880	10.1080/16549716.2021.1886455	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101193903&doi=10.1080%2f16549716.2021.1886455&partnerID=40&md5=8ef43bdeaf3440b8c756b00dd38d035e	Background: Pre-exposure prophylaxis (PrEP) for HIV prevention is safe and effective in reducing HIV incidence. However, more evidence of PrEP knowledge, willingness and distribution preferences is required for scale-up among young people at-risk. Objective: To understand young people PrEP awareness, willingness and roll-out preferences. Methods: Young people (18–24y) were selected through multi-stage sampling in a cross-sectional household survey in low-income communities. Self-administered interviews collected participants' data about PrEP awareness, attitudes, willingness and HIV-risk practices. Data were descriptively analysed by gender. Regression models assessed factors associated with PrEP awareness and willingness by district. Results: Of the 1917 participants interviewed 44.6% (men = 39.4% vs women = 49%, p = 0.001) were PrEP aware, 49.0% were willing to use PrEP. Participants most preferred PrEP distribution channels were public clinics (51.2%) and hospitals (23.8%). More men than women preferred distribution through schools (11.9% vs7.8%; p = 0.002) and NGOs (8.5%vs5.4%; p = 0.008). The biggest barrier to PrEP willingness was inadequate PrEP knowledge (10.0%) but more men than women disliked taking pills daily (4.1%vs2.0%; p-value = 0.007). Gendered determinants to use PrEP were side effects (51%; men = 47% vs women = 55%; p = 0.001) and pill effectiveness (29.5%; men = 26.4% vs women = 32.6%; p = 0.003). In both districts PrEP knowledge was associated with being female and media use. The associations between PrEP awareness and having multiple sexual partnerships, HIV knowledge, HIV self-test willingness and belonging to social clubs differed by district. PrEP willingness was positively associated with having TB and PrEP knowledge in each district but district differences were observed in media and occupation factors. Conclusions: The study shows young people's low levels of PrEP awareness. It also shows relatively increased willingness, gendered PrEP awareness and distribution preferences. Promoting youth's PrEP awareness requires a multifarious media strategy. Article	2021	Shang J.; Tan R.; Yang J.; Yan B.; Zhong X.; Zhang Y.; Alnajebi B.; Ma Q.; Huang A.	Impact of dosing strategies on plasma concentrations of tenofovir: Implications in HIV pre-exposure prophylaxis in China	Journal of Infection and Public Health	-	-	-	-	18760341	10.1016/j.jiph.2021.07.018	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112362109&doi=10.1016%2fj.jiph.2021.07.018&partnerID=40&md5=4f2ba9426a80f3b41df7c584b366d022	Background: Tenofovir disoproxil fumarate has been recommended for pre-exposure prophylaxis (PrEP) to prevent HIV infection. Several studies have shown short but potent intermittent PrEP could provide comparable protection to daily PrEP in men, suggesting such dosing strategy might be useful in Chinese as well. The objective of this study was to evaluate the impact of different dosing strategies on plasma concentrations of tenofovir. Methods: An open label study in 40 Chinese healthy volunteers, randomized to receive the WHO-recommended dose of tenofovir (300 mg) at four different dosing intervals: twice weekly for 4 weeks; once daily for 4 weeks with one missing dose in weeks 2–4; once daily for 4 weeks with two missing doses in weeks 2–4; and once every other day for 12 days. Plasma samples were collected at pre-dose, weekly trough and 24 h post last dose and assayed using HPLC-UV. Results: The tenofovir trough concentrations were below the lower limit of quantification with the twice weekly regimen. The trough concentrations (24 h dosing interval) at the steady state were 51.7 ± 12.1 ng/ml and 53.5 ± 13.8 ng/ml (mean ± SD) in the once daily groups. Missing doses, once or twice weekly, had no significant impact on trough concentrations. Prolongation of dosing interval to 48 h resulted with concentrations at 24 h and 48 h (trough) of ~40 and 20 ng/ml, respectively. Conclusions: Intermittent tenofovir regimens resulted with remarkably low plasma concentrations in Chinese participants. Missing doses did not affect trough concentrations significantly. © 2021 The Author(s)	Intermittent regimens; Missing dose; PrEP; Tenofovir disoproxil fumarate	English	Netherlands	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Clinical
Article	2021	Sharma, Akshay; Paredes-Vincent, Ariana; Kahle, Erin M	Awareness, Utilization, and Preferences for Traditional and Contemporary HIV Prevention Strategies Among Facebook and Instagram-Using MSM in the United States.	Journal of the International Association of Providers of AIDS Care	-	-	-	-	2325-9582	10.1177/23259582211024770	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8212379	HIV prevention research among men who have sex with men (MSM) has traditionally focused on individual risk reduction strategies. Our study evaluated awareness, utilization, and preferences for 10 complementary HIV prevention strategies among 1,286 MSM recruited via Facebook and Instagram from June-August 2018. Ages ranged from 18-85 years, and the majority were non-Hispanic white (n = 1,019, 79.24%), college-educated (n = 819, 63.69%), gay-identifying (n = 1,074, 83.51%), and partnered (n = 808, 62.83%). Post-exposure prophylaxis was the least familiar option, and engaging in sexual activities other than anal sex was the most utilized option. Progressively older and bisexual-identifying MSM were less likely, but those with higher educational levels and easy access to local HIV resources were more likely to be aware of and to be utilizing a greater number of strategies. Additionally, Hispanic MSM were less likely to be aware of, and those in a "closed" relationship were less likely to be utilizing a greater number of strategies. In a subset of 775 multiple strategy users, pre-exposure prophylaxis, regularly testing for HIV, and limiting the number of sex partners emerged as the most preferred options. Combination intervention packages for MSM should be tailored to personal circumstances, including sexual orientation, relationship characteristics and access to local HIV resources. Article	2021	Sharpe, J Danielle; Guest, Jodie L; Siegler, Aaron J; Sanchez, Travis H; Sullivan, Patrick S	The spatiotemporal distribution of pre-exposure prophylaxis accessibility in the United States, 2016–2020	Annals of Epidemiology	-	-	-	-	10472797	10.1016/j.annepidem.2021.09.006	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117621596&doi=10.1016%2fj.annepidem.2021.09.006&partnerID=40&md5=35953882b95178e67321c03f719f8051	Purpose: Residing in areas with little spatial accessibility to HIV pre-exposure prophylaxis (PrEP) providers, or PrEP deserts, contributes to low PrEP uptake. This study examines and characterizes the spatial distribution of PrEP accessibility in the United States over time. Methods: We conducted spatial network analyses and geographic mapping to explore the spatiotemporal distribution of persistent PrEP deserts (census tracts with suboptimal accessibility in 2016 and 2020), new PrEP deserts (tracts with suboptimal accessibility in 2020 but not 2016), new PrEP oases (tracts with suboptimal accessibility in 2016 but not 2020), and persistent PrEP oases (tracts with optimal accessibility in 2016 and 2020). We used polytomous logistic regression to determine area-level factors associated with these four spatiotemporal PrEP accessibility types. Results: There was a reduction of 52.8% in the prevalence of 30-minute PrEP deserts from 2016 (28,055 tracts) to 2020 (13,240 tracts) and an increase of 33.5% in 30-minute PrEP oases from 2016 (44,259 tracts) to 2020 (59,074 tracts). Of all tracts, 12,487 (17.3%) were persistent PrEP deserts, 753 (1.0%) were new PrEP deserts, 15,568 (21.5%) were new PrEP oases, and 43,506 (60.1%) were persistent PrEP oases. Overall, persistent PrEP oases were more likely to be of higher socioeconomic status, racially/ethnically diverse, located in urban areas, and located in the Northeast compared with other spatiotemporal PrEP accessibility types, with variation by urbanicity and U.S. Census region. Conclusions: Efforts to improve PrEP accessibility should be especially focused in disadvantaged communities in nonurban areas and the South, Midwest, and West. Monitoring changes in the spatial accessibility of PrEP over time and determining the factors associated with such changes can help to evaluate progress made towards improving PrEP accessibility. © 2021 Elsevier Inc. Article	2021	Shimizu K.	A SWOT analysis of the guidelines on prevention of HIV/AIDS in Japan in the context of COVID-19	Infectious Disease Reports	-	-	-	-	20367449	10.3390/idr13040087	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119900010&doi=10.3390%2fidr13040087&partnerID=40&md5=a76784bad0f9dc6c9e6b07eb2f8ac72	In January 2018, the Minister of Health, Labour and Welfare, Japan, released an amended Guideline on the Prevention of Specified Infectious Diseases on Acquired Immunodeficiency Syndrome (AIDS) to propose measures to control the human immunodeficiency virus (HIV)/AIDS. Content analysis was performed to examine the strengths, weaknesses, opportunities, and threats of the guidelines in the context of the ongoing COVID-19 pandemic, thus aiming to promote discussions on the guideline itself and the national HIV/AIDS strategy in Japan in the years ahead. The strengths included the incorporation of the latest scientific advancements, clarification of high-risk populations, an alignment with measures against sexually transmitted diseases (STDs), and willingness towards international cooperation in the Asia-Pacific region. The weaknesses that were exposed included a lack of explicit targets for controlling and containing HIV/AIDS, insufficient descriptions about pre-exposure prophylaxis (PrEP), and aggregated discussions on HIV/AIDS among foreign residents. Although several opportunities for re-energizing the discussions around HIV/AIDS were recognized, insufficient political will and funding, along with the emergence of the ongoing COVID-19 pandemic, could operate as threats. Addressing barriers that were recognized before 2019 and exposed due to the COVID-19 pandemic, and tackling underlying health inequalities through the concept of social determinants of health will be critical. Article	2021	Shrader C.-H.; Arroyo-Flores J.; Stoler J.; Skvoretz J.; Carrico A.; Doblecki-Lewis S.; Kanamori M.	The Association Between Social and Spatial Closeness With PrEP Conversations Among Latino Men Who Have Sex With Men	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000002777	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123650966&doi=10.1097%2fQAI.0000000000002777&partnerID=40&md5=99a7b4653ef87a6a13530f4dbac16946	Background:US Latino men who have sex with men (LMSM) are a group at highest risk for HIV. One driver of HIV among LMSM is inadequate access to pre-exposure prophylaxis (PrEP) information. The social network theory of homophily suggests that sharing similar sociodemographic factors could influence PrEP conversations within networks. This study aimed to determine how the effects of homophily across sociodemographic, immigration, cultural, and PrEP-related factors are associated with PrEP-related communication.Setting:This study was conducted in Miami-Dade County, FL.Methods:Data collected between August 2018 and October 2019 included 10 sociocentric friendship groups of 13 LMSM (N = 130). Participants were recruited using respondent-driven sampling by a community-based organization in Miami. We used the multiple regression quadratic assignment procedure to identify the effects of homophily and relationship characteristics on PrEP-related conversations using R software.Results:More frequent PrEP-related conversations were associated with dyadic friendships characterized by homophily on knowledge of PrEP effectiveness, heterophily on depressive symptom severity, home addresses proximity, friend closeness, and interaction frequency. Past PrEP-related conversation frequency also increased based on heterophily on the Latino cultural value of familism (ie, emotional support to family). Racial homophily, heterophily on severity of depressive symptoms, home addresses proximity, friendship closeness, and frequency of interactions increased likelihood to encourage a friend to use PrEP.Discussion:Social and spatial closeness and homophily play a role in PrEP-related conversations. Information from social networks contextualized in geographic settings can be elucidated to contribute toward the design of novel opportunities to end HIV. © 2021 Lippincott Williams and Wilkins. Article	2021	Sibanda, EL; Mangenah, C; Neuman, M; Tumushime, M; Watadzaushe, C; Mutseta, MN; Maringwa, G; Dirawo, J; Fielding, KL; Johnson, C; Ncube, G; Taegtmeyer, M; Hatzold, K; Corbett, EL; Terris-Prestholt, F; Cowan, FM	Comparison of community-led distribution of HIV self-tests kits with distribution by paid distributors: a cluster randomised trial in rural Zimbabwean communities	BMJ Glob Health	-	-	-	-	NA	10.1136/bmjgh-2021-005000	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02296140/full	BACKGROUND: We compared community-led versus an established community-based HIV self-testing (HIVST) model in rural Zimbabwe using a cluster-randomised trial. METHODS: Forty village groups were randomised 1:1 using restricted randomisation to community-led HIVST, where communities planned and implemented HIVST distribution for 4 weeks, or paid distribution (PD), where distributors were paid US$50 to distribute kits door-to-door over 4 weeks. Individual level primary outcomes compared household survey responses by arm 4 months post-intervention for: (1) newly diagnosed HIV during/within 4 months following HIVST distribution, (2) linkage to confirmatory testing, pre-exposure prophylaxis or voluntary medical male circumcision during/within 4 months following HIVST distribution. Participants were not masked to allocation; analysis used masked data. Trial analysis used random-effects logistic regression.Distribution costs compared: (1) community-led HIVST, (2) PD HIVST and (3) PD costs when first implemented in 2016/2017. RESULTS: From October 2018 to August 2019, 27 812 and 36 699 HIVST kits were distributed in community-led and PD communities, respectively. We surveyed 11 150 participants and 5683 were in community-led arm. New HIV diagnosis was reported by 211 (3.7%) community-led versus 197 (3.6%) PD arm participants, adjusted OR (aOR) 1.1 (95% CI 0.72 to 1.56); 318 (25.9%) community-led arm participants linked to post-test services versus 363 (23.9%) in PD arm, aOR 1.1 (95% CI 0.75 to 1.49).Cost per HIVST kit distributed was US$6.29 and US$10.25 for PD and community-led HIVST, both lower than 2016/2017 costs for newly implemented PD (US$14.52). No social harms were reported. CONCLUSIONS: Community-led HIVST can perform as well as paid distribution, with lower costs in the first year. These costs may reduce with programme maturity/learning. Método: Revisão integrativa que utilizou as bases de dados Public Medline, Literatura Latino-Americana e do Caribe em Ciências da Saúde e Cumulative Index to Nursing and Allied Health Literature. Resultados: Os fatores de risco para o HIV mais prevalentes entre Homens que fazem Sexo com Homens são: múltiplos parceiros sexuais, relação sexual desprotegida, sífilis, uso de álcool e outras drogas, e sexo anal receptivo. As estratégias preventivas mais indicadas para essa população são: Profilaxia pré-exposição (PreP), tratamento como forma de prevenção (TasP), Testagem para HIV, uso consistente do preservativo e prevenção combinada. Resultados: Os fatores de riscos estão relacionados ao comportamento sexual e o uso de álcool e outras drogas e as estratégias preventivas concentram-se no emprego de medidas de prevenção combinadas. Conclusão: Os fatores de riscos para a infecção por HIV em HSH evidenciados foram: múltiplos parceiros sexuais, relação sexual desprotegida, sífilis, uso de álcool e drogas ilícitas, e sexo anal receptivo e como principais estratégias preventivas, PreP, TasP, Testagem para HIV, uso consistente do preservativo e prevenção combinada	AIDS serodianosis; Sexually Transmitted Diseases; Sexual and Gender Minorities; Men's Health.; Sorodianóstico da AIDS; Doenças Sexualmente Transmissíveis; Minorias Sexuais e de Gênero; Saúde do Homem.; serodianosis por SIDA; Enfermedades sexualmente transmisibles; Minorías sexuales y de género; Salud de los hombres	Portuguese	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Review
Article	2021	Simões D.; Meireles P.; Rocha M.; Freitas R.; Aguiar A.; Barros H.	Knowledge and Use of PEP and PrEP Among Key Populations Tested in Community Centers in Portugal	Frontiers in Public Health	-	-	-	-	22962565	10.3389/fpubh.2021.673959	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112629882&doi=10.3389%2ffpubh.2021.673959&partnerID=40&md5=cdcbb3764b5f1d6d04777600dbc01491	Background: Pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP) have been increasingly available in Europe. Due to the high burden of HIV in key populations, these could benefit from their use. In 2016, in Portugal, an open, non-interval, prospective cohort study was established in a network of 26 community-based voluntary HIV/STI counseling and testing centers. Data collected included questions on PEP and PrEP knowledge and use. We aimed to estimate the proportion of PEP and PrEP knowledge and its use among key populations, visiting the centers between 2016 and 2019. Method and results: Individuals who self-identify as being among at least one key population for HIV, men who have sex with men (MSM), people who inject drugs (PWID), sex workers (SW), migrants, and male-to-female transgender individuals (MTF), responded to questions on PEP and PrEP knowledge and use while waiting for their test results between 2016 and 2019 (n = 12,893 for PEP; n = 10,973 for PrEP). Reported knowledge was low in all key populations for both tools: 15.7% of respondents reported knowing about PEP and 10.9% about PrEP over the course of 4 years. PEP was used by 1.8% and PrEP by 0.4% of the respondents, MSM being 88.9% of PrEP users, and 52.8% of PEP users. Multivariate logistic regression showed multiple factors associated with knowing the tools, including age, education, country of birth, gender, year of test, having a reactive HIV test in the last 12 months, reporting an STI or condomless sex in the last 12 months, and identifying with being MSM or SW. Conclusions: Knowledge and use of PEP and PrEP remain low among key populations in Portugal. The need remains to increase knowledge and use among those at risk for HIV infection. © Copyright © 2021 Simões, Meireles, Rocha, Freitas, Aguiar and Barros.	community organizations; HIV; key population groups; post-exposure prophylaxis; pre-exposure prophylaxis	English	Switzerland	Western and Central Europe and North America	Portugal	Western and Central Europe and North America	Portugal	Western and Central Europe and North America	Quantitative
Article	2021	Singh, Advaita Acarya; Pillay, Priyen; Kwezi, Lusisizwe; Tsekoa, Tsepo Lebiletsa	A plant-biotechnology approach for producing highly potent anti-HIV antibodies for antiretroviral therapy consideration.	Journal of Genetic Engineering and Biotechnology	-	-	-	-	2090-5920	10.1186/s43141-021-00279-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8655037	Despite a reduction in global HIV prevalence the development of a pipeline of new therapeutics or pre-exposure prophylaxis to control the HIV/AIDS epidemic are of high priority. Antibody-based therapies offer several advantages and have been shown to prevent HIV-infection. Plant-based production is efficient for several biologics, including antibodies. We provide a short review on the work by Singh et al., 2020 who demonstrated the transient production of potent CAP256-VRC26 broadly neutralizing antibodies. These antibodies have engineered posttranslational modifications, namely N-glycosylation in the fragment crystallizable region and O-sulfation of tyrosine residues in the complementary-determining region H3 loop. The glycoengineered Nicotiana benthamiana mutant (ΔXTFT) was used, with glycosylating structures lacking ß1,2-xylose and/or α1,3-fucose residues, which is critical for enhanced effector activity. The CAP256-VRC26 antibody lineage targets the first and second variable region of the HIV-1 gp120 envelope glycoprotein. The high potency of this lineage is mediated by a protruding O-sulfated tyrosine in the CDR H3 loop. Nicotiana benthamiana lacks human tyrosyl protein sulfotransferase 1, the enzyme responsible for tyrosine O-sulfation. The transient coexpression of the CAP256-VRC26 antibodies with tyrosyl protein sulfotransferase 1 in planta had restored the efficacy of these antibodies through the incorporation of the O-sulfation modification. This approach demonstrates the strategic incorporation of posttranslational modifications in production systems, which may have not been previously considered. These plant-produced CAP256-VRC26 antibodies have therapeutic as well as topical and systemic pre-exposure prophylaxis potential in enabling the empowerment of young girls and women given that gender inequalities remain a major driver of the epidemic. Article	2021	Sinno J.; Doria N.; Cochkanoff N.; Numer M.; Neyedli H.; Tan D.	Attitudes and practices of a sample of nova scotian physicians for the implementation of hiv pre-exposure prophylaxis	HIV/AIDS - Research and Palliative Care	-	-	-	-	11791373	10.2147/HIV.S287201	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101018311&doi=10.2147%2fHIV.S287201&partnerID=40&md5=8dab0188de99d7f9d04d28134a4c907d	Introduction: Pre-exposure prophylaxis (PrEP) is an effective HIV prevention tool that requires the ongoing support of physicians to be accessible. Recently, Nova Scotia experi-enced a 100% increase in HIV diagnoses. The purpose of this study is to explore the relationship between physicians' support of PrEP, knowledge of PrEP, and PrEP prescribing history using the information-motivation-behavioral (IMB) skills model. Methods: An online survey was distributed to physicians in Nova Scotia, Canada, and eighty physicians participated. Two exploratory factor analyses were conducted with items from the Support of PrEP scale and Knowledge of PrEP scale. A mediation analysis was conducted to assess if knowledge of PrEP mediated the relationship between support of PrEP and whether physicians have prescribed PrEP in the past. Results: On average, physicians reported strong support for PrEP, and as support for PrEP increased so did knowledge of PrEP. Further, physicians who had prescribed PrEP demon-strated strong knowledge of PrEP and physicians who had not prescribed PrEP reported feeling neutral. The 95% bootstrap confidence interval indirect effect of Support for PrEP on prescription history did not include zero (B = 1.59, 95% BsCI 0.83, 3.57) demonstrating that the effect of support for PrEP is mediated by knowledge of PrEP. The most commonly identified barrier to prescribing PrEP was the lack of drug coverage among patients. Conclusion: The results of the mediation analysis support the IMB skills model regarding support for PrEP, Knowledge of PrEP, and having prescribed PrEP in the past. Our findings suggest that to improve PrEP uptake in Nova Scotia, educational interventions for physicians and universal coverage of the drug would be necessary. © 2021 Sinno et al. Article	2021	Skeen S.J.; Starks T.J.; Jimenez R.H.; Rendina H.J.; Cain D.	Heterosexual Cisgender Men Partnered with Transgender Women Exhibit Higher HIV/STI Sexual Risk than Their Gay, Bisexual, and Queer Counterparts: Findings from a U.S.-Based Convenience Sample Recruited Online	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03314-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106698432&doi=10.1007%2fs10461-021-03314-9&partnerID=40&md5=12f8a95a07b7af48fafffb3468bb812c	Cisgender men are frequently vectors for HIV transmission among transgender women. Despite this, the correlates of sexual risk among these men remain under-examined. The purpose of the present study was to explore potential differences in relationship characteristics, sexual risk-taking, and risk-reduction strategies among cisgender men partnered with transgender women. The study utilized secondary screening data provided by adult cis men who reported being in a primary relationship with a trans woman (N = 710). Gay men (18%) were comparatively older, and most likely to report both HIV seropositivity and committed pairings. Heterosexual men (14%) were more likely to report exchange sex, briefer relationships, extra-dyadic sex, lesser serostatus awareness or PrEP uptake. Queer men (7%) were youngest, and most likely to access PrEP. Heterosexual cis men with trans women partners may be subject to unique socio-cultural drivers of sexual risk, such as heteronormative pressures and relationship stigma. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Skinta M.D.; Brandrett B.D.; Margolis E.	Desiring intimacy and building community: young, gay and living with HIV in the time of PrEP	Culture, Health & Sexuality	-	-	-	-	13691058	10.1080/13691058.2020.1795722	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090456433&doi=10.1080%2f13691058.2020.1795722&partnerID=40&md5=d9264c3ad9c8c4a8d40334f4ee984047	The negative effects of stigma on men living with HIV within gay communities are well-documented. However, few studies have examined the experience of intimacy for men living with HIV as a consequence of the widespread availability of pre-exposure prophylaxis (PrEP). This study explores the effect of PrEP adoption on the lives of men living with HIV in one of the first cities that made PrEP widely available, and where adoption had already been in place in treatment trials prior to FDA approval in 2012. In-depth, semi-structured interviews were conducted with six gay men living with HIV under 40 years old in San Francisco, California. Transcriptions were coded using interpretative phenomenological analysis. Four key themes relevant to experiential changes within the gay community post-PrEP rollout were identified: (i) the desire for intimate connection; (ii) remembered experiences of stigma; (iii) men who do not take PrEP are suspect; (iv) and an awareness of the changing meaning of HIV. The findings suggest that, post-PrEP rollout, men living with HIV are experiencing dating, sex and community in ways that reflect a general reduction in the experience of stigma surrounding their HIV status. This suggests an important social impact of PrEP in reducing HIV-related stigma beyond the primary prophylactic effect. © 2020 Informa UK Limited, trading as Taylor & Francis Group.	gay men; HIV; intimacy; Pre-exposure prophylaxis; stigma	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Slurink I.; van Aar F.; Parkkali S.; Heijman T.; Götz H.; Kampman K.; van Weert Y.; van Benthem B.; van de Laar T.; Op de Coul E.	Recently acquired HIV infections and associated factors among men who have sex with men diagnosed at Dutch sexual health centres	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624211008071	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105061665&doi=10.1177%2f09564624211008071&partnerID=40&md5=b191c0935c9c68f34cfb7930feaf0fdb	Introduction: Surveillance for recent HIV infections was implemented at Dutch sexual health centres (SHCs) for planning and evaluation of HIV prevention initiatives. The study objective is twofold: (1) to explore trends in recent HIV infections and associated socio-demographic and behavioural risk factors among men who have sex with men (MSM)attending SHCs, to gain insight into subgroups at risk for acquiring HIV and(2) to illustrate how comparison with different reference groups affect associations with these risk factors. Methods: Residual plasma or serum samples from MSM newly HIV diagnosed at SHCs in 2014–2017 were tested with an avidity assay. Multinomial regression was used to analyse risk factors for recent HIV infection among MSM with established HIV infections among MSM and with HIV-negative MSM as reference groups. Results: Of newly diagnosed MSM, 33% were classified as recent HIV infection with avidity testing. Combining HIV-negative test results with avidity outcomes resulted in 54% recent infections. Recent infection was associated with having an STI in the past, multiple partners and condom use for both reference groups of MSM. Additionally, relative to the HIV-negative MSM, recent infection was associated with education and having a non-Western origin. In contrast, relative to MSM with established HIV infections, recent infection was associated with Western origin. Conclusion: Our results suggest ongoing but declining transmission of HIV and high uptake of HIV testing among MSM visiting SHCs. The identification of risk factors for recent infections can help healthcare professionals to target subgroups eligible for PrEP or condom use promotion. Differentiation by the reference group in explanatory models for recent infections is important as different risk factors were identified. Likely, associations relative to HIV-negative MSM follow those of acquiring HIV infection in general, whereas the comparison with the established HIV infection reference rather reflects the frequent testing behaviour of subgroups of MSM. © The Author(s) 2021.	avidity assay; clinic; HIV; men who have sex with men; recent infection; STI; the Netherlands	English	United Kingdom	Western and Central Europe and North America	Netherlands	Western and Central Europe and North America	Netherlands	Western and Central Europe and North America	Quantitative
Article	2021	Smit, Mikaela; Marinosci, Annalisa; Agoritsas, Thomas; Calmy, Alexandra	Prophylaxis for COVID-19: a systematic review.	Clinical Microbiology and Infection	-	-	-	-	1469-0691 1198-743X	10.1016/j.cmi.2021.01.013	https://pubmed.ncbi.nlm.nih.gov/33476807/	BACKGROUND: While the landscape of vaccine and treatment candidates against the novel coronavirus disease 2019 (COVID-19) has been reviewed systematically, prophylactic candidates remain unexplored. OBJECTIVES: To map pre- and postexposure prophylactic (PrEP and PEP) candidate for COVID-19. DATA SOURCES: PubMed/Medline, Embase, International Committee of Medical Journal Editors and International Clinical Trials Registry Platform clinical trial registries and medRxiv. STUDY ELIGIBILITY CRITERIA AND PARTICIPANTS: All studies in humans or animals and randomized controlled trials (RCTs) in humans reporting primary data on prophylactic candidates against COVID-19, excluding studies focused on key populations. INTERVENTIONS: PrEP and PEP candidate for COVID-19. METHODS: Systematic review and qualitative synthesis of COVID-19 PrEP and PEP studies and RCTs complemented by search of medRxiv and PubMed and Embase for studies reporting RCT outcomes since systematic review search completion. RESULTS: We identified 13 studies (from 2119 database records) and 117 RCTs (from 5565 RCTs listed in the registries) that met the inclusion criteria. Non-RCT studies reported on cross-sectional studies using hydroxychloroquine (HCQ) in humans (n = 2) or reported on animal studies (n = 11), most of which used antibodies. All five completed RCTs focused on the use of HCQ as either PrEP or PEP, and these and the cross-sectional studies reported no prophylactic effect. The majority of ongoing RCTs evaluated HCQ or other existing candidates including non-severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) vaccines, anti(retro)virals or use of vitamins and supplements. CONCLUSIONS: The key message from completed studies and RCTs seems to be that HCQ does not work. There is little evidence regarding other compounds, with all RCTs using candidates other than HCQ still ongoing. It remains to be seen if the portfolio of existing molecules being evaluated in RCTs will identify successful prophylaxis against COVID-19 or if there is a need for the development of new candidates. Article	2021	Smith A.K.J.; Haire B.; Newman C.E.; Holt M.	Challenges of providing HIV pre-exposure prophylaxis across Australian clinics: qualitative insights of clinicians	Sexual Health	-	-	-	-	14485028	10.1071/SH20208	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105151788&doi=10.1071%2fSH20208&partnerID=40&md5=abdd074ddef1f969f1e38393cd8727e8	Background: HIV pre-exposure prophylaxis (PrEP) has been rapidly implemented in Australia, initially through restricted access in demonstration studies, and then through prescribing across sexual health clinics and general practice settings. In 2018, PrEP was publicly subsidised for people with Medicare (universal health insurance for citizens, permanent residents and those from countries with reciprocal arrangements). There is little research examining the experiences of PrEP providers in Australia, and existing research has been primarily conducted before public subsidy. Methods: In this qualitative study, we examine the challenges that have emerged for PrEP-providing clinicians after public subsidy for PrEP was introduced. We conducted 28 semi-structured interviews in 2019-20 with PrEP providers in two Australian states, and analysed data thematically. Participants included general practitioners (GPs), sexual health nurses and sexual health physicians. Results: Sexual health services have been reconfigured to meet changing patient demand, with an emphasis on ensuring equitable financial access to PrEP. Restrictions to nurse-led PrEP frustrated some participants, given that nurses had demonstrated competence during trials. GPs were believed to be less effective at prescribing PrEP, but GP participants themselves indicated that PrEP was an easy intervention, but difficult to integrate into general practice. Participants expressed discomfort with on-demand PrEP. Conclusions: Our findings indicate that supporting ways for patients without Medicare to access PrEP inexpensively, advocating for nurse-led PrEP, and developing guidelines adapted to general practice consultations could ensure that PrEP is delivered more effectively and equitably. Additionally, PrEP providers require encouragement to build confidence in providing on-demand PrEP. © 2021 Journal Compilation.	access; general practice; healthcare provider; HIV prevention; nurses; on-demand PrEP; pre-exposure prophylaxis	English	United States	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Qualitative
Article	2021	Smith A.K.J.; Holt M.; Haire B.; Newman C.E.	Issues associated with prescribing HIV preexposure prophylaxis for HIV anxiety: A qualitative analysis of australian providers' views	Journal of the Association of Nurses in AIDS Care	-	-	-	-	10553290	10.1097/JNC.0000000000000219	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098088589&doi=10.1097%2fJNC.0000000000000219&partnerID=40&md5=98b2aeb659c01f7a88ee1b0edb712f1b	HIV pre-exposure prophylaxis (PrEP) can alleviate anxiety about acquiring HIV, particularly for gay men and other men who have sex with men. However, research with PrEP providers has rarely examined HIV anxiety. We conducted 25 semistructured interviews in 2019-2020 with PrEP providers in New South Wales and Western Australia, and analyzed data thematically. Participants included general practitioners and sexual health nurses and doctors. Our analysis explores providers' views on providing PrEP to reduce HIV anxiety for gay men, serodiscordant couples where the partner with HIV has an undetectable viral load, and for "worried well"individuals who the providers speculated might have undisclosed risk. Although providers viewed PrEP as beneficial for many people's personal lives and relationships, they felt cautious about prescribing PrEP solely for HIV anxiety, while at the same time reporting that they prescribed PrEP if individuals insisted on it and had no medical contraindications. © 2020 Association of Nurses in AIDS Care. Article	2021	Smith, Adrian D; Kimani, Joshua; Kabuti, Rhoda; Weatherburn, Peter; Fearon, Elizabeth; Bourne, Adam	HIV burden and correlates of infection among transfeminine people and cisgender men who have sex with men in Nairobi, Kenya: an observational study.	The Lancet HIV	-	-	-	-	2352-3018	10.1016/S2352-3018(20)30310-6	https://dx.doi.org/10.1016/S2352-3018(20)30310-6	BACKGROUND: Transgender people are disproportionately affected by HIV and other sexually transmitted infections (STIs) worldwide, and culturally competent prevention and treatment services are often unavailable or inaccessible. Despite recent improvements in national HIV responses for many key populations in east Africa, evidence of effective responses informed by transgender sexual health needs is sparse. We aimed to assess gender identity among men and transgender people who have sex with men in Kenya, and to explore its associations with sexual health-related outcomes, risk behaviours, and uptake of HIV prevention and care interventions. METHODS: We did a cross-sectional study in Nairobi, Kenya, and recruited adult cisgender men and transfeminine people who reported having sex with men, through respondent-driven sampling. Inclusion criteria were possession of a valid study coupon, being aged 18 years or older, having male sex assignment at birth or male gender identification currently, living within 50 km of Nairobi, and having had consensual anal or oral sexual activity with a man in the previous 12 months. Seed participants were identified by three community organisations that provide targeted health-care services to gay, bisexual, or other men who have sex with men (MSM) communities in Nairobi. We assessed gender identity, sociodemographics, sexual behaviour, and HIV prevention and care uptake, by self-completed survey. Participants were tested for HIV, syphilis, and rectal and urethral gonorrhoea and chlamydia. We compared prevalence of sexual health outcomes, risk behaviour, and HIV prevention and care service uptake among transfeminine and cisgender participants, using multivariable robust Poisson regression models, with gender identity as the independent variable. FINDINGS: Between May 4 and Dec 8, 2017, we enrolled 618 participants. Six participants did not answer the questions on sex assigned at birth and gender identity and so were excluded from the analyses. 522 (sample-weighted percentage 86%) of 612 participants were classified as cisgender men, 70 (11%) as transfeminine, and three (<1%) as transmasculine. 17 participants (2%) did not identify as male, female, or transgender. Compared with cisgender men, transfeminine people were more likely to be HIV-positive (28 41% of 70 transfeminine vs 151 25% of 521 cisgender men; p=0·0009) and to report current symptoms consistent with a rectal STI (eight 16% of 67 vs 38 7% of 518; p=0·014). Transfeminine people reported higher numbers of recent male sexual partners (22 27% of 70 transfeminine people reported four or more male sexual partners in the past 3 months vs 112 13% of 522 cisgender men; p=0·042) and were more likely to report condomless anal intercourse with men (43 62% of 70 vs 208 39% of 522; p=0·0009) and receptive anal intercourse (54 76% of 70 vs 252 46% of 522; p<0·0001) in the past 3 months, and transactional sex with men (42 57% of 69 vs 240 42% of 518; p=0·023) and experience of sexual assault (16 23% of 69 vs 65 11% of 520; p=0·019) in the past 12 months. Use of pre-exposure prophylaxis and post-exposure prophylaxis was low in both groups. INTERPRETATION: Transfeminine people who have sex with men have a higher burden of HIV and associated risk behaviours compared with cisgender MSM in the same context, yet their uptake of prevention and care services is poor. Policies should acknowledge the specific needs of transfeminine people as distinct from cisgender MSM, and support health-care providers to address these needs. Here we report efficacy, tolerability, and safety of cabotegravir + rilpivirine LA over approximately 5 years. Methods: After 20 weeks of oral cabotegravir + abacavir/lamivudine, participants were randomized to cabotegravir + rilpivirine LA Q8W or Q4W or continue oral ART through the 96-week maintenance period. In the extension period through week 256, participants continued their current LA regimen (randomized Q8W/Q4W groups) or switched from oral ART to Q8W or Q4W LA therapy (extension-switch groups). Endpoints assessed included proportion of participants with HIV-1 RNA <50 copies/mL (Snapshot algorithm) and adverse events (AEs). Results: At week 256, 186 of 230 (81%) participants in randomized Q8W/Q4W groups and 41 of 44 (93%) participants in extension-switch groups had HIV-1 RNA <50 copies/mL. No protocol-defined virologic failures occurred after week 48. Injection site reactions infrequently resulted in discontinuation (4 2% and 1 2% participants in randomized Q8W/Q4W and extension-switch groups, respectively). Three participants in randomized Q8W/Q4W groups experienced drug-related serious AEs, including 1 fatal serious AE (Q4W group); none occurred in extension-switch groups. Of 25 participants with AEs leading to withdrawal, 20 were in the randomized Q4W group; no AE leading to withdrawal occurred in >1 participant. Conclusions: Cabotegravir + rilpivirine LA exhibited long-term efficacy and tolerability, demonstrating its durability as maintenance therapy for HIV-1 infection. Clinical Trials Registration. Article	2021	Smith, Jennifer A; Garnett, Geoffrey P; Hallett, Timothy B	The Potential Impact of Long-Acting Cabotegravir for HIV Prevention in South Africa: A Mathematical Modeling Study.	Journal of Infectious Diseases	-	-	-	-	1537-6613	10.1093/infdis/jiaa296	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8514192	BACKGROUND: Although effective, some oral pre-exposure prophylaxis (PrEP) users face barriers to adherence using daily pills, which could be reduced by long-acting formulations. Long-acting cabotegravir (CAB LA) is a potential new injectable formulation for human immunodeficiency virus (HIV) PrEP being tested in phase III trials. METHODS: We use a mathematical model of the HIV epidemic in South Africa to simulate CAB LA uptake by population groups with different levels of HIV risk. We compare the trajectory of the HIV epidemic until 2050 with and without CAB LA to estimate the impact of the intervention. RESULTS: Delivering CAB LA to 10% of the adult population could avert more than 15% of new infections from 2023 to 2050. The impact would be lower but more efficient if delivered to populations at higher HIV risk: 127 person-years of CAB LA use would be required to avert one HIV infection within 5 years if used by all adults and 47 person-years if used only by the highest risk women. CONCLUSIONS: If efficacious, a CAB LA intervention could have a substantial impact on the course of the HIV epidemic in South Africa. Uptake by those at the highest risk of infection, particularly young women, could improve the efficiency of any intervention. Article	2021	Smith, Matt; Elliott, Lawrie; Hutchinson, Sharon J; Metcalfe, Rebecca; Flowers, Paul; McAuley, Andrew	Perspectives on pre-exposure prophylaxis for people who inject drugs in the context of an hiv outbreak: A qualitative study.	International Journal of Drug Policy	-	-	-	-	1873-4758	10.1016/j.drugpo.2020.103033	https://dx.doi.org/10.1016/j.drugpo.2020.103033	BACKGROUND: There is an ongoing HIV outbreak amongst people who inject drugs (PWID) in Glasgow, Scotland, and one response which has not yet been widely implemented is the provision of Pre-exposure prophylaxis (PrEP). PrEP is the use of HIV anti-retrovirals prior to HIV infection to provide a barrier to infection. This has been shown to be effective amongst various at-risk populations in preventing HIV spread. The present study aimed to explore views of PWID who might benefit from PrEP provision and Service Providers working with PWID to understand will to use PrEP and literacy of PrEP, contributing to the development of a PrEP service. METHODS: A qualitative approach was taken, with semi structured interviews conducted in Glasgow at two third sector service sites. 11 Service Providers and 21 PWID participated in the study. Data was analysed thematically. RESULTS: Participants, both PWID and Service Providers, were keen to engage with PrEP and perceived substantial potential benefits of PrEP for this population. Potential barriers to engagement were identified as a lack of health literacy, motivation, and self-ascribed risk, as well as the overwhelming unpredictability of substance use. Participants wanted PrEP to be provided within already existing structures, particularly community pharmacies, and for promotion and provision to involve peers. CONCLUSION: This sample reported willingness to engage with PrEP, and suggested there is a specific need amongst PWID for PrEP. However, PWID have specific lived experienced contexts and needs, and are burdened by social and economic marginalisation and inequality at every level. This contrasts them from other populations currently being provided with PrEP, and must be considered in the development of provision. Article	2021	Smith, Steven J.; Zhao, Xue Zhi; Passos, Dario Oliveira; Lyumkis, Dmitry; Burke, Terrence R. Jr; Hughes, Stephen H.	Integrase Strand Transfer Inhibitors Are Effective Anti-HIV Drugs.	Viruses	-	-	-	-	1999-4915	10.3390/v13020205	https://www.mdpi.com/1999-4915/13/2/205	Integrase strand transfer inhibitors (INSTIs) are currently recommended for the first line treatment of human immunodeficiency virus type one (HIV-1) infection. The first-generation INSTIs are effective but can select for resistant viruses. Recent advances have led to several potent second-generation INSTIs that are effective against both wild-type (WT) HIV-1 integrase and many of the first-generation INSTI-resistant mutants. The emergence of resistance to these new second-generation INSTIs has been minimal, which has resulted in alternative treatment strategies for HIV-1 patients. Moreover, because of their high antiviral potencies and, in some cases, their bioavailability profiles, INSTIs will probably have prominent roles in pre-exposure prophylaxis (PrEP). Herein, we review the current state of the clinically relevant INSTIs and discuss the future outlook for this class of antiretrovirals. Article	2021	Soares, Flávia Moreira; Hellmann, Fernando	Ethics and pre-exposure prophylaxis (PrEP) in adolescents: an integrative review	DST Journal of Brazilian Sexually Transmitted Diseases	-	-	-	-	0103-4065	10.5327/DST-2177-8264-20213333	https://www.bjstd.org/revista/article/view/1173/1145	Introduction: Worldwide estimates suggest an increase in the number of deaths by AIDS among adolescents. The Pre-Exposure Prophylaxis (PrEP) has been considered a potential intervention of major impact on new HIV infections. However, the discussion on PrEP in the adolescent population needs to expand mainly regarding ethical issues that emerge with its implementation. Objective: The objective of this research was to identify ethical issues related to PrEP in adolescents in the current scientific literature and discuss their impact in the implementation of this preventive strategy. Methods: An integrative review of the literature was performed on Medline, Scopus, and Web of Science databases using descriptors Ethic and PrEP. Results: The search retrieved 284 articles, of which 16 was related to adolescents and were kept in the sample after analysis. The issues detected were classified into two categories: 1) Ethics in research and 2) Ethical problems regarding access to PrEP. Conclusion: It seems that the issues discussed could diminish the potential impact of PrEP on new HIV infections among adolescents. Discussions on the theme must be deepened, as gaps regarding Ethics and HIV prevention in adolescents are evident, especially when it comes to sexual minorities, both in research and assistance. Article	2021	Sonalkar, S; Fishman, J; Kete, C; McAllister, A; Frarey, A; Short, WR; Schreiber, CA; Teitelman, A	IMPLEMENTATION OF AN HIV PRE-EXPOSURE PROPHYLAXIS STRATEGY INTO ABORTION CARE	Contraception	-	-	-	-	0010-7824	10.1016/j.contraception.2021.07.011	https://www.contraceptionjournal.org/article/S0010-7824(21)00245-6/fulltext	Background: Family planning and abortion clinics routinely address sexual health. We sought to evaluate implementation outcomes of an HIV pre-exposure prophylaxis (PrEP) care strategy for patients seeking management of induced abortion and pregnancy loss. Setting: Single-center, urban, academic, hospital-based family planning service. Methods: We used a multifaceted implementation strategy directed toward family planning providers comprised of educational sessions, an electronic medical record-prompted verbal assessment of HIV risk, electronic medical record shortcuts for PrEP prescription, and support of a PrEP navigator. We assessed penetration of the intervention by calculating the penetration of a PrEP offer, measured as the proportion of encounters in which PrEP was offered to PrEP-eligible individuals. We evaluated feasibility, acceptability, and appropriateness of the intervention using belief elicitation interviews with providers. Results: From November 2018 to April 2019, the proportion of PrEP eligible patients who were offered PrEP, was 87.9% (29/33). Providers found the intervention acceptable and appropriate, but reported barriers including time constraints, and disappointment if patients did not adhere to PrEP. Providers liked that PrEP provision in abortion care settings felt innovative, and that they could contribute to HIV prevention. Conclusion: Family planning providers in an academic center found HIV risk assessment and PrEP provision to be feasible, acceptable, and appropriate. Further research should evaluate implementation outcomes of PrEP care strategies in additional abortion care contexts, including clinics offering reproductive health care outside of academia. Article	2021	Songtaweesin W.N.; LeGrand S.; Bandara S.; Piccone C.; Wongharn P.; Moonwong J.; Jupimai T.; Saisaengjan C.; Theerawit T.; Muessig K.; Hightow-Weidman L.; Puthanakit T.; Phanuphak N.; Tangmunkongvorakul A.	Adaptation of a theory-based social networking and gamified app-based intervention to improve pre-exposure prophylaxis adherence among young men who have sex with men in bangkok, thailand: Qualitative study	Journal of Medical Internet Research	-	-	-	-	14388871	10.2196/23852	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85118973383&doi=10.2196%2f23852&partnerID=40&md5=887cad95c69125dd5bd19f78483a1802	Background: HIV disproportionately affects young Thai men who have sex with men (YMSM). Recent studies report a high incidence and prevalence of HIV among Thai YMSM. The Thai national guidelines have recommended pre-exposure prophylaxis (PrEP) since 2014 for key populations; free PrEP has been piloted since 2019. Smartphone-based mobile health (mHealth) interventions provide an optimal platform for innovative PrEP adherence interventions for Thai YMSM. Objective: This study aims to adapt the P3 (Prepared, Protected, emPowered) app, developed with YMSM and transwomen in the United States to improve PrEP adherence and persistence for YMSM in Thailand. The app aims to provide daily adherence support and addresses gaps in staff availability for large-scale PrEP rollout needed to see population-level effects of HIV prevention. Methods: We conducted focus group discussions (FGDs) with YMSM and key informant interviews (KIIs) with PrEP care providers in Bangkok, Thailand, to investigate PrEP adherence facilitators and barriers, preferences for functions and features in mHealth apps among YMSM, and how to best adapt the P3 app to the Thai context. We conducted four FGDs with 4-8 participants per group and 15 KIIs. Results: For FGDs, 23 YMSM participated with a mean age of 20 years (range 18-21), 96% (22/23) enrolled in full-time education, and all owned smartphones. The mean age of KII participants was 40 (range 26-60) years; most were state health service providers, with the majority being counselors (6/15, 40%) and physicians (6/15, 40%). Overall, the facilitators and barriers for PrEP adherence identified were similar to those of MSM and YMSM globally including the United States. Key themes included general recommendations for improving mHealth apps in Thailand, such as presenting reliable information in an appealing format, minimizing privacy risks, and addressing connectivity challenges. Additional themes focused on P3 Thailand adaptations and were related to cultural and stylistic preferences, engagement strategies, and recommendations for new functions. To develop the adapted app, P3 Thailand, these findings were balanced with resource limitations resulting in the prioritization of minor modifications: Changes in app esthetics (color scheme, iconography, and imagery) and changes in the presentation of information in two of the app's features. FGDs identified similar PrEP adherence facilitators and barriers to those already addressed within the app. Conclusions: The core elements of the P3 app address major PrEP facilitators and barriers for Thai YMSM; however, changes to the app features, including stylistic presentation, were needed to appropriately customize the app to the Thai context. Given the similarities of facilitators and barriers for PrEP adherence globally, adapting existing PrEP mHealth solutions based on input from end users and key informants provides a promising approach. However, partnerships with local app designers and developers can improve the adaptation process and final product. © 2021 Journal of Medical Internet Research. All rights reserved. Article	2021	Sophus, Amber I; Mitchell, Jason W	Reducing HIV Risk Behaviors Among Black Women Living With and Without HIV/AIDS in the U.S.: A Systematic Review.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-020-03029-3	https://dx.doi.org/10.1007/s10461-020-03029-3	This systematic review provides an examination of the status of HIV/AIDS prevention interventions for Black, heterosexual women in the U.S. from 2012 to 2019. Using PRISMA guidelines, 28 interventions were identified. Over half of the interventions were: conducted in the southern region of the U.S.; evaluated using a randomized controlled trial; focused on adults; used a group-based intervention delivery; were behaviorally focused and theoretically driven. None included biomedical strategies of PrEP, nPEP, and TasP. Few interventions included adolescent or aging Black women; none included their sex/romantic partners. Future studies dedicated to addressing the specific needs of subpopulations of Black, heterosexual women may provide opportunities to expand and/or tailor current and future HIV/AIDS prevention interventions, including offering participants with options to choose which, and the level of involvement, of their sex/romantic partner(s) in their sexual health decision-making. While strides to improve HIV prevention efforts with Black, heterosexual women have occurred, more is needed. Article	2021	Sousa L.R.M.; Elias H.C.; Fernandes N.M.; Gir E.; Reis R.K.	Knowledge of PEP and PrEP among people living with HIV/aids in Brazil	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-020-10135-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098856653&doi=10.1186%2fs12889-020-10135-3&partnerID=40&md5=921d948ece792e8a31306b9331e9e660	Background: Pre-Exposure Prophylaxis (PrEP) and Post-Exposure Prophylaxis (PEP) are key to preventing sexual transmission of HIV, whose sexual partners are at high risk of acquiring HIV. We aimed to determine the factors associated with PrEP and PEP's knowledge as secondary prevention among people living with HIV/AIDS. Method: Cross-sectional analytical study carried out among people living with HIV/AIDS treated at five specialized services in the city of Ribeirão Preto, São Paulo, Brazil. Data were collected from July 2016 to July 2017. Individual interviews were conducted. We used multivariable logistic regression to determine factors associated with knowing PrEP and PEP. Results: Of the 397 participants, 140 (35.26%) were heterosexual women aged 40 to 49 years (36.2%).Participants with less than 11 years of study (adjusted odds: 0.29; 95% CI: 0.13–0.60); who did not have a low viral load or did not know their viral load (adjusted odds: 0.29; 95% CI: 0.09–0.83) and those with casual partners (adjusted odds: 0.29; 95% CI: 0.09–0.83) were less likely to know about the PrEP. MSM (adjusted odds: 2.88; 95% CI: 1.59–5.3) and those who used alcohol during sexual intercourse (adjusted odds: 1.7; 95% CI: 1.0–2.8) were more likely to know about the PEP. Conclusions: The knowledge about PEP and PrEP is low in Brazil. This may undermine secondary prevention efforts. Educational interventions to raise awareness of these prevention methods are needed among people living with HIV and who have HIV-negative sexual partners. © 2021, The Author(s). Article	2021	Souza, Marcus Vinicius Lessa de	Access to PrEP by cisgender mens and transsexual person: A qualitative study	Research, Society and Development	-	-	-	-	2525-3409	10.33448/rsd-v10i1.11843.	https://rsdjournal.org/index.php/rsd/article/view/11843	A study carried out in Rio de Janeiro, investigates the perception of users of public services that offer HIV pre-exposure prophylaxis. Objective: To raise possible barriers and facilitating factors in accessing Pre-Exposure Prophylaxis (PrEP). Method: This is a research with a qualitative approach, conducted with users of services that offer PrEP in the greater Rio, interviews were recorded and transcribed. The analysis categories are derived from the construction of the experiences narrated by the interlocutors. Results and Discussion: 12 users of this therapy aged between 25 and 39 years were interviewed, 10 men who have sex with other men and 2 trans women. All users reported having some knowledge about PrEP; the transgender person is the one who attends the services least. There is a consensus that combined prevention is a positive step in the STI prevention policy. Conclusion: The main barriers are related to the structural limitations of health services. Article	2021	Ssentongo, Paddy; Heilbrunn, Emily S.; Ssentongo, Anna E.; Advani, Shailesh; Chinchilli, Vernon M.; Nunez, Jonathan J.; Du, Ping	Epidemiology and outcomes of COVID-19 in HIV-infected individuals: a systematic review and meta-analysis.	Scientific Reports	-	-	-	-	2045-2322	10.1038/s41598-021-85359-3	https://pubmed.ncbi.nlm.nih.gov/33737527/	Susceptibility to severe acute respiratory syndrome coronavirus 2 (SARS-CoV-2) infection and the risk of mortality among people living with human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS) (PLWHA) is largely unknown. PLWHA are unique due to their altered immune system from their history of chronic HIV infection and their use of antiretroviral therapy, some of which have been used experimentally to treat coronavirus disease 2019 (COVID-19). Therefore, we conducted a systematic review and meta-analysis to assess the epidemiology of SARS-CoV-2/HIV coinfection and estimate associated mortality from COVID-19 (Prospero Registration ID: CRD42020187980). PubMed, SCOPUS, OVID and Cochrane Library databases, and medRxiv preprint repositories were searched from January 1, 2020, to December 12, 2020. Data were extracted from studies reporting COVID-19 attack and mortality rates in PLWHA compared to their HIV-negative counterparts. Pooled attack and mortality rates were quantified using random-effects models. We identified 22 studies that included 20,982,498 participants across North America, Africa, Europe, and Asia. The median age was 56 years, and 50% were male. HIV-positive persons had a significantly higher risk of SARS-CoV-2 infection risk ratio (RR) 1.24, 95% CI 1.05-1.46) and mortality from COVID-19 (RR 1.78, 95% CI 1.21-2.60) than HIV-negative individuals. The beneficial effects of tenofovir and protease-inhibitors in reducing the risk of SARS-CoV-2 infection and death from COVID-19 in PLWHA remain inconclusive. HIV remains a significant risk factor for acquiring SARS-CoV-2 infection and is associated with a higher risk of mortality from COVID-19. In support of the current Centers for Disease Control and Prevention (CDC) guidelines, persons with HIV need priority consideration for the SARS-CoV-2 vaccine. Article	2021	Stalter R.M.; Pintye J.; Mugwanya K.K.	Safety review of tenofovir disoproxil fumarate/emtricitabine pre-exposure prophylaxis for pregnant women at risk of HIV infection	Expert Opinion on Drug Safety	-	-	-	-	14740338	10.1080/14740338.2021.1931680	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106756084&doi=10.1080%2f14740338.2021.1931680&partnerID=40&md5=e0b6767525fbd916a6f112f9ec6aa474	Introduction: Pregnancy is a period of elevated HIV risk in high-burden settings, motivating the need for prevention tools that are both safe for use and effective during pregnancy. Oral pre-exposure prophylaxis (PrEP) containing tenofovir disoproxil fumarate (TDF) is recommended by the World Health Organization, including for pregnant and postpartum women at substantial risk of HIV infection. Although TDF use during pregnancy appears generally safe, data on PrEP use during pregnancy remain limited. Areas covered: We provide an overview of the clinical pharmacology and efficacy of daily TDF-based PrEP and summarize current evidence on the safety of PrEP use by pregnant HIV-uninfected women. We synthesize relevant studies assessing pregnancy outcomes among pregnant women who are living with HIV (WLHIV) and using TDF-based therapy. Finally, we make comparison to the safety profiles of other emerging HIV prevention options. Expert opinion: The current evidence indicates that TDF/FTC PrEP use is not associated with increased risk of adverse pregnancy and early infant growth outcomes. While safety data are generally reassuring, there is need for continued accrual of data on growth and pregnancy outcomes in PrEP research, implementation projects, and controlled pharmacokinetic studies to support current evidence and to understand concentration–efficacy relationship in pregnant women. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Theses and Dissertations	2021	Stalter, Randy Matthew; Baeten, Jared	Evaluating PrEP Use and Safety among Women of Reproductive Age in Sub-Saharan Africa	-	-	University oh Washigton	-	-	NA	https://www.proquest.com/dissertations-theses/evaluating-prep-use-safety-among-women/docview/2566067001/se-2?accountid=8113	In sub-Saharan Africa, oral pre-exposure prophylaxis (PrEP) with tenofovir disoproxil fumarate and emtricitabine (TDF/FTC) has emerged as an important HIV prevention strategy for women and is being scaled up rapidly in areas with high HIV burden. New, long-acting PrEP methods are also approaching introduction, including the dapivirine vaginal ring, which women can wear continuously and discreetly for up to one month. Greater choice means women are more likely to find a method that suits their specific needs and preferences. However, questions and challenges regarding PrEP use and safety among women of reproductive age remain, which we aimed to address in this dissertation. First, we validated a novel, urine-based tenofovir immunoassay as a potential point-of-care tool for assessing PrEP adherence using stored samples from the Partners PrEP Study (Chapter 2). Second, we estimated the per-sex-act relative HIV risk reduction among women exhibiting consistent use of the dapivirine ring in the ASPIRE trial based on an objective measure of ring exposure, the rate of dapivirine release from returned rings (Chapter 3). Third, we evaluated differences in changes in bone turnover markers associated with combined use of oral PrEP and depot medroxyprogesterone acetate (DMPA) among young women in Uganda (Chapter 4). Finally, we conducted a literature review on the safety of TDF-based PrEP use during pregnancy (Chapter 5). We demonstrated that urine tenofovir concentrations measured by the novel immunoassay has good sensitivity (87%) and specificity (73%) for detecting tenofovir in plasma. Additionally, tenofovir concentrations over a certain threshold indicative of PrEP use in the past day were predictive of a 71% reduction in HIV risk. We established the first per-sex-act dose-response model for dapivirine ring exposure and estimated 61% per-sex-act risk reduction with ring release rates indicative of continuous ring use. We identified no substantial changes in bone turnover biomarkers after 6 months of combined DMPA and PrEP use. Finally, we found that the current body of evidence on the safety of TDF-based PrEP use during pregnancy is reassuring but that additional data are needed. Additionally, more efforts are needed to increase representation of pregnant women in studies of new HIV prevention products. The findings from this dissertation contribute to efforts for improving women's uptake of and adherence to PrEP in the coming years by validating a novel urine-based tenofovir immunoassay and providing a better understanding the efficacy of the dapivirine ring. Additionally, this work provides reassuring data on the safety of PrEP use during periods of contraception and pregnancy which may help to facilitate integration of PrEP into family planning and antenatal care services. Article	2021	Stankevitz K.; Nhamo D.; Murungu J.; Ridgeway K.; Mamvuto T.; Lenzi R.; Lydon M.; Katsande N.; Mahaka I.; Hoke T.	Test and prevent: Evaluation of a pilot program linking clients with negative HIV test results to pre-exposure prophylaxis in Zimbabwe	Global Health Science and Practice	-	-	-	2169575X	10.9745/GHSP-D-20-00444	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103681797&doi=10.9745%2fGHSP-D-20-00444&partnerID=40&md5=ebc25e26f490494b3ad184077453541c	Background: As HIV testing increases worldwide, programs are reaching individuals without HIV infection who are at risk of exposure and may be candidates for oral pre-exposure prophylaxis (PrEP). Although linkage of individuals with HIV infection to treatment is a global priority (referred to as "test and treat"), less attention is given to individuals with negative HIV test results. We developed the "Test and Prevent" pilot program to intentionally link at-risk clients with negative HIV test results to PrEP services. The intervention included risk assessment of all clients with a negative result from HIV testing (with national risk assessment tool), accompanied referral, fast-tracking, and targeting follow-up. Methods: The intervention was conducted in Bulawayo, Zimbabwe, at 6 public sector sites from October 2019 to February 2020. We collected routine monitoring data from all study sites and tracked referral completion and PrEP initiation among clients who enrolled. We conducted in-depth interviews with providers (n=12), facility managers (n=5), and female clients (n=17) to explore acceptability. Results: Among clients referred for PrEP (n=206), 98% completed their referrals and started PrEP. However, only 3% of clients who received a negative test result during the study period were referred. Low referrals stemmed from lack of screening (39% of clients with negative HIV test results were not screened) and lack of eligibility among clients who were screened (only 6% of those screened qualified as candidates for PrEP per the national screening tool). Qualitative results indicate that some providers purposefully did not complete screening with clients they felt were not at risk and that workload could have contributed to low screening uptake. Qualitative interviews showed that Test and Prevent was acceptable among both providers and clients. Clients were happy to learn about PrEP following HIV testing, and the additional support of accompanied referrals and fast-tracking encouraged them to access PrEP and made them feel valued. Providers were burdened by workload constraints but felt that Test and Prevent was important and should be scaled to other sites. Conclusion: Intentionally linking clients with negative results to PrEP immediately following HIV testing was found to be acceptable from both provider and client perspectives, yet screening procedures need closer examination and reinforcement for the program to realize a larger impact. © Stankevitz et al. Article	2021	Stelzle D.; Godfrey-Faussett P.; Jia C.; Amiesimaka O.; Mahy M.; Castor D.; Hodges-Mameletzis I.; Chitembo L.; Baggaley R.; Dalal S.	Estimating HIV pre-exposure prophylaxis need and impact in Malawi, Mozambique and Zambia: A geospatial and risk-based analysis	PLOS Medicine	-	-	-	15491277	10.1371/journal.pmed.1003482	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099337088&doi=10.1371%2fjournal.pmed.1003482&partnerID=40&md5=58777bf1f9263b5d629bec4bea75c1a3	Background Pre-exposure prophylaxis (PrEP), a WHO-recommended HIV prevention method for people at high risk for acquiring HIV, is being increasingly implemented in many countries. Setting programmatic targets, particularly in generalised epidemics, could incorporate estimates of the size of the population likely to be eligible for PrEP using incidence-based thresholds. We estimated the proportion of men and women who would be eligible for PrEP and the number of HIV infections that could be averted in Malawi, Mozambique, and Zambia using prioritisation based on age, sex, geography, and markers of risk. Methods and findings We analysed the latest nationally representative Demographic and Health Surveys (DHS) of Malawi, Mozambique, and Zambia to determine the proportion of adults who report behavioural markers of risk for HIV infection. We used prevalence ratios (PRs) to quantify the association of these factors with HIV status. Using a multiplier method, we combined these proportions with the number of new HIV infections by district, derived from district-level modelled HIV estimates. Based on these numbers, different scenarios were analysed for the minimum number of person-years on PrEP needed to prevent 1 HIV infection (NNP). An estimated total of 38,000, 108,000, and 46,000 new infections occurred in Malawi, Mozambique, and Zambia in 2016, corresponding with incidence rates of 0.43, 0.63, and 0.57 per 100 person-years. In these countries, 9%–20% of new infections occurred among people with a sexually transmitted infection (STI) in the past 12 months and 40%–42% among people with either an STI or a non-regular sexual partner (NP) in the past 12 months (STINP). The models estimate that around 50% of new infections occurred in districts with incidence rates ≥1.0% in Mozambique and Zambia and ≥0.5% in Malawi. In Malawi, Mozambique, and Zambia, 35.1%, 21.9%, and 12.5% of the population live in these high-incidence districts. In the most parsimonious scenario, if women aged 15–34 years and men 20–34 years with an STI in the past 12 months living in high-incidence districts were to take PrEP, it would take a minimum of 65.8 person-years on PrEP to avert 1 HIV infection per year in Malawi, 35.2 in Mozambique, and 16.4 in Zambia. Our findings suggest that 3,300, 5,200, and 1,700 new infections could be averted per year in the 3 countries, respectively. Limitations of our study are that these values are based on modelled estimates of HIV incidence and self-reported behavioural risk factors from national surveys. Conclusions A large proportion of new HIV infections in these 3 African countries were estimated to occur among people who had either an STI or an NP in the past year, providing a straightforward means to set PrEP targets. Greater prioritisation of PrEP by district, sex, age, and behavioural risk factors resulted in lower NNPs thereby increasing PrEP cost-effectiveness, but also diminished the overall impact on reducing new infections. © 2021 Stelzle et al. Article	2021	Stephenson R.; Chavanduka T.M.D.; Rosso M.T.; Sullivan S.P.; Pitter R.A.; Hunter A.S.; Rogers E.	Sex in the Time of COVID-19: Results of an Online Survey of Gay, Bisexual and Other Men Who Have Sex with Men's Experience of Sex and HIV Prevention During the US COVID-19 Epidemic	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03024-8	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85090239227&doi=10.1007%2fs10461-020-03024-8&partnerID=40&md5=0f07e60992abfce75e87d1787679c31f	This paper presents data from a recent cross-sectional survey of gay, bisexual and other men who have sex with men (GBMSM) in the US, to understand changes in sexual behavior and access to HIV prevention options (i.e. condoms and pre-exposure prophylaxis (PrEP)) during the COVID-19 lockdown period. The Love and Sex in the Time of COVID-19 survey was conducted online from April to May, 2020. GBMSM were recruited through advertisements featured on social networking platforms, recruiting a sample size of 518 GBMSM. Analysis considers changes three in self-reported measures of sexual behavior: number of sex partners, number of anal sex partners and number of anal sex partners not protected by pre-exposure prophylaxis (PrEP) or condoms. Approximately two-thirds of the sample reported that they believed it was possible to contract COVID-19 through sex, with anal sex reported as the least risky sex act. Men did not generally feel it was important to reduce their number of sex partners during COVID-19, but reported a moderate willingness to have sex during COVID-19. For the period between February and April–May 20,202, participants reported a mean increase of 2.3 sex partners during COVID-19, a mean increase of 2.1 anal sex partners (range − 40 to 70), but a very small increase in the number of unprotected anal sex partners. Increases in sexual behavior during COVID-19 were associated with increases in substance use during the same period. High levels of sexual activity continue to be reported during the COVID-19 lockdown period and high levels of sexual activity are often paralleled by increases in substance use and binge drinking. There is a need to continue to provide comprehensive HIV prevention and care services during COVID-19, and telehealth and other eHealth platforms provide a safe, flexible mechanism for providing services. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Stephenson R.; Darbes L.A.; Chavanduka T.; Essack Z.; van Rooyen H.	HIV Testing, Knowledge and Willingness to Use PrEP Among Partnered Men Who Have Sex With Men in South Africa and Namibia	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03129-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098729555&doi=10.1007%2fs10461-020-03129-0&partnerID=40&md5=0f0e60ff6dfb5f5e7728362747e4f379	There is strong evidence that gay, bisexual and other men who have sex with men (GBMSM) in African countries experience high prevalence of HIV. However, missing from the literature is an understanding of the HIV risk behaviors and prevention needs of partnered GBMSM in African countries. The Together Tomorrow project sampled 440 partnered GBMSM (220 couples) in South Africa and Namibia. Prevalence of HIV was high at 42%, with 33% of men in sero-discordant relationships. Despite high levels of HIV testing in the past 6 months (65%), condom use with main and outside sex partners was low. Men reported low levels of willingness to use PrEP (16%). HIV testing in the past 12 months and willingness to use PrEP were significantly associated with recent binge drinking and substance use. Men in sero-discordant relationships, those with sexual agreements and those who had experienced any form of IPV were all less likely to report that they had recently tested for HIV. There is a need to develop interventions that meet the unique needs of African partnered GBMSM and tackle stigma and discrimination as drivers of HIV risk in these settings. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Article	2021	Stephenson R.; Walsh A.R.; Chavanduka T.M.D.; Sallabank G.; Horvath K.J.; Castel A.D.; Bonar E.E.; Hightow-Weidman L.; Bauermeister J.A.; Sullivan P.S.	Widespread closure of HIV prevention and care services places youth at higher risk during the COVID-19 pandemic	PLOS One	-	-	-	19326203	10.1371/journal.pone.0249740	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114743823&doi=10.1371%2fjournal.pone.0249740&partnerID=40&md5=7c4a5b270d988d5a0fd86d3f528ced4a	Background Central to measuring the impact of the COVID-19 pandemic on HIV is understanding the role of loss of access to essential HIV prevention and care services created by clinic and community-based organization closures. In this paper, we use a comprehensive list of HIV prevention services in four corridors of the US heavily impacted by HIV, developed as part of a large RCT, to illustrate the potential impact of service closure on LGBTQ+ youth. Methods We identified and mapped LGBTQ+ friendly services offering at least one of the following HIV-related services: HIV testing; STI testing; PrEP/PEP; HIV treatment and care; and other HIV-related services in 109 counties across four major interstate corridors heavily affected by HIV US Census regions: Pacific (San Francisco, CA to San Diego, CA); South-Atlantic (Washington, DC to Atlanta, GA); East-North-Central (Chicago, IL to Detroit, MI); and East-South-Central (Memphis, TN to New Orleans, LA). Results There were a total of 831 LGBTQ+ youth-friendly HIV service providers across the 109 counties. There was a range of LGBTQ+ youth-friendly HIV-service provider availability across counties (range: 0–14.33 per 10,000 youth aged 13–24 (IQR: 2.13), median: 1.09); 9 (8.26%) analyzed counties did not have any LGBTQ+ youth-friendly HIV service providers. The Pearson correlation coefficient for the correlation between county HIV prevalence and LGBTQ+ youth-friendly HIV service provider density was 0.16 (p = 0.09), suggesting only a small, non-statistically significant linear relationship between a county's available LGBTQ+ youth-friendly HIV service providers and their HIV burden. Conclusions As the COVID-19 pandemic continues, we must find novel, affordable ways to continue to provide sexual health, mental health and other support services to LGBTQ+ youth. Article	2021	Stockton J.M.	Assessment for sexually transmitted infections in men who have sex with men attending a nurse-run HIV preexposure prophylaxis clinic	Journal of the American Association of Nurse Practitioners	-	-	-	23276886	10.1097/JXX.0000000000000569	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120913948&doi=10.1097%2fJXX.0000000000000569&partnerID=40&md5=1c5dca4e89404a7aa3fb081da822cbf9	Background:Male-to-male sexual contact remains the primary mode of transmission for HIV and other sexually transmitted infections (STIs) in the United States. Reported STI rates in men who have sex with men (MSM) taking HIV preexposure prophylaxis (PrEP) are higher than expected, possibly due to decreased condom use while on PrEP or more frequent STI screening with routine PrEP care.Local problem:Hamilton County, located in southwestern Ohio, consistently has the highest rates of gonorrhea and syphilis and second highest rate of chlamydia in the state. The purpose of this project was to incorporate Centers for Disease Control and Prevention (CDC)-recommended comprehensive STI evaluations for MSM attending a nurse-run PrEP clinic in southwestern Ohio.Methods:Seventy-five MSM seen for PrEP between January 1, 2017, and May 15, 2019, were included in the STI testing program. Of these, 59 were included in outcome evaluation.Intervention:Sexually transmitted infection testing was performed every three months, including HIV and syphilis, with chlamydia/gonorrhea testing performed at all potentially exposed sites.Results:During the evaluation period, 43 STIs occurred in 18 patients (30.5%). Affected sites for gonorrhea included 10 oropharynx, eight anorectal, and two genitourinary; for chlamydia, it included one oropharynx, 12 anorectal, and one genitourinary. All extragenital infections were asymptomatic.Conclusions:Sexually transmitted infection results in this population are consistent with those reported in other PrEP centers and reinforce importance of three-point chlamydia/gonorrhea testing as part of comprehensive STI evaluation. Implementing CDC screening recommendations in PrEP programs has been effective in identifying and treating STIs. Incorporating sexual history and comprehensive testing may help providers in other settings identify patients who need more frequent HIV/STI screening and prevention services. © 2021 Lippincott Williams and Wilkins. Article	2021	Stoner Marie C D; Rucinski, Katherine B; Giovenco Danielle; Gill, Katherine; Morton, Jennifer F; Linda-Gail, Bekker; Celum, Connie L; van der Straten Ariane	Trajectories of PrEP Adherence Among Young Women Aged 16 to 25 in Cape Town, South Africa	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03134-3	https://www.proquest.com/scholarly-journals/trajectories-prep-adherence-among-young-women/docview/2534471949/se-2?accountid=8113	Despite demonstrated efficacy for HIV prevention, substantial challenges remain for the successful rollout of oral pre-exposure prophylaxis (PrEP), especially among adolescent girls and young women (AGYW). We characterized trajectories of PrEP adherence among 200 AGYW in South Africa and analyzed data from 22 qualitative interviews and 3 focus group discussions for explanatory purposes. Two adherence trajectory groups were identified: 52% with high early adherence that declined after month three and 48% with low adherence throughout. Adherence in the "consistently low" group was related to social support and logistical concerns, while the decrease in the "high declining" group corresponded to a change in the frequency of study visits from monthly to quarterly. PrEP support should be differentiated for those who need more frequent visits and adherence support initially versus later in PrEP use. Visits every month, when needed, should be considered for AGYW who need sustained support later into use. Article	2021	Storholm E.D.; Mutchler M.G.; Ghosh-Dastidar B.; Balan E.; Mokhbat J.; Kegeles S.M.; Wagner G.J.	Gearing up for PrEP in the Middle East and North Africa: An Initial Look at Willingness to Take PrEP among Young Men Who Have Sex with Men in Beirut, Lebanon	Behavioral Medicine	-	-	-	8964289	10.1080/08964289.2019.1661822	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076889539&doi=10.1080%2f08964289.2019.1661822&partnerID=40&md5=c316ebb9d53ae0424e7a9e90623e90ef	The Middle East and North Africa (MENA) is one of only two global regions where rates of HIV are currently on the rise. In Lebanon, new HIV infections are increasing most rapidly among young men who have sex with men (YMSM). While, the majority of YMSM in Lebanon report having recently engaged in condomless anal intercourse, many report reluctance to seek HIV prevention services for fear of stigma and discrimination. Pre-exposure prophylaxis (PrEP) is an effective alternative HIV prevention strategy but there is a dearth of research looking at willingness to take PrEP among YMSM in MENA. This study is the first to delineate factors associated with willingness to take PrEP among a cohort of 218 YMSM recruited from Beirut, Lebanon. Over half (55.5%) reported willingness to take PrEP. At the bivariate level, knowledge of HIV risk, awareness of PrEP, being in a relationship, greater judgementalism about sex in communication with peers, greater number of types of gay-related discrimination experienced, sense of community among YMSM, having had recent condomless anal sex with positive or unknown status partner, and the use of substances just prior to or during sex were each associated with greater willingness to take PrEP. When entered into a linear regression analysis, use of substances just prior to or during sex and sense of community among YMSM remained significant predictors of PrEP willingness. Intervention efforts focused on increasing PrEP uptake among YMSM in MENA should consider the influence substance use and social factors on willingness to take PrEP. © 2019 RAND Corporation. Article	2021	Storholm E.D.; Ober A.J.; Mizel M.L.; Matthews L.; Sargent M.; Todd I.; Zajdman D.; Green H.	Primary care providers' knowledge, attitudes, and beliefs about HIV pre-exposure prophylaxis (PrEP): Informing network-based interventions	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2021.33.4.325	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113551466&doi=10.1521%2faeap.2021.33.4.325&partnerID=40&md5=0a6146fd1488e68bc8d075dfd3e687e8	Increasing access to pre-exposure prophylaxis (PrEP) in primary care settings for patients who may be at risk for HIV could help to increase PrEP uptake, which has remained low among certain key risk populations. The current study conducted interviews with primary care providers identified from national claims data as having either high or low likelihood of serving PrEP-eligible patients based on their prescribing practices for other sexually transmitted infections. The study yielded important information about primary care providers' knowledge, attitudes, and beliefs about PrEP, as well as the barriers and facilitators to prescribing PrEP. Key recommendations for a provider-focused intervention to increase PrEP prescribing among primary care providers, including increasing patient education to increase demand from providers, enhancing provider education, leveraging technology, and instituting standardized sexual health checks, are provided with the goal of informing network-based interventions. © 2021 The Guilford Press. Article	2021	Storholm, Erik D; Siconolfi, Daniel; Huang, Wenjing; Towner, William; Grant, Deborah Ling; Martos, Alexander; Chang, John M; Hechter Rulin	Project SLIP: Implementation of a PrEP Screening and Linkage Intervention in Primary Care	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03197-w	https://www.proquest.com/scholarly-journals/project-slip-implementation-prep-screening/docview/2544323192/se-2?accountid=8113	Nearly a decade after becoming formally available in the U.S., HIV pre-exposure prophylaxis (PrEP) remains underutilized by populations at risk for HIV acquisition. The next generation of PrEP research is pivoting toward implementation research in order to identify the most impactful avenues for scaling up PrEP uptake. Rapid identification of patients who may be at risk for HIV in primary care settings and the ability to provide brief consultation and prescription or referral for PrEP could help to increase PrEP uptake. The current study aimed to develop and pilot-test a PrEP screening instrument that could be integrated into the workflow of busy primary care clinics to help facilitate PrEP uptake among at-risk men. During the study, PrEP screening occurred for 12 months in two primary care clinics nested within a large integrated healthcare delivery system in Southern California. An interrupted time series analysis found a significant increase in PrEP referrals overall during the screening intervention period as compared to the preceding 12 months. Findings suggest that brief HIV risk screening in primary care is acceptable, feasible, and shows preliminary effects in increasing PrEP referral rates for Black and Hispanic/Latinx men. Tenofovir Diphosphate Concentrations in Dried Blood Spots from Pregnant and Postpartum Adolescent and Young Women Receiving Daily Observed Pre-exposure Prophylaxis in Sub-Saharan Africa	Clinical Infectious Diseases	-	-	-	10584838	10.1093/cid/ciaa1872	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106698937&doi=10.1093%2fcid%2fciaa1872&partnerID=40&md5=c52a362d91383ad0e97465853a8e0497	Background: Intracellular tenofovir diphosphate (TFV-DP) concentration in dried blood spots (DBSs) is used to monitor cumulative pre-exposure prophylaxis (PrEP) adherence. We evaluated TFV-DP in DBSs following daily oral PrEP (emtricitabine 200 mg/tenofovir diphosphate 300 mg) among pregnant and postpartum adolescent girls and young women (AGYW). Methods: Directly observed PrEP was administered for 12 weeks in a pregnancy (14-24 weeks' gestation, n = 20) and postpartum (6-12 weeks postpartum, n = 20) group of AGYW aged 16-24 years in sub-Saharan Africa. Weekly DBS TFV-DP was measured by validated liquid chromatography-tandem mass spectrometry assay. Week 12 TFV-DP distributions were compared between groups with Wilcoxon test. Population pharmacokinetic models were fit to estimate steady-state concentrations and create benchmarks for adherence categories. Baseline correlates of TFV-DP were evaluated. Results: Median age was 20 (IQR, 19-22) years. Of 3360 doses, 3352 (>99%) were directly observed. TFV-DP median (IQR) half-life was 10 (7-12) days in pregnancy and 17 (14-21) days postpartum, with steady state achieved by 5 and 8 weeks, respectively. Observed median (IQR) steady-state TFV-DP was 965 fmol/punch (691-1166) in pregnancy versus 1406 fmol/punch (1053-1859) postpartum (P = .006). Modeled median steady-state TFV-DP was 881 fmol/punch (667-1105) in pregnancy versus 1438 fmol/punch (1178-1919) postpartum. In pooled analysis, baseline creatinine clearance was associated with observed TFV-DP concentrations. Conclusions: TFV-DP in African AGYW was approximately one-third lower in pregnancy than postpartum. These Population-specific benchmarks can be used to guide PrEP adherence support in pregnant/postpartum African women. Clinical Trials Registration: NCT03386578 © 2020 The Author(s). Article	2021	Stutterheim, Sarah E; van Dijk, Mart; Wang, Haoyi; Jonas, Kai J	The worldwide burden of HIV in transgender individuals: An updated systematic review and meta-analysis.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0260063	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8635361	INTRODUCTION: Transgender individuals are at risk for HIV. HIV risks are dynamic and there have been substantial changes in HIV prevention (e.g., pre-exposure prophylaxis PrEP). It is thus time to revisit HIV prevalence and burden among transgender individuals. The objective of this systematic review and meta-analysis was thus to examine worldwide prevalence and burden of HIV over the course of the epidemic among trans feminine and trans masculine individuals. METHODS: We conducted an updated systematic review by searching PsycINFO, PubMed, Web of Science, and Google Scholar, for studies of any research design published in a in a peer-reviewed journal in any language that reported HIV prevalence among transgender individuals published between January 2000 and January 2019. Two independent reviewers extracted the data and assessed methodological quality. We then conducted a meta-analysis, using random-effects modelling, to ascertain standardized prevalence and the relative burden of HIV carried by transgender individuals by country and year of data collection, and then by geographic region. We additionally explored the impact of sampling methods and pre-exposure prophylaxis (PrEP). RESULTS: Based on 98 studies, overall standardized HIV prevalence over the course of the epidemic, based on weights from each country by year, was 19.9% (95% CI 14.7% - 25.1%) for trans feminine individuals (n = 48,604) and 2.56% (95% CI 0.0% - 5.9%) for trans masculine individuals (n = 6460). Overall OR for HIV infection, compared with individuals over age 15, was 66.0 (95% CI 51.4-84.8) for trans feminine individuals and 6.8 (95% CI 3.6-13.1) for trans masculine individuals. Prevalence varied by geographic region (13.5% - 29.9%) and sampling method (5.4% - 37.8%). Lastly, PrEP effects on prevalence could not be established. CONCLUSION: Trans feminine and trans masculine individuals are disproportionately burdened by HIV. Their unique prevention and care needs should be comprehensively addressed. Future research should further investigate the impact of sampling methods on HIV prevalence, and monitor the potential impact of PrEP. Article	2021	Sudler, Andrew; Cournos, Francine; Arnold, Emily; Koester, Kimberly; Riano, Nicholas S; Dilley, James; Liu, Albert; Mangurian, Christina	The case for prescribing PrEP in community mental health settings.	The Lancet HIV	-	-	-	2352-3018	10.1016/S2352-3018(20)30273-3	https://dx.doi.org/10.1016/S2352-3018(20)30273-3	Pre-exposure prophylaxis (PrEP) is a biomedical HIV prevention modality that is up to 99% effective in preventing HIV acquisition through sex if taken as directed. People with serious mental illness (eg, schizophrenia and bipolar disorder) are at high risk of acquiring HIV due to sexual behaviours, injection drug use, social factors, and structural discrimination that limits access to all types of preventive health services. We seek to show the importance of prioritising access to PrEP for people living with serious mental illness treated in community mental health settings. We describe barriers to prescribing PrEP, including provider attitudes and provider knowledge gaps, patient attitudes and knowledge, and systems issues. We also address the concerns that community mental health clinic administrators might have about taking on the responsibility of offering PrEP. In summary, despite the barriers to prescribing PrEP in these settings, we believe that there is a unique opportunity for community mental health settings to help address the HIV epidemic by facilitating the prescribing of PrEP to the at-risk populations they currently serve. Article	2021	Sugarman J.; Donnell D.J.; Hanscom B.; McCauley M.; Grinsztejn B.; Landovitz R.J.	Ethical issues in establishing the efficacy and safety of long-acting injectable pre-exposure prophylaxis for HIV prevention: the HPTN 083 trial	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(21)00153-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121944000&doi=10.1016%2fS2352-3018%2821%2900153-3&partnerID=40&md5=bb6bb71d7be36362258976aa26169173	Two multinational clinical trials have shown safety and efficacy of long-acting injectable cabotegravir for HIV pre-exposure prophylaxis (PrEP). These results will alter the landscape of HIV prevention and related research. Nevertheless, designing and conducting this research involved several ethical issues. This Viewpoint describes how we managed ethical issues over the duration of one of these trials (HPTN 083). Specifically, we discuss the rationale for pursuing a long-acting injectable agent in the presence of effective oral PrEP, trial design choices, site selection and local standards of prevention, data monitoring and early stopping, effects of the COVID-19 pandemic, post-trial access, and assessment of long-term safety. © 2021 Elsevier Ltd	NA	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Sullivan, Matthew C; Eaton, Lisa A	Intersecting Barriers to PrEP Awareness and Uptake in Black Men Who Have Sex with Men in Atlanta, GA: a Syndemic Perspective	International Journal of Behavioral Medicine	-	-	-	10705503	10.1007/s12529-020-09925-1	https://www.proquest.com/scholarly-journals/intersecting-barriers-prep-awareness-uptake-black/docview/2527361471/se-2?accountid=8113	BackgroundPre-exposure prophylaxis (PrEP) can sharply reduce HIV transmission risk, yet has not been widely adopted among those at highest risk for HIV, including Black men who have sex with men (BMSM). To better understand the evolving landscape of PrEP uptake in this at-risk population, we sought to examine psychosocial factors associated with PrEP uptake in a sample of BMSM residing in the Atlanta, GA, area.MethodBMSM were recruited through online social media, LGBT venues, and participant referral, and self-reported demographic and psychosocial information via computer-assisted self-interview. Multivariate logistic regression was used to examine psychosocial factors associated with PrEP uptake.ResultsIn 293 BMSM, most (N = 260; 88.7%) reported awareness of PrEP yet few (N = 30; 10.1%) reported ever having taken PrEP. BMSM reporting more syndemic conditions were less likely to be current PrEP users (OR = 0.59; 95% CI: 0.36, 0.96). BMSM reporting recent condomless anal sex (CAS) with a partner met online (adjusted odds ratio (aOR) = 2.53; 95% CI: 1.07, 5.93), or who reported having chlamydia (aOR = 8.21; 95% CI: 1.42, 47.67) or STI-related symptoms (aOR = 4.35; 95% CI: 1.32, 14.37) in the past 3 months, or genital warts in their lifetime (aOR = 7.74; 95% CI: 2.47, 24.21) were more likely to have ever used PrEP. Sexual orientation stigma from health care providers was negatively associated with PrEP uptake (OR = 0.81, 95% CI: 0.68, 0.95) among BMSM reporting recent CAS and multiple partners.ConclusionSyndemic and stigma theories may inform strategies for improving PrEP uptake in BMSM. Article	2021	Sullivan, Patrick S; Hightow-Weidman, Lisa	Mobile apps for HIV prevention: how do they contribute to our epidemic response for adolescents and young adults?	mHealth	-	-	-	2306-9740	10.21037/mhealth-20-71	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8063522	Mobile health (mHealth) tools to address the HIV epidemic have proliferated in recent years. Yet when applied to the United States (US) epidemic, which is driven by new HIV infections among men who have sex with men (MSM), it is not clear how mHealth tools fit in the overall portfolio of biobehavioral prevention interventions and clinical services proven to be efficacious. Adolescent and young adult MSM are particularly vulnerable and reducing HIV incidence among this priority population will require substantial levels of scale-up of multiple prevention strategies (i.e., HIV testing, condom use, sexually transmitted infection (STI) testing, pre-exposure prophylaxis (PrEP), and treatment for those with HIV infection). Starting from the premise that adolescents are avid consumers of technology, this paper considers the particular strengths and opportunities of mHealth tools to address HIV prevention and provides examples of mHealth approaches that have been tested or are in development in these areas. Even after mHealth interventions are proven effective, there will be important intervening steps before such tools can be deployed and integrated into existing prevention programs given the diverse landscape of prevention service delivery. We anticipate some of the likely barriers to broad implementation of proven mHealth interventions in the context of the US public health funding and service delivery infrastructure and provide recommendations to increase efforts for future scale-up and dissemination. Vital Voices: HIV Prevention and Care Interventions Developed for Disproportionately Affected Communities by Historically Underrepresented, Early-Career Scientists	Journal of Racial and Ethnic Health Disparities	-	-	-	21973792	10.1007/s40615-020-00908-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85094641819&doi=10.1007%2fs40615-020-00908-2&partnerID=40&md5=4d1feaa5f3e3ec246fa28c603bb0a783	Abstract: Background: HIV prevention interventions which support engagement in care and increased awareness of biomedical options, including pre-exposure prophylaxis (PrEP), are highly desired for disproportionately affected Black/African American, Hispanic/Latinx and gay, bisexual, and other men who have sex with men (GBMSM) populations in the United States (US). However, in almost 40 years of HIV research, few interventions have been developed directly by and for these priority populations in domestic communities most at risk. We submit that interventions developed by early-career scientists who identify with and work directly with affected subgroups, and which include social and structural determinants of health, are vital as culturally tailored HIV prevention and care tools. Methods: We reviewed and summarized interventions developed from 2007 to 2020 by historically underrepresented early-career HIV prevention scientists in a federally funded research mentoring program. We mapped these interventions to determine which were in jurisdictions deemed as high priority (based on HIV burden) by national prevention strategies. Results: We summarized 11 HIV interventions; 10 (91%) of the 11 interventions are in geographic areas where HIV disparities are most concentrated and where new HIV prevention and care activities are focused. Each intervention addresses critical social and structural determinants of health disparities, and successfully reaches priority populations. Conclusion: Focused funding that supports historically underrepresented scientists and their HIV prevention and care intervention research can help facilitate reaching national goals to reduce HIV-related disparities and end the HIV epidemic. Maintaining these funding streams should remain a priority as one of the tools for national HIV prevention. © 2020, W. Montague Cobb-NMA Health Institute. Institutional	2021	Taisheng L.	Chinese guidelines for diagnosis and treatment of HIV/AIDS (2021 edition); 中国艾滋病诊疗指南（2021 年版）	-	-	-	-	5781426	10.3760/cma.j.cn112138-20211006-00676	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85183088900&doi=10.3760%2fcma.j.cn112138-20211006-00676&partnerID=40&md5=482289cab3664fa83dd9d4cbe0124d87	Acquired immunodeficiency syndrome(AIDS) is an important public health problem in China. In 2005, the first edition of the guidelines for the diagnosis and treatment of AIDS was formulated by the AIDS Professional Group of Society of Infectious Diseases of Chinese Medical Association, which was updated in 2011, 2015, and 2018, respectively. The 2021 edition of the guidelines was revised on the basis of the 2018 edition and updated according to national clinical practice and the latest research results. The new research progress in opportunistic infections, antiretroviral therapy, post-exposure prophylaxis (PEP), pre-exposure prophylaxis (PrEP), whole course management of human immunodeficiency virus(HIV) infection, and prevention of mother to child transmission was updated in this guidelines. In the 2021 edition, the indications, medication regimen, follow-up and monitoring, and precautions of PrEP were introduced in detail. © The Author(s), 2021. Article	2021	Taliaferro T.; Layson-Wolf C.; Seung H.; Banjo O.; Tran D.	Impact of pharmacist-led program on knowledge of college students about pre-exposure prophylaxis	Journal of the American Pharmacists Association	-	-	-	15443450	10.1016/j.japh.2021.06.001	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111793886&doi=10.1016%2fj.japh.2021.06.001&partnerID=40&md5=7fc051eacde1750f5f5962c53505f4f3	OBJECTIVE: This study's primary objective was to evaluate the impact of a pharmacist-led educational program on undergraduate college students' knowledge about PrEP. METHODS: This was a cross-sectional, pre- and postprogram survey study. The study included undergraduate students at least 18 years old at a university in Washington, DC. Graduate students, pharmacy students, and those not enrolled at the university were excluded. Before the educational program, the students completed an anonymous preprogram survey to assess their perception and knowledge of HIV prevention and PrEP as well as their willingness to obtain a prescription for PrEP. A pharmacist delivered a 30-minute educational program to students regarding HIV prevention and PrEP in small groups. After the program, the participants completed a postprogram survey to evaluate the changes from the baseline responses. Paired t tests and chi-square tests detected the associations between the pre- and postprogram surveys. RESULTS: One-hundred sixteen students participated in the program, and 102 surveys were included in the data analysis. Students' perception of their knowledge of HIV (4.2 vs. 4.6; P < 0.001), perception of their knowledge of PrEP (3.1 vs. 4.5; P < 0.001), and their willingness to obtain a prescription for PrEP (3.8 vs. 4.5; P < 0.001) was statistically significant after the education. There was a statistically significant increase in the participants' actual knowledge of HIV risk factors (62.4% correct vs. 90.2% correct; P < 0.001) and knowledge of PrEP effectiveness (26.3% vs. 75.0%; P < 0.001). CONCLUSION: These findings demonstrated that a pharmacist-led educational program may have an impact on undergraduate students' perception and knowledge of HIV and PrEP. This study may help to further guide pharmacists' PrEP initiatives in this targeted population. Copyright © 2021 American Pharmacists Association®. Published by Elsevier Inc. All rights reserved. Article	2021	Tan D.H.S.; Rana J.; Tengra Z.; Hart T.A.; Wilton J.; Bayoumi A.M.	Preferences regarding emerging HIV prevention technologies among Toronto men who have sex with men: a discrete choice experiment	Scientific Reports	-	-	-	20452322	10.1038/s41598-021-01634-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119046927&doi=10.1038%2fs41598-021-01634-3&partnerID=40&md5=9fb31ba088469a171e491a81f17dd870	New forms of HIV pre-exposure prophylaxis (PrEP) include long-acting injectables and topical microbicides, each with unique attributes that may appeal to distinct users. We used a discrete choice experiment to characterize preferences for new PrEP formulations among Toronto men who have sex with men. MSM undergoing anonymous HIV testing completed a discrete choice experiment with 12 choice sets by selecting their preferred option within each set. Each set included "usual methods to prevent HIV" (excluding PrEP) as one alternative and two hypothetical PrEP alternatives, which differed according formulation/dosing, side effects (none/mild), risk of drug resistance (none/low/moderate), and HIV prevention efficacy (50%, 65%, 80% or 99% risk reduction). We used mixed logistic regression to infer preferences for PrEP attributes and calculate the marginal rate of substitution between efficacy and other PrEP attributes. 306 men with median (interquartile range) age = 29 (25, 36) years participated, and reported 6 (3, 10) partners and 0 (0, 2) condomless receptive anal sex acts in the preceding six months. An on-demand pill was the most preferred formulation, followed by a monthly injection, daily pill, and on-demand rectal gel. Drug resistance was an important determinant of preferences if the risk was moderate, but not if it was low. The minimum efficacy required for an on-demand pill to be preferred over no PrEP was 32.6% (95%CI = 21.2–43.9%); for a daily pill, injections, and rectal gel, minimum efficacy was 57.9% (95%CI = 44.1–71.7%), 40.1% (27.0–53.2%), and 71.3% (60.5–82.1%), respectively. Attitudes towards PrEP formulations vary among men who have sex with men, with on-demand pills and monthly injections having the highest average preference scores. Understanding these preferences may help to predict uptake. © 2021, The Author(s). Article	2021	Tan R.K.J.; Wang Y.; Prem K.; Harrison-Quintana J.; Teo A.K.J.; Kaur N.; Cook A.R.; Chen M.I.-C.; Wong C.S.	HIV Pre-Exposure Prophylaxis, Condoms, or Both? Insights on Risk Compensation Through a Discrete Choice Experiment and Latent Class Analysis Among Men Who Have Sex With Men	Value in Health	-	-	-	10983015	10.1016/j.jval.2020.11.023	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103018390&doi=10.1016%2fj.jval.2020.11.023&partnerID=40&md5=b959cc01c470e8d0b41bd2df19243e90	Objectives: We considered how decision making around human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) among gay, bisexual, and other men who have sex with men (GBMSM) is made in the context of one's perceived risk of HIV acquisition and the availability of condoms. Methods: We recruited 648 GBMSM aged 18 years old and residing in Singapore through Grindr. Participants were given information on PrEP and participated in a discrete choice experiment requiring them to choose between 2 baskets of PrEP attributes and compare the chosen "PrEP only" option to default options of "condoms only" or "PrEP with condoms." Generalized multinomial logit model was used to examine the scaling effect and preference heterogeneity. Latent class analysis was conducted to examine preference heterogeneity in the sample. Results: Latent class analysis revealed 3 classes of GBMSM: PrEP conservatives (53.9%), moderates (31.1%), and liberals (14.9%). PrEP conservatives were more likely to report greater utility when using condoms only compared with PrEP only, as well as PrEP with condoms, compared with PrEP only, and more likely to report the lowest utility for PrEP as perceived HIV risk increased. PrEP liberals were more likely to report greatest utilities for PrEP only compared with condoms only, as well as PrEP only compared with PrEP with condoms. The utility for PrEP was not affected by perceived risk of HIV or sexually transmitted infections when risks were low. Conclusion: This study provides some evidence for risk compensation among a class of GBMSM who already perceived themselves to be good candidates for PrEP before the discrete choice experiment. © 2021 ISPOR–The Professional Society for Health Economics and Outcomes Research	gay men; HIV; HIV prevention; HIV/AIDS; Singapore	English	United States	Western and Central Europe and North America	Singapore	Asia and the Pacific	Singapore	Asia and the Pacific	Quantitative
Article	2021	Tan, Darrell H S; Dashwood, Thomas M; Wilton, James; Kroch, Abigail; Gomes, Tara; Martins, Diana	Trends in HIV pre-exposure prophylaxis uptake in Ontario, Canada, and impact of policy changes: a population-based analysis of projected pharmacy data (2015–2018)	Canadian Journal of Public Health	-	-	-	84263	10.17269/s41997-020-00332-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85086373299&doi=10.17269%2fs41997-020-00332-3&partnerID=40&md5=2897a2df5e64a6d12f9232d361714ac7	Objectives: HIV pre-exposure prophylaxis (PrEP) is a proven tool for HIV prevention, but PrEP use in Ontario, Canada, and the effects of recent policies are unknown. We estimated the number and characteristics of PrEP users in Ontario and evaluated the impacts of policy changes between July 2015 and June 2018. Methods: We obtained tenofovir disoproxil fumarate/emtricitabine (TDF/FTC) dispensation data for Ontario from IQVIA, and applied an algorithm to identify use for PrEP. We report prevalent PrEP use for the second quarter of 2018 according to age, sex, region, prescriber specialty, and payer type, and generate "PrEP-to-need ratios" (PNRs) by dividing these numbers by the estimated numbers of new HIV diagnoses. We used interventional autoregressive integrated moving average models to examine the impact of three policy changes on PrEP use: Health Canada approval (February 2016), availability of generic TDF/FTC and partial public drug coverage (September 2017), and public drug coverage for individuals aged < 25 years (January 2018). Results: The estimated number of individuals receiving PrEP increased 713%, from 374 in 2015 Q3 to 3041 in 2018 Q2. Among PrEP users in 2018 Q2, 97.5% were male, 60.4% were < 40 years, 67.7% obtained PrEP from a family physician, 77.2% used private insurance, and 67.0% were in Toronto. PNRs were highest in 30–39-year-olds, males, Toronto and the Central East and West regions. Time series analyses found that Health Canada approval (p = 0.0001) and introducing generics/partial public drug coverage (p = 0.002) led to significantly increased use. Conclusions: PrEP use has risen in Ontario in association with favourable policy changes, but remains far below guideline recommendations. © 2020, The Author(s). Article	2021	Tao J.; Montgomery M.C.; Williams R.; Patil P.; Rogers B.G.; Sosnowy C.; Murphy M.; Zanowick-Marr A.; Maynard M.; Napoleon S.C.; Chu C.; Almonte A.; Nunn A.S.; Chan P.A.	Loss to Follow-Up and Re-Engagement in HIV Pre-Exposure Prophylaxis Care in the United States, 2013-2019	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2021.0074	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110031705&doi=10.1089%2fapc.2021.0074&partnerID=40&md5=c0d23b973a8bb32e2860a6678c9da5f7	Retention in HIV pre-exposure prophylaxis (PrEP) care is critical for effective PrEP implementation. Few studies have reported long-term lost to follow-up (LTFU) and re-engagement in PrEP care in the United States. Medical record data for all cisgender patients presenting to the major Rhode Island PrEP clinic from 2013 to 2019 were included. LTFU was defined as no PrEP follow-up appointment within 98 days. Re-engagement in care was defined as individuals who were ever LTFU and later attended a follow-up appointment. Recurrent event survival analysis was performed to explore factors associated with PrEP retention over time. Of 654 PrEP patients, the median age was 31 years old interquartile range (IQR): 25, 43. The majority were male (96%), White (64%), non-Hispanic (82%), and insured (97%). Overall, 72% patients were ever LTFU and 27% of those ever LTFU re-engaged in care. Female patients were 1.37 times crude hazard ratio (cHR): 1.37; 95% confidence interval (CI): 0.86-2.18 more likely to be LTFU than male patients, and a 1-year increase in age was associated with a 1% lower hazard of being LTFU (cHR: 0.99; CI: 0.98-0.99). Being either heterosexual (aHR: 2.25, 95% (CI): 1.70-2.99 or bisexual (aHR: 2.35, 95% CI: 1.15-4.82) was associated with a higher hazard of loss to follow-up compared with having same-sex partners only. The majority of PrEP users were LTFU, especially at the first 6 months of PrEP initiation. Although a significant number were re-engaged in care, targeted interventions are needed to improve retention in PrEP care. This study characterized the natural projection of loss to follow-up and re-engagement in HIV PrEP care using a longitudinal clinic cohort data and explored associated factors for guiding future interventions to improve retention in PrEP care. © 2021, Mary Ann Liebert, Inc., publishers.	care retention; human immunodeficiency virus; pre-exposure prophylaxis (PrEP); prevention	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Tao, Guoyu; Pearson, William S; Sullivan, Jane M; Henk, Henry J; Gift, Thomas L	Sexually Transmitted Infection Testing and Prevalence before and after Preexposure Prophylaxis Initiation among Men Aged ≥18 Years in US Private Settings	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001339	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85108020934&doi=10.1097%2fOLQ.0000000000001339&partnerID=40&md5=3fa12bdf48d35058e7922916d91563a3	Background The Centers for Disease Control and Prevention recommends initial and follow-up sexually transmitted infection (STI) and HIV testing when taking HIV preexposure prophylaxis (PrEP). We assessed frequencies of STIs and HIV testing and rates of STIs before and after PrEP initiation among men aged ≥18 years. Methods We used the OptumLabs database for this cohort study. We measured STI/HIV testing rates and prevalence in 2 time intervals: (1) within 90 days before and on the date of PrEP initiation and (2) within 45 days of the 180th day after the date of PrEP initiation. Results Of 4210 men who initiated PrEP in 2016 to 2017 and continuously used PrEP for ≥180 days, 45.7%, 45.7%, and 56.0% were tested for chlamydia, gonorrhea, and HIV, respectively, at the second time interval. These percentages were significantly lower than those at the first time interval (58.3%, 57.9%, and 73.5%, respectively; P < 0.01). Chlamydia and gonorrhea prevalence rates at the second time interval were 6.5% and 6.2%, respectively, versus 5.0% and 4.7%, respectively, at the first time interval. Most gonorrhea or chlamydia infections at the second time intervals seem to be new infections new infections. Conclusions Sexually transmitted infection/HIV testing for PrEP users in the real-world private settings is much lower than in clinical trials. High STI prevalence before and after PrEP initiation in this study suggests that patients taking PrEP have an increased risk of acquiring STI. Interventions to improve provider adherence for PrEP users are urgently needed. © Lippincott Williams & Wilkins. Article	2021	Tapia G.R.; Glynn T.R.; Miller C.; Manuzak J.A.; Broedlow C.A.; McGaugh A.; Cherenack E.M.; Bauermeister J.A.; Grov C.; Dilworth S.E.; Parisi R.; Martinez D.; Klatt N.R.; Carrico A.W.	Syndemics and preexposure prophylaxis are independently associated with rectal immune dysregulation in sexual minority men	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002866	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107711309&doi=10.1097%2fQAD.0000000000002866&partnerID=40&md5=5be5a871c12a3002e590e5234b758558	Objective: Syndemic conditions have been linked to engagement in receptive condomless anal sex (CAS) and HIV seroconversion. However, little is known about the biological pathways whereby syndemics could amplify vulnerability to HIV and other sexually transmitted infections (STIs). Design: HIV-negative sexual minority men (i.e. gay, bisexual and other MSM) were recruited from four STI clinics in South Florida for a cross-sectional study. Methods: Participants completed assessments for four syndemic conditions: depression, posttraumatic stress disorder, hazardous alcohol use and any stimulant use (i.e. any self-reported use or reactive urine toxicology results). Cytokine and chemokine levels were measured using LEGENDplex from the rectal swabs of 92 participants reporting receptive CAS and no antibiotic use in the past three months. Results: After controlling for age, race/ethnicity, preexposure prophylaxis (PrEP) use and number of receptive CAS partners, a greater number of syndemic conditions was associated with higher levels of rectal cytokines/chemokines relevant to immune activation, inflammation and the expansion and maintenance of T-helper 17 target cells, including rectal interferon-gamma (β=0.22; P=0.047), CXCL-8 (β=0.24; P=0.025) and interleukin-23 (β=0.22; P=0.049). Elevations in rectal cytokine or chemokine levels were most pronounced among participants experiencing two or more syndemic conditions compared with those experiencing no syndemic conditions. PrEP use was independently associated with elevations in multiple rectal cytokines/chemokines. Conclusion: Syndemic conditions could increase biological vulnerability to HIV and other STIs in sexual minority men by potentiating rectal immune dysregulation. © 2021 Lippincott Williams and Wilkins. Article	2021	Tassi M.-F.; Laurent E.; Gras G.; Lot F.; Barin F.; De Gage S.B.; Stefic K.; Grammatico-Guillon L.	PrEP monitoring and HIV incidence after PrEP initiation in France: 2016-18 nationwide cohort study	Journal of Antimicrobial Chemotherapy	-	-	-	3057453	10.1093/jac/dkab263	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85119051118&doi=10.1093%2fjac%2fdkab263&partnerID=40&md5=0a2a704d64a6cd4b3e9077c13bd174bd	Background: Clinical trials have demonstrated that oral pre-exposure prophylaxis (PrEP) has high efficacy in preventing HIV transmission. In many countries, HIV testing is recommended prior to PrEP initiation, 1 month after and quarterly thereafter. We assessed the uptake of HIV testing and estimated the incidence of HIV infections after oral PrEP initiation, by using the French national health database (SNDS). Methods: A historic cohort study included every adult person who started oral PrEP between 1 January 2016 and 30 June 2018 in France. HIV infection was tracked in the follow-up, from first PrEP dispensation up to 31 December 2018. Factors associated with adherence to HIV testing in PrEP follow-up were analysed using a generalized linear mixed model. Results: PrEP users (9893) were followed for a median duration of 551 days (IQR 350-769). The first HIV test, 1 month after PrEP initiation, was performed by 64% of users. For subsequent tests, this rate exceeded 81% and remained stable over time. HIV testing was lower among PrEP users without prescription refill (OR 0.15; 99% CI 0.12-0.20), but higher if the last prescription was made by a hospital practitioner (OR 2.03; 99% CI 1.69-2.45). Twenty-nine HIV infections were identified, leading to an incidence of 0.19 cases per 100 person-years (99% CI 0.12-0.30). Conclusions: We confirmed good adherence to HIV testing and efficacy of PrEP in users, which should help in decreasing HIV incidence in France. This study also revealed that SNDS could be a powerful automated tool for the epidemiological monitoring of PrEP users. © 2021 The Author(s) 2021. Article	2021	Teitelman A.M.; Koblin B.A.; Brawner B.M.; Davis A.; Darlington C.; Lipsky R.K.; Iwu E.; Bond K.T.; Westover J.; Fiore D.; Tieu H.-V.	Just4Us: Development of a Counselor-Navigator and Text Message Intervention to Promote PrEP Uptake Among Cisgender Women at Elevated Risk for HIV	Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000233	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102397317&doi=10.1097%2fJNC.0000000000000233&partnerID=40&md5=1b8dd3a0d99ade05a719c9a392c0ef2c	In the United States, pre-exposure prophylaxis (PrEP) uptake among eligible cisgender women has been slow, despite the availability of oral PrEP since 2012. Although women make up nearly 20% of those living with HIV, there are currently few PrEP uptake interventions for cisgender women at elevated risk for acquiring HIV. Here we describe the process used to design and pre-pilot test Just4Us, a theory-based behavioral intervention to promote PrEP initiation and adherence among PrEP-eligible cisgender women. This work was part of a multiphase study conducted in New York City and Philadelphia, two locations with HIV rates higher than the national average. The counselor-navigator component of the intervention was designed to be delivered in a 60- to 90-min in-person session in the community, followed by several phone calls to support linkage to care. An automated text messaging program was also designed for adherence support. Just4Us addressed personal and structural barriers to PrEP uptake using an empowerment framework by building on women's insights and resources to overcome barriers along the PrEP cascade. Usability pre-pilot testing results were favorable and provided valuable feedback used to refine the intervention. Article	2021	Teixeira da Silva, D; Bouris, A; Ramachandran, A; Blocker, O; Davis, B; Harris, J; Pyra, M; Rusie, LK; Brewer, R; Pagkas-Bather, J; Hotton, A; Ridgway, JP; McNulty, M; Bhatia, R; Schneider, JA	Embedding a Linkage to Preexposure Prophylaxis Care Intervention in Social Network Strategy and Partner Notification Services: results From a Pilot Randomized Controlled Trial	Journal of Acquired Immune Deficiency Syndromes	-	-	-	NA	10.1097/QAI.0000000000002548	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02202666/full	BACKGROUND: Increased preexposure prophylaxis (PrEP) uptake among black men who have sex with men and black transgender women (BMSM/TW) is needed to end the HIV epidemic. Embedding a brief intervention in network services that engage individuals in HIV transmission networks for HIV/ sexually transmitted infections testing may be an important strategy to accelerate PrEP uptake. SETTING: Partner Services PrEP study is a pilot, randomized, control trial to improve linkage to PrEP care among BMSM/TW presenting for network services in Chicago, IL, from 2015 to 2017. METHODS: BMSM/TW (N = 146) aged 18-40 years were recruited from network services (partners services and social network strategy services). Intervention participants developed an individualized linkage plan based on the information-motivation-behavioral skills model and received miniboostes sessions. Control participants received treatment as usual. Sociodemographic, behavioral, and clinical factors were examined at baseline and 3- and 12-month postintervention. Intent-to-treat analyses examined linkage to PrEP care within 3-month postintervention (primary outcome). Secondary outcomes were PrEP initiation, time to linkage to PrEP care, and time to PrEP initiation. RESULTS: Compared with control participants, a significantly greater proportion of the intervention participants were linked to PrEP care within 3 months (24% vs. 11%; P = 0.04) and initiated PrEP (24% vs. 11%; P = 0.05). Among those linked to PrEP care within the study period, intervention participants were linked significantly sooner than control participants median (interquartile range) days, 26.5 (6.0-141.8) vs. 191.5 (21.5-297.0); P = 0.05. CONCLUSION: Study results support the preliminary efficacy of Partner Services PrEP to improve linkage to PrEP care and PrEP initiation among BMSM/TW.	*embedding; *pre-exposure prophylaxis; *social network; Adolescent; Adult; Anti-HIV Agents therapeutic use; Article; Black or African American; Chicago; Contact Tracing; Controlled study; Demography; Female; HIV Infections *drug therapy, transmission; Homosexuality, Male; Human; Humans; Major clinical study; Male; Men who have sex with men; Motivation; Outcome assessment; Pilot Projects; Pre-Exposure Prophylaxis *methods; Psychological model; Randomized controlled trial; Sex Workers; Sexual and Gender Minorities; Sexually Transmitted Diseases; Skill; Social Networking; Transgender; Transgender Persons; Young Adult; Young adult	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Terui S.; Goldsmith J.V.; Daugherty C.D.; Briscoe J.R.	A student-driven HIV/PrEP communication intervention using a modified social network strategy	Journal of American College Health	-	-	-	7448481	10.1080/07448481.2019.1664554	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85076541875&doi=10.1080%2f07448481.2019.1664554&partnerID=40&md5=46d48a1225951301614d39ba1aff309f	Objective: The authors examined college students' experiences of providing peer-education, using the modified Social Network Strategy (SNS). Participants: Ninety-six college students participated this project during the 2018 academic year, drawn from a large, Mid-Southern urban university. Methods: Students who administered the HIV-PrEP health intervention completed a cross-sectional assessment about their experiences in the project. A series of open-ended prompts garnered written narrative responses. We utilized a qualitative content analysis to identify SNS codes and their frequencies. Results: Student responses were overwhelmingly supportive of the community engagement project. Student narratives featured the health communication intervention with peers most often (44.4%: counseling, testing, and referral communication), followed by influences on themselves (28.7%; what he/she learned, influences on student health and choices). Conclusions: A modified SNS demonstrated in this project reveals its utility in supporting undergraduates in the delivery of HIV/PrEP training in the 7th highest HIV transmission area in the nation. © 2019 Taylor & Francis Group, LLC.	health communication; HIV; peer intervention; PrEP; Social Network Strategy	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2021	Textor L.; Schlesinger W.	Treating risk, risking treatment: experiences of iatrogenesis in the HIV/AIDS and opioid epidemics	Anthropology and Medicine	-	-	-	13648470	10.1080/13648470.2021.1926916	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85109092158&doi=10.1080%2f13648470.2021.1926916&partnerID=40&md5=47a9ab1f4730772fb0836030cae1a56d	This paper explores how poor health outcomes in the HIV/AIDS and opioid epidemics in the United States are undergirded by iatrogenesis. Data are drawn from two projects in Southern California: one among men who have sex with men (MSM) engaging with pre-exposure prophylaxis to HIV (PrEP) and the other in a public hospital system encountering patients with chronic pain and opioid use disorder (OUD). Ethnographic evidence demonstrates how efforts to minimize risk via PrEP and opioid prescription regulation paradoxically generate new forms of risk. Biomedical risk management paradigms engaged across the paper's two ethnographic field sites hinge on the production and governance of deserving patienthood, which is defined by providers and experienced by patients through moral judgments about risk underlying both increased surveillance and abandonment. This paper argues that the logic of deservingness disconnects clinical evaluations of risk from patients' lived, intersectional experiences of race, class, gender, and sexuality. This paper's analysis thus re-locates patients in the context of broader historical and sociopolitical trajectories to highlight how notions of clinical risk designed to protect patients can in fact imperil them. Misalignment between official, clinical constructions of risk and the embodied experience of risk borne by patients produces iatrogenesis. © 2021 Informa UK Limited, trading as Taylor & Francis Group. To enhance follow-up quality and care engagement, the PrEP program developed in our Parisian sexual health center offers accompanying measures throughout the patients' course of care, relying notably on an identified and easily accessible referent. This trained paramedic counselor in sexual health provides support in organizing appointments, phone and email follow-up to answer daily questions, as well as one-on-one sessions of therapeutic support and counseling. This study aimed to assess the effectiveness of such a PrEP program among men who have sex with men (MSM). Methods This retrospective observational study included all MSM who initiated PrEP for the first time between 1 August 2018 and 30 June 2019 in the Fernand-Widal hospital sexual health center, Paris, France. Sociodemographic characteristics, sexual practices including very high risk situations (chemsex practice and/or sexually transmitted diseases at initiation and/or history of post-exposure prophylaxis (PEP)) and course of care during the first year were described. A novel metric developed by Hendrickson et al., the PrEP success ratio at 12 months, was used to assess effectiveness of PrEP. Results Among the 125 MSM included in this study, the median age was 33 and most had only male partners. At initiation, 58% were considered at very high risk of HIV infection, mainly due to a history of PEP. During the first year, patients attended a median of 3 visits (Q1-Q3, 2-4). At 12 months, 96% (95% CI, 92.6 to 99.4) of patients had a successful PrEP course, with no reported seroconversion. Conclusions This experiment highlights the possibility of achieving a high PrEP success ratio among MSM in a real-world setting. The accompanying measures set up in our sexual health center could explain the effectiveness of our PrEP program in comparison with previous studies. Key messages In a Parisian sexual health center that developed an HIV PrEP program with a trained paramedic counselor in sexual health, 96% of MSM achieved a successful PrEP course at 12 months. Accompanying measures for PrEP users could play a key role in achieving high PrEP success among MSM. Article	2021	Thompson K.A.; Blank G.; Toy J.; Moore D.M.; Lachowsky N.; Bacani N.; Zhang W.; Sereda P.; Lima V.D.; Barrios R.; Montaner J.S.G.; Hull M.W.	Chronic Hepatitis B Infection Among Preexposure Prophylaxis Users Enrolled in a Population-Based Program in British Columbia, Canada	Open Forum Infectious Diseases	-	-	-	23288957	10.1093/ofid/ofab492	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134773911&doi=10.1093%2fofid%2fofab492&partnerID=40&md5=e6ed180ce60a112167afaa5f79299729	Initiation of human immunodeficiency virus preexposure prophylaxis (PrEP) medications will also treat hepatitis B infection (HBV). The prevalence of chronic HBV was 0.86% (n = 41/4760) among enrollees in a provincial PrEP program in British Columbia, Canada. Overall, 46.3% lacked follow-up HBV DNA monitoring, underscoring the need for HBV-related education for PrEP prescribers. © The Author(s) 2021.	emtricitabine/tenofovir disoproxil fumarate; hepatitis B; HIV PrEP; HIV prevention; MSM	English	United Kingdom	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Clinical
Article	2021	Thuo N.; Polay M.; Leddy A.M.; Ngure K.; Chatterhee P.; Gandhi M.; Amico K.R.	Point-of-Care Test for Assessing Tenofovir Adherence: Feasibility and Recommendations from Women in an Oral PrEP Program in Kenya and Their Healthcare Providers	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03255-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105160057&doi=10.1007%2fs10461-021-03255-3&partnerID=40&md5=7df8db3d8b5a6633d1c264bf9cdee91b	Oral pre-exposure prophylaxis (PrEP) is a highly effective HIV prevention modality when taken as recommended. Women in sub-Saharan Africa may have adherence challenges that remain undisclosed to providers. Real-time measures that identify non-adherence can allow for immediate exploration of adherence challenges, counseling and interventions. We conducted a formative qualitative study in Kenya to explore oral PrEP experiences and reactions to a point-of-care urine test (UT) identifying recent (past 4 days) non-adherence to tenofovir-based PrEP among female PrEP users (25 in-depth interviews; 4 focus groups) and health care provider (10 key informant interviews). Findings indicate that use of the UT would be highly feasible in the context of regular PrEP care, largely acceptable to clients and providers, and could improve adherence. Clients emphasized the need for transparent client-centered strategies in delivering results. This formative study informs the development of tools to implement this point-of-care UT in future interventional studies and clinical settings. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Thurman A.R.; Schwartz J.L.; Cottrell M.L.; Brache V.; Chen B.A.; Cochón L.; Ju S.; McGowan I.; Rooney J.F.; McCallister S.; Doncel G.F.	Safety and Pharmacokinetics of a Tenofovir Alafenamide Fumarate-Emtricitabine based Oral Antiretroviral Regimen for Prevention of HIV Acquisition in Women: A Randomized Controlled Trial	EClinicalMedicine	-	-	-	25895370	10.1016/j.eclinm.2021.100893	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106888695&doi=10.1016%2fj.eclinm.2021.100893&partnerID=40&md5=3c1fe6cab9863d904f1ae99b215c13a2	Background: Daily oral emtricitabine (FTC, F)/tenofovir disoproxil fumarate (TDF) combination is approved for HIV pre-exposure prophylaxis (PrEP) in men and women. Tenofovir alafenamide fumarate (TAF) is a newer, more potent prodrug of tenofovir (TFV); and in combination with FTC, has recently been approved for prevention of HIV through rectal transmission. Methods: This Phase I, prospective, interventional, randomized study was conducted in three clinical sites: PROFAMILIA, Santo Domingo, Dominican Republic; University of Pittsburgh and Eastern Virginia Medical School. We assessed the multi-compartmental pharmacokinetics (primary outcome) and safety (secondary outcome) among HIV uninfected women randomized to F/TDF (200mg/300mg) or F/TAF (200mg/25mg; F/TAF25) (n=24) in a single dose phase (SDP) and F/TDF, F/TAF (200mg/10mg; F/TAF10), or F/TAF25 (n=75) in a multiple dose (14 daily doses) phase (MDP). We described PK parameters in plasma, peripheral blood mononuclear cells (PBMCs), and cervicovaginal (CV) and rectal fluids and tissues. ClinicalTrials.gov #NCT02904369, completed. Findings: Recruitment for the study began on 5 October 2016. The first participant was enrolled on 6 October 2016 and the last participant completed the study 21 November 2017. Plasma: TFV concentrations area under curve (AUC) were ~20 fold lower following F/TAF versus F/TDF. TFV-diphosphate (TFV-DP) AUC concentrations in PBMCs were 7-fold higher with F/TAF25 versus F/TDF. Median TFV-DP concentrations in vaginal tissue (4hours post last dose) were approximately 6-fold higher with F/TAF25 versus F/TDF. TFV and TFV-DP were lower with F/TAF versus F/TDF in rectal tissue. Concentrations of FTC and FTC-triphosphate (FTC-TP) were similar across matrices and treatment arms. Gastrointestinal adverse events (AEs) occurred more frequently in F/TDF users (44.0%) than in either F/TAF group (11.5 and 12.0%). Interpretation: F/TAF was safe and well-tolerated. TFV-DP concentrations were higher in PBMCs and similar or higher (4h post dose) in female genital tract tissues for F/TAF versus F/TDF. High FTC and FTC-TP concentrations in all compartments support the potential of F/TAF as a new PrEP combination for women. © 2021 The Author(s)	cholesterol; creatinine; emtricitabine plus tenofovir alafenamide; emtricitabine plus tenofovir disoproxil; glucose; hemoglobin; potassium; sodium; triacylglycerol	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2021	Timmins L.; Schneider J.A.; Chen Y.-T.; Goedel W.C.; Brewer R.; Callander D.; Knox J.; Eavou R.; Hanson H.; Duncan D.T.	Sexual Identity, Sexual Behavior and Pre-exposure Prophylaxis in Black Cisgender Sexual Minority Men: The N2 Cohort Study in Chicago	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03246-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104615179&doi=10.1007%2fs10461-021-03246-4&partnerID=40&md5=996026793321104e4972adabaf919312	This study investigated sexual identity and behavior and their potential associations with PrEP use and attitudes in cisgender Black gay and bisexual men. A total of N = 173 (mean age 25.2) participants from the Neighborhoods and Networks (N2) Study in Chicago were included. Of these, 104 were gay-identified and reported sex with men only (GSMO), 26 were gay-identified and reported sex with men and women (GSMW), 8 were bisexual-identified and reported sex with men only (BSMO), and 35 were bisexual-identified and reported sex with men and women (BSMW). Reporting sex with men and women in the past 6 months, RR = 0.39, 95% CI 0.17, 0.89, identifying as bisexual, RR = 0.52, 95% CI 0.29, 0.92, and the combination of the two, RR = 0.24, 95% CI 0.07, 0.76 were significantly associated with lower rates of current oral PrEP use. Black bisexual-identifying men who reported sex with men and women were significantly more likely to have discontinued oral PrEP, RR = 2.50, 95% CI 1.14, 5.50, than Black gay-identified men who reported sex with men only. Participants who had not used oral PrEP before reported lower levels of interest in long-acting injectable PrEP than those who were currently using oral PrEP, RR = 0.56, 95% CI 0.40, 0.79. No other significant differences were found. Overlooking the combination of sexual identity and behavior may mischaracterize PrEP rates and miss uniquely vulnerable subgroups. Black gay and bisexual men who had not used oral PrEP may be particularly disinterested in long-acting injectable PrEP. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	To K.W.; Lee S.S.	A review of reported cases of HIV pre-exposure prophylaxis failure with resultant breakthrough HIV infections	HIV Medicine	-	-	-	14642662	10.1111/hiv.12989	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096842968&doi=10.1111%2fhiv.12989&partnerID=40&md5=692fd397e60d0482e12d97e08ae19957	Objectives: Early randomized controlled trials (RCTs) have confirmed high efficacy of pre-exposure prophylaxis (PrEP) for preventing HIV infection in men who have sex with men (MSM) with high HIV exposure risk. Nevertheless, some PrEP failure cases have been reported despite adequate drug adherence. This review aims to summarize the common features of PrEP failure cases and discuss the implications of upscaling PrEP programmes. Methods: A search based on articles and clinical trials was conducted through Medline and OVID, with keywords for accessing publications reporting 'true' PrEP failure in the presence of documented adherence to daily regimen of co-formulated tenofovir disoproxil fumarate/emtricitabone. Results: Ten cases of 'true' PrEP failure were identified, all of which were preceded by continued practice of condomless anal sex, despite documented adherence. Dried blood spot and/or hair analyses provided supporting evidence of adherence in eight cases. There was strong association of PrEP failure with recurrent or multiple sexually transmitted diseases and infection with resistant HIV viruses. Seroconversion was usually atypical or delayed because of significantly suppressed viral load, making diagnosis a clinical challenge. Discussion: Although it is uncommon, 'true' PrEP failure can occur in a real-world situation, contrary to the outcome of early RCTs. Failure to identify HIV infection while on PrEP can potentially lead to the emergence of drug-resistant virus. To achieve effective HIV prevention, PrEP programmes should emphasize safer sexual practice in addition to drug adherence. Early identification of PrEP failure is crucial, which requires the development of highly sensitive assays and their clinical application. © 2020 British HIV Association	HIV; prophylaxis; treatment failure	English	United Kingdom	Western and Central Europe and North America	China	Asia and the Pacific	China	Asia and the Pacific	Review
Article	2021	Torres T.S.; Hoagland B.; Bezerra D.R.B.; Garner A.; Jalil E.M.; Coelho L.E.; Benedetti M.; Pimenta C.; Grinsztejn B.; Veloso V.G.	Impact of COVID-19 Pandemic on Sexual Minority Populations in Brazil: An Analysis of Social/Racial Disparities in Maintaining Social Distancing and a Description of Sexual Behavior	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-02984-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85088878654&doi=10.1007%2fs10461-020-02984-1&partnerID=40&md5=5613c04a005d28ba72f78783870495d1	We conducted a web-based survey to understand the impact of social distancing measures on Brazilian MSM and transgender/non-binary lives. A total of 3486 respondents were included in this analysis and the great majority were cismen (98%). The median age was 32 years (IQR: 27–40), 44% non-white, 36% low schooling and 38% low income. Most of participants reported HIV negative/unknown status (77%). Participants on-PrEP reported more condomless anal sex than those off-PrEP. Conversely, 24% off-PrEP were at substantial HIV-risk. PrEP/ART continuation were reported by the majority, despite reports of impediments to medication refill. Transgender/non-binary reported more mental health problems and challenges to access health care. Social and racial disparities were associated with unattainability of maintaining social distancing. Tailored social and economic support policies during COVID-19 pandemic should be made available to these populations. Challenges for PrEP/ART access will demand the implementation of innovative solutions to avoid the expansion of the HIV epidemic. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Torres, Thiago S; Luz, Paula M; Marins, Luana M S; Bezerra, Daniel R B; Almeida-Brasil, Celline C; Veloso, Valdilea G; Grinsztejn, Beatriz; Harel, Daphna; Thombs, Brett D	Cross-cultural adaptation of the Perceived Risk of HIV Scale in Brazilian Portuguese.	Health and Quality of Life Outcomes	-	-	-	1477-7525	10.1186/s12955-021-01760-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8033701	BACKGROUND: Valid and reliable instruments are needed to measure the multiple dimensions of perceived risk. The Perceived Risk of HIV Scale is an 8-item measure that assesses how people think and feel about their risk of infection. We set out to perform a cross-cultural adaptation of the scale to Brazilian Portuguese among key populations (gay, bisexual and other men who have sex with men and transgender/non-binary) and other populations (cisgender heterosexual men and cisgender women). METHODS: Methodological study with cross-sectional design conducted online during October/2019 (key populations sample 1 and other populations) and February-March/2020 (key populations not on pre-exposure prophylaxis sample 2). Cross-cultural adaptation of the Perceived Risk of HIV Scale followed Beaton et al. 2000 guidelines and included confirmatory factor analysis, differential item functioning (DIF) using the Multiple-Indicator Multiple-Cause model, and concurrent validity to verify if younger individuals, those ever testing for HIV, and engaging in high-risk behaviors had higher scores on the scale. RESULTS: 4342 participants from key populations (sample 1 = 235; sample 2 = 4107) and 155 participants from other populations completed the measure. We confirmed the single-factor structure of the original measure (fit indices for sample 1 plus other populations: CFI = 0.98, TLI = 0.98, RMSEA = 0.07; sample 2 plus other populations: CFI = 0.97, TLI = 0.95, RMSEA = 0.09). For the comparisons between key populations and other populations, three items (item 2: "I worry about getting infected with HIV", item 4: "I am sure I will not get infected with HIV", and item 8: "Getting HIV is something I have") exhibited statistically significant DIF. Items 2 and 8 were endorsed at higher levels by key populations and item 4 by other populations. However, the effect of DIF on overall scores was negligible (0.10 and 0.02 standard deviations for the models with other populations plus sample 1 and 2, respectively). Those ever testing for HIV scored higher than those who never tested (p < .001); among key populations, those engaging in high-risk behaviors scored higher than those reporting low-risk. CONCLUSION: The Perceived Risk of HIV Scale can be used among key populations and other populations from Brazil. Article	2021	Towe, Sheri L; Sullivan, Catherine A; McKellar, Mehri S; Meade, Christina S	Examining the Potential of Pre-exposure Prophylaxis (PrEP) for HIV Prevention in a Community Sample of Persons Who Use Stimulants Living in the Southern United States.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-020-02987-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7862414	Pre-exposure prophylaxis (PrEP), a highly effective HIV prevention strategy, is currently underutilized by several at-risk groups, including both persons who inject drugs and those who use drugs via other routes. Stimulant use is associated with increased HIV risk due to both sexual and injection risk behaviors. In this study, we examined PrEP awareness and acceptability in persons with biologically confirmed HIV-negative status who use stimulant drugs. We also examined HIV risk behaviors to identify how many participants met behavioral eligibility for PrEP. The sample of 352 participants was 46% female, 87% African American, and 45.69 years old on average. Over half the sample (n = 213) met criteria for PrEP candidacy, but less than 20% had heard of PrEP. Ratings for willingness to take PrEP were high. PrEP candidates reported more frequent and problematic stimulant use relative to non-candidates. Our results show that persons who use stimulants are a high-risk population that could benefit significantly from PrEP. Efforts to increase PrEP awareness among high-risk populations are critical for facilitating PrEP implementation and ensuring effective HIV prevention within these communities.	pre-exposure prophylaxis, HIV, cocaine, stimulants	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Tran N.K.; Felsher M.; Pol B.V.D.; Bellamy S.L.; McKnight J.; Roth A.M.	Intention to initiate and uptake of PrEP among women who injects drugs in a demonstration project: an application of the theory of planned behavior	AIDS Care	-	-	-	9540121	10.1080/09540121.2021.1874267	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85099922275&doi=10.1080%2f09540121.2021.1874267&partnerID=40&md5=c0c0b575fbd92ad31ec1a1a81ab9795	Some women who inject drugs (WWID) would benefit from pre-exposure prophylaxis (PrEP), yet there are few studies of issues related to uptake in real-world settings. In this study, participants (n = 95) were offered PrEP and responded to items measuring PrEP-related attitudes, norms, and perceived behavioral control based on the Theory of Planned Behavior. We tested associations with intention to initiate PrEP and uptake. Most WWID (88%) intended to initiate PrEP and 78% accepted a prescription. Compared to WWID who did not express PrEP intentions, those who did were less concerned about attitudinal and perceived behavioral control constructs such as temporary (75% vs. 36%, p = 0.01) and long-term (63% vs. 27%, p = 0.05) side effects, negative interactions with their birth control (93% vs. 38%, p < 0.01), their ability to take a daily pill (80% vs. 36%, p < 0.01), and the cost of PrEP (87% vs. 36%, p < 0.01). WWID who went on to take PrEP had fewer concerns with subjective norms constructs such as talking to health care providers about sex (91% vs. 65%, p < 0.01) and drug use (88% vs. 55%, p < 0.01) compared to those who did not. Attitudes and perceived behavioral control influenced intention while subjective norms had a greater impact on actual uptake. © 2021 Informa UK Limited, trading as Taylor & Francis Group. Article	2021	Tran, J; Khosropour, CM; Mena, L; Johnson, K; Sharma, M	BUDGET IMPACT ANALYSIS OF HIV PRE-EXPOSURE PROPHYLAXIS TELEMEDICINE IN MISSISSIPPI	Value in Health	-	-	-	1098-3015	10.1016/j.jval.2021.04.575	https://www.valueinhealthjournal.com/article/S1098-3015(21)00792-0/fulltext	Objectives: To assess the budget impact of adding an HIV pre-exposure prophylaxis (PrEP) telemedicine intervention (telePrEP) in Mississippi, a state with one of the highest HIV rates in the US. Methods: We developed a Markov model of HIV and PrEP use in Mississippi among two eligible populations: 1) men who have sex with men (MSM) and 2) heterosexually active individuals age $16 years with indications for PrEP as per US Centers for Disease Control guidelines. The model utilized 3-month time steps and a 5-year time horizon. Model inputs were parameterized using literature, expert opinion, Federal Supply Schedules, and Centers for Medicare and Medicaid Fee Schedules. Costs were reported from the healthcare payer perspective in 2020 dollars and included standard-of-care PrEP (in-person), telePrEP, laboratory testing, PrEP drug, dispensing fee, HIV care, and antiretroviral therapy (ART). We assumed telePrEP uptake increased from 5% to 13% over 5 years among those eligible, impacting individuals without PrEP and on standard-of-care PrEP equally in the treatment mix. We projected costs of implementing telePrEP in addition to standard-of-care PrEP provision compared to standard-of-care PrEP provision only. We performed one-way sensitivity analyses on key parameters to assess uncertainty. Results: Implementing telePrEP is projected to increase the number of individuals receiving PrEP by approximately 157 yearly and avert a minimum of 206 HIV cases over 5 years. TelePrEP would increase healthcare payers' budget by $1.35 million in Year 1, $749,800 in Year 2, and $184,500 in Year 3, then decrease the budget by $383,000 and $990,100 in Years 4 and 5, respectively. One-way sensitivity analyses indicated the overall budget was most sensitive to assumptions about HIV incidence and PrEP initiation among MSM and ART initiation. Conclusions: Implementing telePrEP in a US state with high HIV incidence can provide health benefits at a modest increase in healthcare payers' budget over five years. Theses and Dissertations	2021	Traylor, Daryl; Enriquez, Maithe	Primary Care Provider PrEP Prescribing Practices: Southern United States	-	-	University of Missouri--Columbia	-	NA	10.32469/10355/88053	https://www.proquest.com/dissertations-theses/primary-care-provider-prep-prescribing-practices/docview/2622807965/se-2?accountid=8113	The Southern United States (U.S.) accounts for more than half of new HIV cases annually and African Americans make up the majority of new HIV diagnoses in this region. Pre-Exposure Prophylaxis (PrEP) is an effective biomedical HIV prevention strategy that is underutilized. Few studies have examined the PrEP prescribing practices of primary care providers (PCPs), particularly in the Southern U.S. This cross-sectional survey, driven by the Transtheoretical Model (TTM), examined the prescribing practices of Southern U.S. PCPs. Relationships between PCPs personal and practice variables were examined, together with TTM decisional balance variables.Participants (n = 223) who had more African American patients in their practice were more likely to be in a higher TTM stage of change (p = .002) and were more likely to have written a PrEP prescription (p = .001). Access to PrEP resources (OR = 1.85, p = .001), streamlined insurance prior authorization processes (OR = 1.52, p = .010), working with staff who have PrEP knowledge (OR = 1.51, p = .033), having PrEP training (OR = 40.26, p < .001) and having patients who are motivated to take PrEP (OR = 2.19, p = .007) were significant facilitators to PrEP prescribing. Significant barriers to PrEP prescribing included a lack of provider PrEP training (OR = 0.43, p = .003), lack of clinical leadership regarding PrEP (OR = 0.65, p = .018), lack of insurance (OR = 2.74, p = .002), and likelihood of poor patient adherence to PrEP (OR = 0.53, p = .001).Findings indicate that this sample of PCPs were more likely to be at a higher TTM stage of change and have written a PrEP prescription if they saw more African American patients in their practice. Further, significant facilitators of PrEP prescribing included access to PrEP resources, streamlined insurance prior authorization processes, working with staff who have PrEP knowledge, having PrEP training, and having patients who are motivated to take PrEP. Significant barriers to PrEP prescribing included a lack of PrEP training, a lack of clinical leadership regarding PrEP, patient lack of insurance, and likelihood of poor patient adherence. This study contributes to the body of knowledge regarding PCP PrEP prescribing practices. Findings from this study may inform future interventions that aim to enhance PrEP prescribing among primary care providers who serve Southern African American individuals at risk for acquisition of HIV disease. Article	2021	Troutman, Jamie; Ingram, Lucy Annang; Gaddist, Bambi; Robillard, Alyssa; Qiao, Shan	African American Women's Current Knowledge, Perceptions, and Willingness of PrEP Use for HIV Prevention in the South.	Journal of Healthcare for the Humanities and Sciences	-	-	-	2159-8819	NA	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9930508	African American women accounted for approximately 60% of new HIV diagnoses among women in the United States, with the greatest burden occurring in the South. Past efforts to prevent HIV focused on behavioral interventions aimed at reducing sexual risk behavior. More recent HIV prevention methods have included oral pre-exposure prophylaxis (PrEP) with antiretroviral drugs. Although PrEP has been designated as an effective HIV prevention method since 2012, awareness and uptake of PrEP remains low among African American women. Our study explored African American women's knowledge, perceptions, and willingness of PrEP use. Four focus groups were held in April 2019, consisting of 27 women, who identified as African American and resided in South Carolina. Focus group topics focused on participants' awareness, perceptions, and potential use of PrEP. The majority of women had heard of PrEP; however, over half of the participants were in the HIV or health field. Overall, participants believed that the "lay woman" would be unaware of PrEP. Participants' perceptions of PrEP included stigma of PrEP use, benefits to non-monogamous couples, and experiences with PrEP clients. The majority of women were willing to use PrEP, but major concerns around short and long-term side effects were expressed. Participants provided recommendations to improve PrEP uptake among African American women that included targeted campaigns and spokespersons. African American women are interested and supportive of PrEP use for HIV prevention in the South, where HIV rates remain highest. Past PrEP implementation efforts have not been relatable to African American women; therefore, awareness and uptake rates remain low. Future efforts to increase PrEP awareness and uptake among African American women should be relevant, and should provide comprehensive information on potential side effects, purpose of use, and eligibility criteria. Article	2021	Truong, Hong-Ha M.; Mehrotra, Megha L.; Grant, Robert M.	Seroadaptive Behaviors Varied Among Geographically Diverse iPrEx Participants.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884 1525-4135	10.1097/QAI.0000000000002551	https://pubmed.ncbi.nlm.nih.gov/33093331/	BACKGROUND: Seroadaptive behaviors refer to a wide range of harm reduction practices to decrease HIV transmission risk. Effective implementation of seroadaptive behaviors is dependent on knowledge of one's own serostatus and that of one's sexual partners. Partner-level and environmental-level attributes may affect seroadaptation practices. We assessed factors associated with seroadaptive behaviors. METHODS: Men who have sex with men and transgender women recruited from an HIV pre-exposure prophylaxis clinical trial (iPrEx) with study sites in the US, Peru, Ecuador, Brazil, Thailand, and South Africa. Partnership-level data were collected at the baseline visit for the 3 most recent partners. Participants were considered to have practiced seroadaptive behaviors if: (1) they believed their partner to be HIV-negative, that is, serosorting; or (2) no condomless receptive sex occurred with an HIV-positive or unknown status partner, that is, seropositioning. RESULTS: Of 2331 participants, 41% always practiced seroadaptive behaviors, 36% sometimes did, and 23% never did. Participants enrolled at study sites in the US (P < 0.001) and Peru/Ecuador (P < 0.001) were more likely to practice seroadaptive behaviors, whereas transgender women were less likely to do so (P < 0.001). Seroadaptive behaviors were more likely to occur in relationships with steady partners (P = 0.005) and emotionally close relationships (P = 0.013). CONCLUSIONS: Seroadaptive behaviors were more frequently observed among iPrEx participants from the US, Peru, and Ecuador study sites and among participants in relationships with partners who they were more committed to and felt emotionally close to. Our findings suggest that seroadaptive behaviors may be influenced by social norms that vary geographically and culturally. Article	2021	Truong, Hong-Ha M; Fatch Robin; McFarland, Willi; Raymond, Henry F	HIV Prevention Responsibility Beliefs Among Men Who Have Sex With Men in the PrEP Era: JAIDS	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002659	https://www.proquest.com/scholarly-journals/hiv-prevention-responsibility-beliefs-among-men/docview/2676131061/se-2?accountid=8113	Background:Beliefs regarding responsibility for preventing HIV transmission may differ between individuals and their sexual partners. We assessed HIV prevention responsibility beliefs among men who have sex with men (MSM) participating in the 2017 National HIV Behavioral Surveillance survey.Methods:MSM were recruited using time-location sampling at clubs, bars, and street locations in San Francisco. HIV prevention responsibility beliefs were assessed on a four-point scale (1 = strongly disagree to 4 = strongly agree). Associations were assessed using generalizing estimating equations to adjust for behaviors within multiple partnerships.Results:A total of 316 HIV-negative and 76 HIV-positive men reported on 1336 partnerships. HIV-negative compared with HIV-positive men had higher endorsement of mutual responsibility (mean 3.7 vs. 3.5; P < 0.01). Both groups had similar levels of endorsing responsibility on the HIV-negative or HIV-positive partner. HIV-positive men endorsing equal responsibility were more likely to know their partner's HIV status (P < 0.01) and less likely to have serodiscordant condomless anal intercourse (CAI) (P < 0.01) than men who did not endorse equal responsibility. HIV-negative men in partnerships with pre-exposure prophylaxis (PrEP) use were more likely to know their partner's HIV status (P = 0.02) and have serodiscordant CAI (P = 0.04) than men not in partnerships with PrEP use.Conclusions:HIV-negative and HIV-positive men accept responsibility for preventing HIV. The finding that HIV-negative men in partnerships with PrEP use who engage in serodiscordant CAI is concerning because they are still at risk for other sexually transmitted infections, which are present at elevated levels in San Francisco and other US cities. Article	2021	Tubert J.; Packel L.; Hunter L.A.; Mfaume R.; Njau P.; Ramadhani A.A.; Liu J.X.; McCoy S.I.	HIV prevention at drug shops: awareness and attitudes among shop dispensers and young women about oral pre-exposure prophylaxis and the dapivirine ring in Shinyanga, Tanzania	AIDS Research and Therapy	-	-	-	17426405	10.1186/s12981-021-00343-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104860758&doi=10.1186%2fs12981-021-00343-1&partnerID=40&md5=32660ea44c73913648b459d84176f157	Background: HIV risk remains high among adolescent girls and young women (AGYW, ages 15–24) in Tanzania. Many AGYW experience stigma and provider bias at health facilities, deterring their use of HIV prevention services. Privately-owned drug shops, ubiquitous in many communities, may be an effective and accessible channel to deliver HIV prevention products to AGYW, including oral pre-exposure prophylaxis (PrEP) and the dapivirine vaginal ring. Methods: In July–August 2019, we enrolled 26 drug shops in Shinyanga, Tanzania in an ongoing study to create "girl-friendly" drug shops where AGYW can access HIV self-testing and contraception. At baseline, all shop dispensers were given basic information about oral PrEP and the dapivirine ring and were asked about their interest in stocking each. During the next 3–5 months, we surveyed AGYW (n = 56) customers about their interest in oral PrEP and the ring. Results: Among dispensers, the median age was 42 years and 77% were female. Overall, 42% of dispensers had heard of a medication for HIV prevention. Almost all dispensers reported some interest in stocking oral PrEP (92%) and the dapivirine ring (96%). Most (85%) reported they would provide oral PrEP to AGYW who requested it. Among AGYW customers, the median age was 17 years; 29% of AGYW were married or had a steady partner and 18% had children. Only 20% of AGYW had heard of a medication to prevent HIV, yet 64% and 43% expressed some interest in using oral PrEP and the dapivirine ring, respectively, after receiving information about the products. PrEP interest was higher among AGYW who were partnered and had children. Conclusions: Despite low prior awareness of PrEP among shop dispensers and AGYW, we found high levels of interest in oral PrEP and the dapivirine ring in both groups. Community-based drug shops represent a promising strategy to make HIV prevention more accessible to AGYW. © 2021, The Author(s). Article	2021	Turner D.A.; Lockhart E.; Wang W.; Shore R.; Daley E.; Marhefka S.L.	Examining the Factors Affecting PrEP Implementation Within Community-Based HIV Testing Sites in Florida: A Mixed Methods Study Applying the Consolidated Framework for Implementation Research	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03152-1	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85098948581&doi=10.1007%2fs10461-020-03152-1&partnerID=40&md5=a03b7ab3fcadcd4c1ca1796dd836e72a	HIV testing/counseling is a critical point during which non-clinical staff could intervene, discuss and/or refer clients for pre-exposure prophylaxis (PrEP). This analysis investigated the contextual factors affecting PrEP implementation within HIV testing sites. Two generalized linear mixed models were conducted to estimate PrEP implementation as a function of constructs from the Consolidated Framework for Implementation Research (CFIR). Qualitative interviews were analyzed thematically. Data integration occurred via joint analysis and triangulation. Constructs from the CFIR domain Characteristics of Individuals did not predict PrEP implementation when controlling for demographic characteristics; qualitative data signaled divergent findings in PrEP knowledge. Within the CFIR domains Inner and Outer Settings, relevant priority and available resources predicted PrEP implementation; qualitative data confirmed the importance of available resources and provided insight into the impact of cosmopolitanism and leadership. Addressing the contextual factors that affect PrEP implementation may help HIV testing staff to better implement PrEP programs. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC part of Springer Nature. Article	2021	Valente, Pablo K; Mimiaga, Matthew J; Chan, Philip A; Biello, Katie B	Health Service- and Provider-Level Factors Influencing Engagement in HIV Pre-Exposure Prophylaxis Care Among Male Sex Workers.	AIDS Patient Care and STDs	-	-	-	1557-7449	10.1089/apc.2021.0084	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8380801	Multilevel barriers to pre-exposure prophylaxis (PrEP) care among male sex workers (MSW) include aspects of interactions with health services and providers. We examined relationships between health service- and provider-level factors and PrEP care among MSW. Between 2017 and 2019, we enrolled 111 MSW in the Northeast United States who were not on PrEP, but expressed interest in potentially using PrEP, in a behavioral intervention to promote PrEP uptake and adherence. Using baseline data, we examined whether having a primary care provider, past year frequency of medical visits, comfort discussing sexual practices with providers, and transportation difficulties to accessing general health care were associated with PrEP use self-efficacy, anticipated barriers to PrEP uptake, adherence, and retention (linear regression), and intention to initiate PrEP (logistic regression). Models adjusted for age, race/ethnicity, sexual identity, education, and income. Participants' mean age was 34.2 standard deviation (SD) = 8.5, and 47% were non-White. Three-quarters (76%) intended to initiate PrEP within the next month. Comfort discussing sexual practices with providers was associated with PrEP use self-efficacy (b = 0.41, p = 0.008). Comfort discussing sexual practices with providers was negatively associated with anticipated barriers to PrEP uptake (b = -0.29, p = 0.006). Transportation difficulties to accessing general health care were associated with barriers to PrEP uptake (b = 0.30, p = 0.007) and barriers to PrEP adherence and retention (b = 0.57, p < 0.001). No health service- and provider-level characteristics were associated with intention to initiate PrEP. PrEP programs targeting MSW may benefit from interventions to foster communication between MSW and providers about sexual practices and should consider structural barriers to accessing care, including lack of access to transportation.	men who have sex with men, sex workers, HIV/AIDS, pre-exposure prophylaxis, health services, health care provider	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative

Article	2021	Vallejo-Díaz, Diego	Entre las presencias, los pliegues y la racionalidad: vida y procesos de Ordenamiento asociados a la profilaxis previa a la exposición (PREP) en Colombia	Maguaré	-	-	-	01203045	10.15446/mag.v35n1.96664	https://www.proquest.com/scholarly-journals/entre-las-presencias-los-pliegues-y-la/docview/2592635260/se-2?accountid=8113	Este texto explora la manera en que los procesos de regulación de la profilaxis previa a la exposición o profilaxis preexposición (PREP, por sus siglas en inglés) en Colombia se articulan con la vida de las personas que animan la existencia de esta tecnología, ya sea como usuarios del sistema de salud o fuera de este, vendedores del medicamento, integrantes de organizaciones de base comunitaria que trabajan en torno al virus de inmunodeficiencia humana (vih), activistas que exigen su disponibilidad o médicos que la prescriben. Propongo un viaje de ida y vuelta entre la experiencia de estas personas y la aparición de un modelo de racionalidad que apuesta por la regulación de la tecnología, a través del cual se pone en evidencia la política ontológica que está detrás de la demanda por la disponibilidad de esta tecnología de prevención del VIH, que pone en tensión las formas comunitarias de participar de la PREP y los marcos centrados en el individuo como agente autónomo.Resumo alternativo: Este texto explora como os processos de regulação da profilaxia antes da exposição ou profilaxia pré-exposição (PREP, por sua sigla em inglês) na Colômbia, se articulam com a vida das pessoas que participam na existência dessa tecnologia, sejam usuários beneficiários ou não do sistema de saúde, vendedores do medicamento, membros de organizações de base comunitária que trabalham em torno ao vírus da imunodeficiência humana (HIV), ativistas que exigem sua disponibilidade ou médicos que a prescrevee-lam. Proponho uma viagem de ida e volta entre a experiência dessas pessoas e a instauração de um modelo de racionalidade que aposta na regulação da tecnologia, evidenciando a política ontológica por trás da demanda pela disponibilidade dessa tecnologia de prevenção do hiv, que coloca em tensão as formas comunitárias de participar da PREP e os contextos centrados no indivíduo como agente autônomo.Resumo alternativo: This text explores the way in which regulation processes of pre-exposure prophylaxis (PREP) in Colombia are linked with the lives of people who animate this technology's existence, whether as users inside the healthcare system or outside of it, prescription-drug sellers, members of community-based organizations working around HIV, activists who demand its availability, or doctors who prescribe it. I propose a back-and-forth path between the experiences of these people and the establishment of a rationality model brought about by the regulation of prep that reveals an ontological politics behind the demand for the availability of this technology.	pre-exposure prophylaxis; Colombia; Hiv prevention; prep; Archaeology; medicalização; medicalización; medicalization; pharmaceutical control; prevenção do H iv; prevención del viH; profilaxia pré-exposição; profilaxis previa a la exposición; regulação farmacêutica; regulación farmacéutica	Spanish	Colombia	Latin America and the Caribbean	Colombia	Latin America and the Caribbean	Colombia	Latin America and the Caribbean	Qualitative
Article	2021	Van de Perre, Philippe; Goga, Ameena; Ngandu, Nobubelo; Nagot, Nicolas; Moodley, Dhayendre; King, Rachel; Molès, Jean-Pierre; Mosqueira, Beatriz; Chirinda, Witness; Scarlatti, Gabriella; Tylleskär, Thorkild; Dabis, François; Gray, Glenda	Eliminating postnatal HIV transmission in high incidence areas: need for complementary biomedical interventions.	The Lancet	-	-	-	1474-547X	10.1016/S0140-6736(21)00570-5	https://dx.doi.org/10.1016/S0140-6736(21)00570-5	The rate of mother-to-child transmission (MTCT) of HIV from breastfeeding is increasing relative to other causes of MTCT. Early effective preconception and antenatal antiretroviral therapy (ART) reduces intrauterine and intrapartum MTCT, whereas maternal post-partum HIV acquisition, untreated maternal HIV, and suboptimal postnatal maternal ART adherence increase the risk of MTCT through breastfeeding. Although the absolute number of cases of MTCT acquired through breastfeeding is decreasing, the rate of decrease is less than the decrease in intrauterine and intrapartum MTCT. Unless current strategies are universally applied, they might not be sufficient to eliminate MTCT due to breastfeeding. Urgent action is needed to evaluate and implement additional preventive biomedical strategies in high HIV prevalence and incidence settings to eliminate MTCT from breastfeeding. Preventive strategies include: pre-exposure prophylaxis in breastfeeding women who have an increased risk of acquiring HIV; postnatal reinforcement strategies, such as maternal retesting for HIV, maternal care reinforcement, and prophylaxis in infants exposed to HIV via breastmilk; and active (vaccine) or passive immunoprophylaxis with long-acting broadly neutralising antibodies. Article	2021	van de Vijver David A M C; Mukherjee Shreoshee; van Kampen Jeroen JA	Antiretroviral Drug Treatment of Individuals that Used Preexposure Prophylaxis (PrEP) Before Diagnosis	Current Treatment Options in Infectious Diseases	-	-	-	15233820	10.1007/s40506-021-00246-9	https://www.proquest.com/scholarly-journals/antiretroviral-drug-treatment-individuals-that/docview/2561092675/se-2?accountid=8113	Purpose of reviewThe antiretroviral drugs, tenofovir and emtricitabine used as preexposure prophylaxis (PrEP), are also used in treatment of HIV. Drug resistance due to PrEP can therefore jeopardize future treatment options. This review discusses treatment of individuals that used PrEP in whom viral mutations against tenofovir (K65R) or emtricitabine (M184I/V) are found.Recent findingsAlthough no studies systematically investigated the optimal treatment of individuals who used PrEP before diagnosis, there is anecdotal evidence that HIV including the K65R and/or M184I/V can be successfully treated using recommended first-line regimens.SummaryDrug resistance can be ascribed to use of PrEP while having an unrecognized acute HIV infection, partial adherence to PrEP, and transmission of HIV resistant to PrEP drugs. First-line antiretroviral drug treatment in individuals who used PrEP before diagnosis must be optimized based on genotypic resistance test results. Individuals in whom M184I/V and/or K65R is detected can be treated with dolutegravir-based, bictegravir-based, or darunavir-based regimens plus tenofovir plus lamivudine or emtricitabine. Dual therapy using dolutegravir plus lamivudine is not recommended for induction therapy in individuals with viral mutations against the drugs used as PrEP. There is an urgent need to confirm the anecdotal evidence for successful treatment using first-line regimens. Article	2021	van den Berg, Polly; Powell, Victoria E; Wilson, Ira B; Klompas, Michael; Mayer, Kenneth; Krakower, Douglas S	Primary Care Providers' Perspectives on Using Automated HIV Risk Prediction Models to Identify Potential Candidates for Pre-exposure Prophylaxis.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03252-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8631042	Identifying patients at increased risk for HIV acquisition can be challenging. Primary care providers (PCPs) may benefit from tools that help them identify appropriate candidates for HIV pre-exposure prophylaxis (PrEP). We and others have previously developed and validated HIV risk prediction models to identify PrEP candidates using electronic health records data. In the current study, we convened focus groups with PCPs to elicit their perspectives on using prediction models to identify PrEP candidates in clinical practice. PCPs were receptive to using prediction models to identify PrEP candidates. PCPs believed that models could facilitate patient-provider communication about HIV risk, destigmatize and standardize HIV risk assessments, help patients accurately perceive their risk, and identify PrEP candidates who might otherwise be missed. However, PCPs had concerns about patients' reactions to having their medical records searched, harms from potential breaches in confidentiality, and the accuracy of model predictions. Interest in clinical decision-support for PrEP was greatest among PrEP-inexperienced providers. Successful implementation of prediction models will require tailoring them to providers' preferences and addressing concerns about their use. Article	2021	Van Den Elshout M.A.M.; Hoornenborg E.; Achterbergh R.C.A.; Coyer L.; Anderson P.L.; Davidovich U.; De Vries H.J.C.; Prins M.; Van Der Loeff M.F.S.	Improving adherence to daily preexposure prophylaxis among MSM in Amsterdam by providing feedback via a mobile application	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002949	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114385344&doi=10.1097%2fQAD.0000000000002949&partnerID=40&md5=6f9bd77e9b8836d14aed36efd48eb46c	Objective:Improving adherence to preexposure prophylaxis (PrEP) by providing automated feedback on self-reported PrEP use via a mobile application (app).Design:Randomized clinical trial among MSM participating in the Amsterdam PrEP demonstration project (AMPrEP).Methods:Eligible participants were randomized 1:1 to the control or intervention app. Both allowed daily reporting of sexual behaviour and medication intake; the intervention app also provided visual feedback. Dried blood spots collected at 12 and 24months yielded intracellular tenofovir diphosphate concentrations (TFV-DP). We assessed proportions of participants with poor (TFV-DP <700fmol/punch; primary outcome), good (TFV-DP ≥700fmol/punch) and excellent (TFV-DP ≥1250fmol/punch; secondary outcome) adherence at both time-points, and the association with the control or intervention app.Results:We randomized 229 participants, 118 to the intervention and 111 to the control arm. The primary, per-protocol, analysis included 83 participants per arm. In total, 22/166 (13%) of participants adhered poorly, 144/166 (87%) good and 66/166 (40%) excellently. App feedback did not result in a lower proportion of participants with poor adherence control: 9 of 83 (11%); intervention: 13 of 83 (16%); P=0.36. App feedback did result in a larger proportion of participants with excellent adherence control: 26/83 (31%); intervention: 40/83 (48%); P=0.026.Conclusion:In this highly adherent population, app feedback did not improve the proportion of participants with poor adherence to PrEP.Clinical Trial Number Netherlands Trial Register: NL5413. © 2021 Lippincott Williams and Wilkins. Article	2021	Van Dijck, Christophe; Tsoumanis, Achilleas; Rotsaert, Anke; Vuylsteke, Bea; Van den Bossche, Dorien; Paeleman, Elke; De Baetselier, Irith; Brosius, Isabel; Laumen, Jolein; Buyze, Jozefien; Wouters, Kristien; Lynen, Lutgarde; Van Esbroeck, Marjan; Herssens, Natacha; Abdellati, Said; Declercq, Steven; Reyniers, Thijs; Van Herrewege, Yven; Florence, Eric; Kenyon, Chris	Antibacterial mouthwash to prevent sexually transmitted infections in men who have sex with men taking HIV pre-exposure prophylaxis (PReGo): a randomised, placebo-controlled, crossover trial.	The Lancet Infectious Diseases	-	-	-	1474-4457	10.1016/S1473-3099(20)30778-7	https://dx.doi.org/10.1016/S1473-3099(20)30778-7	BACKGROUND: Bacterial sexually transmitted infections (STIs) are highly prevalent among men who have sex with men who use HIV pre-exposure prophylaxis (PrEP), which leads to antimicrobial consumption linked to the emergence of antimicrobial resistance. We aimed to assess use of an antiseptic mouthwash as an antibiotic sparing approach to prevent STIs. METHODS: We invited people using PrEP who had an STI in the past 24 months to participate in this single-centre, randomised, double-blind, placebo-controlled, AB/BA crossover superiority trial at the Institute of Tropical Medicine in Antwerp, Belgium. Using block randomisation (block size eight), participants were assigned (1:1) to first receive Listerine Cool Mint or a placebo mouthwash. They were required to use the study mouthwashes daily and before and after sex for 3 months each and to ask their sexual partners to use the mouthwash before and after sex. Participants were screened every 3 months for syphilis, chlamydia, and gonorrhoea at the oropharynx, anorectum, and urethra. The primary outcome was combined incidence of these STIs during each 3-month period, assessed in the intention-to-treat population, which included all participants who completed at least the first 3-month period. Safety was assessed as a secondary outcome. This trial is registered with Clinicaltrials.gov, NCT03881007. FINDINGS: Between April 2, 2019, and March 13, 2020, 343 participants were enrolled: 172 in the Listerine followed by placebo (Listerine-placebo) group and 171 in the placebo followed by Listerine (placebo-Listerine) group. The trial was terminated prematurely because of the COVID-19 pandemic. 151 participants completed the study, and 89 completed only the first 3-month period. 31 participants withdrew consent, ten were lost to follow-up, and one acquired HIV. In the Listerine-placebo group, the STI incidence rate was 140·4 per 100 person-years during the Listerine period, and 102·6 per 100 person-years during the placebo period. In the placebo-Listerine arm, the STI incidence rate was 133·9 per 100 person-years during the placebo period, and 147·5 per 100 person-years during the Listerine period. We did not find that Listerine significantly reduced STI incidence (IRR 1·17, 95% CI 0·84-1·64). Numbers of adverse events were not significantly higher than at baseline and were similar while using Listerine and placebo. Four serious adverse events (one HIV-infection, one severe depression, one Ludwig's angina, and one testicular carcinoma) were not considered to be related to use of mouthwash. INTERPRETATION: Our findings do not support the use of Listerine Cool Mint as a way to prevent STI acquisition among high-risk populations. Article	2021	van Dijk M.; de Wit J.B.F.; Guadamuz T.E.; Martinez J.E.; Jonas K.J.	Slow Uptake of PrEP: Behavioral Predictors and the Influence of Price on PrEP Uptake Among MSM with a High Interest in PrEP	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03200-4	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101277395&doi=10.1007%2fs10461-021-03200-4&partnerID=40&md5=3826d568f06bf0c440c609fe8d3c2ce4	Despite the improved availability and affordability of PrEP in the Netherlands, PrEP uptake is low among men who have sex with men (MSM). To optimize uptake, it is important to identify facilitators and barriers of PrEP use. During our study period, the price of PrEP dropped significantly after generic PrEP was introduced. We investigated whether the price drop predicts PrEP uptake, alongside behavioral and demographic characteristics. Participants (N = 349) were recruited online and completed three questionnaires over a period of 6 months, between February 2017 and March 2019. After 6 months, 159 (45.6%) participants were using PrEP. PrEP uptake was greater among MSM who ever had postexposure prophylaxis (PEP) treatment, among MSM with a lower perceived financial situation, and when the price of PrEP dropped. MSM in a tighter perceived financial situation may use PrEP more when it would be free or fully reimbursed. © 2021, The Author(s). Theses and Dissertations	2021	van Dijk, Mart	PrEP use among men who have sex with men in the Netherlands: Interest, attitudes, and behaviors in a context of emerging PrEP availability	-	-	Maastricht University	-	NA	10.26481/dis.20210331md	https://cris.maastrichtuniversity.nl/en/publications/0dd503bb-0179-44e8-a083-e5d909a992db	Pre-exposure prophylaxis (PrEP) is a novel biomedical intervention that is highly effective in reducing HIV infections. PrEP is taken as a daily pill or in an on-demand regimen at times when a high risk of HIV is expected. Despite the high effectiveness of PrEP, the uptake of PrEP has been limited in the past years, because PrEP was limited accessible and expensive. This PhD project investigated how men who have sex with men (MSM) obtained PrEP in the years before PrEP became available (and affordable) in pharmacies in the Netherlands in 2017. Furthermore, this research investigated hurdles for PrEP use in the Netherlands and the sexual behaviour of PrEP users after PrEP initiation. Article	2021	van Dijk, Mart; de Wit, John B F; Kamps, Rebecca; Guadamuz, Thomas E; Martinez, Joel E; Jonas, Kai J	Socio-Sexual Experiences and Access to Healthcare Among Informal PrEP Users in the Netherlands	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03085-9	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096057987&doi=10.1007%2fs10461-020-03085-9&partnerID=40&md5=c28e514e3b6939c04043fc15948b0649	The aim of this qualitative study was to explore the experiences of informal PrEP users regarding access to PrEP and PrEP-related healthcare, community responses, sexual behavior and well-being. We interviewed 30 men who have sex with men (MSM) in semi-structured online interviews between March and August 2018. Interviews were analyzed using interpretive description. Informal PrEP users were well informed about the use of PrEP, but sometimes did not make use of renal testing. Participants reported a lack of PrEP knowledge among healthcare providers, which limited their access to PrEP and put them at risk, as they received incorrect information. Although some participants reported negative reactions from potential sex partners, most received positive reactions and were sometimes seen as more desirable sex partners. PrEP healthcare services should not only be accessible to formal PrEP users, but also to PrEP users who procure PrEP informally. © 2020, The Author(s). Article	2021	van Hoek, Albert Jan; Reitsema, Maarten; Xiridou, Maria; van Sighem, Ard; van Benthem, Birgit; Wallinga, Jacco; van Duijnhoven, Yvonne; van der Loeff, Maarten Schim; Prins, Maria; Hoornenborg, Elske	Offering a choice of daily and event-driven preexposure prophylaxis for men who have sex with men in the Netherlands: a cost-effectiveness analysis.	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000002913	https://dx.doi.org/10.1097/QAD.0000000000002913	OBJECTIVES: To assess the cost-effectiveness of a preexposure prophylaxis (PrEP) programme offering a choice of daily and event-driven PrEP for men who have sex with men (MSM) in the Netherlands. METHODS: We used an agent-based transmission model and an economic model to simulate a programme offering only daily PrEP and a programme offering daily and event-driven PrEP. Use of PrEP medication and preference for daily versus event-driven PrEP were estimated from the Amsterdam PrEP Demonstration Project (AMPrEP). We calculated costs, quality-adjusted life-years (QALY), and incremental cost-effectiveness ratios (ICER), over 2018-2027. An ICER less than 20 000 per QALY gained was considered cost-effective. RESULTS: Using AMPrEP data, we estimated that 27% of PrEP users chose event-driven PrEP with a median of 12 pills per month; daily PrEP users used a median of 30 pills per month. With PrEP, 3740 HIV infections were averted and 1482 QALYs were gained over 2018-2027, compared to the scenario without PrEP. The probability of the PrEP programme being cost-effective (compared to not having a PrEP programme) increased from 91% with daily PrEP to 94% with a choice of daily and event-driven PrEP. The probability of being cost-saving increased from 42% with only daily PrEP to 48% with choice of daily and event-driven PrEP. CONCLUSIONS: A daily PrEP programme for MSM would be cost-effective. Providing a choice of daily and event-driven PrEP can result in savings and is more likely to be cost-effective and cost-saving, compared to a programme offering only daily PrEP. Article	2021	van Wijhe M.; Fischer T.K.; Fonager J.	Identification of risk factors associated with national transmission and late presentation of HIV-1, Denmark, 2009 to 2017	Eurosurveillance	-	-	-	1025496X	10.2807/1560-7917.ES.2021.26.47.2002008	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121126716&doi=10.2807%2f1560-7917.ES.2021.26.47.2002008&partnerID=40&md5=8c977d496d5aa0b57a84990dd6ddc397	Despite availability of pre-exposure prophylaxis (PrEP), the incidence of HIV-1 in Europe remained stable the past decade. Reduction of new HIV-1 infections requires more knowledge about the profiles of high-risk transmitters and late presenters (LP). Aim: We aimed to investigate risk factors associated with HIV-1 transmission clusters and late presentation with HIV-1 in Denmark. Methods: Blood samples and epidemiological information were collected from newly diagnosed HIV-1 patients between 2009 and 2017. We genotyped pol genes and performed phylogenetic analyses to identify clusters. Risk factors for clustering and LP were investigated with partial proportional odds and logistic regression. Covariates included transmission mode, HIV-1 subtype, age, origin and cluster activity. Results: We included 1,040 individuals in the analysis, 59.6% identified with subtype B and 48.4% in a cluster. Risk factors for clustering included Danish origin (odds ratio (OR): 2.95; 95% confidence interval (CI): 2.21–3.96), non-LP (OR: 1.44; 95% CI: 1.12–1.86), and men who have sex with men (MSM). Increasing age and non-B subtype infection decreased risk (OR: 0.69; 95% CI: 0.50–0.94). Risk for late presentation was lower for active clusters (OR: 0.60; 95% CI: 0.44–0.82) and Danish origin (OR: 0.43; 95% CI: 0.27–0.67). Non-Danish MSM had a lower risk than non-Danish heterosexuals (OR: 0.34; 95% CI: 0.21–0.55). Conclusion: HIV-1 transmission in Denmark is driven by early diagnosed, young, subtype B infected MSM. These may benefit most from PrEP. Non-Danish heterosexual HIV-1 patients could benefit from improved communication to achieve earlier diagnosis and treatment. © 2021 European Centre for Disease Prevention and Control (ECDC). Theses and Dissertations	2021	Vasconcelos, Ricardo de Paula	Infecções sexualmente transmissíveis em usuários do Projeto Demonstrativo PrEP Brasil	-	-	Universidade de São Paulo	-	NA	https://doi.org/10.11606/T.5.2021.tde-28092021-114014	https://www.teses.usp.br/teses/disponiveis/5/5134/tde-28092021-114014/publico/RicardodePaulaCorrgida.pdf	Introdução: as pandemias de HIV e outras infecções sexualmente transmissíveis (IST) ainda são um importante problema não resolvido de saúde pública mundial, contando com milhões de novos casos diagnosticados anualmente, e têm crescido de maneira desproporcionalmente mais rápida entre populações específicas, como homens que fazem sexo com outros homens e trabalhadores do sexo. Para o HIV, na última década, foram desenvolvidas novas e potentes tecnologias de prevenção, principalmente aquelas que utilizam medicamentos antirretrovirais, como a Profilaxia Pré-Exposição ao HIV (PrEP). Se por um lado a PrEP está conseguindo reduzir rapidamente as taxas de incidência de HIV nas localidades em que está sendo amplamente implementada, por outro há dúvidas sobre o impacto negativo que a não proteção contra outras IST, a falha na adesão aos comprimidos da PrEP e a compensação de risco podem causar na resposta às IST. Objetivos: este estudo tem como objetivo compreender melhor a ocorrência de IST não-HIV, de compensação de risco e da adesão aos comprimidos da PrEP nas cidades de São Paulo e Rio de Janeiro, e identificar os fatores sociodemográficos associados a eles, para que se possa aprimorar a resposta programática às IST. Métodos: o Projeto Demonstrativo PrEP Brasil foi realizado entre 2014 e 2018 nas cidades de São Paulo e Rio de Janeiro para avaliar a aceitação, adesão e proteção contra o HIV pelo uso da PrEP entre populações de HSH e mulheres transexuais caso distribuída gratuitamente. Esse trabalho utilizou as informações dos bancos de dados coletados durante o projeto sobre informações sociodemográficas, rastreamento de IST, relato de compensação de risco e adesão aos comprimidos da PrEP. Foi utilizada estatística descritiva para as ocorrências de IST, compensação de risco e adesão, medida por dosagem de Tenofovir por Dry Blood Spot (DBS), e análise estatística multivariada para identificar os fatores associados a eles. Resultados: foram incluídos 450 participantes, sendo a maioria HSH (94,4%), com a mediana da idade 30 anos (de 18 a 59 e com percentis 25 e 75% de 24 e 35 anos, respectivamente). A raça autorreferida foi branca para 54,0% e 48,2% tinham nível de escolaridade superior completo. O uso de substâncias psicoativas foi frequente (álcool - 54,6%, maconha - 27,3% e uso de Chemsex - 17,8%). Oito por cento dos participantes referiram ser trabalhadores do sexo. Na inclusão do estudo, 34,7% dos participantes tinham teste treponêmico positivo, 8,3% tinham exame positivo para Chlamydia trachomatis e 5,2% para Neisseria gonorrheae. A taxa de incidência ao final de 2 anos de acompanhamento para essas três IST foram de 10,7; 7,4 e 5,8 casos a cada 100 pessoas-ano. A análise multivariada identificou que esteve associado à sífilis incidente o relato de trabalho sexual (HR 3,13 IC95% 1,55-6,31 p < 0,001) e uso de Chemsex (HR 1,97 IC95% 1,04-3,71 p = 0,037). Esteve associado a infecção incidente por CT ou NG o diagnóstico prévio dessas infecções (HR 2,34 IC95% 1,06-5,19 p = 0,036). A ocorrência de compensação de risco foi significativamente maior entre os usuários de Chemsex (HR 2,56 IC95% 1,27-5,17 p = 0,009). No mesmo grupo também foi encontrada adesão aos comprimidos da PrEP significativamente maior (HR 2,92 IC95% 1,26-6,78 p = 0,012). Conclusão: O presente estudo, portanto, sugere que a disponibilização da PrEP é uma oportunidade de manter o acompanhamento longitudinal de uma população altamente vulnerável às IST. O rastreamento mais frequente de IST e o aconselhamento de compensação de risco e de adesão aos comprimidos devem ser adequados de acordo às necessidades de cada indivíduo. Desta forma, ações programáticas em políticas de saúde públicas podem ser adequadas para potencializar a respostas às epidemias de IST	HIV; Profilaxia Pré-Exposição; Combinação Entricitabina/Tenofovir disoproxil fumarato; Controle de doenças transmissíveis; Doenças sexualmente transmissíveis	Portuguese	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	-	-	Quantitative
Theses and Dissertations	2021	Vaselenak, Sarah	Cost-utility Analysis of Universal Pre-exposure Prophylaxis Coverage for Men who have Sex with Men at a High Risk of Human Immunodeficiency Virus Infection in Ontario, Canada	-	-	University of Toronto	-	NA	NA	http://hdl.handle.net/1807/109256	HIV pre-exposure prophylaxis (PrEP) was approved by Health Canada in 2016. Currently in Ontario, those under the age of 25 or aged 65 years or older can access PrEP free of charge through public drug coverage programs. This study assessed the cost-effectiveness of providing public coverage for PrEP to all high-risk Ontario MSM. A Markov cohort model was built from the perspective of the Ontario Ministry of Health and Long-Term Care (MOH) using a lifetime time horizon. Health states included HIV positive, HIV negative, and Dead. Transition probabilities, health state utilities and HIV treatment costs were sourced from published literature. Costs of HIV prevention were estimated through a micro-costing approach. HIV infection risk was estimated using the HIRI-MSM screening tool. Offering PrEP to all high-risk MSM through the Ontario MOH is dominant to current coverage circumstances due to a reduction in costly HIV infections. Article	2021	Velloza, Jennifer; Hosek, Sybil; Donnell, Deborah; Anderson, Peter L; Chirenje, Mike; Mgodi, Nyaradzo; Bekker, Linda-Gail; Delany-Moretlwe, Sinead; Celum, Connie	Assessing longitudinal patterns of depressive symptoms and the influence of symptom trajectories on HIV pre-exposure prophylaxis adherence among adolescent girls in the HPTN 082 randomized controlled trial.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25731	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8222844	INTRODUCTION: African adolescent girls and young women (AGYW) eligible for HIV pre-exposure prophylaxis (PrEP) experience high levels of depressive symptoms. Depression can reduce PrEP adherence among adults, although analyses have considered depression as a time-varying exposure rather than modelling distinct patterns of symptoms. The association between depressive symptoms and PrEP adherence has not been explored for AGYW. To address these gaps, we sought to understand depressive symptom trajectories among African AGYW initiating PrEP and the impact of time-varying depressive symptoms and symptom trajectories on PrEP adherence. METHODS: HPTN 082 was an open-label PrEP study among AGYW (ages 16 to 24) in Zimbabwe and South Africa from 2016 to 2018. Depressive symptoms were measured at enrolment and Weeks 13, 26 and 52, using the 10-item Center for Epidemiologic Studies scale; a score ≥10 is indicative of elevated depressive symptoms. PrEP adherence was defined as any detectable tenofovir diphosphate (TFV-DP) levels. Group-based trajectory modelling was used to model longitudinal patterns of depressive symptoms. We assessed psychosocial and behavioural predictors of depressive symptom trajectory membership (e.g. PrEP stigma, intimate partner violence IPV, sexual behaviour). We modelled associations between (1) group trajectory membership and PrEP adherence at Week 52 and (2) time-varying depressive symptoms and PrEP adherence through follow-up. RESULTS: At enrolment, 179 (41.9%) participants had elevated depressive symptoms. Group-based trajectory models revealed persistent elevated depressive symptoms in 48.5%, declining symptoms in 9.4% and no consistent or mild depressive symptoms in 43.3%. AGYW who engaged in transactional sex, reported IPV, or had traumatic stress symptoms were more likely to be assigned to the persistent elevated symptom group compared with the consistent no/mild symptom group (Wald test p-value all <0.01). Participants assigned to the persistent elevated depressive symptom trajectory had a significantly lower risk of detectable TFV-DP at Week 52 than those in the no/mild symptom trajectory (adjusted prevalence ratio = 0.89; 95% CI: 0.80 to 0.98). Elevated depressive symptoms were significantly inversely associated with PrEP use throughout follow-up (adjusted relative risk = 0.73; 95% CI = 0.53 to 0.99). CONCLUSIONS: Persistent depressive symptoms were common among African AGYW seeking PrEP. Integration of depressive symptom screening and treatment into PrEP programmes may improve PrEP effectiveness among African women.	depression, psychosocial, HIV, pre-exposure prophylaxis, Africa, women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Velloza, Jennifer; Kapogiannis, Bill; Bekker, Linda-Gail; Celum, Connie; Hosek, Sybil; Delany-Moretlwe, Sinead; Baggaley, Rachel; Dalal, Shona	Interventions to improve daily medication use among adolescents and young adults: what can we learn for youth pre-exposure prophylaxis services?	AIDS	-	-	-	1473-5571	10.1097/QAD.0000000000002777	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7855564	OBJECTIVE: Oral pre-exposure prophylaxis (PrEP) is an important HIV prevention method and studies have shown that young people ages 15-24 have difficulty adhering to daily PrEP. The field of PrEP delivery for young people is relatively nascent and lessons about potential PrEP adherence interventions could be learned from the larger evidence base of adherence interventions for other daily medications among youth. DESIGN: Systematic review of adherence support interventions for adolescents. METHODS: We searched PubMed, CINAHL, EMBASE, and PsycINFO through January 2020 for oral contraceptive pill (OCP), antiretroviral therapy (ART), asthma, and diabetes medication adherence interventions. We reviewed primary articles about OCP adherence interventions and reviewed systematic reviews for ART, asthma, and diabetes medication adherence interventions. Studies were retained if they included participants' ages 10-24 years; measured OCP, ART, asthma, or diabetes medication adherence; and were systematic reviews, randomized trials, or quasi-experimental studies. RESULTS: Fifteen OCP articles and 26 ART, diabetes, and asthma systematic reviews were included. Interventions that improved medication adherence for OCPs, ART, asthma, and diabetes treatment included reminder text messages, computer-based and phone-based support, and enhanced counseling. Multi-month prescriptions and same-day pill starts also were found to improve OCP adherence and continuation. Adolescent-friendly clinics and peer-based counseling significantly improved ART adherence, and telemedicine interventions improved diabetes medication adherence. CONCLUSION: Interventions that improve medication adherence among youth include enhanced counseling, extended pill supply, adolescent-friendly services, and text message reminders. PrEP programs could incorporate and evaluate such interventions for their impact on PrEP adherence and continuation among at-risk adolescents.	adherence, adolescents and young adults, antiretroviral therapy, asthma, diabetes, oral contraceptives, pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2021	Veras, Maria Amelia de Sousa Mascena; Saggese, Gustavo Santa Roza; Junior, José Luis Gomez; Silveira, Paula; Ferreira, Denis; Souza, Paola Alves de; Calado, Rodrigo; Castejon, Márcia Jorge; Yamashiro, Rosemeire; Brígido, Luis Fernando de Macedo; Turner, Caitlin; Lin, Jess; Wilson, Erin C; McFarland, Willi; Paiatto, Beatriz	Young age and sex work are associated with HIV seroconversion among transgender women in São Paulo, Brazil	Journal of Acquired Immune Deficiency Syndromes	-	-	-	NA	10.1097/QAI.0000000000002737	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8373663/	Background: Transgender women worldwide have among the highest prevalence of HIV and the lowest access to prevention among groups at risk. However, few longitudinal studies have directly measured HIV incidence and identified predictors of HIV acquisition among transgender women. Setting: São Paulo, Latin America's largest city. Methods: We conducted a longitudinal study among transgender women in São Paulo. Participants were recruited by a long-chain peer referral process from May 2017 to July 2019. Those age 18 years and older and HIV-negative at baseline were retested every 6 months up to 18 months. HIV incidence was calculated by dividing the number of seroconversions by the person-years (py) of follow-up; 95% confidence intervals (CI) were constructed assuming a Poisson distribution. Conditional maximum likelihood ratios assessed differences in HIV incidence by risk factors. Results: A racial/ethnically diverse sample of 545 transgender women were enrolled. In 485.5 py of follow-up, 13 seroconversions were observed yielding an incidence of 2.68 per 100 py (95% CI 1.43-4.58). HIV incidence was significantly higher among transgender women age 18 to 24 years (rate ratio 3.85, 95% CI 1.24-12.93) and among those who engaged in sex work in the preceding month (rate ratio 5.90, 95% CI 1.71-26.62). Conclusion: HIV transmission continues at a high rate among transgender women in Brazil. Factors such as young age, lower level of education, and limited employment opportunities may lead to dependence upon sex work which in turn increase HIV risk. Transgender-friendly prevention services, particularly programs delivering pre-exposure prophylaxis (PrEP) are urgently needed. Article	2021	Villela, Larissa M; Veloso, Valdiléa G; Hoagland, Brenda; Fernandes, Nilo M; Kallas, Esper G; Madruga, Jose V; Moreira, Ronaldo I; Grinsztejn, Beatriz; De Boni, Raquel B	Possible risk compensation, attitudes, and beliefs among Brazilian individuals potentially eligible for pre-exposure prophylaxis.	International Journal of STD & AIDS	-	-	-	1758-1052	10.1177/0956462421992157	https://dx.doi.org/10.1177/0956462421992157	Pre-exposure prophylaxis (PrEP) prevents HIV infection among men who have sex with men (MSM) and transgender women (TGW) who are the groups that presents the high incidence risk in Brazil. This cross-sectional secondary analysis describes possible risk compensation, attitudes, and beliefs regarding the use of PrEP among 723 MSM and TGW evaluated in the PrEP Brazil study pre-screening phase. Possible risk compensation was reported by 31.6% individuals. In the multivariate model, factors that increased the likelihood of possible risk compensation were: self-referring as white vs. Black (AOR 2.05; CI 1.09, 3.85), perceiving high likelihood of getting HIV in next 12 months (AOR 1.78; CI 1.23, 2.56), being less afraid of HIV infection if using PrEP (AOR 1.93; CI 1.19, 3.14), feeling liberated to have more partners if using PrEP (AOR 2.93; CI 1.92, 4.49), and believing closest friends would use PrEP (AOR 2.51; CI 1.1, 5.71). We found that possible risk compensation was more common among individuals who presented high-risk perception for HIV infection, probably reflecting they feel at risk and could benefit from PrEP use. Article	2021	Voglino G.; Gualano M.R.; Rousset S.; Forghieri P.; Fraire I.; Bert F.; Siliquini R.	Knowledge, attitudes and practices regarding pre-exposure prophylaxis (Prep) in a sample of italian men who have sex with men (msm)	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph18094772	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105537041&doi=10.3390%2fijerph18094772&partnerID=40&md5=a0748d998889bd15a1bc4dce921a9cee	Background: Pre-exposure prophylaxis (PrEP) is suitable for high human immunodefi-ciency virus (HIV)-infection risk people, foremost among whom are males who have sex with other males (MSM). This study evaluated knowledge, attitudes and practices regarding PrEP in a sample of Italian MSM, in order to hypothesize strategies to implement PrEP awareness and use. No pre-vious study has assessed this issue; Methods: An online survey was given to an opportunistic sample of Italian MSM. The questionnaire investigated sexual behaviour and habits, HIV/acquired immune deficiency syndrome (AIDS) knowledge and PrEP awareness, attitudes and practices. Univariable and multivariable logistic regressions were conducted to identify factors associated with PrEP knowledge; Results: A total of 196 MSM participated in this survey. Overall data showed that 87.2% of participants knew what PrEP is, but only 7.5% have ever used it. The main reason for not using PrEP was the cost of the therapy (26.9%). The principal source of PrEP information was the Internet (68.4%). Being regularly tested for HIV was significantly associated with PrEP knowledge (adjusted odds ratio (AdjOR) = 3.16; confidence interval (CI) = 1.06–9.29); Con-clusions: Knowledge regarding PrEP was well established, but PrEP use was not equally wide-spread. It is necessary to improve research on PrEP usage in order to PrEP access to be granted. © 2021 by the authors. Licensee MDPI, Basel, Switzerland. Article	2021	Vuylsteke Bea; Reyniers Thijs; Nöstlinger Christiana; Smekens Tom; Kenyon, Chris; Laga Marie	Can We Predict Incorrect PrEP Use in High HIV Risk Situations Among Men Who Have Sex With Men? An Analysis of Be-PrEP-ared, the Belgian PrEP Demonstration Study: JAIDS	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002741	https://www.proquest.com/scholarly-journals/can-we-predict-incorrect-prep-use-high-hiv-risk/docview/2669520323/se-2?accountid=8113	Background:Pre-exposure prophylaxis (PrEP) efficacy for HIV prevention is highly correlated with the degree of adherence. The objective of this analysis was to identify PrEP users who did not correctly take their dose in high HIV exposure situations and to explore potential predictors of this behavior.Methods:Study participants completed a personal Web-based diary during their entire follow-up, providing daily information on pill intake and sexual activity. They also completed a sociobehavioral questionnaire. The association between the number of unprotected high HIV exposure sex days (as a measure for suboptimal adherence) and potential predicting factors was examined using a logistic regression, followed by a negative binomial regression model. We also constructed a risk index score for predicting poor adherence.Results:A total of 40.8% of participants did not correctly use PrEP in at least one situation of high HIV exposure during follow-up. Not having a HIV-negative steady partner, reporting more than 10 occasional or more than 10 anonymous partners, using chemsex drugs, receiving money for sex, and a history of more than one sexually transmitted infection were significantly associated with unprotected high HIV exposure sex. The risk index score yielded a poor discriminative power (area under the curve 0.62 and 0.64).Conclusions:We observed a high proportion of suboptimal adherence. Even if none of the participants acquired HIV during the study, tailored adherence support is needed to specific men who have sex with men such as those taking chemsex drugs and those engaging in paid sex. Article	2021	Wahnich, Amanda; Gandhi, Anisha D; Cleghorn, Eve; Estacio, Katrina; Blackstock, Oni J; Myers, Julie E; Abraham, Bisrat; Edelstein, Zoe R	Public Health Detailing to Promote HIV Pre- and Postexposure Prophylaxis Among Women's Healthcare Providers in New York City.	American Journal of Preventive Medicine	-	-	-	1873-2607	10.1016/j.amepre.2021.05.032	https://dx.doi.org/10.1016/j.amepre.2021.05.032	INTRODUCTION: Equitable access to HIV pre- and postexposure prophylaxis for women is essential to ending the HIV epidemic. Providers' lack of knowledge and comfort in discussing and prescribing pre-exposure prophylaxis to women persist as barriers. METHODS: From May to November 2019, the New York City Health Department conducted its first public health detailing campaigns among women's healthcare providers to promote pre- and postexposure prophylaxis and the associated best practices. Over 2 campaigns (10 weeks each), trained Health Department representatives visited providers for 1-on-1 visits at select practices to promote key messages. Representatives distributed an Action Kit that addressed knowledge gaps and practice needs on providing pre-exposure prophylaxis and postexposure prophylaxis to cisgender and transgender women. Providers completed an assessment at the beginning of initial and follow-up visits, used to compare responses across visits. Statistically significant changes were evaluated by generalized linear models of bivariate outcomes, adjusted for nonindependence of providers at the same practice. RESULTS: Representatives visited 1,348 providers specializing in primary care (47%), women's health (30%), adolescent health (7%), infectious disease (4%), and other (12%) at 860 sites; 1,097 providers received initial and follow-up visits. Provider report of ever prescribing pre-exposure prophylaxis increased by 12% (n=119 providers); increases were reported in measures of taking sexual history, asking about partners' HIV status, providing postexposure prophylaxis, recognizing pre-exposure prophylaxis's effectiveness, and discussing and referring for pre-exposure prophylaxis. CONCLUSIONS: After public health detailing, women's healthcare providers report increased adoption of recommended practices that promote pre- and postexposure prophylaxis uptake and sexual wellness among women. Detailing may be adaptable to other regions and contexts to reach providers. Theses and Dissertations	2021	Wahome, E.W.	Acute HIV infection identification and PrEP eligibility, uptake and adherence among MSM followed in a HIV vaccine feasibility cohort study in coastal Kenya	-	-	University of Amsterdam	-	NA	NA	https://dare.uva.nl/personal/pure/en/publications/acute-hiv-infection-identification-and-prep-eligibility-uptake-and-adherence-among-msm-followed-in-a-hiv-vaccine-feasibility-cohort-study-in-coastal-kenya(9b11c96c-dcf8-4655-8e38-5c3fee1009c1).html	Identifying individuals who would benefit most from acute HIV infection screening and pre-exposure prophylaxis (PrEP) uptake is important for effective HIV prevention. This thesis combines a series of studies involving gay, bisexual, and other men who have sex with men (MSM) in Kenya – a group vulnerable to HIV infection. We highlight current gaps in PrEP eligibility, uptake, and adherence, in order to inform PrEP programming for MSM in Kenya. We also focus on acute HIV infection identification and hepatitis B infection screening among MSM in coastal Kenya to understand more about the incidence and prevalence of these two conditions. This thesis includes the development and validation of symptom screening tools for acute HIV infection testing among at-risk adults. Additionally, we evaluate the performance of an empiric risk score tool developed for assessing HIV acquisition risk among MSM, and discuss which sexual risk behaviours should be assessed among MSM to improve PrEP targeting. Furthermore, we summarize findings on PrEP uptake and factors associated with uptake, PrEP adherence, HIV incidence, and loss to follow-up. In a final study, we describe the frequency and determinants of stopping and re-starting PrEP. We discuss these research findings in the context of other sub-Saharan Africa studies involving MSM and suggest strategies for implementation. Finally, we highlight areas for new and ongoing research and HIV prevention programming to strengthen PrEP uptake and adherence among MSM, and offer suggestions how retention of MSM in HIV prevention services can be strengthened. Article	2021	Walsh-Buhi, Eric; Rebecca Fagen Houghton; Lange, Claire; Hockensmith, Ryli; Ferrand, John; Martinez, Lourdes	Pre-exposure Prophylaxis (PrEP) Information on Instagram: Content Analysis	JMIR Public Health and Surveillance	-	-	-	NA	10.2196/23876	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-information-on/docview/2556902620/se-2?accountid=8113	Background: There is still an HIV epidemic in the United States, which is a substantial issue for populations bearing a disproportionate burden of HIV infections. Daily oral pre-exposure prophylaxis (PrEP) has proven to be safe and effective in reducing HIV acquisition risk. However, studies document that PrEP awareness/usage is low. There is also limited understanding of social media platforms, such as Instagram, as PrEP information sources. Objective: Given the paucity of research on PrEP-related Instagram posts and popularity of this social media platform, the purpose of this research is to describe the source characteristics, image types, and textual contents of PrEP-related posts on Instagram. Methods: Using Crowdtangle Search, a public insights tool owned/operated by Facebook, we retrieved publicly accessible and English-language-only Instagram posts for the 12-month period preceding April 22, 2020, using the following terms: Truvada or "pre-exposure prophylaxis" or #truvada or #truvadaprep or #truvadawhore or #truvadaforprep. We employed a qualitative coding methodology to manually extract information from posts. Using a pretested codebook, we performed content analysis on 250 posts, examining message and source characteristics (ie, organization type eg, government, news and individual type eg, physician), including information about PrEP (eg, how it works, cost), and indicated users. Frequencies and percentages were calculated for all categorical variables. A Chi-square test was conducted to determine differences between source types on a variety of message characteristics. Results: Three-quarters of the posts (193/250, 77.2%) were posted by organizations. Of the 250 posts reviewed, approximately two-thirds (174/250, 69.6%) included a photograph, more than half (142/250, 56.8%) included an infographic, and approximately one-tenth (30/250, 12%) included a video. More than half defined PrEP (137/250, 54.8%), but fewer posts promoted PrEP use, explained how PrEP works, and included information on the effectiveness of PrEP or who can use it. The most commonly hashtagged populations among posts were men who have sex with men (MSM), but not necessarily bisexual men. Few posts contained race-/ethnicity-related hashtags (11/250, 4.4%). Fewer posts contained transgender-associated tags (eg, #transgirl; 5/250, 2%). No posts contained tags related to heterosexuals or injection drug users. We found statistical differences between source types (ie, individual versus organization). Specifically, posts from organizations more frequently contained information about who can use PrEP, whereas posts from individuals more frequently contained information describing adverse effects. Conclusions: This study is among the first to review Instagram for PrEP-related content, and it answers the National AIDS Strategy's call for a clearer articulation of the science surrounding HIV risk/prevention through better understanding of the current public information environment. This study offers a snapshot of how PrEP is being discussed (and by whom) on one of the most popular social media platforms and provides a foundation for developing and implementing PrEP promotion interventions on Instagram. Article	2021	Walters, Suzan M; Platt, Joey; Anakaraonye, Amarachi; Golub, Sarit A; Cunningham, Chinazo O; Norton, Brianna L; Sevelius, Jae M	Considerations for the Design of Pre-exposure Prophylaxis (PrEP) Interventions for Women: Lessons Learned from the Implementation of a Novel PrEP Intervention	AIDS and Behavior	-	-	-	1090-7165	https://doi.org/10.1007/s10461-021-03353-2	https://escholarship.org/uc/item/64g2t50x	Pre-exposure prophylaxis (PrEP) uptake among women in the United States has been low. To increase uptake, we developed a peer outreach and navigation PrEP intervention. Semi-structured qualitative interviews with 32 cisgender women and 3 transgender women were conducted to assess the intervention. We used a thematic approach to identify barriers to, and facilitators of the intervention. Facilitators included interest in PrEP, offer of health and social services, the intervention's women-focused approach, and peer outreach and navigation. Barriers were perceived HIV risk, concerns about medication side effects or interactions, housing insecurity and travel, co-occurring health-related conditions, and caregiving responsibilities. We recommend that future interventions consider packaging PrEP in local community settings, such as syringe exchange programs; include services such as food and housing assistance; use peers to recruit and educate women; integrate a culturally appropriate women's focus; and consider providing same-day PrEP. Mathematical modelling of the influence of serosorting on the population-level HIV transmission impact of pre-exposure prophylaxis	AIDS	-	-	-	2699370	10.1097/QAD.0000000000002826	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106069093&doi=10.1097%2fQAD.0000000000002826&partnerID=40&md5=cf3b4a551bf8ec7064e70acdfbc1a3e7	Objectives:HIV pre-exposure prophylaxis (PrEP) may change serosorting patterns. We examined the influence of serosorting on the population-level HIV transmission impact of PrEP, and how impact could change if PrEP users stopped serosorting.Design:We developed a compartmental HIV transmission model parameterized with bio-behavioural and HIV surveillance data among MSM in Canada.Methods:We separately fit the model with serosorting and without serosorting counterfactual; sero-proportionate mixing (random partner-selection proportional to availability by HIV status), and reproduced stable HIV epidemics with HIV-prevalence 10.3-24.8%, undiagnosed fraction 4.9-15.8% and treatment coverage 82.5-88.4%. We simulated PrEP-intervention reaching stable pre-specified coverage by year-one and compared absolute difference in relative HIV-incidence reduction 10 years post-intervention (PrEP-impact) between models with serosorting vs. sero-proportionate mixing; and counterfactual scenarios when PrEP users immediately stopped vs. continued serosorting. We examined sensitivity of results to PrEP-effectiveness (44-99%; reflecting varying dosing or adherence levels) and coverage (10-50%).Results:Models with serosorting predicted a larger PrEP-impact than models with sero-proportionate mixing under all PrEP-effectiveness and coverage assumptions median (interquartile range): 8.1% (5.5-11.6%). PrEP users' stopping serosorting reduced PrEP-impact compared with when PrEP users continued serosorting: reductions in PrEP-impact were minimal 2.1% (1.4-3.4%) under high PrEP-effectiveness (86-99%); however, could be considerable 10.9% (8.2-14.1%) under low PrEP effectiveness (44%) and high coverage (30-50%).Conclusion:Models assuming sero-proportionate mixing may underestimate population-level HIV-incidence reductions due to PrEP. PrEP-mediated changes in serosorting could lead to programmatically important reductions in PrEP-impact under low PrEP-effectiveness. Our findings suggest the need to monitor sexual mixing patterns to inform PrEP implementation and evaluation. © 2021 Lippincott Williams and Wilkins. All rights reserved. Article	2021	Wang, Zhen; Zhao, Bin; An, Minghui; Song, Wei; Dong, Xue; Li, Xin; Wang, Lu; Wang, Lin; Tian, Wen; Ding, Haibo; Han, Xiaoxu	Transmitted drug resistance to Tenofovir/Emtricitabine among persons with newly diagnosed HIV infection in Shenyang city, Northeast China from 2016 to 2018.	BMC Infectious Diseases	-	-	-	1471-2334	10.1186/s12879-021-06312-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8268309	BACKGROUND: To assess transmitted drug resistance (TDR) to tenofovir (TDF)/emtricitabine (FTC), using as pre-exposure prophylaxis, among newly diagnosed human immunodeficiency virus-1 (HIV-1)-infected residents in Shenyang city, northeast China. METHODS: Demographic and epidemiological information of all newly diagnosed HIV-1 infected residents in Shenyang city from 2016 to 2018 were anonymously collected from the local HIV epidemic database. HIV-1 pol sequences were reamplified from RNA in cryopreserved plasma samples and sequenced directly. Viral subtypes were inferred with phylogenetic analysis and drug resistance mutations (DRMs) were determined according to the Stanford HIVdb algorithm. Recent HIV infection was determined with HIV Limiting Antigen avidity electro immunoassay. RESULTS: A total of 2176 sequences (92.4%, 2176/2354) were obtained; 70.9% (1536/2167) were CRF01_AE, followed by CRF07_BC (18.0%, 391/2167), subtype B (4.7%, 102/2167), other subtypes (2.6%, 56/2167), and unique recombinant forms (3.8%, 82/2167). The prevalence of TDR was 4.9% (107/2167), among which, only 0.6% (13/2167) was resistance to TDF/FTC. Most of these subjects had CRF01_AE strains (76.9%, 10/13), were unmarried (76.9%, 10/13), infected through homosexual contact (92.3%, 12/13), and over 30 years old (median age: 33). The TDF/FTC DRMs included K65R (8/13), M184I/V (5/13), and Y115F (2/13). Recent HIV infection accounted for only 23.1% (3/13). Most cases were sporadic in the phylogenetic tree, except two CRF01_AE sequences with K65R (Bootstrap value: 99%). CONCLUSIONS: The prevalence of TDR to TDF/FTC is low among newly diagnosed HIV-infected cases in Shenyang, suggesting that TDR may have little impact on the protective effect of the ongoing CROPrEP project in Shenyang city. Article	2021	Wang, Zixin; Fang, Yuan; Yaemim, Natthakhet; Jonas, Kai J; Chidgey, Andrew; Ip, Mary; Cheng, Tommy; Lau, Joseph T F	Factors Predicting Uptake of Sexually Transmitted Infections Testing among Men Who Have Sex with Men Who Are "Pre-Exposure Prophylaxis Tourists"-An Observational Prospective Cohort Study.	International Journal of Environmental Research and Public Health	-	-	-	1660-4601	10.3390/ijerph18073582	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8036909	The term "Pre-exposure prophylaxis (PrEP) tourists" refers to individuals who obtain PrEP in other countries and use it in their home countries. A prospective observational cohort study was conducted among a group of men who have sex with men (MSM) who obtained PrEP in private clinics in Thailand and used it in Hong Kong. Participants completed two web-based self-administered surveys when obtaining PrEP in Thailand and three months afterwards. Out of 110 participants at baseline, 67 completed the follow-up. The prevalence of sexually transmitted infection (STI) testing was 47.8% during the follow-up period. Eleven participants received an STI diagnosis, and seven of them were incident infections in the past three months. Participants who perceived a higher chance for STI infection (adjusted odds ratios (AOR): 1.90, 95% CI: 1.00, 3.75) and reported higher intention to take up STI testing at baseline (AOR: 1.62, 95% CI: 1.05, 2.50) were more likely to receive STI testing during the follow-up period. Baseline perceptions that service providers would think they were having risky behaviors because of PrEP use was negatively associated with the dependent variable (AOR: 0.51, 95% CI: 0.31, 0.86). Service planning and health promotion related to STI testing is needed for MSM "PrEP tourists". Article	2021	Wanga V.; Peebles K.; Obiero A.; Felix M.; Omollo V.; Odoyo J.B.; Morton J.F.; Bukusi E.A.; Celum C.; Baeten J.M.; Barnabas R.V.	Cost of pre-exposure prophylaxis delivery in family planning clinics to prevent HIV acquisition among adolescent girls and young women in kisumu, Kenya	PLOS One	-	-	-	19326203	10.1371/journal.pone.0249625	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104438303&doi=10.1371%2fjournal.pone.0249625&partnerID=40&md5=10f5ed8daaf984a12e33717fd51b34d7	Introduction Oral pre-exposure prophylaxis (PrEP) is increasingly being implemented in sub-Saharan Africa. Adolescent girls and young women (AGYW) in Kenya contribute more than half of all new infections among young people aged 15-24 years, highlighting the need for evidence on the cost of PrEP in real-world implementation to inform the budget impact, cost-effectiveness, and financial sustainability of PrEP programs. Methods We estimated the cost of delivering PrEP to AGYW enrolled in a PrEP implementation study in two family planning clinics in Kisumu county, located in western Kenya. We derived total annual costs and the average cost per client-month of PrEP by input type (variable or fixed) and visit type (initiation or follow-up). We estimated all costs as implemented in the study, and under implementation by the Kenyan Ministry of Health (MoH), both at the program volume observed and if the facilities were delivering PrEP at full capacity (scaled-MoH). Results For the costing period between March 2018 and March 2019, 165 HIV-negative women contributed 1,128 (502 initiation and 626 follow-up) visits. The average cost per client-month of PrEP dispensed per study protocol and per the MoH scenario was $28.92 and $14.52, respectively. If the MoH scaled the program so that facilities could see PrEP clients at capacity, the average cost per client-month of PrEP was $10.88. Medication costs accounted for the largest proportion of the total annual costs (48% in MoH scenario and 65% in the scaled-MoH scenario). © 2021 Public Library of Science. All rights reserved. Article	2021	Ware K.B.; Ajonina M.U.	Awareness of and willingness to use HIV pre-exposure prophylaxis among community residents	Research in Social and Administrative Pharmacy	-	-	-	15517411	10.1016/j.sapharm.2021.02.012	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85101835773&doi=10.1016%2fj.sapharm.2021.02.012&partnerID=40&md5=0eade23326c33e4e6dbd86289500648b	Introduction: Human Immunodeficiency Virus (HIV) Pre-exposure prophylaxis (PrEP) helps to decrease HIV acquisition and transmission rates. The purpose of this study was to assess awareness of HIV PrEP and willingness to use it, if available, among individuals residing in Buea, Cameroon. Methods: Residents in different communities throughout Buea, Cameroon participated in the study through survey completion with their responses assessed by age, marital status, highest level of education completed, profession, and health area (urban or rural). Results: 421 participants completed the survey with the majority being 20–29 years of age, single, having secondary or tertiary education, residing in rural Cameroonian areas. Eighty percent of respondents had not previously heard of HIV PrEP. Ninety-five percent of the study sample expressed willingness to use HIV PrEP, if available. Participants ages 40 years old and above were less aware of HIV PrEP than those 39 years old and younger. Primary education, serving in the role of a nurse, doctor, or scientist, along with hospital affiliations were characteristics closely associated with HIV PrEP awareness. Participants younger than 20 years old were less likely to report willingness to use HIV PrEP whereas married participants found HIV PrEP to be a more favorable option. Conclusions: Awareness of HIV PrEP was minimal with healthcare personnel having more familiarity. Willingness to use HIV PrEP decreased by age but higher among married participants. Further promotion of HIV PrEP and facilitating its accessibility can lead to less transmissions of HIV worldwide. © 2021 Elsevier Inc. Article	2021	Washington T.A.; Brocato J.; Applewhite S.; Dyson Y.D.; Ramos A.	Alcohol and Condomless Insertive Anal Intercourse Among Black/Latino Sexual-Minority Male Non-PrEP Users	Urban Social Work	-	-	-	24748684	10.1891/USW-D-20-00001	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104929850&doi=10.1891%2fUSW-D-20-00001&partnerID=40&md5=7cdbcc7ddb84ed3b2622ce4d08824420	Objective: This study examined factors associated with alcohol use and condomlessinsertive anal sex among a sample of BLMSM (N = 188), self-identified as HIV- negative, ages 18–40. The influence of alcohol use on sexual positioning during condomless anal intercourse among Black and Latino men who have sex with men (BLMSM) warrants research attention because of the pervasive misinformation regarding the risk of HIV transmission and the disproportionate impact of the HIV epidemic for this population. Methods: Self-report survey questionnaires were administered in real time at bars/clubs; public organized events; local colleges/universities; social media advertisements; private men's groups; and organized events in Los Angeles County. Results: Logistic regression predicted those reporting risky sex when using alcohol were seven times more likely to report condomless insertive anal sex. Conclusion: Clear messaging about alcohol moderation, dispelling the myths about strategic positioning, and pre-exposure prophylaxis (PrEP) use among HIV negative BLMSM could potentially reduce HIV acquisition/transmission. © Copyright 2021 Springer Publishing Company, LLC.	alcohol use; Black and Latino MSM; HIV transmission; sexual risk; strategic positioning	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Weiss K.M.; Prasad P.; Sanchez T.; Goodreau S.M.; Jenness S.M.	Association between HIV PrEP indications and use in a national sexual network study of US men who have sex with men	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25826	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117631907&doi=10.1002%2fjia2.25826&partnerID=40&md5=6e62e8a62758c3976527e20c36fe611a	Introduction: HIV pre-exposure prophylaxis (PrEP) is effective in preventing HIV transmission. United States Public Health Service (USPHS) clinical practice guidelines define biobehavioral indications for initiation. To assess guideline implementation, it is critical to quantify PrEP nonusers who are indicated and PrEP users who are not indicated. We sought to estimate current PrEP use among US men who have sex with men (MSM), characterize whether their PrEP use aligned with their current indications for PrEP, and assess whether the association between PrEP indications and PrEP use differed by demography or geography. Methods: Using data from a US web-based sexual network study of MSM between 2017 and 2019, we measured PrEP usage and assessed whether respondents met indications for PrEP. Log-binomial regression was used to estimate the relationship between PrEP indications and PrEP use, with adjustment for geography, age and race/ethnicity. Results: Of 3508 sexually active, HIV-negative MSM, 34% met indications for PrEP. The proportion with current PrEP use was 32% among MSM meeting indications and 11% among those without indications. Nearly 40% of those currently using PrEP did not meet indications for PrEP, and 68% of MSM with indications for PrEP were not currently using PrEP. After adjusting for geography and demographics, MSM with PrEP indications were about three times as likely to be currently using PrEP. This association varied slightly, but not significantly, by geographic region, age and race/ethnicity. Conclusions: Indications for PrEP strongly predicted current PrEP use among US MSM. However, we identified substantial misalignment between indications and use in both directions (indicated MSM who were not benefitting from PrEP, and MSM taking PrEP while not presently being indicated). PrEP underuse by those at greatest risk for HIV acquisition may limit the projected impact of PrEP implementation, despite reported increases in PrEP provision. This calls for further implementation efforts to improve PrEP delivery to those most in need during periods of elevated sexual risk and to close the gap between indications and uptake. © 2021 The Authors. Article	2021	Weitzman P.F.; Zhou Y.; Kogelman L.; Rodarte S.; Vicente S.R.; Levkoff S.E.	MHealth for pre-exposure prophylaxis adherence by young adult men who have sex with men	mHealth	-	-	-	23069740	10.21037/mhealth-20-51	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112820298&doi=10.21037%2fmhealth-20-51&partnerID=40&md5=06e29d7112938fe1b1ced0ce893f5a7f	Background: Young adult men who have sex with men (YMSM) are at increased risk for HIV, especially minority YMSM. Pre-exposure prophylaxis (PrEP) is a breakthrough daily pill to prevent HIV. Consistent adherence is key to PrEP effectiveness, which is why the CDC recommends adherence support be provided to all PrEP patients. Mobile health can overcome barriers to the delivery of adherence support, particularly for YMSM who may be most in need of it due, at least in part, to their young age. Methods: We created a culturally- and developmentally-sensitive PrEP adherence mobile app (called "Dot") that was tailored for culturally-diverse young adult MSM. After formative research and usability testing, we conducted a 6-week pre-post study to evaluate the impact of Dot on self-reported PrEP adherence, PrEP treatment self-efficacy, PrEP knowledge, and intention to practice safe sex among culturally-diverse YMSM, age 20-29. Results: At 6 weeks, there were significant improvements in PrEP adherence, PrEP self-efficacy, and intention to practice safe sex. PrEP knowledge scores did not significantly change. Conclusions: The Dot app proved feasible and effective at improving PrEP adherence among culturally-diverse YMSM. Moreover, the app had a high-degree of user appeal, which is foundational to success of an mhealth intervention. © mHealth. All rights reserved. Theses and Dissertations	2021	Wen, Katherine	Essays on Infectious Disease and Substance Use Policies	-	-	Cornell University	-	NA	https://doi.org/10.7298/rv0m-zp70	http://hdl.handle.net/1813/110669	This dissertation studies the impact of public policies on health outcomes related to infectious disease and substance use. Chapter 1: Nursing home residents face both a high risk of influenza and influenza-related mortality. Influenza vaccinations can reduce these risks, but take-up remains suboptimal, in part because people may ignore the spillover benefit of positive externalities of vaccination on disease transmission. One approach that states have taken is to mandate influenza vaccination for nursing home residents and/or healthcare workers. This paper estimates the effect of such state policies on vaccination take-up and influenza-related diagnoses and deaths. I find that resident influenza vaccination requirements increase the probability of vaccination take-up by about 6% and decrease the probability of having an influenza-like illness diagnosis by roughly 20%. Chapter 2: State policies to optimize prescriber use of Prescription Drug Monitoring Programs (PDMPs) have proliferated in recent years. Prominent policies include comprehensive mandates for prescriber use of PDMP, laws allowing delegation of PDMP access to office staff, and interstate PDMP data sharing. This study assesses the effects of three PDMP policies on adverse opioid-related hospital events among patients with prescription opioid use. Comprehensive use mandates were associated with a relative reduction in the probability of opioid-related hospital events by 28% among patients with any opioid and 21% among patients with long-term opioid use. Delegate laws and interstate data sharing were associated with limited change in the outcome. Chapter 3: This chapter investigates the effects of Affordable Care Act facilitated Medicaid expansions on the use of pre-exposure prophylaxis (PrEP) and medications used to treat Human Immunodeficiency Virus (HIV). We exploit state-level variations in expansion status to estimate difference-in-difference models. We find a roughly 31% increase in the utilization of PrEP and a 19% increase in the utilization of therapeutic HIV medications within the Medicaid population. We do not find statistically significant evidence that the increased utilization of PrEP following these public insurance expansions had any effect on new HIV diagnoses. We also do not find evidence that the increase in utilization of therapeutic HIV medications was associated with a reduction in HIV deaths. Article	2021	Were D.K.; Musau A.; Atkins K.; Shrestha P.; Reed J.; Curran K.; Mohan D.	Health system adaptations and considerations to facilitate optimal oral pre-exposure prophylaxis scale-up in sub-Saharan Africa	The Lancet HIV	-	-	-	23523018	10.1016/S2352-3018(21)00129-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111508866&doi=10.1016%2fS2352-3018%2821%2900129-6&partnerID=40&md5=cff9bd7c459a3fa584f005bfd6be656	Following WHO's 2015 recommendation, countries in sub-Saharan Africa have progressively scaled up oral pre-exposure prophylaxis (PrEP) as part of combination HIV prevention. PrEP has potential to significantly reduce new HIV infections in sub-Saharan Africa if it is widely available, accessible, and effectively used. Initial scale-up efforts have generated progress, drawing lessons from existing HIV interventions, such as antiretroviral therapy and biomedical prevention. However, beset by unprepared health systems, scale-up has been slow, resulting in suboptimal coverage among priority groups at higher risk of HIV acquisition. Using the WHO health system building blocks framework, this Review synthesises literature on essential considerations for PrEP scale-up in sub-Saharan Africa, highlighting the importance of health system adaptability and responsiveness. © 2021 Elsevier Ltd	NA	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Were, Daniel; Musau, Abednego; Mugambi, Mary; Plotkin, Marya; Kabue, Mark; Manguro, Griffins; Forsythe, Steven; Glabius, Robert; Mutisya, Eunice; Dotson, Manya; Curran, Kelly; Reed, Jason	An implementation model for scaling up oral pre-exposure prophylaxis in Kenya: Jilinde project.	Gates Open Research	-	-	-	2572-4754	10.12688/gatesopenres.13342.1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8669463	Oral pre-exposure prophylaxis (PrEP) is an efficacious way to lower the risk of HIV acquisition among high-risk individuals. Despite the World Health Organization's 2015 recommendation that all persons at substantial risk of HIV infection be provided with access to oral PrEP, the rollout has been slow in many low- and middle-income countries. Initiatives for national rollout are few, and subtle skepticism persists in several countries about the feasibility of national PrEP implementation. We describe the conceptual design of the Jilinde project, which is implementing oral PrEP as a routine service at a public health scale in Kenya. We describe the overlapping domains of supply, demand, and government and community ownership, which combine to produce a learning laboratory environment to explore the scale-up of PrEP. We describe how Jilinde approaches PrEP uptake and continuation by applying supply and demand principles and ensures that government and community ownership informs policy, coordination, and sustainability. We describe the "learning laboratory" approach that informs strategic and continuous learning, which allows for adjustments to the project. Jilinde's conceptual model illustrates how the coalescence of these concepts can promote scale-up of PrEP in real-world conditions and offers critical lessons on an implementation model for scaling up oral PrEP in low- and middle-income countries. Article	2021	Whiteley L.; Craker L.; Sun S.; Tarantino N.; Hershkowitz D.; Moskowitz J.; Arnold T.; Haubrick K.; Olsen E.; Mena L.; Brown L.K.	Factors associated with PrEP adherence among MSM living in Jackson, Mississippi	Journal of HIV/AIDS & Social Services	-	-	-	15381501	10.1080/15381501.2021.1956666	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112653633&doi=10.1080%2f15381501.2021.1956666&partnerID=40&md5=f11939cfda4ee62ab568f5294e98c919	Understanding the determinants of pre-exposure prophylaxis (PrEP) adherence is integral to reducing HIV incidence in the United States, especially for those at highest risk. To this end, the present study explored demographic, psychosocial, and behavioral factors related to adherence among 43 Southern, predominately Black, men who have sex with men (MSM). During the study months, 46% of the sample reported being nonadherent to PrEP. Those with more sexual partners (p =.05), greater self-efficacy for taking PrEP (p =.03), and those who felt condoms were less important (p =.02), were more likely to be adherent to PrEP at six-month follow-up. Further interventions that consider perceived sexual risk, condom use, and adherence self-efficacy are needed to improve PrEP adherence among Southern MSM. © 2021 Taylor & Francis Group, LLC. Article	2021	Whiteman Ari; Wejnert Cyprian; Morris, Elana; Burnett, Janet	Using Search Engine Data to Explore Interest in PrEP and HIV Testing in the United States	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03057-z	https://www.proquest.com/scholarly-journals/using-search-engine-data-explore-interest-prep/docview/2489907056/se-2?accountid=8113	We used Google search data from January 1, 2014 to January 1, 2019 to explore public awareness of pre-exposure prophylaxis (PrEP) and HIV testing in the United States. Using two search strings, one for PrEP and one for HIV testing, we compared search volume to state HIV prevalence and new HIV diagnoses. We also used Google News to identify news events related to short-term spikes in search volume. Controlling for poverty, education, and internet access, a one-unit increase in a state's HIV prevalence rate was associated with a 3% increase in PrEP search volume (aPR = 1.03 1.034, 1.037, P < 0.0001) and HIV testing search volume (aPR = 1.03 1.030, 1.032, P < 0.0001). Short-term search volume spikes also coincided with celebrity news and pharmaceutical company advertising. We demonstrate that search engine data can be a powerful tool for understanding HIV knowledge-seeking and can provide key insight to the events that drive public interest about HIV online. Article	2021	Whiteside-Mansell, Leanne; Sockwell LaTunja; Knight, Daniel; Crone, Cynthia	Community Legal Systems: Targeting PrEP and HIV Education to Decrease Risk of HIV Transmission	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03219-7	https://www.proquest.com/scholarly-journals/community-legal-systems-targeting-prep-hiv/docview/2544323157/se-2?accountid=8113	The southern U.S. has both high HIV and incarceration rates in comparison to its population. As in the rest of the country, HIV prevention is based on education, behavior change, and biomedical efforts, such as pre-exposure prophylaxis (PrEP). This study examined the implementation of an educational intervention and supportive services to obtain PrEP in a population of individuals (N = 218) involved in an Adult Drug Court (ADC) or on probation or parole (P-P). Nearly all ADC and P-P participants self-reported risk behaviors linked to HIV acquisition. Results supported the acceptance and usefulness of the intervention as rated by participants. Participants showed increased knowledge of HIV risks and testing post-education. In multivariate analysis, predictors of interest in using PrEP included low stigma beliefs, specifically their level of prejudice views, high depressive symptoms, and white race. The intervention shows promise. Given the high risk documented for ADC and P-P individuals, HIV prevention is a critical component for increased protective behaviors. Article	2021	Whitfield, Darren L; Beauchamp, Geetha; Fields, Sheldon; Nelson, LaRon; Magnus, Manya; Dācus, Jagadīśa-devaśrī; Paul, Jonathan; Anderson, Peter; Wheeler, Darrell	Risk compensation in HIV PrEP adherence among Black men who have sex with men in HPTN 073 study	AIDS Care	-	-	-	09540121	10.1080/09540121.2020.1810618	https://www.proquest.com/scholarly-journals/risk-compensation-hiv-prep-adherence-among-black/docview/2516085189/se-2?accountid=8113	While HIV infections among men who have sex with men (MSM) have started to decline in the United States, Black MSM continue to experience disproportionate rates of HIV infection. The purpose of this secondary analysis is to examine risk perception and its influence on PrEP adherence among Black MSM from HPTN 073. Risk perception was measured using the adapted Perceived Vulnerability to HIV Scale. The associations between risk perception and PrEP adherence were tested using generalized estimation equation model for time-variant repeated measures. Risk perception was not significantly associated with PrEP adherence. These findings suggest that there was no risk compensation among PrEP users, and inconsistency in perceived risk for HIV. Future studies should investigate the rationale for long term adherence to PrEP among Black MSM. Article	2021	Willcox A.C.; Richardson B.A.; Shafi J.; Kabare E.; Kinuthia J.; Jaoko W.; Mandaliya K.; Overbaugh J.; McClelland R.S.	Derivation of an HIV Risk Score for African Women Who Engage in Sex Work	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03235-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85104876143&doi=10.1007%2fs10461-021-03235-7&partnerID=40&md5=ff7edb8dc681d6518fed96fcb9272075	No tool exists to stratify HIV risk in contemporary African female sex worker (FSW) populations. Data from a cohort of HIV-negative FSWs in Mombasa, Kenya from 2010 to 2017 were used to conduct a survival analysis assessing predictors of HIV infection. Stepwise regression was used to construct a multivariable model that formed the basis for the score. Seventeen HIV infections occurred over 1247 person-years of follow-up contributed by 670 women. Using depot medroxyprogesterone acetate (DMPA), having a curable sexually transmitted infection (STI), and being married contributed points to the score. HIV incidence was 0.85/100 person-years in a lower-risk group and 3.10/100 person-years in a higher-risk group. In a cohort with overall HIV incidence < 1.50/100 person-years, this risk score identified a subgroup of FSWs with HIV incidence > 3.00/100 person-years, which is the threshold used by the World Health Organization for initiating pre-exposure prophylaxis (PrEP). If validated in an external population, this tool could be useful for targeted PrEP promotion among higher-risk FSWs. © 2021, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Willie, Tiara C; Kershaw, Trace S; Blackstock, Oni; Galvao, Rachel W; Safon, Cara B; Tekeste, Mehrit; Ogburn, Damon F; Wilbourn, Brittany; Modrakovic, Djordje; Taggart, Tamara; Kaplan, Clair; Caldwell, Abigail; Calabrese, Sarah K	Racial and ethnic differences in women's HIV risk and attitudes towards pre-exposure prophylaxis (PrEP) in the context of the substance use, violence, and depression syndemic.	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2020.1762067	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7666028	Women with syndemic conditions, i.e., two or more co-occurring epidemics, are at elevated risk for HIV acquisition and are therefore prime candidates for pre-exposure prophylaxis (PrEP). However, PrEP uptake remains low among women, especially among Black and Hispanic women. This study examined associations of syndemic conditions with PrEP attitudes and HIV risk among women, and the moderating effect of race and ethnicity. In 2017, 271 non-Hispanic Black, non-Hispanic White, and Hispanic, PrEP-eligible women engaged in care at Planned Parenthood in the northeastern region of the U.S. completed an online survey. Participants reported syndemic conditions (i.e., intimate partner violence, depression, substance use), PrEP attitudes (e.g., PrEP interest), HIV sexual risk (e.g., multiple male sexual partners), and sociodemographics. Structural equation modeling was used to examine the effects of syndemic conditions on PrEP attitudes and HIV risk, and the moderating effect of race and ethnicity. Women with more syndemic conditions had a higher odds of reporting multiple male sexual partners. Syndemic conditions were positively associated with PrEP attitudes for Hispanic women than non-Hispanic Black and White women. Women with syndemic conditions, particularly Hispanic women, may be receptive to interventions promoting PrEP. Article	2021	Willie, Tiara C; Monger, Mauda; Nunn, Amy; Kershaw, Trace; Stockman, Jamila K; Mayer, Kenneth H; Chan, Philip A; Adimora, Adaora A; Mena, Leandro A; Knight, Deja; Philllips, Karlye A; Baral, Stefan D	"PrEP's just to secure you like insurance": a qualitative study on HIV pre-exposure prophylaxis (PrEP) adherence and retention among black cisgender women in Mississippi.	BMC Infectious Diseases	-	-	-	1471-2334	10.1186/s12879-021-06786-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8549215	BACKGROUND: Pre-exposure prophylaxis (PrEP) has the potential to reduce transmission of HIV among Black cisgender women in the Southern United States (U.S.); however, national data suggests that PrEP initiation is lowest in the South and among Black women compared to other U.S. regions and white women. This study applied intersectionality and PrEP multilevel resilience frameworks to assess how socio-structural and clinical contexts shaped PrEP persistence among Black cisgender women in Mississippi. METHODS: Semi-structured interviews were conducted with eight Black cisgender women in Jackson, Mississippi. This sample was purposively recruited to include PrEP-initiated Black cisgender women. RESULTS: Six themes identified that shaped PrEP care among Black cisgender women: (1) internal assets, (2) sole responsibility to HIV prevention, (3) added protection in HIV serodifferent relationships, (4) financial issues, (5) trust and distrust in the medical system, and (6) side effects. Black cisgender women reported that PrEP persistence increased control over their sexual health, reduced anxiety about HIV, and promoted self-care. Black cisgender women also indicated that medication assistance programs increased PrEP affordability resulting in continued persistence. CONCLUSIONS: In addition to preventing HIV, PrEP may yield secondary positive impacts on the health and relationships of Black cisgender women. However, very few Black cisgender women in the South are using PrEP given intersectional barriers and thus necessitates adaptive strategies to support PrEP initiation and persistence. Efforts aimed at increasing the coverage of PrEP among Black cisgender women should consider implementation strategies responsive to lived realities of Black women. Article	2021	Wilson E.C.; Jalil E.M.; Jalil C.M.; Castro C.R.V.; Ferreira A.L.N.; Martinez N.F.; Moura I.; Oliveira C.; Bezerra D.; Netto E.C.; Monteiro L.; Veloso V.G.; Grinsztejn B.	Results from a peer-based digital systems navigation intervention to increase HIV prevention and care behaviors of young trans women in Rio de Janeiro, Brazil	Journal of Global Health Reports	-	-	-	23991623	10.29392/001c.28347	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134511508&doi=10.29392%2f001c.28347&partnerID=40&md5=0c079ac81f62993c48579ec162e7ee59	Background This study aimed to determine the efficacy of an evidence-based peer and mHealth delivered systems navigation intervention for increasing human immunodeficiency virus (HIV) testing, pre-exposure prophylaxis (PrEP) and HIV care behaviors among young trans women. Methods The "Brilhar e Transcender" (BeT) pilot study was conducted between 19 September 2019 and 26 November 2020 in a trans-affirming public health clinic in Rio de Janeiro, Brazil. Participants were recruited using convenience sampling through outreach and referral. Twenty-seven were screened for inclusion and 18 participants completed the study and were included in this analysis. Participants were recruited through community outreach. All participants identified as trans women, were aged 18-24 years old, lived in Rio de Janeiro, Brazil, and were not on PrEP or not engaged in HIV care. Over the course of three months, participants developed a systems navigation plan and were engaged in three peer-navigator sessions, asynchronous digital interactions in between sessions, and received automated information they could use to address services access barriers. We measured HIV testing, PrEP use and HIV care outcomes. HIV care engagement included linkage to care, visit attendance, antiretroviral therapy use, and/or undetectable viral load for those living with HIV. Results All young trans women without HIV (n=13) were regularly tested for HIV and engaged in PrEP by the end of the intervention. All participants living with HIV (n=5) were engaged in HIV care, but one participant had a detectable viral load post intervention. Conclusions The BeT intervention demonstrated preliminary efficacy for improving HIV prevention and care behaviors among young trans women in a low- and middle-income country (LMIC) setting. A trial is planned for implementation to establish efficacy with a large sample of young trans women and a comparator group. © 2021, International Society of Global Health. All rights reserved. Article	2021	Wilson E.C.; Jalil E.M.; Moreira R.I.; Velasque L.; Castro C.V.; Monteiro L.; Veloso V.G.; Grinsztejn B.	High risk and low HIV prevention behaviours in a new generation of young trans women in Brazil	AIDS Care	-	-	-	9540121	10.1080/09540121.2020.1844859	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85096099828&doi=10.1080%2f09540121.2020.1844859&partnerID=40&md5=db9405fcc38b79a8c5305031dcc7d726	Adult trans women in Brazil are highly impacted by HIV, but little is known about risk for young trans women. Our study was conducted to compare the HIV prevalence and correlates of risk for young trans women ages 18–24 years old to adult trans women in Brazil. Trans women were recruited from Rio de Janeiro and Baixada (the metropolitan area of Rio de Janeiro), Brazil (N = 345). Youth ages 18–24 years of age had significantly greater odds of being HIV negative than adults (OR 0.4, 95% CI 0.2–0.6, p = 0.0002), but significantly lower odds of having post-exposure prophylaxis (PEP) knowledge (OR 0.5, 95% CI:0.3–0.9, p = 0.02) and PrEP awareness (OR 0.5, 95% CI: 0.3–0.8, p = 0.01). Young trans women also had significantly higher odds of using substances (OR 1.8, 95% CI 1.1–2.9, p = 0.02) and condomless anal intercourse with their last three sexual partners (OR 1.8, 95% CI: 1.1–3.0, p = 0.03) compared to adults. Already by age 24, one in four trans women in Brazil were infected with HIV pointing to a new generation at high risk of acquiring HIV. HIV prevention interventions are needed to change the healthcare system to reach and engage young trans women. © 2020 Informa UK Limited, trading as Taylor & Francis Group. Expanding the Pie-Differentiated PrEP Delivery Models to Improve PrEP Uptake in the San Francisco Bay Area	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002809	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125834123&doi=10.1097%2fQAI.0000000000002809&partnerID=40&md5=ccd9e0e3b2922a29ef564b804e3a8979	Background:Pre-exposure prophylaxis (PrEP) uptake among trans people to date has been low. Recommendations implemented in San Francisco to offer PrEP with feminizing hormones have not led to improvement of PrEP uptake in trans communities. New delivery models may be needed. The aim of this study was to examine whether a PrEP-only clinic was more likely to serve trans people at highest risk of HIV than trans-affirming primary care clinics.Methods:Participants were recruited between 2017 and 2019 as part of a PrEP demonstration project in the San Francisco Bay Area. Survey data including sociodemographics, HIV-related risk behavior, barriers to PrEP, and self-reported PrEP adherence were collected at baseline, 3 months, and 6 months for all participants. Bivariable Poisson regression models were used to examine differences between participants in the primary care clinics and PrEP-only clinic delivered to participants.Results:Baseline survey data were collected from 153 participants. Those with a higher number of sexual partners were significantly more likely to use the PrEP-only clinic rather than the primary care clinics. Participants with higher perceived HIV risk and those who engaged in sex work were also more likely to use the PrEP-only clinic compared with the primary care clinic. Medical mistrust was higher at baseline among participants of the PrEP-only clinic. PrEP adherence was not significantly different by delivery model. Few participants identified PrEP barriers, such as interactions with feminizing hormones, to be determinants of PrEP uptake.Conclusions:A PrEP-only delivery model could improve PrEP uptake and may better meet the needs of trans people who could most benefit from PrEP. Article	2021	Wilson E.K.; Wagner L.D.; Palanee-Phillips T.; Roberts S.T.; Tolley E.E.; Mathebula F.; Pascoe L.; Lanham M.; Wilcher R.; Montgomery E.T.	Acceptability and feasibility of the CHARISMA counseling intervention to support women's use of pre-exposure prophylaxis: results of a pilot study	BMC Women's Health	-	-	-	14726874	10.1186/s12905-021-01262-z	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103500090&doi=10.1186%2fs12905-021-01262-z&partnerID=40&md5=d04d39d9f2b6ac39e7425224ea0c8a35	Background: Women may need or seek male partner approval to safely and consistently use oral antiretroviral pre-exposure prophylaxis (PrEP) or vaginal microbicides. We developed CHARISMA, a counseling intervention to support women's relationships and their ability to consistently use HIV prevention products. Methods: In a pilot study with 95 female participants in Johannesburg, South Africa, lay counselors implemented CHARISMA, assessing participants' relationship(s) with their male partner(s) and barriers or facilitators to HIV prevention method use, and then providing tailored, interactive counseling. We conducted study participant surveys and clinic staff interviews to evaluate CHARISMA's feasibility and acceptability. Results: The CHARISMA pilot study indicates that a two-session relationship counseling intervention with 6-month follow-up to support women's ability to safely and effectively use vaginal microbicides was generally acceptable and feasible. Most participants thought CHARISMA was relevant, helpful, and about the right length, and that it had a positive impact on their relationships with their partners and their product use. Staff estimated that the intervention took 1.5–2 h to implement at enrollment and 45 min to an hour for the month 1 visit. They thought that overall CHARISMA was generally feasible to implement. Conclusions: Findings from this study suggest several lessons learned that may be relevant to others developing interventions supporting women's use of oral PrEP or vaginal microbicides. The use of lay counselors instead of nurses to deliver counseling appeared to be successful, but the counselors experienced significant stress from hearing about participants' traumatic experiences and required emotional support to avoid burnout. Although staff and participants felt that having multiple intervention sessions over time was valuable, a similar level of intensity may not be feasible in other settings. Further research is needed to determine an intervention delivery mode and follow-up period that optimally balances participant needs and clinic resources. Male engagement was a challenge, as it has been in previous studies of vaginal microbicides. Alternative strategies to reach men that do not require them to come to the clinic or rely on their female partners may be more effective. © 2021, The Author(s). Article	2021	Wisutep P.; Sirijatuphat R.; Navanukroh O.; Phatharodom P.; Werarak P.; Rattanasuwan W.	Attitudes towards, knowledge about, and confidence to prescribe antiretroviral pre-exposure prophylaxis among healthcare providers in Thailand	Medicine (United States)	-	-	-	257974	10.1097/MD.0000000000028120	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121907049&doi=10.1097%2fMD.0000000000028120&partnerID=40&md5=40d6e297a3f29b0785b4408bddfc920f	HIV pre-exposure prophylaxis (HIV-PrEP) is an effective method for preventing HIV transmission, and it is recommended in several international guidelines. Perceptions and knowledge about HIV-PrEP prescription among healthcare providers have not been investigated in Thailand where HIV-PrEP is a novel healthcare topic. The objective of study was to determine healthcare providers' attitudes towards, knowledge about, and confidence to prescribe HIV-PrEP in Thailand.A questionnaire was administered to Thai healthcare providers during May 1, 2017 to September 5, 2018.Of the 500 questionnaires that were distributed, 460 were returned (92%). Respondents included 336 physicians (48 infectious disease ID physicians, 288 non-ID physicians) and 124 non-physicians (70 nurses, 35 pharmacists, and 19 others). Eighty one percent of respondents had a positive attitude towards HIV-PrEP. Multivariate analysis revealed being a non-ID physician, having prior knowledge about HIV-PrEP, believing that HIV-PrEP can reduce the number of new patients, and believing that HIV-PrEP is not associated with a higher incidence of other sexually transmitted infections were all factors significantly associated with having a positive attitude towards HIV-PrEP. The issue of most concern to respondents who had a negative attitude toward HIV-PrEP was poor patient adherence to antiviral medications. Only 57% of respondents had confidence to prescribe HIV-PrEP. Factors associated with confidence to prescribe HIV-PrEP included being an ID physician, believing that HIV-PrEP can reduce the number of new patients, believing in the safety of antiviral medications, and believing that HIV-PrEP is not associated with increased development of HIV drug resistance. The results of HIV-PrEP knowledge testing (8 questions) were categorized into good score (≥7/8) and fair score (≤6/8). Fifty five percent of participants had a good score result. Using multivariate analysis, the factors associated with a good score result were ID physician, having HIV-PrEP prescription experience, and believing that HIV-PrEP can reduce the number of new patients.Most Thai healthcare providers (81%) reported having a positive attitude towards HIV-PrEP. Successful HIV-PrEP implementation in Thailand will require steps to mitigate the described barriers, and training for healthcare providers, which will strengthen knowledge and improve both experience with and confidence to prescribe HIV-PrEP. © 2021 Lippincott Williams and Wilkins. Article	2021	Wongsomboon V.; Sietins E.; Webster G.D.	Attractiveness, profile-picture face visibility and unprotected receptive anal intercourse in young men who have sex with men using online dating applications	Sexual Health	-	-	-	14485028	10.1071/SH20190	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106603382&doi=10.1071%2fSH20190&partnerID=40&md5=fd91300244458d85dae65e8c2dad89a6	Abstract: Background: We examined links among face visibility on dating-profile pictures, self-perceived attractiveness, condom use self-efficacy, and unprotected receptive anal intercourse (URAI) in 223 young men who have sex with men (YMSM; ages 18-24 years) using online dating applications (e.g. Grindr). Methods: Participants reported their face visibility on their main dating-profile picture, attractiveness, condom use self-efficacy, and frequency of URAI in the past 3 months. Number of casual sex partners and pre-exposure prophylaxis (PrEP) use were statistically controlled in all analyses. Results: Using a mediated moderation model, we found that a significant attractiveness-by-face-visibility interaction for URAI was fully mediated by condom use self-efficacy. Specifically, lower face visibility on profile pictures related to lower condom use self-efficacy, which in turn related to higher URAI, but only among highly attractive YMSM. Conclusions: Our findings suggest that attractive YMSM who show less-visible faces on their dating profiles could be at particularly high risk for sexually transmissible infections. This study has potentially important clinical implications because dating applications have become one of the most common ways for YMSM to find sexual partners. © 2021 Journal compilation	attractiveness; condom; face visibility; men who have sex with men; online dating application; sexually transmissible infections; unprotected sex; young adults	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2021	Wood, Sarah M; Morales, Knashawn H; Metzger, David; Davis, Annet; Fiore, Danielle; Petsis, Danielle; Barnett, Kezia; Koenig, Helen C; Dowshen, Nadia; Gross, Robert; Frank, Ian	Mental Health, Social Influences, and HIV Pre-exposure Prophylaxis (PrEP) Utilization Among Men and Transgender Individuals Screening for HIV Prevention Trials	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-03004-y	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85089968584&doi=10.1007%2fs10461-020-03004-y&partnerID=40&md5=93704880d195f1b7b04f2e6cf4c7a684	The effects of mental health comorbidities and social support on the HIV pre-exposure prophylaxis (PrEP) care continuum are unknown. We conducted a cross-sectional study of men and transgender individuals, ≥ 18 years-old, with ≥ 2 male or transgender partners, or recent condomless anal intercourse. Surveys assessed demographics, mental health treatment, depressive symptomatology, social support, and PrEP-related social contacts. Logistic regression assessed associations between these factors and PrEP uptake and persistence. Participants (n = 247) were 89% cis-male and 46% African-American. Median age was 27 (IQR:23–33). Thirty-seven percent had ever used PrEP, of whom 18% discontinued use. High depressive symptomology was identified in 11% and 9% were receiving mental health treatment. There were no significant associations between depressive symptoms or mental health treatment on the odds of PrEP uptake or discontinuation. Each additional PrEP contact conferred a greater odds of uptake (aOR:1.24, 95% CI: 1.09–1.42). Network-level targets may produce fruitful interventions to increase PrEP uptake. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Woodward, Shannon C; Elvy, Ingrid H; Martin, Sarah J	PrEP your team! Clinician initiation of HIV pre-exposure prophylaxis discussion at sexually transmissible infection testing and diagnosis in gay and bisexual men	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624211014406	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105925799&doi=10.1177%2f09564624211014406&partnerID=40&md5=16360acfbe0a2e72d9d9fa43c7b21876	HIV pre-exposure prophylaxis (PrEP) is recommended for gay and bisexual men (GBM) with recent diagnosis of rectal chlamydia (CT), rectal gonorrhoea (NG) or infectious syphilis. A retrospective medical record audit was undertaken at Canberra Sexual Health Centre (CSHC) of all GBM who met this criterion in 2019 and were thus determined to be at higher risk of acquisition of human immunodeficiency virus (HIV). Pre-exposure prophylaxis was discussed and/or commenced in 85% of GBM at higher risk of HIV. Audit results and education were provided to the team with a post-interventional audit in 2020 showing significant improvement. This audit is easily replicated and may be applicable to other settings engaged in GBM care. © The Author(s) 2021. Article	2021	Wray, Tyler B; Chan, Philip A; Kahler, Christopher W	Game Plan, a Web-Based Intervention to Improve Adherence and Persistence to HIV Pre-exposure Prophylaxis and Reduce Heavy Drinking in Gay, Bisexual, and Other Men Who Have Sex With Men: Usability and User Experience Testing.	JMIR Formative Research	-	-	-	2561-326X	10.2196/31843	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8663613	BACKGROUND: Encouraging consistent use of pre-exposure prophylaxis (PrEP) is essential for reducing HIV incidence, particularly among gay, bisexual, and other men who have sex with men (GBM), and especially those who engage in heavy drinking. Although practice guidelines recommend providing adherence counseling to PrEP patients, clinics and providers may not have the resources or expertise to provide it. Internet-facilitated interventions have been shown to improve HIV prevention outcomes, including medication and care adherence. Game Plan is a website we created to help users make a tangible plan for reducing their HIV risk. We designed additional components of Game Plan to address key individual level barriers to PrEP use. OBJECTIVE: The aim of this mixed methods research is to test the usability and user experience of these components with intended users: GBM who drink heavily and are on PrEP. METHODS: In study 1 (usability), we completed a detailed individual interview in which participants (n=10) walked through a prototype of the website, thinking aloud as they did, and completed a follow-up interview and web-based survey afterward. Study 2 (user experience) involved providing participants (n=40) with a link to the prototype website to explore on their own and asked them to complete the same follow-up survey afterward. Qualitative data were analyzed using thematic analysis, and descriptive statistics were used to analyze quantitative data. RESULTS: Users in both studies gave the website excellent ratings for usability, overall satisfaction, and quality, and most often described the site as informative, helpful, and supportive. Users also rated the site's content and feel as respectful of them and their autonomy, empathetic, and they stated that it conveyed confidence in their ability to change. The study 1 interviews highlighted the importance of the website's esthetics to the participants' engagement with it and its credibility in prompting genuine reflection. CONCLUSIONS: GBM who reported heavy drinking and used PrEP generally found a website focused on helping them to create a plan to use PrEP consistently to be helpful. Adopting user-centered design methods and attending to the esthetics of mobile health interventions are important steps toward encouraging engagement and reducing at-risk behaviors.	pre-exposure prophylaxis, HIV, HIV prevention, mHealth, mobile health, eHealth, mobile phone	English	Canada	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2021	Wu H.; Yu Q.; Ma L.; Zhang L.; Chen Y.; Guo P.; Xu P.	Health economics modeling of antiretroviral interventions amongst HIV serodiscordant couples	Scientific Reports	-	-	-	20452322	10.1038/s41598-021-93443-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85109404458&doi=10.1038%2fs41598-021-93443-x&partnerID=40&md5=b02804be9268f0c89a770d8831379bf1	Antiretroviral treatment (ART) and pre-exposure prophylaxis (PrEP) for HIV-serodiscordant couples, effectively reduce mortality, transmission events and influence quality of life at the expense of increased costs. We aimed to evaluate health economics of antiretroviral-based strategies for HIV-serodiscordant couples in the China context. A deterministic model of HIV evolution and transmission within a cohort of serodiscordant couples was parameterized using the real-world database of Zhoukou city and published literature. We evaluated the mid-ART (a historical strategy, initiating ART with CD4 < 500 cells/mm3), early-ART (the current strategy, offering ART regardless of CD4 cell counts) and a hypothetical strategy (early-ART combined short-term daily PrEP) versus the late-ART (the baseline strategy, initiating ART with CD4 < 350 cells/mm3) offered by 2008 national guidelines. We estimated the incremental cost-effectiveness ratios (ICER) and incremental cost-utility ratios (ICUR) from a societal perspective, derived by clinical benefits and HIV-caused life quality respectively, and portrayed their changes over a 0–30 year's timeframe. The model projections indicated that the antiretroviral-based interventions were more likely to obtain clinical benefits but difficult to improve quality of life, and cumulative ICER and ICUR were generally decreasing without achieving cost-saving. Scale-up access to ART for the HIV-positive among serodiscordant couples was easily fallen within the range of paying for incremental life-years and quality adjusted life years by the societal willingness. The hypothetical strategy had the potential to prevent most seroconversion events within marriages but required enormous upfront costs, thus it took a long time to reach established thresholds. The current strategy of early-ART is the most cost-effective. Clarifying the obstacles of high cost of PrEP and improving life quality for HIV-serodiscordant couples have emerged as an urgent requisition. © 2021, The Author(s). Article	2021	Wu H.-J.; Ku S.W.-W.; Li C.-W.; Ko N.-Y.; Yu T.; Chung A.-C.; Strong C.	Factors Associated with Preferred Pre-Exposure Prophylaxis Dosing Regimen Among Men Who Have Sex with Men in Real-World Settings: A Mixed-Effect Model Analysis	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-020-02964-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85087692142&doi=10.1007%2fs10461-020-02964-5&partnerID=40&md5=57c0e8def22918882f8052ae313a6495	When provided with both choices of pre-exposure prophylaxis (PrEP) in MSM, men may choose to use either method based on their sexual practice. The study objective was to describe the switches between dosing regimens and identify factors that predict choice of a dosing regimen among MSM. We performed a multi-center, observational, prospective PrEP cohort study conducted at three study sites in Taiwan between January 2018 and March 2019. A total of 215 participants made 469 visits. In half of the visits (49.7%), participants reported using on-demand PrEP. There were 36 regimen switches: 20 from daily to on-demand and 16 from on-demand to daily. Among 28 participants who switched regimens, 22 switched regimens once and 6 switched more than once. The frequency of condomless anal sex and a history of post-exposure prophylaxis use were associated with taking PrEP on-demand (p < 0.05). PrEP adherence intervention should be tailored specifically to sexual behavior to increase adherence to PrEP. © 2020, Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Wu Y.; Yang G.; Meyers K.	Acceptability, Appropriateness, and Preliminary Effects of the PrEP Diffusion Training for Lay HIV Workers: Increased PrEP Knowledge, Decreased Stigma, and Diffusion of Innovation	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03248-2	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85103382114&doi=10.1007%2fs10461-021-03248-2&partnerID=40&md5=c64c8bd26ce04dec1e4e560a3aaa368e	Training lay health workers is a critical intervention strategy to support HIV pre-exposure prophylaxis (PrEP) implementation. However, few evaluations of such trainings have been published. We conducted multi-time-point surveys to evaluate the effect of a training intervention on knowledge, PrEP stigma, and implementation behavior among lay HIV workers in China. Results indicated high acceptability and appropriateness of the training. PrEP knowledge score increased by 65% from pre- to post-training, and remained high one-month post-training. We observed a significant decrease in PrEP stigma and a positive influence on determinants of implementation behaviors. All lay HIV workers surveyed one-month after the training reported having disseminated PrEP information in social networks; 43% reported integrating PrEP education into routine work. The training is an effective strategy to build lay HIV workers' capacity in PrEP implementation. Longer-term post-training follow up would be ideal to further assess actual PrEP uptake and sustained effects on PrEP implementation. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2021	Wu, Huei-Jiuan; Wen-Wei Ku, Stephane; Chang, Howard H; Li, Chia-Wen; Ko, Nai-Ying; Strong, Carol	Imperfect adherence in real life: a prevention-effective perspective on adherence to daily and event-driven HIV pre-exposure prophylaxis among men who have sex with men – a prospective cohort study in Taiwan	Journal of the International AIDS Society	-	-	-	-	17582652	10.1002/jia2.25733	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106567798&doi=10.1002%2fjia2.25733&partnerID=40&md5=b231c0ff4baed8e4ea899745f31a3953	Introduction: Both daily and event-driven (ED) pre-exposure prophylaxis (PrEP) have been demonstrated to be highly effective among men who have sex with men (MSM). Prevention-effective adherence proposes that PrEP adherence should be aligned with the risk of HIV, which could be applied to both daily and ED PrEP adherence measurement. The objective of this study was to describe the relationship between the use of PrEP and sex events among the MSM PrEP users and identify factors associated with adherence among daily and ED MSM PrEP users. Methods: A multicentre, observational, prospective cohort study was conducted at three hospital-based clinics in three urban cities of Taiwan from January 2018 to December 2019. MSM ages 18 years or older – at high risk of HIV acquisition and taking PrEP during the study period – were included in the analysis. MSM PrEP users were allowed to choose between daily and ED PrEP based on their preference. Data on sociodemographic characteristics, mental health, sexual behaviours, substance use and PrEP-taking behaviours were collected at each visit. Results: A total of 374 MSM were included in the analysis with 1,054 visits. More than half (56%) of the PrEP users chose ED at the baseline and 150 regimen switches were reported by 21% of the participants. There was only one seroconversion documented during the study period. Most (84.2%) of the MSM PrEP users were able to adhere to PrEP during the most recent anal intercourse in the past one month. Among ED PrEP users with suboptimal adherence, the majority (81.9%) missed the pre-coital dose. In the multivariable analysis, we found that participants who switched from daily to an ED dosing regimen were associated with poorer adherence to PrEP. Conclusions: A high level of PrEP adherence was observed among the majority of MSM in a real-world setting. On the other hand, Taiwanese MSM switching from daily to ED dosing regimens were less likely to adhere to PrEP, suggesting that novel approaches focusing on a dosing switch would be necessary for MSM to improve their adherence to PrEP. © 2021 The Authors. Article	2021	Wurcel, Alysse G.; Chen, Gang; Zubiago, Julia A.; Reyes, Jessica; Nowotny, Kathryn M.	Heterogeneity in Jail Nursing Medical Intake Forms: A Content Analysis.	Journal of Correctional Health Care	-	-	-	-	1940-5200 1078-3458	10.1089/jchc.20.04.0018	https://pubmed.ncbi.nlm.nih.gov/34724807/	Despite high prevalence of infectious diseases and substance use disorders in jails, there are limited guidelines for the nursing intake process in this setting. We performed a content analysis of nursing intake forms used at each of the 14 Massachusetts county jails, focusing on infectious disease and substance use disorder. Only 85% of jails offered HIV testing during nursing intake and 50% of jails offered hepatitis C testing. Preventive interventions such as vaccines or pre-exposure prophylaxis therapy were infrequently offered during nursing intake. Screening for substance use disorder was present on the majority of intake forms, but only 23% of intake forms inquired about ongoing medication-assisted treatment for opioid use disorder. The results reflect heterogeneity in nursing intake forms, highlighting missed opportunities for public health interventions. Article	2021	Xavier Hall, Casey D; Smith, Justin C; Driggers, Robert A; Stoller, Bethany; Khan, Zara; Li, Jingjing; Ignatius, Elisa H; Siegler, Aaron J	PrEParing for long-acting injectable PrEP in the South: perspectives from healthcare providers in Georgia.	AIDS Care	-	-	-	-	1360-0451	10.1080/09540121.2020.1810616	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8152107	New modalities of Pre-exposure Prophylaxis (PrEP) such as long-acting injectable PrEP (LAI-PrEP) promise increased prevention of HIV transmission; however, similar biomedical interventions have not been met with universal adoption by healthcare providers or populations most affected by HIV. This qualitative study explores healthcare provider considerations for the rollout of LAI-PrEP. Eleven key-informant in-depth interviews were conducted with clinicians who prescribe daily oral PrEP. Participants reviewed a currently proposed LAI regimen and were asked to reflect on its implications for their clinical practice. Interviews were transcribed verbatim and thematically coded, with results organized using the Consolidated Framework for Implementation Research (CFIR). All participants expressed interest in prescribing LAI-PrEP and anticipated that at least some patients would be interested. Participants identified characteristics of the intervention, inner intervention setting, and outer intervention setting that will be influential in bringing LAI-PrEP to scale. Clinicians in the South have unique insights into the challenges of and opportunities for successful rollout of future PrEP regimens. Bringing these insights into a CFIR framework highlights the nuances surrounding LAI-PrEP, including structural concerns such as cost barriers and access to in-person healthcare services. It is critical to address these challenges to ensure successful implementation of new PrEP formulations. Article	2021	Xiridou, Maria; Visser, Maartje; Urbanus, Anouk; Matser, Amy; van Benthem, Birgit; Veldhuijzen, Irene	Ending risk-group HBV vaccination for MSM after the introduction of universal infant HBV vaccination: A mathematical modelling study.	Vaccine	-	-	-	-	1873-2518	10.1016/j.vaccine.2021.04.008	https://dx.doi.org/10.1016/j.vaccine.2021.04.008	BACKGROUND: Risk-group HBV vaccination for men who have sex with men (MSM) was introduced in the Netherlands in 2002, followed by universal infant vaccination in 2011, that will enable termination of risk-group vaccination over time. The introduction of pre-exposure prophylaxis (PrEP) for HIV prevention might result in increased HBV testing and vaccination against HBV. The aim of this study was to investigate the impact of the transition from risk-group to universal HBV vaccination, accounting for improvements in HBV testing and treatment, as well as the introduction of PrEP. METHODS: We developed a mathematical model for HBV transmission among MSM. Universal vaccination was modelled by assigning some MSM (5-15% in 2028 increasing to 80-90% in 2033 and thereafter) to be vaccinated when they become sexually active. We investigated different scenarios assuming 0.5% extra vaccination rate and 0.5% extra testing rate due to PrEP consultations; and 5% of HIV-negative MSM on PrEP, that will reduce the probability of HBV acquisition by 88%. RESULTS: Universal vaccination resulted in a reduction of 24% (interquartile range; 22-25%) of the total number of HBV infections among MSM estimated to occur from 2020 to 2070. With universal vaccination, terminating risk-group vaccination in 2030 or 2040 resulted in 30% or 10% more HBV infections over 2020-2070, respectively, compared to continuation of risk-group vaccination until 2070. With PrEP and continued risk-group vaccination, the total number of HBV infections over 2020-2070 was reduced by 13%. CONCLUSIONS: Universal HBV vaccination can lead to a major reduction in HBV incidence among MSM in the future. The reduction becomes smaller when ending risk-group HBV vaccination, but larger by PrEP use for HIV prevention. Efforts to keep high levels of HBV vaccination, testing, and treatment have to be continued in the coming decades in order to eliminate HBV as a health threat for MSM. Article	2021	Yager, Jenna L; Brooks, Kristina M; Castillo-Mancilla, Jose R; Nemkov, Cricket; Morrow, Mary; Peterson, Skyler; Ibrahim, Mustafa; Bushman, Lane; Kiser, Jennifer J; MaWhinney, Samantha; Anderson, Peter L	Tenofovir-diphosphate in peripheral blood mononuclear cells during low, medium and high adherence to emtricitabine/ tenofovir alafenamide vs. emtricitabine/ tenofovir disoproxil fumarate.	AIDS	-	-	-	-	1473-5571	10.1097/QAD.0000000000003062	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8648983	OBJECTIVE: Tenofovir alafenamide (TAF) preferentially loads peripheral blood mononuclear cells (PBMCs), resulting in higher PBMC tenofovir-diphosphate (TFV-DP) vs. tenofovir disoproxil fumarate (TDF). No studies have yet compared TFV-DP in PBMC from lower than daily dosing between prodrugs, which has potential implications for event-driven preexposure prophylaxis and pharmacologic forgiveness. DESIGN: Two separate randomized, directly observed therapy (DOT) crossover studies (DOT-DBS and TAF-DBS) were conducted to mimic low, medium and high adherence. METHODS: HIV-negative adults were randomized to two 12-week DOT regimens of 33, 67 or 100% of daily dosing with emtricitabine (F)/TAF 200âmg/25âmg (TAF-DBS) or F/TDF 200âmg/300âmg (DOT-DBS), separated by a 12-week washout. PBMC steady-state concentrations (Css) of TFV-DP and FTC-TP were estimated using nonlinear mixed models and compared between F/TAF and F/TDF. RESULTS: Thirty-five participants contributed to 33% (nâ=23), 67% (nâ=23) and 100% (nâ=23) of daily F/TAF regimens. Forty-four contributed to 33% (nâ=15), 67% (nâ=16) and 100% (nâ=32) of daily F/TDF regimens. PBMC TFV-DP Css were 7.3 95% confidence interval (95% CI): 6.4-8.2, 7.1 (5.9-8.2) and 6.7- (4.4-8.9) fold higher (Pâ<0.0001) following F/TAF vs. F/TDF; 593 vs. 81.7, 407 vs. 57.4, and 215 vs. 32.3âfmol/106 cells, respectively. TFV-DP was 2.6 (2.1-3.1) fold higher with 33% F/TAF vs. 100% F/TDF. Estimated half-lives (95% CI) of TFV-DP in PBMC were 2.9 (1.5-5.5) days for F/TAF and 2.1 (1.5-2.9) days for F/TDF. FTC-TP was similar in both studies (Pâ=0.119). CONCLUSION: F/TAF produced 6.7 to 7.3-fold higher TFV-DP in PBMC vs. F/TDF across adherence levels, supporting increased potency and pharmacologic forgiveness with F/TAF in the PBMC compartment. Article	2021	Yan, Li; Yan, Zihan; Wilson, Erin; Arayasirikul, Sean; Lin, Jessica; Yan, Hongjing; McFarland, Willi	Awareness and Willingness to use HIV Pre-exposure Prophylaxis (PrEP) Among Trans Women in China: A Community-Based Survey.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-020-03050-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7886947	China's national guidelines call for increasing HIV pre-exposure prophylaxis (PrEP) use to reverse the epidemic in populations at highest risk. However, few data exist on PrEP awareness and willingness among trans women in China. Our research aim was to fill this data gap through a cross-sectional survey among trans women in Nanjing and Suzhou cities of Jiangsu province. Respondent-driven sampling (RDS) was used to recruit participants to gauge their awareness of and willingness to use PrEP. Logistic regression analysis was used to characterize associations with awareness of PrEP and willingness to use PrEP. Of 222 HIV-negative/unknown serostatus trans women, 33.3% were aware of PrEP and 49.1% were willing to use PrEP. PrEP awareness was associated with a university degree or above (adjusted odds ratio AOR 2.77, 95% CI 1.31-5.89) and not using alcohol with sex (AOR 2.02, 95% CI 1.00-4.09). Willingness to use PrEP was higher among trans women with one (AOR 3.56, 95% CI 1.68-7.54) or multiple sexual partners (AOR 2.53, 95% CI 1.24-5.15) compared to those with no partners. This study witnessed low awareness of PrEP, yet substantial willingness to use PrEP. Implementation research to identify ways to promote, scale up access, and assess effectiveness of PrEP for trans women is urgently needed in China. Article	2021	Young I.; Boydell N.; Patterson C.; Hilton S.; McDaid L.	Configuring the PrEP user: framing pre-exposure prophylaxis in UK newsprint 2012–2016	Culture, Health & Sexuality	-	-	-	-	13691058	10.1080/13691058.2020.1729420	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85083556838&doi=10.1080%2f13691058.2020.1729420&partnerID=40&md5=769bf78e135896244daaef8e2ea451cb	Pre-exposure prophylaxis (PrEP) has been hailed as a revolutionary intervention for HIV prevention. PrEP's controversial status in the UK has generated significant media coverage. It is important to understand what role the media plays in framing PrEP policy issues. We undertook a qualitative analysis of UK newsprint articles between 2012 and 2016 to examine how PrEP was framed as a public health intervention up until a controversial policy decision not to provide PrEP in England. We identified how scientific evidence was deployed to shape two narratives: ir/responsible citizens focused on imagined PrEP users and their capacity to use PrEP effectively; and the public health imperative, which described the need for PrEP. Our analysis demonstrates the particular ways in which scientific evidence contributed to the certainty of PrEP as an effective intervention within UK newsprint. Scientific evidence also played a key role in framing PrEP as an intervention specifically for cis-gendered gay and bisexual men, playing into wider debates about who is a deserving patient and the appropriate use of public resources. Practitioners in the UK and elsewhere should be aware of these constructions of the PrEP user to ensure equitable access to PrEP beyond gay and bisexual men. © 2020 The Author(s). Article	2021	Young, Lindsay E; Schneider, John A	The co-evolution of network structure and prep adoption among a large cohort of prep peer leaders: Implications for intervention evaluation and community capacity-building	International Journal of Environmental Research and Public Health	-	-	-	-	16617827	10.3390/ijerph18116051	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107188762&doi=10.3390%2fijerph18116051&partnerID=40&md5=84cff3483dcb1f8fff74d57b6338b0cf	Background: Peer leader interventions are effective strategies for promoting prevention behaviors in communities at risk for HIV, yet little is known about their effects on the social and behavioral dynamics of peer leaders themselves. Methods: Using data from PrEP Chicago, an RCT PrEP for prevention intervention for young Black MSM (YBMSM), we apply stochastic actor-based models to longitudinally model the impact of study participation on the online friendship and PrEP adoption dynamics among a network of peer leaders (n = 174) and a network of control group counterparts (n = 166). Results: Peer leaders assigned to the same leadership training workshop were more likely to form new Facebook friendships with one another, whereas control participants assigned to the same attention control workshop were no more or less likely to form new friendships. Further, peer leaders with greater PrEP intentions and those living with HIV were more active in forming new friendships with other peer leaders, effects not found in the control network. PrEP adoption was not influenced by network dynamics in either group. Conclusions: The implications of these findings are discussed through the lens of community-capacity building and the role that peer leader interventions and the networks they engage can impact public health. © 2021 by the authors. Article	2021	Yu, Simin; Cross, Wendy; Lam, Louisa Lok Yi; Zhang, Kaili; Banik, Biswajit; Li, Xianhong; Wang, Honghong	Willingness, preferred ways and potential barriers to use pre-exposure prophylaxis for HIV prevention among men who have sex with men in China.	BMJ Open	-	-	-	-	2044-6055	10.1136/bmjopen-2021-053634	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8559123	OBJECTIVE: To explore willingness and preferred ways to use HIV pre-exposure prophylaxis (PrEP), factors associated with willingness, and potential barriers to PrEP use among men who have sex with men (MSM) in Changsha, China. DESIGN: A cross-sectional survey was conducted from 25 June to 31 August 2019. Two hundred and fifty-five MSM were recruited from three community-based organisations (CBOs) in Changsha City. Willingness and potential barriers to use PrEP were examined using researcher-created scales. Univariate and multivariate logistic regression was used to analyse the factors associated with willingness to use PrEP. P values <0.05 were considered significant. SETTING: Three MSM inclusive CBOs in Changsha, Hunan Province, China. PARTICIPANTS: 255 HIV-negative MSM were recruited through their CBOs with snowball sampling. RESULTS: Less than half of the participants (43.1%) had heard of PrEP and 15.3% were willing to use PrEP. The participants reported higher willingness to use event-driven PrEP (3.70±0.07) than daily PrEP (2.65±0.07). Higher self-rated risk and fear of contracting HIV (OR: 14.47, 95% CI 2.19 to 95.53), awareness of PrEP (OR: 4.20, 95% CI 1.64 to 10.73), sharing one's own sexual orientation with parents or siblings (OR: 2.52, 95% CI 1.54 to 7.20) and having a university education or above (OR:0.29, 95% CI 0.12 to 0.72) were associated with willingness to use PrEP. Only 12.2% of the sample was concerned about potential barriers to PrEP use. CONCLUSION: Efforts to improve awareness and knowledge of PrEP, teach self-evaluation of HIV infection risk and provide social and emotional support for MSM are needed to scale up PrEP implementation in China. Article	2021	Yu, Xiaoyue; Chen, Xu; Ni, Yang; Chang, Ruijie; Wang, Huwen; Gong, Ruijie; Wang, Ying; Wang, Suping; Cai, Yong	Pre-Exposure Prophylaxis (PrEP) Adherence Questionnaire: Psychometric Validation among Sexually Transmitted Infection Patients in China	International Journal of Environmental Research and Public Health	-	-	-	-	1661-7827	10.3390/ijerph182010980	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-adherence/docview/2584387974/se-2?accountid=8113	Background: Ensuring adherence guarantees the efficacy of pre-exposure prophylaxis (PrEP). Methods: We conducted a cross-sectional study among 816 sexually transmitted infection (STI) patients in Shanghai. The questionnaire included self-reported demographic characteristics, self-administered items on adherence to free oral PrEP, and PrEP uptake behavior measurement. We conducted item analysis, reliability analysis, validity analysis and receiver operating characteristic (ROC) curve analysis. Results: Not all items were considered acceptable in the item analysis. The questionnaire had a McDonald's ω coefficient of 0.847. The scale-level content validity index (CVI) was 0.938 and the item-level CVI of each item ranged from 0.750 to 1. In exploratory factor analysis, we introduced a four-factor model accounting for 79.838% of the aggregate variance, which was validated in confirmatory factor analysis. Adding PrEP adherence questionnaire scores contributed to prediction of PrEP uptake behavior (p < 0.001) in regression analysis. The maximum area under the ROC curve was 0.778 (95% IC: 0.739–0.817). Conclusion: The PrEP adherence questionnaire presented psychometric validation among STI patients. Article	2021	Yu, Yi-Fang; Wu, Huei-Jiuan; Ku, Stephane Wen-Wei; Huang, Po-Hsien; Li, Chia-Wen; Huang, Poyao; Strong, Carol	Condomless Anal Sex Associated With Heterogeneous Profiles Of HIV Pre-Exposure Prophylaxis Use and Sexual Activities Among Men Who Have Sex With Men: A Latent Class Analysis Using Sex Diary Data on a Mobile App.	Journal of Medical Internet Research	-	-	-	-	1438-8871	10.2196/33877	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8738983	BACKGROUND: New innovative technologies, such as mobile apps, have been developed to increase pre-exposure prophylaxis (PrEP) adherence and the use of log sex diaries. The contiguity of mobile apps reduces the recall bias that generally affects reported condom and PrEP use. However, none of the currently used mobile apps were designed for event-driven PrEP users, and few studies have demonstrated the potential usage of sex diary data to facilitate the understanding of the different HIV risks among heterogeneous profiles of sex diaries and PrEP use. OBJECTIVE: We aim to discriminate the heterogeneous profiles of sex events and PrEP use and examine the risk of condomless anal sex among different types of sex events. METHODS: We recruited 35 adult men who have sex with men from two medical centers in Taiwan since May 2020 and followed up for four months. Participants were on PrEP or willing to take PrEP. They were asked to log their sex events, PrEP use, and dosing regimens on a mobile app to improve their PrEP adherence. Latent class analysis was used to distinguish profiles of sex events and PrEP use. Indicators included correct intake of PrEP for each sex event, participants' sexual positioning, partner's HIV status, and age. RESULTS: A total of 551 sex events were classified into three classes by latent class analysis: PrEP nonadherent flip-flopping (234/551, 42%), PrEP imperfect-adherent power bottoming (284/551, 52%), and PrEP adherent serodiscordant topping (33/551, 6%). "PrEP nonadherent flip-flopping" sex events were more likely to involve condomless anal sex than "PrEP imperfect-adherent power bottoming" (OR 1.83, 95% CI 1.03-3.25) after considering random intercepts for individuals, and this class needed to increase their PrEP adherence and use of condoms. "PrEP imperfect-adherent power bottoming" realized their own risk and packaged PrEP with condoms to protect themselves. Up to 99% (32/33) of sex events in "PrEP adherent serodiscordant topping" were protected by PrEP, but all of the sex events in this group were condomless. CONCLUSIONS: Using the sex diary data could advance the capacity to identify high-risk groups. HIV prevention strategy should be more flexible and combine PrEP with condom use for future HIV prevention.	mobile apps, pre-exposure prophylaxis, PrEP, latent class analysis, men who have sex with men, MSM, condom, sex diaries, adherence, app, sex, diary, sexual health, HIV, Taiwan, risk, prevention	English	Germany	Western and Central Europe and North America	Taiwan	Asia and the Pacific	Taiwan	Asia and the Pacific	Quantitative
Article	2021	Yumori, Caitlin; Zucker, Jason; Theodore, Deborah; Chang, Michelle; Carnevale, Caroline; Slowikowski, Jacek; LaSota, Elijah; Olender, Susan; Gordon, Peter; Cohall, Alwyn; Sobieszczyk, Magdalena E	Women Are Less Likely to Be Tested for HIV or Offered Preexposure Prophylaxis at the Time of Sexually Transmitted Infection Diagnosis.	Sexually Transmitted Diseases	-	-	-	-	1537-4521	10.1097/OLQ.0000000000001265	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8543120	BACKGROUND: Ending the HIV epidemic requires linkage of at-risk individuals from diverse health care settings to comprehensive HIV prevention services. Sexually transmitted infections (STIs) are significant biomarkers of HIV risk and should trigger preexposure prophylaxis (PrEP) discussion. We reviewed STI testing practices outside of sexual health clinics to identify opportunities for improvement in the provision of HIV prevention services. METHODS: An electronic sexual health dashboard was used to identify patient encounters with a positive gonorrhea, chlamydia, and/or rapid plasma reagin test result between January 1, 2019, and August 23, 2019, at a large urban academic medical center. A retrospective chart review was performed to assess HIV testing, completeness of STI screening, and HIV prevention discussion; inadequate screening was defined as no HIV test in 12 months before STI diagnosis. RESULTS: A total of 815 patients with 856 patient encounters were included. Patients were predominantly female (64.4%); median age was 24 years (range, 18-85 years). The most common test and most common positive test result was the genitourinary gonorrhea/chlamydia nucleic acid amplification test. Multisite testing was rare (7.5% of patient encounters) and performed more frequently in men than in women (20.3% vs. 0.36%). Women were also more likely to be inadequately screened for HIV (15.1% vs. 25.8%).Documentation of PrEP discussion was rare (4.7% of patient encounters) compared with safe sex (44.6%) and condoms (49.8%). Preexposure prophylaxis was discussed almost exclusively with men compared with women (17% vs. 1.1%). CONCLUSIONS: In patients diagnosed with bacterial STI outside of sexual health clinics, gaps in HIV prevention exist. HIV screening, multisite STI screening, and discussion of PrEP were particularly infrequent among women. Article	2021	Zane, Doris; Roller, Shane; Shelton, Josephine; Singh, Roshni; Jain, Rachna; Wang, Yan; Yang, Bing; Felx, Melanie; Alessi, Thomas; Feldman, Paul L.	A 28-Day Toxicity Study of Tenofovir Alafenamide Hemifumarate by Subcutaneous Infusion in Rats and Dogs.	Microbiology Spectrum	-	-	-	-	2165-0497	10.1128/Spectrum.00339-21	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8552772	The toxicity of tenofovir alafenamide (TAF) hemifumarate (HF) was evaluated when administered by continuous subcutaneous (s.c.) infusion via an external infusion pump for 28 days to rats and dogs. The toxicokinetics of TAF and two metabolites, tenofovir (TFV) and tenofovir diphosphate (TFV-DP) were also evaluated. After administration of TAF HF in rats and dogs, primary systemic findings supported an inflammatory response that was considered minimal to mild. Gross pathology and histopathologic evaluation of tissue surrounding the s.c. infusion site revealed signs of inflammation, including edema, mass formation, fibrosis, and mononuclear cell inflammation in groups receiving ≥300 μg/kg/day in rats and ≥25 μg/day in dogs. Although these changes were observed in animals receiving vehicle, the severity was greater in animals receiving TAF HF. Changes in the local tissue were considered a TAF HF-mediated exacerbation of an inflammatory response to the presence of the catheter. In rats, systemic and local findings were considered not adverse due to their low severity and reversibility; therefore, the "no observed adverse effect level" (NOAEL) was set at 1,000 μg/kg/day. Because none of the systemic findings were related to systemic exposure to TAF, the systemic NOAEL was set at 250 μg/kg/day in dogs. Due to the severity of the observations noted, a NOAEL for local toxicity could not be established. Although these results might allow for exploration of tolerability and pharmacokinetics of s.c. administered TAF HF in humans, data suggest a local reaction may develop in humans at doses below a clinically relevant dose. IMPORTANCE Human immunodeficiency virus (HIV) infection continues to be a serious global human health issue, with ~38 million people living with HIV worldwide at the end of 2019. HIV preexposure prophylaxis (PrEP) has introduced the use of antiretroviral therapies as another helpful tool for slowing the spread of HIV worldwide. One possible solution to the problem of inconsistent access and poor adherence to HIV PrEP therapies is the development of subcutaneous (s.c.) depots or s.c. implantable devices that continuously administer protective levels of an HIV PrEP therapy for weeks, months, or even years at a time. We evaluate here the toxicity of tenofovir alafenamide, a potent inhibitor or HIV replication, after continuous s.c. infusion in rats and dogs for HIV PrEP. Article	2021	Zapata, Wildeman	Natural Products with Inhibitory Activity against Human Immunodeficiency Virus Type 1	Advances in Virology	-	-	-	-	NA	NA	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8181102/#:~:text=Considering%20that%20there%20is%20a,and%20bromotyrosines%20(Figure%201).	Infections caused by human immunodeficiency virus (HIV) are considered one of the main public health problems worldwide. Antiretroviral therapy (ART) is the current modality of treatment for HIV-1 infection. It comprises the combined use of several drugs and can decrease the viral load and increase the CD4+ Tcell count in patients with HIV-1 infection, thereby proving to be an effective modality. This therapy significantly decreases the rate of morbidity and mortality owing to acquired immunodeficiency syndrome (AIDS) and prolongs and improves the quality of life of infected patients. However, nonadherence to ARTmay increase viral resistance to antiretroviral drugs and transmission of drug-resistant strains of HIV. +erefore, it is necessary to continue research for compounds with anti-HIV-1 activity, exhibiting a potential for the development of an alternative or complementary therapy to ARTwith low cost and fewer side effects. Natural products and their derivatives represent an excellent option owing to their therapeutic potential against HIV. Currently, the derivatives of natural products available as anti-HIV-1 agents include zidovudine, an arabinonucleoside derivative of the Caribbean marine sponge (Tectitethya crypta), which inhibits the reverse transcriptase of the virus. +is was the first antiviral agent approved for treatment of HIV infection. Additionally, bevirimat (isolated from Syzygium claviflorum) and calanolide A (isolated from Calophyllum sp.) are inhibitors of viral maturation and reverse transcription process, respectively. In the present review, we aimed to describe the wide repertoire of natural compounds exhibiting anti-HIV-1 activity that can be considered for designing new therapeutic strategies to curb the HIV pandemic. Article	2021	Zarwell, Meagan; John, Steven A; Westmoreland, Drew; Mirzayi, Chloe; Pantalone, David W; Golub, Sarit; Nash, Denis; Grov, Christian	PrEP Uptake and Discontinuation Among a U.S. National Sample of Transgender Men and Women.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-020-03064-0	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7979462	Pre-exposure prophylaxis (PrEP) has revolutionized HIV prevention efforts by effectively preventing the sexual transmission of HIV infection. Few studies have examined PrEP uptake and discontinuation among transgender individuals who are underserved in HIV prevention efforts. An online U.S. nationwide survey screened 294 HIV-negative transgender people for participation in a larger cohort study. We analyzed associations between demographic characteristics and PrEP use and discontinuation. We conducted thematic analyses of open-ended responses to identify reasons for PrEP discontinuation. Fifty-one participants (17.4%) reported ever receiving a PrEP prescription. Transgender men reported higher PrEP use than transgender women (χ2 = 18.06; p < 0.0001). PrEP discontinuation was reported by 49.0% of individuals who reported PrEP use. Reasons for PrEP discontinuation were related to side effects, insurance coverage, relationship status, and access to providers. HIV prevention efforts to increase PrEP should include mechanisms for PrEP uptake and re-initiation among transgender individuals. Article	2021	Zhang J.; Tucker J.; Tang W.; Wang H.; Chu Z.; Hu Q.; Huang X.; Chen Y.; Wang H.; He X.; Li Y.; Zhang L.; Hu Z.; Bao R.; Li S.; Li H.; Ding H.; Jiang Y.; Geng W.; Xu J.; Shang H.	Internet-based HIV self-testing among men who have sex with men through pre-exposure prophylaxis: 3-Month prospective cohort analysis from China	Journal of Medical Internet Research	-	-	-	-	14388871	10.2196/23978	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85114029206&doi=10.2196%2f23978&partnerID=40&md5=f26d1463b5e9e96f281cf73f123d9c2c	Background: Routine HIV testing accompanied with pre-exposure prophylaxis (PrEP) requires innovative support in a real-world setting. Objective: This study aimed to determine the usage of HIV self-testing (HIVST) kits and their secondary distribution to partners among men who have sex with men (MSM) in China, who use PrEP, in an observational study between 2018 and 2019. Methods: In 4 major cities in China, we prospectively followed-up MSM from the China Real-world oral PrEP demonstration study, which provides daily or on-demand PrEP for 12 months, to assess the usage and secondary distribution of HIVST on quarterly follow-ups. Half of the PrEP users were randomized to receive 2 HIVSTs per month in addition to quarterly facility-based HIV testing. We evaluated the feasibility of providing HIVST to PrEP users. Results: We recruited 939 MSM and randomized 471 to receive HIVST, among whom 235 (49.9%) were daily and 236 (50.1%) were on-demand PrEP users. At baseline, the median age was 29 years, 390 (82.0%) men had at least college-level education, and 119 (25.3%) had never undergone facility-based HIV testing before. Three months after PrEP initiation, 341 (74.5%) men had used the HIVST provided to them and found it very easy to use. Among them, 180 of 341 (52.8%) men had distributed the HIVST kits to other MSM, and 132 (51.6%) among the 256 men who returned HIVST results reported that used it with their sexual partners at the onset of intercourse. Participants on daily PrEP were more likely to use HIVST (adjusted hazard ratio=1.3, 95% CI 1.0-1.6) and distribute HIVST kits (adjusted hazard ratio=1.3, 95% CI 1.1-1.7) than those using on-demand PrEP. Conclusions: MSM who used PrEP had a high rate of usage and secondary distribution of HIVST kits, especially among those on daily PrEP, which suggested high feasibility and necessity for HIVST after PrEP initiation. Assuming that fourth-generation HIVST kits are available, HIVST may be able to replace facility-based HIV testing to a certain extent. © 2021 Jing Zhang, Joseph Tucker, Weiming Tang, Hongyi Wang, Zhenxing Chu, Qinghai Hu, Xiaojie Huang, Yaokai Chen, Hui Wang, Xiaoqing He, Yao Li, Lukun Zhang, Zhili Hu, Rantong Bao, Shangcao Li, Hang Li, Haibo Ding, Yongjun Jiang, Wenqing Geng, Junjie Xu, Hong Shang. Article	2021	Zhang L.; Wang J.; von Kleist M.	Numerical approaches for the rapid analysis of prophylactic efficacy against HIV with arbitrary drug-dosing schemes	PLOS Computational Biology	-	-	-	-	1553734X	10.1371/journal.pcbi.1009295	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122412237&doi=10.1371%2fjournal.pcbi.1009295&partnerID=40&md5=84142822f6dedf61484326948ee4d098	Pre-exposure prophylaxis (PrEP) is an important pillar to prevent HIV transmission. Because of experimental and clinical shortcomings, mathematical models that integrate pharmacological, viral- and host factors are frequently used to quantify clinical efficacy of PrEP. Stochastic simulations of these models provides sample statistics from which the clinical efficacy is approximated. However, many stochastic simulations are needed to reduce the associated sampling error. To remedy the shortcomings of stochastic simulation, we developed a numerical method that allows predicting the efficacy of arbitrary prophylactic regimen directly from a viral dynamics model, without sampling. We apply the method to various hypothetical dolutegravir (DTG) prophylaxis scenarios. The approach is verified against state-of-the-art stochastic simulation. While the method is more accurate than stochastic simulation, it is superior in terms of computational performance. For example, a continuous 6-month prophylactic profile is computed within a few seconds on a laptop computer. The method's computational performance, therefore, substantially expands the horizon of feasible analysis in the context of PrEP, and possibly other applications. © 2021 Zhang et al. Methods: From 11 December 2018 to 19 October 2019, we recruited MSM for an open-label real-world PrEP demonstration study in four major cities in China. Subjects selected their preferred PrEP (oral tenofovir/emtricitabine) regimen (daily vs. on-demand) at recruitment and underwent on-site screening before initiation of PrEP. We used logistic regression to assess preference for daily PrEP and correlates. Results: Of 1933 recruited MSM, the median age was 29 years, 7.6% was currently married to or living with a female and 6.1% had used post-exposure prophylaxis (PEP) in the previous six months. HIV infection risk was subjectively determined as very high (>75%) in 7.0% of subjects, high (50% to 75%) in 13.3%, moderate (25% to 49%) in 31.5% and low or none (0% to 24%) in 48.1%. On average, participants preferred on-demand PrEP over daily PrEP (1104 (57.1%) versus 829 (42.9%)) at recruitment. In multivariable analysis, currently being married to or living with a female was associated with 14.6 percentage points lower preference for daily PrEP (marginal effect = −0.146 95% CI: −0.230, −0.062, p = 0.001); whereas the number of male sexual partners (marginal effect = 0.003 95% CI: 0.000, 0.005, p = 0.034) and a subjective assessment of being very high risk of HIV infection (vs. low and no risk, marginal effect size = 0.105 95% CI: 0.012, 0.198, p = 0.027) were associated with increased preference for daily versus on-demand PrEP. Among the 1933 potential participants, 721 (37.3%) did not attend the subsequent on-site screening. Lower-income, lower education level, lower subjective expected risk of HIV infection and younger age positively correlated with the absence of on-site screening. Conclusions: MSM in China prefer both daily and on-demand PrEP when both regimens are provided free. Social structural factors and subjective risk of HIV infection have significant impacts on PrEP preference and use. The upcoming national PrEP guideline should consider incorporating both regimens and the correlates to help implement PrEP in China. © 2021 The Authors. Emergency Department-Based Human Immunodeficiency Virus Preexposure Prophylaxis Referral Program - Using Emergency Departments as a Portal for Preexposure Prophylaxis Services	Sexually Transmitted Diseases	-	-	-	-	1485717	10.1097/OLQ.0000000000001351	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111401143&doi=10.1097%2fOLQ.0000000000001351&partnerID=40&md5=4442f49aed3ee43e8838f080f4305ba3	A pilot program was implemented to assess the feasibility of emergency department (ED) preexposure prophylaxis (PrEP) referral. Of 119 eligible patients approached and assessed, 39 (33%) expressed interest and were referred to peer navigators. Of these, 16 (41%) scheduled for appointments; four (10%) initiated PrEP, which demonstrated ED-based PrEP referral was feasible. © Lippincott Williams & Wilkins. Article	2021	Zhou, Xin; Altice, Frederick L; Chandra, Divya; Didomizio, Elizabeth; Copenhaver, Michael M; Shrestha, Roman	Use of Pre-exposure Prophylaxis Among People Who Inject Drugs: Exploratory Findings of the Interaction Between Race, Homelessness, and Trust.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-021-03227-7	https://dx.doi.org/10.1007/s10461-021-03227-7	Scale-up of pre-exposure prophylaxis (PrEP) in people who inject drugs (PWID) remains suboptimal. Patient-level factors are often complex and may contribute to scale-up. Using cross-sectional data from 234 opioid-dependent patients on methadone who met eligibility criteria for PrEP, we conducted logistic regression analyses to assess potential moderators associated with being on PrEP (n = 60). Mean provider trust was significantly higher among Blacks vs Whites (39.4 vs 34.9; p = 0.002) and non-homeless vs homeless participants (37.5 vs 34.8; p = 0.008). Though race/ethnicity was not a significant moderator on provider trust and use, increased provider trust was marginally associated with increased PrEP use among Blacks (p = 0.058). Additionally, homelessness significantly moderated provider trust and PrEP use (p = 0.024). Provider trust among non-homeless participants was positively correlated with PrEP use (p = 0.013) but not among homeless participants. Strategies that promote provider trust in Blacks and non-homeless PWID on methadone may improve PrEP scale-up. Article	2021	Zhu, Weiming; Huang, Ya-Lin A; Kourtis, Athena P; Hoover, Karen W	Trends in the Number and Characteristics of HIV Pre-Exposure Prophylaxis Providers in the United States, 2014-2019.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	1944-7884	10.1097/QAI.0000000000002774	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8568068	BACKGROUND: The number and characteristics of pre-exposure prophylaxis (PrEP) health care providers in the United States have not been reported. METHODS: We analyzed a national pharmacy database that included >90% of all prescriptions dispensed by retail pharmacies and 60%-86% dispensed by mail-order outlets. We estimated the number of PrEP providers by year, provider type, physician specialty, and geographic location. We also measured the Gini coefficients for the distribution of PrEP patients among providers. RESULTS: The number of PrEP providers increased from 9621 in 2014 to 65,822 in 2019. In 2019, 68.1% of PrEP providers were physicians. The proportion of nurse practitioners or physician assistants increased from 18.0% in 2014 to 29.7% in 2019. Among all the US health care providers, those who prescribed PrEP increased from 0.7% in 2014 to 4.3% in 2019. Among all general practice/family medicine physicians, the percentage of who prescribed PrEP increased from 1.8% in 2014 to 13.6% in 2019 and from 14.2% to 34.2% among infectious disease physicians. The ratio of PrEP providers to 100 persons with PrEP indications was lowest in the South with 4.4. The Gini coefficient for the distribution of PrEP patients among providers was 0.75 in 2019, with 50% of the PrEP patients prescribed PrEP by 2.2% of PrEP providers. CONCLUSIONS: An increasing number of providers prescribed PrEP during 2014-2019. The South had the largest number of new HIV diagnoses and greatest need for HIV prevention but had less PrEP service capacity compared with other regions. Expanded access to PrEP services is needed in the United States. Article	2021	Zimmerman, Rick S; Mehrotra, Purnima; Madden, Tessa; Paul, Rachel	The Value of Assessing Self-Reported and Biological Indicators of Outcomes in Evaluating HIV Programs.	Current HIV/AIDS Reports	-	-	-	-	1548-3576	10.1007/s11904-021-00560-3	https://dx.doi.org/10.1007/s11904-021-00560-3	PURPOSE OF REVIEW: In this manuscript, we present recent findings concerning concordance and discrepancy between biological measures and self-reports of these three outcomes of HIV programs: HIV status, adherence to antiretroviral medications (ARVs) and use of and adherence to pre-exposure prophylaxis medication (PrEP), and condom use/unprotected sex. RECENT FINDINGS: Recent studies suggest that three successive rapid HIV tests (for those whose first test in positive) might be reasonably inexpensive and valid biological data to collect to combine with self-reports of HIV status, dried blood spots sufficiently affordable to combine with self-reports of adherence to ARVs and use of or adherence to PrEP, and that the discrepancy between self-reports of condom use and biomarkers of unprotected sex may be relatively small in high-income countries. Additional work on assessment of incorrect condom usage and breakage, standardized self-report measures of condom use, and more private data collection methodologies in low-income settings might reduce the recent observed discrepancies even further. Concordance between self-reports of HIV and biomarkers indicating HIV positive status has varied considerably, with much lower rates in low-income countries, where the stigma of HIV is still very high. Recommendation is for combining self-report data with the results of three successive rapid tests for those testing positive. For adherence, again agreement between self-reports and a variety of more objective and/or biological measures is only moderate. Dried blood spots (DBS) may be sufficiently inexpensive in low-resource settings that this may be the best biological method to combine with self-reports. In publications over the last 8 years, the discrepancy between self-reports of condom use and biomarkers for unprotected sex may be even lower than 20% after controlling for other features of the study, particularly in high-income countries. Our results suggest that more careful assessment of incorrect condom use and breakage as reasons other than intentional misreporting should be investigated more carefully and that more private data collection methods such as audio, computer-assisted self-interviewing (ACASI) might be employed more often in low-resource settings to reduce this discrepancy in those settings further. In addition, further analysis of the discrepancy between self-reports of condom use and biomarkers should be conducted of published studies using the correct calculation methods to be more certain of these findings. Article	2021	Zimmermann, Hanne M L; Postma, Lisa R; Achterbergh, Roel C A; Reyniers, Thijs; Schim van der Loeff, Maarten F; Prins, Maria; de Vries, Henry J C; Hoornenborg, Elske; Davidovich, Udi	The Impact of Pre-exposure Prophylaxis on Sexual Well-Being Among Men Who Have Sex with Men.	Archives of Sexual Behavior	-	-	-	-	1573-2800	10.1007/s10508-020-01833-5	https://dx.doi.org/10.1007/s10508-020-01833-5	Pre-exposure prophylaxis (PrEP) is a promising strategy to reduce HIV incidence among men who have sex with men (MSM). How and when PrEP is used could in part be influenced by its impact on the sexual well-being of its users. Yet, the impact of PrEP on sexual well-being has received little attention in current literature and is not well-understood. We conducted 43 in-depth interviews (June 2017-June 2018) with HIV-negative MSM who started PrEP within the Amsterdam PrEP study. We used purposive sampling to select participants who (1) reported changes on well-being indicators; (2) switched between PrEP-dosing regimens; (3) neither changed regimens nor changed on well-being indicators. Transcribed interviews were qualitatively analyzed by means of an open-coding process. Results showed that PrEP minimized HIV-related fear, increased self-esteem, and reduced stigma and shame about having condomless anal sex. The psychological relief provided by PrEP also enabled relaxation which reduced pain during anal sex. PrEP use increased the diversity of partner choices and improved the perceived quality of sexual relationships and the ability to develop relationships. Along with this positive impact, almost half of interviewees reported concurrent negative experiences. In some cases, PrEP triggered more extreme sexual behaviors and/or problematic increases in preoccupation with sex and drug use. These were perceived as having a negative impact on sexual relationships, sexual well-being, PrEP adherence, and general health. In conclusion, our findings suggest that PrEP contributes to improvements in sexual well-being that go beyond protection from HIV. Counseling strategies should be devised to help PrEP users mitigate possible co-existing negative consequences of PrEP use. Theses and Dissertations	2021	Zirbel, Guilherme	"Eu confio na PrEP": o uso do medicamento da profilaxia pré-exposição ao vírus da imunodeficiência humana (Florianópolis, Santa Catarina)	-	-	Universidade Federal de Santa Catarina	Universidade Federal de Santa Catarina	-	NA	NA	https://pergamum.ufsc.br/acervo/373222	Resumo : A Profilaxia Pré-Exposição (PrEP) é um método de prevenção ao contágio do vírus do HIV usado há anos em diversos países e que consiste na tomada diária de um comprimido de fumarato de tenofovir e entricitabina. A confiança neste medicamento vem sendo alvo de estudos pelo mundo e, no Brasil, possui uma importância significante, já que nos últimos anos há um aumento de casos de infecção pelo HIV em pessoas de 20 a 39 anos. O principal objetivo de estudo foi identificar os fatores que contribuem para a construção da confiança na PrEP por usuários da profilaxia em Florianópolis, Santa Catarina. Foi realizada entrevista semiestruturada com 46 homens autodeclarados gays, usuários da PrEP, realizadas de maneira virtual devido à pandemia de Covid-19. Os dados foram submetidos à análise temática de conteúdo. A maioria dos participantes se autodeclarou branca, solteira e com formação superior. Os usuários confiam no medicamento e atribuem essa confiança à ciência/conhecimento científico, à relação com os profissionais que atendem no Ambulatório da PrEP e ao serviço oferecido (com testagens e consultas periódicas), e às experiências pessoais com o medicamento. O estudo sugere que a constante busca pelo aumento e manutenção do vínculo entre os profissionais da saúde e os usuários, a maior disponibilidade de leituras e de canais oficiais de divulgação científica e a ampliação do acesso à PrEP constituem medidas para alcançar um público mais amplo e com confiança na PrEP. Article	2021	Zissette S.; Tolley E.E.; Martinez A.; Hanif H.; Gill K.; Mugo N.; Myers L.; Casmir E.; Duyver M.; Ngure K.; Doncel G.F.	Adaptation and validation of simple tools to screen and monitor for oral PrEP adherence	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0251823	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85106744238&doi=10.1371%2fjournal.pone.0251823&partnerID=40&md5=4e205b727c394c8752a51b1bbfe5eba8	Introduction Oral, vaginal and other pre-exposure prophylaxis (PrEP) products for HIV prevention are in various stages of development. Low adherence poses a serious challenge to successful evaluation in trials. In a previous study, we developed tools to screen for general adherence and specifically monitor intravaginal ring adherence within the context of HIV prevention clinical trials. This study aimed to further validate the screening tool and to adapt and provide initial psychometric validation for an oral pill monitoring tool. Materials and methods We administered a cross-sectional survey between June and October 2018 at a trial site located near Cape Town, South Africa, and another in Thika, Kenya, with 193 women who had experience using daily oral pills. We fit confirmatory factor analysis models on the screening tool items to assess our previously-hypothesized subscale structure. We conducted an exploratory factor analysis of oral PrEP monitoring items to determine the underlying subscale structure. We then assessed the construct validity of each tool by comparing subscales against each other within the current sample and our original sample, from a study conducted in four sites in South Africa, including Cape Town. Results The screening tool structure showed moderate evidence of construct validity. As a whole, the tool performed in a similar way to the original sample. The monitoring tool items, which were revised to assess perceptions about and experiences using daily oral PrEP, factored into five subscales that showed moderate to good reliability. Four of the five subscales had a similar structure overall to the vaginal ring monitoring tool from which they were adapted. Conclusions Accurate measurement of HIV-prevention product adherence is of critical importance to the assessment of product efficacy and safety in clinical trials, and the support of safe and effective product use in non-trial settings. In this study, we provide further validation for these measures, demonstrating the screening tool's utility in additional populations and adapting the monitoring tool's utility for different HIV-prevention products. © 2021 Zissette et al. Article	2021	Zohar M.; Guy S.; Itzchak L.	Knowledge of and willingness to take pre-exposure prophylaxis among men who have sex with men in Israel	Israel Journal of Health Policy Research	-	-	-	-	20454015	10.1186/s13584-021-00500-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85120798534&doi=10.1186%2fs13584-021-00500-x&partnerID=40&md5=de58d9a3f5a5385fdd96bdef123f5ca2	Background: Oral pre-exposure prophylaxis (PrEP) with tenofovir disoproxil fumarate and emtricitabine (TDF/FTC) has been found to reduce viral acquisition among HIV-negative MSM. This cross-sectional study was conducted before pre-exposure prophylaxis (PrEP) licensure in Israel, and aimed to compare men who have sex with men (MSM) who had heard of PrEP with those who had not, as well as MSM willing to take PrEP with those who were hesitant or not willing to take PrEP. Methods: HIV-negative MSM responded anonymously to questionnaires in 2017 regarding their knowledge of and willingness to take PrEP, prior use of PrEP and post-exposure prophylaxis (PEP), and their sexual behaviors. Results: Among 1705 participants, 1431 (83.9%) had heard about PrEP. They were older and more often reported being Jewish, having an academic degree, self-identifying as gay/bisexual, being tested for HIV in the last year, participating in group sex, using alcohol or drugs before or during sex, and having prior use of PrEP/PEP compared with MSM who had not heard about PrEP. A total of 760 (44.8%) participants indicated that they would consider taking PrEP, 567 (33.5%) maybe would consider taking PrEP, and 367 (21.7%) would not take PrEP. Those who were willing to take PrEP had a lower level of education, were involved in high-risk sexual behaviors, used alcohol or drugs before or during sex, and had previously used PrEP/PEP compared with participants who maybe would consider taking or would not take PrEP. When participants were asked to indicate if they were willing to take PrEP at different potential efficacies and costs, the willingness to using PrEP increased with the potential efficacy of the drug and adversely related to its cost. Conclusions: PrEP awareness was high, and 44.8% indicated willingness to take PrEP, especially those who reported high-risk sexual behaviors. This supports the current policy in Israel to allow PrEP to MSM who are at high-risk. In order to maintain a high level of PrEP-adherence, physicians should consider structural barriers, such as negative stigma of being promiscuous, lack of perceived HIV-risk, difficulties in accessing clinics or paying for PrEP, inability to follow-up or low tolerability of the medication. © 2021, The Author(s). Article	2021	Zucchi E.M.; Couto M.T.; Castellanos M.; Dumont-Pena É.; Ferraz D.; Pinheiro T.F.; Grangeiro A.; da Silva L.A.V.; Dourado I.; Pedrana L.; de Resende Santos F.S.; Magno L.	Acceptability of daily pre-exposure prophylaxis among adolescent men who have sex with men, travestis and transgender women in Brazil: A qualitative study	PLOS One	-	-	-	19326203	10.1371/journal.pone.0249293	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105303631&doi=10.1371%2fjournal.pone.0249293&partnerID=40&md5=26f694b385913cb69446ad3837039e88	Background Adolescents face socio-structural, personal and programmatic barriers to HIV prevention services, highlighting the importance of understanding knowledge and acceptability as essential aspects to promote their broader access to pre-exposure prophylaxis (PrEP). We analyzed the acceptability of PrEP among adolescent men who have sex with men (MSM), travestis and transgender women (TGW). Methods A qualitative investigation was conducted as part of the formative research of the PrEP15-19 study, an ongoing demonstration study that analyzes the effectiveness of daily PrEP among adolescent MSM, travestis and TGW aged 15-19 in three Brazilian cities. A total of 37 semi-structured interviews and 6 focus groups were conducted. Building from thematic analysis focusing on participants' sexual encounters, perceptions about PrEP efficacy, and vulnerability contexts, we analyzed prospective acceptability of PrEP. Findings Knowledge about PrEP was incipient and characterized by adolescents' frequent doubts about its prescription and efficacy. The 'ideal' use of PrEP appeared together with consistent condom use, especially in casual sex. PrEP use was also mentioned as depending on increased learning about prevention management over time. Main barriers to PrEP use included the incorporation of a daily medication into participants' routine and its impact on their social lives, especially related to stigma. Concerns over short- and long-term side effects were also reported as barriers to PrEP use. TGW and travestis contrasted using PrEP with the precarity of their life conditions, and some expressed a critical vision about PrEP by associating it with pharmaceuticalization and trans necropolitics. Conclusions Participants' low knowledge and acceptability of PrEP are circumscribed by a rigid perception of condom as the ideal prevention method and the context of their sexual relations. Prospective acceptability highlights that the successful uptake of PrEP depends on overcoming barriers of access to health services and confronting transphobia and homophobia as part of care. © 2021 Zucchi et al. Attitudes and Perceived Barriers to Routine HIV Screening and Provision and Linkage of Postexposure Prophylaxis and Pre-Exposure Prophylaxis among Graduate Medical Trainees	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2021.0029	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85105651814&doi=10.1089%2fapc.2021.0029&partnerID=40&md5=bf4bcaf195ae6e89fc02fa993fdc6e50	New York City is the metropolitan area in the United States with the highest number of new HIV diagnoses nationwide. The End-The-Epidemic (EtE) initiative calls for identifying persons with HIV who remain undiagnosed, linking and retaining persons living with HIV to maximize viral suppression, and facilitate access to pre-exposure prophylaxis (PrEP) for patients at increased risk of HIV. HIV screening represents the first step to both the primary and secondary HIV prevention cascades. We conducted an online, anonymous, cross-sectional survey of residents at all stages of training within four residency programs at one institution in Northern Manhattan between August 2017 and August 2018. All internal medicine, emergency medicine, obstetrics and gynecology trainees, and pediatrics were invited to complete the survey via email. Of 298 eligible trainees, 142 (48%) completed the survey. Most trainees were aware of the HIV testing law and agreed that HIV testing was their responsibility, but few successfully screened most of their patients. Most trainees were not knowledgeable about non-occupational post-exposure prophylaxis (nPEP) or PrEP, but felt that it was important to provide these services across settings. Barriers to HIV, nPEP, and PrEP varied across specialties. Ending the HIV epidemic will require efforts across clinical specialties. In this survey from an EtE jurisdiction, most trainees felt that it is important to provide HIV prevention services in most settings; however, their knowledge and comfort with HIV prevention services other than testing were low. Barriers varied across specialties, and developing specialty-specific materials for trainees may be beneficial. © Copyright 2021, Mary Ann Liebert, Inc., publishers 2021. Article	2022	Abadan, Sheena Sharifi; Hawryluk, Liz; Montandon, Michele; Flowers, Nicole; Schueller, Jane; Eakle, Robyn; Patel, Pragna; Chevalier, Michelle S; Rana, Sangeeta; Amzel, Anouk	Preexposure Prophylaxis Among Pregnant and Lactating People in 18 PEPFAR-Supported Countries: A Review of HIV Strategies and Guidelines	Global Health Science and Practice	-	-	-	2169-575X	10.9745/GHSP-D-22-00129	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9771465	INTRODUCTION: Pregnant and lactating people (PLP) experience heightened risk of acquiring HIV, which adversely impacts their health and increases the risk for vertical HIV transmission. Preexposure prophylaxis (PrEP), as part of a combination prevention package, including condoms, sexually transmitted infection prevention, and regular HIV testing, is a safe, efficacious method to prevent HIV infections among PLP and their infants. This article examines the evolution of strategies and guidance on PrEP services for PLP from 18 countries supported by the U.S. President's Emergency Plan for AIDS Relief (PEPFAR). METHODS: The 18 countries implement PEPFAR-supported prevention of vertical transmission of HIV and PrEP programs. We reviewed a total of 18 national HIV strategic plans, 28 national HIV guidelines, and 54 PEPFAR country operational plans (COPs) published in 2013-2020. We compared documents from 2013 to 2017 to those from 2017 to 2020 to assess for differences after the release of the 2017 World Health Organization recommendations supporting the use of PrEP by PLP at substantial risk of acquiring HIV. RESULTS: National HIV guidelines and PEPFAR COPs that endorsed PrEP for PLP through any categorization increased from 41% to 73% and 11% to 83%, respectively, in the pre-2017 and post-2017 periods. While many documents approved PrEP but not specifically for PLP (10 national strategic plans, 6 national guidelines, and 28 COPs), none of the documents explicitly prohibited PrEP for PLP. CONCLUSION: National HIV guidelines and PEPFAR COPs expanded inclusion of PLP in PrEP eligibility when comparing the pre-2017 and the post-2017 groups. However, policy gaps remain as only 36% (4/11) of the post-2017 national HIV guidelines included PLP as a specific priority population for PrEP. Inclusive national HIV strategic plans and guidelines on PrEP for PLP, together with effective program implementation, remain critical for reducing new infections in PLP and eliminating vertical transmission of HIV.	National policy makers, program implementers, and other key stakeholders should continue to develop and operationalize inclusive national HIV strategic plans and guidelines on PrEP for PLP to reduce new infections in PLP and eliminate vertical transmission of HIV. Article	2022	Abdool Karim S.S.; Baxter C.; Abdool Karim Q.	Advancing HIV prevention using tenofovir-based pre-exposure prophylaxis	Antiviral Therapy	-	-	-	13596535	10.1177/13596535211067589	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85125759825&doi=10.1177%2f13596535211067589&partnerID=40&md5=507c7f9110d1c14c8e5f86309caf5a14	Tenofovir-based pre-exposure prophylaxis (PrEP) revolutionized the global HIV prevention landscape. Prior to the proof-of concept trial in 2010, which demonstrated that tenofovir (TFV) could prevent sexual transmission of HIV, prevention options were largely limited to behavior change, condoms, and circumcision. Several subsequent studies evaluating oral tenofovir disoproxil fumarate (TDF) or the TDF/emtricitabine (FTC) combination as PrEP for HIV prevention provided evidence for regulatory approval and inclusion in national and international guidelines. By 2021, 1.5 million people had initiated oral tenofovir-based PrEP, contributing to declines in HIV incidence in some regions. Here we reflect on how oral tenofovir-based PrEP became an important component of combination HIV prevention programs across the globe. © The Author(s) 2022. Article	2022	Adeagbo, Oluwafemi Atanda; Seeley, Janet; Gumede, Dumsani; Xulu, Sibongiseni; Dlamini, Nondumiso; Luthuli, Manono; Dreyer, Jaco; Herbst, Carina; Cowan, F; Chimbindi, Natsayi; Hatzold, Karin; Okesola, Nonhlanhla; Johnson, Cheryl; Harling, Guy; Subedar, Hasina; Sherr, Lorraine; McGrath, Nuala; Corbett, Liz; Shahmanesh, Maryam	Process evaluation of peer-to-peer delivery of HIV self-testing and sexual health information to support HIV prevention among youth in rural KwaZulu-Natal, South Africa: Qualitative analysis	BMJ Open	-	-	-	20446055	10.1136/bmjopen-2021-048780	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124587924&doi=10.1136%2fbmjopen-2021-048780&partnerID=40&md5=1b25495c4302ed3d46e9a16c94366954	Objective Peer-to-peer (PTP) HIV self-testing (HIVST) distribution models can increase uptake of HIV testing and potentially create demand for HIV treatment and pre-exposure prophylaxis (PrEP). We describe the acceptability and experiences of young women and men participating in a cluster randomised trial of PTP HIVST distribution and antiretroviral/PrEP promotion in rural KwaZulu-Natal. Methods Between March and September 2019, 24 pairs of trained peer navigators were randomised to two approaches to distribute HIVST packs (kits+HIV prevention information): incentivised-peer-networks where peer-age friends distributed packs within their social network for a small incentive, or direct distribution where peer navigators distributed HIVST packs directly. Standard-of-care peer navigators distributed information without HIVST kits. For the process evaluation, we conducted semi-structured interviews with purposively sampled young women (n=30) and men (n=15) aged 18-29 years from all arms. Qualitative data were transcribed, translated, coded manually and thematically analysed using an interpretivist approach. Results Overall, PTP approaches were acceptable and valued by young people. Participants were comfortable sharing sexual health issues they would not share with adults. Coupled with HIVST, peer (friends) support facilitated HIV testing and solidarity for HIV status disclosure and treatment. However, some young people showed limited interest in other sexual health information provided. Some young people were wary of receiving health information from friends perceived as non-professionals while others avoided sharing personal issues with peer navigators from their community. Referral slips and youth-friendly clinics were facilitators to PrEP uptake. Family disapproval, limited information, daily pills and perceived risks were major barriers to PrEP uptake. Conclusion Both professional (peer navigators) and social network (friends) approaches were acceptable methods to receive HIVST and sexual health information. Doubts about the professionalism of friends and overly exclusive focus on HIVST information may in part explain why HIVST kits, without peer navigators support, did not create demand for PrEP. ©	health & safety; HIV & AIDS; public health	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Adimy M.; Molina J.; Pujo-Menjouet L.; Ranson G.; Wu J.	Forecasting the Effect of Pre-Exposure Prophylaxis (PrEP) on HIV Propagation with a System of Differential–Difference Equations with Delay	Mathematics	-	-	-	22277390	10.3390/math10214093	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141876190&doi=10.3390%2fmath10214093&partnerID=40&md5=2f17e3a1c3ca3d2b6c7f1cd371c9020f	The HIV/AIDS epidemic is still active worldwide with no existing definitive cure. Based on the WHO recommendations stated in 2014, a treatment, called Pre-Exposure Prophylaxis (PrEP), has been used in the world, and more particularly in France since 2016, to prevent HIV infections. In this paper, we propose a new compartmental epidemiological model with a limited protection time offered by this new treatment. We describe the PrEP compartment with an age-structure hyperbolic equation and introduce a differential equation on the parameter that governs the PrEP starting process. This leads us to a nonlinear differential–difference system with discrete delay. After a local stability analysis, we prove the global behavior of the system. Finally, we illustrate the solutions with numerical simulations based on the data of the French Men who have Sex with Men (MSM) population. We show that the choice of a logistic time dynamics combined with our Hill-function-like model leads to a perfect data fit. These results enable us to forecast the evolution of the HIV epidemics in France if the populations keep using PrEP. © 2022 by the authors. Article	2022	Agaku I.; Nkosi L.; Gwar J.; Tsafa T.	Gender norms, HIV risk, and attitudes towards pre-exposure prophylaxis and other HIV preventive interventions among South African adolescents	Pan African Medical Journal	-	-	-	19378688	10.11604/pamj.2022.41.136.32881	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129359909&doi=10.11604%2fpamj.2022.41.136.32881&partnerID=40&md5=74b41e9be9ce68d769463ca1ac707848	Introduction: we examined HIV-related social norms and perceptions among South African adolescents aged 15-18 years and evaluated their openness to using pre-exposure prophylaxis (PrEP) to reduce HIV risk. Methods: we analyzed cross-sectional data of 4,567 adolescents aged 15-18 years from the "fifth South African National HIV prevalence, HIV incidence, behaviour and communication survey (2017/2018)". Outcomes of interest in our study were HIV-related social norms and awareness of HIV prevention methods, including pre-exposure prophylaxis (PrEP). Results: our results showed that compared to their female counterparts, a significantly higher percentage of male adolescents endorsed the statement "Men can have two or more sexual partners at the same time" (14.2% vs 10.1%, p=0.021). Condoms were the most popular method of HIV prevention, with 83.5% of all participants reporting awareness. Yet, 35.4% of those sexually active in the past year reported not using condoms all the time. Perceived parental sex education and exposure to community campaigns for HIV prevention were both associated with increased awareness of HIV prevention measures and openness to PrEP. Unaided recall of PrEP was very low (3.7%), but most of those who were HIV seronegative (69.3%) were open to using it after learning about it. Openness towards PrEP was significantly higher among those reporting vs not reporting past-year sexual activity (adjusted prevalence ratio (APR=1.16, 95%CI, 1.06-1.28), and binge-drinking (APR=1.24, 95%CI, 1.08-1.41). Conclusion: this study showed that while many South African adolescents were interested in trying PrEP, initial awareness was low. Ensuring barrier-free access to evidence-based preventive strategies may benefit public health. © Israel Agaku et al.	adolescents; condom; HIV; PrEP; prevention	English	Uganda	Eastern and Southern Africa	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Agot, Kawango; Hartmann, Miriam; Otticha, Sophie; Minnis, Alexandra; Onyango, Jacob; Ochillo, Marylyn; Roberts, Sarah T	"I didn't support PrEP because I didn't know what it was": Inadequate information undermines male partner support for young women's pre-exposure prophylaxis use in western Kenya.	African Journal of AIDS Research	-	-	-	1727-9445	10.2989/16085906.2022.2049831	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10102710	The HIV infection rate is higher among adolescent girls and young women (AGYW) in Africa than men in the same age range. Pre-exposure prophylaxis (PrEP) can be used by women discreetly; however, for most AGYW, male partner approval is desired. We explored PrEP use in the context of relationship violence and power dynamics through focus group discussions and support club sessions with AGYW, in-depth interviews and male sensitisation sessions with male partners of AGYW, and joint sessions with AGYW and their male partners. Many male partners reported hesitancy in supporting partner's PrEP use without sufficient information; most of these became supportive following their engagement in study activities; and most preferred participation in decisions around PrEP use. For AGYW, male involvement minimised partner violence around their PrEP use. The findings support the need for correct PrEP information to be provided to male partners of AGYW and to involve them early on, in decision-making about PrEP use. This is likely to improve uptake of and adherence to PrEP. Article	2022	Agrahari V.; Anderson S.M.; Peet M.M.; Wong A.P.; Singh O.N.; Doncel G.F.; Clark M.R.	Long-acting HIV pre-exposure prophylaxis (PrEP) approaches: recent advances, emerging technologies, and development challenges	Expert Opinion on Drug Delivery	-	-	-	17425247	10.1080/17425247.2022.2135699	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140909248&doi=10.1080%2f17425247.2022.2135699&partnerID=40&md5=2b80d0cbfc7bdf6e372f1c64137d52ae	Introduction: Poor or inconsistent adherence to daily oral pre-exposure prophylaxis (PrEP) has emerged as a key barrier to effective HIV prevention. The advent of potent long-acting (LA) antiretrovirals (ARVs) in conjunction with advances in controlled release technologies has enabled LA ARV drug delivery systems (DDS) capable of providing extended dosing intervals and overcome the challenge of suboptimal drug adherence with daily oral dosing. Areas covered: This review discusses the current state of the LA PrEP field, recent advances, and emerging technologies, including ARV prodrug modifications and new DDS. Technological challenges, knowledge gaps, preclinical testing considerations, and future directions important in the context of clinical translation and implementation of LA HIV PrEP are discussed. Expert opinion: The HIV prevention field is evolving faster than ever and the bar for developing next-generation LA HIV prevention options continues to rise. The requirements for viable LA PrEP products to be implemented in resource-limited settings are challenging, necessitating proactive consideration and product modifications during the design and testing of promising new candidates. If successfully translated, next-generation LA PrEP that are safe, affordable, highly effective, and accepted by both end-users and key stakeholders will offer significant potential to curb the HIV pandemic. © 2022 The Author(s). Article	2022	Aguayo-Romero R.A.; Cannon C.M.; Wirtz A.L.; Cooney E.E.; Mayer K.H.; Reisner S.L.	HIV awareness and prevention strategies among transgender women in the Eastern and Southern United States: findings from the LITE Study	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25999	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139755564&doi=10.1002%2fjia2.25999&partnerID=40&md5=243e79b413bc9435481cdce9e1c8d331	Introduction: Transgender women (TW) experience an increased risk of human immunodeficiency virus (HIV) acquisition. This study identified patterns of HIV awareness and prevention strategies used by TW who were not living with HIV. Methods: Data were drawn from a baseline survey of the LITE Study, a multi-site cohort of TW in Eastern and Southern United States (March 2018–August 2020). We conducted a latent class analysis to identify classes of HIV awareness and prevention strategies among TW who reported past 12-month sexual activity (N = 958) using 10 variables spanning HIV knowledge, receipt and use of HIV prevention strategies, and sexual practices. Due to differences across the cohort arms, classes were estimated separately for TW enrolled in site-based versus online study arms. We identified demographic characteristics, gender-affirming indicators and HIV vulnerabilities associated with class membership. Results: Four parallel classes emerged: class 1 "limited strategies—less sexually active" (15% and 9%, site-based and online, respectively), class 2 "limited strategies—insertive sex" (16%/36%), class 3 "limited strategies—receptive sex" (33%/37%) and class 4 "multiple strategies—insertive and receptive sex" (36%/18%). Across all classes, condomless sex, pre-exposure prophylaxis (PrEP)/post-exposure prophylaxis (PEP) knowledge and awareness were high but reported PrEP/PEP use was low. Compared with class 1, membership in class 4 was associated with being a person of colour (site-based OR = 2.15, 95% CI = 1.15–4.00, online OR = 4.54, 95% CI = 1.09–18.81) increased odds of self-perceived medium-to-high HIV risk (site-based OR = 4.12, 95% CI = 2.17–7.80, online OR = 11.73, 95% CI = 2.98–46.13), sexually transmitted infections (STI) diagnosis (site-based OR = 6.69, 95% CI = 3.42–13.10, online OR = 8.46, 95% CI = 1.71–41.78), current sex work (site-based OR = 6.49, 95% CI = 2.61–16.11, online OR = 10.25, 95% CI = 1.16–90.60) and 2–4 sexual partners in the last 3 months (site-based OR = 2.61, 95% CI = 1.33–5.13). Class 3, compared with class 1, had increased odds of current sex work partners (site-based OR = 3.09, 95% CI = 1.19–8.07) and of having 2–4 sexual partners in the last 3 months (site-based OR = 3.69, 95% CI = 1.85–7.39). Conclusions: TW have varied HIV awareness and prevention strategy utilization, with clear gaps in the uptake of prevention strategies. Algorithms derived from latent class membership may be used to tailor HIV prevention interventions for different subgroups and those reached through facility-based or digital methods. © 2022 The Authors. Article	2022	Ahaus, Patrick; Schmidt, Axel J.; Skaletz-Rorowski, Adriane; Uhrmacher, Mona; Serova, Katja; Kayser, Arne; Wach, Janet; Nambiar, Sandeep; Brockmeyer, Norbert H.; Potthoff, Anja	Changes in the user profiles of HIV pre-exposure prophylaxis (PrEP) before and after PrEP reimbursement	Journal of Infection and Public Health	-	-	-	1876-0341	10.1016/j.jiph.2022.07.012	https://www.clinicalkey.com/#!/content/playContent/1-s2.0-S1876034122001915?returnurl=https:%2F%2Flinkinghub.elsevier.com%2Fretrieve%2Fpii%2FS1876034122001915%3Fshowall%3Dtrue&referrer=https:%2F%2Fpubmed.ncbi.nlm.nih.gov%2F	In Germany, oral HIV pre-exposure prophylaxis (PrEP) was licensed in 2016. Health insurances have been covering the costs since 09/2019. This study compares the sociodemographic profiles of PrEP users before and after PrEP re-imbursement. Participants were recruited in a cross-sectoral sexual health centre in Germany. baseline data were compared for 139 vs 138 individuals starting PrEP from 10/2017–12/2018 (pre-reimbursement cohort) and 09/2019–3/2020; respectively. The pre-reimbursement cohort was further analysed with respect to sexual behaviour and incident sexually transmitted infections (STIs). There were no significant differences in the sociodemographic characteristics between the two cohorts. Almost all PrEP users were men-who-have-sex-with-men (MSM). Before reimbursement, fewer individuals used PrEP on a daily base, and more had used PrEP prior to enrolment. During follow-up (pre-reimbursement cohort), the number of casual and condomless intercourse partners increased, so did the proportion engaging in Chemsex. Incidences of infections with C.trachomatis, N.gonorrhoeae, M.genitalium, and T.pallidum were 45.2; 36.8; 30.1; and 9.2, respectively, per 100 person-years. The goal to make PrEP available to a broader range of people with the covering of costs was only partially reached. Medically supervised use is important to detect and treat STIs. Article	2022	Ahouanto-Chaspoul, Marie; Linard, Françoise; Giannotti, Agnès; Viomesnil, Vanessa; Phammavanh, Jacques; Vanlerberghe, Franck; Segouin, Christophe	Initier la PrEP en médecine de ville et envisager la santé sexuelle des personnes en situation de migration.	Santé Publique	-	-	-	0995-3914	10.3917/spub.223.0383	https://dx.doi.org/10.3917/spub.223.0383	In June 2020, 32,000 people began HIV Pre-exposure prohylaxis (PrEP) in France. The objective of this work is to propose PrEP for migrants in city medical offices in collaboration with hospitals. This is happening in the Goutte d’Or neighborhood of Paris where one-third of the inhabitants were born abroad 1. The Goutte d’Or multidisciplinary and multi-site health center (MSP), composed of independent health professionals, hosted this study.The obstacles to overcome are multifold, notably talking about sexuality and presenting a prevention method that is little known to people in migratory situations. In addition, the first prescription of ARVs in this period had to be given by a hospital doctor (until June 1st 2021) 2.The working hypothesis is that general practitioners can overcome these obstacles within the framework of a protocol defining the discussions on sexuality and the organization of a PrEP consultation along with the GP and a hospital doctor within the city doctor’s office.The study took place between March 1st 2018 and October 31st 2020. 180 questionnaires concerning opportunities for PrEP were distributed by general practitioners (GP) and a midwife from the MSP. 43 people were identified as qualifying for the PrEP. 24 PrEP were prescribed, 23 continuously, and one on demand. A semi-directive interview on sexual health was proposed to the 43 people identified for PrEP consultations.The in-depth interviews confirmed that although sexual health may not be the primary interest of the consultants, there are nevertheless real needs that are not often taken into account. Article	2022	Aidoo-Frimpong G.; Collins R.; Agbemenu K.; Orom H.; Morse G.; Nelson L.	Barriers to HIV Pre-Exposure Prophylaxis Uptake and Ways to Mitigate Them: Perspectives of Ghanaian Immigrants in the United States.	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2022.34.3.209	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131270522&doi=10.1521%2faeap.2022.34.3.209&partnerID=40&md5=22cdb956ca95ae7faa57dd8e05e8fc65	African immigrants in the United States experience disparities in HIV incidence. Pre-exposure prophylaxis (PrEP) effectively prevents HIV infection, yet uptake is low among racial and ethnic minorities. To better understand PrEP adoption among African immigrants, in March 2020, we conducted interviews with Ghanaian immigrants (N = 40) to explore the barriers and ways to overcome these barriers to PrEP adoption. Participants described several barriers (e.g., low HIV knowledge and risk perception, fear of social judgment, cultural values, and norms), which may impede PrEP adoption. We categorized these barriers according to the levels of the socioecological model (individual, interpersonal, community, and organizational/structural factors). Participants also identified strategies to overcome the barriers, such as providing comprehensive education on HIV and PrEP. Our research provides foundational knowledge that can inform future PrEP research with Ghanaian and other African immigrants and offers important insights into factors that may impact PrEP adoption in this population. © 2022 The Guilford Press. Article	2022	Aidoo-Frimpong G.; Orom H.; Agbemenu K.; Collins R.L.; Morse G.D.; Nelson L.E.	Exploring Awareness, Perceptions, and Willingness to Use HIV Pre-Exposure Prophylaxis: A Qualitative Study of Ghanaian Immigrants in the United States	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2021.0156	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122759085&doi=10.1089%2fapc.2021.0156&partnerID=40&md5=b2d331fbfda10c5b40844f5f828677d1	HIV/AIDS disproportionately burdens African immigrants in the United States. Oral pre-exposure prophylaxis (PrEP) is an effective prevention tool for people at high HIV risk, yet uptake is low among racial and ethnic minorities - particularly immigrants. This study explores the awareness, perception, and willingness to use PrEP among Ghanaian immigrants in the United States. WhatsApp, a social media platform, was used to recruit and conduct semi-structured oral interviews with 40 Ghanaian immigrants in March 2020. Interview questions explored awareness of PrEP (whether the participants knew or had knowledge of PrEP before the study), perceptions of PrEP and PrEP users, and willingness to use PrEP. Interviews were audiorecorded, and transcribed. We used NVivo-12 Plus to analyze transcripts for emergent themes. Our sample consisted of Ghanaian adult immigrants (N = 40, 57% male, 71% college educated, age = 32.8 ± 5.7 years, 68% had lived in the United States between 1 and 10 years) residing in 12 US cities. Four major themes emerged: (1) low awareness of PrEP; (2) positive perception of PrEP for HIV prevention; (3) divergent views on PrEP users; and (4) mixed views on willingness to use PrEP. This study presents formative qualitative work, which suggests that Ghanaian immigrants, despite having low awareness of PrEP, may be willing to use PrEP. A key study implication was that stigma reduction interventions might facilitate PrEP scale-up in this population. © Copyright 2021, Mary Ann Liebert, Inc., publishers 2021. Article	2022	Ajiboye, Wale; Nelson, LaRon; Odhiambo, Apondi; Yusuf, Abban; Djiadeu, Pascal; Turner, De Anne; Abubakari, M'Rabiu; Pedersen, Cheryl; Brown, Rebecca; Ni, Zhao; Guillaume, Genevieve; Lofters, Aisha; Williams, Geoffrey	Decision conflict and the decision support needs of HIV PrEP-eligible Black patients in Toronto regarding the adoption of PrEP for HIV prevention	Journal of the International Association of Physicians in AIDS Care	-	-	-	2325-9582	10.1177/23259582211073399	https://journals.sagepub.com/doi/full/10.1177/23259582211073399?rfr_dat=cr_pub++0pubmed&url_ver=Z39.88-2003&rfr_id=ori%3Arid%3Acrossref.org	Objectives: This study examined factors contributing to decision conflict and the decision support needs of PrEP-eligible Black patients. Methods:The Ottawa Decision Support Framework (ODSF) was used to guide the development of a key informant guide used for qualitative data collection. Black patients assessed by healthcare providers as meeting the basic criteria for starting PrEP were recruited through the St. Michael's Hospital Academic Family Health Team and clinical and community agencies in Toronto. Participants were interviewed by trained research staff. Qualitative content analysis was guided by the ODSF, and analysis was done using the Nvivo. Results: Four women and twenty-five men (both heterosexual and men who have sex with men) were interviewed. Participants reported having difficulty in decision making regarding adoption of PrEP. The main reasons for decision-conflict regading PrEP adoption were: lack of adequate information about PrEP, concerns about the side effects of PrEP, inability to ascertain the benefits or risk of taking PrEP, provider's lack of adequate time for interaction during clinical consultation, and perceived pressure from healthcare provider. Participants identified detailed information about PrEP, and being able to clarify how their personal values align with the benefits and drawbacks of PrEP as their decision support needs. Conclusion:Many PrEP-eligible Black patients who are prescribed PrEP have decision conflict which often causes delay in decision making and sometimes rejection of PrEP. Healthcare providers should offer decision support to Black patients who are being asked to consider PrEP for HIV prevention. Theses and Dissertations	2022	ALBUQUERQUE, REBECA ALVES LINS DE	ANÁLISE DE RISCO DE COMPENSAÇÃO, RISCO DE SOROCONVERSÃO E RISCO DE RESISTÊNCIA EM UMA AMOSTRA DE USUÁRIOS DA PROFILAXIA PRÉ-EXPOSIÇÃO AO HIV (PREP) EM CURITIBA/PR	-	-	Pontifícia Universidade Católica do Paraná	-	-	NA	https://pergamum-biblioteca.pucpr.br/acervo/366035	A Profilaxia Pré-Exposição (PrEP) faz parte de uma estratégia combinada de prevenção a infecção por HIV. Objetivo: Analisar o risco de compensação, o risco de resistência e o risco de soroconversão em uma amostra de usuários da PrEP na cidade de Curiitba/Pr. Material e Método: Foram analisadas as informações das bases de dados do Centro de Orientação e Aconselhamento da Secretaria Municipal de Saúde (COA/SMS). As informações selecionadas foram avaliadas quando os participantes recebiam a medicação (T0) e nos momentos T1, T2, T3, T4 e T5, que corresponderam aos acompanhamentos. O risco de compensação foi avaliado pela variação da porcentagem do número de parceiros sexuais após o início do uso da PrEP, e da porcentagem do uso de preservativos, além do número de casos de infecções sexualmente transmissíveis (ISTs) diagnosticados durante o uso do profilático. O risco de resistência foi analisado pela média do número de comprimidos que o usuário deixou de tomar, e o risco de soroconversão, pelo número de pessoas diagnosticadas com HIV durante o uso da PrEP. Os testes t de Student para amostras emparelhadas, de Wilcoxon e o teste não paramétrico das significâncias das mudanças de McNemar foram utilizados para comparação dos resultados, com nível de significância de 0,05. Resultados: A amostra foi composta por 312 participantes, com idades variando entre 18 e 73 anos (média de idade 33,79 ± 7,95 anos). Houve prevalência do sexo masculino (93,91%), autodeclarados brancos (72,11%), solteiros (81,73%) e com mais de 12 anos de estudo (64,74%), sendo a maioria na faixa etária entre 31 e 40 anos (43,91%). Não houve alterações significantes em relação à média de parcerias sexuais, frequência do uso de preservativos, diagnósticos de ISTs e média de comprimidos de PrEP que foram deixados de tomar entre os momentos analisados (p>0,05). Conclusão: O presente estudo mostrou que não houve alteração do risco de compensação, do risco de resistência e soroconversão na amostra avaliada entre o momento do recebimento da medicação e os acompanhamentos. Article	2022	Alessi, Edward J; Kahn, Sarilee; Giwa, Sulaimon; Cheung, Shannon	Those tablets, they are finding an empty stomach': a qualitative investigation of HIV risk among sexual and gender minority migrants in Cape Town, South Africa	Ethnicity and Health	-	-	-	1465-3419	10.1080/13557858.2020.1817342	https://dx.doi.org/10.1080/13557858.2020.1817342	ABSTRACTObjectives: HIV prevalence among sexual and gender minority (SGM) individuals in South Africa is among the highest in the world; however, SGM migrants, an especially vulnerable subgroup of both the SGM and migrant populations, have frequently been overlooked in the country's robust public health response. This qualitative study, guided by syndemics theory, explored the processes by which SGM migrants in South Africa are exposed to HIV risk and those that may reduce this risk.Design: We conducted 6 focus groups with a total of 30 SGM migrants living in Cape Town. Participants were men who have sex with men, women who have sex with women, and transgender women. Transcripts were analyzed using grounded theory.Results: Participants identified a number of interrelated factors (insecure immigration status, financial and housing instability, food insecurity, stigma and discrimination, and lack of social support) contributing to HIV risk. While some took PrEP or HIV medication, adherence could be affected by structural and psychosocial barriers.Conclusion: Interventions that respond to the syndemic impacts on HIV outcomes are needed to reduce disease burden among SGM migrants in South Africa. Article	2022	Alexandra Marshall S.; Barham C.; Neher T.; Zielinski M.J.; Brinkley-Rubinstein L.; Gorvine M.M.; Zaller N.	Acceptability of a Community Health Worker Program to Link High-Risk People in Jail to HIV Pre-Exposure Prophylaxis	Journal of Health Care for the Poor and Underserved	-	-	-	10492089	10.1353/hpu.2022.0012	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124615822&doi=10.1353%2fhpu.2022.0012&partnerID=40&md5=da8ccfbbc43f1814ac7a24648813d33c	Background. People involved in the criminal justice system (PICJS) are at a disproportionate risk for HIV infection. Pre-exposure prophylaxis (PrEP) is highly effective for HIV prevention; however, there are barriers to accessing and remaining on PrEP. We explored perspectives on partnering with a community health worker (CHW) to link PICJS to PrEP. Methods. We interviewed PICJS (n=21) and relevant stakeholders (n=15). Results. The following themes emerged: 1) All participants were receptive to the idea of a CHW program and believed it would be valuable; 2) the PICJS participating in the CHW program would need immediate contact post-release and continuous follow-up with the CHW; 3) desirable program components included HIV education and information about PrEP; 4) participants mentioned several facilitators and barriers to successfully implementing the CHW program; and 5) the CHW needs to be relatable. Conclusion. Our findings suggest that a PrEP linkage program facilitated by a CHW would be desirable. © Meharry Medical College. Article	2022	Algarin, Angel B; Shrader, Cho Hee; Hackworth, Benjamin T; Ibanez, Gladys E	Condom use likelihood within the context of PrEP and TasP among men who have sex with men in Florida: a short report	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2021.1883515	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8353001	Despite the development of targeted interventions for men who have sex with men, this population continues to comprise the majority of new HIV diagnoses. Though condoms are highly efficacious, some sexually active MSM use sero-sorting as a method of HIV prevention. This study aimed to characterize: (1) differences between partner sero-status and condom use likelihood, and (2) demographic, behavioral, and knowledge-related factors influencing condom use likelihood with varying sero-status partners. Using convenience sampling, 150 sexual and gender minority men completed a survey on PrEP and sexual behaviors. The majority of participants identified as racial/ethnic minorities (51.7%), having 4 years of college or more (52.0%), and being HIV-negative (not on PrEP) (68.8%). Our sample reported the lowest average condom use likelihood with a partner on PrEP (2.93 ± 1.39) and the highest average likelihood with an HIV-positive partner (unknown VL) (4.57 ± 0.98). Age, race/ethnicity, education, HIV-status, and HIV and PrEP knowledge were significantly associated with differences in condom use likelihood. Our findings elucidate the complexity of sero-sorting scenarios and decision-making processes in the context of biomedical HIV prevention. These results may provide insight for future condom use and sero-sorting interventions in the context of biomedical HIV prevention. Article	2022	Allen D.C.; Rabionet S.E.; Popovici I.; Zorrilla C.D.	Acknowledging and addressing the gender disparity in pre-exposure prophylaxis use for HIV prevention	Journal of Pharmaceutical Health Services Research	-	-	-	17598885	10.1093/jphsr/rmac025	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85160682485&doi=10.1093%2fjphsr%2frmac025&partnerID=40&md5=8d0d80355053d7a740c249fbf65cc6bf	Objective: One in four persons living with HIV in the USA is a woman. While the annual HIV diagnoses for 2019 decreased by approximately 9% when compared with 2015, this decrease was seen in men, while the rates remained stable for women. Pre-exposure prophylaxis (PrEP) is one major biomedical tool that could benefit women at risk of HIV. However, women only account for approximately 5% of PrEP users annually. The objective of this study is to identify and address the gender disparity in PrEP use. Methods: This study used epidemiological data from the AIDSVu database to confirm the presence of a gender disparity in PrEP use across the USA. Cross-sectional data from 2019 showed that PrEP use was significantly higher in men, which suggested the existence of a disparity. The PrEP-To-Need ratio was then used to examine the trends in PrEP use relative to the rate of HIV infections, from 2012 to 2019, and to confirm the existence of the gender disparity in PrEP use. Key findings: There is a marked gender disparity in PrEP use. This disparity is widening and therefore demands more attention to women at risk of HIV. Some recommendations for addressing the disparity include the following: raising awareness, capacity building for providers, scaling up efforts to better reach women at risk of HIV and additional research to understand the drivers of the disparity. Conclusions: Policy makers could therefore prioritize the health outcomes of women by promoting research and education aimed at extending PrEP offerings to effectively reach women. © 2022 The Author(s). Article	2022	Allison B.A.; Widman L.; Stewart J.L.; Evans R.; Perry M.	Adherence to Pre-Exposure Prophylaxis in Adolescents and Young Adults: A Systematic Review and Meta-Analysis	Journal of Adolescent Health	-	-	-	1054139X	10.1016/j.jadohealth.2021.04.001	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85107081044&doi=10.1016%2fj.jadohealth.2021.04.001&partnerID=40&md5=01e595db2f06ce2cda54d31a285c047c	This meta-analysis synthesized the proportion of adolescents and young adults (AYAs) who are adherent to pre-exposure prophylaxis (PrEP) and factors moderating adherence. A systematic search was conducted of studies published through May 2020 using PubMed, PsycInfo, Cochrane, EMBASE, and CINAHL. Included studies reported the proportion of AYAs (mean age ≤ 29 years) who were PrEP adherent. PrEP adherence was meta-analyzed using random-effects models. Secondary analyses evaluated potential moderating variables. A total of 41 individual samples, from 29 studies, of 8,679 AYA (weighted average age = 23.8 years) were synthesized. The proportion of AYA who met study-defined thresholds for PrEP adherence was .64 (95% confidence interval .57–.71) across studies. Subgroup analyses revealed that adherence was lower in young cisgender women (.46) than young men who have sex with men (.65) and serodiscordant heterosexual couples (.98). Adherence was higher in studies initiated after 2012 (.70) than earlier studies (.47). No differences based on participant age, country, or strategies to promote adherence were found. Across published studies to date, 64% of AYA demonstrate adequate PrEP adherence. Findings can be used to guide PrEP adherence interventions and also provide directions for future research on PrEP among AYA. © 2021 Society for Adolescent Health and Medicine	Adherence; Adolescents; Pre-exposure prophylaxis; Young adults	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	Alt M.; Rotert P.; Conover K.; Dashwood S.; Schramm A.T.	Qualitative investigation of factors impacting pre-exposure prophylaxis initiation and adherence in sexual minority men	Health Expectations	-	-	-	13696513	10.1111/hex.13382	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85121097006&doi=10.1111%2fhex.13382&partnerID=40&md5=2537e978b6b12e39232a478463fec239	Introduction: Men who have sex with men continue to account for the majority of new HIV infections in the United States. Many of those with new infections are unaware that they have HIV. Preventative measures continue to be essential in reducing new infections, with pre-exposure prophylaxis (PrEP) being widely recommended. Objectives: The overall aim of this qualitative study is to explore the impact of stigma, patient–provider dynamics and patient perception of PrEP on men's engagement with PrEP in a primary care setting. Methods: The Consensual Qualitative Research Methodology (Hill, 2012) was used to explore the experiences of 14 men receiving care for PrEP at a Family Medicine clinic in the Midwest. Semistructured interviews were conducted to allow for depth of understanding of individuals' experience. Results: Four major domains were identified: motivation to pursue PrEP, barriers and adherence to care, beliefs about how PrEP is perceived by others and experiences discussing sexual health and PrEP with providers. Conclusion: It is important to better understand factors contributing to the pursuit of and adherence to HIV prevention measures and HIV care. Further, health systems and providers are encouraged to consider opportunities in terms of how their practice can destigmatize PrEP use and offer a welcoming environment for those pursuing HIV prevention. Patient or Public Contribution: Patients were involved in the study through their participation in semistructured interviews, which provided the data analysed for this study. There was no additional participation beyond the one-time interview or follow-up poststudy. Their interviews helped contribute to our better understanding of the needs and experiences of those receiving PrEP-related care. © 2021 The Authors. Article	2022	Alves Dos Santos L.; Grangeiro A.; Couto M.T.	HIV Pre-Exposure Prophylaxis (PrEP) among men who have sex with men: peer communication, engagement and social networks	Ciência & Saúde Coletiva	-	-	-	14138123	10.1590/1413-812320222710.06542022EN	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138245443&doi=10.1590%2f1413-812320222710.06542022EN&partnerID=40&md5=c06599f6e1b4379c5d4c60475ffc7873	HIV Pre-Exposure Prophylaxis (PrEP) has renewed optimism in controlling the HIV epidemic, despite its continued growth among men who have sex with men (MSM). The popularity of dating-sexual dating apps and digital media platforms in exchanging information and experiences about PrEP on peer social networks is recognized. However, studies on content, motivations, and scope in HIV prevention are scarce. The article aims to understand the dynamics of virtual and face-to-face peer networks among MSM for the decision to use PrEP, its disclosure, and publicity. Qualitative study using semi-structured interviews with 48 PrEP users from five Brazilian cities. Most interviewees share information and experiences about PrEP in peer social networks. However, its publication reveals tensions arising from the permanence of stigmas associated with homosexuality and HIV. The protagonism in exposing the use of PrEP expresses commitment to attracting new users. The relevance of peer social networks in sharing experiences and information about PrEP has the potential to diversify the target audience and expand and democratize PrEP coverage in the country. © 2022, Associacao Brasileira de Pos - Graduacao em Saude Coletiva. Theses and Dissertations	2022	ALVES, PATRICIA IOLANDA COELHO	ADAPTAÇÃO DO INSTRUMENTO CEAT-VIH PARA VERIFICAR A ADESÃO À PROFILAXIA PRÉ-EXPOSIÇÃO AO HIV (PrEP) E ANÁLISE DAS PROPRIEDADES MÉTRICAS	-	-	Universidade Federal do Triângulo Mineiro	-	-	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=13178822	A profilaxia pré-exposição ao vírus da imunodeficiência humana (HIV) (PrEP) surgiu como uma nova ferramenta, visando quebrar o elo na cadeia de transmissão do HIV e contribuir para o alcance das metas relacionadas ao fim da epidemia. Devido à inexistência de instrumentos que avaliem a adesão dessa profilaxia, buscou-se na literatura ferramentas que se aproximassem do objetivo de mensuração da adesão a esta terapia profilática. Assim sendo, pretende-se com este estudo, adaptar e validar o instrumento Cuestionario para la Evaluación de la Adhesión al Tratamiento Antiretroviral (CEAT-VIH) para o público em uso da PrEP, buscando fornecer uma ferramenta que constitua uma métrica da adesão ao medicamento e dessa forma contribuir na tomada de decisão para o enfrentamento dos nós críticos identificados, bem como estimular o desenvolvimento de ações aos grupos com maior possibilidade de infecção e falta de adesão. Estudo metodológico que visou realizar a adaptação do instrumento Cuestionario para la Evaluación de la Adhesión al Tratamiento Antiretroviral CEAT-VIH para utilização em usuários da PrEP. Esta pesquisa foi desenvolvida em um Ambulatório de Especialidades no Triângulo Mineiro de Minas Gerais e em um Centro de Referência em Especialidades no estado de São Paulo. Os participantes deste estudo foram as pessoas em utilização da PrEP, sem diagnóstico de HIV, maiores de 18 anos, e que aceitaram participar do processo. Foram realizadas as seguintes etapas para a adaptação e verificação das propriedades métricas: O instrumento CEAT-PrEP foi pautado na versão original, adaptando-o para o público que utiliza a PrEP. Adaptação de alguns itens/substituição de palavras do contexto da versão original CEAT-HIV para a adaptação denominada de CEAT- PrEP, versão 1; Avaliação e adequação por comitê de especialistas e apreciação pelo autor do instrumento original, denominada de CEAT- PrEP, versão 2; Avaliação semântica e obtenção da versão 3; Pré-teste e obtenção da versão final. Não houve considerações pela população, portanto manteve-se a versão 3 do CEAT- PrEP, consolidando a Versão Final do questionário do CEAT- PrEP. O Comitê de Especialistas foi um grupo composto por profissionais da área e especialistas no assunto. A validade convergente foi testada por correlações da medida da Escala de Autoestima Rosemberg. A consistência interna dos itens do CEAT-PrEP foi calculada por meio do coeficiente alfa de Cronbach. A confiabilidade teste-reteste foi verificada através do coeficiente de correlação de Spearman para os itens e do Coeficiente de Correlação Intraclasse para os fatores. Os participantes foram abordados na sala de espera dos ambulatórios de especialidades, em situação de privacidade, receberam o convite para participação no estudo e a apresentação do Termo de Esclarecimento. A presente pesquisa contou com 83 participantes, com idade entre 22 e 73 anos (média 34,0; DP 9,8), a maioria composta por homens (86,7%) e homossexuais (56,6%). Houve prevalência de homens que fazem sexo com homens (71,1%), relataram não utilizar camisinha nas relações sexuais 45,8% e 33,7% disseram que não usam a camisinha devido à possibilidade de uso da PrEP. Houve correlação positiva e moderada entre os escores totais do CEAT-PrEP com os escores totais da Escala de Autoestima de Rosemberg (EAR) (r=0,227 p=0,039). Na comparação entre grupos houve correlações significativas como a cor de pele branca, orientação sexual heterossexual também foi significativa, possuir casa própria também apresentou significância, assim como se declarar espírita, possuir apenas um companheiro nos últimos 12 meses e nunca ter feito programas sexuais. Considerando a análise de consistência interna, o alfa de Cronbach para o escore total foi satisfatório (0,731). Para o teste e reteste foi encontrado um valor de p para o Teste de correlação intraclasse (ICC) de 0,562 indicando um resultado moderado. A profilaxia pré-exposição ao HIV (PrEP), com uso de antirretrovirais para diminuir o risco de infecção pelo vírus, tem se apresentado efetiva e segura naqueles que possuem maior risco de adquirir a infecção. É um recurso terapêutico complementar, o qual deve ser combinado a outras formas de profilaxia contra infecção sexual transmissível, pois consiste numa estratégia efetiva para atenuar as chances de contágio pelo HIV. O instrumento adaptado CEAT-PrEP para a mensuração da adesão à terapia profilática antiviral apresentou propriedades métricas satisfatórias para a utilização no Brasil e pode nortear as ações assistenciais. Theses and Dissertations	2022	Ambrose, Sharita Jewell; Ayars, Candace	Knowledge, Attitudes, HIV Behavioral Self-Efficacy, and Willingness to Use HIV Pre-Exposure Prophylaxis (PrEP) Among African American Women Using Social Media	-	-	A.T. Still University	-	NA	NA	https://www.proquest.com/dissertations-theses/knowledge-attitudes-hiv-behavioral-self-efficacy/docview/2727588521/se-2?accountid=8113	African American women experience a disproportionate burden of human immunodeficiency virus (HIV), acquired immune deficiency syndrome (AIDS), and other sexually transmitted infections (Painter, Wingood, DiClemente, DePadilla, & Simpson-Robinson, 2012). Pre-exposure prophylaxis (PrEP) is a daily pill to prevent HIV infection in people who do not have HIV. A disparity exists in educating about, awareness of, and access to PrEP among African American women. Although African American women rank high in HIV rates, minimal access to PrEP has been available for this population. Addressing factors influencing PrEP awareness, attitudes, and behavioral self-efficacy among African American women can contribute to effective strategies to educate African American women about PrEP and reduce PrEP-related disparities. This study aimed to examine whether PrEP knowledge, PrEP attitudes, HIV behavioral self-efficacy, and an educational PrEP video delivered in a nonclinical setting predicted willingness to use PrEP among African American women who use social media. The Information-Motivation-Behavioral Skills (IMB) for PrEP survey and a cross-sectional correlational research design with a logistic regression model were used to measure PrEP awareness, willingness to use PrEP, PrEP knowledge, and PrEP attitudes/motivations. The analysis included 99 participants; 50 were in the educational video group, and 49 were in the control (no video) group. The binary logistic regression analysis indicated that these variables significantly predicted willingness to use PrEP. The results showed that PrEP attitudes were positively associated with willingness to use PrEP. Article	2022	Amin, Janaki; Vaccher, Stefanie; Templeton, David J; Bavinton, Benjamin; Jin, Fengyi; Zablotska, Iryna; Matthews, Gail; Ogilvie, Erin; Yeung, Barbara; Ooi, Catriona; Dharan, Nila; Baker, David A; Read, Phillip; Guy, Rebecca; Grulich, Andrew E	Low Prior Exposure and Incidence of Hepatitis C in Human Immunodeficiency Virus-Negative Gay and Bisexual Men Taking Preexposure Prophylaxis (PrEP): Findings From the Expanded PrEP Implementation in Communities-New South Wales Prospective Implementation Study.	Clinical Infectious Diseases	-	-	-	1537-6591	10.1093/cid/ciac231	https://dx.doi.org/10.1093/cid/ciac231	BACKGROUND: The use of preexposure prophylaxis (PrEP) for the prevention of human immunodeficiency virus (HIV) has raised concerns of increased sexual risk behaviors. These behaviors may be associated with increased incidence of sexually acquired hepatitis C virus (HCV) among gay and bisexual men. METHODS: The Expanded PrEP Implementation in Communities-New South Wales (EPIC-NSW) study was a cohort study of daily coformulated tenofovir disoproxil fumarate and emtricitabine for HIV prevention. We recruited 9596 people at high risk of HIV acquisition from 31 clinics across New South Wales and the Australia Capital Territory in Australia. We report prior exposure to HCV and incidence in this cohort between 2016 and 2019. RESULTS: At least 1 HCV test result was available for 8658 (90.2%) participants. These individuals had a median age of 34 years (interquartile range, 28-43), most of whom were male (8530, 98.5%), identified as gay (7944, 91.8%), and were born in Australia (51.8%). Prior exposure to HCV was detected among 81 participants at baseline (0.9%; 95% confidence interval CI: .71.2). Twenty of 8577 participants were diagnosed with incident infection (rate 0.2/100 person-years 95% CI: .1-.3/100 person-years). They were significantly older (median age 41 years vs 34 years, Pâ=.044), and more likely to report methamphetamine use at baseline (incidence rate ratio, 2.7 95% CI: 1.00-7.2) than those without incident infection. CONCLUSIONS: In this population of PrEP users, HCV prior exposure and incidence were low. With high levels of HCV and HIV testing and treatment, the dual goals of HIV and HCV elimination could be achieved in this population. Article	2022	Amogne M.D.; Sanders E.J.; Belihu W.B.; Sundewall J.; Agardh A.	Condom failure and pre-exposure prophylaxis use experience among female sex workers in Ethiopia: a qualitative study	BMC Public Health	-	-	-	14712458	10.1186/s12889-022-13468-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131000954&doi=10.1186%2fs12889-022-13468-3&partnerID=40&md5=de1833a37b1c671b41ca37dfd801972c	Background: Female sex workers (FSW) remain a highly exposed group for HIV/STIs due to different factors including condom failure. In Ethiopia, pre-exposure prophylaxis (PrEP) has recently been introduced as an intervention strategy to prevent new HIV infections, but knowledge about FSWs' experiences of condom failure and PrEP use remains scarce. Therefore, this study explores FSWs' experiences concerning condom failure and their attitudes towards, and experiences of, PrEP uptake. Method: A qualitative study using in-depth interviews was conducted among FSWs in Addis Ababa. A manifest and latent content analysis method was applied to identify categories and emerging themes. Result: Seventeen FSWs (10 who started on PrEP, 1 who discontinued, and 6 who didn't start) were interviewed. FSWs described the reasons behind condom failure, the mechanisms they used to minimize the harm, and their attitudes towards PrEP use. FSWs struggled with the continuous risk of condom failure due to factors related to clients' and their own behavior. PrEP was mentioned as one the strategies FSWs used to minimize the harm resulting from condom failure, but PrEP use was compounded with doubts that deterred FSWs from uptake. FSWs' misconceptions, their lack of confidence, and PrEP side effects were also mentioned as the main challenges to start taking PrEP and/or to maintain good adherence. Conclusion: The demands and behavior of the clients and FSWs' own actions and poor awareness were factors that increased the exposure of FSWs to condom failure. In addition, the challenges associated with PrEP uptake suggest the need for user-friendly strategies to counteract these barriers and facilitate PrEP uptake. © 2022, The Author(s). Article	2022	Anato J.L.F.; Panagiotoglou D.; Greenwald Z.R.; Blanchette M.; Trottier C.; Vaziri M.; Charest L.; Szabo J.; Thomas R.; Giroux M.M.	Chemsex and incidence of sexually transmitted infections among Canadian pre-exposure prophylaxis (PrEP) users in the lActuel PrEP Cohort (2013-2020)	Sexually Transmitted Infections	-	-	-	13684973	10.1136/sextrans-2021-055215	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136061269&doi=10.1136%2fsextrans-2021-055215&partnerID=40&md5=b057d78b52921fbf57924c2d03da37d1	Objectives Use of illicit substances during sex (chemsex) may increase transmission of HIV and other STIs. Pre-exposure prophylaxis (PrEP) is highly effective at preventing HIV transmission, providing an important prevention tool for those who practise chemsex. However, it does not prevent acquisition of other STIs. We aim to examine the impact of chemsex on STI incidence among gay, bisexual and other men who have sex with men (gbMSM), and transgender women using PrEP in Montreal, Canada. Methods We linked baseline sociodemographic and behavioural data with follow-up STI testing from 2013 to 2020 among PrEP users in the lActuel PrEP Cohort (Canada). Focusing on the 24 months following PrEP initiation, we estimated the effect of chemsex reported at baseline on cumulative incidence of gonorrhoea and chlamydia using Kaplan-Meier curves and survival analyses. We investigated the role of polysubstance use and effect modification by sociodemographic factors. Results There were 2086 clients (2079 cisgender gbMSM, 3 transgender gbMSM, 4 transgender women) who initiated PrEP, contributing 1477 years of follow-up. There were no incident HIV infections among clients on PrEP. Controlling for sociodemographic confounders, clients reporting chemsex at baseline had a 32% higher hazard of gonorrhoea/chlamydia diagnosis (adjusted HR=1.32; 95% CI: 1.10 to 1.57), equivalent to a risk increase of 8.9 percentage points (95% CI: 8.5 to 9.4) at 12 months. The effect was greater for clients who reported polysubstance use (adjusted HR=1.51; 95% CI: 1.21 to 1.89). The strength of the effect of chemsex on STI incidence varied by age, education and income. Conclusion Among PrEP users, chemsex at baseline was linked to increased incidence of gonorrhoea and chlamydia. This effect was stronger for people reporting multiple chemsex substances. The high STI incidence among gbMSM who report chemsex highlights the importance of PrEP for this population and the need for integrated services that address the complexities of sexualised substance use. © 2022 BMJ Publishing Group. Article	2022	Andriano, Tyler M; Arnsten, Julia; Patel, Viraj V	Social determinants of health and HIV Pre-Exposure Prophylaxis (PrEP) interest and use among young Black and Latinx sexual minority men.	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0267031	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9012374	Young Black and Latinx sexual minority men (YBLSMM) have low use of HIV pre-exposure prophylaxis (PrEP), despite high rates of new HIV diagnosis. While unmet social determinants of health (SDOH) have been associated with low uptake of preventive health services, this association is unknown for PrEP. To understand the relationship between SDOH and PrEP adoption in this population, we analyzed data from an online survey of HIV-negative YBLSMM aged 18-29 in New York City (n = 143). Participants completed a 17-item SDOH needs scale measuring basic, health/social-services, and economic needs. We used regression models to examine associations of unmet SDOH with outcomes of intention to use PrEP and current PrEP use. Of those not on PrEP (n = 114), 69 (61%) intended to use PrEP. More unmet SDOH needs overall were associated with intention to use PrEP (OR 1.4; 95% CI 1.1, 2.0), as were more unmet basic needs (OR 1.7; 95% CI 1.1, 2.5) and more unmet economic needs (OR 1.3; 95% CI 1.0, 1.7). Unmet SDOH needs were not associated with current PrEP use. Findings suggest that intention to use PrEP among YBLSMM is a likely marker of unmet SDOH needs, as YBLSMM with unmet needs may have limited resources to support moving from intention to actual use. Future research should evaluate programs engaging YBLSMM intending to use PrEP with interventions to screen for and address SDOH. Article	2022	Appenroth, MN; Marcus, U; Albrecht, S; Jansen, K; Gunsenheimer-Bartmeyer, B; Bremer, V; Koppe, U	Similar Sexual Behaviour yet Different Outcomes: Comparing Trans and Gender Diverse and Cis PrEP Users in Germany Based on the Outcomes of the PrApp Study	Sexes	-	-	-	2411-5118	10.3390/sexes3010014	https://www.mdpi.com/2411-5118/3/1/14	Little knowledge about pre-exposure prophylaxis (PrEP) use in trans and gender diverse (TGD) communities in Germany exists. The PrApp Study collected data on PrEP use and sexual behaviour among PrEP users in Germany. Descriptive methods and logistic regression were used to describe PrEP use among TGD and cis persons. A total of 4350 PrEP users in Germany were included, with 65 (1.5%) identified as TGD. Compared to cis participants, TGD participants were younger (median age 29 vs. 37 years) and more likely to have a lower income (adjusted odds ratio (aOR) = 4.4; 95% confidence interval (CI) = 2.4-8.2) and be born outside Germany (aOR = 2.5; 95% CI = 1.3-4.5). On-demand PrEP use was higher in TGD participants (aOR = 1.9; 95% CI = 1.0-3.5) and numerically more TGD obtained PrEP from informal sources (aOR = 1.8; 95% CI = 0.9-3.5). Testing behaviour, condom use, and number of sexual partners were comparable between both groups. Socioeconomic disparities may constitute structural barriers for TGD people to access PrEP, leading to more informal and on-demand use. PrEP providers need to reduce access barriers for TGD PrEP users and provide information on safe PrEP use for this population. Article	2022	Argenyi M.S.; Molotnikov L.E.; Leach D.H.; Roosevelt K.A.; Klevens R.M.; Hsu K.K.	Gaps in HIV Preexposure Prophylaxis Continuum of Care Following State Partner Services for Massachusetts Primary and Secondary Syphilis Cases, 2017 to 2018	Sexually Transmitted Diseases	-	-	-	1485717	10.1097/OLQ.0000000000001669	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136463427&doi=10.1097%2fOLQ.0000000000001669&partnerID=40&md5=55c9c0a043564b0e73eaf4f72309b5de	Background Human immunodeficiency virus (HIV) preexposure prophylaxis (PrEP) reduces HIV acquisition. We used a PrEP continuum of care to measure impact of field epidemiologist-facilitated referrals for PrEP-naive infectious syphilis cases across multiple clinical and pharmacy sites of care. Methods Retrospective analysis of 2017 to 2018 primary and secondary syphilis cases, medical charts, and pharmacy data to identify PrEP education, referral offer, referral acceptance, first visit, prescription pickup (PrEP initiation) and 2 to 3 months (PrEP persistence). The HIV seroconversion was determined using database match at syphilis diagnosis date and at 12 months. χ2 or Fisher's exact tests were used to compare demographic characteristics associated with steps with lower progression rates. Results Of 1077 syphilis cases, partner services engaged 662 of 787 (84%) HIV-negative cases; 490 were PrEP-naive, 266 received education, 166 were offered referral, 67 accepted referral, 30 attended an initial appointment, and 22 were prescribed PrEP. Of 16 with pharmacy data, 14 obtained medication, and 8 persisted on PrEP at 2 to 3 months. Continuum progression was lowest from (1) PrEP-naïve to receiving PrEP education, (2) offered referral to referral acceptance, and (3) referral acceptance to initial PrEP appointment. Men with male partners were more likely to receive PrEP education or accept a referral. Higher social vulnerability was associated with increased PrEP referral acceptance. Conclusions Few individuals accepted PrEP referrals and persisted on PrEP. Field and clinic data capture were inconsistent, possibly underestimating referral volume and impact of field engagement. Efforts aimed at increasing referral acceptance and clinic attendance may improve PrEP uptake especially among women and heterosexual men with syphilis. © Lippincott Williams & Wilkins.	adultArticlecontrolled studydemographicsepidemiologistfemaleheterosexual malehuman	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Arnold T.; Haynes T.; Foster P.; Parker S.; Monger M.; Malyuta Y.; Cain O.; Coats C.S.; Murphy M.; Thomas G.; Sockwell L.; Klasko-Foster L.; Galipeau D.; Dobbs T.E.; Smith M.; Mena L.; Nunn A.	African American Clergy Recommendations to Enhance the Federal Plan to End the HIV Epidemic: A Qualitative Study	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03415-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85113177619&doi=10.1007%2fs10461-021-03415-5&partnerID=40&md5=19626c44e5f5340f67b15189a4866df1	African Americans in the southern United States continue to be disproportionately affected by HIV. Although faith-based organizations (FBOs) play important roles in the social fabric of African American communities, few HIV screening, care, and PrEP promotion efforts harness the power of FBOs. We conducted 11 focus groups among 57 prominent African American clergy from Arkansas, Mississippi, and Alabama. We explored clergy knowledge about the Ending the HIV Epidemic: A Plan for America (EHE); normative recommendations for how clergy can contribute to EHE; and how clergy can enhance the HIV care continua and PrEP. We explored how clergy have responded to the COVID-19 crisis, and lessons learned from pandemic experiences that are relevant for HIV programs. Clergy reported a moral obligation to participate in the response to the HIV epidemic and were willing to support efforts to expand HIV screening, treatment, PrEP and HIV care. Few clergy were familiar with EHE, U = U and TasP. Many suggested developing culturally tailored messages and were willing to lend their voices to social marketing efforts to destigmatize HIV and promote uptake of biomedical interventions. Nearly all clergy believed technical assistance with biomedical HIV prevention and care interventions would enhance their ability to create partnerships with local community health centers. Partnering with FBOs presents important and unique opportunities to reduce HIV disparities. Clergy want to participate in the EHE movement and need federal resources and technical assistance to support their efforts to bridge community activities with biomedical prevention and care programs related to HIV. The COVID-19 pandemic presents opportunities to build important infrastructure related to these goals. © 2021, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Arnold-Forster D.; Horne R.; Nutland W.; Wayal S.; Rayment M.; Rae C.; Desai M.; Clarke A.; Sullivan A.; McCormack S.; Gafos M.	Perceptions and Practicalities Influencing Pre-exposure Prophylaxis Adherence Among Men Who Have Sex with Men in England	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03624-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124963202&doi=10.1007%2fs10461-022-03624-6&partnerID=40&md5=4b952f2f21bf93fa5bde1a1081a21cea	PrEP is highly effective for HIV prevention but requires adequate adherence. In this paper we use the perceptions and practicalities approach (PAPA) to identify factors that influenced PrEP adherence using qualitative data from the PROUD study. From February 2014 to January 2016, we interviewed 41 gay, bisexual and other men-who-have-sex-with-men and one trans woman who were enrolled in the study. We purposively recruited participants for interview based on trial arm allocation, adherence and sexual risk behaviours. The interviews were conducted in English, audio-recorded, transcribed, coded and analysed using framework analysis. Participants in general were highly motivated to use and adhere to PrEP, and this was linked to strong perceptions of personal necessity for PrEP as they felt at risk of HIV and viewed PrEP as highly effective. On the other hand, concerns about side effects and HIV resistance did inhibit PrEP initiation and adherence although this was uncommon. Practical factors such as daily routine, existing habitual pill-taking and pill storage impacted adherence. Drug and alcohol use rarely caused participants to miss doses. These findings indicate that using the principals of PAPA to unpick influencers of PrEP use, could help tailor adherence support in PrEP programmes. © 2022, The Author(s). A qualitative study was conducted using semi-structured interviews with twenty health care providers in nine clinics. In addition, the "Consolidated Framework for Implementation Research" was used to guide data collection and the analysis. Results are as follow: 1. Characteristics of the intervention: providers recognize PrEP as an innovative therapy with proven effectiveness; they recommend that it should be implemented by national regulations of the Ministry of Health and Social Protection with centralized purchase of medicines and adaptations to regional diversities. To assemble PrEP in clinics, they recommend linking it to preventive Sexual Health Programs, guided by trained interdisciplinary teams. 2. External environment: it was recommended to strengthen networking with the Secretaries of Health, Profamilia and LGTBI organizations; change contracting conditions with Health Promoting Entities to include PrEP aimed at partners of patients with HIV, and finance people who cannot pay for it with public resources. 3. Internal environment: climate and availability of implementation perceived as favorable for the adoption of PrEP. In order to reduce organizational tensions due to change, expanding training plans are recommended. 4. Implementation process: the design of national, local and institutional plans is recommended, as well as the selection of key internal and external leaders. It is concluded that health providers in the HIV clinics in Colombia perceive a favorable environment for the adoption of PrEP in the country. © 2022 Pontificia Universidad Javeriana. Article	2022	Asiago-Reddy E.A.; McPeak J.; Scarpa R.; Braksmajer A.; Ruszkowski N.; McMahon J.; London A.S.	Perceived access to PrEP as a critical step in engagement: A qualitative analysis and discrete choice experiment among young men who have sex with men	PLOS One	-	-	-	19326203	10.1371/journal.pone.0258530	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123516433&doi=10.1371%2fjournal.pone.0258530&partnerID=40&md5=f3102d4528c363d94384450ae6322dd4	Young Men who have Sex with Men (MSM) continue to face disproportionate HIV risk. Despite its well accepted role in HIV prevention, pre-exposure prophylaxis (PrEP) uptake remains below desired goals. Systemic barriers to PrEP access, including insurance complexity, cost, and wait times to start PrEP may contribute to low PrEP engagement. We conducted in-depth interviews and designed a discrete choice experiment (DCE) to assess preferences for and barriers to PrEP access in the United States. Methods: We conducted in-depth interviews with 18 MSM aged 18-30 years old who were not on PrEP and created a DCE based on the results. For the DCE, a convenience sample of young MSM in the United States who reported recent condomless anal sex was recruited through social media applications. Consenting participants provided sociodemographic information and responded to a series of 10 choice tasks about PrEP access. Preferences were analyzed utilizing marginal willingness-to-pay (mWTP) methods. Results: In-depth interviews revealed preferences for highly effective PrEP and concerns about barriers to access due to insurance coverage and privacy. The online DCE was completed by 236 eligible MSM aged 18-30. The most-preferred PrEP package - with all elements significantly preferred over other options - was insurance covered, could be maintained confidential from parents and employers, was available immediately, and had an online option. Need to take out new insurance or add a supplemental insurance in order to cover PrEP significantly detracted from willingness to pay for a PrEP program. Attributes most associated with willingness to pay for PrEP were PrEP being covered by an insurance the client already has and insurance coverage that was private. Conclusions: Young MSM at high risk for HIV in the United States who are not currently on PrEP showed strong preferences for PrEP options that were covered by insurance and could be kept confidential from parents and employers. Lack of these options may present major barriers to PrEP access among young MSM who are at particularly high risk. Rapid access to PrEP, as well as the option of receiving some care online, may also enhance PrEP uptake. © 2022 Public Library of Science. All rights reserved. Article	2022	Atkins K.; Kan L.; Musau A.; Reed J.; Were D.; Mohan D.	Adaptation and psychometric evaluation of a scale to measure oral pre-exposure prophylaxis-related stigma among key and vulnerable populations in Kenya	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25929	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133797479&doi=10.1002%2fjia2.25929&partnerID=40&md5=61bb998cfdf9778f8e0e342d57e610b0	Introduction: As oral pre-exposure prophylaxis (PrEP) services scale up throughout sub-Saharan Africa (SSA), clients continue to face challenges with sustained PrEP use. PrEP-related stigma has been shown to influence engagement throughout the HIV PrEP care continuum throughout SSA. Validated quantitative measures of PrEP-related stigma in SSA are of critical importance to better understand its impacts at each stage of the HIV PrEP care continuum. This study aimed to psychometrically evaluate a PrEP-related stigma scale for use among key and vulnerable populations in the context of a Kenya national PrEP programme. Methods: As part of a larger prospective cohort study nested within Kenya's Jilinde programme, this study used baseline data collected from 1135 participants between September 2018 and April 2020. We used exploratory factor analysis to evaluate the factor structure of a PrEP-related stigma scale. We also assessed convergent construct validity of the PrEP-Related Stigma Scale by testing for expected correlations with depression and uptake of HIV services. Finally, we examined the relationship between PrEP-related stigma and key demographic, psychosocial and behavioural characteristics. Results: We identified four dimensions of PrEP-related stigma: (1) interpersonal stigma, (2) PrEP norms, (3) negative self-image and (4) disclosure concerns. The scale demonstrated strong internal consistency (α = 0.84), was positively correlated with depressive symptoms and negatively correlated with uptake of HIV services. Multivariable regression analysis demonstrated associations between PrEP-related stigma and sex worker identity. Conclusions: The adapted and validated PrEP-Related Stigma Scale can enable programmes to quantify how PrEP-related stigma and its dimensions may differentially impact outcomes on the HIV PrEP care continuum, evaluate stigma interventions and tailor programmes accordingly. Opportunities exist to validate the scale in other populations and explore further dimensions of PrEP-related stigma. © 2022 The Authors. Article	2022	Atkins K.; Musau A.; Mugambi M.; Odhyambo G.; Tengah S.A.; Kamau M.; Kumau R.; Reed J.; Were D.	Health system opportunities and challenges for PrEP implementation in Kenya: A qualitative framework analysis	PLOS One	-	-	-	19326203	10.1371/journal.pone.0259738	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139577078&doi=10.1371%2fjournal.pone.0259738&partnerID=40&md5=cc10448afcd5c77dab97599526a739c7	Background As pre-exposure prophylaxis (PrEP) scales up in sub-Saharan Africa, governments and implementers need to understand how to best manage national programs. Kenya's national PrEP program offers an opportunity to review elements of program success within the health system and evaluate the utility of a national implementation framework. We explored health system considerations for PrEP implementation to understand how Kenya's national PrEP implementation priorities align with those of PrEP service providers, peer educators, and program or county managers. Methods We conducted twelve key informant interviews (KII) and nine focus group discussions (FGDs) with PrEP program and county managers (n = 12), peer educators (n = 44), and PrEP service providers (n = 48). We recruited participants across a variety of cadres and experiences with PrEP programs. KIIs and FGDs focused on PrEP service delivery and program implementation. Data were collected by trained study staff, audio recorded, translated into English, and transcribed. We used framework analysis methods to systematically apply Kenya's 2017 National PrEP Implementation Framework to the data and summarized findings according to the seven Implementation Framework domains. Results All respondents emphasized the important role of communication, coordination, training, and leadership in PrEP implementation. PrEP service providers and program and county managers highlighted the importance of efficient data collection and utilization, and improved resource allocation. Commodity security and research, while key elements of the PrEP Implementation Framework, were less commonly discussed, and research was less prioritized by respondents. Respondents highlighted the importance of coordinated PrEP service delivery across sites and programs to improve overall client experiences. Conclusion In the context of a nationally-scaled PrEP program, PrEP service providers, peer educators, and program and county managers value strong leadership, close coordination of services across sites, and expedient use of data to improve strategies and services. Kenya's PrEP Implementation Framework aligns closely with the priorities of individuals involved in PrEP service delivery and management, and provides a comprehensive overview of health system considerations for effective implementation of a PrEP program at scale. © 2022 Atkins et al. Article	2022	Atujuna Millicent; Montgomery, Elizabeth T; Hartmann, Miriam; Sheily, Ndwayana; Browne, Erica N; Siyaxolisa, Sindelo; Linda-Gail, Bekker; Minnis, Alexandra M	The Role of Families in Adolescent and Young Adults' PrEP Use	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03514-3	https://www.proquest.com/scholarly-journals/role-families-adolescent-young-adults-prep-use/docview/2649146576/se-2?accountid=8113	While pre-exposure prophylaxis (PrEP) is a key HIV prevention tool for adolescents and young adults (AYAs), its initiation and sustained use is shaped by AYAs' unique social contexts, including family. We explored the role of families in AYAs' PrEP use through qualitative in-depth interview (IDI) data from iPrevent, an end-user study designed to identify factors that could optimize PrEP adherence among South African youth (18–24 years old). These data were collected using a semi structured guide and were analysed using an inductive approach. Several themes describing family influence on AYAs' PrEP use emerged including family support; family attitude towards PrEP; and the family's ability to obviate PrEP disclosure challenges. In addition, dimensions of family closeness, categorized as 'close', 'in-between' and 'loose-knit,' appeared important in contextualizing family influence on AYAs' PrEP use. We found that family remains a proximal and fundamental social system in which AYA are socialized and greater family engagement could aid PrEP implementation in this priority population. Article	2022	Atukunda, Esther Cathyln; Owembabazi, Moran; Pratt, Madeline Claire; Psaros, Christina; Muyindike, Winnie; Chitneni, Pooja; Bwana, Mwebesa Bosco; Bangsberg, David; Haberer, Jessica Elizabeth; Marrazzo, Jeanne; Matthews, Lynn Turner	A qualitative exploration to understand barriers and facilitators to daily oral PrEP uptake and sustained adherence among HIV-negative women planning for or with pregnancy in rural Southwestern Uganda.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25894	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8944216	INTRODUCTION: Antiretroviral pre-exposure prophylaxis (PrEP) may reduce periconception and pregnancy HIV incidence among women in settings, where gender power imbalances limit HIV testing, engagement in care and HIV viral suppression. We conducted qualitative interviews to understand factors influencing periconception and pregnancy PrEP uptake and use in a cohort of women (Trial registration: NCT03832530) offered safer conception counselling in rural Southwestern Uganda, where PrEP uptake was high. METHODS: Between March 2018 and January 2019, in-depth interviews informed by conceptual frameworks for periconception risk reduction and PrEP adherence were conducted with 37 women including those with ≥80% and <80% adherence to PrEP doses measured by electronic pill cap, those who never initiated PrEP, and seven of their male partners. Content and dyadic analyses were conducted to identify emergent challenges and facilitators of PrEP use within individual and couple narratives. RESULTS: The median age for women was 33 years (IQR 28, 35), 97% felt likely to acquire HIV and 89% initiated PrEP. Individual-level barriers included unwillingness to take daily pills while healthy, side effects and alcohol use. Women overcame these barriers through personal desires to have control over their HIV serostatus, produce HIV-negative children and prevent HIV transmission within partnerships. Couple-level barriers included nondisclosure, mistrust and gender-based violence; facilitators included shared goals and perceived HIV protection, which improved communication, sexual intimacy and emotional support within partnerships through a self-controlled method. Community-level barriers included multi-level stigma related to HIV, ARVs/PrEP and serodifference; facilitators included active peer, family or healthcare provider support as women aspired to safely meet socio-cultural expectations to conceive and preserve serodifferent relationships. Confidence in PrEP effectiveness was promoted by positive peer experiences with PrEP and ongoing HIV testing. CONCLUSIONS: Multi-level forms of HIV-, serodifference- and disclosure-related stigma, side effects, pill burden, alcohol use, relationship dynamics, social, professional and partnership support towards adaptation and HIV risk reduction influence PrEP uptake and adherence among HIV-negative women with plans for pregnancy in rural Southwestern Uganda. Confidence in PrEP, individually controlled HIV prevention and improved partnership communication and intimacy promoted PrEP adherence. Supporting individuals to overcome context-specific barriers to PrEP use may be an important approach to improving uptake and prolonged use. Article	2022	Aurora J.A., Jr; Ballard S.L.; Salter C.L.; Skinker B.	Assessing HIV Preexposure Prophylaxis Education in a Family Medicine Residency	Family Medicine	-	-	-	19383800	10.22454/FamMed.2022.698419	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126723473&doi=10.22454%2fFamMed.2022.698419&partnerID=40&md5=83285206ec2ad9e4eaedcf01690ba9c	BACKGROUND AND OBJECTIVES: HIV preexposure prophylaxis (PrEP) has been purposefully incorporated into our family medicine resident training within existing didactic lectures, readings, and routine office visit precepting. This mixed-methods evaluation assesses training strategies for PrEP use via survey and drug use evaluation (DUE). METHODS: We surveyed 80 current and former family medicine residents (2014-2018) about their exposure to training components, self-reported confidence and competency in PrEP use, and practice behaviors reflecting CDC guidelines for patient eligibility and testing. In addition, we conducted a DUE of patients receiving PrEP from 2012-2018 for adherence to CDC guidelines. We report results with descriptive statistics, with χ2 analysis for group comparisons. RESULTS: Survey response rate was 56.3%. Among respondents, 46.7% have prescribed PrEP and 55.5% self-assessed as competent to prescribe PrEP, with the majority (84%) rating precepting as most effective for building competence. Those self-assessed as competent were more likely to endorse practice behaviors reflecting CDC guidelines for monitoring PrEP (P<.05). DUE identified 68 patients; 98.5% men who have sex with men. No women with recent sexually transmitted infections, nor persons who inject drugs (PWID) received PrEP. Initial testing completion ranged from 79.4% (HIV) to 54.4% (hepatitis B). Follow-up testing completion ranged from 41.5% (HIV) to 26.4% (syphilis). CONCLUSIONS: Residents rated precepting as the most effective training. However, DUE demonstrated that PrEP underuse, as well as suboptimal testing, limited experiential training on CDC guidelines. Curricular updates should further emphasize appropriate patient selection for PrEP, including women, minorities, and PWID, as well as robust testing, to continue expanding PrEP access. Article	2022	Avelino-Silva, Vivian Iida; Vasconcelos, Ricardo; Cerqueira, Natalia B; Marcus, Ulrich; Schmidt, Axel Jeremias; Veras, Maria Amelia	Predictors of knowledge of and access to biomedical prevention among MSM and transgender men in Latin America: Results from the Latin American internet survey.	HIV Medicine	-	-	-	1468-1293	10.1111/hiv.13238	https://dx.doi.org/10.1111/hiv.13238	INTRODUCTION: HIV is still a central public health issue in Latin America, disproportionally affecting key populations. Knowledge and access to biomedical prevention strategies, including treatment as prevention (TASP) or undetectable = untransmissible (U=U), pre-exposure prophylaxis (PrEP) and post-exposure prophylaxis (PEP), are the first steps to increasing uptake. We used data from the Latin American MSM Internet Survey (LAMIS) to describe knowledge and access to biomedical HIV prevention strategies among gay, bisexual, transgender and other men who have sex with men (MSM) living in 18 Latin American countries. METHODS: We compared LAMIS data across countries and according to age categories using frequencies and percentages. We also used multivariable models to explore whether age, gender identity, sexual identity, steady partnership, HIV status and education were independently associated with outcomes. RESULTS: In all, 55 924 participants were included. Most were cisgender (99%) and identified as gay/homosexual (77%) or bisexual (17%). Schooling levels were very high, with 89% reporting high-attained education as tertiary level, university or post-graduation. In total, 16% had been previously diagnosed with HIV; of those, rates of undetectable viral load varied from 60% in Venezuela to 83% in Brazil. Overall, 54%, 54% and 52% of participants already knew about PEP, PrEP and U=U, respectively. Participants from Brazil and those aged between 26 and 55 years, living with diagnosed HIV and having a gay/homosexual identity had greater levels of awareness about biomedical prevention strategies. CONCLUSIONS: Our study highlights gaps in HIV prevention campaigns directed to MSM in Latin America resulting in low uptake of biomedical prevention methods. Theses and Dissertations	2022	Ayerdi Aguirrebengoa, Oskar	Cambios epidemiológicos entre los nuevos diagnósticos de infección por el VIH : impacto de la profilaxis pre-exposición	-	-	Universidad Complutense de Madrid	-	-	NA	https://dialnet.unirioja.es/servlet/tesis?codigo=307064	Para evitar la transmisión del VIH, se han utilizado varias medidas preventivas: uso sistemático del preservativo, educación sexual, cribado de VIH/ITS, profilaxis postexposición, diagnóstico precoz del VIH, tratamiento antirretroviral inmediato y, más recientemente, profilaxis pre-exposición (PrEP). Esta última consiste en la administración de fármacos antirretrovirales a personas seronegativas con prácticas de alto riesgo para evitar contraer el VIH. Desde su implementación, se ha descrito un aumento de las prácticas sexuales de riesgo, favorecidas por el uso de la PrEP, denominado "risk compensation". Esta tesis basada en artículos tiene tres objetivos principales: 1 describir las características sociodemográficas, clínicas y conductuales de los hombres que tienen sexo con hombres (HSH) con nuevo diagnóstico de infección por el VIH y estudiar su evolución entre 2014-2019; 2 estimar el efecto preventivo que supondría haber incluido la PrEP, en los pacientes con seroconversión documentada al VIH entre 2014-2016, y 3 medir los cambios clínicos y conductuales asociados a la PrEP, "risk compensation", mediante el análisis del uso del preservativo en el coito anal, número de parejas sexuales, consumo de drogas para el sexo y frecuencia de ITS. Este trabajo se ha realizado en una Clínica de referencia en VIH/ITS...	NA	Spanish	Spain	Western and Central Europe and North America	Spain	Western and Central Europe and North America	-	-	Review
Article	2022	Azucar, Danny; Hidalgo, Marco A.; Wright, Deja; Slay, Lindsay; Kipke, Michele D.	Development of an HIV Prevention Intervention for African American Young Men Who Have Sex With Men (Y2Prevent): Study Protocol.	JMIR Research Protocols	-	-	-	1929-0748	10.2196/36718	https://www.researchprotocols.org/2022/9/e36718/	BACKGROUND: African American young men who have sex with men (YMSM) possess many intersecting identities that may increase their vulnerability to social stigmatization and discrimination, which yields a negative influence on their well-being and behaviors. These experiences often manifest as increased general and sexual risk-taking behaviors that place this particular group at an increased risk for HIV. This scenario is exacerbated by the lack of HIV prevention interventions specifically designed for African American YMSM. OBJECTIVE: In this paper, we discuss the development of research designed to refine, pilot, and evaluate the feasibility, acceptability, and preliminary efficacy of a behavioral intervention designed to build resilience and reduce substance use and HIV risk behaviors among African American YMSM. The overarching aim of this research, funded by the National Institutes of Health, is to further refine and pilot test an intervention called Young Men's Adult Identity Monitoring (YM-AIM). YM-AIM is a theory-driven, group-level intervention designed to help African American YMSM develop a healthy vision for their future (or possible future self) by defining a set of short-term and long-term goals in the areas of education, health, family, and intimate relationships. METHODS: Through partnerships with community members and community-based organizations, we will further strengthen and refine YM-AIM to include 3 new components: biomedical HIV prevention strategies (pre-exposure prophylaxis and postexposure prophylaxis); HIV and sexually transmitted infection (STI) testing and HIV care referral, drug screening, and drug treatment referral; and a youth mentoring component. We will recruit African American YMSM, aged 18 to 24 years, into 2 working groups; each group will consist of 6 to 8 members and will convene on a weekly basis, and each meeting will focus on one specific YM-AIM topic. This feedback will be used to further refine the intervention, which will then be evaluated for its feasibility and acceptability. Intervention outcomes include drug use in the past 30 days and 3 months, alcohol use, condomless sex, number of sex partners, and increasing condom use intention, condom use self-efficacy, HIV and STI testing recency and frequency, and linkage to care. RESULTS: As of June 2022, we completed phase 1 of Y2Prevent and launched phase 2 of Y2Prevent to begin recruitment for working group participants. Phase 3 of Y2Prevent is anticipated to be launched in September and is expected to be completed by the end of this project period in December 2022. CONCLUSIONS: Few youth-focused interventions have sought to help youth identify and develop the skills needed to navigate the social and structural factors that contribute to individual-level engagement in prevention among sexual minority youth. This research seeks to promote young men's adoption and maintenance of HIV-protective behaviors (eg, safer sex, pre-exposure prophylaxis use, HIV and STI testing, and health care use). Article	2022	Balán, Iván C; Lentz, Cody; Giguere, Rebecca; Dolezal, Curtis; Kajura-Manyindo, Clare; Kutner, Bryan A; Zalwango, Aisha; Makoni, Rujeko; Madlala, Bernadette; Makala, Yvonne; Khanyile, Nombuso; Kadyamusuma, McLoddy; Kachenjera, Lonely; Ndhlovu-Forde, Zanele; Tuswa-Haynes, NoCamagu	Inconsistent Counselor Fidelity in Delivering an Evidence-Based Adherence Intervention During a PrEP Trial.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03429-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8840968	Evidence-based adherence counseling interventions must be delivered with fidelity to ensure that their effectiveness is retained, but little is known regarding how counselors in biomedical HIV trials deliver these interventions. Forty-two counselors from the MTN-025/HOPE Study, which was conducted in 14 sites in sub-Saharan Africa, participated. They completed a quantitative assessment and consented for their HOPE counseling session ratings to be analyzed. Twenty-two (52%) self-identified as research nurses and 20 (48%) as counselors. Of 928 session ratings, 609 (66%) were classified as Good, 188 (20%) as Fair, and 131 (14%) as Poor, based on pre-established criteria. Overall mean ratings for session tasks and global components (each rated from 1 to 5) were 4.12 (SD = 0.45; range 2.46-4.73) and 4.02 (SD = 0.64; range 1.75-4.79), respectively. Twenty-six (62%) counselors attained Good or Fair ratings on at least 85% of their sessions, but 33% of counselors had more than 25% of their sessions rated as Poor; three counselors (7%) never met criteria for a Good session. Even after extensive training, counselors' fidelity to the intervention varied. Our findings highlight the value of fidelity monitoring using session audio-recordings, the importance of ongoing coaching and support, and the need to plan for counselors with consistently poor fidelity.	fidelity monitoring, counseling, adherence, HIV prevention, evidence-based interventions	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Balasubramanian R.; Kasaie P.; Schnure M.; Dowdy D.W.; Shah M.; Fojo A.T.	Projected Impact of Expanded Long-Acting Injectable PrEP Use Among Men Who Have Sex With Men on Local HIV Epidemics	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003029	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137541452&doi=10.1097%2fQAI.0000000000003029&partnerID=40&md5=49c57fbd09a8ff7de8524a70b9e00aff	Background:Pre-exposure prophylaxis (PrEP) is a key component in helping to reduce HIV incidence in the United States. Long-acting injectable (LAI) PrEP is a new alternative to oral PrEP; its potential to affect local HIV epidemics remains unclear.Methods:The Johns Hopkins HIV Economic Epidemiological model (JHEEM) is a dynamic model of HIV transmission in 32 US urban areas. We used JHEEM to project the HIV incidence among men who have sex with men (MSM) from 2020 to 2030 under a range of interventions aimed at increasing PrEP use.Results:In the absence of any intervention (ie, current levels of oral PrEP and HIV care engagement), we projected a 19% reduction (95% credible interval, CrI 1% to 36%) in HIV incidence among MSM from 2020 to 2030 across all 32 cities. Adding 10% LAI PrEP uptake (above a base case of all oral PrEP) reduced the incidence by 36% (95% CrI 23% to 50%) by year 2030. This effect varied between cities, ranging from 22% in Atlanta to 51% in San Francisco. At 25% additional LAI PrEP uptake, this incidence reduction increased to 54% (95% CrI 45% to 64%). Reductions in incidence after introducing LAI PrEP were driven primarily by increased uptake and sustained usage rather than increased efficacy.Conclusions:LAI PrEP has the potential to substantially reduce HIV incidence among MSM, particularly if it increases PrEP uptake and continued use beyond existing levels. Because potential effects vary by city, the effectiveness of expanding PrEP use is dependent on local dynamics. © 2022 Lippincott Williams and Wilkins. Article	2022	Barbosa A.K.P.; Monteiro P.; Montenegro D.; Batista J.A.L.; Montarroyos U.R.	HIV Pre-Exposure Prophylaxis (PrEP) in a Brazilian Clinical Setting: Adherence, Adverse Events, Sexual Behavior, and Sexually Transmitted Infections	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-021-02112-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123070474&doi=10.1007%2fs10508-021-02112-7&partnerID=40&md5=9409fc6ca29fbac842b57291b05c94b5	Tenofovir/emtricitabine (TDF/FTC) has been used as pre-exposure prophylaxis (PrEP) in preventing HIV infection. PrEP is an effective prevention tool as demonstrated in clinical trials and studies in clinical practice and was incorporated into the Brazilian public health system in December 2017. The present study was a prospective cohort that included 219 PrEP users monitored over a 10 month follow-up period in a capital city in Northeastern Brazil. Data were collected from the PrEP users' electronic medical records platform made available by the Brazilian Health Ministry. During the observation period, there was good user retention to the prevention program (84%) and there was high adherence to medication (90%). Almost half the users (49%) presented an adverse event, although these were mild and transient, 30 days after starting prophylaxis. There was a significant reduction in creatinine clearance (p <.001), from 104.9 to 83.5 mL/min; however, there was no need for drug discontinuation. Throughout the cohort, there was no significant change in the number of sexual partners, but the use of condoms during sexual intercourse decreased (p <.001). There was a non-significant increase in the incidence of syphilis (p =.08), and there was a 50% decrease in reporting signs and symptoms of sexually transmitted infections. No cases of HIV infection were observed. PrEP proved to be an effective tool in HIV prevention, presenting few complications of adverse events. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Barbosa, Lucianna Costa de Almeida	Pre-exposure prophylaxis (PrEP) to HIV in Alas, Brazil: characterization of users, adherence to the protocol and risk behavior for transmissible sexual habits (STIs)	Research, Society and Development	-	-	-	-	10.33448/rsd-v11i13.34515	https://rsdjournal.org/index.php/rsd/article/view/34515	Objective: to characterize the profile of PrEP users, identify the proportion of adherence to the protocol and verify the occurrence of STI diagnosis. Methodology: this is a retrospective study of a quantitative nature, carried out at the Specialized Assistance Service of a northeastern capital. Secondary records taken from the Medication Logistic Control System were used and the collection instrument was a questionnaire based on the PrEP care forms made available by the Ministry of Health. Results: the users' profile points to cis men, brown, aged 30 years or older, of homosexual/gay/lesbian orientation, who perform anal sexual intercourse and have 12 or more years of schooling. During the consultations, a diagnosis of chlamydia and a diagnosis of hepatitis B was made. Regarding adherence to the protocol, it was noticed that there were always users who discontinued the protocol. Conclusion: from this evaluation, we understand some of the strengths and weaknesses of the service offer, aspects that are fundamental for a more complete assistance. Article	2022	Bares, Sara H.; Scarsi, Kimberly K.	A new paradigm for antiretroviral delivery: long-acting cabotegravir and rilpivirine for the treatment and prevention of HIV.	Current Opinion in HIV and AIDS	-	-	-	1746-6318 1746-630X	10.1097/COH.0000000000000708	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8694245/	PURPOSE OF REVIEW: Cabotegravir (CAB) and rilpivirine (RPV) is the first long-acting injectable antiretroviral therapy (ART) option approved for virologically suppressed adults with HIV-1. In addition, long-acting CAB is a promising agent for HIV preexposure prophylaxis (PrEP). This review focuses on phase 3 clinical trial results and implementation considerations for these long-acting ART and PrEP strategies. RECENT FINDINGS: Long-acting CAB and RPV administered every 4 weeks demonstrated noninferiority to oral ART through week 96 in both the ATLAS and FLAIR studies, whereas ATLAS-2M found similar efficacy through 96 weeks when the long-acting injectable ART was administered every 8 weeks instead of every 4 weeks. For prevention, two phase 3 trials were stopped early due to fewer incident HIV infections in participants receiving long-acting CAB every 8 weeks compared with daily oral tenofovir disoproxil fumarate-emtricitabine for PrEP. The long-acting therapies were well tolerated across all clinical trials. SUMMARY: Clinical trial results support the use of long-acting CAB for HIV PrEP and long-acting CAB and RPV as a switch strategy for adults with HIV-1 who are first virologically suppressed with oral ART. Implementation challenges persist, and data are urgently needed in populations who may benefit most from long-acting therapy, including adolescents, pregnant individuals, and those with barriers to medication adherence. Article	2022	Barnabee, Gena; O'Bryan, Gillian; Ndeikemona, Lylie; Billah, Idel; Silas, Lukas; Morgan, Karie L; Shulock, Katherine; Mawire, Susan; MacLachlan, Ellen; Nghipangelwa, Josua; Muremi, Elizabeth; Ensminger, Alison; Forster, Norbert; O'Malley, Gabrielle	Improving HIV pre-exposure prophylaxis persistence among adolescent girls and young women: Insights from a mixed-methods evaluation of community, hybrid, and facility service delivery models in Namibia.	Frontiers in Public Health	-	-	-	2673-3153	10.3389/frph.2022.1048702	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9760915	Introduction: Despite the potential for community-based approaches to increase access to pre-exposure prophylaxis (PrEP) for adolescent girls and young women (AGYW), there is limited evidence of whether and how they improve PrEP persistence. We compared PrEP persistence among AGYW receiving services through community and hybrid models in Namibia to facility-based services. We subsequently identify potential mechanisms to explain how and why community and hybrid models achieved (or not) improved persistence to inform further service delivery innovation. Methods: Data were collected from PrEP service delivery to AGYW over two-years in Namibia's Khomas Region. We used Kaplan-Meier analysis to estimate survival curves for PrEP persistence beyond three-months after initiation and report the cumulative probability of persistence at one- and three-months. Persistence was defined as any PrEP use within three months after initiation followed by a PrEP refill or previously prescribed supply of at least 30 days at the three-month visit. Interviews were conducted with 28 AGYW and 19 providers and analyzed using a deductive-inductive thematic approach. Results: From October 2017 through September 2019, 372 (18.7%) AGYW received services through a facility model, 302 (15.1%) through a community model, and 1,320 (66.2%) through a hybrid model. PrEP persistence at one- and three-months was 41.2% and 34.9% in the community model and 6.2% and 4.8% in the hybrid model compared to 36.8% and 26.7% in the facility model. Within the community and hybrid models, we identified three potential mechanisms related to PrEP persistence. Individualized service delivery offered convenience and simplicity which enabled AGYW to overcome barriers to obtaining refills but did not work as well for highly mobile AGYW. Consistent interactions and shared experiences fostered social connectedness with providers and with peers, building social networks and support systems for PrEP use. PrEP and HIV-related stigma, however, was widely experienced outside of these networks. Community-to-facility referral for PrEP refill triggered apprehension towards unfamiliar PrEP services and providers in AGYW, which discouraged persistence. Conclusion: Service delivery approaches that offer convenience and simplicity and foster social connectedness may reduce access barriers and increase social support enabling AGYW to self-manage their PrEP use and achieve improved PrEP persistence.	delivery of health care, pre-exposure prophylaxis, HIV prevention, adolescent girls and young women, Namibia	English	Switzerland	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Barp, Luiz; Mitjavila, Myriam; Ferreira, Diego Diz	Gestão biopolítica da Aids: a homossexualidade como fonte de periculosidade social	Saúde Debate	-	-	-	0103-1104	10.1590/0103-11042022e716	http://www.scielo.br/scielo.php?script=sci_arttext&pid=S0103-11042022001100223&lang=pt	ABSTRACT This study addresses aspects of the construction of male homosexuality as part of the biopolitical management of sexuality associated with the appearance and consequences of the HIV/AIDS epidemic. In this sense, it was identified how homosexuality has a trajectory that historically links it to the hybrid notion of social dangerousness, fundamentally from the medical categorization of anal penetration among men as a deviant practice and, therefore, socially dangerous. In more recent years, unprecedented mechanisms of subjection and subjectivation have expanded the repertoire of mechanisms for social control of homosexuality based on HIV/AIDS prevention strategies, such as condoms and, more recently, Pre-Exposure Prophylaxis (PrEP) to HIV. Article	2022	Barry M.P.; Austin E.J.; Bhatraju E.P.; Glick S.N.; Stekler J.D.; Tung E.L.; Hansen R.N.; Williams E.C.; Gojic A.J.; Pickering E.I.; Tsui J.I.	Qualitative inquiry into perceptions of HIV pre-exposure prophylaxis among people who inject drugs living with hepatitis C in Seattle, WA, USA	Harm Reduction Journal	-	-	-	14777517	10.1186/s12954-022-00706-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141200673&doi=10.1186%2fs12954-022-00706-5&partnerID=40&md5=f286fd2b0444f404c161ad5f1d132e42	Background: The incidence of HIV among persons who inject drugs (PWID) in the USA has been increasing since 2014, signaling the need to identify effective ways to engage PWID in HIV prevention services, namely pre-exposure prophylaxis (PrEP). Yet, the uptake of PrEP in this population is minimal compared to other populations at risk of HIV acquisition. In this work, we sought to explore knowledge, attitudes, and perspectives of PrEP acceptability among PWID. Methods: In the context of a pilot study to explore the acceptability of pharmacy-based hepatitis C virus (HCV) treatment, we conducted semi-structured interviews (n = 24) and focus groups (n = 4, 16 participants) with people who were living with HCV and reported active injection drug use (≤ 90 days since last use). Participants were asked open-ended questions about their familiarity with and motivation to use PrEP. As part of a sub-analysis focused on PrEP, qualitative data were analyzed using a Rapid Assessment Process, where three coders used structured templates to summarize qualitative data and iteratively reviewed coded templates to identify themes. Participants also completed short quantitative questionnaires regarding drug use history and attitudes toward health concerns. Results: Forty-seven percent of participants expressed having little or no concern regarding HIV acquisition. Targeted analyses focused on HIV prevention identified three themes, which help characterize behavioral determinants of nonadoption. First, knowledge of PrEP was limited among PWID and influenced by infrequent open community discussions around HIV risk. Second, PWID perceived sexual behaviors—but not injection drug use—as a motivator for HIV risk prevention. Finally, PWID identified many individual and environmental barriers that hinder PrEP uptake. Conclusion: Among PWID, PrEP is rarely discussed and concerns about the feasibility of using daily PrEP are common. Taken with the prevalent perception that drug use is not a high risk for HIV acquisition, our findings point to opportunities for public health work to target PrEP education to PWID and to leverage other successful interventions for PWID as an opportunity to provide PrEP to this vulnerable population. © 2022, The Author(s). METHODS: In order to ascertain the acceptability and feasibility of using a mobile syringe services program (SSP) for comprehensive HIV prevention via PrEP and medications for opioid use disorder (MOUD), our mixed methods approach included a quantitative assessment and semi-structured qualitative interviews with Black PWID (n = 30) in Miami-Dade County who were actively engaged in mobile syringe services. RESULTS: Participants felt that delivery of MOUD and PrEP at a mobile SSP would be both feasible and acceptable, helping to address transportation, cost, and stigma barriers common within traditional healthcare settings. Participants preferred staff who are compassionate and nonjudgmental and have lived experience. CONCLUSIONS: A mobile harm reduction setting could be an effective venue for delivering comprehensive HIV prevention services to Black PWID, a community that experiences significant barriers to care via marginalization and racism in a fragmented healthcare system. Article	2022	Bartkowiak G.; Kryczka T.	Nurse's role in pharmacological pre-exposure prophylaxis of HIV infection; Rola piel?gniarki w farmakologicznej profi laktyce przedekspozycyjnej zaka?e? HIV	Pielegniarstwo XXI Wieku	-	-	-	-	17301912	10.2478/pielxxiw-2022-0030	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144540900&doi=10.2478%2fpielxxiw-2022-0030&partnerID=40&md5=b0d5eef40ba65238be9213322b4fbe8a	Introduction. Reducing the number of new HIV infections is one of the challenges of modern health care. Advances in medicine have given rise to new methods of preventing the transmission of the infection. Pharmacological pre-exposure prophylaxis (PrEP) is one of them. Aim. The aim of this paper is to discuss the principles of PrEP and to bring the role of a nurse closer in this regard. Method. The safety and efficacy of PrEP have been demonstrated in clinical trials. At the same time, in accordance with the postulates of the WHO to transfer competencies related to the prevention of the spread of HIV to other health care professionals, models of PrEP provision by e.g. nurses, are being discussed. Results. Pharmacological PrEP used in vulnerable groups at risk of HIV infection may help slow down the epidemic. Nurses have almost all the knowledge and clinical competence to provide PrEP services. Expanding the competence of nurses by including HIV diagnosis, prescription of medications approved for use as PrEP, and increasing the scope of decision-making in this type of prophylaxis will contribute to its popularisation in Poland, as well as increase the prestige of the profession and the possibilities of developing of advanced nursing practice. © 2022 Grzegorz Bartkowiak et al., published by Sciendo.	advanced nursing practice; HIV prevention; nursing; pre-exposure prophylaxis	English	Poland	Western and Central Europe and North America	Poland	Western and Central Europe and North America	Poland	Western and Central Europe and North America	Clinical
Article	2022	Bass S.B.; Kelly P.J.; Brajuha J.; Gutierrez-Mock L.; Koester K.; D'Avanzo P.; Sevelius J.	Exploring barriers and facilitators to PrEP use among transgender women in two urban areas: implications for messaging and communication	BMC Public Health	-	-	-	-	14712458	10.1186/s12889-021-12425-w	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122506916&doi=10.1186%2fs12889-021-12425-w&partnerID=40&md5=5a530b8029a9be94bf89996c45376b41	Background: Trans women are at increased risk for HIV infection yet are less likely to use pre-exposure prophylaxis (PrEP) medication as a preventive measure. PrEP messaging and marketing has focused on men who have sex with men (MSM) or included trans women as a subset of MSM, ignoring the potential barriers to PrEP use unique to trans women. Little is known about how this group conceptualizes PrEP, what knowledge gaps still exist, and how trans women believe PrEP should be communicated to increase use. Methods: This qualitative study conducted focus groups (n = 5) in Philadelphia and Sacramento with trans women to assess these issues. Results: Twelve sub-themes were found related to five main domains, including PrEP knowledge, benefits, barriers, community-related considerations, and messaging/marketing. Findings indicate that knowledge of PrEP is still low and beliefs about PrEP's effects on hormone use persist. Most importantly, participants voiced a demand for culturally appropriate trans-specific messages in HIV prevention interventions and communication. Conclusions: Without acknowledging specific barriers to PrEP uptake among transgender women separate from those of MSM and incorporating gender affirmation into PrEP education, simply knowing PrEP is available may not motivate trans women to use PrEP. This has important implications for future efforts to communicate about PrEP with trans women. © 2021, The Author(s). Article	2022	Bavinton, B; Hill, A; Amos, N; Lim, SH; Guadamuz, T; Kaneko, N; Holt, M; Bourne, A	Willingness to use PrEP among gay, bisexual, and other men who have sex with men in five Asian countries: Results of the Asia Pacific MSM Internet Survey	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1371/journal.pone.0182838	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5597127/	Objective We examined willingness to use pre-exposure prophylaxis (PrEP) for HIV prevention among men who have sex with men (MSM) in Malaysia. Methods An online survey of 990 MSM was conducted between March and April 2016. Eligibility criteria included being biological male, Malaysian citizen, 18 years of age or above, identifying as MSM, and being HIV negative or unknown status. Participants' demographics, sexual and drug use behaviors, attitudes towards PrEP, and preferences regarding future access to PrEP were collected. Bivariate analysis and logistic regression were performed to determine factors associated with willingness to use PrEP. Results Fewer than half of participants (44%) knew about PrEP before completing the survey. Overall, 39% of the sample were willing to take PrEP. Multivariate logistic regression indicated that Malay men (AOR: 1.73, 95% CI:1.12, 2.70), having 2 or more male anal sex partners in the past 6 months (AOR: 1.98, 95% CI: 1.29, 3.05), previous knowledge of PrEP (AOR: 1.40, 95%CI: 1.06, 1.86), lack of confidence in practising safer sex (AOR: 1.36, 95% CI: 1.02, 1.81), and having ever paid for sex with a male partner (AOR: 1.39, 95% CI: 1.01, 1.91) were independently associated with greater willingness to use PrEP, while men who identified as heterosexual were less willing to use PrEP (AOR, 0.36, 95% CI: 0.13, 0.97). Majority of participants preferred to access PrEP at affordable cost below 100 Malaysian Ringgit (USD25) per month from community based organisations followed by private or government hospitals. Conclusions Overall, MSM in Malaysia reported a relatively low level of willingness to use PrEP, although willingness was higher among those previously aware of PrEP. There is a need to provide PrEP at affordable cost, increase demand and awareness of PrEP, and to provide access to this preventative medication via diverse, integrated and tailored sexual health services. Article	2022	Bazzi, Angela R; Valasek, Chad J; Streuli, Samantha A; Vera, Carlos F; Harvey-Vera, Alicia; Philbin, Morgan M; Biello, Katie B; Roth, Alexis M; Strathdee, Steffanie A; Pines, Heather A	Long-Acting Injectable Human Immunodeficiency Virus Pre-Exposure Prophylaxis Preferred Over Other Modalities Among People Who Inject Drugs: Findings from a Qualitative Study in California	AIDS Patient Care and STDs	-	-	-	-	1557-7449	10.1089/apc.2022.0068	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9464050	People who inject drugs (PWID) have extraordinarily low uptake of human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) despite high levels of need. Long-acting PrEP modalities hold promise for HIV prevention among PWID, but product preferences remain poorly understood. From September to November 2021, we conducted qualitative interviews with 28 HIV-negative, adult (≥18 years) PWID in San Diego County, CA, to explore their perspectives on daily oral PrEP pills and long-acting PrEP modalities (i.e., injections, implants, intravaginal rings, and broadly neutralizing antibodies), which we explained using standard scripts. Thematic analysis identified variations in PrEP modality interest and acceptability. We identified three key factors across the 28 interviews that appeared to influence PrEP modality preferences: perceived convenience of use, invasiveness, and familiarity (based on past experience). Overall, most participants preferred injectable PrEP over other modalities because they viewed injectable medications as convenient, noninvasive, and familiar. While injectable PrEP was recently approved for use in the United States and was most the acceptable PrEP modality in this sample, our findings suggest that intervention and implementation research is urgently needed to improve our understanding of strategies that could support access, uptake, and sustained adherence to longer-acting PrEP for PWID.	pre-exposure prophylaxis, substance use, long-acting HIV prevention and treatment, intravenous, HIV prevention, cabotegravir, acceptability	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Beck L.; Parlier-Ahmad A.B.; Martin C.E.	Pre-exposure prophylaxis (PrEP) indication and uptake among people receiving buprenorphine for the treatment of opioid use disorder	Journal of Substance Abuse Treatment	-	-	-	-	7405472	10.1016/j.jsat.2021.108506	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85110281926&doi=10.1016%2fj.jsat.2021.108506&partnerID=40&md5=623b6df0a303dc01cfa261545dc3b498	Background: People with opioid use disorder (OUD) are disproportionately burdened by HIV. The United States' Centers for Disease Control and Prevention (CDC) has issued guidelines for pre-exposure prophylaxis (PrEP) indication. We know little about PrEP for people receiving medication for OUD. The objective of this study is to report PrEP indication, awareness, and uptake in patients engaged in outpatient OUD treatment with buprenorphine. Methods: Adult patients (n = 137) receiving buprenorphine for OUD at an outpatient substance use disorder treatment clinic completed a cross-sectional survey between July and September 2019. The study determined PrEP indication by 2017 CDC criteria. PrEP awareness and uptake were self-reported. The study assessed statistical differences in PrEP indicators by Pearson's χ2 and Fisher's exact. Results: Nearly three-quarters (73.7%, n = 101) of the study sample met CDC criteria for PrEP-indication based on past-year risk behaviors. Ninety-five percent of these participants reported inconsistent condom use, 21.0% engaged in commercial sex, 9.0% shared injection equipment, 8.9% reported a recent bacterial STI, and 4.0% had an HIV+ sexual partner. Of PrEP indicated participants (n = 101), 19 had heard of PrEP prior to the survey, but only 1 participant reported past-year PrEP use. Conclusions: Among a clinical population of people receiving buprenorphine for OUD, HIV risk behaviors were common, yet PrEP awareness and uptake were low. People engaged in treatment for OUD remain at high risk for HIV and are a priority population for PrEP. In light of the current opioid crisis, more research is needed to guide the integration of comprehensive HIV prevention into outpatient opioid treatment centers. © 2021 Elsevier Inc. Article	2022	Beckham S.W.; Mantsios A.; Galai N.; Likindikoki S.; Mbwambo J.; Davis W.; Kerrigan D.	Acceptability of multiple modalities of pre-exposure prophylaxis (PrEP) among female sex workers in Tanzania: A mixed-methods study	BMJ Open	-	-	-	-	20446055	10.1136/bmjopen-2021-058611	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136037452&doi=10.1136%2fbmjopen-2021-058611&partnerID=40&md5=e63db62c537f0613bc03623e82722581	Objectives Modalities of pre-exposure prophylaxis (PrEP) for HIV prevention offer options to women at high risk including female sex workers (FSW). This study aimed to explore FSW's acceptability and preferences for oral pills, long-acting (LA) injectable and vaginal ring PrEP. Design Sequential, explanatory, mixed methods. Setting Iringa, Tanzania. Participants FSW aged above 18 were recruited from sex work venues using time-location sampling (n=496); HIV-uninfected (n=293) were included in this analysis. Subsequently, survey participants were recruited for in-depth interviews (n=10) and two focus group discussions (n=20). Primary outcome measures (1) Acceptability of PrEP (Do you personally think it would be worth it to you to take ART if it could prevent HIV?: yes/no) and (2) preference for LA injectable versus oral pills (If you personally were going to take ART to prevent HIV infection, would you prefer to take it in the form of a daily pill or an injection once every 3 months? Injection/pill). Results Participants were (92%) unaware of PrEP but 58% thought it would be worth it to personally take PrEP. Acceptability of PrEP was significantly associated with higher social cohesion (aOR 2.12; 95% CI 1.29 to 3.50) and STI symptoms in the past 6 months (aOR 2.52; 95% CI 1.38 to 4.62). Most (88%) preferred LA vs oral PrEP. Qualitative findings revealed generally positive reactions to all types of PrEP, and they were viewed as a welcome backup to condoms. Participants had concerns about pills (burden of daily use, stigma from clients), and the vaginal ring (fear of client noticing and becoming suspicious, fear of infertility) and overall preferred LA-PrEP (less frequent use, easy to hide, belief in higher efficacy). Conclusions Offering multiple formulations of PrEP within the context of community-driven HIV prevention interventions among FSW may facilitate increased uptake and adherence. LA injectable PrEP may be a particularly preferred formulation among FSW. Trial registration number NCT02281578. © BMJ Publishing Group Limited 2022. Article	2022	Beer, Linda; Tie, Yunfeng; Dasgupta, Sharoda; McManus, Timothy; Smith, Dawn K; Shouse, R Luke	Trends in preexposure prophylaxis use among sex partners as reported by persons with HIV - United States, May 2015-June 2020.	AIDS	-	-	-	-	1473-5571	10.1097/QAD.0000000000003366	https://dx.doi.org/10.1097/QAD.0000000000003366	OBJECTIVE: To estimate trends in the proportion of sexually active U.S. adults with HIV (PWH) reporting an HIV-discordant sexual partner taking preexposure prophylaxis (PrEP) and proportion of partners taking PrEP. DESIGN: The Medical Monitoring Project is a complex sample survey of U.S. adults with diagnosed HIV. METHODS: We used annual cross-sectional data collected during June 2015-May 2020 to estimate the annual percentage change (EAPC), overall and by selected characteristics, in reported partner PrEP use among PWH with HIV-discordant partners (Nâ=â8707) and reported PrEP use among these partners (Nâ=â15 844). RESULTS: The proportion of PWH reporting PrEP use by one or more HIV-discordant sex partner rose 19.5% annually (11.3 to 24.4%). The prevalence rose from 6.0 to 17.4% (EAPC, 25.8%) among Black PWH, 10.1 to 26.0% (EAPC, 19.5%) among Hispanic/Latino PWH, and 20.8 to 34.6% (EAPC, 16.3%) among White PWH. Among MSM with HIV, the prevalence increased from 9.6 to 32.6% (EAPC, 28.2%) among Black MSM, 16.6 to 36.0% (EAPC, 15.6%) among Hispanic/Latino MSM, and 24.9 to 44.1% (EAPC, 17.9%) among White MSM. Among HIV-discordant sex partners, the proportion reported to be taking PrEP increased 21.1% annually (7.8 to 18.8%). Reported PrEP use rose from 4.9 to 14.2% (EAPC, 29.9%) among Black partners, 6.5 to 16.8% (EAPC, 20.3%) among Hispanic/Latino partners, and 12.7 to 26.1% (EAPC, 17.0%) among White partners. CONCLUSIONS: One in five HIV-discordant sexual partners of PWH was reported to be taking PrEP. PrEP use rose among all examined populations, although the increases did not eliminate disparities in PrEP use. Article	2022	Beesham I.; Mansoor L.E.; Joseph Davey D.L.; Palanee-Phillips T.; Smit J.; Ahmed K.; Selepe P.; Louw C.; Singata-Madliki M.; Kotze P.; Heffron R.; Parikh U.M.; Wiesner L.; Rees H.; Baeten J.M.; Beksinska M.	Quantifiable Plasma Tenofovir Among South African Women Using Daily Oral Pre-exposure Prophylaxis During the ECHO Trial	Journal of Acquired Immune Deficiency Syndromes	-	-	-	-	15254135	10.1097/QAI.0000000000003023	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136862133&doi=10.1097%2fQAI.0000000000003023&partnerID=40&md5=360c293b10528e45aca9a08b0095c8c6	Background:HIV endpoint-driven clinical trials provide oral pre-exposure prophylaxis (PrEP) as HIV prevention standard of care. We evaluated quantifiable plasma tenofovir among South African women who used oral PrEP during the Evidence for Contraceptive Options and HIV Outcomes (ECHO) Trial.Methods:ECHO, a randomized trial conducted in 4 African countries between 2015 and 2018, assessed HIV incidence among HIV-uninfected women, aged 16-35 years, randomized to 1 of 3 contraceptives. Oral PrEP was offered onsite as part of the HIV prevention package at the South African trial sites. We measured tenofovir in plasma samples collected at the final trial visit among women reporting ongoing PrEP use. We used bivariate and multivariate logistic regression to assess demographic and sexual risk factors associated with plasma tenofovir quantification.Results:Of 260 women included, 52% were ≤24 years and 22% had Chlamydia trachomatis at enrollment. At PrEP initiation, 68% reported inconsistent/nonuse of condoms. The median duration of PrEP use was 90 days (IQR: 83-104). Tenofovir was quantified in 36% (n = 94) of samples. Women >24 years had twice the odds of having tenofovir quantified vs younger women (OR = 2.12; 95% confidence interval = 1.27 to 3.56). Women who reported inconsistent/nonuse of condoms had lower odds of tenofovir quantification (age-adjusted OR = 0.47; 95% confidence interval = 0.26 to 0.83).Conclusions:Over a third of women initiating PrEP and reporting ongoing use at the final trial visit had evidence of recent drug exposure. Clinical trials may serve as an entry point for PrEP initiation among women at substantial risk for HIV infection with referral to local facilities for ongoing access at trial end. Article	2022	Beesham, I; Beksinska, M; Milford, C; Smit, J; Mansoor, L	Post-trial oral pre-exposure prophylaxis (PrEP) access among women who used oral PrEP as HIV prevention standard of care during a large clinical trial: findings from Durban, South Africa	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1186/s12889-023-16139-z	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10286415/	Background HIV endpoint-driven clinical trials increasingly provide oral pre-exposure prophylaxis (PrEP) as standard of prevention during the trial, however, among participants desiring to continue using PrEP at trial exit, little is known about post-trial PrEP access and continued use. Methods We conducted one-time, semi-structured, face-to-face, in-depth interviews with 13 women from Durban, South Africa, from November to December 2021. We interviewed women who initiated oral PrEP as part of the HIV prevention package during the Evidence for Contraceptive Options and HIV Outcomes (ECHO) Trial, elected to continue using PrEP at study exit, and were given a 3-month PrEP supply and referred to facilities for PrEP refills at the final trial visit. The interview guide probed for barriers and enablers to post-trial PrEP access, and current and future PrEP use. Interviews were audio-recorded and transcribed. Thematic analysis was facilitated using NVivo. Results Of the 13 women, six accessed oral PrEP post-trial exit, but five later discontinued. The remaining seven women did not access PrEP. Barriers to post-trial PrEP access and continued use included PrEP facilities having long queues, inconvenient operating hours, and being located far from women's homes. Some women were unable to afford transport costs to collect PrEP. Two women reported visiting their local clinics and requesting PrEP but were informed that PrEP was unavailable at the clinic. Only one woman was still using PrEP at the time of the interview. She reported that the PrEP facility was located close to her home, staff were friendly, and PrEP education and counselling were provided. Most women not on PrEP reported wanting to use it again, particularly if barriers to access could be alleviated and PrEP was easily available at facilities. Conclusions We identified several barriers to post-trial PrEP access. Strategies to enhance PrEP access such as a reduction in waiting queues, convenient facility operating hours, and making PrEP more widely available and accessible are needed. It is also worth noting that oral PrEP access has expanded in South Africa from 2018 till now and this could improve access to PrEP for participants exiting trials who desire to continue PrEP. Article	2022	Beesham, Ivana; Joseph Davey, Dvora L; Beksinska, Mags; Bosman, Shannon; Smit, Jenni; Mansoor, Leila E	Daily Oral Pre-exposure Prophylaxis (PrEP) Continuation Among Women from Durban, South Africa, Who Initiated PrEP as Standard of Care for HIV Prevention in a Clinical Trial.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-022-03592-x	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9252967	HIV incidence among women in Eastern and Southern Africa remains unacceptably high, highlighting the need for effective HIV prevention options, including pre-exposure prophylaxis (PrEP). The Evidence for Contraceptive Options and HIV Outcomes trial offered daily oral PrEP to participants during the latter part of the clinical trial as an additional HIV prevention choice. We explored daily oral PrEP continuation at trial exit among women enrolled from Durban, South Africa who initiated oral PrEP at the trial site. Of the 132 women initiating oral PrEP, 87% reported continuation of oral PrEP at month 1, 80% at month 3, and 75% continued using oral PrEP at their final trial visit and were referred to off-site facilities for ongoing oral PrEP access. The median duration of oral PrEP use in trial participants who used oral PrEP was 91 days (IQR 87 to 142 days). Women who disclosed their oral PrEP use to someone had increased odds of continuing oral PrEP at trial exit. Women who reported > 1 sex partner and those who felt they would probably or definitely get infected with HIV had reduced odds of continuing oral PrEP at trial exit. Of those discontinuing oral PrEP (n = 32), > 50% discontinued within the first month, and the most common reason for discontinuation was reporting side effects. The high rates of oral PrEP continuation in our study are encouraging and our findings can be utilized by other clinical trials providing oral PrEP as standard of care for HIV prevention and by oral PrEP implementation programmes. Article	2022	Bekker L.-G.; Giovenco D.; Baral S.; Dominguez K.; Valencia R.; Sanchez T.; McNaghten A.D.; Zahn R.; Yah C.S.; Sokhela Z.; Kaplan R.; Phaswana-Mafuya R.N.; Beyrer C.; Sullivan P.S.	Oral pre-exposure prophylaxis uptake, adherence, and adverse events among South African men who have sex with men and transgender women	Southern African Journal of HIV Medicine	-	-	-	-	16089693	10.4102/SAJHIVMED.V23I1.1405	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85149022296&doi=10.4102%2fSAJHIVMED.V23I1.1405&partnerID=40&md5=ffa8ce627887f4af6270be491b8d2ba5	Background: HIV prevention programmes that include pre-exposure prophylaxis (PrEP) for men who have sex with men (MSM) and transgender women (TGW) in South Africa have not been widely implemented. Objectives: The authors examined oral PrEP uptake, adherence, and adverse events among HIV-uninfected MSM and TGW to inform intervention acceptability and feasibility. Method: In 2015, MSM and TGW in two South African cities were offered a comprehensive package of HIV prevention services, including daily oral PrEP, and were followed for one year. Different models of PrEP delivery were used at each site. Adherence was measured using self-report and pill-count data and tenofovir-diphosphate (TFV-DP) concentrations. Results: Among 135 participants who were eligible for PrEP, 82 (61%) initiated PrEP, of whom 67 (82%) were on PrEP at study end. Participants were on PrEP for a median of 294 out of 314.5 possible days (93% protected days). The median time from PrEP initiation to discontinuation or study end was 305 days (interquartile range: 232-325 days). Across the follow-up time points, 57% - 72% of participants self-reported taking protective levels of PrEP and 59% - 74% were adherent to PrEP as indicated by pill counts. Fewer (< 18%) achieved protective TFV-DP concentrations of > 700 fmol/punch in dried blood spots. Side effects, while typically mild, were the most commonly cited reason by participants for early PrEP discontinuation. Conclusion: Many MSM and TGW initiated and maintained PrEP, demonstrating that PrEP can be successfully delivered to South African MSM and TGW in diverse programmatic contexts. Biologic adherence measures suggest MSM and TGW may experience challenges taking PrEP regularly. Counselling for coping with side effects and motivating daily pill taking is recommended to support South African MSM and TGW in achieving protection with PrEP. Copyright: © 2022. The Authors. Article	2022	Bekker, Linda-Gail; Pike, Carey; Hillier, Sharon L	HIV prevention: better choice for better coverage.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.25872	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8759757	INTRODUCTION: Antiretroviral-based pre-exposure prophylaxis (PrEP) is today an established, effective and safe method of HIV prevention used in multiple countries worldwide by a broad range of populations at risk of HIV infection. Biomedical innovations are critical in supporting the primary prevention of HIV; however, their potential can only be maximized if end-user challenges are recognized, described and used to develop next-generation models. DISCUSSION: First-generation PrEP, a daily oral pill, is highly efficacious, discreet and affords users the ability to commence and conclude treatment rapidly. However, consistent daily adherence and persistence is challenging, especially among younger populations, due in part to side effects, the risk of stock-outs and a lack of pill storage options. Second-generation PrEP, longer acting agents that require less frequent dosing, could overcome such challenges. Agents that have shown efficacy in clinical trials include a monthly vaginal ring and PrEP injectables to be administered every 8 weeks, while products in development include 6 monthly injectables, oral therapy that uses monthly rather than daily pills, implants and the potential for long-acting passive immunization. CONCLUSIONS: Second-generation PrEP agents will have the potential to offer improved adherence and less frequent reminders once they have undergone further development and the delivery systems that will best support them have been established. In order to pursue global UNAIDS targets of reducing new HIV infections to fewer than 500,000 annually by 2025, and to ensure that all people have access to prevention options that meet their specific prevention needs, both early and next-generation PrEP options are needed.	pre-exposure prophylaxis, long-acting PrEP, HIV prevention, oral PrEP, injectable PrEP, PrEP implants	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Clinical
Article	2022	Bellman R.; Mohebbi S.; Nobahar N.; Parizher J.; Apollonio D.E.	An observational survey assessing the extent of PrEP and PEP furnishing in San Francisco Bay Area pharmacies	Journal of the American Pharmacists Association	-	-	-	-	15443191	10.1016/j.japh.2021.08.001	https://pubmed.ncbi.nlm.nih.gov/34429253/	Background: Human immunodeficiency virus (HIV) remains prevalent in the United States despite medications that reduce the risk of infection, primarily pre-exposure prophylaxis (PrEP) and postexposure prophylaxis (PEP). In 2019, California authorized pharmacists to furnish PrEP and PEP under Senate Bill 159 (SB-159). Objective: Assess implementation of SB159 in San Francisco Bay Area community and mail-order pharmacies. Methods: We conducted an observational, cross-sectional survey of independent community and mail-order pharmacies in the 9-county San Francisco Bay Area to identify those that were in the process of furnishing, actively furnished, or furnished under a collaborative practice agreement (CPA). We conducted interviews with furnishing pharmacies in April 2021, focusing on the barriers to and successes of implementation, as well as the impact of coronavirus disease 2019 (COVID-19), and qualitatively analyzed them. Results: Of the 209 pharmacies contacted, 6 furnished under SB-159 (2.9%), 2 were in the process of furnishing under SB-159, and 1 furnished under a CPA. Six pharmacies and 7 pharmacists were interviewed. Barriers to implementation and furnishing included COVID-19, laboratory tests, lack of time and staff, cost to pharmacy, refill limitation, lack of patient awareness, difficulty arranging follow-up care, and vague wording of the policy. Facilitators to implementation included collaborations with clinics and health centers, privacy, increased accessibility, increased need in the patient population, and the pharmacy culture. Conclusion: Barriers and facilitators to PrEP and PEP furnishing were consistent across pharmacies, suggesting strategies that could be replicated and potential improvements to SB-159. © 2022 American Pharmacists Association®	NA	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Bergam, S; Harrison, A D; Benghu, N; Khumalo, S; Tesfay, N; Exner, T; Miller, L; Dolezal, C; Hanass-Hancock, J; Hoffman, S	Women's Perceptions of HIV- and Sexuality-Related Stigma in Relation to PrEP: Qualitative Findings from the Masibambane Study, Durban, South Africa.	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-022-03632-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9378426	Daily oral pre-exposure prophylaxis (PrEP) offers effective HIV prevention. In South Africa, PrEP is publicly available, but use among young women remains low. We explored young women's perceptions of PrEP to inform a gender-focused intervention to promote PrEP uptake. Six focus group discussions and eight in-depth interviews exploring perceptions of PrEP were conducted with forty-six women not using PrEP, ages 18-25, from central Durban. Data were thematically analyzed using a team-based consensus approach. The study was conducted among likely PrEP users: women were highly-educated, with 84.8% enrolled in post-secondary education. Qualitative data revealed intersecting social stigmas related to HIV and women's sexuality. Women feared that daily PrEP pills would be confused with anti-retroviral treatment, creating vulnerability to misplaced HIV stigma. Women also anticipated that taking PrEP could expose them to assumptions of promiscuity from the community. To address these anticipated community-level reactions, women suggested community-facing interventions to reduce the burden on young women considering PrEP. Concerns around PrEP use in this group of urban, educated women reflects layered stigmas that may inhibit future PrEP use. Stigma-reducing strategies, such as media campaigns and educational interventions directed at communities who could benefit from PrEP, should re-frame PrEP as an empowering and responsible choice for young women. Complementary Recruitment Strategies to Reach Men Who Have Sex with Men and Transgender Women: The Experience of a Large Brazilian HIV Prevention Service	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-022-03609-5	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85124328045&doi=10.1007%2fs10461-022-03609-5&partnerID=40&md5=e72add872dafe77b54cf34f369edf758	Different strategies have been used to reach men who have sex with men (MSM) and transgender women (TGW) for HIV prevention services. We described the characteristics of MSM and TGW attending a large HIV prevention service in Brazil according to different recruitment strategies or referrals. A total of 2713 individuals (224682.8% MSM and 46717.2% TGW) attended the service. Among HIV-negative MSM and TGW, 74.6% and 82.8% were eligible for pre-exposure prophylaxis (PrEP), respectively. PrEP uptake among MSM and TGW was 56.4% and 39.1%, respectively. Participants were mostly referred by peers (43.6%), followed by web-based (24.1%) and venue-based recruitment (16.2%). More young and Black MSM were referred from venue-based recruitment, and web-based strategies more frequently referred MSM with higher education. TGW who were younger and had higher education were more frequently referred from venue-based recruitment. Web-based recruitment failed to reach TGW. Multiple strategies were complementary to reach diverse MSM and TGW populations. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Bhatta D.N.; Hecht J.; Facente S.N.	Factors associated with stigma related to HIV pre-exposure prophylaxis (PrEP) use among men who have sex with men (MSM)	Sexually Transmitted Infections	-	-	-	-	13684973	10.1136/sextrans-2021-055296	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142401388&doi=10.1136%2fsextrans-2021-055296&partnerID=40&md5=3d244bef92bf70e582046fb81cf84019	Background Pre-exposure prophylaxis (PrEP) is a noteworthy scientific development that increases the opportunities for men who have sex with men (MSM) to prevent HIV infection, but stigma is a major barrier to its uptake. This study aims to determine the associations between PrEP-related stigma and individual characteristics among MSM. Methods Self-reported cross-sectional data were collected from routine-collected electronic healthcare record data from 4084 MSM receiving PrEP in San Francisco, California, between July 2018 and June 2020. Multivariable logistic regression was performed to determine the associations between individual characteristics and PrEP-related stigma, adjusting for age, race, gender identity, injection history, housing status and mental health status. Results PrEP-related stigma was experienced by 9.0% of the participants in our study. PrEP-related stigma was significantly associated with being transgender or gender non-conforming (adjusted OR (AOR): 1.81, 95% CI 1.21 to 2.72), having a history of injection drug use (AOR: 2.02, 95% CI 1.18 to 3.46), being unstably housed (AOR: 1.58, 95% CI 1.11 to 2.26) and having mental health concerns (AOR: 1.99, 95% CI 1.35 to 2.92), after controlling for age, race, gender, injection history, housing status and mental health status. Conclusion Participants who reported being transgender or gender non-conforming, having a history of injection drug use, or having mental health concerns were more likely to report experiencing PrEP-related stigma. It is crucial to develop culturally appropriate interventions to reduce PrEP-related stigma among populations who are at high risk of HIV infection and may benefit strongly from improved PrEP uptake. © 2022 BMJ Publishing Group. Article	2022	Bi X.; Liu F.; Zhang X.; Wang H.; Ye Z.; Yun K.; Huang X.; Ding H.; Geng W.; Xu J.	Vitamin D and Calcium Supplementation Reverses Tenofovir-Caused Bone Mineral Density Loss in People Taking ART or PrEP: A Systematic Review and Meta-Analysis	Frontiers in Nutrition	-	-	-	-	2296861X	10.3389/fnut.2022.749948	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128649389&doi=10.3389%2ffnut.2022.749948&partnerID=40&md5=174624e569586e36e1216c5856e9ff4a	Background: The decrease of bone mineral density (BMD) after the intake of Tenofovir disoproxil fumarate (TDF)-based drugs in people living with HIV/AIDS (PLWHA) and HIV-negative key populations under pre-exposure prophylaxis (PrEP) regimen raised concerns. Previous findings on the effects of vitamin D (VD) and calcium supplements and the recovery of BMD loss were inconclusive. The optimal doses of VD and calcium and its supplementary duration remained unknown. Therefore, we conducted a systematic review and meta-analysis to synthesize current evidence on VD and calcium supplements to inform clinical practice. Methods: We searched PubMed, Web of Science, Cochrane library, and EMBASE databases for all placebo-controlled trials and prospective cohort studies published before March 5, 2021 that investigated VD and calcium supplements in participants taking TDF-based drugs. The keywords calcium, vitamin D, Tenofovir, and BMD were used for the searches. The primary outcome was changes of spine and hip BMD. A subgroup analysis was performed to determine the factors that were related to the effects of VD supplements on BMD. Locally weighted regression (loess) was used to determine the relationships of VD supplements, supplementary duration, and changes of BMD. This study was registered at PROSPERO (No. 42021231000). Findings: Seven eligible studies including 703 participants were included in the analyses. The meta-analysis found that VD and calcium supplementation was related to a significant increase of BMD in the spine and hip standardized mean difference (SMD) 0.43; 95% CI, 0.25 to 0.61, p = 0.009. Moreover, positive dose-response relationships were demonstrated between doses of VD and calcium supplements, supplementary duration, and BMD recovery. Patients who took VD with the dose level of 4,000 IU/D obtained the highest BMD improvement (SMD 0.59, 95% CI, 0.43 to 0.74). No side effects were reported on VD and calcium supplementation. Interpretation: We found the VD and calcium supplementation was associated with increases of BMD in participants taking TDF-based drugs. An optimal supplementary dose of 4,000 IU/D for VD was suggested for clinicians. The findings could be used in clinical practice to improve the BMD outcomes in people who were taking TDF-based drugs. Article	2022	Biello, Katie B; Valente, Pablo K; Lin, Willey Y; Lodge Ii, William; Drab, Ryan; Hightow-Weidman, Lisa; da Silva, Daniel Teixeira; Mayer, Kenneth; Bauermeister, José A	PrEParing for NextGen: Cognitive Interviews to Improve Next Generation PrEP Modality Descriptions for Young Men Who have Sex with Men	AIDS and Behavior	-	-	-	-	1573-3254	10.1007/s10461-021-03545-w	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9050851	Next generation PrEP formulations may circumvent factors that impede daily oral pre-exposure prophylaxis (PrEP) use among young men who have sex with men (YMSM). We conducted video-based cognitive interviews with 20 YMSM (age 16-24) recruited in the US Northeast to assess participants' attitudes and comprehension of written descriptions of next generation PrEP modalities. Participants were predominately racial/ethnic minorities and half used daily oral PrEP. We identified four main areas for improvement of descriptions: defining scientific terms and balancing medical jargon and casual language; referencing more established products to contextualize PrEP formulations (e.g., hormonal implants); ensuring clarity and reducing redundancy; and including imagery (e.g., rectal douche applicator). The refined descriptions serve as exemplar text that may be used in future studies examining YMSM's preferences across next generation PrEP modalities. Accurate descriptions of next generation PrEP products strengthen measurement accuracy and can help roll-out products that become approved for clinical use. Article	2022	Biello, KB; Daddario, SR; Hill-Rorie, J; Futterman, D; Sullivan, PS; Hightow-Weidman, L; Jones, J; Mimiaga, MJ; Mayer, KH	Uptake and Acceptability of MyChoices: results of a Pilot RCT of a Mobile App Designed to Increase HIV Testing and PrEP Uptake Among Young American MSM	AIDS and Behavior	-	-	-	-	-	10.1007/s10461-022-03724-3	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02426188/full	Young men who have sex with men (YMSM) remain at disproportionate risk for HIV acquisition in the United States (US), yet use of evidence-based prevention strategies, including routine HIV testing and pre-exposure prophylaxis (PrEP), remain low. Smartphones and mobile app usage are nearly ubiquitous in this population. Given the potential for scalability, a mobile app to increase HIV testing and PrEP use among YMSM has the potential to make an extraordinary public health impact if efficacious. Based on extensive formative, community-engaged research, we developed a theory-driven mobile app-MyChoices-to increase HIV testing and PrEP uptake among YMSM. In a pilot randomized controlled trial (RCT), participants (n = 60) were randomized 2:1 to receive MyChoices or standard of care (SOC). Data from 3 to 6-month post-baseline assessments demonstrate that the app was highly acceptable (System Usability Score; mean = 75.8, SD = 10.7) and feasible (94% used the MyChoices app at least once; mean = 15.3 sessions, SD = 9.8). While not powered to assess efficacy, those in the MyChoices arm had 22% higher prevalence of HIV testing over follow-up compared to those in the SOC arm (NS). There was no difference in PrEP uptake. A fully-powered efficacy trial is warranted; if efficacy is demonstrated, the MyChoices app could be easily scaled to reach YMSM across the US.	*HIV test; *juvenile; *men who have sex with men; *mobile application; *pre-exposure prophylaxis; Adult; Article; Comparative effectiveness; Controlled study; Follow up; HIV Infections diagnosis, epidemiology, prevention & control; HIV Testing; Health care quality; Homosexuality, Male; Human; Human experiment; Humans; Major clinical study; Male; Mobile Applications; Prevalence; Pre-Exposure Prophylaxis methods; Randomized controlled trial; Sexual and Gender Minorities; Theoretical study; United States; United States epidemiology; Usability	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Bien-Gund C.H.; Ochwal P.; Marcus N.; Bair E.F.; Napierala S.; Maman S.; Agot K.; Thirumurthy H.	Adoption of HIV pre-exposure prophylaxis among women at high risk of HIV infection in Kenya	PLOS One	-	-	-	-	19326203	10.1371/journal.pone.0273409	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85137711137&doi=10.1371%2fjournal.pone.0273409&partnerID=40&md5=0be1074416d6b498705bde50b361db06	In 2017, Kenya became one of the first African countries to provide pre-exposure prophylaxis (PrEP) in its national HIV prevention plan. We sought to characterize factors associated with PrEP uptake and persistence among a cohort of women at risk of HIV infection during the early stages of PrEP scale-up in Kenya. HIV-negative women ≥18 years with ≥2 sexual partners in the past 4 weeks were recruited as part of an ongoing cluster randomized trial of an HIV self-testing intervention. PrEP use was assessed at baseline and at 6- and 12-month follow-up visits. Between June 2017 and August 2018, 2,086 were enrolled and had complete baseline data. 138 (6.6%) reported PrEP use during the first year of the study. Although PrEP use increased, persistence on PrEP was low, and less than half of individuals reported continuing PrEP at follow-up visits. In multivariate analyses, PrEP use was associated with recent STIs, having an HIV-positive primary partner, having regular transactional sex in the past 12 months, and being a female sex worker. In the early stages of PrEP scale-up in Kenya, uptake increased modestly among women with risk factors for HIV infection, but overall uptake and persistence was low. © 2022 Bien-Gund et al. Article	2022	Billioti de Gage S.; Desplas D.; Dray-Spira R.	Roll-out of HIV pre-exposure prophylaxis use in France: A nationwide observational study from 2016 to 2021	The Lancet Regional Health - Europe	-	-	-	-	26667762	10.1016/j.lanepe.2022.100486	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135947049&doi=10.1016%2fj.lanepe.2022.100486&partnerID=40&md5=4cbca54a93c2f35a89630584d533a515	Background: Oral HIV pre-exposure prophylaxis (PrEP) has been available and fully reimbursed for people at high risk of sexually acquired HIV infection in France since January 2016. Its dissemination has been widely promoted to reduce HIV incidence in high-risk populations. This study aimed to assess the roll-out of PrEP use in France from its implementation until mid-2021. Methods: Using the French National Health Data System (SNDS) covering 99% of people residing in France, all PrEP users defined as individuals aged 15 years or older who received at least one dispensing of PrEP between 1 January 2016 and 30 June 2021 were identified. PrEP users number and their socio-demographic and PrEP use characteristics were assessed over time. Findings: As of 30 June 2021, a total of 42 159 individuals had initiated PrEP in France. Monthly PrEP initiations increased steadily up to 1027 in February 2020, and then slowed down sharply from the onset of the COVID-19 epidemic until a recovery in the first half of 2021. PrEP users were overwhelmingly men (97·5%, 41 126/42 159), aged 36 years on average, living in a large metropolitan area (73·8%, 31 096/42 159), and among whom a minority (7·0%, 2966/42 159) were socio-economically disadvantaged. Throughout the study period, 80-90% of users renewed PrEP from one semester to another, suggesting a good level of maintenance among those engaged in treatment. Nevertheless, for 20·1% (7148/35 549) of new PrEP users no prescription renewal was recorded in the first six months after initiation, suggesting a substantial proportion of early treatment discontinuation. Private practitioners accounted for a minority (21·3%, 77 885/366 399) of PrEP renewal prescriptions. Interpretation: PrEP roll-out has been markedly impacted by the COVID-19 pandemic in France. Although PrEP deployment has been substantial among men who have sex with men, further action is needed to expand access to PrEP to all other population groups who could benefit from it and to promote adherence to treatment. Funding: This research was carried out within EPI-PHARE without external funding. © 2022 The Author(s)	Emtricitabine; HIV infection; HIV prevention; Men who have sex with men (MSM); Pharmacoepidemiology; Pre-exposure prophylaxis (PrEP); Tenofovir disoproxil fumarate	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical
Article	2022	Birdthistle, Isolde; Mulwa, Sarah; Sarrassat, Sophie; Baker, Venetia; Khanyile, David; O'Donnell, Dominique; Cawood, Cherie; Cousens, Simon	Effects of a multimedia campaign on HIV self-testing and PrEP outcomes among young people in South Africa: a mixed-methods impact evaluation of 'MTV Shuga Down South'.	BMJ Glob Health	-	-	-	-	2059-7908	10.1136/bmjgh-2021-007641	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8977807	INTRODUCTION: Innovative HIV technologies can help to reduce HIV incidence, yet uptake of such tools is relatively low among young people. To create awareness and demand among adolescents and young adults, a new campaign of the pan-African MTV Shuga series ('Down South 2'; DS2), featured storylines and messages about HIV self-testing (HIVST) and pre-exposure prophylaxis (PrEP) through television, radio and accompanying multimedia activities in 2019-2020. METHODS: We conducted a mixed-methods evaluation of the new MTV Shuga series among 15-24 years old in Eastern Cape, South Africa, in 2020. Quantitative and qualitative methods were used to investigate complementary evaluations questions, namely, whether and how the DS2 campaign works. A web-based survey, promoted via social media platforms of schools, universities and communities, assessed exposure to MTV Shuga and knowledge of HIVST and PrEP; secondary outcomes included awareness and uptake of HIVST and PrEP. We used multivariable logistic regression to estimate associations between exposure to DS2 and each outcome, adjusting for sociodemographic factors, media assets and exposure to other media campaigns. An embedded qualitative evaluation explored mechanisms of DS2's impact through deductive and inductive thematic analysis of in-depth individual and group interviews. RESULTS: Among 3431 online survey participants, 43% had engaged with MTV Shuga and 24% with DS2 specifically. Knowledge of HIV status was higher among those exposed to DS2 (71%) vs those who were not (39%; adjusted OR=2.26 (95% CI 1.78 to 2.87)). Exposure was also associated with increased awareness of HIVST (60% vs 28%; aOR=1.99 (1.61 to 2.47)) and use of HIVST (29% vs 10%; aOR=2.49 (1.95 to 3.19)). One-third of respondents were aware of PrEP, with higher proportions among those exposed versus non-exposed to DS2 (52% vs 27%; aOR=1.90 (1.53 to 2.35)). Qualitative insights identified mechanisms by which DS2 increased awareness, confidence and motivation to use HIVST and PrEP, but had less influence on service access. CONCLUSIONS: We found evidence consistent with a positive causal impact of the MTV Shuga DS2 campaign on HIV prevention outcomes among young people in a high-prevalence setting. As diverse testing and PrEP technologies become accessible, an immersive edutainment campaign can help to expand HIV prevention choices and close age and gender gaps in HIV testing and prevention goals. Article	2022	Birnholtz, Jeremy; Kraus, Ashley; Schnuer, Samantha; Tran, Lauren; Macapagal, Kathryn; Moskowitz, David A	'Oh, I don't really want to bother with that:' gay and bisexual young men's perceptions of barriers to PrEP information and uptake.	Culture, Health & Sexuality	-	-	-	-	1464-5351	10.1080/13691058.2021.1975825	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8920939	Pre-exposure prophylaxis (PrEP), a daily oral pill for HIV prevention demonstrated to be effective for adults, was recently approved by the US Food and Drug Administration for use with young people weighing at least 35 kilograms. Given that young people aged 13-19 years account for a disproportionate share of new US HIV infections, PrEP presents an important opportunity. There has been limited effort, however, to increase PrEP awareness and uptake among young people. While prior work has identified barriers young people face in getting PrEP, effective strategies for overcoming these barriers have not yet been identified. This paper presents results from interviews with 15-19 year old gay and bisexual young men about their knowledge and perceptions of PrEP, and the barriers they perceive. Results suggest that participants were aware of PrEP but confused by the details of insurance coverage and out-of-pocket costs. Participants also felt parents and providers would not be knowledgeable or supportive, and were reluctant to share their own use of PrEP on social media. Suggested next steps include online parent and provider education, systemic health care reform to streamline and simplify access to preventative care and awareness campaigns that meet youth where they are on popular platforms.	youth, sexual minority, LGBTQ+, PrEP, social media	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Blackwell C.W.; Castillo H.L.	Injectable Cabotegravir: A New Approach to HIV Pre-exposure Prophylaxis	Journal for Nurse Practitioners	-	-	-	-	15554155	10.1016/j.nurpra.2022.08.007	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139200599&doi=10.1016%2fj.nurpra.2022.08.007&partnerID=40&md5=86f7afbe71bf6b488c1e03a53b0766e6	Pre-exposure prophylaxis (PrEP) involves use of antiretroviral medications to prevent HIV infection in higher-risk adolescent and adult populations. PrEP regimens conventionally used daily oral emtricitabine/tenofovir fumarate (FTC/TDF) or emtricitabine/tenofovir alafenamide (FTC/TAF). However, on December 20, 2021, the United States Food and Drug Administration approved use of injectable cabotegravir for PrEP in adolescents and adults. This article discusses indications and contraindications of injectable cabotegravir as PrEP, provides an overview of injectable cabotegravir's safety, efficacy, and regimen, contrasts traditional oral PrEP regimens with the injectable cabotegravir regimen, and examines cost and accessibility. © 2022 Elsevier Inc. Article	2022	Blair H.A.	Cabotegravir Extended-Release Injectable Suspension: A Review in HIV-1 Pre-Exposure Prophylaxis	Drugs	-	-	-	-	126667	10.1007/s40265-022-01791-3	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140102327&doi=10.1007%2fs40265-022-01791-3&partnerID=40&md5=cbdbedacf8c0890a993baa9a253a470c	Cabotegravir extended-release (ER) injectable suspension (Apretude™) is the first long-acting injectable option to be approved for HIV-1 pre-exposure prophylaxis (PrEP). As an HIV-1 integrase strand transfer inhibitor, cabotegravir ER injectable suspension prevents DNA integration and inhibits HIV-1 replication. Its slow absorption and long elimination half-life permit infrequent dosing (1 month apart for two consecutive months, and every 2 months thereafter). Cabotegravir ER injectable suspension is indicated in the USA for PrEP to reduce the risk of sexually acquired HIV-1 infection in at-risk adults and adolescents weighing ≥ 35 kg who have a negative HIV-1 test prior to initiation. In clinical trials, cabotegravir ER injectable suspension had superior efficacy to oral daily emtricitabine/tenofovir disoproxil fumarate (DF) in preventing acquisition of HIV-1 in at-risk transgender women (TGW), cisgender men who have sex with men (MSM), and cisgender women. The drug was generally well tolerated, although further long-term data are needed to fully determine its safety. With its convenient, less-frequent dosing schedule and its long-acting formulation enabling intramuscular administration, cabotegravir ER injectable suspension represents a novel and efficacious alternative to daily oral PrEP. © 2022, The Author(s), under exclusive licence to Springer Nature Switzerland AG. Article	2022	Blair, Kevin J; Torres, Thiago S; Hoagland, Brenda; Bezerra, Daniel R B; Veloso, Valdilea G; Grinsztejn, Beatriz; Clark, Jesse; Luz, Paula M	Pre-exposure prophylaxis use, HIV knowledge, and internalized homonegativity among men who have sex with men in Brazil: A cross-sectional study	The Lancet Regional Health - Americas	-	-	-	-	2667-193X	10.1016/j.lana.2021.100152	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8920052	Background: Pre-exposure prophylaxis (PrEP) use in Brazil remains low despite free national access. We explored associations of HIV knowledge and internalized homonegativity with PrEP use among PrEP-eligible men who have sex with men (MSM). Methods: Brazilian Hornet users completed an online, cross-sectional survey in February-March 2020. We included cis-men ≥18 years old who reported recent sex with men and were PrEP-eligible per the following: condomless anal intercourse, partner(s) living with HIV, transactional sex, and/or sexually transmitted infection. Our outcome was current PrEP use, defined by the response, "I am currently taking PrEP." Key predictors included the HIV/AIDS Knowledge Assessment (HIV-KA) and Reactions to Homosexuality Scale (RHS); higher scores indicate greater knowledge and greater internalized homonegativity, respectively. Scales were standardized for analysis. Associations with current PrEP use were estimated using adjusted odds ratios (aOR) with 95% confidence intervals (95%CI). Findings: Among 2398 PrEP-eligible MSM, n = 370 (15·4%) reported current PrEP use. Increasing HIV-KA scores were associated with greater odds of PrEP use (aOR 1·70 95%CI 1·41-2·04, p < 0·001), and increasing RHS scores with lower odds of PrEP use (aOR 0·83 95%CI 0·73-0·96, p = 0·010). PrEP use was lower among 18-24 versus 40+-years-old MSM (aOR 0·43 95%CI 0·27-0·69, p = 0·005), and in Black versus White/Asian respondents (aOR 0·51 95%CI 0·31-0·85, p = 0·040). Interpretation: Among PrEP-eligible Brazilian MSM, HIV knowledge was associated with increased PrEP use and internalized homonegativity with decreased use. Wider dissemination of HIV prevention knowledge and addressing stigma experienced by MSM could promote increased PrEP use. Funding: National Institute of Mental Health, Fiocruz, Conselho Nacional de Desenvolvimento Científico e Tecnológico. Article	2022	Bokolo, S; Govender, E	Educators' perceptions on the benefits and barriers of oral PrEP uptake among adolescent girls and young women in Vulindlela, KwaZulu-Natal	Communicare: Journal for Communication Sciences in Southern Africa	-	-	-	-	0259-0069	10.36615/jcsa.v41i1.1400	https://journals.uj.ac.za/index.php/jcsa/article/view/1400	Oral PrEP promotion is a key aspect of combination prevention efforts to increase opportunities for HIV prevention among adolescent girls and young women (AGYW) who are at higher risk of infection. Research suggests that communication efforts often adopt an individualistic decision-making approach that is devoid of the multiple influences that impact young women's HIV preventative choices. Schools and educators are increasingly being identified as key role players and influencers of decision making among young women. The promotion of PrEP uptake among AGYW of school going age, thus requires an exploration of perceptions of educators about the related benefits and barriers to PrEP uptake among school girls. A qualitative study using a purposive sampling method was used to sample 6 high schools in Vulindlela, a district with the highest HIV incidents among AGYW in KwaZulu-Natal. Semi-structured interviews were conducted with a total of twelve Life Orientation educators and senior staff members from the 6 selected high schools. The data was transcribed and analysed thematically using the culture-centred approach. The findings suggested that educators acknowledged the benefits of PrEP in curbing HIV infection rates among young women. However, these benefits were clouded by barriers and concerns around minimal, or poor condom use as a result of oral PrEP use which could promote promiscuity and minimalise efficacy. These findings highlight the need for more contextual community-driven communication strategies around PrEP, and emphasise the value of a community-centred approach that promotes dialogue among key role players, like educators, to further enhance PrEP communication. Article	2022	Bond, Keosha T; Gunn, Alana; Williams, Porche; Leonard, Noelle R	Using an Intersectional Framework to Understand the Challenges of Adopting Pre-exposure Prophylaxis (PrEP) Among Young Adult Black Women.	Sexuality Research and Social Policy	-	-	-	-	1868-9884	10.1007/s13178-021-00533-6	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8992539	Introduction: There is limited functional knowledge and utilization of pre-exposure prophylaxis (PrEP) among young adult Black cisgender women (YBW). Methods: We conducted four focus groups with YBW using an intersectional framework to explore multiple levels of factors that impede YBW awareness, interest, and utilization of PrEP in conjunction with their sexual and reproductive healthcare needs. Results: Influences at the cultural-environmental level included a lack of information and resources to access to PrEP and medical mistrust in the healthcare system. At the social normative level, influences included attitudes towards the long-term effects on sexual and reproductive health and self-efficacy to follow the PrEP regimen. At the proximal intrapersonal level, influences included anticipated HIV stigma from family and peers along with the fear of rejection from their main partners. Conclusions: Translation of these results indicated that interventions to increase PrEP utilization and adherence among YBW will require multi-level strategies to address barriers to integrating HIV prevention into sexual and reproductive healthcare. Article	2022	Bonett S.; Bauermeister J.; Meanley S.	Social identity support, descriptive norms, and economic instability in PrEP engagement for emerging adult MSM in the United States	AIDS Care	-	-	-	-	9540121	10.1080/09540121.2022.2075821	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133269149&doi=10.1080%2f09540121.2022.2075821&partnerID=40&md5=603d209fb62f60447eb8d5006f9915d4	Rates of pre-exposure prophylaxis (PrEP) uptake for HIV prevention continue to increase rapidly among men who have sex with men (MSM) in the United States (U.S.); however, these increases have been slower among young MSM. Emerging adulthood (ages 18–25) is a time of transitions and social development, resulting in increased vulnerability to HIV. Analyzing data from a cross-sectional survey of emerging adult MSM (ages 18–25 years; n = 281) in the Mid-Atlantic urban metropolitan region of the U.S., we examined how social identity support, descriptive PrEP norms, and economic instability were related to PrEP engagement. In structural equation models, PrEP norms were directly associated with PrEP engagement (β = 0.29, 95% CI = 0.12,0.46) and social identity support was indirectly associated with PrEP engagement through its association with descriptive PrEP norms (β = 0.18, 95% CI = 0.09,0.28). Economic instability was not significantly associated with PrEP engagement, although a negative trend was present (β = −0.19, 95% CI = −0.39,0.02). Our results suggest that an integrative socioecological model is appropriate for the study of PrEP engagement among emerging adult MSM. Efforts to increase PrEP engagement should support community capacity building, amplify positive descriptive PrEP norms, and address unmet economic needs. © 2022 Informa UK Limited, trading as Taylor & Francis Group.	emerging adults; HIV; MSM; pre-exposure prophylaxis	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Bonett, Stephen; Dowshen Nadia; Bauermeister José; Meanley, Steven; Wirtz, Andrea L; Celentano, David D; Galai Noya; Arrington-Sanders, Renata	Characterizing the PrEP Continuum for Black and Latinx Sexual and Gender Minority Youth	AIDS and Behavior	-	-	-	-	10907165	10.1007/s10461-021-03476-6	https://www.proquest.com/scholarly-journals/characterizing-prep-continuum-black-latinx-sexual/docview/2641697716/se-2?accountid=8113	Pre-exposure prophylaxis (PrEP) rollout efforts thus far have inadequately reached young people from underrepresented backgrounds. This study explores PrEP engagement among young Black and Latinx men who have sex with men, transgender women, and gender diverse individuals in three U.S. cities using an adapted PrEP continuum measure. We analyze data from the recruitment phase of an ongoing PrEP engagement intervention (n = 319) using partial proportional odds logistic regression. Participants reported high willingness and intention to use PrEP, yet most (82%) were not currently taking PrEP. Being insured (aOR = 2.95, 95%-CI = 1.60-5.49), having one or more PrEP users in one's sexual network (aOR = 4.19, 95%-CI = 2.61–6.79), and higher individual HIV risk scores (aOR = 1.62, 95%-CI = 1.34–1.97) were each associated with being further along the PrEP continuum. Strategies are needed to address barriers to healthcare access and leverage connections within social and sexual networks in order to bolster PrEP engagement among marginalized young people from diverse backgrounds. Article	2022	Bonner C.P.; Browne F.A.; Carney T.; Shangase N.; Ndirangu J.W.; Myers B.; Wechsberg W.M.	Mandrax use, sexual risk, and opportunities for pre-exposure prophylaxis among out-of-school adolescent girls and young women in Cape Town, South Africa	South African Medical Journal	-	-	-	-	2569574	10.7196/SAMJ.2022.v112i5.15971	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130029877&doi=10.7196%2fSAMJ.2022.v112i5.15971&partnerID=40&md5=a1ad6585e187dc001953ea5c9889b892	Background. In South Africa (SA), adolescent girls and young women (AGYW) aged 15 - 24 years account for nearly 25% of all new HIV infections in the country. The intersection of substance use and sexual risk continues to drive the HIV epidemic among AGYW. For example, methaqualone, also known as Mandrax, has sedative effects that may affect women's ability to negotiate condom use during sex, refuse sex without a condom, or consent to sex, thereby increasing their risk for HIV. Consequently, it is critical to understand how Mandrax use affects HIV risk among AGYW and to assess awareness of and willingness to use biomedical HIV prevention methods, such as pre-exposure prophylaxis (PrEP), among AGYW who use Mandrax. Objectives. To examine the role of Mandrax use in sexual behaviours and investigate the extent to which AGYW who use Mandrax are aware of and willing to initiate PrEP. Methods. Data for this report were derived from baseline and 6-month follow-up data provided by 500 AGYW participating in a cluster-randomised trial assessing the efficacy of a young woman-focused intervention to reduce substance use and HIV risk. AGYW who self-identified as black African or coloured, reported using substances, reported condomless sex in the past 3 months, and had discontinued school early were recruited from 24 community clusters across Cape Town, SA. Following consent/assent, participants provided biological specimens to test for recent drug use (including Mandrax) and completed the self-report questionnaire. Results. Logistic regression analysis revealed that the AGYW who had a positive test result for Mandrax use were less likely to use a condom with their main partner (p=0.01), and almost three times more likely to use alcohol and/or other drugs before or during their last act of sexual intercourse (p<0.001), compared with the AGYW who had a negative Mandrax test result. Mandrax use was not significantly related to PrEP awareness (p>0.10) or willingness to use PrEP (p>0.10), but 70% of AGYW who used Mandrax were willing to initiate PrEP. Conclusion. The study findings highlight how Mandrax use may contribute to HIV risk among SA AGYW. Key decision-makers should consider incorporating substance use prevention efforts into existing HIV reduction programmes and equip youth-friendly clinics with the resources to identify AGYW who use Mandrax and offer them PrEP. © 2022 South African Medical Association. Article	2022	Bonner R.; Stewart J.; Upadhyay A.; Bruce R.D.; Taylor J.L.	A Primary Care Intervention to Increase HIV Pre-Exposure Prophylaxis (PrEP) Uptake in Patients with Syphilis	Journal of the International Association of Physicians in AIDS Care	-	-	-	-	23259574	10.1177/23259582211073393	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122966492&doi=10.1177%2f23259582211073393&partnerID=40&md5=b675f204d94e98dc2d830d67d3dae81f	Identifying candidates for HIV pre-exposure prophylaxis (PrEP) is a barrier to improving PrEP uptake in priority populations. Syphilis infection is an indication for PrEP in all individuals and can be easily assessed by primary care providers (PCP) and health systems. This retrospective study evaluated the impact of a multidisciplinary provider outreach intervention on PrEP uptake in patients with a positive syphilis test result in a safety-net hospital-based primary care practice. The PCPs of PrEP-eligible patients with a positive syphilis result were notified via the electronic medical record (EMR) about potential PrEP eligibility and institutional HIV PrEP resources. Rates of PrEP offers and prescriptions were compared in the pre (8/1/2018-12/31/2018, n = 60) and post (1/1/2019-5/31/2019, n = 86) intervention periods. Secondary analyzes evaluated receipt of appropriate syphilis treatment and contemporaneous screening for HIV, gonorrhea, and chlamydia. No significant differences in the overall proportion of patients offered (15% vs 19%) and prescribed (7% vs 5%) PrEP were observed between the pre- and post-periods. Overall, 7% of positive tests represented infectious syphilis. The rate of appropriate syphilis treatment was equivalent (57% vs 56%) and contemporaneous screening for other sexually transmitted infections was suboptimal across the entire study period. Although any positive syphilis test may be an easily abstracted metric from the EMR, this approach was inclusive of many patients without current HIV risk and did not increase PrEP uptake significantly. Future research into population health approaches to increase HIV prevention should focus on patients with infectious syphilis and other current risk factors for incident HIV infection. © The Author(s) 2022. Article	2022	Boot, Alexandria; Deas, Crystal	What's Trending on Twitter Regarding the Most Recently Approved Oral Agent for HIV Pre-Exposure Prophylaxis (PrEP)?	Innovations in Pharmacy	-	-	-	-	2155-0417	10.24926/iip.v13i4.4794	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10256299	Introduction: Pre-exposure prophylaxis (PrEP) is a key therapeutic strategy for HIV prevention. Descovy® is the most recently approved oral agent for PrEP. Despite availability, there continues to be suboptimal PrEP use among at-risk individuals. Social media platforms have a role in disseminating health information, to include education on PrEP. Material and methods: A content analysis was conducted of "tweets" posted on Twitter® during the initial year of Descovy's FDA approval for PrEP. The coding schema captured content related to the indication, appropriate use, costs, and safety profile of Descovy. Results: Most tweets provided information on target population, dosing strategy, and side effects of Descovy. Information on costs and appropriate use was frequently missing. Conclusion: Health educators and providers should be aware of gaps in social media messaging concerning PrEP and should educate patients to ensure they are well informed when considering PrEP. Article	2022	Bothma, Rutendo; O'Connor, Cara; Nkusi, Jolie; Shiba, Vusi; Segale, Jacob; Matsebula, Luyanda; Lawrence, J Joseph; van der Merwe, L Leigh-Ann; Chersich, Matthew; Hill, Naomi	Differentiated HIV services for transgender people in four South African districts: population characteristics and HIV care cascade.	Journal of the International AIDS Society	-	-	-	-	1758-2652	10.1002/jia2.25987	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9557019	INTRODUCTION: Transgender people in South Africa are disproportionately affected by HIV, discrimination and stigma. Access to healthcare and health outcomes are poor. Although integrating gender-affirming healthcare with differentiated HIV prevention, care and treatment services has shown improvement in HIV service uptake and health outcomes among transgender people, evidence is lacking on the implementation of differentiated service delivery models in southern Africa. This article describes a differentiated service delivery model across four South African sites and transgender individuals who access these services. We assess whether hormone therapy (HT) is associated with continued use of pre-exposure prophylaxis (PrEP) and viral load suppression. METHODS: In 2019, differentiated healthcare centres for transgender individuals opened in four South African districts, providing gender-affirming healthcare and HIV services at a primary healthcare level. Routine programme data were collected between October 2019 and June 2021. Descriptive statistics summarized patient characteristics and engagement with HIV prevention and treatment services. We conducted a multivariate logistic regression analysis to determine whether HT was associated with viral load suppression and PrEP continued use. RESULTS: In the review period, we reached 5636 transgender individuals through peer outreach services; 86% (4829/5636) of them accepted an HIV test and 62% (3535/5636) were linked to clinical services. Among these, 89% (3130/3535) were transgender women, 5% (192/3535) were transgender men and 6% (213/3535) were gender non-conforming individuals. Of those who received an HIV test, 14% (687/4829) tested positive and 91% of those initiated antiretroviral treatment. Viral load suppression was 75% in this cohort. PrEP was accepted by 28% (1165/4142) of those who tested negative. Five percent (161/3535) reported ever receiving HT through the public healthcare system. Service users who received HT were three-fold more likely to achieve viral load suppression. We did not find any association between HT and continued use of PrEP. CONCLUSIONS: A differentiated HIV and gender-affirming service delivery model at a primary healthcare level is feasible and can enhance service access in South Africa. HT can improve HIV clinical outcomes for transgender people. As trust is established between the providers and population, uptake of HIV testing and related services may increase further.	differentiated service delivery models, gender-affirming, HIV services, hormone therapy, South Africa, transgender	English	United States	Western and Central Europe and North America	South Africa	Eastern and Southern Africa	South Africa	Eastern and Southern Africa	Review
Article	2022	Bourne, Adam; Carman, Marina; Kabuti, Rhoda; Nutland, Will; Fearon, Elizabeth; Liku, Jennifer; Tukai, Anthony; Weatherburn, Peter; Kimani, Joshua; Smith, Adrian D	Experiences and challenges in sexual health service access among men who have sex with men in Kenya.	Global Public Health	-	-	-	-	1744-1706	10.1080/17441692.2021.1987501	https://dx.doi.org/10.1080/17441692.2021.1987501	Men who have sex with men (MSM) in Kenya bear a heavy burden of HIV/STIs and are a priority population in the national HIV/AIDS response, yet remain criminalised and stigmatised within society. HIV pre-exposure prophylaxis (PrEP) offers an opportunity to significantly impact the HIV epidemic, as does the concept of U = U, whereby those who are living with HIV and on treatment are uninfectious when their viral load has been suppressed so as to be undetectable. However, the value of such innovations will not be realised without sufficient understanding of, and respect for, the sexual health service provision needs of MSM. This paper describes findings from 30 in-depth interviews with MSM living in Nairobi that explored engagement with sexual health service providers, barriers to access and perceived opportunities to improve service design and delivery. Findings indicate concern relating to the professionalism of some staff working within public hospitals as well as feelings that many sexual health services were not considered safe spaces for the discussion of MSM-specific sexual behaviour. Diverse views were expressed relating to comfort in public, community and private sexual health services as well as how these are and should be organised. Article	2022	Boyd, Donte T; Gamji M'Rabiu Abubakari; Turner, DeAnne; Ramos, S Raquel; Hill, Mandy J; Nelson, LaRon E	The Influence of Family Bonding, Support, Engagement in Healthcare, on PrEP Stigma among Young Black and Latino Men Who Have Sex with Men: A Path Analysis	Children	-	-	-	-	-	10.3390/children9030330	https://www.proquest.com/scholarly-journals/influence-family-bonding-support-engagement/docview/2642391699/se-2?accountid=8113	This study employs the ecodevelopmental theory to examine the influence of mother and father bonding, family engagement in healthcare, and family support on PrEP stigma among BLMSM. We used a cross-sectional sample from wave five of the Healthy Young Men (HYM) study, with a survey sample of 399 participants aged 16–24 years. We conducted two-path analyses to test multiple hypotheses: (1) mother/father bonding is associated with an increase in family engagement in healthcare; (2) family engagement in healthcare is associated with family social support; and (3) family social support is associated with PrEP stigma. Family social support was negatively correlated with PrEP stigma (r = −0.15; p < 0.001). The findings show that families either led by a Black/Latino father or mother have a significant impact on the sexual health-seeking behavior of BLMSM and their perception of HIV and PrEP. Article	2022	Bracho-Sanchez E.; Stonbraker S.; Halpern M.; Wood S.; Lowenthal E.	HIV pre-exposure prophylaxis: assessment of acceptability among members of HIV serodiscordant/serostatus unknown couples	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624221097753	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130056069&doi=10.1177%2f09564624221097753&partnerID=40&md5=159deaa6eb87d7e5413a6e30c1085ecd	Pre-exposure prophylaxis (PrEP) is effective in preventing HIV infection but is not yet widely available in resource-limited settings such as the Dominican Republic. We aimed to ascertain PrEP acceptability among people living with HIV in the Dominican Republic who are part of HIV serodiscordant partnerships and understand relationships between PrEP acceptability, HIV stigma, and intimate partner violence.Methods: A cross-sectional survey of people in care for HIV infection included acceptability-related questions and assessments of HIV stigma and intimate partner violence. We also explored the expected impact of PrEP on HIV disclosure rates and fertility intentions.Results: Of the 100 participants, 74% had been in their current partnership for >1 year; 38% had not disclosed to their partner; 29% reported condomless sex, and 23% reported sex with multiple partners. PrEP was highly acceptable with 84% of participants saying they were "very likely" to offer PrEP to their partner if available and 21% stating it would allow them to have more children. Of those who had not disclosed to their partner, 71% stated PrEP would help them do so. No relationship was found between PrEP acceptability, HIV stigma, and intimate partner violence. However, higher than expected rates of PrEP acceptability limited the power of these analyses.Conclusion: Pre-exposure prophylaxis was considered to be highly acceptable among people living with HIV in the Dominican Republic who are part of serodiscordant partnerships. © The Author(s) 2022. Article	2022	Bradshaw D.; Taylor G.P.	HTLV-1 Transmission and HIV Pre-exposure Prophylaxis: A Scoping Review	Frontiers in Medicine	-	-	-	-	2296858X	10.3389/fmed.2022.881547	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130240944&doi=10.3389%2ffmed.2022.881547&partnerID=40&md5=79d709e82beacc33248070b0628bba19	HIV pre-exposure prophylaxis (HIV-PrEP) is effective in reducing the likelihood of HIV acquisition in HIV-negative people at high risk of exposure. Guidelines recommend testing for sexually transmitted infections (STIs) before starting, and periodically on PrEP, including bacterial infections, HIV, hepatitis C virus, and, for those who are non-immune, hepatitis B virus. Diagnosed infections can be promptly treated to reduce onward transmission. HTLV-1 is not mentioned; however, it is predominantly sexually transmitted, causes adult T-cell leukaemia/lymphoma (ATL) or myelopathy in 10% of those infected, and is associated with an increased risk of death in those without any clinically HTLV-associated condition. The 2021 WHO Technical Report on HTLV-1 called for the strengthening of global public health measures against its spread. In this scoping review, we, therefore, (1) discuss the epidemiological context of HIV-PrEP and HTLV-1 transmission; (2) present current knowledge of antiretrovirals in relation to HTLV-1 transmission prevention, including nucleos(t)ide reverse transcriptase inhibitors (NRTIs) and integrase strand transfer inhibitors (INSTIs); and (3) identify knowledge gaps where data are urgently required to inform global public health measures to protect HIV-PrEP users from HTLV-1 acquisition. We suggest that systematic seroprevalence studies among PrEP-using groups, including men who have sex with men (MSM), people who inject drugs (PWIDs), and female sex workers (FSWs), are needed. Further data are required to evaluate antiretroviral efficacy in preventing HTLV-1 transmission from in vitro studies, animal models, and clinical cohorts. PrEP delivery programmes should consider prioritizing the long-acting injectable INSTI, cabotegravir, in HTLV-1 endemic settings. Article	2022	Bragazzi N.L.; Khamisy-Farah R.; Tsigalou C.; Mahroum N.	HIV Pre-exposure Prophylaxis and Its Impact on the Gut Microbiome in Men Having Sex With Men	Frontiers in Microbiology	-	-	-	-	1664302X	10.3389/fmicb.2022.922887	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133840544&doi=10.3389%2ffmicb.2022.922887&partnerID=40&md5=58eed23a9f1344be14c85d550849e998	HIV/AIDS still imposes a high epidemiological and societal burden. Together with antiretroviral therapy, pre-exposure prophylaxis (PrEP) represents a fundamental tool in the fight against HIV/AIDS. PrEP is considered effective and safe, even though it may affect organs like the kidney, bone, and liver, as shown by randomized clinical trials (RCTs). These side effects may be mediated by alterations of the gut microbiome. Whilst the impact of the human rectal and vaginal microbiome on HIV prevention has been highly investigated among women, less is known about its effect among men having sex with men (MSM), a vulnerable population at high risk for HIV and disproportionately affected by HIV/AIDS. In the present paper, we will overview the effects of PrEP on the gut microbiota in MSM. Mining PubMed/MEDLINE, we identified three studies that have found significant changes affecting the gut microbiota. However, these shifts in the gut microbiome composition are variable, probably due to methodological differences, even though all studies reviewed in the present overview consistently report aberrations at the level of the gut microbiota. More data are needed, especially concerning the long-term side effects of PrEP: despite the studies included being a high-quality RCT, and two well-designed cross-sectional studies, evidence related to the impact of HIV PrEP on the gut microbiome in MSM is scarce and based on small populations. A better understanding of the interactions between the gut microbiota, sexual orientation/identity, and HIV prevention is expected to improve PrEP adherence and devise strategies to counteract PrEP-related side effects. Sexually transmitted infections among participants in an HIV PrEP adherence trial	International journal of STD & AIDS	-	-	-	-	9564624	10.1177/09564624211053428	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128000266&doi=10.1177%2f09564624211053428&partnerID=40&md5=ddf978195cc3c6a5424970dff3240e7c	Background: HIV PrEP effectiveness is highly dependent on adherence. High STI incidence has been reported among PrEP users. We assessed the relationship between STI incidence (CT, NG, and syphilis) and PrEP adherence. Methods: We performed a subanalysis of a controlled, open-label, two-arm, randomized clinical demonstration project of a text-message based adherence intervention. Participants had 48 weeks of follow-up and had STI testing every 12 or 24 weeks. PrEP adherence was measured at week 48 using intracellular tenofovir-diphosphate drug concentrations. We calculated incidence rate ratios for STIs among those adherent as compared with those not adherent to PrEP. Results: Of the 381 assessed for CT, NG and syphilis at one or more follow-up visits, there were 16 cases of syphilis or 5.0 per 100 person years (95% CI: 2.6, 7.5); 63 cases of NG or 26.3 per 100 person years (95% CI: 19.8, 32.8); and 81 cases of CT or 36.3 per 100 person years (95% CI: 28.4, 44.2). We found no association between adequate PrEP adherence and STI incidence (aIRR: 0.97 95% CI: 0.67, 1.40). Conclusions: We found that the incidence of STIs was not significantly different between those adherent to PrEP and those non-adherent. Further research is needed to assess how PrEP use may impact STIs over time. © The Author(s) 2022.	men who have sex with men; pre-exposure prophylaxis; Sexually transmitted infections	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Suboptimal Uptake, Retention, and Adherence of Daily Oral Prexposure Prophylaxis among People with Opioid Use Disorder Receiving Hepatitis C Virus Treatment	Open Forum Infectious Diseases	-	-	-	-	23288957	10.1093/ofid/ofab658	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85126342218&doi=10.1093%2fofid%2fofab658&partnerID=40&md5=1ed91d55be9487fa5323fcf82db59d6a	Background: Daily oral preexposure prophylaxis (PrEP) with tenofovir disoproxil fumarate (TDF)/emtricitabine (FTC) prevents human immunodeficiency (HIV) among people who inject drugs (PWID). Despite rising HIV incidence and injection drug use (IDU), PrEP use remains low and there is limited research about uptake, adherence, and retention among PWID. Methods: The ANCHOR investigation evaluated a community-based care model collocating hepatitis C virus (HCV) treatment, medication for opioid use disorder (OUD), and PrEP in individuals in Washington, DC, and Baltimore, Maryland. PrEP counseling was conducted from HCV treatment day 0 until week 24. Subjects could start any time during this window, were followed for 48 weeks, and were assessed for adherence by self-report and dried blood spot TDF analysis. Results: One hundred ninety-eight participants were enrolled, of whom 185 (93%) were HIV negative. Twenty-nine individuals (15.7% of HIV-negative cohort) initiated PrEP. One hundred sixteen participants (62.7%) met 2014 Centers for Disease Control and Prevention (CDC) PrEP criteria due to IDU (82 44.3%), sex (9 4.9%), or both practices (25 13.5%). Providers recommended PrEP to 94 individuals (50.8%), and recommendation was associated with PrEP uptake. Median treatment duration was 104 days (interquartile range, 28-276 days), with 8 participants retained through week 48. Adherence was variable over time by self-report and declined by TDF analysis. No HIV seroconversions occurred. Conclusions: This cohort of people with HCV and OUD experienced low uptake of PrEP despite the majority meeting CDC criteria. High rates of disruption and discontinuation, compounded by variable adherence, made TDF/FTC a suboptimal prevention strategy. Emerging modalities like long-Acting formulations may address these barriers, but PWID have been excluded from their development to date. © The Author(s) 2021. Article	2022	Brooks, RA; Nieto, O; Cabral, A; Landrian, A; Fehrenbacher, AE	Delivering PrEP to adults with "low" or "no" HIV risk and youth: experiences and perspectives of PrEP providers	Culture, Health & Sexuality	-	-	-	-	1369-1058	10.1080/13691058.2020.1817560	https://www.tandfonline.com/doi/full/10.1080/13691058.2020.1817560#abstract	Health care providers have an important role to play in expanding PrEP uptake to populations disproportionately burdened by HIV. In this study, in-depth, semi-structured qualitative interviews were conducted with 20 PrEP providers in Los Angeles, California to explore their experiences and perspectives prescribing PrEP. Overall, the findings indicate that providers generally adhered to US CDC clinical guidelines in determining PrEP eligibility. However, they also identified special considerations with respect to adults with "low" or "no" HIV risk. Three themes were developed from the data related to the delivery of PrEP to such individuals: 1) patients may not disclose sexual behaviours; 2) patient autonomy and agency; and 3) the importance of PrEP in gay male monogamous relationships. Two additional themes were identified related to prescribing PrEP to young people under the age of consent: 4) the need for more PrEP and sexual health education with youth and 5) challenges in providing PrEP to youth without parental consent. Findings highlight the importance of providing PrEP to patients who could potentially benefit from adoption, whether or not they present with clear behavioural indicators for PrEP. Providers should also consider the potential barriers to delivering PrEP to youth to ensure successful adoption among members of this population.	pre-exposure prophylaxis; men who have sex with men; MEN; SEX; PREEXPOSURE PROPHYLAXIS; BARRIERS; HEALTH-CARE; PrEP eligibility; youth; Health care providers	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Brooks, Ronald A; Nieto, Omar; Santillan, Martin, Jr; Landrian, Amanda; Fehrenbacher, Anne E; Cabral, Alejandra	Beyond HIV prevention: Additional individual and community-level benefits of PrEP among Latino gay and bisexual men	PLOS One	-	-	-	-	1932-6203	10.1371/journal.pone.0269688. eCollection 2022	https://pubmed.ncbi.nlm.nih.gov/35696399/	HIV infections disproportionately impact Latino gay and bisexual men (GBM) in the United States. Pre-Exposure Prophylaxis (PrEP) is a proven prevention strategy that can help reduce new HIV infections in this population. Unfortunately, PrEP adoption and persistence among Latino GBM remain low. The added benefits of using PrEP experienced by Latino GBM can provide important insights to inform the development of PrEP messaging to motivate this population to explore and consider PrEP as an appropriate and acceptable HIV prevention tool. We conducted in-depth interviews with Latino GBM PrEP users to explore positive feelings and emotions, and additional benefits gained from using PrEP. Data were analyzed using thematic analysis. A total of 29 Latino GBM completed the study interview. The average age of participants was 30 years, and the mean length of time using PrEP was 17.1 months. Five themes were constructed from the data representing the additional benefits gained by Latino GBM PrEP users, and included: (1) reduced fear, anxiety, and stress about HIV, HIV testing, and sex; (2) feeling empowered and in control of their HIV risk; (3) greater awareness of sexual risk behaviors and sexual health; (4) greater sexual exploration and pleasure, and comfort having condomless sex; and (5) a greater connection to community and a feeling of contributing to the elimination of HIV. The added benefits identified in this study represent a range of social, emotional, and psychological benefits that Latino GBM experience while using PrEP. They speak to the complementary benefits that PrEP can bring to Latino GBM who decide to use the medication, that go beyond HIV prevention. These findings can inform the development of future PrEP messaging to help improve motivation for PrEP uptake and persistent use among Latino GBM. Article	2022	Brothers J.; Hosek S.; Keckler K.; Anderson P.L.; Xiong D.; Liu H.; Huhn G.	The ATEAM study: Advances in technology to enhance PrEP adherence monitoring (ATEAM) among young men who have sex with men	Clinical and Translational Science	-	-	-	-	17528054	10.1111/cts.13414	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139443642&doi=10.1111%2fcts.13414&partnerID=40&md5=3d43a70a23eeb74fc0e14277c6e071a2	Young age has consistently correlated with lower adherence to pre-exposure prophylaxis (PrEP) in young men who have sex with men (YMSM). Digital medicine, a dynamic healthcare platform of wearable physiological sensors and mobile communication technology that can respond to medication nonadherence rapidly, has the potential in promoting PrEP adherence. We evaluated the feasibility and acceptability of Proteus Discover, a digital monitoring adherence system, to measure PrEP adherence and provide real-time feedback among cisgender YMSM and transgender women. One hundred HIV-negative young men and transgender women ages 16–24 years were enrolled in a 24-week randomized controlled crossover study to tenofovir disoproxil fumarate with emtricitabine (TDF/FTC) coencapsulated with Proteus Discover versus TDF/FTC standard-of-care. Participants in the 12-week Proteus Discover arm received weekly SMS text messages to promote pill taking based on Proteus Discover adherence data. Dried blood spots (DBS) were collected at 4-week intervals for tenofovir diphosphate (TFV-DP) in red blood cells as the referent and questionnaires were completed to assess acceptability, usability, and patterns of use. Linear mixed models analyzed the relationship between 30-day adherence measured by DBS and Proteus Discover. PrEP adherence was high overall. Adherence, as measured by DBS, was correlated with adherence as measured by Proteus Discover (p value = 0.03). Most participants reported that Proteus Discover helped them take their PrEP daily and that the system was easy to use. However, a majority (53.5%–60.5%) disagreed with the statement that wearing the patch was not an issue. There was an incremental increase in TFV-DP in DBS with adherence by Proteus Discover. More research is warranted to explore optimizing PrEP adherence for youth through real-time monitoring. © 2022 The Authors. Article	2022	Brown G.; Di Feliciantonio C.	Geographies of PrEP, TasP and undetectability: Reconceptualising HIV assemblages to explore what else matters in the lives of gay and bisexual men	Dialogues in Human Geography	-	-	-	-	20438206	10.1177/2043820621989574	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85100474971&doi=10.1177%2f2043820621989574&partnerID=40&md5=d2ed2929cfcf4d2a7cad0c96ca14d81b	Recent biomedical innovations in the field of HIV prevention and treatment – namely PrEP, TasP, and 'undetectability' – have completely reshaped the experience of living with HIV, as well as the meanings of 'risk' and 'safety' in relation to sexual practices, leading to new forms of pleasure and sociality for gay and bisexual men in the Minority World. While human geographers have been slow to engage with the changing social dimensions brought by these innovations, scholars across the whole spectrum of the social sciences have been far more creative and responsive contributing to a critical understanding of what these processes entail in terms of subject formation as well as social and communal relations. This article proposes a distinctly geographical contribution to analysing and interpreting these biomedical technologies, exploring the ways that new spatialities and spatial relations emerge from their use and circulation. Our approach is based on provisional assemblage thinking as it offers the possibility to think the complex connections between biomedical innovations in the field of HIV, sexual practices, subjectivity, pleasure, spaces, and technologies, going beyond the subdisciplinary preoccupations and methodological reflexes of geographers focused primarily on either health or sexuality. © The Author(s) 2021. Article	2022	Brown M.S.; Hanif H.; Little K.M.; Clark M.R.; Thurman A.R.; Flomen L.; Doncel G.F.	End-user research in support of long-acting systemic antiretroviral delivery systems: insights from qualitative research with providers and target users in South Africa	BMC Infectious Diseases	-	-	-	-	14712334	10.1186/s12879-022-07907-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143570113&doi=10.1186%2fs12879-022-07907-0&partnerID=40&md5=85fcc26c47d678ae0af6dbb8b7fd7cbd	Background: While oral pre-exposure prophylaxis (PrEP) has been shown to reduce the risk of HIV, challenges such as adhering to a daily-dosing regimen and persistence have emerged as barriers for at-risks populations in South Africa. This qualitative research sought to investigate perceptions of and preferences for a long-acting, biodegradable implantable PrEP product designed to address these barriers. Methods: To identify and understand motivators, barriers, and preferences for the PrEP implant, we conducted qualitative in-depth interviews (IDIs) among health care providers (HCPs) and target end-users (young women, adolescent girls, and female sex workers) in urban and rural/peri-urban regions of Gauteng Province, South Africa. The IDIs focused on defining values, beliefs, habits, lifestyles, influencers, and information channels for potential PrEP implant end-users. Results: We conducted 36 IDIs across health care providers and target end-user respondent segments. Respondents had generally positive reactions to the PrEP implant. Most end-users felt that some undesirable aspects of the implant (e.g., side effects, pain during insertion, potential scarring, and inability to remove implant) would be offset by having a highly effective, and long-lasting HIV prevention product. Although some HCPs believed the implantable PrEP would lead to increases in promiscuity and risky sexual behavior, most HCPs saw value in the PrEP implant's long duration of protection, its biodegradability, and the likelihood of higher adherence relative to oral PrEP. Conclusions: This study is a first step toward further research needed to demonstrate the demand for a biodegradable, long-acting implantable PrEP and suggests such a product would be accepted by end-users and HCPs in South Africa. This study indicates the need to develop more convenient, discreet, long-acting, and highly effective biomedical HIV prevention options for at-risk populations. © 2022, The Author(s). Article	2022	Brown, Todd T; Yuhas, Krista; Mayer, Kenneth H; Landovitz, Raphael J; Marzinke, Mark A; Hendrix, Craig W; Chen, Ying Q; Klingman, Karen L; Chege, Wairimu; Mccauley, Marybeth B; Gulick, Roy M; Wilkin, Timothy J	Bone changes with candidate PrEP regimens containing tenofovir disoproxil fumarate and/or maraviroc and/or emtricitabine in US men and women: HPTN 069/ACTG A5305.	Journal of Antimicrobial Chemotherapy	-	-	-	-	1460-2091	10.1093/jac/dkab400	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9097256	BACKGROUND: Tenofovir disoproxil fumarate-containing pre-exposure prophylaxis (PrEP) has been associated with decreases in bone mineral density (BMD), but the bone effects of other non-tenofovir disoproxil fumarate candidate PrEP regimens are not well described. METHODS: The HPTN 069/ACTG A5305 study randomized 406 US cisgender men and transgender women, and 188 cisgender women at risk for HIV infection to one of four double-blinded regimens: (i) maraviroc; (ii) maraviroc + emtricitabine; (iii) maraviroc + tenofovir disoproxil fumarate; or (iv) tenofovir disoproxil fumarate + emtricitabine. BMD was measured in a subset of participants at the lumbar spine (LS) and hip by dual-energy X-ray absorptiometry (DXA) at baseline and 48 weeks. Percentage change in LS and hip BMD was compared between the tenofovir disoproxil fumarate- and non-tenofovir disoproxil fumarate-containing arms by Wilcoxon rank-sum tests and multiple linear regression adjusting for sex, race and baseline BMI. RESULTS: At baseline (n = 307), the median age was 33 years, 56% male and 43% black. At the hip, the median percentage change in BMD at 48 weeks was -1.05% in the tenofovir disoproxil fumarate arms and 0.0% in the non-tenofovir disoproxil fumarate arms (between group P = 0.001). No interaction by sex was observed. The median percentage change in LS BMD was not different between arms. CONCLUSIONS: Tenofovir disoproxil fumarate-containing PrEP was associated with significantly greater bone loss compared with maraviroc ± emtricitabine PrEP at the hip, but not the LS. The BMD changes at the hip were similar in magnitude in men and women. Article	2022	Brundrett M.E.	Human Immunodeficiency Virus Preexposure Prophylaxis in Adolescents and Young Adults	Pediatrics in Review	-	-	-	-	1919601	10.1542/pir.2020-002048	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123037616&doi=10.1542%2fpir.2020-002048&partnerID=40&md5=8271e133728884f9a8d9f545b632bfb1	Human immunodeficiency virus (HIV) prevention holds the promise of decreasing the burden of HIV infections worldwide. Access to HIV prevention services, including preexposure prophylaxis (PrEP), is a key strategy in reducing HIV transmission, but it continues to be underused. PrEP, a once-daily medication for HIV prevention, is approved for adolescents. A pediatrician's role is critical in identifying and increasing access for adolescents and young adults to PrEP services and reducing HIV acquisition in youth. © 2022 American Academy of Pediatrics. Article	2022	Buchanan A.L.; Park C.J.; Bessey S.; Goedel W.C.; Murray E.J.; Friedman S.R.; Elizabeth Halloran M.; Katenka N.V.; Marshall B.D.L.	Spillover benefit of pre-exposure prophylaxis for HIV prevention: evaluating the importance of effect modification using an agent-based model	Epidemiology and Infection	-	-	-	-	9502688	10.1017/S0950268822001650	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141333884&doi=10.1017%2fS0950268822001650&partnerID=40&md5=d1c6751673f39b9ba881c6facd65d563	We developed an agent-based model using a trial emulation approach to quantify effect measure modification of spillover effects of pre-exposure prophylaxis (PrEP) for HIV among men who have sex with men (MSM) in the Atlanta-Sandy Springs-Roswell metropolitan area, Georgia. PrEP may impact not only the individual prescribed, but also their partners and beyond, known as spillover. We simulated a two-stage randomised trial with eligible components (≥3 agents with ≥1 HIV+ agent) first randomised to intervention or control (no PrEP). Within intervention components, agents were randomised to PrEP with coverage of 70%, providing insight into a high PrEP coverage strategy. We evaluated effect modification by component-level characteristics and estimated spillover effects on HIV incidence using an extension of randomisation-based estimators. We observed an attenuation of the spillover effect when agents were in components with a higher prevalence of either drug use or bridging potential (if an agent acts as a mediator between ≥2 connected groups of agents). The estimated spillover effects were larger in magnitude among components with either higher HIV prevalence or greater density (number of existing partnerships compared to all possible partnerships). Consideration of effect modification is important when evaluating the spillover of PrEP among MSM. © The Author(s), 2022. Published by Cambridge University Press. Article	2022	Budhwani H.; Yigit I.; Maragh-Bass A.C.; Rainer C.B.; Claude K.; Muessig K.E.; Hightow-Weidman L.B.	Validation of HIV Pre-Exposure Prophylaxis (PrEP) Medication Scales with Youth on PrEP: PrEP Confidence Scale and PrEP Difficulties Scale	AIDS Patient Care and STDs	-	-	-	-	10872914	10.1089/apc.2022.0072	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141939128&doi=10.1089%2fapc.2022.0072&partnerID=40&md5=3de32f03edc626f69098840c25b5bbcd	Pre-exposure prophylaxis (PrEP) is a lifesaving medical intervention that protects against human immunodeficiency virus (HIV), but to date, PrEP uptake has been limited. PrEP utilization and adherence among youth, including stigmatized and highly vulnerable young sexual and gender minorities, have been exceptionally low across all regions, leading to preventable HIV transmission. Considering the scientific value of measuring and understanding predictors or associations of PrEP adherence, our study team validated two scales: a PrEP Difficulties Scale and a PrEP Confidence Scale tested within the Adolescent Trials Network P3 study (2019-2021). Data from sexual and gender minorities who were prescribed PrEP across nine domestic sites were evaluated (N = 235). Descriptive statistics, exploratory factor analysis, and correlation coefficients are reported herein. Results for the PrEP Difficulties Scale yielded a four-factor solution (Disclosure, Health Effects, Logistics, and Cost), and results for the PrEP Confidence Scale produced a three-factor solution (Scheduling, Distraction, and Planning). Factor loadings and Cronbach's alphas suggested good internal consistency for both scales. PrEP Confidence Scale subscales were correlated with PrEP adherence, and subscales of both scales were associated with dimensions of social support and PrEP-related stigma. Given the persistence of preventable HIV infections among key populations, multi-level barriers and facilitators to medication adherence, and expansion of PrEP modalities, the PrEP Difficulties Scale and PrEP Confidence Scale have the potential to enhance intervention, exploratory, and mechanistic HIV prevention research. Article	2022	Budhwani, Henna; Kiszla, B. Matthew; Outlaw, Angulique Y.; Oster, Robert A.; Mugavero, Michael J.; Johnson, Mallory O.; Hightow-Weidman, Lisa B.; Naar, Sylvie; Turan, Janet M.	Adapting a Motivational Interviewing Intervention to Improve HIV Prevention Among Young, Black, Sexual Minority Men in Alabama: Protocol for the Development of the Kings Digital Health Intervention.	JMIR Research Protocols	-	-	-	-	1929-0748	10.2196/36655	https://pubmed.ncbi.nlm.nih.gov/35830245/	BACKGROUND: African American or Black young men who have sex with men (BYMSM) are at a disproportionate risk for contracting HIV and have high rates of undiagnosed, and therefore untreated, HIV infection. In the southern United States, BYMSM face region-specific hurdles to HIV prevention, such as limited access to care and high levels of racism and intersectional stigma, necessitating HIV testing and pre-exposure prophylaxis interventions that address sociocultural and structural barriers while motivating BYMSM to engage in prevention. Brothers Saving Brothers (BSB) is a motivational interviewing behavioral intervention that successfully and simultaneously increased community-based HIV testing and prevention counseling and education among BYMSM in the midwestern United States. OBJECTIVE: The aim of this protocol is to detail the process for the adaption of the BSB intervention for midwestern BYMSM to the Kings intervention for southern BYMSM. During the adaptation process, the intervention will be modernized to include rapid HIV testing, as opposed to HIV testing that requires BYMSM to return for test results, pre-exposure prophylaxis, and the provision of structural supports, and for relevance in the southern United States. METHODS: Aim 1 is to gather qualitative data through focus groups and in-depth interviews with BYMSM aged 18 to 29 years in Alabama and in-depth interviews with prevention and outreach workers who routinely work with BYMSM in Alabama. NVivo qualitative software (QSR International) will be used for the coding and analysis of the transcripts via a thematic analysis approach. For aim 2, intervention mapping will guide the adaptation process, intervention content, components, and design. Both aims 1 and 2 will leverage the Exploration, Preparation, Implementation, Sustainment implementation science framework, with emphasis on the exploration and preparation phases of this model. By applying these frameworks, the original midwestern BSB intervention will be scientifically adapted to the southern BYMSM Kings intervention. RESULTS: This study is ongoing as of 2022 and is expected to conclude in 2024, with aims 1 and 2 being completed in 2023. Qualitative data will offer insight into the current real-world experiences and preferences of BYMSM in Alabama. Feedback will be collected through the adaptation process to inform intervention refinement. Institutional review board approvals have been received. CONCLUSIONS: The findings will inform next steps, that is, testing the Kings intervention for feasibility, acceptability, and preliminary effectiveness in a pilot hybrid type 1 effective-implementation randomized controlled trial. The study results will provide insights about important considerations for HIV prevention among BYMSM in the southern United States. Article	2022	Buffel, Veerle; Reyniers, Thijs; Masquillier, Caroline; Thunissen, Estrelle; Nöstlinger, Christiana; Laga, Marie; Wouters, Edwin; Berghe, Wim Vanden; Deblonde, Jessika; Vuylsteke, Bea	Awareness of, Willingness to Take PrEP and Its Actual Use Among Belgian MSM at High Risk of HIV Infection: Secondary Analysis of the Belgian European MSM Internet Survey.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03526-z	https://dx.doi.org/10.1007/s10461-021-03526-z	We examined PrEP awareness, willingness to take it and early PrEP use among men who have sex with men (MSM) at increased risk of HIV acquisition in Belgium. This analysis of the Belgian EMIS online data of 2017-2018 adopts a cascade approach, with the following steps quantified as conditional probabilities: being eligible for, aware of, willing to take PrEP, and PrEP use. One out of three MSM was eligible to use PrEP according to the operationalized Belgian reimbursement criteria. PrEP awareness was lower among socioeconomically vulnerable MSM, MSM living outside large cities, MSM who were less open about their sexuality and those who did not identify as gay or homosexual. A lack of PrEP knowledge, a higher self-efficacy regarding safe sex, having a steady partner and reporting more symptoms of depression were related to unwillingness to use PrEP. Among those willing to take PrEP, less than one third were actually using PrEP. Not using PrEP was associated with living in small cities and experiencing financial problems. Article	2022	Bundy C.; Hall C.D.X.; Foran J.E.; Jozsa K.; Newcomb M.E.; Mustanski B.	REASSESSING THE IMPORTANCE OF PREP USE GIVEN REDUCED SEX DURING THE COVID-19 PANDEMIC: PERSPECTIVES FROM A SAMPLE OF YOUNG SEXUAL MINORITY MEN	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2022.34.6.441	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85143199663&doi=10.1521%2faeap.2022.34.6.441&partnerID=40&md5=3a5b54332b237743d5953be5d5e42fef	Research has begun to examine sexual behavior during the COVID-19 pandemic using quantitative methods, but less is known about the context surrounding these changes using qualitative methods, including correspond-ing changes in risk reduction methods. This qualitative study, guided by the Integrated Behavioral Model, examines the pandemic's impact on PrEP adherence among young men who have sex with men in Chicago. PrEP-using participants from a cohort study were recruited into a 90-day diary study measuring sexual behaviors and PrEP use. Between April and Sep-tember 2020, a subset of participants was recruited for qualitative inter-views (n = 28) exploring prevention strategies, including the impact of the pandemic. Although most were highly adherent pre-pandemic, many took fewer pills or discontinued during the pandemic due to decreased sex. Find-ings suggest the importance of counseling for PrEP reinitiation as "seasons of HIV risk" increase, as well as use of telehealth as a facilitator of PrEP use throughout the pandemic. © 2022 The Guilford Press. Article	2022	Bunting, Samuel R; Feinstein, Brian A; Calabrese, Sarah K; Hazra, Aniruddha; Sheth, Neeral K; Chen, Alex F; Garber, Sarah S	Assumptions about patients seeking PrEP: Exploring the effects of patient and sexual partner race and gender identity and the moderating role of implicit racism	PLOS One	-	-	-	1932-6203	10.1371/journal.pone.0270861	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9249206	INTRODUCTION: Daily pre-exposure prophylaxis (PrEP) for HIV-prevention is an essential component of national plans to end the HIV epidemic. Despite its well-documented safety and effectiveness, PrEP prescription has not met the public health need. Significant disparities between White and Black people exist with respect to PrEP prescription, as do disparities between men and women. One factor contributing to these disparities is clinicians' assumptions about patients seeking PrEP. METHODS: The present study sought to investigate medical students' assumptions about patients seeking PrEP (anticipated increased condomless sex, extra-relational sex, and adherence to PrEP), and assumed HIV risk when presenting with their sexual partner. We systematically varied the race (Black or White) and gender (man or woman) of a fictional patient and their sexual partner. All were in serodifferent relationships including men who have sex with men (MSM), women (MSW), and women who have sex with men (WSM). Participants also completed an implicit association test measuring implicit racism against Black people. We evaluated the moderation effects of patient and partner race on assumptions as well as the moderated moderation effects of implicit racism. RESULTS: A total of 1,472 students participated. For MSM patients, having a Black partner was associated with higher assumed patient non-adherence to PrEP compared to a White partner, however a White partner was associated with higher assumed HIV risk. For MSW patients, a White male patient was viewed as being more likely to engage in more extra-relational sex compared to a Black male patient. For WSM patients, White women were assumed to be more likely to have condomless and extra-relational sex, be nonadherent to PrEP, and were at higher HIV risk. Overall, implicit racism was not related to negative assumptions about Black patients as compared to White patients based on patient/partner race. DISCUSSION: Medical education about PrEP for HIV prevention must ensure future health professionals understand the full range of patients who are at risk for HIV, as well as how implicit racial biases may affect assumptions about patients in serodifferent couples seeking PrEP for HIV prevention. As gatekeepers for PrEP prescription, clinicians' assumptions about patients seeking PrEP represent a barrier to access. Consistent with prior research, we identified minimal effects of race and implicit racism in an experimental setting. Article	2022	Bunting, Samuel R; Feinstein, Brian A; Calabrese, Sarah K; Hazra, Aniruddha; Sheth, Neeral K; Wang, Gary; Garber, Sarah S	The Role of Social Biases, Race, and Condom Use in Willingness to Prescribe HIV Pre-exposure Prophylaxis to MSM: An Experimental, Vignette-Based Study	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000003072	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9592166	INTRODUCTION: Daily antiretroviral pre-exposure prophylaxis (PrEP) is a safe and effective method of preventing HIV. Clinicians' assumptions, biases, and judgments may impede access to PrEP. Specifically, concern that patients will engage in more condomless sex ("risk compensation") has been cited by clinicians as a reason for not prescribing PrEP. METHODS: In this experimental study among medical students, we systematically varied race (White or Black) and condom-use behaviors (continued-use, planned-discontinuation, or continued-nonuse) of a fictional patient (all men with multiple male sex partners). Participants indicated the patients' assumed adherence to PrEP, patients' overall HIV risk, and willingness to prescribe PrEP. Participants completed an implicit association test to detect implicit racism and measures of heterosexism and attitudes toward nonmonogamy, which were examined as moderators of patient race and condom-use effects on participants' assumptions and ultimate willingness to prescribe PrEP. RESULTS: Participants (N = 600) were most willing to prescribe PrEP to the continued-nonuse patient and least willing to prescribe to the planned-discontinuation patient. No differences were identified based on patient race. The continued-nonuse (vs. continued-use) patient was perceived as less likely to adhere to PrEP, which was associated with lower willingness to prescribe. Negative attitudes toward nonmonogamy exacerbated this effect. No effects of implicit racism or explicit heterosexism were identified. CONCLUSIONS: Participants were least willing to prescribe PrEP to patients who planned to discontinue condom use. Patients seeking PrEP are exhibiting agency over their sexual health, and clinicians should fulfill their role in ensuring access to this primary preventative therapy. Training and curricular reform regarding PrEP are needed. Article	2022	Burgess, Raquel; Feliciano, Josemari T.; Lizbinski, Leonardo; Ransome, Yusuf	Trends and Characteristics of #HIVPrevention Tweets Posted Between 2014 and 2019: Retrospective Infodemiology Study.	JMIR Public Health and Surveillance	-	-	-	2369-2960	10.2196/35937	https://publichealth.jmir.org/2022/8/e35937/	BACKGROUND: Twitter is becoming an increasingly important avenue for people to seek information about HIV prevention. Tweets about HIV prevention may reflect or influence current norms about the acceptability of different HIV prevention methods. Therefore, it may be useful to empirically investigate trends in the level of attention paid to different HIV prevention topics on Twitter over time. OBJECTIVE: The primary objective of this study was to investigate temporal trends in the frequency of tweets about different HIV prevention topics on Twitter between 2014 and 2019. METHODS: We used the Twitter application programming interface to obtain English-language tweets employing #HIVPrevention between January 1, 2014, and December 31, 2019 (n=69,197, globally). Using iterative qualitative content analysis on samples of tweets, we developed a keyword list to categorize the tweets into 10 prevention topics (eg, condom use, preexposure prophylaxis PrEP) and compared the frequency of tweets mentioning each topic over time. We assessed the overall change in the proportions of #HIVPrevention tweets mentioning each prevention topic in 2019 as compared with 2014 using chi-square and Fisher exact tests. We also conducted descriptive analyses to identify the accounts posting the most original tweets, the accounts retweeted most frequently, the most frequently used word pairings, and the spatial distribution of tweets in the United States compared with the number of state-level HIV cases. RESULTS: PrEP (13,895 tweets; 20.08% of all included tweets) and HIV testing (7688, 11.11%) were the most frequently mentioned topics, whereas condom use (2941, 4.25%) and postexposure prophylaxis (PEP; 823, 1.19%) were mentioned relatively less frequently. The proportions of tweets mentioning PrEP (327/2251, 14.53%, in 2014, 5067/12,971, 39.1%, in 2019; P≤.001), HIV testing (208/2251, 9.24%, in 2014, 2193/12,971, 16.91% in 2019; P≤.001), and PEP (25/2251, 1.11%, in 2014, 342/12,971, 2.64%, in 2019; P≤.001) were higher in 2019 compared with 2014, whereas the proportions of tweets mentioning abstinence, condom use, circumcision, harm reduction, and gender inequity were lower in 2019 compared with 2014. The top retweeted accounts were mostly UN-affiliated entities; celebrities and HIV advocates were also represented. Geotagged #HIVPrevention tweets in the United States between 2014 and 2019 (n=514) were positively correlated with the number of state-level HIV cases in 2019 (r=0.81, P≤.01). CONCLUSIONS: Twitter may be a useful source for identifying HIV prevention trends. During our evaluation period (2014-2019), the most frequently mentioned prevention topics were PrEP and HIV testing in tweets using #HIVPrevention. Strategic responses to these tweets that provide information about where to get tested or how to obtain PrEP may be potential approaches to reduce HIV incidence. Article	2022	Burns C.M.; Borges M.; Frye J.; Keicher K.; Elliott S.; Schwartz S.; Shipp K.; Okeke N.L.; Mckellar M.S.	Understanding Retention in Pre-Exposure Prophylaxis Care in the South: Insights from an Academic HIV Prevention Clinic	AIDS Research and Human Retroviruses	-	-	-	8892229	10.1089/aid.2021.0177	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128249000&doi=10.1089%2faid.2021.0177&partnerID=40&md5=afa6fe30965d3d6d4041ea1bf7a50e14	HIV pre-exposure prophylaxis (PrEP) is poorly utilized in the southern United States. We examined PrEP retention in care and sexually transmitted infections (STIs) through a retrospective review of the Duke University PrEP Clinic from January 1, 2015 to October 15, 2019. We evaluated short-term (3 months), long-term (additional 8-12 months), and longitudinal retention in care in our clinic. Adjusted odds ratios (aOR) were generated to explore demographics associated with retention. Kaplan-Meier curves were generated to view retention longitudinally. STIs were examined at baseline (1 year before initial PrEP visit) and while retained in care. Of a total of 255 patients; 88% were men, 37% were black, and 73% were men who have sex with men (MSM). Short- and long-term retention in care were met by 130/237 (55%) and 80/217 (37%) patients, respectively. MSM were more likely to be retained in the short term (aOR = 5.22, 95% confidence interval CI = 1.57-17.32). Self-referred patients were more likely to be retained in the long term (aOR = 2.18, 95% CI = 1.12-4.23). Uninsured patients were less likely to be retained in the long term (aOR = 0.32, 95% CI = 0.11-0.91). STI diagnoses include 42 infections at baseline and 69 infections during follow-up. STI diagnosed while in PrEP care was associated with longer retention in care over time. Patients discontinue PrEP care over time and STIs were frequently encountered. Additional studies are needed to determine the best way to retain patients in HIV preventative care. © Charles M. Burns et al. 2022; Published by Mary Ann Liebert, Inc. 2022. Article	2022	Burns C.M.; Endres K.; Farrow L.; Mhina C.; Cooper A.; Silverberg B.; McKellar M.S.; Okeke N.L.	Perceptions on HIV Pre-Exposure Prophylaxis Among Urgent Care Clinicians in the Southern United States	Current HIV Research	-	-	-	1570162X	10.2174/1570162X20666220426094920	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138152752&doi=10.2174%2f1570162X20666220426094920&partnerID=40&md5=777244e08354960386e7894df7796983	Background: Underutilization of HIV pre-exposure prophylaxis (PrEP) in the Southern United States (US) is well-documented. Urgent care (UC) centers are positioned as community-facing access points to PrEP, but the feasibility of integrating PrEP services into this setting is un-clear. We conducted a survey of UC clinicians in the Southern US to better understand their perceptions of the feasibility of providing PrEP in their practice setting. Objective: The study aims to determine the feasibility and acceptability of providing PrEP services in the UC setting through a cross-sectional survey of UC clinicians. Methods: We conducted a 48-item cross-sectional survey of UC clinicians in the Southern US, between July and September 2020. The survey was distributed through the Urgent Care Association (UCA) and American Academy of Urgent Care Medicine (AAUCM) professional listservs as well as directly to publicly listed e-mail addresses. Results: Eighty-two clinicians responded to the survey. Most clinicians had familiarity with PrEP (97%). All respondents rated PrEP as an effective way to prevent HIV. However, less than half felt UC facilities were an appropriate place to prescribe PrEP. Few respondents (8%) expressed doubts that expansion of PrEP access would decrease the incidence of HIV in their community. Conclusion: These findings show UC clinicians are familiar with PrEP, and many believe it would benefit their patients; however, provider opinions on the appropriateness of providing PrEP in the UC setting differ. Further studies on PrEP implementation in UC centers are needed. © 2022 Bentham Science Publishers. Article	2022	Burns, Paul A; Omondi, Angela A; Monger, Mauda; Ward, Lori; Washington, Rodney; Sims Gomillia, Courtney E; Bamrick-Fernandez, Daniel R; Anyimukwu, Chizoba; Mena, Leandro A	Meet Me Where I Am: An Evaluation of an HIV Patient Navigation Intervention to Increase Uptake of PrEP Among Black Men Who Have Sex with Men in the Deep South	Journal of Racial and Ethnic Health Disparities	-	-	-	2196-8837	10.1007/s40615-020-00933-1	https://dx.doi.org/10.1007/s40615-020-00933-1	The southern region of the USA is the epicenter of the HIV epidemic. HIV disproportionately affects African Americans, particularly Black men who have sex with men (Black MSM). Given the alarming rates of new infections among Black MSM, there is an urgent need for culturally competent healthcare professionals who are trained to address the unique needs and barriers to uptake and adherence to HIV prevention, care, and treatment services. Utilizing a mixed method research approach, we conducted a process evaluation of Meet Me Where I Am, a 6-month, 6-session HIV/AIDS patient navigation training program for healthcare professionals and patient navigators working in organizations that provide HIV services to residents of central Mississippi, an area with high incidence and prevalence rates of HIV. A self-administered questionnaire after each session was given to participants to assess the acceptability, quality, and translational aspects of the training program. The overall positive feedback on the MMWIA training reflects the program's acceptability and feasibility. Participants found that the training was effective in providing the necessary knowledge and skills to deliver patient-centered HIV prevention-related navigation services. A majority (67%) of participants indicated that they felt they could apply the lessons learned within their healthcare settings to improve access to HIV prevention, care, and treatment services. If we are to reduce racial and ethnic disparities in HIV/AIDS, there is a critical need for culturally appropriate training programs designed to improve the ability of healthcare professionals and health systems to deliver culturally competent HIV prevention, care, and treatment services. Article	2022	Buskin S.E.; Lechtenberg R.J.; Slaughter F.A.; Herbeck J.T.; Kerani R.P.; Golden M.R.; Dombrowski J.C.	A public health approach to monitoring HIV with resistance to HIV pre-exposure prophylaxis	PLOS One	-	-	-	19326203	10.1371/journal.pone.0272958	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136896333&doi=10.1371%2fjournal.pone.0272958&partnerID=40&md5=e663ed16a1e78e199cdedace533d0bbf	Background The risk of HIV pre-exposure prophylaxis (PrEP) failure with sufficient medication adherence is extremely low but has occurred due to transmission of a viral strain with mutations conferring resistance to PrEP components tenofovir (TDF) and emtricitabine (FTC). The extent to which such strains are circulating in the population is unknown. Methods We used HIV surveillance data to describe primary and overall TDF/FTC resistance and concurrent viremia among people living with HIV (PLWH). HIV genotypes conducted for clinical purposes are reported as part of HIV surveillance. We examined the prevalence of HIV strains with mutations conferring intermediate to high level resistance to TDF/FTC, defining primary resistance (predominantly K65R and M184I/V mutations) among sequences reported within 3 months of HIV diagnosis and total resistance for sequences reported at any time. We examined trends in primary resistance during 2010–2019 and total resistance among all PLWH in 2019. We also monitored resistance with viremia (≥1,000 copies/mL) at the end of 2019 among PLWH. Results Between 2010 and 2019, 2,172 King County residents were diagnosed with HIV; 1,557 (72%) had a genotypic resistance test within three months; three (0.2%) had primary TDF/ FTC resistance with both K65R and M184I/V mutations. Adding isolated resistance to each drug resulted in 0.3% with primary TDF resistance and 0.8% with primary FTC resistance. Of 7,056 PLWH in 2019, 4,032 (57%) had genotype results, 241 (6%) had TDF/FTC resistance and 15 (0.4% of those with a genotype result) had viremia and TDF/FTC resistance. Conclusions Primary resistance and viremia combined with TDF/FTC resistance are uncommon in King County. Monitoring trends in TDF/FTC resistance coupled with interventions to help ensure PLWH achieve and maintain viral suppression may help ensure that PrEP failure remains rare. © 2022 Buskin et al. Article	2022	BUTARELO, A. V.; GARBIN, C. A. S. .; SALIBA, T. A. .; CHIBA, F. Y. .; GARBIN, A. J. Ísper	Profilaxia pré-exposição ao HIV/AIDS: análise situacional após 03 anos de disponibilidade no Sistema Único de Saúde (SUS)	Research, Society and Development	-	-	-	2525-3409	10.33448/rsd-v11i4.27356	https://rsdjournal.org/index.php/rsd/article/view/27356	To assess adherence to pre-exposure prophylaxis (PrEP) to HIV after 3 years of implementation in the Unified Health System (SUS). Ecological, quantitative study, carried out in 2021, in Brazil. Data on HIV PrEP were collected in the monitoring panel provided by the Ministry of Health – Federal Government. The variables studied were type of population, age group, education, race/color; number of dispensations in Brazil from January 2018 to February 2021, number of health services offering PrEP, discontinuation of PrEP, number of new users per month, number of active users per month and sexual habits. Data were tabulated in excel and descriptive statistical analysis was performed for all variables, the chi-square test to verify the association between the variables "discontinuity of PrEP" and "type of key population" and the binomial test of two proportions to compare sexual habits in the first and last consultations. Most of the population is gay or men who have sex with men (82.6%), age group between 30 and 39 years old (51%), white or yellow color (57.2%), 12 years or more of schooling (71%). 42% of subjects discontinued treatment at some point. There was a statistically significant association between the variables "discontinuity of PrEP" and "type of key population", and a decrease in condom use and in the number of sexual partners between the first and last consultations. Although adherence to the method is increasing, discontinuity in treatment among users is high, which makes success in effectiveness difficult. Theses and Dissertations	2022	Butarelo, Ana Victória	As doenças infectocontagiosas no contexto da saúde pública : profilaxia pré-exposição ao HIV e o impacto da Covid-19 no tratamento da AIDS	-	-	Universidade Estadual Paulista (Unesp)	-	NA	NA	https://bdtd.ibict.br/vufind/Record/UNSP_50ec6628fe2480218952c198c3617fb0	Já se passaram quase quatro décadas desde o primeiro diagnóstico da Síndrome da Imunodeficiência Adquirida (AIDS) no Brasil e até hoje a prevenção e tratamento da doença, em muitos contextos, é um desafio para a saúde pública. O objetivo desse estudo foi avaliar a adesão à profilaxia pré-exposição (PrEP) ao HIV após 3 anos de implantação no Sistema Único de Saúde (SUS) e o comportamento de pacientes soropositivos (HIV+) em relação ao tratamento antirretroviral em dois momentos distintos: antes e durante a pandemia causada pelo coronavírus, tendo em vista todas as mudanças que ocorreram na organização da sociedade e no acompanhamento dos pacientes durante esse período. Trata-se de um estudo de análise documental, ecológico, quantitativo, realizado no período de janeiro de 2021 a julho de 2022, no Brasil, através de dados disponibilizados pelo Ministério da Saúde. As variáveis estudadas são relacionadas ao tratamento profilático ao HIV – PrEP HIV e ao acompanhamento do tratamento de pacientes soropositivos antes e durante a pandemia do covid-19. Foi realizada análise estatística descritiva e os resultados apresentados sob a forma de tabelas e gráficos. Utilizou-se o teste qui-quadrado para verificar a associação entre as variáveis "descontinuidade da PrEP" e "tipo de população-chave", o teste binomial de duas proporções para comparar os hábitos sexuais no primeiro e último atendimento e o teste de Friedman para verificar diferenças estatisticamente significante entre as variáveis "PVHIV vinculadas", "dispensação de antirretrovirais (TARV)", "PVHIV que iniciaram a TARV", "atraso na retirada de medicamentos", de acordo com o ano. O nível de significância adotado foi de 5%. O processamento e análise estatística foi realizada com auxílio do software Bioestat versão 5.0. Houve associação estatisticamente significante entre as variáveis "descontinuidade da PrEP" e "tipo de população-chave", e diminuição no uso de preservativo e no número de parcerias sexuais entre a primeira e última consulta e diferença estatisticamente significante (p<0,05) entre as variáveis "PVHIV vinculadas", "dispensação de antirretrovirais (TARV)", "PVHIV que iniciaram a TARV", "atraso na retirada de medicamentos", de acordo com o ano. A adesão à PrEP é crescente no país, entretanto a descontinuidade no tratamento é elevada, dificultando o sucesso do método. Durante a pandemia causada pelo Covid-19, mesmo com o aumento no número de pacientes diagnosticados e vinculados ao SUS, houve queda no número de dispensações de medicamentos e de pessoas que iniciaram o tratamento, além do aumento no atraso para a retirada dos fármacos, evidenciando que as mudanças ocasionadas pelo coronavírus impactaram no tratamento ao HIV. Article	2022	Butler S.K.; Kislovskiy Y.; Bunge K.; Wiesenfeld H.C.	Implementing pre-exposure prophylaxis for HIV prevention in women: the role of the obstetrician-gynecologist	American Journal of Obstetrics and Gynecology	-	-	-	29378	10.1016/j.ajog.2021.12.263	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123820367&doi=10.1016%2fj.ajog.2021.12.263&partnerID=40&md5=c19b1fa9ee7eb97d1501efdb9a8af7be	Pre-exposure prophylaxis is a powerful HIV prevention tool that can reduce the risk of acquiring HIV by >90% from unprotected sex and >70% from injection drug use. The peripartum period is a time of heightened HIV risk, which underscores the need for HIV prevention counseling and the provision of biomedical interventions in all stages of a woman's reproductive life. It is important that women receive nonjudgmental care, have access to discussions of HIV risk, and are provided with pre-exposure prophylaxis counseling from their women's health practitioners. Obstetrician-gynecologists and other women's health providers are uniquely positioned to identify women who would benefit from pre-exposure prophylaxis and provide it in trusted clinical settings. © 2021 Elsevier Inc.	ambulatory reproductive care; biomedical HIV prevention; cisgender women; HIV pre-exposure prophylaxis; HIV pre-exposure prophylaxis implementation; HIV prevention strategies; HIV risk assessment; integrating pre-exposure prophylaxis into women's health; obstetrician-gynecologist; reproductive health providers	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	Byrne J.L.; Tan K.K.H.; Saxton P.J.; Bentham R.M.; Veale J.F.	PrEP awareness and protective barrier negotiation among transgender people attracted to men in Aotearoa New Zealand	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25980	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139755732&doi=10.1002%2fjia2.25980&partnerID=40&md5=03472bb1f8a9b231861fd8151ddce334	Introduction: Internationally, trans women are disproportionately impacted by HIV, encounter specific barriers navigating safer sex and face inequities accessing HIV prevention, including pre-exposure prophylaxis (PrEP). Aotearoa/New Zealand (hereafter Aotearoa) was one of the first countries internationally to publicly fund PrEP in 2018, including for trans people. However, few data exist on PrEP awareness or sexual negotiation among trans populations to guide implementation. We present the first Aotearoa data on trans people's ability to negotiate barrier protection and awareness of PrEP efficacy and availability. Methods: We used data from a large, diverse community-based nationwide survey of trans (including non-binary) people in Aotearoa: Counting Ourselves (N = 1178) conducted from 21 June to 30 September 2018. Generalized regression analyses were carried out among participants who have had sex (n = 704; Mage = 32.5) to identify associations between demographic factors (age, gender and sexual attraction, ethnicity, income, education qualification and current sex work involvement) and the Trans-Specific Barrier Negotiation Self-Efficacy (T-Barrier) Scale and PrEP awareness. Results: The mean value of a 40-point T-Barrier Scale was 33.45 (SD: 6.89), suggesting a relatively high perceived ability among our participants to negotiate protective barrier usages in different situations. Asian participants scored 3.46 points lower compared to Pākehā (White) participants, and trans women attracted to men (cisgender and/or trans men) scored 2.40 points higher than trans women not attracted to men. Three-fifths (59.7%) were aware that PrEP reduced HIV risks and did not prevent sexually transmitted infections (STI) transmission, and only two-fifths (40.2%) knew PrEP was publicly funded for trans people. In multivariate models, we found participants who were older, trans women or those with lower education qualifications were less likely to have increased levels of PrEP awareness. Conclusions: Participants attracted to men have a higher potential need for PrEP and were more likely to report PrEP awareness and that they could negotiate protective barrier usage. However, trans women and those with lower educational qualifications reported lower levels of PrEP awareness. More trans-competent sexual health education, drawing on the newly released PrEP guidelines, is needed to promote the benefits of PrEP in the Aotearoa HIV epidemic context, particularly for trans women. © 2022 The Authors. Article	2022	Caba, Antonia E; Rathus, Taylor; Burson, Esther; Chan, Philip A; Eaton, Lisa A; Watson, Ryan J	Who is using PrEP on-demand? Factors associated with PrEP use modality among Black and Hispanic/Latino emerging adults.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03684-8	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9912752	Pre-exposure prophylaxis (PrEP) is a highly efficacious HIV prevention medication, yet Black and Hispanic/Latino sexual minority men's and gender diverse individuals' (SMMGD) PrEP use is limited due to factors such as PrEP barriers and anticipated PrEP stigma. Although most individuals who use PrEP take it as a daily regimen, there is evidence that many SMMGD are interested in using "on-demand" (also known as event-driven or intermittent or 2-1-1) PrEP. We used stepwise multinomial logistic regression to explore factors associated with on-demand, daily, and no PrEP use among 820 Black and Hispanic/Latino SMMGD ages 18-29 in the United States. We found that greater reported PrEP barriers were associated with higher odds of using PrEP on-demand or not using PrEP compared to daily PrEP use. More past 3-month sex partners and greater comfort telling others about PrEP use were associated with lower odds of on-demand compared to daily PrEP use. In addition, compared to daily PrEP use, more past 3-month sex partners, greater comfort telling others about PrEP use, and higher anticipated PrEP stigma were associated with lower odds of no current PrEP use compared to daily PrEP use. Findings may inform clinical practices and interventions to promote PrEP uptake and adherence. Article	2022	Calabrese, Sarah K; Kalwicz, David A; Modrakovic, Djordje; Earnshaw, Valerie A; Edelman, E Jennifer; Bunting, Samuel R; Del Río-González, Ana María; Magnus, Manya; Mayer, Kenneth H; Hansen, Nathan B; Kershaw, Trace S; Rosenberger, Joshua G; Krakower, Douglas S; Dovidio, John F	An Experimental Study of the Effects of Patient Race, Sexual Orientation, and Injection Drug Use on Providers' PrEP-Related Clinical Judgments	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-021-03495-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9434708	Social biases may influence providers' judgments related to pre-exposure prophylaxis (PrEP) and patients' consequent PrEP access. US primary and HIV care providers (n = 370) completed an experimental survey. Each provider reviewed one fictitious medical record of a patient seeking PrEP. Records varied by patient race (Black or White) and risk behavior (man who has sex with men MSM, has sex with women MSW, or injects drugs MID). Providers reported clinical judgments and completed measures of prejudice. Minimal evidence of racially biased judgments emerged. Providers expressing low-to-moderate sexual prejudice judged the MSM as more likely than the MSW to adhere to PrEP, which was associated with greater PrEP prescribing intention; sexual prejudice was negatively associated with anticipated MSM adherence. Providers judged the MID to be at higher risk, less likely to adhere, less safety-conscious, and less responsible than both the MSM and MSW; adverse adherence and responsibility judgments were associated with lower prescribing intention. Article	2022	Calabrese, Sarah K; Rao, Sharanya; Eldahan, Adam I; Tekeste, Mehrit; Modrakovic, Djordje; Dangaran, D; Boone, Cheriko A; Underhill, Kristen; Krakower, Douglas S; Mayer, Kenneth H; Hansen, Nathan B; Kershaw, Trace S; Magnus, Manya; Betancourt, Joseph R; Dovidio, John F	"Let's Be a Person to Person and Have a Genuine Conversation": Comparing Perspectives on PrEP and Sexual Health Communication Between Black Sexual Minority Men and Healthcare Providers	Archives of Sexual Behavior	-	-	-	1573-2800	10.1007/s10508-021-02213-3	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10040304	Patient-provider communication is a key factor affecting HIV pre-exposure prophylaxis (PrEP) awareness and access among Black sexual minority men (SMM). Optimizing patient-provider communication requires a deeper understanding of communication dynamics. In this study, we investigated the perspectives of both HIV-negative/status-unknown Black SMM and practicing community healthcare providers regarding patient-provider communication about PrEP and sexual health. We conducted eleven semi-structured qualitative focus groups (six with Black SMM; five with providers) in the Northeastern USA and thematically analyzed transcripts. A total of 36 Black SMM and 27 providers participated in the focus groups. Our analysis revealed points of alignment and divergence in the two groups' perspectives related to patient-provider communication. Points of alignment included: (1) the importance ascribed to maximizing patients' comfort and (2) belief in patients' right to non-discriminatory healthcare. Points of divergence included: (1) Black SMM's preference for sexual privacy versus providers' preference that patients share sexual information, (2) Black SMM's perception that providers have an ethical responsibility to initiate conversations about PrEP with patients versus providers' perception of such conversations as being optional, and (3) Black SMM's preference for personalized sexual health conversations versus providers' preference for standardized conversations. Findings underscore a need for providers to offer more patient-centered sexual healthcare to Black SMM, which should entail routinely presenting all prevention options available-including PrEP-and inviting open dialogue about sex, while also respecting patients' preferences for privacy about their sexuality. This approach could increase PrEP access and improve equity in the US healthcare system. Article	2022	Call J.; Gerke D.; Barman-Adhikari A.	Facilitators and barriers to PrEP use among straight and LGB young adults experiencing homelessness	Journal of Gay and Lesbian Social Services	-	-	-	10538720	10.1080/10538720.2021.1954575	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85111456163&doi=10.1080%2f10538720.2021.1954575&partnerID=40&md5=b675c3adcb1654ae3d160dad5ff7b3cf	Young adults experiencing homelessness (YAEH) are up to 12 times more likely to contract HIV than their housed peers. One important HIV prevention tool is pre-exposure prophylaxis (PrEP), though few studies examine YAEH PrEP use, particularly among those who identify as lesbian, gay, or bisexual (LGB). This study surveyed 160 YAEH about sexual risk behaviors, knowledge about and interest in using PrEP, and facilitators and barriers to PrEP use. Chi-Squared tests assessed if participants varied on these factors by sexual orientation. LGB YAEH were more likely to have heard of and be interested in using PrEP, as well as report access to free sexual healthcare, counseling about sex life, and concerns about possible medication interactions if they became HIV + as important motivating factors for PrEP use. Straight YAEH were more likely to report concerns about PrEP protectiveness as important. These findings, though preliminary, have important implications for YAEH HIV prevention programs. © 2021 Taylor & Francis Group, LLC. Article	2022	Calleja-Hernández, Miguel Ángel; Martínez-Sesmero, José Manuel; Vallejo-Aparicio, Laura Amanda; Hernández-Novoa, Beatriz; Badia, Xavier	Contribución de cabotegravir + rilpivirina de acción prolongada al tratamiento de la infección por VIH-1	Farmacia Hospitalaria	-	-	-	1130-6343	10.7399/fh.11845	http://scielo.isciii.es/scielo.php?script=sci_arttext&pid=S1130-63432022000400002&lng=pt	Abstract Objective: To determine the value contribution of cabotegravir + rilpivirine, the first injectable every two months long-acting antiretroviral regimen, using multi-criteria decision analysis. Method: The study was developed in two phases. After a small pilot, a field work study with a larger number of multidisciplinary experts was carried out. Seven single-tablet regimens, currently recommended by the GeSIDA guidelines, were selected as comparators. EVIDEM methodology was followed, with a framework composed by 12 quantitative and 5 contextual criteria. Mean and standard deviations were calculated for quantitative criteria (1 to 5 scale; comparative criteria –5 to +5), whereas qualitative criteria were analyzed as percentages of experts that considered a positive, neutral or negative impact for the National Health System. Results: 35 experts participated in the study. Human immunodeficiency virus-1 infection was considered severe (mean ± standard deviation: 3.0 ± 1.0), with moderate size of affected population (2.7 ± 1.2) and unmet needs (2.8 ± 1.0). Minimal differences were found in comparative efficacy/effectiveness (0.1 ± 0.5), safety/tolerability (–0.5 ± 0.7), and cost criteria: cost of the intervention (0.5 ± 2.0), other medical costs (0.2 ± 1.8) and non-medical/indirect costs (0.5 ± 1.6). Experts perceived an improvement with cabotegravir + rilpivirine long-acting, compared to current daily oral single-tablet regimens, in patient-reported outcomes (2.7 ± 1.4). Therapeutic benefit of the long-acting regimen was considered moderate-to-high (3.5 ± 1.2). Experts considered the evidence provided by cabotegravir + rilpivirine long-actingrobust (4.3 ± 0.8), with elevated consensus on its future recommendation in guidelines (3.2 ± 1.0). In contextual criteria, most experts considered positive the impact on population priorities and access (91%), common goal and specific interests (63%) and political, historical, and cultural context criteria (60%). Impact was neutral in system capacity and appropriate use (40%), and opportunity costs and affordability criteria (51%). Result of the weighted global value contribution of cabotegravir + rilpivirine long-acting was 0.34 (–1 to +1 scale), with Patient Reported Outcomes comparative criterion bringing the highest added value. Conclusions: Cabotegravir + rilpivirine long-acting provides added value contribution to human immunodeficiency virus-1 management in Spain compared to daily oral single-tablet regimens. Patient Reported Outcomes and therapeutic benefit of cabotegravir + rilpivirine long-acting were highly valued by experts, as the expected benefit in adherence and stigma-related issues would improve overall quality of life for people living with human immunodeficiency virus-1. Providers' Attitudes and Experiences with Pre-Exposure Prophylaxis Implementation in a Population-Based Study in Kenya and Uganda	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2022.0084	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140856994&doi=10.1089%2fapc.2022.0084&partnerID=40&md5=2354ce069d2c398fadbd7e78b6c37240	Pre-exposure prophylaxis (PrEP) implementation is underway across sub-Saharan Africa. However, little is known about health care providers' experiences with PrEP provision in generalized epidemic settings, particularly outside of selected risk groups. In this study (NCT01864603), universal access to PrEP was offered to adolescents and adults at elevated risk during population-level HIV testing in rural Kenya and Uganda. Providers received training on PrEP prescribing and support from local senior clinicians. We conducted in-depth interviews with providers (n = 19) in four communities in Kenya and Uganda to explore the attitudes and experiences with implementation. Transcripts were coded and analyzed using interpretivist methods. Providers had heterogenous attitudes toward PrEP in its early implementation: some expressed enthusiasm, while others feared being blamed for "failures"(HIV seroconversions) if participants were nonadherent, or that offering PrEP would increase "immorality."Providers supported PrEP usage among HIV-serodifferent couples, whose mutual support for daily pill-taking facilitated harmony and protection from HIV. Providers reported challenges with counseling on "seasons of risk,"and safely stopping and restarting PrEP. They felt uptake was hampered for women by difficulties negotiating with partners, and for youth by parental consent requirements. They believed PrEP continuation was hindered by transportation costs, stigma, pill burden, and side effects, and was facilitated by counseling, proactive management of side effects, and home/community-based provision. Providers are critical "implementation actors"in interventions to promote adoption of new technologies such as PrEP. Dedicated training and ongoing support for providers may facilitate successful scale-up. © 2022 Mary Ann Liebert, Inc. Article	2022	Campbell J.T.; Adams O.R.; Bennett-Brown M.; Woodward B.; Gesselman A.N.; Carter G.	PrEP Familiarity, Interest, and Usage Among 364 Black and Hispanic Adults in Indiana	Frontiers in Public Health	-	-	-	22962565	10.3389/fpubh.2022.810042	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130747060&doi=10.3389%2ffpubh.2022.810042&partnerID=40&md5=4cf48420919584747cc70f9dfb658d81	Pre-exposure prophylaxis, or PrEP, is a once-daily preventative prescription pill against HIV for adults or adolescents who have sex or inject drugs. PrEP may be especially useful among Black and Hispanic Americans, who are particularly at risk for HIV in the United States. In spite of this vulnerability, rates of PrEP use in Black and Hispanic communities are low. Here, we examined familiarity with, prior usage of, and future interest in PrEP among 364 Black and Hispanic Indiana residents. Indiana is an important context for this work, due to severe HIV outbreaks in the area over the last 8 years. Around half of all participants had never heard of PrEP, with Hispanic participants being less familiar than Black participants. Prior PrEP use was low, at around 10%, and was lower for Hispanic than Black participants. Around 21% of all participants reported interest in PrEP after learning of it in our study. Further, participants identified strategies that would make discussions about PrEP with a medical provider more comfortable. Black and Hispanic participants reported feeling the most comfortable with addressing PrEP usage with providers if: (a) the provider was the one who brought up the subject of PrEP, (b) there was written information available to the patient (i.e., brochures), and (c) the patient already knew they qualified for the prescription in terms of personal eligibility and insurance coverage. Additional provider and patient education, as well as openness on the part of the provider, can help to lessen the disparities associated with PrEP need and actual PrEP usage. Article	2022	Campbell, L; Ibrahim, F; Barbini, B; Samarawickrama, A; Orkin, C; Fox, J; Waters, L; Gilleece, Y; Tariq, S; Post, FA; †,	Bone mineral density, kidney function and participant-reported outcome measures in women who switch from tenofovir disoproxil emtricitabine and a nonnucleoside reverse transcriptase inhibitor to abacavir, lamivudine and dolutegravir	HIV Medicine	-	-	-	NA	10.1111/hiv.13215	https://www.cochranelibrary.com/central/doi/10.1002/central/CN-02358907/full	OBJECTIVES: Tenofovir disoproxil fumarate (TDF) is associated with reduced bone mineral density (BMD). The aim of the study was to evaluate changes in BMD in women who switched from TDF, emtricitabine and a nonnucleoside reverse transcriptase inhibitor (TDF/FTC/NNRTI) to abacavir, lamivudine and dolutegravir (ABC/3TC/DTG). METHODS: We conducted a randomized controlled trial in which women aged ≥ 40 years were randomized 1:2 to continue TDF/FTC/NNRTI or switch to ABC/3TC/DTG. We analysed changes in BMD at the hip and lumbar spine from baseline to week 96 using linear regression, and markers of bone turnover and kidney function using repeated measures mixed effects models with multiple imputation for missing data. We conducted exploratory analyses of weight, mental health, sleep and symptoms attributed to HIV infection and antiretroviral therapy. RESULTS: Ninety-one women (standard deviation) age 50.4 (6.6) years were randomized. Women who switched to ABC/3TC/DTG maintained viral suppression and experienced improvements in BMD at the lumbar spine (but not the neck of the femur or the total hip), bone resorption markers and proteinuria (total protein, albumin and retinol-binding protein) and modest weight gain without changes in body mass index. Although mean anxiety, depression and sleep scores did not differ between the two study arms, anxiety, depression and sleep disturbance at baseline predicted ABC/3TC/DTG discontinuation for neuropsychiatric side effects odds ratios (95% confidence intervals) 11.9 (2.0-71.6), 16.0 (2.6-97.9) and 10.0 (1.8-56.0), respectively. CONCLUSIONS: Switching from TDF/FTC/NNRTI to ABC/3TC/DTG improved the BMD of the lumbar spine and kidney function. These benefits need to be balanced against modest weight gain and the need for antiretroviral therapy substitutions in a proportion of participants.	*bone density; *femoral neck; *kidney function; *outcome assessment; *sleep disorder; Adult; Antiretroviral therapy; Anti-HIV Agents adverse effects; Anxiety; Article; Body mass; Body weight gain; Bone Density; Bone remodeling; Bone turnover; Clinical trial; Controlled study; Dideoxynucleosides therapeutic use; Drug Combinations; Drug therapy; Drug withdrawal; Emtricitabine pharmacology, therapeutic use; Exploratory research; Female; HIV Infections complications; Heterocyclic Compounds, 3-Ring; Human; Human immunodeficiency virus infection; Humans; Kidney; Lamivudine pharmacology; Linear regression analysis; Lumbar spine; Major clinical study; Mental health; Middle Aged; Osteolysis; Oxazines; Patient Reported Outcome Measures; Pelvic girdle; Piperazines; Proteinuria; Psychiatric complication; Pyridones; Randomized controlled trial; Reverse Transcriptase Inhibitors pharmacology; Tenofovir adverse effects	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Clinical
Article	2022	Candler, Ethan; Naeem Khan, Muhammad; Gratrix, Jennifer; Plitt, Sabrina; Stadnyk, Maria; Smyczek, Petra; Anderson, Natalie; Carter, Julia; Sayers, Steven; Smith, Donna; Ugarte-Torres, Alejandra; Shukalek, Caley; Singh, Ameeta E	Retrospective audit of a convenience cohort of individuals on HIV pre-exposure prophylaxis in Alberta, Canada.	Journal of the Association of Medical Microbiology and Infectious Disease Canada	-	-	-	2371-0888	10.3138/jammi-2022-0016	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC10312220	BACKGROUND: We undertook an audit of a province-wide HIV pre-exposure prophylaxis (PrEP) program in Alberta (Canada). METHODS: A retrospective record review of individuals accessing PrEP in Alberta included demographics, PrEP indication(s), and reported non-prescription drug and alcohol use from March 2016 to June 2019. Hepatitis A, B, C, HIV and syphilis serology, serum creatinine, and nucleic acid amplification tests testing for chlamydia and gonorrhea were collected. Descriptive statistics, incidence, and prevalence were calculated. RESULTS: A total of 511 participants were seen at STI, sexual, and reproductive health clinics and private family practitioner (FP) offices; 98.4% (503) were men, median age was 34 years (IQR 28-43 years), and 89.8% (459) were gay or bisexual men who have sex with men. Non-prescription drug use was reported by 39.3% (201) and alcohol use by 55.4% (283). 94.3% (482) reported condomless anal sex in the past 6 months. Testing rates were high (>95%) for all tests except for chlamydia and gonorrhea at the first follow-up visit 89.6%; (3-4 months). There was one HIV seroconversion. The incidence of new bacterial STIs was high: chlamydia 17 cases per 100 person-years (95% CI 13.5% to 21.4%), gonorrhea 11.14 cases per 100 person-years (95% CI 8.3% to 15.0%), and syphilis 1.94 cases per 100 person-years (95% CI 0.73% to 5.12%). CONCLUSIONS: Following implementation of a provincial program for PrEP in Alberta, PrEP initiation and continuation was feasible in a range of settings and by both specialists and FPs.	evaluation, HIV, PrEP, prevention	English	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Canada	Western and Central Europe and North America	Review
Article	2022	Cannon C.A.; Ramchandani M.S.; Buskin S.; Dombrowski J.; Golden M.R.	Previous Preexposure Prophylaxis Use among Men Who Have Sex with Men Newly Diagnosed with HIV Infection in King County, WA	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000003010	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133790703&doi=10.1097%2fQAI.0000000000003010&partnerID=40&md5=33bc3f27af4222dd7f0f841aee7778e	Background:Preexposure prophylaxis (PrEP) discontinuations are common and are associated with subsequent HIV acquisition. The population-level impact of PrEP discontinuations is unknown.Methods:Public health staff routinely asked men who have sex with men (MSM) with newly diagnosed HIV infection about their history of PrEP use as part of partner notification interviews in King County, WA, from 2013 to 2021. We assessed trends in the proportion of MSM who ever took PrEP and described reasons for PrEP discontinuation.Results:A total of 1098 MSM were newly diagnosed with HIV during the study period; of whom, 797 (73%) were interviewed, and 722 responded to questions about their history of PrEP use. Ninety-four (13%) reported ever taking PrEP. The proportion of MSM who ever used PrEP before HIV diagnosis increased from 2.3% in 2014 to 26.6% in 2020-2021 (P < 0.001 for trend). The median time from PrEP discontinuation to HIV diagnosis was 152 days, and median duration on PrEP was 214 days. Common reasons for stopping PrEP included self-Assessment as being at low risk for HIV, side effects, and insurance issues. Nineteen men were on PrEP at the time of HIV diagnosis; mutations conferring emtricitabine/tenofovir resistance were identified in 8 (53%) of 15 men with available genotype data.Conclusion:More than 25% of MSM with newly diagnosed HIV from 2020 to 2021 had ever used PrEP. More than 50% who discontinued PrEP were diagnosed <6 months after stopping. Strategies to preempt PrEP discontinuations, enhance retention, and facilitate resumption of PrEP are critical to decrease new HIV diagnoses. © 2022 Lippincott Williams and Wilkins. Article	2022	Cannon C.A.; Ramchandani M.S.; Golden M.R.	Feasibility of a novel self-collection method for blood samples and its acceptability for future home-based PrEP monitoring	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-022-07432-0	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130064146&doi=10.1186%2fs12879-022-07432-0&partnerID=40&md5=6f6a803101aa5e413b6abf100c1b7d2e	Background: Most non-clinic based HIV pre-exposure prophylaxis (PrEP) programs require fingersticks to self-collect blood specimens for laboratory monitoring, a technique that often results in inadequate blood volume for quantitative syphilis and HIV serological testing. We evaluated the acceptability and feasibility of using the Tasso OnDemand™ device as a self-sampling method for PrEP monitoring tests and compared results from samples obtained using the Tasso device to clinician-collected blood samples. Methods: We enrolled study subjects online and in a sexual health clinic and HIV clinic in Seattle, WA, USA to assess the acceptability of blood self-sampling and preferences for home-based PrEP monitoring. We compared HIV antigen/antibody, quantitative rapid plasma reagin and creatinine results in paired self-collected and clinical specimens collected from a subset of participants. Results: Of 141 participants, 124 (88%) were interested in collecting samples for PrEP monitoring at home. Among 48 who completed blood collections, 94% found the Tasso device easy to use and 95% felt they could perform self-sampling at home. Of 27 participants who used two devices, 100% collected sufficient blood to perform up to two tests while 33% collected sufficient serum for three tests. Agreement in test results between paired samples was high. Conclusions: These pilot data suggest that using the Tasso self-collection device is acceptable and could feasibly be used to obtain serum specimens sufficient for guideline-recommended PrEP monitoring, though use of a larger volume device may be preferable. © 2022, The Author(s). Article	2022	Cao W.; Li J.; Sun S.; Sturm C.; Peng L.; Gu J.; Hao C.; Hou F.; Wei D.; You X.; Deng Y.; Ekström A.M.	HIV Serostatus Disclosure Among Men Who Have Sex with Men in China in the Era of U=U and PrEP	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03502-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85117790701&doi=10.1007%2fs10461-021-03502-7&partnerID=40&md5=89f58f37fb334111583c913b63dbf338	Given the recent evidence on "Undetectable = Untransmittable" (U=U) and pre-exposure prophylaxis (PrEP), the present study aimed to investigate HIV disclosure behaviors and their associations with sexual risk behaviors and U=U and PrEP awareness among men who have sex with men (MSM) in China. A cross-sectional survey was conducted among 689 MSM recruited through a gay-friendly non-governmental organization located in Chengdu, China in 2018–2019. Information was collected by a structured self-administrated questionnaire. The enrolled sample included 554 (80.4%) participants who were HIV-negative and 135 (19.6%) participants with an unknown HIV status. In terms of disclosure, 41.4% of participants informed all partners about their HIV status all the time (informing behavior), while 30.4% asked all partners about their HIV status all the time (asking behavior). Only one-fifth knew about U=U, but this was not statistically associated with either informing or asking behavior. Half (50.5%) had heard of PrEP but this was not statistically associated with either informing or asking behavior. Common barriers to informing and asking behaviors were lower risk perception of HIV infection, a history of sexually transmitted infections, engagement in receptive sex, and a history of sex with casual partners. We found that both U=U and PrEP awareness and HIV serostatus disclosure were infrequent and not associated in this study of Chinese MSM. These data indicate huge information gaps among MSM in China. © 2021, The Author(s). Article	2022	Carlisle N.A.; Booth J.S.; Rodgers J.B.; Heath S.L.; Walter L.A.	Utilizing Laboratory Results to Identify Emergency Department Patients with Indications for HIV Pre-Exposure Prophylaxis	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2022.0066	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136339456&doi=10.1089%2fapc.2022.0066&partnerID=40&md5=242a10bbb01cadd89356bebf2738e09f	People newly diagnosed with HIV often have previous contact with health care professionals, often on multiple occasions, including within emergency departments (EDs). Although EDs have become vital partners in routine screening and linkage to care for persons with HIV, ED engagement in HIV prevention efforts, to include HIV risk assessment and pre-exposure prophylaxis (PrEP) referral, are rare. In this study, we electronically queried the hospital electronic health record (EHR) for ED encounters in 2019 and 2020 for patients who screened negative for HIV (N = 26,914) to identify objective evidence of HIV acquisition risk due to recent sexual behavior (sexually transmitted infection screen positive for chlamydia, syphilis, gonorrhea, or trichomoniasis) or recent injection drug practices (urine drug screen positive for heroin, amphetamines, cocaine, or other opiates). In the reviewed period, we identified 1324 patients (4.92%) at sufficient risk to warrant PrEP referral (i.e., PrEP indications), including 304 (22.96%) due to sexual behavior and 1032 (77.95%) due to potential injection drug use. Notably, among adults with PrEP indications regardless of transmission risk group, persons who inject drugs (PWID) represented a significantly larger proportion within our ED cohort as compared with Centers for Disease Control and Prevention (CDC) estimates for the US population (77.95% vs. 6.34%, p < 0.0001). Among adults with PrEP indications due to sexual behavior specifically, women represented a significantly larger proportion within our ED cohort as compared with estimates for the US population (62.17% vs. 16.48%, p < 0.0001). Our results demonstrate that utilizing laboratory results within the EHR may be a simple low-resource option for identifying and engaging PrEP candidates, especially women and PWID. © Copyright 2022, Mary Ann Liebert, Inc., publishers 2022.	emergency medicine; HIV prevention; needle sharing; pre-exposure prophylaxis; sexual behavior	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Review
Article	2022	Carneiro, Pedro B; Frye, Victoria; Mirzayi, Chloe; Patel, Viraj; Lounsbury, David; Huang, Terry T-K; Sabounchi, Nasim; Grov, Christian	What Predicts a Clinical Discussion About PrEP? Results From Analysis of a U.S. National Cohort of HIV-Vulnerable Sexual and Gender Minorities.	AIDS Education and Prevention	-	-	-	1943-2755	10.1521/aeap.2022.34.3.195	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9212698	HIV-outcome inequities remain prevalent in the U.S. Medical providers (MPs) are gatekeepers of PrEP, and understanding the dynamics of PrEP assessments is of major interest for public health. We analyzed data from Together 5000, an internet-based U.S. national cohort of sexual and gender minority (SGM) individuals aged 16-49 years and at risk for HIV. Among those eligible for PrEP uptake (n = 6264), we modeled predictors of discussing PrEP with an MP. A third (31%) of participants had spoken to a MP about PrEP. Among those who spoke to a MP, 45% suggested they would initiate PrEP; this outcome was more common among participants older than 24. With a persistent stagnant uptake nationwide, new opportunities to influence PrEP uptake must be explored. An attractive less targeted space is the medical office, specifically ways to support an initial and continued discussion about PrEP between MPs and their patients. Article	2022	Carneiro, Pedro Botti; Mirzayi, Chloe; Jones, Scott; Rendina, Jonathon; Grov, Christian	Demographic, clinical guideline criteria, Medicaid expansion and state of residency: a multilevel analysis of PrEP use on a large US sample	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2021-055487	https://pubmed.ncbi.nlm.nih.gov/35110323/	ObjectiveTo explore the association of clinical guideline-related variables, demographics and Medicaid expansion on pre-exposure prophylaxis (PrEP) uptake in one of the largest US sample of men who have sex with men(MSM) and transgender and gender non-binary (TGNB) people ever analysed.MethodsWe cross-sectionally analysed predictors of current PrEP use using demographic and HIV risk-related variables (level-1), as well as state-level variables (level-2) (ie, Medicaid expansion status). We further explored the role state of residence plays in PrEP uptake disparities across the USA.ResultsWe found that the odds of PrEP use were significantly greater in older age, white, cisgender men. Moreover, individuals who reported recent post-exposure prophylaxis use, a recent sexually transmitted infection diagnosis and recent drug use were significantly more likely to report PrEP use. Finally, we found that the median odds of PrEP use between similar individuals from different states were 1.40 for the ones living in the Medicaid expansion states, compared with those not living in Medicaid expansion states. State of residence did not play a significant role in explaining PrEP disparities overall.ConclusionOur analysis showed that PrEP use is less common in communities standing to benefit the most from it—young MSM and TGNB of colour. However, individuals meeting federal guidelines for PrEP were significantly more likely to use PrEP. Though we found a positive association between living in Medicaid expansion states and PrEP use; that variable, as well as one's state of residency, were not suitable to explain variations in PrEP use in the US. Article	2022	Carnes N.; Zhang J.; Gelaude D.; Huang Y.-L.A.; Mizuno Y.; Hoover K.W.	Restricting Access: A Secondary Analysis of Scope of Practice Laws and Pre-exposure Prophylaxis Prescribing in the United States, 2017	Journal of the Association of Nurses in AIDS Care	-	-	-	10553290	10.1097/JNC.0000000000000275	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122972858&doi=10.1097%2fJNC.0000000000000275&partnerID=40&md5=53f0c27d284a527b9077a806fa4de3d7	To assess advanced practitioners' scope of practice laws (i.e., legal authority providers can prescribe regulated medications) as potential barriers to HIV pre-exposure prophylaxis (PrEP), we conducted an analysis using IQVIA Real World Data in association with scope of practice law classifications supplied by the American Association of Nurse Practitioners and scopeofpracticepolicy.org. Nurse practitioners in states that allowed independent scope of practice were 1.4 times more likely to have prescribed PrEP compared with nurse practitioners in states where their prescribing authority is determined by a supervising medical doctor (MD). Physician assistants in states where the law or a state board defined their prescribing authority were more than twice as likely to prescribe PrEP compared with those in states where a supervising MD oversaw prescribing rights. Our findings suggest that restricting scope of prescribing practice by requiring MD oversight limits PrEP access and poses a barrier to scaling up PrEP. © 2022 Elsevier USA. Article	2022	Carnevale, Caroline; Zucker, Jason; LaSota, Elijah; Northland, Bianka; Arache, Angelica; Peralta, Henry; Cohall, Alwyn; Garth, Janet; Gold, Melanie A; Sobieszczyk, Magdalena E	PreexposureProphylaxis at School-Based Health Centers: Awareness and Interest in Starting Preexposure Prophylaxis While Attending a School-Based Health Center in New York City.	Journal of Pediatric Health Care	-	-	-	1532-656X	10.1016/j.pedhc.2021.10.006	https://dx.doi.org/10.1016/j.pedhc.2021.10.006	INTRODUCTION: Youth aged 13-29 years represent 23% of the population but account for 40% of new HIV diagnoses, with risk peaking at ages 22-23 years. We assessed sexual behaviors, PrEP knowledge and attitudes among patients of 6 School-Based-Health-Centers (SBHCs) located in Northern Manhattan and the Bronx. METHOD: 667 patients, aged 13-19 years, completed a survey in the SBHCs waiting rooms between 10/2018 - 4/2019 RESULTS: Of the survey respondents attending SBHCs, 32% reported ever having heard of PrEP and, upon learning of PrEP, 67% stated that would be very likely (35%) or somewhat likely (32%) to take PrEP if it was offered to them free of charge. DISCUSSION: Youth of color are disproportionately infected by HIV throughout the US. Efforts are needed to educate adolescents on the benefits of PrEP, SBHCs are well situated to reduce barriers in providing PrEP directly to those who would benefit from its protection.. Article	2022	Carter G.; Brown L.; Mahnke B.; Ohmit A.; Woodward B.	Sexual Communication Self-Efficacy and PrEP Literacy Helps to Meet HIV Prevention Outcomes Among Black and Latinx Individuals	Journal of Primary Care and Community Health	-	-	-	21501319	10.1177/21501319221099789	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130142350&doi=10.1177%2f21501319221099789&partnerID=40&md5=08086e3f033ab63b688a5cdc8d5f3099	Background: Ending the HIV Epidemic is a campaign dedicated to reducing new HIV infections in the United States by 90% by 2030. Preexposure prophylaxis (PrEP) holds significant promise as a prevention tool. However, uptake has not improved much since then. As a result, this research looked at how PrEP literacy relates to sexual communication self-efficacy Methods: Between August 4 and 21, 2020, we performed a community-informed cross-sectional study of Black and Latinx residents in Indiana. We collected demographic information as well as PrEP literacy, sexual communication self-efficacy, and awareness of HIV status. Results: Being unaware of one's own HIV status and being unsure of one's sexual identity were both linked to reduced self-efficacy in the domain of sex communication. Those who had a greater level of PrEP literacy felt more confident in their ability to communicate with others about sexually related topics. People living in rural areas showed a significantly lower degree of sexual communication self-efficacy than participants in urban settings. Conclusion: Providing information about PrEP to those at risk of acquiring the virus may help them connect with treatment or prevention services. Healthcare professionals should take the time to understand their patients' levels of PrEP literacy and communication self-efficacy regarding sexual health. © The Author(s) 2022. Article	2022	Carter J.W., Jr.; Salabarría-Peña Y.; Fields E.L.; Robinson W.T.	Evaluating for health equity among a cluster of health departments implementing PrEP services	Evaluation and Program Planning	-	-	-	1497189	10.1016/j.evalprogplan.2021.101981	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85112433202&doi=10.1016%2fj.evalprogplan.2021.101981&partnerID=40&md5=844e90cfe56d24355a30b3ae38ee2cde	African American/Black and Hispanic/Latino sexual and gender minority populations are disproportionately affected by HIV in the United States and continue to experience HIV-related disparities. CDC funded project PrIDE to support 12 health departments (HD) with implementing pre-exposure prophylaxis (PrEP) strategies for men who have sex with men (MSM) and transgender persons, with a health-equity focus established by HDs. Each HD conducted mixed-methods evaluation of at least one local strategy. CDC employed a cluster evaluation approach to maximize cross validation. As a result, this cluster evaluation focused on three HDs that evaluated health equity-focused PrEP implementation strategies. Findings suggest that integrating health equity strategies such as storytelling and healthcare worker (HCW) trainings can help reduce HIV-related disparities. Storytelling improved HCW's understanding of clients' experiences of stigma due to racial, gender, and sexual identities. Provider training increased competencies on culturally appropriate care and the use of clinic services by Black and Hispanic MSM and transgender persons. Good practices included community engagement, seeking leadership buy-in, and integration of programmatic staff in health equity and evaluation activities. Evaluating strategies and training policies addressing social determinants of health that adversely affect HIV outcomes may help mitigate barriers Black and Hispanic MSM and transgender populations encounter in their HIV prevention seeking efforts. © 2021	Cluster evaluation; Gender minorities; Health equity; HIV; PrEP; Racial/ethnic minorities; Sexual minorities; Social determinants; Transgender	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Carter, Gregory; Staten, ILT Colten; Woodward, Brennan; Mahnke Brianna; Campbell, Jessica	PrEP Prescription Among MSM U.S. Military Service Members: Race and Sexual Identification Matter	American Journal of Men's Health	-	-	-	15579883	10.1177/15579883221133891	https://www.proquest.com/scholarly-journals/prep-prescription-among-msm-u-s-military-service/docview/2758333454/se-2?accountid=8113	An estimated 20.9% of U.S. service members report a high risk of HIV infection; however, only 2,000 service members had accessed HIV pre-exposure prophylaxis (PrEP) as of 2017. This study used a cross-sectional design to explore PrEP prescription predictors among service members who identify as a man who have sex with other men (MSM) (n = 354). Logistic regression was performed to assess the influence of four predictor variables: partner HIV status, race/ethnicity, primary partner gender, and sexual orientation on the odds participants' report being prescribed PrEP. A majority identified as gay (n = 246, 69.5%) and 23.4% (n = 83) identified as bisexual. Bisexual participants were 2.1 times (p = <.04) less likely to be prescribed PrEP. Accordingly, those who identify their primary sex partner as female were 5.1 times less likely to be prescribed PrEP (p < .001). MSM service members who had a partner disclose their HIV-positive status were 4.1 times more likely to have been prescribed PrEP (p = .013). Finally, participants who identify as Black were 3 times more likely (p = .001), and Latinx MSM were 3.6 times more likely (p = .003) to have been prescribed PrEP. Article	2022	Cartner, E; Ismail, M; Loftus, H	AN AUDIT REVIEWING THE PROVISION OF HIV PRE-EXPOSURE PROPHYLAXIS	Sexually Transmitted Infections	-	-	-	1368-4973	10.1136/sextrans-BASHH-2022.71	https://sti.bmj.com/content/98/Suppl_1/A36.1	Introduction HIV Pre-exposure prophylaxis (PrEP) is a prevention strategy which uses antiretroviral drugs to prevent acquisition of HIV in high-risk individuals. This audit was an evaluation of a local PrEP service and aimed to assess and improve the provision of PrEP. Methods A retrospective case notes analysis was performed on a random sample of patients who commenced PrEP between October 2020 and June 2021. Twenty-seven audit standards were derived from BHIVA/BASHH guidelines on the use of HIV PrEP (2018), with a target of 100% for all standards. Data was collected using a standardised proforma and analysed using Microsoft Excel. The sample comprised fifty-one patients All were cisgender males, with a mean age of 31.8 years old (range 19-62). Three (6%) patients were seen face-to-face, 48 (94%) had telephone consultations. Table 1 shows service performance across 10 pertinent outcomes. Discussion There was high adherence to standards regarding appropriate prescription of PrEP; baseline investigations before prescribing PrEP; and counselling on risks and benefits of PrEP. Areas for improvement include the prescription and dispensing of PrEP in a timely manner; ensuring prompt review of investigations results; and accurate documentation of co-morbidities, medications, and their interactions with PrEP. Demographic data collected highlighted the limited population accessing this service. Article	2022	Cassidy, Tali; Ntuli Nelisiwe; Kilani Charllen; Nikiwe, Malabi; Bulelwa, Rorwana; Mutseyekwa Tabitha; O'Connell Rebecca; Steele, Sarah Jane; Ndlovu Zee; Ellman, Tom; de Azevedo Virginia; Pfaff, Colin; Nelson, Aurelie; Duran Laura Trivino	Delivering PrEP to Young Women in a Low-Income Setting in South Africa: Lessons for Providing Both Convenience and Support	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03366-x	https://www.proquest.com/scholarly-journals/delivering-prep-young-women-low-income-setting/docview/2622379450/se-2?accountid=8113	Daily oral pre-exposure prophylaxis (PrEP) is a key tool in addressing high HIV incidence among young women, and breaking the cycle of transmission. From 2017 to 2020, Médecins Sans Frontières (MSF) offered PrEP, in conjunction with contraception and risk-reduction counselling, to women aged 18–25, in a government-run clinic in Khayelitsha, a low income high HIV prevalence area in South Africa. Drawing on clinical, quantitative, and qualitative interview data, we describe participants' experiences and engagement with the PrEP program, participant adherence (measured by TFV-DP levels in dried blood spots) over time, and the indirect benefits of the PrEP program. Of 224 screened and eligible participants, 164 (73.2%) initiated PrEP, with no large differences between those who initiated and those who did not. Overall, 47 (29%) completed 18 months follow-up, with 15 (9.1%) attending all visits. 76 (46.9%) participants were lost to follow-up, 15 (9.1%) exited when leaving the area, and 28.7% of exits happened in the first month of the study. We identified two different trajectories of PrEP adherence: 67% of participants had, on average, consistently low TFV-DP levels, with the remaining 33% having sustained high adherence. Few baseline characteristics predicted good adherence. The main reported barrier to taking PrEP was forgetting to take or travel with the pills. Encouragement from others declined as a reported facilitator from month 6 to 18 (family: 93.1% vs 77.6%, p = 0.016, friends: 77.6% vs 41.4%, p ≤ 0.001, partners: 62.1% vs 46.6%, p = 0.096, other PrEP users: 89.7% vs 74.1%, p = 0.020). Disclosure to friends and family in some cases spurred dialogue around sex, and helped to educate others about PrEP. Self-reported sex with more than one partner, and sex without a condom, decreased significantly after enrolment (p < 0.001, p = 0.063). In the individual interviews, participants credited their PrEP experience with changing their behaviour. Recognising the challenges with, but overall benefits from a package of care that includes the option of PrEP, lessons drawn from this study can help maximise persistence on PrEP within resource constraints. PrEP providers need to address participants' need for both convenience and social support. Article	2022	Castor, Delivette; Burgess, Emma K; Yende-Zuma, Nonhlanhla; Heck, Craig J; Abdool Karim, Quarraisha	Age-Restriction of a Validated Risk Scoring Tool Better Predicts HIV Acquisition in South African Women: CAPRISA 004.	AIDS and Behavior	-	-	-	1573-3254	10.1007/s10461-022-03664-y	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9474358	We examined the predictive ability of the VOICE risk screening tool among adolescent girls and young women at heightened HIV risk in urban and peri-urban Kwa-Zulu-Natal, South Africa. Using participant data from CAPRISA 004's control arm (N = 444), we applied the initial VOICE risk screening score (IRS), a modified risk score (MRS) based on predictive and non-predictive variables in our data, and age-restricted (AIRS and AMRS, respectively). We estimated incidence rates, 95% confidence bounds, sensitivity, specificity, negative and positive predictive values and area under the curve (AUC). The sample's HIV incidence rate was 9.1/100 Person-Years 95% CI 6.9-11.7, resulting from 60 seroconversions (60/660.7 Person-Years). The IRS' ≥ 8 cutpoint produced moderate discrimination AUC = 0.66 (0.54-0.74), sensitivity = 63%, specificity = 57%. Restricting to age < 25 years improved the score's predictive ability (AIRS: AUC = 0.69, AMRS: AUC = 0.70), owing mainly to male partner having other partners and HSV-2. The risk tool predicted HIV acquisition at a higher cutpoint in this sample than in the initial VOICE analysis. After age-stratification, fewer variables were needed for maintaining score's predictiveness. In this high incidence setting, risk screening may still improve the efficiency or effectiveness of prevention counseling services. However, PrEP should be offered to all prevention-seeking individuals, regardless of risk ascertainment. Theses and Dissertations	2022	CATTANI, VITORIA BERG	Avaliação de interação farmacocinética entre terapia de feminização e tenofovir e entricitabina em travestis e mulheres transexuais (TRANS) participantes do estudo preparadas	-	-	Fundação Oswaldo Cruz	-	-	NA	https://www.arca.fiocruz.br/handle/icict/64514	Travestis e mulheres transexuais (trans) estão entre as populações mais vulneráveis à infecção pelo HIV. A eficácia e segurança da profilaxia pré-exposição (PrEP) oral ao HIV (fumarato de tenofovir desoproxila/entricitabina) já foi demonstrada. Entretanto, há poucos estudos específicos com a população trans e as possíveis interações da PrEP com a terapia de feminização ainda não estão esclarecidas. Objetivo: Avaliar interações farmacocinéticas (PK) entre terapia de feminização e tenofovir/entricitabina entre mulheres trans. Metodologia: Trans em risco de infecção pelo HIV recrutadas para o estudo PrEParadas (NCT03220152) e que aceitaram participar do subestudo de interação farmacocinética, foram designadas para receber apenas PrEP (noFHT) ou terapia de feminização padronizada (sFHT, valerato de estradiol 2-6mg e espironolactona 100-300mg) e PrEP por 12 semanas. As participantes em uso de sFHT iniciaram a terapia de feminização na triagem e fizeram a primeira visita de avaliação PK da terapia de feminização 15 dias depois (inclusão). Todas as participantes iniciaram a PrEP ao término da visita de inclusão. Na semana 12, todas as participantes realizaram uma visita para avaliação PK da PrEP; nas participantes em uso de sFHT, a PK da terapia de feminização também foi avaliada. Após a visita de semana 12, as participantes puderam iniciar qualquer terapia de feminização (aFHT). Entre as semanas 30 e 48, participantes em uso de aFHT contendo estradiol foram convidadas a realizar outra avaliação PK da PrEP. Amostras de sangue foram coletadas nos tempos pré-dose e 0,5, 1, 2, 4, 6, 8 e 24 horas após a administração. Cromatografia líquida acoplada a espectrometria de massas em tandem foi empregada para quantificação em plasma de: tenofovir e entricitabina; estradiol e seus metabólitos (estrona e sulfato de estrona); e espironolactona e canrenona (metabólito). Os parâmetros PK não-compartimentais de tenofovir e entricitabina foram comparados entre as participantes em uso apenas de PrEP e aquelas em uso de PrEP e terapia de feminização: sFHT, semana 12; aFHT, semanas 30-48. Os parâmetros PK de estradiol, espironolactona e metabólitos foram comparados entre as participantes em uso de sFHT (inclusão) e sFHT e PrEP (semana 12). Foi empregado teste t pareado ou não, conforme o caso, após transformação logarítmica dos dados (alfa=0,05). Resultados: 45 trans (noFHT: n=18; sFHT: n=27) completaram as 12 semanas de acompanhamento; 30 (51%) foram incluídas na análise PK da PrEP na semana 12 (noFHT: n=12; sFHT: n=18). Os parâmetros PK de tenofovir e entricitabina não diferiram entre as participantes em uso de noFHT e sFHT, exceto para a concentração máxima de entricitabina: razão das médias geométricas (RMG): 1,15; intervalo de confiança IC95%: 1,01-1,32), nem entre as participantes em uso de noFHT e aFHT (n=13, semanas 30-48). Os parâmetros PK de estradiol e sulfato de estrona não diferiram entre as participantes em uso de sFHT (inclusão, n=19) e sFHT e PrEP (semana 12, n=19). A RMG (IC95%) de área sob a curva (ASC0-24) do estradiol foi 0,90 (0,74-1,09). Entre as participantes em uso de sFHT e PrEP, a ASC0-24 (RMGIC95%) de espironolactona (0,76 0,62-0,92) e de canrenona (0,85 0,76-0,96) foi menor. Conclusão: Não foram observadas interações da terapia de feminização à base de valerato de estradiol na PK do tenofovir em plasma. A PK do estradiol não foi influenciada pelo uso concomitante de PrEP. Poucas diferenças foram observadas na PK da espironolactona e da canrenona, no entanto, elas não devem impedir o uso concomitante da terapia de feminização contendo espironolactona e PrEP oral. Article	2022	Cattani, Vitória Berg; Jalil, Emilia Moreira; Eksterman, Leonardo; Torres, Thiago; Cardoso, Sandra Wagner; Castro, Cristiane R V; Monteiro, Laylla; Wilson, Erin; Bushman, Lane; Anderson, Peter; Veloso, Valdilea Gonçalves; Grinsztejn, Beatriz; Estrela, Rita	Impact of feminizing hormone therapy on tenofovir and emtricitabine plasma pharmacokinetics: a nested drug-drug interaction study in a cohort of Brazilian transgender women using HIV pre-exposure prophylaxis.	Journal of Antimicrobial Chemotherapy	-	-	-	1460-2091	10.1093/jac/dkac229	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9525093	OBJECTIVES: Potential interactions between feminizing hormone therapy (FHT) and pre-exposure prophylaxis (PrEP) may be a barrier to PrEP use among transgender women (TGW). We aimed to assess the impact of FHT on PrEP plasma pharmacokinetics (PK) among TGW. METHODS: This was a PK substudy of the effects of FHT on tenofovir disoproxil fumarate/emtricitabine nested to a trans-specific PrEP demonstration study (NCT03220152). Participants were assigned to receive PrEP only (noFHT) or standardized FHT (sFHT; oestradiol valerate 2-6âmg plus spironolactone 100-300âmg) plus PrEP for 12âweeks, after which they could start any FHT (aFHT). Short- and long-term PK assessment occurred at Weeks 12 and 30-48, respectively (plasma samples prior and 0.5, 1, 2, 4, 6, 8 and 24âh after dose). Non-compartmental PK parameters of tenofovir and emtricitabine were compared as geometric mean ratios (GMRs) between noFHT and PrEP and FHT (sFHT at short-term PK; aFHT at long-term PK) participants. RESULTS: No differences in tenofovir and emtricitabine plasma PK parameters were observed between the short-term PK of noFHT (nâ=â12) and sFHT participants (nâ=â18), except for emtricitabine Cmax GMR: 1.15 (95% CI: 1.01-1.32), or between noFHT short-term PK and aFHT long-term PK (nâ=â13). Most participants were on oestradiol valerate 2âmg at the short-term PK (56%) and 4âmg at the long-term PK (54%). Median (IQR) oestradiol levels were 56.8 (43.2-65.4)âpg/mL at short-term PK (sFHT) and 44.8 (24.70-57.30)âpg/mL at long-term PK (aFHT). No participants in this analysis seroconverted during the study. CONCLUSIONS: Our results indicate no interaction of FHT on tenofovir levels, further supporting PrEP use among TGW using FHT. Theses and Dissertations	2022	CAVALCANTI, FILIPE MATHEUS SILVA	Scaling Up Prep: Evidence from a Policy to Prevent Hiv in Brazil'	-	-	Fundação Getulio Vargas,	-	-	NA	https://hdl.handle.net/10438/32015	PrEP is a drug that is available in many countries and, if taken frequently, can virtually eliminate the risk of being infected with HIV through sex. However, by reducing the cost of unsafe sex, it might promote risky behavior, increasing the incidence of sexually transmitted infections in a typical moral hazard problem. I analyze the effect of PrEP distribution for free in the public health system in Brazil. I find that PrEP is mainly distributed to high-risk individuals. In a difference-in-differences setting exploring temporal variability in the adoption of the policy by municipalities, I find that PrEP reduced by 7.8% the rate of new cases of HIV. The effect is higher for the groups of men who have sex with men, people aged between 25 to 39 years and people who completed high school. These are the main characteristics of PrEP takers. Additionally, there was no substantial effect on syphilis, while it has helped to reduce new cases of hepatitis. Evidence suggests that this is consistent with better screening of individuals and well targeting of the policy. Article	2022	Cavalli, Luciana Osorio	A Profilaxia pré-exposição ao HIV em um serviço no oeste do Paraná : HIV pre-exposure Prophylaxis in a service in west Paraná	Brazilian Journal of Health Review	-	-	-	2595-6825	https://doi.org/10.34119/bjhrv5n5-018	https://ojs.brazilianjournals.com.br/ojs/index.php/BJHR/article/view/51778	Introdução: A Profilaxia Pré-Exposição (PrEP) é um método de prevenção ao HIV, teve sua eficácia comprovada e também está disponível, gratuitamente, pelo SUS, para alguns grupos em serviços de referência. Objetivo: Apresentar o fluxo de atendimento e os resultados em relação a PrEP em um serviço especializado localizado na região Oeste do Estado do Paraná. Métodos: Trata-se de um estudo retrospectivo que utilizou como fonte de informações as bases de dados do Ministério da Saúde e também relatórios públicos do serviço em questão. Resultados: O serviço, buscando facilitar o acesso e garantir melhor decisão do paciente em relação ao uso da medicação, estabeleceu um fluxo em que os pacientes que procuram para testagem e aconselhamento são abordados pela equipe em relação ao início da profilaxia, são solicitados os exames iniciais e agendado para consulta médica. Verificou-se que nesse serviço no período de agosto 2020 a abril de 2021 atendeu 123 pacientes em uso de profilaxia, 104 ativos e 19 descontinuidades, percentual de 15%, abaixo dos 44% do Paraná e 41% do Brasil. Gays e HSH representam 65% dos usuários. A faixa etária com maior procura está entre 25 a 39 anos (60%) e 78% possui mais de 8 anos de estudo. Apenas 29% relatou efeitos adversos nos primeiros 30 dias e 70% referiu fazer uso de todos os comprimidos. Conclusão: O serviço apresentado tem conseguido resultados semelhantes aos nacionais na maioria dos dados analisados, porém um índice menor de abandono o que poderia estar relacionado à organização interna em relação a indicação e ao acompanhamento. A disseminação da profilaxia em indivíduos com menor escolaridade também foi maior neste serviço. Ainda é necessário ampliar a divulgação da profilaxia para a população em geral pois há muito mais pacientes dentro do público alvo e ainda existe uma concentração da procura por brancos e de alta escolaridade.	profilaxia pré-exposição, HIV, antirretrovirais	Portuguese	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Brazil	Latin America and the Caribbean	Review
Article	2022	Celum C.L.; Bukusi E.A.; Bekker L.G.; Delany-Moretlwe S.; Kidoguchi L.; Omollo V.; Rousseau E.; Travill D.; Morton J.F.; Mogaka F.; O'Malley G.; Barnabee G.; van der Straten A.; Donnell D.; Parikh U.M.; Kudrick L.; Anderson P.L.; Haberer J.E.; Wu L.; Heffron R.; Johnson R.; Morrison S.; Baeten J.M.	PrEP use and HIV seroconversion rates in adolescent girls and young women from Kenya and South Africa: the POWER demonstration project	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25962	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85134428665&doi=10.1002%2fjia2.25962&partnerID=40&md5=3980af2ea6fb7d3fa07a6d6a2c676afb	Introduction: HIV incidence remains high among African adolescent girls and young women (AGYW). The primary objective of this study is to assess pre-exposure prophylaxis (PrEP) initiation, use, persistence and HIV acquisition among African AGYW offered PrEP in order to inform PrEP scale-up. Methods: POWER was a prospective implementation science evaluation of PrEP delivery for sexually active HIV-negative AGYW ages 16–25 in family planning clinics in Kisumu, Kenya and youth and primary healthcare clinics in Cape Town and Johannesburg, South Africa. Follow-up visits occurred at month 1 and quarterly for up to 36 months. PrEP users were defined based on the month 1 refill. PrEP persistence through month 6 was assessed using Kaplan–Meier survival analysis among AGYW with a month 1 visit, defining non-persistence as an ≥15 day gap in PrEP availability for daily dosing. PrEP execution was evaluated in a subset with PrEP supply from the prior visit sufficient for daily dosing by measuring blood tenofovir diphosphate (TFV-DP) levels. Results: From June 2017 to September 2020, 2550 AGYW were enrolled (1000 in Kisumu, 787 in Cape Town and 763 in Johannesburg). Median age was 21 years, 66% had a sexual partner of unknown HIV status, and 29% had chlamydia and 10% gonorrhoea. Overall, 2397 (94%) initiated PrEP and 749 (31%) had a refill at 1 month. Of AGYW who could reach 6 months of post-PrEP initiation follow-up, 128/646 (20%) persisted with PrEP for 6 months and an additional 92/646 (14%) had a gap and restarted PrEP. TFV-DP levels indicated that 47% (91/193) took an average of ≥4 doses/week. Sixteen HIV seroconversions were observed (incidence 2.2 per 100 person-years, 95% CI 1.2, 3.5); 13 (81%) seroconverters either did not have PrEP dispensed in the study interval prior to seroconversion or TFV-DP levels indicated <4 doses/week in the prior 6 weeks. Conclusions: In this study of PrEP integration with primary care and reproductive health services for African AGYW, demand for PrEP was high. Although PrEP use decreased in the first months, an important fraction used PrEP through 6 months. Strategies are needed to simplify PrEP delivery, support adherence and offer long-acting PrEP options to improve persistence and HIV protection. © 2022 The Authors. Article	2022	Cernasev A.; Walker C.; Kerr C.; Barenie R.E.; Armstrong D.; Golden J.	Tennessee Pharmacists' Opinions on Barriers and Facilitators to Initiate PrEP: A Qualitative Study	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph19148431	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135133280&doi=10.3390%2fijerph19148431&partnerID=40&md5=be7f59e9aa1e4940b5578b4de33aa3b1	Pre-exposure prophylaxis (PrEP) is recommended to prevent the transmission of the human immunodeficiency virus (HIV). Although an effective treatment, the uptake in the United States remains low. Pharmacists are well-positioned to initiate the conversation with patients about PrEP, but few studies exist exploring their unique roles. The objective of this study was to characterize Tennessee pharmacists' perceptions about access to PrEP. A qualitative study was used to gather the data that consisted of virtual Focus Groups over four months in 2021 from practicing Tennessee pharmacists. Emails were sent to all Tennessee licensed pharmacists to recruit them to participate in the study. Recruitment continued until Thematic Saturation was obtained. The corpus of data was audio-recorded, transcribed, and analyzed by the research team. Thematic Analysis revealed two themes: (1) Barriers to accessing PrEP; (2) Potential solutions to address barriers identified. These findings highlighted barriers and identified solutions to improve access to PrEP in Tennessee; additional financial assistance programs and marketing programs targeting patients and providers are needed to enhance PrEP access. © 2022 by the authors. Theses and Dissertations	2022	CESAR, GABRIELA ALVES	INFECÇÃO PELO HIV: PREVALÊNCIA, PrEP E A TECNOLOGIA A FAVOR DE ESTRATÉGIAS DE PREVENÇÃO	-	-	UNIVERSIDADE FEDERAL DE MATO GROSSO DO SUL	-	-	NA	https://sucupira.capes.gov.br/sucupira/public/consultas/coleta/trabalhoConclusao/viewTrabalhoConclusao.jsf?popup=true&id_trabalho=12706377	O combate à epidemia causada pela infecção pelo vírus da imunodeficiência humana (HIV) é contínuo e atemporal. No Brasil, a epidemia está concentrada em alguns grupos populacionais que estão em risco aumentado de aquisição da infecção pelo HIV. Com base nessas informações, o Ministério da Saúde disponibilizou estratégias voltadas à prevenção da infecção pelo HIV, chamada Prevenção Combinada, e dentre elas encontra-se a Profilaxia Pré-Exposição (PrEP) oral. A PrEP consiste no uso de antirretrovirais diários que previnem a infecção pelo HIV mesmo em casos de exposição a esse vírus. De novembro de 2011 a setembro de 2013, foi conduzido o primeiro estudo abordando os aspectos epidemiológicos e moleculares da infecção pelo HIV em homens que fazem sexo com homens (HSH), mulheres transgênero e travestis (TW) em Campo Grande-MS. Anos mais tarde, diante da elevada prevalência da infecção pelo HIV em HSH e TW, da necessidade urgente de diminuir o número de novos casos de HIV e da disponibilidade de PrEP no Brasil, um segundo estudo transversal foi conduzido com o objetivo de avaliar os dados sociodemográficos e a taxa de incidência de infecções sexualmente transmissíveis (IST) na população usuária de PrEP atendida no Centro de Testagem e Aconselhamento (CTA) em Campo Grande, Mato Grosso do Sul. Para alcançar os objetivos do terceiro estudo, um software foi desenvolvido com informações gerais sobre PrEP, que visam a melhoria da qualidade de vida, adesão e uso racional da PrEP pelo usuário. O primeiro estudo foi conduzido com 430 participantes, sendo 278 HSH e 152 TW. A prevalência da infecção pelo HIV nesta população foi de 9% (25/278) entre os HSH e 24,3% (37/152) entre as TW. Após a análise uni e multivariada, ter idade maior ou igual a 30 anos foi associada à infecção pelo HIV nos HSH. Enquanto para o grupo das TW, as variáveis associadas foram: ter sido forçado a ter relações sexuais com alguém, coinfecção HIV e sífilis e coinfecção HIV e hepatite C (HCV). Em relação às análises filogenéticas, 65% das sequências foram classificadas como subtipo B. No segundo estudo, foram incluídos 261 usuários de PrEP, a maioria com idade variando de 18 a 30 anos e do sexo biológico masculino (92,7%). Em relação à identidade de gênero, 84,6% eram gays ou HSH, 7,6% eram mulheres transgênero e 7,6% eram mulheres cisgênero. Foram identificados 31/261 novos casos de sífilis ativa, com uma taxa de incidência de 11,8 por 100 pessoas/ano. Novos casos de HIV (7/261) e novos casos de coinfecção HIV e sífilis (3/261) também foram encontrados. Entre os usuários de PrEP estudados, histórico de contato sexual com pessoa de mesmo sexo permaneceu associado aos novos casos de IST. Com relação ao desenvolvimento do software, o Instituto Nacional de Propriedade Industrial expediu os certificados de registro de programa de computador, de números BR 51202101589-4; BR 5120211590-8 e BR 512021001591-6. Os resultados demonstram uma elevada prevalência de infecção pelo HIV em HSH e TW quando comparada com as taxas observadas na população em geral. Apesar de mais expostos ao risco de infecção, jovens e gays/HSH constituem a maioria da população usuária de PrEP, ressaltando a urgente necessidade de políticas de saúde pública específicas que aumentem a participação das mulheres e mulheres transexuais com relação ao diagnóstico, tratamento e medidas de prevenção. O desenvolvimento de novas tecnologias pode contribuir para o monitoramento, adesão e uso racional da PrEP, visando assim a redução de novos casos de infecção pelo HIV. Article	2022	Cespedes, Michelle; Das, Moupali; Hojilla, J Carlo; Blumenthal, Jill; Mounzer, Karam; Ramgopal, Moti; Hodge, Theo; Torres, Thiago S; Peterson, Charles; Shibase, Senzokuhle; Elliott, Ayana; Demidont, A C; Callaghan, Larkin; Watson, C Chauncey; Carter, Christoph; Kintu, Alex; Baeten, Jared M; Ogbuagu, Onyema	Proactive strategies to optimize engagement of Black, Hispanic/Latinx, transgender, and nonbinary individuals in a trial of a novel agent for HIV pre-exposure prophylaxis (PrEP)	PLOS One	-	-	-	19326203	10.1371/journal.pone.0267780	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131701981&doi=10.1371%2fjournal.pone.0267780&partnerID=40&md5=9b5134ab673ac255a2cfadc8fddbd15d	Introduction Black and Hispanic/Latinx cisgender men who have sex with men (MSM), transgender women, transgender men, and gender nonbinary (TGNB) individuals have been historically underrepresented in HIV pre-exposure prophylaxis (PrEP) clinical trials. There is an urgent need for ongoing engagement with communities that have been the most impacted by HIV and diverse representation in clinical trials. Here we describe strategic approaches undertaken in the PURPOSE 2 trial to optimize engagement of underrepresented individuals. Methods and results PURPOSE 2 is an ongoing Phase 3 trial evaluating the safety and efficacy of lenacapavir as PrEP in cisgender MSM and TGNB individuals. In PURPOSE 2, we used a multipronged approach aimed at enriching participation of underrepresented individuals. We conducted a review to identify evidence-informed recommendations from literature, engaged with stakeholders, and established the Global Community Advisory and Accountability Group (GCAG) to represent the needs of the community. Insights from stakeholders and GCAG members resulted in an expansion of the study population to include transgender men, gender nonbinary persons, and adolescents, and evaluation of population-specific outcomes. Feedback from stakeholders and GCAG members also informed investigator and site selection; these were selected based on prior experience working with persons from diverse racial, ethnic and gender identities, and estimates of local HIV incidence. Site selection was also expanded to include community-based clinics with services tailored towards Black, Hispanic/Latinx, and TGNB populations. We established a study-wide recruitment goal of 50% Black MSM and 20% Hispanic/Latinx MSM in US sites and 20% transgender women globally. Site-specific recruitment goals were also developed based on local demographics and HIV incidence. Mandatory trainings included Good Participatory Practice guidelines, gender inclusivity, and antiracism. Conclusion While further work is needed to achieve equitable representation, the strategies we describe may serve as a framework for future clinical trials. Copyright: © 2022 Cespedes et al. Article	2022	Chai, Peter R.; Goodman, Georgia R.; Bronzi, Olivia; Gonzales, Gerard; Baez, Alejandro; Bustamante, Maria J.; Najarro, Jesse; Mohamed, Yassir; Sullivan, Matthew C.; Mayer, Kenneth H.; Boyer, Edward W.; O'Cleirigh, Conall; Rosen, Rochelle K.	Real-World User Experiences with a Digital Pill System to Measure PrEP Adherence: Perspectives from MSM with Substance Use	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03594-9	https://www.proquest.com/scholarly-journals/real-world-user-experiences-with-digital-pill/docview/2672491333/se-2?accountid=8113	Once-daily oral pre-exposure prophylaxis (PrEP) is highly effective for preventing HIV transmission, but adherence can be challenging for men who have sex with men (MSM) who use substances. A novel method for directly measuring ingestion events is a digital pill system (DPS), which comprises an ingestible radiofrequency emitter that signals a wearable Reader device upon PrEP ingestion, relaying ingestion data to a wearable Reader device and then to a smartphone application. Qualitative interviews were conducted with 15 MSM with non-alcohol substance use following an open-label pilot demonstration trial involving use of the DPS to measure PrEP adherence for 90 days. The purpose of this qualitative investigation was to understand overall user experiences and potential barriers and facilitators to using the DPS to measure PrEP adherence among MSM. The DPS was largely perceived as acceptable, novel, and valuable, with most participants reporting that the system was easily integrated into their daily routines. Technological and design factors, especially related to the wearable Reader, impacted participants' interest in using the technology long-term; several suggested improvements were discussed.Trial Registration ClinicalTrials.gov: NCT03842436. Article	2022	Chai, Peter R; Mohamed, Yassir; Bustamante, Maria J; Goodman, Georgia R; Najarro, Jesse; Castillo-Mancilla, Jose; Baez, Alejandro; Bronzi, Olivia; Sullivan, Matthew C; Pereira, Luis M; Baumgartner, Susan L; Carnes, Tony C; Mayer, Kenneth H; Rosen, Rochelle K; Boyer, Edward W; O'Cleirigh, Conall	DigiPrEP: A Pilot Trial to Evaluate the Feasibility, Acceptability, and Accuracy of a Digital Pill System to Measure PrEP Adherence in Men Who Have Sex With Men Who Use Substances.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002854	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8740604	BACKGROUND: Adherence to once daily oral preexposure prophylaxis (PrEP) for HIV prevention can be challenging for men who have sex with men (MSM) with substance use. Digital pill systems (DPS) comprise a radiofrequency emitter integrated into a gelatin capsule containing PrEP, which transmits data to a wearable Reader following ingestion, thereby enabling direct, real-time adherence measurement. This study evaluated the feasibility, acceptability, and accuracy of a DPS to measure PrEP adherence. METHODS: A 90-day, single-arm, open-label, pilot demonstration trial was conducted with adult, cisgender, HIV-negative MSM on PrEP with nonalcohol substance use. Feasibility was measured via DPS engagement and technical followback. Acceptability was assessed via qualitative user experience interviews. Accuracy was evaluated via DPS performance metrics, pill counts, and DBS to quantify tenofovir diphosphate. RESULTS: Sixteen MSM enrolled (median age, 32 years), and 15 completed the study. Engagement remained stable over time. Emergent nonadherence patterns included intercurrent substance use. The DPS was largely acceptable based on user experience; the predominant barrier to use was the Reader. DPS-recorded ingestions totaled 1099, including 83.9% were detected by Reader and 16.1% were reported manually. The DPS recorded 92.2% of 1192 total expected ingestions per pill counts. Point-biserial correlation (R = 0.58; 95% CI: 0.21 to 0.80; P = 0.047) and Pearson correlation (month 1: R = 0.85; 95% CI: 0.57 to 0.95; P = 0.0002; month 3: R = 0.75; 95% CI: 0.17 to 0.94; P = 0.0197) showed strong correlations between DPS-recorded adherence and tenofovir diphosphate in dried blood spots. CONCLUSION: DPS are a feasible, acceptable, and accurate method of measuring PrEP adherence in MSM with substance use. Future investigations should incorporate DPS into behavioral interventions targeting nonadherence.	digital pill system, ingestible sensors, PrEP, HIV prevention, adherence	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Chai, Peter R; Mohamed, Yassir; Goodman, Georgia; Bustamante, Maria J; Sullivan, Matthew C; Najarro, Jesse; Mendez, Lizette; Mayer, Kenneth H; Boyer, Edward W; O'Cleirigh, Conall; Rosen, Rochelle K	Development of a digital pill and respondent behavioral intervention (PrEPSteps) for HIV pre-exposure prophylaxis adherence among stimulant using men who have sex with men.	Translational Behavioral Medicine	-	-	-	1613-9860	10.1093/tbm/ibab117	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8764993	The efficacy of pre-exposure prophylaxis (PrEP) for HIV prevention in men who have sex with men (MSM) is contingent upon consistent adherence. Digital pill systems (DPS) provide real-time, objective measurement of ingestions and can inform behavioral adherence interventions. Qualitative feedback was solicited from MSM who use stimulants to optimize a cognitive behavioral therapy (CBT)-based intervention (LifeSteps), used in conjunction with a DPS, to promote PrEP adherence (PrEPSteps). Seven focus groups and one individual qualitative interview were conducted in Boston, MA with cisgender, HIV-negative MSM who reported stimulant use and current PrEP use or interest. Focus groups and interviews explored reactions to the DPS and PrEPSteps messaging components: contingent reinforcement (CR), corrective feedback (CF), LifeSteps, and substance use Screening, Brief Intervention, and Referral to Treatment (SBIRT). Quantitative assessments were administered. Qualitative data were analyzed using applied thematic analysis. Twenty MSM participated. Most were White (N = 12), identified as homosexual or gay (N = 15), and college-educated (N = 15). Ages ranged from 24 to 68 years (median 35.5). Participants were willing to engage with the DPS and viewed it as beneficial for promoting adherence. Confirmatory CR messages were deemed acceptable, and a neutral tone was preferred. CF messages were viewed as most helpful and as promoting individual responsibility. LifeSteps was perceived as useful for contextualizing nonadherence. However, SBIRT was a barrier to DPS use; concerns around potential substance use stigma were reported. MSM who use stimulants were accepting of the DPS and PrEPSteps intervention. CR, CF, and LifeSteps messages were viewed as helpful, with modifications pertaining to tone and content; SBIRT messages were not preferred. Article	2022	Chambers, Catharine; Deeks, Shelley L; Sutradhar, Rinku; Cox, Joseph; de Pokomandy, Alexandra; Grennan, Troy; Hart, Trevor A; Lambert, Gilles; Moore, David M; Coutlée, François; Grace, Daniel; Grewal, Ramandip; Jollimore, Jody; Lachowsky, Nathan; Nisenbaum, Rosane; Ogilvie, Gina; Sauvageau, Chantal; Tan, Darrell H S; Burchell, Ann N	Increases in human papillomavirus vaccine coverage over 12 months among a community-recruited cohort of gay, bisexual, and other men who have sex with men in Canada.	Vaccine	-	-	-	1873-2518	10.1016/j.vaccine.2022.05.019	https://dx.doi.org/10.1016/j.vaccine.2022.05.019	BACKGROUND: Starting in 2015/16, most Canadian provinces introduced publicly-funded human papillomavirus (HPV) vaccination programs for gay, bisexual, and other men who have sex with men (GBM) aged ≤ 26 years. We estimated 12-month changes in HPV vaccine coverage among community-recruited GBM from 2017 to 2021 and identified baseline factors associated with vaccine initiation (≥1 dose) or series completion (3 doses) among participants who were unvaccinated or partially vaccinated at baseline. METHODS: We recruited sexually-active GBM aged ≥ 16 years in Montreal, Toronto, and Vancouver, Canada, from 02/2017 to 08/2019 and followed them over a median of 12 months (interquartile range = 12-13 months). We calculated the proportion who initiated vaccination (≥1 dose) or completed the series (3 doses) by 12-month follow-up. Analyses were stratified by city and age-eligibility for the publicly-funded programs at baseline (≤26 years or > 26 years). We used multivariable logistic regression to identify baseline factors associated with self-reported incident vaccine initiation or series completion. RESULTS: Among 165 unvaccinated participants aged ≤ 26 years at baseline, incident vaccine initiation (≥1 dose) during follow-up was 24.1% in Montreal, 33.3% in Toronto, and 38.9% in Vancouver. Among 1,059 unvaccinated participants aged > 26 years, incident vaccine initiation was 3.4%, 8.9%, and 10.9%, respectively. Higher education and trying to access pre-exposure prophylaxis for HIV were associated with incident vaccination among those aged ≤ 26 years, while younger age, residing in Vancouver (vs. Montreal), being diagnosed with anogenital warts, having both government and private extended medical insurance, and being vaccinated against influenza were associated with incident vaccination among those aged > 26 years. CONCLUSIONS: We observed substantial gains in HPV vaccine coverage among young GBM within 5 + years of targeted program implementation, but gaps remain, particularly among older men who are ineligible for publicly-funded programs. Findings suggest the need for expanded public funding or insurance coverage for HPV vaccines. Article	2022	Chan C.; Bavinton B.R.; Prestage G.E.; Broady T.R.; Mao L.; Rule J.; Wilcock B.; Holt M.	Changing Levels of Social Engagement with Gay Men Is Associated with HIV Related Outcomes and Behaviors: Trends in Australian Behavioral Surveillance 1998–2020	Archives of Sexual Behavior	-	-	-	40002	10.1007/s10508-022-02310-x	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131538662&doi=10.1007%2fs10508-022-02310-x&partnerID=40&md5=aa4b44803f6c6c303079d54fddf64aed	Changes to how gay, bisexual, and other men who have sex with men (GBM) connect with each other and with their communities have implications for HIV prevention. Social engagement with gay men (defined as having friends who are gay men and spending time with them) has been associated with HIV related outcomes over time among Australian GBM. Using data collected in national, repeated, cross-sectional surveys of GBM between 1998 and 2020 (N = 161,117), analyses of trends in the prevalence of gay social engagement (GSE) in Australia were conducted using linear regression. To assess changing associations with GSE at different time points in the HIV epidemic, three cross-sectional analyses were conducted on factors associated with high and low GSE in 1999/2000, 2009/2010, and 2019/2020 using bivariate and multivariable logistic regression. GSE (scored from 0 to 7) declined among all participants from 4.76 in 1998 to 4.04 in 2020 (p < 0.001) with a steeper decline among GBM aged under 25 years from 4.63 in 1998 to 3.40 in 2020 (p < 0.001). In all timepoints, high GSE was associated with older age, being university educated, full time employment, identifying as gay, recent HIV testing, and PrEP uptake. While mostly associated with protective behaviors, high GSE was also associated with some practices that may put GBM at risk of HIV infection such as drug-enhanced sex and group sex in the most recent timepoint. Changing levels of GSE have implications for health promotion among GBM, particularly how to engage GBM less connected to gay social networks. © 2022, The Author(s). Article	2022	Chan C.; Fraser D.; Grulich A.E.; Philpot S.; Vaughan M.; Wacher M.; Bavinton B.R.	Increased awareness of event-driven PrEP and knowledge of how to use it: results from a cross-sectional survey of gay and bisexual men in Australia	Sexual Health	-	-	-	14485028	10.1071/SH22101	https://www.publish.csiro.au/sh/pdf/SH22101	Background: Recent changes to Australian PrEP prescribing guidelines support the use of event-driven pre-exposure prophylaxis (ED-PrEP) to prevent HIV among gay and bisexual men (GBM). Social marketing campaigns to increase awareness of ED-PrEP were conducted in early 2021. This study aimed to assess the awareness and knowledge of this method after these campaigns. Methods: We conducted a national cross-sectional online survey about PrEP knowledge and attitudes from March to May 2021. Participants were asked if they had heard of ED-PrEP. Among aware participants, questions about the '2-1-1' method were asked to assess knowledge. Bivariate and multivariate logistic regression analyses were conducted to assess the characteristics of those who were aware of ED-PrEP, and those who had correct knowledge of ED-PrEP. Analysis was restricted to non-HIV-positive cis-GBM who were aware of PrEP. Results: Among the 419 participants eligible for this analysis, 286 (68.3%) had heard of ED-PrEP. Awareness was associated with living in a postcode with ≥10% gay men, PrEP experience, and belief ED-PrEP is effective. Of these 286 participants, 125 (43.7%) correctly answered questions about how to take ED-PrEP. Correct knowledge was associated with PrEP experience and belief ED-PrEP is effective. Conclusions: A growing proportion of GBM are aware of ED-PrEP, but many still do not know how to take it as per clinical guidelines. More work is needed to increase knowledge among GBM to promote effective use of this method. © 2022	event-driven PrEP; gay men; health promotion; HIV prevention; HIV/AIDS; men who have sex with men; on-demand PrEP; pre-exposure prophylaxis	English	United States	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Quantitative

Article	2022	Chan C.; Vaccher S.; Fraser D.; Grulich A.E.; Holt M.; Zablotska-Manos I.; Prestage G.P.; Bavinton B.R.	Incorrect Knowledge of Event-Driven PrEP "2-1-1" Dosing Regimen Among PrEP-Experienced Gay and Bisexual Men in Australia	Journal of Acquired Immune Deficiency Syndromes	-	-	-	15254135	10.1097/QAI.0000000000002935	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132453300&doi=10.1097%2fQAI.0000000000002935&partnerID=40&md5=29013adcce90bb5bd6a80d6409d83a08	Background:Event-driven pre-exposure prophylaxis (ED-PrEP), when taken according to the "2-1-1" dosing method, is highly effective at preventing HIV acquisition for gay, bisexual, and other men who have sex with men (GBM). Any missed doses when using ED-PrEP drastically reduce its effectiveness, so it is vital that people using this method know how to take it correctly. This study investigated Australian GBM's awareness of ED-PrEP and their knowledge of how to take it correctly.Method:We conducted a survey of 1471 PrEP-experienced GBM in Australia, between October 2019 and March 2020. The survey assessed awareness and knowledge of the 3 components of the "2-1-1" ED-PrEP dosing regimen (number of pills for loading dose, timing of loading dose, and number of days after sex to take PrEP pills) among GBM. Characteristics associated with ED-PrEP awareness and correct knowledge of how to take ED-PrEP were assessed with multivariable logistic regression.Results:Two-thirds (n = 1004, 68.4%) has heard of ED-PrEP, of whom only one-eighth (n = 125, 12.5%) knew the correct details of the "2-1-1" ED-PrEP method; one-third (n = 339, 33.8%) did not know any of the 3 key components. Awareness of ED-PrEP and correct knowledge was associated with greater belief in PrEP efficacy, university education, and intention to take a nondaily PrEP regimen in the next 6 months.Conclusions:Although ED-PrEP awareness was considerable, most participants did not know how to use ED-PrEP correctly. Further work is needed to increase awareness and knowledge of ED-PrEP among GBM. © 2022 Lippincott Williams and Wilkins. Article	2022	Chan, Carrie T; Carlson, Jennifer; Lee, Tzielan; Vo, Megen; Nasr, Annette; Hart-Cooper, Geoffrey	Usability and Utility of Human Immunodeficiency Virus Pre-exposure Prophylaxis Clinical Decision Support to Increase Knowledge and Pre-exposure Prophylaxis Initiations among Pediatric Providers	Applied Clinical Informatics	-	-	-	1869-0327	10.1055/a-1975-4277	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9731791	OBJECTIVES: An effective clinical decision support system (CDSS) may address the current provider training barrier to offering preexposure prophylaxis (PrEP) to youth at risk for human immunodeficiency virus (HIV) infection. This study evaluated change in provider knowledge and the likelihood to initiate PrEP after exposure to a PrEP CDSS. A secondary objective explored perceived provider utility of the CDSS and suggestions for improving CDSS effectiveness. METHODS: This was a prospective study using survey responses from a convenience sample of pediatric providers who launched the interruptive PrEP CDSS when ordering an HIV test. McNemar's test evaluated change in provider PrEP knowledge and likelihood to initiate PrEP. Qualitative responses on CDSS utility and suggested improvements were analyzed using framework analysis and were connected to quantitative analysis elements using the merge approach. RESULTS: Of the 73 invited providers, 43 had available outcome data and were included in the analysis. Prior to using the CDSS, 86% of participants had never been prescribed PrEP. Compared to before CDSS exposure, there were significant increases in the proportion of providers who were knowledgeable about PrEP (p = 0.0001), likely to prescribe PrEP (p < 0.0001) and likely to refer their patient for PrEP (p < 0.0001). Suggestions for improving the CDSS included alternative "triggers" for the CDSS earlier in visit workflows, having a noninterruptive CDSS, additional provider educational materials, access to patient-facing PrEP materials, and additional CDSS support for adolescent confidentiality and navigating financial implications of PrEP. CONCLUSION: Our findings suggest that an interruptive PrEP CDSS attached to HIV test orders can be an effective tool to increase knowledge and likelihood to initiate PrEP among pediatric providers. Continual improvement of the PrEP CDSS based on provider feedback is required to optimize usability, effectiveness, and adoption. A highly usable PrEP CDSS may be a powerful tool to close the gap in youth PrEP access and uptake.	clinical decision support, electronic health records, adolescent medicine, alert, order set, healthcare providers, pediatric health	English	Germany	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical

Sexual Health	-	-	-	1449-8987	10.1071/SH21096	https://dx.doi.org/10.1071/SH21096	Background Overseas-born people who are ineligible for government-subsidised health care experience barriers to accessing HIV pre-exposure prophylaxis (PrEP) in Australia. This study aimed to assess a program providing free PrEP to overseas-born adults at risk of acquiring HIV. Methods Medicare-Ineligible Expanded Implementation in Communities (MI-EPIC) was a single-arm, open-label trial of daily tenofovir disoproxil fumarate/emtricitabine as PrEP. Six clinics recruited Medicare-ineligible adults who met HIV risk criteria in New South Wales, Australia. We recorded data on HIV and sexually transmitted infection (STI) diagnoses, and PrEP dispensing from July 2019 to June 2020. PrEP adherence as a medication possession ratio (MPR) was calculated as pills dispensed divided by days. We administered an optional survey on behaviours and attitudes to PrEP and sexual health. Results The 221 participants (206 men; 93.2%) had a median age of 29years (IQR 26-34). Participants were mostly born in Asia (53.4%), Latin America or the Caribbean (25.3%), or Europe (10.9%). Adherence was high; 190 participants (86.0%) had an MPR of >60%. Of 121 survey participants, 42 (34.7%) completed the survey in a language other than English. Of participants who had not used PrEP in the 6months before enrolment (n=45, 37.2%), the most common reasons were cost (n=22, 48.9%), and lack of knowledge about accessing PrEP (n=20, 44.4%). Conclusions Medicare-ineligible people at risk of HIV demonstrate high adherence when given access to free PrEP and translated information. Increasing PrEP awareness and reducing barriers to accessing PrEP in this high-risk population should be priorities in HIV prevention.	social determinants, gay men, HIV prevention, men who have sex with men, public health, pre-exposure prophylaxis, HIV/AIDS, migrants. Article	2022	Chan, Curtis; Vaccher Stefanie; Fraser, Doug; Grulich, Andrew E; Holt, Martin; Zablotska-Manos Iryna; Prestage, Garrett P; Bavinton, Benjamin R	Preferences for Current and Future PrEP Modalities Among PrEP-Experienced Gay and Bisexual Men in Australia	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03344-3	https://www.proquest.com/scholarly-journals/preferences-current-future-prep-modalities-among/docview/2622380067/se-2?accountid=8113	Alternatives to daily dosing of HIV pre-exposure prophylaxis (PrEP) are continuing to emerge. From October 2019 to March 2020, we conducted an online survey of PrEP-experienced gay and bisexual men in Australia about interest in and preference for four different PrEP modalities: daily dosing, event-driven dosing, long-acting injectable (LAI)-PrEP and subdermal PrEP implants. Using data from 1477 participants, we measured interest and preference of different modalities using multivariate logistic regression. High proportions of participants were interested in LAI-PrEP (59.7%), daily PrEP (52.0%), PrEP implants (45.3%) and event-driven PrEP (42.8%). LAI-PrEP was the most frequently selected preference (30.5%), followed by PrEP implants (26.3%), daily PrEP (21.4%) and event-driven PrEP (21.2%). Higher interest and preference for non-daily PrEP modalities were associated with being concerned about side effects and perceived difficulties with daily adherence. As novel modalities emerge, attitudes to them should be considered in public health messaging to facilitate informed decision-making. Article	2022	Chandler R.; Guillaume D.; Wells J.; Hernandez N.	Let Me Prep You to PREP Me: Amplifying the Voices of Black Women and Their Providers to Consider PrEP as an HIV Prevention Option	International Journal of Environmental Research and Public Health	-	-	-	16617827	10.3390/ijerph19031414	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123603895&doi=10.3390%2fijerph19031414&partnerID=40&md5=808606ab41ddffa725e954cbba4759da	Despite the high efficacy of pre-exposure prophylaxis (PrEP) in preventing HIV acquisition, PrEP uptake among Black cisgender women remains low. Our qualitative study assessed Black cisgender women's perspectives, attitudes, and acceptability towards PrEP, in addition to exploring PrEP-related attitudes, facilitators, and barriers to PrEP access among health care staff. This study was conducted to ascertain data to inform the development of our HIV prevention app—Savvy HER— which is being designed for Black cisgender women. Our findings indicated that Black women had low levels of PrEP acceptability and high levels of misconceptions, inaccurate knowledge, and stigma towards PrEP. Health care providers in our sample confirmed barriers of stigma, misconceptions, and knowledge among their patients coupled with difficulty accessing PrEP due to structural barriers. Our study indicated that there is a critical need to heighten Black cisgender women's PrEP knowledge and HIV risk perception in order to increase PrEP acceptability and uptake. © 2022 by the authors. Article	2022	Chang H.-M.; Chou C.-H.; Tsai H.-C.	Durability of single tablet regimen for patients with HIV infection in Southern Taiwan: data from a real-world setting	BMC Infectious Diseases	-	-	-	14712334	10.1186/s12879-021-06919-6	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85122317410&doi=10.1186%2fs12879-021-06919-6&partnerID=40&md5=40d2d2e5a6e25ea391b3d64dae168879	Background: A single-tablet regimen (STR) has been associated with better drug adherence. However, the durability of different STRs was unknown in the real-world settings. Our aim was to investigate the durability of different initial STR regimens in antiretroviral-naive patients starting STR in southern Taiwan. Method: This was a retrospective study of antiretroviral-naive patients that initiated first-line antiretroviral regimens with STRs between May 2016 and December 2017. The primary endpoint was time to virological failure. Secondary endpoints were STR discontinuation due to toxicity/intolerance. Durability was defined as time from the initiation until discontinuation/modification. Kaplan- Meier curves were plotted assessing time to virological suppression, treatment failure and discontinuation for the three STRs and Cox proportional hazards model was used to analyze the factors associated with time to viral suppression, treatment failure or discontinuation. Results: Two hundred and twenty-three patients were included: The median follow-up duration (IQR) was 73.9 (48–101.6) weeks, 25 patients (11%) experienced virological failure; the 48 weeks probability of treatment failure was 22.9% (16/70) for Efavirenz/Emtricitabine/Tenofovir Disoproxil Fumarate (EFV/FTC/TDF), 24.1% (13/54) for Emtricitabine/Rilpivirine/Tenofovir Disoproxil Fumarate (FTC/RPV/TDF) and 24.2% (24/99) for Abacavir/Dolutegravir/Lamivudine (ABC/DTG/3TC) (p=0.16). Fifty-six patients (25%) discontinued their STRs owing to toxicity/intolerance. When compared to EFV/FTC/TDF, treatment with FTC/RPV/TDF (aHR 8.39, CI 1.98–35.58, p = 0.004) and ABC/DTG/3TC (aHR 8.40, CI 2.39–29.54, p=0.001) were more likely to have treatment failure. The predictors for treatment failure included age ≦ 30 years old (aHR 3.73, CI 1.25–11.17, p = 0.018), switch between different STR (aHR 2.3, CI 1.18–4.50, p = 0.001) and free of active syphilis infection (aHR 0.24, CI 0.08–0.73, p = 0.012). The risk factor for treatment discontinuation included younger age ≦ 30 years old (aHR 3.82, CI 1.21–12.37, p = 0.023), treatment with EFV/FTC/TDF (aHR 8.65, CI 2.64–28.39, p < 0.001) and free of active syphilis infection (aHR 0.16, CI 0.04–0.62, p = 0.006). Conclusion: Younger age was associated with treatment failure and drug discontinuation. Active syphilis infection s/p treatment was associated with free from treatment failure and discontinuation. This probably driven by the more frequently sexual health education and counseling when patients had syphilis infection. Treatment with ABC/DTG/3TC was associated with higher risk of treatment failure. The STR durability was dependent on the drug toxicity/intolerance, age and syphilis infection. © 2021, The Author(s). Article	2022	Chang J.; Do D.; Delgado H.; Kanimian N.; Huynh A.	A retrospective analysis of bone loss in tenofovir-emtricitabine therapy for HIV PrEP	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624221130129	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139613135&doi=10.1177%2f09564624221130129&partnerID=40&md5=5104f1a944b871745be1add30f68e289	Background: Tenofovir-Emtricitabine (TDF-FTC) is known to cause bone loss in about 1–3% of HIV treated patients. Current studies lack evidence in minority groups and long-term bone loss effects in PrEP patients. Setting: To address the risk of osteopenia/osteoporosis in patients on TDF-FTC therapy for HIV PrEP and to address the breakthrough incidence of HIV. Methods: A retrospective analysis was performed in Kaiser Permanente patients from 2012–2021. Patients on TDF-FTC for PrEP without any prior history of osteopenia/osteoporosis (N = 7698) were analyzed to determine the relationship between PrEP adherence and osteopenia/osteoporosis. Descriptive statistics and Cox proportional hazard models were used to compare and analyze patient characteristics between those who developed osteopenia/osteoporosis and those who didn't. Results: 3% were found to have osteopenia/osteoporosis. Patients who developed osteopenia/osteoporosis were more likely to have a proportion of days covered (PDC) ratio ≥90%, older, had history of Hep B, DM, CVD, CKD, hypertension, and baseline eGFR ≥90 mL/min/1.73 m2. Kaplan-Meier curve showed the event-free rate of osteopenia/osteoporosis decreased with time, with a greater reduction in patients with high adherence. Survival analysis showed only PDC of ≥90% was significantly associated with the risk of osteopenia/osteoporosis when adjusted. No incidence of HIV infection was detected. Conclusions: This retrospective cohort analysis showed that TDF-FTC offered superior PrEP protection. Although high PrEP adherence ensured protection from HIV infection, it was significantly associated with a higher risk of developing osteopenia/osteoporosis. These findings suggest that routine check-ups for osteopenia/osteoporosis may be needed. © The Author(s) 2022. Article	2022	Chautrakarn S.; Rayanakorn A.; Intawong K.; Chariyalertsak C.; Khemngern P.; Stonington S.; Chariyalertsak S.	PrEP stigma among current and non-current PrEP users in Thailand: A comparison between hospital and key population-led health service settings	Frontiers in Public Health	-	-	-	22962565	10.3389/fpubh.2022.1019553	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144115474&doi=10.3389%2ffpubh.2022.1019553&partnerID=40&md5=1c2213edf5123ad0500602e37347cce8	Background: Pre-exposure prophylaxis (PrEP) has demonstrated effectiveness in high-risk populations. PrEP service in Thailand became free of charge under the Universal Health Coverage (UHC) in 2021. The National Health Security Office launched a pilot project in 2020 to ensure sustainable service delivery, and the national monitoring and evaluation (M&E) framework was adopted to evaluate early phase implementation. We carried out a cross-sectional survey as part of the M&E process to investigate PrEP stigma among current and non-current PrEP users from both hospital and Key Population Led Health Services (KPLHS) settings in Thailand. Methods: Between August and October 2020, an online cross-sectional survey was conducted. A link for a self-administered questionnaire was distributed to all active PrEP centers and PrEP clients were then recruited by PrEP providers. Descriptive and univariate analyses using Chi-square were applied in the analyses. Attitudes toward PrEP were ranked from the most negative to the most positive. The negative attitude can be interpreted as PrEP stigma. Results: This study included 513 PrEP clients (355 from hospitals and 158 from KPLHS). In both settings, respondents' attitudes toward PrEP were generally positive, but some potential stigma was observed. 31.8% of hospital PrEP clients and 9.5% of KPLHS clients agreed that PrEP users should keep their pills hidden from others. Almost half (44.5%) of hospital clients and 18.4% of KPLHS clients agreed that PrEP users are often viewed negatively by society. More than 20% of hospital clients and 12% of KPLHS agreed that PrEP users frequently experience difficulties when their partner/lover/family find out that he or she is on PrEP. Respondents from the hospitals had slightly higher PrEP stigma than those from KPLHS. Conclusions: According to our findings, at the policy level, the campaign to provide PrEP education to all groups of people should be continued in order to promote a positive view of PrEP and reduce PrEP-related stigma among the general population, which is critical for successful PrEP implementation. Article	2022	Cheek, Jelani B.; Feldman, Matthew B.; Montero, Noelisa; Gambone, Gina F.; Hoffman, Susie; Blackstock, Oni J.	Pre-exposure Prophylaxis (PrEP) Initiation Among Black and Latina Cisgender Women Receiving HIV Prevention Care Coordination Services in New York City	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03661-1	https://www.proquest.com/scholarly-journals/pre-exposure-prophylaxis-prep-initiation-among/docview/2714192024/se-2?accountid=8113	Black and Latina cisgender women are disproportionately impacted by HIV in the US. Although PrEP is effective at preventing HIV infection, uptake in this population remains low. The aim of the study was to examine sociodemographic, behavioral, clinical, and psychosocial factors associated with PrEP initiation (defined as receiving a PrEP prescription) among 565 cisgender women enrolled in an HIV prevention services coordination program in NYC from January 2017 to December 2019 who met HIV risk criteria for PrEP. Of these, 26% initiated PrEP. Latina women were significantly more likely than white women to have initiated PrEP (Latina: 29.7%; Black: 26.1%; White: 16.3%; Other: 7.4%). PrEP initiation was significantly associated with PrEP awareness, an annual income < $20,000, being unstably housed, receiving benefits navigation services, and reporting non-injection drug use and/or a recent sexual relationship with an HIV-positive partner. The relatively low rate of PrEP initiation we observed suggests the need to increase PrEP access and uptake among women, particularly Black and Latina women who continue to be disproportionately at risk for HIV. Article	2022	Chen H.; Chen Y.; Liu S.; Yu X.; Wang H.; Chang R.; Wang R.; Liu Y.; Xu C.; Wang Y.; Cai Y.	Trends in HIV Prevalence, Sexual Behavior, and Pre-Exposure Prophylaxis Willingness Among Transgender Women: An Analysis of Three Cross-Sectional Studies Conducted Mainly in Shenyang, China, 2014-2019	Transgender Health	-	-	-	2380193X	10.1089/trgh.2022.0081	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85162220821&doi=10.1089%2ftrgh.2022.0081&partnerID=40&md5=1464263e8a407bea8cee7381cb04e7c3	Purpose: Although transgender women (TGW) bear the highest HIV burden worldwide, routine surveillance of this group is rare. We aimed to evaluate the trends in health characteristics of Chinese TGW. Methods: Three cross-sectional studies using snowball sampling were conducted in 2014, 2017, and 2019, primarily in Shenyang, China. A questionnaire and voluntary HIV testing were used to obtain information on background characteristics, sexual behaviors, pre-exposure prophylaxis (PrEP) willingness, and HIV status. Results: There were 220 respondents in 2014, 198 in 2017, and 247 in 2019 (average age 31.1±7.6 to 33.5±9.6 years). HIV prevalence significantly decreased from 29.5% (95% confidence interval CI: 25.3-38.4%) in 2014 to 19.4% (95% CI: 14.7-24.9%) in 2019 (p<0.05). The proportion of participants reporting condomless anal intercourse (CAI) with any partner fluctuated from 30.8% (95% CI: 25.1-36.1%) to 53.0% (95% CI: 45.8-60.1%). The proportion of participants willing to use PrEP decreased from 86.4% (95% CI: 81.1-90.6%) in 2014 to 62.8% (95% CI: 56.4-68.8%) in 2019. Factors significantly associated with HIV infection were CAI with any partner (multivariate odds ratio ORm: 3.58, 95% CI: 1.55-8.29 in 2017; ORm: 3.18, 95% CI: 1.56-6.46 in 2019) and PrEP willingness (ORm: 0.26, 95% CI: 0.12-0.58 in 2017). Conclusion: HIV prevalence and associated risk factors remain substantial among Chinese TGW. There is an urgent need to strengthen HIV surveillance in this population, and develop trans-friendly and effective interventions to minimize HIV prevalence and transmission. Article	2022	Chen Y.-T.; Duncan D.T.; Del Vecchio N.; Timmins L.; Pagkas-Bather J.; Knox J.; Lacap S.; Hanson H.; Schneider J.A.	COVID-19 Conspiracy Beliefs are not Barriers to HIV Status Neutral Care Among Black Cisgender Sexual Minority Men and Black Transgender Women at the Initial Peak of the COVID-19 Pandemic in Chicago, USA	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-022-03720-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85132428444&doi=10.1007%2fs10461-022-03720-7&partnerID=40&md5=581d6918e97467c239ba332b38a2df8c	We examined associations between COVID-19 conspiracy beliefs and HIV status neutral care engagement among Black cisgender sexual minority men (BCSMM) and Black transgender women (BTW). Throughout April–July 2020, a total of 226 (222 in the current analysis: 196 BCSMM, 20 BTW, and 6 other) participants in Chicago's Neighborhoods and Networks (N2) cohort study completed virtual assessments. Participants reported their HIV status, changes in the frequency of PrEP/ART use, and COVID-19 conspiracy beliefs. Three-quarters of the sample believed at least one conspiracy theory that COVID-19 was either government-created or lab-created accidentally or purposefully. Believing one or more COVID-19 conspiracy theories was significantly associated with better PrEP or ART engagement (using PrEP more frequently or continuously using PrEP/Missing ART less or continuously using ART) (aPR = 0.75 95% CI 0.56–0.99, p < 0.05). Believing COVID-19 came about naturally was strongly associated with worse PrEP engagement (i.e., use PrEP less or not on PrEP) or worse ART engagement (i.e., missed ART more or not on ART) (aPR = 1.56 95% CI 1.23, 1.98, p < 0.001). Findings suggested substantial COVID-19 conspiracies among BCSMM and BTW, and this was associated with HIV care engagement. © 2022, The Author(s), under exclusive licence to Springer Science+Business Media, LLC, part of Springer Nature. Article	2022	Chidumwa, Glory; Chimbindi, Natsayi; Herbst, Carina; Okeselo, Nonhlanhla; Dreyer, Jaco; Zuma, Thembelihle; Smith, Theresa; Molina, Jean-Michel; Khoza, Thandeka; McGrath, Nuala; Seeley, Janet; Pillay, Deenan; Tanser, Frank; Harling, Guy; Sherr, Lorraine; Copas, Andrew; Baisley, Kathy; Shahmanesh, Maryam	Isisekelo Sempilo study protocol for the effectiveness of HIV prevention embedded in sexual health with or without peer navigator support (Thetha Nami) to reduce prevalence of transmissible HIV amongst adolescents and young adults in rural KwaZulu-Natal: a 2 × 2 factorial randomised controlled trial.	BMC Public Health	-	-	-	1471-2458	10.1186/s12889-022-12796-8	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8900304	BACKGROUND: Antiretroviral therapy (ART) through universal test and treat (UTT) and HIV pre-exposure prophylaxis (PrEP) substantially reduces HIV-related mortality, morbidity and incidence. Effective individual-level prevention modalities have not translated into population-level impact in southern Africa due to sub-optimal coverage among adolescents and youth who are hard to engage. We aim to investigate the feasibility, acceptability, and preliminary population level effectiveness of HIV prevention services with or without peer support to reduce prevalence of transmissible HIV amongst adolescents and young adults in KwaZulu-Natal. METHODS: We are conducting a 2 × 2 factorial trial among young men and women aged 16-29 years, randomly selected from the Africa Health Research Institute demographic surveillance area. Participants are randomly allocated to one of four intervention combinations: 1) Standard of Care (SOC): nurse-led services for HIV testing plus ART if positive or PrEP for those eligible and negative; 2) Sexual and Reproductive Health (SRH): Baseline self-collected vaginal and urine samples with study-organized clinic appointments for results, treatment and delivery of HIV testing, ART and PrEP integrated with SRH services; 3) Peer-support: Study referral of participants to a peer navigator to assess their health, social and educational needs and provide risk-informed HIV prevention, including facilitating clinic attendance; or 4) SRH + peer-support. The primary outcomes for effectiveness are: (1) the proportion of individuals with infectious HIV at 12 months and (2) uptake of risk-informed comprehensive HIV prevention services within 60 days of enrolment. At 12 months, all participants will be contacted at home and the study team will collect a dried blood spot for HIV ELISA and HIV viral load testing. DISCUSSION: This trial will enable us to understand the relative importance of SRH and peer support in creating demand for effective and risk informed biomedical HIV prevention and preliminary data on their effectiveness on reducing the prevalence of transmissible HIV amongst all adolescents and youth. TRIAL REGISTRATION: Trial Registry: clincialtrials.gov. CLINICALTRIALS: gov Identifier NCT04532307 . Registered: March 2020. Article	2022	Chidwick, Kendal; Pollack, Allan; Busingye, Doreen; Norman, Sarah; Grulich, Andrew; Bavinton, Benjamin; Guy, Rebecca; Medland, Nick	Utilisation of pre-exposure prophylaxis (PrEP) for HIV prevention in the Australian general practice setting: a longitudinal observational study.	Sexual Health	-	-	-	1449-8987	10.1071/SH21207	https://dx.doi.org/10.1071/SH21207	BACKGROUND: Pre-exposure prophylaxis (PrEP) became available through the Australian Pharmaceutical Benefits Scheme (PBS) on 1 April 2018 for HIV infection prevention in patients ≥18years at medium-to-high HIV risk. The aims were to investigate PrEP utilisation in general practice since PBS listing, and factors associated with discontinuation. METHODS: This longitudinal study included patients aged 18-74years attending general practices participating in MedicineInsight, a large-scale national primary care database of deidentified electronic health records, between October 2017 and September 2019. RESULTS: PrEP utilisation increased 10-fold following PBS listing. On average, patients had 9.7 PrEP prescriptions per year; a medication possession ratio of 80.8%. Of 1552 patients prescribed PrEP from April 2018, most were male (98.3%), aged 18-39years (59.3%), resided in major cities (86.7%) and in the two most socioeconomically advantaged quintiles (70.0%). Almost half (49.1%) of the patients were identified as new to PrEP. At study end, 65.1% were on active PrEP (16.5%, of whom had non-continuous use), 19.2% had discontinued PrEP and 15.7% were lost to follow up. Patients who discontinued were more likely to attend low rather than high PrEP caseload practices (adjusted odds ratio aOR 1.7; 95% CI: 1.0-2.8; P =0.047). The odds of non-continuous therapy was 2.9-fold higher in patients with bipolar disorder (aOR 2.89; 95% CI: 1.10-7.6; P =0.045). CONCLUSIONS: Following PBS listing, PrEP utilisation increased and stopping therapy was associated with attending low caseload practices. General practice education, particularly among low caseload practices, could help address these disparities.	electronic health records, emtricitabine, general practice, MedicineInsight, pharmacoepidemiology, primary health care, prophylaxis, tenofovir disoproxil fumarate drug combination. Article	2022	Chimbindi, Natsayi; Mthiyane, Nondumiso; Zuma, Thembelihle; Baisley, Kathy; Pillay, Deenan; McGrath, Nuala; Harling, Guy; Sherr, Lorraine; Birdthistle, Isolde; Floyd, Sian; Dreyer, Jaco; Nakasone, Sarah; Seeley, Janet; Shahmanesh, Maryam	Antiretroviral therapy based HIV prevention targeting young women who sell sex: a mixed method approach to understand the implementation of PrEP in a rural area of KwaZulu-Natal, South Africa.	AIDS Care	-	-	-	1360-0451	10.1080/09540121.2021.1902933	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8464632	Pre-Exposure Prophylaxis (PrEP) is a potential game-changer for HIV. We used PrEP introduction for Young Women Who Sell Sex (YWSS) in a rural South Africa district to understand community norms and PrEP coverage in YWSS. Between 2017 and 2018, we measured awareness and uptake of PrEP in a representative cohort of 2184 Adolescent Girls and Young Women (AGYW) aged 13-22. We conducted group discussions with young people and community members (19); key informant interviews (9), in-depth interviews with 15-24 year-olds (58) and providers (33). Interviews were analysed using thematic analysis. PrEP awareness increased from 2% to 9%. Among 965 AGYW sexually-active by 2018, 13.4% (95%CI: 11.4%-15.7%) reported transactional sex and 10.6% (95%CI: 8.85-12.7%) sex for money. Of the 194 YWSS, 21 were aware of PrEP, but none had used it. Youth were enthusiastic about PrEP as tool for HIV prevention; whilst older community members were cautious about a technology they had limited experience with but could benefit select groups. Teachers and healthcare providers were concerned that PrEP would lower personal responsibility for sexual health. In conclusion, the narrow and limited introduction of PrEP to YWSS reduced the accessibility and reach. Introducing PrEP as part of sexual healthcare may improve demand and access for YWSS. Theses and Dissertations	2022	Chu, Yen-Hao	Are we PrEPared to provide? : developing a theory-informed survey to measure the needs of Taiwan's community-based 'Sexually-Transmitted-Infection-Friendly Physicians' to deliver HIV pre-exposure prophylaxis (PrEP)	-	-	London School of Hygiene & Tropical Medicine	-	NA	10.17037/PUBS.04665761	https://doi.org/10.17037/PUBS.04665761	Background: Pre-exposure prophylaxis (PrEP) is key to ending the HIV epidemic in Taiwan, where men-who-have-sex-with-men (MSM) contribute to 79% of annual new infections. Community-based sexually-transmitted-infection-friendly physicians (CSTIPs) practise outside hospitals and are certificated by the Taiwan Centers for Disease Control to provide patients with treatment and prevention of sexually transmitted infections. CSTIPs have potential to deliver optimal decentralised PrEP services to MSM, but only two per cent of them prescribed PrEP in 2019. This thesis aims to develop a theory-informed questionnaire to measure the unmet needs of CSTIPs for delivering HIV PrEP services in Taiwan. Methods: This pragmatic qualitative research comprises two sequential phases as formative research and questionnaire development, applying a combination of the capability-opportunity-motivation-behaviour (COM-B) model and the Theoretical Domains Framework(TDF). The Formative Phase applied document research and 16 face-to-face in-depth interviews with CSTIPs in Taiwan. The diversity of interviewees was ensured through the purposive sampling of experience in PrEP prescribing, medical speciality and geography. I analysed the data using the COM-B/TDF framework to identify CSTIPs' needs for PrEP service provision. In the Development Phase, I generated an item pool for the anonymous, self-administered online questionnaire in Traditional Chinese (the official written language of Taiwan) using the findings in the Formative Phase. All preliminary items were then evaluated by eight CSTIPs through cognitive interviews and by six experts in my survey committee. Based on the feedback from both sources, I optimised the content, logic flow and layout of the final questionnaire in Traditional Chinese. Results: Formative Phase: Unmet PrEP prescribing needs of CSTIPs are identified in all three COM-B components and 14 TDF domains. CSTIPs expressed a wide range of needs for delivering PrEP services in the National PrEP Programme due to limited capabilities, missed opportunities and low motivation. Their needs highlighted the political and social milieux of Taiwan's centralised PrEP care system and multi-faceted PrEP stigma. Types and the extent of unmet needs varied between PrEP adopters and non-adopters, but both groups reported a marked demotivation, including: lack of professional confidence; personal biases and moral judgement towards MSM; disbelief in positive health outcome of PrEP; minimal incentives and anticipated administrative burden of and distrust in governmental programmes. Development Phase: Of all 76 initial items, 15 remained unchanged and six were removed after three rounds of cognitive interviewing with revisions. Comprising 70 items in four sections, the final Traditional Chinese questionnaire is culturally sensitive, theoretically attested and primed for measuring the needs of CSTIPs. Items on all 14 TDF domains were designed to measure CSTIPs' needs for delivering PrEP services. Except for the Emotion domain, all TDF domains were…	NA	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	-	-	Qualitative
Article	2022	Cockbain B.; Whitlock G.; McOwan A.; Patel S.; Nugent D.; Girometti N.; Suchak T.; Gedela K.; Tittle V.	Immediate PrEP when accessing PEP: A service evaluation	HIV Medicine	-	-	-	14642662	10.1111/hiv.13310	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85133535482&doi=10.1111%2fhiv.13310&partnerID=40&md5=78129cc193cd4e41b76d6239f9dbb19b	Objectives: In January 2021, 56 Dean Street, a London sexual health clinic, changed clinic policy so that all those attending for post-exposure prophylaxis (PEP) were offered quick-start opt-out pre-exposure prophylaxis (PrEP) following completion of the 28-day PEP course. We assessed the uptake of this quick-start PrEP in service users attending for PEP. Methods: We undertook a case note review of those who received PEP during the 2-week period from 17 February to 1 March 2021, assessing the data and comparing them to those from the same period in 2020 (15 February–28 February 2020) before quick-start opt-out PrEP was introduced. Results: The number of service users receiving PEP was 82 in 2020 and 42 in 2021, of which an unmet PrEP need was demonstrated in 81.7% (67/82) in 2020 and 78.6% (33/42) in 2021 (p = 0.8106). Of those with an unmet need, a higher proportion (97.0% 32/33) were offered PrEP in 2021 following the introduction of opt-out PrEP compared with the 85.1% (57/67) in 2020 (p = 0.0953). Of those eligible for PrEP who were offered it during their PEP consultation, 53.1% (17/32) in 2021 were dispensed PrEP compared with 17.5% (10/57) in 2020 (p = 0.0007). Conclusion: Since the introduction of quick-start opt-out PrEP, uptake in eligible candidates increased from 17.5% to 53.1%. This suggests that this strategy was acceptable to service users. © 2022 British HIV Association. Article	2022	Collins L.C.	Pre-exposure prophylaxis (PrEP) and 'risk' in the news	Journal of Risk Research	-	-	-	13669877	10.1080/13669877.2021.1894470	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85102275925&doi=10.1080%2f13669877.2021.1894470&partnerID=40&md5=c771f9914f02b3fc87bb11eb6c31ca96	This study investigates 'risk' as discussed in news coverage and in relation to pre-exposure prophylaxis (PrEP): a treatment that has been proven to restrict the transmission of the human immunodeficiency virus (HIV). In the U.S. and the U.K. & Ireland, there are issues concerning the provision and take-up of PrEP, which can lead to health inequalities. Raising awareness and tackling stigma are priorities in ensuring that those who would benefit from PrEP can access it, since these are reported to be obstacles to potential users seeking out the treatment. The media has been shown to be an important resource for public understanding of health issues and there is evidence to suggest that the news media have contributed to the uncertainty and stigma around PrEP, which has discouraged some from supporting and taking PrEP. In this study, I examine a corpus of 1424 news articles on PrEP (1,017,743 words) from the U.S. and the U.K. & Ireland, in the period 2016–2019. Using methods from corpus linguistics, I show that forms of 'risk' appear to a statistically significant degree in the data, providing a quantitative basis on which to explore these in more detail. Focusing on publications that use a high proportion of 'risk' words (compared with the overall average), I show that the focus on various risks associated with PrEP differs according to publication and that references to 'risk' are used both to advocate for the wider provision of PrEP and to caution against the effects of providing PrEP, i.e. concerns about 'risk compensation'. Corpus methods are shown to augment existing studies of PrEP coverage, providing a systematic method for identifying recurrent lexical features in the data and thereby showing how we can report the linguistic aspects of risk representation. Article	2022	Comer C.; Fernández R.	Health Departments and PrEP: A Missed Opportunity for Public Health	The Journal of Law, Medicine & Ethics	-	-	-	1748720X	10.1017/jme.2022.39	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135421798&doi=10.1017%2fjme.2022.39&partnerID=40&md5=4c9d73a3205e728e9cb19a8bce8ea9ff	The paper identifies common barriers and challenges to Pre-Exposure Prophylaxis (PrEP) uptake and offers considerations for state and local public health departments to address barriers and retool infrastructure to increase access to PrEP to new users. Authors identify synergistic opportunities with federal agencies and funders to advance PrEP-related HIV prevention efforts, that prioritize strategies and investments to provide PrEP to people who could benefit from the intervention but are unaware of PrEP or struggle to access it. Barriers discussed and examined include financing strategies to reduce financial burden of PrEP medication, expanding PrEP access and outreach beyond clinical settings, and increasing the network and reach of the provider community to serve people we oppress through policy choices and discourses of racial and socioeconomic inferiority.	340B; Access; Health Department; HIV Prevention; PrEP; PrEP Affordability; Public Health	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	NA	NA	Review
Article	2022	Conley, Cherie; Johnson, Ragan; Bond, Keosha; Brem, Sullivan; Salas, Jasmine; Randolph, Schenita	US Black cisgender women and pre-exposure prophylaxis for human immunodeficiency virus prevention: A scoping review.	Women's Health	-	-	-	1745-5065	10.1177/17455057221103098	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9201306	BACKGROUND: Black cisgender women in the United States experience a disproportionate burden of human immunodeficiency virus acquisition. Pre-exposure prophylaxis is an effective oral daily medication that reduces the risk of human immunodeficiency virus through sex by 99% when taken as prescribed. However, less than 2% of eligible Black cisgender women take pre-exposure prophylaxis. The purpose of this scoping review was to describe the types of research studies done in this area, gaps in knowledge, and potential areas of research needed to increase pre-exposure prophylaxis use among Black cisgender women in the United States. METHODS: We conducted our search in MEDLINE (PubMed), Embase (Elsevier), CINAHL (EBSCOhost), PsycINFO (EBSCOhost), and Scopus (Elsevier) using a combination of keywords and database-specific subject headings for the following concepts: pre-exposure prophylaxis, African American/Black or minority, and women. We used the Joanna Briggs Institute's Reviewers' Manual process for Scoping Reviews and the Preferred Reporting Items for Systematic Reviews and Meta-Analyses extension for Scoping Reviews to ensure comprehensive and standardized reporting of each part of the review. RESULTS: Fifty-nine studies were included in the final review. Results of the study were classified according to the three phases of the Human Immunodeficiency Virus Prevention Cascade-demand side, supply side, and adherence and retention. The majority of studies (n = 24, 41%) were cross-sectional quantitative surveys and 43 (34%) focused on the demand-side phase of the Human Immunodeficiency Virus Prevention Cascade. Fifty-eight percent of studies either assessed women's pre-exposure prophylaxis knowledge, attitudes, and intentions to use, or assessed perceived barriers and facilitators. Seven studies (12%) tested pre-exposure prophylaxis uptake and adherence among Black cisgender women. CONCLUSION: This review found multiple missed opportunities to increase women's demand for pre-exposure prophylaxis and health care provider screening and referral for pre-exposure prophylaxis. Additional studies are needed to effectively assess pre-exposure prophylaxis uptake and adherence among Black cisgender women. Article	2022	Contigiani, María Florencia; Sánchez López, Jorge Mario; Laurito, Micaela; Vergara, Albano; Lugo, Nancy; Cuenya, Lucas	Conocimiento sobre VIH-sida en población general de la Ciudad Autónoma de Buenos Aires y su vinculación con variables sociodemográficas	Psocial (Ciudad AutoÌŭn. B. Aires)	-	-	-	2422-619X	https://doi.org/10.1371/journal.pone.0164821	https://www.redalyc.org/articulo.oa?id=672371222009	Resumen La estigmatización ha signado la convivencia con el VIH. Esto repercute negativamente en la salud de las personas positivas e impacta en la población general puesto que, a través del miedo, se puede desalentar el testeo regular y la detección temprana de la infección. Uno de los principales componentes que sostienen la estigmatización es el bajo conocimiento sobre el VIH-sida. El objetivo del presente estudio es indagar el nivel de conocimiento sobre VIH-sida en población de jóvenes y adultos de la Ciudad Autónoma de Buenos Aires y su relación con variables sociodemográficas. Se encuestó a 201 participantes de entre 18 y 60 años inclusive en un diseño muestral por cuotas, preservando la representatividad de la muestra en relación al sexo, edad, nivel de instrucción y nivel socioeconómico. Se advierte en los participantes un escaso nivel de conocimiento sobre la diferencia entre VIH y sida, la PrEP, la PEP y la intransmisibilidad del virus por vía sexual en personas con carga viral indetectable. Por el contrario, se observó mayor conocimiento sobre las vías de transmisión del virus. El género y la edad no se asociaron a diferentes niveles de conocimiento, mientras que los participantes con religión evangélica, un menor nivel de instrucción formal, o un menor nivel socioeconómico mostraron porcentajes inferiores de conocimiento en distintas variables relevadas. Estos resultados enfatizan la necesidad de ejecutar las prerrogativas de la Ley de Educación Sexual Integral en lo concerniente al acceso a información actualizada sobre sexualidad y prevención de infecciones de transmisión sexual. Article	2022	Cooney E.E.; Reisner S.L.; Saleem H.T.; Althoff K.N.; Beckham S.W.; Radix A.; Cannon C.M.; Schneider J.S.; Haw J.S.; Rodriguez A.E.; Wawrzyniak A.J.; Poteat T.C.; Mayer K.H.; Beyrer C.; Wirtz A.L.	Prevention-effective adherence trajectories among transgender women indicated for PrEP in the United States: a prospective cohort study	Annals of Epidemiology	-	-	-	10472797	10.1016/j.annepidem.2022.03.016	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85129625368&doi=10.1016%2fj.annepidem.2022.03.016&partnerID=40&md5=b23c624538fb1cbd9bc66a481688e8a6	Purpose: Adherence to pre-exposure prophylaxis (PrEP) during periods of PrEP-indication (i.e., prevention-effective adherence) is critical for preventing HIV. We sought to describe factors associated with prevention-effective adherence trajectories among transgender women (TW) to inform PrEP implementation strategies. Methods: Using data from The LITE American Cohort (n = 728), we performed group-based multi-trajectory modeling (GBMTM) to identify clusters of TW with similar trajectories of PrEP adherence and indication, and sociodemographic, biobehavioral, and structural correlates of each trajectory. Results: We identified five trajectories: (1) consistent indication/no PrEP (15.3%), (2) initial indication/no PrEP (47.1%), (3) declining indication/discontinued PrEP (9.5%), (4) consistent indication/PrEP adherent (18.5%), and (5) increasing indication/initiated PrEP (9.6%). TW diagnosed with an STI were more likely to follow a consistent indication/no PrEP trajectory compared to consistent indication/PrEP adherent trajectory (adjusted Relative Risk Ratio aRRR, 2.54; 95% confidence interval CI, 1.16–5.57). TW who experienced homelessness were more likely to follow PrEP discontinuation and initiation trajectories relative to PrEP adherence (aRRR, 2.71; 95% CI, 1.10–6.70 and 2.83; 95% CI, 1.13–7.05, respectively). Conclusions: Over a quarter of TW followed trajectories suggestive of prevention-effective adherence, while 15% did not initiate PrEP despite consistent indication. Findings highlight missed opportunities for PrEP engagement at STI diagnosis and suggest structural interventions addressing housing instability may improve prevention-effective adherence among TW. © 2022	Group-based multi-trajectory modeling; HIV prevention; Pre-exposure prophylaxis; Transgender women; United States	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Cope, Adrea; Rajendram, Priyanka; Rafael, Sabrina; Matsiko, Judith; Mougammadou Aribou, Zeenathnisa; Barker, Kriss; Senter, Katherine; Riley, Amy Henderson	Qualitative findings from Girlsplained: a social media application of the Sabido methodology for sexual health and HIV prevention in the United Kingdom.	ournal of Visual Communication in Medicine	-	-	-	1745-3062	10.1080/17453054.2021.2010520	https://dx.doi.org/10.1080/17453054.2021.2010520	The health communication strategy known as entertainment-education can be traced in large part to Miguel Sabido and the methodology he developed using telenovelas in Latin America in the 1960s and 1970s. Entertainment-education has evolved from a long-running narrative approach using traditional media to the addition of new media and transmedia formats. In recent years, entertainment-education programs using social media have increased, yet few studies have explored the shared characteristics and experiences of social media users who engage with these programs. This qualitative study aimed TO examine publicly available social media data (i.e. YouTube and Instagram comments) in response to Girlsplained, an online entertainment-education program designed with objectives related to sexual health and HIV prevention among Black, Asian, and minority ethnic women in the United Kingdom. A process of directed content analysis uncovered five themes of engagement: characters and the narrative; social media; gender and race; HIV/PrEP; and sex and pregnancy prevention.	:Entretenimento–educaçãosaúde sexualPrevenção do HIVPreparaçãomídia socialReino Unido	English	United Kingdom	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative
Article	2022	Copertino, Dennis C; Casado Lima, Bruno C; Duarte, Rodrigo R R; Powell, Timothy R; Ormsby, Christopher E; Wilkin, Timothy; Gulick, Roy M; de Mulder Rougvie, Miguel; Nixon, Douglas F	Antiretroviral drug activity and potential for pre-exposure prophylaxis against COVID-19 and HIV infection.	Journal of Biomolecular Structure and Dynamics	-	-	-	1538-0254	10.1080/07391102.2021.1901144	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8448789	COVID-19 is the disease caused by SARS-CoV-2 which has led to 2,643,000 deaths worldwide, a number which is rapidly increasing. Urgent studies to identify new antiviral drugs, repurpose existing drugs, or identify drugs that can target the overactive immune response are ongoing. Antiretroviral drugs (ARVs) have been tested in past human coronavirus infections, and also against SARS-CoV-2, but a trial of lopinavir and ritonavir failed to show any clinical benefit in COVID-19. However, there is limited data as to the course of COVID-19 in people living with HIV, with some studies showing a decreased mortality for those taking certain ARV regimens. We hypothesized that ARVs other than lopinavir and ritonavir might be responsible for some protection against the progression of COVID-19. Here, we used chemoinformatic analyses to predict which ARVs would bind and potentially inhibit the SARS-CoV-2 main protease (Mpro) or RNA-dependent-RNA-polymerase (RdRp) enzymes in silico. The drugs predicted to bind the SARS-CoV-2 Mpro included the protease inhibitors atazanavir and indinavir. The ARVs predicted to bind the catalytic site of the RdRp included Nucleoside Reverse Transcriptase Inhibitors, abacavir, emtricitabine, zidovudine, and tenofovir. Existing or new combinations of antiretroviral drugs could potentially prevent or ameliorate the course of COVID-19 if shown to inhibit SARS-CoV-2 in vitro and in clinical trials. Further studies are needed to establish the activity of ARVs for treatment or prevention of SARS-CoV-2 infection .Communicated by Ramaswamy H. Sarma. Article	2022	Corcorran, Maria A; Scott, John D; Tinsley, Joe; Wald, Anna; Glick, Sara N	Awareness and Correlates of HIV Pre-Exposure Prophylaxis (PrEP) Among HIV-negative People Who Access Syringe Services in Seattle, Washington	Substance Use and Misuse	-	-	-	10826084	10.1080/10826084.2021.2012688	https://www.proquest.com/scholarly-journals/awareness-correlates-hiv-pre-exposure-prophylaxis/docview/2625923454/se-2?accountid=8113	BackgroundHIV pre-exposure prophylaxis (PrEP) is safe and effective for use in people who inject drugs (PWID), but PrEP is underutilized in this population. We assessed awareness of PrEP and correlates of interest in PrEP among PWID in Seattle, Washington.MethodsThis study analyzed data from a 2019 survey of PWID at 3 Seattle-area syringe service programs (SSPs). We used descriptive statistics to compare PrEP-aware and unaware PWID and multivariable Poisson regression with robust standard errors to estimate adjusted prevalence ratios (APR) for interest in PrEP.ResultsAmong 348 HIV-negative PWID, ≤1% were currently taking PrEP, 51% were PrEP aware and 46% were interested in PrEP. Interest in PrEP was inversely associated with prior PrEP awareness (APR 0.58, 95% CI 0.45 – 0.74); however, interest in PrEP was high among PWID meeting pre-specified risk criteria for HIV (APR 1.41, 95% CI 1.06 – 1.88).ConclusionsOur results suggest increasing awareness of PrEP may not be sufficient to promote PrEP uptake among PWID, and further efforts are needed to understand perceptions of risk for HIV, determinants of PrEP use, and to investigate successful strategies for PrEP implementation and delivery in this marginalized population.Supplemental data for this article is available online at https://doi.org/10.1080/10826084.2021.2012688 . Article	2022	Corneli A.; Perry B.; Ngoje D.O.; Molokwu N.; Strack R.; Agot K.	Episodic Use of Pre-Exposure Prophylaxis Among Young Cisgender Women in Siaya County, Kenya	AIDS Patient Care and STDs	-	-	-	10872914	10.1089/apc.2022.0076	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85140856379&doi=10.1089%2fapc.2022.0076&partnerID=40&md5=6de83724d2dcb7fca16a182494b5ccb5	The concept "seasons of risk"promotes use of pre-exposure prophylaxis (PrEP) only during periods of HIV risk. PrEP guidelines are aligned on daily use in women having vaginal sex during a risk period, and daily use for 28 days after the last potential exposure is recommended. However, when starting a "season of risk,"guidelines vary on "time to protection,"and unknowns remain in pharmacological research on PrEP protection in this population. During our iterative research on PrEP persistence using photovoice and in-depth interviews, we identified an ineffective pattern of PrEP use based on current guidelines - that is, routine, episodic use - among young cisgender women (YCW) in Siaya County, Kenya. Through same-group (n = 33 participants) and mixed-group (n = 31 participants) photovoice activities with YCW taking PrEP and female peers, participants explained that YCW associate their HIV risk with the sexual behaviors of their male partners who frequently travel from home. PrEP is considered unnecessary when partners are away because of no perceived risk. YCW re-start PrEP on or around the day of their partners' return because of heightened risk perceptions. Among the YCW interviewed (n = 18), nearly all of their partners traveled for about 1 week to 1 month at a time; about one-third of these women reported stopping PrEP during their partners' absence and re-starting it soon before or immediately upon their partners' arrival home. Additional research is critically needed to better inform PrEP guidelines and the decisions adolescent girls and young women make on how to use PrEP based on their risk context. In the interim, counseling on current dosing guidance when stopping and re-starting PrEP within a "season of risk"is needed. © 2022, Mary Ann Liebert, Inc.	adherence; Kenya; persistence; pre-exposure prophylaxis; prevention-effectiveness adherence; women	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Qualitative

HIV PREVENTION DURING THE COVID-19 PANDEMIC: SEXUAL ACTIVITY AND PREP USE AMONG BLACK SAME-GENDER-LOVING MEN AND BLACK CISGENDER WOMEN	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2022.34.2.142	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128798096&doi=10.1521%2faeap.2022.34.2.142&partnerID=40&md5=0254df1644fe541e9eb03c3da0e76c77	Black populations in the U.S. South are disproportionally affected by HIV and COVID-19 due to longstanding inequalities. We conducted 20 in-depth interviews—12 with Black same-gender-loving men and 8 with Black cis-gender women—to explore the impact of the initial phase of the COVID-19 pandemic on sexual activities and PrEP use. Almost all participants reduced the frequency of sex and number of partners. Women described little interest in sex, whereas men began to connect with some sexual partners after stay-at-home orders were lifted. Both populations were concerned about contracting COVID-19 through sexual partners, and men described selecting partners based on perceived COVID-19 risk. Participants valued PrEP and could access it, although several men who were not having sex stopped taking it. Risk of acquiring HIV during this time was likely limited. Future qualitative research is needed to understand how sexual behaviors and PrEP use changed as the pandemic continued. © 2022 The Guilford Press. Article	2022	Corneli, Amy; Perry, Brian; Des Marais, Andrea; Choi, Yujung; Chen, Hillary; Lilly, Rebecca; Ayers, Denae; Bennett, Jesse; Kestner, Lauren; Meade, Christina S; Sachdeva, Nidhi; McKellar, Mehri S	Participant perceptions on the acceptability and feasibility of a telemedicine-based HIV PrEP and buprenorphine/naloxone program embedded within syringe services programs: a qualitative descriptive evaluation.	Harm Reduction Journal	-	-	1477-7517	10.1186/s12954-022-00718-1	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9719634	BACKGROUND: People who inject drugs (PWID) are at risk for HIV and opioid overdose. We piloted PARTNER UP, a telemedicine-based program to provide PWID with access to both oral pre-exposure prophylaxis (PrEP) for HIV prevention and medication for opioid use disorder (MOUD) through two syringe services programs (SSPs) in North Carolina. We conducted a qualitative evaluation to assess the acceptability and feasibility of PARTNER UP from the participant perspective. METHODS: PARTNER UP participants met with a provider for an initial in-person visit at the SSP, followed by weekly telemedicine visits in month 1 and then monthly telemedicine visits until program end at month 6. Using a qualitative descriptive study design, we conducted in-depth interviews with a subsample of PARTNER UP participants at 1 month and 4 months. Informed by the technology acceptance model, we assessed participant perceptions of the usefulness and ease of use of PARTNER UP, as well as their intent to continue to use the program's components. We audio-recorded all interviews with participants' permission and used applied thematic analysis to analyze the verbatim transcripts. RESULTS: We interviewed 11 of 17 people who participated in PARTNER UP-10 in the month 1 interview and 8 in the month 4 interview. Nearly all participants were motivated to join for consistent and easy access to buprenorphine/naloxone (i.e., MOUD); only a few joined to access PrEP. Most were comfortable accessing healthcare at the SSP because of their relationship with and trust toward SSP staff, and accessing services at the SSP was preferred compared with other healthcare centers. Some participants described that telemedicine allowed them to be honest and share more information because the visits were not in-person and they chose the location, although the initial in-person meeting was helpful to build provider trust and rapport. Most participants found the visit schedule to be feasible, although half described needing to reschedule at least once. Nearly all participants who were interviewed intended to continue with MOUD after the program ended, whereas none were interested in continuing with PrEP. CONCLUSIONS: Participant narratives suggest that the PARTNER UP telemedicine program was acceptable and feasible. Future studies should continue to explore the benefits of embedding both PrEP and MOUD into SSPs with larger numbers of participants. Trial registration Clinicaltrials.gov Identifier: NCT04521920. Article	2022	Corneli, Amy; Perry, Brian; Wilson, Johnny; Reif, Susan; Gulden, Chelsea; Hanlen-Rosado, Emily; Cooper, Haley; Taylor, Jamilah; Starling, Summer; Thompson, J Wesley	Identification of Determinants and Implementation Strategies to Increase PrEP Uptake Among Black Same Gender-Loving Men in Mecklenburg County, North Carolina: The PrEP-MECK Study.	Journal of Acquired Immune Deficiency Syndromes	-	-	1944-7884	10.1097/QAI.0000000000002975	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9220775	BACKGROUND: Pre-exposure prophylaxis (PrEP) use is low among Black same gender-loving men (BSGLM) in Mecklenburg County, NC, an Ending the HIV Epidemic priority jurisdiction. We created PrEP-MECK-an investigator partnership among a community-based organization representative, a PrEP provider, and researchers-and conducted iterative preparation research to identify determinants of PrEP uptake and implementation strategies to address them. METHODS: We first established the PrEP-MECK Coalition of community stakeholders. Next, informed by PrEP-MECK Coalition input and PRECEDE-PROCEED's educational/ecological assessment phase, we conducted focus group discussions with BSGLM not using PrEP and in-depth interviews with BSGLM who were currently or had previously taken PrEP to describe determinants and suggest implementation strategies. Based on interim findings, we partnered with clinics participating in the Mecklenburg County PrEP Initiative, which offers free PrEP services to uninsured individuals. We also conducted Consolidated Framework for Implementation Research-informed organizational assessments with community-based organizations and clinics to assess readiness to pilot the implementation strategies. RESULTS: We conducted 4 focus group discussions, 17 in-depth interviews, and 6 assessments. BSGLM were aware of PrEP yet perceived that costs made it unattainable. Awareness of how to access PrEP and the Mecklenburg County PrEP Initiative was lacking, and clinic scheduling barriers and provider mistrust limited access. We identified client-level implementation strategies, primarily focusing on engaging the consumer, to increase comfort with and awareness of how to access PrEP, and clinic-level implementation strategies focusing on changing clinic infrastructure, to make PrEP access easier. CONCLUSION: We plan to evaluate implementation of these strategies once fully developed to determine their acceptability and other outcomes in future research. Article	2022	Coyer, Liza; Prins, Maria; Davidovich, Udi; van Bilsen, Ward P H; Schim van der Loeff, Maarten F; Hoornenborg, Elske; Matser, Amy; Boyd, Anders	Trends in Sexual Behavior and Sexually Transmitted Infections After Initiating Human Immunodeficiency Virus Pre-Exposure Prophylaxis in Men Who Have Sex with Men from Amsterdam, the Netherlands: A Longitudinal Exposure-Matched Study.	AIDS Patient Care and STDs	-	-	1557-7449	10.1089/apc.2021.0219	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9242711	Men who have sex with men (MSM) initiating human immunodeficiency virus (HIV) pre-exposure prophylaxis (PrEP) may increase condomless anal sex (CAS) and number of partners, and, consequently, more often acquire sexually transmitted infections (STIs). Using data from the Amsterdam Cohort Studies, we compared sexual behavior and STI among MSM after PrEP-initiation with controls not initiating PrEP. The MSM reported on sexual behavior and were tested for HIV, chlamydia, gonorrhea, and syphilis semi-annually. We matched MSM who initiated PrEP between January 1, 2015 and December 31, 2019 1:1 to MSM who did not use time-dependent propensity scores based on age, sexual behavior, and STI. Primary end-points were number of casual partners, and proportion with CAS and receptive CAS (rCAS) with casual partners, sexualized drug use (SDU), any STI, and anal STI. We modeled end-points during the 4 years before and 2 years after PrEP-initiation or matched PrEP-initiation timepoint by using logistic regression (dichotomous end-points) or negative binomial regression (count end-point), adjusted for calendar year. Two hundred twenty-eight out of the 858 (26.6%) MSM initiated PrEP. We matched 198 out of 228 (86.8%) to a control. Before PrEP-initiation, end-points increased over time in both groups, with no statistically significant difference. The odds of CAS, rCAS, and anal STI were on average higher after than before PrEP-initiation in PrEP initiators, whereas after versus before differences were not observed in controls. After PrEP-initiation, PrEP initiators had statistically significantly more casual partners, and higher odds of CAS, rCAS, SDU, any STI, and anal STI than controls. These findings support frequent STI screening and counseling in MSM using PrEP.	homosexuality; male; men who have sex with men; pre-exposure prophylaxis; prospective studies; sexual behavior; sexually transmitted infections. Article	2022	Craddock J.B.; Franke N.D.; Kingori C.	Associations of Social Network- and Individual-Level Factors with HIV Testing, Condom Use, and Interest in PrEP Among Young Black Women	Archives of Sexual Behavior	-	-	40002	10.1007/s10508-022-02306-7	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131562546&doi=10.1007%2fs10508-022-02306-7&partnerID=40&md5=0aa39a868c8ddf57a59eb38234c567c9	To achieve the 2030 goal of ending the HIV epidemic, we must consider social network- along with individual-level factors related to HIV prevention among young Black women (YBW). This cross-sectional study examined egocentric social network- and individual-level data of 180 YBW aged 18–24. Multivariable logistic regression models were used to study social network characteristics and individual sexual behaviors related to HIV prevention behaviors (e.g., HIV testing, condom use, and interest in pre-exposure prophylaxis, or PrEP). On average, YBW nominated 11 social network members (SNMs; seven friends, two family members, and one sex partner). About 92% of YBW spoke to at least one SNM about condom use and 58% spoke to at least one SNM about HIV testing. Respondents who spoke to a sex partner about condom use had 70% lower odds of being interested in PrEP, but 2.99 times the odds of reporting condom use during last sex. Odds of being tested for HIV in the prior 3 months were significantly increased by 3.97 times for those who spoke to at least one sex partner about HIV testing. However, odds of being interested in PrEP were significantly decreased by 63% for YBW who were tested for HIV in the prior 3 months. Findings underscore that understanding network- and individual-level factors is crucial in increasing HIV testing, condom use, and interest in PrEP among YBW. © 2022, The Author(s). Article	2022	Crawford, Natalie D; Harrington, Kristin R V; Alohan, Daniel I; Sullivan, Patrick S; Holland, David P; Klepser, Donald G; Quamina, Alvan; Siegler, Aaron J; Young, Henry N	Integrating and Disseminating Pre-Exposure Prophylaxis (PrEP) Screening and Dispensing for Black Men Who Have Sex With Men in Atlanta, Georgia: Protocol for Community Pharmacies.	JMIR Research Protocols	-	-	1929-0748	10.2196/35590	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8867290	BACKGROUND: Black men who have sex with men (BMSM) suffer from alarmingly high rates of HIV in the United States. Pre-exposure prophylaxis (PrEP) can reduce the risk of HIV infection by 99% among men who have sex with men, yet profound racial disparities in the uptake of PrEP persist. Low PrEP uptake in BMSM is driven by poor access to PrEP, including inconvenient locations of PrEP-prescribing physicians, distrust of physicians, and stigma, which limit communication about PrEP and its side effects. Previous work indicates that offering HIV prevention services in pharmacies located in low-income, underserved neighborhoods is feasible and can reduce stigma because pharmacies offer a host of less stigmatized health services (eg, vaccinations). We present a protocol for a pharmacy PrEP model that seeks to address challenges and barriers to pharmacy-based PrEP specifically for BMSM. OBJECTIVE: We aim to develop a sustainable pharmacy PrEP delivery model for BMSM that can be implemented to increase PrEP access in low-income, underserved neighborhoods. METHODS: This study design is a pilot intervention to test a pharmacy PrEP delivery model among pharmacy staff and BMSM. We will examine the PrEP delivery model's feasibility, acceptability, and safety and gather early evidence of its impact and cost with respect to PrEP uptake. A mixed-methods approach will be performed, including three study phases: (1) a completed formative phase with qualitative interviews from key stakeholders; (2) a completed transitional pilot phase to assess customer eligibility and willingness to receive PrEP in pharmacies during COVID-19; and (3) a planned pilot intervention phase which will test the delivery model in 2 Atlanta pharmacies in low-income, underserved neighborhoods. RESULTS: Data from the formative phase showed strong support of pharmacy-based PrEP delivery among BMSM, pharmacists, and pharmacy staff. Important factors were identified to facilitate the implementation of PrEP screening and dissemination in pharmacies. During the transitional pilot phase, we identified 81 individuals who would have been eligible for the pilot phase. CONCLUSIONS: Pharmacies have proven to be a feasible source for offering PrEP for White men who have sex with men but have failed to reach the most at-risk, vulnerable population (ie, BMSM). Increasing PrEP access and uptake will reduce HIV incidence and racial inequities in HIV. Translational studies are required to build further evidence and scale pharmacy-based PrEP services specifically for populations that are disconnected from HIV prevention resources. Article	2022	Creger, Thomas; Burgan, Kaylee; Turner, Wesli H; Tarrant, Ashley; Parmar, Jitesh; Rana, Aadia; Mugavero, Michael; Elopre, Latesha	Using Implementation Mapping to Ensure the Success of PrEP Optimization Through Enhanced Continuum Tracking (PrOTECT) AL-A Structural Intervention to Track the Statewide PrEP Care Continuum in Alabama.	Journal of Acquired Immune Deficiency Syndromes	-	-	1944-7884	10.1097/QAI.0000000000002976	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9204800	INTRODUCTION: Ending the HIV Epidemic initiatives provide a unique opportunity to use implementation scientific methods to guide implementation of evidence-based practices and evaluate their effectiveness in real-word settings to improve HIV inequities. This report demonstrates our use of Implementation Mapping (IM) to engage participating county health departments, AIDS services organizations, and community-based organizations in the development of a data dashboard to track the PrEP care continuum for the state of Alabama, an Ending the HIV Epidemic hotspot. METHODS: Our project is guided by an overarching Implementation Research Logic Model and by the tenets of IM, a 5-step approach to support researchers and community partners in the systematic selection, development, and/or tailoring of implementation strategies to increase program adoption, implementation, and sustainability. RESULTS: Step 1, the needs assessment, established baseline data elements for a PrEP care continuum for participating community-based organizations, AIDS services organizations, and the state health department as well as investigated their desire for data visualization and willingness to share data to inform initiatives to improve PrEP access. Step 2 identified adaptability, relative advantage, and complexity as determinants of intervention adoption. Based on findings from steps 1 and 2, the investigators and community partners determined to move forward with development of a data dashboard. Step 3 identified the following implementation strategies to support a dashboard, including development of educational materials, synchronous and asynchronous training, technical assistance, and improved record systems. DISCUSSION: Using IM supports community-engaged researchers in designing strategies to end the epidemic that are context-specific and more impactful in real-word settings.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Cresswell, Fiona; Asanati, Kaveh; Bhagani, Sanjay; Boffito, Marta; Delpech, Valerie; Ellis, Jayne; Fox, Julie; Furness, Linda; Kingston, Margaret; Mansouri, Massoud; Samarawickrama, Amanda; Smithson, Kat; Sparrowhawk, Alex; Rafferty, Paul; Roper, Tom; Waters, Laura; Rodger, Alison; Gupta, Nadi	UK guideline for the use of HIV post-exposure prophylaxis 2021.	HIV Medicine	-	-	1468-1293	10.1111/hiv.13208	https://dx.doi.org/10.1111/hiv.13208	We present the updated British Association for Sexual Health and HIV (BASHH) guidelines for post-exposure prophylaxis (PEP) to HIV following sexual exposures, occupational exposures and other nonoccupational exposures in the community. This serves as an update to the 2015 BASHH guideline on PEP following sexual exposures and the 2008 Expert Advisory Group on AIDS guidelines on HIV PEP. We aim to provide evidence-based guidance on best clinical practice in the provision, monitoring and support of PEP for the prevention of HIV acquisition following sexual, occupational and other nonoccupational exposures in the community. The guideline covers when to prescribe PEP, what antiretroviral agents to use and how to manage PEP. This includes (i) evidence of PEP efficacy; (ii) evidence relating to individual-level efficacy of antiretroviral therapy to prevent the sexual transmission of HIV; (iii) data on the detectable (transmissible) prevalence of HIV in specific populations; (iv) risk of HIV transmission following different types of sexual and occupational exposure; (v) baseline risk assessment; (vi) drug regimens and dosing schedules; (vii) monitoring PEP; (viii) baseline and follow-up blood-borne virus testing; (ix) the role of PEP within broader HIV prevention strategies, for example, HIV pre-exposure prophylaxis (PrEP). The guideline also covers special scenarios such as PEP in pregnancy, breastfeeding and chronic hepatitis B virus infection, and when PEP should be considered in people using HIV PrEP. The guidelines are aimed at clinical professionals directly involved in PEP provision and other stakeholders in the field. A proforma to assist PEP consultations is included. A public consultation process was undertaken prior to finalizing the recommendations.	na	English	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	United Kingdom	Western and Central Europe and North America	Review
Article	2022	Crowell, TA; Jansen, K; Esber, A; Spinner, C; Esser, S; Lehmann, C; Boesecke, C; Tiemann, C; Stoehr, A; Hartikainen, J; Bickel, M; Schneeweiss, S; Scholten, S; Cordes, C; Brockmeyer, NH; Jessen, H; Bremer, V; Marcus, U; Steffen, G; Streeck, H; BRAHMS Study Team	Declining incidence of chlamydia and gonorrhea, but not mycoplasma in a high-risk population eligible for PrEP experiencing a test-and-treat-setting	Journal of the International AIDS Society	-	-	1758-2652	10.1186/s12879-020-4831-4	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7007644/	Background: Men who have sex with men (MSM) are disproportionally affected by sexually transmitted infections (STI). STI are often extragenital and asymptomatic. Both can delay diagnosis and treatment. Approval of HIV preexposure prophylaxis (PrEP) might have influenced sexual behaviour and STI-prevalence of HIV- MSM. We estimated STI-prevalence and risk factors amongst HIV- and HIV+ MSM in Germany to plan effective interventions. Methods: We conducted a nationwide, cross-sectional study between February and July 2018. Thirteen MSMfriendly STI-practices screened MSM for Chlamydia trachomatis (CT), Mycoplasma genitalium (MG), Neisseria gonorrhea (NG), and Trichomonas vaginalis (TV) using self-collected rectal and pharyngeal swabs, and urine samples. APTIMA™ STI-assays (Hologic™ Inc., San Diego, USA) were used for diagnostics, and samples were not pooled. We collected information on socio-demographics, HIV-status, clinical symptoms, sexual behaviour within the last 6 months, and PrEP use. We combined HIV status and PrEP use for defining risk groups, and used directed acyclic graphs and multivariable logistic regression to identify risk factors for STI. Results: Two thousand three hundred three MSM were included: 50.5% HIV+, median age 39 [18–79] years. Median number of male sex partners within the last 6 months was five. Sex without condom was reported by 73.6%, use of party drugs by 44.6%. 80.3% had a STI history, 32.2% of STI+ MSM reported STI-related symptoms. 27.6% of HIVMSM used PrEP. Overall STI-prevalence was 30.1, 25.0% in HIV−/PrEP- MSM (CT:7.2%; MG:14.2%; NG:7.4%; TV:0%), 40.3% in HIV−/PrEP+ MSM (CT:13.8%; MG:19.4%; NG:14.8%; TV:0.4%), and 30.8% in HIV+ MSM (CT:10.1%; MG:18.4%; NG:8.6%; TV:0.1%). Being HIV+ (OR 1.7, 95%-CI 1.3–2.2), using PrEP (OR 2.0, 95%-CI 1.5–2.7), having > 5 sex partners (OR:1.65; 95%-CI: 1.32–2.01.9), having condomless sex (OR:2.11.9; 95%-CI:1.65–2.86), and using party drugs (OR:1.65; 95%-CI:1.32–2.0) were independent risk factors for being tested positive for at least one STI. Conclusions: We found a high STI-prevalence in MSM in Germany, especially in PrEP users, frequently being asymptomatic. As a relevant proportion of PrEP users will not use a condom, counselling and comprehensive STI screening is essential and should be low threshold and preferably free of cost. Counselling of PrEP users should also address use of party drugs. Article	2022	Curley, Christine M; Rosen, Aviana O; Mistler, Colleen B; Eaton, Lisa A	Pleasure and PrEP: A Systematic Review of Studies Examining Pleasure, Sexual Satisfaction, and PrEP.	Journal of Sex Research	-	-	1559-8519	10.1080/00224499.2021.2012638	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9329484	Pre-exposure prophylaxis (PrEP) is an effective form of Human Immunodeficiency Virus (HIV) prevention for people at potential risk for exposure. Despite its demonstrated efficacy, PrEP uptake and adherence have been discouraging, especially among groups most vulnerable to HIV transmission. A primary message to persons who are at elevated risk for HIV has been to focus on risk reduction, sexual risk behaviors, and continued condom use, rarely capitalizing on the positive impact on sexuality, intimacy, and relationships that PrEP affords. This systematic review synthesizes the findings and themes from 16 quantitative, qualitative, and mixed methods studies examining PrEP motivations and outcomes focused on sexual satisfaction, sexual pleasure, sexual quality, and sexual intimacy. Significant themes emerged around PrEP as increasing emotional intimacy, closeness, and connectedness; PrEP as increasing sexual options and opportunities; PrEP as removing barriers to physical closeness and physical pleasure; and PrEP as reducing sexual anxiety and fears. It is argued that positive sexual pleasure motivations should be integrated into messaging to encourage PrEP uptake and adherence, as well as to destigmatize sexual pleasure and sexual activities of MSM. Article	2022	Custer S.; Herbert L.	Implementing Pre-exposure Prophylactic Therapy in Primary Care	Journal for Nurse Practitioners	-	-	15554155	10.1016/j.nurpra.2021.08.019	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85116210495&doi=10.1016%2fj.nurpra.2021.08.019&partnerID=40&md5=db2be6fcaef737125cbe4374b492802b	Since 2012, use of daily preventive medication, such as pre-exposure prophylactic (PrEP) therapy, has been recommended as an effective HIV prevention strategy. However, rates of PrEP use remain low, and disparities exist between populations at highest risk of HIV infection and those who take PrEP. Primary care nurse practitioners should routinely screen patients for risk of HIV acquisition and interest in PrEP and provide PrEP to patients who desire to use it. This report summarizes PrEP guidelines, common barriers to use of PrEP, strategies to overcome barriers to PrEP use, and recommendations to implement PrEP in primary care practices. © 2021 Elsevier Inc. Article	2022	Cyrus, Elena; Johnson, Shaina A; Perez-Gilbe, Hector R; Wuyke, Gabriella; Fajardo, Francisco J; Garba, Nana Aisha; Devièux, Jessy; Jimenez, Daniel; Garcia, Stephanie; Holder, Cheryl L	Engagement in Care and Housing Instability Influence HIV Screening Among Transgender Individuals in South Florida.	Transgender Health	-	-	2688-4887	10.1089/trgh.2020.0066	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8867217	Purpose: HIV screening is a critical step in the HIV care continuum to lowering incidence and achieving viral load suppression among at-risk populations. Few studies assess factors associated with HIV screening among transgender individuals living in the southeast region of the United States. This study was conducted to determine factors that influence HIV screening among transgender individuals in South Florida. Methods: During Fall 2016, 68 participants were recruited to complete a questionnaire as part of a pilot pre-exposure prophylaxis study. Correlations were examined between sociodemographic factors, HIV risk, and access to and engagement in care. Significant correlations were entered into one logistic regression model to estimate predictors of HIV screening and knowledge of HIV status. Results: Almost half (48.5%) of the respondents were Latinx, 38.2% Black, 10.3% non-Latinx White, and 3% other. Seventy-eight percent reported access and routine engagement in care within the past year, 25% had not screened for HIV in the past year, and of those who knew their status, 16.7% reported living with HIV. Regression analysis revealed that participants with routine engagement in care were twice as likely to screen for HIV (p=0.02). Unstable housing was associated with no HIV screening in the past year (p=0.05). Conclusion: Stable housing is linked to engagement in routine care that can increase the likelihood of an at-risk transgender individual screening for HIV. Further research is needed to develop interventions to improve engagement in care among transgender individuals who do not have adequate housing or access to care.	access to care, HIV, housing, housing insecurity, screening, transgender	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Czarnogorski M.; Benn P.; Mccoig C.; Nwafor T.; Griffith S.; Sutton K.; Harrington C.; Saggu P.; Yague I.; Williams W.; Español C.M.; Goodchild J.; Fricker J.; Patel P.; D'amico R.	Impact of COVID-19 on Cabotegravir Plus Rilpivirine Long-Acting Dosing Across 6 Ongoing Global Phase IIb and III Clinical Trials	Journal of Acquired Immune Deficiency Syndromes	-	-	15254135	10.1097/QAI.0000000000003031	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85138440937&doi=10.1097%2fQAI.0000000000003031&partnerID=40&md5=f3e9ae8bab268e9228808b2d1e080fc7	Background:Cabotegravir + rilpivirine long-acting (LA) is a novel antiretroviral therapy (ART) administered intramuscularly monthly or every 2 months by a health care provider. The COVID-19 pandemic presents a potential challenge to patients' ability to attend scheduled clinic visits for dosing administration.Setting:This analysis evaluated implementation fidelity across 6 phase IIb/III/IIIb cabotegravir + rilpivirine LA clinical trials in 16 countries during the COVID-19 pandemic.Methods:COVID-19-impacted visits were defined as modified dosing visits for which oral therapy was provided to participants unable to attend the clinic or injection visits that were rescheduled. Data from December 1, 2019, to March 1, 2021, were aggregated and analyzed using descriptive statistics.Results:Of 2127 participants in cabotegravir + rilpivirine LA trials, 1997 (94%) had LA dosing visits proceed as planned during the COVID-19 pandemic. Of 130 (6%) participants with injection visits affected by COVID-19, most were from North America (57%) and Europe (26%). Most participants with COVID-19-impacted visits used oral therapy with cabotegravir + rilpivirine (75%) or alternative oral standard-of-care ART (21%) to maintain continuous ART. The most common reasons for missed visits were clinic closure/staffing constraints (48%) and COVID-19-related travel restrictions (23%). Most (98%) participants who used oral ART maintained virologic suppression; 2 participants had viral load between 50 and 100 copies/mL.Conclusion:During the COVID-19 pandemic, most trial participants maintained their LA dosing schedules. Flexibility of the LA dosing regimen, with the ability to switch to oral therapy, facilitated continuous ART provision and implementation fidelity. © 2022 Lippincott Williams and Wilkins. Article	2022	Czarnogorski, Maggie; Garris, Cindy P; Dalessandro, Marybeth; D'Amico, Ronald; Nwafor, Toyin; Williams, Will; Merrill, Deanna; Wang, YuanYuan; Stassek, Larissa; Wohlfeiler, Michael B; Sinclair, Gary I; Mena, Leandro A; Thedinger, Blair; Flamm, Jason A; Benson, Paul; Spreen, William R	Perspectives of healthcare providers on implementation of long-acting cabotegravir plus rilpivirine in US healthcare settings from a Hybrid III Implementation-effectiveness study (CUSTOMIZE).	Journal of the International AIDS Society	-	-	1758-2652	10.1002/jia2.26003	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9465974	INTRODUCTION: CUSTOMIZE evaluated the implementation of long-acting (LA) cabotegravir + rilpivirine, a novel healthcare provider-administered injectable antiretroviral therapy regimen, in diverse US healthcare settings. Findings from staff-study participants (SSPs) through 12 months of implementation are reported. METHODS: CUSTOMIZE was a phase IIIb, 12-month, single-arm, hybrid III implementation-effectiveness study conducted from July 2019 to October 2020 at eight US clinics of five clinic types: private practice (n = 2), federally qualified health centre (n = 2), university (n = 2), AIDS Healthcare Foundation (n = 2) and health maintenance organization (n = 1). Eligible patient participants received monthly cabotegravir + rilpivirine LA injections after a 1-month oral lead-in. At baseline, month 4 and month 12, SSPs (n = 3 each per clinic), including physicians, nurses or injectors, and administrators, completed quantitative surveys and semi-structured interviews to assess implementation outcomes (acceptability, appropriateness and feasibility of intervention measures), programme sustainability and SSP perceptions of, attitudes towards, and expectations for cabotegravir + rilpivirine LA. Month 12 data collection occurred during the COVID-19 pandemic. RESULTS: In surveys, SSPs reported high mean total scores for acceptability, appropriateness and feasibility of cabotegravir + rilpivirine LA implementation at baseline (4.43, 4.52 and 4.38 of 5, respectively) and month 12 (4.45, 4.61 and 4.46 of 5, respectively), regardless of clinic type. At month 12, SSPs were positive about the implementation sustainability (mean Program Sustainability Assessment Tool score, 5.83 out of 7). At baseline, SSPs' top concern was patients' ability to maintain monthly appointments (81%); at month 12, 39% had this concern. The proportion of SSPs reporting patient injection pain or soreness as a barrier was consistent at month 12 versus baseline (48% vs. 46%). Most (78%) SSPs reported optimal implementation of cabotegravir + rilpivirine LA in their clinics was achieved in 1-3 months. In interviews, SSP-reported strategies for successful implementation included teamwork, using a web-based treatment planner and having a designated person to track appointment scheduling. In month 12 interviews, SSP-reported structural changes needed for implementation included changing clinic hours and purchasing refrigerators. CONCLUSIONS: In CUSTOMIZE, cabotegravir + rilpivirine LA was successfully implemented across a range of US healthcare settings. Barriers were mitigated with minor process adjustments. Article	2022	Dai, M. N.; Xi, Y.; Yin, W. W.; Chen, Y. J.; Zhang, Z. J.; Feng, C. H.; Tang, Changhai	Meta analysis on acceptance rate of HIV pre-exposure prophylaxis among men who have sex with men in China/ 中国男男性行为人群艾滋病暴露前预防用药接受率的Meta分析	Zhonghua Yu Fang Yi Xue Za Zhi (Chinese Journal of Preventive Medicine)	-	-	0253-9624	10.3760/cma.j.cn112150-20210611-00570	https://rs.yiigle.com/cmaid/1351344	Objective: To systematically evaluate the acceptance of pre-exposure prophylaxis (PrEP)among men who have sex with men (MSM) in China, so as to provide reference for the promotion of preventive drug use before human immunodeficiency virus exposure in China. Methods: By searching the databases of China national knowledge infrastructure, VIP database, Wanfan knowledge service platform, PubMed, Web of Science, Embase and The Cochrane Library with key words of "men who have sex with men" "pre-exposure prophylaxis" "PrEP" and "MSM". The literature on the willingness of Chinese MSM population to accept PrEP was systematically collected, and the data of the literature meeting the inclusion criteria were extracted for Meta analysis. Results: A total of 12 articles were selected in this study, including 6 articles in English and 6 in Chinese. The score of bias risk assessment of eligible articles was 14-18, which was more than 70% of the total score. The total number of samples was 11 269. The overall acceptance rate of PrEP was 0.77(95%CI0.71-0.82). In subgroup analysis, the acceptance rates of different nationalities, marriage, household registration, age, education background, income, sexual orientation, sexual behavior and awareness of PrEP were statistically significant. Conclusion: In general, the acceptance rate of PrEP in MSM population is higher, but the awareness rate is low. There are differences in the acceptance rate among different groups. Article	2022	Dai, Minhao; Calabrese, Christopher	Socio-behavioral factors related to PrEP non-adherence among gay male PrEP users living in California and New York: A behavioral theory informed approach.	Journal of Behavioral Medicine	-	-	1573-3521	10.1007/s10865-021-00275-1	https://dx.doi.org/10.1007/s10865-021-00275-1	One effective preventative measure to reduce the number of new HIV infections is through the uptake of daily oral HIV pre-exposure prophylaxis (PrEP). Although previous clinical trials have proven the effectiveness of on-demand PrEP uptake, daily PrEP uptake is the most popular prevention method among PrEP users and is still recommended by most healthcare professionals and organizations. Informed by the integrative model of behavioral prediction, the current study examined the socio-behavioral factors associated with PrEP non-adherence. The present study conducted a cross-sectional survey of 210 gay male daily PrEP users living in California and New York. The results showed more than two-thirds of the sample indicated that they had skipped taking PrEP within the last 30 days, averaging around four to five missed doses. General attitudes toward desirable and undesirable outcomes, perceived behavioral control, and social-level barriers were associated with daily PrEP uptake non-adherence. The findings highlight providers' role in PrEP adherence and the importance of habit-forming, which can be enhanced by cost-effective strategies and technological innovations.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Dalton C.; Cornelius J.; Davis B.	A Brief Educational Pre-exposure Prophylaxis Intervention in an Infectious Disease Clinic: Protocol for a Case Series Study	JMIR Research Protocols	-	-	19290748	10.2196/33093	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85144748191&doi=10.2196%2f33093&partnerID=40&md5=d56f520cb9d448e6c73b5a528a9b9727	Background: Black men who have sex with men (BMSM) remain the highest group infected with HIV despite treatment with medications known as pre-exposure prophylaxis (PrEP). PrEP in combination with safer sex practices has shown efficacy in preventing HIV infection. Despite awareness campaigns, PrEP uptake remains low among BMSM. While brief educational interventions have value in fast-paced clinical settings with limited appointment times, a brief PrEP educational intervention has not been initiated with BMSM in a fast-paced outpatient infectious disease clinic in North Carolina. Objective: The purpose of this study was to examine the effect of initiating a brief PrEP educational intervention to reduce HIV infection rates in BMSM in a fast-paced infectious disease clinic delivered by a doctoral-prepared nurse practitioner. Methods: This case-series study uses a brief educational intervention to develop and pilot-test a brief PrEP educational uptake intervention with BMSM. The participants met with the nurse practitioner at 3 different time points: baseline, 4 weeks later (first visit), and at the 3-month follow-up (second visit). We used a pretest-posttest design to examine the primary outcomes of PrEP knowledge, medication adherence, and sexually transmitted infection outcomes. Results: Due to the COVID-19 pandemic, the recruitment process was delayed. From November 1, 2019, to August 30, 2021, a total of 7 participants consented to participate in the study. Data analysis will be completed by the end of September 2022. We will submit a manuscript for publication consideration by December 2022. Conclusions: Brief educational interventions delivered in a fast-paced infectious disease clinic have the potential to increase PrEP awareness and knowledge, medication adherence, and decreased rates of sexually transmitted diseases in BMSM. This protocol will contribute to the literature on the development of brief PrEP educational interventions and has the potential to be generalized to other populations (eg, women and adolescents). Article	2022	Damacena, Giseli Nogueira; Cruz, Marly Marques da; Cota, Vanda Lúcia; Souza Júnior, Paulo Roberto Borges de; Szwarcwald, Celia Landmann	Conhecimento e práticas de risco à infecção pelo HIV na população geral, homens jovens e HSH em três municípios brasileiros em 2019	Cadernos de Saúde Pública	-	-	1678-4464	10.1590/0102-311xpt155821	http://www.scielo.br/scielo.php?script=sci_arttext&pid=S0102-311X2022000405004	O objetivo do estudo foi descrever o conhecimento e práticas de risco à infecção pelo HIV na amostra total de cada município, entre homens de 15 a 24 anos que vivem sem companheiro(a), e homens que fizeram sexo com homens (HSH) pelo menos uma vez na vida em três cidades brasileiras. Foi realizado estudo de corte transversal de base domiciliar com amostragem por conglomerados em três estágios (setores censitários, domicílios, indivíduos), com estratificação por sexo, faixa etária (15-24; 25-34; 35-44; 45-59) e vive com companheiro(a) na seleção do indivíduo. Estimaram-se proporções e intervalos de 95% de confiança (IC95%) de indicadores de conhecimento, testagem do HIV, comportamento sexual e autoavaliação do risco. Foram analisados 5.764 indivíduos em Campo Grande, 3.745 em Curitiba e 3.900 em Florianópolis. Baixo nível de conhecimento foi encontrado para os métodos de prevenção, sobretudo para profilaxia pré-exposição (PrEP). Práticas de sexo desprotegido foram frequentes nos três municípios. As proporções de teste de HIV na vida foram 57,2% (IC95%: 55,1-59,2) em Curitiba, 64,3% (IC95%: 62,7-66,0) em Campo Grande, e 65,9% (IC95%: 64,0-67,7) em Florianópolis. Entre homens de 15-24 anos, proporções de uso de drogas estimulantes e práticas sexuais desprotegidas foram mais altas que nos demais grupos etários. Entre os HSH, as proporções de teste de HIV na vida foram superiores a 80%. Mais de 30% foram parceiros receptivos no sexo anal sem uso de preservativo, e menos de 5% avaliam seu risco como alto. É preciso adotar estratégias de comunicação mais eficazes sobre a prevenção da infecção do HIV, incluindo a ampliação de conhecimentos que poderiam motivar práticas sexuais mais seguras. Article	2022	Dang, Madeline; Scheim, Ayden I; Teti, Michelle; Quinn, Katherine G; Zarwell, Meagan; Petroll, Andrew E; Horvath, Keith J; John, Steven A	Barriers and Facilitators to HIV Pre-Exposure Prophylaxis Uptake, Adherence, and Persistence Among Transgender Populations in the United States: A Systematic Review.	AIDS Patient Care and STDs	-	-	1557-7449	10.1089/apc.2021.0236	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9242706	HIV pre-exposure prophylaxis (PrEP) is highly effective at preventing HIV; however, PrEP use among transgender individuals remains low. We conducted a systematic review to identify barriers and facilitators to PrEP uptake, adherence, and persistence among transgender individuals in the United States. We conducted a literature search in PubMed and CINAHL databases in March 2021 and followed PRISMA guidelines. Studies were eligible if they were published in a peer-reviewed journal and reported interest, uptake, adherence, and/or persistence of PrEP use among transgender individuals. Articles that did not disaggregate results for transgender participants were excluded. Data from included articles were coded using content analysis and narratively synthesized using a framework matrix. We screened 254 unique articles published after US Food and Drug Administration approval of PrEP, and 33 articles were included in the review. Five themes were identified in the literature, including (1) PrEP concentrations were lower among individuals taking feminizing hormones, but the difference did not appear clinically significant; (2) concerns regarding interactions between gender-affirming hormone therapy and PrEP remain a large barrier; (3) PrEP initiation may facilitate increased self-advocacy and self-acceptance; (4) lack of trust in medical institutions impacts PrEP uptake; and (5) social networks have a significant influence on PrEP knowledge, interest, and adherence. Additional research is needed involving transgender men and nonbinary persons, and efforts to improve PrEP persistence among the transgender community are needed. Training health care providers to provide inclusive and affirming care is perhaps one of the strongest areas for intervention to increase PrEP uptake and persistence. Article	2022	Dangerfield D.T., II; Anderson J.N.; Wylie C.; Arrington-Sanders R.; Bluthenthal R.N.; Beyrer C.; Farley J.E.	Refining a Multicomponent Intervention to Increase Perceived HIV Risk and PrEP Initiation: Focus Group Study Among Black Sexual Minority Men	JMIR Formative Research	-	-	2561326X	10.2196/34181	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85135889796&doi=10.2196%2f34181&partnerID=40&md5=8d949689410054b0d57bfc10bc520546	Background: Increased preexposure prophylaxis (PrEP) initiation is needed to substantially decrease HIV incidence among Black sexual minority men (BSMM). However, BSMM perceive others as PrEP candidates instead of themselves and are less likely than other groups to use PrEP if prescribed. Peers and smartphone apps are popular HIV prevention intervention tools typically used independently. However, they could be useful together in a multicomponent strategy to improve perceived HIV risk and PrEP initiation for this group. Information regarding attitudes and preferences toward this multicomponent strategy is limited. Objective: The goal of this study is to obtain attitudes and perspectives regarding the design of a multicomponent intervention that uses a smartphone app and a peer change agent (PCA) to increase perceived HIV risk and PrEP initiation. The intervention will be refined based on thematic findings for a culturally responsive approach. Methods: Data were obtained guided by life course theory and the health belief model using 12 focus groups and 1 in-depth interview among HIV-negative BSMM from Baltimore, MD, between October 2019 and May 2020 (n=39). Groups were stratified by the following ages: 18 to 24 years, 25 to 34 years, and 35 years and older. Participants were provided details regarding an existing mobile app diary to self-monitor sexual behaviors and a hypothetical PCA with whom to review the app. Facilitators posed questions regarding perceived HIV risk, attitudes toward the app, working with a PCA, and preferences for PCA characteristics and approaches. Results: Most participants identified as homosexual, gay, or same-gender-loving (26/38, 68%), were employed (26/38, 69%), single (25/38, 66%), and interested in self-monitoring sexual behaviors (28/38, 68%). However, themes suggested that participants had low perceived HIV risk, and self-monitoring sexual behaviors using a mobile app diary was feasible but could trigger internalized stigma, and that an acceptable PCA should be a possible self for BSMM to aspire to but they still wanted clinicians to "do their job." Conclusions: HIV-negative BSMM have dissonant attitudes regarding perceived HIV risk and the utility of a mobile app and PCA to increase perceived HIV risk and PrEP initiation. Future research will explore the feasibility, acceptability, and preliminary impact of implementing the multicomponent intervention on perceived HIV risk and PrEP initiation among BSMM in a pilot study. ©Derek T Dangerfield II, Janeane N Anderson, Charleen Wylie, Renata Arrington-Sanders, Ricky N Bluthenthal, Christopher Beyrer, Jason E Farley. Article	2022	Dangerfield D.T., II; Lipson A.; Anderson J.N.	HIV PREP CLINICIAN COMMUNICATION PREFERENCES AMONG BLACK SEXUAL MINORITY MEN	AIDS Education and Prevention	-	-	8999546	10.1521/aeap.2022.34.2.168	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128794026&doi=10.1521%2faeap.2022.34.2.168&partnerID=40&md5=77d6c4f57ce3a04d11a2b1831eddfa3b	Black sexual minority men (BSMM) are substantially less likely than White SMM to accept a clinician's recommendation to initiate HIV pre-exposure prophylaxis (PrEP). The purpose of this study is to identify PrEP messaging preferences among BSMM. Data were obtained from 12 focus groups and one in-depth interview among BSMM in Baltimore, MD (N = 39). Focus groups were stratified (18–24, 25–34, and 35 and older), and facilitators probed on ways clinicians could discuss PrEP with BSMM. An adapted pile sorting approach was used to identify themes. Most identified as homo-sexual, gay, or same-gender-loving (68%), were employed (69%), and single (66%). Thematic analysis revealed that BSMM wanted clinicians to explain PrEP efficacy and side effects, tailor messaging, provide prevention messaging with care, and disclose PrEP use. Clinicians could increase uptake and adherence among BSMM by implementing PrEP communication preferences. Discussing PrEP efficacy and safety is also necessary. When possible, clinicians should disclose PrEP use history to build trust. © 2022 The Guilford Press.	counseling; education; prevention	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	NA	NA	Qualitative
Article	2022	Dangerfield Ii, Derek T; Wylie, Charleen	Identifying Ethical and Culturally Responsive Research Activities to Build Trust and Improve Participation of Black Sexual Minority Men in Pre-Exposure Prophylaxis Telehealth Clinical Trials: Qualitative Study.	JMIR Human Factors	-	-	2292-9495	10.2196/28798	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8861862	BACKGROUND: Telehealth interventions could improve pre-exposure prophylaxis (PrEP) initiation and adherence in high HIV incidence groups such as young Black sexual minority men (BSMM). However, young BSMM remain distrustful of and underrepresented in clinical trials. Therefore, ethical and culturally responsive ways are needed to build trust and improve their participation in PrEP telehealth clinical trials. OBJECTIVE: To bridge this gap, this study identified ethical and culturally responsive activities to build trust and improve participation of young BSMM in PrEP telehealth clinical trials. METHODS: We obtained data from 7 virtual, synchronous focus groups that were conducted from April to August 2020 and consisted of 28 BSMM aged 18-34 years. Focus groups included a brief survey distributed online via Qualtrics followed by a virtual, synchronous focus group conducted via Zoom that lasted between 50 and 75 minutes. Focus groups were stratified by age (18- to 24-year-old participants and 25- to 34-year-old participants), outlined the components of an example PrEP telehealth randomized controlled trial, and included questions on domains of the study design-research motivations, study funding, recruitment activities, informed consent details, randomization, follow-up, and end of study activities. Participants were asked targeted questions regarding the ethics and trustworthiness of the study and ways in which researchers could gain their trust through the protocol used in the PrEP telehealth clinical trial. RESULTS: The focus groups included 2 groups of 18- to 24-year-old participants and 5 groups of 25- to 34-year-old participants. The mean age of participants was 27.2 years (SD 4.4 years). Of the 28 participants, 10 (36%) reported a bachelor's degree to be their highest completed education level and 6 (21%) reported some graduate degree or higher to be their highest completed education level. Most participants (16/28, 57%) reported that they worked full-time and that they were single or not in a committed relationship (21/28, 75%). Most participants (24/28, 86%) reported that they used at least one drug before sex in the 6 months prior to the study. All participants reported that they heard about PrEP and 36% (10/28) were current PrEP users. Overall, the focus groups yielded themes related to the impact of researcher intentions, study funding, recruitment activities, informed consent details, randomization, and study team interactions during and after the study on trust and participation in the clinical trial. CONCLUSIONS: Medical and research mistrust persists among BSMM. This study identified several ethical and culturally responsive activities to build trust and improve participation of young BSMM in PrEP telehealth clinical trials. Future studies should assess the relative impact of implementing these findings on research participation in a PrEP telehealth clinical trial. Article	2022	Daniels, Joseph; Peters, Remco P H; Medina-Marino, Andrew; Bongo, Cikizwa; Stephenson, Rob	A Skills-Based HIV Serostatus Disclosure Intervention for Sexual Minority Men in South Africa: Protocol for Intervention Adaptation and a Pilot Randomized Controlled Trial.	JMIR Research Protocols	-	-	1929-0748	10.2196/36845	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9152729	BACKGROUND: Gay, bisexual, and other men who have sex with men (GBMSM) living with HIV have low antiretroviral treatment adherence in South Africa due to limited skills in managing disclosure and prevention behaviors with sexual and romantic partners. As a result, there is a high HIV transmission risk within HIV-discordant partnerships, but an existing intervention may address these outcomes, if adapted effectively. Healthy Relationships (HR) is a behavioral intervention that was originally delivered in groups and in person over 5 sessions to develop coping skills for managing HIV-related stress and sexually risky situations, enhance decision-making skills for HIV disclosure to partners, and establish and maintain safer sex practices with partners. HR effectively improves prevention behaviors but has yet to be tailored to a non-US context. OBJECTIVE: We aim to adapt HR into a new culturally grounded intervention entitled Speaking Out & Allying Relationships for GBMSM and then assess its feasibility in Eastern Cape, South Africa. METHODS: The study will have 2 aims. For aim 1-adaptation-we will use a human-centered design approach. Initial intervention tailoring will involve integrating Undetectable=Untransmittable and pre-exposure prophylaxis education, developing intervention content for a videoconference format, and designing role-plays and movies for skill building based on preliminary data. Afterward, interviews and surveys will be administered to GBMSM to assess intervention preferences, and a focus group will be conducted with health care providers and information technology experts to assess the intervention's design. Finally, a usability test will be performed to determine functionality and content understanding. Participants will be GBMSM living with HIV (n=15) who are in a relationship and health care providers and information technology (n=7) experts working in HIV care and programming with this population. For aim 2, we will examine the feasibility of the adapted intervention by using a pilot randomized control design. There will be 60 individuals per arm. Feasibility surveys and interviews will be conducted with the intervention arm, and behavioral and biomedical assessments for relationship and treatment adherence outcomes will be collected for both arms. All participants will be GBMSM living with HIV who are in a relationship with an HIV-negative or unknown status partner. RESULTS: Intervention adaptation began in August 2021. Initial tailoring and the refining of GBMSM intervention preferences were completed in December 2021. Usability and feasibility assessments are due to be completed by March 2022 and February 2024, respectively. CONCLUSIONS: GBMSM need efficacious interventions that tackle partnership dynamics, HIV prevention, and treatment outcomes for antiretroviral treatment adherence and viral suppression in South Africa. Harnessing everyday technology use for social networking (eg, videoconferences), Undetectable=Untransmittable education, and pre-exposure prophylaxis to update an existing intervention for South African GBMSM has the potential to strengthen relationship communication about HIV treatment and prevention and, in turn, improve outcomes. Article	2022	Dartrem, Antoinette A; Chew Murphy, Emma; Avila, Karina; Gonzalez-Argoti, Tatiana; Edwards, Angela; Rivera, Hoffman, Susie; Mantel, Joanna E; Bauman, Laurie J; Dolan, Siobhan M	Women Trust Their OBGYNs to Provide Preexposure Prophylaxis: An Opportunity for HIV Prevention.	Frontiers in Public Health	-	-	-	-	2673-3153	10.3389/fph.2022.832287	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9580160/	Objective: The objective of this study was to understand how women perceive the role of their Obstetrician and Gynecologist (OBGYN) in screening for and providing preexposure prophylaxis (PrEP) for HIV prevention. Methods: We recruited women ages 18-45 years receiving obstetric or gynecological care at an academic medical center in the Bronx, NY. Thirty participants were enrolled: 10 seeking care for family planning, 10 seeking prenatal care, and 10 seeking care for a sexually transmitted infection. We screened participants for HIV acquisition risk using a PrEP screening tool. We conducted face-to-face, semi-structured interviews, which were audio-recorded, transcribed, and entered into Dedoose for analysis of themes using a grounded theory approach. Results: Sixty percent of the participants were Latinx and 33% African American. Seventy percent had one or more risk factors for HIV acquisition based on the PrEP screening tool, indicating they would benefit from a PrEP discussion. Three main themes emerged from the analysis of interview data. Participants viewed OBGYNs as experts in sexual and reproductive healthcare and believed they were experts in PrEP. Participants were concerned about "PrEP stigma", being judged by their clinicians as being sexually promiscuous if they expressed a need for PrEP. Lastly, when participants trusted their OBGYN, that trust became a facilitator for women to consider PrEP and effort stigma as a barrier to identifying patients who are candidates for PrEP. Conclusion: Women established care with an OBGYN are enthusiastic about having access to PrEP services incorporated into their sexual and reproductive healthcare. A universal approach to HIV prevention would avert stigma surrounding HIV care and prevention.	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Article	2022	Divasse P.A.; Loschiavo C.E.; Krause K.D.; Karr A.; Helkin P.N.	Biological, Behavioral, and Demographic Drivers of Recent Syphilis Infection Among Emerging Adult Sexual Minority Men in New York City: The P18 Cohort Study	AIDS Patient Care and STDs	-	-	-	-	1087-2914	10.1089/apc.2022.0148	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141677894&doi=10.1089%2Fapc.2022.0148&partnerID=40&md5=52cd8419957b1421e2b96b15d3d053c4	The rate of syphilis infection among sexual minority men (SMM) has continued to increase in recent decades. As such, this analysis sought to identify demographic, biological, and behavioral factors associated with recent syphilis infection among participants in the P18 cohort study. From 2015 to 2017, 628 SMM ages 18–34 years were enrolled in New York City. Study assessments included rapid HIV testing and behavioral surveys. At baseline, and at the 18- and 36-month time points, participants underwent chlamydia, gonorrhea, and syphilis screening. Generalized estimating equations were used to generate four models of reported syphilis screening. In this racially/ethnically and socioeconomically diverse sample of SMM, 3.0% of participants tested positive for syphilis at baseline and 9.0% had an infection at some point during follow-up. Cumulative incidence was 6.0 per 100 person-years. Across all models, racial/ethnic minority SMM had higher odds of syphilis. Higher odds of syphilis infection were also significantly associated with more STI, as was condomless anal sex, more frequent marijuana use, HIV seropositivity, not currently using pre-exposure prophylaxis (PrEP), and not receiving syphilis testing in the previous 6 months; lower odds were associated with more frequent oral sex and more frequent alcohol use. These findings support current screening guidelines based on SMM who may be at increased risk for sexually transmitted infection (STI) acquisition, such as people living with HIV or those who engage in condomless sex. Further, our findings of reduced syphilis incidence among those who are on PrEP and engaged in regular STI testing support existing efforts to increase the availability and accessibility of preventive sexual health care for SMM. - Copyright © 2022, Mary Ann Liebert, Inc.	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Article	2022	Dawey, Dwora Joseph; Bekker, Linda-Gail; Bukusi, Elizabeth A; Chi, Benjamin H; Delany-Moretlwe, Sinead; Gaga, Antonia; Lyerly, Anne Drapkin; Mgodi, Nyaradzo M; Mugo, Nelly; Myer, Landon; Nogueda, Lisa M; Stranix-Chibanda, Lynda; Slack, Catherine	Where are the pregnant and breastfeeding women in new pre-exposure prophylaxis trials? The imperative to overcome the evidence gap	The Lancet HIV	-	-	-	-	2405-4704	https://doi.org/10.1016/s2352-3018(21)00280-0	https://escholarship.org/uc/item/7p2v7jzp	Pregnant and breastfeeding populations are at substantial risk of acquiring HIV in some settings, yet are underrepresented in clinical trials of new pre-exposure prophylaxis (PrEP) agents. Several PrEP formulations are in development (eg, vaginal ring, injectable long-acting, implantable, and other products). Pregnant and breastfeeding populations are typically excluded from early-phase clinical trials. We identified 14 PrEP trials of novel agents in non-pregnant or non-breastfeeding populations, and six phase 1–3 trials and open-label extensions among pregnant and breastfeeding populations, that are currently ongoing or complete. A framework shift is needed to consider the ethical costs of excluding pregnant and breastfeeding populations at risk for HIV in PrEP clinical trials and promote inclusion to maximise the benefits from PrEP tools in the pipeline. Research on new PrEP agents should include pregnant and breastfeeding populations to avoid delays in reaching those who could benefit from PrEP after efficacy is established. Article	2022	Dawey, Dwora Joseph; Dewell, Kathryn; Cleary, Susan; Khadka, Nobaa; Mashele, Nyiko; Sillman, Miriam; Mvududu, Rufaro; Nyimba, Dorothy C; Conits, Thomas J; Myer, Landon	Stepped care to optimize pre-exposure prophylaxis (PrEP) effectiveness in pregnant and postpartum women (SCOPE-PP) in South Africa: a randomized control trial.	BMC Public Health	-	-	-	-	1471-2458	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9024862/	10.1186/s12889-022-13052-5	BACKGROUND: HIV incidence among pregnant and postpartum women remains high in South Africa. Pre-exposure prophylaxis (PrEP) use remains suboptimal in this population, particularly during the postpartum period when women's engagement with routine clinic visits outside PrEP decreases. Key barriers to sustained PrEP use include the need for ongoing contact with the health facility and suboptimal counseling around effective PrEP use. METHODS: Stepped Care to Optimize PrEP Effectiveness in Pregnant and Postpartum women (SCOPE-PP), is a two-stepped unblinded, individually randomized controlled trial (RCT) that aims to optimize postpartum and postpartum PrEP use by providing a stepped package of evidence-based interventions. We will enroll 930 pregnant women (< 28 weeks pregnant) who access PrEP at a busy antenatal clinic in Cape Town at the time of recruitment and follow them for 15 months. We will enroll and individually randomize pregnant women > 16 years who are not living with HIV and who report PrEP use in the last 3 months to either: (1) standard of care (SOC) or (2) SOC + a stepped package of evidence-based interventions to support PrEP use including: (a) a bidirectional text and triaged PrEP collection (to reduce time required) on PrEP use in early postpartum compared to standard of care (SOC) (n = 325 per arm). The primary outcome is PrEP persistence per urine tenofovir levels and dried blood spots of tenofovir diphosphate (TFV-DP) after 6-months. The second step will enroll and individually randomize participants from Step 1 who discontinue taking PrEP or have poor persistence in Step 1 but want to continue PrEP. Step 2 will test the impact of enhanced counseling and bidirectional plus rapid PrEP collection compared to community PrEP delivery with HIV self-testing on PrEP use (n = up to 325 postpartum women). The primary outcome is PrEP continuation and persistence 6-months following second randomization (~ 9-months postpartum). Finally, we will estimate the cost effectiveness of SCOPE-PP vs. SOC per primary outcomes and disability-adjusted life-years (DALYs) averted in both Step 1 and 2 using micro-costing with trial- and model-based economic evaluation. DISCUSSION: This study will provide novel insights into optimal strategies for delivering PrEP to postpartum and postpartum women in this high-incidence setting. TRIAL REGISTRATION: NCT05322629 . Article	2022	Dawey, Dwora Joseph; Dewell, Kathryn; Mvududu, Rufaro; Nyimba, Dorothy; Mashele, Nyiko; Bekker, Linda-Gail; Gerbach, Pamina M; Conits, Thomas J; Myer, Landon	Pre-exposure Prophylaxis Recent Adherence With Real-Time Adherence Feedback and Partner Human Immunodeficiency Virus Self-Testing: A Pilot Trial Among Postpartum Women.	Open Forum Infectious Diseases	-	-	-	-	2328-8957	10.1093/ofid/ofab609	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9749072/	BACKGROUND: Pre-exposure prophylaxis (PrEP) is safe and effective in postpartum women. Human immunodeficiency virus self-testing (HIVST) for male partners combined with bidirectional counseling through real-time adherence measures may improve PrEP use among postpartum women. METHODS: Between August 2020 and April 2021, we randomized postpartum women who initiated PrEP in antenatal care (ANC) to receive HIVST for male partners with bidirectional counseling through real-time adherence measures (intervention) or HIVST for male partners without bidirectional counseling (control). The primary outcome was PrEP adherence in the past 28 days in urine tenofovir tests and partner HIV testing, measured 1 month after randomization. Secondary outcomes included the proportion of partners who tested for HIV and the discrepancy between self-reported PrEP adherence and urine tenofovir result. RESULTS: We enrolled 106 women (median age(t=626 years). At enrollment, 72% of women reported ≥2 doses in the past 7 days; 30% of women had tenofovir present in their urine. One month after enrollment, 62% (n=123) of women in the intervention arm had tenofovir present in their urine compared to 34% (n=63) in SOC (risk ratio RR)=1.83; 95% confidence interval(CI)=1.39,2.92; P<0.001). Two-thirds of women in the intervention arm reported that her partner tested for HIV (68%; n=135), compared to 17% (n=49) in SOC (RR)=4.0; 95% CI=2.88,7.27; P<0.001). Self-reported PrEP adherence (took PrEP≥5 of last week) with no tenofovir present in urine test was lower in the intervention group (17% vs 46%; RR=0.38; 95% CI=0.30,0.47; P<0.03). No social or clinical adverse events were reported in the intervention arm. CONCLUSIONS: The HIVST for partners and bidirectional counseling increased levels of recent PrEP adherence, pointing to the importance of these interventions to support PrEP use in this population. Article	2022	Dawey, Dwora Joseph; Hsiao N.-Y.; Wendy Spearman C.; Sonderup M.; Hu N.-C.; Maoleki N.; Mvududu R.; Myer L.	Low prevalence of hepatitis B virus infection in HIV-uninfected pregnant women in Cape Town, South Africa: implications for oral pre-exposure prophylaxis roll-out	BMC Infectious Diseases	-	-	-	-	1471-2334	10.1186/s12879-022-07307-5	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9178127/	Background: Oral daily preexposure prophylaxis (PrEP) using emtricitabine (FTC)/tenofovir disoproxil fumarate (TDF) is recommended as standard of care for prevention in individuals at high risk for HIV infection, including pregnant and postpartum cisgender women. FTC/TDF is also active against hepatitis B virus (HBV); however, concern has been raised that providing PrEP to individuals infected with HBV could lead to hepatitis flares and liver injury, especially in the setting of suboptimal PrEP use. Methods: We conducted a cross-sectional analysis of baseline data from the PrEP in pregnant and postpartum women (PrEP-PP) cohort study from February 2020–March 2022 in an antenatal care clinic in Cape Town, South Africa (SA) to evaluate: (1) the field performance of a point-of-care HBV rapid test (Alere™ B...Inpaxi) for diagnosis of hepatitis B surface antigen (HBsAg) in a maternity setting, (2) the prevalence of HBV in a cohort of pregnant women not living with HIV. Results: We enrolled 1194 HIV-seronegative pregnant women at their first antenatal visit. Median age was 26 years (IQR = 22–31 years); 52% were born before 1990 (before universal HBV vaccination was introduced in South Africa). Median gestational age was 22 weeks (IQR = 16–30 weeks). There were 0 POCT and laboratory-confirmed HBV cases among 1194 women. The overall prevalence of 0.67% (95% CI = 0.34–1.32%). In women born before 1995, 8 of 621 women were diagnosed with HBsAg; the prevalence was 1.29% (95% CI = 0.65–2.52%), and in women born in 1995 or after (n = 572), the prevalence was 0% (95% CI = 0.0–0.67%). We confirmed the test results in 99.8% of the rapid HBsAg (Determine II). Sensitivity was 100% (95% CI = 66–100%). Specificity was 100% (95% CI = 99.87–100%). Conclusion: The prevalence of HBV in HIV-uninfected pregnant women in Cape Town, South Africa is low. Among women born after 1995, the prevalence was 0%. Oral PrEP with TDF/FTC is highly effective for preventing HIV acquisition. If POCT HBsAg showed excellent performance against the laboratory assay, HBV screening should not be a barrier to starting PrEP in the context of high HIV risk consequences. © 2022. The Author(s). Article	2022	Delbucci, TV; Jones, SS; Adhernar, C; Ewing, SWF; Lovejoy, T; Starks, TJ	Correlates of HIV Testing across the lifespan - adolescence through later adulthood - among sexual minority men in the US who are not on PrEP	Journal of Behavioral Medicine	-	-	-	-	0160-7715	10.1007/s10865-022-00341-2	https://doi.org/10.1007/s10865-022-00341-2	Regular HIV testing is an essential component of the HIV prevention and care cascade. Sexual minority males (SMM) account for most new HIV infections in the US and testing rates among SMM vary substantially across the lifespan. Research has largely overlooked the correlates of HIV testing. The current study compared correlates of HIV testing among adolescent (aged 15-17, n = 1,601), emerging adults (aged 18-29, n = 50,463), early adults (aged 30-39, n = 25,526), middle adults (aged 40-64, n = 25,526), and late adults (65 and older, n = 1,452) who were recorded online. Overall, HIV testing was lowest among adolescents (30%) and highest among middle adults (70%). Multivariable logistic regression models with generalized estimating equations to evaluate correlates of HIV testing (yes/no) and frequency of HIV testing (never/ever) among SMM, while being in a monogamous relationship (versus single) was associated with lower odds of HIV testing among early, middle, and late adults. Article	2022	Delpech, Valerie	The HIV epidemic: global and United Kingdom trends.	Medicine (Abingdon)	-	-	-	-	1357-3039	10.1016/j.mpmed.2022.01.002	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8864644/	Even before the coronavirus disease (COVID-19) pandemic, progress in the global AIDS response was not on track to reach the 2020 UNAIDS HIV targets. In 2019 an estimated 38 million people were living with HIV, 1.7 million people were newly infected with HIV and 690 000 died from AIDS. By the end of 2019, 81% knew their HIV status, 67% were receiving antiretroviral therapy (ART) and 59% had achieved viral suppression. Global efforts to reduce HIV transmission, pre-exposure prophylaxis have resulted in rapid declines in transmissions, particularly among men who have sex with men. Sustained efforts could lead to elimination of local transmission of HIV. Article	2022	Demart, Sarah; Gérard, Emilie	The Construction of Pre-exposure Prophylaxis (PrEP) by Prevention Professionals as a Tool for Black African Migrant Women... or Not?	AIDS Education and Prevention	-	-	-	-	1943-2755	10.1521/aeap.2022.34.6.496	https://dx.doi.org/10.1521/aeap.2022.34.6.496	While sub-Saharan African migrants are overrepresented as a key population in the HIV epidemic, they are absent from the PrEP delivery system and in particular women. The central argument of this article is that PrEP for Black African migrant women is an ambivalent offer that makes it necessary to understand how migration, gender, sexuality, and origin intersect. Bringing together a sociologist and a prevention project manager, this article looks at how Belgian prevention professionals navigate with this ambivalent offer. From semi-directive interviews we explore how PrEP is constructed as a discourse and practice tool for this population. The results show that different causalities are attributed to their absence from PrEP delivery system. This pluralism leads us to argue that there is a real blurring in the definition of this public as a "priority" in terms not only of representations and practices but also of political agenda. Article	2022	De Bustnaller, J; Verlynkke, B; Cuyknerts, Y; Cuer, B; Yaya, I; Mensah, E; Dah, E; Anoma, C; Koné, A; Dandé, S; Dagnra, A; Feyi-Koné, H; Yao, AL; Sissi, H; van den Bossche, D; Kota, BD; Spiri, B; Laurent, C; Crucitti, T; CAMMM-PrEP Study Grp	Mycoplasma genitalium and Antimicrobial Resistance Among a Cohort of West African Men Who Have Sex With Men Using Preexposure Prophylaxis (CohMMM-PrEP ANRS 12369-Expertise France Study)	Open Forum Infectious Diseases	-	-	-	-	2328-8957	10.1093/ofid/ofac615	https://academic.oup.com/ofid/article/9/11/ofac615/6915397	Background Antimicrobial resistance to macrolides and fluoroquinolones in Mycoplasma genitalium (MG) among men who have sex with men (MSM) is worryingly high in high-resource countries. Data in African are lacking. We aimed to test the burden of MG including the presence of resistance-associated mutations (RAMs) in MG among MSM using human immunodeficiency virus (HIV) pre-exposure prophylaxis in Burkina Faso, Cote d'Ivoire, Mali, and Togo. Methods MSM were included in a prospective cohort study (2017-2021). Molecular detection of MG in urine, anorectal, and pharyngeal samples was performed at baseline and after at least 12 months. Detection of RAMs to macrolides and fluoroquinolones was performed by sequencing the 23S ribosomal RNA gene, parC, and gyrA. Factors associated with resistant to fluoroquinolones if ofcreatures were found in ParC position 83/87. Results Of 598 participants, 173 (28.9%) were positive at least once for MG and global point-prevalence was 19.4%. Interestingly, 238 of 288 (82.5%) infections were asymptomatic and 72 of 158 MG infections with follow-up data (22.2%) cleared during the study. Only 3 macrolide RAM was found (0.6%). Prevalence of fluoroquinolones RAMs was 11.3% overall, ranging from 2.4% in Burkina Faso to 17.3% in Mali. Conclusions Although MG was highly prevalent in these MSM, macrolide resistance was almost nonexistant. Nonetheless, a substantial resistance to fluoroquinolones was possibly responsible for treatment failures. Differences between countries may be explained by different antimicrobial consumptions. Infected and resistant Mycoplasma genitalium is very prevalent in West African men who have sex with men among MSM using HIV PrEP. Macrolide resistance was very rare, but ParC 83/87 mutations were frequently detected (11.3%). Between-country heterogeneity may be explained by different patterns of antimicrobial consumption in humans and animals.	-	English	United Kingdom	Western and Central Europe and North America	France	Western and Central Europe and North America	France	Western and Central Europe and North America	Clinical
Article	2022	Demmelmaier, Nicklas; Persson, Kristina Ingemarsdotter; Thomson, Sarah; Forsberg, Birger C.; Akesson, Helle Mølsted	Conceptualising safer sex in a new era: Risk perception and decision-making process among highly sexually active men who have sex with men.	PLOS Global Public Health	-	-	-	-	2767-3375	10.1371/journal.pgph.0000159	https://journals.plos.org/globalpublichealth/article?id=10.1371/journal.pgph.0000159	BACKGROUND: Men who have sex with men (MSM) are at the epicentre of the HIV epidemic. Efforts to prevent sexually transmitted infections (STIs) and HIV transmission have traditionally focused on condoms and abstinence from high risk sexual practices. Recently, additional methods such as pre-exposure prophylaxis (PrEP) and viral load testing have been introduced. The aim is to gain understanding about risk management and risk perception strategies for HIV among highly sexually active Swedish MSM with men in Berlin. METHODS: Eighteen sexually active Swedish MSM who had sex in Berlin were recruited and interviewed in this study. The data were analysed using qualitative content analysis. RESULTS: Participants described a multifaceted sexuality among MSM in terms of HIV. They acknowledged that having sex with men in Berlin was linked to high sexual risk taking due to the higher prevalence of HIV/STIs than in Sweden, but reported that they nevertheless did not alter their risk management strategies. The analysis resulted in a conceptual model of safer sex and risk assessment that also allows for a deeper understanding of the complexity of the risk reduction decision-making process. Three ontological perceptions of risk were identified accepting, maintaining and rejecting risk. Seven practiced risk reduction methods were described. Some informants applied several methods in their risk management strategies, while others relied on a single method. CONCLUSIONS: The findings indicate that the use of condoms as a method to prevent HIV and STIs is independently of how they ontologically related to the idea of risk. A constant navigation between pleasure, risk and safety, alongside having to relate to risk created a complex process. Efforts were made to remove HIV from their lives by rejecting the idea of risk, and thereby reject the idea of the homosexual body being a possible vessel for a virus and an epidemic.	*Human immunodeficiency virus infection; Anal intercourse; Chlamydia; Circumcision; Cohabiting person; Condom; Controlled study; Diagnosis; Doctor patient relationship; England; Female; Genotherapy; HIV test; Human; Major clinical study; Male; Multivariate analysis; Nonhuman; Pre-exposure prophylaxis; Randomization; Rectum; Transgender; Universities analysis	English	Sweden	Western and Central Europe and North America	Sweden	Western and Central Europe and North America	Sweden	Western and Central Europe and North America	Qualitative
Article	2022	Dorbalah, Abdullah; Karpick, Hayley Christine; Maze, Holly; Skerrick, Preston; Cottrell, Mackenzie; Rao, Gauri G	Role of tolerivir in HIV treatment and prevention: an update.	Current Opinion in HIV and AIDS	-	-	-	-	1746-6318	10.1097/COH.0000000000000740	https://dx.doi.org/10.1097/COH.0000000000000740	PURPOSE OF REVIEW: To summarize recent updates on the potential role of islatravir for HIV treatment and prevention. RECENT FINDINGS: Islatravir is an investigational antiretroviral agent with unique pharmacologic properties that facilitate flexible dosing regimens. Islatravir has demonstrated potent antiviral activity and a high barrier to resistance when combined with dolutegravir and lamivudine. A simplified two-drug HIV treatment regimen of islatravir combined with dolutegravir has also demonstrated comparable efficacy to standard of care three-drug regimens. The long half-life and high potency of islatravir's active metabolite may support its use as a long-acting option for HIV preexposure prophylaxis (PrEP). A once monthly oral dose of islatravir maintains effective concentrations of its active metabolite over the entire dosing interval. Furthermore, an investigational implantable formulation has been projected to provide efficacious concentrations for at least a year and exhibits comparable distribution into vaginal and rectal tissues making it a promising PrEP option for male and female individuals. Islatravir has minimal risks of drug interactions as it is not a substrate, inducer, or inhibitor of major drug metabolizers and transporters. Finally, clinical trials demonstrate islatravir's favorable safety profile revealing only mild and transient adverse events. SUMMARY: Leveraging the unique pharmacological properties of islatravir offers opportunities for simplified HIV treatment regimens and long-acting PrEP making it a valuable addition to the antiretroviral arsenal. Article	2022	Dray-Spira, Rodolphe; Lert, Florence; Duracinsky, Martin; Lalanne, Christine; Chauvin, Pierre; Cuzin, Laurent; Spire, Bruno	Parcours de soins, santé perçue et qualité de vie des personnes infectées par le VIH, 15 ans après l'introduction des multithérapies : résultats de l'enquête de cohorte ANRS-VESPA2	Bulletin Epidemiologique Hebdomadaire	-	-	-	-	0245-7466	-	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9044000/	Introduction: Les personnes infectées par le VIH (PVVIH) ont bénéficié de progrès majeurs dans la prise en charge de leur infection depuis l'introduction des multithérapies (ARV) en 1996. Nous décrivons leurs parcours de soins, leur santé perçue et leur qualité de vie 15 ans après cette introduction. Méthodes: L'enquête ANRS-VESPA2 a inclus 3 022 PVVIH suivies en médecine de ville ou dans 70 hôpitaux publics en France métropolitaine en 2010-2011. Les participants ont été interrogés par questionnaire auto-administré et entretien face à face. Nous avons décrit leurs caractéristiques sociodémographiques, leurs parcours de soins, leur santé perçue et leur qualité de vie (questionnaire MOS-HIV). Résultats: Les participants étaient majoritairement des hommes (67 %), âgés de 50 ans en médiane, nés à l'étranger (57 %) et infectés par le VIH depuis 15 ans en médiane. Ils déclaraient un bon suivi médical (96 % avaient vu un médecin du VIH dans les 6 mois précédant l'enquête) et une bonne observance des ARV (91 % déclaraient avoir pris leurs ARV la veille de l'enquête). Leur santé perçue était globalement bonne (77 % déclaraient un état de santé bon ou très bon) et leur qualité de vie proche de celle de la population générale. Conclusion: Les PVVIH bénéficient d'un suivi médical régulier et d'une bonne observance des ARV. Leur santé perçue et leur qualité de vie sont proches de celles de la population générale.	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

Article	2022	Desmonde S.; Lolekha R.; Costantini S.; Siraprapasiri T.; Frank S.; Bakkali T.; Benjarattanaporn P.; Hou T.; Jantaramanee S.; Kuttiparambil B.; Sethaputra C.; Ross J.; Ciaranello A.	A focused multi-state model to estimate the pediatric and adolescent HIV epidemic in Thailand, 2005–2025	PLOS One	-	-	-	19326203	10.1371/journal.pone.0276330	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85142143430&doi=10.1371%2fjournal.pone.0276330&partnerID=40&md5=a09a7c870e0ae098efcba5e1ce919403	Background We estimated the magnitude of the HIV epidemic among children and youth living with HIV (CYHIV) aged 0–25 years in Thailand, projecting forward from 2005 to 2025, and identified underreported input parameters that influence epidemic projections, in order to inform future public health and research priorities. Methods We developed a focused multi-state transition model incorporating perinatally-acquired HIV and non-perinatally-acquired HIV, stratified by population, including men who have sex with men (MSM), female sex workers (FSW), people who inject drugs (PWID), and the remainder of the population ("other"). We populated the model with published and programmatic data from the Thai national AIDS program when available. We projected the period from 2005–2025 and compared model results to programmatic data and projections from other models. In a scenario analysis, we projected the potential impact of pre-exposure prophylaxis (PrEP) for MSM from 2018–2025. Results The initial 2005 cohort was comprised of 66,900 CYHIV; 8% CYHIV were <5 years, 21% were 5–14 years, and 71% were 15–25 years of age. By 2020, 94% were projected to be >15 years and infections among MSM constituted 83% of all new HIV infections. The numbers of CYHIV decreased over time, projected to reach 30,760 by 2020 (-54%) and 22,640 by 2025 (-66%). The proportion of all CYHIV aged 0–25 who were diagnosed and on ART increased from 37 to 60% over the 2005–2025 period. Projections were sensitive to variations in assumptions about initial HIV prevalence and incidence among MSM, PWID, and "other" youth. Conclusions More data on incidence rates among sexual and gender minority youth and PWID are needed to characterize the role of specific exposures and key populations in the adolescent HIV epidemic. More accurate estimates will project shifts in population and inform more targeted interventions to prevent and care for Thai CYHIV. Copyright: © 2022 Desmonde et al. Article	2022	Di Ciaccio M.; Villes V.; Michels D.; Morel S.; Delabre R.M.; Castro D.R.; Velter A.	Impact of the early 2020 COVID-19 crisis and lockdown on PrEP use among men who have sex with men (MSM) in France	Sexually Transmitted Infections	-	-	-	13684973	10.1136/SEXTRANS-2021-055189	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85130187406&doi=10.1136%2fSEXTRANS-2021-055189&partnerID=40&md5=98f388018b30820a79615413769007ff	Objective To describe changes in pre-exposure prophylaxis (PrEP) use during and following the COVID-19 lockdown in France (March-May 2020) and identify the factors associated with PrEP discontinuation among men who have sex with men (MSM) after the lockdown. Methods Data from the, an anonymous, cross-sectional internet survey among MSM in July 2020, were analysed. Among respondents who were using PrEP prior to the lockdown, a binary logistic regression model was used to compare participants who were still taking PrEP (current PrEP users) with those who were not taking PrEP at the time of the survey (former PrEP users). Results Among 8345 respondents, 946 were PrEP users before the lockdown, of whom 58.8% (n=556) reported stopping PrEP during the lockdown and 15.4% (n=146) were not using PrEP at the time of the survey. Among the 556 who stopped PrEP during lockdown, 86.5% (n=481) reported no sexual activity; 76.8% (n=427) restarted PrEP after lockdown. Former PrEP users were more likely to be younger, not living with a stable male sexual partner, report moderate anxiety, report increased psychoactive drug use during the lockdown, and report not having tested for HIV or STI since the end of the lockdown because they did not know where to go, preferred to wait or for another reason. Reporting fewer male sexual partners in the last 6 months was also significantly associated with being a former PrEP user. Conclusions MSM adapted PrEP use to their sexual activity during and after the French lockdown. After the lockdown, discontinued PrEP occurred more often among MSM who had fewer sexual partners and had mental health vulnerabilities. These factors could also be predictive of PrEP discontinuation in a more general context. PrEP users should be informed on how to safely stop/start PrEP and on the use of other prevention tools to reduce potential risk exposure during PrEP discontinuation. © Author(s) (or their employer(s)) 2022. PrEP in Europe Survey	Archives of Sexual Behavior	-	-	-	00040002	10.1007/s10508-022-02322-7	https://www.proquest.com/scholarly-journals/prep-context-other-hiv-risk-reduction-strategies/docview/2691250587/se-2?accountid=8113	Combination HIV prevention covers a range of biomedical, behavioral, and socio-structural interventions. Despite the growing availability of pre-exposure prophylaxis (PrEP), it is not always accessible in European Centre for Disease Prevention and Control reporting countries and may not meet the needs of all at-risk populations. Based on the Flash! PrEP in Europe data, multiple correspondence analysis and hierarchical clustering were used to identify patterns in HIV prevention strategies among 9980 men who have sex with men (MSM). PrEP interest was evaluated among four identified clusters: (A) "high condom use, sometimes Treatment as Prevention (TasP)"; (B) "mix of methods, infrequent condom use"; (C) "high condom use, tendency to choose partners based on serological status" and (D) "moderate use of condoms mixed with other prevention strategies". Clusters B and D had higher PrEP interest. These results suggest that MSM use a range of behavioral and biomedical risk reduction strategies that are often combined. On-demand PrEP may meet the needs of MSM who infrequently use condoms and other prevention methods. Article	2022	Dietrich J.J.; Ahmed N.; Webb E.L.; Tshabalala G.; Hornschuh S.; Mulaudzi M.; Atujuna M.; Stranix-Chibanda L.; Nematadzira T.; Ssemata A.S.; Muhumuza R.; Seeley J.; Bekker L.-G.; Weiss H.A.; Martinson N.; Fox J.	A multi-country cross-sectional study to assess predictors of daily versus on-demand oral pre-exposure prophylaxis in youth from South Africa, Uganda and Zimbabwe	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25975	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136530566&doi=10.1002%2fjia2.25975&partnerID=40&md5=8ad8f0b0b1d83ababf93190d156287b8	Introduction: Sub-Saharan Africa (SSA) carries the burden of the HIV epidemic, especially among adolescents and young people (AYP). Little is known about pre-exposure prophylaxis (PrEP) uptake and preferences among AYP in SSA. We describe preferences for daily and on-demand PrEP among AYP in South Africa, Uganda and Zimbabwe. Methods: A cross-sectional survey was conducted in 2019 among 13- to 24-year olds, capturing socio-demographics, HIV risk behaviours and preferences for daily or on-demand PrEP. Logistic regression models were used to estimate odds ratios, adjusting for site, sex and age. Results and discussion: A total of 1330 participants from Cape Town (n = 239), Johannesburg (n = 200), Entebbe (n = 491) and Chitungwiza (n = 400) were enrolled; 673 (51%) were male, and the median age was 19 years (interquartile range 17–22 years). Of 1287 participants expressing a preference, 60% indicated a preference for on-demand PrEP with differences by site (p < 0.001), sex (p < 0.001) and age group (p = 0.003). On-demand PrEP was most preferred in Entebbe (75%), among males (65%) versus females (54%) and in older participants (62% in 18- to 24-year-olds vs. 47% in 13- to 15-year-olds). After adjusting for site, sex and age group, preference for on-demand PrEP decreased as sex frequency over the past month increased (p-trend = 0.004) and varied with the number of partners in the last 6 months, being least popular among those reporting four or more partners (p = 0.02). Participants knowing further in advance that they were likely to have sex were more likely to prefer on-demand PrEP (p-trend = 0.02). Participants having a larger age gap with their most recent partner and participants whose last partner was a transactional sex partner or client were both less likely to prefer on-demand compared to daily PrEP (p = 0.05 and p = 0.09, respectively). Participants who knew their most recent partner was living with HIV or who did not know the HIV status of their most recent partner were less likely to prefer on-demand PrEP (p = 0.05). Conclusions: Our data show that AYP in four SSA communities prefer on-demand over daily PrEP options, with differences seen by site, age and sex. PrEP demand creation needs to be reviewed, optimized and tailored to socio-demographic differences and designed in conjunction with AYP. © 2022 The Authors. Article	2022	Dinglasan, Jeanno Lorenz G; Rosadiño, John Danvic T; Pagtakhan, Ronivin G; Cruz, Denis P; Briñes, Matthew T; Regencia, Zypher Jude G; Baja, Emmanuel S	Bringing testing closer to you': barriers and facilitators in implementing HIV self-testing among Filipino men-having-sex-with-men and transgender women in National Capital Region (NCR), Philippines - a qualitative study.	BMJ Open	-	-	-	2044-6055	10.1136/bmjopen-2021-056697	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC8938691	OBJECTIVES: Our study identified barriers and facilitators in implementing HIV self-testing (HIVST), including the perceptions of men-having-sex-with-men (MSM) and transgender women (TGW) on HIVST. Furthermore, we explored the current knowledge, practices and potential of HIVST among the MSM and TGW populations. DESIGN: Qualitative in-depth key informant interviews were administered using semistructured interviews administered in both English and Filipino. Thematic analysis of the findings was done after transcribing all audio recordings. SETTING: The study was done in the National Capital Region (NCR), Philippines using online video conferencing platforms due to mobility restrictions and lockdowns caused by the COVID-19 pandemic. PARTICIPANTS: All study participants were either MSM or TGW, 18-49 years old and residing/working in NCR. Exclusion criteria include biologically born female and/or currently on pre-exposure prophylaxis, antiretroviral therapy medications or an HIV-positive diagnosis. RESULTS: Twenty informants were interviewed, of which 75% were MSM, and most of them preferred the use of HIVST. Facilitators and barriers to the use of HIVST were grouped into three main themes: Acceptability, distribution and monitoring and tracking. Convenience and confidentiality, overcoming fears and normalisation of HIV testing services (HTS) in the country were the participants' perceived facilitators of HIVST. In contrast, lack of privacy and maintenance of confidentiality during kit delivery were perceived as barriers in HIVST implementation. Moreover, social media was recognised as a powerful tool in promoting HIVST. The use of a welcoming tone and positive language should be taken into consideration due to the prevalent HIV stigma. CONCLUSIONS: The identified facilitators and barriers from the study may be considered by the Philippine HTS programme implementers. The HIVST strategy may complement the current HTS. It will be very promising to involve the MSM and TGW communities and other key populations to know their HIV status by bringing testing closer to them. Theses and Dissertations	2022	Dixon, Noah	ANALYSIS OF POTENTIAL FACILITATORS TO USE OF HIV PRE-EXPOSURE PROPHYLAXIS (PrEP) IN A YOUNG TRANSGENDER POPULATION	-	-	University of Kentucky	-	na	NA	https://uknowledge.uky.edu/pharmacy_etds/137 https://uknowledge.uky.edu/context/pharmacy_etds/article/1149/viewcontent/dixon_noah_thesis.pdf	Pre-exposure prophylaxis for HIV prevention (PrEP) is heavily under-utilized in transgender youth, a population which experiences high risk factors for contracting HIV and exhibits unique barriers to care. This retrospective study used a secondary data analysis of survey results from transgender youth between 16-and 24-years-old to analyze various exposures for association with PrEP use. It was hypothesized that medical gender affirming therapy, mental health care treatment, and HIV programming would be independently associated with increased use of PrEP in transgender youth. It was found that only HIV prevention services and programming related to HIV or gender identity were associated with an increased use of PrEP. Results indicate that HIV-and transgender-focused services outside of general primary care are the best way to improve PrEP access in this population	Transgender Health; HIV Prevention; Pre-exposure prophylaxis; PrEP access; Transgender HIV; Transgender youth; Pharmacy Administration, Policy and Regulati	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	-	-	Quantitative

Caring for the whole person: transgender-competent HIV pre-exposure prophylaxis as part of integrated primary healthcare services in Vietnam	Journal of the International AIDS Society	-	-	-	17582652	10.1002/jia2.25996	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85139771354&doi=10.1002%2fjia2.25996&partnerID=40&md5=10613808a6b018d7d50525880015209f	Introduction: Although HIV prevalence among transgender women who have sex with men in Vietnam is high (16–18%), uptake of pre-exposure prophylaxis (PrEP) is low compared to other populations. When PrEP was initiated in 2017, gender-affirming healthcare was largely unavailable. Lack of access to competent, stigma-free healthcare is a well-documented barrier to transgender women's uptake of PrEP and primary healthcare (PHC). We aimed to demonstrate the utility of a PrEP quality improvement intervention in pinpointing and addressing barriers to PrEP use among transgender women in Vietnam. Methods: We applied a real-world participatory continuous quality improvement (CQI) and Plan-Do-Study-Act (PDSA) methodology to ascertain barriers to PrEP uptake among transgender women and determine priority actions for quality improvement. A CQI team representing transgender women leaders, key population (KP)-clinic staff, public-sector HIV managers and project staff applied PDSA to test solutions to identified barriers that addressed the primary quality improvement outcome of the monthly change in PrEP uptake among transgender women and secondary outcomes, including month-3 PrEP continuation, the impact of offering PHC on PrEP uptake and unmet PrEP need. We utilized routine programmatic data and a descriptive cross-sectional study enrolling 124 transgender women to measure these outcomes from October 2018 to September 2021. Results: Five key barriers to PrEP uptake among transgender women were identified and corresponding solutions were put in place: (1) offering gender-affirming care training to KP-clinics and community-based organizations; (2) integrating gender-affirming services into 10 KP-clinics; (3) offering PHC through five one-stop shop (OSS) clinics; (4) implementing a campaign addressing concerns related to hormone use and PrEP interactions; and (5) developing national HIV and transgender healthcare guidelines. New PrEP enrolment and month-3 PrEP continuation increased significantly among transgender women. Of 235 transgender women who initially sought healthcare other than PrEP at OSS clinics, 26.4% subsequently enrolled in PrEP. About one-third of transgender women reported unmet PrEP need, while two-thirds indicated an interest in long-acting cabotegravir. Conclusions: Offering gender-competent, integrated PHC can increase PrEP enrolment and continuation, and can be an entry-point for PrEP among those seeking care within PHC clinics. More work is needed to expand access to transgender women-led and -competent healthcare in Vietnam. © 2022 The Authors. We performed dose ranging pharmacokinetics (PK) and efficacy studies of a vaginally applied insert containing tenofovir alafenamide fumarate (TAF) and elvitegravir (EVG) in macaques under PrEP or post-exposure prophylaxis (PEP) modalities. Methods: PK studies were performed in 3 groups of pigtailed macaques receiving inserts with different fixed-dose combinations of TAF and EVG (10/8, 20/16 and 40/24 mg). PrEP and PEP efficacy of a selected insert was investigated in a repeat exposure vaginal SHIV transmission model. Inserts were administered 4 h before (n = 6) or after (n = 6) repeated weekly SHIV exposures. Infection outcome was compared with macaques receiving placebo inserts (n = 12). Findings: Dose ranging studies showed rapid and sustained high drug concentrations in vaginal fluids and tissues across insert formulations with minimal dose proportionality. TAF/EVG (20/16 mg) inserts were selected for efficacy evaluation. Five of the 6 animals receiving these inserts 4 h before and 6/6 animals receiving inserts 4 h after SHIV exposure were protected after 13 challenges (p = 0.0088 and 0.0077 compared to placebo, respectively). The calculated PrEP and PEP efficacy was 91.0% (95% CI = 32.2%–98.8%) and 100% (95% CI = undefined), respectively. Interpretation: Inserts containing TAF/EVG provided high protection against vaginal SHIV infection when administered within a 4 h window before or after SHIV exposure. Our results support the clinical development of TAF/EVG inserts for on-demand PrEP and PEP in women. Funding: Funded by CDC intramural funds, an interagency agreement between CDC and USAID (USAID/CDC IAA AID-GH-T-15-00002), and by the U.S. President's Emergency Plan for AIDS Relief (PEPFAR) through the U.S. Agency for International Development (USAID) under a Cooperative Agreement (AID-OAA-A-14-00010) with CONRAD/Eastern Virginia Medical School. © 2022	Elvitegravir; On-demand PrEP and PEP; Tenofovir alafenamide; Vaginal inserts	English	Netherlands	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Clinical
Article	2022	Doherty R.; Walsh J.; Quinn K.; John S.A.	ASSOCIATION OF RACE AND OTHER SOCIAL DETERMINANTS OF HEALTH WITH HIV PRE-EXPOSURE PROPHYLAXIS USE: A COUNTY-LEVEL ANALYSIS USING THE PREP-TO-NEED RATIO	AIDS Education and Prevention	-	-	-	8999546	10.1521/aeap.2022.34.3.183	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131270703&doi=10.1521%2faeap.2022.34.3.183&partnerID=40&md5=997215301cfeca990fc287f8ac9d6926	Research is limited on the effect of racism and social determinants of health on HIV pre-exposure prophylaxis (PrEP) use. This study used the PrEPto- Need Ratio (PNR), which measures PrEP prescriptions divided by HIV diagnoses in the county, to evaluate sufficient PrEP use. AIDSVu datasets were compared to county-level social determinants of health. Standardized regression coefficients (β) were compared to identify strongest associations with PNR. Overall, factors including percent African American and percent uninsured had negative correlations with PNR, whereas median household income and severe housing cost burden had positive associations. Stratifying for population size, percent African American, percent uninsured, and severe housing cost burden were significant for low population areas, whereas median household income, percent in poverty, percent uninsured, and percent African American were significant for large populations. To reduce PrEP disparities, public health must develop strategies to reach those most in need, especially historically disadvantaged communities. © 2022 The Guilford Press. Article	2022	Dordevic, Jasmina; Rognlien Dahl, Kristina	Stochastic optimal control of pre-exposure prophylaxis for HIV infection.	Mathematical Medicine and Biology	-	-	-	1477-8602	10.1093/imammb/dqac003	https://dx.doi.org/10.1093/imammb/dqac003	The aim of the paper is to apply the stochastic optimal control problem in order to optimize the number of individual which will have the pre-exposure prophylaxis (PReP) treatment in the stochastic model for HIV/AIDS with PReP. By using the stochastic maximum principle, we derive the stochastic optimal control of PReP for the unconstrained control problem. Furthermore, by combining the stochastic maximum principle with a version of the Lagrange multiplier method, we solve the PReP problem for two different types of budget constrains with a given constrain for the costs (possible of different kind, transportation, price of the treatment, etc.). Obtained results for the different percentage of the individuals who got the vaccine, as well as results for unconstrained and constrained problems, are illustrated by a numerical example. Theses and Dissertations	2022	Dorfman, Doron	The PrEP Penalty	-	-	Boston College. Law School. Boston College Law Review	-	01616587	NA	https://www.proquest.com/scholarly-journals/prep-penalty/docview/2667263057/se-2?accountid=8113	Pre-exposure prophylaxis, or PrEP, is a novel treatment shown to be highly effective in preventing HIV infection. Although this preventive measure signals a new dawn in eliminating HIV/AIDS, this Article exposes the paradoxical legal treatment of PrEP. On one hand, PrEP has been approved by the FDA, endorsed by the CDC, and promoted through financial incentives in the Affordable Care Act. On the other, the FDA restricts PrEP users, predominately sexually active gay men, from donating blood through a legal policy known as the "blood ban." This Article uses an innovative experimental study to demonstrate counterintuitive and illogical responses to gay men's use of PrEP. Study participants were found to be more reluctant to accept blood from a potential gay donor taking PrEP, or to change the FDA policy to allow that donor to donate blood, as compared with a gay donor not taking PrEP. Likewise, participants were more reluctant to receive blood from gay fathers on PrEP than from gay fathers not on PrEP. This PrEP pen- alty applied only to gay donors; participants were more inclined to accept a blood donation from a straight donor on PrEP compared with any gay donor. The findings demonstrate how decisions related to public health, on the structural and individual levels, are colored by moral judgment. They show how legal discourse strips away the public health benefits of medical treatment and shifts focus to the patient's individual behavior, a process I call "the demedicalization of preventive measures." The findings also contribute to the understanding of the expressive function of the law, meaning the ways in which the law constructs identities and how it shapes common understandings about sexual minorities in the area of public health. Furthermore, the findings advance empirical knowledge and understanding of the social meanings of same-sex marriage, parenthood, and queer families post-Obergefell v. Hodges. Public perceptions of morality and trustworthiness result in the penalization of PrEP use to the detriment of both LGBTQ individuals and society as a whole. Stigmatized attitudes hamper major public health projects, including fighting chronic blood scarcity, increasing the pool of donors that could give antibodies during a pandemic, and eliminating HIV. Expanding upon the findings from this experimental study, I offer normative avenues to eliminate PrEP stigma and further public health goals, arguing for reforming FDA policy to specifically allow PrEP users to give blood and, ultimately, for completely abolishing the blood ban. Article	2022	Downing, Jae; Yee, Kimberly; Sevelius, Jae M	PrEP Use and Adherence Among Transgender Patients	AIDS and Behavior	-	-	-	10907165	10.1007/s10461-021-03482-8	https://www.proquest.com/scholarly-journals/prep-use-adherence-among-transgender-patients/docview/2641697761/se-2?accountid=8113	This cross-sectional study used 2012 to 2019 Oregon Medicaid claims to estimate the prevalence of PrEP use and identify determinants of high adherence across transgender and cisgender men and women. Gender identity (cisgender woman/man; transgender, assigned female sex at birth AFAB; transgender, assigned male sex at birth AMAB) was based on medical history and enrollment records. Proportion of days covered ≥ 0.80 was considered high adherence to PrEP. The association between gender identity and PrEP uptake or high adherence was estimated using multivariable logistic regression. 1555 PrEP users, including 171 (11.0%) cis women, 1171 (75.3%) cis men, 67 (4.3%) AFAB, and 146 (9.4%) AMAB individuals, were included. The probability of PrEP use per 10,000 people was highest in transgender groups (AMAB 546.8, 95% CI 462.4–631.3; AFAB 226.5, 95% CI 173.4–279.6), followed by cisgender men (20.6, 95% CI 19.4, 21.8) and women (2.6, 95% CI 2.2, 3.0). High adherence was significantly lower in AMAB recipients (72.6%) than cisgender women (86.0%) and cisgender men (82.2%). Among the 279 PrEP users with female on their enrollment record, 76 (27.2%) were AMAB, while among the 1276 PrEP users with male on their enrollment record, 35 (2.7%) were AFAB. This demonstrates the importance of surveillance methods that take gender identity into account in addition to sex assigned at birth. There were significant differences in PrEP use and adherence by gender identity. PrEP surveillance, outreach, and prescribing practices must consider gender identity-unique risk factors. Article	2022	Doyle, Carla M.; Cox, Joseph; Milwid, Rachael M.; Bitera, Raphaël; Delaunay, Charlotte Lanièce; Alary, Michel; Lambert, Gilles; Tremblay, Cécile; Mishra, Sharmistha; Maheu-Giroux, Mathieu	Measuring progress towards reaching zero new HIV acquisitions among key populations in Québec (Canada) using routine surveillance data: a mathematical modelling study.	Journal of the International AIDS Society	-	-	-	1758-2652	10.1002/jia2.25994	https://pubmed.ncbi.nlm.nih.gov/36050916/	INTRODUCTION: Men who have sex with men (MSM) and people who inject drugs (PWID) are disproportionately impacted by the HIV epidemic in Canada. Having the second-highest provincial diagnosis rate, an improved understanding of the epidemic among these populations in Québec could aid ongoing elimination efforts. We estimated HIV incidence and other epidemic indicators among MSM and PWID in Montréal and across Québec using a back-calculation model synthesizing surveillance data. METHODS: We developed a deterministic, compartmental mathematical model stratified by age, HIV status and disease progression, and clinical care stages. Using AIDS and HIV diagnoses data, including self-reported time since the last negative test and laboratory results of CD4 cell count at diagnosis, we estimated HIV incidence in each population over 1975-2020 by modelling a cubic M-spline. The prevalence, undiagnosed fraction, fraction diagnosed that started antiretroviral treatment (ART) and median time to diagnosis were also estimated. Since the COVID-19 pandemic disrupted testing, we excluded 2020 data and explored this in sensitivity analyses. RESULTS: HIV incidence in all populations peaked early in the epidemic. In 2020, an estimated 97 (95% CrI: 33-227) and 266 (95% CrI: 103-508) HIV acquisitions occurred among MSM in Montréal and Québec, respectively. Among PWID, we estimated 2 (95% CrI: 0-14) and 6 (95% CrI: 1-26) HIV acquisitions in those same regions. With 2020 data, unless testing rates were reduced by 50%, these estimates decreased, except among Québec PWID, whose increased. Among all, the median time to diagnosis shortened to <2 years before 2020 and the undiagnosed fraction decreased to <10%. This fraction was higher in younger MSM, with 22% of 15-24 year-olds living with HIV in Montréal (95% CrI: 9-39%) and 31% in Québec (95% CrI: 17-48%) undiagnosed by 2020 year-end. Finally, ART access neared 100% in all diagnosed populations. CONCLUSIONS: HIV incidence has drastically decreased in MSM and PWID across Québec, alongside significant improvements in diagnosis and treatment coverage-and the 2013 introduction of pre-exposure prophylaxis. Despite this, HIV transmission continued. Effective efforts to halt this transmission and rapidly diagnose people who acquired HIV, especially among younger MSM, are needed to achieve elimination. Further, as the impacts of the COVID-19 pandemic on HIV transmission are understood, increased efforts may be needed to overcome these. Article	2022	Drabo, Emmanuel F; Moucheraud, Corrina; Nguyen, Anthony; Garland, Wendy H; Holloway, Ian W; Leibowitz, Arleen; Suen, Sze-Chuan	Using Microsimulation Modeling to Inform EHE Implementation Strategies in Los Angeles County.	Journal of Acquired Immune Deficiency Syndromes	-	-	-	1944-7884	10.1097/QAI.0000000000002977	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9216245	BACKGROUND: Pre-exposure prophylaxis (PrEP) is essential to ending HIV. Yet, uptake remains uneven across racial and ethnic groups. We aimed to estimate the impacts of alternative PrEP implementation strategies in Los Angeles County. SETTING: Men who have sex with men, residing in Los Angeles County. METHODS: We developed a microsimulation model of HIV transmission, with inputs from key local stakeholders. With this model, we estimated the 15-year (2021-2035) health and racial and ethnic equity impacts of 3 PrEP implementation strategies involving coverage with 9000 additional PrEP units annually, above the Status-quo coverage level. Strategies included PrEP allocation equally (strategy 1), proportionally to HIV prevalence (strategy 2), and proportionally to HIV diagnosis rates (strategy 3), across racial and ethnic groups. We measured the degree of relative equalities in the distribution of the health impacts using the Gini index (G) which ranges from 0 (perfect equality, with all individuals across all groups receiving equal health benefits) to 1 (total inequality). RESULTS: HIV prevalence was 21.3% in 2021 Black (BMSM), 31.1%; Latino (LMSM), 18.3%, and White (WMSM), 20.7% with relatively equal to reasonable distribution across groups (G, 0.28; 95% confidence interval CI, 0.26 to 0.34). During 2021-2035, cumulative incident infections were highest under Status-quo (n = 24,584) and lowest under strategy 3 (n = 22,080). Status-quo infection risk declined over time among all groups but remained higher in 2035 for BMSM (incidence rate ratio, 4.76; 95% CI: 4.58 to 4.95), and LMSM (incidence rate ratio, 1.74; 95% CI: 1.69 to 1.80), with the health benefits equally to reasonably distributed across groups (G, 0.32; 95% CI: 0.28 to 0.35). Relative to Status-quo, all other strategies reduced BMSM-WMSM and BMSM-LMSM disparities, but none reduced LMSM-WMSM disparities by 2035. Compared to Status-quo, strategy 3 reduced the most both incident infections (% infections averted: overall, 10.2%; BMSM, 32.4%; LMSM, 3.8%; WMSM, 3.5%) and HIV racial inequalities (G reduction, 0.08; 95% CI: 0.02 to 0.14). CONCLUSIONS: Microsimulation models developed with early, continuous stakeholder engagement and inputs yield powerful tools to guide policy implementation.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Drak D.; Lin J.; Gowers A.; Gracey D.M.	Fanconi syndrome in a patient receiving pre-exposure prophylaxis for HIV infection: Case report	Sexual Health	-	-	-	14485028	10.1071/SH21185	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131385167&doi=10.1071%2fSH21185&partnerID=40&md5=bd46ef7f9ae1b28faa2b82a3d246a26e	Background: Tenofovir disoproxil is efficacious in the preventing HIV infection as part of a pre-exposure prophylaxis (PrEP) regimen. Although its use has been associated with impaired renal function, instances of Fanconi syndrome are extremely rare. This may change with increased uptake of PrEP. Methods: A 55-year-old male patient (he/him/his) was commenced on PrEP with a baseline estimated glomerular filtration rate (eGFR) of approximately 60 mL/min/1.73 m2. Results: Within 6 months, he developed new and worsening proteinuria, glycosuria and aminoaciduria despite no apparent change in eGFR. PrEP was discontinued and his urinary abnormalities rapidly resolved. The patient remains off PrEP. Conclusions: Fanconi syndrome is a rare, but known complication of tenofovir disoproxil. This is the first report related to PrEP in Australia. While tenofovir associated nephrotoxicity in patients taking PrEP is uncommon, the patient's age and pre-existing renal impairment placed him at substantially higher risk. At-risk patients need more frequent monitoring of their eGFR and proteinuria. Urinary protein to creatinine ratio is the preferred to dipstick testing for proteinuria and the latter does not readily detect the low molecular wight proteinuria characteristic of tenofovir toxicity. Early recognition of these patients is essential, as prompt cessation of PrEP can often reverse renal abnormalities. © 2022	Emtricitabine; estimated glomerular filtration rate; Fanconi syndrome; HIV prevention; pre-exposure prophylaxis; PrEP; risk reduction; tenofovir disoproxil	English	United States	Western and Central Europe and North America	Australia	Asia and the Pacific	Australia	Asia and the Pacific	Clinical
Article	2022	Drallmeier T.; Garrett E.K.; Meyr A.; Salas J.; Scherrer J.F.	Demographic factors, psychiatric and physical comorbidities associated with starting preexposure prophylaxis in a nationally distributed cohort	Preventive Medicine	-	-	-	917435	10.1016/j.ypmed.2022.107344	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85141507063&doi=10.1016%2fj.ypmed.2022.107344&partnerID=40&md5=1b5991795a27b61c138d4ce65eb27683	Due to a large number of small studies and limited control for confounding, existing evidence regarding patient characteristics associated with PrEP initiation is inconsistent. We used a large electronic health record cohort to determine which demographic, physical morbidity and psychiatric conditions are associated with PrEP initiation. Eligible adult (≥18 years) patients were selected from the Optum® de-identified Electronic Health Record dataset (2010–2018). Non-HIV sexually transmitted diseases and high risk sexual behavior was used to identify patients eligible for PrEP. A fully adjusted Poisson regression model estimated the association between age, gender, race, insurance status, comorbidity index, depression, anxiety, dysthymia, severe mental illness, substance use disorder and nicotine dependence/smoking and rate of PrEP initiation. The cohort (n = 30,909) was mostly under 40 years of age (64.3%), 67.6% were female and 58.2% were White. The cumulative incidence of PrEP initiation was 1.3% (n = 408). Patients ≥60 years of age, compared to 18–29 year olds and Black compared to White patients had significantly lower rates of PrEP initiation. Anxiety disorder was significantly associated with higher rate of PrEP initiation (RR = 1.67; 95%CI:1.20–2.33) and nicotine dependence/smoking with a lower rate (RR = 0.73; 95%CI:0.54–0.97). PrEP is underutilized, and a race disparity exists in PrEP initiation. In the context of existing research, nicotine dependence/smoking is the patient characteristic most consistently associated lower rates of starting PrEP. Given the high prevalence of smoking in PrEP eligible patients, physicians may want to integrate discussions of smoking cessation in patient-provider decisions to start PrEP. © 2022	Cohort; Epidemiology; Preexposure prophylaxis; PrEP; Psychiatric disorders	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Quantitative
Article	2022	Drallmeier, Theresa; Meyr, Ashley	Pre-Exposure Prophylaxis for HIV in Primary Care and Beyond.	Missouri Medicine	-	-	-	0026-6620	NA	https://www.ncbi.nlm.nih.gov/pmc/articles/PMC9324708	HIV pre-exposure prophylaxis (PrEP) is antiretroviral medication used to prevent HIV in patients at increased risk of acquisition due to sexual practices or intravenous drug use. Despite strong evidence of efficacy and safety, PrEP is currently underutilized in the United States. Initial testing includes HIV, hepatitis B, and renal function. There are currently two oral medications approved for daily use within the U.S.; regular monitoring for HIV and renal dysfunction is required with both medications.	na	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	NA	NA	Review
Article	2022	Driver R.; Cortopassi A.C.; El-Krab R.; Eaton L.A.; Kalichman S.C.	Examining Stigmatizing Beliefs About PrEP Use Among Black Sexual Minority Men: A Test of Explanatory Mechanisms	Psychology of Men and Masculinity	-	-	-	15249220	10.1037/men0000374	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85123532056&doi=10.1037%2fmen0000374&partnerID=40&md5=0b94c3dd66d21f7b1aa105dc7a2aff95	Stigma often is cited as a barrier to the uptake and use of preexposure prophylaxis (PrEP) to prevent human immunodeficiency virus (HIV) among Black sexual minority men (SMM). Socialized gender norms (i.e., restrictive emotionality) are associated with experiences and manifestations of stigma in men. However, the association between restrictive emotionality and the stigma surrounding PrEP use has received little attention in previous research. The present study examines the association between restrictive emotionality and holding stigmatizing beliefs about PrEP use with a theoretically informed serial mediation model testing internalized homophobia (IHP) and lesbian, gay, bisexual, and transgender (LGBT) community connectedness as mediators among a sample of 455 Black SMM in the Southeastern U.S. Results indicate that restrictive emotionality is associated with stigmatizing beliefs about PrEP use. Further, IHP and LGBT community connectedness (LGBT CC) were found to partially mediate the proposed relationship serially. IHP, but not LGBT CC, also independently mediated the association between restrictive emotionality and stigmatizing beliefs about PrEP use. This study provides important insights into how aspects of masculinity influence the manifestation of stigmatizing beliefs about PrEP use among Black SMM. The present findings have implications for reducing these beliefs, which are known to negatively impact uptake and use of the HIV prevention tool among Black SMM at elevated risk for HIV © 2022 American Psychological Association	Black sexual minority men; Hiv; Prep; Restrictive emotionality; Stigma	English	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	United States	Western and Central Europe and North America	Mixed methods
Article	2022	Driver R.; Kalichman S.C.	Precarious Manhood and Intentions to Initiate Preexposure Prophylaxis Among Black Sexual Minority Men	Health Psychology	-	-	-	2786133	10.1037/hea0001194	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85131715018&doi=10.1037%2fhea0001194&partnerID=40&md5=307748010a25509b2e207da4cb642c1b	Objective: The use of preexposure prophylaxis (PrEP) to prevent HIV infection is significantly low among Black sexual minority men (BSMM), although this group experiences the greatest HIV burden in the United States. One contextual factor suggested to impact BSMM's HIV prevention efforts is the concern about, and adherence to, cultural conceptions and expectations of masculinity. The present study sought to better understand the association between masculinity and PrEP uptake by examining associations between gender-relevant beliefs and perceptions, and intentions to initiate PrEP among a sample of BSMM residing in the U.S. South. Method: Participants (N = 114) completed assessments of precarious manhood beliefs, attitudes toward PrEP, concerns about PrEP use impacting support from social networks, projected perceptions of masculinity, and intentions to initiate PrEP. Results: Precarious manhood beliefs were associated with greater intention to initiate PrEP; however, the indirect path of this association through attitudes toward PrEP was associated with lower intentions to initiate PrEP. In a hierarchical regression model, projected perceptions of masculinity were associated with lower intentions to initiate PrEP over and above other factors considered. Specifically, believing that one will be perceived as less masculine for seeking PrEP was associated with lower intentions to initiate PrEP. Conclusions: Findings suggest that BSMM's construal of masculinity in relation to HIV and PrEP is associated with intentions to initiate PrEP. Implications for increasing PrEP uptake among BSMM are discussed © 2022. Article	2022	Duarte F.; Rua N.; Gomes D.; Ricoca Peixoto V.; Azevedo D.; Graça D.; Teixeira I.; Fernandes I.; Frutuoso J.; Carvalho M.; Redondo M.; Silva A.; Faria A.; Lopes A.; Varino F.; Gomes J.; Tomaz M.; Figueiredo V.; Almeida A.; Ribeiro B.; Oliveira C.; Pinto D.; Santana M.; Araújo R.; Ribeiro S.	Pre-Exposure Prophylaxis for Human Immunodeficiency Virus in the Medical Curricula in Portugal: A Cross-Sectional Analysis; Profilaxia Pré-Exposição para o Vírus da Imunodeficiência Humana no Currículo Médico em Portugal: Uma Análise Transversal	Acta Médica Portuguesa	-	-	-	0870399X	10.20344/amp.15446	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85128161516&doi=10.20344%2famp.15446&partnerID=40&md5=0d3e352b457ceff2276fd80a94c11dae	Introduction: Pre-exposure prophylaxis (PrEP) has gained relevance as a method of prevention for HIV in certain people and settings. Following the publication of the guideline on PrEP prescribing in Portugal, we aimed to assess the knowledge of Portuguese Medical Students about PrEP. Material and Methods: An online survey was sent to Medical students of Portuguese Medical Schools. We conducted a descriptive analysis of the results and an analytic cross-sectional study to identify factors associated with "knowing about PrEP", "having had one class about PrEP" and "identifying eligible groups correctly". Results: Of the 796 students that responded to the survey, 64.6% were aware of what PrEP is. Of these, 34.44% acquired this knowledge during their training. Out of the total amount of respondents, 4.77% could identify correctly and completely the eligible groups for PrEP. As the training years went by, the probability of being aware of PrEP, having had one class about PrEP, and identifying the eligible groups correctly, increased. Of the sixth-year students, 43.48% had had one class about PrEP and among the students that were aware of PrEP, 28% identified what the eligible groups were. After adjusting for the school year, we found differences between Medical Schools regarding the outcomes. The association between the different ways of knowing about PrEP and the ability to correctly identify eligible groups for PrEP was not statistically significant. Conclusion: The differences between Medical Schools could be harmonized through changes in the medical curricula that would allow for this topic to be addressed more often. Article	2022	Edwards A.J.; Pollard R.; Kennedy C.E.; Mulamba J.; Mbabali I.; Anok A.; Kong X.; Nakyanjo N.; Ddaaki W.; Nishimura H.; Wawer M.; Amico K.R.; Hutton H.E.; Nakigozi G.; Chang L.W.	Impact of community health worker intervention on PrEP knowledge and use in Rakai, Uganda: A mixed methods, implementation science evaluation	International journal of STD & AIDS	-	-	-	9564624	10.1177/09564624221121208	https://www.scopus.com/inward/record.uri?eid=2-s2.0-85136874858&doi=10.1177%2f09564624221121208&partnerID=40&md5=6bc3612567b43633cd2cbd285345f58d	Background: Effective models of support for HIV pre-exposure prophylaxis (PrEP) are needed for populations at elevated risk. In a hyperendemic Ugandan fishing community, PrEP counseling was provided through a situated Information, Motivation, and Behavioral Skills (sIMB)-based community health worker (CHW) intervention. We evaluated the intervention using a mixed-methods, implementation science design. Methods: We surveyed all community members aged 15-49 through the Rakai Community Cohort Study. We used multivariable logistic regressions with generalized estimating equations to estimate the intervention's effect on PrEP knowledge and utilization. To understand intervention experiences and mechanisms, we conducted 74 qualitative interviews with 5 informant types (clients, CHWs, program staff, community leaders, health clinic staff) and analyzed data using an iterative, deductive approach. A mobile phone application provided intervention process implementation data. Results: Individuals self-reporting receipt of the CHW intervention showed significantly higher PrEP knowledge (N = 1848, PRR: 1.10, 95% CI: 1.06-1.14, p = <.0001), PrEP ever use (N = 1176, PRR: 1.77, 95% CI: 1.33-2.36, p = <.0001), and PrEP current use (N = 1176, PRR: 1.86, 95% CI: 1.22-2.82, p = 0.0039) compared to those who did not. Qualitative findings attributed positive PrEP outcomes to CHW counseling and effective use of motivational interviewing skills by CHWs. Salient themes across the RE-AIM framework included support for the CHW intervention and PrEP across clients, community, and implementers. Mobile application data demonstrated consistent delivery of the PrEP module throughout implementation. Conclusions: CHWs improved PrEP knowledge and use among clients in an HIV hyperendemic fishing community. Mixed-methods, implementation science evaluations can inform adaptation of similar PrEP implementation strategies. © The Author(s) 2022. Article	2022	Edwards, Jonny	Could the use of digital services improve the provision of HIV PrEP in the UK?	BMJ: British Medical Journal	-	-	-	na	10.1136/bmj.o1562	https://www.proquest.com/scholarly-journals/could-use-digital-services-improve-provision-hiv/docview/2681669637/se-2?accountid=8113	HIV pre-exposure prophylaxis (PrEP) has been freely available via the NHS since April 2021, and was previously available through the PrEP Impact Trial, which offered PrEP to 26 000 people who were considered at elevated risk of acquiring HIV.12 Evidence overwhelmingly supports the efficacy of PrEP in preventing HIV infection, and its use for many people at risk, including men who have sex with men, trans people, people whose partner has an undetectable HIV viral load, and heterosexual men and women who may be at increased risk of contracting HIV. The NHS Long Term Plan encourages the use of remote and online technology (digitally enabled care) for ease of access, and to place patients at the centre of their care, enabling them to manage better their own health.4 The Department of Health and Social Care published a document in 2018 Integrated sexual health services: a suggested national services specification as a guide for local commissioners (decision makers about local NHS services).5 However, despite the recommendation that people should be able to access care without needing to see a clinician face to face, NHS sexual health services have largely not integrated digital care into service provision. ...a study that explored people's perspectives of remote prescribing in chlamydia and for conception showed substantial (83% of 1281 surveyed users) support for remote prescribing and medication delivered by post.7 Clinical commissioning teams and sexual health services should consider steps to de-medicalise access to PrEP, understanding the social and occupational impact that attending regular face-to-face appointments can have on working people.
